Digital Media: In contrast to analog media, which involve inscription with ink, carving, and the like, digital media use electronic switches to encode information. Programming involves arranging thousands of electronic switches to produce, receive, and exchange data. Digital media includes the physical hardware used in the encoding process, the digital "content" itself, and the mediating software.

Enclosure: A term in economic and agricultural history referring to the termination of shared rights (to land, especially) in favor of an owner, who subsequently uses a resource exclusively. The expansion of economic markets often involves changes in the way a natural or social resource is treated. Because digital spaces serve economic purposes, exchanges among users occurring there can involve economic enclosure. Social media provides numerous examples, in which creators of a networking site own and profit from the everyday communication of users.

Global North/South: Terms that denote the generic geographic, historical, economic, educational, and political division between North and South. North America, Europe, and developed parts of East Asia disproportionately control global resources. Disparities of wealth, housing, education, digital media access and numerous other factors underscore the power and privilege enjoyed by the Global North, while the Global South, home to the majority of natural resources and population, is excluded.

Knowledge Economy: A term denoting an economic shift toward knowledge as a chief commodity. A knowledge economy, unlike agriculture- or labor-intensive economies, places emphasis on expertise and other forms of human capital as opposed to material products. As nonrenewable resources dwindle, economic advantage shifts toward knowledge products—innovation and reorganization of existing frameworks.

Literacy Myth: Coined by educational historian Harvey Graff, literacy myths fuse the ability to read and write with economic and even moral progress. Graff and others, such as Stuckey (1990), argue that myths of economic progress through literacy obscure and oversimplify economic and political factors affecting prosperity, especially with regards to populations placed at risk because of race, socioeconomic status, and/or gender.

Neocolonialism: A term referring pejoratively to the economic influence of capitalism, especially in the form of foreign investment and market expansion, on developing countries. Neocolonialism refers to new means (i.e., business, free trade) to reach familiar ends (i.e., exploitation of developing regions, political influence) without direct military force.

Neoliberalism: A term that refers pejoratively to the tendency of governments in developed regions to use their resources to support privatization, free trade, and reduction of economic regulation.

New Economy: A term referring to the shift from the manufacturing-based economy to a service economy.

Chapter 61
Scandal Politics and Political Scandals in the Era of Digital Interactive Media

Kamil Demirhan
Bülent Ecevit University, Turkey

ABSTRACT

This study focuses on scandal politics and political scandals in the era of digital interactive media. Scandals are the part of symbolic power struggles. Media is one of the main actors of these struggles. In fact, political scandals have a constructive function in democracies because they help releasing corruptions. After scandals, the public get the opportunity to discuss on the legitimacy of political-legal institutions and political system. However, this discussion is not possible in the conditions of scandal politics. This study is interested in scandal politics and political scandals in the era of digital interactive media. It evaluates the maintaining role of traditional media in the era of digital media, and the potentials of digital interactive media to utilize the constructive functions of political scandals in democracies. The cases of WikiLeaks and Ashley Madison affair are used to evaluate the scandal politics and political scandals in the era of digital interactive media.

INTRODUCTION

This study aims at clarifying the relationship between scandals and media in the era of digital interactive media in terms of scandal politics and political scandals. This study explains the difference between scandal politics and political scandals in terms of the presence or the absence of critical public discussion. The presence of critical public discussion on the legitimacy of political system after the release of a corruption is considered as essential for making political scandals functional in democratic system. This study separates the media power on political scandals as before and after the use of digital interactive media. It has critical points about the optimistic views on the role of digital interactive media on political participation and its role as an alternative media to challenge the dominancy of scandal politics.

DOI: 10.4018/978-1-5225-3822-6.ch061

This study examines authoritarian responses in democratic countries towards digital interactive media. However, this study does not deny the challenges in communication and information processes realized by the development of digital media. It tries to find these challenges and understand the main characteristic of political scandals and scandal politics in the age of digital interactive media.

Scandal politics is a concept related to the power of information in politics. Participative democracy supports the access to information by the public and the active participation of citizens to political processes by the way of public discussions. Scandal politics does not comply with the participative democracy consisting of critical public debate about public issues even if it is essential for the revision of political system. However, in scandal politics, scandals are the important parts of political power struggles. Media companies characterize scandal politics using scandals for both making profit and using these struggles as a part of reputation wars. Symbolic power is useful for manipulating people's opinion in order to get their vote in elections or eliminate political rivals. Media has an important role in this manipulation process. In terms of scandal politics, media holds the power of producing information and forming opinion. Moreover, media elites corporate with power elites in this process.

Scandal wars among politicians is a part of politics. Politicians search for information about the corruptions of their rivals useful to attack or counter-attack to them. Journalists and whistle-blowers are main information sources for mainstream media. Blackmailing is a part of political struggles in the conditions of scandal politics. These struggles cause to the loss of political importance of information promoting public debate. Thus, disinformation increases and trust to media dissolves. Details and stories about corruptions are used as profitable commodities by media. In this system, the link between scandals and the unethical character of corruptions disappears. Corruptions as sensational events take the attention of audiences temporarily instead of being a part of long term public discussion as a main problem of political systems.

With the development of information and communication technologies (ICTs), digital interactive media is regarded as an alternative space and channel to challenge the dominancy of scandal politics. People tend to use new and alternative media channels (Castells, 2009). There is a respectable literature on the role of Internet, social media and multimedia systems for the establishment of a new critical public sphere (Dahlberg, 2001; van Dijk, 2006; Halpern & Gibbs, 2013). It is claimed that Internet has various information sources, and transforms the rules of traditional media and traditional journalism. It promotes investigative and participative ways for releasing information. Corruptions are becoming more and more visible by means of Internet and social media such as blogs, microblogs, wikis, or interactive online forums. In the last decade, new digital interactive media channels are used during the protests against governments accused by corruption (Rahimi, 2011). These new communication technologies are thought as a new potential to develop participative politics including critical public discussion.

This study firstly explains interconnection among political scandals, scandal politics and media. This part underlines the importance of scandals as a catalyst for public discussion focusing on the legitimacy of political institutions. Secondly, it dwells on the main characteristic of traditional media in relation to political scandals. Thirdly, it explains the role of digital interactive media in scandals, and scandal politics in digital era. This last part tries to clarify following issues: the maintaining role of traditional media in the era of digital interactive media; obstacles for digital interactive media; and changes in the nature of scandals in this new media era. The arguments of this study are discussed in terms of the cases of WikiLeaks and Ashley Madison affair affected the character of scandals in the last decade.

POLITICAL SCANDALS, SCANDAL POLITICS AND MEDIA

The term of scandal is used "to describe a broader form of moral transgression" (Thompson, 2000). Scandals are related to releasing of the transgression of moral values or norms. Scandal is briefly explained as a released corruption (Lowi, 1988). Corruption is explained as illegal or unethical actions of public authorities or political elites including the use of official positions illegally ignoring public duties (Klitgaard, 1988).Corruption occurs with the breaking of a law or moral norm by public figures or political elites. Thompson (2000, p. 29) explains that "corruption can give rise to scandal, and some of the most important and consequential scandals have been based on charges of corruption." When a corruption released, then it becomes a scandal. By the way of scandal, corruption gains a public character. Therefore, a political scandal can be called as a released corruption of public figures, politicians or officers.

Corruptions become public issues. Thus, scandals play a positive role in democratic countries informing the public about corruptions. In democratic countries, scandals help evaluating democratic system in terms of its stability, powerfulness and trustfulness. Tumber and Waisbord (2004a) explain that "scandals allow us to analyze and gauge the effectiveness of democratic process and procedure. In fact, scandals encapsulate the dynamics of accountability in liberal democracies." Even though scandals have this function in democracies, it needs to meet some conditions to operate successfully. For example, personalization of a scandal is one of the mistakes causes to decrease in the importance of the relationship between scandal and politics in a large extent. This relationship stands on the concept of legitimacy. Attitudes breaking political, social, economic or ethical norms have to be punished. However, this is not enough, the conditions of corruption have to be discussed by the public to make necessary challenges in political system. The discussion about the legitimacy of political system indicates the power of public opinion. In democratic systems, all political decisions and policies have to be debated by the public to gain legitimacy. Therefore, scandals should create an environment for realizing extensive and inclusive public discussion about the legitimacy of institutions and public figures. Legitimacy needs critical public discussion. The presence of a critical public deliberation, and freedom of press, expression and organization are essential requirements for the development of legitimacy.

Although scandals have important role in democracies making corruptions apparent for the public, the functions of scandals can only be useful in the presence of democratic conditions. Evidences about corruptions coming to light after scandals cannot be functional in dictatorships or authoritarian regimes. However, there are also obstacles in democracies to utilize the functions of scandals. The manipulation of public opinion and the commoditization of scandals by media limit the legitimacy discussion by the public. In this situation, political scandals become a part of political competition among politicians and media holds the control of politics in reputation wars. Therefore, discussion of legitimacy and the importance of released corruptions lost their importance as public issues in the conditions of scandal politics.

In terms of scandal politics, media has not the potential to be a catalyst for the development of critical public discussion. Instead, it is one of the actors in scandal wars. Media holds the power of the control of information and communication channels. It can manipulate public opinion and lead informational processes during scandals. In this position, media is a part of symbolic power struggles. It is also not an independent actor. There are political and financial control on media. Thus, media losses its critical role and scandals start to determine the political system instead of political reason. Scandal hunters, sensationalizing and tabloidization of scandals by media, damage to the potential of public debate on corruptions. Therefore, the term of scandal politics insists on the loss of critical role of media in public

issues. And it indicates the increase of the importance of political appearance on media. Thus, corruptions stay behind the presentation of corruption on media.

Media has important role in the disclosure process of corruptions and the breaking out of scandals. Thompson (2000) uses the term of "mediated scandal." Scandals are mediated events so media organizations hold the power of leading people opinion about scandals. In fact, media has the responsibility of informing people about public issues in democracies (Habermas, 1991; Bennett & Entman, 2001). With regard to this responsibility, news about scandals should not be perceived as commodities by media companies for making profit. Events should be seriously mediated in appropriate to the principles of trustfulness and the independency of media. However, when the power of media industry is considered, media companies regard political scandals as marketable products. And they write interesting stories about scandals for taking audiences' attention. These stories become more important than the principles. The next section explains to the background of the challenge on the role of media in politics.

TRADITIONAL MEDIA: THE FALL OF INVESTIGATIVE JOURNALISM AND THE RISE OF SENSATION AND SURVEILLANCE

The development of scandal politics is related to the industrialization of media. Media has lost its public role when it became an industrial power (Habermas, 1991). Media productions focus on consumption. Thus, political communication turns to an activity of political marketing and political advertising. Media conglomerations aim at maximizing their profits. Media contents are under the control of advertisers and media bosses. In this situation, media contents focus on producing enjoyable times for audiences instead of motivating them for public debates. Conglomeration and monopolization in media industry cause to the standardization of media contents (Croteu & Hoynes, 2003, p. 47). This situation damages to the plurality in media environment.

The loss of the productive role of media in public issues has a historical background. It is seen that there is a rise and fall in the public role of journalism in history. The importance of investigative journalism in scandals raised in 1960s and 70s. Investigative journalism consists of bringing truth into open. The press was responsible to inform the public to develop civic culture and political life. However, in 1980s, the importance of investigative journalism started to fall due to the high costs, the gap between costs and profits, and the problems with legal, political and financial authorities. These factors encouraged to sensational journalism instead of investigative one (Tumber & Waisbord, 2004b).

Ekström and Johansson (2008) insist that broadcasting a scandal is an activity more than bringing information into open. As mentioned before, scandals are mediated events. In terms of consumption, the role of media is not only transforming information but also dramatizing it for taking public attention. It uses story telling technics and makes news more interesting for audiences. In terms of scandal politics, sensationalizing is very important. Media uses the strategies of dramatization, sensationalizing, and shocking for attracting audiences. This situation shows that a corruption is not enough to cause to break out a scandal. As Castells (2006) claimed with the terms of scandal politics, media manages scandals and gets power in politics. Its power as an actor in the political struggles is not limited to the sensationalizing of scandals for making profit. Media power in politics causes to new relationships between media and political elites based on mutual interests. Politicians utilize media to increase their symbolic power during political campaigns. Some of politicians are also media bosses, and they use their media power to increase their political interests. For example, in 2001, Michael Bloomberg, used his media power to

become New York governor. At the same year, Silvio Berlusconi, another famous politician and media boss, used his media power in political competition (Croteu & Hoynes, 2003).

The power of media is not only owned by politicians. Public authorities also hold the media power in hand and use its power. Governments have power to control information and communication process. Also, they try to get their own media or cooperate with established private media organizations (Croteu & Hoynes, 2003). With regards to this relationship between media and politics, scandals are open to manipulation of financial and political actors due to their commercial interests or political deals with media bosses, or the control of governments. Therefore, media is not an independent or neutral actor in politics. Its contribution to public sphere and critical public debates about scandals is weak. Thus, questioning the legitimacy of public figures seems not possible. The democratic responsibility of media disappears in the conditions of scandal politics.

The position of audiences in scandal politics is insufficient to recognize them as a part of critical public debate and discussants of the legitimacy of political system. Media provides a huge amount of commodity for audiences. It provides enjoyable times, so people regards media commodities as means for enjoyment. People do not trust to media due to its commercial concerns and its close relation with politicians. Furthermore, people are aware of the government control on media. Therefore, they are unresponsive to media contents. People watch programs instead of considering the public role of media. Medium is considered as a means for passing time. The claim of McLuhan (2001), "medium is the message", is important to evaluate this situation. Content is less important for people than the medium. They are mostly interested in medium and having fun watching programs rather than thinking on messages, so they do not have real demands from media. Therefore, a scandal mediated by mainstream media with sensationalizing and dramatization cannot get enough potential to develop a public debate, and contribute to the discussion of legitimacy about political system due to the problems of value, trustfulness and perception.

Scandals mediated by mainstream media are not seen as reality by the public (Castells, 2009). Highly charged debates about scandals broadcasted on TV do not have special meaning for audiences more than TV series or talk shows. These broadcasts may mobilize some feelings for a short time but they do not continue when TV turned off. Therefore, it is hard to separate their effects from fictional entertainments. Audiences watch the conflict between prospective bride and groom on a marriage program; competition in a floor show, and a talk show about a political scandal on same screen. People watch or read news about sensationalized scandals among countless violence news. In programs about scandals, the sides of a scandal (political elites, journalists, media producers) are making highly charged discussions, they threaten each other. These are similar to competitors in show programs who always accuse each other. The main point of scandal, corruption or transgression of a moral or legal norm disappears in the noise pollution on media. The media environment does not have the capacity to develop a critical public debate and to solve the problems of political system (causing corruptions) around a legitimacy discussion.

Scandals create several public reactions limited to unorganized and discrete events. Some people follow discussions and talk about them but these reactions have not a real aim and consistency. Thompson (2000) explains that "scandals have been described as frenetic events, media and political frenzies that initially capture a great deal of attention and later, gradually or suddenly, disappear." Tumber and Waisbord (2004a) insisted that media is failed to create public reaction. This reaction is essential for critical public discussion to reinstate the legitimacy of political-legal system. In this context, legitimacy crises have no more connection to the public because of the influence of symbolic power struggles in political wars and their presentation on traditional media provides high ratings.

DIGITAL INTERACTIVE MEDIA, SCANDALS AND LEGITIMACY

Social media as an alternative media having potential to pass over the dominancy of scandal politics (Castells, 2009). It has a role in the process of diffusion of information and ideas. Lee and Lio (2016) insists that Internet helps the processes of information production and dissemination. It improves the freedom of expression and plurality in communication. These are important components of critical public discussion. A high level of public access to information improves accountability and supports the struggle against corruptions.

Williams and Delli-Carpini (2004) claims that mainstream media cannot maintain its power as a gatekeeper in the era of digital interactive media. Any actors has no central position in communication process in this new era. Williams and Delli-Carpini (2004) explains that there are so much information on Internet ready to progress. People do not only consume the contents of media but they also produce information on Internet. Consumers have more impact than before, the interaction between producers and consumers is stronger in this new media era than traditional media. Users are not only audiences on digital interactive media but they are also producers so they are called as prosumers. Prosumers produce contents besides consuming them (Dunn, 2013). For example, teacher violence against students in class can be recorded by students using mobile phones, and records can rapidly flow through users' online social networks. Bribery can be recorded and uncovered on social media. New actors (amateurs) engage in the production and dissemination process of information and communication. The users of digital interactive media have power to investigate corruptions as well as journalists, public investigators or political advisors. Also, so many people have capacity to mediate corruptions sharing information with people in their social networks. Williams and Delli-Carpini (2004) claim that the gatekeeping and issue-framing roles of mainstream media are challenged by the development of digital interactive media.

The number of scandals have been increased seriously by the use of information and communication technologies (ICTs). Since, Internet provides more accessible and interactive spaces than mainstream media. Information and news are cycling through social networks. New mobile multimedia systems (van Dijk) record videos and voices which are useful to get proofs about corruptions. The multimedia systems and social networks help releasing corruptions. The files as voices, videos or texts can be used in a combination by means of digital interactive media (Dunn, 2013). The types of the presentation of proofs as visual, audible and written forms with a combination make scandals more impressive for audiences. Also, access to these technologies is easier than to access the mainstream media channels.

Mainstream media manipulates public opinion in the conditions of scandal politics. However, new digital interactive media may increase the awareness of public about the role of scandals. People share information and news about corruptions, and they talk about scandals on Internet. Lee and Lio (2016, p.128) imply that Internet users create pressure on governments. This is important to overcome corruptions in governmental level. Reporting has become easier by means of Internet. It improves the auditing potential of people on public officers. Tumber and Waisbord (2004b) insist that digital interactive media reduces the power of official media under the control of state. Thus, corruptions in governmental level become more visible for the public. For this reason, digital interactive media is seen as an important part of democratization process especially in "authoritarian regimes" and "weak democracies". Dunn (2013) stresses that ICTs are used considerably to release concealed corruptions in the last decade. Therefore, digital interactive media technologies are seen as necessary for increasing public interests and civic culture.

Although new digital interactive media has strengths for accountability, transparency and participation, it is not totally characterized as a critical and alterative media. It also improves conditions for scandal

politics. Tumber (2004b) claims that new digital media provides additional spaces to rumor and talk about scandals. There are new actors who are desired to mention scandals and many blogs and websites make profit by this way. This new era is open to tabloidization, too. There is many information supplier and a huge amount of information on Internet. Scandals cycle on social media by means of online talk forums, rapidly, consistently, and without huge costs. For example, the sites like Drudge Report has role as a forum for spreading rumor and sensationalizing scandals. Tumber and Waisbord (2004b) insist that "by validating claims and providing the illusion of immediacy to acts of wrongdoing, video and sound tapes are important ammunition for actors involved in scandal politics."

However, scandal politics on digital interactive media is different from traditional media. Miltner and Baym (2015) imply that the control power of stories about scandals is challenged by the development of digital technologies. There are different mechanisms and actors in scandalizing process. Investigation of scandals and distribution of them are easier on digital interactive media rather than traditional media because the processes of investigation, storytelling and broadcasting are not only realized by professionals. There are many various actors having role in the investigation of scandals and in the process of information dissemination after scandals. There is not only special investigators, but also whistle-blowers or political advisors hunting scandals. All people can be a potential whistle-blower having a mobile phone and an account on social media platforms. The necessity of professionality in the processes of investigation and broadcasting are challenged by the digital interactive media. The subjects of scandals are also changed in this era. Usually, scandals mediated by traditional media are related to public figures, officers or political elites. On social media, scandals can be related to ordinary people.

The dominancy of scandal politics on digital interactive media is a contradictory issue. Literature on the role of social media in politics presents that social media is not a powerful channel to develop a public discussion challenging the current political environment (Morozov, 2009). However, events in the last decade show that people have had power using social media during protests after political scandals. Especially, in the countries called as "weak democracies" in terms of their political system, scandals caused to social and political reactions and political changes. Nevertheless, these movements have not a real effort to challenge the problems of democratic system around a discussion on legitimacy regarding the problems on the basis of scandals. Therefore, it is not certain whether these political movements are a part of public discussion or temporal reactions open to manipulation by the actors of scandal politics.

The availability of information on Internet about scandals, the rapid flow of information on social media and mentions cannot directly prevent corruptions. Accountability and transparency can only be realized in the presence of political control of the public, the presence of discussion about the legitimacy of public institutions and public figures, and the presence of sharing some common social or moral values. Scandals can only be constructive if they promote to public discussion, legitimacy crises and the revision of political-legal system. Digital interactive media cannot challenge scandal politics although it has potential. From this point, it seems that factors due to financial, political and governmental control on traditional media are important problems against political change in the era of digital interactive media, too. Moreover, there is political control on social media in liberal democracies as well as "authoritarian regimes" or "weak democracies." The control prevents the freedom of expression and damages the main conditions of public discussion. Therefore, the limits of public discussion and legitimacy debate in the era of digital interactive media makes the situation similar to the one of traditional media.

The opportunities of digital interactive media for social and political movements promise hope for people to develop critical public discussion. People may cause to change in the position of traditional media because they are reacted to its reckless and unresponsive position. Digital interactive media chan-

nels have become alternative media in these protests. However, communication on digital media is not totally independent from traditional media. Traditional media becomes a part of communication process a short time after the beginning of social movements. It leads the information flow and takes public attention. The role of taking public attention is a powerful function of mainstream media in the new media era. Digital interactive media is investigative, and information on digital media needs to some editorial assistance by media professionals. Therefore, digital interactive media actors corporate with traditional media companies, and they carry on business. Thus, they find places on the era of digital interactive media supplying their products and continue to use their strategies like storytelling and sensationalizing.

The opportunities increase with taped telephone conversations, the records of videos or secret talks are obtained by and accessible on digital interactive media. These materials are seen as the proofs of corruptions. It is claimed that communication on social media creating pressure on public figures, and it has the role to prevent corruptions. However, it is not sure whether the huge number of proofs have a real impact to overcome corruptions. Discussions on social media are similar to traditional media focusing on the subjects of scandals. However, the main issue is not public figures or politicians as subjects. The issue should be the reasons of corruptions. Scandals sometimes cause to resignation of public figures or punishment. However, scandals do not create debates on the legitimacy of political-legal system. The main reason of this situation is the absence of critical public discussion.

In terms of scandal politics, the huge number of scandals on social media cause to decrease in the importance of scandals. People consider scandals as media events in the abundance of scandals. There are many scandals on social media but they do not cause to public discussion and not resulted with decrease in the number of corruptions. Also, ordinary people becomes a potential subject of scandals in digital interactive media era. Sometimes, people share their unmoral or illegal attitudes on social media and cause to scandals about themselves in their social networks. It seems like self-whistleblowing behavior. Moreover, they become parts of unmoral activities which are accessible as well as information on the era of digital interactive media. Thus, the popularization of scandals causes to decrease in the importance of their political character. It also has impact on scandal politics. If somebody is already a subject of scandal what does a scandal about public figure mean for this person? Popularization, increase in the number of scandals, their inefficiency in political area make scandals meaningless media events for people. This situation also makes the boundaries between private and public blurred.

WIKILEAKS AND ASHLEY MADISON AFFAIR

This part evaluates the arguments of this study by means of WikiLeaks and Ashley Madison affair, famous websites related to popular scandals in the era of digital interactive media. WikiLeaks is a digital interactive media platform played an important role releasing corruptions related to the public authorities of countries in the world. The case of WikiLeaks is useful to understand the role of new digital technologies in political scandals, and it clarifies change in the role of traditional media. WikiLeaks uses digital technologies and has new methods for investigating and broadcasting corruptions. Anonymous information networks, using hacking attacks for investigation, and the online publication of documents are some of the methods used by WikiLeaks.

In the last decade, WikiLeaks has played an important role to disclosure many political scandals. It is crucial to understand scandal politics in the age of digital interactive media. Since, WikiLeaks is scandalized by traditional media by means of allegations about Julian Assange. The case of WikiLeaks

clarifies the changes in scandal politics and political scandals in the era of digital interactive media in terms of the processes of investigating and broadcasting corruptions, the role of traditional media in digital era, and surveillance in modern democratic countries.

Another digital interactive media platform is the website Ashley Madison. The website was scandalized with the disclosure of users' identities after a hacking attack. In this case, scandals were about ordinary people rather than important public figures. It seems that although this case includes unmoral relationships of many number of public officers, it cannot be seen as a classical political scandal. In fact, it has political character if its political and social consequences are regarded. The scandal was not only about the disclosure of users' identities, but also Ashley Madison website has a potential to be a scandal with regards to its service "arranging extramarital relationships." After this affair, the number of registration to website has increased surprisingly.

The cases of WikiLeaks and Ashley Madison are useful examples to understand scandal politics and political scandals in the era of digital interactive media. The main point about these digital interactive platforms is finding out the challenges of scandal politics and the change of political scandals. In this context, this study discusses the possibility of critical public discussion about the legitimacy of political-legal system after political scandals in the era of digital interactive media. Political scandals are defined as functional events in democratic systems if they can contribute to the revision of political system. In other way, corruptions can be apparent in authoritarian regimes but if it is not discussed by the public, scandals cannot realize their function in political system.

WikiLeaks

The case of WikiLeaks is evaluated in terms of the following issues: i. the maintaining role of traditional media as storyteller and gatekeeper; ii. the role of traditional media due to the weakness of investigative journalism, tabloidization and sensationalizing on social media; iii. surveillance on social media; iv. the challenge of scandal politics.

WikiLeaks (WikiLeaks, 2016) is explained as "a multi-national media organization and associated library." It was founded in 2006 by Julian Assange. It publishes "censored datasets or otherwise restricted official materials involving war, spying and corruption." WikiLeaks published more than 10 million documents and associated analyses (WikiLeaks, 2016). It is called as "a whistle-blowing organization and website that publishes materials provided by anonymous sources" (Beyer, 2014, p. 143). Volunteers in anonymous networks are important in the process of obtaining secret information about governments or corporations, and sharing documents on digital interactive era.

WikiLeaks aims at contributing to the establishment of a networked public sphere (Benkler, 2013). It is regarded as a powerful source for a real democracy. In democracies, people have the right to access true and reliable information about the policies of governments. Also, people have to be a part of policy making process in appropriate to participatory culture (Jenkins, 2009; Dunn, 2013). People in anonymous networks all around the world provide information and proofs about corruptions using digital interactive channels (Dunn, 2013). These features of WikiLeaks are compatible with the claims about the advantages of digital interactive media for revitalizing democracy.

WikiLeaks has important role in scandals releasing corruptions in international level. It became popular in 2010, after the publication of U.S. secret documents. These documents claim that U.S. army and U.S. government broke the official principle of secrecy. WikiLeaks' documents caused a couple of scandals called as Collateral Murder, The Iraq War Logs, The Afghan War Diary, and Cablegate.

The Collateral Murder is an important one of these scandals about U.S. air strike in the July, 2007 that killed Iraqi journalists working for Reuters (Brevini et al., 2013). Investigation efforts failed and a copy of the video requested by Reuters as an evidence was not launched. However, WikiLeaks obtained and launched this video, and made it available to the international public (The video on YouTube is viewed by 15.547.171 user by the June, 2016.). It clarifies the power of WikiLeaks releasing scandals. The popularity of WikiLeaks increased rapidly after the broadcasting of this video.

The Maintaining Role of Traditional Media as Storyteller and Gatekeeper

WikiLeaks uses investigative methods such as whistle-blowing and hacking activities. And it has various publication methods. It publishes secret documents on its website and/or makes contract with mainstream media for the publication of these documents. Its self-publication activity is different from traditional standards of journalism. It does not use editing procedures or arrangements like storytelling, or dramatization of news. Therefore, the form of documents in the website are regarded as investigative data rather than news. These data do not make sense for the public because they seem as raw material and need to gain a frame. Therefore, traditional media and new media collaborate. WikiLeaks has contractual relationships with more than 100 major traditional media organizations (Wikileaks, 2016). New York Times, the Guardian, Le Monde, El Cezire TV and Der Spiegel have published the documents provided by WikiLeaks. These traditional channels are functional for the dissemination of information, attracting public attention to corruptions, and providing financial support to WikiLeaks. As Rogers (2011) stressed that WikiLeaks helps journalists to obtain information, classify and analyze data, and present information to the public. Making news using data is the work of data journalists. It could be seen as intervene on the raw material (investigative documents) by traditional media.

Getting information from an organized partners instead of unknown personal sources is also an advantage for established news organizations. It is insisted that WikiLeaks has been challenged the relationship between journalists and whistle-blowers (Thorsen et al., 2013). Organizations such as Al Jazeera and New York Times get information from organizations like WikiLeaks, and collaborate them in the status of partnership to obtain leaks and to secure this process. This new collaboration challenges the sources of leaks. Organizations like WikiLeaks are more responsible and reliable than personal sources (Benkler, 2013).

The Role of Traditional Media Due to the Weakness of Investigative Journalism, Tabloidization of Social Media and Sensationalization

Traditional media helps WikiLeaks for publication and increases public attention about corruptions (Dunn, 2013). It means that even if sources are investigative documents obtained by WikiLeaks, these documents reach to the public by the stories of traditional media. The methods of the publication of documents used by mainstream media are different from WikiLeaks. Mainstream media companies need to analyze data and provide story about investigations.

Although traditional and new digital media have a cooperation, there are some contradictories. WikiLeaks is different from traditional media in terms of its non-profit nature. The main aim of WikiLeaks is revitalizing critical public debate about governments and politics lightening corruptions with documentary evidences obtained by a volunteer global information networks (Benkler, 2013). On the contrary, mainstream media aims at making more profit. Moreover, the collaboration between WikiLe-

aks and mainstream media has risks for both of them. Media players faced with economic and political risks due to the collaboration with WikiLeaks producing scandal including government agents. Media companies also strive for preserving their authenticity. It is also complicated for WikiLeaks because it aims at creating an opponent public and challenging hegemony. It is a counter-hegemonic project against both traditional media and political elites.

This collaboration has also ideological and methodological risks. Storytelling and sensation, and regarding news as commodity are not appropriate to the strategies of WikiLeaks. Another problem is the main components of the nature of traditional media that are tabloidization and sensationalization. WikiLeaks and its symbol name Assange are also marked as sensational news by mainstream media. While many corruptions in international level were scandalized by WikiLeaks, mainstream media scandalized Assange due to the allegations about sexual misconducts. Dunn (2013) stresses that there was a tension occurred between traditional media when collaborators, Guardian and New York Times, reported the allegations of sexual misconduct by Assange, denied by him. This scandal caused to the decrease in the meaning of WikiLeaks, and it caused to the tabloidization of WikiLeaks.

Surveillance on Social Media

Digital interactive media is considered as a space providing the freedom of information for people. In Arab spring, western countries claimed that Internet is a channel to challenge authoritarian regimes. However, it is seen that this declaration is not trustworthy. The power of Internet is considered as a part of struggle for freedom against authoritarian countries. However, modern democratic countries apply surveillance and control on the platforms of digital interactive media like WikiLeaks as well as authoritarian regimes (Hintz, 2013).

WikiLeaks is seen as a symbol of the freedom of information (Beyer, 2014). McCarthy (2015, p. 439) explains that groups like Anonymous and WikiLeaks are "a part of information movement against practices of information asymmetry." WikiLeaks is an example of "the use of liberation technology and experiences of individuals and movements in advancing free expression, transparency and social transformation" (Hintz, 2013, p.147). Beyer (2014), suggests that "the cross-national online norm of freedom of information" has troubles with domestic legal practices. According to Beyer (2014) this conflict is clearly seen in the U.S. government's effort to get rid of WikiLeaks from the Internet. After the scandals of Collateral Murder, The Iraq War Logs, The Afghan War Diary, Cablegate, U.S. government started to censor on web servers providing services to WikiLeaks (Assange, 2012). After this censorship, WikiLeaks supporters started to mass-mirroring to continue broadcast the website (Enriquedans, 2010).

Also, there are financial, political and legal control on digital interactive media. In this context, digital media is similar to traditional media. This control is explained as control on infrastructure, control on financial support provided by the supporters of radical online disclosure, and control on analytical labor interpreting raw material (Brevini & Murdock, 2013). Political, financial and legal control on digital media causes to the limitation of freedoms. Internet provides advantages for companies. Some of huge companies control the digital media market. Google, Facebook, YouTube hold the large part of information and communication economy. Web-sites use web services provided by these powerful companies. Service providers establish control on digital interactive media (Brevini & Murdock, 2013).

After the disclosure of U.S. embassy diplomatic cables, WikiLeaks is declared as a threat for homeland security by government. The service providers cut off their services to WikiLeaks due to the reaction of U.S. government. In terms of financial control, an unofficial pressure was applied on the banks

to prevent the transfers of donations via banking service or credit cards (Brevini & Murdock, 2013). Financial control also affected the analytic labor which needs high prices to work (Brevini & Murdock, 2013). If an Internet platform cannot pay these costs, it could not be publicly visible.

Control on digital media in democratic countries is similar to authoritarian regimes filtering the web contents and blocking access to websites during social-political movements. Governments have control on web service providers, search engines, and infrastructure. Political power collaborates with corporations in this process. Surveillance is applied on the contents of communication like emails. User's data (activist or supporters) are collected from social media sites (Hintz, 2013; Winseck, 2013) as proof for accusations. These controls were applied in the case of WikiLeaks. Moreover, Assange accused of spying; surveillance was applied on supporters, on publications of WikiLeaks and the use of WikiLeaks' documents by mainstream media, public officials or academicians (Beyer, 2014; Hintz, 2013).

Scandal Politics and Digital Interactive Media

Scandal politics consists of the manipulation of public opinion by media and political elites. However, public opinion established through public debate is very important to use scandals for democracy. In terms of WikiLeaks, Beyer (2014) explains that surveys present that the majority of U.S. citizens did not support WikiLeaks. Chaiken (2014) writes that Washington Post-ABC News poll finds that "most of those polled (68%) say the WikiLeaks' exposure of government documents about the State Department and U.S. diplomacy harms the public interest. Nearly as many (59%) say the U.S. government should arrest Assange and charge him with a crime for releasing the diplomatic cables." However, Beyer (2014) stresses that an age considering survey shows that especially young people supported both Assange and their information freedom. Also, Beyer (2014) claims that the new movement for freedom of information presents evidence for the power of Internet and political participation, especially for the participation of young people.[1] Dunn (2013) suggests that the scandals broken out by WikiLeaks contributed to public discussions. For example, politically conservative Newspaper group The Gleaner's publication in Jamaica took partner with WikiLeaks and publicized information about the U.S. Embassy cables was very important for Jamaican civic life. The Gleaner's publication of U.S. Diplomacy Cables developed public debate and deliberation in Jamaica. Dunn (2013) claims that this publication has contribution to the development of organized, connected and broadened civic culture.

The relationship between WikiLeaks and Arab Spring is important for the development of public debate and legitimacy crises in authoritarian countries. The documents of Cablegate provided many information about corruptions in administration level in MENA countries. Saleh (2013) summarizes the cables about Arab Spring released by WikiLeaks in terms of three issues. The first one is the cables related to "the diplomatic positions of Arab leaders towards Iran and Israel; the second one is related to "the US backing of dictators in the region"; the third one is "focused heavily on abuses of civil liberties particularly in Egypt" (Saleh, 2013, p. 237). These are important allegations about the political authorities in the world.

In terms of WikiLeaks' impact on Arab Spring, Saleh (2013) takes attention to the low level of information literacy, and Internet access gap in MENA countries. Saleh, also stresses the prohibition of access to social media sites, and the gap between Internet users and politically active young population. In this situation, Saleh insisted that there was an interaction between online and offline political participation in Arab Spring. WikiLeaks' cables had an important role promoting public debate and anger

against political authorities. It contributed to the development of democratic politics in Arab countries providing information about corrupt relations among governments (Saleh, 2013).

York (2013) claims that in the Arab world, demands for transparency are encouraged after the cables released by WikiLeaks, and by traditional media. For example, Al Jazeera released more than 1,600 documents about Israeli-Palestinian peace process, Palestine Papers (Aljazeera, 2016). Corruptions about the president of Tunis were released by the WikiLeaks two weeks before the protests (Bachrach, 2011). WikiLeaks partnered with Nawaat.org - an activist media site- published cables on a site called as TuniLeaks. Cables related to Morocco also released by means of similar version of TuniLeaks called as MoroLeaks (York, 2013). However, it is not certain that WikiLeaks is directly related to uprisings in Arab world. In terms of the demands for transparency, WikiLeaks can be regarded as a catalyst for the uprisings rather than as a reason.

After the releases of corruptions, demonstrations aimed at defending both the freedom of information and democracy. It shows that information freedom was a part of these movements. The problem about freedom is also one of the problems of liberal democracies because surveillance and control on digital interactive media maintain in democratic countries. The development of public debate using digital interactive media is closely related to the freedom of expression and freedom of information. This is the reason of the claim that scandals have a function in democratic countries. However, surveillance on digital interactive media like WikiLeaks is an important obstacle to characterize interactive platforms on Internet as alternative channels for disclosure (Brevini & Murdock, 2013). Although WikiLeaks documents about corruptions motivate struggles for democracy and public debate, debates on corruptions cannot cause to a real change in political system. They could create a powerful doubt about the public figures, elites and institutions resulting with the revision of political system. However, it is not certain that WikiLeaks and Assange have strong support from the global public opinion.

Ashley Madison Website

The Ashley Madison affair explains how scandals in digital interactive media are socialized events. Many ordinary people become the parts of scandals in the age of digital interactive media by this event. Interaction spaces on digital era open to act transgressing social norms. People have access to online services providing unmoral experiences. These services are mostly conflicting with social norms and public values. However, the privacy of users are not safe in digital interactive media. Hackers' attacks, leaks in companies' privacy systems, and personal information sharing for profit among companies cause to scandals. In fact, the services of companies providing unmoral relations or damaging social values are already scandalous. However; the release of personnel information makes scandals more apparent for the public. In the age of digital interactive media, political figures are no longer the single actors of political scandals. All the people have a potential to be a part of scandals. Socialization of scandals affects the political scandals including the members of the public, the main source of critical public discussion.

Ashley Madison is a digital interactive media platform the center of which is in Canada established in 2002. The running company of this website is Avid Life Media (ALM) (Mansfield-Devine, 2015). Ashley Madison is a social networking site aiming at providing extramarital relationships to its users from all around the world and its motto is "Life is short. Have an affair." (Mansfield-Devine, 2015). A group of hackers who called themselves as the Impact Team hacked this website in July, 2015. Hackers threatened ALM to uncover the identities of users. However, Ashley Madison continued its service. In August, hackers started to explain the identities of the users.

There are 39 million registration in this site from 53 countries (Mansfield-Devine, 2015). According to analysis, 34% of accounts are fake. With regard to this information the number of valid accounts is founded about 25 million (Mansfield-Devine, 2015). The broadcasting of a huge number of users' identities caused the Ashley Madison affair. This case is not seem as directly political at the first glance. However, it is related to the transgression of a modern ethical norm (faith among family members) by a huge number of people from many countries. After the hackers attack and the disclosure of personal information, many people have become a part of social scandal all around the world. The scandal become a public event including public figures politicians, priests, military members, civil servants, celebrities (Lamont, 2016).

In general, extramarital relationship is accepted as unmoral behavior in many societies. However, this digital interactive media company provides extramarital relationship to its users. It has about 25 million users. This situation means that an unmoral service is not directly create a scandal. The scandal was broken out after the release of users' identities. The company stayed calm and continued to provide its services without any restriction (Mansfield-Devine, 2015). This attack was declared by the company as a criminal attack rather than hacktivism, and it was insisted that "The criminal, or criminals, involved in this act have appointed themselves as the moral judge, juror and executioner, seeing fit to impose a personal notion of virtue on all of society" (cf. Mansfield-Devine, 2015, p.12).

This scandal affected the social status of people and their careers. However, its impact was wider than any other media scandal about popular public figures. Because many ordinary people were affected by this scandal. For example, nearly 15.000 official email addresses related to U.S. military and government (.mil and .gov) used during registration to website are released. There are many email addresses related to public institutions and private companies. People are punished according to institutional procedures. However, the effects are not only about the careers of people. Couples were divorced, families were damaged, people lost their social status, and the affair was mentioned in relation to suicides (Mansfield-Devine, 2015, p.13). This attack is considered as a crime and unmoral attack to people life (Mansfield-Devine, 2015, p.13).

In order to understand the relationship between Ashley Madison affair and political scandals in the era of digital interactive media, evaluating this service and the aim of people for using this service are necessary. According to the research of Pelucio (2015, p.45) man registered on Ashley Madison website enjoy due to the risks of using this service. They think that the service supports their masculinity. Users are taking risks like controlling information about them, they use nick names, and the risk of disclosure of personal photos. However, users claim that they have abilities to manage risks and these risks mean for them having control, power and autonomy contributing their masculinity. Any problem in the process of risk management is shown as fun, and they regard this situation as "risk adventure" rather than a trouble (Pelucio, 2015, p.45).

There is a relationship between providing an unmoral service and its use by people, and public reaction to political scandals. People are the parts of public who are responsible for the evaluation of the attitudes of public figures or political elites in public issues, and the evaluation of the transgression of socio-political norms organizing the societies. In this situation, the scandal of Ashley Madison is related to degeneration of social norms and public values. By the way of this scandal, ordinary people became the subject of a scandal besides public figures related to scandals. The subjects of Ashley Madison affair are the part of the public as the subjects of critical deliberation.

In the era of social media, many people become a part of scandals, and scandals become ordinary events. This situation causes to fall of the importance of public discussion and legitimacy debates about corruptions. The concepts of risk management and risk adventure used in terms of the risks about the extramarital relationship have connection with people's perception about public figures involved in scandals. In this situation, people cannot ask ethical questions, and they do not discuss about the reasons of corruptions. Thus, they do not try to find the ways of change. On the contrary, people consider scandals as the failures of public figures and political elites in the process of risk management.

Scandals should create public discussion about the legitimacy of political institutions, and they should cause to the revision of political-legal system. Therefore, the meaning of scandal for public is important to talk about the political character of scandals. When corruption is not considered as media event, or most people become a part of scandals, scandals loss their political meaning. If people conceive scandals as unsuccessful corruption attempts, scandals will be seen as a personal fails of the subjects. If corrupt persons can manage their corruption successfully, they can continue their social and political position. If they fail to manage this crisis, the person has to be leave his/her position. The consideration of scandals between the scale of success and fail, causes to the fall of discussion about legitimacy, and the process cannot be completed with the revision of political-legal system.

CONCLUSION

This study focused on scandal politics and political scandals in the era of digital interactive media. It supports that scandal politics is still affecting the politics in the era of digital interactive media. Although the power of traditional media is challenged by the innovations in ICTs, it has important function in the same era. The challenges mainly consist of changes in the investigation and broadcasting process. The investigation of scandals and broadcasting process include many actors different from traditional media organizations and professional journalists. The gatekeeping role of mainstream media is challenged, too. Recently, many people are a part of the whistle-blowing process. Nevertheless, traditional media has some functions in digital interactive media era. The financial cooperation and taking public attention are the maintaining roles of traditional media. The rules of scandal politics are also valid in this era. Scandalization, tabloidization, and surveillance are important problems preventing the realization of critical public discussion. These are also causes to the loss of the importance of investigative information.

The case of WikiLeaks presents that traditional media is not any more the single actor in the process of investigation and the publication of news. Governments' control on information and communication process is decreased by the way of hacking activities and anonymous networks. The communication process is not central in social media and media elite is no single power in the process of scandalizing. However, political, financial and technological control still maintain on digital era. Ashley Madison affair presents the change in the nature of scandals. Digital interactive platforms provide new spaces open to the transgression of social-moral norms. Inclusion of a variety of subjects in scandals besides public figures causes to the popularization of scandals. Scandal politics are not only about the public figures in political area but also it is about the figures of social area. It affects the families' lives, careers and relationships between ordinary people. Digital media caused to the increase of the number of scandals. The spectrum of scandal is widened. Hacktivism and leaks, or information leaks from services ignoring

their users' privacy are an important part of the releases of scandals. Even, accessible profiles on social media are useful to break out scandals about people because they share their own unmoral or illegal activities there. Although, there is an important increase in the number of scandals, there are not affective public discussions about the legitimacy of system. Because scandals are popularizing day to day. When everybody being a part of a scandal, scandals may lose their importance in politics.

KEY TERMS AND DEFINITIONS

Ashley Madison: A digital interactive media platform services extramarital relationships to its users.

Corruption: The actions of public authorities or political elites including transgression of the social and political norms of society.

Critical Public Discussion: The base of public opinion in participative politics having potential to challenge scandal politics.

Political Scandal: Political scandal means a scandal breaking out after the releases of corruptions related to public figures and political elites.

Scandal Politics: It means the use of scandals as a component of political struggles in symbolic power wars. Media is a powerful actor in politics as holding the means of information and communication channels.

Social Media: All digital technologies and platforms provide opportunities to users for interaction. Video recording mobile phones with social media applications, social media platforms like Twitter, Facebook, YouTube, Instagram, blogs, wikis, forums and interactive website like WikiLeaks.

WikiLeaks: A digital interactive media organization aims at releasing corruptions all around the world. It investigates information about corruptions and publish on the website. Its aims at increasing public awareness and contribute to the transparency of governments.

ABSTRACT

Though the use of social media for political campaigning has been widely studied, its correlation with electoral success has not received much attention. The current study uses the 2013 Israeli elections to examine the impact of social media on campaigns as a process. Findings indicate that parties and candidates that invest in social media are more likely to achieve social media success, which in turn increases their chances of achieving electoral success. Some may dispute the level of influence of social media; however, study findings suggest that being active in the digital arena has become a significant element in achieving ballot box success.

INTRODUCTION

One of the most challenging political communication questions concerns social media in election campaigns. These days, social media serve as a public stage for political deliberation (Bode et al., 2014; Dvir-Gvirsman et al., 2014; Kushin & Kitchener, 2009; Zhang et al., 2010). As the new media become an increasingly important part of every campaign (Dimitrova et al., 2014; Trent & Friedenberg, 2008; Trippi, 2013), researchers and practitioners have been attempting to understand whether social media

DOI: 10.4018/978-1-5225-3822-6.ch062

popularity can be linked to electoral success. This study deals directly with that issue by looking at the role of Facebook in the 2013 Israeli elections.

In the U.S., the 2008 presidential campaign was considered a social media turning point. Indeed, in 2008, CNN went so far as to ask whether the presidential election would be won on Facebook (Rawlinson, 2007). In 2012, the Obama digital campaign made several significant changes, and the general impression was that these contributed to the President's re-election (Trippi, 2013).

Previous studies have examined this phenomenon from various perspectives. Some that examined political preferences and election results (Ceron et al., 2013; Lui et al., 2011) found that social media activity can be used to forecast results in Italy and France (Ceron et al., 2013). Others looked at how citizens use social media during election campaigns (Baumgartner & Morris, 2010; Fernandes et al., 2010; Kushin & Yamamoto, 2010; Robertson el al., 2010; Small, 2008), and how candidates were portrayed (Woolley et al., 2010). Some studies dealt with the impact of social media on political participation (Bakker & de Vreese, 2011; Baumgartner & Morris 2010; Conroy et al., 2012; Dimitrova et al., 2014; Vitak et al., 2011; Wolfsfeld et al., 2013; Zhang et al., 2010) and social capital (Pasek et al., 2009; Valenzuela et al., 2009; Gil de Zúñiga et al., 2012), while others focused on candidates' use of social media (Bronstein, 2013; Church, 2010; Gueorguieva, 2008; Metzgar & Maruggi, 2009; Perlmutter, 2008; Robertson et al., 2010; Wen, 2014).

The current study examines the impact of social media on election campaigns as a process, beginning with the amount of resources a political party invests in digital media, the extent to which this investment leads to greater social media success, and the extent to which this second variable can be translated into electoral success. To better understand this process, the authors took into consideration additional factors such as the parties' initial Knesset1 size and their relative success in the traditional news media. The 2013 Israeli elections were considered by many to be the first Facebook elections in Israel, since social media hosted an extensive part of the campaigns and political discussions. Using Israel as a case study provides a more international perspective (compared to most studies in the field, which were conducted in the US). The characteristics of the Israeli political system enable us to compare these variables in a multi-party parliamentary system.

INVESTING IN DIGITAL MEDIA

Early studies focused on mass media investments and their role in changing voters' attitudes. Most scholars agree that traditional media coverage of issues and events influences public opinion (de Vreese et al., 2011; Entman, 2003; McQuail, 1994), especially when dealing with political issues, such as election campaigns (Hopmann et al., 2010; van Aelst et al., 2008). For example, Norris et al. (1999) found that the media can have direct effects on political opinions. Thus, media shapes its recipients' conceptions of political reality, while setting the frames of reference that they use to interpret public events (McQuail, 1994; de Vreese et al., 2011). Previous studies have indicated a link between traditional media coverage and audience attitudes (Beck et al., 2002; de Vreese et al., 2011; Druckman, 2005; Entman, 1993; Gamson, 1992; Mazzoleni & Schulz, 1999; Mendelsohn, 1996), taking into consideration that other factors, such as personal experience and interactions with peers, also affect audience views (Neuman et al., 1992). Previous studies also found that financial investment in media campaigning provides resourceful candidates with an advantage over their rivals (Davis, 2000; Ganz, 1994, 2000).

Whereas the above studies relate mostly to traditional media, the emergence of Web campaigns sparked an important new line of research. The question was whether the lower costs of internet use provided a way for candidates and political parties to compete on a more equal basis. Proponents of the equalization hypothesis argued that creating a website requires many fewer resources than using public relations and advertising agencies (Corrado & Firestone, 1996; Gibson & Ward, 1998; Rash, 1997). Conversely, critics argued that the Web reflects the traditional power play, because candidates with better resources have better online media. Effective web campaigns are expensive, and operating professional websites requires significant resources (Margolis & Resnick, 2000).

The majority of early studies supported the normalization hypothesis and identified that the larger parties had more advanced and well-designed websites, and were able to generate a significantly greater volume of traffic (Bowers-Brown & Gunter, 2002; Gibson & Ward 1998; Gibson & Ward, 2000; Norris, 2001; Ward & Gibson, 2003). The growth of social networking services renewed the debate and led to further studies.

Indeed, the Web 2.0 era provides wider evidence for the equalization hypothesis. The 2008 US Democratic primaries, as well as Obama's victory, were widely influenced by skillful use of social media, again in favor of the candidate originally perceived as the underdog (Harfoush, 2009; Hindman, 2009; Trippi, 2013). Similar trends were found in Scandinavia (Carlson & Strandberg, 2008; Kalnes, 2009), Australia (Gibson & McAllister, 2009), and Germany (Zittel, 2009). In contrast, Schweitzer's 2011 study of German online campaigns indicated normalization, because larger parties used social media to their advantage much more efficiently. Studies in the UK and US also regularly point in the direction of normalization (Gibson, 2010; Gulati & Williams, 2013; Williams & Gulati, 2013).

Does Success With Social Media Lead to Electoral Success?

Media attention during the election campaign is seen as vital to the election outcome (Harrop, 1987; Hopmann et al., 2010; van Aelst et al., 2008), and politicians are convinced that media attention is crucial for their electoral success (van Aelst et al., 2008). Media attention was found to contribute to the electoral success of parties and candidates (Brosius & Kepplinger, 1992; Gerth & Siegert, 2011; Maddens et al., 2006; Sheafer & Weimann, 2005; van Aelst et al., 2008).

The impact of social media on election outcomes, however, has not received enough scholarly attention. A related topic that has been studied is the impact of social media on political participation and civic engagement. Social media's political use was found to correlate with civic engagement, and enhance both digital and traditional political participation (Bode et al., 2014; Gil de Zúñiga et al., 2012; Wolfsfeld et al., 2013; Xenos et al., 2014; Zhang et al., 2010). If so, it is reasonable to expect social media campaigning to affect political processes.

To date, there are only a few studies that have dealt with the impact of online campaigns on election outcomes. One of the earliest (D'Alessio, 1997) found that investing in online campaigns is linked to electoral success. Findings did not clearly indicate whether Web campaigns directly affect the election outcomes; rather, they suggested that such campaigns reflect the parties' size and power, as well as their level of campaign preparation, thus supporting the normalization hypothesis. Given the increasing use of the internet in political contexts, more studies supported this trend. Gibson and McAllister (2006; 2011) studied the impact of digital campaigning on voting in the Australian elections in a Web 1.0 environment during the 2004 elections, and in a Web 2.0 environment during the 2007 elections, generally finding that online campaigns constitute an important component of a winning election strategy, but those effects are

moderated by the party and the tools used (Gibson & McAllister, 2011). Their findings indicated that Web-based techniques are non-traditional, providing a clear advantage in election outcomes (Gibson & McAllister, 2006). Similarly, while examining the 2006 US midterm congressional elections, Wagner and Gainous (2009) found that digital campaigning and Web presence were significant predictors of the total votes candidates garnered, even when controlling for funding, incumbency, and experience. Further, Sudulich and Wall (2010) found that Web-based campaigns are more effective in areas with higher internet penetration. Apart from website presence, Rackaway (2007) emphasized the influence of blogs and "grassroots mobilizing sites" to the success of campaigns.

Investment in Web 2.0 platforms made the study of online campaign outcomes even more complex and challenging, mainly because users are able to directly engage and channel campaigns in several directions, making it harder for the candidates to control the process. Thus, Gueorguieva (2008) found that YouTube and Myspace indeed offer greater potential for new candidates to spread their messages. However, once the message is reproduced and changed by users, candidates lose control over it. Zittel (2009), reporting on the 2005 German federal elections, further found that young candidates and those running in districts with a high share of young voters were more likely to engage in and benefit from social media campaigning. Hence, the use of interactive online platforms may particularly leverage the outcomes of parties that employ them. It seems, for example, that parties that can appeal to the younger audience may benefit more from employing Web 2.0 tools in their election campaigns.

Engagement:[2] The Mediating Factor

The engagement of online audiences is therefore an important and perhaps crucial factor for evaluating the election outcomes. Park and Perry (2008) showed that online campaigns clearly influence the level of engagement and the social interaction between users, who further spread information to their friends. In recent years, social networking platforms, particularly Facebook, have been embraced by many political candidates as a platform for engaging and mobilizing their supporters. Hong and Nadler (2012) explored the relationship between presidential candidates' use of social media channels by measuring the number of mentions they received on Twitter. Their findings showed that high levels of presidential candidate Twitter activity had only minimal effects on their mentions by users in this channel. This provides another indication that investment in social media has a certain independence from both candidates' actions and election outcomes. To conclude, most studies on election campaigns conducted on the internet examine the relationship either between online investment and election success, or between online investment and audience engagement. As far as can be discerned, no previous studies have systematically explored the relationship among the three stages: investment in digital media, social media success, and electoral success.

The theoretical argument is straightforward: all other things being equal, political parties that make a significant investment in social media during an election campaign are more likely to have citizens react positively to the party and/or candidate posts on Facebook. Social media success should, in turn, lead to electoral success. Investing in digital media is the independent variable, social media success is the intervening variable, and the dependent variable is electoral success.

The underlying logic is that social media represents a powerful tool for encouraging potential voters emotionally and ideologically. The traditional electoral campaign, which is vastly different from what happens in the digital era, is based on two major communication channels: the mainstream news media and political advertisements, that is, two inherently passive types of communication that can nevertheless

attract success at the ballot box. Social media, however, enables potential supporters to become actively engaged in the campaign, which the authors believe offers major advantages. In addition, potential supporters receiving the political messages from their "friends" increases the likelihood that such communications will be read and watched. The term "potential" is critical here. The assumption is that political parties that are able to successfully exploit the social media are in a better position to reach voters who consider that party or candidate as a viable voting option. A massive investment in social media by an inherently unpopular party will not save it. In addition, in a multi-party system, most voters identify with a certain ideological camp, and few will consider voting for a party that is opposed to their core political beliefs. Thus, the authors expect strong correlations between the three variables, but do not see investment in the social media as something that always brings electoral success.

The study's hypothesis claims that the impact of social media on election campaigns is a process; the amount of resources a political party invests in digital media leads to greater levels of social media success, which in turn can lead to electoral success. Success on social media is expected to serve as a mediator variable between the parties' and candidates' investment on digital media and their electoral success.

METHOD

This study examines the 19th Israeli parliament (the Knesset) elections, held on January 22, 2013. Israel has a multi-party proportionate representation system, which has always led to coalition governments. In the 2013 elections, 32 parties ran for the Knesset (many did not have a realistic chance of being elected, due to the two-percent threshold that is required to secure any representation). The 19th Knesset's 120 seats are distributed between 12 parties. The citizens in Israel vote for their preferred party, but due to the tendency in western democratic countries to emphasize and personalize candidates (Balmas et al., 2014)—and a few changes that were made in the Israeli voting system3— – candidates (and especially party leaders) play a significant role in the election campaign. As such, the authors decided to also examine the impact of Facebook pages for both parties and certain candidates. Social media played a central role in the 2013 Israeli election campaigns, and politicians' use of new media tools is correspondingly vast. Almost all political parties had a digital campaign (including Facebook pages), and their financial investment was 50 percent of the total budget (Mann & Lev-On, 2014). The authors selected the parties and candidates for this study based on their chances to pass the two-percent threshold, as reflected in the polls before the elections. The final list included 14 parties and nine candidates.4

In keeping with the study's goals, several interviews with the parties' campaign managers and new media managers were conducted. The parties and candidates' online activity was Web-mined via monitoring their Facebook activity and mentions in prominent news websites (see below). The indicator for candidates' political success was the election result.

Investment in Digital Media

The information about the three investment variables was collected through 27 interviews with campaign staff members.5 During those post-election interviews, the campaign managers provided us with information about their parties' financial, personnel, and time investments in digital media.

To assess the parties' commitment to digital media, the authors examined three indicators:

1. Financial investment (the percentage of the total media budget invested in digital media);
2. The number of the campaign's digital media staff members; and
3. The length of the digital media campaign (measured in weeks).

These three aspects, which were presented as part of the factors of political campaigns professionalism in previous studies (Gibson & Römmele, 2001; 2009; Tenscher et al., 2012), together provided a broad, albeit imperfect, assessment of parties' investment in digital media.

Investment in Digital Media Scale

To effectively estimate the parties' investment in digital media, the authors constructed the Investment in Digital Media scale. The scale was calculated using the three indicators mentioned: the parties' financial investment in new media, the number of the campaign's digital media staff members, and the length of the digital media's campaign. The scale's range was determined by merging those three indicators' standardized scores, and confirmed using a factor analysis (with loadings of no less than 0.807 for any of the items).

Online Activity and Success

The authors chose to focus on Facebook because it is by far the most popular social network site in Israel, with 4.3 million users (more than 50 percent of the population), 95 percent of whom are over the age of 18 and considered potential voters, according to official Facebook figures (Kabir & Urbach, 2013).6 For each party and candidate, the authors collected activity data during 52 days before the elections (between December 1, 2012 and January 21, 2013).7 Specifically, the authors looked at the daily party and candidate mentions in mainstream online newspapers, and the number of likes given to their official Facebook pages. Because most online activity in Israel is conducted in Hebrew, the authors measured only Hebrew content. The authors recorded Facebook activity on the relevant official pages of the parties and the candidates, using the following measurements:

Online News

This variable consisted of the daily average number of news mentions of each party and candidate. The authors used the full names of the candidates and the official names of their parties as appeared on the official Israeli government website (The Israeli elections website, n.d.). The data on news mentions were retrieved using software called Makam (Makam, n.d.) that systematically mined thousands of Web pages using pre-selected keywords. For the news data, the authors looked at the number of items mentioning each political party or candidate in all mainstream sites in Israel including Ynet, Walla, NRG, Haaretz, The Marker, Globes, Nana10, and News1. For the purpose of this study, even when a party or a candidate was mentioned more than once in the same news item, it was counted only as one mention. Given the massive amount of content, no attempt was made to assess whether the news stories were considered "positive" or "negative." Thus, the measure is meant to convey media standing rather than legitimacy.

Facebook Data

After identifying the official Facebook pages of the parties and their candidates, the authors used three measurements to examine their success:

1. *Facebook's "talking about this" (TAT) scale*, which refers to the number of people who responded to a post in a page mainly by sharing, liking, or commenting on it during the last seven days. The authors calculated the average TAT for each party or candidate between December 1, 2012 and January 21, 2013.
2. *Facebook Likes added to the page during the campaign*. For each party or candidate, the authors calculated the number of likes added during the campaign by subtracting those in the beginning of December from the number on the day of the elections. This measurement gives us a general overview of the party or candidate's pages.
3. *Facebook Likes (daily average)* compensates for this general overview by providing the information on a daily basis.[8]

Overall Facebook Success Scale

In order to get a better estimation of the parties' and candidates' success on Facebook, the *Overall Facebook Success scale* was calculated using the three indicators noted: Facebook's TAT scale, the number of Facebook Likes added to the page during the campaign, and the daily average number of Facebook Likes. The scale was gauged by merging those three indicators' standardized scores, and confirmed using a factor analysis (with loadings of no less than 0.900 for any individual item).

Political Success

The election results were used to measure the parties and candidates' political success. Two indicators were used:

1. The *number of Knesset seats* won by the respective parties in the elections, and
2. The *change in the party's number of seat from the last elections*. This last represents the rise or decline of the parties' political power during the elections.

The examination of the absolute number of seats won provides us with a completely objective measure of electoral success, since winning seats is the ultimate goal of every political party. However, the disadvantage of this measurement is its problematic assumption that every party starts from zero, ignoring the major advantages that existing parties have in terms of resources and voter loyalty. An examination of the change in each party's number of seats compared to the last elections solves this problem. While there are many factors that affect the ability of parties to improve their Knesset representation, it is important to see whether social media is among the factors that contribute to that success.

In addition to the political success in the 2013 election, the *number of seats of each party in the previous Knesset* (according to the 2009 elections) was taken into account and served as a controlling variable in the study's analysis. An examination of the number of existing seats in the beginning of the campaign is important, because party size affects both its resources (because the state's election funding

relies on party size) and its political success in the current elections (because, as mentioned above, the party's Knesset size has an effect on its ability to attract voters). Table 1 presents the distribution of the variables used in the study.

RESULTS AND DISCUSSION

This section will examine the study's hypotheses, beginning by examining the correlation between the parties' and candidates' investment and social media success, and conclude by examining the full model, beginning with the parties' and candidates' investment in digital media, through their success on it, and on to their political success in the elections.

It is important to note that in contrast to most studies, the statistical significance of the results is less of a concern. The reason is that the authors were basically examining all the political parties with a reasonable chance of entering the Knesset. The major reason to examine statistical significance is to attempt to generalize from the sample to a more general population. In general, the authors found that the correlations were strong (Table 2), although due to the small number of cases (23) not always statistically significant.

In accordance with the hypothesis and as shown in Table 2, a relatively strong correlation was found between the parties' and candidates' investment in social media and their subsequent success. The findings indicate that an increase in the investment in digital media leads to more success in all three Facebook variables: the Overall Facebook Success scale ($r = 0.494$); and online news coverage,[9] while controlling for the number of seats in the previous elections, a variable that also tells us the amount of state funding the party received for the election campaign (the zero sum correlation between the investment and the success on the different digital media variables is presented in Table 2).[10]

Table 1. Summary of variables

Variables Distribution (Means and Standard Deviations)			
	N	**Mean**	**SD**
Facebook's Talking about this scale	23	20,545.30	22,460.61
Facebook's Likes added to page during the campaign	23	14,048.65	19,315.04
Facebook Likes (daily average)	23	464.28	597.43
Overall Facebook Success	23	0	0.72
Online News Exposure	23	50.31	45.10
Financial investment in digital media	18	19.08	14.644
Number of digital media staff members	18	6.67	3.56
Digital media's campaign length	18	25.22	25.55
Digital Investment	18	0.07	0.71
Seats in last elections	23	9.26	11.03
Number of seats in the Knesset	23	10.22	10.30
Change in the number of seats since the last elections	23	0.96	11.77

*$p \leq .1$. **$p \leq .05$. ***$p \leq .01$.

This relationship between investment in digital media and success on Facebook certainly makes sense, but is far from obvious, and there are surely political parties that make a major investment in social media, but either their messages or their candidates fail to resonate. These results suggest, however, that most parties do receive a return on their social media investments. Parties and candidates that invest more heavily in digital media will generally be more successful in social media, regardless of their party size.

As presented in model 1 of Tables 3 and 4, parties' and candidates' investments in digital media can predict their political success in the elections for both indicators. The more heavily a party or candidate invests in digital media, the greater their political success. Model 2 (of Tables 3 and 4) adds success in digital media (the Overall Facebook Success scale) as a predictor. Findings indicate that it explains the effect of parties' and candidates' investment in digital media on both indicators of their political success (Hayes, 2013). Investment in digital media leads to parties and candidates' popularity there, which leads to election success. Model 3 (of Tables 3 and 4) adds the number of seats in the previous elections as a control variable, and exhibits similar findings. The model in Table 3 explains more than 41 percent of the variance of the number of seats, and the model in Table 3 explains more than 60 percent of the same.

Surprisingly, the number of seats in the previous elections serves as a negative predictor for the change (Table 4). One possible explanation is that this result had to do with the particularities of this election and not any theoretical issue that can be generalized; during the 2013 elections in Israel, two small parties received a large amount of votes (*Yesh Atid,* a new party, went from zero seats to 19, and

Table 4. Predicting relative electoral success (change in the number of seats since the last elections), using investment and social media success, and existing Knesset size (regression model)

*$p \leq .1$. **$p \leq .05$. ***$p \leq .01$.

Habayit Hayehudi went from three seats to 12). At the same time, the largest party in the previous elections, Kadima, lost 26 seats (from 28 seats to only two).

Similar to the concept of advertising and public relations (Reis & Reis, 2002), the findings suggest that while dealing with election campaigns in the Web 2.0 era, investment in digital media leads to political power. In addition, the evidence provides some support to the normalization hypothesis (Bowers-Brown & Gunter, 2002; Gibson & Ward, 2000; Norris, 2001). Table 5 gives more detail on social media success when controlling for party size.

CONCLUSION

The findings provide strong support for the hypothesis. In the Israeli election campaign of 2013, digital media investment was clearly worth every shekel spent (Israel's currency). These findings should assist both scholars and practitioners in the field of political communication.

Table 5. Digital investment (the different components), social media success, and online news exposure, controlling for party size

	Overall Facebook Success	Facebook's Talking about This Scale	Facebook's Likes Added to Page during the Campaign	Facebook Likes (Daily Average)	Online News Exposure
Financial investment in digital media - controlling for party size. (zero-order correlation)	.652* (.752**)	.659* (.730**)	.700* (.796**)	.355 (.505)	.525 (.278)
Number of digital media staff members - controlling for party size. (zero-order correlation)	.488 (.515*)	.397 (.455)	.581* (.529*)	.258 (.291)	.398 (.492)
Digital media's campaign length - controlling for party size. (zero-order correlation)	.060 (.057)	.061 (.004)	.169 (.231)	-.113 (-.082)	.062 (-.164)

*$p \leq .05$. **$p \leq .01$. ***$p \leq .001$, *N=23*

One reason to treat these findings with a bit of caution is that the authors decided to focus on parties and leaders who had a realistic chance of passing the two-percent threshold and getting into the Knesset. This decision makes theoretical sense because the authors do not believe that an investment in Facebook will save a party with little initial support. As argued, the assumption is that investment in social media allows parties and leaders to attract *potential* voters. There are certainly unpopular parties that did invest in social media and never made it into the Knesset. This reality is important to keep in mind, especially for those who might exaggerate the potential of social media to compensate for other, more inherent problems facing political parties and leaders.

Nevertheless, this assumption may be more problematic in some types of elections than others. In the US, for example, the primary system provides opportunities for completely unknown candidates to become popular. In this context, the use of social media may prove critical in generating some initial excitement about a candidate. It would be indeed worthwhile to look at *all* candidates and parties running in different types of elections. One would also assume that social media are more effective in some countries than in others. If so, future studies should examine similar research questions in other countries and other political systems. In addition, it would be interesting to review the topic over time; in different election campaigns in the same country, it will allow us to get a better understanding of the impact over time.

Another limitation has to do with the relatively small number of cases used in the study. The authors measured 14 parties and 9 candidates that had a realistic chance to get elected, constituting a small data set. Since the study deals with the whole range of Israeli political parties, and the findings indicate substantial correlations between the variables, the findings and conclusion are meaningful notwithstanding the small number of cases tested.

Despite these caveats, the findings do tell us that being active in the digital arena has become a significant element in achieving ballot box success.

KEY TERMS AND DEFINITIONS

Engagement on Social Media: A salient indicator of social media's success is the ability to promote audiences' emotional involvement in its messages. Audience engagement can be measured using various methods, including the number of "Likes" and "Shares" a post receives and the "talking about this" scale.

"Facebook Elections": This term refers to the notion that contemporary elections are won through successful Facebook campaigns due to the rise of social networks as the key campaigning arena.

Investment in Digital Media: Political actors invest resources to promote their messages through digital media based on their appreciation of its role in today's reality. The factors that can help us better understand such investments include the amount of money, the digital campaign's duration, and the number of people working on it.

Political Deliberation: The process of thoughtfully weighing options, usually prior to political decision-making. Deliberation emphasizes the use of logic and reason as opposed to power struggles via the active involvement of citizens in the political process.

Political Success in Election Campaigns: Political success is measured by the election outcomes. In parliamentary elections, political success is measured in the number of seats a party receives.

The Equalization-Normalization Debate in Social Media: A debate regarding the ability of social networks to promote equality between incumbents and challengers, due to the ease with which social media campaigns are launched in comparison to the mainstream media campaigns. Equalization refers to social media's ability to promote equal standing whereas normalization refers to maintenance of the former inequality.

The Israeli Political System: Israel has a multi-party proportionate representation system, which has always led to the formation of coalition governments. The Israeli Parliament ("the Knesset") has 120 seats, and the citizens in Israel vote for their preferred party.

ENDNOTES

1 The Israeli parliament.

2 The term "engagement" in social media refers to all activity on a party or a candidate's page (as shown in the number of "Likes", the Facebook "Talking about this" scale, etc.). The level of online engagement reflects political success on social media.

3 In the 1996, 1999, and 2001 election campaigns, the electoral system was changed to a "direct election of the Prime Minister" system. Citizens were given two ballots and were asked to vote for a particular candidate for Prime Minister and a political party for the Knesset. In the 2003 elections, Israel returned to the original system with some changes, but some believe this further accelerated the more personalized type of voting.

4 The candidates examined in the study are: Netanyahu, Lapid, Yachimovich, Bennett, Yishi, Liberman, Galon, Livni, and Mofaz. The parties are: HaLikud, Yesh Atid, Haavoda (Labor), Habait Hayehudi, Shas, Meretz, HaTnua, Kadima, Am Shalem, Kalkala, Ale Yarok, Otzma LeIsrael, DaAm, and Eretz Hadasha. Only four parties that were elected for the Knesset in the 2013 elections were not examined in the study. All of them represent sectorial groups in the Israeli society, and do not turn to the average, Hebrew-speaking Israeli for his vote. Three of the parties are Arab political parties that together have 11 of the 120 seats in the 19th Knesset, and their campaigns (both in the traditional and digital media) are in Arabic. The fourth is Yahadut Hatora (with seven seats in the 19th Knesset)—an Ultra-Orthodox party that does not campaign online (or in the mainstream traditional media), since it turns to Ultra-Orthodox voters that do not tend to use digital media for religious reasons.

5 Interviews were conducted with campaign staff members of 12 of the 14 parties, and all candidates studied. For most parties, at least two interviews (one of which was with the campaign manager or digital campaign manager) were conducted.

6 Unlike many other countries, Twitter is not popular in Israel: only 150,000 Israelis have Twitter accounts (Goldenberg, 2013).

7 Not all Facebook pages of candidates and parties were available for analysis at the same time. Some Facebook pages were mined starting from December 5, 2012, and others from December 24, 2012 due to data availability. The Facebook measurements are based on the daily average of activity.

8 The number of likes can be reduced if users "unlike" a page.

9 Although our hypotheses do not deal with online news coverage, nor whether such coverage is positive, the correlation can help us better understand the influence of digital investment on the parties and candidates overall level of publicity.

10 An examination of the correlations between each component of the investment in digital media by itself and digital media success is presented in Table 5.

This research was previously published in Social Media Performance Evaluation and Success Measurements edited by Michael A. Brown Sr., pages 225-248, copyright year 2017 by Information Science Reference (an imprint of IGI Global).

Chapter 63
Leveraging the Design and Development of Multimedia Presentations for Learners

Lijia Lin

Danilo M. Baylen
University of West Georgia, USA

ABSTRACT

The chapter addresses how multimedia presentations can be designed effectively for learners. Based on the literature, it defines the related terms and discusses the role of human factors during the design and development process of multimedia. Then, it discusses strategies, such as providing learner control and using visual cueing, to design effective multimedia presentations. In addition, various technologies in creating multimedia-based instruction are described. Finally, the chapter discusses evaluation frameworks, as well as the implications for integrating multimedia into educational practices.

INTRODUCTION

We know the old saying that "A picture is worth a thousand words". And many times we assume that learning from the combination of words and pictures should be better than learning from words alone. That may be the major reason that we have illustrations in the printed textbooks, we have a job aid with static screenshots and text labels to show you how to install a piece of software, or we have a narrated video to get you started for a brand new laptop with a new operating system. Sometimes however, as a teacher, an instructional designer or a developer, you may rely solely on your experience and intuition

DOI: 10.4018/978-1-5225-3822-6.ch063

to design and develop a multimedia presentation without evidence-based guidance. Your target audience may still find the instruction difficult to understand even with the combination of words and pictures. In this chapter, we will define multimedia related concepts and discuss human factors and strategies for effective multimedia design and development in the hope of inspiring both research and practice. To guide educational practices, we will also identify technologies for multimedia design and development, provide evaluation frameworks for effective multimedia products, and discuss implications for integrating multimedia into practices.

Defining Multimedia Presentations as Levers for Learning

In computer-based learning environments such as online learning systems, intelligent tutoring systems, or virtual worlds, information may be presented to learners in a variety of forms, such as on-screen texts, music, narrations, illustrations, diagrams, animations, and videos. The combination of all or some of these media is considered as multimedia. Mayer (2005a) adopted a presentation mode view to define multimedia—"presenting material in verbal and pictorial form" (p. 2). From this broad perspective, multimedia are not limited to computer-based environments. Texts and visualizations in printing format can also be considered as media. Also, a learner is learning from multimedia if the printed texts and visualizations are presented with other technology-based media (e.g., computer-based animations and narrations). As technology advances, multiple forms of information presented on mobile devices may also be categorized as multimedia. For instance, by tapping on the screen of your mobile phone, you learn about how to conduct a knee surgery from the application *Virtual Knee Surgery* that includes audios, visuals and on-screen texts (see: http://www.edheads.org/activities/knee). This type of mobile learning is also in the form of multimedia. In sum, the term *multimedia* in this chapter refers to multiple forms of information presented on a wide range of platforms and these platforms are mostly technology-based.

Multimedia learning, particularly in research, is to describe learning in multimedia environments. It occurs when a learner constructs mental representations via multimedia in his/her working memory by integrating his/her prior knowledge and stores these representations in his/her long-term memory. The rationale for using multimedia presentations to foster learning is that presenting information in multiple formats is aligned with our humans' cognitive architecture (Mayer, 2005b).

Based on our current understanding of human's cognitive architecture, we process incoming information via two channels, one channel dealing with verbal information and the other channel dealing with visual information (Baddeley, 1986; Mayer, 2005b; Paivio, 1986). These two channels do not necessarily process information separately. Information processed in one channel can be converted to the other channel for further processing. For example, when the word "dog" is presented to a learner textually, an individual may process the information via his/her verbal channel. However, he/she can also mentally form a visualization of a dog, therefore converting verbal information to visual information and allowing the visual channel to process. It is also possible that a learner may mentally construct textual descriptions when he/she views an animation that shows the blood flow in the human cardiovascular system. Due to the limited capacity of our working memory (Miller, 1956), each channel can only process a limited amount of information. A learner may experience cognitive overload if too much information is squeezed into one channel at the initial processing stage. For instance, when both animations and on-screen texts are used to explain human cardiovascular system, all of these visual instructional messages may be initially processed through a learner's verbal channel, and his/her limited processing capacity may become a bottle neck for information processing, thus preventing him/her from understanding the

incoming instructional messages. However, if animations are visually presented with narrated audio of the instructional explanations, a learner can initially receive and process information via both channels and his/her understanding may be fostered. Therefore, externally presenting instructional messages through multimedia is aligned with our humans' internal cognitive architecture, and multimedia presentations optimize the information processing in our verbal and visual channels.

Exploring Human Factors for Strategic Multimedia Design and Development

Based on decades of studies on the effectiveness of multimedia in education and training, researchers find that there is a diversity of animated visualizations (Ploetzner & Lowe, 2012), which may contribute to the diversity of the efficacy of multimedia (e.g., Mayer, Hegarty, Mayer, & Campbell, 2005; see Höffler & Leutner, 2007; Tversky, Morrison, & Betrancourt, 2002). Hegarty (2004) pointed out that research should investigate "what conditions must be in place for dynamic visualizations to be effective in learning" (p. 344). To inspire research and guide educational practices, it is important to discuss the human factors during the process of designing and developing multimedia presentations.

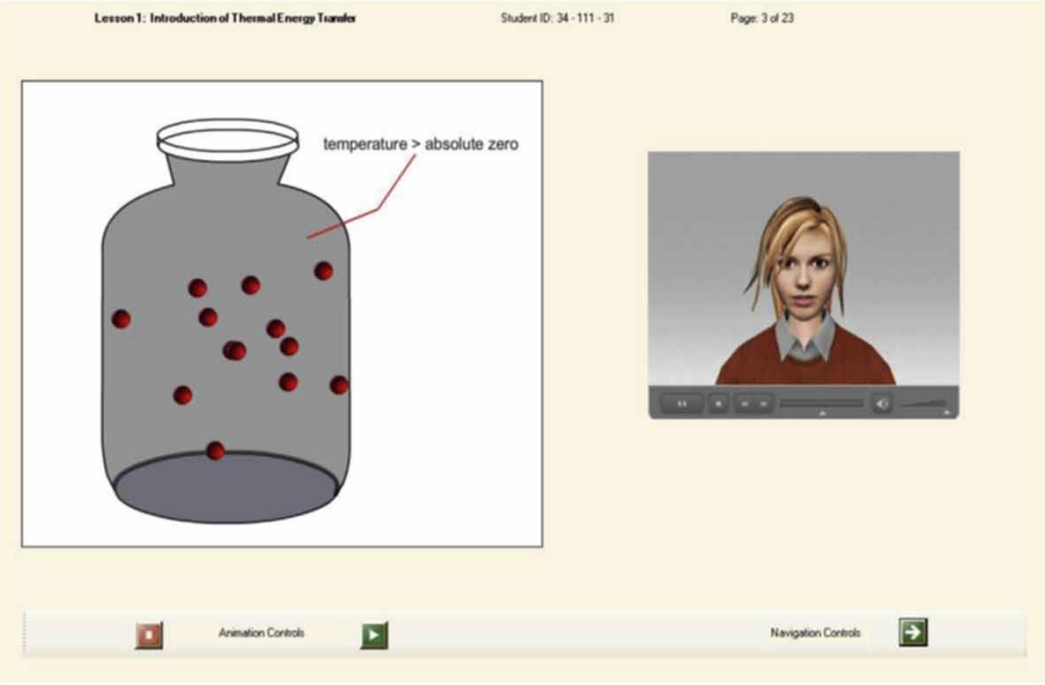
Learners' prior knowledge is one of the human factors that researchers and practitioners should consider. For example, a primary school child cannot understand a derivative function no matter whether the instruction is multimedia-based or not, because he/she has not even learned algebra. Research in the past decades has supported the claim that the instructional design that enhances novice learners' learning may not be helpful for expert learners, and vice versa (c.f., *expertise reversal effect*, Kalyuga, Ayres, Chandler, & Sweller, 2003; Kalyuga, Rikers, & Paas, 2012). For instance, two recent experiments demonstrated that when learners were instructed to learn soccer play, novice learners benefited more from static and low-speed presentations, whereas expert learners benefited more from animated and high-speed presentations (Khacharem, Zoudji, Spanjers, & Kalyuga, 2014). As learners' existing knowledge plays an important role moderating the effect of instruction, instructional designers should have some knowledge about their target audience's prior knowledge before designing and developing their products. This process is usually referred to as learner analysis in the systematic instructional design process (Dick, Carey, & Carey, 2005). Researchers and practitioners can also focus on designing and developing learning systems that provide adaptive instruction to individual learners (Kalyuga, 2007), as there is evidence showing adaptive computer-based tutoring can produce large learning gains (Sabo, Atkinson, Barrus, Joseph, & Perez, 2013).

Learner motivation is another factor that plays an important role in multimedia-based learning and instruction. Cognitive processes such as selecting information, organizing information in meaningful structures and integrating information with one's prior knowledge, are all influenced by motivation. A highly motivated learner may be willing to spend a considerable amount of time and effort making sense of the presented instructional material, which may lead to enhanced learning and performance. However, a learner lacking motivation may choose to quit learning. The challenge for educational researchers and practitioners is how to motivate learners in multimedia presentations. Traditionally, instructional designers present a problem, ask a question, or present a scenario at the beginning of the instruction to stimulate learners. When this type of motivation techniques is applied to learning in multimedia environments, there is empirical evidence showing that they may be effective. For example, some researchers presented learners with a series of predicting questions and instructed them to predict the function of a mechanical system. They found that this technique enhanced learners' understanding of the mechanical system no matter whether they viewed static or animated visualizations of the system (Hegarty, Kriz,

& Cate, 2003). On the other hand, technology per se has a great potential to motivate students in multimedia environments. Multimedia can be used to provide abstract outlines for learners before detailed instruction is delivered, which is served as the function of an advance organizer. Willerman and Mac Harg (1991) utilized a concept map as an advance organizer in an 8th grade science classroom and they found that the students performed better in a science test than their peers who did not use the concept map. Vogel-Walcutt, Guidice, Fiorella, and Nicholson (2013) used video games as advance organizers before a computer-based training that taught learners to complete a military's call for fire task. They found that learner who played the video games showed more interest in learning. In addition to pre-instruction motivators, other technology supported techniques have showed promises. Embedding an animated pedagogical agent in a multimedia presentation is one method that researchers have investigated in the 21st century. An animated pedagogical agent is "a lifelike character that provides instructional information through verbal and nonverbal forms of communication" (Lin, Atkinson, Christopherson, Joseph, & Harrison, 2013, pp.239, see Figure 1 for an example). When the multimedia environment incorporates an agent, learners may consider interacting with the computer as a social event and are motivated to interact with the computer to learn (Atkinson, Mayer & Merrill, 2005). In summary, learner motivation plays an important role in the effectiveness of multimedia presentations, and there are multiple ways to motivate learners in multimedia learning.

It is of note that there are other human factors, such as learners' affect state, metacognition, and self-regulation, which teachers, instructional designers and developers should bear in mind during the design and development process. We recommend conducting a learner analysis (and other related analyses such

Figure 1. A screen shot of a multimedia environment embedded with an animated agent (Lin, Atkinson, Christopherson, Joseph, & Harrison, 2013)



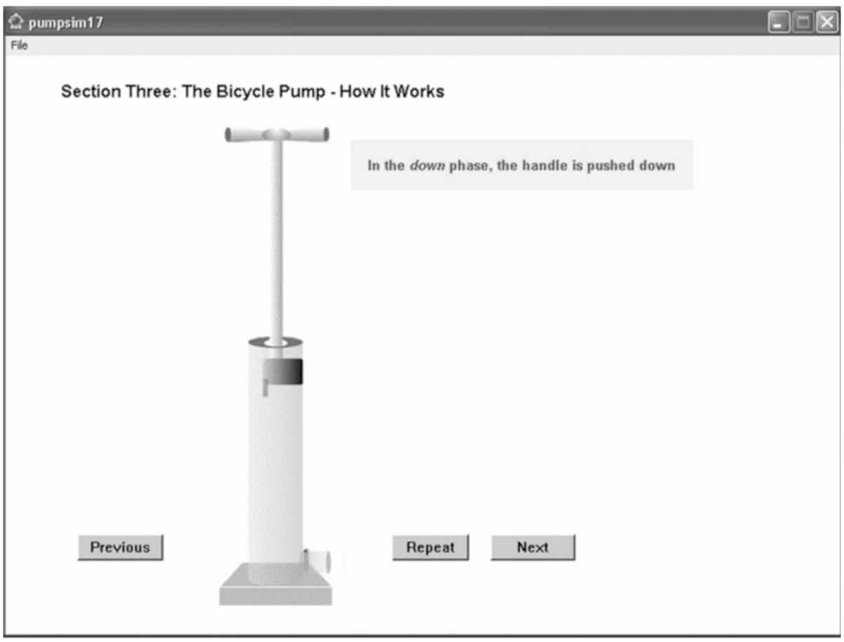
as needs assessment) at the beginning of a systematic instructional design process so that a clear picture of the target audience can be obtained.

Understanding Strategies for Creating Multimedia Presentations

Based on well-designed scientific studies, researchers have proposed a series of evidence-based principles to guide both research and practice in multimedia presentations (Mayer, 2005c). These principles provide a solid foundation for teachers, instructional designers and developers to understand the strategies for creating multimedia presentations.

Providing learner control is the first strategy we would discuss for creating multimedia. Based on the empirical evidence, Clark and Mayer (2011) summarized it as the *Learner Control Principle*. According to Betrancourt (2005), learner control is to let learners control the pace and/or the direction of a multimedia presentation. This is critical to learning when dynamic visualizations, such as animations and videos, are used to deliver instruction in the learning environments. Due to the transitory nature of an animation, a learner may not fully understand the information contained in the animation when the presentation of the animated information has already finished. Granted with the control (e.g., a playback button or a pause button), a learner can go back to receive the instruction by viewing the animation once again. And he/she can view the animation for the third or even fourth time, if he/she feels that there is a need to do so. The results of some research studies have provided empirical evidence to support this design strategy (Evans, & Gibbons, 2007; Hasler, Kersten, & Sweller, 2007; Mayer, & Chandler, 2001; Mayer, Dow, & Mayer, 2003; Moreno, & Valdez, 2005; Schwan, & Riempp, 2004; Wouters, Tabbers, & Paas, 2007). For instance, Evans and Gibbons (2007) found that using an interactive diagram, in which a learner can control the presentation of texts and segments of animations (see Figure 2), facilitated

Figure 2. A screen shot of the interactive version of the learning environment (Evans, & Gibbons, 2007)



undergraduate students' deep learning about the mechanism of a bicycle pump. In their case, learners could click the Repeat button to play the segment of animation again, click the Previous button to study the previous segment and the Next button to study the next segment. However, learner control may not be as critical in static visuals as in dynamic visuals, since static visuals are not transient in nature. The study conducted by Boucheix and Schneider (2009) provides some evidence that integrating a series of static graphics without learner control enhanced students' understanding of a mechanical system.

Visual cueing (or "signaling") is another strategy to create effective multimedia presentations for instruction and training. It is a technique to add non-content signaling devices to the learning environments to direct learners' attention to the important information. It is not difficult to imagine a situation that so many elements, such as on-screen texts, narrations, animations, control buttons, navigation links and other elements, are presented to learners in a multimedia environment that learners' attention may be directed to perceptually salient information that may be irrelevant to learning. As a result, instructional designers and developers need to direct learners' attention by utilizing visual cues. Lin and Atkinson (2011) used arrow cueing to point to the important information presented in the animation that showed concepts and processes of rock cycle (see Figure 3), and they found cueing fostered efficiently learning. Nelson, Kim, Foshee and Slack (2014) found that learners experienced lower mental demands in a virtual world, in which sheep objects were cued with symbols (see Figure 4). The current literature shows other empirical evidence to support the use of visual cues as a strategy for creating an effective multimedia presentation (e.g., Lin, Atkinson, Savenye, & Nelson, 2014; see de Koning, Tabbers, Rikers,

Figure 3. A screen shot of the learning environment that shows visually cued animations (Lin, & Atkinson, 2011)

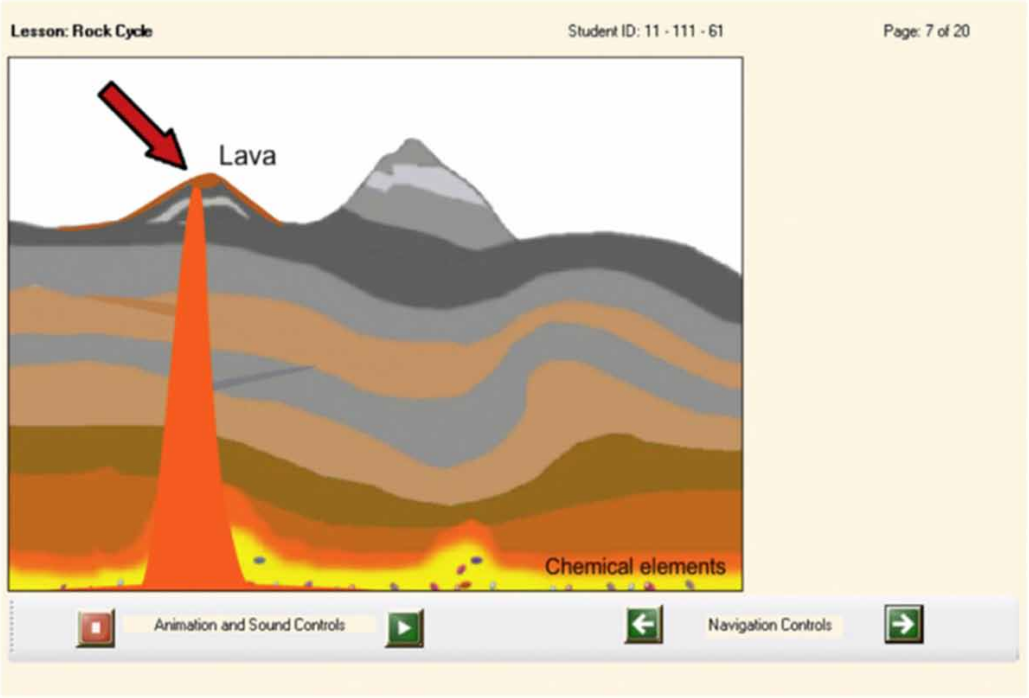


Figure 4. A screen shot of the virtual world environment that shows a player is interacting with a visually cued sheep (Nelson, Kim, Foshee, & Slack, 2013)

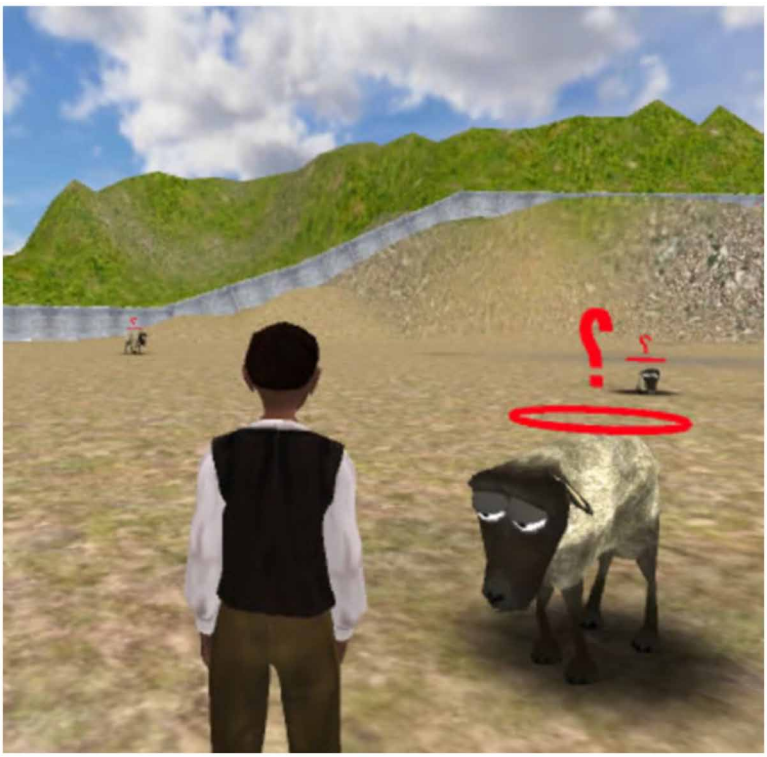

& Paas, 2009 for a review). The learning principle based on it is referred to as the Signaling Principle (Mayer & Moreno, 2003).

We have described two prominent strategies—providing learner control and visual cueing—for creating effective multimedia presentations. These two strategies are unique for multimedia, but there are other strategies that are worth mentioning. For example, when designing and developing multimedia, visualizations should be arranged in close proximity to the corresponding texts to enhance the limited attention; graphics accompanied with audio narrations are better than graphics with on-screen texts to optimize learners' information processing in their cognitive system; animations are better to be presented in segments to overcome the transitory nature of animations. These strategies are all based on evidence-based learning principles in the multimedia learning literature (Mayer, 2005c).

Identifying Technologies for Creating Multimedia Presentations

When creating multimedia presentations, we should always keep the aforementioned strategies, providing learner control and utilizing visual cues, in mind and identify appropriate technologies for project development. Media types used in multimedia presentations may include text, images, animations, audio and video; therefore, one may select a variety of hardware and software for the multimedia production. What technologies do we need to consider when creating multimedia presentations? How do we identify appropriate technologies for such presentations?

First, let us look at the technologies available for creating multimedia presentations. Technology advances rapidly. It is much easier to develop a multimedia presentation today than before because many computers come with a built-in microphone and camera, and many multimedia applications are user-friendly at low cost or even free of charge. Hence, it is not difficult to develop a multimedia presentation. However, producing a sophisticated multimedia presentation of high quality may still require money and time that many people cannot afford.

In general, when producing a multimedia presentation, one should use a powerful computer with appropriate hardware and software. Examples of the hardware include, but are not limited to, video cameras, digital cameras, microphones, scanners, storage devices (CDs, DVDs, or/and external hard drives), ports (firewire or/and USB), and monitors. Examples of the software include, but are not limited to, *PowerPoint, Keynote, Prezi, Metta, Mediator, Adobe Captivate, Articulate Presenter, and Camtasia*. For more information concerning multimedia presentation technologies, one may simply conduct an Internet search using keywords, such as, multimedia tools or applications, etc.

How do we identify out of those available technologies the appropriate ones for the multimedia presentation we want to create? One factor to consider is the purpose of the presentation. A presentation with a commercial purpose is expected to be very different from a presentation for education. A sophisticated and highly professional commercial multimedia presentation may help to sell the product. Such a level of sophistication is not required to facilitate student learning in educational multimedia presentations; those presentations may be deemed successful as long as they support student learning.

A learning goal is a key factor to consider when identifying technologies for creating multimedia presentations. If the goal of a multimedia presentation is to teach students specific concepts, one may consider using *Metta* that allows instructor to include YouTube videos, pictures, voice recordings, and content from Pinterest, and then to insert a quiz during or at the end of the presentation. Should the purpose of a multimedia presentation be to help learners develop a presentation and to deliver it in front of an audience, one may consider the use of presentation software (e.g., PowerPoint and Keynote), since they are commonly used and widely available.

Another factor for consideration when identifying technologies for creating multimedia presentations is budget. As we mentioned earlier, it is no longer difficult to create multimedia presentations due to the technology advancement and decreasing cost of hardware and software. However, some technologies are still costly, especially the ones for commercial multimedia presentations. Therefore, one should check how much money has been earmarked for the multimedia production before one starts the project. Otherwise, one might run out of money before the project is complete.

The other factor for consideration is the target audience, e.g., culture, age, and gender. Although this factor might not be strictly related to identifying technologies for creating such presentations, it plays a critical role in developing the presentations. For instance, a multimedia presentation for a young learner may involve considerable amount of animations that might not be appropriate in a presentation for adults. For audiences with certain specific backgrounds and cultures, a developer needs to carefully decide the use of colors. A color may mean something positive to one group of people but symbolize the opposite to another. For example, the color of "yellow" symbolizes "Mourning" to Egyptians while means "royalty" to Chinese.

In summary, nowadays everyone should be able to create a multimedia presentation. Factors for consideration when identifying technologies for creating multimedia presentations include, but are not limited to, purpose, goal, and budget. The target audience is also an important factor to consider when developing a multimedia project.

Evaluating the Effectiveness of Multimedia Presentations

Formative evaluation and summative evaluation are two types of evaluation that are commonly used in instructional design and other educational and training practices. Formative evaluation is conducted when the design and development activities are still ongoing. The data collected for this type of evaluation can be quite informal: small-scale interviews with the target audience, interviews with the internal experts, and very small-scale quantitative surveys, etc. It is very useful to improve the ongoing project, as designers and developers can modify their work with relatively low cost of time, money and other resources. It can effectively avoid a project's changes or growth that cannot be controlled as the project progresses ("project creeps"). Summative evaluation is conducted to assess the final project and is usually conducted externally. The data collected for this type of evaluation could be focus group interviews, expert ratings, large-scale attitudinal surveys, and learning outcomes, etc. The results of this type of evaluation are to judge the actual value of the final product—whether it is good or bad. A systematic design and development process for an effective multimedia product definitely needs both formative and summative evaluation. For instance, we, as a team of instructional designers and developers, need to create a multimedia program to teach high school students about thermodynamics for a science course. We have followed the systematic design process: (a) We know that the target students have some knowledge about thermodynamics and they are easily bored in class (learner analysis). We also know that the school would like to have some changes in traditional teaching methods (need analysis). (b) We have formulated a series of instructional goals and objectives according to the standards and consultation with teachers. We have determined the contents and instructional sequence, as well as the interface of the multimedia program. At this stage, a formative evaluation could be conducted by consulting with teachers and interviewing with students to determine (a) whether the contents and instructional sequence are appropriate, (b) whether teachers and students like the program interface. Based on the results of this round of formative evaluation, we modify the content and the program interface if necessary, and then hand the product to the technology staff to let them work on the development. When the developers have a prototype ready, we can run another formative evaluation internally (alpha testing) to test the prototype and provide feedback to the developers. Then, the developers modify the program and we, along with some teachers, run another formative evaluation (beta testing). At the final stage, we submit the multimedia product to the school leaders and teachers and, with their approval, implement the product in class. Based on the collected data from the schools leaders and teachers (interview records, quantitative ratings, etc.), class observations, and students' attitude and learning outcomes, all concerned parties can make a judgment (summative evaluation) about the effectiveness of this multimedia program

Another well-known evaluation model is the Kirkpatrick's four-level model (Kirkpatrick, 1994; Kirkpatrick, & Kirkpatrick, 2006). This model has been so widely used to evaluate training programs in academia and industry that we believe it is still applicable to assess the effectiveness of multimedia presentations. The four levels are *Reaction*, *Learning*, *Behavior*, and *Results* and they are listed in order. The first level *Reaction* is to evaluate attitude: how learners perceive about the program—whether they like it or not, whether they feel boring or interesting, satisfied or dissatisfied, competent or incompetent, etc. The second level *Learning* is to evaluate learners' knowledge: how the learners perform on a post-training test (it could be a self-designed test, a standard test or both). The third level *Behavior* is to evaluate the effectiveness of a program on the behavioral level: whether learners have changed their behaviors, how learners apply their knowledge, etc. The fourth and the final level *Results* is to evaluate the effectiveness of a program on an institutional level or on a community level: how the company's

sales have changed, how many prospective employees have applied for positions in the company, how many additional students have enrolled, etc. It is often very difficult and costly to conduct the evaluation activities on the third and fourth level, no matter whether it is in the academia or industry. But educational professionals could utilize the Kirkpatrick model to evaluate the effectiveness of multimedia presentations. Using the multimedia program to teach high school students about thermodynamics as an example, Table 1 presents the data sources that we believe could be collected to evaluate the effectiveness of the multimedia program using the Kirkpatrick model.

Implications for Integrating Multimedia Presentations as Best Practice

This section will address: 1) ways of constructing effective learning environments for students' success, 2) pedagogical functionalities of multimedia presentations that can positively impact the successful implementation of technology integration practices, and 3) possible barriers to integrating multimedia presentations.

Multimedia presentations, as a delivery medium in teaching, require pedagogically equipped facilitators who create effective environments for successful learning. Research reports that multimedia presentations impact students' learning in specific contexts where research-based and goal-oriented learning environments promote learning. The prominent learning environment reported was a constructivist-based learning environment using multimedia (Neo & Neo, 2009). It can be seen that students experienced high levels of motivation and self-esteem when doing the multimedia project. More importantly, it enhanced their confidence levels in the newly acquired skills because they realized that they can use the same skills in future undertakings. A technology-enhanced constructivist learning environment, as suggested by Jonassen (1994, 1999), can be successful in allowing students to engage in meaningful, relevant problem-solving activities, experience active learning, and be more engaged in their learning processes. Another environment that is worth mentioning for is an authentic learning environment (Herrington, Reeves, Oliver, & Woo, 2004). In this environment, students showed increased understanding of the topic and were able to see the relevance of the project to real-life situations. The third environment is a multimedia-assisted, project-based learning environment (Moursund, 1999). This method promotes a learner-centered constructivist model, and helps students develop the pre-service teachers' knowledge and self-efficacy in (a) technology, (b) subject matter, and (c) teaching (Seo, Templeton, & Pellegrino, 2008).

Additionally, we need to pay attention to pedagogical functionalities of multimedia presentations that address many of the contemporary issues in education, such as self-directed learning and evidence-

Table 1. Use the Kirkpatrick model to evaluate a multimedia program that delivers instruction about thermodynamics to high school students

Kirkpatrick Model	Data Sources
Reaction	Students' satisfaction, perceived confidence and competence, etc.
Learning	Students' scores on an in-class quiz, midterm exam, etc.
Behavior	Observations of applying knowledge in daily life, etc.
Results	Increased enrollment of the course, etc.

based (data-driven) teaching. A growing body of theoretical and empirical literature supports the view that, when students' perceptions of control in the learning situation increases, so does their motivation to learn (Alderman, 1990; Ames, 1990; Deci & Ryan, 1991). Researchers recently reported a relatively strong relationship between multimedia technologies and self-directed learning (Kim, 2012). Therefore, we can see that learner controlled, multimedia-rich learning environments foster self-directed learning by enabling learners to have control over the pace of their own learning and by being empowered to take charge of their learning trajectories. In terms of data-driven teaching, the assessments in multimedia presentation tools offer more access to instant data than ever before for teachers (Gonzalez-Sanchez, Chavez-Echeagaray, Gibson, & Atkinson, 2013). Multimedia presentation tools strengthen the capacity to access data to improve developmentally appropriate decision-making in instruction, which leads to adaptive learning and personalized learning opportunities.

Although multimedia presentations hold many promises in education, it is important to be aware of some possible barriers to their successful integration and utilization. Steelman (2005) identified technical difficulties with software, hardware, and networks, and teachers lacking uniformed tools, as main hindrances. Time restraints, insufficient teacher training, and tedious administrative requirements, such as keeping up with permission slips, were other difficulties cited. In the course of developing their multimedia projects, the students encountered software glitches and computer malfunctions that led to a great deal of frustration for them. These problems also caused more anxiety when there was no prompt technical support. In addition, it was challenging for the instructor to address the needs of all students because they had different interests and varying degrees of computer skills. Further, teachers need to be able to customize instruction in such a way as to fit the target students' knowledge levels and learning goals. It is critical to understand both the promises and barriers in implementing multimedia presentations as well as making the connection with pedagogy, technology, and content.

CONCLUSION

In this chapter, we have defined the concepts of multimedia and multimedia learning based on the literature. Several factors, such as prior knowledge and motivation, were identified and discussed in the contexts of designing and developing multimedia-based instruction. In discussing these factors, we argued for better understanding of the cognitive mechanisms that contribute to the efficacy of multimedia presentations in helping learners learn. Further, reviewing related research evidence led to identification of effective strategies for creating multimedia that supports learning and instruction. Based on that, we provided principles to guide instructional design and development practices. Finally, we identified and described several technology-based tools and applications that could be used for creating multimedia, along with the frameworks for evaluating multimedia and implications for integrating multimedia into practice.

KEY TERMS AND DEFINITIONS

Animated Pedagogical Agent: A lifelike character that is incorporated into a multimedia environment to provide verbal and nonverbal forms of communication.

Expertise Reversal Effect: Instructional design that enhances novice learners' learning may not be helpful for expert learners, and vice versa.

Formative Evaluation: Evaluation conducted when instructional design and development are still ongoing.

Learner Control: Let learners control the pace and/or the direction of the instruction.

Multimedia: Presenting verbal and pictorial materials through multiple media.

Multimedia Learning: Learners construct mental representations in multimedia environment in which verbal and pictorial instructional materials are presented.

Summative Evaluation: Evaluation conducted to assess the success of a final project or program when it is completed.

Visual Cueing: A technique to add non-content signaling devices to learning environments to direct learners' attention to the important information.

Chapter 64
Digital Humour, Gag Laws, and the Liberal Security State

Judith Bessant
RMIT University, Australia

ABSTRACT

This chapter presents a case study of Facu Diaz, a Spanish satirist whose on-line ridicule of the Spanish government created a political furor that brought him before the courts. The chapter engages the problem of the criminalization of political dissent by liberal states in the digital age. The case highlights how digital media is now being used to create content for satire, as well as to replicate and infiltrate more traditional political and media forums, changing many traditional forms of political practice. The case [points to some of the central problems inherent in liberalism which may give reason to curb the enthusiasm of those who think that new digital media creates fresh opportunities for augmenting the 'public sphere'. It is argued that liberalism as a political theory and ethos, tends to be blind to non-traditional political expressions like satire and other artistic work. In addition, the expansion of security laws in many countries suggests, liberalism's ostensible commitment to freedom needs to be reframed by recalling its historical preoccupation with security.

INTRODUCTION

On 29th October 2014, Facu Diaz a 23 year-old Catalonian comedian broadcast a three-minute satire called 'The Popular Party is Dissolved' on the Spanish 'Tuerka' television news program. It was then uploaded onto the internet. The comedy routine generated significant national and international controversy and provoked a swift legal reaction in Spain. The Spanish group *Dignity and Justice*, claiming to represent victims of terrorism, an organization closely associated with absolutist and extreme members of the ruling Popular Party, initiated criminal proceeding claiming Diaz had contravened Spain's anti-terrorist legislation by 'glorifying terrorism'.

Diaz was not alone. Other activists like the Spanish rapper 'Cesar Strawberry' was one of many arrested in mid-2016 in a police operation against those using digital media and specifically Facebook and Twitter, who it was alleged committed the crime of glorifying terrorism. Police claimed the singer used

DOI: 10.4018/978-1-5225-3822-6.ch064

digital media to praise 'the Anti-Fascist Resistance Group left (Gapo) and the Basque separatist group ETA. Guillermo Zapata (Madrid City Councilor) and member of a grassroots political movement (Ahora Madrid) faced similar charges for tweeting comments which police alleged 'discredited and 'humiliated victims of terrorism. Alfonso Lazaro de la Fuente and Raul Garcia Perez two puppeteers from the theatre group 'Puppets From Below' (Títeres Desde Abajo) were arrested and charged with the same offence in 2016 for allegedly making comments supportive of ETA.

It is often said the genius of good comedy depends on the timing. In cases like Facu Diaz and his co-accused, timing was everything.

While Diaz's primary object of critique was the ruling Popular Party Spanish government, which led him to raise the sensitive issue of political corruption, Diaz also used new media to pushed a number of historically sensitive buttons. Diaz used the digital media to produce and broadcast a powerful remix satire targeting the powerful while at the same time reminding Spaniards of their recent experience of financial crisis and the longer history of terrorism as he drew an analogy between the Basque separatist group ETA (*Euskadi Ta Askatasuna*)[1] and the ruling Popular Party.

The bid to call Diaz to account provides an example of a more general attempt to criminalize political dissent, and in this case those using new forms of media to engage in political debate. It is argued that there should no surprise when an ostensibly liberal democratic polity move to criminalize dissent. The chapter situates art, and in particular satire at the centre of politics, arguing that such practices work to broaden the public sphere and secure liberal principles like the right to free speech. This case study also demonstrates how digital media is being used to create and communicate satirical political humour in ways that are integrating that technology into participatory political practice. It is a popular form of political communication which spreads easily on-line in the context where the technology and interest to do so is now at the fingertips of many citizens.

By the time Diaz aired his satire in 2014, the Spanish government, along with many other governments had increased their regulation of political activity and dissent. Such moves to criminalize dissent involving those who engaged in on-line political activity poses questions about democracy and the socio-ethical base of the contemporary political order. It also raises questions about the extent to which digital media can be employed for the purpose of extending participation in democratic practices. It also raises questions about the ways new media can itself be used by the state to monitor and regulate that participation.

It is now generally acknowledged that many jurisdictions have seen significant increases in criminalization of political activities. This includes the creation of new laws and the reform of old legislation treating certain behavior as criminal. As studies show, we have seen a punitive turn and increases in criminalization on the part of governments of all political orientation Ashworth 2009, Lacey 2012, Zedner 2009, Garland 2001). Legislatively this involves declaring more activity illegal by increasing the number of criminal laws or by mandating longer prison sentences. In the courts it evident when judges issue harsher sentences and a higher likelihood of prison sentences, increased emphasis on the rights of victims and a corresponding reduction in regard for the rights of defendants and reduced use of parole. On the streets it is evident in the ways increased police powers enable the use of stop and search practiced. It can also mean that governments and police increasingly rely on preventive justice measures like the use of anti-social behaviour orders, control orders or dispersal orders (Ashworth and Zedner 2014).

While most liberal states have a long history of criminalizing political dissent, this disposition seems to have intensified after the terrorist attacks in New York and Washington on 11 September 2001. For Aoude it marks a time when we began living with 'a permanent fear of terrorism' as governments introduced measures privileging security at the expense of civil liberties ostensibly designed to protect

their citizenry (Aoude 2002). As Hogg observes, academics and lawyers alike became deeply concerned about the fate of the rule of law and liberal democratic institutions in the 'war on terror' (Hoggs 2007 p.84). And as Hocking pointed out the evolution of counter-terrorist law and policy since 2001 in western democratic states allowed 'for the pre-emptive control of political conflict and dissent, which may or may not protect individual citizens but which certainly protects the state itself' (2003 p.371).

This is the backdrop for the increased criminalization of political protest and public assembly. In advanced democracies like Canada we saw the management of protestor managed courtesy of search, seizure and detention powers. In 2010 eg., a 10,000 strong police contingent corralled protestors involved in the the anti-G20 'March for Justice Toronto' into confined spaces where they were contained for many hours (Salter 2011:211-238). Many many governments have also extended their already far reaching electronic surveillance to monitor all citizens on the assumption we are all potential offenders. Many states also use such electronic surveillance to pre-empt and monitor activists who have increasingly come to rely on digital media to communicate, mobilize and organize action. All this occurred alongside moves to expand, to retain and analyze mega-data without the conventional regulation implicit in judicial warrants. This is taking place in democracies like Australia, UK and USA, France and in autocracies like China, Iran and Russia. In Spain Facu Diaz, was charged with violating the 'glorification of terrorism laws' because he drew analogies between corrupt government politicians and well-known Basque terrorists and then used digital media to disperse his message and engage in further public debate (Berrerda 2015).

The fact this was done by autocratic regimes may not be so surprising, but the criminalization of dissent has become normalized in liberal democracies that their claim to be different from authoritarian totalitarian states because they protect and promote civil liberties (eg freedom of speech, freedom of association association, and civil disobedience) may be more of surprising to those who take liberalism at face value. As Brabazon asks 'Why would these states … not welcome social movements and dissent … as a natural part of the rich fabric of citizen participation in decision-making?' (Brabazon 2006 p.3).

In this chapter I consider the ideal standard or normative basis of the political conceived within the modern neoliberal security state with its overvaluation of order and consensus, and revisit arguments that dissent is a vital aspect of any vibrant democratic polity. It is an analysis also of how this takes place in a context marked by increasing use of digital media for the purpose of political communication. I begin with an outline of the comedy skit itself.

CASE STUDY: FACU DIAZ'S SATIRE AND DIGITAL MEDIA

The sketch which lasts three minutes began with Díaz sitting at a desk, pretending to be a spokesperson-news reader with his face covered by the iconic black balaclava worn by the Basque separatists. On the wall behind him were logos made to look like those of the ruling conservative Christian 'Popular Party' (PP). In front of Diaz was a photo of Francisco Granados, former Minister of the Presidency, Justice and Home Affairs in Spain's governing Popular Party government. In October 2014 Granados was sentenced to prison for high-level corruption. It was a high profile scandal that revealed how syndicates of political elites had been receiving lucrative kickbacks of 2-3% on government contracts worth 250 million Euros.

Diaz also portrayed himself as a spokesperson for 'People's Party' and began reading a statement ostensibly issued by the ruling 'Popular Party', but did so in a style that mimicked ETA's distinctive way of issuing political demands. The statement referred to widespread political corruption which he declared left the 'People's Party' on the brink of collapse and disbandment. While pretending to be a

spokesperson for the 'Peoples party' Diaz asked for a 'ceasefire from far left-wing political group', a reference to the new and increasingly popular leftist party 'Podemos' ('We Can') (Global Voices 2015). Diaz used digitally re-mixed announcements to create the content of his satire, calling for the 'Popular Party corrupt prisoners' to be relocated closer to places '…where 'the food is good', a barbed reference to ETA's earlier demands that their imprisoned members be repatriated to their Basque homeland.

Diaz then switched genres performing a mock interview with himself, asking (himself) what he would do in the future as a comedian if the 'Popular Party' collapsed under the weight of the series of corruption scandals. He answered he would lose a rich source of inspiration for his satirical work. He continued the jibing, announcing that several members of 'Popular Party' will be integrated back into political life through the new right wing Christian 'Popular Party', a breakaway party 'VOX' ('Voice') and the anti-separatist UPyD ('Union Progress Y Democracia').

Diaz's satirical humour went viral online within hours. Political jokes it seemed provided carnivalesque relief that worked to subvert, and open opportunities for critique. The prevalence of new communication technology meant such critiques could be instantly replicated and sent rapidly through vast social and political networks with ease.

Diaz's satire distributed primarily through digital media served as a lightning rod for Spanish popular anger and indignation directed at the politically corrupt and a government seemingly more concerned about the health of major banks and the well-being of financiers than ordinary citizens. It was a situation made more difficult to bear in a context where so many people were suffering as a result of harsh austerity measures which the government claimed were necessary in order to make savings and to demonstrate the state's fiscal responsibility to international creditors.

It is perhaps unsurprising that when Diaz drew analogies between the ruling government and the Basque National Liberation Movement he would receive the responses he did. Besides provoking the ire of the president of the high court specializing in terrorism, the true spokesman for 'People's Party', Javier Berreda accused Diaz of ridiculing victims of 'ETA terrorism' arguing: 'We cannot support those who make mockery of the victims of terror' (Berreda 2015). Diaz responded on-line, explaining that his satire was not directed at victims of ETA, but at the 'People's Party'. He invited people to view the video on-line, where he said they will see no such reference and argued that those who were representing his satire as an attack on victims of ETA were disingenuous and opportunistic because such claims were making political capital out of the satire, while also diverting attention away from the legitimate criticisms he was making, (eg, their corruption) (Diaz 2014).

Diaz found himself summonsed to appear before the Spanish High Court on charges of 'glorifying terrorism' where he was required to answer for his 'mocking tone', offences that carried the prospect of imprisonment for 2 years. At that point Diaz relied on digital media to spread his suspicion that the legal challenge was really motivated by conservative interests concern about the growing popularity of the progressive politician with whom he was affiliated - Palbo Iglesia (founder of Spain's new left 'Podemos' political party). The Podemos political party became an increasingly popular opposition party born out of the anti-austerity *Movimiento 15-M* and the *Indignados* protests against inequality and corruption (Global Voices 2015). They were Spanish expressions of a global youth movement that came into being in the wake of the international economic crisis of 2008. It was a social movement reliant on new media to communicate information and mobilize action which developed out of concern, primarily by young people, about their future, high unemployment, and cuts to the public sector.

Ironically Diaz's trial took place (9 January 2015) two days after the shooting of workers in the French satirical newspaper Charlie Hebdo (7 January 2015) and as millions of people mobilised on-line

and in the streets across Europe in support of freedom of the speech. Even more paradoxically at the same time the Spanish government took a public stand in support of freedom speech, voicing support for the French satirical magazine Charlie Hebdo. Spain's Prime Minister Mariano Rajoy declared that 'They will not be able to destroy the most sacred that we human beings have, that is, our rights and our freedoms' (Rajoy 2015).

Adding to the irony, the official statements declaring support for free speech came soon before the government's introduction of its own new 'Citizens Security Law, "Gag Law," (1 July 2015) said to represent the biggest threat to democratic rights since the Franco era. Reportedly a majority of Spaniards (82%) opposed the law. The incongruity was not lost on Diaz and his supporters who used digital media to make more political capital by making jokes about that contradiction.

In the lead up to Diaz's court appearance millions of people entered the fray, rallying on-line and in the streets supporting Diaz, using his encounter with the legal fraternity as a platform for further protest about political corruption and clamp downs on freedom of speech (see Facu Diaz of #YoconFacu - 'I'm with you Facu'). Prominent politicians like Spain's Secretary General Pablo Iglesia, leader alternative party 'Podemos' ('We can') defended the satirists on twitter. Meanwhile demands that Diaz apologize to victims of ETA and be punished continued.

Diaz appeared in the 'National Court' on 15 January 2015. Magistrate Javier Gomez Bermudez closed the case declaring Diaz had not contravened the law, and that his satire was not humiliating for victims of terrorism: 'Like it or not, it [the satire] does not discredit or humiliate the victims' (Bermudez cited Europa press, Nacional 2015). While that decision saved Diaz from further prosecution it is a reminder of how any modern state is rarely a fully coherent or integrated entity and usually consists of groups with quite different interests and competing views that are resolved always in political struggle. In this case groups of intellectuals and artists critical of state repression of free speech were joined by judicial groups like the 'Judges for Democracy' (http://www.juecesdemocracia.es/), and by journalists who initiated legal action in the European Court of human rights (December 2015) in a bid to force the Spanish government to repeal its new 'security law'.

Context

To appreciate the responses to Diaz's political comedy it's helpful to recall the recent history of Spain. Spain had been making a major transition from a brutal and authoritarian dictatorship under General Franco that lasted for nearly forty years into a constitutional democracy. The process began in November 1975 on the death of Franco. Franco made King Juan Carlos I, his successor and the king, led Spain into a democratic order in 1978 when Spain adopted a democratic constitution. The constitution had a major impact on Spain's institutional and legal framework. Equally the details of this transition are still being worked through with respect to the rights of citizens, which amongst other things, were seriously compromised by the struggle with Basque separatists and by the adoption of 'Austerity' policies in Spain after 2009. Added to this is the increased media literacy of entire populations and its integration into everyday democratic practices.

The claim by Diaz that the Spanish government behaved like terrorists in adopting Austerity measures hit a large, and particularly raw nerve. The 'Basque conflict', also known as the Spain–ETA conflict, or what some describe as 'Basque terrorism' refers to a long history of political and armed conflict between Spain and the Basque National Liberation Front (ETA). In 1959 ETA launched a campaign for

autonomy first against the Franco dictatorship which they continued with the constitutional government that assumed office in 1976.

The fact that debate is still active about what to call the struggle with Basque separatists is a reminder that the power to define reality and alternatives is the ultimate power: in most cases as Bourdieu observed we can safely assume that power normally resides with the state (2014). The Basque National Liberation Front (ETA) has been proscribed as a terrorist organisation by Spanish, French, British and American governments. However as one writer argued the Basque political conflict is based on a legitimate claim by Basques for sovereignty in a Spanish state which denied them the right to decide their own status something that was grounded in a legal framework inherited from the Franco dictatorship (Blasquez 2011). In 1978 autonomy was restored to the Basques who achieved a significant degree of self-government based on the *Statute of Autonomy* which ensured Basques had their own police corps and manage their own public finances. The Basque Autonomous Community was led by the Basque nationalist Christian Democratic party since its reinstatement in the early 1980s until 2009 when the Socialist Party of the Basque Country gained office in the Basque autonomous region of northern Spain.

If the Basque conflict highlights deep fissures in modern Spain over national identity, the financial crisis and recession of 2008 exacerbated that inherent rift while digital media helped place inequality and justice on the political agenda. The issue of large-scale and high-level political corruption was a similarly sensitive topic for Spanish citizens still reeling from the hardship most suffered courtesy of the 2008 Global Financial Crisis, an economic catastrophe many saw as the direct result of official corruption, and the criminality and excessive risk taking on the part of many business elites. Adding insult to injury were decisions taken by treasury to use tax-payers money to 'bail out' the banks and others responsible for creating the financial crash. It was hardship was made worse by the government's decision to implement 'austerity policies'.

The 2008 recession had a devastating effect on workers and their families and on welfare beneficiaries especially in southern Europe. Many governments implemented a range of monetary, fiscal and other policies ostensibly to mitigate damage to credit markets and to restore economic growth and market activity. This involved large-scale nationalisation of banks as well as fiscal stimulus packages including increased government spending and tax cuts tax cuts,. To fund these projects money was borrowed from capital markets. The European Union also provided a 200 billion euro strategy for its member states to meet the immediate crisis. Once the immediate crisis seemed to be under control another crisis emerged.

Towards the end of 2009 the European Central Bank and the IMF backed by the German and French governments discovered another problem or sovereign debt default. It became apparent that some governments like Spain, Greece, Italy, Portugal and Ireland could not to repay or refinance the debts they incurred in their bids to mitigate the damage caused by the 2008 crisis (Weber and Schmitz 2011). To reduce the risk of those governments defaulting on their loans, (Germany, the European Central Bank and the IMF) offered them more credit so they could repay their earlier loans - but with new strings attached. The loan offers were now conditional on governments who were at risk of defaulting agreeing to implement 'austerity' policies. The 'austerity' measures were harsh and aimed at reducing public debt, involving tax increases, job and wage cuts in the public sector effecting education, health and welfare expenditure. Moreover, they were justified in terms of 'adjustments' 'needed' to stabilize the economy and demonstrate the states capacity to be 'fiscally responsible'. This meant amongst other things that many government employees lost their jobs, or took salary cuts, it meant increased costs of basic amenities (like electricity), cuts to welfare, education, health services and public sector generally. Not surprisingly, many people were not happy. Apart from the context that Diaz drew on to make his satire

so pointful, the Diaz case raises questions about the salience and the effectiveness of digital media for political communication, the state of democratic politics and indeed how we think about the political.

One starting point is Habermas' influential contribution to discussions about deliberative democracy and the possibilities for reviving the 'public sphere' (1989).

Participation, Democracy and the Internet

Habermas described the 'public sphere' as that space constituted by citizens freely engaging in critical and rational deliberation about public issues (1984, 1987). Subsequently he added his 'communicative action' model (1989). It was an account of discursively grounded communication theory built on Kant's principle of universalisability, which argued that for a decision to be valid we need to ensure that everyone affected by it can accept the consequences of their observance. According to his 'ideal speech situation', valid norms of action are only legitimate if they can be justified in such a moral-practical discourse. In this way Habermas outlines the claim that those affected by a decision ought to participate in processes that led to the decision. In short, those with an interest in the decision at which this process arrives ought reasonably to prefer that decision to any alternative (1996). Writers have subsequently elaborated Habermas' work (eg Dryzek 1990, Olson 2006).

The affinities between Habermas's conception of the 'public sphere' (1989) and the idea that the internet provides a digital platform for a new public sphere has been a significant focal point for theorists and researchers for several decades. For many of these commentators a good case exists for revising traditional accounts of politics and the public sphere given the ways in which digital technology is now being used to engage more people politically and to open-up new deliberative spaces.

They point to new forms of political action enabled by the digital media such as hacker 'clubs', movements like 'Anonymous' and 'Lulz sec' and electronically sponsored Distributed Denial of Service (actions, the later of which that facilitate the digital co-ordination of large numbers of protesters to disable websites) (Bessant 2016, pp.921-937). Popular protests and large-scale political mobilisation of people using digital media in Egypt and comparable developments in Tunisia, Yemen and Libya, the 'Occupy movement' across many Westerns countries, plus student action against fee increases in many countries highlight how digital medium was central to the distribution of ideas and to recruitment and organization of people for different kinds of political action (Bessant 2014).

Dahlgren is an important post-Habermasian interested in the democratic potential of digital space, while distancing himself from Habermas's account of a single public sphere and the idealization of deliberative practice on which it relies. Dahlgren does not accept Habermas' insistence that deliberation should only ever be directed towards consensus, pointing to instances where democracy has been promoted by political conflict and antagonism – something that is ever-present in relations between various political interests (2009:156). Dahlgren's point is that citizens are more than rational beings and democracy can be augmented by means other than rational deliberation (Dahlgren 2009: 147–162, 2000: 335–340.). 'Non-rational' human qualities including moral emotions like righteous anger, disillusionment, or disgust, and responses like laughter and hilarity evoked by humour or satire play a critical role in the public sphere. These expressive responses play a role in political life as much as more conventionally understood forms of political action like rational deliberation. As many writers have noted contemporary digital media provides the affordances which enhance the production and distribution of opinion including genres like user-generated satire in what now constitutes multiple public spheres.

Given that normatively more participation on relatively equitable grounds is good, digital media provides a technical means for enlarging participation in will formation. In this way digital media *can* provide a technical resource for enhancing equity by opening multiple spaces and by helping to secure political cultures where values like equity, fairness, openness and a pluralism may be realized (Dahlgren 2009).

Unlike Habermas who is skeptical of the Internet's capacity to enhance deliberative practice, Dahlgren maintains that digital technology moves us beyond narrow definitions of the 'public sphere' by connecting us to 'civic cultures in subtle, unintended and surprising ways' (2009:48).

Dahlgren unlike Habermas does not rely on an untenable account of the political and the liberal polity by insisting on consensus and by blanking out of dissent from the picture which in Habermas's case is done prescriptively. For Habermas a functioning public sphere can be identified by the way it encourages a flow of ideas and exchange of information that produce consensus and political will, which then becomes political action by means of various political actors. It assumes that liberal democratic polities welcome and promote democratic dissent as part of that process.

Yet as I now explain, there is no reason however to suppose this is the case.

TWO PROBLEMS WITH LIBERALISM

Liberalism has always had major difficulties accommodating dissent. This is so for two different but connected reasons identified by a body of distinguished critics of contemporary liberal politics.

1. Consensus Rationality

As Unger argues, the liberal tradition assembled over many centuries by the likes of writers such as Locke, Kant, Bentham, Mill, Berlin and Rawls, privileges a rationalist, universalist and individualist conception of human being and society (1977). Liberalism that assumes that rational consensus is possible, that it can eliminate conflict, that it is preferable to dissent and protest, and that electoral politics is the essential institutional device for a democratic polity.

Many unspoken assumptions about what constitutes 'the political' operate in the liberal tradition. One is that for an action to be political, motivation needs to be expressed in political language, that is it has to be rationally articulated and expressed through legitimate institutional means. This focus on rationality highlights the ways disciplines like political science legitimate activity as being 'political' by relying on the idea that 'rationality' relies on conventional forms of strategic political action (Akram 2014 p.382).

Added to this is political theory that is also interested in what counts as political. It's a tradition that articulates conventional rules of engagement, values and consensus over dissensus and privileges *rational* deliberation. For Habermas all communicative action is oriented towards 'understandings' or agreements (1984 1996). Such understandings rely on mutual comprehension (i.e. people using the same words with the same meanings so they can reach shared or mutual comprehension) which extends to consensus about truth and what is good (Habermas 1984 p.42).This rational communication considered necessary for democracy involves identifying the rules or norms underpinning rational discourse or ideal speech (eg listening to each other, taking turns, relative equity between participants etc). Habermas' claim that a 'public sphere' connects rational deliberation to the democratic political process is fine in theory, but how does that happen? What does this mean in practice he doesn't say (1989).

The ostensibly defining features of liberalism, like its privileging of rationality and consensus, have helped erode a normative conception of the political as an inherently 'agonistic' enterprise (e.g. Mouffe 2005a and b, Unger 2014). Some contemporary theorists refer to a crisis of of 'the political' and of liberal democracy (Furedi 2005, Mouffe 2005 a-b). For Mouffe, too many proponents of liberalism are 'blind to ... the political in its dimension of conflict-decision' and cannot perceive the value of opposition in political life (2005:3).

Mouffe's point is made clearer when she distinguishes between antagonism and agonism. Antagonism is a 'we–they' relationship where 'they' are 'enemies' and do not share common ground. Agonism refers to a 'we' relationship in which conflicting parties declare commitments to shared ethical–political principles (e.g. liberal democracy). While agonists acknowledge there may be no immediate, or even long-term solution to their differences, they nonetheless recognize the legitimacy of their opponents' disagreement and resistance and its value for democratic processes.

The preference for consensus over conflict and the 'blindness' to the value of opposition encourages a taming of disagreement and dissent. It is a trend exacerbated from the early 1980s with the rise of a neo-liberal political imaginary that supports the 'economization' and 'technicization' of politics which characterize conflict as a source of economic inefficiency or political dysfunction (Buchanan and Tullock 1962). All this narrows and depletes the public sphere.

2. Security, Order and Prerogative

The second closely related problem inherent in liberalism is that rather than valuing freedom, liberalism exhibits a preoccupation with maintaining order and security. As Neocleous argued, this privileging of order and security over freedom is deeply embedded in the history of liberalism (2000, 2003).

As Neocleous argues, these are bad days for liberty because any 'claim to liberty in the contemporary world is offset by the counter-demand for security (2007: 131). As he says the claim that in seeking security, 'states need to constantly limit the liberties of citizens, and that the democratic society is one which has always aimed to strike the right 'balance' between liberty and security' (2007:132).

Although there is considerable detailed political and philosophical explanation to be engaged in, and more than is possible here, Neocleous' argument is that if we search for a solid liberal belief in freedom over security we will not find it. Indeed if we go back to the origins of liberalism to Locke's account of civil society we see the latent preoccupation with order and security.

Neocleous' reading of Locke is clear (2007: 134-7). Locke's political thought appears to revolve around the power of the people to enter into a contract with each other to form government in which again they place political supremacy in the legislature. Here is the liberal founding myth: the legislature is supreme because it assures the rule of law, protects life, liberty and property, and prevents any exercise of arbitrary power.

Yet Locke says there must also be scope for discretion, because the public good - the protection of life, liberty and property - may sometimes require immediate and decisive action to preserve the good order of the state.

Locke concedes that 'the good of the Society requires, that several things should be left to the discretion of him, that has the Executive Power'. Events may occur where 'strict and rigid observation of the laws may do harm'. Law-making is often too slow, too cumbersome and cannot deal with 'accidents and necessities' that may concern the public. The power to act in these circumstances is what Locke understands by prerogative power:

This Power to act according to discretion, for the public good, without the prescription of the law, and sometimes even against it, is that which is called Prerogative.

According to Locke it is through prerogative that the people permit their Rulers to act 'of their own free choice', not only where there is no clear legal position ('where the Law was silent'), but sometimes where they might feel the law insufficient or unimportant ('against the direct letter of the Law').

Prerogative therefore grants to the sovereign discretionary powers not bound by law and which might even be used against the law. This is 'an Arbitrary Power', Locke comments - in parenthesis, as though it were a minor point which might be passed over and which allows him to ignore the fact that arbitrary power is precisely the kind of power his constitution was designed to prevent. Prerogative, then, grants rulers powers which are legally indeterminate at best. At worst, prerogative serves to place rulers beyond law. The only requirement is that prerogative be exercised in the interests of the 'public good'. ' *Salus Populi Suprema Lex* [the safety of the people is the supreme law] is certainly so just and fundamental a Rule that he who sincerely follows it, cannot dangerously err'. In other words, prerogative 'is, and always will be just' so long as it is exercised in the interest of the people (Locke, 1988, 373-375, 377, 405). Determining what is in the interest of the people is of course the state will alone determine.

In short this is why liberal states so freely declare 'states of exception' (Agamben 2007) as they breach constitutive principles of liberalism, such as the rule of law and rights to freedom of speech and assembly in pursuit of order and 'security'.

DISCUSSION AND CONCLUSION

The implication of this argument for this chapter is that we cannot assume as many have, that a natural or elective affinity exists between dissent of the kind evident in on-line satire and a liberal polity. This affinity cannot be assumed simply because we now have new kinds of open access or peer-to-peer technologies. Any affinity between dissent and a liberal polity has to be argued for repeatedly by people who are prepared to engage in political dissent and to defend this practice.

Inherent in liberalism is a tendency towards security and order as much as there is an interest in freedom. When push comes to shove however if its power is threatened, the state has at its disposal that prerogative to deny liberties like freedom of speech and to squash any dissent deemed to threaten the state. In this way what we are seeing now in places like Spain and many other liberal democracies is the exercise of that prerogative and a playing out of the preference for security over freedom.

This chapter adumbrates the point made by Appiah that laughter and ridicule can make moral revolutions happen and bring about political change (2010:3-17). The case of Diaz demonstrates how in the context of economic crises, digital media offers the means to create content for satirical humour and to communicate it so it filters through vast networks in ways that ridicule and provoke political debate.

According to traditional liberal theory, activities like satire do not fit the category of rationality because it relies on emotion, is playful and not oriented towards consensus. The modern liberal constitutional state privileges an overly narrow conception of politics-as-consensus and defines its remit as needing to work in accordance with that.

As such satire, particularly if it is on-line does not fit the traditional Habermasian liberal category of deliberative practice said to be an essential feature of a public sphere. Indeed for writers like Griffith, frivolity is problematic because it is open-ended and resistant to closure or consensus (1994). Yet while

on-line satire and the digital debates that accompany it may not fit these accounts of 'rational' action or 'the political', it does none-the-less augment participation and offers a powerful and influential political critique. It is also a direct form of communication that typically comes from 'below'. As Kiley and Shuttleworth observe, satire's literary manner blends critique with humour, and wit for the purpose of 'improving' social conditions (1971).

While the influence of humour and ridicule in politics has been acknowledged in political science (Holbert 2013:305-323, Baym and Jones 2012), it has received minimal acknowledgment by conventional political science.

Brian Barry (2001) is a modern philosopher who made the case for a right to ridicule, a case grounded in his conception of justice. It is a case worth rehearsing. He argues that there should be only one status of citizen (no estates or castes), so that everybody enjoys the same legal and political rights (Barry 2001:7). Barry is interested in deriving principles of justice that allow persons with highly divergent interests, attitudes and conceptions of the good to live together amicably- because everyone will recognize that whatever disputes do arise they will be adjudicated according to principles that all can appreciate as fair.

By privileging rationality and consensus traditional liberal theory omits the idea of politics as 'agonistic'. In this way proponents of liberalism are 'blind to politics' that comes in the form of conflict-decision', and cannot perceive the constitutive role of opposition in social life (Mouffe 2005a p.3). I pointed to the ways liberalism relies on an excessively rationalist individualist conception of human being and society, and assumes rational consensus is possible, that it can eliminate conflict, that consent is preferable to dissent, and that electoral politics is the essential institutional device for a democratic polity.

Finally user-generated satire like Diaz's comedy has flourished with the advent digital media, as users make their own content and broadcast them globally. As Dias da Silva and Luís Garcia argue, this has come to play a significant role in politics (2011: 89-114). Millions of remixes and mash-ups in the form of spoof and satire now circulate courtesy of the web. This has 'knock on' effects in mainstream media in ways that see satire break out of sharing sites and smaller networks and enter into mainstream media and political forums in ways that shape 'public opinion', contemporary politics and that reveal how digital media has become integrated into participatory democracy.

Chapter 65
The Irrevocable Alteration of Communication:
A Glimpse Into the Societal Impact of Digital Media

ABSTRACT

In our digital society, the ability to communicate has irrevocably changed. The purpose of this chapter is to provide a glimpse into the impact of digital media on society, specifically digital communication. This glimpse is framed in terms of four characteristics of digital communication: product/ion, semiotic, public, and transitory. Issues are examined that relate to the democratization and monopolization of communication, who has access, the persistent Spiral of Silence, privacy, cyber bullying, identity theft, the ethereal being captured, as well as education and new literacies. Methodological gaps are noted in the research corpus and suggestions are proposed regarding the need for timeliness, support for a comprehensive span of research paradigms, and representation of a full range of populations. Finally, implications and recommendations are explored for civic engagement, commerce, education, and policy.

DOI: 10.4018/978-1-5225-3822-6.ch065

INTRODUCTION

Communication is core to human existence. Throughout time and civilizations, humans consistently created varied forms of communication. Ancient civilizations created cave drawings, petroglyphs, pictograms, cuneiform, hieroglyphs, and alphabets. More recently, civilizations created newspapers, magazines, telephones, and radio. The ability to share ideas, emotions, desires, and plans, to mention a few reasons we communicate, is the essence of the human experience. The purpose of this chapter is to discuss the societal impact of digital media on communication. We view society, digital media, and communication as dynamic entities that are inextricably intertwined and continually impact one another. Therefore, we examine both the impact of society and digital media on communication as well as the impact of digital communication on society. To manage this broad and varied topic our discussion is framed in terms of four characteristics of digital communication: product/ion, semiotic, public, and transitory (Baker, 2001). We define and illuminate each characteristic by exploring research related to exemplars. Issues emerge regarding the democratization and monopolization of communication, access to digital communication, persistent Spiral of Silence, online ethics and safety, ethereal captured while privacy is compromised, and education. Methodological gaps are evident in the extant research corpus. Implications are discussed and recommendations are made for local and global civic engagement, commerce, education and policy. We acknowledge that other frameworks, constructs, and exemplars can be used to understand digital communication. Our goal is not to provide a comprehensive or conclusive discussion of digital communication but to provide fodder for grappling with this timely and emerging topic.

IMPACT OF DIGITAL MEDIA ON COMMUNICATION

Production Nature of Digital Communication

Production is defined as "the process of making something" while product is defined as "something that is the result of a process" ("Production", n.d., para. 1; "Product", n.d., para. 1). By definition, written communication culminates as a product. Up through the first millennium mankind created varied written products including pictographs, hieroglyphs, letters, and scrolls. In 1999, the Biography channel broadcasted a countdown of the most influential people of the second millennium. This countdown included such notables as Newton, Darwin, and Einstein. Among these notables, they concluded the most influential person of the second millennium was Gutenberg. Arguably, one reason Gutenberg was given this distinction is that the printing press made it easier to transform communication into products that, in turn, could be widely disseminated. Communication has always been shaped by the technology at hand (Hartman, Morsink, & Zheng, 2010; Leu, 2006; Leu & Kinzer, 2000). With the advent of digital media, it is argued that we are witnessing a comparably significant, and likely more significant, even unprecedented development in the history of communication (D. Hartman, personal communication, August 17, 2012).

In her analysis of the ontology of literacy, Baker (2010a, 2013b) argued that the ability to transform communication into products is significant because products can travel through time and space. Written communication can defy the laws of physics. Authors and readers can become time travelers who explore historical times and geographical locations that are beyond their physical limitations. Because Socrates' words were written down we can read his thoughts--even though we live in a different time and place.

The product/ion nature of written communication allows authors and audiences to travel through time and space. In our digital era, this travel is not only instantaneous but also global. Each day 182.9 billion emails are sent (Radicati, 2013), 55 million Facebook statuses are updated (Facebook Statistics, 2014), and 1,400 hours of YouTube video are uploaded (You Tube, n.d., para. 3). The instantiation of communication as products defies physical limitations to time and space by affording global dissemination within seconds. The mitigation of production means that anyone with a digital device and Internet access can produce a message that is instantly available worldwide. Publishers are no longer the gatekeepers of producing and disseminating written communication. The proliferation of blogs, FaceBook, Twitter, citizen journalism, self-publishing, and eBooks exemplifies the product/ion nature of digital communication.

- **Blogs:** Blogs, "originally a space for narrating personal life stories" (Harrison, 2014, p. 337) are often used to create traffic for business endeavors, incite political action, and teach audience members interested in affinity content (e.g., parenting and cooking). For example, blogs written by ordinary people whose purpose is to share private information among an affinity group, such as individuals struggling with infertility, now "play an important role in public and political negotiations of fertility issues" (Harrison, 2014, p. 338). Drawing a similar comparison to blogging and foreign policy, Hestres (2008) asserted, "blogs have evolved into more than alternative media outlets: they have become vehicles for online organizing and activism for ordinary individuals who care about foreign policy and are willing to take action to influence it" (p. 1). Endorsed with sponsored advertising, bloggers have the opportunity to communicate with a polished and professional appearance. In 2014, one blog platform, WordPress, boasted 75.5 million blogs that had 409 million views and 60.5 million posts each month (Digital Marketing Ramblings, 2014b). Blogs, produced with the specific intent to inform, educate, and persuade audience members across the globe, are a tool accessible to any unskilled person. What was once a casual conversation between like-minded individuals, or a nicely designed tri-fold brochure for local distribution, has become an opportunity to influence the masses by creating a polished blog that is official in appearance.
- **Facebook and Twitter:** Beyond blogs, platforms such as Facebook (launched in 2004) and Twitter (launched in 2006), contribute to the unskilled person's ability to produce professional-grade communication. In a 2013 survey of 1,802 Internet users, Duggan and Brenner (2013) found 16% used Twitter while, ranking the highest, 67% used Facebook. The ability to produce written communication on these platforms, at face value, might not seem to yield global impact. Originally designed to connect users with families and friends, the possible applications of these platforms has evolved to include audience solicitation and audience retention methods which provide publishers, skilled and unskilled alike, with a forum to sell ideas, products, and entire belief systems to a global audience. The statistics indicate that the public is taking advantage of available platforms to publish their ideas.
- **Self-Publishing and eBooks:** In 2000, Mace (2010) deemed eBooks as "failed" for the following reasons: not enough eBooks, cost, cumbersome hardware, nascent digital periodicals, and poor marketing. Mace noted that "at least six eBook reader devices [were] on the market or in preparation" (para. 2) with estimates of seven million devices to be sold in 2011, by 2015 over 10 percent of the publishing market will be eBooks, and by 2030 over 90 percent will be eBooks. The increase in eBook production provides greater variety and choice for consumers and illuminates challenges for self-publishers. Aside from the few that skyrocketed to fame, the majority of self-publishers engage in time-consuming activities to build a fan base and create awareness of their offering in

a market ripe with choices. Social media endeavors and exclusive content offerings are two of the ploys that authors use. One such author, Rachel Abbott, reported spending 12 hours a day just to build her profile (Carolan & Evain, 2013). Self-publishers are not discouraged by these statistics. It seems the allure of production is more compelling than roadblocks to monetary gain. Baverstock and Steinitz (2013) found that self-publishers have two fundamental motives: desire for control and pure love of writing.

Semiotic Nature of Digital Communication

Since the advent of the alphabet, written communication has been predominantly verbocentric (Reinking, 1998). That is to say, written communication has historically been dominated by the use of words. While printed newspapers, magazines, and books include non-verbocentric information such as illustrations, photographs, and charts, written communication has been overwhelmingly dependent on words. With the advent of digital media, written communication is increasingly semiotic. Semiotics is the study of sign systems (Peirce, 1991). The alphabet is merely one of a myriad of sign systems we use daily. For example, we communicate with body language. A smile, smirk, cold stare, and frown communicate volumes. We communicate with paintings, sculpture, and music. Baker (2001) noted that digital communication increasingly mimics face-to-face communication by allowing authors to compose multimedia products. The popularity of incorporating audio, photos, and video in digital communications demonstrates the semiotic nature of digital communication.

- **Popularity of Audio, Photo, and Video:** Podcasts, Pinterest, and YouTube are less verbocentric than print media because they allow authors to capture auditory and visual communication. Podcasts are an example of audio-based digital communication. Podcasts are defined as, "a program (as of music or talk) made available in digital format for automatic download over the Internet" ("Podcast," n.d., para. 1). The term podcast was coined by technology writer, Ben Hammersly, who made an off-hand comment about names for online radio (Sterne, Morris, Baker, & Freire, 2008). Podcasts were first made popular by the introduction of the iPod. Free software such as Audacity, launched in 2002, made the production of professional-grade audio ubiquitous (Sterne, Morris, Baker, & Freire, 2008).

In 2010, the top three podcasts were categorized as general, music, and technology; education came in 8th and news 14th (Olmstead, Mitchell, & Rosentstiel, 2011). In 2004, Duke University provided Apple iPods to all incoming freshmen so they could download podcasts with schedule information as well as lectures (Flanagan & Calandra, 2005). From 2009 to 2010 Olmstead, Mitchell, and Rosenstiel (2011) noted a 28% growth in podcast production; nonetheless only 45% of Americans knew what a podcast was. In 2014, Wolf found that podcasts were on the rise and posits this is due to "continued smartphone growth, better podcast apps and the explosion in great content, [as well as] dedicated podcast fans" (para. 1). The product/ion and semiotic nature of digital communication are unmistakable; digital communication that emulates a full range of *semiotic* sign systems appears to increase as technology enables both authors and audience to *produce*, disseminate and access digital semiotic communication.

Pinterest is an example of photo-based digital communication. Pinterest is a social network where photos are "pinned" to a virtual board. These pins are linked to websites of origin. Authors share pins and re-pin photos on other authors' boards. The basic function is to allow users to collect, organize, and

share pins (Han et al., 2014). The pins are organized on the boards by tastes and interests. Pinterest was launched in 2010 and by 2014 had 70 million users who had created more than 750 million boards with over 30 billion individual pins (Digital Marketing Rambling Statistics, 2014a; See also Smith, 2014a). In addition, 54 million new pins are added each day (Bercovici, 2014). To emphasize the popularity of photo-based digital communication, it has been said, "Facebook is selling the past and Twitter the present, Pinterest is offering the future" (Bercovici, 2014, para. 9). Users access Pinterest with computers as well as mobile devices with 52% using smartphones as the primary device to pin photos (Smith, 2014b). Each board, each pin, is a photo that is posted to communicate ideas, thoughts, and possibilities. These statistics are staggering and underscore the semiotic nature of digital communication.

YouTube is an example of video-based digital communication. YouTube, since its inception in 2005, has transformed daily life into a global production, capitalizing on the semiotic nature of communication. Anyone with a digital camera, a smart-device, or a computer, can become authors of video-based communication. Prior to YouTube, there were other online video websites that did not succeed. Shareyourworld.com, launched in 1997, was one of the first video-sharing websites. Then came Singfish in 2000, which was acquired by Thompson Multimedia. Blinkx, founded in 2004, offered a video search engine. These forums did not flourish, but the power of video-based digital communication did. In 2005, Google Video as well as Yahoo! Video began as video search engines that allowed people to search the web for videos (Soukup, 2014). Meanwhile, in 2005 Chad Hurley, Steve Chen, and Jawed Karim founded YouTube as a way to post and share video. Google bought YouTube in 2006 with expectations that the website would grow (Strangelove, 2010). YouTube was transformed from a repository of videos to "becoming a force that is investing in content creation" (YouTube & News, 2012).

By 2010, 150 million videos were posted to YouTube each week (Strangelove, 2010). In 2011, YouTube was viewed for the one-trillionth time. By 2014, YouTube had one billion users who uploaded 100 hours of video per minute, posted 150 million videos per week, and watched six billion hours each month (Smith, 2014c). According to Purcell (2013), 72% of adult Internet users have watched a video on a video-sharing site like YouTube, 56% have watched videos online, and 36% have downloaded video files to a phone or computer so they can watch at a later time. Four features are credited for the success of YouTube: video recommendations, email links that enable video sharing, comments, and an embedded video player (Gannes, 2006). It also offers social networking features (Soukup, 2014). Given its magnitude, Strangelove stated that YouTube showcases the lives of people around the world, from videos providing intimate details of indiscretion, to American presidential primaries, to soldiers documenting their lives and killings in Iraq (Strangelove, 2010). These statistics indicate that what was once the purveyance of face-to-face communication has migrated to digital communication.

Vine is an example of the semiotic nature of digital communication that, similar to YouTube, embraces video. Vine is designed for smartphone users and allows them to create six-second videos and then embed these videos in text messages, Facebook, and Twitter (M. Miller, 2013). Vine launched in 2012. In 2013, Twitter bought Vine, which quickly attained 40 million users (Fiegerman, 2013). By late 2014 over one billion Vine loops were played each day (Crook, 2014).

- **Ubiquity of Capturing the Ethereal:** An important aspect of the semiotic nature of digital communication is the ubiquity of capturing the ethereal. Ethereal refers to, "lacking material substance" ("Ethereal," n.d., para. 2). With the ability to record audio, photo, and video with Internet-connected mobile devices the ethereal is readily captured and shared, worldwide. Before the ubiquity of such digital devices, conversations, actions, and settings were fleeting—they lacked substance, they

were ethereal. Now, surveillance videos assist with crime detection (e.g., Boston Marathon bombing), street witnesses capture police brutality (e.g., Arab Spring), and on a lighter note, cat owners capture the antics of their pets.

In 2012, Google developed Google Glass; a pair of glasses intended to provide seamless online access. Users see an Internet screen in the upper right side of one lens. Among other things, they can capture covert videos and photos and instantly share them online. Honan (2013) conducted an informal study of Glass by wearing them throughout most of 2013. He wore them to identify their usefulness—but instead found consistent derision and increased animosity by those around him. He became known as the "Glasshole." Even his wife was willing to let him video record the birth of their child with a traditional video camera—but not with Glass. While there are reports that Google Glass is being abandoned, wearable technology is in its infancy and will likely become less obvious and a social norm. As it does, the capturing and sharing of the ethereal will become increasingly normal.

British surveillance cameras demonstrate the pervasive ability to capture the ethereal. Schlosberg and Ozer (2007) described Britain's response to the bombing of London in the 1990s by the Irish Republican Army. By 1994, 79 British cities installed surveillance cameras for their central districts. By 1998, up to 75% of Britain's crime prevention budget was spent on cameras. The result was that by 2004, Britain installed over four million surveillance cameras in approximately 500 British towns. By 2006, the average person in London was captured on video 300 times per day.

Google Glass and the British video surveillance system are two examples of how the ethereal is readily captured and shared. Consider the sheer number of audio, photo, and video postings made to social networks. Users post conversations, actions, and settings that were formerly ethereal. The ethereal has become a product—and these products are readily distributed.

Public Nature of Digital Communication

Public is defined as "exposed to general view" ("Public," n.d., para. 2). There is a plethora of digital communication that is public. Consider web sites, blogs, and social networks. These digital communications, pending privacy settings, are public. Anyone with Internet access can view these digital forms of communication. Ten billion "ALS ice bucket challenge" views on Facebook alone during the summer of 2014 (Smith, 2014d) is evidence of the speed at which digital communication is crafted, distributed, and received, internationally. Due to the breadth of this topic, in this section we focus on a particular phenomenon related to the Public nature of digital communication: collective intelligence. Wooley, Chabris, Pentland, Hashmi, and Malone (2010) contended that just as individuals have intelligence, so do groups. The Center for Collective Intelligence at MIT examines how people and computers can work together "more intelligently than any person, group, or computer has ever done before" (2014, para. 2). While collective intelligence is as old as society and exhibited by most forms of life (Malone & Bernstein, in press), due to the public nature of digital communication, we are on the precipice of something previously unattainable. We can formulate collaborative communities that span the globe to generate intelligence that previously lacked coordination and the power generated through think-tank contributions on a global scale (Weiss, 2005). Some examples include Wikipedia, Arab Spring, Kickstarter, online product reviews, HapMap, Uber, World of Warcraft, and Coursera. These examples represent the following types of collective intelligence: knowledge, political action, funding, commerce, medicine, crowdsourcing, entertainment, and education. A closer examination of citizen journalism, Massive Mul-

tiplayer Online Games (MMOGs), Massive Open Online Classes (MOOCs), and Arab Spring reveals the public nature of digital communication.

- **Citizen Journalism:** Glaser (2006) described citizen journalism as,

People without professional journalism training [using] the tools of modern technology and the global distribution of the Internet to create, augment or fact-check media on their own or in collaboration with others.… The average citizen can now make news and distribute it globally, an act that was once the province of established journalists and media companies…. One of the main concepts behind citizen journalism is that mainstream media reporters and producers are not the exclusive center of knowledge on a subject — the audience knows more collectively than the reporter alone. (Para. 1, 2, 3)

Citizen journalism has become a modern vehicle for communication of events, both in the realm of serious news writing as well as entertainment. Howe (2008) stated that in order to keep costs and profits in balance, news reporting is outsourced to "a large, undefined group of people via an open call, generally over the Internet" (p. 47). Several platforms support the organized dissemination of news via citizen journalists. Huffington Post and BuzzFeed are among the most popular with BuzzFeed staffing 170 writers, including reputable award-winning writers. Mitchell (2014) reported that in 2012 there was a 6.4% decline in newspaper jobs while in 2014 there were more than 5,000 full-time professional jobs for online journalists at approximately 500 digital news outlets.

Photojournalism by citizens is also on the rise. According to Pew Research Center's Journalism Project Staff (2012), during the week following the 2011 tsunami in Japan, videos of the disaster, mostly recorded by eyewitnesses, were watched more than 96 million times. Another example of citizen journalism is evident in the dissemination of photographs by American soldiers, wherein soldiers capture their daily activities and observations, and share them with the world via email and other platforms (Sontag, 2004).

- **MMOGs:** Massively Multiplayer Online Games (MMOGs) are an example of collective intelligence. MMOGs "are highly graphical two-or three-D video games played online, allowing individuals, through their self-created digital characters or 'avatars,' to interact not only with the gaming software (the designed environment of the game and the computer-controlled characters within it) but with *other players*' avatars as well" (Steinkuehler, 2007, p. 298). MMOGs are an example of collective intelligence because players around the world are able to perform acts of "intelligence" that are qualitatively different and enhanced over what they would accomplish as individuals. Users form teams or organizations that cooperate together in order to win virtual battles or accomplish virtual tasks. Typically, team members are familiar with each other only in these online environments. Online voice communication and a shared online interface allows users to play concurrently. Users are able to interact and work in real time to organize activities in the games (Ruiz, 2013).

According to Wiess (2006), this mode of sharing is increasingly growing and affecting the mindset of the present and future generations. Collective intelligence for these generations has become the norm. Flew and Humphreys (2005) argued that "interactivity" in the online game environment and the continual dialogue between consumers and game designers, who are active in videogames as groups or associations, frequently collaborate to accomplish their goals (see also Lévy & Bononno, 1998). Jenkins (2006) suggested, "collective intelligence can be seen as an alternative source of media power" (para. 6). Because

of their collective intelligence, the participatory cultures that emerge between media companies, game producers, and users show a central change in the nature of media production and consumption. Gosney (2005) examined Alternate Reality Gaming and described it as an "across-media game that deliberately blurs the line between the in-game and out-of-game experiences" (p. 2). Actions occur outside the game reality and extend into players' lives. This genre of gaming requires an exceptional level of collaboration and collective intelligence to solve mysteries posed within the game.

Banks (2003), a cultural theorist and online community developer, studied the influence of online fan communities in the invention of Trainz (a series of 3D train simulator computer games). He claimed that its commercial success was primarily due to "the formation and growth of an active and vibrant online fan community that would both actively promote the product and create content extensions and additions to the game software" (p. 11). The fans' collective intelligence enabled improvement and promotion of the game.

- **Massive Open Online Classes (MOOCs):** Massive Open Online Courses (MOOCs) are an example of collective expertise. MOOCs have open registration, publicly shared curriculum, open-ended outcomes, and are commonly free (McAuley, Stewart, Siemens, & Cormier, 2010). MOOCs incorporate social networking, available online resources, and are assisted by leading experts in the field of study. More importantly, MOOCs engage students according to their personal learning goals, background knowledge and skills, and mutual interests. The collective knowledge created by participants generates a whole that is greater than the sum of its parts. "It is, in many ways, a microcosm of a nation" (McAuley, Stewart, Siemens, & Cormier, 2010, p. 54). MOOCs work best when people bond on the basis of their lives, interests, and understandings of their worlds. MOOCs create a collaborative and interactive experience for those who would otherwise not have the opportunity to get an elite education.

Coursera is a MOOC identified as a "social entrepreneurship company that partners with many top universities across the globe to offer free courses online for anyone to take" (Audsley, Fernando, Maxson, Robinson & Varney, 2013, p. 137). Its purpose is to educate millions of people around the world by offering courses on numerous topics from privileged universities such as Stanford, Princeton, the University of Michigan, and the University of Pennsylvania. Professors have the ability to teach 30,000 or more students at once due to an instructional platform reinforced by vigorous computing power and complex infrastructure (Audsley et al., 2013). Anyone in the world with Internet access has the capability to obtain a self-paced education. Coursera purposely encourages digital communication between students. For example, students work together through discussion boards and virtual study rooms. Al Filreis, professor at the University of Pennsylvania, is fascinated by the ways in which the students interact on the discussion boards. "Coursera is building a system like Yelp that will let these students value each other's comments; the most valued and respected will rise to the top" (Henn, 2012). Filreis noted that within just one Coursera class, he is able to teach more students than he ever has throughout his career (Borup, West, & Graham, 2012). MOOCs focus on collective intelligence over individual intelligence, participation over publishing, breadth of expertise over concentrated expertise, and collaboration over individual authorship (Stewart, 2013).

- **Arab Spring:** The Arab Spring is another example of collective intelligence. It represented a new kind of revolution; a "Revolution 2.0" as Ghonim (2012) called it. The ability to orchestrate efforts

reverberated throughout the world. Conventional forms of civil disobedience were transformed by the capabilities of digital communication. Howard and colleagues (2011) suggested that social media is commonly used for political conversations. The demographic group in the Arab Spring was "young, urban, relatively well-educated individuals, and many of whom were women" (p. 2). Social networks were used to coordinate efforts and recruit participants. In a Facebook-based survey, Salem and Mourtada (2011) found that nine out of ten Egyptians and Tunisians reported that they used social networks to heighten awareness and arrange protests. During the Arab Spring, the use of social media doubled (Huang, 2011). Although the Arab Spring occurred for many reasons, collective intelligence is recognized as pivotal in efforts to advocate for democratic revolution (Rheingold, 2007).

In addition, news media contributed to the collective by forming an almost symbiotic relationship with people reporting from the front lines. This relationship allowed participants to effectively raise awareness of the more violent actions of the ruling governments against their citizens. This awareness reached international news sources that promoted their cause with unprecedented velocity. This type of dissemination informed citizens throughout the world and facilitated the organization of protests. Before and throughout the revolutions, these people worked on social media to put pressure on their governments. Governments also recognized the power of opposition movements armed with social media. Tunisia officials tried to block social media sites and arrested people who used social media to spread negative news about the government (Howard et al., 2011). While these efforts stalled and disrupted digital communication, the collective was tech-savvy and gained assistance from hackers and skilled computer programmers who were able to close online government services and offer protesters alternatives to censored access. Information that had been localized was instantly made public. Aided by the power of collective intelligence, young Arab people overcame what was thought to be insurmountable barriers and made their plight known. Government forces were unable to stop the movement. Internet controls were transcended by the ingenuity of the collective. A local issue became a worldwide concern through digital communication of text, image, and video.

Transitory Nature of Digital Communication

Baker (2001) argued that digital sources and compositions are in continual flux; they are transitory. Transitory is defined as "tending to pass away: not persistent" ("Transitory," n.d., para. 1). In the morning, you might read an article in the digital version of USA Today®—then when you share it with someone the same afternoon it may be updated; it may no longer be the same article. The same is true of postings made to social media, YouTube, eBooks, retail sites, and the list continues. Digital media is readily revisable making it perpetually transitory. Karlsson (2012) referred to digital communication as liquid, dynamic, and fluid. Others referred to the ephemeral nature of digital communication (Metz, 2013). Analyses of wikis, Snapchat, online news, and video production demonstrate the transitory nature of digital communication.

- **Wikis:** Wikis are an example of the transitory nature of digital communication because users can update them—at any moment. Unlike print media, that is stable, wikis are transitory. WikiWikiWeb, created in 1995 by Ward Cunningham, is credited with being the first wiki ("WikiWikiWeb," n.d.). "The term 'wiki' comes from the Hawaiian word "wee kee wee kee" which means, "fast" (Shu &

Yu-Hao, 2011). As the Hawaiian name implies, wikis are quickly and easily modified; they are transitory. Wikis allow multiple people to make changes instantaneously.

Wikipedia, established in 2001, is the most widely used wiki (Rand, 2010). According to Rand, the English version of Wikipedia receives 8,291,487 views per hour, which equals nearly 200 million views per day—in English alone. Any registered user can revise Wikipedia (Rand, 2010). Due to the openness of revisions, Wikipedia maintains administrative oversight of these revisions. At the time of this writing, Wikipedia had active editors in 285 languages that contributed to 31,000,000 articles ("Wikipedia: About," n.d.). "Every day, hundreds of thousands of visitors from around the world collectively make tens of thousands of edits and create thousands of new articles to augment the knowledge held by the Wikipedia encyclopedia" ("Wikipedia: About," n.d., para. 4). The English edition is the largest with 4,641,658 articles ("Wikipedia: About," n.d.). "Wikipedia is among the most prolific collaborative authoring projects ever sustained in an online environment" (Bryant, Forte, & Bruckman, 2005, p. 1).

Wikipedia's accessibility (Bryant, Forte, & Bruckman, 2005) makes it easy for the 23,051,284 registered users of the English version ("Wikipedia: About", n.d.) to edit and contribute new information. Unlike printed encyclopedias, authors do not have to worry about size constraints (Rand, 2010). Rainie and Tancer (2007) contended that Americans' reliance on search engines and the prevalence of Wikipedia sources on those search engines, have contributed to the growth and popularity of Wikipedia. Google's algorithm is interested in the number of links a site has. The vast number of links within Wikipedia, which also links readers to other Wikipedia articles, is a contributing factor for its popularity in search engines (Rainie & Tancer, 2007).

- **Snapchat:** App users have become interested in a type of social media that claims to erase their digital communication within a timeframe they specify. What was available a few seconds ago (10 seconds is the maximum amount of time that Snapchat postings can be viewed) has now vanished ("Support," n.d.). Snapchat has 100 million monthly active users who send over 700 million Snaps and view over 1 billion Stories per day (Wong, 2014). These numbers have doubled since the third quarter of 2013 when 350 million Snaps were sent (Duggan, 2013). MacMillan (2013) reported that rival apps are available in China and Japan. There is fascination with digital communication that disappears as soon as it is viewed. Users appear to value the transitory nature of digital communication.
- **Online News:** Online news has entered the transitory arena, although it did not begin this way. Originally, it was much like print news with the exception that it was online (Karlsson, 2012). Online and offline news were comparably static. In his examination of online media, Karlsson found that this is no longer true of all online news sources. He stated, "Online news has the ability to rework or delete incorrect stories or facts swiftly and without notice" (Karlsson, 2012, p. 390). Karlsson studied four different Swedish news sites. He monitored 15 stories on these sites for a period of three months. He manually captured what the sites published every 10 minutes. He continued to watch a story until that it had not been updated for three hours. He then revisited the story three more times over the next 24 hours to see if any additional changes had occurred. While Karlsson's work focused on Swedish news sites, which are subsidized and therefore may have the resources to revise more frequently than others, this work demonstrates the transitory nature of digital news. He found that not only were the online articles changing via internal updates but also external updates. Three of the four sites encouraged citizen journalism by asking viewers to send in pictures,

videos, and other information. He found news reports were updated between three to nine times with stories commonly updated eight times.

- **Video Production:** If we purchase a DVD, we know that the movie we purchased will be the same each time we play it. However, digital video files can be manipulated quite easily. In his book *Rewire,* Zuckerman (2013) gave the example of the film *Desert Warrior* created by Sam Bacile in the summer of 2011. The script was poorly written and ridiculed by the actors. When the trailer was published on YouTube in 2012, the actors' lines had been overdubbed and the title had been changed to *The Innocence of Muslims*. At this point, it became clear why the filmmaker was indifferent to the quality of the script. He had a different agenda. "The actors now delivered lines about the Prophet Muhammad, portraying the Prophet as a sex-obsessed, violent pedophile" (Zuckerman, 2013, p. 31). According to one of the actors, Tim Dax, those who were hired for their roles thought they were starring in a film about ancient warriors. Dax thought he was hired to play the role of the Biblical character, Samson (Gould, 2012). Unbeknownst to the actors, the director re-created the film for his own purposes. The transitory nature of digital video surprised the actors but fulfilled the purposes of the filmmaker.

Summary

In this section, we explored digital communication in terms of the following characteristics: product/ion-oriented, semiotic, public, and transitory. We highlighted exemplars for each characteristic (see Table 1). We want to point out that these exemplars, while used to illustrate specific characteristics, in reality exemplify multiple characteristics. For example, while Facebook mitigates challenges to production it is simultaneously semiotic, public, and transitory. While Wikipedia mitigates challenges to revising encyclopedia entries (transitory) it is simultaneously product/ion-oriented, semiotic, and a perfect example of collective intelligence (public). In a sense, the fact that these exemplars can be used to illustrate multiple characteristics reiterates our point: digital communication is product/ion-oriented, semiotic, public, and transitory.

Table 1. Exemplars used to illustrate characteristics of digital communication

Production Exemplars	• Blogs • Facebook • Twitter • eBooks
Semiotic Exemplars	• Podcasts • Pinterest • YouTube • Vine • Surveillance cameras • Google Glass
Public Exemplars	• Citizen journalism • MMOGs • MOOCs • Arab Spring
Transitory Exemplars	• Wikipedia • Snapchat • Online news • Video production

CURRENT ISSUES

A range of issues emerges in a world with blogs, eBooks, podcasts, Pinterest, YouTube, Vine, Google Glass, surveillance cameras, collective intelligence, wikis, Snapchat, and ubiquitous video production. It is argued that digital communication, while being democratized is simultaneously being monopolized. In addition, there are issues related to access, the persistence of the Spiral of Silence, ethical violations and safety, the ethereal being captured while privacy is compromised, and the preparedness of education.

Democratization and Monopolization of Communication

It has been argued that digital media fosters the democratization of communication (Boler, 2010; Howard & Hussain, 2011). The ability to capture the ethereal, record previously fleeting moments of conversations and actions, and produce a message that no longer requires gatekeeper approval for dissemination, is lauded as providing voice to the masses. The aforementioned discussions of citizen journalism, self-publishing, YouTube, FaceBook, Twitter, Google Glass, MMOGs, MMOCs, Arab Spring, and Wikipedia all lend themselves to the democratization of communication. The bottleneck, formerly held by gatekeepers who maintained access to audience, has been opened. Anyone with an Internet-ready digital device can *produce* a *semiotic* message and make it available to the *public*.

There are, however, indications that the democratization of communication is in peril. There is concern that the masses rely too heavily on a few providers (Greenwald, 2014). Currently, Facebook with 1.2 billion active users, Twitter with 300 million active users (comparable to the U.S. population), Google with 3.5 billion searches each day, and YouTube with over 4.2 billion video streams each day (YouTube Statistics), outpace their rivals. Given limited conduits for digital communication raises serious issues. While the popular providers of digital communication will come and go, concern for the monopolization of communication remains anytime few providers control access to digital communication. "We are nearing the point where an idea banished by Twitter, Facebook, and Google all but vanishes from public discourse entirely" (Greenwald, 2014). McChesney (2013) argued that capitalism is turning the Internet against democracy and noted, "that what is emerging veers toward a classic definition of fascism: the state and large corporations working hand in hand to promote corporate interests, and a state preoccupied with militarism, secrecy, propaganda, and surveillance" (p. 171).

Access to Digital Communication

The monopolization of communication raises issues of access. For some, access is a matter of availability. For others it is an issue of government control. In terms of availability, Wang (2013) found that more people own cell phones than have access to functioning toilets. Specifically, nearly 6 billion of the estimated 7 billion people in the world have access to mobile phones while only 4.5 billion have access to properly functioning toilets. In 2014, Mobithinking reported that there were 6.9 billion mobile cellular subscriptions with broadband subscriptions expected to reach 2.3 billion in 2014 (Sanou, 2014). This data indicated that the Internet, on average, appeared to be accessible. However, government control remains a concern.

Because organizers used social media to plan the 2009 Ürümqi riots in China, the government shut down access to Facebook (Kirkland, 2014). With pressure from international businesses, in 2013, the Chinese government reopened access—but only within 17 miles of Shanghai. Since the 2009 shut down,

the Chinese government has taken an active role in monitoring online communication. The Chinese government deletes posts and blocks access to websites (Kirkland, 2014). Bradsher and Mozur (2014) pointed out that Chinese Internet censorship causes economic problems for companies that export out of China. In 2014, Google decided to encrypt users' searches. The Chinese government responded by blocking access to Google (Bradsher & Mozur, 2014). The Google blockade made it difficult for businesses to place ads and collaborate via Google Drive.

In addition to China's efforts to censor and deny access to digital communication, there are other dictatorial governments that actively monitor Internet communication, censor digital communication, shut down access to primary providers (e.g., Twitter, Facebook, and Google), and shut down Internet access (see Table 2). Nonetheless, citizens in these countries find ways to get around bans via proxy servers, virtual private networks (VPNs), and anonymous browsers (Bennett, 2014). Digital communication is so vital that citizens around the world strive to gain access.

Persistent Spiral of Silence

The Spiral of Silence (Noelle-Neumann 1974, 1993) is the phenomenon in which people do not talk about topics that are not popular or will not be well received. "A major insight into human behavior from pre-Internet era studies of communication is the tendency of people not to speak up about policy issues in public... when they believe their own point of view is not widely shared" (Hampton et al., 2014, para. 1). Hampton and colleagues wondered if Facebook and Twitter had changed the culture of talk and empowered people to speak despite the Spiral of Silence. In a survey of 1,801 adults, they found that the pre-Internet Spiral of Silence phenomenon persists in the Internet era. They asked participants if they would be willing to discuss the Snowden issue (an American computer professional who leaked classified information from the National Security Agency). Eighty-six percent of respondents said that they would discuss it in person, while only 42% said they would share information on the issue via Facebook or Twitter. The survey results indicate that one's audience, similar to the pre-digital era, influence self-censorship. According to Hampton and colleagues, "In both personal settings and online settings, people were more willing to share their views if they thought their audience agreed with them" (para. 7). For the vast majority of authors, a like-minded audience remains key to choosing whether to produce and disseminate digital communication.

In an era in which digital communication is readily available to the masses, the Spiral of Silence raises concern regarding the voices being heard. There is an issue regarding the variety of information being communicated through digital media. It also follows that, if there is not an audience for a particular viewpoint, then it may not get communicated, despite the digital tools at our disposal. Wikipedia may be an example. The English version offers more than double the selection of the next largest edition, Swedish (Wikipedia, 2014). This creates an imbalance of power, or at the very least, presence, in this digital space.

Ethics and Safety

- **Privacy Settings:** Based on the growth trajectory of social media, it appears that such services will persist into the foreseen future and remain a conduit of digital communication for millions of people. The popularity of these services raises issues of ethics and safety. Wasike (2013) explained that when information is public, there are limited guarantees of privacy. Even if the information

*Table 2. Countries that have limited access to social media**

Country	Facebook	Twitter	YouTube
Bangladesh	Government monitors for inappropriate posts. In 2010, it was shut down for an entire week.		
China	Banned except for a 17 square mile zone of Shanghai	Banned	Banned
Cuba	Internet is difficult and costly to access with slow download speeds. The only place that the Internet can be accessed is in Internet cafes.	Internet is difficult and costly to access with slow download speeds. The only place that the Internet can be accessed is in Internet cafes.	Internet is difficult and costly to access with slow download speeds. The only place that the Internet can be accessed is in Internet cafes.
Egypt	For several days in 2011, several social media sites were blocked due to the fact that people were trying to overthrow the regime of President Hosni Mubarak. Allowed What can be said on the social media sites is limited by Decree 72, which was put into place September 2013. Prohibits news being shared on social media sites.

*Data from Bennett (2014) and Kirkland (2014)

is deleted from the author's account, the information may have been copied and shared. Thus, the information persists. Vander Veer (2008) found that 25% of social media consumers cannot locate the security settings offered by social media services and are therefore left to the mercy of default settings. Flatow (2008) found that control of privacy has limited benefits to the users by noting that too many options confuse the users who then make poor choices. For example, he describes

how consumers use their self-designated "friends" to guarantee privacy, and this can make users' information more accessible than if they are presented with fewer, but easier-to-understand options. Lenhart and Madden (2007) found that only 66% of teenagers use the privacy settings to reduce access to their profiles. Regardless of an increasing awareness of the importance of their "digital footprint," tracking personal information left behind by social media communication, only 3% of social media users check their online presence regularly (Madden, Fox, Smith, & Vitak, 2007). Acquisti and Gross (2005) found that many users have misconceptions about the privacy of their communications.

- **Cyber Bullying:** The two-edged nature of digital communication, balancing between opportunities and risks, reveals an emerging societal issue recognized as cyber bullying (Walrave & Heirman, 2011). Electronic bullying, online bullying, and cyber bullying are new means of bullying. These types of bullying are defined as harassment using technology such as social websites, email, chat rooms, mobile phone texting and cameras, picture messages, IM (instant messages), and/or blogs (Miller & Hufstedler, 2009; Beale & Hall, 2007). Studies confirmed that cyber bullying is a widespread and a serious problem. Mishna, Khoury-Kassabri, Gadalla, and Daciuk (2012) found that over 30% of students had personally experienced cyber bullying, either as victims or offenders; within a three month period, one in four (25.7%) stated that they were involved in cyber bullying as both a bully and a victim. Adams (2010) found that around 20% of students said they had been cyber bullied. Meanwhile, in a survey of 62 adolescents, Wong-Lo and Bullock (2011) found that 90% of the participants had experienced cyber bullying either as victims or as bystanders. The outcomes of cyber bullying can be serious. Brown, Jackson, and Cassidy (2006) reported indications that victims struggle with suicide, eating disorders, and in extreme cases homicide. Victims of cyber bullying can show "consequences ranging from low self-esteem, anxiety, anger, depression, school absenteeism, poor grades, an increased tendency to violate against others, to youth suicide" (p. 16). Cyber bullying "can contribute independently to psychological distress" (Mitchell, Finkelhor, Wolak, Ybarra & Turner, 2010, p. 132).
- **Identity Theft:** Reznik (2012) described two types of identity theft. The more common type happens when a perpetrator builds a fabricated profile of the victim and then uses that identity for online communications. The second type happens when the perpetrator steals a victim's password or gets access to a victim's social media account and subsequently impersonates the victim by using that account. Rainie and colleagues (2013) found that 55% of Internet users ages 18-29 have experienced at least one of these types of identity theft problems, compared with 42% of those ages 30-49, 30% of those ages 50-64 and 24% of those ages 65 and older.

Ethereal Captured While Privacy Compromised

In the not too distant past, people told strangers only basic information about themselves. But, nowadays, revealing names and place of birth as well as other information like the names of favorite books, movies, first pets, etc. is a common practice. People share this information without much concern. On social media, people share not only basic information but also narrate their lives through photos, videos and comments. This information has become fodder for such companies as Google, Microsoft, and Facebook. They use this information to create user profiles, which in turn allows them to provide personalized advertisements. Microsoft, for example, identified women with risk of postpartum depression through

mining online conversations, and Facebook studied how parents and kids interact (Jayson, 2014). What was once private has become public. What was once ethereal has been captured and distributed worldwide.

In a world where we capture and document what was once ethereal, privacy issues are not just limited to social media; video surveillance raises issues. Kelly (2013) explained that facial recognition software…

… Identifies objects by shape, size and color. It can read license plates and recognize cars. When it comes to people, it can detect their gender, approximate age, mood and other demographic information. Using multiple cameras, it can track their patterns and some behaviors. It automatically zooms in on any person's face and identifies them based on things like the distance between their eyes or the shape of their nose. (Para. 15)

When cameras with facial recognition software are linked to the same database, it becomes possible to track people. It becomes possible to single out a person who has attended multiple political protests at different places (Kelly, 2013). The ability to capture what was formerly ethereal raises issues of privacy.

Given that the ethereal can be captured and made public, the European Union has actively sought and formulated regulations known as the "Right to be Forgotten." The concept is that people have the right to control their online identities. Instead of misleading, erroneous, and negative information being replicated and persistently available online, individuals should have the right to erase such information. The primary strategy for this erasure is to eliminate information from Google searches. In other words, regulations require Google to censor its search results. It is argued that international laws of censorship sets precedent for additional forms of online censorship thus stepping over "a first amendment red line" (Scheer, 2014, para. 1). To facilitate the Right to be Forgotten, others call for the breakup of Google (Shapiro & Meyer, 2014).

Education, New Literacies, and Digital Communication

The ability to proficiently communicate with digital media is an active research agenda among the literacy research community. Leu and colleagues investigated the literacy skills required to skillfully find, synthesize, and report findings from Internet-based queries (e.g., Leu et al., in press; Leu et al., 2011). Gee and colleagues examined the literacy skills involved in gaming (e.g., Gee, 2007; 2010). Others examined the literacy skills required to proficiently communicate with various digital formats such as fan fiction (Black, 2008; Chandler-Olcott & Mahar, 2003; Thomas, 2007), multimedia (Mayer, 2008; Stein, 2008; Wyatt-Smith & Elkins, 2008), synchronous chats (Baker, Vogler & Schallert, 2014), voice recognition (Baker, 2012, 2013c, 2014), and zines (Guzzetti, 2010). There is research that examined the blurred lines between digital authors and digital audience (Baker, Rozendal, & Whitenack, 2000), ways to support comprehension of digital texts (Proctor, Dalton, Grisham, 2007), embodied literacies (Fleckenstein, 2003; Leander & Boldt, 2013; M. Miller, 2013), as well as theoretical groundwork of reading and writing with technology (Baker, 2010b; Leu & Kinzer, 2003). These and others contended that the ability to communicate with digital media requires literacies that previously did not exist. These literacies are known as New Literacies (Baker, 2010b; Coiro, Knobel, Lankshear, & Leu, 2008).

Despite significant investment in technology, schools struggle to incorporate these digital and informational literacy skills into the curriculum (Leu et al., 2013). In 2011, Hutchison and Reinking conducted a national survey of U.S. teachers to examine their perceptions of how well they support students' development of new literacies and digital communication. They found that the research being

done has had relatively little infiltration into classrooms. In an analysis of elementary classroom web sites, Baker (2007a, 2007b) found woefully lackluster opportunities for students to learn and use either traditional or new literacies and therefore proposed strategies for making a match between technologies and classrooms (Baker, 2003). Some teachers do not know how to use technology tools. Some mistake the transfer of curriculum from print to pixel as inherently equivalent (Hartman, Morsink, & Zheng, 2010). Others feel constrained by high-stakes tests that focus on traditional instead of new literacies (Hobbs, 2010). Legislation that was intended to "leave no child behind" has had the opposite effect. Those struggling to pass the high-stakes tests are required to practice for the test and therefore do not have time to learn new literacies (which are not on the test) (Baker & Dooley, 2010; Baker, Schmidt, & Whitmore, 2011; Leu, 2006).

Some may argue that students do not need to be taught how to effectively communicate with digital devices. After all, they are digital natives (Prensky, 2001) who have spent their entire lives communicating digitally. They have extensive out of school experiences with video, social networking, gaming, and texting (Alvermann, Hutchins & DeBlasio, 2012; Zickuhr, 2010). Surprisingly, research indicates that even digital natives know relatively little about digital communication (Bennet, Maton, & Kervin, 2008; Leu, 2006). Rather, K-16 students tend to be proficient communicators with the few platforms they use with their peers. This leaves them woefully unprepared for the digital communication required in the workplace (Mikulecky, 2010). Students struggle to find, critically evaluate, and read online information (Forzani & Burlingame, 2012; Graham & Metaxas, 2003; Kuiper & Volman, 2008). "Rather than seeing the web as a neutral source of 'information,' students need to be asking questions about the sources of that information, the interests of its producers and how it represents the world" (Buckingham, 2007, p. 113).

As part of the standards movement, the United States has moved from No Child Left Behind (2002) legislation to the Common Core State Standards (CCSS) which specify learning goals for the end of each K-12 grade. Several of these goals support the use of new literacies in the classroom. For example, Writing Anchor Standard 6 states, "Use technology, including the Internet, to produce and publish writing and to interact and collaborate with others" (CCSS, 2012, p. 43). Writing Anchor Standard 8 states, "Gather relevant information from multiple print and digital sources, assess the credibility and accuracy of each source, and integrate the information while avoiding plagiarism" (p. 44). These CCSS require students to develop the ability to participate in complex digital communication tasks that involve multiple steps and skills that emulate the real world. These standards expect teachers to think in new ways about how to evaluate and teach students to proficiently communicate digitally (Drew, 2013; Leu et al., 2013). While these standards draw some attention to new literacies they lack specificity. It is uncertain how educational policies, curricula, and pedagogy will make the necessary shifts to prepare children to be proficient digital communicators.

METHODOLOGICAL GAPS AND FUTURE RESEARCH

Given the transitory nature of digital communication, there is a wide range of topics emerging for which relatively little is known. Instead of discussing these topical gaps, that quickly emerge and fade, in this section we focus on something more fundamental: we focus on methodological gaps. As we explored research regarding the societal impact of digital media on communication, we noted that the research methods themselves had the following gaps: timeliness, paradigm, and population.

Timeliness Gaps

Traditionally, it takes three to five years for research to be conceived, conducted, and reported in peer-reviewed journals. The impact of digital media on communication outpaces conventional research cycles. By the time research is published it may provide insights into bygone digital communications. The current process of scholarship fails to keep pace with a world in which 100 hours of video was uploaded to YouTube in the last 60 seconds (YouTube, n.d.). Each of these videos provided semiotic illuminations that impact who we are, what we favor, and how we choose to communicate in and about our world. The information we receive from research studies can be stymied by being out of date before they are published. We refer to this phenomenon as a timeliness gap.

News reporters provide up-to-date information about digital communication. Many news outlets have sections dedicated to technology. Other news outlets specialize solely in the societal impact of technology (e.g., CNET, Wired). There are daily reports of the impact of online bullying, government censorship, the use of Twitter, Facebook, YouTube, and such to influence politics and instigate revolution. While trusted news reporters research their stories, their research methods do not meet the robust criteria required by scientific research. Thus, while trusted news outlets provide timely information, they lack systematic and scientific research methods.

Paradigm Gaps

Kuhn (1970) argued that the history of science is a history of scientific paradigms that coalesce around concepts of ontology, epistemology, and methodology (Hatch, 2002). Different paradigms have "fundamentally different beliefs systems concerning how the world is ordered" (Hatch, 2002, p. 11). In this sense, Hatch described five research paradigms: positivist, postpositivist, constructivist, critical/feminist, and poststructuralist. Each paradigm defines reality differently and therefore enacts research differently. Positivists define reality in objective terms and therefore collect and analyze objective statistical data. Such data can be quickly generated and analyzed by software. Internet sites such as Pew Research, Expanded Ramblings, and KISSmetrics provide information about who, what, and how many people use various forms of digital communication. Herein, positivistic studies are poised to address the aforementioned timeliness gap. While valuable, positivistic research only one of many paradigms.

Postpositivists are described as those who view reality as complex and "due to limitations of human inquiry… [view reality as] approximated but never fully apprehended" (Hatch, 2002, p. 14). Research therefore can merely provide approximations of reality. Constructivists define reality in terms of the users. Research therefore involves labor-intensive examination of individual cognition and is commonly situated within social norms. Critical/feminists define reality in terms of power structures and focus on who is being empowered and disempowered. Such research also requires labor-intensive analysis of social norms. Finally, poststructuralists say there is no inherent reality. While positivistic and non-positivistic paradigms derive insights from both quantitative and qualitative data it is common for non-positivistic paradigms to employ qualitative research methods that require prolonged, in-situ data collection and analyses that are inordinately labor-intensive such as those used to grounded theory, conduct ethnography, case study, phenomenology, and naturalistic inquiry. Herein lies a conundrum: On one hand, research that seeks to understand the societal impact of digital media on communication is threatened by lack of timeliness; on the other hand, there is a need for the research corpus to represent a full range

of paradigmatic insights. Positivistic insights can be timely—but represent only one of many views of reality. Non-positivistic research can reveal a range of valued insights—but commonly require extensive labor-intensive work with findings that emerge over time.

Population Gaps

Another noteworthy methodological gap is *who* is represented in the research corpus. We contend that digital communication permeates digital cultures and therefore impacts users from birth to death. However, the majority of studies we found were skewed toward 18-45 year olds. While there were studies that focused on preschool and elementary children as well as adults over 45, the vast majority focused on the 18-45 year old population. A population gap creates a skewed understanding of digital communication. For example, the research corpus about MMOGs focuses on adolescent gamers and therefore creates a misconception that gamers are a youth subculture. An entire volume of the *Journal of Adolescence, Vol. 21*(1), was dedicated to the damaging effects of video games on adolescent gamers. Yee (2006) pointed out that research reiterates the stereotype that gamers are both adolescent and that gaming has damaging effects. Griffiths, Davies and Chappell (2003) noted, "the image of a typical gamer is seen as socially negative and remains firmly within a youth subculture" (p. 81). Population gaps leave us relatively uninformed of digital communication among large pools of the population.

Future Directions for Research Methodologies

Given insights into research gaps, we offer suggestions for future research. Our suggestions are limited by our own research methods. Specifically, we sought to glean research that revealed understanding of the product/ion, semiotic, public, and transitory nature of digital communication. So, while we posit that research gaps in timeliness, paradigm, and population appear to be significant, we base this on our review of research as it pertained to our framework. We recommend that both meta-analyses and metasyntheses (S. Miller, 2013; Sandelowski & Barroso, 2007) of research that investigates digital communication be conducted to dis/confirm the following recommendations we make for future directions of research methodologies.

Timeliness is currently addressed by statistical reports and trusted news outlets. As stated, statistical reports ignore insights offered by multiple paradigms and news reports lack scientific rigor. We advocate for continued statistical reports as well as concerted efforts to support non-positivistic research. Federal and foundation funding for grounded theory, ethnographies, case studies, phenomenologies, naturalistic inquiry, and other non-positivistic work is necessary if we are to ascertain an informed understanding of digital communication. Given the plethora of news reports, one such effort could be an on-going systematic content analysis of these reports that focuses on social interactions and the nature of digital cultures as well as varied non-positivistic constructs. Open access and online journals may mitigate challenges to timeliness by decreasing the time it takes to disseminate research. Population gaps need to be addressed by all research paradigms. We recommend statistical as well as qualitative analysis of all age groups. While our work indicated a population gap as it relates to age we recommend a systematic analysis of whether a range of populations related to gender, race, class, sexuality and disability, are included in the research corpus.

IMPLICATIONS AND RECOMMENDATIONS

The title of this chapter is, *The Irrevocable Alteration of Communication: A Glimpse into the Societal Impact of Digital Media.* Some may argue that digital media has had little impact on the alteration of communication. After all, communication has always had a production component (e.g., cave drawings, cuneiform, alphabets), included semiotic sign systems (e.g., body language, illustrations, photos), for an audience/the public, and been edited and revised (transitory). What is irrevocably altered? Isn't digital communication simply non-digital communication—just in digital form? At the beginning of this chapter, we stated that communication is fundamental to human existence. Linguists argue that humans communicate to satisfy physical, emotional and social needs as well as to learn about one's milieu, be creative, and convey facts (Halliday, 1977). Our exploration of the nature of digital communication reveals that the *reasons* humans communicate remain unaltered, while the *ability* to communicate appears to have been profoundly altered. A brief discussion of implications and recommendations for local and global civic engagement, commerce, education, and policy brings to light a sample of alterations in our ability to communicate.

Civic Engagement

Civic engagement is dependent on communication. To be civically engaged, local and global citizens must ascertain issues relevant to the public. Citizens engage in face-to-face conversations with their friends and neighbors, read local newspapers, and attend local city council meetings. In the past, geographic restrictions limited citizens' abilities to have these conversations with those across the state, country, and globe. In our digital world, what was once limited to local civic engagement can be instantaneously distributed and accessed regardless of geographic location. Whether by real-time interactive video feeds (e.g., Skype) or by following hashtags, digital communication mitigates challenges to geographic limitations. Hackers and skilled programmers were civically engaged in the Arab Spring regardless of their geographic location. Their participation subverted government attempts to shut down communication and facilitated open access for local protestors to organize and communicate with one another as well as with the world. The ability to *produce* a *semiotic* message that can be made *public* and instantaneously distributed worldwide has irrevocably changed how citizens engage in local and global civic action. The digital *collective* appears to be qualitatively different from previous forms of civic engagement. It will be interesting to see how the nature of digital communications continues to impact the civic engagement of citizens and in turn impact our societies.

Commerce

The *public* nature of digital communication appears to have an irrevocable impact on commerce. Consumers share evaluations of products and services. Before purchasing a toy, book, or car, consumers read previous consumers' ratings and decide whether to buy the product and from whom to make the purchase. Using smartphones, consumers scan bar codes to attain price comparisons. Is the baby food in your cart offered elsewhere at a better price? You no longer have to drive around town to find out. Just check prices from multiple merchants on your smart phone. It remains to be seen if this collective intelligence favors monopolies that can sell at cheaper prices. Some may be concerned that Amazon and Alibaba are too big. The purpose of this chapter is not to parse economic philosophies. However,

we would be remiss if we did not highlight the significant impact that digital communication is having on commerce.

In 1999, DiNucci popularized the term, Web 2.0. He argued that a paradigm shift had occurred on the Internet. Early web sites were dispensary. Users could explore retail shops and local grocery store web sites to see what was on sale. In the late 1990s this changed. Web sites became interactive. Users could respond to web sites. They could post comments. They could join social networks. In the case of wikis, they could become co-authors. In 2006, Markoff argued that the Web morphed again. Specifically, in Web 1.0 and Web 2.0 iterations, the user reads the web. In Web 3.0 iterations, the web reads the user. Cookies, algorithms, and artificial intelligence are used to personalize what users receive as they explore the Internet. Web 3.0 has implications for many areas of our lives, but we highlight it here for the implications it has for commerce. Information on the Internet is immense. Users want to find what they are looking for. Web 3.0 attempts to understand users and sift through the myriad of information online to provide them with what they seek. This includes giving users advertisements that pertain to their interests. Users are more likely to pay attention to ads that feature goods and services they want. On the other hand, Web 3.0 has implications for who is empowered to discern search results: the Web or the users? Similar to shifts in civic engagement, it will be interesting to see where commerce goes in an increasingly interconnected, digitally communicative world.

Education

Digital communication requires heightened awareness of new communication skills, demands an understanding of new pedagogies, and provides new opportunities for learners. Studies indicate that the ability to read offline has no correlation to the ability to read online (see Current Issues: Education, new literacies, and digital communication). In this chapter we discussed a range of technologies (e.g., blogs, Twitter, Facebook, YouTube). Each technology requires specialized communication skills. Each technology has specialized affordances. For example, for a parent to communicate with a child to determine if he is ready to be picked up from soccer requires an understanding of the affordances of text messaging versus email, social media, and the like. Baker (2013a) proposed that these affordances can be readily integrated into classrooms as new genres. Every teacher teaches genre (e.g., Baker & Monte-Sano, 2012; Baker & Shanahan, 2012). Every teacher can teach new genres. There are new communication skills required to proficiently read digital texts as well as compose digital texts. Too often, it is assumed that digital natives will pick up on these skills. Yet, we do not make this assumption regarding print natives. Why would we make this assumption about digital literacies? Policymakers, principals, parents, teachers, and the public need to be made aware of the need to teach K-16 students how to effectively communicate in our digital world. We recommend a heightened awareness of this need. Otherwise, we are in danger of preparing our children for the 1950s instead of the 2050s (Baker, Pearson, Rozendal, 2010).

Similarly, there are new pedagogies. There is a need to recognize that classrooms that integrate technology as well as online education are not merely digitized versions of traditional classrooms. There is a need to recognize the existence and harness the affordances of new pedagogies. We recommend extensive support for teachers. In his seminal sociological study of teachers, Lortie (1975) found that teachers teach the way they were taught. In other words, pedagogy is a social practice. Teachers emulate those who taught them. Herein lies the dilemma: the pedagogies of yesteryear are insufficient for today. Concerted efforts must be made to heighten awareness as well as support teachers as they prepare children to be active citizens who can effectively compete in a global, digital market. We recommend

that professional development, advanced degrees, pedagogical coaching, any and every innovative and effective support be given to teachers as they face this exciting and challenging time. High stakes tests appear to exacerbate this effort by threatening teachers who neglect to teach to the test (Baker & Dooley, 2010; Baker & Pacheco, 2011; Baker, Schmidt, & Whitmore, 2011). We recommend professional support as teachers surmount and master these cultural shifts.

Meanwhile, digital communication is opening doors previously unavailable educational opportunities. MOOCs, online universities and university courses, as well as online K-12 schools and K-12 courses are increasingly available. Students are no longer limited by their inabilities to travel to schools, pay for schools, or find time for schools. Education is available to those with Internet access, MOOCs and a myriad of educational information are available for free (e.g., Khan Academy), and many are asynchronous which allows students to participate at times that fit their family and work schedules. Critics warn that MOOCs simply disseminate information, which should not be confused with an education and are driven by profit not pedagogy (Mazoue, 2013; Rees, 2013). It remains to be seen whether MOOCs and other online K-12 courses are forces for democratization or economic exploitation.

Policy

We advocate for policies that support digital communication. This includes continued efforts to protect users from online exploitation. Identity theft, privacy, and cyber bullying are just a few examples of the need for policies that keep online users safe. In addition, we advocate for access. At the time of this writing, net neutrality and corresponding policies are being debated. While these policies are politicized, we advocate for policies that protect access. Digital communication is central to civic engagement, commerce, education, entertainment and more. Policies should support efforts to communicate. Finally, policies need to support research. Funding for multiple paradigms that investigate digital communication among a broad spectrum of the population in a timely fashion is needed.

FINAL THOUGHTS

This chapter provided a glimpse into the impact of digital media on society, specifically digital communication. We framed this glimpse in terms of four characteristics of digital communication: product/ion, semiotic, public, and transitory. To explicate the nature of digital communication we highlighted a few exemplars of each characteristic. These exemplars included blogs, Facebook, Twitter, eBooks, podcasts, Pinterest, YouTube, Vine, surveillance cameras, Google Glass, citizen journalism, MMOGs, MOOCs, Arab Spring, wikis, Snapchat, online news, and video production. We discussed issues related to the democratization and monopolization of communication, who has access, the persistent Spiral of Silence, privacy, cyber bullying, identity theft, the ethereal being captured, as well as education and new literacies. We explored methodological gaps in the research corpus and made recommendations regarding the need for timeliness, support for a comprehensive span of research paradigms, and representation of a full range of populations. Finally, we discussed implications and recommendations for civic engagement, commerce, education, and policy.

Our attempt to understand the nature of digital communication was ambitious. This chapter is characterized as a mere glimpse. Given the breakneck pace by which varied instantiations of communication

technologies rise and fall, this glimpse will quickly become an historical record--a snapshot in time. The impact of digital communication on society is evolutionary. It is our hope that this chapter, in concert with this volume, contributes to the national and international dialog that seeks to understand the impact of digital media on society.

KEY TERMS AND DEFINITIONS

Collective Intelligence: Collective intelligence is the phenomenon that emerges when large pools of individuals share, collaborate, and compete thus formulating intelligence that was unattainable by individuals. Examples include collective political action, collective funding, collective medicine, and collective reviews.

Ethereal Captured: Ethereal captured is the phenomenon whereby conversations, actions, and settings that lack substance are electronically captured. When the ethereal is captured, what lacked substance (e.g. conversations, actions, settings) is instantiated and becomes available for replay and dissemination.

New Genres: New genres refer to categories of digital communication that provide unique affordances. Examples include text messages, email, and social networks. Text messages have communication affordances dissimilar to email or social networks.

New Literacies: New literacies refer to the abilities needed to communicate with digital media in ways that were non-existent in a pre-digital era. Examples include the abilities to find online information, use hyperlinks, and compose multimedia texts.

New Pedagogies: New pedagogies refer to the abilities needed to teach with digital media in ways that were impractical or non-existent in a pre-digital era. Focus is placed on the affordances of technology to support learning that were impractical or non-existent in pre-digital era. Examples include using social media to foster the development of a community of learners, asynchronous conversations with a worldwide group of learners and experts to forge collective intelligence, and situating learners in authentic settings via virtual reality.

Spiral of Silence: Spiral of Silence is the phenomenon in which people do not talk about topics that are perceived as unpopular or anticipated to be ill received.

Transitory: Transitory is the characteristic of being fleeting, temporary; something that lasts a short time.

Verbocentric: Verbocentric refers to phenomena that are dominated by words. Examples include oral language and alphabetic print media.

Web 3.0: Term coined in 2006 by John Markoff of the *New York Times* to characterize a paradigm shift in the evolution of the Web from dispensary (Web 1.0) to interactive (Web 2.0) to reciprocal (Web 3.0) whereby instead of users reading the Web, as done with Web 1.0 and 2.0, the Web also reads the users. Examples include cookies, algorithms, and artificial intelligence that personalizes what users receive as they explore the Internet.

ABSTRACT

Media Literacy is reckoned as an integral part of learning innovations in modern day technology enabled learning domains. In order to facilitate the information handling and interaction procedures, essence of media literacy cannot be underestimated. Many Organizations and institutions in different setups play a significant role in inculcating media literacy among the citizens of a nation. These organizations are carrying out initiatives for facilitating critical thinking, awareness about different media setups to different stakeholders in both real and virtual environments. They provide user-friendly tools for facilitating educators, researchers, policy makers, young media makers, and students to find the information they are looking for in a timely and organized manner. This chapter attempts to explore, identify and analyze various such organizations that facilitate media literacy in different settings.

INTRODUCTION

Media education is a quest for meaning. Much of the value of a quest lies in the search itself as well as in the achievement of the goal. — Chris Worsnop

The current digital age witnesses a paradigm shift in information and communication technology (ICT) giving rise to an innovative practice of literacy termed as computer literacy or web literacy (Livingstone, 2004). According to Kellner and Share (as cited in Gainer, 2010), most of the information is obtained from highly fashioned audio visuals and media layouts. People today usually prefer to retrieve electronic

DOI: 10.4018/978-1-5225-3822-6.ch066

information over the traditional print sources. Keeping the shift in mind, it is just inadequate to educate students to read and write only with letters and numbers. Students and citizens need to be well aware about the growing technologies and media so that they can effectively access, scrutinize, evaluate and create media messages of all kinds. It has also become equally important for an individual to possess the necessary skills to handle different types of media available (Media Literacy Project, 2014). Media literacy as a discipline includes the critical thinking skills and offers a variety of methods and styles for the efficient scrutiny of media messages enclosed in any media presentation. It is defined by Dutch Culture Council (2005) as "the whole of knowledge, skills and attitudes that allow citizens to deal with a complex, changing and mediatised world in a conscious and critical manner. It is the ability to use media in an active and creative manner, aimed at social participation". Media literacy enables students to develop a critical understanding of the nature of mass media, the tools used by them, and the impact of these tools. More specifically, it is education helps students to know how the media work, how they can produce meaning to the media and how they can organize and construct. Media literacy also aims to provide students with the skills to create new media products.

The prime objective of media literacy is to address the indiscriminate use of the media. In order to become media literate, users ought to take responsibility to know the programming they use. It does not only involve practical skills, but it also involves media awareness from practice, insights in the mechanisms of commercial communication and the media industry, critical information and strategic skills, and sensible and safe use of media. At present, utmost information is received through the complex combination of text, pictures, and sounds. Media literate individuals are better able to comprehend the complex messages from the digital media. Many educators are of the view that media literacy is an operative and engaging way to apply critical thinking skills to an inclusive range of concerns. To strengthen the public interest to improve socio-political conditions, people need to be media literates. Media literacy empowers people to participate actively in open discussions and deliberations to affect change, and to fulfil their rights and obligations (Martinsson, 2009). It brings the world into the classroom, giving proximity and applicability to traditional subjects such as History, Politics, Health, Psychology and the Creative Arts, making it as a perfect bond for subject amalgamation and interdisciplinary studies. It also embodies and furthers current pedagogies, which stresses student-centered learning, the acknowledgement of multiple intelligences, and the investigation and management – rather than just the simple storage – of information. Media create a mutual environment and hence acts as catalysts for smooth learning. The literacy further boosts users to use multimedia tools innovatively, a strategy that contributes to "understanding by doing" and prepares them for a workforce that progressively demands the use of stylish forms of communication (Valerie, 2014). The concept of Media literacy is widening and becoming more complex as new media are being developed. This means that media literacy is not mere easy task to master the skills and become literate all at once, but it is a part of lifelong learning. Hence, media literacy is of primary significance for all age categories, although it is certainly true that "learn young, learn fair" applies as always. Media literacy as stated by Thoman (1995) comprises of three stages. First stage is the stage of becoming conscious of how much media individuals are learning on daily basis. In the second stage, unique skills required for critical viewing, analysing and questioning what is in media are identified. And in the last stage an individual becomes aware about who produces media, their purpose and media advantages and disadvantages.

BACKGROUND

Literacy is usually referred to as an ability to read and write and just like that media literacy refers to the capability of an individual to access, scrutinize, evaluate and create media messages of all kinds. Today, most of the information needed is retrieved through interlaced system of media technologies. Traditional media is rapidly transmuting into Digital media and is accessible to most of the modern learners. This change is extraordinarily broad and so is its impact. The impact of this change is very extensive, but for now focus is on the learner's response to the media they use. It has become important for an individual in 21st century to possess the necessary skills to read many types of media available [Media Literacy Project, 2014; United Nations Alliance of Civilizations (UNAOC), 2014]. Media literacy is having an intense influence on the behavior of a user, the way in which he passes his time, process information, and ponders about world. Surely, interactive technology adds to the excellence to the standard of users' lives (meanwhile, on the other hand, privacy and computer interruption have emerged as severe apprehensions). Undeniably, the Media literacy is redefining almost every sphere of professional development of user's life (Fixmer, 1999).

Information literacy, the concept originally conceptualized in 1970s (Bundy, 2004), nowadays is frequently used to define the proficiency of an individual to communicate and interact efficiently in the digital environment. Lot of discussions and debates have taken place as to know whether the term is appropriate enough to describe the skills required by the citizen of the information society. It is however evident that assorted literacies are required in order to use the web based technologies, communication media and traditional sources of information. Predominantly information literacy can be used to define the skills and proficiency required by an individual to use information and communication technologies effectively and efficiently (Wallis, 2005). Ability of an individual to access, comprehend and generate communication in assorted contexts is termed as media literacy. The term being in use for at least a quarter of a century is still in a state of muddle and disagreement about its appropriate explanation. The similarity between the concept of print literacy and media literacy raises number of questions about the learning and interpreting media and so on (Buckingham et al., 2005). Earlier literacy actually just means to be able to read and write with the aid of the media form of the day, whatever that would be. Consuming and constructing words through just reading and writing was taken to be sufficient for the centuries. But now this tech-society has numerous new, easy to use and inexpensive tools and technologies and an individual needs to be familiar with novel forms of media as well as texts counting sound, graphics and moving images. All this changed the nature of literacy as well, as now expression has made a swing from sternly individual to social, kinds of communication. Traditional articles remain indispensably significant, but they now co-exist with innovative media within the framework of a "social web," regularly referred to as Web 2.0, which permits collaborative narrative construction and publication through blogs and services like Myspace, Google Docs, and YouTube (Ohler, 2009). The outlook of the society about mass media began to take a new shape from the earlier set definition of media and entertainment as "the culture of reforming and remodeling human personality along the lines enacted by technological domination" (Aronowitz and Giroux, 1991) and thus needed to be loathed, dreaded, and banned. With the passage of time educators began to feel that we should come over the prejudice thinking that print is the only actual medium to what we should stick to. The whole new generation of educators came up with the fact that television and multimedia should be recognized as a novel form of expression, communication and education but also explored practical ways to promote serious inquiry and analysis—in higher education. Educators in many fields of study are eager to find pedagogical tools that help their

students engage in conversations about media, popular culture, and digital communication technology as a means to guide their learning. Gathering of members of media literacy education community in the year 2009 at Detroit, Michigan came up with a clear picture of progress in building the communication, creativeness, cooperation and critical intellectual skills of children, youth and adults in relationship to mass media and emerging technologies (Hobbs & Jensen, 2009). In this age, everybody needs to be media literate to some extent. If not full-fledged, then at least an individual should be aware of the basic skills. Depending on the purpose and usage of media by an individual, he/she needs to develop the skills and become media literate. Media literacy is not just intellectual thing and rational matter: it involves emotive reaction, amusement and ethnic gratitude. It is far more than merely a matter of learning to safeguard oneself from things that are seen as being in some way immoral or destructive. Upcoming research needs to embrace an extensive, non-reductionist attitude to study media literacy in practice (Buckingham et al., 2005). Media literacy is not just a single concept of literacy. It is indeed amalgamation of various form of literacy, which are information literacy, visual literacy, documentary literacy, innovative media literacies, and mass media literacy. The idea of media literacy is growing its importance day by day and among others UNESCO and the European Commission have systematized research and called upon national government to include media literacy in their policies. Pretty good number of European governments have already acted on this, variety of projects are approved within the field, but there is still lot more to do. Authors and experts are of the view that it is the job of the library personnel to improve the media proficiencies and skills of school children, adults and other citizens. This a tough challenge for libraries in an age where patrons are switching from the library and encyclopedia to web resources (Nijboer, Hammelburg, 2010). Users prefer to use web sources of information over the traditional ones because of its fast and easy accessibility whereas the reliability of the information seems to be of less concern. The searchers are not usually aware of many breaches in their media literacy aptitudes. Many a time's students do not have any idea how to evaluate the retrieved documents and select the relevant ones for the assignments (Dirkx et al., 2006). Educators needs to be competent enough to make use of media as a whole and for that libraries need to take a position by actively seeking cooperation with educational field and with media producers.

MEDIA LITERACY ORGANIZATONS

Massive amount of literature has been published highlighting the significance of Media Literacy in the current digital information driven age. It is divulged from the available literature that a number of organizations and institutions have come up with Media Literacy as a part of their academic curricula and have furnished interactive platforms including a plethora of Digital Literacy resources on the web to enhance the media literacy among its users. Some of the organizations that cover the same domain has been discussed are as:

1. **Media Education Foundation (**http://www.mediaed.org/**):** The Media Education Foundation (MEF) is a non-profit organization which produces various educational resources (documentary films, transcripts, study guides, links, articles which frame the comprehensive issues of media education) and distributes the same in order to stimulate the critical thinking about social, cultural and political impact of American mass media. MEF designs its discussion guides to assist teachers and students in various issues raised in their videos and these guides mostly provide free

access to various sections like video section summaries, discussion questions, key pints, writing and research exercises, various additional resources and internet links. It has a large collection of its own films having full record in terms of transcripts which provide an easy and rapid access to text of MEF films so that those films while referencing could be properly cited. Besides, these transcripts increase the comprehensiveness of each film to its users. In Handouts & Articles section MEF provides both short handouts and in depth details of classroom use and various issues related to media education. MEF e-newsletter, a free monthly e-newsletter which includes news articles; information about special offers, new video releases, and various upcoming events; updates about media education and media reforms along with action alerts is send to the registered users of MEF. Furthermore, users can have access to the archives of past e-newsletters as well. MEF bookstore provides the collection of books authored by those scholars who have been featured in MEF videos and these books can be purchased by interested users through an online independent seller of used and new books namely Powell's Books. Since MEF is a non-profit organization, a part of this purchase gives a financial support to the foundation.

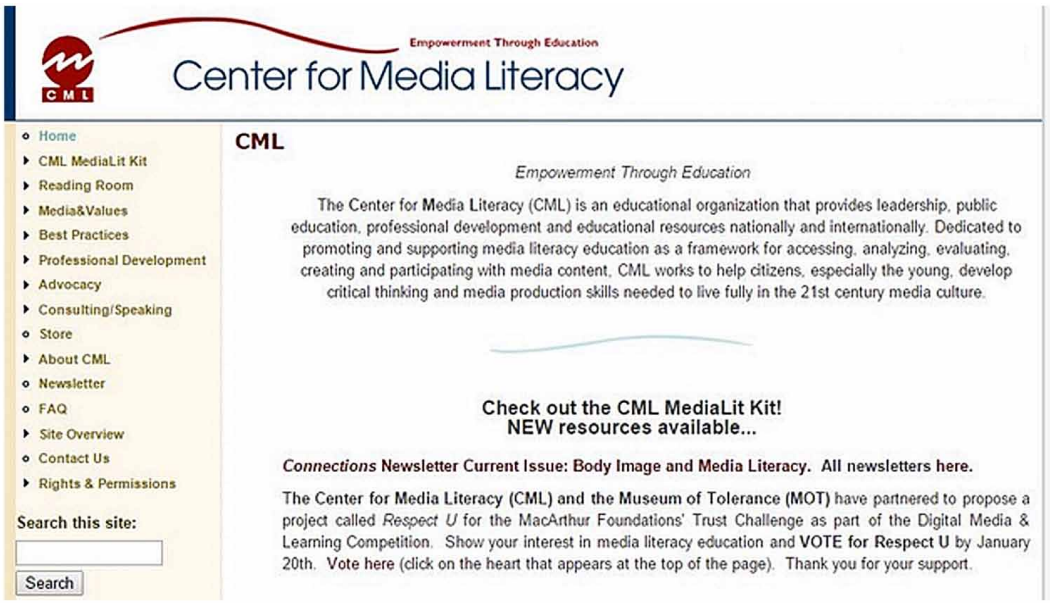
2. **Center for Media Literacy** (http://www.medialit.org/)**:** The Center for Media Literacy (CML) has been the pioneer in its field over the years. It is an educational organization providing leadership, professional development, public education and educational resources both at national and international level. CML completely dedicates its support to promote media literacy education. With this aim, it helps citizens, especially young enthusiastic people to develop critical thinking and various skills related to media culture. CML devotes itself to a vision of literacy for 21st century with a motto to help populace in this global media culture by translating research and theory of media literacy into training, practical information and educational tools. Besides, CML promotes an educational philosophy of "Empowerment through Education" which incorporates three concepts. Firstly, in present global media world, media literacy is education for life. It is the responsibility of today's families, schools and all community institutions to prepare youth for their living and learning in this global culture that is connected through multi-media. Secondly, the central point of media literacy lies within an informed inquiry which encourages and helps young and energetic people to attain an empowering set of navigational skills which includes the ability to access information, analyze and explore how messages are created, evaluate these messages, express or create one's own messages using various media tools, and take part in a global media culture. Finally, Media literacy is antonymous to political points of view and does not endorse such partisan agenda. Its power lies

Figure 1. (Source: http://www.mediaed.org/)

in its ability to encourage independent thinking and cultivate critical analysis. As long as CML propagates this educational philosophy, it is totally devoted and dedicated to media education as a very crucial and empowering life-skill for the 21st century. CML provides various consultation and training programs which include guidance, motivation and information about media literacy field, pedagogy about basics of media literacy, and specific execution of change management strategies and programs. Since its inception, CML has organized and successfully conducted more than two dozen model workshops. These workshops are meant to introduce teachers to media literacy education which encompasses its theory/pedagogy, classroom practices, various topic areas like violence in media etc. It provides an educational resource called as CML MediaLit Kit, originally formed in 2002 and updated regularly since then. The Kit provides an elementary framework for media literacy, besides having a collection of foundational resources like handouts, posters etc. that can be used in classrooms, training programs, community education etc. CML, along with the help of authors, producers or developers, originates new resource materials to meet the evolving needs of teachers and leaders in schools, community and religious agencies, etc.,. Besides, CML's work has its roots in *Media & Values* magazine which is evolved during 70's to 90's, has documented various important issues still relevant at present and now has developed to a publication with extensive editorial crafting as an educational resource. It reflects the early days of media literacy, besides providing a foundation for national movement in United States. Reading room, an important facility provided by the foundation, is an online reference center which provides access to core research works, background articles, and reports along with historical archive which documents media literacy development in United States. Monthly newsletter is issued by the Consortium of Media Literacy offering research highlights, teaching tips, current events and MediaLit.

3. **Media Literacy Project** (http://medialiteracyproject.org/)**:** The foundation for this nationally recognized project, Media Literacy Project (MLP), was laid in 1993 by Deirdre Downs. Since then, the

Figure 2. (Source: http://www.medialit.org/)



project has been housed by Albuquerque Academy. MLP is known to deliver a number of robust multimedia presentations at various workshops, conferences, symposiums, and classrooms all over the country. The project is working on the mission to transform society into critical media users, inform media policy, as well as create such media which reveal their lived experiences through various education programs and campaigns. MLP delivers media literacy training programs to their users across the New Mexico and the U.S. and these programs are customized according to the needs of users and include up-to-date and related media examples like music video clips, commercials, TV shows, photographs, movie, audio etc. It may include any area of media literacy from a single presentation on minimum 45-minutes to multi-day literacy trainings. MLP which is a non-profit body advances media education and advocacy for media justice. It manages its own pressroom where latest news regarding the recent advances in media literacy are updated at regular intervals. Besides, it keeps a track of local and national press coverage of their work and maintains its own blog as well.Youth for Media Justice (Y4MJ) is a new program that has been recently launched by MLP considering the interest of young people in Albuquerque under age group of 15 to 21 who are willing to work on media justice and media policy issues.

4. **MEDIA SMARTS (**http://mediasmarts.ca/**):** MediaSmarts, formerly recognized as Media Awareness Network, is a Canadian non-profit charitable organization showing award-winning performance from over 15 years for producing digital and media literacy resources and programs. The organization was the result of a TV violence initiative launched in early 1990s by Canadian Radio-Television and Telecommunication Commission (CRTC). It then began its journey in 1994 under the auspices of the National Film Board of Canada and then in 1996, it became an autonomous body. It works with the vision that the youth develop critical thinking skills to get involved with media as informed and dynamic digital citizens. In order to achieve this goal, they have developed a high quality of digital and media literacy resources, besides inculcating leadership in developing digital and media literacy in Canadian homes, schools and communities since 1996. The work of MediaSmarts falls into following three main areas; Education, Public Awareness, and Research and Policy. MediaSmarts has a collection of K-12 resources covering a comprehensive range of traditional media issues and

Figure 3. (Source: http://medialiteracyproject.org/)

addressing various unique issues arising for digital media as well. Most of the educational resources are freely available on the website of MediaSmarts which include classroom lesson plans, along with work sheets, tip sheets and essays multimedia games and quizzes, etc. Other than the free resources, MediaSmarts also license professional development workshops for teachers and librarians along with interactive modules for students. MediaSmarts makes it possible to increase awareness about the importance of media literacy among youth and children. In order to achieve this goal, they have developed extensive awareness campaigns and online resources for parents and people who work with these children and youth. 'Media Literacy Week' is one of the main awareness event that is being held annually by MediaSmarts in collaboration with the Canadian Teachers' Federation so that Canadian people can be more involved in media literacy activities all over the country. Above and beyond, there are various research and policy programs run by MediaSmarts. Young Canadians in a Wired World (YCWW) is an ongoing research program initiated in 2000. YCWW is Canada's largest and most comprehensive study about the internet use among young generation. Besides this program, MediaSmarts produce discussion papers both independently and in collaboration with other institutions as well. These discussion papers include a wide range of media issues comprising of digital literacy, privacy education, food marketing, internet governance, and online civic engagement.

5. **PROJECT LOOK SHARP (**http://www.projectlooksharp.org/**):** Project Look Sharp is a curriculum-driven media literacy initiative managed by the School of Humanities and Sciences at Ithaca College, working in collaboration with local school districts, New York State BOCES, the National Association of Media Literacy Education (NAMLE) and other national media literacy organizations. Like other organizations, this project is also designed with a view to encourage and support the integration of media literacy and critical thinking among the youth at all grade levels, as well as to evaluate the efficiency of media literacy education in schools. The project works directly with teachers and supports the staff so that they can reach students, besides helping to foster a spirit of collaboration among the educators using media literacy. It offers curriculum materials, besides advice and strategies for media literacy instruction. It acts as a link between educators and the media literacy field as well. Besides all these features, the project provides a number of profes-

Figure 4. (Source: http://mediasmarts.ca/)

sional development services for teachers, students, faculty and other professionals working with K-12 organizations. One such service is Media Literacy Summer Institute which is conducted by Project Look Sharp every year for all the educators, faculty, support staff and other professionals dealing with the students in an educational setup. It provides training in both theory and practice of media literacy, and help participants learn various applications of digital technology that can be useful in media literacy education. Another such professional development service includes Workshops and Speakers. Various large and small scale workshops and presentations are conducted on a variety of topics related to media literacy ranging from general introduction about the use of media literacy in classrooms to specific workshops having some specific themes pertinent to media literacy. Moreover, there are a number of goals and objectives for which Project Look Sharp is working ranging from promoting and supporting media literacy education at community, state and national level; providing trainings to teachers and mentoring them in media education; evaluating the effectiveness of media literacy as pedagogical approach to education; and developing a model which can be included in school curriculum at all grade levels.

CONCLUSION AND SUGGESTIONS

Media Literacy enables users to browse, access, evaluate and involve in intellectual thinking about a plethora of information they locate, retrieve and disseminate so as to make wise decisions related to the problems that they face usually regarding their information needs, health, personal, politics, religious etc. It allows persons to partake actively in open discussions and debates to affect transformation and to accomplish their rights and responsibilities. Moreover, it ensures users to achieve outlook on the

Figure 5. (Source: http://www.projectlooksharp.org/)

impact of communicating media (mainly on the Internet and digital resources) on users and culture and furnishes a platform to decipher the complex content into an easy comprehensible form. It also brings the world into a single interface thereby providing collocation and applicability to outmoded subjects such as History, Politics, Education, Health, Psychology and Creative Arts, making it as a flawless bond for subject unification and interdisciplinary studies.

Literature divulges that Media literate users attain skills to make use of digital media in an efficient way. It calls for the inclusion of media literacy skills in the academic institutions, organizations and educational standards of every country and in almost every subject. Media literacy comprises of a number of interdisciplinary knowledge beached in work in Economics, Sociology, Mass media, Communications, Biotechnology, and Information technology. Furthermore, various national and international organizations, agencies, government institutions and various centers are working in the field. Although, a number of organization are playing a pivotal role in furnishing resourceful platforms and programs for inculcating Media literacy skills among its users globally as discussed above in the chapter but there is still a long way to encompass cent percent literacy among all the individuals worldwide.

FUTURE RESEARCH DIRECTIONS

Media Literacy has led to the re-construction of meaning of literacy from traditional to new literacy thereby changing the role of media in a society. The advent of media technology calls for understanding new media and promoting the importance media literacy among researchers, educators, and policy makers. Media literacy educators must have a better understanding of the past, to understand what changes we have in present and what can be in future. It becomes necessary for educators to assist students to become best writers of media news, using variety of digital media and technological tools for self-expression, research, and education. Media literacy will surely help in addressing the issues that are central to the growing up in a world full of mass media as well as digital media. It will further enable an individual to learn how to analyze news and advertising, examining the social functions of digital tools, introduction of media tools in classes, means of entertainment and application of information media in other domains of life. With the advancement of digital media, a plethora of new media literacy skills have been witnessed and it is the need of the hour that educators should take foremost steps to inculcate these skills among the novice users so that they can use the nascent media tools in more efficient and can deepen students' reasoning, critical thinking, and communication skills. Though the concept of Media literacy is still in the budding stage but its scope has highly widened and needs to be given application in each and every sphere of life.

KEY TERMS AND DEFINITIONS

Digital Media: Media that are encoded in a machine-readable format and can be created, viewed, distributed, modified and preserved on computers.

Information Literacy: The ability to know when there is a need for information, to be able to identify, locate, evaluate, and effectively use that information for the issue or problem at hand.

Multimedia: Content that uses a blend of diverse content forms contrasting with media that use only basic computer displays. It includes a combination of text, audio, still images, animation, video, or interactivity content forms.

Pedagogical Tools: Tools relating to teaching and education.

Social Web: Set of social relations that link people through the World Wide Web. The Social web incorporates how websites and software are designed and developed in order to support and foster social interaction.

Socio-Technical: The interaction between society's complex infrastructures and human behaviour.

Visual Literacy: The ability to interpret, negotiate, and make meaning from information presented in the form of an image.

Chapter 67
Digital Leisure or Digital Business?
A Look at Nigerian Women Engagement with the Internet

Joseph Wilson
University of Maiduguri, Nigeria

Aisha Kolo Lawan
University of Maiduguri, Nigeria

ABSTRACT

The fourth world conference on women in Beijing in 1995 was a springboard for women acceptance to explore various media possibilities to enhance their global visibility for societal recognition, address the negative media portrayal of women, and strengthen the gender equality struggles. Their platform for action on women and the media was to strategically increase the participation and access of women to expression and decision-making in and through the media and new technologies of communication. These declarations and strategies were clear indications and a call for creating new avenues for expression and participation for the purpose of empowering women. These plans of action and adoption of new technologies of communication must translate into relevant engagement with these technologies to be able to achieve the set goals. Engaging with technologies for leisure purposes (digital leisure) are likely to be of little significance to serious Internet activities relevant to women empowerment drive (digital business). The purpose for which women engage these new technologies should reflect issues that are in tandem with women empowerment drive. This Chapter examined what area Nigerian women are engaging the Internet. Findings showed that more Nigeria women access the Internet through mobile devices such as smartphones and tablets. Nigerian women engage the Internet for both digital leisure and digital business but they do more leisure-based Internet activities than serious activities that facilitate women empowerment (their Internet activities are more leisure oriented than business oriented) The women Internet empowerment drive can only be realised if Nigerian women up their game in digital business activities on the Internet.

DOI: 10.4018/978-1-5225-3822-6.ch067

INTRODUCTION

When women accepted (at the fourth world conference on women in Beijing in 1995) to explore the use of ICTs as one of their options to enhance their global visibility for societal recognition, strategically increase the participation and access of women to expression and decision making, it was a call for serious business of engaging with new technologies for desired global impact. Are Nigerian women using ICTs for leisure or the business of women empowerment? Digital leisure oriented activities such as downloading beauty tips, latest fashion styles, latest movies; teens flirting on social network sites and virtual gaming may seem like typical behaviour in developed countries where these technologies have been appropriated in their everyday life, yet in the context of developing countries, it is seen as unusual and perhaps an anomaly in their new media practice especially when viewed from the perspective of the need to focus on more serious issues that would translate into some form of socio-political and economic advantages (Arora & Rangaswamy, 2013).

Nigerian women participation at various global fora for women attest to the fact they are not isolated from the global trends in respect of women. Nigerian Women visibility at the Beijing Conference in 1995 indicates their acceptance of the positions of the conference its platform for action on women and the media. The growing penetration of ICTs since 1998 and the formulation of Information technology Policy, which although does not reflect gender characteristics, make it necessary to explore how ICT such as the Internet manifest in the lives of women and their quest for empowerment. Wilson and Lawan (2015) notes female undergraduates in Nigeria use the Internet for various purposes but do not make inputs (which is an important activity on the Internet towards empowering others with useful information) on the Internet.

Since several Internet activities take place among Nigeria women, how relevant are these activities to women empowerment drive? Are the activities leisure-based or based on the business of women empowerment?

The Chapter examines whether Nigerian women activities on Internet is for leisure or for women empowerment. The study has the following objectives: to identify ways through which women access the Internet (Internet access platform) and to examine the activities they engage in on the Internet. The study focused on women from various walks of life (Women academicians, women working in private and public sector, self-employed/business women and full time house wives) in two Nigerian cities in North Eastern Nigeria: Yola, Adamawa State and Maiduguri Borno State in 2015. Somolu (2012) sums up the profile of women online in Nigeria, thus, predominantly young: Up to mid-40s, Undergraduate Level Education, Professional / 'White-Collar' Careers. Women professionals form an important part of actualization of the ICTs for empowerment process (a process by which women gain control over resources such as income, knowledge, information technology, skills and training, challenge the ideology of patriarchy and participate in leadership, decision-making process, enhance self-image of women, to become active in the process of change and to develop skills for enhancement (Komar, 2012) These professionals are also vital in policy and contents development as well as mobilization of younger women and housewives to adopt and make maximum use of these technologies to realise their empowerment .

Developments in Information and communication technologies (ICTs) have resulted in human engagement with these technologies for different purposes. Individuals, public and private organization and interest groups globally have embraced technologies as tools for facilitating their global impact. . These show that in modern societies, the ICTs encloses various possibilities by creating new spaces for political expression and participation; increased opportunity for a more active involvement in delibera-

tion processes within a very different interaction framework from the one that is provided by conventional media. ICTs have the potential to improve the social and economic well-being of the poor and ensuring that marginalised groups are not left out in the developments of the global information society (Schultz, 2000; Chadwick, 2006; Esteves, 2007, Gillwald, Milek & Stork, 2010, Wilson, Gapsiso & Usman, 2014). Akinpelu (2008) notes that Information and communication Technology (IT) has been promoted as an important tool in ensuring that marginalized groups, particularly women, are included in the development of the global information society. Jain (2007) notes that in this modern world, ICTs are central for women's empowerment, considering that women have traditionally been excluded from the external information sphere, because of several factors such as lack of freedom of movement or low levels of education. ICT enables women have access to the outside world. Information flows to them without any distortion or censoring. This leads to broadening of perspectives, greater understanding of their current situation and easy avenue for information exchange.

Empowerment of women in the context of knowledge societies requires developing the abilities and skills of women to gain insight into the issues affecting them and their capacity to voice their challenges. It entails developing the capacities of women to overcome social and institutional hurdles and strengthening their participation in the economic and political processes so as to realise an overall improvement in their quality of life (Jain, 2007). The Internet, in particular, has had an immense impact on the development of information society. The ultimate aim of the information society is the empowerment of all its citizens' trough access to and use of knowledge (Goulding & Spacey, 2003). The Internet has delivered useful information, such as market prices for women in small and micro-enterprises, training opportunities for women professionals, health information for women etc. case studies from developing countries such as India China, Philippines reveals that both urban and rural women despite the challenges are successfully using technologies such as the Internet towards their empowerment, marketing their products, banking and networking, expanding their business, discussing issues, finding solutions, to their personal problem and most importantly, educate themselves (Karan & Das, 2005; Nath, 2001).

The Internet has increased information access and sharing globally. Women today do not have to rely on the copy machine and the surface mail to share knowledge. They can have access to feminist library on line through the Internet, check on current developments on a full range of women empowerment issues. They can also through the Internet share messages with other women (Wilson & Gapsiso, 2012; Dillman, 1985).

The Internet enables women to be connected within a country and around the world to share resources, thus creating an environment of togetherness and do not have to depend on the commercial media, which supposedly, limited in terms of information about women projects (Smith, 1983). This shows that the Internet technology is an important tool for women and a very important alternative communication channel providing several opportunities for users. Jagboro (2004) notes that, the Internet is a rich, multilayered, complex, ever-changing textual environment. It is a "live", "dynamic", theoretically borderless with potentially endless space for the production and circulation of information .The Internet, is a mechanism for information dissemination and a medium for collaborative interaction between individuals and their computers without regards for geographic limitation of space (Singh, 2002).

Somolu, (2012) notes that using Internet to Empower women entails: Awareness-Raising; Self-expression; Knowledge-Building, Mobilising groups to transform the world, Documenting work, Sharing information and resources to and from stakeholders; Helping create media coverage for their work; Reaching potential donors; Communicating Online: E-mail; Skype – Internet Research (Search Skills, Alerts) – Internet Business Promotion Strategies: Social Networking Sites; Emailing Lists; Blogs; Websites

Another important aspect of the Internet for women empowerment is in the area of Internet for Advocacy, which involves learning to use technology (social media) to create change in their communities. Exploring the use of technology for advocacy on issues such as Women's Rights, Gender Based Violence, Girls' Education, Health) these activities are made possible through: Communicating a Message Effectively (Writing) – Documenting & Explaining Issues (Blogs) – Capturing an Event (Video, Photos, Text) – Illustrating the Issues (Images) – Coordinating Communities (Social Networking Sites) (Somolu, 2012). One of the most powerful applications of the Internet and other ICTs in the domain of knowledge networking is electronic commerce. Electronic commerce besides the being the business of selling of products and services online, has the advantage of linking producers and traders directly to markets at national, regional and even global levels, allowing them to restructure their economic activities reflect global standard (Jain, 2007) These Internet-based activities contribute to women empowerment business globally and made possible through a nation´s Internet penetration, access and relevant uses status.

The penetration of the Internet technology in Nigeria in the last ten years has placed it as one of the leading nations in Africa in terms of access. Ventures Africa in December, 2014 report, noted that Internet penetration in Africa has been gathering pace over the last half-decade and Nigeria leads the African continent in Internet usage which is driven by inexpensive mobile phone broadband connection. The growth of telecommunication industry has made Internet services cheap and handy to most Nigerians. Telecommunication companies in Nigeria now compete among themselves to provide affordable Internet services alongside other services. This has made it possible for Nigerians to access their Internet via their mobile phones. Studies and reports in recent times have indicated that Internet usage is now driven primarily by mobile phones, (Wilson & Gapsiso, 2009; *Vanguard,* 2010; Aderibigbe, 2014). The Nigerian government recognizes ICTs as tools for empowering women and girls and has put in place policy frameworks to ensure that gender issues move from the side-lines of policy and decision-making and are placed amongst the priorities so that ICTs provide a useful avenue for the inclusion and active participation of women in development.

The possibilities or potentials encapsulated in ICTs surpass the mere access and use but largely dependent on relevant and meaningful utilization of these technologies by interest groups. Mere adoption of Information and communication technologies without a meaningful engagement with these technologies is likely not to achieve the set goals. Engaging with technologies for leisure purposes (digital leisure) are likely not to yield a result that far from the serious business of women empowerment drive (digital business). Jain (2007) notes that access to ICTs is crucial if they are to be a means for women's empowerment. It is important not only to establish physical facilities, such as Internet networks or computers, but also to ensure that these facilities are utilized appropriately.

The success of the Internet for empowerment depends largely on access and most importantly the purpose for which these technologies are used. It is only when women use the Internet appropriately that the set target can be achieved. Wilson and Gapsiso (2012) note that unless women are actively involved in the planning and usage of the new information technologies, there is the risk that ICTs will serve to reinforce rather than overcome gender inequalities. Recognising the importance of women using ICTs many projects are incorporating gender analysis to address women's access, participation and determination of how such technologies are designed and deployed.

There is a serious gender gap in Internet access and usage especially in developing countries ITU report in 2013 has it that 16 percent fewer women than men use Internet in developing countries. There are currently 200 million fewer women online than men and globally, women are coming online later more slowly than men. Out of the world ´s 2.8 billion Internet users in 2013, only 1.3 billion are women

(Thisday, 2014). Somolu (2012) notes that women make up approx. 50% of Nigeria's population, but take up less than 20% of ICT activities. Somolu further notes that technology is an engine of economic development. So economic development is stunted by half of the population left out. Technology is a channel for social development. So learning and networking opportunities lost by low access and poor knowledge of uses of ICTs. There is also gap in terms of the relevance of uses. When users focus on less relevant activities on the Internet, it is considered a gap, and such activities do not usually yield a positive contribution to empowerment issues. Sometimes Internet users spend too much time on the computer chatting and playing games. This constitutes a gap in terms of Internet uses for empowerment. For example spending hours on Internet gaming may be irrelevant to economic empowerment activity of searching for possible market for a product online or looking for donors to fund women activities in some communities ..

An interesting phenomenon in the Internet utilization is digital leisure. Digital leisure entails Photoshopping of newlyweds, downloading the latest movies, music, teens flirting on social network sites and virtual gaming (Arora and Rangaswamy, 2013). The Internet has been a source of leisure before the World Wide Web; recent developments in digital technology have resulted in the unprecedented uptake of digital technology engagement as a leisure-time pursuit across the age span (Grimley, 2012). Lenhart et al, 2008). Many Internet forums have sections devoted to games and, music and funny videos; short cartoons in the form of Flash movies are also popular. Many use the Internet to access and download music, movies and other works for their enjoyment and relaxation. These activities have their positive contributions to human development but they are limited when serious issues of content creation, networking etch for women empowerment. According to Coker (2013) in many organizations, non-work-related web surfing is discouraged. This is not unconnected to its likely minimal relevance to serious issues or business of productivity.

According to Cornner (2012) there are many activities that mere waste of time in organization. Surfing the Internet or website unrelated to work is a major culprit. He noted that many employees spend time surfing non-work related websites everyday, which obviously affects productivity. Goulding and Spacey (2003) note that women spend more time playing games online than men. Men spend more time searching for news, financial information, product or service information, sell and buy stocks and shares and participate in online auction. These activities by men are serious business-related activities that lead to empowerment. For example engagement in online game could be highly time consuming and because it takes full concentration, the player is often socially isolated and completely consumed, with that, important commitments online are neglected. In such a case it is a total waste of time especially as it relates to issues of empowerment (One Cent at a Time, 2015).

As important as contributing materials online could be to Internet users Wilson and Lawan (2015) in a study on Internet access and use by female undergraduates in Nigeria revealed that 74% of the respondents do not post/contribute information/materials on the Internet. Tashiwa (2005) notes that most Internet users in the developing countries are "downloaders" and very few "upload" to the Internets. That in spite the issue of finance posing as a major challenge to Internet access and usage, female students still spend time to use the Internet, mostly for research purpose and they find the women related websites useful but a greater percentage of them do not contribute information or materials on the Internet.

The Empowerment of women as pursued by women organizations worldwide would be highly enhanced if attention is paid on younger women such as female undergraduates who have the educational capability and Internet potentials to effectively pursue the realization of the cause of women in Nigeria

and worldwide by encouraging them to go beyond mere consumption of Internet martials but to also upload useful and meaningful information to the Internet (Wilson & Lawan, 2015).

Digital leisure might be important in the aspect user relaxation but it is unproductive especially when it does not add to empowerment activities. Lavoie and Pychyl (2001) notes that many Internet users spend a reasonable amount of time on the Internet procrastinating; a modern form of cyber slacking in which an individual waste time and company resources by entertaining oneself on the Internet when one should be working on serious empowerment issues (Marron, 2000). Darbi et al (2013) research on the incidence of dysfunctional Internet usage in Ghana, found that more women are likely to use the Internet for personal email and chatting compared to men. Some most common non-productive use of the Internet which constitute some form of unproductive digital leisure activities are personal emails, chatting, game playing, chatting. Social networking leisure activities, video calls, Music Downloads, visiting porn websites, online purchases (Young & Case, 2002; Darbi et al, 2013). What areas are Nigerian women engaging the Internet and its numerous components? Are their engagements for leisure or business?

METHOD

Survey was carried out in Maiduguri Borno State and Yola Adamawa State in North Eastern Nigeria Quantitative data needed for the research was obtained through self-designed questionnaire administered to 500 women who were purposively selected. The Purposive Sampling Technique is selection based relevance of a respondent to a study, which in this case was Nigerian women that are involved in Internet activities or that use the Internet). Furthermore the purposive selection centred on women who are conversant with the Internet and engage with the Internet frequently (daily) more meaningfully (a complex activity like Internet banking, shopping, teaching and learning, uploading information materials, blogging). The study population comprised of Women academicians, women working in private and public sector, self-employed/business women and full time housewives in the two Nigerian cities irrespective of age. The categories of women are in one way or the other involved in one Internet based activity the other. A total 410 questionnaires were retrieved and were found useable. Results were collated and analysed with frequency tables and percentage.

FINDINGS

Internet Access Platform

Respondents were asked to indicate their Internet access platform (ways through which they gain access to the Internet). The result is shown in Table 1.

Table 1. Internet access platform

Platform	Numbers of Responses and Percentage
Personal Computers (Laptop and desk top)	190 (46%)
Mobile Devices (Mobile/Smart phones and Tablets)	360 (88%)

Source: field work 2015

Mobile Devices (Mobile/Smart phones and Tablets) 88% followed by the Personal Computers (Laptop and desk top) 46%. This finding shows that most of the women access the Internet via their mobile devices such as mobile/smart phones and tablets. 360 out of the 410 women use the mobile devices while 190 use personal computers. Among the 190 there are those who use the mobile devices as some respondents ticked both PC and Mobile devices as their access platforms. This finding underscores the unprecedented growth in mobile Internet among Nigerians.

Internet Activities

Using some of Arora and Rangaswamy (2013) Somolu, (2012) classifications of what makes Internet leisure activities and serious business or empowerment activities, two categories (Leisure and Serious business) were drawn with components that make up each category as shown in Table 2.

Respondents were asked to indicate their Internet activities (What activities they engage in on the Internet). The result is shown in Table 2.

Table 2 shows the various Internet activities among by the respondents. The table indicates two categories of activities: the serious business activities and the leisure activities. The table shows that 10% of the respondents use the Internet for serious business of Documenting and explaining women issues (Blogging). 45% carryout Research on the Internet on various issues (search for skills, training.12% engage the Internet for Networking with women groups. 16% of the respondents search for business/ entrepreneurial opportunities and tips. 26% search for women health tips.32% are involved in Online

Table 2. Internet activities

		Number of Responses and Percentage
Digital Business Activities	Documenting and explaining women issues (Blogging)	41 (10%)
	Research (search for skills, training, academic issues)	186 (45%)
	Networking with women groups	48 (12%)
	Searching business/entrepreneurial opportunities and tips	67 (16%)
	Searching women health tips	107 (26%)
	Online Shopping (buying and Selling of products/ services online)	133 (32%)
	Internet banking	80 (20%)
	Women mobilization (connecting with other women on issues that relates to women, Coordinating women communities)	86 (21%)
Digital Leisure Activities	Video calls/Skype	97 (23%)
	Photo shopping fashion styles	82 (20%)
	Downloading movies,	126 (31%)
	Virtual gaming	79 (19%)
	Chatting on social networking platform (Facebook, WhataApp, Blackberry Messages)	266 (65%)
	Sending Personal emails	148 (36%)
	Music Downloads	139 (34%)
	Reading Celebrity news	40 (9%)

Source: Field work, 2015

shopping, which involves activities such as buying and Selling of products/ services online. 20% are involved in Internet banking and 21% so some form of women mobilization (connecting with other women on issues that relates to women, Coordinating women communities).

For the Leisure Internet activities, the table indicates that 23% of the respondents are involved in Video calls/Skype. 20% of the respondents Photoshop fashion styles on the Internet. 31% are involved in downloading movies on the Internet.19% engage the Internet for virtual gaming activities. 65% of the respondents engage the Interne for chatting on social networking platforms such as Facebook, Whata-App and Blackberry Messenger. 36% use the Internet for personal emails. 34% engage the Internet to download music and 9% for reading and catching up on celebrity news.

This table indicates that the highest Internet activity in the two categories is the chatting on social networking platform with 65%.

Table 3 gives an idea of the two categories, which Internet activity thrives more among the respondents.

The table shows 57% of Internet activities is centred on leisure while 43% is serious business activities.

The study further found that these women face challenges such as the high cost of Internet data bundle, which limits their duration of activities on the Internet. Slow Internet service or poor Internet network is another hindrance to Internet activities. The near absence of privacy in Internet activity also hinders the Internet activities of the respondent. Other challenges are the epileptic electricity power supply and the difficulty in retrieving relevant (indigenous) materials on the Internet.

Discussion of Findings

Using the Internet for empowerment requires engaging in activities on the Internet. This study has made an effort to show that women are involved in various activities on the Internet. It is obvious that mobile Internet is continuously gaining grounds among Nigerians. 88% of the respondents access the Internet via mobile devices such as mobile/smart phones as well as tablets. This finding is in line with positions in several reports on mobile Internet in Nigeria for example Ericsson ConsumerLab reports that more than 95% of mobile broadband users in Nigeria access mobile broadband on smartphones. That 82% of mobile phone users are accessing the Internet with their devices on a daily basis (Ojabo, 2015).

Recent statistics by National Communication Commission (Nigeria´s telecommunication regulator) reveals that a number of active Internet subscribers that access the web (Global System for Mobile Communication (GSM) network rose from 63 million in February to over 83 million in February 2014 is a pointer that Nigeria has leapfrogged PC-based Internet access (Ojabo, 2015).

Similarly, Hillsberg, (2014) revealed that more women in The United States of America use smart phones and tablets to access social media. This trend illustrates how women are setting the pace in driving the migration of Internet and especially social media access from desktop to mobile and that 60% of social media time is spent in smartphones and tablet

Table 3. Overall digital business activities and digital leisure activities

Internet Activities	Total Number of Responses
Digital Business Activities	748 (43%)
Digital Leisure Activities	977 (57%)

While access remains a key factor in determining the impact of Internet in any society, Internet use is also a key. This study indicates that there are impressive Internet activities that are both serious business-based and Leisure-based, the highest concentration activity centres on leisure, which is Chatting on social networking platforms (Facebook, WhataApp and Blackberry messaging) with 65%. This finding finds expression in the stance of others in respect of women leisure and business activities on the Internet. For instance Vermeren (2015) notes that women use social media less than men for business purpose, whereas women use social media to share more personal information, revealing more about their personal lives, men in contrast, use social media for serious business activities such as to gather information they need to build influence; perform research, gather relevant contacts and ultimately increase their status. Behind every social media platform stand millions of women and they certainly seem to love their mobile phones on which they spend nothing less than ten minutes social networking through the mobile web or through apps every day. Among the Internet users, a greater percentage of women use Facebook, Tumblr, Pinterest, Snapchat, Instagram and Twitter (Vermeren, 2015).

Similarly Hillsberg (2015) note that several key studies on social media revealed that women dominate this territory. There are more women in top social media platforms and use it more often daily.

There is more of digital leisure activities than the digital business activities as seen in this study. 57% of activities by women is leisure-based. However, that is not to say that there are no serious business activities. The study shows that 43% of Internet activities are serious business activities, which is predominantly Research (search for skills, training, academic issues, women health tips etc). Some of other digital business activities include: Documenting and explaining women issues (Blogging), Networking with women groups, Searching business/entrepreneurial opportunities and tips, Online Shopping (buying and selling of products/ services online), Internet banking and mobilization (connecting with other women on issues that relates to women, coordinating women communities). In line with digital business, Lee (2011) notes that there is an unprecedented growth in consumer web companies in both user adopting and revenue, the little secret that's gone unnoticed by most is that women users are the unsung heroines behind the engaging, fastest growing and most valuable consumer Internet and e-commerce companies. Businesswomen recognize the networking power of the behind offering online newsletters, discussion board and forums. They also participate in more online social networking and sharing not only business ideas but also advertising for products and services (Wolfe, n.d, eMarketer, 2007; Fisher, 2006)

Women also take advantage of online resources. They are quick to surf the net looking for resources and connections that will help them succeed in business. There are more "women helping women" websites than sites dedicated exclusively for male self-help websites. Women in business seem to have made the connection that easy access to services and product on the Internet makes for good business (Wolfe, n.d, eMarketer, 2007; Fisher, 2006). These strides are reports from the western countries like he united states of America and countries in Europe. However, these can be achieved in developing countries like Nigeria especially considering the growth in the penetration of Internet technologies and from this study the 43% digital business activities on the Internet.

Internet for mobilization is another area the study shows women engage the Internet for digital business activities. The hashtag advocacy/activism (use of hashtag (#) to stay in the public view) is a typical example of how women can use the Internet to keep their empowerment effort in the limelight and mobilize global support. For example the hashtag Internet activity has been associated with the 2014 Chibok Girls Kidnapping, with hopes that it would help keep the story in the news and attract international attention. Millions of twits and comments flooded the Internet on this issue.

CONCLUSION

These findings suggest that women spend more time doing leisure Internet rather than focusing on the serious business of women empowerment. It would be necessary for reorientation of women on the fact that not all Internet activity drives empowerment. Some are mere a "waste" of time and resources that could be channelled to harnessed to enormous benefits of Internet in facilitating the women empowerment. The social networking that dominates the Internet activities can also be channelled to empowerment drive such as using these social networking sites for advocacy on women related issues such as maternal health issues, girl child education, promoting small scale business, promoting products and services of fellow women, mobilizing women for political participation, prompting women organization and several other empowerment drives via the social media platforms.

The place of Internet is essential to women empowerment across Africa and women participation in meaningful online participation is a critical step towards reshaping economic, political and social condition to allow for equality in opportunities. These enormous benefits of transformative power of Internet can only be harnessed if and when Nigerian women engage the Internet in doing more digital business activities than leisure activities.

KEY TERMS AND DEFINITIONS

Digital Business Activities: Internet-based activities that yield some form of economic and other benefits that are not mere enjoyable pastime. (Skills accusation entrepreneurial skills, political mobilization, advocacy, fund raising, promotion of business etc.).

Digital Leisure Activities: Internet-based activities that does not add any economic value but for ease and relaxation or pastime enjoyable activity.

Empowerment: To give quality or abilities. The process of enhancing the capacity of individual or group to make choices and to transform those choices into desired results.

Chapter 68
Parent–Emerging Adult Relationships in the Digital Age:
A Family Systems Theoretical Perspective

Justin Peer
University of Michigan – Dearborn, USA

ABSTRACT

Emerging adulthood is a period of life characterized by increased individuation and independence. For emerging adults to successfully navigate this process, many aspects of the parent-child relationship must be renegotiated, including rules and expectations related to communication. The emergence of digital communication technology has provided an added layer to this process. This chapter summarizes research related to the influence of digital technology on parent-emerging adult relations. Early findings suggest that digital influence on this stage of development is complex. This chapter employs a Family Systems perspective to offer insight into how current and historical family functioning influences choices related to the use of digital communication technology and how these choices affect the development of emerging adults. Implications for practice as well as avenues for future research are offered.

INTRODUCTION AND BACKGROUND

Emerging adulthood, the time of life between the ages of 18 and 29, is characterized by exploration and instability. The goal of this period is the development of autonomy and self-sufficiency (Arnett, 2015). Though many emerging adults navigate the journey toward adulthood successfully (Arnett, 2007), the instability that coincides with self-exploration triggers increased stress (Arnett, 2015; Asberg, Bowers, Renk, & McKinney, 2008; Peer, Hillman, & Van Hoet, 2015) and self-doubt (Peer & McAuslan, 2016) for some. Social support is critical for buffering the negative impacts during this time (Masten, Obradović, & Burt, 2006). Parents serve as primary sources of such support, particularly during the early stages of emerging adulthood when individuals are beginning the process of establishing an identity independent of their family. As emerging adults work toward individuation, they maintain emotional connections with their parents (Lee, Mazaros, & Colvin, 2009). Moreover, healthy development during this stage of

DOI: 10.4018/978-1-5225-3822-6.ch068

life is intimately related to family relationships, yet change and instability in these relationships are also part of emerging adult experiences (Aquilino, 2006).

Digital technology has revolutionized the manner in which emerging adults and their parents communicate with each other (Clark, 2011). As "digital natives," emerging adults consume approximately 12 hours of digital media per day (Arnett, 2015). Cell phone usage, text messaging, and social media websites have become the preferred methods of communication among emerging adults. Digital technology has also become a main platform for communication for families and has greatly expanded the opportunities and frequency for emerging adults and their parents to communicate. Digital technology allows emerging adults and their parents to be in contact constantly and nearly instantly, wherever they may be and at any time.

Digital communication technology acts as an "electronic tether" between emerging adults and their parents (Hofer, 2008), which may impact emerging adult development and adjustment (Ramsey, Gentzler, Morey, Oberhauser, & Westerman, 2013). On the one hand, digital communication can enhance autonomy through the provision of a tool that individuals can use to efficiently gain needed support from parents, sometimes making it easier and less stressful to make important decisions. Emerging adults, for example, have reported that they rely on the support that they receive from their family through digital technology modalities (Arnett, 2015). On the other hand, this "instant access" can also serve to stifle developmental progress through overreliance on parents and in some cases through a continuation of dysfunctional family patterns via a new means. It is therefore critical to understand how evolving digital technologies influence the changing nature of parent-child relationships and how they can support and/or hinder healthy development of the emerging adult. In turn, it is also important to assess various factors related to the quality of the parent-child relationship (i.e., level and types of support provided, emotional closeness, level of conflict, and attachment patterns) and how they influence the use of digital technology to communicate (Ramsey et al., 2013).

In this chapter, I explain the potential effects of digital communication on parent-child relations during this stage of development. I use a theoretical framework, especially the Family Systems Theory (Bertalanffy, 1968; Goldenberg & Goldenberg, 1996), for understanding the impact of various aspects of family functioning on the successful integration of digital technologies into communication between parents and emerging adults. Specifically, I point to the importance of parents and children renegotiating their relationship during this period by discussing and creating new rules, expectations, and boundaries. Finally, the chapter concludes with a discussion about applications for family life education and clinical practice as well as implications and opportunities for future research based on the current research findings.

THE POTENTIAL IMPACT OF DIGITAL TECHNOLOGY ON PARENT-CHILD RELATIONS DURING EMERGING ADULTHOOD

In Western society, adulthood is highlighted by independence and self-sufficiency. Emerging adults experience a sense of feeling "in-between," as they have achieved some level of independence that differentiates them from adolescents, yet they still require emotional, material, and financial support from parents (Arnett, 2015). To successfully navigate this time of life, emerging adults must move toward self-responsibility and away from dependency upon their parents. The very nature of their relationship with their parents must evolve for this to be fully realized.

The parent-child relationship during this period moves toward a relationship based on mutual respect between two adults, rather than a relationship based on authority and control between a parent and their dependent child (Aquilino, 2006). Emerging adults and parents see each other more as humans rather than simply as a "parent" or as a "child." As the parent-emerging adult relationship changes, a renegotiation of many aspects of the relationship is required, including expectations and patterns of communication. This is a bi-directional process. Parents should respect their child's growing maturity and privacy, while the emerging adult should be respectful of their parents' responsibilities and availability for communication. While the underlying foundation of emotional support remains, the parent-child relationship should evolve into one highlighted by parental support of their child's self-sufficiency and autonomy (Aquilino, 2006). Developmentally, the critical concern for emerging adults is their ability to balance personal autonomy and connection with their parents. For parents specifically, it is vital to acknowledge and support their child's growing sense of independence while also maintaining a strong connection and open line of communication.

As the emerging adult develops more independent decision-making ability, new and a wider range of topics of conversation between parents and emerging adults arise (Arnett, 2015). For example, more open and freer conversations involve financial, career, and child-rearing matters. Parents are also able to offer "coaching" on a variety of topics. Furthermore, the technological revolution has allowed contact between emerging adults and their parents to increase dramatically and these advances have made communication accessible and affordable for most (Arnett, 2015).

Digital technology has offered not only a new avenue for communication between emerging adults and their parents but also another area up for renegotiation as independence is established. The 24-hour, instant access that digital technology allows could provide a sense of parental support for emerging adults or could be an area of conflict if boundaries are not established or enforced. Digital social media (Facebook, for example) provides potentially both positive and negative impacts for parent-child relations (Child & Westermann, 2013). The upside to digital mediums like Facebook is that they provide a convenient and easy way for family members to maintain an open line of communication. However, there is also the potential for serious conflict stemming from parental privacy intrusions and/or poor respect for personal boundaries, which could be initiated by both parent and emerging adult. Furthermore, though digital technology may benefit the relationship through the almost instant accessibility offered, some theorists believe that technology could possibly hinder the emerging adult's maturational process through the emerging adult's dependence on this instant access to their parents for decision-making purposes versus actively problem solving and making decisions on their own (Miller-Ott, Kelly, & Duran, 2014).

In their book, *The iConnected Parent,* Hofer and Moore (2010) explore in detail the process of parents remaining connected with their college-aged children while also learning to appreciate their child's emerging independence. They define "iConnected parenting" as "a culture of parents deeply involved in their children's lives, even as they approach adulthood, that uses technology of instant communication to enhance their connection" (p. 2), and they argue that this represents a new age in parenting. They state that the instant access afforded by digital communication explains why the frequency with which emerging adults and their parents communicate has risen rather dramatically in recent times. Parents, for example, believe that contact with their emerging adult is significantly greater than the contact they had had with their parents during emerging adulthood (Arnett, 2015). It is important to note that this process is bi-directional. Parents are contacting their kids more frequently and emerging adults are also contacting their parents more often. Some emerging adults contact their parents using cell phones

multiple times per day and, in some circumstances, desire even more frequent contact with their family (Chen & Katz, 2009).

Hofer and Moore (2010) contend that the instant access that cell phones and computers allow creates a closeness conflict for parents. Although emotional closeness and communication are key to emerging adult development, parents must "stay in touch while letting them (their emerging adult children) grow" (Hofer & Moore, 2010, p. 12). They believe that this has become more difficult given the instant access parents have to their children through digital technology, as this instant access provides an "electronic tether" between parent and child that could hinder emerging adult autonomy. This could also lead to potential conflict and relationship dissatisfaction for the child and/or the parent. To avert this conflict, the renegotiation of digital communication rules and expectations for both emerging adults and their parents is of critical importance. The ability to effectively negotiate digital communication likely buffers relationship issues and positively impacts an emerging adult's ability to develop a sense of independence.

DIGITAL COMMUNICATION AND PARENT-EMERGING ADULT RELATIONS USING A FAMILY SYSTEMS PERSPECTIVE

Being able to successfully communicate through digital media is a process not solely determined by the current state of the parent-child relationship. This adaptation is occurring within a dynamic family system. Relationships are evolving and adjusting given the developmental needs of individual family members involved (both the emerging adult and parents). The quality of ties and the ability/willingness to discuss and integrate digital technology into their relationship is rooted within the complexity of developmental needs, as well as the functioning of the family historically. What occurs relationally between emerging adults and their parents currently, including the use of digital means of communication, mirrors explicit/implicit rules and roles utilized within the family unit over time. Understanding communication between emerging adults and their parents within this type of framework offers significant insight into the dynamics that contribute to successful integration of digital technology into family communication patterns. It complements the interplay between the family system and society, and acknowledges the bi-directional influences among family members within the overall family system as well as sub-components within this system.

Family Systems Theory, born from General Systems Theory (Bertalanffy, 1968; Goldenberg & Goldenberg, 1996), provides a framework for understanding how families are organized and the interdependence among members of the family system. Within this framework, the focus is on relationships between family members rather than on individuals in isolation. Structurally, family systems are usually composed of a generally stable set of relationships among members who tend to function in typical ways within that specific system. Interactions among family members serve to strengthen or weaken the stability (wholeness) of the family system. Family interaction "typically follows organized, established patterns, based on the family structure; these patterns enable each person to learn what is permitted or expected of him or her as well as others in the family transactions" (Goldenberg & Goldenberg, 1996, p. 44). In other words, individuals within the system are best understood through interactions with other family members. These interactions are governed by rules, boundaries between family members, and openness to change that all serve to maintain a sense of stability within the system.

The family strives for a sense of balance, or homeostasis, per this framework. Emerging adulthood and the developmental changes associated with it can create a sense of instability within the family

system. This is due to the changing needs of the individual during this stage. Family Systems Theory is an applicable and suitable framework for exploring the multiple paths through which digital media may affect family functioning (Lanigan, 2009). Though this theory is not sufficient for exploring the characteristics of a particular technology and its influence on family relations, through the emphasis on the family unit, Family Systems Theory does provide a useful framework for exploring the process through which families discuss, and potentially integrate, digital technology into their structure and routines. Further, it explains the effects that the integration of digital media may have on the family system and the ability of the system to adapt to these changes.

Only one known study (Lanigan, Bold, & Chenoweth, 2009) has directly applied a systems perspective to the impact of technology on family life. Within their study, Lanigan et al. (2009) found that families believed that communication through a personal computer (e-mail, instant messaging, etc.) increased the sense of family connection. The authors support that using a systems perspective provides a framework for understanding how computer use influences family dynamics. However, their study does not focus solely on the emerging adult-parent relationship nor does it consider other forms of digital communication. Applying this framework to a broader range of communication technologies provides a more detailed view of family processes during emerging adulthood.

STABILITY AND CHANGE IN THE FAMILY SYSTEM

Renegotiation and other necessary steps associated with emerging adulthood impact the sense of normalcy within the family, thus disrupting the system's sense of homeostasis. According to Family Systems Theory, the family takes part in multiple processes to assure a sense of balance. Through these processes, the family rules that define relationships within the system may become activated. Adaptability becomes a crucial aspect of functioning for families. The system's ability to adapt to the developmental needs, including those related to communication, of the emerging adult will predict how satisfactory and productive relations will become. A cardinal characteristic of the family system is that it is constantly evolving while attempting to establish a new sense of balance.

In family systems terminology, the parental struggle between supporting their emerging adult and "letting go" is described as a dilemma of "morphogenesis" and "morphostasis." In other words, it is the parent-child relationship's ability to adapt and grow (morphogenesis) while simultaneously maintaining a sense of emotional support (morphostasis) that potentially creates conflict (Goldenberg & Goldenberg, 1996). The family system must be flexible and open to changes within the emerging adult and responsive to their communication needs. Families that are able to achieve and maintain stability in the midst of change are thought to be stronger (Goldenberg & Goldenberg, 1996).

Parental monitoring of digital media should be considered within this context. As emerging adults mature, parents adapt by respecting the developing autonomy of their child. Part of this adaptation is relinquishing a sense of control related to how their children use digital media and what content they consume. Although not an active part of communicating through social/digital media, expectations around parental mediation can certainly impact quality of relationships within families with emerging adults. Mediation (including viewing media with emerging adults, discussing digital media, and actively monitoring bills and content that is viewed) could aid emerging adults as they transition toward adulthood. However, it could also negatively affect the parent-child relationship if parental mediation is not negotiated and is seen as a means of control (Coyne, Padilla-Walker, & Howard, 2013; Vaterlaus,

Beckert, & Bird, 2015). Minimal research has been conducted to thoroughly explore this area, but intuitively, it makes sense that for emerging adults to attain developmental and relational success, rules and expectations related to parental mediation of digital media must be discussed. Filtered through the family systems perspective, there are various reasons why a parent would or would not mediate their child's digital media usage. According to the principle of morphogenesis (Goldenberg & Goldenberg, 1996), a family that is flexible and open to change is responsive to the growth and development of their emerging adult. However, striving for familial balance must continue. Remaining sensitive to the stability of previously established, warm relationships with their child (morphostasis), the family adapts by accepting their child's budding autonomy and having a collaborative discussion regarding digital media (morphogenesis). Parents display adaptability through their willingness to discuss the use of media, content of media, and ways in which they could assist their child, seeking feedback from their emerging adult as part of this discussion. The emerging adult gains new insight regarding the use of digital media and new rules are implemented regarding how parents may monitor and be supportive of the child's digital technology use. Thus, the family has "grown" by establishing a new way of functioning that integrates continued parental support and monitoring (morphostasis) with education, rules, and expectations that support the emerging adult's autonomy (morphogenesis). This stabilizes the family and promotes healthy parent-child relationships. A dynamic balance in the midst of change allows for this to occur.

The sheer number of digital technologies available also must be considered within the context of stability and change. As the family unit evolves, the types and number of digital technologies utilized to communicate contribute to the complexity of the parent-child relationship, potentially impacting both quality and satisfaction. Schon (2014) found that the more technologies that parents and emerging adults used to communicate the more positive the impact was on communication satisfaction and relationship satisfaction. Though the total number of technologies used by participants in the study was low (mean number of 3.49 technologies for emerging adult/mother communications and 3.11 for emerging adult/father communications), there still was modest positive impact on relationship satisfaction. Findings relating satisfaction with the number of technologies utilized suggest that part of a healthy morphogenetic process should include negotiating rules and expectations around what is discussed via digital media, when it should be discussed, and through what means it is discussed. The Media Multiplexity Theory (Haythornthwaite, 2005) is based on the idea that people with stronger emotional/social ties to others will use media more to communicate than those with weaker ties. Based on this theory, those with "stronger ties" are going to use more forms of communication (Schon, 2014). Schon's study supports healthy morphostatic functioning as it was found that "communication competence" explained a greater amount of variance for relationship satisfaction than the number of technologies utilized. Communication competence is a collective term for multiple quality factors including supportiveness, empathy, and self-disclosure (Rubin & Martin, 1994).

Families who are unable to adapt, who remain rigidly tied to old rules, and who resist change within relationship dynamics are likely to experience an inability to grow and develop effectively. An overreliance on morphostatic functioning can be attributed to various factors. Dysfunctional roles and rules within the system, trauma, substance abuse, and mental illness are examples of variables that can contribute to the system's resistance to change. Even a parent's own anxiety, real or perceived, about their child's wellness may promote an unhealthy morphostasis through the parent's unwillingness to relinquish their monitoring role (Hofer & Moore, 2010). Overly rigid or porous boundaries between parent and emerging adult may also contribute to the family's inability to negotiate rules and related expectations regarding the use of digital communication. Relationship satisfaction in the digital world may also paral-

lel parent-child relationship quality in the "real world." Gentzler, Oberhauser, Westerman, and Nadorff (2011) found that emerging adults who experienced supportive and satisfying relationships with their parents spoke to their parents more often on the phone. But satisfaction with communication through digital technology differed based on the channel of communication utilized. Emerging adults who communicated with their parents through texting, e-mail, and social networking sites actually reported higher levels of loneliness, anxious parent-child attachment patterns, and conflict with their parents. Gentzler et al. (2011) explain this finding using the Theory of Electronic Propinquity (Korzenny, 1978), which is built on the idea that individuals use electronic devices as a means to maintain closeness to others. Using this theory, the authors state that the use of the cell phone as a method of communication with parents provides the optimal balance of independence and closeness that is developmentally appropriate during emerging adulthood.

Emerging adults and their parents must also consider the method of communication when negotiating rules and expectations. Families should not force emotionally laden cell phone conversations, for example, if this is not the preferred communication method among members within the family system. As the family adapts, attention and care should be given to preferences among all members. The system must "cut the wireless cord" (Lee et al., 2009) if a particular method is not preferred. Neglecting to do so may increase conflict and impede growth of both the system and the individual members within the system.

Additionally, the connection among non-cell phone digital methods of communication, anxious attachment, and parental conflict is efficiently explained through Family Systems Theory. Given that attachment relationships are determined through early parent-child interactions, relational issues and attachment problems at the emerging adult stage represent a remnant of historical role, rule, and boundary disturbances among members of the family system. The balance within the system was likely conflicted, which provided an atmosphere in which anxious attachment patterns could develop and persist within parent-child dyads. This pattern likely remained part of the equilibrium within the system and continues to be demonstrated in a novel way as emerging adults have reported higher levels of conflict with their parents (Gentzler et al., 2011). Further, utilizing these written methods of digital communication (e-mail, texting) may offer a way for emerging adults to avoid speaking to parents with whom they have an established anxious emotional connection.

Other researchers have also evaluated the influence of digital technology on parent-emerging adult attachment relationships. Lee et al. (2009) assessed the function of cell phones for emerging adult college students and its effects on their perceived attachment relationships with their parents. Individuals who were considered to be "connected" cell phone users reported greater attachment to their parents, particularly to their mother. Factors that identified a "connected" user were those who prefer the cell phone for social interactions, use the various functions that cell phones provide regularly, view the cell phone as a necessary component of living in modern society, and feel safer having access to a cell phone. Lee et al. (2009) suggest that "connected" users may feel more attached to their mothers based on their preference for using cell phones. "Connected" users may reach out to their parents for more reasons than those who use cell phones less frequently and are less reliant on this mode of communication. Talking to parents on cell phones, in turn, increases a sense of emotional attachment to their parents, especially their mother. Similarly, Ramsey et al. (2013) found that those parent-emerging adult dyads that used cell phones for regular communication reported the highest quality of parent-child relationships. Specifically, emerging adults who had regular contact with their parents via cell phone reported greater parental support, intimacy/closeness, and relationship satisfaction. The authors suggest that this may be due to the intimacy that is created through hearing a loved one's voice versus reading a text message, e-mail, or

other similar technology. Collectively, these studies address how historical systemic functioning relates strongly to current parent-emerging adult attachment, relationship quality, and satisfaction, among other important indicators.

Digital technology also serves to maintain and strengthen current relationships between emerging adults and their parents. In a study of the relationship between the use of electronic communication technologies and parent-child attachment relationships during the transition to college, Sarigiani, Trumbell, and Camarena (2013) found that students viewed electronic communication as a way to stay in touch with their parents, ease the negative feelings associated with missing their family, and "maintain a deep parent-child bond" (p. 53). The authors believe that electronic communication is a protective factor that helps students buffer the stress associated with the college transition and promotes healthy adjustment. From a systemic perspective, electronic communication technology serves as a method for maintaining healthy morphostatic functioning. However, digital communication technology could also play a role in increasing relational conflict between emerging adults and their parents if rules and expectations are not discussed. Digital technology may serve to maintain both positive and negative relationships among members of the family system.

RULES WITHIN THE FAMILY SYSTEM

Rules are established patterns of interaction that denote expectations of family members. Miller-Ott et al. (2014) argue that communication rules allow parents and emerging adults to standardize and organize their interactional patterns while also establishing healthy boundaries. Most family rules are unstated, are learned through experience within the family unit, and govern the effectiveness of family functioning. Family rules may exist where "children do not challenge their parents" or "children do not have a voice." These rules may follow a "redundancy principle" (Jackson, 1965) whereby they are repeated over and over during the family life cycle. The emerging adult's ability to renegotiate frequency and expectations associated with digital communication may be influenced by these types of rules. If the implicit rule within the home is "the child does not have a voice," then the emerging adult may feel distressed in relation to the potential of being perceived as "challenging" their parent regarding rules of communication. In a system where family rules are based on equality and openness, this is likely not an issue.

Privacy management within families is a prime example of an embedded family rule that could potentially affect parent-emerging adult digital communication satisfaction. In a study on privacy rules and emerging adult responses to parental Facebook friend requests, Child and Westermann (2013) state that "the interior family privacy orientation is cultivated through both direct communication within the family and the occurrence of such practices among sub-groups within the family as concealing secrets from one another" (p. 49). This orientation is reported to be positively related with family functioning and satisfaction. To support this assertion, the authors reference previous work (Hawk, Keijsers, Hale, & Meeus, 2009) that reveals that the level of privacy invasion relates reciprocally with conflict among parents and young adults. Consistent with Family Systems Theory, Child and Westermann (2013) found that emerging adults who accepted Facebook friend requests, primarily from their mothers, were from families in which rules allowing for the sharing of private information between family members were already established. These individuals accepted the requests without changing any privacy rule settings within Facebook before doing so. Interpreted through a systems perspective, family rules related to the open sharing of personal/private information were ingrained in the system and allowed to occur via

digital technology means. Within family systems with a closed line of communication and/or rules that discouraged open disclosure, the invitations would likely be ignored or turned down, potentially leading to conflict among members of the system. This suggests that embedded within family rules are values related to open versus closed communication practices. This is important as it helps to explain family dynamics in relation to the decision by emerging adults to allow/establish a line of communication with their parents via social media (Child & Westermann, 2013).

BOUNDARIES WITHIN THE FAMILY SYSTEM

Family systems are composed of various subsystems that carry out numerous tasks. The parental subsystem, one of the most enduring subsystems, serves the function of raising and nurturing children and moving them toward a sense of autonomy and self-determination. An integral component of the parental subsystem is boundaries, which are "invisible lines of demarcation" (Goldenberg & Goldenberg, 1996, p. 55) that differentiate family members and establish autonomy among the separate individuals within the subsystem. As within the larger family system, boundaries within subsystems must be flexible without becoming overly porous or rigid. Thus, rules should be established that govern the boundaries within the subsystem. Boundaries are directly related to negotiations of digital communication between emerging adults and their parents. If healthy boundaries are established and maintained, emerging adults and their parents engage in patterns of communication that are supportive yet respectful. In families where boundaries are porous and/or rigid, parents may be overly involved in the emerging adult's life, stifling their journey toward independence and creating an atmosphere that is conflictual and potentially highly dysfunctional.

Digital communication technologies, most notably cell phones, produce opportunities for boundary violations among emerging adults and their parents (Miller-Ott et al., 2014). Without establishing rules for how cell phones will be utilized for communication, the temptation of instant contact may weaken boundaries or exacerbate historical boundary disturbances between emerging adults and parents. In a study of relationship satisfaction related to having cell phone rules, Miller-Ott et al. (2014) explored the symbiotic relationship between rules and boundaries within the parent-emerging adult subsystem. They found that cell phone usage is frequent between emerging adults and their parents, particularly their mothers. The authors analyzed multiple rules (examples include availability, repeated contact, and arguments over the cell phone) related to cell phone communication and found that rules between emerging adults and their mothers were associated with relationship satisfaction and feelings of closeness. Miller-Ott et al. (2014) note that rules may counterbalance relational tension associated with autonomy and closeness within the mother-emerging adult dyad. They further described that, without rules, emerging adults may avoid parent phone calls or otherwise limit their access as a part of establishing a sense of independence. From a systemic perspective, this would disrupt homeostasis within the family system. Parents may respond to this disruption by actions designed to re-establish stability within the system. Parents may engage in intrusive behaviors—including monitoring their child's cell phone usage, making calls to their child that are not welcomed, and eavesdropping on calls to exert control—all conducted, from within the system's framework, in an effort to return the system to homeostasis. However, this behavior can lead to conflict and can compromise the emerging adult's drive for independence, further emphasizing the importance of role/rule negotiation and boundary establishment/maintenance.

HISTORICAL FAMILY FUNCTIONING

Current patterns of digital communication between emerging adults and their parents likely reflect both the quality of "offline" communication patterns and historical patterns of communication. Ramsey et al. (2013) suggest that parent-emerging adult satisfaction with the utilization of communication technology for correspondence reflects the quality of other relationship factors (support, intimacy, conflict) that occur outside of the digital realm. Members of the system rely on historical/redundant rules and patterns of communication with one another instead of opening the system to the full menu of behavioral patterns available to them. This explains the mirroring effect that the literature suggests, pertaining to satisfaction with digital communication between emerging adults and their parents. To understand how they will relate in the "digital world," the rules and expectations for communication in the "real world" must be clear. Analyzing rules, roles, and positive/negative feedback loops (information about past systemic functioning being "looped" back into the system as a way of controlling the system) in face-to-face interactions is likely predictive of systemic functioning when utilizing digital technology.

It is critical to consider historical systemic functioning when gauging the quality and satisfaction of digital relationships. Multiple studies (Gentzler et al., 2011; Lee et al., 2009; Sarigiani et al., 2013) describe the relationship between aspects of digital communication and the quality of attachment relationships between emerging adults and their parents. Given that attachment patterns are representative of early parent-child interactions and considered enduring (Bowlby, 1969), understanding the quality of current systemic functioning related to digital technology within the context of historical relational quality is important. From a systems perspective, this could again reflect redundancy within the system. Even more, the structure and organization of the system must be considered. Anxious or ambivalent patterns of attachment that persist from infancy into emerging adulthood may reflect a "closed system." A closed system is one that resists change, lacks constructive feedback to its members, and struggles to adapt (Goldenberg & Goldenberg, 1996). Opposing, "open systems" are flexible and adapt to change effectively, and are marked by open, constructive communications among members of the system. Current research reveals that present digital communication satisfaction is likely influenced by systemic functioning historically (Gentzler et al., 2011; Lee et al., 2009; Sarigiani et al., 2013). Attachment relationships represent, in this context, an indicator of how the system has functioned over time. The integration of digital technology serves to exacerbate and perpetuate the nature and quality of these attachments. Thus, to fully understand satisfaction among emerging adults and their parents, it is crucial to consider the historical context within which this relationship occurs.

SOLUTIONS AND RECOMMENDATIONS

Understanding parent-emerging adult relationships in the digital age is critical. Having knowledge of how digital communication and media impacts parent-child relations deepens our awareness of how completely technology has permeated our relationships. Not only does digital communication affect the quality of parent-emerging adult relations, but it may also directly and/or indirectly influence healthy psychological adjustment, independence/autonomy, and identity formation during this time of life. Although there remains a paucity of research devoted to this area of inquiry, the research that has been conducted speaks to the multifaceted ways that digital communication technology can influence parent-child relationship quality and satisfaction during emerging adulthood. This is not a linear relationship.

Satisfaction with digital communication relates to means of communication, current and historical family system functioning, parent-child roles within the family system, and expectations/rules for when contact can be made and what can be discussed, among other influential factors. The complexity of this relationship provides multiple implications for family life educators as well as clinical mental health professionals who work with emerging adults and/or their parents.

Preventatively, family life educators should provide information for emerging adults and/or their parents regarding the multiple ways that digital technology should be discussed and negotiated. Included in this information should be rules and expectations regarding when digital technology can be used, what can be discussed through digital technology, what is the preferred type of digital technology to be used to communicate, and how to competently utilize digital technology (primarily for parents) when communicating. Providing parents with information about the developmental goals of emerging adulthood and the importance of allowing for change while maintaining the stability of close emotional ties with their child, and considering how digital communication technology may facilitate and/or hinder this process, is important.

Mental health professionals (such as individual therapists working with emerging adults and family therapists) should assess the ways that relevant digital technology may be creating and/or perpetuating parent-emerging adult conflict. Further, aiding emerging adults and/or their parents to establish functional rules and expectations around the use of technology for communication purposes may help in reducing conflict and increasing a sense of cohesiveness and support within the family system. Professionals should also consider historical patterns of attachment when conceptualizing current family conflict regarding the use of digital communication technology.

For family life educators and mental health professionals, utilizing a systems perspective to conceptualize how rules, roles, boundaries, and historical functioning influence electronic communication on parent-emerging adult relations is useful. This perspective provides a framework for both understanding and explaining the nuanced ways that technology impacts the health and quality of relationships during this time. Further, it is critical for professionals to consider the implications stemming from the failure of the family system to renegotiate rules and roles, observe appropriate boundaries, and adapt to the use of digital technology effectively. The inability to adapt places the family at risk for entropy (Goldenberg & Goldenberg, 1996), which is marked by systemic decay, disorganization, and disordered functioning. It increases the likelihood of conflict within the family during a critical phase of human development. This conflict, in turn, may negatively influence the developmental trajectory of the emerging adult. From a broader perspective, the inability to adapt and grow effectively may hinder the family's ability to respond to demands in times of prolonged stress and/or crisis. During this time there may be a regression toward old, ineffective rules for communication. The professional plays a vital role in preventing this regression from occurring through the use of systemic assessment/intervention and the provision of information that aids the ability for families to clarify rules, roles, and boundaries related to technological integration successfully.

FUTURE RESEARCH DIRECTIONS

Though the current base of literature on the influence of digital technology on parent-emerging adult relationships provides foundational knowledge on the topic, there are still many unanswered questions that warrant exploration. This area of scientific inquiry is still in its infancy, and further quantitative and

qualitative research is necessary to enhance our knowledge of how technology influences parent-child relations during emerging adulthood. In a review of digital media and emerging adult development, Coyne et al. (2013) note that "we know almost nothing about how emerging adults and parents use media and this represents a particularly useful area for future research" (p. 133). Emphasized here is the importance of forging new lines of inquiry exploring various aspects of the relationship between digital media and family functioning during emerging adulthood. Doing so will potentially explain differences within different family systems and subsystems, as well as address the heterogeneity that exists within our emerging adult population.

One area of future research is analyzing the role of fathers in parent-emerging adult digital communications. Having supportive relationships from both parents likely increases the emerging adult's sense of comfort and confidence as they move toward independence. The literature base suggests differential relationships among emerging adults, mothers, and fathers in relation to digital communication (Child & Westermann, 2013; Hofer & Moore, 2010; Lee et al., 2009; Miller-Ott et al., 2014; Sarigiani et al., 2013). Research suggests a more active role being played by mothers, while fathers are more passive and distant in their digital relationships with emerging adult children. Hofer and Moore (2010) strongly encourage fathers to initiate and sustain contact with their children. Further research is warranted to tease out the factors that differentiate mothers and fathers and should especially investigate the roles, rules, and history functioning within the family system that contributes to the father's place within the periphery of digital communication with their emerging adult child. From a family systems perspective, understanding family organization is pivotal for understanding interactional patterns and overall functioning. Finding the underlying historical, cultural, and systemic reasons for this difference could provide answers that bring fathers into a more active role within their child's life and, in turn, increase both relationship satisfaction and successful developmental outcomes for emerging adults.

Future research should also expand the subject base. The literature base currently relies heavily, if not exclusively, on digital communication between parents and emerging adults who are making the transition from high school to college. Given that emerging adulthood ranges from ages 18 to 29, it is logical to assert that digital relationships may evolve as the emerging adult moves closer and closer to the independence, self-sufficiency, and personal responsibility associated with adulthood. Little is known about how digital relationships change during the course of emerging adulthood. Longitudinal and cross-sectional studies that compare the influence of digital technology on parent-emerging adult relationships across this entire period are needed. This could shed light on the stability of digital communications during this stage and could potentially highlight shifts in their use over time. Research in this area may emphasize the changing needs and expectations/rules related to digital communication for emerging adults as they mature.

The current research base relies heavily on the use of undergraduate college students, thus neglecting potential differences in digital communication quality, style, and patterns among parents and other subsections of the emerging adult population. Little, for example, is known about how emerging adults who do not attend college and their parents relate within this "digital age." Arnett (2015) describes the developmental period of emerging adulthood as one that contains significant heterogeneity among its members. There are multiple paths toward adulthood and differences within this group should be acknowledged and appreciated. Providing research attention to how digital technology influences relationship quality/satisfaction for non-college attending emerging adults and their parents is significant. Coyne et al. (2013) echoes the need for investigating digital media use among non-college samples. They suggest,

in line with Aquilino (2006), that researchers focus more on samples that contain emerging adults who do not attend college or who attend community colleges or vocational/technical schools. To offer even more depth and texture to the current base of literature, studies that sample emerging adults who live at home versus independently should also be conducted.

Finally, examining other forms of digital technology may lead to a greater understanding of emerging adulthood and parent-child communication. As forms of digital technology are ever evolving, future research should focus on how more recent social media platforms (Snapchat, Instagram, Twitter) serve to facilitate or inhibit parent-emerging adult communication.

CONCLUSION

Digital technology has revolutionized how individuals communicate with one another. We now enjoy instant access to others, regardless of their location. A primary developmental task of emerging adulthood is the renegotiation of rules between emerging adults and their parents. Rules for use of digital communication between emerging adults and their parents is a critical component of this renegotiation. The available limited literature suggests that digital technology undoubtedly affects the relationship quality and satisfaction between emerging adults and their parents. Research reveals that satisfaction with digital communication among emerging adults and their parents is related to various factors associated with the type of technology utilized, rules/expectations for media use, competence related to media use, and present and historical family functioning. Family Systems Theory provides a useful framework for understanding this impact. As the emerging adult strives for autonomy, the family system must adapt to accommodate this pivotal developmental goal. This framework aids in understanding how the family balances relational change and stability within the digital world. Further, it provides a solid theoretical foundation for future research, family life education, and clinical practice involving family communication during emerging adulthood as new technologies become available.

KEY TERMS AND DEFINITIONS

Boundaries: Established limits that distinguish a family system and differentiate the members within the family system.

Closed System: A system that struggles to adapt, resists change, and lacks constructive communication between family members.

Digital Communication Technology: An electronic method of interaction among individuals, such as text messaging, cell phone calls, or social media websites.

Emerging Adulthood: A theory describing human development between the ages of 18 and 29. This period is marked by several distinctive features.

Entropy: Disorder or chaos resulting from lack of information or input from outside of the family system as a means of resolving a crisis or problem.

Family Systems Theory: A theoretical framework that suggests that the family is composed of a variety of relational subsystems that influence each other and the family unit as a whole. The system organizes to adapt to the changing needs of its members while simultaneously working to maintain a sense of balance.

Homeostasis: The ability of the family system to use outside information and feedback processes to maintain internal stability.

iConnected Parenting: A cultural trend in parenting in which technology is utilized to communicate and enhance parental connection with their child.

Morphogenesis: The ability for the family system to adapt and grow.

Morphostasis: The ability for the family system to maintain a sense of balance and stability.

Open System: A family that is flexible, adapts to change, and has open, constructive communication between members.

Redundancy Principle: The tendency for family members to interact using rules/roles in a repetitive sequence.

Chapter 69
Designing Pervasive Virtual Worlds

Everardo Reyes-Garcia
University of Paris 13, France

ABSTRACT

Virtual worlds can be approached in a broader sense of that which refers to common conceptions of virtual reality and immersive environments. This chapter explores the design of virtual worlds in a time when much contemporary media is accessed through and simulated by software. Today, the main extensions of man are cognitive skills and experiences. Software is a way of seeing the world; it plays a central role in media design and distribution. Software and perception of reality are intertwined and pervasive: media not only exist in form of software but the shape and properties of media are also designed with software. In order to understand the implications of computational media, it is necessary to re-articulate problems in a creative and virtual manner. At the end of the chapter, the author speculates on design approaches and presents some examples developed by him.

INTRODUCTION

Today, many types of media have been translated into electronic forms and formats. One of the main consequences of this situation is that most forms of media are now created, accessed, distributed, shared and modified by electronic means. In this scenario, the computer has become one of the most important media because it allows not only to simulate old media but also to extend and virtualize them. The interrelationships of hardware, software and code are the fundamental basis of modern media.

But mastering a computer is not the only necessary skill for media design. It does not fully encompass the complexity of the medium. In a reverse direction, the challenges for designers of media have broadened. Among other complexities, we mention three. First, media is designed with software, which implies to learn how to use software but we also need to understand how the computer works in order to create our own software and different manners to design media. Second, as the massive adoption of computing and human-computer interaction evolve, it also comes with the establishment of conventions, i.e., determined structures based on patterns and practices. To what extent is it useful to move outside

DOI: 10.4018/978-1-5225-3822-6.ch069

these conventions? How can we identify conventions? How can we embrace and criticize them for the sake of creativity? Third, software shares some features with natural language and culture, specially regarding its evolution. It happens that some changes can be observed easily but some others are more difficult to notice. For instance, in the fashion industry trends can be celebrated from year to year, but this is not the case in natural language where changes occur at the level of idioms, jargon, syntactic and semantic models of language (new words, new meanings, new languages, etc.). In software, we can observe new features and styles from one version to another, but it is more difficult to detect evolutions in data structures, programming paradigms, algorithms or abstractions.

In this chapter we revisit the notion of pervasive virtual worlds, as previously investigated in 2011 (Reyes, 2011). Our intention with this notion was to understand the emerging environment that combines analog and electronic media. Our focus was on everyday life, where we are constantly extended by portable devices but also by amplified objects in the environment. The ecosystem of connected objects and the processes and actions we can perform on them give rise to electronic realities, which are as real as the 'real world'. So the task is to take advantage of the coupling of analog with electronic in order to design augmented experiences by creatively and constantly questioning the virtual and real worlds. The notion of 'virtual world' is approached in a broader sense of that which refers to common conceptions of virtual reality and immersive environments. We rather consider the virtual as a state of being, thus making reference to the philosophical strand.

In the following section we start by reviewing the notion of 'pervasive virtual worlds'. Then we discuss software as medium, taking as a departing point the definition of media elaborated by Marshall McLuhan, which observes them as technologies that extend or restrain man. From here, we will then put particular attention on media within the continuum of technological evolution and innovation. And to conclude the first section of this chapter we present and discuss two analytical maps of the computing medium, which were created from of its main forms and structures. Through these maps, we try to identify patterns and trends in the era of cultural computing.

The last section of this chapter explores a couple of examples inspired by the idea of pervasive virtual worlds. Our examples are informed by research on digital humanities, speculative computing, aesthetic provocations, design by disruption, experimentation and media art. The projects and experiments selected for the discussion serve also as conceptual tools to think about the virtualization of man.

BACKGROUND: PERVASIVE VIRTUAL WORLDS

The classic definition of virtual worlds, also referred to as 'artificial worlds' or 'virtual environments', comes from research on computer virtual reality. The first innovations in this field started during the 1960s. Prominent examples of pioneering systems include the "Sensorama Simulator" by Morton Heiling in 1960, and the "Ultimate Display" by Ivan Sutherland in 1965. Short after, the first artistic virtual worlds were developed. David Em, while artist in residence at NASA, created "Aku" (1977), "Transjovian Pipeline" (1979) and "Persepol" (1985). From this tradition, a virtual reality system has been defined as

… an interface between a man and a machine capable of creating a real-time sensory experience of real and artificial worlds through the various human sensory channels. These sensory channels for man are: Vision, Audition, Touch, Smell, and Taste (Burdea 1993, cited by Boulanger 2008).

From the context of our contemporary ecosystem of electronic media and devices, we believe it is necessary to understand virtual worlds as something more like 'pervasive virtual worlds'. The term 'world' should be understood in a broader sense, both physically and metaphysically, as a reality, a context and an environment; as it is known and experienced by a series of actors; as a unit or whole containing its own forces and rules in a transcendental way. As we will develop further below, the world exists independently of humans. Following recent works on the philosophical tradition of 'realism', humans are only one actor among others in the world. There are also things, objects, ideas, in the world, and all should be granted equal ontological status, what has been called 'flat ontology' (Bryant cited by Bogost, 2013). This approach to the world is valuable because it tries to move beyond a human-centered tradition where the world is only seized and understood by humans and its possibilities (sensory channels, language, cognition), what has been called 'correlationism' (Meillassoux, 2012). If we humbly accept that the world is more than we know, 'realism' allows to speculate on the phenomenology, ethics, politics and aesthetics of all things in general.

Regarding the term 'virtual', we use it from a philosophical perspective, that is, as one of the four states of being that coexist together: the real, the possible, the actual, and the virtual. The notion of virtual derives from the work of Gilles Deleuze, inspired by Henri Bergson. Pierre Lévy has summarized and discussed, through examples of digital culture, the virtual mode of being in the world. First of all, the virtual is not opposed to the real, however the former is latent and the later is manifest. The four different states of being are noted as manifest or latent. The real and the actual are manifest; they are the result of events. The possible is the latent state that tends to the real (realization) and the virtual is the latent state that tends to the actual (actualization). The opposite direction, from the manifest to the latent state also exists. From the real to the possible it is the potentialization and from the actual to the virtual is the virtualization.

The relevance of considering these four states of being resides in identifying two different modes of creation. For example, when something is created, it can be done either in: first, a more innovative or, second, in a more standardized form. This is not to say that there is no creativity in the standard, but only that its focus is on the practical achievement of something and not in the questioning of the existent. Of course, innovation may rise from standards and when the standard was first invented it was once a creative type, but as it is widely adopted it becomes more and more a repetition and not a difference (Deleuze, 1968). However, when something is created in a creative manner, it explores and approaches a solution in a different way. This is the actualization. The creative thinking implies to refashion, modify, remix and combine elements. And when this creative solution is questioned and re-articulated it is being virtualized.

The given example might suggest that the virtual state is an exclusive feature of the human specie. However, we believe it is not. In that case, it would be a contradiction with the realist perspective of the world. We are rather inclined to think that other actors perform virtual processes that indeed cannot be fully understood by humans due to the fact that we perceive them only through our senses and capacities. For instance, consider biological evolution, which studies how new species appear and evolve to better adapt to the environment (Darwin, 1859). Perhaps the natural process acts instinctively and modifies ADN accordingly, but it certainly cannot foresee in advance which changes will happen in the environment. It is difficult for a human to perceive and note directly when and how such changes occur. The scale is very small (molecules, cells, atoms) and the time is very slow (millions of years) for the human senses. But, can evolution of species be related to virtuality? It is not our intention to speculate on answers about this question, we only want to recall the importance of the philosophical questioning of virtuality from a

realist perspective. In this direction, we point the reader to the work of Manuel De Landa. He identifies himself as a 'realist' and has devoted a book on virtuality based on Gilles Deleuze (De Landa, 2002).

The notion of 'pervasive virtual worlds' is also an attempt to describe the analogical and electronic world that is mixed, extended and mediated through media. As we will see later, media will also have to be understood broadly, something more related to techniques and technologies than to mass communication media. Pervasive virtual worlds are made of concrete and simple forms, but also of abstract and complex ones, produced by the interaction of heterogeneous actors: individuals, things, objects, machines; these forms can be physical but immaterial as well. Furthermore, recalling the idea of the world as larger than human perception and understanding, some forms can even be unknown for some actors of the world.

An example of pervasive virtual world could be all those projects that rely extensively on the ecology of portable devices and communication networks. As it has happened, the explosion of cell phones has overpassed personal computers, so there is a portable device with almost everyone, everywhere. These devices do not only function as telephone but also as text machines, typewriters, game platforms, multimedia centers, to mention some. Such ecology of media has virtualized actions of individuals and places. We can extend our presence into several places simultaneously: while we are physically in a geographical location, we can be acting in a remote place at the same time. Accordingly, the type of action we perform remotely can be very similar to those we perform in the physical space. Of course, the type of presence is electronic, however this is as unique feature of computer virtual worlds. Pierre Boulanger has identified 'virtual reality systems' as general-purpose presence-transforming machines. The importance of presence, says Boulanger, deserves greater attention as recent psycho-physiological studies show that participants exhibit similar reactions to presented situations as they would in similar situation in real life, e.g., they behave the same: show fear reactions, perform tasks in 'normal' manner, show socially conditioned responses (Boulanger, 2008).

In a pervasive virtual world, presence can be simulated through media or experienced physically. One of the fundamental changes in media design (of both content and interfaces) has been precisely to translate old media into digital formats, but at the same time new kinds of media are invented in the process. At the center of this turnover, software, hardware and code play a decisive role in the materialization, perception, understanding, creation, evolution and virtualization of media.

Media, as we mentioned earlier, needs to be studied in the largest possible sense and allowing different entry points for their analysis. For example, media has proven to be a rich objet of study through the seminal notion of 'remediation' (Bolter and Grusin, 1999), a term inspired by Marshall McLuhan's understanding of media as 'extensions of man' (McLuhan, 1964). But there are other interesting notions related to media: 'artifacts' and 'devices' in the sense of Michel Foucault and Gilles Deleuze; 'artwork' or 'text' for semioticians like Roland Barthes and Umberto Eco. And what about virtuality? Indeed, Pierre Lévy has revisited McLuhan's notion and formulates that media are really virtualizations of actions, organs and things (Lévy, 1998).

To discuss an example let's take the act of hammering, also commented briefly by Lévy. Hammering is a virtualization of the act of pushing or pressing a surface against another one. From the point of view of McLuhan, the stone could be seen as an extension of the fist and the hammer as an extension of the arm. Once the action has been virtualized, it can be accomplished with other things and communicated even in the absence of stones and hammers. To adventure in a further step, we can advance that hammering has influenced the act of 'buttoning', i.e. pressing buttons as implemented in machines and their following remediations in digital user interfaces. These two actions are both related to 'contact' and we will explore them in more detail in following sections. For Lévy, he observes that in the

history of virtualizations there is a small number of virtualizations but a large number of realizations: How many times the act of hammering has been discovered in opposition to how many times people have hammered throughout history? For those readers familiar with semiotics, this idea finds echo in the distinction between type and token; the invention of a word and its utterances. Moreover, it is also related to the concept of 'technical object' as elaborated by Gilbert Simondon:

… the technical object is specified by the convergence of structural functions because there is not, at a given epoch or time, an infinite plurality of possible functional systems. Human needs diversify to infinity, but the directions of convergence of technical species are of a limited number (Simondon, 1969:23, our translation from French).

To conclude this part we want to argue that the notion of pervasive virtual worlds offers a different view for designing media simulations and exploring new communication models. Virtual worlds are pervasive because there is an ever-increasing quantity and types of devices connected between them: from mobile handhelds to ambient intelligence to the internet of things. But simulation, communication, extension and virtualization do not depend on those artifacts to flourish because they are latent. As we have seen, organs and actions are being virtualized in artificial worlds from the perspective of human beings (such as teleporting in Second Life or changing perspective in physical world trough an Oculus Rift), but there is still a lot of work to do if we approach virtualization from the vantage point of things, objects and ideas for example. This is to suppose that we could speculate on virtualizing acts done by things and then to apply them or combine them with human or object actions. Moreover, actions have become more and more simulated in digital environments (representations and digital restitutions), and it is interesting to note that these virtualizations can in turn re-enter the process of virtualization and be actualized again; something like an n-degree of virtualization. In these terms, potentially anything can be used as media: either to communicate with it or to study its communicative possibilities or to analyze its effects at other human and non-human levels. If we come back to some claims from the speculative realism, an actualization of these acts would follow a similar path of what Ian Bogost has called 'alien phenomenology' or to approach what is like to be a thing (Bogost, 2013). In a more modest endeavor, we can start by understanding media and techniques as the result of visions of actors and events that were influent at their origin and through their evolution. These visions have often had different and multiple sources of inspiration, such as a passions, needs, problem-solving. In the end, media and techniques represent modes or ways of seeing and acting in the world, they shape *ways of being* (Winograd and Flores, 1986). The invitation is to start tracing and documenting media, technologies, sciences, and art by taking into account aesthetics, politics, ethics, technics and material aspects. If a catalog of virtualizations of organs, actions, and things could exist we could not only understand media better but also consider different approaches to creative innovation.

SOFTWARE AS MEDIA

In the evolution of digital computers there has been a major revolution regarding their social and cultural role: the development of human-computer interaction, mainly led at Xerox PARC in the 1960s. It is safe to situate at that time various inventions still in use today: among the most popular, the mouse, the pointer, hypertext, videoconferencing and graphical user interfaces. It is interesting to recall the fast

pace at which computers evolved afterwards. In the following decade, during the 1970s, two of the most influential programming languages were developed: first, Pascal, designed by Niklaus Wirth between the universities of Stanford and Zurich, influential in procedural programming; second, Smalltalk, at Xerox PARC, influential in object-oriented programming. These languages, together with the advancements in hardware and operating systems, allowed computer designers to create another kind of software: software to design media. For instance, one of the most influential software in cultural digital imaging has been Photoshop, developed in 1987 mainly with Pascal (at least 75% of the source code was written in Pascal) for the Apple Macintosh by Thomas and John Knoll.

By the 1990s the computer was already seen as a media machine and a variety of media software started to be used and sold (Manovich, 2013): Aldus Pagemaker (1985), Adobe Illustrator (1987), Director 1.0 (1988), 3D Studio (1990), Pro Tools 1.0 (1991), After Effects (1993), Maya 1.0 (1998), etc. Nowadays, we believe there are at least two greater impacts of this cultural computation turn. First, media is primarily designed with software, which implies that media designers must learn how to use computers and software, and even at to some point to write scripts and to install plugins to extend the basic options of software applications. Second, if media is designed with software, what about the design of software to design media? Why does software includes this or that function? Why should it be used in the way it exists? Indeed, as we mentioned before, media, software and technologies in general, represent the actualization/realization of the visions of actors (a complex that includes humans, things, worlds, simulations, events, technical objects) that identified and developed a way of seeing the world and acting through it. Software is thus what needs to be learned if we want to go further in the design of new media.

In this section, we explore these two impacts: the design of media with software and the design of media software. This task is of course enormous, thus the scope of the present chapter will only be to sketch some directions that require further research and development. In some cases we will be able to give empirical examples from experimental projects in digital humanities. So instead of describing a design methodology, we rather discuss four main dimensions that should be taken into account in the design of pervasive virtual worlds: 1) technical-archaeological; 2) standard-conventional; 3) cultural-cognitive; 4) computational-digital. We need to remark that there is no hierarchical value behind this list, all items are equally important.

First Dimension: Technical-Archaeological

The first dimension sees media as technology. The aim of this approach is to adopt a similar perspective of media archaeology, which has been elaborated by academic researchers such as Siegfried Zielinski, Jussi Parikka, Friedrich Kittler and Oliver Grau, among others. Media archaeology attempts to uncover histories of media "through insights of past new media, often with an emphasis on the forgotten, the quirky, the non-obvious apparatuses, practices and inventions" (Parikka, 2012:2). In our current context, the importance to consider media archaeology is to investigate the several virtualizations of actions, organs and things as well as their implementation through technological means.

As we mentioned earlier, in this chapter we consider media in its largest possible conception, which is necessary to analyze it from different angles. In relation to technology we have already remembered that Marshall McLuhan defined media as extensions of man. In his famous book "Understanding Media" (McLuhan, 1964), he analyzed television, radio and comics, but also the wheel, garment, money and fashion. So media is a vast field which most of the times cannot be seized in its totality because we are

immersed into it, both physically and cognitively. As media archaeologist Siegfried Zielinski suggests: "all we can do is to make certain cuts across it to gain operational access" (Zielinski, 2006). For him, these cuts are of two kinds: built constructs (interfaces, devices, programs, technical systems, networks) and media forms of expression and realization (film, video, books, websites, machine installations).

To discuss the relationship of media and technology, we will mainly concentrate on those 'built constructs'. The design of media with software has been largely inspired by previous media, but also by general-purpose devices and techniques. The software available to design media has envisioned the functions of previous media. For instance, a software like Photoshop has remediated operations from the field of painting, drawing and photography. Of course, we cannot say these functions are mere simulations of ancient techniques, they have been translated into computational forms where they interact with techniques from other domains. For instance, while an artist who uses analog tools may paint and draw on canvas using brushes, pencils and other inscription technologies, in the computer environment she disposes of simulations: icons representing those tools that can me customized with parameters. Both domains create a new hybrid medium: multiple types of brushes in a single software application, accessed through buttons, sliders, menus, panels and other conventions.

To conduct media archaeology with the intention of analyzing the design of media with software requires looking back at representations of previous tools and techniques but also the virtualizations of actions, organs and things. In other words, it assumes that there are actions that have already been virtualized and that those virtualizations have been translated into technical objects and then to computing forms. It will be interesting to put special attention in turnover cases, i.e when a radical new tool and/or a way of being is introduced, because it points to a state of actualization of a virtual idea. The evolution and analysis of media software is a complex matter because those virtualizations arrive when new problems are explored that, in turn, could only emerge through the translation of past new media into computational forms.

To exemplify the complexity of layers intertwined inside a media software, let's come back to our previous case of hammering. As we said, the act of hammering is a virtualization that, in terms of McLuhan, extends the fist and the arm. We mentioned earlier that hammering is related to buttoning, given that both actions are based on contact. Allow us now to reveal some situations that should be considered if we want to study push-buttons as elements of the graphical interface in media software.

It seems we need to start by addressing the hand. Sigfried Giedion has made important observations about the human hand, which can point, seize, hold, press, pull, mold with ease. It can search and feel. Flexibility and articulation are its key words (Giedion, 2013:46). However, the hand has limitations and, above all, the main limitation is it cannot act endlessly. For Giedion, "the first phase of mechanization consists in transforming the pushing, pulling, pressing of the hand into continuous rotation" (Giedion, 2013:47). One may wonder about the reason why motion is evoked. In fact, Giedion makes the argument that 'movement' is closely linked to 'rationalism'. He stresses how often contradictory visions of the world have influenced our understanding of science and techniques: temporal vs eternal, rational vs irrational, internal vs external. For a society in the quest of progress, the last state to reach is perfection, so it is in a temporal mode rather than in an eternal one. In order to reach this goal, it needs to capture and dominate movement, to control it and to fix it, not to liberate it.

Would it be possible to say that our graphical user interfaces are virtualizations of pushing, pulling, pressing? The case of push-buttons might tell us some clues. As we know, push-buttons are almost ubiquitous in today's GUI. Buttons function along with pointers. The basic case of use is: the user manipulates the pointing device, she moves it and clicks on it (press, hold, release). These actions are

represented on the screen: the pointer moves around the screen and, if it is accordingly positioned over an electronic representation of a button, it launches an action in the system. We believe one of the first virtualizations behind this simple scheme is the action of switching states and their associated processes.

The virtualization of pushing, pressing and pulling is at the heart of inventions such as the hammer and the bow. Many implementations of these actions can be found in objects such as springs, which were adapted for first mold-based locks in XVIII century. Other virtualizations can be found in pipe organs. During the XIV century, organs constituted one of the most complex inventions of that time. The basic components of pipe organs are very telling for us: the arrangement of pipes, a wind system and a key desk. The place where the user controlled the whole system was the key desk, and comprised manuals, pedals and stop controls. In order for the organist to perform a musical piece, some actions were performed. First there was a secondary user who fed the system with wind. Then the organist relied on the tracker action, which is the mechanical connection between the key desk and the wind system. The series of acts of pressing and pushing on manuals and pedals functioned along with the combination of stops, which was basically turning on or off the passage of air.

Yet another virtualization in the history of push-buttons can be seen in first electric telegraphs, which virtualized some operations and mechanisms of the pipe organ. Not only the user interface of the first telegraphs resembled pedals and manuals, but also the basic principle of switching on and off, however in this case the detection of electric current.

Switching states is one of the virtualizations behind push-buttons. But now let's consider the 'play button' as it exists in media players such as Apple Quicktime, in media authoring software such as Adobe After Effects, Autodesk Maya, Adobe Acrobat, and in programming environments such as Processing. It is possible to identify the play button as a remediation of previous buttons that appeared in recording devices that required to playback recorded signals. In this case, the act of switching on/off conveys movement from different angles: play a movie (QuickTime), preview a film montage (After Effects), go forward or go next (Acrobat) or compile a programming code (Processing). What happens now is that the action of pushing a button in an electronic environment is associated with larger series of processes and algorithms. This means that switching between 0 and 1 corresponds to modifying the entire system, from state A to state B, which may alter state C, and in turn state D.

To pursue our example, the task now would be to identify those processes and the virtualizations of actions, organs and things. But to do that it is necessary to conduct more research and to document empirical results. Today, media archaeology is still in its early stages. We need more projects that tackle the relationship between media and technology in an evolutionary perspective. We need to interrogate where do our tools come from? How are they related to past new media? What was at stake at the origin of the invention? How the invention altered other technologies? How media virtualizes us and things? An example of such endeavor is the Media Archaeology Lab, presented in 2011 by Lori Emerson. The project aims at documenting hardware, software, peripherals and individual collections that explain how tools were used in the past (MAL, 2013).

Second Dimension: Standards-Conventional

There are a series of passages that occur in the life of inventions. The time in which those passages is accomplished could take years or even decades, and sometimes the passage might not take place until centuries later. Those passages go from the latent state to the manifest, from the virtual to the actual. The process starts in small scale. Gilbert Simondon has called the 'abstract object' to that moment of

technical species when they are only known to their direct actors involved with the invention. Then, as the object interacts with others and the actualization of actions and transformations gets recognized, it could be that technical objects tend toward its 'concrete' phase. To be 'concrete' means that the object has evolved intrinsically and externally, within its parts and to its users and ecosystem. In the concreteness, the technical object couples in equal ontological manner with the user. No one is manipulated by the other, rather both cooperate for the same purpose.

The case of media design of course does not escape standardization and conventionalism, however we believe we are still far from the concreteness state of digital media. Standards and conventions allow media to consolidate a vocabulary, its syntax, its rules, its semantics; that allow to be communicated and foster the exchange of parts and modules. On the other hand, if pervasive virtual worlds would tend to full concreteness they would no longer be virtual, but possible, from the philosophical perspective that we discussed before. The point of virtual worlds is precisely to remain in constant dynamism and to motivate creative questions about them.

In the last section we borrowed from Zielinski the terms 'built constructs' and 'media forms of expression and realization' with the intention to make evident the distinction between media container and media content, respectively. As we will see, conventions and standards exist for both forms.

Let's take a brief look at conventions in media content. The investigation about conventions in film, radio, TV, games and other kinds of mass media has been done mainly in the field of humanities and social sciences, particularly in media studies, communication, information, humanities, literature, etc. From the moment a technical object or a new media is released to public at large, there has been noted a gap of thirty years until the first conventions appear. Alexander Galloway calls this gap the 'thirty-year rule', starting from the invention of a medium and ending at its ascent to proper and widespread *functioning in culture at large* (Galloway, 2006:85). In film studies, to mention an example, we can observe this gap between the introduction of the cinématographe, by Louis and Auguste Lumière in 1895, and the use of visual narrative techniques by David W. Griffith in a film like "The Birth of a Nation" (1915) or in rules of montage posited by Sergei Einsenstein in films such as "The Battleship Potemkin" (1925).

We use the notion of convention in similar terms as Janet Murray does: "social practices and communication formats shared by members of a culture or subculture, as well as media formats shared by artifacts within the same genre" (Murray 2012:415). This definition also considers the distinction between media content and media containers. For Murray, digital media is still in its immature phase, so its conventions have not yet fully been settled. As it has not yet passed the thirty-year rule. While other more established fields look for refinement, media designers deal with invention: "inventing something for which there is no standard model" (Murray 2012:3).

According to Murray, the move towards convention must follow a direction in which the four affordances of digital media are best exploited. These affordances are: encyclopedic, spatial, procedural and participatory. The method to follow is to design media by doing new media and, at the same time, to search for an increase of awareness in design choices, cultural traditions, cultural values, human needs and media specific conventions. While all these questions are deeply important, we also suggest that pervasive virtual worlds should adopt an open point of view in regard of conventions. Virtualization and actualization require to be informed by actions, organs, components of the widest range, even going further than human perception.

Murray is right in adopting a more professional standpoint where conventions need to solve human needs. Do we really have needs? Instead of debating around questions that go beyond the scope of this

chapter, we prefer to review three existent models that seem oriented toward the installation of conventions in digital media, if not fully in content and container, at least focused on the latter, the 'built constructs'.

First, perhaps the most advanced efforts on standardizing digital media come from software guidelines and specifications, best-practices, international recommendations, consortiums and, more recently, design patterns. Among the most acclaimed software guidelines we may cite the Macintosh Human Interface Guidelines, later changed to Apple's Human Interface Guidelines and more recently also making available the iOS Human Interface Guidelines. In those documents, Apple describes the notions of WYSIWYG, metaphors, direct manipulation and how to use the interface elements (i.e. menus, windows, dialog boxes, controls, icons, colors, behaviors and language) the Mac way (Apple Computer Inc., 1993). Regarding specifications, in 1993 the International Organization for Standardization released the ISO 9241 titled Ergonomic requirements for office work with visual display starting with requirements for Visual Displays and Keyboards. Today, ISO 9241 covers ergonomics of human-computer interaction around eight levels, going from software ergonomics to environment ergonomics and tactile and haptic interactions (ISO 2014). Another example of standardization is the World Wide Web Consortium (W3C), initiated by Tim Berners-Lee in 1994, and which is focused on standards for the World Wide Web: languages, technologies, protocols and guidelines (W3C 2014). Finally, in a more user-oriented and content-oriented fashion, we have seen recently the development of design and programming patterns. An example is the online repository Yahoo Design Pattern Library which categorizes user interface patterns around layout, navigation, selection, rich interaction and social categories. A pattern, in terms of Yahoo, "describes an optimal solution to a common problem within a specific context (Yahoo! Developer Network, 2014). Any pattern is defined by a title, a problem, a context and a solution". Although Yahoo gathers and promotes the resources, it is a social-driven catalog, where users can submit and contribute with their own discoveries.

Second, one of the underlying principles that has allowed media software to flourish and expand is the availability to interchange files and data between applications and operating systems. This is possible because data structures and data formats are common in several environments. For example, although the Graphics Interchange Format (GIF) started as a proprietary technology developed and owned by CompuServe in 1987, it can be used free today, that is to say that the technique of data-compressing with the algorithm LZW and its packaging in a GIF file can be freely used by developers. As we know, GIF animated images have gained popularity with the explosion of web-based social networks so they can be opened, distributed, embedded and produced with many different software. Conversely, the MP3 format (MPEG-1 Audio Layer III), popular for compressing audio files, is not free and media software developers would need to pay a license to the Fraunhofer Society in order to distribute or sell encoders/decoders. This is one of the reasons why, for instance, a web browser like Mozilla Firefox does not support MP3 files. Instead, Firefox relies on the open format Ogg Vorbis.

Third, it seems that many required professional skills to access to job positions influence on the establishment of 'de facto' standards. This is also true for other cultural and conventional factors such as popularity and acceptance. We can refer once again to Adobe Photoshop as an example. Despite de fact that it is proprietary and commercial media software, it remains the number one choice among graphic designers, photographers and visual artists. Recently we have witnessed that alternative solutions exist, tools developed by the open-source community: the GIMP or the online Pixlr editor. However, the Adobe culture is still dominant.

The importance of taking a look at conventions and standards from the point of view of the design of pervasive virtual worlds is to embrace a reflexive thinking about our practices and tools. If we make the

effort to detach ourselves from the continuum of everyday life and conventions, we can reinvigorate a critical and creative posture of our media. This is like natural language in culture, we don't often realize when a change was produced and suddenly we are using the same convention.

We would like to observe a final case that we believe makes the bridge with the following section. A large part of contemporary web design is done through content management systems (also called by the acronym CMS), for example WordPress; they can be extended with frameworks, plugins and libraries like Bootstrap. In the end, it seems like the design of web sites is based extensively on models and de facto standards. As a result, the web experience is more or less the same in a navigation session. Against the use of conventions, we react sometimes delighted when we see a piece of net art while navigating the web. As it occurred in the twentieth century with the installations by artists like Marcel Duchamp and Nam June Paik, who questioned and rearranged everyday objects, technologies and media, today media artists constitute an important community that questions the conventions of our electronic worlds.

Third Dimension: Cultural-Cognitive

In this section we adopt an approach more centered on the design of media software, and not on the design of media with software. The main focus is now on tools to create software. As we have seen, media is designed with software and this software constitutes the vision of actors that conceive a way of acting and accessing the world. We will now explore the design of software especially created for media production.

Media software can be broadly divided into media player software and authoring media software (Wardrip-Fruin, 2009). In this section we will focus on the latter and more specifically in those systems designed for desktop computers, instead of portable devices. The reason of this choice is twofold. On the one hand, software applications for desktop computers have existed for a larger time, so there are more lessons that can be learned from the implementation of computing forms, processes and interfaces. On the other hand, we believe mobile applications is an exciting field that requires a deeper investigation and we should accord it its own space in a further contribution.

Authoring media software, as we mentioned, inherit visions from pioneers who understood the computer as a media machine. We have also said that media software is a combination of conventions from past new media with properties exclusive of digital treatment of signals and information. In that manner, not only the established conventions should now be accessed and manipulated through graphical user interfaces, but also those conventions are informed by techniques from other domains and create new forms of designing media. Lev Manovich, in his recent book "Software Takes Command" (Manovich, 2013), observes how filters in Photoshop are varied and combined techniques from photography, painting and drawing such as blur and artistic effects. And there are also other filters that borrow actions developed in electrical engineering such as noise.

The design of media software is complex because there is always a dialectic relationship between conventions and new features. For instance, if we create a plugin, a script or a new menu for an experimental feature in already existing software, we must make it available through the given arrangement of the software. Conventions such as menus and submenus, property panels and inspectors, buttons and icons, are closely related to the operating system and middleware available to access components of the computer.

The case of software for media art is appealing because we have seen different conceptions of how to be in the world. The cooperation between digital artists and software developers has produced prominent

examples of how to remediate past new media, to access to their features and to add new combinations, actions and processes. Software like Pure Data (1996), SuperCollider (1996), Processing (2001), Cinder (2010), NodeBox (2010), qualify in this category. Reas and Fry account for the importance of software in arts: "software holds a unique position among artistic media because of its ability to produce dynamic forms, process gestures, define behavior, simulate natural systems, and integrate other media including sound, image, and text" (Reas & Fry, 2007). Reas and Fry not only talk about media and software but they are also the beginners and main developers of Processing, a programming tool specifically created for artists and designers.

In their book, Reas and Fry dedicate a useful appendix to present other development tools oriented toward art and design; and they are all programming languages. Media art software could be then better seized if understood as an authoring system where software applications and programming languages interrelate and cooperate. As we know, the great majority of software applications users mainly communicate with it though its GUI, but a lot of those programs can also be extended with scripts and computer code. This means that GUI and programming languages lay in the same container; they are like two creative modes and/or layers that can be used separately or integrative.

We must add another remark regarding this particular software dedicated to create media art. Artists have always explored and combined new materials (Shanken, 2009). In the digital terrain this often means hacking, modifying, disrupting, connecting, and remixing software components, scripts, source code and binary files (besides hardware and devices). In that form, media artists may consider any software as a potential environment and laboratory to create media artworks, even if it is an accounting application or an office suite.

What are the effects of media art software? One of the pioneers of digital art, Jack Burnham, curated in 1970 one of the first exhibitions devoted to digital art: "Software, Information Technology: Its New Meaning for Art". As Edward Shanken points out, Burnham's idea of software was of a metaphor for art: "He conceived of 'software' as parallel to the aesthetic principles, concepts, or programs that underlie the formal embodiment of the actual art objects, which in turn parallel 'hardware'" (Shanken, 1998). We agree. Most studies on art movements understand art mainly from the aesthetics standpoint, concentrating on the experiences from the visitor side, on the dialogue that was established, and the altered effects that remain at the end of the day (most of the time in the viewer, and for Burnham, also in the manipulated artwork).

Is it possible to say the similar about media art software? Is there something like an aesthetics of media art software? To tackle this question we have to direct our discussion towards 'software criticism', which completes the aesthetic approach. Software critics reflect on ethical, political and socio-historical questions.

For example, Matthew Fuller understands software as a form of digital subjectivity (Fuller, 2003). The accent is put on the human-computer interface as the window and mirror of software, but also of a series of ideological, historical, and political values attached to it. To study the HCI implies to investigate power relations between the user and the way the software acts as a model of action. This idea goes along, although not exactly formulated as software criticism, with Winograd and Flores: "We encounter the deep questions of design when we recognize that in designing tools we are designing ways of being" (Winograd & Flores, 1986).

In a recent essay, Alexander Galloway thinks about the question of interfaces and claims that they are not objects, but rather processes and effects (Galloway, 2013). He observes the computer as a set of actions that relate to the world, so he embraces the philosophical standpoint of ethics to develop his

arguments. For the author, the interface is a functional analog to ideology. Hence, the interface is not the object, but it is within it. It is manifested at the surface level of digital media, devices, and graphical representations.

Later, Galloway claims that software inherits some properties from interfaces. Software would be an allegorical analogy to ideology, i.e. more a simulation than a vehicle of ideology: "What is crucial in software is the translation of ideological force into data structures and symbolic language" (Galloway, 2013).

These brief insights into software criticism allow to think about 'media art software' differently. First, following Galloway, software functions in a dialectical fashion that requires visibility and invisibility. While computing code might be hidden as it is, only to be interpreted and parsed, at the same time, the artist/developer has a high degree of declarative reflexivity (variables, functions, etc.). This resonates with our earlier coupling of software applications and programming languages: media art can also have two entry points for software criticism and should take into account the dialectical logic between invisibility and syntax formalism.

Second, following Fuller, our practice as media artists could also be thought in terms of 'speculative software'. If software simulates ideology, then such simulations might be interrogated. Speculative software would be software that reveals its processes as it enacts them:

What characterizes speculative work in software is, first, the ability to operate reflexively upon itself and the condition of being software (…) to make visible the dynamics, structures, regimes, and drives of each of the little events which it connects to. Second, (…) to make the ready ordering of data, categories, and subjects spasm out of control. Third, it is to subject the consequences of these first two stages to the havoc of invention (Fuller, 2003).

Finally, let's come back to digital subjectivity. Nake and Grabowski seem to summarize Fuller and Burnham. They see 'aesthetic computing' as the introduction of subjectivism into computing… with all its consequences. They recall a very important aspect of software and computers:

… the computer does not directly operate on the pixels on the screen. It operates on their representations in the display buffer, and further down on this scale of manipulability are representations of other entities that form the real stuff of programs (Nake & Grabowski, 2008).

For any speculative effort on software, it seems necessary to go further down the GUI. The more we know the software, the more we can interrogate its simulations. But before simulations, there are bits and bytes, functions and classes, visual representations, etc. How can we access to them? How they relate between them? These are some questions that need to be addressed by designers of digital media and media software.

To summarize, the design of pervasive virtual worlds demands to ask deeper questions about the selection of processes and data formats that we implement in any project. Software is the reflection of cultural choices by its designers, who often take into account the cognitive framework of the final user. As we have showed with the example of media art software, the development of our tools should be accompanied by a reflective thinking that looks at ethical, political and aesthetical considerations. Furthermore, it is also pertinent to be aware of recent research on cognitive sciences and cognitive semiotics because they consider the coupling of meaning, mind and perception. Unfortunately we are not aware of

any empirical project that links software design and cognitive semiotics, however we can point to studies that are interested on 'translations' from the visual to the audio realm by using software (AGI, 2014).

Fourth Dimension: Computational-Digital

The fourth dimension in the design of media software puts attention on software and its computational aspects. It is about understanding software and computation themselves, as an object of study. So far we have traced a line of study that goes from the archaeology of media to conventions and standards to cultural and ideological aspects of media software. In this part the focus is on material properties of software. If media is created with software and if we must regard how media software is designed, then a further step is to investigate which are the components of software and how they work.

Traditionally, this area has been the subject of computer science, which explores the theory and practice of computer systems, methods, languages, structures and processes. Most of the efforts in computer science have been directed toward the optimization and performance of computer systems. However, the implication of humanists and artists has also motivated creative innovations. The case of artists in residence, like David Em at NASA in the 70s, is an example of advances and uses from the creative and artistic standpoint.

For humanists and social scientists, perhaps one of the most notable crossings between computer science and history, literature, philosophy, and cultural studies, has been the emergence of the 'humanities computing', or as it is known today: digital humanities. The first practices that emerged from this interdisciplinary convergence were based on text and its statistical processing in order to distinguish patterns and features that could assist in issues of stylometry and lexicography. More recently, digital humanities increasingly use computing methods to produce information visualization, network analysis, text mining, databases, digital publishing and even the design of software especially dedicated to assist the work of digital humanists.

As it can be perceived, art, social and human sciences hold a close relationship with computer science. Humanities have made contributions in the sense of reflecting on the human effects and consequences of computing. Recently, Bruno Latour has insisted on considering the effects of the digital on the environment (Latour 2014). For Latour the materiality required by digital data has often been neglected and created a myth around the immateriality of the digital. Digital media is very material. To put it simply, software and data are stored in devices that process information. This information can be digital, saved as binary data, but in the end it needs to be rendered analogically for human consumption. The acquisition, processing and restitution from digital to analog requires electricity to power up computers and this source of energy has direct incidence in the environment: nuclear plants, massive hangars to store hard drives and servers, together with all infrastructure necessary to maintain our current state of affairs. Materiality cannot be disregarded any longer, but in this section we will inspect another type of materiality of software, the 'real stuff', in terms of Nake and Grabowski. These material properties are their constituent elements.

Where to start in order to grasp the complexity of software and its place within the computer sciences? As an entry point we will use the Computing Classification System elaborated by the Association for Computing Machinery (ACM, 1998) with the objective to index articles and publications in conferences, journals and books edited by the ACM Press. The ACM has a three-level classification system and their descriptors. At the top level there are eleven domains: A. General Literature, B. Hardware, C. Computer

system organization, D. Software, E. Data, F. Theory of computation, G. Mathematics of computing, H. Information systems, I. Computing methodologies, J. Computer applications and K. Computing milieux.

As the computing machinery field has evolved and as researchers have published and documented their results, the categories and subcategories have grown. Is it possible to say that subcategories represent refinement in the domain? Can we say that the computing filed is dynamic instead of static, i.e. in continuous expansion? Which are those categories where refinement has taken place? Figure 1 shows a flow diagram connecting the first level with the second.

As we can see, I. Computing methodologies is the largest region and has 7 subcategories at the second level. From these subcategories, the most abundant are I.2 Artificial intelligence, I.4 Image processing and computer vision, and I.3 Computer graphics. The second largest category is D. Software, with 4 stronger subcategories within D.2 Software engineering. The third largest is B. Hardware, which has 8 subcategories mainly concentrated in B.4 Input/output and data communications, B.1 Control structures and B.6 Logic design.

In Figure 2 we show a network map with the connections between the first level and the last one, that is the descriptors. In this diagram it will interesting to note how descriptors appear in several different categories. For example, Interactive systems, Nonprocedural languages, and Standards exist both in I. Computing methodologies and D. Software. The link between I. Computing methodologies and B. Hardware is given by the descriptors Algorithms and Parallel. D. Software and B. Hardware are related by Diagnostics, Simulation, and Virtual memory. It would be curious to note there is no single descriptor that relies the three largest domains (I, D and B). The only descriptor that relies more than two domains is Standards, which is the link between C. Computer system organization, D. Software, I. Computing methodologies and K. Computing milieux. A deeper analysis will have to investigate what and why are those relationships? What are the topics and problems that scientific papers regard? Or, is it possible that more links between domains appear in the future?

While a brief analysis like this can help approaching trends in computer science, we can also try to explore a different angle directly related to media software. For this matter we will follow Manovich's definition of media: *media = data structures + algorithms* (Manovich, 2013). For him, the most fundamental constituents of media software are algorithms and data structures. For his formula, Manovich declares inspiration from Niklaus Wirth, designer of the programming language Pascal, and particularly from his book "Algorithms Plus Data Structures Equals Programs "(1975). Our intention at present will be precisely to explore data structures and algorithms in more detail.

Which are the major algorithms? And which are those algorithms particularly dedicated to media, for example images? Which techniques have been introduced by those algorithms? What kinds of data structures they use? What is the relationship between data structures and algorithms for digital imaging? How have they influenced our conception of digital media and the operations we can perform with them? Is there a place for virtualization of digital media?

Algorithms and data structures are in constant development. A field such as computational geometry, for instance, considers among its interests the systematic study of geometry algorithms, observing the "realization that classical characterizations of geometric objects are frequently not amenable to the design of efficient algorithms (…) computational geometry must reshape –whenever necessary- the classical discipline into its computational incarnation" (Preparata & Shamos, 1985). So far, we can say that the existing types of data structures are more reduced in number than the amount of algorithms. For computational geometry, Preparata and Shamos recall that the most common complex objects in the design of geometric algorithms are sets and sequences, so they must use data structures particularly suited for

Figure 1. Flow diagram of first two levels of ACM classification system (Everardo Reyes, 2014).

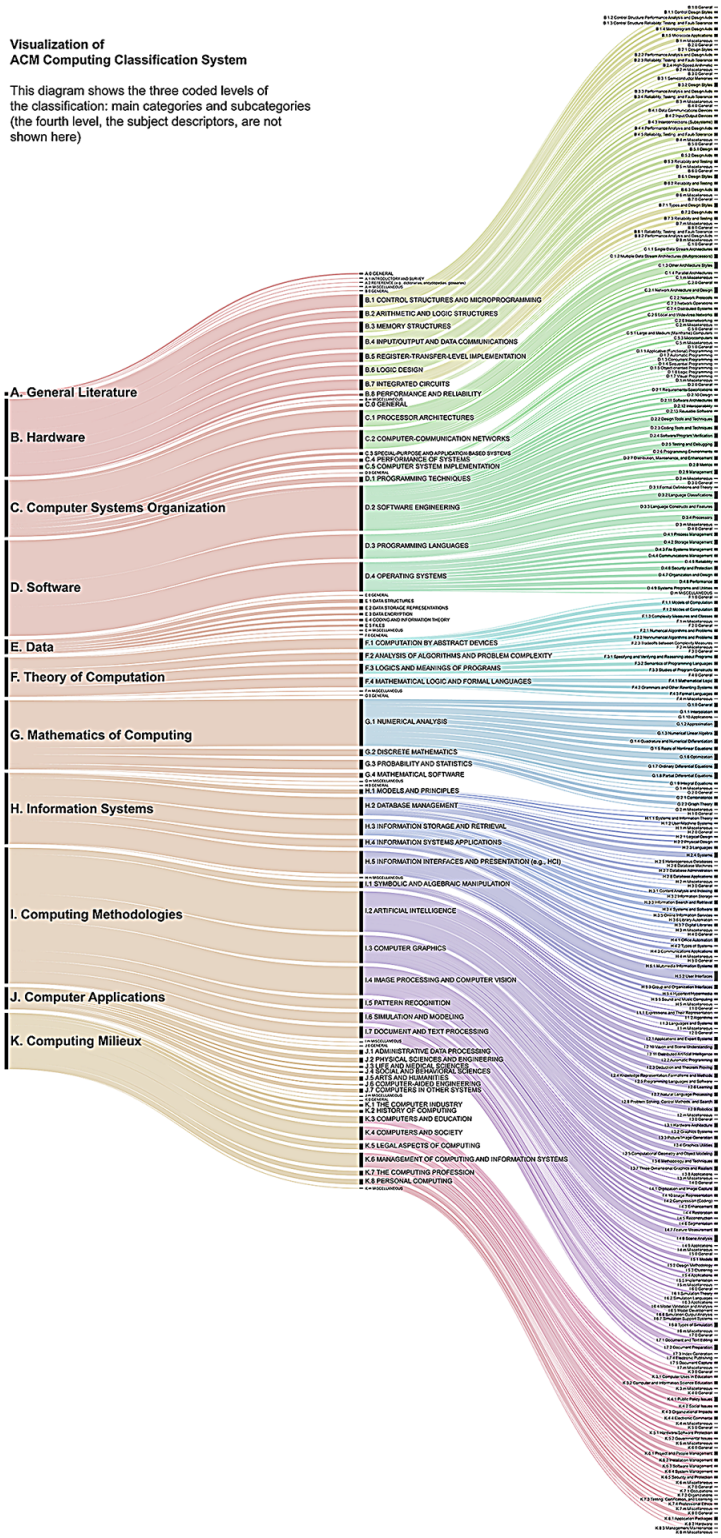

Figure 2. Network diagram of ACM classification system
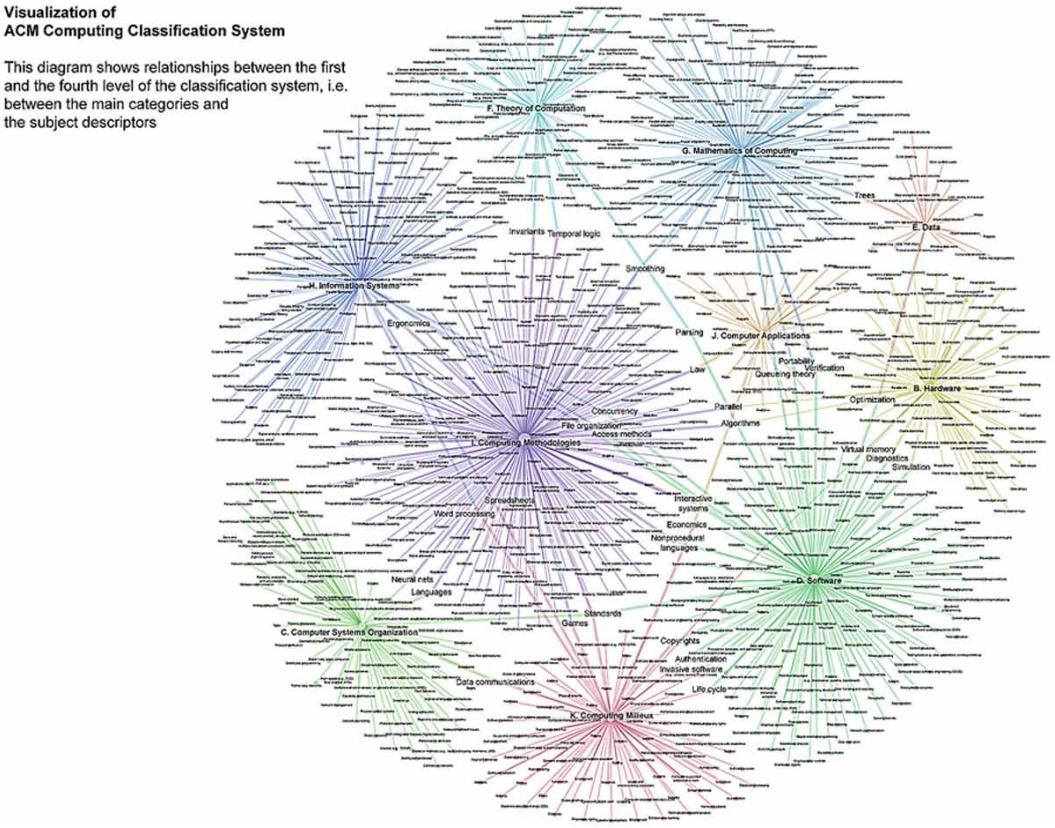
(Everardo Reyes, 2014).



these objects. This situation can be explained in a similar manner as the relationship between letters and words in natural language. There is a limited number letters and words, but a relatively infinite number of combinations and techniques to use them.

According to the ongoing classification by Wikipedia's users and editors, there are five major kinds of data structures: data types, linear data structures, trees, hashes, and graphs (Wikipedia 2014a). (Although the information available in Wikipedia is in constant change, we believe it is pertinent for the sake of our argument because it reflects the current understanding of the field by a community constituted by both specialists and non-specialists.) The primitive types of data types are perhaps the most well-known types to beginners and first-comers into computer science: Booleans, integers, floats, strings, arrays, matrices, bitmaps. Other lesser-known structures are: trees, heaps, tries, hashes and graphs. It is important to notice that data structures determine how information is structured and stored, in order to be processed by algorithmic techniques.

Algorithms, as it can be guessed, have larger types and classifications. Following Wikipedia, algorithms are classified in five types: 1) combinatorial (network analysis, routing for graphs, graph search, string metrics, etc.); 2) computational mathematics (collision detection, triangulation, discrete logarithms, computation of PI, eigenvalues, etc.); 3) computational science (algorithms of astronomy, bioinformatics, geoscience, linguistics, medicine, physics, and statistics); 4) computer science, and 5)

software engineering (database, operating systems, memory allocation, distributed systems -all of them are interesting entry points to search deeper the relation between the ACM's categories B. Hardware and I. Computing methodologies evoked before) (Wikipedia 2014b).

The fourth category of algorithms, called computer science, is particularly exciting to study because it contains many operations behind techniques in software for media design. Within the subcategory of 'digital signal processing', for example, we find image processing algorithms: contrast enhancement, dithering and half-toning, feature detection, segmentation, which are familiar in digital graphic design and scientific visualization. Other media techniques can be found in different subcategories, computer graphics algorithms (clipping, ambient occlusion, beam tracing, ray tracking), shading algorithms, coding theory algorithms (image and video compression).

The manner in which these algorithms act and are implemented in software is varied: it could be through the graphical user interface; or it could be in parallel or in sequential series; or they can be invoked by the click of one or a combination of buttons; or by parametric adjustments; or even automatically programmed upon an indirect action. Within this context, virtualizations of media may arrive by combining different algorithms and data structures. But at another level, virtualizations might also occur in the creation of new data structures and new algorithms. To put an example, let's imagine an engine to visualize the fourth spatial dimension. How to represent something that goes beyond the grasp of our senses and cognition?

TWO EXERCISES IN THE DESIGN OF PERVASIVE VIRTUAL WORLDS

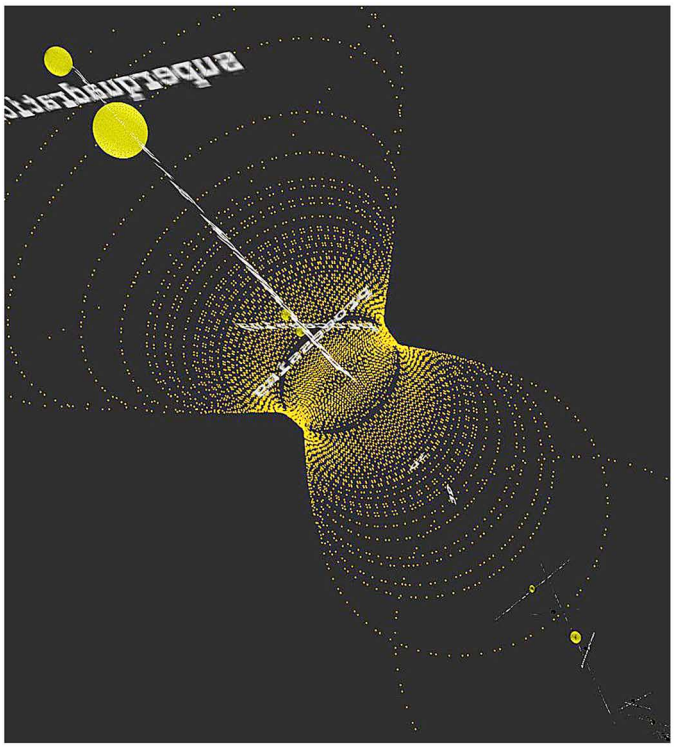
In this part we present a couple digital works developed by us. The intention is to inform the reader on the creative strategies put in practice behind our productions. In all the cases, we have tried to question standard and conventional paradigms of information visualization. Our practice is thus more related to speculative computing, aesthetic provocations, design by disruption, experimentation and media art.

Messages Vers Le Futur

'Messages vers le futur' was an installation presented at the event 'La nuit de chercheurs' at the IUT Bobigny, Paris, in September 28, 2012. The main intention of the event was to introduce science and technology to public in general. We decided to propose an installation consisting on a video projection and a computer station. In the projection the visitor saw the representation of a hyperbolic figure floating in a dark digital 3D environment. This figure was inspired from the theoretical concept of 'wormhole' in physics, coined by John Wheeler in 1967, also known as the Einstein–Rosen bridge, described as *a hypothetical shortcut for travel between distant points in the Universe* (Thorne, 1994:484).

The idea of 'Messages vers le futur' was to invite visitors to metaphorically send a message to the future. Through the computer station or through their mobile devices, they could send a message about they feelings or sensation of the present time: something appealing to them, or a recent event they lived, or something they would like to do in the future. This message could contain de hashtag #messagesfutur and so it appeared on screen in form of a 3D sphere along with the text of the message. The sphere crossed the wormhole and then disappeared from the projection. For every message sent, the user registered her email address and received the message sent one year later into her email inbox. Figure 3, shows a screenshot of the electronic wormhole and a message passing by.

Figure 3. Graphical projection from then installation Messages vers le future (Everardo Reyes, 2014).



Technically speaking, the projection was made with Processing, enhanced with the libraries Twitter API, TwitterStream, PeasyCam and Box2D. For the design of the hyperbolic figure we translated into the Processing language the mathematical formula of super-quadratic figures. We started from the main algorithm by Kostas Terzidis (Terzidis, 2009), who kindly agreed to be used as the base for 'Messages vers le futur'. Some assistance should also be credited to Eleanor Dare, who made suggestions to refine the algorithm and implementation in Processing.

The metaphor of space-time traveling was interesting to be studied. During the exhibition, it was well-received mainly by young visitors (teenagers and younger) who got the idea immediately. We received few questions about the graphical rendering. Instead, the questions were about the content of the message: what can I write? As the answer is open, users evoked the fact of messaging to a future self.

Another thing to note was the implementation of mathematical formulae. Because Processing does not have a function to draw a one-sheet hyperboloid, it was necessary to code the figure. This single aspect led to think on what other mathematical figures and surfaces does not have a computational representation though software. What are we missing because there is no access through software? Where can find alternatives to standardized software which already proposes different figures than those in Euclidean geometry? And ultimately, can we represent a fourth spatial dimension? This has been a real question in science and astronomy. Recent research at UC Santa Barbara demonstrated that, at very small nano scales, there are particles that exist in two places at the same time (Cho, 2010) or that time moves slower as we separate from the Earth's surface (Reinhardt, 2007).

In any case, what is interesting to evoke at this point is that virtualization of digital media has an opportunity with computers and electronic representation. Designers can obtain inspiration from the vantage point of objects and environment. How do objects perceive? What is like for an environment to be connected with multiple devices at the same time? How does the environment perceive the transmission of signals?

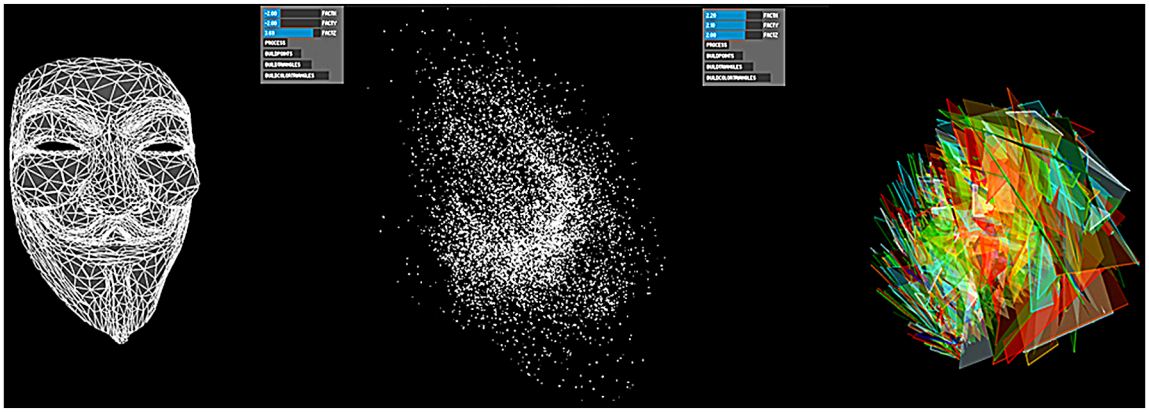
Disrupting 3D Models

3D models are generally considered as digital objects made of geometry that simulate width, height and depth inside a computational environment. Although their origins can be traced to computer graphics during the 60s, when pioneers created computer simulations, virtual reality, virtual worlds and visual effects in film, nowadays we encounter them in graphic design, video games, architecture, art, advertising, Web, industrial design, scientific visualizations, and digital humanities.

In 2012 we have developed a simple application that allows users to interact with 3D models. Technically speaking, we used Processing with ModelBuilder and ControlP5 libraries. The application basically takes a STL model and renders it in the 3D digital environment. For us, the importing process implies to read the original geometry in the STL file and to render it in its organized 3D spatial layout in form of a series of points or a formation of polygonal shapes (triangles). Once a file has been loaded, the user is able to interact inside the 3D view environment. A series of GUI sliders indicate modifications upon three factors. Additional buttons apply transformations, change mode view (points or triangles), and reset the model to its original state. Figure 4 shows an original model, the user interface and the resulting transformation.

The idea of the system is to invite users to perform transformations on the models. The resulting images from transformations are basically non-figurative. Some would be appealing but disrupting at the same time. They show how the same quantity of triangles in a model may be recomposed. Of course because STL relies heavily on tessellation, triangles are never broken apart. That means, geometry is not spread, they rather create new solid forms. If a transformation is made on the view mode of POINTS, then the result looks like a particle explosion.

Figure 4. Disrupting 3D models
Everardo Reyes, 2014).



As we mentioned earlier, we used Processing to develop our viewing/transformation system. Regarding the acquisition of 3D models, we used several different software applications depending on the input kind of model. Before developing our own application, we asked ourselves if it was possible to produce our generative transformations with existing software. Although Maya and Blender, among others, allow to enhance their functionalities with scripting code, we decided to create our own system mainly because we wanted to deploy a simple user interface to interact with objects. Indeed, Maya and Blender are complex environments that cover topics from modeling to animation and rendering. Furthermore, they handle their own file formats. It is possible to export/import to other formats but the main workspace remains the same. For us, we used STL format, which is widely adopted for 3D printing and would accordingly satisfy the desire of printing a complex and disordered model. But perhaps the main reason behind the production of this experimental system was the cultural practices that it supported. A complex and integrated environment, such as Maya in the case of 3D modeling, is suited for many tasks required by cultural industries but not precisely for a particular artistic approach and research need.

How could the approach on disruption be used for virtual worlds? We believe disrupting software could foster creative practices, but in a virtual world we can also disrupt reality, or the simulations of the physical world, or even fictions, plots and sequences of events. The task would be to challenge human perception, to adopt existing processes from other fields (science, astronomy, neurology, archaeology, etc.). But because software and digital media have the inherited intention of extending our senses, we have to consider the world at large, beyond our senses and experiences, from the transcendental perspective.

CONCLUSION

In this contribution we have explored the notion of pervasive virtual worlds in order to describe the analogical and electronic world that is mixed, extended and mediated through media. Media was understood in its largest sense: as technique and technology. Pervasive virtual worlds are composed of concrete and simple forms, but also of abstract and complex ones, produced by the interaction of heterogeneous elements: individuals, things, objects, machines; these forms can be physical but immaterial as well. Furthermore, recalling the idea of the world as larger than human perception and understanding, some forms can even be unknown for some actors of the world.

Pervasive virtual worlds is an idea aiming at opening opportunities for new design and communication processes. Virtual worlds are pervasive because there is an ever-increasing quantity and types of devices connected between them: from mobile handhelds to ambient intelligence to the internet of things. But simulation, communication, extension and virtualization do not depend on those artifacts to flourish, principally because they are latent. As we have seen, organs and actions are being virtualized in artificial worlds from the perspective of human beings, but there is still a lot of work to do if we approach virtualization from the vantage point of things in general, for example.

We proposed to study the design of media with software and the design of media software by taking into account four perspectives:

1. Media archaeological;
2. Standards and conventions;
3. Cultural;
4. Computational.

The main intention was to rethink media within a larger context and to point to design strategies for new media in creative manners. Media are the result of the vision of a series of actors, they are manifest in the form of representations, simulations, devices, graphical interfaces. These are for us examples of pervasive worlds that can be virtualized and actualized.

KEY TERMS AND DEFINITIONS

Analytical Maps: A material and graphical support that tries to make evident and easy to identify patterns and trends about a domain. It consists of digital processing of data and its rendering in visual form. It is a tool for research and study. It could assist researchers that work in digital humanities, speculative computing, aesthetic provocations, design by disruption, experimentation and media art. The projects and experiments in analytical maps, as well as other forms of graphical representations, might also serve as conceptual tools to think about the virtualization processes and archaeology.

Computing Medium: Also related to the notion of 'software as medium'. It describes the computer as a media machine, that is, an virtualizing tool for creating media content, but also as a tool to create media software (software to create other media). The complexity of the computing medium relies in its combination of conventions from past new media with properties exclusive of digital treatment of signals and information. In that manner, not only the established conventions are now accessed and manipulated through graphical user interfaces, but also those conventions are informed by techniques from other domains and create new forms for designing media.

Media Archaeology: A recent approach elaborated within media studies that investigates the several virtualizations of actions, organs, and things as well as their implementation through technological means throughout historical periods. It assumes that there are actions that have already been virtualized and that those virtualizations have been translated into technical objects and then, more recently, to computing forms. It asks, among other questions: where do our tools come from? How are they related to past new media? What was at stake at the origin of the invention? How the invention altered other technologies? How media virtualize us and virtualize things?

Pervasive Virtual Worlds: A vision of the world from a creative and innovative standpoint, mainly for design and communication. It considers the emerging environment that combines analog and electronic media as the ground and sandbox to experiment with new forms of design and communication. It is an attempt to describe the analogical and electronic world that is mixed, extended and mediated through media. A pervasive virtual world is complex. It recalls the importance of taking into account concrete and simple forms, but also of abstract and complex ones, produced by the interaction of heterogeneous actors: individuals, things, objects, machines; these forms can be physical but immaterial as well. Furthermore, recalling the idea of the world as larger than human perception and understanding, some forms can even be unknown for some actors of the world.

User-Interface Convention: Generally referred as those graphical elements that have been embraced and acknowledged because they facilitate using a computer and software by a common person. Broadly speaking, UI conventions can be elements from the WIMP paradigm: windows, icons, mouse, pointers. But they is also related to visual and language metaphors, where the software applications reside: operating systems, middleware, etc. The most famous metaphor related to the computing medium remains

the desktop, but others can emerge in a time when portable devices, ambient intelligence and different kind of artisanal and experimental software develop.

Virtual World: In its traditional meaning, informed by the computer sciences, it can also be referred to as 'artificial worlds' or 'virtual environments'. From a different perspective, that is, from a philosophical one, a virtual world is approached as a state of being. Following the work by Pierre Lévy, Gilles Deleuze, Henri Bergson, there are four states of being: the real, the possible, the actual and the virtual. The virtual and the possible are latent, while the real and the actual are manifest. The main difference between the virtual and the possible is that the virtual questions a creative solution to a problem: it tries to problematize it again, while the possible only executes and repeats already existing solutions.

Virtualization: The passage from the actual state of being to the virtual. The actual is a manifest state that tries to solve a problem in a creative manner, but when this creative solution is questioned again it is re-articulated and virtualized. It is a process of dematerialization but at the same time of thinking, inspiring, reasoning, and connecting different (and often non-obvious) actors.

Chapter 70
New and Strange Sorts of Texts: The Shaping and Reshaping of Digital and Multimodal Books and Young Adult Novels

Melanie Kittrell Hundley
Vanderbilt University, USA

Teri Holbrook
Georgia State University, USA

ABSTRACT

Dennis Baron (1999) writes about the impact of digital technology on literacy practices and thus is a good exemplar for considering how communication technologies are changing the ways in which stories are told. In this chapter, we argue that young adult literature authors and readers are currently in what Baron terms an inventive stage as they devise new ways of producing storied texts. Young adult authors, aware of their readers as avid, exploring, and savvy tech users, experiment with text formats to appeal to readers growing up in a digital "participatory culture" (Jenkins, Purushotma, Weigel, Clinton & Robins, 2009). In a cultural climate where the very notion of what constitutes a book is changing, our chapter responds to Baron's (2009) claim that readers and writers are in the process of "[learning] to trust a new technology and the new and strange sorts of texts that it produces" (p. x).

For many of us, the computer revolution came long ago, and it has left its mark on the way we do things with words. (Baron, 2009, p. 15)

Books as cultural tools are part of the shaping and reshaping of cultures and the stories those cultures tell. Recent changes in communication technologies have raised the alarm that *the book* as a format is in danger. Readers accustomed to the terse prose of Tweets and the speedy delivery of ebooks to their tablets, the worry goes, may lose interest in the long form of literary prose. However, the book per se is not as fragile and unchangeable as many fear; books have already proven that they can both cause and survive cultural shifts. In observing the power and resilience of the book, Richard Nash (2014) pointed out

DOI: 10.4018/978-1-5225-3822-6.ch070

Books withstood the disruption of new modes of storytelling—the cinema, the TV set. And books have been the disruptor themselves many times, disrupting the Roman Church and upending the French aristocracy, the medieval medical establishment, then the nineteenth-century medical establishment. (para. 35)

Thus, as Nash asserted, the tensions surrounding contemporary developing communication technologies and their ongoing influence on the shape and form of the book echo the tensions expressed in previous moments of cultural change.

Two videos, both available on YouTube at the time of this chapter's writing, demonstrate this current moment of cultural tension surrounding the book. The first video, a piece of Norwegian sketch comedy originally broadcast in 2001 called "The Medieval Helpdesk" (NRK, 2007), shows a befuddled monk seeking expert advice on how to use the new technology of the codex. He expresses delight and frustration as he labors to understand the page-turning functions of the unfamiliar format. The second video, a more recent ad by Ikea (Ikea Singapore, 2014), features a serene speaker explaining the ease of use of the company's paper-and-ink catalog, referred to as not an iBook or an ebook but as a "bookbook."

The popularity of both videos (YouTube views combined are in excess of 20 million) points to the contested present in which practitioners of the book form--both readers and makers--find themselves. The videos' humor hinges on the ongoing anxious relationship between the book community and the technolog(ies) at its creative disposal. In the 2001 "Medieval Helpdesk" video, social satirists reflected the helplessness readers felt towards perplexing new digital formats and related practices (D'Arcens, 2014); in the 2014 Ikea work, marketers tapped into a perceived consumer nostalgia for the out-of-fashion process of turning a page. In less than 15 years, readers went from bewildered babes in the woods to wistful old hands.

But while readers and writers today are increasingly turning to portable technology for the consumption and distribution of texts, discussions within book communities over the nature and role of the book in the digital era are by no means settled. Instead, they continue to intensify. At the heart of the discussion is the very structure of texts and modes of content in the digital age and, as a result, the qualities and types of experiences available to readers and writers. Print-based books, by the nature of their physical make-up, are predominantly linear, ordered, and bounded while digital and electronic texts--which feature multimodal communication and linking capabilities--can be multi-sensory, changeable, impermanent, flexible, and unbounded. Creators, academics, publishers, and users wrestle with this overarching problem: Given that the book form is a technology that directs extensive aspects of human experience, what are the effects when that technology is radically altered, when the components of "bookness" are profoundly disrupted? Said differently, what happens when the structure of the book, which Marshall McLuhan (1960) argued was responsible for human constructs ranging from the assembly line to romantic love, is displaced by newer technologies of knowledge? Underlying these concerns is an even more daunting inquiry: If, since its inception, the technology of the book has guided how humans make knowledge, then how can the features of digital communication technology support humans "to begin to think differently" (McLuhan, 1960) and what repercussions might that thinking differently bring?

The scope of these questions is vast, which perhaps adds to the current jitteriness of the discussion. Dennis Baron (2009) comfortingly reminds us that we are in the process of learning to "trust" these emerging communication technologies and the "new and strange sorts of texts" (p. x) made possible by them. In this chapter, we start by looking at some of the tensions surrounding the impact of digital technologies on the book format and how those tensions might be framed within stages of technological development. We give an overview of early electronic literature as a response on the part of authors

wanting to experiment with what new literacy technologies make possible. Recognizing the impact of Internet and computer use on young people, we position readers of young adult (YA) literature as integral to literary experimentation taken up by creators of YA novels seeking to engage and respond to their Internet-fluent audience. We will look at how such text-related trends as transmedia and user-developed content point to the need for research, particularly educational research, to inform practices around the cultivation of students as text participants (Jenkins, Purushotma, Weigel, Clinton, & Robison, 2009). Finally, we will examine conversations around standards and policy that suggest educators can create generous spaces of learning that include young adult literature and digital media so that students can participate in and eventually lead this present technological moment.

WHAT IS A SUCCINCT OVERVIEW OF THE RESEARCH?

Stages of Communication Technologies

We find it useful to view the changes impacting notions of the book and other textual formats through Baron's (1999) stages of literacy and communication technologies. Baron argued that with new technology, "we are thrown into excitement and confusion as we try it on, try it out, reject it, and then adapt it to our lives—and, of course, adapt our lives to it" (p. 16). He posited that literacy technologies go through similar stages of development, whether they involve making marks in clay or displaying pixels on a screen: the stages of invention, accessibility, function, and authentication.

High costs and small numbers of early adopters usually mark the beginning invention stage of new communication technologies, when "practitioners keep [the technology] to themselves...either on purpose or because nobody else has any use for it" (Baron, 1999, p. 16). After periods of relatively exclusive use, this "priestly" class adapts and mediates the technology so that it becomes more generally functional, primarily by presenting the technology as similar to existing communication practices. Costs drop, and as the public recognizes the usefulness of the technology, they respond by developing new literacy practices. "Only then does the technology come into its own, no longer imitating the previous forms given us by the earlier communication technology, but creating new forms and new possibilities for communication" (p. 16). As the practices associated with the new forms become prevalent, the technology undergoes an authentication stage, where segments within a given society negotiate appropriate use and work to establish trustworthiness of the technology by combatting fraud and other illegal operations.

As an example, Baron (1999) used the pencil. Early pencil production involved "proprietary secrets as closely guarded as any Macintosh code" (p. 18) and required increasingly fine-tuned experimentation in lead mixtures, wood selections, production equipment, extrusion processes, and finishing elements, such as built-in erasers and painted exteriors. Over the 250-year course of its development, "the humble wood pencil…developed from a curiosity of use to cabinet-makers, artists and note-takers into a tool so universally employed for writing that we seldom give it any thought" (p. 18). As part of the pencil's incorporation into social use, users experimented with it, making decisions about where it was useful and trustworthy (e.g., in schools) and where it was not (e.g., in legal documents).

Like pencils, Baron (1999) argued, computers went through their invention and "priestly" stages when only a few used them, but their access and functionality expanded as users acquired the emerging technologies, experimented with them, and expanded their function. Currently, computer-based technologies are in the midst of an intense authentication stage as users—including institutions such as

governments, educational bodies, corporations, and religious entities—engage in negotiations around possible and acceptable practices. Trustworthiness is an ongoing development; the International Society for Technology in Education (ISTE) sets standards for technology use in schools that include "safe, legal, and responsible use of information and technology" (ISTE, 2007) and cyber crime is listed by the U.S. Department of Justice as a top priority (United States Department of Justice, n.d.).

Viewed Through Stages: Early Hypertext Fiction as Invention

Baron's stages are recurrent, concurrent, and inexact, as can be seen in the varied cycles between contemporary technological innovations and the users who adopt, adapt, and distribute them. With this entanglement noted, the stages nonetheless provide a useful lens for considering the impact of digital and electronic technologies on the form of the book. In moving from printed page to pixeled screen, authors in the last quarter of the 20th century entered a "curiosity of use" stage (Baron, 1999, p. 18), akin to the experimentation Baron attributed to 16th century cabinet-makers exploring the affordances of the newly invented pencil.

In 1987, author Michael Joyce plunged into the inventive stage of digital book forms when he wrote what is generally considered the first hypertext fiction, *afternoon, a story*. Hypertext fiction takes advantage of the linking functions available via computer codes and software to create an interactive text. Instead of the assumption made by print authors that readers will follow a word-by-word, sentence-by-sentence path through a piece of writing, hypertext fiction authors programmed hyperlinks into their writing that allowed readers to move from site to site (or node to node) within a text. In *afternoon,* Joyce used a nodal textual architecture (via the early hypertext software Storyspace) to construct a network of multiple pathways through the story. Depending on the links readers chose, the narrative--and the experience of the story--changed.

Joyce (1991) envisioned a flowering of hypertext fiction where the reader-as-writer would "[give] birth to the true electronic text" (para. 25). This reader was better termed, Joyce said, as an interlocutor who would have a "reciprocal relationship" (para. 32) with the author and co-construct the text as she read. In this way, hypertext fiction put the author's authority under pressure. The architecture of hypertext fiction, which relied on the reader to make choices and to retrace pathways for different effects, encouraged a deliberately different alliance between author and reader than the one engendered by fixed and linear print texts. Writing about the impact of hypertext on fiction, Joyce said, "The book is dead, long live the book" (para. 9). In this statement was the recognition of transformational writing technology, the prediction that while *the book* might be disappearing, it would be remade based on the interactive possibilities afforded by electronic and digital technology.

Around the same time, new media theorist Jay David Bolter (1991a) also saw the impact emerging electronic technologies would have on traditional print books, placing the development of electronic literature within a historical context:

Electronic technology remakes the book in two senses. It gives us a new kind of book by changing the surface on which we write and the rhythms with which we read. It also adds to our historical understanding of the book by providing us with a new form that we can compare to printed books, manuscripts, and earlier forms of writing. (p. 3-4)

As an example of such comparisons, Bolter cited the period following the invention of the printing press, during which printers continued to produce texts bearing the same characteristics as handwritten manuscripts. "It took a few generations," Bolter noted, "for printers to realize that their new technology made possible a different writing space" (p. 3), one that allowed them to present written words in ways that were markedly different from earlier manually scribed texts.

Hypertext as Laboratory

Bolter and Joyce were both writing during what author Robert Coover (1999) described as the golden age of literary hypertext, the decade before the development of commercially available browsers that made the Internet--and its increasingly multimodal, user-produced content--widely accessible. In the 1980s and 1990s, hypertext was taken up by several authors as a new technology of reading and writing that could change the textual landscape. Hyperfiction writers such as Stuart Moulthrop (*Victory Garden*), Judy Malloy (*Uncle Roger* and *its name was Penelope*), and Shelley Jackson (*Patchwork Girl*) created hypertexts that were nodal and linked, but primarily print-based, a hallmark of early writers experimenting with the new electronic technologies. George Landow (1992/2006) and other early hypertext theorists (e.g. Bolter, 1991a, 1991b; Joyce, 1995; Moulthrop, 1994) saw hypertext as a "laboratory in which to test…ideas" regarding "textuality, narrative, and the roles or functions of reader and writer" (p. 2). This laboratory produced a variety of metaphors to describe hypertext: non-linear text (Nelson, 1981), a structure of structures (Bolter, 1991a), an event (Morgan, 2000), and a network of possibilities (Hayles, 2002), among others.

The energy behind the early days of hypertext fiction pointed to the profundity with which emerging technologies were impacting notions of the book and, along with it, literacy. James Gee (2003) maintained that "we never just read or write…we always read or write *something in some way*" (p. 14). Hypertext, with its focus on text architecture, interactivity, indeterminancy, and reader-as-writer authorship, changed both the *something* (product) that was written or read and the *some way* (process) in which that product was created and consumed.

Hypertext as Transformational Technology

The enthusiasm with which early hypertext authors and theorists engaged in their inquiries point to the transformational nature of the electronic technologies they were employing. Landow (1997) argued that hypertext "calls into question ideas of plot and story current since Aristotle" (p. 181). Instead of the traditional novel's fixed page and predictable order of printed words, hypertext resisted closure by offering readers a "field of linkage and associational play whose meaning depends upon permutations" (Moulthrop, 1991, p. 260). Instead of the traditional book's claim of a clear differentiation between author and reader, hypertext intentionally fused the two, requiring the reader to make overt decisions to navigate the text. Instead of the absolute authority of the lone author, hypertext exploded the boundaries of text by not allowing a single point of view. Hypertext permitted authors to demonstrate that the notions of plot and story in Western culture, made so commonplace as to be considered common sense, were the function of print technology, and therefore open to transformation by new technological developments.

"Print fiction," wrote Bolter and Joyce (1987), "is proud of its rigidity," and since hypertext could not depend on fixity as a core attribute, it "must therefore draw its aesthetic strength from its capacity for change" (p. 49). Communication researcher Johndan Johnson Eilola (1994) saw the impact of hypertext thusly:

[Hypertext provided the] opportunity to remap [our] conceptions of literacy, to reconsider the complex, interdependent nature of the ties between technology, society, and the individual in the acts of writing, reading and thinking. Adding the concept of hypertext to theory does not replace other definitions or conceptions of writing and reading; it opens those definitions up to debate and change." (p. 204)

During the golden age of hypertext, the debate was enjoined. The traditional book was to be disrupted as authors took into their artistry the affordances and constraints of emerging electronic communication technologies.

Tensions in the Accessibility Stage

Using Baron's (1999) stages of literacy technology, the experimentation that is fertile during the invention stage undergoes pressure as a technology becomes more widely accessible and adopted. As more people take up a technology, it spreads into general use, but some of the earlier innovations may be dampened as adopters map it onto familiar, existing practices. With digital literacy technology, this movement can be seen in Coover's (1999) description of hypertext fiction's transition into what he called the silver age:

Silver ages are said to follow upon golden ages as marriage and family follow upon romance, and last longer but not forever. They are characterized by a retreat from radical visions and a return to major elements of the preceding tradition — while retaining a fascination with surface elements of the golden age innovations, by a great diffusion and popularization of its diluted principles and their embodiment in institutions, and by a prolific widespread output in the name of what went before, though no longer that thing exactly. (para. 4)

In Coover's view, the silver age of hyperfiction was ushered in "almost overnight" (para. 14) by the emergence of Internet accessibility, along with browsers, html code, laptops with large memory banks, and other technological developments that made hypermedia--with its multimodal, massively linked social networks--a practicable avenue for human expression.

Influence of the Internet

Whereas the 1980s had seen hypertext fiction develop from a "daring" and "frivolous" form to one that was "a serious and sensible" use of computer technology (Bolter & Joyce, 1987, p. 41), by the dawn of the 20th century, hypertext was "used more to access hypermedia as enhancements for more or less linear narratives, when it's not launching the reader out into the mazy outer space of the World Wide Web, never to be seen again" (Coover, 1999, para. 15). Coover argued that such an environment, where hyperlinks were synonymous with surfing the Web, was not conducive to the kinds of literary thinking taken up by early hypertext authors.

[The Web] tends to be a noisy, restless, opportunistic, superficial, e-commerce-driven, chaotic realm, dominated by hacks, pitchmen and pretenders, in which the quiet voice of literature cannot easily be heard or, if heard by chance, attended to for more than a moment or two. Literature is meditative and the Net is riven by ceaseless hype and chatter. Literature has a shape, and the Net is shapeless. The discrete object is gone, there's only this vast disorderly sprawl, about as appealing as a scatter of old magazines on a table in the dentist's lounge. (para. 15)

As the multimodal, hypermedia features of the Web became more usable, Coover claimed, writers (and readers) would generate texts that did not privilege the word but were constructed to share space with images and sound. While these "wondrous and provocative invasions of text by sound and image" (para. 22) were not wholly welcomed by Coover, he nonetheless saw them as opportunities for authors to experiment and develop the technological tools at their disposal.

Response to Born-Digital Literature

The stage seemed set, as it were, for a maturing of electronic literature into more general use as authors and readers accepted digital and multimodal texts as commonplace literary forms. However, that maturing did not necessarily take the form or occur with the speed that the early hypertext community predicted. One expectation was for a robust industry of born-digital literature, defined by Katherine Hayles (2008) as a "first generation digital object created on a computer and (usually) meant to be read on a computer" (p. 3). In the first 15 years of the 21st century, the development of the field of born-digital literature has been uneven. YouTube (n.d.) reports that 100 hours of video are uploaded daily to viewers who watch 6 billion hours a month, but the growth of born-digital literature has been less secure. In the emerging field of transmedia, for example, technological barriers and wary publishers are among the challenges transmedia creators navigate as the form strives to take hold (Piesing, 2012). Numbers of readers who purchase e-books may be growing, but it is harder to get a handle on numbers of readers of born-digital literature (Bell, 2014). In a reflection on the field of electronic literature, Scott Rettberg (2009) wrote, "Electronic literature has not found a large popular audience, and it is entirely possible that it never will" (para. 6).

Referencing the popularity of the e-book platform, where many books are electronic versions of print texts, Bolter (2010) noted that the introduction of new technology does not necessarily mean that new forms will be taken up.

You could say that e-books change everything. You could say that they are magical and revolutionary. You could also say that they change nothing. In much the same way the digital cinema could be said to be simply the perfectly projected digital version of traditional Hollywood film, the e-book could be said to be .... the digital remediation of the printed book. (Bolter, 2010)

Through remediation rather than transformation, Bolter posited, "the community may accept this change of technology without rethinking the form or cultural position of the book at all." This resistance to rethinking the book, he argued, can be seen by the muted response to born-digital literature by the traditional academic and literary establishment, which has remained committed to print forms. In this light, Joyce's earlier ironic statement becomes commutative: the book is dead = long live the book.

ONGOING STAGES OF INVENTION AND AUTHENTICATION

Despite an expressed disappointment by early adopters of hypertext literary forms, contemporary users continue to take up new communication technologies and manipulate them for their own purposes. Indeed, in terms of novels and other storytelling media, computer-based technologies are arguably still in an ongoing "curiosity of use" stage, in which authors, illustrators and creative teams are experimenting to see just what is possible. As Rettberg (2009) observed,

Electronic literature has forked down a multitude of paths, so many in fact that it has become difficult to describe the field in terms of distinct genres. In comparison to other literary cultures, e-lit culture is still marginal, produced by a comparatively small group of writers dispersed around the globe, often working in isolation. (para. 4)

And yet, Rettberg continued, the field is growing as indicated by the increasing number of dissertations, festivals, and examples of work being produced. Whereas early hypertext blended new capabilities (branching and linking) with more familiar forms (established patterns of print texts with few images and sounds), born-digital literature now encompasses a full range of multimodal features and exists in multiple formats and platforms as creators continue to challenge the form and structure of the print novel.

In the midst of this literary experimentation, issues of trustworthiness and authentication are also in play. A National Endowment for the Arts report (2007) queried the role of technology in American reading trends within the context of those trends' "considerable consequences" (p. 5). Educators are examining the role communication and literacy technologies play in reading practices through the affordances of multimodal digital texts (e.g., O'Brien & Voss, 2011), in relation to students with disabilities (e.g., Schneps, Thomson, Chen, Sonnert, & Pomplun, 2013), and in regards to national literacy standards (e.g., Dalton, 2012/2013, 2013). Awards and recognitions tackle questions of literary quality and merit (e.g., Electronic Literature Organization, 2014). In this way, participants in the field of digital texts find themselves navigating through recursive--if messy--stages of development to gain permanence.

WHAT ARE THE CURRENT ISSUES IN THE FIELD RAISED BY THESE STUDIES?

To discuss the current issues involving the impact of digital technology on the book, we focus on one literary field--the young adult novel. Writing in the 1960s, McLuhan (1960, 1964/1994) argued that electronic media had transformational effects on its users, and because young people of his era grew up as television viewers, they engaged with the world differently than previous generations whose experiences were molded by print technology. We take up McLuhan's construct of youth in the electronic age to suggest that audiences for young adult novels, having grown up as computer users, have different expectations of and experiences with texts than readers from previous generations. As a result, young adult literature has become a site for a rich curiosity of use stage as authors experiment with text forms and practices aimed at these readers.

In this section, we look to young adult literature--in its curiosity of use period--to consider how technology is impacting the form and function of contemporary narrative. We give an overview of data as evidence of adolescents as avid users of digital technology. We examine specific examples of young

adult literature to consider how technology-derived subgenres are incorporated within print-based narratives, how technology is used to disrupt and replace narrative structures, and how technology allows new ways to read and participate in narrative formats within storyworld and across platforms.

Adolescent Readers as Technology Users

Considerable data indicates the prevalence of online participation by teens and young adults. Recent Pew reports shed light on the amount of time young people spend on the Internet and the types of activities in which they engage while online. Ninety-five percent of American teens ages 12-17 use the Internet, while 76% of respondents in that age group report using social networking sites and 77% report having cell phones. In the 18-29 age group, 96% report being Internet users, while 84% use social networking sites, and 97% report having cell phones (Anderson & Rainie, 2012). In addition, 57% of teens are "content creators" who employ the Internet to make blogs and web pages; distribute personal artwork, narratives, and videos; and craft mash-ups (Lenhart & Madden, 2005).

With their audience so connected to digital technology, it is not surprising to see YA authors experimenting with digital-related features in their texts, effectively engaging in an invention stage. In a recent newspaper article, publishing experts laid out two trends in the production of digital texts that, if taken together, can point to how digitally-derived young adult literature is in a generative curiosity of use period. The first is the emergence of Tumblr as a venue for creative work, particularly for fanfiction. Tumblr has developed into "a co-creation, self-publishing platform" (Rafferty, qtd. in Flood, 2014, para. 2). Oftentimes working collaboratively, "thousands of people are...producing a lot of short-form, episodic fiction and hundreds of thousands more are reading it.... Tumblr allows this creativity to explode, making it very easy for readers and publishers to discover real talent and energy there" (para. 2). Industry observers note that the site's image-based orientation makes it "increasingly important" for people in creative fields (Bercovici, 2013). Industry data indicates that Tumblr users skew toward a younger demographic, with 46% of the 34 million contributors/users worldwide between the ages of 16 and 24 (Smith, 2013). Whether these young adult users are posting individually created content, working collaboratively to generate content, or engaging with and reposting other users' content, they are involved in a complex fertile sphere of content creation.

A second trend identified by digital publishing experts is the continued struggle of "anything involving location-based storytelling, intrinsic and overt gamelike interactivity, augmented reality, and 'born digital' fiction" (Franklin, qtd. in Flood, 2014, para. 4). However, experts noted, "these experiments" can be commercially viable if done well (para. 4).

We see in these two trends an incentive and logic for young adult literature authors to be experimenting with digitally-related and born-digital texts. An audience that is actively engaged online and who makes up approaching 50% of the users of a noted creative site are more than readers. Many of them are part of what Henry Jenkins et al. (2009) termed a "participatory culture:"

A participatory culture is a culture with relatively low barriers to artistic expression and civic engagement, strong support for creating and sharing one's creations, and some type of informal mentorship whereby what is known by the most experienced is passed along to novices. A participatory culture is also one in which members believe their contributions matter, and feel some degree of social connection with one another (at the least they care what other people think about what they have created). (p. xi)

These participatory teens are not only reading online, they are reposting and linking. They aren't only consuming, they are taking the tools of production into their own hands, sometimes in commentary, sometimes in collaboration, sometimes in individually created works in which they seek out and reciprocate with feedback. This atmosphere is fast-paced, public, and messy--and it is into this oxygen that young adult literature authors enter, curious and motivated, trying to find formats, textual elements, and narratives that will reach their readers.

Echoing McLuhan, Ong (1982) contended that "[t]echnologies are not mere exterior aids, but also interior transformations of consciousness, and never more than when they affect the word" (p. 315). Miskec (2007) argued that today's adolescents "have lived a distinct way of knowing the world because of their connection to technology--a very different experience than those in the generations that preceded them" (p. 7). The digital connection that shapes adolescents' way of seeing the world also shapes how they see books and stories told across multiple media. Texts no longer are defined as words on paper, presumably (and falsely) created by a lone author. For adolescent readers, texts can be multimodal, interactive, hyperlinked, dispersed, revisable, rhizomatic, and nodal, which renders insufficient the concepts of print-only modes of text production and bounded, fixed texts.

But, as Jenkins et al. argued (2009), "the computer does not operate in a vacuum" (p. 7). Incorporating digital technologies into text creation "necessarily affects our relationship with every other communications technology, changing how we feel about what can or should be done with pencils and paper, chalk and blackboard, books, films, recordings" (p. 7). Changing familiar formats and creating new possibilities for stories by shifting from words on paper to more multimodal and digital formats changes the tools people use to structure consciousness. YA authors are involved in this consciousness restructuring as they use media that transforms text into new shapes and forms, thus building on the ways their readers--media-savvy teens--engage with and make sense of the world.

New and Strange Books and Young Adult Novels

The affordances of digital media—linking, interactivity, connectivity, sound, animation, and immediacy of information—provide opportunities for readers to explore and engage with texts in an expanded textual landscape. The pervasiveness of digital media and the ease with which readers can navigate digital texts allows for different kinds of movements through texts. The linear movement through a text, facilitated by the familiar structure of a book, is shifted when the text is moved to a digital format; modes can be combined within the same framework; navigation among and out of screens can be as easy as following a link. This redefines the structures of the story and challenges the expectations for what readers do as they read. This remaking of a path through a book challenges the linear structure of the book as well as the long-established traditions associated with linearity—tension, transitions, etc. Glazier (2002) noted that what "writing *is* becomes altered by how it is physically written through its production technology" (p. 4). What is necessary in one format becomes obsolete in another as the way in which text is created alters and shapes what stories can be told.

The use of digital technology in and for books and YA novels is increasingly complex as authors explore the composing possibilities of digital technologies. "Many young adult authors utilize the affordances of digital media—non-linearity, lack of closure, narrative dispersed across multiple genres, disrupted narrative flow, and images that carry narrative weight—to situate their texts in larger digital contexts" (Parsons and Hundley, 2012, p. 242). These affordances provide young adult authors with other tools, not bounded by the shape and form of the book, to tell their stories. Changing the tools of storytelling

illustrates Bolter's (1991a) argument that technology allows for a "new kind of book by changing the surface on which we write" (p. 3-4). Thus, what stories can be told and what tools can be used to tell them reconstructs expectations of the book. As readers become more and more fluent in social media such as texting, Facebook, blogging, etc., authors are beginning to incorporate those reading experiences into the texts they create. Authors are also considering the ways in which multiple media formats can be combined to tell stories; for example, authors may use print and video side-by-side to tell a particular story. Additionally, some authors are experimenting with digital only text structures and exploring what stories can be told using web-based storytelling. In this section, we will examine ways in which technology is currently shaping and reshaping the narrative structures authors are using to construct the novels.

Technology Subgenres Within Print-Based Narrative

The description of today's teenager often discusses the ways in which that teenager engages with the digital world, focusing, in particular, on teen participation in social media. Sweeney (2010) argued,

The students that we teach today are products of a very different environment, one in which the ability to stay connected with others is constant and communication takes many forms. Writing, for adolescents who live in an age of digital communication, has taken on new importance and plays a prominent role in the way they socialize, share information, and structure their communication. (p. 121)

The texts these adolescents create and the narratives they construct across media provide an alternative paradigm for the structure of the book. This way of knowing the world, connected, interactive, and immediate, shapes their expectations of text and media. The influence of social media—Twitter, instant messaging, texting, Facebook, Instagram, etc.—shape the teen as both reader of multiple media texts and also as creator of those texts. The tropes and protocols of social media become a part of their expectations of composing for that media.

Social Media Tropes Used in Narrative

Authors such as Todd Strasser, Alex Bradley, Adele Griffin, Ken Baker, and Mari Mancusi incorporate the tropes of social media into the structure of their narrative. These authors use email, blogs, Twitter, and instant messaging (IM) within what are essentially traditional print texts to explain events, provide conflict, and push their characters to action. The role and use of social media in the context of the story relies on a reader who is familiar with the protocols of that media. Incorporating social media as a component of the text adds to the complexity in two ways; it disrupts the narrative flow and it challenges the reader to construct the story across multiple genres. Understanding social media as different genres of communication requires a reader who is relatively fluent in how those media are used in daily interactions. While many students "do not recognize this type of communication as writing" (Sweeney, 2010, p. 124), they are familiar with the expectations of a Facebook status update, an instant message, a Tweet, etc. "Writing," Sweeney (2010) acknowledged, "is an integral part of students' lives today due to their use of texting and social networking sites" (p. 124). YA authors recognize their readers' engagement with these forms of social media and make the choice to include these formats. This increases the authenticity of the adolescent characters' experiences in the text while also providing composing tools for the author.

Strasser's (2011) murder mystery *Kill You Last* uses texting and email in the narrative structure to provide both clues to the mystery and to create suspense for the reader. The novel opens with a prologue that provides an example of each. Shelby, the main character, receives a text from a boy she is interested in dating and a short email from someone who tells her, "I like you, Shelby Sloan. If I have to kill you, I'll kill you last" (prologue). The tone of the text and the email provide immediate contrasts; the text is friendly and uses text speak while the email is threatening and uses complete sentences. When Shelby receives the second threatening email, she shows both to her friend who asks, "Who sends e-mails?" (p. 2). This question establishes the expectation that texting is new and current while email technology is older, providing a clue to the identity of the person making the threats. Later, some emails from that character feature text speak but others do not. Shelby confronts Ashley, a classmate who has admitted to sending her threatening emails, and learns that there are two people sending threats using similar screen names. Shelby and Ashley compare the patterns for texting and the use of sentences. The emails that use text speak are clearly from a teenager. The emails that actually threaten Shelby are written in more formal speech. This important clue is hidden in the text expectations; Ashley treats the short emails as though they are text messages and uses the accepted protocols for texts; the killer treats emails as short letters and uses the accepted format for letters. Recognizing the protocols and expectations of different subgenres as both a tool for storytelling and as a clue within the narrative requires a writer who is familiar with textual expectations and knows how to manipulate social media features. It also calls upon readers to know and recognize those protocols and expectations in order to engage with the story.

Wish You Were Dead (Strasser, 2009) builds on the expectations of social media and the ease with which online participants can hide their identities. The novel, another murder mystery, uses layers of social media to create the story. Blogs, blog comments, screen names, text messages, and Facebook are embedded in the narrative. An anonymous blogger posts how much she hates a popular girl, and the popular girl disappears. Characters text each other, post comments to the blog, and refer to Facebook. The juxtaposition of the social media tools that are used by the characters or referred to by the characters establish authenticity. Social media is employed in multiple ways and in multiple contexts by teens so the layered use of social media in this novel contributes to an interactive feel as well as a sense of reality. The readers see the blog posts that detail a very stressed teen girl's struggles at fitting in; the accompanying comments mirror the kinds of typical blog responses seen in online spaces. The blog comments range from caring to hostile. The ability to hide or create different identities is an intrinsic aspect of social media, and authors use this ability to create/recreate their characters.

24 Girls in 7 Days (Bradley, 2006) uses the anonymity of social media to explore how protagonist Jack can connect with multiple girls in a short period of time. Jack openly acknowledges that his love life is awful; his friends decide to help him find a date to the prom. While he is talking to, emailing, and meeting the girls on his friends' lists, he receives emails and instant messages from Fancypants. Over the course of the seven days, he falls in love with Fancypants without knowing who she actually is IRL (in real life). When her identity is revealed, it challenges his established relationship with her because he has to re-examine it with the lens of what he knows about Fancypants. This ability to hide one's identity behind a screen name in order to develop a relationship challenges the expected social mores.

The destructive power of social media is highlighted in Cann's (2004) *Text Game*; in this novel, a devious fellow student uses insidious text messages to break up Melissa and Ben just as they start their relationship. The texts interrupt Melissa's day, and this highlights both the anonymity of texting and the immediacy of the messages. The texts continue over several weeks; Melissa doesn't know who is sending them or if she can trust Ben. The constant comments about how Ben is going to break up with her, how

ugly she is, and how she can't trust him disrupt Melissa's life as well as the narrative flow of the story. Visually, the texts are in bold and inset from the other paragraphs. Each text is preceded by a symbol for a text message. The visual style signals the use of social media and the interruption of the narrative flow.

Facebook and texting take center stage in Griffin's (2010) *The Julian Game*. Raye is a new student at an elite private school. On a whim, she creates a Facebook profile for the imaginary Elizabeth, describing her as an exchange student from Poland. Raye creates such a believable profile that Elizabeth is suddenly "friended" by most of the popular people at her new school. This set up, which eventually leads to Raye's duplicity being discovered, allows the author to depict the ease with which social media can be used in cyber-bullying. When presented with the opportunity to "destroy" another character, Raye muses that she is "[p]rotected and anonymous, a ghostwriter without fingerprints" (p. 191). The author relies on the reader to bring certain knowledge and experiences to the text: an understanding of the protocols of social media such as posting, following, commenting, friending; familiarity with cyber-bullying through news stories or personal experiences; and awareness of the ubiquity and inescapability of social media.

Mancusi's (2008) *Gamer Girl* incorporates the instant messaging components of a gaming environment. The author weaves a traditional narrative, game play--including the instant messaging between players--and manga to create a story about identity and relationships online. This story relies on the reader's understanding of the role of instant messaging in game play and recognition of how closely players identify with their characters. The main character Maddy moves in and out of identities and uses gaming plots to create a fanfiction manga, reflecting similar practices by adolescent readers. Without an understanding of these digital literacy practices, the reader would not be able to weave the storylines together to see how integral the gamer identity is to those who participate. The adolescent reader, as a participant in these forms of digital practices, is able to construct meaning across the texts.

Incorporating social media into more familiar narrative structures allows authors to bring to bear multiple levels of engagement and understanding to the narrative; this level of experimentation with the tools requires not just author exploration but also reader fluency.

Blogs and Blogging as Tropes Used in Narrative

Like other social media tools, blogs provide an opportunity for a character to express his or her opinion or to comment on what someone else has posted. The characteristics of blogs provide an opportunity for authors to explore the private/public nature of social media, the longer structure of blog posts as opposed to Twitter or Facebook, or insight into a character's secret thoughts. Shana Norris, Cathleen Davitt Bell, and Robynn Clairday are authors who use blogs to reveal secrets and explore character motivation.

In Norris's (2008) *Something to Blog About*, main character Libby has had a pretty rough few weeks. She's set her hair on fire in a horrible chemistry lab accident. Not only that, she did it in front of the boy she really likes. Her mother is dating her arch-enemy's father. Libby does what many teens do when they feel overwhelmed by their lives--she writes about it in a blog. Norris incorporates Libby's blog into the narrative, building on the expectations that blogs are places for characters to explore the way they are feeling about events; in this particular text, the author equates blogs with diaries. Just as a teen expects her diary to be secret, so too does Libby expect her blog to be secret. When this expectation is violated and the blog becomes public, Libby recognizes a key aspect of online posting; nothing is ever really private. In this way, the author engages with the public/private nature of writing.

The speed in which the divide between public/private writing can be dismantled is illustrated in Bell's (2011) *Little Blog on the Prairie.* Main character Gen begins blogging as a way to vent her feelings

about being forced to participate in a pioneer summer camp. Her blog gradually increases in popularity until she has over 500,000 followers. The author uses the rapid rise in popularity of Gen's blog to show how social media interactions can become news stories themselves. For example, the author picks up on how blogs can lead to social activism when Gen writes about the possibility of having to kill Pumpkin, a chicken that lives on the farm, and almost immediately someone a creates a "Save Pumpkin" Facebook page with almost 20,000 followers. Gen's blog takes on a life of its own, spawning Facebook pages, news stories, and a reality television show. In this way, the story explodes the public/private nature of blogging and demonstrates how online texts can become memes or other social markers.

Genesis Bell, the main character in Clairday's (2005) *Confessions of a Boyfriend Stealer*, knows exactly how public blogs can be and uses that to her advantage. She writes her blog posts, not to deal with her emotional issues with her family, but rather to tell her side of an ongoing battle with her ex-best friends. Genesis uses the public nature of the blog to control the public story of how she "stole" her two best-friends' boyfriends. She also uses the blog to explore her thinking behind the movies and documentaries that she makes as class projects. She talks explicitly to the reader of her blog, and, while there are comments on her blog, she does not have a dramatic moment where her blog is shared with the other characters. Clairday's Genesis differs from Norris's Libby and Bell's Gen because she understands how blogs can be used. She tells the reader in the first post that she is there to tell her side of the story. In this instance, the author uses the reader's understanding that blogs and social media are ways to talk directly to the public in order propel the story.

In these examples, we can see how readers must be familiar with the tropes of social media in order to figure out how to situate the media within the context of the story. Young adult authors play with the reader's understanding of the media to provide authenticity to their teen characters but also to challenge traditional narrative formats.

Technology to Replace the Narrative

Just as some print authors eschew paragraphs and chapter structures and choose to write novels in verse or in diary or letter formats, some young adult authors choose to use the formats of social media as the tool to tell their story. Authors such as Lauren Myracle and Elizabeth Rudnick do more than incorporate social media into the narrative structure of their novels; they use social media to replace the traditional narrative format. For readers who are not active users of social media, this can be disorienting. The visual layout of the pages of these novels resembles the on-screen look of instant messenger, Twitter, emails, and blogs. For the reader, this establishes how the novel should be read and seamed together. The visual cues are necessary to provide the roadmap for the novel.

Myracle's (2005) *ttyl* is the first in a four-book series about Maddie, Angela, and Zoe; what is unique about this series is that each book is told entirely in IM format. There are no paragraphs or chapter breaks. The conversations are divided by dates rather than chapter headings. Tools such as narration, description, and transition are replaced by IMs. The use of IMs as the way in which the story is told alters how the reader learns about characters and how tension is developed. Choosing a different platform for constructing the story both limits and expands what the author can do in the telling of the story. Relying entirely on what Maddie, Angela, and Zoe say in their IMs means that everything that happens in the story is reported action occurring off-screen. If the characters attend a party, the reader does not see them at the party, rather the reader sees what the characters say about the party. The characters have screen names, use emoticons, and visually represent their actions with short phrases framed by asterisks. This method

of storytelling relies on a reader who is a fluent user of instant messaging and understands not only how to read IMs but also how to combine multiple people's IMs into a coherent story.

Rudnick's (2010) *Tweet Heart*, like *ttyl*, requires readers to seam parts of the narrative together. However, *Tweet Heart* does not rely on a single format of social media to construct the text. Rather, it combines IM, Twitter, emails, and blogs. *Tweet Heart* is a multi-genre, multimodal text constructed entirely of multiple forms of social media. The story is built across several platforms of social media, and when "media platforms converge, the varying platforms provide opportunities to tell different parts of a story in different ways" (Groenke and Maples, 2010, p. 40). *Tweet Heart* relies on readers who are as familiar with social media as the characters are.

Technology to Reshape the Narrative

The incorporation of video and animation in a more traditional print text allows for the technology to reshape the story that is being told. Multi-platform novels are texts in which more than one platform are used to tell the story; the platforms work together to create the story but components of the text exist only in a single platform. For example, *Skeleton Creek*, Carman's (2009) multi-platform novel, follows Ryan and Sarah as they try to solve a mystery in their small town. The story, told in both print and video, requires the reader to seam those two platforms together to create the single story. The readers get part of the story from Ryan's journal and part of the story from Sarah's videos. Neither is complete without the other. The print component of the novel is designed to look like a journal; the cover is marbled to resemble a composition book and the font looks like handwriting. The pages are lined. Images and typed notes look as though they are pasted or taped in. At certain points in the novel, readers are directed to an online site where they type in a specific password to gain access to Sarah's videos. The videos exist only online; however, there are references to them in the print text, and all of the passwords that a reader needs in order to access the videos are in the print text. The interaction between print and video and the juxtaposition of the two platforms create a story that exists in the intersections of each platform. The two platforms do not retell what happened in the other; rather they build on or contradict the other. The reader constructs the story from the two platforms. The narrative in this novel is dispersed across the two media formats, raising questions about how the media work together, how the author constructs the text, and how the reader reads across media. Additionally, the text challenges the physical idea of a book as it exists in both print and digital formats.

While the *Skeleton Creek* series uses print and video to create the story, *BZRK* (Grant, 2013) and *Virus on Orbis* (Haarsma, 2008) use digital media to build and supplement the world of the novel. *BZRK,* the story of a group of rebellious teens who are fighting for their right to be human in a world in which biotechnology and nanotechnology control people, is accompanied by an app that allows the reader to play in the world created by the book. *Virus on Orbis,* the adventures of Johnny Turnbull as he negotiates an alien world, has a companion video game that lets the readers play in the world of the novel but requires them to bring information from the novel to the video game. With both *BZRK* and *Virus on Orbis*, the novel can exist without the app or game, but the game does not work without the text. The world of the book gives shape and form to the games and, in order to play the games, the reader must have read the book.

Like *BZRK* and *Virus on Orbis*, *The Survivors* (Havard, 2011) uses technology to supplement the world of the print novel; however, this novel has both a print and app version of the text. The actual text of the novel and the text of the app are the same; however, the app layers on additional information,

extending the text. A reader can click on watermark symbols embedded in the text to see a Google map of the setting, hear referenced songs, see a character's Facebook page, or follow a character on Twitter. Additionally, the reader can see the author's notes, supplemental information on a historical event, and reference materials the author used to research and develop the story. The considerations of authorship and the boundaries of a text are challenged by the ways in traditional narrative formats are reshaped by the inclusion of technology as components of the narrative structure.

Ruby Skye, P.I. (http://rubyskyepi.com/) produced by Karen Walton, Jill Golick, and Steven Golick (2010-2012) is a series designed to be an online, video version of familiar girl detective stories. Ruby, a modern-day Nancy Drew or Trixie Belden, solves mysteries in her local neighborhood and school. The video series takes on the tropes of both print detective series and television detective series. Each season is divided into short episodes that serve as a video-chapter that readers can access on the teen detective's home page. The video-chapters follow the kinds of chapter patterns that teen detective novels follow; each one ends with a question, cliffhanger, or clue that may or may not turn out to be significant. The main character talks both to the other characters and to the viewer. While the story itself exists in video format only, the web site and accompanying media provide transmedia extensions of the story. The reader can follow particular characters, learn about other girl detectives, read blog posts about female activists, and participate in social media interactions with other viewers. The structure of this text challenges the expectations of traditional print narratives.

Technology to Read, Co-Construct, and Explore the Narrative

Authors, particularly young adult authors, have embraced the communicative aspects of digital media to create stories that exist across multiple platforms, to connect with their readers, and to allow for reader participation. Many authors have extensive web sites designed to support the storyworlds created in their novels. Authors such as Laurie Halse Anderson, Rick Riordin, John Green, and J.K. Rowling take advantage of the affordances of digital media to engage with their readers; they provide additional information about their stories and their characters as well as interactive sites for the readers to engage in the texts. Readers expect authors to give them more—more story, more access, more connections. The expectation is that the book is one format of the story situated in a larger digital world. Readers follow authors and characters on Twitter and Facebook and respond to author blogs; they play games and interact with other fans of novels on online sites. Adolescent readers expect more than a book.

Participating in Storyworlds

Texts such as *The Collider Comics (*Garley, Stewart, Gowran, Tempest, Pickering, and Simmonds, 2012), and *The Collider Quest* (Bernardo, Scott, Neves, Gomes, Azevedo, and Cantwell, 2012) exist as a constellation of online graphic novels, apps, games, and web sites. Each individual media format contains a rich and complete story; however, these stories interact to create a larger, interconnected storyworld. Experiences with the graphic novel give the players information to guide gameplay and interactions on the web sites. The narrative is not a singular story extended across multiple media formats as in *Skeleton Creek*; the juxtaposition of text and video game play does not extend the narrative as it does in *Virus on Orbis.* Instead, each media format in The Collider world stands alone. The formats, however, are stronger when read together.

As more authors, artists, and game designers come together to create storyworlds, this kind of multiplatform storytelling and world creation will become more common. The kinds of reader participation in the storyworld of the text opens up new composing opportunities as well as for reader creation and connection. Because the storyworld of a novel extends beyond the text, it creates a larger participation space for the reader. The reader may read the text, play a game, read the graphic novels, or write fanfiction. Because the world exists in multiple formats and platforms, the reader has greater opportunity for choice. The question for the reader to consider is not how to read the multiple formats to create stories but rather how to consider multiple storylines within a storyworld.

The multiple sites that support storyworlds designed to extend reader experiences with an author or authors' work allow spaces for readers to create fanfiction. Fanfiction, as a component of these large storyworlds, extends the worlds of the novel and allows for the participatory creation of story. In digital environments, the lines between author/reader/composer are blurred and fluid, illustrating Jenkins' (2006) argument that we can't "talk about media producers and consumers as occupying separate roles" (p. 3). Jenkins explained that we should "see [producers and consumers] as participants who interact with each other according to a new set of rules that none of us fully understands" (p. 3). Jodi Lynn Anderson (2010) allowed readers of her online novel *Loser/Queen* to vote on particular plot elements and included their responses in subsequent installments. This invitation to participate in the creation of the novel "pushes the boundaries of reader co-construction to a new level" and builds on some of the key features of social media—interactivity, connectivity, and participation (Parsons and Hundley, 2012, p. 243). The final print version of the novel incorporated the readers' collaborative choices into the text. While Anderson's choice to allow her readers to co-construct the text does not explicitly connect to the readers' creation of fanfiction, it blurs the lines between author and reader by opening up the participatory possibilities. Fanfiction extends this participation and further blurs the lines, although the author's invitation to create is not necessarily a part of that format. Readers can develop stories based on characters and worlds created by authors without the author's explicit invitation to do so.

Transmedia

Jenkins (2007) explained that

… [t]ransmedia storytelling represents a process where integral elements of a fiction get dispersed systematically across multiple delivery channels for the purpose of creating a unified and coordinated entertainment experience. Ideally, each medium makes it own unique contribution to the unfolding of the story. (para. 3)

This definition focuses on the ways in which the familiar components of fiction get taken up and used in stories spread out across several media—video, web sites, games, text, image, etc. What is particularly interesting about the definition is the emphasis on how each medium is expected to carry narrative weight in the ways in which the story develops. Each medium provides a way of looking at the story through a new lens and level of participation, bringing with it the genre-like expectations about what this medium can do for the story. What does a video make possible in the narrative that a single image does not? This expands the composing options for the writer while also expanding the participation options for the reader. *Collapsus, Inanimate Alice, The Cainsville Files*, *The Julian Year,* and *The Memory Machine* are narratives that push at structural boundaries; they exist in electronic format as

apps, e-books, and online stories. These stories exist across multiple platforms, genres, and modes and require reader participation to construct the narrative.

As writers, artists, and composers experiment and play with the composing possibilities for storytelling, readers are provided with a dizzying array of "texts" with which to play and participate, raising questions such as, Is this a story or a game? Is this a movie or a game or a story? The either/or binary are subsumed in transmedia storytelling into an and/and/and construction.

For example, *Collapsus* (www.collapsus.com), directed by Tommy Pallotta, is an online multimedia text ; the director of the text describes *Collapsus* as "transmedia story" and as an "annotated film" (Pallotta, 2011, np). The story is told through a mix of character videos, graphic-novel style animations, documentary clips, blogs, articles, and text. There is also an interactive component that forces readers to make choices on the issues surrounding energy usage. The screen is divided into three panels with the central panel providing the fiction component of the story. The reader is introduced to characters through a mix of video, text, and animations. The panels to the left and right of the central screen contain additional components of the story—an interactive panel that pushes readers to make choices and a panel that contains blogs, articles, documentaries, and other texts that provide character development, additional data about the issues, and plot components that ratchet up the reader's stress level. The multiple media formats in this story work together to create the story.

Kate Pullinger and Chris Joseph's (2011) *Inanimate Alice* (http://www.inanimatealice.com/), an online serial story about young Alice and her growing up in various countries, uses words, images, sounds, movement, games, and animation to create a story that exists across the modes. This story, read on screen, is structured in episodes that provide glimpses into Alice's family life, her friendships, and, among other events, her father's disappearance. The complexity of the story depends on the interactions of the modes. For example, the episodes' strategic use of sound both foregrounds tension and supports the other events happening in the story. The use of whispering, knocking, and wind are subtle and powerful. As a reader, the sounds often blend into the background and at strategic moments increase in volume or completely disappear. In either case, the sound becomes an integral part of the narrative structure.

In *The Cainsville Files* (2014), Kelley Armstrong, author of adult and young adult fantasy novels, explores the storytelling possibilities of graphic novels, animations, sound, and explicit game-like reader choice. Just as early hypertext incorporated linking and allowed readers and writers to "reconsider the writer's use of sequence in order to control the passage of readers through the text" (Snyder, 1996, p. 66) so, too, does the use of explicit reader choice in sections of this story guide the reader's navigation. The app opens with a scene of protagonist Jenn's new office; we learn that she is a former police office now turned private investigator. At several points in each section, the reader is given the option to choose how Jenn will respond to another character's actions or whether or not she will explore particular locations for clues. This use of choice, often a component of video games, allows the reader to co-create the narrative; some choices will end the story within just a few screens while others will take the reader deeper into the mystery. The table of contents for this story is a series of visual images of locations in which some action in the story occurs. The story can be read and reread and the story itself will change as the reader chooses a different path through the mystery.

Like *The Cainsville Files*, Gregory Lamberson's *The Julian Year* (2014) relies on explicit reader choice to construct the narrative. The use of the visual table of contents for *The Cainsville Files* provides a way for the reader to orient herself in the text; *The Julian Year* uses a technology called Tree Branching technology to provide the reader a visual map of where she has been in the text. Tree-branching, like hypertext linking, is based on nodes and branching pathways. *The Julian Year* must be read using

MMG Sidekick, an app that allows the reader to read and participate in the text. While the choices in *The Julian Yea*r are not as extensive as *Collapsus* or *The Cainsville Files*, the use of the tree branching technology provides a way for authors to reconceptualize narrative as fluid, branching, and not fixed.

Denise Chapman Weston's (2014) *The Memory Machine*, a multigenre, multimodal ibook, tells the story of Anna, her autistic brother, and her grandfather. The text uses journal entries, sound, images, and video to construct a story about memory, memory loss, and family. The reader of this story does not choose to construct the story path, rather, she chooses to explore small tangents and moments that bring richness and depth to the idea of memory and the small details that create a life. The narrative spine of *The Memory Machine* is a journal format, but the entries incorporate more than text. The reader must figure out the arch of the story via the intersections of modes and genres created by the author. The author provides navigational directions for the reader as well as color coded text markers to indicate additional information.

WHAT ARE THE GAPS IN THE EXTANT RESEARCH AND DIRECTIONS FOR FUTURE RESEARCH?

The participatory and transmedia texts described here are textually subversive because they form and "[re-form] with successive readings, no two readings are alike" (Snyder, 1996, p. 93). Readers may or may not start and end at the same point in the text in successive readings. Because the texts shift based on reader choice, they are not fixed; they are performative. Each iterative reading is a new performance, an event in the making. Morgan (2000) contended that "hypertext is always an event—a text just in the process of becoming as we read and ceasing to exist in that sequence when we quit the program" (p. 133). The idea of text as an event contrasts with the seeming fixedness of traditional print texts.

As the digital tools used to create these kinds of texts become more ubiquitous, more writers will work to create texts that exist across platforms and incorporate multiple paths, genres, and modes. The contrast between the apparent fixedness of traditional print formats and the text-as-event formats of these kinds of digital texts provide both a current issue for authors and readers as well as areas of future research. Learning to construct a text that is performative is challenging for the author; applying the reading and participation strategies that are part of the participatory culture in which they are engaging is challenging for readers; redefining what authorship, reader, and text means in this environment provides a challenge for researchers as well. Just as the use of the codex reshaped the work that authors and scholars could do and provided opportunities for new text forms such as the novel, so, too, will these participatory and transmedia texts provide new ways of composing for authors and readers, and raise new questions about form and authorship for researchers.

Gee (2003) made the case that video games are "a new form of art. They will not replace books; they will sit beside them, interact with, and change them and their role in society" (p. 204). Similarly, the authors described above are exploring digital media tools to develop "a new form of art" and storytelling, one that sits beside and interacts with the more familiar forms of text. They are situating multiple platforms beside and within texts to explore narrative possibilities. As Jenkins (2006) argued, "Old media are not being displaced. Rather, their functions and status are shifted by the introduction of new technologies" (p. 14). Due to the current exploration of what is possible, new digital technologies have become part of the author's and reader's toolkit.

What this means for researchers is multi-faceted. Drawing from McLuhan's (1960) assertion that communication technologies are implicated in a wide-range of human constructs, what relational practices and structures will digital text formats generate? Do communication technologies, as McLuhan posited, propel people to think differently, and if so, how might that difference be conceptualized? What discourses and organizing structures might develop around the changing notions of the book? How might the ways in which people create and use emerging text formats impact such institutions as media, government, and education—and vice versa? In a partial consideration of that last question, we give a brief overview of how educational discourses are being impacted by the social practices arising around text forms made possible by communication technologies.

WHAT ARE THE RECOMMENDATIONS/IMPLICATIONS FOR EDUCATION, CIVIC ENGAGEMENT (GLOBAL AND LOCAL), SOCIAL PRACTICE, AND POLICY?

In the current intense curiosity of use stage, YA authors are experimenting with form and participation, responding to the perceived media literacy practices of their readers. They draw from established technology tropes, remixing them with print conventions and within print formats. They explore and try out the affordances of computer-based technologies, including the Internet, to test the elasticity of narrative. As literacy educators, we posit this question: If authors and creative teams are engaged in a curiosity of use stage as they make moves within their art form to reach their young adult audience, what are the implications for educators concerned with the cultivation of students' literacy practices in the digital age?

We respond to this question by taking up Jenkins' et al. (2009) work on participatory culture to suggest that engagement with these "new and strange sorts of texts" (Baron, 2009, p. x) could be a critical component of students' in-school and out-of-school education. We will explore the ideas of participatory culture as it relates to adolescents who are reading, writing, communicating, and composing within a participatory culture. We will suggest that notions of a parallel pedagogy (Leander, 2009) can be used to productively consider the tensions emerging between "old" and "new" literacy practices in K-12 instruction and the role digital-related literature can play. Finally, we will look briefly at current structures operating within U.S. education--explicitly the Common Core State Standards--and how digital young adult literature can be harnessed to aid in the development of students' digital literacy practices.

Learning in a Participatory Culture

In their influential MacArthur Foundation report entitled "Confronting the Challenges of Participatory Culture," Jenkins et al. (2009) offered a general overview of youth digital practices for educators concerned with new media literacies. They suggested a definition of 21st century literacy that built on earlier constructs:

A definition of twenty-first century literacy offered by the New Media Consortium (2005) is "the set of abilities and skills where aural, visual, and digital literacy overlap.These include the ability to understand the power of images and sounds, to recognize and use that power, to manipulate and transform digital media, to distribute them pervasively, and to easily adapt them to new forms" (p. 8). We would modify this definition in two ways. First, textual literacy remains a central skill in the twenty-first century. Before students can engage with the new participatory culture, they must be able to read and write. Youth must

expand their required competencies, not push aside old skills to make room for the new. Second, new media literacies should be considered a social skill. (p. 19)

Noting that educators frequently focus on the digital divide--that is, students' equitable access to digital technology--as a dominant topic, Jenkins's team argued that more crucial was the question of participation. "A focus on expanding access to new technologies carries us only so far if we do not also foster the skills and cultural knowledge necessary to deploy those tools toward our own ends" (p. 8). Instead of the digital haves and have-nots that were the concern of digital divide conversations, students are more likely to be divided into groups "for whom the Internet is an increasingly rich, diverse, engaging and stimulating resource...and those for whom it remains a narrow, unengaging, if occasionally useful, resource of rather less significance" (Livingstone & Bober, qtd. in Jenkins et al., p. 17).

Engaging in the participatory culture of the Internet allows students to develop "cultural competencies and social skills needed for full involvement" (Jenkins et al., 2009, p. xiii) in their own era. This engagement may include participating in online communities, creating and posting individually- or collaboratively-created digital works, developing new knowledge in formal or informal teams, and contributing to the circulation and form of media through blogging and other venues. The effects of the participatory culture creates "a new form of the hidden curriculum" (p. xii), whereby some students are prepared with the skills needed to be active and effective members of their societies and others are not. While traditional curriculum has frequently focused on individual achievement and work, a participatory culture perspective privileges community involvement and social skills over individual expression. This shift creates different types of skills that students should cultivate. Among these, according to the authors, are play (experimenting to solve problems), appropriation (sampling and remixing content), multitasking (scanning to identify details), distributed cognition (interacting with tools to expand cognition), transmedia navigation (following information and narratives across modalities), and networking (searching, synthesizing, and disseminating information).

Jenkins et al. further noted that some educators argue students will learn digital media practices outside of school and on their own. The authors countered, however, with three issues that they claimed make concerted pedagogical attention necessary:

1. **The Participation Gap:** The unequal access to "opportunities, experiences, skills, and knowledge" needed for societal participation (p. xii)
2. **The Transparency Problem:** A need to focus on students' awareness of how "media shape perceptions of the world" (p. xii)
3. **The Ethics Challenge:** The need for socialization and professionalization processes to support students as they develop ethical norms as "media makers and community participants" (p. xiii)

To respond to these issues and to support students as they cultivate new cultural competencies requires a systemic and creative approach on the part of schools, policy makers, community organizations, and families.

Working and Expanding School Learning Structures

Literacy education in schools has long addressed the three concerns identified by Jenkins's team, albeit primarily in the context of print literacy. Literacies are conventionally understood as social practices

and engagements, media (texts) as motivated shapers of perception and knowledge is the backbone of critical literacy, and the ethical norms of reading and writing are part of standard language arts curricula. Now, however, schools are tasked with considering those concepts anew within the digital environment.

Kevin Leander (2009) posed a question no doubt opined by many educators:

[How] can we possibly fit more into an already overcrowded curriculum, even if we do decide to buy into an expanded definition of what it means to be literate (Kinzer and Leander, 2003)? Behind such [a question] is a key issue with important consequences: how do we imagine the relationship of so-called 'new literacies' (Lankshear and Knobel, 2003) to more conventional print-based literacies? (p. 147)

Leander noted four "stances" toward the incorporation of new literacies into language arts classes: resistance, replacement, return, and remediation. The resistance stance privileges the reading and writing of print-based texts. The replacement stance takes the position that print-based texts are essentially antiquated and should be replaced with the kinds of texts that are among the "native, everyday practices of youth" (p. 148), such as blogs and multimedia genres. The return stance has a print-centric focus that understands new literacy practices as means to develop print-based literacies; in other words, print genres are valued as the ultimate guide to knowledge production. The remediation stance reflects an understanding that elements of conventional media are "communicated, or mediated once again" through newer forms. In other words, "the new is never entirely apart from the old" (p. 148).

Remediation also entails recognizing that we are currently in need of understanding the modes of thinking and learning that we want our students to engage in, and consider which media, including print, still and moving images, music, voice, embodied performance, or other that might best 'mediate' such modes of thinking and learning. (p. 148)

Educators taking a remediation stance are "agnostic" (p. 148) in the face of multiple media, more interested in the processes, meanings, and effects of media than a favoring of a single form.

Adopting a remediation stance, Leander went on to describe the concept of a parallel pedagogy, in which "old and new literacy practices, including print texts and visual texts, may be fruitfully taught side by side, rather than the 'old' being a precursor to the new or being replaced by it" (p. 149). This move to a parallel pedagogy works at a meta level. Rather than focusing on the specific products of specific media, Leander's notion of parallel pedagogy asks students to explore how certain aspects of texts have "powerful purchase across media" (p. 160). How, for example, might argument be conveyed through image without a reliance on words (Hundley & Holbrook, 2013)? How is time conveyed differently through visuals, transitions, or print? By taking up a parallel pedagogy, Leander suggested, teachers might be able to address the scheduling issue that makes adding digital literacy instruction so daunting.

Other educators have also argued for the importance of making instructional space for new literacies (e.g., Hicks, 2013; Hundley, Smith, & Holbrook, 2013; Selfe, 2007; Wysocki & Lynch, 2012). As one example, Troy Hicks and Franki Sibberson use the conventional reading/writing workshop model to create time and structure for digital composition in their classrooms (Hicks & Sibberson, 2015).

The question of the place of digital-related literature in language arts classrooms can be found in the arguments presented above. If students need to develop the competencies and social skills to navigate and affect the cultural currents of their time, then should literature generated in response to technologi-

cal affordances be part of that work? If online communities have developed around the stories told in transmedic young adult literature, should the social practices that govern those communities be seen as both in-school and out-of-school learning? If it is important for students to engage in critical literacy, understanding that no text is neutral and that texts shape cultural perceptions, should the hypermedia/multimodal texts in which they engage be open to their informed scrutiny? And finally, if students are already participating in a curiosity of use stage as they craft and distribute their own works, should these practices be brought under the auspices of their classroom curriculum? Undergirding these questions is the belief that schools have a responsibility to support students' cultural competencies around technology as they explore literature as a means of constructing themselves and the societies in which they live.

Digital Literacies and the Common Core

Considering those questions cannot be done outside the structures of assessment and standards, including the Common Core State Standards (CCSS). While the CCSS standards are used in the United States, they were developed within a global context and raise issues relevant in international educational settings. Educators and educational researchers have examined how the CCSS seemingly position digital literacy and technology, noting that the standards in these areas are vague and broad, which can be both a bonus and a problem (Avila & Moore, 2012; Dalton, 2012/2013; Pandya & Auckerman, 2014). In addition, some see tensions in language arts instruction that stem from the kinds of assessments mandated by educational stakeholders and policymakers, nationally as well as internationally. For example, Leander (2009) surmised that the resistance stance toward new literacies curricula may be less a fear of technology than a pragmatic response to standardized assessments that favor conventional print literacy practices.

In the face of what could be seen as moves to restrict and deprofessionalize teachers, educators are advocating ways of reading the emerging standards for flexibility and space. Jessica Van Cleave and Sarah Bridges-Rhoads (in press) encouraged teachers to ask "different questions of the CCSS" by positioning it

> *… as a living document that can be read again and again with an eye toward all sorts of literacy teaching and learning in classrooms….[We], as teachers, can begin to think and speak ourselves as authors of the CCSS and thus become participants in writing its history. (p. 42)*

By engaging in conversations about what the CCSS can be, teachers can actively make the standards in the talking and teaching of them.

In this vein, educators are finding ways of navigating these institutionalized structures to bring digital and new literacies into the classrooms. Expressing an emerging view, Dalton (2012/2013) wrote that while the CCSS does not include an explicit standard addressing technology, "the standards assume that being literate means being digitally literate." The standards can be read, she maintained, to understand technology as not supplemental to literacy development, "but rather...deeply infused throughout teaching, curriculum, and learning" (p. 333). Working with the notion that digital literacy is an assumed aspect of curriculum, Dalton operated within the "open-endedness" (p. 333) of the standards to design projects that permitted students to develop as digital composers.

JuliAnna Avila and Michael Moore (2012) argued that looking at the CCSS with critical and digital literacies in mind could "offset some of the stifling aspects of standardization" (p. 28). Noting that digital literacy held a "relatively low profile" in the standards, they maintained educators nonetheless had the

power to "shape the standards toward a stronger inclusion of both digital and critical literacies" (p. 29), thereby helping students prepare to be active agents in civic life. Similar to Dalton, Avila and Moore enacted the stance that the Common Core's language arts standards can be read to include--even assume--digital and new literacies, a position which then opens opportunities for teachers to create classrooms in which students explore and craft digital multimodal texts.

Drawing from Luke and Freebody's work on the four resource model, Jessica Zacher Pandya and Maren Aukerman (2014) argued that the CCSS were written to promote some aspects of technology use but not others. Luke and Freebody (1999) posited that readers and writers rely on four types of competencies or families of practices as they engage and produce texts: coding, pragmatic, semantic, and critical. Each of these families of practices are necessary but not sufficient in and of themselves, Luke and Freebody argued, for the development of literate citizens. The practices also change depending on prevailing notions of literacy, impacted by the communication tools adopted by societies.

In their examination of the CCSS, Pandya and Aukerman (2014) maintained that the standards promote technological use in the development of pragmatic ("the ability to use texts to get things done" [p. 429]) and semantic ("the ability to make meaning from and with texts" [p. 429]) competencies. However, the standards provide less focus on coding ("the ability to decode words, including knowledge of...keyboard layout and keyboarding" [p. 429]) and critical ("the ability to critique and analyze texts...[and] the knowledge that texts are never neutral" [p. 429]) competencies. While they acknowleged that "optimistic" (p. 431) educators see room in the CCSS for critical literacy around technology use, Pandya and Aukerman are less encouraged, concerned that teachers may not be able to find space if such foci are not required.

If, as many researchers argue, digital and new literacies are assumed in the CCSS, then how can educators find that space in their day-to-day teaching so students can develop as active, involved, responsible participants in the digital age? Like Pandya and Aukerman, we find reason to be skeptical as we watch schools enact mandated instruction and narrow interpretations of the CCSS. However, we also believe that teachers can work against constricted understandings of the standards in their selection of texts and related practices. We suggest that bringing digitally-derived and born-digital literature into English Language Arts classes can involve students in complex and productive literacy practices. Referring to Jenkins et al.'s (2009) list of key technology-related skills, we see that by engaging students in the types of experimental texts created by young adult literature authors, teachers can support students as they cultivate such skills as play, appropriation, multitasking, distributed cognition, transmedia navigation, and networking.

Furthermore, reading/writing workshops that immerse students in not only the reading of such texts but the creation of them as well can go far to address Jenkins et al.'s gaps in participation, transparency, and ethics. Instead of relying on out-of-school and home-based spaces to provide students access to online participation, schools can engage student participation through the affinity groups that develop around young adult literature, immersing them in online communities that critique and expand the narratives, positioning students as active co-creators of texts and the shapers of discourse. By engaging students in critical conversations around young adult literature, including experimental texts, they can explore the systems of power and normativity that make no text neutral. And by incorporating these texts--and the online communities and practices they include--into classrooms, teachers can support students as they explore the ethics of being content producers and responsible participants in digital environments.

In this chapter we have posited that YA authors are engaged in a curiosity of use process in response to their tech-savvy adolescent readers. But it's interesting to note that as they experiment and invent,

their work may, in time, reach other audiences. A recent study discussed in *Publisher's Weekly* (2012) explained that

… fully 55% of buyers of works that publishers designate for kids aged 12 to 17 -- known as YA books -- are 18 or older, with the largest segment aged 30 to 44, a group that alone accounted for 28% of YA sales. And adults aren't just purchasing for others -- when asked about the intended recipient, they report that 78% of the time they are purchasing books for their own reading. (para. 1)

While young adult authors are exploring the options for digital media in storytelling and using tools that their intended audience are employing in their daily lives, their audience extends beyond just adolescents. Over half of the books identified as books for young adults are bought by adults, purchased for themselves. As authors experiment with digital media in storytelling, they are reshaping reader expectations and helping determine which storytelling tools will become more than a curiosity of use, not just for a segment of readers but for larger audiences. Similarly, Jenkins and other scholars working in the intersections of digital technology and the literacy practices of adolescents and young adults point to inquiries that can be taken up by researchers looking at the larger question of the changing nature of the book. For example, more research is needed on the shifting relationship between author and reader in the digital age: *In participatory cultures, what counts as authorship? When books are reconceptualized within notions of transmedia, how is the author function taken up and performed? How do reading practices--and the construct of reader itself--change in the context of transmedia and/or dispersed texts?*

As Nash (2014) noted, books have been a part of culture and a disruption of culture. The jitteriness of the current era, therefore, is nothing new; extending back to the Greeks, observers have fretted over the effects of new communication technologies, including the at-one-time new technology of the book. While, as Coover (1992) worried, contemporary digital technologies seem fragile in their short life cycle, the book is not fragile. Books are extraordinarily resilient. Put to use by motivated humans, books do change the world.

That said, some of the forms and features of texts do change, and in those changes are new possibilities for human agency. One of the exciting aspects of living in a time of curiosity and inventiveness is seeing those possibilities erupt. It could be said that readers and composers of young adult literature are in the business of eruptions. In critiquing the publishing business, Nash (2014) reminded,

A business born out of the invention of mechanical reproduction transforms and transcends the very circumstances of its inception, and again has the potential to continue to transform and transcend itself--to disrupt industries like education…. By defining books as against technology, we deny our true selves, We deny the power of the book. Let's restore to publishing its true reputation--not as a hedge against the future, not as a bulwark against radical change, not as a citadel amidst the barbarians, but rather as the future at hand, as the radical agent of change….(para. 52)

What we see in the work (and play) of adolescent readers and young adult authors as they actively explore and authenticate digital media tools is the remaking and remixing of what a book can be. The book is dead; long live the book.

KEY TERMS AND DEFINITIONS

Codex: Early text form comprised of stitched sheets or pages.

E-Book: Short for "electronic book"; e-books are accessible on digital devices such as computers, tablets, and smart phones and may either be electronic versions of print texts or texts designed to be published in an electronic format.

Hypermedia: An interactive digital or electronic text that includes hyperlinks to other digital or electronic media such as print, videos, image files, and sound files.

Hypertext: An interactive digital or electronic text that includes hyperlinks to other digital or electronic texts; sometimes used synonymously with hypermedia.

Interactive Book: An electronic or digital book designed to include active reader participation via links or embedded reader-enacted functions.

Non-Linear Text: A text designed to disrupt chronological flow or conventional textual sequencing.

Participatory Culture: Term developed by Henry Jenkins to describe contemporary cultures where members of a society do not only consume media content but also create and distribute it.

Story App: Digital application designed to tell a narrative or story, usually employing print, images and sound. Frequently, story apps are also interactive and non-linear.

Transmedia Storytelling: A form of narrative in which the story is told across multiple media platforms (e.g., books, films, websites, story apps) and usually across multiple media forms (e.g., video, audio, print).

Chapter 71
Home Media Access with Heterogeneous Devices

Tayeb Lemlouma
IRISA Laboratory and University of Rennes I, France

ABSTRACT

The intensive use of social content anywhere and from any device presents new challenges for current systems and networks particularly when they are used by novice users. One of the most places where social channels are used by non-expert users and with a wide range of devices is at home. Unfortunately, current digital home systems lack of intelligent components that help terminals and users to find, configure and connect devices for using media content (video, audio, etc.) in an intuitive, transparent and optimized way. In this paper, the author discusses how the user's experience is negatively affected in existing digital home systems. Particularly, in heterogeneous environments with terminals and networks having different capabilities. The author discusses the home media access using a real-world evaluation of existing home systems. The author compares these evaluations to a Web-based approach and show how the use of the home network resources can be significantly improved for sharing and browsing media items and folders.

INTRODUCTION

Digital home systems were designed to offer an interoperable network that ensures sharing media content in a seamless environment regardless: media sources, location, delivery methods and protocols, formats and existing terminals. With the success of different social networks and channels, digital home systems -used mainly by non-expert users- represent an important place where the home users can share and use different media and data coming from different sources. Unfortunately, actual digital home systems do not meet this objective yet (Socher, 2008). Furthermore, many users are still unaware about the existence of digital technologies. Let us consider, for instance, one representative example of a digital standard such as the Digital Living Network Alliance (DLNA). The Digital Living Network Alliance is already integrated in about 74% of existing CEs. This standard knows only 6% of real users that are aware about the existence of the digital functionalities and are able to use them intuitively (In-Sat, 2010). Many rea-

DOI: 10.4018/978-1-5225-3822-6.ch071

sons explain this situation. Mainly we cite the complexity of the proposed technologies inside the home network, the inter communication and cooperation between different industrial and standard norms, the heterogeneity of media formats and devices. Finally, the lack of intelligent components or services that help terminals and users to find, configure and connect their terminals in order to use the media content in the best possible and automatic way.

Many previous works have studied reducing the overhead traffic on services advertisements for example with the UPnP protocol. Digital homes represent an interesting challenging context especially for social applications and home residents that are usually novice. Services are mainly related to sharing, discovering and rendering items such as music, videos and pictures. Also, at home, the residents may use, in the same time, a wide variety of devices and access methods that are heterogeneous in terms of network and rendering capabilities. In order to qualify and quantify the *user's satisfaction* about the *use* of the different services (i.e. the *user experience*), we generally use the concept of *quality of experience*. This concept is widely used to describe how users experience the available services (e.g. the ability to find home media content, the available bandwidth for their applications, the rendering capabilities of their device, etc.). An efficient digital home system should enable the access to media content and services with heterogeneous terminals and without preliminary configurations and settings. Also, it should optimize the network traffic generated by digital homes components by using only necessary traffic when it is really needed by the user and its social applications. This paper shows how the home network resources and the user's experience are affected in existing digital home systems. Particularly, in a heterogeneous environment where users are usually connected through a wireless access using handheld devices.

Based on real-world evaluations, we identify useful lessons for optimizing the media access and network resources. We show and measure how a client-server based approach, like UNIVERSALLY (Lemlouma, 2013), can improve digital home systems by using the Web and the HTTP protocol for heterogeneous devices with limited capabilities. In a heterogeneous environment, many devices are still not compatible with the advanced digital home functionalities (Jovanovic et al., 2012; Ilkic et al., 2013) such as content discovery, multicast dialog, verbose XML parsing and heterogeneous media decoding. We believe that moving toward a client-server model guarantees that no home traffic will be generated if the user does not ask the network for something. This approach ensures that any transmitted data will be an answer of the user's request and avoids unnecessary traffic and bandwidth consumption.

The remainder of the paper is structured as follows. We review the related works and present an overview of a representative case of the current digital home systems. We then discuss the negative impact of current digital home systems. We discuss our measurements regarding the home network traffic used in background and while browsing media items. We identify a set of relevant guidelines in order to optimize the media access at home and evaluate the optimization in terms of bandwidth consumption and media access time after the presentation of a client-server web based approach.

RELATED WORK

The use and the improvement the home media access within heterogeneous mobile devices have been explored in research work over the past few years. Lai et al. (2010) propose a UPnP based content sharing system for supporting multimedia devices in a digital home network. The work uses a server to which devices must be directly plugged in order to be integrated in the sharing system. The approach simplifies the content discovery, reduces the overhead but limits the location of the content that should be

ideally possible anywhere in the home. In (Kim et al., 2007; Oh et al., 2007), a simple proxy's system is proposed for searching and streaming the media contents. The impact and the performance of digital home networks has been a concern in some previous works that studied, for instance, the DLNA impact either directly inside the home network or indirectly by evaluating separately the performances of the used protocols such as the multicast, UPnP and SOAP. We cite the work for Bluetooth (BT) Personal Area Network (PAN) inside the home (Liong & Ye, 2005) and in large home networks (Mills & Dabrowski, 2003). Many other works have studied similar digital environments based on service discovery and multicast (Al-Mejibli & Colley, 2013). Liong and Ye (2005) have shown the negative impact of SSDP (Simple Service Discovery Protocol) advertisements in PAN such as for BT power cost -when advertisements are spread- and channel's bandwidth usage especially for large SOAP messages, transfer and media streaming. The work in (Mills & Dabrowski, 2003) evaluated the UPnP M-SEARCH messages (used to discover devices and services) by varying the jitter bound (MX field of M-SEARCH) and network size. The used simulated model (Mills & Dabrowski, 2003) showed that when the number of root devices increases (generally above 50), the network knows negative performances regarding: the discovery effectiveness (percentage between announcement and real discovery), discovery latency and buffer overruns. The reasons are mainly the responses loss, the explosion of response at the level of control points (CPs) and collision periods in a large network. The work outlined new algorithms for adapting the MX field and an approach for replacing M-SEARCH queries in UPnP. Unfortunately, in heterogeneous and dynamic digital home networks, we should expect several and different implementations (different values of MX fields that are compatible with the UPnP standard) and hence we must take them into consideration in a universal media access approach in order to coexist with existing digital home networks whatever their size.

Other related works have concerned the impact of using SOAP used in the invocation of services in the digital home. For instance, in (Newmarch, 2004) and (Newmarch, 2005) an alternative of SOAP was proposed based on REST (Fielding, 2000). This implies some strong requirements in the digital home system. In particular, media servers should be able to process the new REST URLs and to add a new mime-type in order to distinguish native SOAP POST and REST POST messages. Another consequence is that all the resources and data (even variables included in XML files) must follow a new addressing scheme that should be implemented by DLNA components. Moreover, the description of resources and XML data access are already possible using standards such as the W3C POWDER, XPath and XQuery languages.

The objective of Digital Living Network Alliance technology is to manage and distribute digital content from a source to all the compatible devices (DLNA, 2007; DLNA, 2014). The key functions of Digital Living Network Alliance are: connectivity and networking, device discovery and control, media management, media formats and media transport. Connectivity and networking use the existing network platform at home. Device discovery and control is based on the UPnP Device Architecture (DA) 1.0 (UPnP Forum, 2008a). Media management is based on the UPnP AV (UPnP Forum, 2008b).

Three entities are specified: devices, services and control points (CPs). Services are functions provided by a device, found and invoked by a control point. The main functions of a UPnP device are: IP addressing, discovery (periodic advertisement of services), description of services and capabilities, control in response of CPs requests and eventing to notify registered CPs. SSDP (Simple Service Discovery Protocol) messages are sent over HTTPMU (HTTP Multicast over the *User Datagram Protocol*-UDP) in order to discover resources in the network (UPnP Forum, 2008a). SOAP allows to specify available operations. In the audio video (AV) digital home, the three main entities are: the MS that offers media

content, the media renderer that plays content and CPs that control what and how contents are played. Digital Living Network Alliance defines two main entities: Digital Media Server (DMS) and Digital Media Player (DMP). Digital Media Server is a UPnP/AV Content Directory Service (CDS) device that provides media resources. DMP is a UPnP/AV Content Directory Service (CDS) control point that can discover resources and render them (DLNA, 2007).

DRAWBACK OF CURRENT DIGITAL HOME SYSTEMS

In a digital home, when a media server is added to the network it advertises services and embedded devices to all the connected devices. For instance, in a DLNA-like digital home, servers use a set of multicast NOTIFY messages sent, using the *User Datagram Protocol* (UDP) to the group of all the digital devices (UPnP Forum, 2008a). Three advertisement messages are sent for the root device, two for each embedded device and one message for each service type in each device. Consequently, at each announcement interval, $3+2d+k$ messages are sent (one root device, d embedded devices, and k distinct service types). The NOTIFY message uses a duration (the *CACHE-CONTROL* which is at least 30 minutes) for which the advertisement is valid. Due to the unreliable nature of the User Datagram Protocol (UDP), the Digital Living Network Alliance Interoperability Guidelines, based on the UPnP DA 1.0, recommends that devices should send each of the above discovery messages more than once but not more than three times. Also, advertisements must be periodically re-sent prior to the CACHE-CONTROL value (Figure 1). The NOTIFY messages with ssdp:alive that UPnP devices send periodically are presented by the *B* set. The *C* set presents the advertisements duplicated due to the unreliable nature of UDP multicast. Advertisements and duplicate sets are presented by the *D* group. The norm recommends the implementations to apply a repetition of advertisements using a randomly distributed interval that must be less than one-half of the CACHE-CONTROL value. Moreover, spreading the duplicate sets is suggested to reduce the traffic storm.

Figure 2 presents the SSDP (Simple Service Discovery Protocol) advertisement groups with and without spreading. As for media servers, when a control point (CP) is added to the network, it searches for devices using multicast M-SEARCH messages sent more than once and periodically to guarantee that devices receive it. Each device answers with $3+2d+k$ messages for its root device, embedded devices and service types. In addition to the discovery advertisement and discovery search, the CP retrieves descriptions of the existing devices/services. A control point invokes actions on media servers using the SOAP protocol. Device and service descriptions are written using the UPnP Template Language (UPnP Forum, 2008a). These descriptions have usually an important size.

Figure 1. SSDP advertisements

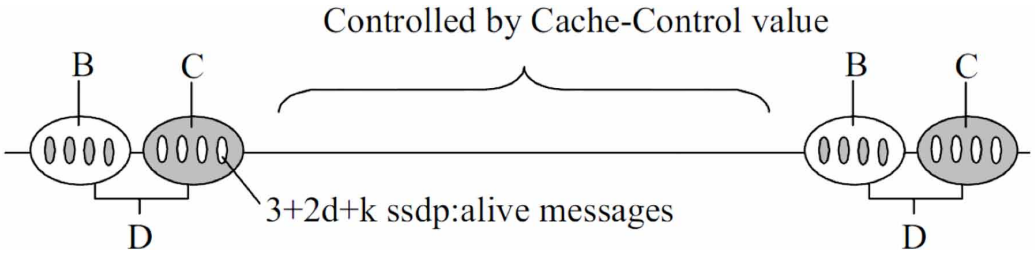

Figure 2. Advertisements and spreading

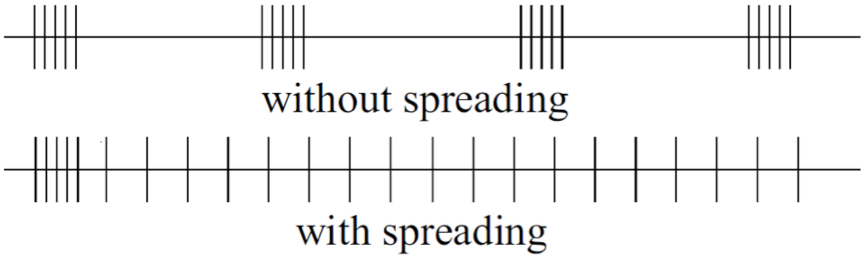

In actual digital homes, the number, the nature (UDP and multicast) and the periodicity of UPnP advertisements are inconvenient. Also, to be able to play one media item, several messages and steps must be achieved (DLNA, 2007; DLNA, 2014). Consequently, a mobile device, that joins the digital home, should support: the multicast function, the UPnP Template Language parsing, the SOAP protocol and the unreliable nature of the User Datagram Protocol (UDP) especially over a wireless access. Moreover, there is no guarantee that the original format of a requested media item is compatible with the renderer. This situation is not adapted for heterogeneous environments where rendering capabilities, access technology, bandwidth, congestion probability and power consumption are not the same for all the existing devices that can be connected through Ethernet, WLAN, Bluetooth, etc.

The UPnP norm, used in digital homes, provides the presentation function that uses a simple Web page presenting a media server. This function can be used in order to provide renderers with some control of the shared media items (UPnP, 2008a). Unfortunately, the level of the provided control depends on the design and implementation of each presentation page. The control of media items is completely specified by the media server's vendor and not standardized. Consequently, the presentation function cannot guarantee a universal access to heterogeneous devices.

MEASUREMENT OF NETWORK TRAFFIC

In this section, we will investigate how existing digital homes systems and media servers affect negatively the network resources and hence the user experience based on real-world evaluations. The unnecessarily use of the network resources and components affects negatively the user experience directly and indirectly. Precisely, it affects the availability and the performance of the home network, the devices used by the network (energy and processing) and the user's applications especially for the user's social applications that may require an important traffic.

We consider the background traffic (needed in current digital homes to discover existing media servers) and the traffic implied by the user's actions while browsing shared items. It is important to notice that heterogeneous devices connected by the wireless network cannot use the shared services because they do not support natively the used protocols (such as the *multicast*, i.e., sending one message for different destinations). If the user of such devices wants to play shared items, he has to set up specific applications and do required configurations to be able to discover media servers, discover and render items (Jovanovic et al., 2012; Ilkic, 2013). Also, only compatible items (e.g. media items with supported codecs) will be rendered. These requirements are not adapted for novice users using heterogeneous devices at home.

Testing Architecture

The testing architecture was implemented in a way that represents a typical digital home architecture. Indeed, the platform includes Media Servers (software and hardware-embedded), Media Players with heterogeneous devices and a basic connecting network (wired and wireless).

The testing platform (Figure 3) is composed of a digital home network connecting two servers, an Internet home box (Orange Pro Livebox), a game box (Play Station 3), a DLNA enabled TV (BRAVIA KDL-46Z5500) and a mobile phone (a 3G iPhone) that represent the heterogeneous devices connected through a WiFi access point. The Ethernet LAN has a monitored switch port connected to a computer that uses the Wireshark packet analyzer. The two servers have different implementations of media servers; the home box uses the native media server of the provider.

Background Traffic

In this section the measurements consider the number of messages and bandwidth consumption of the digital home background traffic (Figure 4 and 5). The considered traffic concerns only the advertisements of the existing digital media servers (software media servers in DMS and the embedded media server of the Home-Box, see Figure 3). The traffic is captured using the monitored port of the switch connecting all the devices of the testing architecture. We do not show the plots for all tested media servers, but we rather select the most commonly used software servers (e.g. TVMOBiLi, PMS, TWonkyMedia and Skifta) in addition to the media server embedded in the Home-Box. Even thought that the traffic is sent to many destinations (using multicast to the IP address: 239.255.255.250:1900), we consider the single traffic as received by only one device connected to the Ethernet LAN. We can easily deduce that if we have n connected device, the whole traffic can be computed by multiplying the single traffic by n.

Figure 3. Testing architecture

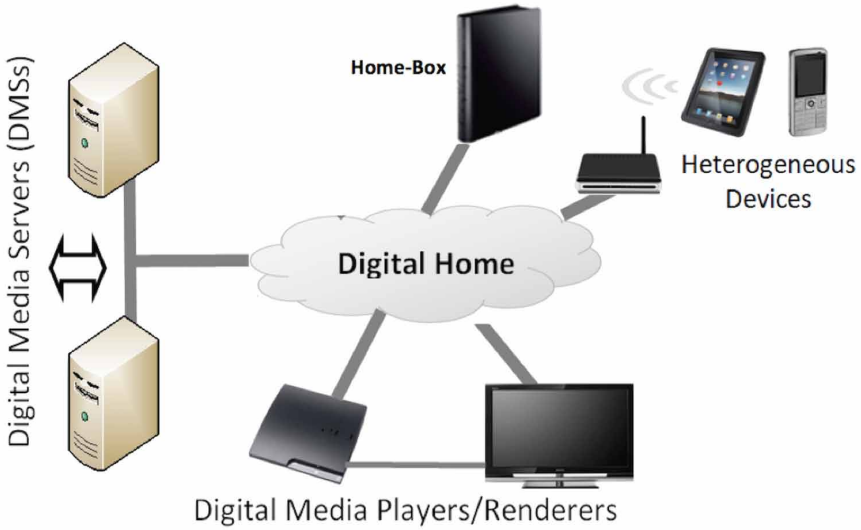

Figure 4. Cumulative number of messages in the background traffic received by one device within 70 min

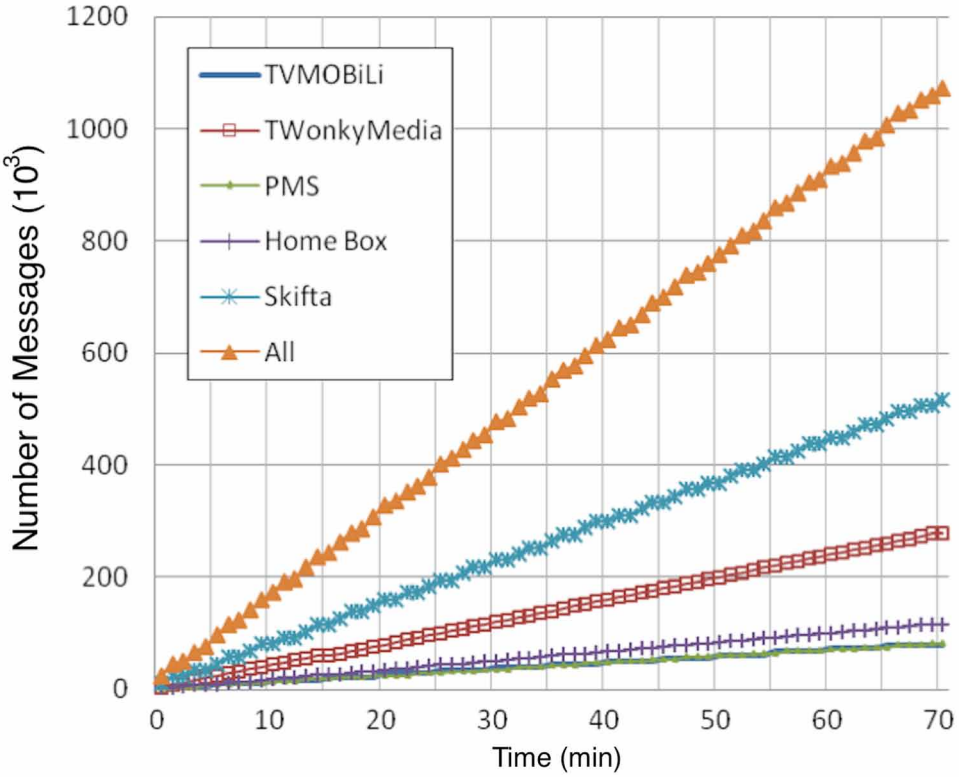


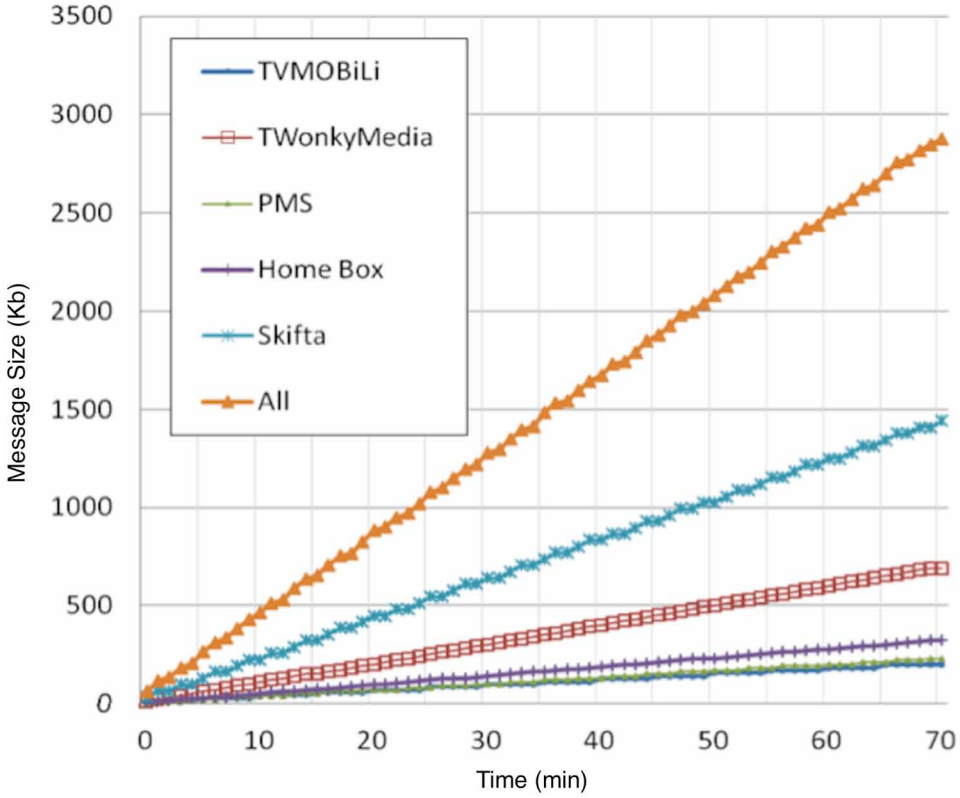
Based on our experimentations, we observe that the behavior of all the tested media servers is DLNA-compliant (DLNA, 2014) which means that the servers implementations follow the DLNA standard specification. The only noticed difference is due to the different implementations of the advertisements intervals.

Measurements show that within one hour, the user's network is affected by approximately 3000 unnecessary Kbytes and more than 104 unnecessary messages per one digital device. Indeed, even if the user does not perform any actions in a standard digital home network (e.g. searching or rendering a media item) the home network components still awake (consuming energy) and the resources are negatively affected by existing media servers. This situation is true when the home include some DLNA devices (i.e. 75% of existing CEs (In-Sat, 2010) such as connected TV) or when the user is unaware about the existence of digital technologies at home, which is mostly the case.

Browsing Shared Media Items

In a digital home, the most frequent action of the user concerns mainly browsing/searching media items and playing them using existing renderers. For novice users, rendering the shared content, through their heterogeneous terminals, is not intuitive and remains, in many cases, impossible (codecs issues, terminals configurations, etc.). Indeed, to be able to find and play one shared media item, a device (such as a handheld devices connected via WiFi) must (1) support the multicast mode in transmitting and receiving

Figure 5. Cumulative size of messages in the background traffic received by one device within 70 min



data, (2) the network interface of the device must be configured for this mode, (3) the device software must be able to parse long descriptions written in the XML-based UPnP Template language, (4) the SOAP protocol must be implemented in the embedded system, (5) the access network method (which is mostly wireless) must handle the unreliable nature of UDP transport, and (6) the device must be able to decode the original format of shared media items since no content adaptations are available by default. Unfortunately, these last identified requirements are not satisfied natively even by recent handheld devices such as smart phones and tablets. If the user's device is compatible to take benefits from his/her digital home environment, the device searches for existing media servers, browses available items and play them.

Figures 6 and 7 show the number and size of messages used to find and browse items shared in the digital home network represented by our testing architecture (Figure 3). In our tested scenario, we consider only one standard media server (the DMS embedded in the home box). The used device is the game box that is connected to a TV set in order to display the rendered media item. From $t = 0$ to 15 seconds, the user searches existing media servers. At $t = 45$ seconds, the user selects the discovered media server and explore its root folder. The root folder stores 24 sub directories and one video item.

From t = 0 to 15 seconds, the renderer sends (as specified by the norm) searching messages in a multicast mode. The media server notifies its existence and then the device retrieves the server's description. Messages from $t = 45$ seconds are related to the root folder's description, metadata and content.

Our measurements show that the total number of exchanged messages (only on the network segment between the media server and the device) is 68. The size of exchanged messages is of 38,98 Kbytes.

Figure 6. Number of messages (over time) used in browsing media items of one MS

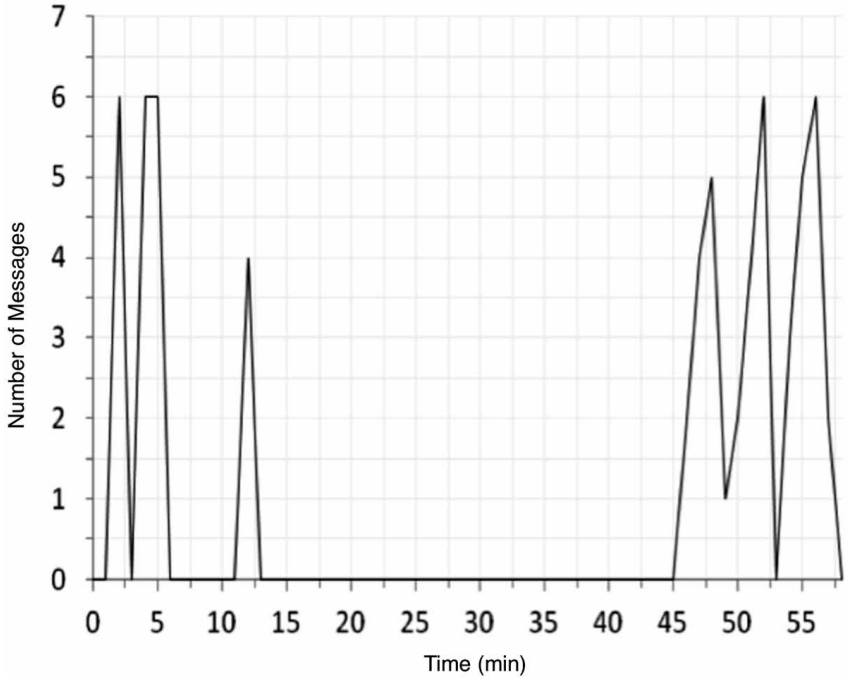


Figure 7. Size of messages (over time) used in browsing media items of one MS

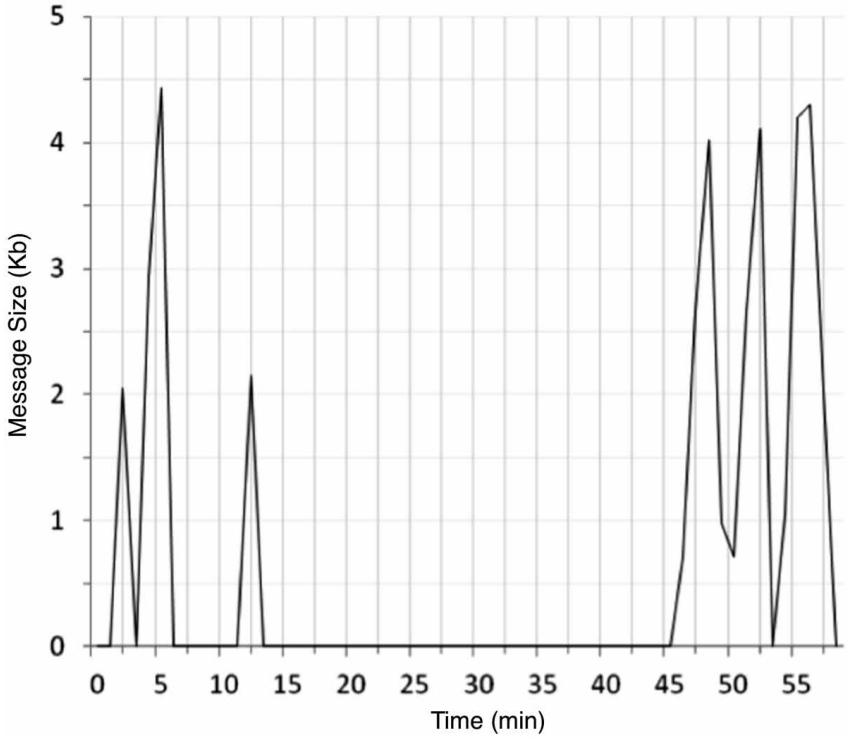


Note that messages do not include any media content and concerns only the listing of the root folder (the first level of the media server). Device searching messages are sent in a multicast mode so they will be transmitted to the other digital devices on all the network segments. Also, if other media servers exist in the home network, the set of messages (from $t = 0$ to 15) will be increased with all of the received notifications (any media server must reply to a searching message as specified by the norm).

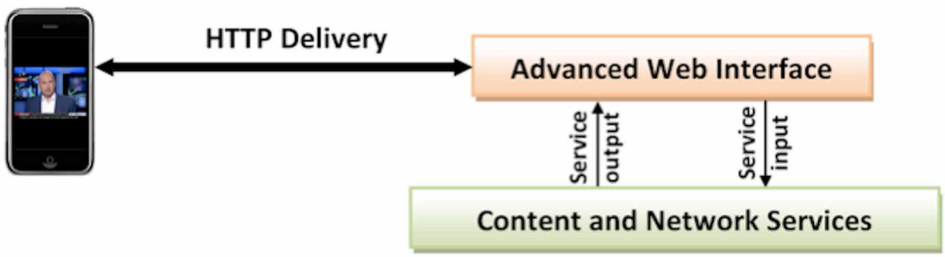
OPTIMIZING MEDIA DISCOVERY AND RENDERING

In this section, we identify a set of guidelines in order to optimize the media access in digital homes usages by novice users and heterogeneous devices. Even if some of these guidelines appear trivial, they are not all followed by the current digital home systems. The identified requirements allow avoiding the unnecessary background traffic of media servers and the traffic used in browsing shared media items hence significantly improving the user's experience. The guidelines are based on our experimentations in the context of digital home environments and from the lessons that we have learned from previous measurements. We identify five guidelines:

1. No network traffic should be generated if the user does not ask the digital home system for some items to browse/render. Also, unnecessary traffic should be avoided if it is not useful for the user's actions.
2. Existing media servers should be *easily* found by the novice user using any terminal whatever its capabilities.
3. Content adaptation and negotiation techniques should be easily integrated to better fit heterogeneous rendering limitations.
4. Proposed optimizations and approaches should be compatible with existing digital home architectures and media servers.
5. Media servers should be easily used by heterogeneous terminals without strong technical requirements on the device side or its access method

The first identified guideline can be easily satisfied by adopting the client/server model where the server answers only to the received requests with the needed content. To be compatible with heterogeneous devices having different software capabilities, the HTTP protocol represents the best candidate for the user's device that interacts with the digital home network through an adaptable Web interface (guideline 2). The network entity that hosts the Web server can behave as a middleware (Figure 8) that

Figure 8. Client/Server mode for home networks



discovers media servers (by applying a set of network operations and use available services), list items in standard Web pages and caches most used results (guidelines 4 and 5).

The client/server model can provide content adaptation and negotiation (guideline 3) based on the HTTP Transparent Content Negotiation (TCN) rules (Holtman & Mutz, 1998) and, if needed, based on external profiles that can describe the capabilities of devices (Figure 9).

USING A WEB CLIENT-SERVER APPROACH

In order to test the impact of our guidelines in existing digital home systems we have integrated a Web client-server system in our testing architecture. We have implemented and integrated the functions of UNIVERSALLY (Lemlouma, 2013). UNIVERSALLY was proposed in (Lemlouma, 2013) to enable the access and control of existing media resources at home using Web interfaces and the HTTP protocol.

Figure 9. Client/Server model for digital homes

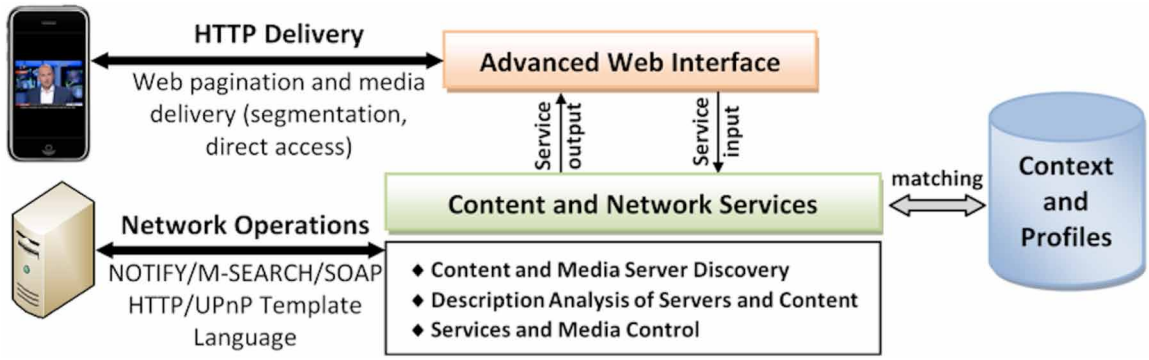


Figure 10. Testing architecture using a Web-based architecture

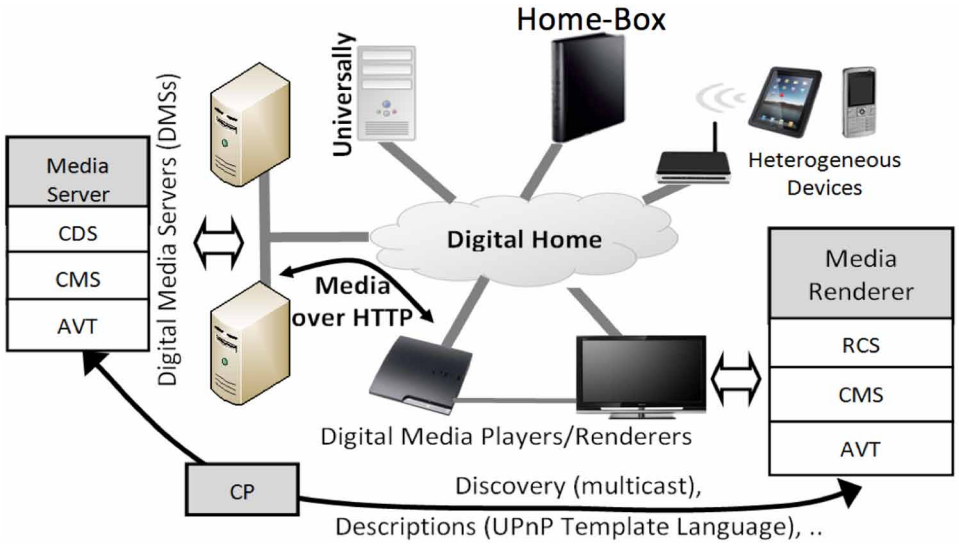

The key idea is to provide an easy media access only when it is needed by a user and requested by its device. Based on Web interface (Called AWI-*Advanced Web Interface* (Lemlouma, 2013)), devices can browse available DMSs and resources using the HTTP protocol. Once a media resource is found, the user can use it directly by hitting the displayed HTML hyperlink. In order to improve the media transfer, the media transport is extended to any transport protocol by including appropriate and compatible transport in the source of hyperlinks. For instance, hyperlink sources can include *rtp://* or *rtsp://* sources if the target device supports them. To perform DLNA media controls and actions (e.g. a stream seek) over HTTP, a web server is implemented with a full support of the HTTP range header (Figure 10). For instance, when the user seeks a certain position of a given media stream, the starting HTTP range is computed according to the corresponding offset of the media file stored in the media server.

UPnP main functions (discovery, control, etc.) were delegated to a specific implemented module that ensures the access for limited devices such as those which do not support the multicast or are not compatible with DLNA. Since devices with advances capabilities can also use the Web interface, UPnP advertisements of media services are filtered and only responses to the M-SEARCH requests originated by the user are authorized. Unnecessary traffic is so avoided. A *context* module is used to describe the hardware and software capabilities of devices that aims to play a media resource. This module is based on the W3C RDF *Multimedia Universal Profiling* (MUP) (Lemlouma, 2013). MUP specifies the displaying and rendering capabilities of a device. Near to 14.000 different HTTP user agents are considered. If the original format of a media is not supported, it can be adapted then transferred to the device. Based on the device's rendering capabilities, the Web interface is also dynamically adapted by performing a pagination of discovery results when the device explores media resources of available DMSs. The pagination allows to dynamically generate small HTML pages with *next* and *previous* links and so only small parts of the content is sent to the user. The pagination is based on the number of discovered resources (*child* of a device or a directory) which is extracted from the SOAP answer (*childCount* attribute of the XML element *DIDL-Lite/container*) of a *Browse/BrowseMetadata* action (UPnP, 2008a; UPnP 2008b).

BANDWIDTH CONSUMPTION AND ACCESS TIME FOR MEDIA ITEMS AND FOLDERS LISTING

In order to demonstrate the importance of the proposed guidelines for current digital homes we focus on the bandwidth consumption and access time when the user lists several media folders and items. Folders and items are hosted within the commonly used media servers at home (for instance a DMS, see Figure 10). We compare these evaluations using the DLNA system and our implementation of the client-server approach compliant to our identified guidelines.

In our experimentation, within the testing architecture (Figure 10), the Web interface of UNIVERSALLY is accessible from the *192.168.1.11* IP address. In a general case, UNIVERSALLY should be run on an IP address known by the digital home system. This can be easily guaranteed using a local DNS server that associates a familiar name to the UNIVERSALLY IP address. A similar technique is usually used by ISPs to access the home box without memorizing the box IP address. The client-server approach provides the access to all the available media servers of our testing architecture and transports media content in a paginated Web interface. Searching MSs is done only once when the user accesses the AWI interface hence background and periodic traffic (such as UPnP announcements) is avoided. Re-

quired messages (such as UPnP requests) are sent only when the user browses the available media items in the home network. The AWI's home page is a implemented using a simple Web page with an HTML *refresh* duration, after which the user is redirected to a new page where the result of services discovery is displayed. At any moment, the user can manually trigger a new services discovery. The client-server approach has allowed to: avoid unnecessary traffic (NOTIFY and M-SEARCH), unify the eventual available presentations of MSs and devices, make the browsing of resources possible and optimal and avoid SOAP and XML UPnP handling and parsing for limited heterogeneous devices.

Media Items and Folders Listing

In a digital home, the main frequent action of a user is searching stored media items such as video and music files. Our real-world experimentations reveal that the user quality of experience is usually affected negatively in the current models of digital home networks. In Figure 11 and 12 we measure the bandwidth consumption and the access time when the user lists several media items and folders. The user's actions (listing folders and items) are performed, in our testing architecture, either using the media server embedded in the home box of an ISP (box MS) or using the client-server approach.

To experiment the cost of media items browsing we consider the following user's actions: browsing media folders/subfolders and browsing media items inside the folders. We focus on the access time and size of messages necessary to perform such actions.

For our purpose, we create 1120 video items (12,9 GBytes) and distribute them into different folders. The content is stored in 14 folders: 7 folders store (each of them) from 20 to 140 subfolders of videos; the 7 other folders store (each of them) from 20 to 140 media items with a step of 20 items.

Figure 11 shows that the network bandwidth is negatively affected when the box MS is used for browsing folders containing several media items (20 to 140 media items with a step of 20). For instance, the client-server model requires 7,51KB to browse 100 media items while the box MS requires 200,62KB.

Figure 11. Browsing items and folders and the bandwidth consumption

	20	40	60	80	100	120	140
Items	42,58	56,11	134,59	177,82	200,62	266,90	323,19

	20	40	60	80	100	120	140
Items	5,08	5,33	10,18	13,49	18,43	21,56	26,17
Folders	2,52	3,00	5,53	5,56	6,91	7,90	16,11
UNIV.	0,0040	0,0081	0,0121	0,0161	0,0201	0,0242	0,0282

The bandwidth consumption required in browsing folders containing subfolders remains acceptable and comparable to the client-server approach that uses the HTTP protocol. For instance, UNIVERSALLY requires 9,78KB to browse 140 folders while the box MS requires 12,33KB.

In Figure 12, the access time is measured between the user's request timestamp and the timestamp of the last packet received by the media renderer. Hence the measured access time includes the processing time of the box MS and the UNIVERSALLY Web server. Figure 12 shows that with a DLNA-compliant media server, the user's quality of experience is negatively affected for both listing subfolders and media items. For instance, 16,11 seconds (resp. 26,17) are required to browse 140 folders (resp. items). However, browsing subfolders and items with the UNIVERSALLY HTTP-based approach improves the required access time. For instance, browsing 140 items (or folders) requires only 0,0282 seconds.

The negative user's quality of experience regarding the access time and bandwidth consumption is mainly explained by the important size of digital home metadata related to items and folders (e.g. *upnp:albumArtURI*, *upnp:genre*, *childCount*, *icons*). These metadata are processed and sent within the media server packets to the media renderer. This approach is not adapted for a home media access within heterogeneous and limited devices using a wireless access (bandwidth consumption). Indeed, devices, such as smartphones and tablets, are not able to natively process the received metadata and the used complex XML schema (DLNA, UPnP and Dublin Core Metadata). Furthermore, in the case where the media item codec is not supported the bandwidth consumption becomes unnecessary. The HTTP-based approach represents the best alternative thanks to the client/server model, the mime-types compact descriptions and caching capabilities.

CONCLUSION

This paper focused on the use of the digital home systems to share and access different media and data coming from different sources using a wide range of different devices. We have shown how the user's

experience is negatively affected in current digital home systems where users are usually novice and search/render media items using heterogeneous handheld devices through a wireless access. For instance, within only one hour and without any user's action, the user's network is still *awake* and affected by approximately 3000 unnecessary Kbytes and more than 104 unnecessary messages per digital device.

We have identified the key requirements to improve the user's quality of experience in such environments in terms of access time and bandwidth consumption. Based on real-world evaluations, we have measured the negative impact of the current digital home network model based on a typical platform. We compared this impact -using the same testing architecture- with the Web client-server implementation that follows our identified guidelines and shows the significant improvements. Besides the fact that the Web-based architecture solves the user's difficulties in using the digital home system and improves the interoperability using heterogeneous devices, the interactivity of the system was also improved. For instance, using existing media servers 16,11 seconds (resp. 26,17) are required to browse 140 folders (resp. items). However, using a client-server model, the user action requires only 0,0282 seconds.

Chapter 72
21st Century New Literacies and Digital Tools as Empowering Pedagogies for Urban Youth of Color

Yolanda Sealey-Ruiz
Teachers College, Columbia University, USA

Marcelle M. Haddix
Syracuse University, USA

ABSTRACT

Increasingly, more youth of color are gaining access to multiple forms of digital and popular media, yet 21st Century Literacies are virtually absent from the curriculum in most schools that serve them. By contrast, their increased knowledge of digital tools is usually met with restrictive access. For example, in many urban public high schools, cell phones are seen as contraband and students are required to "check" them at the door. Additionally, access to the Internet and social media platforms are blocked on most computers to which students have access while in school. More research is needed on how race, gender, ethnicity, and language intersect with access to digital tools in schools. This chapter presents a dialogue about the positive impact of using 21st Century New Literacies and digital tools with Black male middle and high school students. The authors highlight ways that teachers can effectively use digital tools in their classrooms.

INTRODUCTION

In American schools across the country, Black and Latino youth, and more specifically males, find themselves in a precarious position: they are consistently talked about and treated in ways that threaten their social and academic success (Haddix, 2009; Howard, 2013; Hucks, 2011; Noguera, 2003; Sealey-Ruiz & Greene, 2011b; Toldson & Lewis, 2012). Often, they are positioned as those students most in need of disciplinary action (Skiba, Nardo, Peterson, 2002) and academic remediation, and the ones who

DOI: 10.4018/978-1-5225-3822-6.ch072

are least qualified for gifted and talented, and honors programs. These same youth often attend schools where there is limited access to high quality afterschool and tutoring programs, as well as enrichment programs in the arts and technology. As a society, if we continue to underfund the public schools mostly relied on by Black and Latino children, we will maintain the existing access gap between them and their White peers (who often attend well-resourced schools), and ensure Black and Latino underperformance on academic achievement measures (Ladson-Billings, 2006) for years to come.

The authors believe that educators should be concerned with the prevalence of a new kind of 'digital gap' between urban youth from working class and/or low-income communities and their peers who attend school in more economically affluent, White middle class environments. When newer technologies are available, students of color often do not have immediate access to these innovations because they are not readily available in their schools (Hobbs, 2012). Yet, it has been proven that when given access to these technologies, children who have had limited access quickly adapt and gain command in using them (Kaiser, 2010). We are not suggesting that the "digital divide" has disappeared; there is still reason to be greatly concerned about this, even as urban youth of color purchase and use mobile devices, and engage in online social networks in record numbers (Kaiser, 2010). Rather, we call for an examination of the ways in which youth of color are using these newer technologies, and how their increased access to digital tools and digital media is being positioned in schools and in research.

In our research we advocate for a shift in the discourse -- away from binaries created by access and performance -- toward notions of equity that qualify and contextualize digital disparities within local and societal histories, values, languages, and perceptions of success and disproportion. In other words, we argue that merely providing students with technology and online education, (even in varying degrees), and offering them training to meet curriculum and technology standards will not ensure access to social, cultural, and economic capital. Instead, real dialogue and action are needed to address and counter widening academic and digital gaps that persist within and beyond our current education system. In this chapter, we invite readers to engage in dialogue with us about the digital gap facing urban youth, and offer some implications for digital literacy education for youth of color in today's classroom.

As middle and high school literacy teachers, and as scholars in the fields of English and urban education we have observed how some youth are being encouraged to be the builders, creators, and producers of these digital tools and spaces in official school environments while others are not. Addressing and countering any kind of achievement gap requires having open and honest dialogue about its underpinnings and enacting curricula, pedagogy, and educational policies for transformation and change.

Indeed, the "digital divide" is no longer merely a question of access, but as Yang (2007) argues, one of power and control. He writes,

Bridging the digital divide reveals a deeper divide, in which poor, urban, immigrant youth are not full citizens of society. …marginalized youth often appropriate their newfound digital literacies to curse the state of inequality. Specifically, youth create subaltern public spheres, so-called subcultures, through such media as MySpace and text messaging. So framed, the "digital divide" is therefore an ideological divide and should refer to the antagonistic ideologies surrounding the purposes of new media. On one hand, charitable educators and government agencies seek to increase access to the information highway in order to produce compliant citizens for a global economy. On the other hand, youth subvert these resources to become counter-citizens, indulging in pleasure, resisting the "civilizing" project of education, and in some cases, organizing for the disruption of that very global economy (p. 12).

Yang's point suggests support for Banks' (2005) notion of a Black digital ethos. Banks argues that "a set of attitudes, knowledges, expectations and commitments…" (p. 48) must be developed and used by Blacks as they engage with digital technologies. Blacks have a history of civil rights activism in the U.S., and as members of a racialized group (Omi & Winat, 1986), they continue to face threats to their civil rights through institutionalized racist policies like "stop and frisk", the rampant killing of youth by police and others (as in the recent killing of Trayvon Martin), and in the massive closings of public schools in their communities. Black youth have taken up digital tools to announce these injustices in their communities and organize protests. In this way, they connect to the historical legacy of U.S. civil rights activism, and mobilize support for their causes through digital media.

Urban Youth Technology Consumption

Research from the Kaiser Foundation (2010) notes that while children of color are among some of the most active users of video games, television, online and offline music channels, social networks, and cellular phones, they are not usually the populations who are engaged in digital and media literacy opportunities in their schools. Solomon, Allen, and Resta (2002) note, "Although instructional technology has been part of the American educational landscape for decades, the integration of technology into the classroom lags beyond expectations for its use (Cuban, 2001), especially in traditionally underserved populations" (as quoted in Hobbs, 2012, p.2). Research by Hobbs (2012) confirms this digital gap. She writes,

...although there has been a significant funding initiative by charitable foundations over the past 5 years to support the field of digital media and learning, these resources have by and large gone to support a few very small and highly intensive initiatives (including the development of games for learning) and not yet have had much impact on a large number of children in low-income and urban communities." (p. 2).

Despite this evidence, urban students of color creatively find ways to engage with digital media at their local community centers or neighborhood libraries if they don't have immediate access in their homes. They understand the importance of being technologically and digitally literate, and they look beyond their school environments for access.

Viewing Urban Youth Technology Consumption Through a Deficit Lens

The aforementioned Kaiser (2010) study also found that children and teenagers whose parents do not have a college degree spent 90 minutes more per day exposed to media than children from higher socioeconomic families. In 1999, the difference was just 16 minutes. The study found that children of parents who do not have a college degree spend 11.5 hours each day exposed to media from a variety of sources, including television, computer and other gadgets, a reported increase of 4 hours and 40 minutes per day since 1999. In families where a parent has a college education or an advanced degree, Kaiser found that children use 10 hours of multimedia a day, a 3.5-hour jump since 1999. Children of more educated parents, those thought to have a higher socioeconomic status, also use their devices for entertainment. But, a main argument of the report, the point with which we are most concerned and take contention, is its statement that there exists a growing gap between the use of digital tools for education or "meaningful content creation". The writers of the report position those who use technology and other digital tools

for pure entertainment at high rates, as contributing to a 'time-wasting gap'. As researchers, we find it interesting that now, in recent times, when the "digital divide" between youth of color and Whites is narrowing, researchers are *still* finding ways to position urban youth from poorer and/or working class communities in negative ways. According to the Kaiser report, these youth are not 'falling behind' as much as they are 'wasting time'. Now that these youth and their families are engaging with technology in ways, and at comparable rates to their more affluent peers, their digital use is described in deficit ways.

In the past decade, digital technologies have significantly changed the way we live. In schools, from K-12 through the graduate level, computers, smartphones, social networking sites, and APPS are used in many classrooms to issue and complete assignments, share comments, and push student and instructor thinking in new directions. Specifically, as literacy educators we have witnessed the indisputable benefits that technology provides in our writing classrooms. Students in our classrooms are able to capture their thoughts in real time with audio and video recorders; effectively and efficiently edit their work, and include various multimodal elements (images, music, and audio) to enhance their written work, which can take on various forms (i.e. essay, blog, vlog, iMovie, Powerpoint, etc.). Given all of the advantages that digital tools offer students, we are dismayed at the ways in which these tools are restricted in schools where Black and Latino students are the majority, and are suddenly being viewed as negative when poor and low-income youth of color increase their engagement with them (Kaiser, 2010).

NEW LITERACIES IN URBAN ENGLISH LANGUAGE ARTS CLASSROOMS

In their Policy Research Brief on a Framework for 21st Century Learning, and 21st Century Literacies, the National Council for Teachers of English (NCTE) (2009, 2013) makes a compelling argument for the need to engage students in 21st Century literacy instruction, and to design classroom spaces where students and teachers have access to current technologies. NCTE advocates for students to develop technological proficiency, understanding how to "access, evaluate, synthesize, and contribute to information" (NCTE, 2009, p. 5). These policy briefs also discuss the importance of engaging students in the practices and kinds of thinking that are valued in the 21st Century: written and oral communication skills, collaboration, work ethic, critical thinking, and leadership. This framework, however, is taken up in particular ways given the school context and the student demographic. Conceptions of 21st century literacies vary by social context and are an effect of the distribution of economic, cultural, and social power (Gee, 1996). More specifically, how urban youth of color are constructed as 21st century literacy users, is bound by assumptions, and oft times deficit framings, of their race, language, gender, and socioeconomic status.

Research by Hobbs (2012) affirms the significance of using digital media literacy in urban schools. A study she conducted on a teacher and her elementary students in Philadelphia found that the use of digital tools can engage students in complex and difficult topics (like homelessness) for deeper understanding. The research also makes a case for the necessity for teachers to be creative and strategic in their use of digital tools in urban classrooms, and for their willingness to find use for digital tools at unexpected moments. When incorporating digital tools and literacies in classroom curriculum, teachers must first critically examine both the challenges and the benefits for using such tools (Hucks and Ragan, 2012). For example, when teaching writing and composing, using digital tools does not exclude or happen in place of teaching the writing process, facilitating writing workshops, focusing on writing conventions and grammar, or preparing students for writing on demand. This, of course, becomes challenging as

most urban public schools do not have sufficient access to digital technology, and often their teachers are burdened with scripted curriculum that is aligned with very narrow state standards.

Over the past decade we have learned a great deal about how to engage students in academic learning from different cultural, racial, and linguistics backgrounds (Gay, 2010; Heath, 1996; Ladson-Billings, 1997; Moll & Gonzalez, 1994). What is missing from this dialogue is how to develop an empowering pedagogy that builds on new literacy practices for 21st Century learners. Race and culture matter in schools (Banks, 2004; Howard, 2008). Instructional inequities such as tracking and high concentration of students of color in low-performing schools only serve to reify a cycle of failure that contributes to a dominant narrative which pathologizes students of color (Dixson & DeCuir, 2004; Ladson-Billings & Tate, 1995). Through critical literacy pedagogical approaches, efforts have been made within literacy education to incorporate and examine themes related to equity, achievement, and culture (Morrell, 2012); however, there still remains a need for a robust dialogue about how these factors intersect with 21st Century literacy education.

New literacy studies are situated within an intersection of sociolinguistics and anthropology (Morrell, 2004; Schreibman, Siemens & Unsworth, 2008) and represent a re-conceptualization concerning the nature of literacy. New literacy scholars examine local literacy practices and interactions (Street, 2005; Gee, 1996) that focus on how people engage in events to understand how they use literacy to do work, or to get things done. Preparing and supporting teachers to enact pedagogy informed by constructs of New Literacy Studies would begin to foster a conversation about providing more empowering contexts for literacy learning, and help highlight the importance of ensuring that all students are equipped to succeed in the 21st Century beyond school.

The Need for Digital Literacies in Urban Schools

In the next section of this chapter, we share our personal digital access stories that help to position our passion for the digital literacies work we do with youth of color. Within this storytelling dialogue, we continue a conversation previously started in a recent journal article. We had the opportunity to engage in dialogue about the use and restrictions of digital tools in the schools were we've taught. Our conversation was published in the November 2012 issue of the Journal of Adolescent and Adult Literacy. The article we co-authored, *Cultivating Digital and Popular Literacies as Empowering and Emancipatory Acts Among Urban Youth* (Haddix & Sealey-Ruiz, 2012), was the result of multiple conversations over several months. We discussed the work we do in our writing classrooms with young males of color. In the article, we encouraged educators to rethink (and actively use) digital literacies in urban classrooms, and shared the implications for not doing so.

In our conversation, we talked about our respective work with urban youth, particularly Black and Latino males in out of school or alternative spaces, and their persistent and intentional use of digital tools to author and to make meaning of their lives. And, we put forth an argument for the validation and affirmation of their digital composing processes and use of digital tools and other marginalized literacy practices in school and official educational contexts. In that dialogic piece, we wrote about how we find it curious that our use of digital tools and popular culture with urban Black and Latino males happens in "alternative" settings or outside official school contexts and we also make the point that these same literacy practices are not marginalized within other school contexts or with other youth from more privileged backgrounds. We call out the criminalization and policing of digital and popular literacies among Black

and Latino males in urban school settings, and we reflect on the ways that we have witnessed emancipation and empowerment when students were not only allowed, but "free" to engage in such practices.

The idea for this chapter grew out of that journal article and our desire to continue a public discussion around the use of critical, digital, and visual, literacies that seek to achieve positive academic goals for students of color, and more specifically, those students who are marginalized, "pushed aside," and at risk of failing academically. In our research, we explore learning environments that build on and support the curricular and pedagogical practices for teaching composing to urban adolescent youth and ones that establish complimentary digital literacy practices. The lessons we design and the assignments we issue to our students validate their current literacy and language practices, in and out of school, and the ways in which they access technology to communicate their lived experiences via digital composing processes.

In our many years of teaching youth of color, we have observed that these digitally composed processes are often non-school sanctioned, and in contrast, the use of technology "in school" is relegated to remedial instruction which positions urban adolescent youth as "receivers" of information and technology users. We challenge this framing and call for a use of technology in urban school settings that aims to build learning technology environments which position urban adolescent youth as knowledge producers, creators, and designers, and not merely passive and uncritical consumers.

For the past several years, we have worked with males of color -- from middle school to high school age -- in out-of-school and alterative school settings. We have witnessed the ways in which their writing is enhanced (more fluid writing, increase in self-correction of errors and inconsistences in their writing) with the use of digital tools. We have also witnessed, first hand, how these same tools are made to seem suspicious when Black and Latino students, and particularly our male students ask and are allowed to use them.

As colleagues in the field of English education, it is common for us to share ideas about our teaching. During our more recent conversations we began to pay particular attention to what was happening with our students' use of digital technologies in our classrooms, and the attitude toward their use of these tools by some other teachers and administrators in our schools. We also looked further outward, and continued to examine how the literature and popular press framed the use of digital tools by youth of color. We found very little research that focuses on how race, class, ethnicity, and gender intersect with the use of digital literacies in school settings (Vasudevan, L., Schultz, K., & Bateman, J. (2010). Although our article was published in 2012, we continue to conduct research in this area and explore the use of digital tools with our students, and whether or not the use of digital technologies have increased in urban schools.

We continue the conversation in this chapter by asking ourselves additional questions about what we see in the schools where we serve; observing both student access to and engagement with digital literacies. We first share our own stories about growing up during a different time of the "digital divide," when much of the discourse was about inequitable access to computers. Having grown up during the 1970s and 1980s, before the onset of the digital age, we are not considered digital natives. We begin with our own narratives to underscore the importance of teachers and educators situating their own social locations and histories relative to the digital histories of the youth in today's classrooms. We then discuss our observations and share testimony about how student learning is ignited when they are given the opportunity to fully engage with the digital tools and media present in their everyday experiences. In particular, our male students of color who had been "pushed aside" and positioned marginally within the official school context, positively responded to using digital tools and engaging with digital literacies as part of their learning experience. Through our narratives, experiences working with youth, and our

research, we also learned that these opportunities to engage with digital literacies are often restricted in schools attended by youth of color. Here we continue to discuss our observations on the use of digital literacy in urban schools.

DIGITAL LITERACIES: AUTHORS' DIGITAL ACCESS STORIES

Yolanda: When I think about the role of digital literacies in my life, I immediately think about the level of access I had to it. I never realized that my family was poor until I learned how those outside of my South Bronx neighborhood (through movies and newspaper articles) discussed people like us who lived in places like the South Bronx. In the early 1980s I had access to some of the newer technologies that others teens in my hood and I were most interested in: video games! Since my friends and I had access to most of these games through our local candy store, we didn't imagine that we were on the lower end of the digital divide, in fact, we didn't know that one existed!

I would say that my digital literacy skills were developed at Mel's, the most popular candy store on my block. Lessons began when I filled the huge Atari video machine with quarters to play Q-bert, Pac-Man, and Asteroids. Other lessons were learned when I visited my friend Michelle's house (her mom and dad worked so they were considered well-off) where she had these same games on a table top Atari. Her family also owned a computer. Outside of the videogames I played at Mel's and computer time at Michelle's house, I didn't know much about computers or their capabilities. In high school I majored in Computer Science because my junior high school teacher, Mr. Hoffman told me that "computers are going to be the future", and he felt I should be on the right side of that future. I remember trips to the "control room" at school – a large, frigid room with monstrous-sized machines that were said to "run" the computers in the lab. I vaguely remember working on keypunch cards, but not really understanding the Cobal and Fortran coding I was supposed to master by my final year of high school. Even still, my high school experience and trips to Mel's candy store and Michelle's house made an impression on me.

The summer following my second year of college (I had declared myself a Computer Science major there, too), I was able to buy my first (used) Apple computer – an off-white, oddly-shaped "box" with a small, green, monochrome screen. I had worked and saved for an entire year to buy my first Apple. Once I purchased my own computer, I had decided I would focus my college studies on becoming a computer programmer even though I didn't really enjoy what I was learning in school. A new era and way of thinking was happening right before me, and, as Mr. Hoffman cautioned, I wanted to ride the wave of innovation that was taking shape in my lifetime.

Fast forward: it was a decade later when I worked in my first corporate job and I was able to afford a brand new IBM Thinkpad. Years before, I had found the courage to switch my college major from Computer Science to English, but I still understood the need to be in touch with technology and how it was impacting my life. Now access was a little easier – I worked on desktop computer at work and had a laptop at home. I no longer played video games, but I recognized the games I played at Mel's and Michelle's house to be my first steps in acquiring digital literacy skills.

When I started teaching in the early 1990s, I knew the value of technology for my students because I knew the world it had opened up for me. I worked in an alternative high school with limited resources. There were two computers in the library, and one in the teachers lounge. In terms of their access to computers and technology, many of my students were a reflection of me just a decade earlier, but perhaps they were in a more vulnerable position. I had attended Murray Bergtraum High School for Business

Careers and majored in Computer Science, and therefore had regular access to, and some education in computers and technology. At the high school where I taught, there was limited access to computers, and to my knowledge, no courses were taught on computer science or digital technology.

Marcelle: I remember watching an episode of Tony Brown's Journal on PBS back in the late 1980s where he brought on panelists to talk about the digital divide. The digital divide was an issue of access—social and economic mobility was linked closely to whether or not you had a computer in your home. As a teen who spent much of my free time in the public libraries and whose computer access was often limited to use in those spaces (we had a typewriter at home), I remember wondering if I was going to be left behind or somehow disadvantaged if I didn't have immediate access to the latest technology. My dad was obsessed with knowing about advances in technology. He was a factory worker and my mother stayed at home and eventually worked as an administrative assistant, so we didn't have the means to access this technology. However, I was quite aware of the fact that the world was changing and that there was new knowledge and skills to be had.

When I was twelve years old, I participated in a computer literacy summer camp for students of color from working class backgrounds at one of the state universities. At camp, we learned how to write code and how to create graphic images. We learned about computer infrastructure. This was back when computer screens were monochrome. I attended this camp three summers in a row, and as I think about it, the mission of this program was to empower young people of color to be engineers, creators, designers, and producers. The goal of the program was to provide us with digital literacy during a time when computers in schools were limited in use.

Eventually, at home, we acquired a desktop computer. It had a cassette tape drive. At most, I used the computer to play video games and to word process academic assignments. Though, throughout my high school years, I still relied heavily on my typewriter and liquid white out. I then attended a university where they promoted the "Mac in the Room" program—every dorm room was equipped with a Mac computer. I would say that my regular computer use began during my college years; however, much of this use involved word processing. Different from my experiences in computer camp, I was not encouraged to use digital tools for production or creation. Though, I loved that aspect of computer programming. I guess I feel like I might as well have been using a typewriter. Computers just made it easier—I could back space and erase versus reach for the white out.

Professionally, I've worked numerous positions in higher education administration, and with each new position, my use of the computer increased. In one position, I was actually the department Webmaster—I knew how to write HTML code as well as navigate the newer web design programs. Because I had a computer at work, however, I never felt it was a necessity to have a computer for home use. At one point, my partner and I purchased a cheap Toshiba laptop and followed that with the purchase of a Dell laptop. But, my use of digital technology was relegated to my career. I did not use email at home; I did not surf the Internet or shop online at home. Even in the early 2000s, I still wrote out and mailed all of my bills. I preferred to have phone conversations and resisted texting or chatting online. In some ways, I wanted to preserve the sanctity of my home and personal life—no technology allowed.

In the last five years, I moved from being a serial iPhone user to not having a smartphone at all. I do not text, and this often surprises and upsets some people. I do use Facebook and communicate regularly with family and friends via email, but I've been reluctant to participate in other forms of social media unless I'm using it for a course assignment. Honestly, I was becoming a passive consumer of new digital technology, and I feel that many people are. Having the latest smartphone or iPad 6 is more about social capital (or being popular) these days and not about ingenuity and productivity necessarily. But, quite

different from my own childhood, each person in my home has his or her own personal computer. We have more laptops in my home than we do televisions. We do not have cable television, but we probably would not be able to function without WI-FI. My son is a digital native—he uses technology with much ease, including creating and writing on his blog to watching and commenting on Youtube videos. While I understand the importance of being digitally literate in the 21st Century, I want to embrace and promote critical digital literacy. We can be passive consumers and users of digital tools, or we can be active doers, creators, and producers in these new digital and online environments.

Yolanda: Speaking of being creators and producers, I know you have noticed as I have, that students are prohibited from using digital tools in school. Why do you think this is happening to young people in urban schools?

Marcelle: In the English methods course I teach each spring, I showed preservice English teachers a YouTube video of a young artist, Suli Breaks, performing a spoken word poem where he critiques the standardization of the schooling system. We watched this clip on the same day that we discussed Yang's (2007) article about youth organizing through the use of digital tools and online spaces. I asked the students to deconstruct the video, thinking specifically about the digital knowledge and resources necessary and inherent in the composing of the video. I asked them to imagine what was involved in the students' organizing and digital composing processes. I said, "consider what the students did to make this video possible, assumingly without teacher or adult intervention." My students struggled to list what might be involved. Instead, the students focused on all of the limitations or factors that might contribute to students not being able to create such videos and why this kind of project would not be readily possible in a school environment. This is precisely why I engage my preservice teachers in such learning activities—we have to disrupt and shift any thinking that limits the possibilities for our students.

I do not feel that it is an issue of access for urban schools—the resources are there. Our schools have computers, smartboards, and other digital tools. It is a question of how these tools are used, who gets to use them, and for what purposes. The central administration determines which online tools and sites are permissible to students and to teachers. There is strict protocol involved in gaining permission to use certain sites and some teachers feel, why bother? Instead, we construct narratives about students' abilities and capacity to engage with these tools. We tell ourselves that, "Students need to focus on basic reading, writing, and math skills anyway." Or, "We don't have time to teach critical digital literacy, we have to prepare these students for the test."

I recently completed a mini-documentary film project with a group of middle school students at one of the local schools. This school is marked as a persistently low-achieving school in our district, and in fact, it is being restructured for the next school year. Most recently, it was featured in the local news as the school with the highest number of suspensions. In talking with the eighth graders in the film project, they clearly articulate messages like, "these teachers don't care about us" and "we not learning anything so why come to school?" The last few months have been focused on test-taking and completing school work to be promoted to ninth grade. The film project was a departure from their day-to-day. With consent from the principal, I was able to work with the students 2-3 times per work during the school day. We began by previewing several documentary shorts; the students participated in writing workshops to develop their own stories; then I gave each of the students a digital camera and they gathered necessary footage and images. Over several days, the students worked with iMovie to edit their films and construct narratives. They created multilayered stories using text, sound, and images. I did not reveal to the students that I had never created a film or worked with iMovie; this was a first for me too. So, in essence, I was learning to use the tools at the same time they developed these skills. I witnessed firsthand what is

possible when students are equipped with the tools, time, and space to create and produce. We will soon have a screening of their films. The students are proud of their work, as they should be, and they want to share their accomplishments with their teachers and peers. It is essential that the very teachers that doubt their abilities witness and experience the results of their talents and ambition. Yet, I am prepared for the many reasons and factors that teachers will raise to discredit or essentialize why students were able to produce these films. So, as Yang (2007) stated, this is very much about an "ideological divide" and not merely a digital one.

Yolanda: You were willing to be vulnerable and learn along with your students. Some teachers are not comfortable with this. In fact, in some ways it can seem as though a move like this de-centers teacher authority, and yields power to the students. Why would teachers shift or de-center authority to allow students, that are oftentimes feared, a position of power?

Marcelle: When young people have tools that enable them to author their lives and to speak out, power in the classroom is redistributed. We know that certain pedagogical and curricular practices can and will result in a positive return for marginalized, academically underachieving students. This can include leveraging students' interests and choices in the topics, the genres, and the mediums and tools they use when composing in school.

When we refuse to use and encourage such practices, I believe that this is intentional—we do not really want to close this so-called achievement gap. I am constantly witnessing how the same digital tools and practices are demonized in certain spaces and celebrated in others. For example, I've worked in urban school contexts in which students are mandated to "put away or give away" their digital tools before entering the school. In other words, showing school readiness becomes interpreted as "no technology allowed," instead of acknowledging the potential for certain tools to transform literacy learning.

Yolanda: I also ask you that [question] because there is a huge police presence in the surrounding neighborhoods of my alternative school in New York City. The aggressive stop-and-frisk policy in New York allows the police to cruise the area around the school at least twice a week. When some people in the community are arrested on drug-related charges, this image carries over into the school.

I do believe that this stereotype creates a subtext that assumes that if Black and Latino males are texting, they must be engaged in a drug trade. In this way, the everyday act of texting becomes criminalized in a context in which texting, in fact, has the potential for significant teaching and learning possibilities. To me, this kind of racial profiling has a direct negative impact on curricular and pedagogical decisions.

Within educational research, policy, and practice, significant attention is paid to the ways that certain school contexts are designed to control and socialize urban youth of color, especially Black and Latino males, for the school-to-prison pipeline in lieu of identifying and spotlighting the kinds of pedagogical practices that empower them to achieve academic greatness.

Marcelle: So, how are we asking teachers to see digital literacies as emancipatory acts? How are we asking them to rethink the use of digital literacies and popular culture in ways that offer more freedom in the classroom?

Yolanda: I think we are asking them to, one, request more technology access where there isn't much, and two, if there is access to computers and other digital tools, to allow students to use them for their in-school learning experiences. This will involve trusting students to use the Internet to access critical YouTube videos, like the one by Suli Breaks that you mentioned. This means that teachers would need to encourage students to think about how video can enhance student opinions about what needs to be changed in society, starting with the educational system. And then, I think, we are asking educators not to be so alarmed when students want to use their smartphone to compose or download images, and use

Google and other sites as resources. We have to begin to trust them, and particularly with our boys of color, stop jumping to the conclusion *that* they are always visiting inappropriate websites when they go online, or texting with friends (or worse) if they pull out their smartphones. Sure, some of these things may happen, but then that gives educators the opportunity to collaborate with their students on guidelines for their classroom community when working with technology, and engage them in conversation about the importance of trust in the classroom. It will take the teacher to lead this. I know we can do it if we move past some of our discomfort and doubt about our urban students' use of digital tools and media.

IMPLICATIONS FOR 21ST CENTURY EDUCATORS

We want educators (preservice and inservice) to consider this chapter as an entry point to their own digital story. We want them to reflect on personal experiences with digital media making. We would like for educators to closely observe the access their students have to digital tools in their schools and ask then some difficult questions about who has robust access and who does not. We want educators to think about the work they need to do in their classrooms with their own students toward developing their digital literacy skills. We remain concerned with unearthing the reasons why emancipatory pedagogies—which have great potential to undo deficit constructions of Black and Latino males and their literacy practices, including the use of digital tools and popular culture—are not more readily available in traditional urban school settings.

When incorporating digital composing into their classroom curriculum, teachers should first critically examine both the challenges and the benefits of using digital tools in writing instruction and other subjects. Digital tools can serve as a powerful way for teachers to draw on students' out-of-school practices and talents when composing in school and when completing other academic tasks. English educators, in particular, should continue to think about ways to transform their instruction through the use of online digital composing sites such as storybird.com, storify.com, bitstrips.com, xtranormal.com, and other free blogging tools (e.g., blogger.com, wordpress.com). Many sites have tools specifically tailored for teachers to use in the classroom.

CONCLUSION

We are members of the digital age. Digital tools, social media, and multiple ways of digitally expressing ourselves continue to enhance our lives. Youth in our classrooms remind us how significant digital ways of knowing can be, and how media is rapidly changing in ways that can benefit us. We now APP it, Google it, tweet and storiyfy it, Skype in, and turn to tumbler, instagram, or Facebook to stay connected on personal levels, but also to organize mass protests.

Technology continues to rapidly advance. The advent of cellular and smart phones, iPads, etc., has narrowed the divide between students who would have access to technology, and those who would not. Notably, even with access to these tools, many students of color in urban schools are not allowed to engage with them in ways that other students are allowed to. We have witnessed the ease with which our students are able to compose poems, essay drafts, lyrics, and script lines with the use of smart phones in our writing classes. The use of these tools makes learning fun for them. They are engaged, feel in control, and are able to share their work with their social media network instantaneously.

Supporting urban students' 21st Century new literacy learning in race and culturally conscious ways can shrink the 'digital gap' between them and their White peers in well-resourced schools. This support has the potential to create accessible and equitable educational opportunities for urban youth. A critical multicultural framework for preparing teachers to work with diverse student populations must account for both sound content knowledge and advocate for a sustained commitment against oppressive structures that impede the academic success of marginalized students. Beginning teachers, especially, need multiple and complex opportunities to consider how new literacies can and must be enacted in their teaching, and these opportunities must address the demands of an increasingly technologically and digitally sophisticated society.

KEY TERMS AND DEFINITIONS

21st Century New Literacies: A wide range of abilities and competencies which require fluency with technology and building intentional cross-cultural connections and relationships with others as well as attending to the ethical responsibilities required by these complex environments.

Critical Literacy: Critical literacy encourages readers to adopt a critical and questioning approach, and to actively analyze texts. A critical literacy approach offers strategies for uncovering underlying messages present in texts.

Digital Composing Process: This process can take on several forms such as participating in an online discussion through a listserv or bulletin board. It can refer to creating compositions in presentation software, participating in chat rooms, or creating webpages. It can also mean creating a digital portfolio with audio and video files or scanned print writings, as well as composing on a class weblog or wiki.

Digital Divide and Digital Gap: A digital divide is an economic inequality between groups, broadly construed, in terms of access to, use of, or knowledge of information and communication technologies. A digital gap refers to the disparities in how some youth are invited to be creators and innovators of digital media, while other youth are positioned as consumers. The digital gap also refers to the (slower) speed at which newer technologies are introduced to most youth in urban school contexts compared to youth in well-resourced schools.

Digital Literacy: This is the ability to effectively and critically navigate, evaluate and create information using a range of digital technologies. It requires one to recognize and use that power, to manipulate and transform digital media, to distribute pervasively, and to easily adapt them to new forms.

Digital Tools: Digital tools range from devices like desktop computers, ebooks, thumbdrives, smartphones, and laptops, to social media like facebook, tumblr, twitter, to Internet Browsers (Safari, Firefox, Internet Explorer) and email. Essentially, digital tools help us communicate in a variety of ways.

Chapter 73
Vancouver's Digital Strategy: Disruption, New Direction, or Business as Usual?

Tooran Alizadeh
Griffith University, Australia

Neil Sipe
University of Queensland, Australia

ABSTRACT

A growing number of cities have started to realize the need to be 'smart', to use digital technology to drive prosperity and capitalize on the rapidly growing digital economy. Some local governments have developed 'urban digital strategies' to speed up the pace of change, and to move their digital planning from ad-hoc to an integrated and strategic approach. This paper examines Vancouver's Digital Strategy (VDS) and questions the role defined for this new piece of strategy. The findings represent competing views – offered by local government versus digital business community - for the role of digital in two areas of governance, and strategic planning. The paper concludes by suggesting that urban digital strategies need be incorporated into strategic urban and regional planning with a focus on the biggest issues, specific to each city.

INTRODUCTION

There is not a clear consensus in the literature on how to define strategic urban and regional planning. It is however understood that urban and regional planning is far broader that the classic definition of development control which refers to the planning process behind regulating and managing changes to land use and development. The broad definition of strategic urban and regional planning is clarified with reference to local contexts around the ongoing major issues facing cities and regions, whether climate change, social transformation, economic crisis, or technological advancement (Albrechts, 2006). An established body of the literature (Sartorioa, 2005; Searle and Bunker, 2010; Williams, 1999) discusses the never ending shift in the focus of strategic urban and regional planning as a result of the shift in what matters the most in different parts of the world at any points of the time.

DOI: 10.4018/978-1-5225-3822-6.ch073

Infrastructure has been one of the founding pillars of strategic urban and regional planning (Burnham and Bennett, 1909; Saalman, 1971). Planners recognize that infrastructure, as a powerful driver of economic growth and social prosperity, exerts a profound and pervasive influence on cities and regions (Graham and Marvin, 2001; Neuman and Smith, 2010). The definition and scope of infrastructure, and as a result, the major planning concerns and policy issues associated with have evolved over time. More recently, the fast growing digital economy has highlighted the role of telecommunication infrastructure in strategic planning for economic growth and social development (Alizadeh et al., 2015; Neuman and Smith, 2010; World Bank, 2015).

There is a new line of research about how cities and regions can/should capitalize on the potentials of telecommunication. It builds upon the growing international research on smart cities and digital economy; and explores telecommunication-based opportunities in a range of planning topics including but not limited to participatory planning, public safety, disaster management, local and regional economic development, employment growth, sustainable development and control, transport management, governance, development assessment, and infrastructure (Heo et al., 2014; Rodríguez-Bolívar, 2015; Yau et al., 2014). The aim is to apply telecommunication to enhance cities' liveability, workability and sustainability (Berst et al., 2014 p.6).

Debates on the implications of telecommunication are not limited to academia. Different levels of governments around the world have started to develop policies and initiatives with the aim of capitalizing on digital economy (OECD, 2015; World Bank, 2015). National digital strategies now exist in a growing number of both developed and developing countries including: Singapore, India, Taiwan, China, South Korea, Malaysia, Ireland, Israel, Australia and Finland.

Interestingly, the first generation of digital strategies focused on businesses (Bornheim, 2001; Kulatilaka and Venkatraman, 2001; Mithas and Lucas, 2010). The idea was that digital technology had reached the mainstream, so e-business or e-commerce was everyone's business in the new economy (Fingar and Aronica, 2001). The digital business strategies were enforced by the concept of digital disruption (Christensen, 1997) which attracted an extraordinary level of attention from both academia and practice. It was argued that even though disruptive technologies (in this case digital technologies) initially underperform established ones in serving the mainstream market, they eventually displace the established technologies. Discussions on digital disruption put a great emphasis on the timing of adoption of new technologies and suggested that in the process of advancing disruptive technologies, entrant firms that supported the new technologies will ultimately displace the incumbent firms that supported the 'old' technology. The notion of disruptive technology in the business world has been re-examined and re-invented several times (Danneels, 2004; Downes, 2009; McQuivey, 2013). McQuivey (2013), for example, took the disruptive technology notion to the next level and called for businesses to find disruptive new things to do, rather than just doing the old things in new ways.

There is a growing body of literature making a similar argument for cities (Bulu et al., 2014; Heo et al., 2014; Hollands, 2008); that smart technologies have now matured to the point that cities of all sizes can afford and benefit from them; and that cities should use digital technologies in their planning and management (Berst et al., 2014). Some cities have taken up this recommendation with the development of 'digital strategies' to speed up the pace of change, and to move digital planning from ad-hoc to integrated and strategic (Bloomberg et al., 2010; Bloomberg et al., 2013; City of Chicago, 2013; City of Vancouver, 2013). Digital urban strategies cover issues ranging from business creation and productivity growth, to public administration, education, health, environment, citizen engagement, and development

(Alizadeh, 2015; Alizadeh and Sipe, 2015). Such digital strategies are relatively new prepared by ambitious cities such as New York, Vancouver and Chicago.

This paper investigates Vancouver's Digital Strategy (VDS) in order to understand the role defined for the digital economy in urban management. The paper takes the already established concept of digital disruption (Benner, 2003; Dunleavy et al., 2006; Heo et al., 2014) beyond the business world, and applies it to urban governance. It questions the level of disruption, if any, caused by this new piece of technology-based strategy. By doing so, the paper raises a bigger question of interest to urban planners, managers and decision-makers – to what extent should planning for digital technology and the digital economy be integrated with and incorporated into strategic urban planning?

The paper starts with a literature review of urban governance and digital technologies which sets the theoretical foundation. It then provides an investigation of Vancouver's Digital Strategy based on a combination of policy analysis and empirical data gathered through interviewing a sample of stakeholders involved in the strategy development process, and implementation. Lessons learned are mostly focused on a single case study and cannot be easily generalized. However, the core massage could inspire all cities around the world to embrace digital technologies with the aim of enhanced liveability, workability and sustainability; and to address their core issues and challenges.

URBAN GOVERNANCE AND DIGITAL TECHNOLOGIES

While the notion of digital technologies and disruption caused by them has been widely discussed in the business world for the last two decades, its implications for governance and more specifically urban local governance is only beginning to be realised.

One of the first areas impacted by the notion of digital technologies is economic development (Benner, 2003). It is now understood that digital technologies are both critical for and highly disruptive to existing employment opportunities (Brynjolfsson and McAfee, 2012). Many government (national, regional, and local) policies have an explicit goal of both growth and equity in the promotion of digital economy.

A second area of disruption caused by the digital technologies is the introduction of e-government (Dunleavy et al., 2006). E-government involves the use of telecommunication technologies by public organizations to manage, redefine and disseminate information, communication and transaction relations with citizens, businesses and the general community (Edmiston, 2003; Maeng and Nedovic-Budic, 2004). The literature produced in the last ten years suggested that e-government can create improved decision-making, increased government access, better public service delivery, internal efficiency; and support political accountability and participatory democracy (Irani et al., 2005; Jesuale, 2006; Moody, 2007). More importantly, it has been argued that e-government makes many existing organisational structures and processes obsolete (Bovaird, 2003; Georgescu, 2007).

However, research coming out of the US and Europe warns that while the beneficial prospects at all levels of government are high, e-government has been penetrating at higher levels of government much more rapidly than at the local level (Evans-Cowley and Conroy, 2009; Evans-Cowley and Hollander, 2010). One obstacle seems to be the complex nature of digital-readiness necessary to incorporate e-governance with local governments' traditional planning role (Moody, 2007; Weerakkody et al., 2007). Attempts to use telecommunication-based solutions to manage and administer urban development as a core part of local government activities are underdeveloped (Dawes, 2009; Norris and Reddick, 2013).

More recently, Kumar (2015) noted that e-governance literature has been dominated by computer scientists and IT specialists, mostly in the absence of specialists in urban development, urban planning, climate change and energy governance.

In response to the criticism towards limitations of e-governance, an emerging body of literature suggests that the development of digital technology over the last few decades, has set the stage for 'smart cities' (Bulu et al., 2014; Heo et al., 2014; Hollands, 2008). The concept of a smart city involves city innovation in management and policy as well as technology (Nam and Pardo, 2011), and calls for a comprehensive range of specialities including both technologist and urban experts. To provide a vision of how digital technology will transform the cities of tomorrow, the Smart Cities Council has recently released *Smart Cities Readiness Guide: The Planning Manual for Building Tomorrow's Cities Today*. Their definition of a smart city is comprehensive: "A smart city uses information and communications technology (ICT) to enhance its liveability, workability and sustainability" (Berst et al., 2014 p.6).

Such a broad definition for 'smart cities' is part of an argument aiming to overcome the simplistic implications of digital technologies for cities (Allwinkle and Cruickshank, 2011; Caragliu et al., 2011; Chourabi et al., 2012). The smart city concept has been described as a multi-dimensional initiative. Based on a review of current literature, Gil-Garcia et. al (2016) identified multiple dimensions of smart city and proposes an integrative view that highlights how each dimension contributes to the understanding and development of smart governments. The dimensions of smart cities explored in this study are diverse and multifaceted including but not limited to evidence-based decision making (with respect to availability of big data), citizen centricity, sustainability, innovation and entrepreneurialism, equality, citizen engagement and resiliency. From this perspective, the smart city initiative is a potential model for cities of the digital era, providing them with a chance to integrate new technologies, the digital economy, social systems and ecological concerns with the long-term goal of sustainable urban development (Deakin, 2013; Luque et al., 2014).

Encouraged by the promises of smart city advocates as well as the literature over the past ten years describing the socio-economic benefits of new technology (Galloway, 2007; Katz et al., 2010; Willson et al., 2009), many cities have realised the need to be 'smart', to use digital technology to drive prosperity and capitalise on the rapidly growing digital economy. One way cities have begun to be 'smart' is through the development of 'digital strategies' to speed up the pace of change, to ensure that digital economy is a high priority and more importantly to move their digital planning from ad-hoc to integrated and strategic.

RESEARCH METHODOLOGY

In mid-2013 the City of Vancouver released the 'Vancouver's Digital Strategy (VDS) to capitalize on the digital economy and to enhance digital connections amongst its citizens, businesses and the city as a digital organization (City of Vancouver, 2013). The VDS was the result of extensive consultation with stakeholders including external and internal advisory groups and subject matter experts.

This paper investigates the VDS in order to understand the development phase of the strategy and to assess the role defined for the digital in urban management. The paper questions the level of disruption, if any, caused by this new piece of technology-based urban strategy. The investigation starts with a brief policy analysis of the VDS, which is built on earlier studies (Alizadeh, 2015) in which detailed

analysis of the strategy document offered in three areas of context, development process, and content analysis. This brief policy analysis is then followed by an analysis of ten semi-structured interviews of VDS stakeholders. The interviewees included three City of Vancouver officials involved with preparing and implementing the strategy, plus three small and medium enterprises (SMEs), two corporate digital businesses and two academics who participated in the external advisory committee during the VDS development phase. The semi-structured interviews took between 60 to 90 minutes, during which questions were asked mostly in three main areas. Firstly, questions were asked about the involvement of each interviewee with the strategy document either in the development or the implementation phase. Secondly, interviewees were asked about the strengths and limitations of the strategy document, and their perception of the role defined for the VDS in Vancouver. Finally, in the last part of the interviews questions were asked about interviewees' views on how the VDS sits within the broader strategic planning for Vancouver (e.g. in relation to other existing strategic documents prepared for the city such as the Greenest City 2020 Action Plan (City of Vancouver, 2009) and Vancouver's Economic Action Strategy (Vancouver Economic Commission, 2011).The semi-structured nature of interviewees allowed to explore different levels of details based on the interviewees' expertise. For example, digital business experts - interviewed because of their involvement with the external advisory group behind the VDS - were far more interested and able to share their insights on section two of the interview structure.

The digital recordings of all the interviews were transcribed into Microsoft Word documents using a transcription kit. The next step was to code the data for analysis. After several rounds of careful reviews of the transcripts, two major themes were identified under which the interviewees had discussed the role of the VDS in the urban management of Vancouver: 1) governance and 2) strategic planning. Following the identification of the two main themes, two thematic documents were prepared in which all the interview quotations relevant to each main theme were stored. Both thematic documents have been reviewed a number of times to identify sub-themes and their connections with one another, also a number of the quotations were chosen to be used in subsequent writing. The identified sub-themes for the governance theme were about the scale of change: whether digital technologies should/could disrupt the conventional ways in which Vancouver's local government operates; whether the strategy should/could be showing a new direction for governance; or whether the strategy merely facilitates the business as usual. The identified sub-themes for the strategic planning theme focused on the importance of linking with the major strategic issues identified in Vancouver (e.g. environment and economy).

It is, however, important to acknowledge the limitation of this research as a single case study research. Previous literature notes that it is not unusual for case study research to be limited to one case only, especially when the number of available choices is too limited (Stake, 1995). Considering that urban digital strategies are relatively new at the local government level, it was important for this study to select a case of a mid-sized city (Vancouver in this case), and not necessary a champion global city such as New York. A line in the methodological research argues that the value of case study research, and single case study research in particular, might have been underestimated (Flyvbjerg, 2006; Gomm et al., 2000). While there is a question around the generalization of findings based on one or limited number of case studies, there is a growing argument about the power of case study research to explore new concepts, contribute to theory building, and inspire others to learn from the case study under investigation (Gerring, 2007). In the case of this study, lessons learned in Vancouver can inspire any city, looking to play a proactive role in taking advantage of digital opportunities.

A POLICY ANALYSIS OF VANCOUVER'S DIGITAL STRATEGY

This section of the article is built on earlier detailed policy analysis of the VDS (Alizadeh, 2015). The analysis is conducted in three areas of: 1) the context in which the strategy document was prepared; 2) the development process; and 3) a brief content analysis.

- **Context:** The VDS was prepared by Vancouver City Council (2013) located in British Columbia, Canada. Vancouver is Canada's eighth largest city and the third largest metropolitan area. It is the most densely populated in Canada (with population density of about 5,249 people per square kilometre), and the fourth most densely populated city over 250,000 residents in North America, behind New York City, San Francisco, and Mexico City (Statistics Canada, 2011).
- **Development Process:** The VDS was developed over seven months with the Chief Librarian of Vancouver and the CEO of the Vancouver Economic Commission assigned as senior managers overseeing the strategy development process. In October 2012, the Digital Strategy Team with the help of PricewaterhouseCoopers (PWC) assessed the city's current state of digital readiness on two scales: capability (online, mobile, social, infrastructure and assets, organization) and digital maturity (absent, exploring, enabled, connected). The City of Vancouver was positioned between "exploring" and "enabled", and rated as having a moderate level of digital maturity. From November 2012 to January 2013, the Digital Strategy Team consulted with industry insiders, digital thought leaders, start-up founders, students, business executives, citizens and staff. In January and February 2013, the Digital Strategy Team examined more than 120 ideas that emerged from consultation. The team refined the list by identifying 50 concepts from which they drew 9 initiatives. Finally in April 2013, the team presented the strategy to the Standing Committee on City Finance and Services and it was officially approved by Council. In September 2013 a Chief Digital Officer (a new role within the organization) was appointed to lead the implementation of the city's digital strategy.

An in depth investigation of the consultation process has highlighted a few issues. For example, the strategy document refers to an online crowd-sourcing exercise in which participants were asked to add, comment and help prioritize ideas by voting for their favourites. Unfortunately, the online exercise had only 823 users who submitted 43 ideas, 64 comments, and 830 votes. The low rate of participation raises concerns about the quality and extent of public engagement, and whether this strategy was useful. However, it is important to note that this was only one of the consultation methods adopted.

- **Content Analysis:** The VDS is a four-year plan with a vision to enhance multidirectional digital connections amongst citizens, employees, business and government. This vision is supported by four aims and objectives – three primarily on the citizens and businesses, and the fourth focused on the city as a digital organization. The aims cover engagement + access, infrastructure, economy and organizational digital maturity.

While the digital economy is one of the areas of interest in the strategy document, it is noted that in addition to coaching and supporting the business sector, the regulatory environment also needs to be

adjusted accordingly. Further, the VDS addresses the issue of governance and new e-governance opportunities. The digital strategy extends to different areas of the city's responsibility, in order to define a versatile role for the digital technology.

The document identifies nine initiatives with the highest priority to accelerate the vision. Similar to the strategy's aims and objectives, the nine priority initiatives cover a diverse range including e-governance, e-businesses and digital infrastructure. Interestingly, in order to create a favourable and supportive regulatory environment, the strategy make the link to land-use planning and notes that a review of zoning by-laws in needed to remove or minimize impediments to digital clusters.

This paper acknowledges the broad definition of digital strategy offered in the VDS and welcomes the explicit link between land-use planning and digital economy. Finally, (and importantly) the VDS opens an important line of conversation between different stakeholders in the city around the potential role of digital economy in Vancouver' future development.

INTERVIEW FINDINGS

What we learned in the interviews about the role and purpose of the VDS can be described under the two broad themes of: 1) governance and 2) strategic planning.

Governance

The literature over the past ten years emphasises the role of digital technologies in transforming modern governance. Dunleavy et al. (2006) argued that most recent policy changes and public management reforms focused on shifts in digital infrastructure. Based on their research in the UK, Australia, New Zealand, Japan, Netherlands, US and Canada, Dunleavy et al. (2006) concluded that the future of public management and governance depends on digital maturity. Here, digital maturity for governance was described as reintegration of services, holistic and joined-up approaches to policy-making and the extensive digitalization of administrative operations. In other words, previous studies argued that e-governance is the new governance, as it creates a channel bringing government closer to citizens by increasing the speed and efficiency of their interactions (Georgescu, 2007; Kumar, 2015).

The call for the reintegration of services and holistic and joined-up approaches to policy-making in the digital age (Dunleavy et al., 2006; Kumar, 2015) was welcomed in the VDS. During our interviews, government officials noted that the new strategy is playing a binding role to '*pull together a range of conventional efforts at the city governance level*' and that *the strategy basically was the result of a realization on behalf of city staff that we needed a strategic thread through all of the activities related to digital.*

The interviewed city officials further explained that such need to build a link through a digital strategy became clear in 2010 as part of their attempts to redesign the council's website:

One of the things that became very clear as we were redesigning the City website was that, there were many pockets of digital initiatives including web development happening across various service areas in the City. These digital efforts were not consistent in terms of approach, philosophy and implementation… As a result, it became clear that we needed a comprehensive strategy around digital at the City. So, that we weren't all working in isolation.

The binding function of the VDS was described - by several city officials - as a *'horizontal link between otherwise vertically parallel departments in the City*' to provide '*a coherent framework for anything digital going on at the City*'. Moreover, the city official interviewees believed that such a horizontal link would help the city to be more citizen-centric, as it '*will facilitate and streamline communication between the local government and citizens'*.

A focus on the '*internal role'* of the VDS to '*create internal horizontal relationships that did not exist before'* was acknowledged across all interviews. However, there was an opposing view, raised by some members of the external advisory committee suggesting that the VDS was only offering a platform to '*rationalise already approved decisions'*. Some of the external advisory committee members, interviewed by us, questioned the VDS's claim to set out a roadmap from the ad-hoc digital approach to an integrated and strategic one that prioritizes key actions (City of Vancouver, 2013). As they believed that the VDS '*just brought together about 30 million dollars' worth of previously approved council investment that had been already approved*'. One of the interviewees – an external advisory committee member - showed their frustration as follows:

For me this is an exercise of rationalization of existing decisions and less about a re-conceiving or rethinking or disrupting old ways, and more about here's this big desperate bunch of IT and ICT investments and service decisions and a bunch of other stuff that has come up through individual departments; let's put them together, and nothing more.

Some of the external advisory committee members, interviewed for this research, criticized the VDS for being '*a process of rationalization of previously made decisions to make them look coherent*'. One member described the VDS as '*kind of a reverse engineering to turn the planning process upside down*'. This harsh critique of the VDS was explained by:

It wasn't like let's go out and find out what's needed or what's required or what we could do or what should be. It was like what do we have and how to we then organize that in a way that aligns to perhaps some bigger thing… As a result, the final output is a bunch of previous decisions made around information communication technology that were then thematically organized and given a reason as to why those previous decisions should exist: textbook rationalization of power being rationalized.

The opposing views - expressed in the interviews - by which some admired the VDS for defining a horizontal link in the otherwise vertical structure of the local government, and others criticised the VDS for rationalizing already made decisions by putting them together, is perhaps understandable based the levels of expectations set for the digital strategy. On one side of the debate, is a local government recognising that the '*public demands more government services to be online*', as expressed by one government official interviewee. This is a demand beyond the traditional scope of local governments, and an extension of what was traditionally described as responsive governance. As a result, local governments in most cases do not have the in-house capacity to address such a demand. In the case of Vancouver, a consultant (PWC) was hired to lead the development of the digital strategy; and then an external person, with no background in local government and yet highly experienced in digital banking and digital business sector, was hired as the Chief Digital Officer to lead the implementation. In other words, the local

government in Vancouver, while acknowledging the need to adapt to the disruptive new technology, is still in the learning mode. As a result, the interviewed government officials were very modest about the mission of the VDS:

We knew we weren't going to boil the ocean on the strategy – that was not our goal.

The strategy was introduced as a modest one on several occasions by the interviewed government officials using expressions such as '*it is not a change-the-world strategy'*, and *'it's a let's-get-caught-up-to-where-we-need-to-be strategy*'. They also mentioned that:

When you look at where the city of Vancouver was starting in terms of its digital strategy, we just needed to get its house in order first.

From the local government point of view, the VDS was described as a '*pragmatic strategy*' and '*just a beginning of a roadmap'*.

On the other side of this debate, however, is a broader expectation from the digital strategy. This expectation was mostly raised by the digital business sector – interviewed members of the external advisory board - that felt disappointed by what they described as '*the lack of strategic thinking'* in the VDS:

I was hoping that in a city like Vancouver which is quite progressive in many ways we could try to invoke or tap into some sort of bottom-up innovative approach in this digital strategy

When asked to elaborate more on their preferred approach, different members of the external advisory board discussed their expectations of the VDS which was beyond what the local government was ready to go -- at least for the time being. Interviewed members of the external advisory boards who could mostly be described as digital experts, were expecting the VDS to stimulate a clear push for structural reform through e-governance as a way to transform administration across local government in Vancouver. While some admitted that Vancouver was behind in the digital domain and needed to catch up, the interviewed digital experts believed that the city needed to aim to be '*in the leading pack'*.

Different members of the external advisory board offered suggestions to '*disrupt how the government works*' including an emphasis on '*paperless government'*:

If you really want to kind of shift things you'd say we're going to get rid of paper. Not because I think getting rid of paper is the most, Holy Grail, but it really makes you rethink a lot of processes, and disrupt the old ways.

It was mentioned several times that:

The level of ambition embedded in the document is not, from a tech community background, what is expected to be.

The interviewed digital experts who were members of the external advisory board criticised the VDS for '*not being ambitious enough in transforming local government's structure'* and this was explained by:

The technical expertise of the local government staff tends to be for any reasons quite behind the time comparing to the tech problem. In fact, they don't have expertise in house and in most cases, they don't even know what the options available are.

Strategic Planning

The interviewees, who were part of the external advisory to the VDS, described one of the main issues that they had with the VDS in its current format as follows:

This digital strategy could be the digital strategy for an insurance company. There is nothing that makes it specific to Vancouver or even, quite frankly, specific to any urban context.

Vancouver, similar to many other local governments, did not have the in-house capability to produce a digital strategy, and yet recognized the need to do so. This led the city to use an external digital strategy consultant for the production of the VDS. The consultant, similar to most digital strategy companies, had expertise in digital business but had limited experience with local government sector, and did not necessarily understood the complexity and diversity of responsibilities involved. As a result, the urban digital strategy prepared for the Vancouver, looks similar to one that has been produced for an insurance company, banking system or in case any businesses as in this age most businesses need digital strategies.

Members of the external advisory board, interviewed by us, also pointed out a few shortcomings that could be described as specific to Vancouver:

If you are really going to get into the economic development or the economic benefit of digital, look at the zoning of buildings where tech companies want to be. Stuff which is not very digital at all, stuff which is just civic government, urban planning in a sense.

Hearing such ideas from interviewees with digital expertise but no urban planning background or experience was insightful. It was interesting to see how these people, because of their vast experiences in the innovation sector, articulate their spatial expectation of a digital strategy with the aim of boosting economic development.

Moreover, the discussions with different members of the external advisory board with vast expertise in the digital sector clarified the need for the VDS to link to strategic planning. Below quotation is an example:

I always think that digital strategies need to plug into whatever that the city is already good at and think about what can be done better because of the digital…

This emphasis on linking the digital strategy with the '*bigger ideas of what's challenging the city*' was repeated more than 20 times in the interviews; and aligns well with the recent literature on smart cities (Bulu et al., 2014; Heo et al., 2014; Hollands, 2008). Below quotations are a few examples of what was discussed in the interviews – mostly by the external advisory board members. There is a clear expectation for the digital strategy to link to the strategic issues/challenges of the city – in this case Vancouver:

Let's start with the problem as opposed to any solution. Let's start with the big problems that we have in our city rather than imposing a solution just because everyone else is doing it.

The best way to sell a digital strategy and to show that it is needed is to demonstrate how it can contribute to the biggest problems of the city and if it cannot, what's the point of it?

Views like those above led to a new line of discussion in the interviews: how can digital technologies play a role in tacking the big issues in Vancouver?

In the case of Vancouver, it is not difficult to identify the main planning issues and priorities. The City of Vancouver has developed quite a few major strategic documents in the recent years including Greenest City 2020 Action Plan (City of Vancouver, 2009) and Vancouver's Economic Action Strategy (Vancouver Economic Commission, 2011). As part of the interview structure (described earlier in the research methods section of the paper) we asked questions about the strategic links between these three strategies (digital, environmental and economic). The following quote from a government official in charge of the VDS development offers a summary:

We were all very aware of the other strategies but, we didn't see any need to interact with the staffs who were implementing the Greenest City Action strategy. Vancouver Economic Commission (as part of managerial team behind the digital strategy) brought their knowledge of the Economic Action Strategy to the table though.

This lack of interest to link to the other strategies was clearly noticed by the VDS external advisory members who had noticed that '*there were no urban planners involved in the discussions'* and *'they were not even trying to link to any other existing planning strategies'*.

Having said this, the fact that Vancouver Economic Commission was leading two of the recent major strategies - Economic Action Strategy and the VDS - has resulted in a clear economic focus in the digital strategy. This focus aligns with a growing number of digital strategy documents that introduce themselves as digital economy enablers. For example, a study of Brisbane's Digital Strategy showed that a digital economy with an emphasis on enabling SMEs in the digital age was the core of the strategy (Alizadeh and Sipe, 2015). More specifically, in the case of Vancouver, when local government officials were asked to nominate their first priority for the VDS, 'digital economy' was the resounding answer:

Our first priority is creating digital economic opportunities; enabling the sector as identifying what can the city do to nurture their growth.

However, there is still a big question about the lack of alliance between the VDS and the most significant and trademark strategy of Vancouver, the Greenest City 2020 Action Plan. Greenest City Action Plan is the city's top priority. While many cities around the world aim for green targets, Vancouver wants to be the greenest -- #1 -- which makes it very different from any other green strategy prepared around the world.

However, even with such a high priority, there was little connection with the digital strategy. Government officials justified this by declaring their interest in building '*operational alliance'* during the implementation phase. They admitted that during the implementation phase there are some crucial

operational links between the two strategies as both strategies had a number of similar initiatives. For example, the Greenest Strategy has a clean tech demonstration linked with a number of initiatives included in the VDS. So, in the absence of any official links between the two strategies in the development phase, some unofficial attempts have emerged during implementation.

LESSONS LEARNED

The local government in Vancouver should be praised for being the pioneer in taking up digital opportunities through development of an urban digital strategy. As discussed earlier in the paper, the literature (Danneels, 2004; Downes, 2009; McQuivey, 2013) puts a great emphasis on the timing of adoption of new technologies and suggests that pioneers have a strong competitive edge to disrupt the old ways. Having said this, our analysis of the VDS unravels two competing/opposing views on the role defined for the new strategy in the future urban management of Vancouver. The views offered by the local government side could be described as more conservative, while the digital business experts push for a more radical and perhaps disruptive role.

The role of digital in the urban management of Vancouver was discussed under the two broad themes of governance, and strategic planning. A summary of the lessons learned follows:

What we learned from the interviews conducted suggests that there is an agreement across different stakeholders involved with the preparation and implementation of the VDS that digital technologies offer a chance to transform the structure of local governance in Vancouver. There however seemed to be a difference about the scale of this transformation. The interviewed local government officials focused on the power of digital technologies to establishing or strengthening horizontal links within the internal governance structure. The interviewed digital experts - who were members of the external advisory board - however pushed for an extensive transformation, perhaps a disruptive one; and believed that digital technologies provide a chance to strongly question the old ways in which local government was structured. This subgroup of interviewees believed that the VDS fell short of fulfilling such a broader role in transforming local government based on the digital opportunities available.

On the question of digital technology and strategic planning in Vancouver, the lack of explicit link in the document is obvious. All interviewees admitted that there was no real attempt to link the VDS to other competing strategic documents – on environment and economic development - being prepared around the same time. Having said this, the fact that Vancouver Economic Commission was leading both Economic Action Strategy and the VDS has resulted in a clear economic focus in the digital strategy. There is, however, a big question about the lack of alliance between the VDS and the most significant and trademark strategy of Vancouver, the Greenest City 2020 Action Plan.

We identified two opposing views in response to this big question. The local government officials interviewed by us, believed that an operational link at the implementation phase will connect the two technological and environmental strategies. This view was questioned by the digital experts who believed that the VDS looks like any other digital strategy and does not necessarily link to the big issues in Vancouver. This is a concern that resonates with the literature on smart cities. Nam and Pardo (2011), for example, point out that the unique context of each city shapes the technological, organizational and policy aspects of that city, and as a result a smart city should be considered as a contextualized interplay among technological innovation, managerial and organizational innovation, and policy innovation. More specifically, when it comes to the relation between green city and smart city concepts (as it is the big

question in Vancouver), the literature argues that the realization of digital is a necessary component for achieving green city targets. El-Diraby (2009) outlines a vision to harness and analyse sustainability data in urban areas. In this vision, relevant environmental and energy-use data need be extracted from diverse sources so that local decision makers can synchronize the data and create an integrated virtual organization. In this view, making ultimate sustainable decisions and achieving green city targets depends on digital technologies.

Our analysis of the VDS suggests that an operational alliance is not a sufficient substitute for the lack of strategic thinking in the development phase of the VDS. The VDS has failed to align with the flagship green strategy, which raises questions around the core priorities of the VDS versus the core priorities of Vancouver. While Vancouver puts the highest priority on the environment, the VDS fails to explicitly include this in it set of priorities. A strategic link between the two digital and environmental strategies could result in digitally enabled initiatives to support the Greenest Strategy. For instance, one priority area for the VDS is to create digital work/mobile workforce, yet no attempt has been made to link this to the greenest action plan based on the environmental benefits of telework which is widely discussed in the literature (Bose and Luo, 2012; Rietveld, 2011). Surprisingly, telework does not seem to be on the agenda for a city that wants to be the greenest. The city does not even offer telework as part of flexible work options to its own employees. This puts Vancouver behind many other cities that already have that option available.

To sum up, the VDS could be considered as a step in the right direction to capitalize on the digitally enabled opportunities. However, in its current format seems to fail to make strategic connections with the priority green agenda set for the city. This shortcoming highly restricts its ability to play a proactive role in the management of the city, let alone transform or disrupt the old ways.

CONCLUSION

This paper uses a combination of policy analysis and key stakeholder interviews to examine the role of the VDS in planning and governance in Vancouver.

Based on the policy analysis, this paper acknowledges the broad definition of digital strategy offered in the VDS and welcomes the explicit link between land-use planning and the digital economy. The VDS opens an important line of communications between stakeholders on the role of the digital economy in Vancouver's future development.

Our interviews revealed some shortcomings in the VDS in two broad areas of governance and strategic planning. The VDS has been reported to be successful in establishing (previously missing) horizontal links in the internal structure of the local government. However, there was a call made by some of our interviewees – mostly from the digital business community - to take this opportunity to fully transform the internal governance structure with initiatives such as paperless governance. The VDS was criticised for not disrupting the old ways and merely rationalizing (and providing a better framework) for some of the already approved digital decisions.

A second line of discussion in the interviews focused on how the VDS links to the competing environmental and economic strategic documents prepared around the same time in Vancouver. This discussion is in line with the question raised at the beginning of the paper about the extent to which planning for the digital technology should be incorporated into strategic urban and regional planning. Our findings suggest that a digital strategy works best if it is incorporated into strategic planning. In the case of

Vancouver, the lack of a strategic link between the VDS and the city's flagship strategy - the Greenest City Action Plan - was questioned. However, some operational links between the two strategies at the implementation phase was acknowledged.

While there are some areas of improvement, Vancouver should be commended for being a forerunner in producing Canada's first urban digital strategy. Lessons learned from the VDS could inform any city looking forward to play a proactive role in the digital economy, to capitalize on the digitally-enabled solutions in order to address the core issues facing their future.

Chapter 74
Our Future:
With the Good, the Bad, or the Ugly eServices? Case Finland

Maija R. Korhonen
Mikkeli University of Applied Sciences, Finland

ABSTRACT

We live in an ever-changing world. Despite that many new and excellent reforms are achieved, this period of time is also very confusing when many things that were regarded as concrete are becoming virtual. In spite of all this incompleteness, our common goal should be a good information society and the purpose of this chapter is to find out some factors that reveal the steps toward it. The question we ask is how to find a balance between a good life and eServices from the human point of view. The key findings pointed to issues in the needs of structural changes in the society. Another challenge that can be observed and which will be in the most essential role in the future, is the ownership and control over My Data. Agreements are a common practice in the business and when the subject is eServices in the future, we cannot avoid discussion of the end-user agreements, too.

INTRODUCTION

The world is in a great structural change and it seems that the economic growth will be based more and more on services in the future. (European Commission, 2015; Jungner, 2015; Koch, 2015) ICT has played a significant role for decades and this trend still seems to continue, however, in a changing world, the role of ICT has also had to change from a technical role to a more user-oriented role (Digitalization, 2016; Jungner, 2015; Koch, 2015). At the same time as we are encountering so many economic challenges, our common objective should still be the steps towards a good life and good information society (Liideri, 2015). But what does good life mean to us? Very different things, of course, depending on your perspective. The Finnish government has a vision that by the year 2030 Finland is a good place to live a meaningful and dignified life for everyone. The starting point is an individual's dignity and right to live a good and dignified life. Firstly the aim is to take each of us as an individual personality and secondly

DOI: 10.4018/978-1-5225-3822-6.ch074

to emphasize self-determination, while, on the other hand, carrying responsibility for ourselves as well. (Korhonen, 2016; Valtioneuvosto, 2016)

Today, knowledge is the raw material and one of the factors of production. Thinking about business life, it can be said that companies are implementing good life by doing profitable business with knowledge. In practice this means that good eServices are established for the people, other companies and the society. Furthermore, when considering good life from the perspective of the society, the main purpose of eServices is to help and motivate people to take care of themselves as well as possible (Korhonen, 2016). To some, it means health and wellbeing services, some others are motivated by hobbies, entertainment or gaming, while for many contacts with the family, neighbours and friends are the most important. In addition the world is undergoing a dramatic demographic transformation: the trend is toward an older population.

As people are living longer, according to many studies these elderly people are suffering from loneliness to a greater extent. Here eServices, and especially platform technology, can offer an opportunity to solve the problem by helping the elderly people to increase interaction with other people (Marcelino et al., 2005). More often than not the elderly also want to live at their homes as long as possible and digital services can help them to live independently and to feel themselves dignified. The working life is also undergoing great changes. In Finland work has traditionally played a very important role in an individual's life, to the extence that sometimes individual´s value is measured by one´s work or position. Digital services allow new forms of work, as well as different combinations of work and life. Because of that role, eServices are important also in the working life and digital services can be said to be a contribution toward a good life in that sense, too.

The eServices and related matters are reviewed and considered in this chapter. First some background issues are presented while, the next section provides a brief description of digitalization in general and eServices are introduced via three Finnish application examples widely adopted by users: Firstbeat, OniBus.com, and 112 Suomi. However generally stated and unfortunately, all eServices are not good ones. It can be said that there are way too many bad eServices, even ugly ones and that is why we will study and analyse the features of eServices. Users should demand more and better applications and one key to promote this is try to create awareness of possibilities of applications and enhance the understanding and knowledge of the users. When we discuss eServices one important topic is the end-user agreements and this is, of course, a subject of consideration of that cannot be avoided in this chapter. Personal data and My Data are closely linked to eServices. Therefore, the possibilities of these topics are also discussed. Who owns and controls personal data in the future? The service providers or the person her/himself? What will be the roles of the service provider and the user?

Summarily, the purpose of this chapter is to find out some factors that reveal the steps toward the good information society. It seems that, after all, digital services are the most important building blocks of a good life in the future. However, there are also several significant challenges.

BACKGROUND

In order to understand what eServices really are or mean, we have to study the nature of digitalization in general first. Swedish professor Gulliksen (2016) unfurled the concept of "digitality" in his conference speeches by the words "digitization" and "digitalization". As a product of digitization a file stored in a digital form is created. There are many different formats and the one to be used is determined by the

requirements of the application. For example, files meant to be electronically distributed are normally stored in a packed format. Hence, an average person sees digitization just as a simple process in which a digital picture of any readable material is created by using a smart-phone, computer or scanner. However, in practice, the process is much more complicated, since the quality of the copy, the storage file format, the intended use and the questions related to archiving of the file have to be determined. Gulliksen (2016) described the term digitalization as meaning the renovation of the ways of acting by utilising modern information technology. In a broader sense, it can be said that in addition to the renovation of the ways of acting, digitality also means the digitalization of internal processes and electrifying of services i.e. providing eServices.

In the previous paragraph digitalization was defined as a process of moving to a digital business model, and not just some investigation of software or device. What is more, Gartner (2016) links digitalization with different ages of IT. The first phase was the age of IT manufacturing when the focus was on the technology. The age of IT industrialization can be seen as the second phase when the production was heavily developed. Digitalization is the third age in the development of IT and currently the focus is on the business models where the customer is in the central point, in other words, companies want to establish good eServices to the customers.

Thinking ahead, we all want to have a good life, but who can define what good life really means? Should this question be dealt with the possibility of obtaining information, as well as a function of time? Probably. What comes to the Nordic countries, it can be said that in the not so distant past, it were the authorities and specialists who told and, to a major extent, also decided what was best for the people. This was enforced by the fact that it was difficult to gather information and that the expertise and knowledge truly were in the hands of a small academic or otherwise educated elite. It can be rightfully said that during those days information meant power and it was carefully protected in the fear of loss of that power. Companies and organizations were hierarchical and management was practiced one-way only, top-down (source). On the other hand, power also meant concrete responsibility that could not be delegated or avoided. It is obvious that, at the time, life was not fair to everyone, but it should also be noted that according to the hierarchy of needs, from the perspective of an individual, their focus was mainly on the lower levels of that hierarchy as nowadays. That is why for the most the elements of good life meant satisfying the needs for nutrition and a place to live. Opposite to this, the situation today is quite different. The technical development is playing a big role, since Internet and digital services have changed it all: nowadays Internet gives almost every person on the planet equal means to acquire the same information. Information has become real-time and global: News published in Finland is available and accessible simultaneously also in America and Asia. Furthermore, a future trend is an ever increasing emphasis on individuality. People want individual, tailor-made, high quality services that can be accessed independent of time or place as the building blocks for a good life and the digital services are a good solution for that need.

According to several surveys (Digibarometri, 2016; Digibarometri, 2015; SME barometer, 2015) Finland has excellent technical prerequisities for digitalization, but contradictory to that, they had not been widely been applied in the business life. Even though we have some fresh examples of success, such as in the gaming technology, our predominant ways of acting date back to the industrial age, a fact that also applies to the management practices. It can be seen that we have not yet taken benefit of the possibilities offered by these technical preconditions (Korhonen 2015). In addition to this, the rigid structure of the Finnish society that lacks flexibility has been criticized by many. Gartner's (2016) definition for digitalization is following: "*Digitalization is the use of digital technologies to change a*

business model and provide new revenue and value-producing opportunities; it is the process of moving to a digital business". This definition supports the opinion that the Finns have not yet stepped into the era of digitalization.

October 2016 Finnish MIT professor Bengt Holmström was awarded with the Nobel Prize in economics together with professor Oliver Hart for their insights into modern contract theory. Among many others, Holmström (HS, 2015) pointed out that the structures of our working life are too rigid. He manifests that Finland should pay more attention to the changes in the global economy and courageously renew the working life, because the technological development has profoundly changed the nature of work and respectively this calls for large structural reforms respectively. What is more, according to recent studies the new rules in the working life can have a very favourable effect on the economic growth (HS, 2015). Contrary to this, the Finnish labour market institutions have highlighted the problems in the business management. According to the Finnish research (TIVIA, 2016) digitalization, so far, means to Finnish companies more or less electrification of the current processes whereas the possibilities of creating new digital business for international markets have not been utilized yet, and the pioneers of digitalization are low in numbers. Additionally, only 30 per cent of the IT and business managers report that digitalization has evoked interest in the top-level management towards global business opportunities. Stated in this way, the number perhaps does not sound so alarming, but when you look at it from the percpective that 70 per cent of the top-level management is not interested in the utilisation of digitalization, the future outlook raises doubts and worry. According to Kolesnik (2016) the actual roadblock is the lack of leadership. In Finnish organizations, digitalization is, in a way, everybody's and nobody's matter. Even though, digitalization is becoming part of every process and function, the real pioneers of digital business and new business models are missing. Helenius (2016) adds that in Finnish companies, for the time being, the real ownership of the development of digital business is missing and siloed. As a summary, could it be said that according to the made study the managers of digitalization are missing in the Finnish companies and because the digitalization is siloed and nobody's matter, the need for structural reforms becomes inevitable also in the light of this study?

What is more, both the number of ICT equipment and the very essence of ICT has increased continuously in our lives during the last two decades. Among the first digital services that touched the entire Finnish society were the digital banking services introduced by the Finnish banks in the early 90's. It can be said, that closing down of the branch offices and steering the customers into the net to use the new digital services equally involved individuals, companies and authorities. This transition has also been one of the most remarkable structural changes in the society. Furthermore, with the advancements in technology we have started to utilize eservices in our other everyday routines, too. Therefore, it can be said that eservices have creeped in to our lives little by little and this development is one of the reasons why we have not paid enough attention to their quality, but rather have embraced all sorts without much of objection. The development of the majority of eservices has started with the technology, the organizational or financial benefits first in mind whereas the customer or user-friendliness have often been neglected totally. Fortunately, we are slowly heading into a better direction and the successful companies are developing their digital businesses from the basis of customer satisfaction. According to Li & Suomi (2009) the 8 key-elements of the quality of eServices are presented in Table 1: website design, reliability, responsiveness, security, fulfillment, personalization, information and empathy.

Agreements are a common practice in the business life and when the subject turns to eServices, we cannot avoid discussion of agreements, too. According to the Business dictionary (2016) the concept of agreement means negotiated and usually legally enforceable understanding between two or more

Table 1. The eight dimensions of eService quality

Dimension of eService Quality	Description
Website design	• Appealing and well organized website • Consistent and standardized navigation • Well-organized appearance of user interface • Quickly downloading • Ease use of the online transaction
Reliability	• Accurate delivery service • Complete order service • Company being truthful about it offering • The online service always correct • Keeping service promise • Accurate online booking records • Website always available
Responsiveness	• Adequate contact information and performance • Prompt responses to customers • Timely responses to customers • Adequate response time • Quickly solve problems
Security	• Protect the financial data of customers • Protect the personal data of customers • Terms on payment and delivery • Good reputation
Fulfillment	• Information on products or services available when purchasing • Systems runs smoothly in the transaction process. • Accurate promises about delivery service in purchasing process • Available to modify and/or defer the purchasing process at any time without commitment
Personalization	• Personalized • Products and services • Payment terms • Delivery terms • Design
Information	• Updated information • Information current and timely • Information accurate and relevant • Information easy to understand
Empathy	• Good personal attention • Adequate contacts • Address complaints friendly • Consistently courteous

Source: Li & Suomi, 2009.

legally competent parties. In this context we are interested in the end-users and it can be said that those are persons or organizations who actually use a product, opposite to the persons or organizations who authorize, order, procure, or pay for it. So, today nearly everyone is an end-user. What about the status of our end-user agreements then? We made a quick and restricted empirical research related to the end-user agreements with a target group selected from consumers who use eServices. The results of the survey were shocking. We will return to these results later in paragraph the "Agreements and contracts" paragraph.

We mentioned earlier that personalization (Li & Suomi, 2009) is an important dimension of the quality of eService, because it could improve customer´s satisfaction. On the other hand interactivity between customers and enterprises offers opportunities for enterprises to obtain valuable information on

the customer, her/his needs, residence, her/his purchasing habits etc. Collecting customer data has grown exponentially in a relatively short period of time. Nowadays all of our actions on the internet will leave a digital footprint and all data are typically collected by different kinds of companies and organizations. Earlier they were usually big multinational companies, but today "all parties", not just commercial ones, collect relevant, but unfortunately, also irrelevant data about us for their own purposes. We ourselves do not control that data, and generally even know nothing of the nature or contents these collected and recorded contents of data. It is fair to say that the situation is somewhat complicated. In order to offer good eServices companies have to know their customers. However, the data collected needs to be limited to the purposes and use of the eService provided. Warma (2016) presented a good example of this issue in a public lecture held at the Internet Forum organized by Aalto University. In a research test carried out in Germany a candid camera was hidden in a confectionery and when receiving payments from the customers, the shop assistant also asked for their personal information, such as phone number, home address etc. The same customers, who, when using eServices, happily give all the information requested without questioning, were surprised, displeased, angry or even refused to provide the information. In this situation a person wanted to know why the irrelevant information is collected and how that information relates to the purchase of bread. Exactly same questions should be asked when using the eServices, too. This naturally raises the question: Why don´t we?

ESERVICES: THE BUILDING BLOCKS OF A GOOD LIFE

Eservices in General

The world is really changing now: we had transferred via industrial revolution to the information revolution and are now rushing fast toward the digital world where information is the raw material. (Korhonen, 2015; Liideri, 2015; Porter, 2001) It can be said that in the 19th century gold and other metals were mined, whereas in the 20th century enormous amounts of products were produced in factories to the "market" and now in the 21st century it will be the data mining that brings revenue to most companies and the economic growth will be increasingly based on eServices. Hofacker et al. (2007) defined the concept of eService as "an act or performance that creates value and provides benefits for customers through a process that is stored as an algorithm and typically implemented by networked software." Already entirely new opportunities exist already for the use of the existing information and archives for the creation of innovative digital services by enriching, reformulating and combining digitally stored information. Therefore it seems that eServices will have a lot to give to us as the building blocks of a good life.

In the Finnish government´s vision our country is described as a good place to live a meaningful and dignified life for everyone. Thus, the starting point for this vision is the individual's dignity and right to live a good and dignified life. On the other hand the aim is to take each one of us as a unique personality and also to emphasize one´s self-determination. The community is written into this vision too - everyone can be her/himself and is accepted by the society. The above mentioned description also directly applies to the characterization of a good digital service. The basis is the customer need, where customer experience data is gathered and analyzed and finally the user-friendly service is personalized based on that data. A service is also available as needed, independent of time and place, in the form and in a channel desired by the user. The aim and purpose of an eService is to make users' life easier and better. Communication with the near-ones and interaction with the known and unknown persons is

made possible. Furthermore, the eServices are also entertaining and promote the sense of community. In summary, all of these are essential elements of a good quality of life. (Korhonen, 2016) The next three applications are a couple of examples of how ones´s everyday life can be made easier. These examples demonstrate well the needs for structural change in the society, too.

The first example describes a person´s own activities to improve her/his own health. A company called Firstbeat Technologies Ltd has developed heart rate analysis technology and their mission is to bring the actual measurement data as the basis for the analysis and decisions to be made related to the personal wellbeing and physical performance. The application transforms heartbeat data into personalized insights on stress-level, exercise and sleep. It can be said that invisible things become visible and, because of that, you really become aware of your own situation and can choose the optimal level of nutrition, exercise and rest to improve your health and wellbeing. Subsequently in the future we will be increasingly measuring and monitoring our own health ourselves by the means of new applications and eServices. Consequently, this development calls for reform of the society, especially of those public organizations that provide health and social services. (Firstbeat Technologies, 2016)

The second example is related to travel and mobility. OnniBus.com is an innovative inter-city express bus service that is based on a new customer-oriented business model. Tickets are priced dynamically starting from one Euros, so that the earlier you purchase your ticket, the cheaper it becomes, which underlies OnniBus.com´s philosophy: "An empty seat is the most expensive seat". The company operates modern, fuel efficient coaches which are equipped with air conditioning, toilets, free Wi-Fi and limited mobility access. With the excellent service, new routes and flexible pricing it has proved to be a new alternative to air, train and car travel in Finland. The company was established in 2014 and just after one year of operation, significant changes throughout to entire travel business segment could be observed. The state railways monopoly, as well as other bus companies, had to react on the altered behavior and demands of the customers. This resulted in a more customer-oriented operation, more friendly service, lower prices and better routes throughout the country. (OnniBus.com, 2016)

The third example, 112 Suomi, is a public, free-of-charge smartphone application which makes it easier and more secure to get aid and help in the case of emergency. Surprising many, the citizens immediately adopted the service after it was made available free for download. The application enables automatic delivery of the caller's location information to the emergency service dispatcher (in Finland). The service is especially valuable in places where the determination of the exact location is difficult, such as on streets with the same names in cities or on a traffic accident scene on a highway. The application uses phone´s data network connection to transmit the GPS location information. In addition to this, the application also shows the GPS location information on the phone screen and by reading location coordinates aloud the user can forward her/his location to the emergency service dispatcher even without phone´s data network connection. 112 Suomi application is a positive example of the trend that we are heading for a good information society. (112 Suomi, 2016)

Good, Bad or Ugly?

In the previous paragraph an eService was defined from the user and customer perspective. Today, the customer must be placed in the center of action. A successful service is personalized, easy to use and affordable (Lakaniemi, 2014). Unfortunately, in addition to good digital services, there are a lot of not-so-good-services too and when the goal is a good information society and further a good life, it is important to recognize a good eService, which is not always an easy task. Our research is based

on user-orientation and we have considered how to help and encourage users to identify differences in eServices. In general, there is a lot of discussion on digitalization, its benefits and threats, but it seems that the debate often takes place on a too abstract level, and we have also found out that many users are tired of the continuous grinding on the subject, which does not get a grip. One useful way has proven to be to illustrate the difference between a bad and an ugly eService. As an example, words good, bad and ugly are described below simply using a dictionary (Table 2.). It is amazing how well the meaning of words also correlates with the features of an eService, including the importance of visibility and ownership of your personal data. Again, the world has changed: in the industrial era literacy was an essential skill and the transition to a knowledge society gave birth to a need for media literacy, do we need digital information literacy today, i.e. special skills to be able to read digital information, since it is no longer possible to get by with the means of traditional literacy?

Eservices and End-User Agreements: Do We Accept the End-User Agreements Just Because We Feel That We Have No Choice?

Contracts and agreements are an integral part of any business. According to the Business dictionary (2016) end-users can be described as persons or organizations that actually use a product, contrary to persons or organizations that authorize, order, procure, or pay for it. Naturally, when discussing eServices, end-user agreements are of main interest to us.

As we noted earlier today, one way or another, most of us are users of digital services and at the same time we can be called end-users, too. Although all kinds of agreements and contracts, as well as

Table 2. Explanations of words good, bad and ugly, and their correlation with features of eService

Term/Word	Good	Bad	Ugly
Explanation and correlation with features of eService	• Morally excellent; virtuous; righteous; pious: • Satisfactory in quality, quantity, or degree • Of high quality; excellent • Right, proper, fit, well-behaved • Kind, beneficent, or friendly: to do a good deed • Honorable or worthy; in good standing • Profit or advantage; worth; benefit: What good will that do? • Excellence or merit; kindness: to do good • Moral righteousness; virtue: to be a power for good • Having admirable, pleasing, superior, or positive qualities; not negative, bad or mediocre • Suitable or efficient for a purpose • Pleasant, enjoyable, interesting • Healthy • Successful • Positive, suitable, satisfaction	• Not good in any manner or degree • Having a wicked or evil character; morally reprehensible • Of poor or inferior quality; defective; deficient • Inadequate or below standard; not satisfactory for use • Inaccurate, incorrect, or faulty • Invalid, unsound, or false: a bad insurance claim; bad judgment • Causing or liable to cause sickness or ill health; injurious or harmful • A bad condition, character or quality • Not good; of poor quality; inadequate; inferior: bad workmanship, bad soil, bad light for reading • (Often foll by at) lacking skill or talent; incompetent: a bad painter, bad at sports • (Often foll by for) harmful: bad air, smoking is bad for you	• Very unattractive or unpleasant to look at; offensive to the sense of beauty; displeasing in appearance. • Disagreeable; unpleasant; objectionable: ugly tricks; ugly discords. • Morally revolting: ugly crime. • Threatening trouble or danger: ugly symptoms • Mean; hostile; quarrelsome: • An ugly mood; an ugly frame of mind. • (Especially of natural phenomena) unpleasant or dangerous • Ill-favored • Hard-featured • Unsightly • Unlovely • Heinous, vile, monstrous • Corrupt • Disadvantageous • Ominous • Spiteful, stormy, tempestuous

Source: Cambridge dictionary, 2016.

their problems are presented daily by press, governments, European Union, companies etc. no extensive general or public discussion, or debate on the end-user agreements related to eServices has taken place. Why not? Are we just happy and satisfied with the current situation? The question awoke our interest, whether there really is nothing to complain or to disagree. So, before a broader planning and conduct of research, we made a quick empirical pilot survey related to the end-user agreements. The objective of a survey was to find out the level of knowledge of users by means of three questions:

- Do you know, what is an end-user agreement?
- Do you read the end-user agreement before accepting it?
- Do you understand terms and conditions of the end-user agreement?

The target group selected were consumers who had used different kinds of eServices at least two years (Table 3). First, we defined a small 10 person (5 women and 5 men) target group consisting of a student, managing director (administration, academic degree), older person, younger person, middle-aged person, ICT consultant (multinational company), entrepreneur (SME, tourism), public servant, trade worker and teacher (lecturer, health care). In this pilot survey we did not select any experts in law to the target group.

Our expectation was that the responses of participants would disperse: some would know and understand the end-user agreements while others would not know anything about the whole issue. However, the results we got were quite shocking. None of participants understood the end-user agreement (terms and conditions) related to the eServices she/he is using. Only 1 out of 10 read the end-user agreement before accepting it (but still did not understand its content). One of the participants sometimes eyed the text of the end-user agreement trying to find out if some collection of data is involved. 8 out of 10 just accepted the end-user agreement straight away in order gain access to the desired application. The general comment was that they have no option but accept the terms.

Summarily, the result of our empirical pilot survey was:

The participants accepted the end-user agreements when using eServices, even though

- They do not understand the "end-user agreement language".
- They do not understand the contents or terms.
- They do not recognize that an end-user agreement is a legal agreement.

Table 3. Participants of pilot survey in which the familiarity with end-user agreements and their terms and conditions was examined. Consumers had used eServices at least two years.

Participants of Pilot Survey (Consumers, 5 Women and 5 Men)
• Student • Managing director (administration, academic degree) • Older person • Younger person • Middle-aged person • ICT consultant (multinational company) • Entrepreneur (SME, tourism) • Public servant • Trade worker • Teacher (lecturer, health care)

The extent of the pilot survey was limited and that is why broader conclusions should not be drawn. However, the results were so uniform and confusing that we dare to say that this cannot be our future with eServices.

Because the results of study were so surprising, we decided to explore further the contents of the end-user agreements of some applications. Here the focus was specifically on the content, terms, wordings etc. and not on the characteristics or a quality of the application. First of all, if you just read an end-user agreement, you can quickly note that end-user agreements are legal texts and when somebody uses the application, at the same time, she/he will enter into a legal agreement, as well as agrees to all of the listed terms which usually means many pages of obscure legal text. Quite often the next thing the user finds is the adoption of privacy policy which covers how the provider may collect, use, share, and store your personal information. Some agreements are strictly declared that the provider has the ownership of all the data, but there are also cases in which users owns all of the content, feedback, and personal information she/he provides, but even in those cases the users have to grant the provider a non-exclusive license to her/his data. As a rule, the provider announces that they have the right to change or discontinue part or all of the eServices and due to that they do not promise to store user´s content or data, but that it is the user´s sole responsibility. In those agreements in which the text is clearer there are sometimes lists of matters the user can and cannot do. For example, in the user-agreement of LinkedIn (2016) there are lists of "You agree that you will" and, on contrary, "You agree you will not". However, how a user should react when "you will" –list consist of 4 bullets and "you will not"-list has 44 bullets?

When one thinks about the current end-user agreements described above, it inevitably raises the question whether the situation could be reversed: would any eService provider accept an agreement in which the terms and conditions were not understandable and they were unilaterally dictated by user and, in addition to this, the terms could change during the contract period? Not very likely. Then, why do we accept this as users?

For a very long time it has been said that competition is hard in the business world. However, considering the current situation of end-user agreements of eServices, it is not easy to believe the claim. At the moment, the eService provider can offer an agreement with terms and conditions that only the provider her/him/itself understands and is aware of all the contents. Perhaps this current digital revolution leads to a completely new situation in which companies and organizations really have to compete for customers and the agreement with its terms will be a real means of improving customer satisfaction and further an essential key to a success in business. Most likely, increased transparency in the contractual matters would also increase consumer awareness of the contracts and their contents in each sector. Subsequently, this would make the comparison of the alternatives possible, which in turn would lead to a real competition for the customers. Additionally, that kind of situation would create a real opportunity for the companies to also acquire a competitive advantage and succeed in the global market.

CHALLENGES

Personal Data and My Data

The term My Data can be described as a human-centric approach to the management and processing of personal data, in which people are given permission and access to the data gathered on them while they have been using digital service channels. Therefore My Data includes one´s shopping history, phone

logs, traffic data, health records and other data accumulated into the records of different internet service providers. Subsequently, it can be concluded that, what becomes essential over time, is the ability and possibility for the users of these services to migrate this data either to her/himself or into some other authorized service in a, for them, more reusable form. (Poikola et al., 2014)

However, with the ever expanding and wider use of the personal data, more and more uncertainty and doubt is arising among people regarding the possible loss of privacy (Asp, 2014). It is a common perception among private persons that companies and governments already know too much of them, which in turn makes them feel uncomfortable. On the other hand, people do not understand the various advanced ways and methods in which their personal data is used in promoting goods and services in the social media, and in general, directed and personalized marketing in the web. Furthermore, they have no idea of what kind of personal data and how much of it each individual service provider possesses of them. Related to this, we can again talk about the bad and ugly eServices, because it is important for the users of the services to be able to distinguish and understand whether their personal data is used for executing business, crime or other illegal activity or if the method of data collection is just a clumsy one but the collected data will eventually turn into benefit of the user or, in some cases, for the common good in the form of statistical data or via general research.

Related to this, Poikola et al. (2014) point out that the traditional perspective to the protection of privacy is such that, the less personal data is collected, the better. This point of view, however, neglects the value of accumulated data to the person her/himself and is in contradiction with the megatrend of the increasing collection of and usage of personal data. The goal should be enabling the collection and usage of personal data in such a way that the benefits are maximized and the threat of the exposure of the personal data is minimized. The key to reaching this is to enforce individual's role, rights and practical means in the management of the data related to them.

Big data and open data are concepts often discussed in conjunction with the digitalization and they are naturally and closely related to eServices. When interviewing companies and public authorities, it was revealed that, as the most important factors in the usage of big data were regarded the usability of the data, abundance and real-time nature of the collection points, enhanced forecasting potential created by the accumulated amount of data and, finally, the utilization of the combination of dissimilar datatypes and the user experience. On the other hand, as the obstacles for the utilization of this data were seen, for example, the vast quantity of data, questions related to the cost i.e. free vs. chargeable access to the data, issues with the ownership of and access to the data, risks involving possible abuse and loss of the data and, last but not least, the vague status of the rights of the parties handing over their data. (Valtioneuvosto, 2016)

When considering open data and My Data, common characteristics can be observed. Both call for an agreement on common principles, wise regulation and machine-readable interfaces, standards and services for a managed transfer of data, storage, processing and analysis. According to the definition of open data, anyone is technically and juridically free to use, reuse and share it. Correspondingly, My Data could be defined as data owner of which is technically and juridically free to use, reuse and share it. (Poikola et al., 2014)

Furthermore, almost any mass data can contain aspects of My Data i.e. "my-own-data" and, therefore, it plays a critical role in the development of the mass data ecosystem. As an example, a growing group of services are related to the personal health combining data from several separate sources together. In order to solve the issues related to My Data, it is obvious that we need new practices in which the emphasis shifts from the jurisdiction to the tools for managing the data. It is estimated that one of the most

promising means for the creation of tools for managing My Data are the so called blockchain technologies which are well suited to distributed data backup, processing and security and, further, to sharing of a value or resources. (Valtioneuvosto, 2016)

The Structural Changes of Society

Already twenty years ago, in 1995, Tapscott (2016) painted a picture where people are beginning to ask, "Will the smaller world our children inherit be a better one?" The question is very essential at the moment: changes have touched all of us and transformations can be seen in governments, organizations and companies, as well as, in the relationships between people. Digitalization has changed and is changing our everyday lives. Tapscott also pointed out signs by which a new economy has not led to a better life, but on the contrary, our privacy is vanishing, for example.

The existing laws and norms, structures and practices do not work in the new situation. Our information society is built on the foundation of administration and, therefore, the change takes place very slowly. Although we are well aware of that major reforms in the structures are needed, all parties want to hold on to the benefits achieved, and therefore any changes in the laws, norms and practices are difficult to execute. In addition, this rapidly changing world does not accept preparation times that last years or months. Governments are not adequately equipped to meet the new public expectations, as was also judged by the Governance Committee (2013). According to the survey, many governments are following a logic of simply and directly converting existing processes into their online versions. Some improvements can be observed, but mostly the governments spend their time and resources in digitalizing existing models and practices instead of rethinking the whole system by the requirements of the digital age (Tapscott, 2016). In short, one can say that it has been more digitization than real digitilization (Gulliksen, 2016; HS 2016).

What is more, Finnish society is currently undergoing a large structural reform. The existing methods and practices are being questioned with the aim of making them more effective and flexible. Several studies show that the digital skills of Finns are on a high level and, therefore, the prerequisites for the utilization of digitalization are excellent, when, paradoxically, at the same time we are unable to turn this knowledge into practice. (Digile, 2015; Digile 2016; Korhonen, 2015) However, important background work has been done in several projects: National Service Architecture Programme 2014-2017, eServices and eDemocracy Acceleration Programme 2009-2015 and The Finnish Open Data Programme 2013-2015 (Valtioneuvosto, 2016).

According to Pöysti (2016) the ongoing National Provincial Reform is the most extensive reform of the administration and practices in the history of Finland. It has an impact on every citizens' public services, as well as, on hundreds of thousands of jobs and workplaces. The provinces will be responsible for arranging and managing the social and health-care services, general administration and other essential public services in their domain. In this reform, digitalization plays a vital role and it is also a centric tool when implementing it. Heinonen (2016) says that in Finland we are creating something entirely new, since provinces have never before existed in Finland as independent administrative areas as meant by the Finnish constitution. Along with the National Provincial Reform, duties and tasks of over 400 different organizations will be handed over to the 18 provinces as to be arranged by them in the future. This responsibility of the arrangement of the mentioned services will be effective as of 1.1.2019. As of writing the text, the new provinces' own opinion of the task a ahead is best described as a Mission

Impossible (Mäkinen & Korhonen, 2016) and it is clear that successful execution of this reform requires the involvement of every Finnish individual and organization and that this is also our common goal as a nation i.e. we need to transform it in to a Mission Accomplished by 2019.

FUTURE RESEARCH DIRECTIONS

We are going through an interesting time of a digital revolution and it can be seen that this period is very different from the previous decades, since changes are taking place so quickly, globally, simultaneously at different levels and in different sizes, whereas before, the changes took place as in a row of a process, locally, and most often as a function of time. Thinking about eServices, a future direction of research could be divided into two entities: human-company-society (Figure 1) and human intelligence-technology (i.e. machine/automation/robots)-artificial intelligence (Figure 2).

Human-Company-Society

When we think about service business, a direction in the future will be toward more and more customer-oriented and user-centric digital services. From a human point of view, one interesting topic of further research will be the personal data. As mentioned earlier, any mass data can contain aspects of My Data and, therefore, it will play a critical role in the development of the mass data ecosystems (Poikola et al., 2014). Personal health data is a good example: already today there are services that combine data from several sources together. In the future new tools will be needed for managing that combined data rather

Figure 1. The first future direction of research concerning eServices: human-company-society

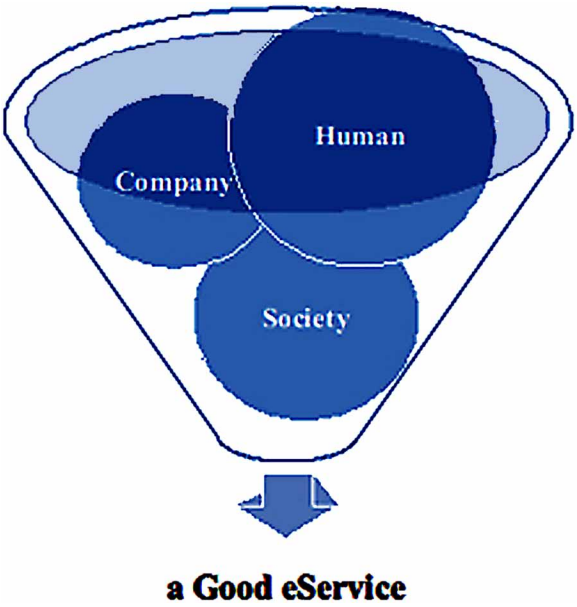

Figure 2. The second direction of research concerning eServices: human intelligence-technology-artificial intelligence

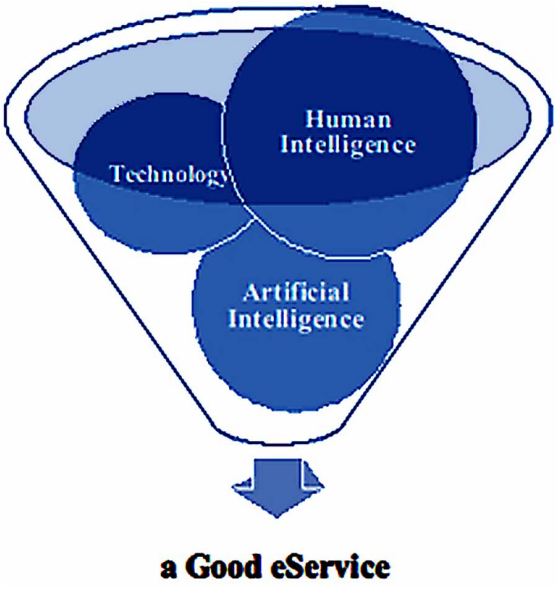

than a law to control the situation. Along with My Data, we can move from the organization centric ways of organazing personal data into more human centric methods by placing the individual in the center of the data management (Open Knowledge Finland, 2016). This means that the service provider offers back the information it has collected on the individual, in its plain or in an enriched form, which the individual can then utilize him/herself or share, trade or sell further to other services. Whether My Data will be the future solution and, unlike today, will we have complete ownership of our personal data in the future?

Further, what comes to services, mobile payment or mobile wallet are important from a company´s point of view. Nowadays, instead of paying with cash or a credit card, a consumer can use a mobile phone to pay for services or goods. These payment services are operated under financial regulation, but what about the future? The banking world is also undergoing a rapid evolution, maybe even a revolution. It can be asked if there are any banks at all in the future. Do we have virtual money, bitcoin or a similar form of currency or payment? Will the blockchain technology be the future solution and, unlike today, we have complete ownership of our money in the future?

According to the futurists, health technology is expected to proliferate. There are already several applications which allow for anybody the possibility to figure out the status of her/his daily health. From the society´s point of view, this self-measurement will be very interesting and also a significant development that will cause structural changes in the society (Social Affairs and Health), and its implications should be further examined, both on the administrative and operative levels.

Human Intelligence -Technology (Machine/ Automation/Robot) - Artificial Intelligence

In this chapter we have considered how to find a balance between eServices and a good life. It can be said that a basis for the digital services is a technology and "a source of ideas", as well "a designer" is the human intelligence. As mentioned earlier, a technology-centric eService could usually be named as a bad or ugly eService and according to several international studies, a user-centric, as well as, consumer-oriented eService is considered a good eService by the customers.

Nowadays, researchers generally agree that there are several types of intelligence, including analytic, emotional and linguistic intelligence. Generally speaking, it can be said that human intelligence is the ability to achieve goals in different environments, or as Legg & Hutter (2007) say, intelligence measures the human's ability to achieve goals in different contexts. Contrary to this, artificial intelligence (A.I.) is exhibited by machines. The difference between the human intelligence and A.I. is in the level of capacities: memory, processing power, learning ability and adaptability. (Russell & Norvik, 2013) When simplifying the elements of a eService design, it can be separated in to three issues:

- Goal,
- Challenges that must be crossed to reach the goal,
- Designer, who aims to overcome the challenges has the needed capabilities.

When thinking about the mentioned elements and eServices as the building blocks of a good life in the future i.e. our needs of good eServices, could it be so that artificial intelligence can also be used as a designer of an eService, and not only as an effective calculator or in decision support such as today?

CONCLUSION

We live in an ever changing world. Although many new and excellent reforms have been achieved, this period of time is also very confusing, when many things which were regarded as concrete and permanent, are becoming virtual. In spite of all this incompleteness, our common goal should be the good information society. As for the economic growth, it seems that eServices are a response to the growth objectives in the near future. The question we ask in this chapter is, how to find a balance between a good life and eServices.

As a conclusion, it seems that digital services will be the most important building blocks of good life in the future. The main purpose of eServices is to help and motivate people to take care of themselves as well as possible. To some, it means health and wellbeing services, some others are motivated by hobbies, entertainment or gaming, while for many contacts with the family, neighbors and friends are the most important. Digital services also allow new forms of work, as well as different combinations of work and living.

On the other hand, also challenges have been identified. The major issue seems to be the need for a structural reform in the society. In Finland the National Provincial Reform (Pöysti, 2016), is going on which means that significant changes in the structure of the society can be expected. These reforms are full of possibilities and, as of writing this text, we believe them to be steps towards a good life, as well as, towards a good information society. However, in order to succeed in this reform, a lot of work, changes in the old attitudes and, especially, cooperation between individuals, companies and organizations is needed.

Digital services can be regarded as information-driven service processes because of the absence of a physical element. Relevant digital information is vital for the customers in their decision making when many things are taking place in the virtual environment and a customer cannot physically examine "what they want or which one to choose". From the human point of view, we need special skills to be able to read and comprehend the digital information, since it is no longer possible to get by with the means of traditional literacy: it certainly can be said that, at the moment, we cannot see the forest from the trees.

There is a lot of discussion of the digitalization and eServices in general, its benefits and threats, but it seems that the debate often takes place on a too abstract level, and we have found that many users are tired of the continuous grinding on the subject. A useful way has proven to be to practically illustrate the differences between a good, a bad and an ugly eService. Another challenge that can be observed and which will be in the most essential role in the future, is the ownership and control over My Data. (Poikola et al., 2014). Furthermore, the end-user agreements are one of the main issues that need to be transformed in to a more user-friendly form. Everyone should understand that they are legally binding agreements that should be taken seriously. It sounds quite absurd that we are willing to accept the terms and conditions that we do not comprehend. This cannot be the right way, and the current practice cannot continue in the future.

In summary we must have courage and determination to demand better and improved eServices, as well as fair agreement terms. Successful companies take the customer experience into account and continuously develop their businesses based on this information and feedback. Tapscott (2016) says that, when you look last twenty years back i.e. the period between 1995 and 2015, it can be detected that the technology alone does not create prosperity, good democracy or justice, but the involvement of the humans is required, too. So, when we set our sight twenty years ahead, it is only the very choices of each one of us that can make a good life possible.

Chapter 75
Digital Retail and How Customer-Centric Technology is Reshaping the Industry:
IT-Enabled Digital Disruption

Pablo Penas Franco
Syracuse University, USA

ABSTRACT

This chapter explains the digital disruption that has occurred and is still happening in the retail industry. It explains the relative positions of the world's leading retailers Wal-Mart, Amazon and Alibaba and the business models of the two top online competitors. It focuses on the impact of SMAC (Social, Mobile, Analytics and Cloud) technologies and new retail trends enabled or boosted by technology such as omni-channel, customer experience, internet of things (IoT) and analytics, fulfillment and delivery. It deepens into IT and business model customer-centric design, the role of the customer and the store in the new digital retail and finishes with an assessment of ROI in retail digitization. The chapter concludes the fundamental IT-enabled changes of digital disruption are critical for all players, traditional brick-and-mortar retailers, pure online players and those with both an online and an offline presence.

INTRODUCTION

Digital Disruption

Digital disruption is a mindset that ultimately leads to a way of behaving; a mindset that bypasses traditional analog barriers, eliminating the gaps and boundaries that prevent people and companies from giving customers what they want in the moment that they want it. (McQuivey, 2013)

DOI: 10.4018/978-1-5225-3822-6.ch075

In order to analyze how technology is reshaping the retail business, we must first understand digital disruption. Digital business is a reality, whether companies are ready or not to compete in a new, fast-pacing, and more competitive environment.

Let's provide a few examples of digital disruption. Goodwin (2015) states:

Uber, the world's largest taxi company, owns no vehicles. Facebook, the world's most popular media owner, creates no content. Alibaba, the most valuable retailer, has no inventory, and Airbnb, the world's largest accommodation provider, owns no real estate.

We could add additional examples such as:

- **Amazon:** The world's largest book retailer, has no bookshops or, more accurately, didn't have any till November 2015. The company has more than 3 million books available and sold around $7.5 billion in books in 2015[1].
- **Apple:** The largest music retailer in the world from 2010, sold 35 billion songs online till 2014 through its online iTunes service. With a minor role of its physical Apple stores, its online iTunes store made Apple become the new leader in the music industry.
- **Google:** A search engine or arguably the already biggest media company in the world generated $67.4 billion in online advertising revenues in 2015. No other company in the world generates that much only from advertising activities.
- **YouTube:** Acquired by Google, is the most populated video service in the world with more than a billion viewers and 6 billion hours of video watched every month, relying mostly in user-generated content.

These examples should lead all companies to reflect on how digital business is reshaping their industries. New digital disruptors menace the status quo relegating former industry leaders to lower rank positions, even leading those unable to adapt into bankruptcy (i.e. Blockbuster). And there is no room for self-complacency. Digital disruptors are subject to be attacked by a new breed of competitors whose business models could make them obsolete or even redundant. For instance, Apple now faces new competition from free streaming and cheap monthly subscription services like Spotify.

The survival of the fittest is neither new nor exclusive to business. A Darwinian view of business evolution explains different periods such as the industrial revolution powered by the steam engine. But this time there is a fundamental and more profound impact: its speed and global reach. According to Bradley, Loucks, Macaulay, Noronha and Wade, (2015), "digital disruption has the potential to overturn incumbents and reshape markets faster than perhaps any force in history." Let's include the impact of globalization. Most digital disruptors were born as global players in an enlarged economic world. Now companies are able to reach not only western traditional markets but also those coming from communist regimes and other traditionally off-limits countries. In this context, the impact of digitization will be remarkable. The digital world is only starting and some disruptors already enjoy more than a billion users a few years after their creation.

The impact of digital disruption undermines the way business are conducted around the world and the very essence of different activities is being challenged. Industries will not change due to digitization.

They probably already did and further changes are in process. Digital technologies have transformed and keep transforming several industries such as music, film, media, passenger transportation, accommodation, and retail!

Digital Retail

According to international rankings, such as Deloitte's Global 250 Powers of Retailing 2016, which includes information for fiscal years up to June 2015, Wal-Mart, a traditional US brick-and-mortar hypermarkets retailer is, by far, the biggest retailer in the world, roughly multiplying by 4.3 its more direct follower. It is the Moby-Dick of retail, the gigantic white whale created by Herman Melville in his renowned 1851 fiction book.

Amazon, which ranked 12th with $70.1 billion in revenues coming from www.amazon.com, is considered the biggest online retailer. If growth rates continue - it climbed to $79.3 billion in 2015 - it may reach a position in the global podium in a few years.

However, considering Wal-Mart for a gold medal may be arguable. The biggest player may not even be ranked, as most rankings only consider revenues from retail activities. Disruption is here, don't underestimate its impact. New business models come with new revenue generating activities and the very idea of traditional sectors/ industries may have limited value (don't forget that Google is, after all, a media company).

Many voices claim the Chinese e-commerce giant Alibaba, owner of www.alibaba.com (B2B), www.taobao.com (C2C) and www.tmall.com (B2C) websites, is bigger than Amazon. The boldest even claim it has overturn Wal-Mart as the biggest retailer in the world.

There are good reasons to support Alibaba's place in the world podium. The first and most obvious: Alibaba manages roughly the same gross merchandise value as Wal-Mart. According to both companies:

- Wal-Mart total revenue was $482.1 billion in fiscal 2016, $13.7 billion from e-commerce (Wal-Mart, 2016a).
- Alibaba sold Gross Merchandise Value of 3.09 trillion Yuan in the 12 months to March 31, 2016 (Alibaba, 2016). This translates to 479.5 or 486.5 billion USD[2] depending on whether we take the exchange rate at the end of the period or an average during it. Roughly Alibaba sells the same as Wal-Mart!

Wal-Mart is by far the biggest retailer in the world in terms of revenues, but switching the focus to the GMV (gross merchandise value) managed by retailers, an online and relatively unknown player in most western markets, has already topped the world rank and will, most likely, consolidate the first position soon, regardless of the current relative decline due to exchange rate fluctuations. This is due to substantial differences in growth rates. While Alibaba has sustained a 2-digits growth rate during the last years, Wal-Mart's has been modest. If we take a look at the last available quarter, in the three months to June 2016, Alibaba (2016b) grew 24% compared to the same period in 2015, while Wal-Mart (2016b) grew only 0.5% from May till July 2016.

Alibaba also managed transactions on a single day worth $14.3 billion, more than Wal-Mart's yearly online sales ($13.7 billion), and way more than Amazon's $1.1 billion sales on a single day[3] . It exceeded $1 billion in the first 8 minutes. So considering Alibaba bigger than Amazon sounds plausible.

Can Alibaba be compared to Wal-Mart? In terms of revenue recognition, Alibaba is not even a retailer. According to The Economist (2013), Alibaba is "a platform for retail, rather than a retailer itself." It sells marketing services to companies and people selling through its websites, rather than charging a commission on merchandise sold. So, technically, the major part of its business does not generate a penny from retail activities. This explains why it is not even ranked by Deloitte and others: it does not sell by itself. It is a new kind of intermediary that facilitates trade and a strategic substitute for retailers. As it enables direct sales between the owner of the merchandise and the end customer, it menaces wholesalers and other intermediaries as well. It covers a number of functions in the retail value chain, regardless of the fact that it does not own the merchandise. From a customers' perspective, Alibaba is a competitor. They simply care about the offer, price, and delivery options, not about how companies organize internally to deliver the merchandise.

What about Amazon? Amazon does not disclose GMV but there are some estimations. It has both first party (1p) and third party (3p) sales, which understate their sales. 1p sales book the full price as revenue, while 3p sales generate a commission which is the only recognized revenue. Amazon's global GMV was estimated to be around $180 billion in 2014 (Chalaban, 2015). Bearing in mind its 1P and 3P sales in 2015, we could estimate this figure to have increased to around $240 billion[4].

GMV allows for a better comparison than revenues. Understanding retail size as the value of merchandise sold and profit as a percentage on that we can compare the three top retailers. Alibaba's amazing 42% profit on revenues is generated thanks to facilitating the sale of almost half a trillion dollars of GMV. Its profitability is above any curve or standard in the low-margin retail industry. But, in fact, comparing it to GMV puts its feet in the ground, as it would show a rather standard 1.4% profit, half than Wal-Mart's 3%. Both Alibaba and Amazon have relatively low profitability, something we can expect from fast-growing companies, who sacrifice relative margins to build a bigger volume of sales. We conclude there are two pure online players in the podium of a traditionally brick-and-mortar dominated sector and a traditional incumbent (see Table 1).

Relative profitability should not be a great concern as long as growth continues. Gordon Orr suggests (Alibaba) could become one of the world's most valuable companies five years from now, with potentially more than $1 trillion of sales passing through its platforms each year (as cited in The Economist, 2013). GMV may not be the only criteria to measure retailers' size. But regardless of Wal-Mart still being the biggest player or not, online sharks and crocodiles are successfully challenging the gigantic Moby-Dick and differences between them show great potential for new disruptors.

Table 1. Top three retailers by GMV in million USD (Note: Fiscal years ending January 31, 2016 (Wal-Mart), March 31, 2016, (Alibaba) and December 31, 2015 (Amazon). Exchange rate for Alibaba at March 31, 2016. Depending on the exchange rate used for comparison, Alibaba would be ahead or behind Wal-Mart in terms of GMV)

	GMV	Revenues	Profit	In % of GMV
Wal-Mart	482,130	482,130	14,694	3.0%
Alibaba	479,454	15,677	6,637	1.4%
Amazon	240,520	79,268	596	0.2%

A GAME OF SHARKS AND CROCODILES

eBay may be a shark in the ocean, but I am a crocodile in the Yangtze River. If we fight in the ocean, we lose—but if we fight in the river, we win. (Jack Ma – Alibaba)

Disruption may adopt different shapes. The well-known and commonly quoted sentence from Jack Ma, comparing eBay with a shark, which perfectly applies to Amazon, and Alibaba with a Crocodile, is a brilliant example. Amazon is strong in western countries, while Alibaba dominates in China. Moving to new markets has proven difficult for both as the online world is not as standard as we could think.

The way they sell merchandise online is almost antagonistic, but both are customer-centric in their own way. Amazon has a western style approach with strong focus on showing the product. Look for instance for a wedding dress and the product will be the center of the site. Alibaba has an apparently childish, even naive, look and feel for western standards. It focuses on trust and relationship. Look for a wedding dress and the main image may be a smiling woman who shows illusion on her face because she is getting married. The dress may not even be completely seen on the initial page.

This approach responds to different buying attitudes in China. Building trust and relationships helps Alibaba in a country where businesses are not always trustworthy. According to Erisman (2015) some people even meet and marry thanks to Alibaba. Would you imagine customers from America, Europe, and most other countries in the world telling they met their lifetime partners through Amazon.com? Probably not.

Another key difference is that Alibaba only facilitates commerce, without actually owning, warehousing or delivering the merchandise, being more similar to a software company than to a retailer. In contrast, Amazon's model strongly relies on 1p sales, selling directly to customers and excelling in logistics.

But success of both Amazon and Alibaba, among other new retailers, has strong underlying grounds that go relatively unnoticed: its customer-centric IT design. Technology enabled business models are reshaping the industry. While technology is a means to an end, not an end by itself, it is a fundamental factor which explains both the rise and success of new digital disruptors, and the digital transformation of traditional brick-and-mortar retailers.

While traditional competitors are soon credited with cutting-edge innovations when they make improvements on their existing business models, many pure online players are born digital with a user-centric focus that is taken for granted. Most of them were born with features that may not necessarily be noticeable. For instance, customers don't need to understand the analytics engine that enables personalized recommendations at Amazon.com. We simply see the result, usually with delight.

The new breed of retailers led by Amazon and Alibaba are changing the game because they are born digital. They use technological developments to unleash customer value. They are born SMAC!

SMAC RETAIL

In the new technological retail landscape, SMAC technologies are winning momentum. SMAC, an acronym which stands for Social, Mobility, Analytics and Cloud, is a term that helps explaining how customer-centric technologies are reshaping the industry, the emergence of digital competitors and business models, and the fundamental shift towards the customer. These technologies play a key role in retail digital transformation. According to Parikh (2014), retailers use:

- Social Media to engage with customers and convert.
- Mobile Platforms to stay connected 'on the go'.
- Analytics to personalize and derive insights.
- Cloud Business Models to quickly design customized solutions over the Internet.

Are retailers becoming SMAC? Let's briefly analyze its four components.

Social

We may intuitively believe online purchases are based solely on price. While price is still an important element in any digital offering, this is no longer true, if it ever was. As retailers enable new social shopping features, purchasing any product online may resemble the in-store shopping experience to a great extent. Thanks to technology we can involve our friends in the purchasing process, asking for opinions and recommendations. This means technology allows replicating online the social interactions that occur offline. The social customer has changed, rather than spending a day walking around a mall, many people now spend hours on visually pleasing product sites that make wish-listing easy and rewarding (Kamenec, 2014). So e-commerce sites also adapt, and are developed ad hoc to cater the taste of an increasingly demanding shopper.

Customer interactions on social networks, forums, etc. strongly determine purchasing decisions. Our friends' opinions are key in order to decide between two similar products. We even trust on unknown customers who write their reviews and tell about their experiences. Why? Because customers are saturated of traditional marketing messages and look for real users' opinions. If there are enough reviews of a product, the social feedback will probably be fair and accurate. Companies react with more targeted, and usually intrusive, marketing messages as they leverage social friends to endorse their products. Overall, 67% of shoppers say that either reading (45%) or writing (22%) social media reviews and comments influences their online shopping behavior (PWC, 2016).

Social commerce is on the rise. According to Smith (2015a) social media increased its share of e-commerce referrals nearly 200% between the first quarters of 2014 and 2015. The growing importance of social aspects encourages top tier competitors, such as Alibaba and Amazon, to add social features:

- Alibaba mixes social-networking functions into its platforms, trying to engage customers and to increase the time they spend on their websites.
- Amazon's 'Wish List' tries to encourage shopping by enabling the creation and sharing of lists of products people want as gifts.

Other pure players are born social, like Polyvore. Launched in 2007 and acquired by Yahoo in 2015 for around $200 million, it has become a visual search engine for clothing and outfits. Polyvore changes the purchasing experience as customers can create 'sets' (several products combined to create an outfit), share them in social networks, like and share the product, and see details of specific products in the set. It heavily relies on customer generated content - around 3 million sets/ month -, it enjoys 20 million users, mostly female, its conversion rate and average order value are among the highest in the industry, and its share of the social shopping market is second, only after Facebook and ahead of Twitter and Pinterest.

Social media is key to capture bigger shares in the retail market. The growth in social-driven retail sales and referral traffic is undeniable and social media has converted into the *great influencer* to make product decisions (PWC, 2016).

Mobility

As a tool for communication, socialization, leisure, and work, smartphones are becoming an extension of our own bodies. They are widespread devices, not only in rich countries, but also in some of the poorest, where smartphones allow rendering services to previously unreachable rural populations. More than 2 billion people already use them.

From a retailers' perspective, cell phones are used to compare prices (36% of customers), research products (36%), access coupons/ promotional codes (31%), and check reviews about the product/ retailer (25%), among others. Overall, 76% of customers are using it in the purchasing cycle (PWC, 2016).

These devices enable new mobility services ranging from providing information to managing transactions. Most retailers (88%) state their purpose with mobile strategies is to drive shoppers to the store (Rosenblum & Rowen, 2015). Customers can receive personalized marketing messages on their phones when they stand in front of a specific shelf, search for product information and customer reviews while navigating the store, etc.

However, one of the best-known success stories is based on getting the opposite: moving the stores closer to customers. If the mountain will not come to Mohammed, then Mohammed must go to the mountain. Homeplus virtual stores, which belong to Tesco, one of the world's biggest retailers, let the stores come to the people in South Korean subway stations. Customers are able to shop on their smartphones by scanning QR codes. As a result, online sales increased by 130% in 3 months and Homeplus soon became the first online retailer in the country and a close second offline[5].

Homeplus is only an example, but the shift towards mobile is global. Mobile commerce already represents 30% of total US online commerce (Brohan, 2015), but in this case, the US is lagging behind other countries. Many people in other nations increasingly rely on mobile devices to make their purchases, i.e. 69% of all transactions on Chinese Singles' day were made on mobile devices (PWC, 2016). The growing importance of mobility is a world-scale phenomenon.

Mobile devices' role has changed from a relatively simple communication device to an open gate to the digital world. As they enable socializing and purchasing functions, they became purchasing tools, which generates new challenges.

Analytics

What gets measured gets managed. (Peter Drucker)

20th century leaders could be successful relying on their intuition to make decisions. Not anymore. The current competitive landscape force business leaders to base their decisions on an increasing amount of previously captured, digitally stored, properly cured, and (hopefully) analyzed data. This is more obvious in the marketing function where traditional creative professionals ('mad men') are being substituted by more analytical profiles ('math men')[6].

The amount of collected data grows exponentially. Eric Schmidt told there were 5 exabytes of information created between the dawn of civilization through 2003, but that much information is now created

every 2 days (as cited in Siegles, 2010). And figures kept growing since then. Internet traffic alone may reach 1.3 Zettabytes in 2016, with an increase from 2015 to 2016 almost equal to all IP traffic generated in 2011 (Cisco, 2012).

But, how is this data managed? Can retailers really derive insights or do they only collect information? Maybe the most famous example of the use of data analytics is Forbes article *How Target Figured Out A Teen Girl Was Pregnant Before Her Father Did* (Hill, 2012). The teenage girl with an upset father is only the tip of the iceberg. Back in 2012, through the analysis of customer purchases, Target could accurately predict the probability of pregnancy for their customers and due dates within very narrow windows. Having retailers managing sensitive information is controversial, as many customers may feel upset if they discover Target (or any other retailer) know about their pregnancies. So Target changed their ad hoc coupons to make them look random, including products a pregnant woman is not likely to buy such as a lawn mower close to those specifically intended for her: diapers, rattles, strollers… Hill makes an important reflection. If they are able to reach and measure your womb, what else they might be able to do?

The shocking part is that, as customers, we don't need to provide much information. Use your loyalty card or a credit card when you pay and the rest will be done in the backstage. Your profile will be enriched with a history of previous purchases and, in cases like Target, the information may be put into the right context to develop useful knowledge about your habits.

Data-driven decision making is a reality only for some companies. While many international retailers invest heavily on big data and analytics, most are still developing their capabilities. Most major players already have a loyalty program, but do not necessarily have the ability to use the information they store. They may even have a number of not interconnected databases lacking an integrated CRM with a 360 degrees view of their customers.

Regardless of their current situation, in order to be competitive retailers must develop their analytical skills. It is critical that they measure the right metrics, analyze their performance on these metrics and adapt accordingly to ensure they survive and thrive (Deloitte, 2015). If not, they risk collecting interesting data without deriving insights. Imagine a married couple buys Coca-Cola on a regular basis, and, occasionally, some Pepsi. It may be interesting to discover a Pepsi lover is visiting them from time to time, but it does not seem useful. Useful data is actionable; it can be leveraged to lead customers into additional purchases, such as predicting pregnancies. If the same customers stop buying meat and suddenly increase the purchase of vegan associated products, then retailers may be able to use this information to target them with a customized vegan offering to increase sales.

Integrating context aware data and information from social networks is another key challenge to improve marketing efficiency. Data generated during the purchasing cycle and the information customers freely share should enrich their profiles. Armed with this information, retailers can reach their customers in new business moments in order to boost their sales.

And customers are only one side of the coin. On the other side of marketing analytics, retailers must optimize their publicity. There are many intermediaries between the marketer or the retailer and the publisher. A typical chain includes an agency, a trading desk, a demand-side platform (DSP), third party data, a supply-side platform (SSP), and an ad server before finally reaching the publisher. The complexity of managing data give rise to data management platforms (DMPs), and allows disintermediating some of these actors (O'Hara, 2016). DMPs allow working with several DSPs simultaneously, integrating both 1p, 2p, and 3p data to get a better understanding of audiences, to do better segmentation and targeting, and increasing the efficiency of publicity budgets.

Cloud

It is difficult to find any computer or smartphone user who does not rely on some cloud computing services, even being unaware of this fact. As individuals, we are likely to use WhatsApp, whose services are rendered on IBM's Softlayer – an IaaS solution –, or e-mail. Gmail, Hotmail, Yahoo, and others deliver e-mail hosted services over the Internet.

Companies in general, and retailers are no exception, are moving to the cloud. Think about the main software categories such as ERPs or CRMs. Most, if not all, major software vendors are offering cloud-based solutions that are substituting on-site implementations. Corporate clients are embracing the cloud in search of greater efficiencies because it is cheaper and easier to implement, it reduces maintenance cost, it improves internal efficiency, and it is easily scalable. The cloud business value includes faster deployment of new technologies and services, create innovative business models that help customization and are based on services, and connect and interact with stakeholders (Parikh, 2014). This trend also reflects the evolution of corporate software. Standard solutions would probably not suffice 15 years ago. Nowadays, their higher quality, continuous upgrades, and sectorial adaptations make standard solutions fit retailers' business and improve value for money.

In order to understand the cloud effect, let's think about music. With Apple's iTunes on the Cloud - included in the iCloud service - customers can store their music, among other files, access, stream, or download it from different devices. It works as a backup not tied to any hardware that can be stolen, lost, or broken. The physical store is a customer touchpoint rather than a music store. From 2016, Spotify offers its streaming services on Google's cloud, without any physical store. Both business models completely differ from that of traditional brick-and mortar music retailers.

As the role of the store is expected to evolve into a showroom providing experiences, insights, and information, but not storing physical products (Gaudin, 2016), cloud computing may have an even greater role to play. Kilcourse (as cited in Gaudin, 2016) states that "by using cloud computing services, retailers won't need to buy new technology, learn how to use it, set it up and manage it." Its simplicity removes barriers and will speed-up adoption.

RETAIL TRENDS ENABLED OR BOOSTED BY TECHNOLOGY

SMAC and other technologies are enabling or boosting fundamental changes that are transforming the way retailers deal and relate with their customers.

Omni-Channel

Omni-channel is about offering continuous purchasing experiences. Customers start a purchase on any channel (i.e. web), continue on another (i.e. store) and place the order on a third one (i.e. smartphone app). Omni-channel implies integration, with all channels serving the customer indistinctly. It differs from multi-channel, in which several channels are in place but not closely intertwined. Though we usually see omni-channel and multi-channel used interchangeably, as omni-channel is the final objective of multi-channel retailers in different stages of maturity.

Retailers are transforming. Omni-channel competitors already dominate the e-commerce sphere, with 39 out of 50 top e-retailers being omni-channel brick and mortar retailers, and 11 out of 50 being pure

online players (Deloitte, 2016). This does not necessarily mean that the experience in all their channels is identical, but at least they are working on improving it. Those unable to adapt to omni-channel may struggle to survive as customers' expectations and competing offerings keep raising the bar of customer service.

Customers are not loyal to a specific channel, "they expect online integration between social networks, mobile and physical stores" (Capgemini, 2012). This explains why retailers are accelerating their omni-channel approach, creating a more innovative retail environment where online and in-store shopping are a seamless experience for customers, and why they are including physical stores as part of their omni-channel strategies (Deloitte, 2016). Even pure online players like Amazon are currently opening some physical stores.

While many retailers still keep focus on individual channels, the seamless shopping experience, which includes the ability to shop across channels will improve if customers can check product availability prior to going to the store (Accenture, 2016).

Customer Experience

I've learned that people will forget what you said, people will forget what you did, but people will never forget how you made them feel. (Maya Angelou)

As customers become increasingly demanding, retailers face the challenge of offering better and better shopping experiences, both online and offline. Customer journeys are strongly linked to omni-channel capabilities, as they must be integrated across all channels. Shoppers used to look for social referrals and/or interactions online before shopping. Now they even do it while navigating the aisles in-store.

According to Kilcourse & Rowen research (2015), 95% of industry professionals believe the store and the digital experience must be brought together for a continuous, seamless experience. They identify the top three consumer-facing opportunities: bringing a digital/ online experience to stores, getting a deeper customer engagement to drive sales through personalized offers, and more personalized attention/ service from retailers' employees.

Customers motivations, behaviors, and actions substantially differ. Leading companies concentrate on the critical impact of understanding their customers and rendering a service that maximizes their experience. Retail winners, those with above average performance, "have been investing in understanding consumer behavior since the initial rise of omni-channel… they feel the imperative to understand what consumers want (thus their concern about falling behind in the consumer-retailer technology arms race)" (Baird & Rowen, 2015). Companies must also develop deep empathy to design a compelling and distinctive customer journey (Lhuer, Olanrewaju & Yeon, 2015).

But, why should customers go to the stores if they can check the price and inventory levels online? A technologically augmented in-store shopping experience may provide the answer from a customers' perspective and may enable cross-sell and up-sell opportunities from a retailers'. But retailers are still on their way to switch from product-focused organizations to customer-focused merchandise suppliers. 93% of industry professionals agree retailers have to do a better job to accommodate a younger, more tech-savvy consumer (Kilcourse & Rowen, 2015).

IoT and Analytics

The Internet of Things (IoT) refers to a world with billions (potentially trillions) of connected devices. Thanks to sensors such as RFID, wireless, QR codes, and Beacons, most daily products can be brought to life in the digital world.

The sensors monitor a wide variety of data that will be analyzed as the basis for decision making. Knowing customers is key to customize marketing messages and increase sales. Online tools for analytics - i.e. Google Analytics, Omniture - provide information on visited pages, number of views, time spent in each site, conversion of visits into sales with breakdown by operating system, device… These analytics are being replicated in-store thanks to IoT, combining sensors and analytical platforms.

Beacons, small low-cost devices that transmit information on Bluetooth Low Energy up to a 50-meter distance, are probably the quickest growing devices, especially in the US. They can be used to monitor location within stores and to submit customized marketing messages, among others. Smith (2015b) estimates 85% of the top 100 US retailers will use these devices in 2016 (up from 8% in 2014) and in-store sales influenced by beacons in these companies will multiply 10-fold in a year, from $4.1 billion in 2015 to $44.4 billion in 2016. Even Facebook is already offering its own beacons to leverage the use of its social network at retailers stores.

IoT is not about sensors or platforms, but about improving services. Customers can now be accompanied and advised through the entire purchasing cycle, with more accurate and targeted information even when the staff is busy. IT systems fed by IoT sensors allow delivering automated customized information without any action from sales staff, for instance in-store navigation to items in customers' wish lists when we enter a physical store.

Collected data also allows companies to reach their customers in different moments during their purchasing cycle that were not available before. For instance, retailers can offer proximity services in-store to digitally identified customers, offering them useful information when they are simply near a digital sign. Or they can accompany customers in different moments of their purchasing cycles such as providing product information when customers are searching from home, allowing them checking if the product is in stock when they are moving to the store, or improving the sales service with staff who is aware of the products they are looking for, who help customers finding them, and suggest related items[7].

IoT will have a profound impact in retail and we will see it soon. 80% of industry professionals believe the IoT will drastically change the way companies do business in the next three years (Baird & Rowen, 2015).

Efficient Fulfillment and Convenient Delivery

Cutting-edge fulfillment capabilities become a competitive advantage available in some leading retailers. For instance, fulfillment from several stores may speed-up delivery. There is a special difficulty with food products, as delivery may imply working with both refrigerated and non-refrigerated perishable merchandise simultaneously. The last mile of home delivery is an unresolved problem from the perspective that online orders are still complex and expensive to manage.

The market evolves to improve speed, narrowing delivery windows to increase convenience for customers. But not all retailers are keeping pace: 56% have next-day delivery capabilities, while just 11%

can deliver on the same day (Accenture, 2016). Other alternatives such as click & collect are not yet widespread and reduce customer value by forcing them to collect the merchandise in-store when they substitute more efficient home delivery.

Amazon, acclaimed as a world-class competitor in terms of logistics and delivery, is getting ahead of competition. Its new service Amazon Prime Now was launched in December 2014, and first expanded abroad to London in June 2015 (Lomas, 2015). The service is already available for premium members in selected postal codes in 28 US cities, and selected locations in other 8 countries. Customers can choose a two-hour delivery window in the same day for free, or 1-hour delivery for a fee for all their orders above a minimum around 15USD/ 20€ /20 GBP depending on the country. The company also plans to reduce delivery time to 30 minutes using drones (unmanned aerial vehicles), though regulatory barriers must be overcome first.

"Delivery offers an incredibly effective means to differentiate from other competitors in the e-commerce landscape, a tool for boosting conversion rates and a powerful mechanism for building customer loyalty" (MetaPack, 2015: 2). It is so important than half of all customers would not buy online due to unsatisfactory delivery options and 96% would be encouraged to purchase again after a positive delivery experience (MetaPack, 2015).

OTHER TRENDS

- **Digital Payments:** As mobile establishes itself as the cornerstone of digital strategies, most innovative payment solutions focus on mobile apps. New solutions target both retailers and shoppers. New digital payments include: financed payments (Klarna, Affirm), NFC (Apple Pay, Google Pay, bank Wallets), Beacons (PayPal, Apple), credit card solutions (Square, iZettle), apps to access bank accounts (Trustly) or even banks via apps (Simple, Gobank).
- **Digital Fitting Rooms:** Popular in fashion. They are useful to try on digital clothes and increase conversion rates. As customers are willing to see how clothes fit their bodies, these fitting rooms remove a key adoption barrier. They can't actually try the garments on, but seeing themselves 'dressed' with them substantially encourages purchasing.
- **Dynamic Pricing:** Still to become widespread, dynamic pricing is supposed to be one of the future trends. According to Kilroy, MacKenzie & Manacek (2015), online pure players react to competitor prices in one hour, reprice top-selling items 3 or 4 times per day (up to 12), and sophisticated multichannel leaders change the price on 10 to 20 percent of their online assortment daily. Some retailers are also able to deliver personalized offers based on past shopping history. Whether or not personalizing pricing, product prices will differ in different moments and channels. Price changes must be carefully managed to avoid public relations problems.
- **Wearables:** New devices are being born and worn, providing new opportunities for retailers regarding in-store shopping experience, personalization and real-time marketing. For instance, an employee with a smart watch wired into the Internet of Things can effectively service new business moments via glanceable information. Bob O'Donnell argues that smart watches are the next kings of wearables in 2016 and head-worn devices, including virtual reality glasses, will be in 2020 (as cited in Anders, 2015).

DESIGNING DIGITAL RETAIL

A lot of people in our industry haven't had very diverse experiences. So they don't have enough dots to connect, and they end up with very linear solutions without a broad perspective on the problem. The broader one's understanding of the human experience; the better design we will have. (Steve Jobs)

Retailers must design solutions that may disrupt their existing business in order to satisfy customers who decide on when, how and who to interact with. They need a systemic view. Originated in the field of engineering by Forrester (1961) and adapted to business by management guru Peter Senge (1990), systemic thinking is the cornerstone to develop innovative business models and new services. Everything is interconnected: social shopping, mobile solutions, omni-channel capabilities, online and in-store analytics, etc. All these ideas merge from the value perspective to offer integrated solutions and IT departments should keep a systemic view in mind to digitize and transform organizations.

Former Apple CEO, Steve Jobs, is considered the father of the one-button smartphone, simplifying the use of an increasingly complex device with a bigger screen and users' fingers for any potential future use. Digital design must manage complexity through simplicity in a very similar fashion. As in the case of the smartphone, retail customers expect a new breed of apps, functionalities and services. But regardless of their being technologically savvy or not, retailers must keep simplicity in the front, i.e. an app that works with a simple button. While customer interaction is easy and intuitive, there may well be many processes, operations, and technologies working in the back, which is completely transparent for the unaware final user.

The Internet of Things is a good example of managing complexity through simplicity. For instance, customers enter stores and receive personalized marketing messages with special offers for the products they are more likely to buy. They are completely unaware of the backstage, where probably, the retailer's IT department has developed a platform to manage beacons, worked with marketing on the design and delivery of promotional messages and developed an app with an SDK (software development kit) embedded to make personalized communication possible. They simply downloaded an app at some point. All the rest just happens, like magic.

Personalization is another cornerstone. Hodkin (2014) explained how the Internet we experience as customers (The Internet of Me) is as unique as our fingerprints. Companies such as Facebook, Google or Netflix show us the information based on a 'relevance' algorithm, which means we receive only the information we want to see to the virtual exclusion of everything else. Customized content is "the new way of exposing users to the whole Internet through their own experiences, habits, and interests, using information that users are often not conscious of" (Hodkin, 2014). This Internet of Me "is changing the way people around the world interact through technology, placing the end user at the center of every digital experience" (Accenture, 2015).

This individualized customization is most obvious in e-commerce. Digital recommendations may rely in our specific tastes and purchasing histories to offer each of us the best of a myriad of alternatives leveraging *the long tail* (Anderson, 2006), or products with an individually low demand that collectively may generate more revenues than blockbusters, to boost sales.

The combination of a systemic view, simplicity and personalization is a winning value proposition for customers. Retailers should become more customer- centric. This has profound implications on how they think of their business in terms of assortment optimization, tailored advertising, marketing and promotions, improving service on loyalty programs, improving the shopping experience of target consumers,

and removing organizational, operational and technical barriers to enable multichannel shopper-centric ways of working (Mercier, Jacobsen, & Veitch, 2012). Changes go beyond IT, affecting the supply chain and the entire organization.

We should make an important distinction between traditional brick and mortar retailers, who, in general, still struggle to integrate the online channel with their stores networks, and more agile, digitally born, pure online players. The former, like the Titanic, need a considerable amount of time and money to change their practices, as they are slaves of their current systems.

Legacy IT systems and practices may be too heavy to get rid of, but there is no need to substitute everything. Gartner's bimodal IT framework suggests using a second team focusing on agility, working in short cycles and centered on the business instead of IT (Gartner, 2016). By developing bimodal IT capabilities, traditional retailers may keep their business as usual running while they set specific teams up to manage new digital projects.

New technological developments also rely heavily on the cloud in its three main alternatives: SaaS (Software as a Service), PaaS (Platform as a Service) and IaaS (Infrastructure as a Service).

SaaS is the most obvious as some of the most important software solutions are directly hired as a Service from top vendors. Instead of traditional implementations, retailers rely on cloud-based solutions managed by third parties. While they may lose the feeling of uniqueness, as this software does not allow much customization to the specifics of their business models, most of them discovered they were not as unique as they used to believe in the first place. Market solutions fit, in general, most competitors' needs, and offer substantial advantages in terms of ease and cost of implementation, maintenance, upgrading, and scalability. The time in which all software had to be developed ad hoc is gone.

PaaS and IaaS are useful for retailers who wish to develop their own apps. For instance, apps developed for social interaction and mobile phones/ tablets are very popular. PaaS is a middleware that offers a framework to develop, customize, manage and execute apps, usually through a self-service portal. IaaS ensures the required underlying infrastructure (hardware) is in place. With these cloud services retailers can focus on faster development and deployment, without worrying about scalability or existing infrastructure capabilities.

Outsourced to third parties, cloud services are typically rendered on the basis of SLAs (service level agreements) and have developed a variety of pay-per-use revenue models that allow optimizing computing power. Nowadays, an American, a European and an Asian retailer may share some servers as new models make no longer attractive to own the needed computing power. When peak demand exceeds by far average utilization, having dedicated computer power round-the-clock implies wasting resources. Cloud services make economic sense allowing to share this power among several companies that work on different time zones or simply have peaks in different moments.

Acknowledging the cloud global importance and its increasing presence in retail, some capabilities may still be developed in-house. Analytics is a good example, as it may imply major customization needs where market solutions may be insufficient. Kilcourse & Rosenblum (2015) state that "if retailers are serious about getting deep into customer data, a purpose-built data warehouse with analytics both built in and discoverable is a must." Retailers have an agreement on wanting to know the customer but many are still unable to make proper use of their business intelligence and analytics tools.

Regardless of developing ad-hoc solutions or buying from top software vendors, the best design takes place in the digital realm, where several functions merge to offer customer-centered solutions developed over an IT backbone. The CDO (Chief Digital Officer) should not be a senior project/ programme manager, buy a member of the executive committee, who helps defining the strategy and coordinating marketing,

IT, and other functions. Putting all functions to work together is a must for successful implementation and a prerequisite to digitize both retailer's front and back ends, leveraging SMAC technologies.

Digitization also requires new methodologies and a portfolio approach. The traditional role of hierarchies is being challenged and new project management methodologies are losing ground to agile ones in which the focus switches from the product to quick delivery and adaptability to changes. Constant interaction between functions with digital professionals leading technical decisions over more senior but technologically outdated managers may become commonplace. Minimum viable products may be preferred to fully developed ones, favoring speed over perfection and improving through a test-and-learn approach. And agile IT methodologies are just the tip of the iceberg: the whole organization should become agile, like a start-up. (Lhuer, Olanrewaju & Yeon, 2015). The new retail is quick, adaptive, and digital.

Digital design must be a strategic priority and must be appropriately managed. According to Bonnet (2016), "success (in digital transformation) comes from consciously managing your digital transformation as a strategic portfolio over time." Design must bear in mind the differences among projects in terms of impact, time horizon, and risk levels. Managing digital transformation as a portfolio implies addressing the why, the what and the how. That is to say, understanding the changes in the industry and new sources of value creation - the why -, designing a portfolio of initiatives that balance short-term improvements with longer term strategic and business model evolution - the what -, and the ability to execute at the right time - the how - (Bonnet, 2016).

THE NEW DIGITAL CUSTOMER

The customer is at the very center of retail. Digital is the cornerstone of a new purchasing experience of an increasingly commanding target customer. However, there is still a huge gap between retailers' reality and customers' growing expectations. This gap between consumers' digital behaviors and expectations and retailers' ability to deliver the desired experiences has been defined as *The New Digital Divide* (Deloitte, 2015).

Shoppers purchasing habits are evolving. An increasing number of shoppers start purchases online even if they finally buy at traditional stores, the so-called ROPO (research online, purchase offline). According to Deloitte (2015), 80% interact with brands or products through digital before arriving at the physical store. Others buy online and collect the merchandise in the store (BOPUS - buying online, picking up in-store). ROPO and BOPUS illustrate changing shopping trends that retailers should be able to forecast and adapt to.

Keeping pace with expectations proves challenging. Without trying to be exhaustive, retail customers are looking for (Accenture 2015 & 2016, PWC 2016):

- Ordering out-of-stocks via mobile devices while they are in the store
- Accessing free Wi-Fi, scanning products and having them shipped home
- Using their mobile devices to locate items in the store
- Receiving real-time promotions and earn loyalty points/ member-only discounts
- Navigating websites optimized by device
- Doing one-click checkouts
- Improved delivery (one-hour delivery, delivery by drone…) and free shipping
- Receiving recommendations based upon social media activity

- Reading feedback from friends for items they are considering
- And, maybe the most important, personalized shopping experiences

So, what is the role of the customer in the new retail digital landscape? We cannot unbind social shopping from customer experience, mobile from omni-channel or analytics from IoT. Everything is deeply intertwined. Retail is digital, omni-channel and SMAC. Social, mobile, analytics and cloud reinforce each other. "While each of the technology elements has the capability of delivering business value individually, however, in combination with each other they become a potent strategic tool for the enterprise to deliver higher value to its customers" (Parikh, 2014).

Customers are, to some extent, at the center of all technological developments. Some of them may be unnoticed. For instance, as customers, we don't really care if our retailers' e-commerce web sites are powered by ATG (Oracle), Hybris (SAP), WebSphere (IBM), Demandware (Salesforce), or any other solution. We really want them to work properly, a user friendly design, and, hopefully, some extra features: social interaction and recommendations. Platforms may evolve in different ways such as providing new cloud services, enhancing analytical capabilities, enabling mobile functionalities, or adding social features.

After retailers upgrade their services, it takes time for customers to realize and get used to the new possibilities. Top tier retailers are competing to develop new solutions that help us interact with our friends - i.e. product recommendations -, manage our wish or gift lists and facilitate transactions. The easiest for consumers, the better for retailers, as they will increase loyalty and repeat orders. Whenever possible, we will avoid downloading apps or logging in to online services. It is about managing complexity in the backstage while offering simplicity in the front.

Technology also enables new business moments in which companies can support the purchasing process providing information and help at virtually any moment: when we research from home, when we enter a store, or while we are in the store waiting for the sales staff. These actions require customer-focused developments, so clients are part of the design objectives and their needs become key before even starting to develop anything.

Finally, the customer-centric approach is also changing the role of the store to "storefronts to choose and order products" (Capgemini, 2012). Worth mentioning some online retailers are also developing their stores networks. In an omni-channel retail world in which customers expect the best personalized experience across channels, having both a digitally enhanced physical presence and a virtual store seems a winning value proposition.

CONCLUSION: WILL DIGITAL RETAIL PAY-OFF?

No doubt SMAC technologies offer great value. Offering social interactions, mobile functionalities, deriving customer insights and improving efficiency are some of the most valued assets. But, as any new investment with uncertain returns, is SMAC, and digital in general, only a way to remain competitive or does it have a real impact in the bottom line? Will retailers monetize their digital investments? Overall, not only it has become a need to remain in business because disruptors are already in the industry, whether incumbents adapt or not, but also the return is clearly positive from a financial standpoint.

The digital influence is surprisingly high. It is not limited to digital, but it already affects most in-store sales. In 2014, only 6.5% of sales were online ($305 billion) but the influence of digital and mobile on store sales is much greater and quickly growing. 49% of total in-store sales ($1.7 trillion) were

influenced by digital devices, up from 14% two years earlier. This figure is expected to have grown to almost two thirds (64%) in 2015. 28% of total in-store sales ($0.97 billion) were influenced by mobile devices up from 5% two years earlier (Deloitte, 2015). We also know consistent omni-channel offerings and improved customer experiences increase retention and boost sales.

The social impact is clear in customer behavior. Social shoppers are 29% more likely to make a purchase on the same day when they use social media, 4x times more likely to spend more on purchases as a result of a digital shopping experience in general and up to 6x times for those very influenced by social media (Deloitte, 2015).

Maximizing mobile or making it easier to purchase from smartphones and tablets, may be one of the most profitable steps retailers can take as there is still a huge gap between ease of purchase on physical stores - 92% of customers believe it is easy or very easy - versus online and mobile - 65% and 42% respectively- (Accenture, 2015). Mobile is also reshaping the in-store purchasing experience for the better.

The new priority in terms of business intelligence and analytics is gaining a better understanding of customers. The focus changed from a reactive approach - providing customers with contextual information under demand - to a proactive one - using information about them to react more quickly to changes in demand - (Kilcourse & Rosenblum, 2015). Trying to establish the ROI at this stage may be misleading as the different initiatives are not easily comparable.

Let's remember the profit (Π) of any company is a function of the price (P) minus the variable cost (VC), multiplied by the number of units sold (Q), minus fixed costs (FC): $\Pi = (P - VC) \times Q - FC$. Social, mobile and analytics focus more on generating additional revenues by increasing sales, mostly selling more units. Prices can also be raised in the long run if additional value is created (dynamic pricing would have an additional impact, when it eventually becomes a widespread reality). Retailers can also substantially profit from cloud solutions in terms of reducing costs and time-to-market, which leads to quicker sales. SMAC technologies directly affect profit components and retailers' bottom lines. But all conversion and ROI numbers must be taken as simple references. Even the best international research shows no consistent figures as methodologies, target participants, and geographies substantially vary.

One thing is for sure. Retail has been and continues to be disrupted by SMAC and other digital technologies. Digital Disruption is a fundamental change boosted by technology that alters the status quo by generating new business models, and innovative products and services that make existing competition obsolete, or even redundant. In order to compete, retailers must digitize, whether they keep a brick-and-mortar stores network, an online presence or both, they must be prepared to leverage technology on their respective offerings and to manage digital transformation strategically. And don't forget:

The future is already here – it's just not evenly distributed. (William Gibson)

KEY TERMS AND DEFINITIONS

Analytics: The search for meaningful patterns in data to derive insights.

App: Acronym for application. Small and specialized computer program.

Cloud Computing: Term that refers to the delivery of hosted services over the Internet. It is broken down in three main services: SaaS (Software as a Service), PaaS (Platform as a Service) and IaaS (Infrastructure as a Service).

Digital Disruption: A fundamental change boosted by technology that alters the status quo by generating new business models, innovative products and services that make existing competition obsolete or even redundant.

E-Commerce: Buying and selling of goods and services through electronic networks, normally through the Internet. The most popular types of e-commerce are: B2C (Business to Consumer), B2B (Business to Business) and C2C (Consumer to Consumer).

Internet of Things (IoT): It refers to the idea of connecting any device, including daily life products, and even machine components to the Internet, where they will enjoy a digital presence.

Omni-Channel: Delivery of services through different channels indistinctly, looking to offer a seamless shopping experience.

Retail: The sale of goods or services directly to consumers.

SMAC: Acronym which stands for Social, Mobility, Analytics and Cloud.

Social Shopping: A kind of commerce in which technology allows involving friends and/or other customers replicating online the social interactions that occur offline.

ENDNOTES

[1] Amazon does not disclose this figure. A 2014 Forbes articles estimated $5.25 billion in 2013 or 7% of its total revenue. Extrapolating this figure to 2015 revenues we get an estimation of $7.5 billion.

[2] USD 479.5 billion translating the final figure at March 31, 2016 with a 6.449 Yuan/ USD exchange rate. USD 486.5 billion considering an average 6.356 Yuan/ USD exchange rate over the period April 2015 to March 2016. The evolution of the exchange rate would place Wal-Mart ahead of Alibaba in terms of GMV when this chapter was submitted. Alibaba was previously ahead. Its relative decline responds to a Yuan depreciation against the dollar. Growth in local currency keeps strong for Alibaba (+27% year on year).

[3] Estimated by the author. In order to estimate how much is Amazon able to sell in one day, the author took Adobe's Digital Index total online sales on Cyber Monday – the major online shopping day in the US ($3.07 billion) and Slice Intelligence estimation that Amazon generated 36.1% of the total online sales on that day. The result is $1.1 billion. Cyber Monday online sales are above those of Black Friday ($2.72 billion) and Thanksgiving Day ($1.73 billion). Alibaba's number are for Chinese 'Singles' day', the major shopping day in China.

[4] In 2014, Amazon's 3p sales represented $18.9 billion. $180 billion GMV implies around $109.9 billion from 3p sales or a 5.81 'multiplier' from recorded 3p sales to 3p GMV. Using this multiplier with 2015 data, we can estimate Amazon's 3p GMV at around 161.3 billion and total GMV at around 240.5 billion.

[5] You can see how it works in YouTube: https://www.youtube.com/watch?v=nJVoYsBym88.

[6] 'Mad men' refer to stereotypical marketing professionals in the 20th century, which were hired for their creativity. 'Math men' represent 21st century new professionals, who derive insights from data. This is also related to the dominance of the right hemisphere in the brain, associated with creativity or the left one, with logical thinking. Another way of referring to these skills is the debate on the 'art or science of marketing'. New marketing professionals should be able to combine both approaches, but they are 'math' men because their job has an increasingly reliance upon data.

[7] The author would like to thank fellow colleague Craig Templin, Director at Neoris US and head of the Neoris Global iBeacon Driven Initiative for his work on Beacons, that has been a key input to write the IoT section.

Chapter 76
Driving Media Transformations:
Mobile Content and Personal Information

Juan Miguel Aguado

Inmaculada J. Martinez
University of Murcia, Spain

ABSTRACT

The consolidation of the mobile ecosystem is deeply influencing the adaptation of traditional media industries to the digital transformations of business, consumption and audiences. Legacy media digitization comes along with a perfect storm where different kinds of crisis converge. This is also the ground where an eventual response to uncertainties about future may appear in the form of new opportunities and possibilities. Simultaneously, mobile content evolution brings forth a new habitus of consumption, an increasingly complex set of social rituals, content format syntax and technical requirements that constitute new consumption scenarios. This chapter aims at discussing a conceptual framework on how the techno-economic drift of the mobile ecosystem matches the evolution of content industries dynamics and content consumption scenarios in terms of dysfunctions and challenges. The theoretical ground is built upon the works from a three-year research project on the evolution of mobile content and the economic and sociocultural relevance of personal information management.

INTRODUCTION

The consolidation of mobile communication technologies has given rise to an entire new ecosystem within digital media landscape. Mobile ecosystem involves a complex and changing net of players (including telecomm operators, handset suppliers, software developers, content aggregators, content producers, new advertising players and users) that are becoming increasingly influential in the sphere of media and content industries (Feijóo, Pasu, Misuraca & Lusoli, 2009).

Legacy media digitization comes along with a perfect storm where different kinds of crisis (of financial resources, of business and management models, of audiences, of distribution systems…) converge. The dramatic drop of advertising expenditure (Perry, 2012) and of pay-per-access income (Pew Research

DOI: 10.4018/978-1-5225-3822-6.ch076

Center, 2013), however, appears not to be exclusively due to global financial crisis, to the increasing fragmentation of audiences or to the fragmentation of users' time and attention in a growing number of devices and media practices (Purcell et alt. 2010). It is also rooted in deeper transformations that concern the whole of the cultural content value chain and which involve a reorganisation of players and influences among them (De Prato, Sanz & Simon, 2014). The impact of the mobile ecosystem in digital content industries is transferred to traditional media industries in the form of innovation vectors or trends that may give answer to some of the pending questions on the future of media: content formats, distribution systems, the role of personal information and new value networks in cultural industries.

The transformations triggered by the process of digitization are as well the ground where an eventual response to uncertainties about future may appear in the form of new opportunities and possibilities. On addition, media digitization is no only a matter of economic or technological challenges. These are intrinsically linked to social transformations. The social and cultural consequences of the mobile revolution have been –and still are- extensively dealt with by many scholars and researchers. But these changes also concerns to the social and symbolic side of mobile content. In this context, mobile content evolution brings forth a new habitus of consumption, an increasingly complex set of social rituals, content format syntax and technical requirements that constitute what we identify -following Goffman (1959)- as consumption scenarios.

In this chapter we intend to outline a conceptual framework for the study of the interrelations between mobile ecosystem players and media in order to understand how the techno-economic drift mobile technologies are driving matches the evolution of content industries in terms of dysfunctions and challenges. Our interest, however, is not solely focused on the economic landscape, but as well in the socio-cultural transformations that accompany the mobile side of the digital revolution.

In broad terms, the resulting picture strengthens the traditional media industry's perception of a collision with software and digital industries, to which cultural content has become a central issue. The conflict points delimited in this chapter (that is, the critical innovation vectors where traditional media show to be more dependent) are basically three: the influence of new distribution channels, the characterisation of content consumption in terms of social interactions and the increasing relevance of personal information in the redefinition of cultural content business models. These aspects constitute as well a relevant argument for consolidating mobile content environment as a specific field in the current development of media studies.

MOBILE PLATFORMS AND THE RE-INTERMEDIATION OF CULTURAL INDUSTRIES

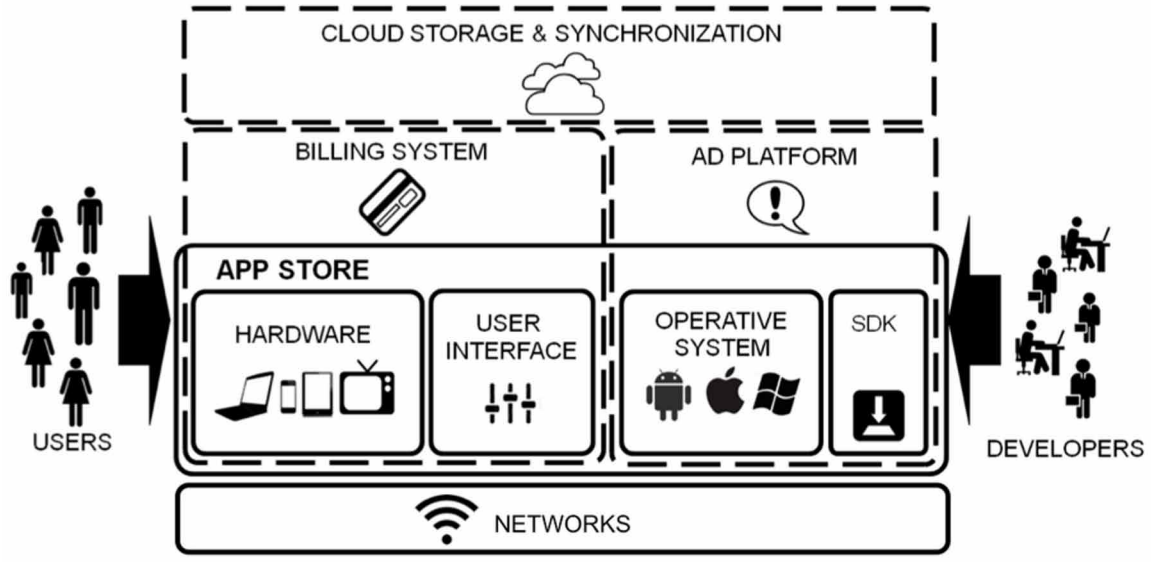
Mobile ecosystem has evolved in the last six years from a network centred structure, in which telecomm operators had a privileged position, to a platform centred structure, in which software developers (especially OS suppliers) influence the relations amongst the different mobile players. In this process of platformisation (Ballon, 2009) the main players tend to group together, in a loose or tight scheme, all of the required roles for a common set of hardware, software and other techno-economic specifications (Feijóo, Gómez-Barroso, Aguado & Barrero, 2012). Mobile platforms enact complex multi-sided markets with multiple interdependencies amongst involved players (DePrato, Sanz & Simon, 2014). Apple's iOS and Google's Android are examples of dominant mobile platforms that tend to create a more or less closed environment in which content becomes a relevant asset and a distinctive product at the same time.

These dominant mobile platforms integrate in an OS-based structure different roles, services and products that contribute to enable access to the mobile information environment: hardware (device specifications), access software (user interface), networks (mobile telecomm operators), distribution (application and content stores), billing systems and third party environments (like specific SDKs for application developers and service providers, and application publishing systems). Application and content stores play a key role in articulating mobile platforms around a viable distribution channel. Mobile platforms also include different added value services, be it addressed to third party players or to end users, such as cloud storage (Apple's iCloud or Google Drive, for instance), multi-device cloud-based synchronisation or mobile specific advertising platforms (like Apple's iAd or Google's AdMob) (see Figure 1).

The process of platformisation is not limited to the mobile environment, however. The relevance of mobile application and content stores (like Apple's iTunes/Appstore or Google's Google Play) as an evolution of online software distribution and the consolidation of mobile apps as a prevalent user interface for accessing content and services become a key issue in the reconfiguration of the content industries landscape. Due to its success, the model of application stores –the front of mobile platforms- is being exported to other media environments, like connected TV, desktop PCs, game consoles and photo cameras. As a part of that cross-device scenario, cloud content storage and synchronization services have become a strategic move for digital players. These services make possible to expand the structure of mobile platforms to a broader and increasingly mobile-influenced digital environment (Feijóo, Lindmark et al., 2013). But they also open the possibility for media and content industries to take advantage of cross-media ubiquitous offer. For instance, the cross-device strategy of The New York Times (so called 'NYT Everywhere') involves an integration of different products, access channels and income models.

The importance of mobile platforms is not accidental in this respect. Mobile technology introduces three key aspects that facilitate the drift of the digital ecosystem towards a cross-media landscape: personalization, integration and ubiquity. Mobile platforms perform a decisive role in integrating in-

Figure 1. Structure of mobile platforms
Source: Elaborated by the authors



formation environments into ubiquitous personalized access, fostering multi-device and multi-purpose coordination of actions in different contexts (searching, buying, having entertainment, self-expressing, socializing, accomplishing specific tasks, etc.) (Google & Ypsos, 2012). The search for diverse wearable devices –like Google Glass or Apple's iWatch- seems to be part of that same process.

The fact that controlling distribution channels is a crucial strategic aspect of media business needs no further explanation. Indeed, despite the importance traditionally given to content producers, it is upon distribution models that legacy cultural industries have always shaped their business and their social influence (DePrato, Esteve & Simon, 2014). And since they are a relevant part of ICT hardware or data based business models, taking over digital distribution channels has also become a decisive factor for the mobile ecosystem players (Manjoo, 2012).

Consequently, platformisation of the mobile and the ICT environment is about how the different players relate to control the value chain of ubiquitous information and content. In its actual shape, platformisation involves a set of latent conflicts, the most relevant of which concern telecomm operators, on one side, and content producers, on the other side. The first ones try to resist being trapped in the same 'dumb pipe' scheme that they already experienced in the Internet in late 90's (Aguado, Feijóo & Martínez, 2011; De Prato, Sanz & Simon, 2014). The latter (including legacy media), expect a neutral mobile ecosystem over neutral mobile networks that operate as a powerful ground for new forms of access to content and related services (Feijóo, Maghiros, Abadie & Gómez Barroso, 2009).

The relevance of OS developer-based mobile platforms lies in their success in implementing distribution channels and controlling users' access to services and content, which used to be the main asset of legacy media in the pre-Internet era. Application stores are the window for content providers and app developers to access users. They provide also the tools for content and service discovery. Consequently, application stores play a crucial role not only in shaping the market (Feijóo, Gómez-Barroso, Aguado & Barroso, 2012), but also in determining users' perception and access routines to mobile content (Bloem, van Doorm, Duivestein & Sjöström, 2013). As a consequence of that, mobile applications have become the prevalent user interface in the mobile Internet (Khalaf, 2013).

Mobile platforms' capacity to personalize and to provide direct access to end user has also fostered the disintermediation process of cultural consumption that already started with the Social Web in the first decade of the 21st Century (De Prato, Sanz & Simon, 2014). The very same channels and tools that allow content producers (such as legacy media) reaching mobile consumers favour also the transformation of content production into an object of cultural consumption. iBook Store or iTunes, not to mention Amazon Store or Google Play, become that way not only repositories for the products and services of legacy or new digital content industries, but also a direct platform through which professional and amateur content producers (writers, musicians, photographers, software developers, etc.) can directly access their audiences without depending on traditional, over-sized, cost-increasing cultural intermediaries.

This disintermediation process facilitated by mobile platforms is part of a re-intermediation strategy through which mobile platforms take the place of traditional cultural industries as content consumption intermediaries (Aguado, 2013; Feijóo, Lindmark et alt., 2013; De Prato, Sanz & Simon, 2014). Their success in controlling digital distribution channels and in shaping content discovery, access and management in an increasingly cross-device environment is well illustrated by one simple fact: in late 2012, the yearly income of Apple's iTunes and App stores (iPhone's and iPad's) exceeded in USD 300 million the combined turnover of The New York Times; Simon & Schuster (the publisher of the best-selling Steve Jobs' biography); Warner Bros. film studios (with popular film franchises like Batman or Harry Potter); and Time Inc. (the largest magazine publisher in the U.S.) (Lee, 2012).

Despite being relevant, typically considered factors such as ubiquitous availability of content, quality standards or cost-utility balance do not provide a sufficient explanation in understanding the privileged position of application stores as a dominant content distribution channel. The failure of mobile television constitutes a good example in that respect (Aguado, Feijóo, Martínez & Roel, 2012). The relational and context-attached nature of mobile devices underlies new forms of understanding digital content and its insertion into everyday consumption practices. In a sense, users' perception and attitudes towards content in mobile (and, by extension, in cross-device) environment have changed more than content producers'.

UNDERSTANDING CONTENT CONSUMPTION IN THE MOBILE ENVIRONMENT

Both in the popular media discourses and in the mind of users mobile devices are basically personal portable devices characterised by their attachment to situations and social interactions (Aguado & Martinez, 2010). Using mobile devices then involves different forms of availability and access to others' communicative presence. Digital content is obviously not alien to that premise. In fact, users' perception on the value of mobile content appears to be highly determined by two factors: the capacity of the user to act upon it and the ease of integrating it into social interactions. Experiences with users clearly emphasize a difference between traditional media (which are to watch, listen to, read…) and mobile media (García Jiménez, 2012). In the mobile context, users increasingly expect not only to access content, but to do things with content (and with others around content). In this very sense, mobile devices contribute to enhance the digital merge of cultural content and social communications. As a result of the evolution of mobile content, users' attitude and content consumption rituals have increasingly evolved towards an intervention paradigm (Scolari, Aguado & Feijóo, 2012).

The consolidation of mobile applications as the prevailing interfaces for mobile media (Khalaf, 2013) and as the prevalent distribution model (De Prato, Sanz & Simon, 2014) should be explained also as a part of that shift. Mobile applications are small pieces of software developed as specific task oriented tools. As any other tool, they do not solely involve the functional purpose they are made for, but also the symbolic frame and the operative instructions under which they are intended to work. It is in this sense that mobile applications involve also an interface: they enact meaning-action frames that presuppose the user (intentions, attitudes and competences) and an object of action (possible results) in a coherent, connected way (Scolari, 2009). As a tool, an app is something that allows (and is intended for) doing things. Since mobile content is increasingly accessed through native (platform based) or web applications (Khalaf, 2013), mobile environment emphasizes the specific connection between mobile content and user actions. Unlike media oriented computer software, mobile applications bring forth a tight semantic link among object (content), user (presupposed intentions, attitudes and competences) and specific tasks (Scolari, Aguado & Feijóo, 2012). Especially for users under age 45, their relation to his or her apps is clearly different from that to his or her desktop computer software. They feel mobile apps and software linked to their everyday life and to the emotional aspects of it. What they have installed in their smartphones (and even which apps they frequently use or what makes them to eventually uninstall an app) has to do with their, with their personal preferences and with their momentary impulses. The two ideas –"content is something to act upon" and "content and apps speak about who I am"- ideally merge in the perception and uses of mobile content applications.

The functional evolution of mobile content apps in the last five years supports these assumptions. Drawing on a semiotic analysis of a sample of 40 content addressed mobile apps, we have developed a

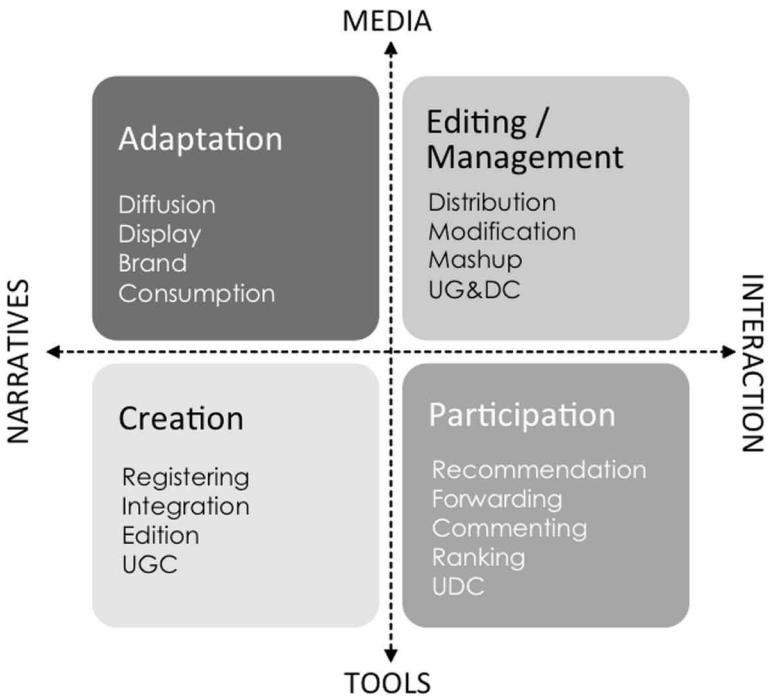
conceptual model defined along two axes (see Figure 2): media / tool orientation (considering a scale from the mere content display to high intervention capacity) and narrative / interaction involvement (from narrative focused apps –in displaying or instrumental terms-, to communication focused apps).

That scheme allowed us developing a general taxonomy of mobile content applications by differentiating four clear fields (Scolari, Aguado & Feijóo, 2012):

1. Adapted or repurposed mobile content apps, addressed to conventional media diffusion and consumption
2. Creative mobile content apps, addressed to facilitate registering, producing and editing user generated content (photos, videos, music, audio, etc.)
3. Content management mobile applications, focusing in organizing and transforming conventional media content (libraries, playlist managers, etc.), including some aspects of user generated and distributed content
4. Participation mobile apps, addressed to integrate mobile media and user generated content into social conversations (including, from the perspective of media, the so called 'user distributed content').

These broad categories were characterised by the prevalence of a given frame of presupposed actions and tasks:

Figure 2. A conceptual frame for the classification of mobile content applications (Scolari, Aguado & Feijóo, 2013)

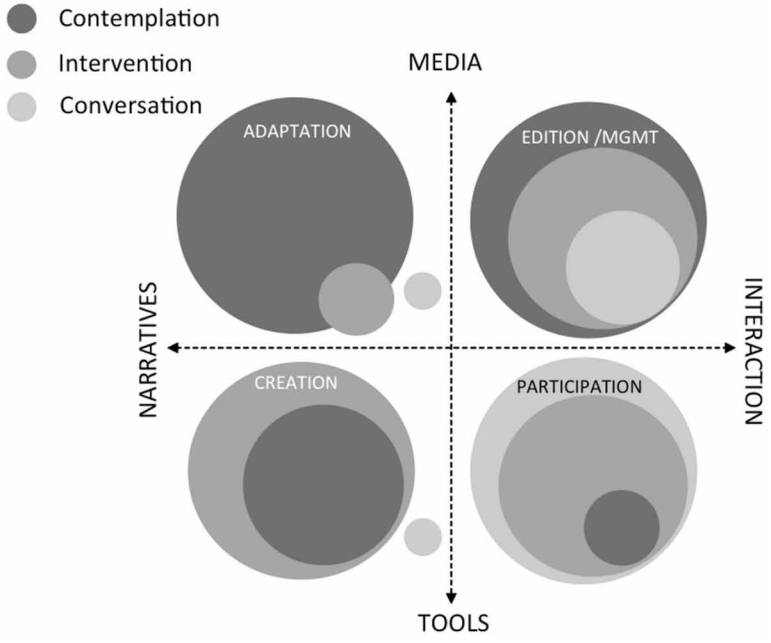


1. Contemplation, which involves passive consumption of conventional content (reading, watching or listening)
2. Intervention, which involves acting upon content to transform it (editing, managing, merging…)
3. Conversation, which involves using content as a source of meaning in social interactions (linking, recommending, commenting, resending…).

Figure 3 illustrates the structure of the involved prevailing actions that characterises the different kinds of mobile content applications. The size of circles in the graph represents relevance, while position (inclusion/exclusion) represents subordination. Accordingly, content apps within the category of adaptation (typically including traditional media apps, like mobile magazines or mobile news apps) presuppose contemplation as the main action guiding interface design and user's attitude, with intervention capacity having a subordinated role. Editing and management mobile content applications (such as content aggregators) perform contemplation oriented interfaces and related conversational functions, however with a more relevant role of intervention capacity. Applications within creation category (typically photo or video editors and music tools) invert the former correlation of actions, focusing interface in intervention and subjecting contemplation to the prevalence of acting upon –characteristically- user generated content. Finally, mobile applications within the conceptual field of participation (such as mobile social networks and messaging apps) perform a conversation-oriented interface that subordinates intervention and contemplation capacities.

One of the interesting points in this taxonomy is that categories are not closed either in conceptual nor in evolutionary terms. Characteristically, for example, networked mobile video games pose a singular merge of both content/tool and narratives/interaction values, involving tight interdependence among

Figure 3. Structure of presupposed actions in mobile content applications
Source: Scolari, Aguado & Feijóo, 2013.

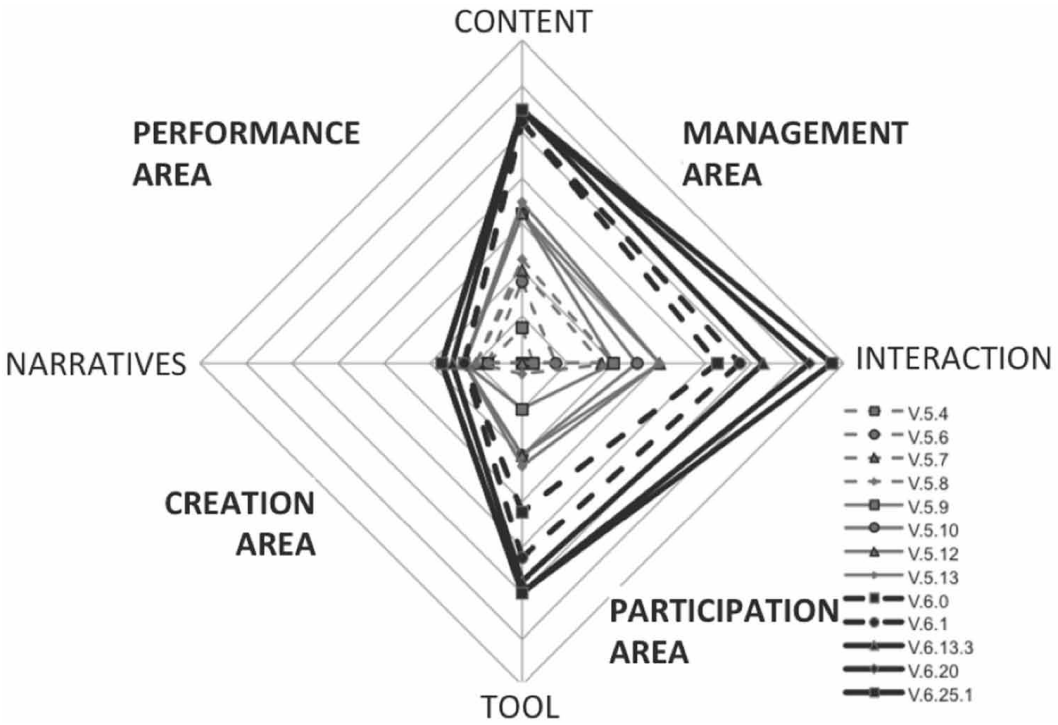


contemplation, intervention and conversation, hence they are located close to the middle point of the conceptual space. Furthermore, the model allows us locating a given app in a concrete place –according to the relevance of its features and the prevailing actions involved- and observing how it evolved through the conceptual space as long as its features changed in the consecutive software actualizations.

The model makes possible to visualize a drift of mobile applications towards the centre of the conceptual space: those applications from the creative and adapted areas progressively include more and more social interaction related features and instrumental functionalities. On the opposite side, those applications from the participation area progressively include more content related features. As a matter of example, the chart in Figure 4 depicts the score of the functional attributes[1] for the actualizations of Twitter app (in iOS) along the 13 versions updated from March 2013 to March 2015. It depicts a clear drift towards a functional relevance of content display and content management within an interaction driven app.

Some of the evolving consumption scenarios and the content formats emerging attached to them support these arguments. The growing importance of multiscreening (Google & Ypsos, 2012) and its semantic translation into transmedia narratives (Scolari, 2009) seem to be directly related to users' activity with content. The so called 'second screen apps' constitute a kind of software implementation for a consumption scenario that involves synchronising different content and social conversation related activities. Users have incorporated conventional media consumption (like watching TV series, sports or movies) to their mobile mediated social conversations in live time: for example, tweeting to friends about an episode of a favourite TV series in virtually co-present watching (Pew Research Centre, 2012). Content industries have turned their interest to mobile social networks and mobile applications as a new source for audience metrics (Noguera et alt., 2013) but also as a vehicle for promoting and expanding

Figure 4. Functional evolution of Twitter app during 2013-2015, from version 5.4 to version 6.25.1
Source: Elaborated by the authors



transmedia content (Scolari, 2009). Second screen apps contribute to systematize that integration between content and social interactions, be it connecting social conversation to a given content (like *The Walking Dead - Walkers Kill Count*, a social network game-like application about guessing the number of kills in an episode of the popular zombies' TV series-, providing extra content and information –like most of Disney's second screen apps-, promoting content related participation –like in the case of apps complementing media coverage of the last USA Presidential Election - or expanding stories in participatory terms –like 'twittersodes' that expand the story of TV series in the form of characters' conversations in which users can participate -.

Media users, in sum, increasingly conceive content as a part of their social interactions and, consequently as a matter to act upon, be it re-creating (transforming mainstream media content into forms of parody, irony, protest or support), co-creating (merging it into user generated content) or channelling (recommending, forwarding, commenting, etc.). This process that shifts content conception from the logic of seeing to the logic of doing poses a deeper connection between user identity and content consumption with two relevant consequences in both media and digital environments: it enters content consumption into the content distribution value chain and constitutes social relations as a specific object of cultural consumption.

PERSONAL INFORMATION AS A NEW VALUE DRIVER

In the previous sections we have outlined a conceptual background for the influence of mobile ecosystem's distribution structures and content formats in transforming conceptions about digital content consumption. But how this affects legacy media and digital industries from a business perspective? Describing mobile platforms as relevant players in a process of re-intermediation of cultural industries demands understanding why and how digital industries have embraced content business as an important part of their strategy. What has content business to offer digital players and what should legacy media learn form digital businesses?

Despite having substantially different business models, all of the big Internet companies –especially the so called "Internet Fantastic Four": Apple, Google, Amazon and Facebook- have rapidly become mobile centred companies giving strategic relevance to content aggregation and distribution (Manjoo, 2012). The central role content and media play in an e-commerce giant like Amazon needs no explanation. However, the convergence of the other Internet giants, with such different businesses like hardware (Apple), search engines (Google) or social networks (Facebook), may deserve a deeper look.

One relevant point these companies manifestly share is their effort to become the centre of a multiscreen platform, with mobile devices (smartphones and tablets) in its centre, but including in different degrees connected TV, desktop computers and game consoles, with cloud synchronisation and storage services (like iCloud, Amazon Cloud Drive or Google Drive) and OTT services (like Apple TV) above them. Amazon, for example, has developed a threefold strategy consisting of providing low-price hardware (Kindle Fire), an integrated distribution channel that complements Internet ecommerce portal (Amazon Appstore), and multi-screen content access (Amazon Instant Video, Amazon Game Studio), building a platform-like structure upon a tailored version of Android OS. Facebook, in turn, has adopted the shape of a platform-nested environment both in desktop and mobile devices, providing platform-like added services such as search, application store or content access (movies, games, etc.) under the umbrella of users' social ties.

One of the reasons for this strategic convergence over cultural content lies in the increasing importance of personal information in cross-device platforms. Data mining about users has become in the last five years a key aspect of Internet service companies (Acquisti, 2010): processing personal information and creating user profiles facilitates enhancing segmentation and adapting both advertising (like in Google and Facebook cases) and content or hardware supply (Amazon and Apple) to user profile and context (Punie, Lusoli, Centeno, Misuraca, & Broster, 2009; Manjoo, 2012). Information about user profile and user behaviour is not only the base for adaptive services in a context-addressed ubiquitous information environment. It is, at the same time, the main asset to support large scale selling or advertising based business models (Acquisti, 2010; Laurila et alt., 2013), including content distribution. For instance, in 2013 Google acquired Behavio, a company specialized in monitoring mobile devices activity (location, movement, proximity, app activity, etc.) and forecasting behavioural patterns. Facebook's strategy –integrating apps, search, browsing, contacts and social networks- is also addressed to settle an access ground to user behaviour without depending on the filters of other platforms, thus adding value to both its metrics and channels (Filloux, 2013).

Cultural content (entertainment, news, advertising, etc.) is a core element in everyday mobile activity: searching, creating, buying, sharing, commenting or simply consuming content (reading, watching or listening to) takes a big part of what we usually do with our smartphones or tablets (AOL-BBDO, 2012). Furthermore, cultural content plays an increasingly relevant role in our communications (Google & Ypsos, 2012; Bloem, van Doorm, Duivestein & Sjöström, 2012). Interviewed users –especially those aged under 45- agreed their attitude and expectations towards mobile device highly depended on content availability, even in the case of communicating to others. Natural behaviour around content becomes that way a valuable source of information not only about users and their world, but –precisely because of that- also about user attitudes towards devices, content, services and brands.

The personal and pervasive condition of mobile devices makes them extremely suitable as information gathering tools. Unlike desktop Internet user profiles, mobile user profiles are consistent (they are about a given user behaviour) (Aguado, 2012) and complex (they include context and location aware parameters). Pervasiveness and ubiquity considerably broaden the range of contextual scenarios in which information is both used and gathered. They also make possible to weave continuity and coherence among these different scenarios. The singular relation between mobile device and user, different from other digital devices, brings forth a specific horizon for both the operative and the economic value of personal information.

According to Acquisty (2010) and Feijóo & Gómez Barroso (2013), personal information involves data about users (user identification, like name, address, economic data derived from purchasing or banking, health related data, etc.) but also about what users do (behavioural information related to browsing, search, use of software and services, etc.) and information about how and when they use services (frequency, stickiness, etc.). Besides facilitating user profile coherence derived from processing usage activity, mobile devices provide additional relevant data concerning location and context related information, allowing to situate the 'how' and the 'when' in relation to behavioural and identity information.

By controlling software access to services, third party developers innovation (via SDKs and OS specifications), content distribution channels (via content and application stores) and hardware specifications (including built-in sensors), mobile platforms have a privileged position in accessing and managing not only mobile personal information. As long as the barriers between conventional Internet and mobile Internet dissolve, mobile platforms get a significant advantage in a cross-device ubiquitous information environment (Feijóo & Gómez Barroso, 2013). That concentration of the capacity to access and manage

personal information in the hands of mobile-centred Internet players disrupts digital business models and raises concerns about privacy protection and transparency (Xu, Rossom, Gupta & Carroll, 2012; Luchetta, 2013; Feijóo & Gómez Barroso, 2013).

EXPANDING DIGITAL CONTENT VALUE CHAIN

In the case of traditional media industries, involved as they are in their very digital transformation, all the above mentioned involves a radical change in the value chain of cultural content. Legacy media business model was characteristically content-centric media dependent. In short terms, content used to be the core and the end of the value creation process. Through controlling production and distribution, legacy media ensured the attention of wholesale audiences, which was in turn monetized in pay-per-access schemes or, more often, via advertising. The whole process ended up in content consumption: there was no value after content was read, watched or listened to. In order to maximize control over production and distribution, the whole productive structure was designed according to media requirements (printed paper, radio or screens), including expensive, complex –and often slow- distribution infrastructures. The confluence in the last decade of digital media development and financial crisis puts that model in serious troubles: the dramatic drop of advertising expenditure (Perry, 2012), the rigidity of over-sized media dependent production structures (Westlund, 2012) and the problems attached to licensing and intellectual property management (Punie, Lusoli, Centeno, Misuraca & Broster, 2009) seriously challenge the viability of conventional media industries.

Legacy media confront thus an urgent need of adaptation to deep changes in production, distribution and consumption. Because of the different structures, players and consumption scenarios that characterize digital environment, old media business models show important dysfunctions in that adaptation: digital advertising is less effective as a revenue source than it used to be traditional advertising, and pay-per-access formulas resist to work in a content saturated environment with hundreds or thousands of free access alternatives (Wolff, 2013). Digital environment, in addition, raises two disruptive conditions that alter the structure of legacy media business: de-materialization of content and its integration into users' social dynamics.

According to the general drift towards dematerialization that characterizes digitization (De Prato, Sanz & Simon, 2014), cultural content is becoming increasingly less constrained by the requirements of the médium and consequently more adaptable to a diversity of consumption scenarios. Dematerialized contents can be accessed through, and deployed in, different media (mobile devices, paper, big screens, etc.), whether in complementary or in alternative forms. New cross-media distribution models take advantage of this, and mobile platforms are becoming the basis for multidevice, malleable content circulation where controlling distribution channels becomes even more crucial. Cross-media distribution fosters (and is equally favoredby) cross-media consumption. The growing interest in transmedia storytelling (Scolari 2009) is connected with that transformation of content and its impact in distribution and consumption (Google & Ypsos 2012)

The second disruption factor coming along digitization and mobility is socialization. Mobile technology poses an increasing merge of media and communication that facilitates the integration of media into social dynamics. It is true that the internalization of media activities as a part of the social global conversation is not strictly speaking a new phenomenon: almost any media effects theory considers in one way or another how media activity gets into everyday life. Furthermore, commenting latest news

while having a coffee with colleagues or recommending a movie to friends are natural ways in which media become part of our social interactions. The difference now is that media related social interactions are not just *about* media, but rather *within* media, and they are taking place in the same digital environment (and often in the same consumption scenario) in which content is accessed and consumed. In other words, social interactions are attached to and share space with media consumption. From the perspective of media industries, this opens a brave new horizon of possibilities, expanding the value chain of cultural content to include what comes after (or around) content consumption. In this respect ubiquity, personalization, integration and pervasiveness are key characteristics that ensure a natural merge of media consumption and the social situations they take place in.

Social networks (and especially mobile social networks) contribute to create new added value for media. The merge of media use and social networks contributes to settle user information management as a relevant asset for digital cross-device oriented media (Purcell et alt, 2010; Noguera, Villy, Nyiro, De Blasio & Bourdaa, 2013). In that context, emerging media players tend to provide the highest number and diversity of possible interactions in order to gather intensive data about user behaviour. The effective management of user information allows tailoring services and products to user's profile and context and (b) it adds value to profiled advertising lowering costs and increasing efficiency through programmatic buying and through escalating inventories and buyers' networks (Feijóo, Gómez Barroso and Martínez, 2010).

However, social networks do not only constitute a new vein of personal information (that enhances content as a source of user data): as argued before, they are changing the focus of media consumption from passive reception to media related social interactions. This change in focus is not about media including (and getting advantage of) social interactions. It is rather the opposite: social interactions including (and getting advantage of) media. In other words, it is the social relationship that constitutes a valuable object of consumption (Noguera et alt., 2013). Media become interesting to the extent they contribute (as a language, as a topic, as an object of parody or emotional positioning, as a matter of re-creation and transformation) to the ritual of social interaction.

As a result of these disruption factors, the digital content value chain is being transformed as well. It is no longer a stable linear process of value creation with its core in distribution-focused legacy media companies. On the contrary, it is rapidly becoming a complex network of heterogeneous players coming from different ecosystems (telecom players, software industries, traditional media, users, new regulators…). The privileged position of some of these players (the so called Internet giants) in accessing end users through content distribution centred platforms drives a re-intermediation process in which legacy media looses its traditional control over audiences. In exchange, as content consumption and social interaction merge, new possibilities for value creation emerge.

Content consumption related social interactions contribute to expand content value chain at least in two ways. In first place, significantly amplifying the role of content consumption as personal information driver. Social conversation around content –and even the use of actual content narratives as a social language (Aguado & Martínez, 2010)- efficiently merges three relevant spheres of information about a person: identity presentation, personal contacts and socio-cultural situation (who you are, to whom you relate and what/where are you doing). As stated in section 3, enhancing the capacity to do things with content is a prerequisite to socially integrate content consumption in a ubiquitous communication environment. In second place, by merging content to social interactions users become a relevant distribution

channel. In fact, content curation, rating and sharing has become a relevant activity for social networking sites and apps. Some of them, like Facebook and Linkedin, are including content recommendation and curation functionalities. Similarly, some content curation oriented aggregators, such as Flipboard, are clearly shifting towards content centred social networking functionalities.

CONCLUDING REMARKS

The impact of the development of a platform centred mobile ecosystem has contributed in a relevant way to shape the horizon of problems and challenges that legacy media and traditional content industries face in adapting to the digital environment (Aguado, Feijóo & Martínez, 2012). The kind of transformations induced by the mobile ecosystem is not limited to diffusion related aspects commonly considered, like mobile device penetration or content access normalisation. Mobile ecosystem evolution is actively contributing to change the nature of players involved in the digital content value chain and the structure of strategic relationships among them (Feijóo, Lindmark et alt., 2013). These changes result as well from a mobile-grounded transformation in users' conception about digital content consumption (Aguado, 2013). This transformation is marked by aspects like intervention capacity and content integration into social interactions, which support the consolidation of content mediated social interactions as an emerging form of cultural consumption. Three main innovation vectors condense these changes:

Firstly, the implementation of new distribution systems, characteristically shaped by the pattern of mobile application stores, which constitute the core of the mobile content ecosystem, disrupts traditional content intermediation structures. The so called 'platformisation' (Ballon, 2009) over application oriented environments favours a re-intermediation processes by means of which legacy media are displaced from value attached relevant positions and raises a category of cloud-based, multi-device accessible and medium independent content that challenges the viability of advertising or copy-centred pay-per-access based traditional business models.

In a complementary way to that, new distribution models and new software based content formats facilitate the redefinition of users' perception about valuable cultural content, driving new content formats that take advantage of the mobile/digital ecosystem's possibilities (integrating user's activity with content, adapting content to user's situation and context, etc.). The consolidation of mobile applications as a prevalent interface involves in this respect a shift from a 'seeing-oriented' logic to a 'doing-oriented logic' that particularly fits mobile's characteristic relational and context-attached nature and constitutes a user-centric environment –instead of the traditional producer-centric one (Westlund, 2012). The application of taxonomy oriented conceptual model for the functional analysis of mobile content applications (Scolari, Aguado & Feijóo, 2013) supports the observation of a shift in mobile content consumption from a contemplation paradigm to an intervention paradigm. This shift allows expanding traditional content value chain by including user activity with content (sharing, transforming, commenting, etc.) into monetizable digital processes (Noguera et alt., 2013).

Finally, the integration of what users do with content into cultural content value chain is implemented upon the availability of personal information and the capacity of digital players to process this information in the forms of profiles that enhance the identity and situation driven adaptation of advertising, products and services (Feijóo & Gómez-Barroso, 2013).

KEY TERMS AND DEFINITIONS

Consumption Scenarios: A consumption scenarios involves the physical, social and symbolic aspects of a situated content consumption by a user. In its physical aspect, it includes hardware, software, and the usual spaces (public or private) in which it is supposed to take place. The social dimension of a consumption scenario includes presupposed rituals and roles, whereas the symbolic dimension involves meaning frameworks and values.

Ecosystem: Referred to techno-economic environments, like the mobile communications one, an ecosystem is here understood as a complex net of interdependent players and environmental factors that (through co-operation and competition) internally generates its own order. The ICT ecosystem, for instance, would include four characteristic layers that group along diverse functions different groups of players: Equipment providers, network operators, content and applications providers, and users.

Interface: Any kind of meaning-action frames that presuppose and connect users (intentions, attitudes and competences), actions and objects of action (tokens) in a coherent and meaningful way (including pragmatic recipes and expectable results).

Mobile Content Applications: Any mobile application whose identifying functions are address to operate about content in terms of performance, creation, management or participation.

Personal Information: Personal information or personal data refer to all those data derived from the digital identity, digital records and online or off-line activities of a given user. Mobile personal information includes also data obtained from the mobile devices' built in sensors (thus converting off-line activities, like walking or running, location, etc., in digital information). According to different policy and regulation traditions, personal data can be understood in either restricted or expanded conception. The restricted conception refers to that information strictly related to digital identity and personal records (like financial parameters, health records, etc.). The expanded conception of personal data includes data derived from what users do (buying, searching, playing, navigating…), how they do and where or when they do, regardless if this is connected or not to digital identity. Digital profiles are coherent sets of personal data.

Platformisation: It refers to the process in which ICT players tend to group together, in a loose or tight scheme, all of the required roles for a common set of hardware, software and other techno-economic specifications. In the mobile environment, since 2007, platforms have been gaining increasing relevance around OS and hardware providers. Apple's iOS and Google's Android are examples of software based mobile platforms.

Value Chain: A value chain or a value network identifies the process, players and relations involved in the creation of value around a given product or service, and how this value is distributed amongst the different players.

ENDNOTE

[1] The scoring model is an adaptation of functional content analysis in which the different actualization items are attributed binary values (0,5 to 1). Versions and actualization items not directly dealing with content (such as "adaptation to retina display" or "minor bug solving") were not considered.

This research was previously published in Emerging Perspectives on the Mobile Content Evolution edited by Juan Miguel Aguado, Claudio Feijóo, and Inmaculada J. Martínez, pages 160-176, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

Chapter 77
Change Management in Information Asset

Prajwal Eachempati
IIT Hyderabad, India

ABSTRACT

We are passing through information age with lightning communication speed. Information asset storage in Cloud and retrieval in the net has become the new invisible corporate voyage into the information space. Information Assets are a valuable source of Knowledge for both Information asset creator as well as the user. These are fluid assets that change overtime based on several internal and environmental factors! This paper seeks to address these aspects of Change that impacts such "fluid" Information Assets and the need to raise up to the changing expectations of the millions of users by satisfying the ever growing information hungry businesses. Providing unreliable information and sub-optimal analytical tools can destroy the user in the first instance and can lead to self-destruction as Information asset provider will find no takers in the long run. In this context this assorted information on Change management is chosen carefully and it is hoped, will benefit the reader who may be a technical expert in his field.

1. INTRODUCTION

Information in any form has been recognised as an asset, now come to be known as, "Information Asset". "An information asset is a body of knowledge that is organized and managed as a single entity". Change is a major threat to the Information asset and key risk to digital continuity. Information can have a short lifecycle and tends to depreciate over time based on the type of information the asset represents, and how accurate the information can remain over time. Its value increases in direct relationship to the number of people who need the information in question. Some information assets an organization carries leave organizational foot prints for the competitors to follow and hence must be preserved from public domain. It is clear in the business world by now that a business seems to be run not just from boardroom but from the offices of the software industry you chose to associate.

Information loafing in files that cannot be used is considered to be a liability in certain cases or could have archaic value for future reference for some others. Such information could still be useful to

DOI: 10.4018/978-1-5225-3822-6.ch077

competitors, and should be managed or destroyed as per a pre-decided schedule and method—depending on the confidentiality classification and future use.

Hence information gatherers and generators need to be careful while dealing with data or/and information. Cloud computing techniques have come handy in such cases to keep engaging the information scientists and users to draw from the cloud the needed information by means of "just-in-time" techniques instead of carrying the information load in their hardware systems.

Information asset assumes various forms over time starting as mere data and undergoes metamorphosis in a way. Such data resides in various physical forms/resides in devices or other component of the environment that supports information based activities as well as in invisible form when encrypted. A simple data can generate various forms of information to the analysts at different points of time and means differently for different users at various points in time and mercurial in nature. Corporates invest huge amounts in not only collecting and collating such data but also for its security from illicit access, disclosure, alteration, destruction and/or theft when the data is residing in any device or moving to various domains through networking. The information security mission is to ensure the confidentiality, integrity, availability of information assets when needed. This needs pro-acting by imaging possible threat sequences and taking counter measures like firewall and encryptions of data. This is change management from illicit data manipulation. When performing risk analysis, it is important to weigh how much to spend protecting each asset against cost of losing the asset. Probability of loss occurrence, intangible costs involved are factored thereon. Intangible costs may take various forms like loss of reputation to punitive measures taken by the user. I.T information risk management has evolved into a huge important area today. Attrition in the IT Sector is a big risk and Change mangers should guard companies from this factor by ensuring proper documentation of their works and with sound HR policies.

One of the most important aspects of information management is to understand the implications of change on the information asset. Changes in IT lead to innovation, new business models and services. Change management and how people deal with it has gained attention across various fields. Finding effective ways for managing the process of changes is key to success in a highly competitive/global business environment.

There are two types of change management programs:

- Systematic organization-wide change initiative that involves an organization-wide transformation effort.
- Specific internal change management or change control program that involves providing tools and processes to control daily operational or project-specific changes.

Change management differs from project management in its ultimate objective. The process of how organizations change draws on many disciplines from psychology and behavioural science to engineering and systems thinking is intriguing. The underlying principle is that change does not happen in isolation. It impacts the whole organization and each individual associated with it.

Information asset is a broad expression and is in a perpetual cycle of change. This paper seeks to study only change management perspectives of lasting value at corporate level and omits all discussion and models dealing with routine change matters or project management/ operational changes. For example, iPhones or Windows software is passing through frequent changes based on certain critical parameters like speed, user friendliness, information management routines it deals with, connectivity or power to hear/battery power or spread across various media or camera lens/photo making capability

or some other intrinsic capability, physical features changes or compliance matters etc. Of course these products modifications/ upgradations constantly take place to stay and compete in the market. But we do not deal with these in this paper.

This paper seeks to study the impact of change on information asset by trying to argue that information managers and owners must welcome change and become change agents instead of trying to avert change to retain information asset as a static body and a lifeless tool in the hands of its users. Change management seeks to adapt to positive change signals at the same pace at which change occurs and mitigates the impact of negative signals by delaying the process of negative change in order to avert damage. It must be realized in this context that the phenomenon called *Change* is enforced mostly due to factors outside the organization on which only proactive change leaders have a prior understanding in an otherwise dormant social system. Change takes place to avert an impending environmental threat in many cases.

Sometimes experience carries the Change from one company to another when people migrate. Before we analyse impact of change on information assets let us first understand what constitute an information asset based upon some published literature.

The rest of the paper is organized as follows. The aspects of information assets and the various technological changes that have occurred over the past decade is covered in Section 2. In Section 3 some interesting existing models of change management are discussed. Section 4 proposes a new model for change management of information assets. Further, the study concludes with conclusion and future research in section 5.

2. LITERATURE REVIEW

2.1. What Is an Information Asset?

The major steps required for asset classification and controls are:

These steps were elucidated as under:

2.1.1. Identification of Assets

What are Information Assets? (Bulgurcu, Cavusoglu, & Benbasat, 2010).

Information assets are grouped by Information Asset Development, Inc. as under

1. End User (external) Information Assets,
2. End User (internal) Information Assets,
3. Business Process Information Assets,
4. Client Staff Information Assets (training, participation and execution).

IT Assets are seen as under:

1. Information assets,
2. Software assets:
    a. Application software,
    b. System software,

3. Physical assets,
4. Services.

The next question is What are the critical assets? This needs an answer to take decisions regarding ownership, acquisition, retention, providing budgets to encircle with security cover for the assets, back up policy etc.

2.1.2. Accountability of Assets

The next step is to establish accountability of assets. This is not difficult for the tangible assets like physical assets. A more difficult task is establishing ownership for the information assets. There will be a number of users for these assets. But the prime responsibility for accuracy will lie with the asset owner and any addition or modification to the information asset will only be done with the consent of the asset owner. Information technology staff will can only make the changes (Government of Alberta. 2004), physically with the consent of its owner. But ownership clearly lies with the business head who has the prime responsibility for the content in the customer database. (Cabinet Office.2013). Using such criteria, we need to identify the actual owners of each of the information assets. Only an owner of the asset will be able to decide the business value of the asset and we cannot identify the security requirement of the asset without its value.

The next step is identifying owners of the application software. Application software implements the business rules. As such the business process owner should be the owner of application software. But the responsibility of maintaining application software to accurately reflect business rules will be vested with the application developers. As such, the accountability for application software should be with the application development manager.

System software ownership could be with the appropriate persons within the IT team. The owner of these assets will be responsible for maintaining all the system software including protecting the organization against software piracy (Kang, Donohoe, Koh et al., 2002)

2.1.2.1. Assets Valuation

What is the value of an asset? Is it replacement cost or written down value? Or is it its utility value? A seemingly small item may be immensely difficult to replace today. True value of the asset will lead us to identify realistic measures needed for protection of the asset.

2.1.3. Preparing a Schema for Classification

The next task is to create classification levels. The criteria for the classification of assets could be in terms of:

1. Confidential
2. Company only
3. Shared
4. Unclassified

Classification based on value could be high, medium or low value. A detailed explanation should be prepared giving the reasoning for this classification. A critical component costing a few rupees may be a very high value item as it is not easily available and could stop the production of a high cost item.

Access rights need to be defined for individuals as well as groups. Who is cleared to access confidential information in the organization? And who decides the access rights? Logically, it will be the asset owner who will decide these access rights.

Destruction should be a scheduled and controlled activity. The information that is no longer needed by the company but which could still be useful to competitors, should be destroyed as per a pre-decided schedule and method—depending on the confidentiality classification. For information recorded on hard disk, mere deletion of files does not obliterate information. A more stringent procedure like multiple overwriting may be needed.

Classification schema should lead to an implementable structure. It should be simple to understand and identify.

2.1.4. Implementation of the Classification Schema

The real test of classification schema is when it is implemented. Information is a fluid resource. It keeps changing its form. The implementation should lead to a uniform way of identifying the information so that a uniform protection could be provided.

Asset classification is thus the key to various security controls that need to be implemented for asset protection.

2.1.4.1. How are Information Assets Valuable to a Company?

Information Assets serve to quantify and qualify business process, function and development. Information Assets remove ambiguity among multiple Information users. Information Assets serve as a means of benchmarking products and services.

Information Assets promote effective corporate communication. Information Assets enable organizational efficiency. Information Assets can be used to support PDM, NPI, ERP, CRM and MRP applications.

2.2. The First “Change” Impact on Information Assets

A book “Computers in Crisis” by Jerome and Marilyn Murray published in 1984 triggered discussion among USENET groups and among a slew of earlier slow motion Internet users and snowballed into a sort of fear psychosis among CEOs by 1990s that all software would reset itself on 1 January 2000 including that deals with time and space. Unaddressed, this would collapse the information assets of all (Ho & Smith, 2001). and 1 January 2000 will be a doomsday for all businesses in general and public opinion on software industry would touch its lowest mark. Businesses were set up to address this impending crisis known as Y2K (Year 2000). We all know, the danger was averted thanks to the millions of newly born ‘software engineers’. In the history of businesses all over the globe no other change management program has galvanised businesses like Y2K bug did. A global disaster was averted by change management of Information Assets belonging to successful or sick organizations, and big or small entities alike. The lesson we learnt here was that Change management requires not only strategy and organizational change

but rapid adoption of quickly found lasting solutions that can beat the speed with which change occurs. Change in Y2K scenario demanded no less than swift action on short notice. The problem was simple -

Earlier Computer Programs were designed to abbreviate four-digit year say 1999 as two digits '99' .to save on memory space. These computers recognise 99 as 1999 but would be unable to recognise 00 as 2000. So by mid-night of 31 Dec 1999 software needed rapid repair or revision or replacement. Projected data malfunctions unless software changes are made rapidly. Banks would collapse if Y2K bug remains on computer. Even computer chips needed replacement in all automated CNC systems like Elevators, Temperature controllers, Medical and Industrial Machinery, Air Crafts etc. Over $300 billion was spent. Even Auditors needed to collect from all clients Y2K Compliance certificates and declarations. Ultimately, 'Millennium bug' was cleared. Y2K thus come to be known as first change management in the information asset.

2.3. Collecting Right Data

Information assets acquisitions, and maintenance involves huge costs. Thus it is important that managers must first concentrate on collecting right data before applying analytical tools to draw information from the data. False metric's lead nowhere. For example, in a digital marketing scenario one should not be carried away by counting on millions of Facebook followers or millions of viewers as prospective customers. Here the challenge is to acquire prospective customers, drive the customer traffic, digital experience or converting the traffic and retention or keeping consumers returning in a cyclical manner. It's a sort of football game with customers or visitors of the webpage bringing them to the goal post of actual purchasing of goods on the digital platform. Call centres, email messages or SMS or loyalty rewards are all to keep customers engaged on the product you promote. Customer Analytics needs a different diagnostic to count on 'recency'-how recently (Ho & Smith, 2001). and how frequently such 'customer' has actually bought (Blanchard, Messatfa, Lorin, 2009). What we need to compute is realised customer value(RCV) of each and every customer. This needs analysis of customer mobilization costs and customer-wise contribution analysis. This analysis lead to new information on sales returns opted by customers based on existing policy and paved the way for evolving new exchange/return and rewarding policy (Russo & Lancaster, 1995).

In another case if you were to collect data on audience response for advertisements in a news channel, (Russo, J. M., & Lancaster, D. R. 1995) you would first classify viewers into "watchholics," at the highest end of the scale of viewers, followed by casual viewers, international viewers and passive viewers or "workholics" at the lower end. This is done by analysts based on 'cluster analysis'. To keep the watchholics engaged being high-valued customer group, direct email contacts, and SMS notifications etc. were tried. But in the same breath while analytics tried on 'workholics' data, it was revealed that they were selective viewers based on inputs of broadcast schedule from the home page news channel's website. Armed with this insight, if analyst created a collection function, placed near the schedule, so users could enter their email address to be notified when favourite shows were airing, it would of course have yielded valuable information about these previously anonymous users. It was reported that one famous news channel in USA did the same and concluded "It flipped the valuation curve a little bit on its head, because while I was supporting the hundred-plus million-dollar digital business, the reality is that the billion-dollar business was within the passive users that were actually driving broadcast eyeballs," analyst reported. This means right data collection and intelligent analysis are drivers of this information age.

This means we need to conclude that a data is correct only after testing the data through suitable analytics. There after 'right data' is retained and basic data preserved in the cloud?

Change management requires that both service providers as well as service takers need to be on constant whistle and acquire right skills or provide right services. It is clear in the business world by now that a business seems to be run not just from boardroom but from the offices of the software industry you chose to associate. This is due to the fact that technology is the driver that controls the value chain in a sense as technological developments and upgradations impact the way businesses are conducted. Competitions and differentiation is now being rested on technological revolutionary changes and not just on the products corporates innovate. Communication of new product concepts holds the key and this is pocketed by owners of 'constantly changing technological developments'. Dynamic pricing, digital marketing, banking styles and methods and even governance is rendered technology dependent. Businesses have driven technologies for their growth and existence and it is now the turn of technologies to lead businesses by constantly providing inputs in the supply chain and financing. Reconciling to this reality, one must pro-act as to what changes are in vogue and what technological innovations will keep the businesses float.

"Net neutrality" has provided a ray of hope for learners with poor background to acquire technologies and remain visible on the net.

In short, the future of work of many will be at stake and move them away from the value chain cycle if right technologies are not acquired by the workforce. Even acquiring a language at the right time can help them remain with the employer due to perhaps some export commitments the employer did. It is different to say that a singer or a dancer or a musician or a journalist/writer can survive with his innate skills and is not influenced by technological innovations. He keeps engaging by being available to the new technological platform and perform the same old art. But what about the millions who do not have such skills. Similarly, if corporates redefine their business by saying 'our business is to take care of our shareholders and not all stakeholders"?

All this argument drives us to the fact that the future hangs on large scale businesses who can afford all this change and bundled up into change agents. It remains to be seen whether these large business houses remotely run governance of a country. But one ray of hope hinges on all employees that as long as they remain cheaper, they tend to get hired. But slowly even this hope is dwindling as cheap labour can become costlier when they tend to handle unknown technologies!

2.4. Internet of Things (IOT)

The next big thing in technological changes that would influence industries is Internet of things and the information flow from this leading to new ways of conducting businesses. IOT, it is said can help businesses to increase productivity, cut costs, improve products and offer new products/services and press into force new business models. IOT needs technology integration and skilled staff for implementation. (Xia, Yang, Wang et al., 2012). Even a simple plumber and service provider for household goods needs to upgrade and get trained. In a paper published in Wharton Journal experts from Wharton and Dell Digital Business Services argue why companies cannot ignore IOT in the digital age to gain competitive advantage." It also often creates new demands around security and interoperability — the capacity for varied computer systems and applications to "talk" with each other" the experts aver (Xia, Yang, Wang et al., 2012). "Across the world, everyday devices are getting connected to the Internet — thermostats, water meters, home alarms, kitchen gadgets, medical equipment, factory machinery and even cars. Col-

lectively, this ecosystem represents the next frontier in the digital revolution — the Internet of Things or IoT. And unlike the simple automation of machinery, IoT is also mobile and virtual, and features a continuous Internet connection (Wortmann & Flüchter, 2015).

The IoT ecosystem consists of data sensors, networks, cloud storage, applications and devices, all working together to help companies and consumers manage their digital lives in a smarter way:

"By converting all passive things around us to active things that share information about themselves, IoT enables us to understand them better than ever before and thereby helps us to bring about huge improvements in everything we do," says Raman Sapra, global head of Dell's digital business services unit. IoT will also drive the next level of digital adoption across consumer industries, manufacturing, supply chain and other areas. "This in turn will result in operational excellence, new revenue models, enhanced employee engagement and a superior customer experience," he adds. (Nah, Lau, & Kuang, 2001).

The story of John Deere, who developed the first commercially successful, self-scouring steel plow, closely parallels the settlement and development of the mid-western United States. He offers a case in point. "The company has been making steel ploughs since 1837 and the name brand is synonymous with farming and tractors in the U.S. But beginning in 2012, John Deere embedded new sensors in its products and marketed connectivity as a key product benefit (Ashton, 2009). Today, those sensors provide farms with decision-support information on where to plow, what crops to plant and when to plant. That information is potentially more valuable over time than the tractor pulling the plow" it was stated in the Journal of Wharton.

IoT works in real time to provide massive amounts of data with great precision. It can help synchronize connectivity when it gets integrated into an organization's enterprise systems, such as enterprise resource planning (ERP), customer relationship management (CRM) and product lifecycle management (PLM). Ajay Jasti, practice leader of IoT at Dell digital business services, agrees that IoT will result in "new products, new services, new business models and enhanced customer experience."

"A German manufacturer of optical microscopes, for example, saved more than $500,000 annually by avoiding 400 on-site visits using an IoT model. Predictive maintenance, meanwhile, can mean fewer claims on warranties, while less downtime for customers means improved customer satisfaction, leading to repeat business". The paper in citation above states. Similarly, in a Hotel, if IOT is implemented sensors would alert to switch off and switch on HVAC systems and other systems to save on unnecessary power bills and save on costs.

IOT has some problems too like security breach and threats from Hackers to make systems collapse. Even disgruntled employees can resort to these games to invalidate systems.

2.5. Change Management Demands From External Environment

The objective of change management in this context is to ensure that standardized methods and procedures are used for efficient and prompt handling of all changes to control IT infrastructure, in order to minimize the number and impact of any related incidents upon service. Changes in the IT infrastructure may arise reactively in response to problems or externally imposed requirements, e.g. legislative changes, or proactively from seeking improved efficiency and effectiveness or to enable or reflect business initiatives, or from programs, projects or service improvement initiatives. Change Management can ensure standardized methods, processes and procedures which are used for all changes, facilitate efficient and prompt handling of all changes, and maintain the proper balance between the need for change and the potential detrimental impact of changes (Bloodgood, & Salisbury, 2001). Existing academic research

has paid little attention to the fact that external variables have contributed to a disjointed process of organizational reform. When the issue of change has been examined within the public safety and security context, it has most often focused at the micro-level.

2.5.1. Understanding Change

We used the expression 'change" in many contexts above. It is time we understand the essence of Change before we think of managing change by trying to be ahead of it or in order to invent change. Infinity and uncertainty are the parents of Change that is growing into the future! If you can't find it invent it and become the change maker or change leader!

2.5.1.1. Genesis of Change

Change can occur in any one or all or some of the following forms at different times or at the same time. Change includes original form of change due to environmental change or due to strategy revision necessitated by external factors or due to correcting missed out factors in the original strategy considerations. It also includes change within the organization, which is made in response to another change. Buckley and Perkins in 1984 advocated that 'change' and 'transformation' vary in that change is gradual and small, whereas transformation is change on a significant scale. Transformation in organization (major overhaul in job definitions, reporting lines etc.), transformation in the way the system operates (communication, processes and working relationship), transformation in employee consciousness (beliefs, myths, attitudes, experienced etc.) is all on a significant scale. Managing change is not a matter of applying standard solutions to standard problems. Well-informed and well-motivated individuals can bring out successful change and there are no standard tools to counter change or implement change. Diagnosis of a situation holds the key for deciding among the best alternatives to manage the change. Surveys, team-building activities, inter group activities; efforts to change corporate culture have one thing in common- change management by trying to pro-act *(*Stevens, Caralli, & Willke, 2005). In his book on 'Management Challenges for the 21st Century' Peter F. Drucker identified the following as the new certainties: These are change agents, modified and presented as under.

Change in composition of demographic influences in the market Accordingly, product mix, production processes, R&D efforts, marketing strategy and corporate strategy, business mix and mission, social mission etc. keep changing.

Shifts in the distribution of disposable income are certain. During 21st century the impact of the above on the industry of any kind has to be understood by clarifying what do we mean by a 'growth', 'mature' and 'declining' industry. A growth industry may be understood as one in which the demand for its products grow faster than national income and/or population.

If such factors are equal, it is a mature industry and if the demand for its products does not grow at the pace at which its income/ population grows, you are hitting a declining industry even if its absolute sales volume still continues to grow. This industry composition varies from one country to another and hence globalization is resorted to in order to give new lease of life to a declining industry of one country to enter growth phase of another country. Financial services, BPO, Information technology and the ever green power sector and water management and agriculture/food sector health care and education become the key investment areas apart from infrastructure based adventures. One sign of decline is that products will become commodities and cost reduction and improvement in quality will be demanded

keeping the managements in a big dilemma whether to invest in R&D or not. This is the reason for global competition will increase since MNCs revolve around countries that have population with growth trends in distributional/ disposable income and apply strategies to squeeze the purse (Ćirić, & Raković, 2010).

How 'performance' is defined and measured varies over time. But ultimately, 'power follows property' and businesses follow performance.

Global competitiveness: The growing incongruence between economic globalization and political splintering.

2.5.1.2. The Flow of Change

- Environment
- Product mix and services it opts to provide
- Technology and working methods
- HR policy changes
- Organization Structure or size

2.5.1.3. Change, Its Nature

Changes can be brought about or thrust on an organization in different ways.

- *New Technology*
- *Reorganization*
- *Working conditions*
- *Change in personnel policies and management styles and communication channels*

It has been established by Burns and Stalker's theories on mechanistic and organic organizations that nature of organizations destines dealings with change.

Effectiveness over elapse of time during the organizational life cycle is the true test. Organizations go through phases of set up, growth in size and scope, slackness in expansion showing signs of ensuing maturity and decline. But such a life cycle may not occur as a rule. The Sigmoid Curve shown below predicts that a corporate would be inclined for change only if decline is certain and in the midst of crisis at point B. But some of the wise managements would act if needed even at point A of upward growth phase in the cycle showing signs of another Sigmoid Curve at A. This leads them into survival and growth.

Apple Computers even though invented first PC with Macintosh user-friendly interface, did not license its technology to others for long and thus failed to set any benchmark. On the other hand, a later entry Microsoft kept off from hardware and went ahead licensing its MS DOSS and Windows. Globalization demanded change and companies that have slept on this never woke up. Successful companies remain at high peak when they practice the acrobat of walking over the waves of the change perpetually! (Engelsman, 2007).

2.5.1.4. Growth Is Also Change

The price of success is growth. If success is not followed by growth, success sinks successful people or organizations.

Greiner (1972, 1998) describes how companies go through a series of phases as they grow. Greiner growth model postulates:

Phase 1: Growth through Creativity.
Phase 2: Growth through Direction.
Phase 3: Growth through Delegation.
Phase 4: Growth through Coordination.
Phase 5: Growth through Collaboration.

Quin argued for logical incremental change, suggesting change management takes place around the need for change in the environment and not through any rhythmic life cycle stated above. Greiner's model of life cycle theory is not reflective of real life situations, though provides some broad perspectives. For example, mergers, setting JVs might skip some early phases. Also growth and effectiveness are different perspectives. (Terra & Gordon, 2003)

2.5.1.5. Issues of Size Have Started Sizzling!

Size has become a hot topic. Change management styles and comforts rest on size of companies.

Smaller size organizations have certain advantages but have proved a failure in handling change.

2.1.5.6. Laddering the Change

When occurrence of Change is an uncontrollable factor, wise managements try to convert this 'threat' as 'opportunity' by pro-acting or laddering the change phenomenon. By pro- acting we mean by initiating the change process on yourself before it is dictated by circumstances. This needs continuous interaction with the environment and introspection with in. To ladder the change, the way you want the following strategy has been proven to be useful. (20)

1. Determine the need or desire for change in a specific area by analysing the elements that trigger change. For example, E-Merk a pharmaceutical company accelerated change by making a strategic alliance with a service provider. Similarly, see the Time Warner merger and Tata Tea and Tetley merger, where their managements pre-empt the change event by inviting the change of themselves instead of waiting for things to happen. This is what we mean by change management (Pandya, Singh, Mittelstaedt et al., 2004).
2. Prepare a tentative plan by examining alternatives to avert the possible change or find rolling up of slow change events into one big alternative.
3. Analyse probable reactions to Change.
4. Bring out alternative strategies and make a firm choice.
5. Define and evolve a time frame with in which change should be landed in various parts of the organization. (Möller & Svahn, 2006).
6. If change is thrust, time frame has no relevance for initiating change management and in such cases immediate action to counter or damage control change is imminent. However, time frame to conclude the change may also be difficult, if such change management becomes continuous. For example, automation of inventory control system or production process can be taken up on a pilot project basis before shifting to total automation of the whole company. Similarly, automation in a bank can be implemented among some selected branches before going for all round automation.

7. Similarly, divestiture of various divisions can be taken up on a step-by-step basis, by first initiating action in one division. Implement the change by continuously reviewing the change process, evaluating various alternatives and incorporating best suitable model relative to the demands of the changing scenario.
8. Organizational changes and change management must be in line with the strategic plan and must fit into strategic formulation process, so change management is integrated into the total strategic framework.

2.4.2. Change and Corporate Culture

Cultural change involves identifying and exposing hidden assumptions of the new culture, trying to identify the conflicts and devise mechanisms for change.

2.4.2.1. The Change Leaders

Change leaders must know why Change fails. Allowing too much complacency, failing to create the required guiding coalition, under estimating visionary outlook, playing into obstacles that block vision, keeping off vision from tasks and doers, failing to create mile stones as short term wins, declaring victory sooner than when it's really won, neglecting to anchor/not just embed changes firmly in the corporate culture, neglecting the HR factor have all contributed to failure among other at all cross roads of change. Change leaders require according to Peter F. Drucker some of the following: Policies to make the future and build future by abandoning past.

1. Organized Improvement.
2. Exploiting success.
3. Systematic methods to look for and anticipate change by innovation.
4. The right way to introduce changes, both within and outside the organization.
5. Policies to balance change and continuity.

2.4.3. How to Implement Change? (Kotter and Cohen, 2005)

Understand the change perspective and dimension and explore piloting change. Implemented as pilot project sometimes helps accomplishing a win-win situation. Establish sense of urgency and take up issues on war footing. Core the challenge and becoming change agents. Create a guiding coalition: Match right people for choicest tasks. Team them up. Ensure the team develop a creative strategic vision and net around it the strategies: Move beyond the numbers game and conceptualize and create. Ensure the team address the creative components of vision and develop the right vision and strategy for the change effort.

Communicate the change vision to all concerned and allow work in transparency and buy change and fly with all its wings. (Markus, & Robey, 1988). Empower broad based action by removing key obstacles and create systems to encourage the team to act and follow visionary change along the strategic path. Real change requires people to adjust their behaviour, and that behaviour is often beyond the control of top management.

Create short-term goals and winnings short enough to energize the change helpers enlighten pessimists, defuse the cynics and doubting Thomas and build momentum for the effort. Fewer resist the change

process and goals. Years of study and experience have shown that the things that sustain change are not bold strokes but long marches. So one has to consolidate gains and move forward until vision is realized.

Anchor new approaches in the culture by creating a supporting structure that provides roots for the new ways of operating. New and winning behaviour need to continue despite pulls of tradition, turnover of change leaders etc.

The next section brings to light some unique existing models for change management of information assets.

3. EXISTING CHANGE MODELS

In order to handle effectively change management of information assets, there are several existing frameworks or models i.e. over 30 are known of which we have listed commonly used 21 for consideration of user' assessment. They are:

1. Kotter's 8 Steps.
2. Change Equation.
3. Prosci's ADKAR (Awareness, Desire, Knowledge, Ability, and Reinforcement) Model.
4. Leadership Change Model.
5. PDCA / Kaizen.
6. Efficacy-Based Change Model.
7. Meaning-Making Change Adaptation Model (MCAM).
8. Bolman & Deal's Reframing Change Model (Four-Frame Model).
9. Swedish Organizational Change Model.
10. Jick's 10 Step Process for Implementing Change.
11. Garvin/GE's change model.
12. FEEL IT.
13. Satir Change Model.
14. Dynamic Stability (Eric Abrahamson).
15. Tichy's TPC (Technical, Political, Cultural) Framework.
16. Burke-Litwin Model.
17. Bridges' Transition Model.
18. Evaluation, Re-evaluation & Action (ERA) Model.
19. Trans theoretical Model of Change (TTM).
20. Osborne and Plastrik's 5 Cs.
21. Lewin/ Schein's three-stage process.

In this paper, we attempt to deal with some of these models only.

3.1. ADKAR Model (Awareness, Desire, Knowledge, Ability, and Reinforcement)

The objectives of this model are:

1. To provide and guide the stakeholders during process of change or transitioning while the change management is taking place.
2. To diagnose and treat the resistance shown by employees towards change.
3. To come up with goal congruence in employees with organization during the change.

3.1.1. Benefits of ADKAR Model

- The model offers the capability of Identification and evaluation of the reasons why changes made are not working and why desired results are not being obtained.
- The model makes it possible for one to break the changes into different parts and then figure out the point where change may not be as effective as planned.
- It offers both business dimension of change as well as people dimension of change.
- When applied to organizational change, this model allows leaders and change management teams to focus their activities on what will drive individual change and therefore achieve desired organizational results.
- ADKAR provides clear goals and outcomes for change management activities.
- It provides a simple, easy-to-use framework for everyone in the organization to think about change.
- Employees, managers and senior leaders alike can all use ADKAR to describe and discuss change together.

3.2. Lewin/ Schein's Three-Stage Process to Change

It is common knowledge that experience is rewarded if it is coupled with accomplishing desired results. Specific managerial skills and team work is Organizational Capital. But there are situations where experience will no more be bliss and becomes a curse! Learning in the words of John Hunt involves not only re-learning but also trying to unlearn what is already known. In some cases, change requires such unlearning and demands fresh learning. Lewin/ Schein's three-stage process to changing human behavior is depicted in Figure 1.

Figure 1. Three-stage process of change

3.3. DICE Model

In their illuminating article "The Hard side of Change management" Harold L. Sirkin, Perry Keenan, Alan Jackson have brought out four key factors which were guarded in most of the successful projects. These are Duration, Integrity, Commitment and Effort (DICE) (The Hard Side of Change Management.2005).

In their words:

D. The duration of time until the change program is completed if it has a short life span; if not short, the amount of time between reviews of milestones.

I. The project team's performance integrity; that is, its ability to complete the initiative on time. That depends on members' skills and traits relative to the project's requirements.

C. The commitment to change that top management (C1) and employees affected by the change (C2) display.

E. The effort over and above the usual work that the change initiative demands of employees.

They suggested a method to evaluate the success of the project based on DICE score which is awarded by the executives based on a set of questions put to them covering each of the four factors. The executive must grade each factor on a scale from 1 to 4 (fractions no bar), and lower the score the better it is about positive outcome that the factor is important for project success.

DICE SCORE = D+(2*I) + (2*C^1) +C^2+E; where C^1 is senior manager level commitment and C^2 is commitment at local level.

Scores were categorised as WIN zone, WORRY zone and WOE zone depending on the scores in the DICE factor score. It is important that DICE scores are awarded by knowledgeable people who have equal commitment to excel in the project and are competent in all respects to participate on equal footing and were properly trained to provide dependable scores and have interest in the survey and are not biased to any set of senior management executives. More light on participating executives is needed. Similarly, sometimes Duration is dictated by urgency caused due to change thrust on the company, like say legal requirement.

The next section proposes a new model in change management of information assets to effectively and holistically manage change.

4. PROPOSED MODEL

Having touched upon topics of change management, we now switch over to the discussion on how we would react to change as information mangers handling the crucial corporate asset the "Information". For this purpose, a new step-wise model has been formulated as follows:

Step 1: Know what information you have and how to manage(protect/exploit) it through transition due to change. If the organization is facing change (administered either due to internal compulsions or external forces) either an organizational one or technological one such as upgrading a key system or due to the fact that top management is preparing change process keeping in view an impending

major change scenario in future, follow the process without having any initial hiccups about your job security or change in your duties/designations. Do not waver from continuing to do your existing routine unless specifically advised otherwise. During change it is very easy for things to move out of alignment, for technology to stop supporting the use of your assets in the way that you need, or your information assets to fail to provide the data that new business requirements call for. Ensure existing data is loaded into the new format without data loss.

Step 2: Understand the Change model suggested: The following were suggested to manage impact of change on Information Assets:

- Understand your business drivers for this investigation and frame your objectives accordingly
- Identify your information assets
- Understand your business requirements for using information
- Document the relationships between your business requirements and your information assets in a way that supports your objectives

Step 3: Setting Objectives:

a. Ask yourself why you are tinkering with the existing information and what you desire to achieve after the exercise? Is it incident based (causing some loss) or more a preventive prescription (with probability of occurrence mapped)? Can you defer action of change as the incident is not repetitive in nature? Is the impact of change likely to be felt on a specific business unit or on whole organization? Can you prioritize your action of change and bring it into any time frame? What impact it will have on employee working conditions? Have you done any Cost benefit analysis of change now and change later? Who did it?

b. How to manage digital continuity of information to enable us to use it as we need?
   Stage 1: Plan for action
   Stage 2: Define your digital continuity requirements:
   Stage 3: Understand the change scenario which varies from time to time
   Stage 4: Ensure digital continuity:
   Stage 5: Digital continuity in change scenario.
   Stage 6: Final steps:

Step 4: Find out how you need to use your information

a. How will you find the desired information and where?
b. Who has access and how he got it and how he does it?
c. How do you need to be able to work with the information? (editable? accessible to disabled user? Who will read and who will write and can you maintain formulae embedded?
d. What are you expected to know about the information? (links to data etc.)
e. Is the information held is reliable and how to check it? (access incidents log etc.)

Step 5: Business requirements and information assets available recorded

a. Are you maintaining Information asset register(IAR) having all details? (description, users, date, assess status, purpose, value, retention schedule, how do you need to use it? Risk perception associated to each)?
b. Identify asset owners
c. Maintain and update IAR

Step 6: Technical review and management:

a. Map to technology dependencies for each asset to meet business needs and understand in the process potential impact of change on them and budgetary preparations to meet the future needs due to change impact.
    i. Know your technical environment in which your information assets are functioning.
    ii. What technical dependencies to be recorded? (how to find/who can access/what to do with the asset/what more to know about it/how far and how long it is reliable?)
    iii. Is your IAR update?
    iv. Capture and record technical dependencies (key data repositories- IAR/CMDB/software registers/hardware registers/IT Help Desk data/facilities & estate management data base)
    v. Key information flows and work flows – (data flow, work flow, software tools, roles and responsibilities
    vi. Monitor and review output
    vii. Understand how mapping helps deliver your usability needs
    viii. Measure them against business objectives
    ix. Review and audit
    x. Review documentation and processes
    xi. Undertake risk assessment, exploit opportunities, assess change impact,
b. Understand your information management needs
c. Identify and mitigate risks
d. Identify opportunities for disposal/use/ savings and efficiencies
e. Manage Change.

The steps are graphically represented in the Figure 2.

In an illuminating paper "Change management information systems development and implementation projects" the authors Zoran Ćirić and Lazar Raković published in Management Information Systems expressed as under:

As demonstrated by numerous research studies, a major number of information system development and implementation projects tend to end in failure. As an inevitable factor of contemporary business operations, changes make a strong impact on the success of a project. (Ćirić, Z., & Raković, L. 2010)

The following pictorial presentations as shown in Figures 3-6 and Table 1 elucidate his argument further.

Some of the hard factors identified by experts handing change have listed them as under and these will affect a transformation initiative. These are the time necessary to complete it, the number of people and mix of people who are required to execute it, and the financial results that intended actions are expected to achieve. So, information scientists must involve in the process of framing the change strategy and provide their valuable inputs in deciding the DICE factors and should not become sacrificial goats while accepting the stupendous task of change management by sacrificing the DICE in favour of change seekers- ask for duration needed, supply tons of integrity, muster commitment from all team members and make all efforts in integrating information assets into the new scenario after change and feel your relevance into the future with confidence. You must remember work comes in search of competence! So be aware at individual level the business exigencies for change. Express your willingness and desire to participate in the change. Learn the change process and change outcome by involving in teams. Muster

Figure 2. Proposed model

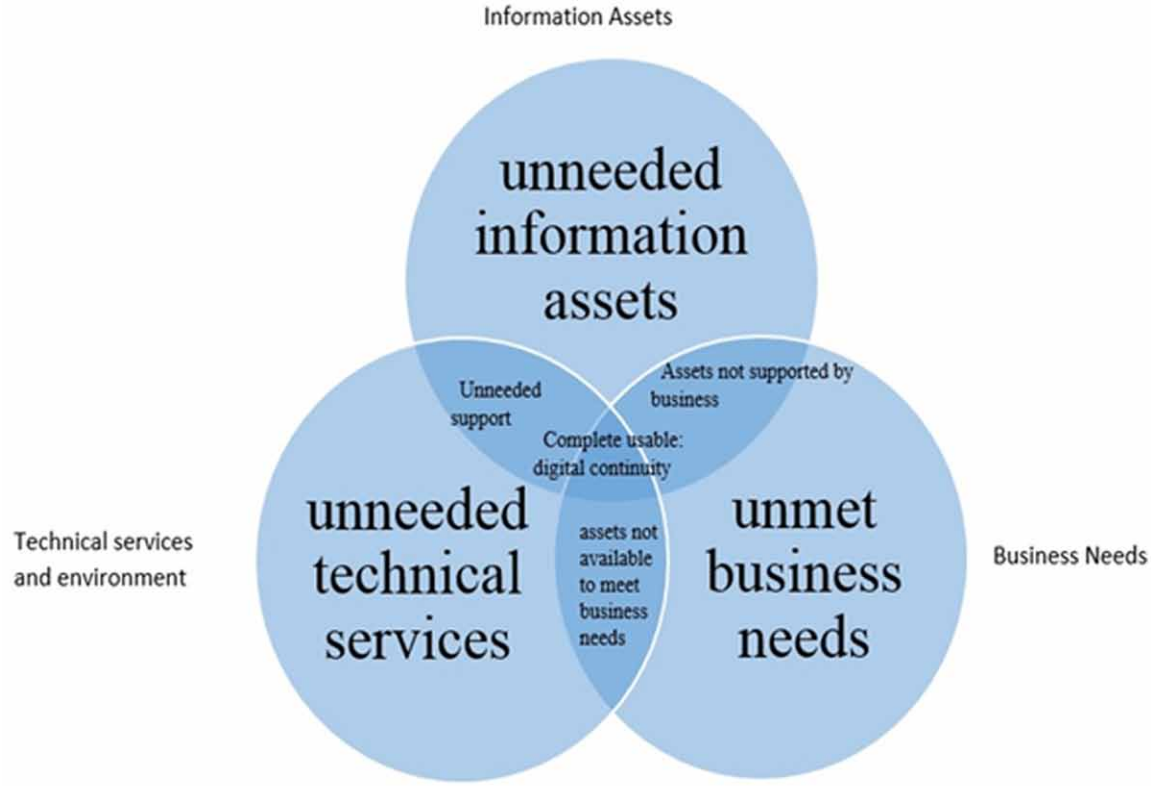

Figure 3. Success rates of information system development projects (Martineau & Shumway,2009)

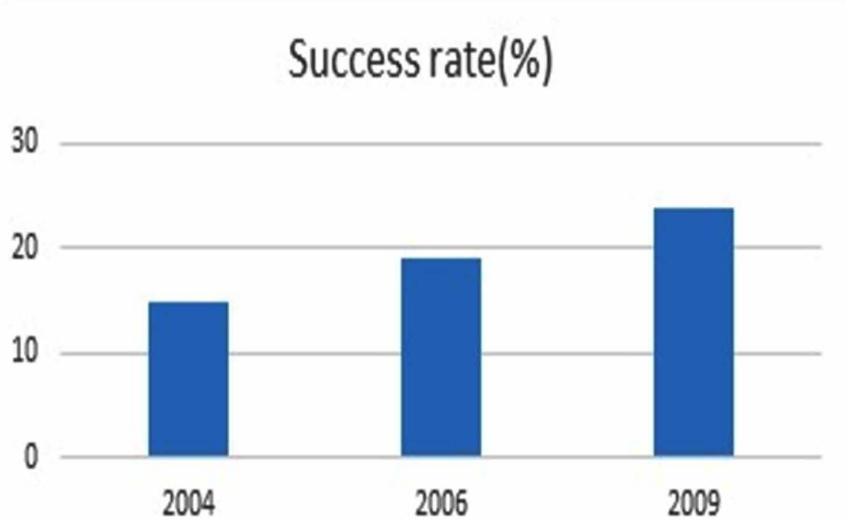

Figure 4. Monitoring change implementation (Partridge,2007)

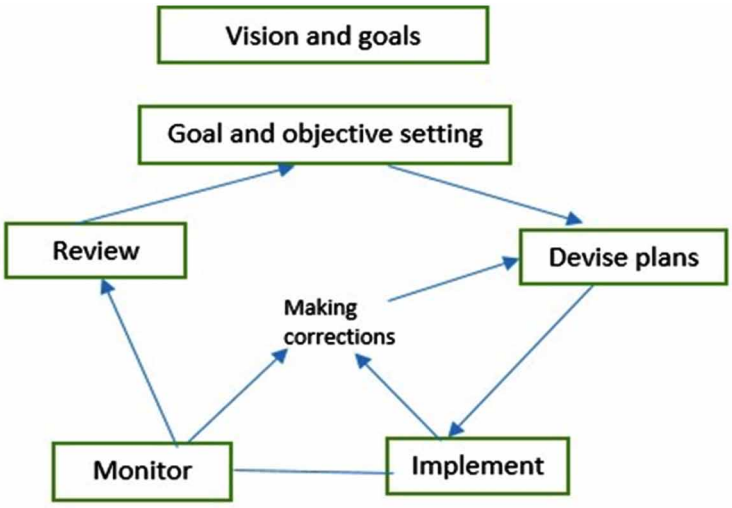

Figure 5. The stages of change (Cadle & Yeates, 2008)

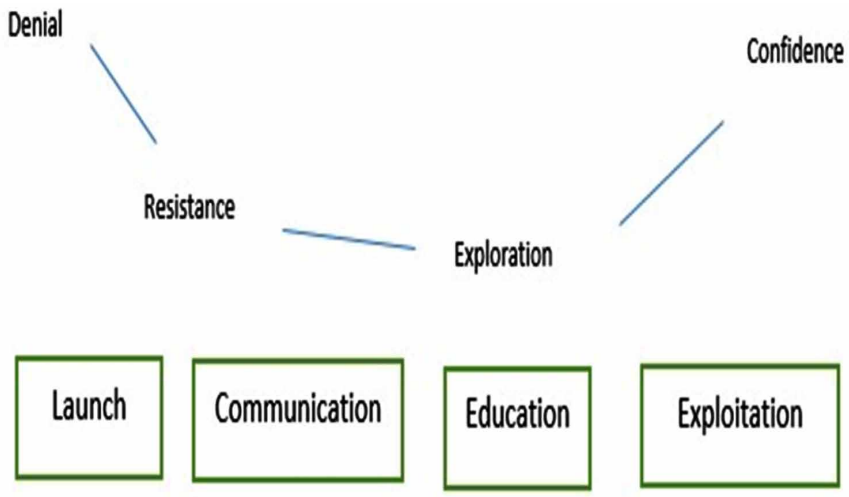

strength and ability to implement the change expected at your level. Old habits die hard. So ensure change sticks and reinforce confidence in the new and improved measure to adopt change.

There are umpteen number of models developed for change management to work. But the common thread passing through all of them is that change may be coined, imagined and scripted by an individual change leader, change may be induced by him but unless it is seasoned with the people's participation and built brick by brick to their imagination and spread across all the desired areas through right information channels, it is difficult to secure required outcome. Information asset will always have to remain current and updated to new business realities. These must be allowed to flow along the business lines.

Figure 6. Change competence/commitment matrix (Cadle &Yeates, 2008)

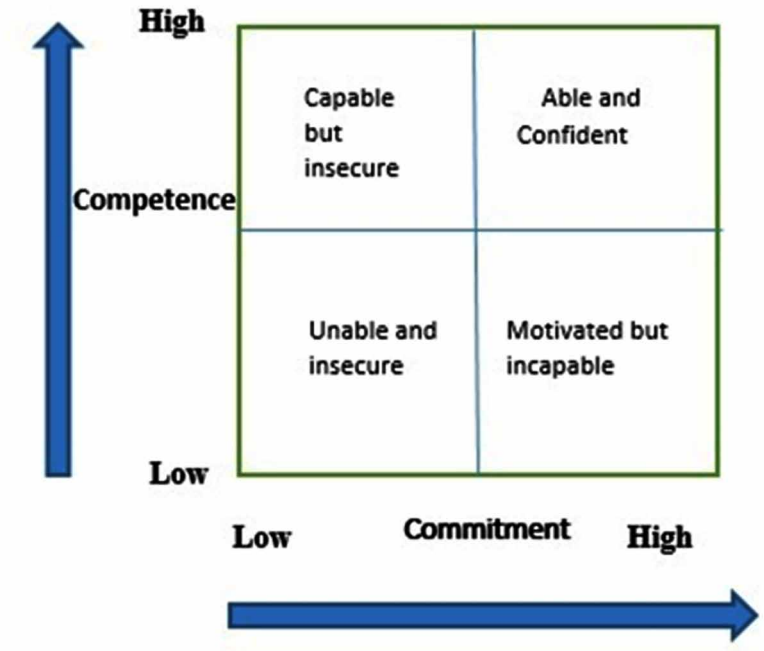

Table 1. Time and change matrix (Cadle & Yeates, 2008)

Change Type	Short-Term (3-9 Months)	Long-Term (>1 Year)
Radical	Restructuring and redeployment of staff	Business process re-engineering
Incremental (gradual)	Process automation and refinement	TQM, innovation schemes

It is neither a game of DICE nor any gambling. Change leaders carry information in their heads and on their shoulders, people and their interests in their nerves and business interests in their heart while finding their path into the uncertain future of ever charging change.

5. CONCLUSION

Change management of information assets is a very serious topic that needs further probe among the channels opened up as above. Technology changes are a key threat to digital continuity, as it is very easy to lose necessary usability of assets during transfer. Change is triggered more often from outside the organization and hence needs mature handling. Information assets belong not only to their creator but more importantly to all its intended users. Calls of Change have to be felt in advance to gear up information assets to the impending change. Companies can claim to hold useful information assets only if these assets foretell impending change. Often the problem lies with the analysts who dive into the information assets but not able to draw meaningful conclusions about impending change. Change managers will not be able to lead change in the industry unless they are equipped with or confident of quickly acquiring meaningful information systems that can withstand change paradigm.

Chapter 78
Development of Innovative User Services

Long Xiao
Peking University Library, China

Yaqiong Liu
Peking University Library, China

ABSTRACT

Higher education is continuously progressing toward globalization and openness, and models of teaching, scientific research, and learning are rapidly changing. Due to macro-environmental changes, academic libraries must actively adjust their functional positions and explore new methods for user services. To satisfy users' increasingly diversified needs for information, academic libraries are continuously extending user service functions, and gradually evolving from libraries that provide lending services to centers of learning, teaching services, knowledge, and culture on campus. Through functional repositioning, academic libraries are constructing more systematic and diversified user service systems by improving basic services, deepening support services, extending services in teaching assistance, boosting services for cultivating humanistic literacy, developing spatial services, and expanding new technical services. Throughout the above-mentioned development processes, there has been a clear trend of change in terms of the contents, marketing, and cooperation of user services.

INTRODUCTION

With the evolution of an information-based society, the development of tertiary education continuously progresses toward globalization and openness. Digitalization, intelligence, ubiquity, and mobility in teaching, scientific research, and learning are becoming increasingly prevalent, with rapidly-changing models and contents. Due to macro-environmental changes, academic libraries must face challenges, repositioning, and transformation in expanding both the objectives and functions of their user services.

This chapter first gives an overview of the repositioning of user services in academic libraries in Mainland China and the reconstruction of the service system framework in new environments. It then focuses on several cases of new types of services, concluding with a summary of the development trends of user services in China.

DOI: 10.4018/978-1-5225-3822-6.ch078

REPOSITIONING OF USER SERVICE FUNCTIONS

As we enter the digital era, information resources and services are becoming increasingly ubiquitous, which challenges the role of academic libraries as a traditional information center. To satisfy users' increasingly diversified needs for information, academic libraries are continuously extending user service functions, and gradually transitioning and repositioning from libraries that provide lending services for books and periodicals to being centers of learning, teaching services, knowledge, and culture on campus.

Learning Center

Along with the changes in higher education models, e-learning, blended learning, and collaborative learning are gradually on the rise. To adapt to this trend, academic libraries are integrating information resources, digital technologies, modern equipment, and multimedia services in order to create a functionally-powerful, one-stop learning center. Through these new services, academic libraries support group learning, as well as collaborative and personalized learning, with abundant resources, improved facilities, and powerful technical equipment and support.

Teaching Service Center

Traditionally, formal instruction at colleges and universities was solely performed by teachers, while libraries only played the role of passive literature providers. However, with the increasing need to cultivate innovative talent in higher education, academic libraries are gradually becoming part of the primary education process, and are providing increased support services for instruction.

On the one hand, libraries directly participate in the teaching process and the undertaking of pedagogical tasks, which includes opening elective courses related to topics such as information literacy and learning literacy. Libraries also provide information literacy training embedded in professional courses and information push services that support professional courses. Models of teaching include classroom teaching, open remote video seminars, massive open online courses (MOOCs), and more.

On the other hand, libraries provide instructors and students with powerful support services, such as reading rooms specifically for course reserves and service platforms for electronic course reserves, in order to facilitate access to reference materials. These services may also include providing teachers with courseware production services for their classroom teaching, flipped classroom teaching, and more.

Knowledge Center

Libraries fully fulfill their traditional functions through knowledge organization and knowledge services. Information resource construction has been implemented based on the disciplines of individual colleges or universities, and libraries establish knowledge systems with comprehensive collections according to the demands of the relevant academic disciplines of the colleges or universities. By collecting, preserving, and disseminating knowledge for the various disciplines, libraries are able to meet the demands of teaching and scientific research with regards to information resources. In addition, libraries provide teachers and students with powerful support for their scientific research and innovations by offering services such as research project consultation, sci-tech novelty search, citation retrieval for research

evaluation, patent and intellectual property services, competitive intelligence services, analyses of scientific research trends, applications of scientific research tools, decision-making support, data support services, subject services, and so on.

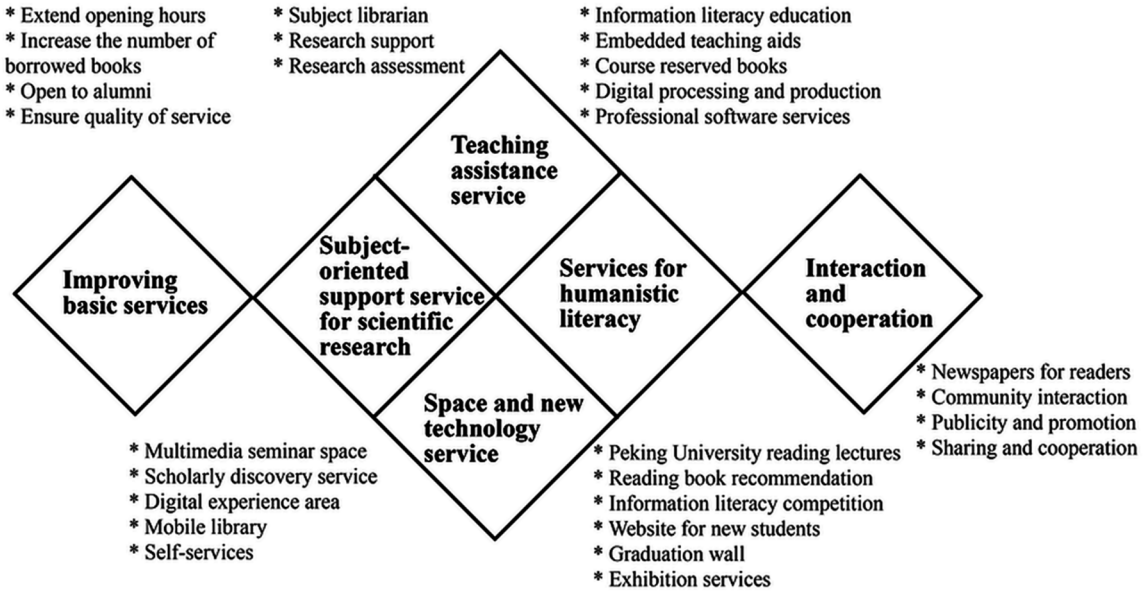
Cultural Center

Academic libraries play a crucial part in the development of campus culture and undertake important responsibilities for preserving and communicating cultures as well as improving the overall quality of university students. Not only do abundant collections play an indispensable role in disseminating human culture, but libraries also serve as activity centers for promoting campus culture. By hosting events such as reading activities, academic salons, expert lectures, calligraphy and painting exhibitions, music appreciation, and film screenings, the humanistic literacy of students can be improved, the cultural tastes of libraries can be projected, and the cultural brand of the campus can be forged.

RECONSTRUCTION OF THE USER SERVICE SYSTEM

Through functional repositioning, academic libraries are gradually breaking down the barriers of traditional service patterns by exploring new models and approaches in user services. They are also gradually constructing more systematic and diversified user service systems. The real-life example in Figure 1 is a schematic diagram illustrating the user service system of Peking University Library, which reflects the reconstruction of the service system.

Figure 1. Schematic diagram of the user service system at Peking University Library



Improving Basic Services

Contemporary society is transitioning from being 'e' (electronic) to being 'u' (ubiquitous). With the assistance of the Internet and new types of information tools, as well as the application of diversified service methods, the traditional services of academic libraries, such as book lending and reference services, have changed fundamentally in order to bring library services to users anywhere and at any time (Pan & Lan, 2008). For example, the use of self-service borrowing and returning machines, mobile borrowing machines, and other related equipment has facilitated a self-service circulation system. In addition, basic services can be further improved by taking certain measures, such as extending library hours or increasing the number of items patrons may check out at one time. In terms of reference services, aside from traditional forms of face-to-face, e-mail, and telephone consultation, many academic libraries also provide real-time virtual reference services with the help of Instant Messaging software. In recent years, academic libraries have increased real-time reference interactions on social media such as WeChat, Microblog, and Renren.com, to accommodate user habits, thereby truly integrating reference services into the daily lives of users.

Deepening Support Services for Scientific Research

Using their resource advantages and information capabilities, academic libraries are deepening support services for scientific research in the following ways:

- First, by continuing to advance the implementation of the subject librarian system, thus delivering more targeted support for teaching and scientific research. Based on the needs of individual schools and departments, as well as developments in different disciplines, academic libraries are able to deliver tailored services such as subject consultation, resource retrieval and application training, information measurement and analysis, information push services, and so on.
- Second, by delivering embedded support for scientific research, including consultations on topic selection, literature surveys, feasibility analyses, data surveys, and more. Academic libraries also deliver services such as sci-tech novelty searches and certification services for indexed and cited papers to facilitate applications for research topics, appraisal of project achievements, applications for papers, and more (Li & Yan, 2014).
- Third, by providing in-depth services in relation to intellectual property, including patent retrieval, consultation for patent evaluation, intelligence analysis on subject competition, and so on.
- Fourth, by using bibliometrics to explore services for scientific research evaluation, including performance appraisal of research achievements, analysis of development trends within a discipline, and so on.

Extending Services in Teaching Assistance

In addition to guaranteeing resources for teaching activities, libraries are gradually participating more directly in instruction at colleges and universities. This includes the following:

- Establishing an all-round and multi-dimensional system of information literacy education, in order to improve students' information awareness and information capabilities. The system includes

relatively short, flexible, and frequent training seminars, campus-wide elective courses related to information retrieval and utilization, and remote service-oriented video-recorded open classes, MOOCs, and e-learning, in addition to face-to-face, interactive small-group training.

- Moving further to the forefront of teaching by providing embedded training related to resource retrieval and utilization. One such type of training is embedded in instruction platforms, where discipline-related resources and teaching courseware are published. In addition, libraries communicate interactively with students to solve difficult problems related to retrieval using a variety of forms such as Internet instant messaging tools, emails, forums, and microblogs. Another type of training is embedded in professional classrooms, where librarians fully participate in the process of course design, instruction, and evaluation; they are responsible for imparting knowledge about information retrieval that is specific to individual courses or projects according to the subject features and the requirements of the course in order to improve students' information literacy.
- Providing course reserves to meet the needs of teachers when starting new courses. Libraries emphasize searching for and managing course reference materials requested by teachers, as well as being equipped for the full-text retrieval of electronic reserves. Librarians spend more time providing resource preparation and support for flipped classrooms due to the increasing popularity of this model of teaching.
- Offering digitizing services, including filming academic conferences and lectures, courseware creation, literature scanning, digitization of film and audio-visual materials, editing of multimedia contents, metadata production, resource publishing, and personalized printing.

Boosting Services for Cultivating Humanistic Literacy

Humanistic literacy, or the literacy in history, philosophy, literature, politics, economics, and law sciences, is an essential quality in the life of a university student. During the process of improving humanistic literacy, academic libraries have fully exhibited their traditional advantage in culture and focused on humanistic care, and have promoted services for humanistic literacy by hosting exciting and diverse activities.

Promoting reading has always been a key highlight in the work of academic libraries in delivering services related to humanistic literacy. By providing services and hosting activities, such as reading lectures, exhibitions of classical bibliographies, new book recommendations, regular release of book borrowing rankings, reading salons, and book review competitions, libraries advocate for reading more and better books and build a positive reading culture on campus.

In addition, academic libraries are typically equipped with lecture halls, exhibition galleries, and multimedia audiovisual spaces. By hosting expert lectures, calligraphy and painting exhibitions, music appreciation events, movie screenings, and other enriched and diversified activities, the humanistic and artistic literacy of the students will be improved, and their diversified and multi-dimensional cultural needs will also be met.

Developing Spatial Services

Along with the arrival of the post-digital era, mainly characterized by a ubiquitous knowledge environment, an increasing number of users are accessing information, literature, data, and knowledge on the Internet anywhere and at any time. Academic libraries have begun to transcend traditional services that

regarded print materials as the library's core to pursue cross-boundary development of new services. The evolutionary trend in which libraries gradually become the Third Space (the social place outside of the living space and studying space) of the campus is inevitable (Xiao, 2013). The spatial services that come with this trend reflect the value of the academic library as a place.

Specifically, this means that aside from conventional reading rooms, universities and colleges need to open up a great amount of space that is solely used for services, such as learning spaces, information commons, makerspaces, leisure spaces, communication spaces, or experiential spaces. These spaces, which are not usually associated with library collections, are designed to provide a friendly and enlightening cultural venue for users to study, research, conduct exchanges and discussions, and maintain social interactions.

Expansion of New Technical Services

Rapidly-changing information technology has created challenges and opportunities for academic libraries, and has exerted a profound impact on both libraries themselves and their user services. To adapt to the significant changes in the information environment and provide users with more convenient information services, academic libraries maintain a high sensitivity to technological developments, and increase and expand their technical services in novel ways, such as offering one-stop academic resource discovery platforms, promoting mobile library services, offering experience services in digital applications based on equipment such as new tablet computers or e-readers, offering 3D printing, delivering training for software applications, and so on.

CASE STUDIES OF INNOVATIVE USER SERVICES

Data Services

In the Big Data era, data has permeated all sectors and industries, and there is increasing emphasis on its value. Within this context, academic libraries spare no effort in actively expanding new types of data services, including: support services for scientific research data, such as the storage, sharing, and mining of research data; and support services for data-related learning, including training in data literacy and data learning. Based on the above services, joint working groups, such as the China Academic Library Research Data Management Implementation Group, have been established to cooperate in promoting this area of work.

Case Study

In May 2013, trial operations began for the Fudan University Dataverse Network (Dataverse), a platform jointly developed by the Fudan University Library and the School of Social Development and Public Policy, as well as the School of Computer Science (Zhang, Yin, Zhang, Guo & Zhang, 2015). This platform was developed based on open source software known as Dataverse, and it was designed to provide data submission, storage, management, and sharing services for teachers, students, researchers, and academic institutions of the university. The functions of the platform include the following:

1. **Data Management:** Submission, review, and release of scientific data, research results, and derivative publications based on scientific data, as well as validation and conversion of file formats for scientific data; for example, when uploading data, file formats are automatically converted to compatible formats required by current mainstream statistical analysis software including SPSS, Stata, S plus, and R data.
2. **Data Analysis:** Online analysis and data visualization; for example, supporting the online analytic display of time series visualization. Recoding and regrouping of data is possible, as is descriptive analysis and advanced statistical analysis. The results of relevant analyses are displayed in the browser window.
3. **Data Exchange:** Supporting background data harvesting and exchange between social scientific data sharing platforms based on data protocol (e.g. OMI-PMH Protocol, Nesstar format protocol, etc.) and other foreign and domestic data-sharing platforms. For example, the Fudan University Dataverse Network can establish data exchange and harvesting mechanisms with social scientific data centers at Harvard University and the University of Michigan.
4. **Data Curation:** Granting users access to data files according to various user roles, such as restricted site visitor, data contributor, data administrator, Dataverse administrator, and Dataverse network-level administrator; setting separate access rights for Dataverse, programs, and files to ensure data safety; version configuration management, such as updating scientific data; and curation and long-term storage of scientific data.

Furthermore, to effectively reveal and share scientific data, a Data Documentation Initiative (DDI)-based metadata description standard was established, thus solving many existing problems, such as failing to effectively manage research data, vague descriptions of research data, and unstandardized metadata. With the help of this platform, secure and shared access to standardized metadata descriptions and restricted data was achieved, further promoting the sharing and services of the university's scientific data.

Thus far, this platform has integrated a total of 54 data sets and 1,041 data files, including social change surveys on the Yangtze River Delta area, data on the Hangzhou urban economic circle, databases on energy flow and carbon emissions factors, and so on, thereby preliminarily achieving the long-term storage and public access of scientific data. In terms of scientific data sharing, the platform has already brought about shared usage among various research groups and databases. For instance, the Center for Energy Economics and Strategy Studies at Fudan University and the Chinese Population Geographic Information System (GIS) research group have successfully integrated databases on Chinese population and consumption and carbon emissions via the shared platform. The resulting database vividly illustrates the energy distribution, flow directions, and carbon emissions in various regions.

Information Literacy Services

Information literacy education is one of the most important responsibilities of the subject services provided by academic libraries. In recent years, the demand for reform in teaching models and for the cultivation of innovative talent have further promoted the innovative development of information literacy education in academic libraries. An increasing number have started to offer packaged courses and training lectures related to information literacy education, and they have begun to explore and practice embedded instruction. Information literacy education has gradually been integrated into the education systems of colleges and universities, and has become an important step in cultivating innovative talent.

Case Study

In order to cultivate basic information skills and inspire innovative thinking in students, the Shanghai Jiao Tong University Library has gradually developed an information literacy education system with three dimensions: popularizing, expanding, and deepening (Gao, Song, Guo, Li, 2013).

Popularizing Information Literacy Education Through Regular Courses and Training

Regular courses and training are the foundation of the campus-wide popularization of information literacy education at the Shanghai Jiao Tong University (SJTU) Library. It includes regular courses, rolling training, and library orientation for freshmen. Of these, regular courses are open to all undergraduate students across the campus. They are divided into general core courses, public elective courses, and a limited selection of professional courses. Rolling training, which is open to all teachers and students of the university, has an online registration system, adopting a 90-minute model that combines classroom teaching with hands-on computer practice. Library orientation for freshmen consists of two parts: a training lecture on how to use the library, and a field visit. There is also a special column on the library website which offers content-rich library guides and online courseware.

Expansion of Information Literacy Education Through Featured Lectures and Innovative Programs

Subject service teams have organized featured lectures and innovative programs based on the professional disciplines. These events are diverse in content and form, and include two major aspects: thematic training for schools and departments, and training programs for information specialists. Thematic training for schools and departments is a thematic and personalized training program on information literacy which is tailor-made by the library's subject service teams according to the needs of the individual departments and scientific research teams. SJTU offers subject service offices in three departments—Science and Engineering, Biomedicine and Agriculture, and Humanities and Social Sciences—as well as ten profession-oriented subject service teams which facilitate the organization and implementation of various forms of training on a flexible basis. Information specialist training programs, specifically targeted at scientific research teams of all schools and departments, are designed to cultivate scientific researchers with a higher level of information literacy. The training, which involves developing all aspects of information literacy, tends to focus more on project survey, situation analysis, and other related knowledge and skills that are conducive to scientific research. Since its implementation in 2009, this program has enjoyed increasing popularity across the university. It has produced 649 information specialists in hundreds of scientific research teams.

In-Depth Development of Information Literacy Education Through Multiple Types of Embedded Teaching

There are various models of embedded teaching in the SJTU Library, including: locally-embedded instruction, which means that the content of lectures on information literacy is tailored to the needs of teachers and students for a particular professional course, while the knowledge and skills necessary for the course are taught in a focused and one-off basis; tracked progressive instruction, involving planning

and customizing advanced training content via the tracking of a four-year course taken by undergraduate students, and then conducting training and consultation services on a progressive basis, from simple to complex levels according to different learning phases from Freshman to Senior; and fully-immersed instruction, which means working closely with teachers on a specific professional course, whereby subject service teams participate in the whole process from setting the objectives, planning curriculum, and designing assignments to performance assessment and so on.

Publishing Services

Given the importance of scholarly publishing in recent years, and new development trends toward digitization, networking, and openness in scholarly communication, an increasing number of academic libraries have started to focus on and provide publishing services, and have offered support to formal or informal scholarly communication in various ways, including digital publishing of dissertations and theses, paper publishing and video release of academic conferences, the establishment of institutional repositories to provide digital storage services, and the development of an open access platform to provide related services. The scholarly publishing services offered by academic libraries have a thematic and subject-based focus as well as rapid publishing speed, in order to reflect the academic development of the university in a timely manner.

Case Study

Peking University Library is committed to participating in campus publishing activities in order to promote the presentation, dissemination, and storage of the university's academic achievements. In March 2013, Peking University Library and the Office of Humanities & Social Sciences at Peking University jointly launched the Peking University Journals Platform, which was designed to integrate the academic publications edited and published by Peking University, to promote scholarly communication, facilitate academic research, carry out digital publishing, and advocate open access.

Since the project was launched, the library has undertaken a large number of investigations. It has investigated domestic and international progress on the research and implementation of integration platforms for institutional publications, online publishing, and the construction of Open Access Journal (OAJ) platforms. It has also meticulously performed a thorough investigation of all journals, collected papers, and internal publications published by Peking University in order to gain a better understanding of their digitization process, development of editing systems, copyright agreements, and more. After completing the survey, the library systematically sorted through the requirements needed for the platform in terms of layout and functions, and assisted a professional company in completing the construction of the platform. In addition, the library signed contracts with various journals for content construction in order to decide the given format and time of release for recently-published journal issues, thus standardizing working procedures; manual online data capturing was performed for back issues.

On September 10, 2014, the Peking University Journal Platform went online. During the first phase of construction, metadata construction for twelve journals was almost complete, of which five had complete full-text databases from the initial issue to the start of 2014, supporting journal title, ISSN, and full-text retrieval based on keyword searching. This platform was the first online integration platform for journals based on open access among Chinese universities. It has provided support for journals published by Peking University in terms of information release and digital publishing, which has effectively

improved the speed of the entire publication process from submission to publication of academic theses, thus increasing the influence of Peking University journals at home and abroad.

New Media Services

Characteristics such as low entry barriers, convenience, and interactivity have enabled social media to gradually become an important tool for academic libraries in conducting service marketing and creating a new user environment in the age of New Media. Academic libraries actively utilize all kinds of popular social media platforms, such as Microblog, WeChat, Renren.com, Douban.com, and Youku.com, and embed them in the user space for the purposes of promoting and publicizing library resources and services. As of April 5, 2014, among the libraries of 112 national key universities, 69 (62%) have launched Sina Microblogs services, and 39 (35%) have launched WeChat services (Huang, 2014).

Case Study

To connect with the information channels of young students, and to narrow the communication gap, Peking University Library launched their official social media (Microblog, WeChat, and Renren.com homepage) in June 2013. These web pages have become important tools in developing new media services for the library. As of May 17, 2015, the three social-media accounts have a total of 53,402 followers, while their popularity and influence are both on the rise. New media service is a novel concept when compared to the traditional marketing activities of libraries. Over the years of experimentation and continued exploration, Peking University Library has gradually determined a set of characteristic and effective measures:

1. **Organizational Structure:** The Library has established an interdepartmental operations team to shape a dynamic and creative team culture. The new media service team is headed by the deputy director of the library. The Departments of Reference Services, Circulations, Multimedia Collections, Special Collections, Rare Books, Collection Development, and Systems and Director's Office, among others, have also assigned junior and senior librarians to join the team as part-time members. Members of the team take responsibility on a rotational basis for the daily operations of social media. Creative plans for thematic activities are generated via brainstorming among team members. Through a working mechanism that focuses on the reasonable allocation of tasks and collective wisdom, the team has developed a new media service that is quick to respond and is close to their readers.
2. **Information Release:** Information that addresses user interests is provided in order to improve the attractiveness of content. Firstly, regular columns have been meticulously established, such as the Treasured Library Collections, Reading Salon, Library Book Recommendations, Today's One-hour Lecture, Featured Movie Screening, 3D Movie of the Day, Videopedia, Music at Teatime, Photographic Library, and more, which involve content such as recommended resources, knowledge sharing, release of the latest news, and artistic appreciation. This enables the full promotion of library resources and services using textual and graphic illustrations. Secondly, the team monitors news and information related to reading, culture, campus life, and other related topics, and repost the interesting information, so the content of the three major platforms can be further enriched. Thirdly, online publicity and releases are synchronized while the library is organizing major activi-

ties in order to increase the popularity and influence of the activities via the radiative effect of the Internet.

3. **Interaction with Users:** Particular attention is paid to real-time interactive communications, so as to establish the image of an enriched, erudite, innovative, and friendly library. Library self-media has achieved a greater effect by pushing enriched and colorful information to attract attention, becoming closer to users with the use of warm and lively language, as well as by increasing their own levels of activity, affinity with users, and practicality. For example, between February 16, 2015 and May 17, 2015, there have been a total of 302 blog posts published on the official Microblog of Peking University Library (of which 250 were original blog posts, and 262 included pictures, videos, or music), 1,169,482 blog views, and 1,473 interactions (receiving 547 forwarding links, 121 comments, and 655 "likes"). There has also been a net increase of 2,763 followers, bringing the total number up to 23,030.

Digital Processing Services

To fulfill the needs of digitally-processed materials for teaching and scientific research, many academic libraries have provided data and digital processing services with the support of various technologies, resources, and equipment. The scope of these services mainly consists of the following: (1) digital processing, collection, and production, including scanning of text and images, scanning of microfilm documents or films, digital shooting, digitization of audio and video materials, collection of multimedia programs, filming services for academic activities, and 3D processing; (2) editing and compiling digital information resources, including a digital resource catalog, content editing, and multimedia editing and production; and (3) releasing and using digital resources and storage.

Case Study

In 2009, Peking University Library established the Data and Digitization Center open to all teaching and research units across the university. It delivers a full range of digital processing services that involves literature scanning, digitization of films, digitization of audio and video materials, collection of born-digital and featured multimedia resources, editing of multimedia content, metadata processing, digital resource publishing, downloading of teaching resources, and publishing and printing on demand.

Among the above-mentioned services, collection of born-digital and featured multimedia resources includes the following:

1. **Filming Services for Academic Activities:** The library provides filming services for academic conferences, lectures, events, and forums that are hosted or sponsored by teaching and research units. It offers free services for units that are able to share conference resources.
2. **Recording of Oral Histories by Scholars at Peking University:** This is a part of the oral history project by renowned college and university scholars. It is jointly recorded with the Department of Information Management of Peking University and the Modern Educational Technology Center.
3. **Collection of Multimedia Programs and Other Related Services:** The collection of born-digital resources has further expanded the genre and scope of information resource development at Peking University Library, and has provided new avenues for the library to perform its basic functions in the digital era.

At present, the annual processing capacity of the Data and Digitization Center has exceeded 50TB. Featured digital resources that have already been produced include: the Chinese Rare Collections Database, Systems for Periodicals Published during the Republic Period (1911-1949), Dissertation and Theses of Peking University, E-reserves Database, Peking University Lectures, A Historical Database of the National Southwestern Associated University, CADAL Publications of the Republic Period, engineering drawings of Peking University Archives, dialect survey data from the Department of Chinese Language and Literature, and old archives in the Office of Human Resources. The above-mentioned resources have benefited not only Peking University, but also scholars across the country.

Reading Promotion Services

The promotion of reading is a natural and important responsibility of academic libraries. In the rapidly-developing Internet age, the importance of reading promotion is increasingly prominent. There are two objectives behind reading promotion: to help students to develop good habits in reading, and to guide students to read good books. In order to promote reading more effectively and build a positive reading culture on campus, many academic libraries in China have explored several useful practices. For example, stereoscopic reading in Tongji University Library, Living Library services in Shanghai Jiao Tong University Library, and mobile reading in East China Normal University have all achieved positive results.

Case Study

Peking University Library is committed to the promotion of reading. In particular, since the establishment of an inter-departmental promotion and publicity team in 2011, the library has organized many creative and welcoming activities.

Hosting Featured Activities to Establish a Library Brand

Since 2012, Peking University Library has organized an annual series of activities before and after World Book and Copyright Day that are varied in content and form. The activities usually last for about two months. For example, between April and May of 2014, with "Elegance of Reading Amidst a Sea of Flowers" as the theme, the library planned and organized many activities including the Peking University Reading Lectures, annual awards for the Weiming Star Readers, an exhibition of bibliographic recommendations and photography on reading, the "Beauty of Books" video program screening, book-crossing, and the "Do Not Let Your Phone Take Control" campaign. After years of development, the above-mentioned series of activities for World Book and Copyright Day organized by the library have become a featured brand in the campus culture of Peking University, with a good reputation and great popularity.

In addition to the annual activities for World Book and Copyright Day, the library also invites three to five renowned writers and scholars to the campus each semester. They hold discussions revolving around certain books or a certain genre of books, and are encouraged to talk about their experiences of reading and share insights about their creations. Since its launch in April 2012, dozens of reading lectures have been held at Peking University. Oriented around vivid themes and filled with abundant content, these lectures have gained great popularity among readers, and have become a well-known brand of cultural activity in the university.

Maintaining the Sustainability of Activities by Offering Regular Services

The library hosts exhibitions of bibliographic recommendations with various themes one to three times per semester. Before carrying out exhibitions, librarians will conduct a survey on reading interests to better understand the reading habits of their users so that targeted reading guidance can be made for different groups of readers.

For example, freshmen may be full of curiosity about and have expectations of campus life, but they likely also feel a sense of discomfort caused by being away from home. Therefore, when holding recommended book exhibitions at autumn orientations for new students, Peking University Library fully takes into account their reading needs. Based on themes such as "To know and love Peking University," and "To read more as knowledge has no boundary," Peking University Library meticulously selects an assortment of books that are suitable for freshmen, and has received a good response. For graduating students, it is not only important to accommodate their sadness in parting and bidding farewell, but also their dreams for their future. Therefore, the library chooses a reading list recommended by certain distinguished alumni as heartwarming gifts for graduating students.

Strengthening the Attractiveness and Popularity of the Above Activities by Innovating the Forms of Activities and Through Three-Dimensional Publicity

Unchanging activities for reading promotion are very likely to generate aesthetic fatigue among readers. Therefore, Peking University Library pays significant attention to novelty when considering the forms of activities. For example, during the activities for World Book and Copyright Day in 2014, the library held the "Elegance of Reading Amidst a Sea of Flowers—An Exhibition of Peking University Library Bibliographic Recommendation and Photography on Reading" (referred to as the 'Bibliographic Recommendation/Photography Exhibition' below). In addition to the recommendations of 30 books, 30 pieces of photographic work imitating Western paintings on reading were displayed. This activity creatively combined the recommended books with elegant reading photography, and the imitations of paintings immediately attracted the attention of users. Popularity and attention were significantly increased.

In addition, every time the library hosts an activity, it makes integrated use of traditional media and social networks to carry out multi-directional and three-dimensional publicity in order to ultimately strengthen the visibility and influence of the activity.

Mobile Services

With the popularity of smartphones and other mobile terminals, as well as the development of 4G technology, the application environment of mobile Internet is becoming increasingly sophisticated, and mobile services are gradually becoming a basic service provided by academic libraries. The service began with the earliest short message service and Wireless Application Protocol (WAP) service, and has been extended to include information searches, mobile reading, and video services.

Case Study

Tsinghua University Library began looking into the idea of the mobile library in 2006. In 2007, the library launched the first-ever mobile service in the form of short message service. Later, the library

fully developed the Tsinghua University Wireless and Mobile Digital Library System (TWIMS). Over the years, a series of mobile services with functions that support academic resources retrieval and full-text reading, OPAC search and book reservation, notices of training and lectures, and more have been launched online. All teachers and students of the university can make use of library resources and services anywhere and at any time.

At present, the major functions of the university's mobile library are as follows:

1. **Short Message Service:** If a user lacks Internet access, they can check personal borrowing information, search, make and cancel reservations, and renew books via mobile messages. They can also receive various kinds of information released by the library via mobile messages.
2. **Multimedia Messaging Service (MMS):** The MMS notification service for the latest information on e-journals provides the latest articles in 132 e-journals, including *Tsinghua Science and Technology* and *Nature*. After completing a journal subscription on the TWIMS Web platform, readers may receive regular MMS messages containing information of the latest articles.
3. **Mobile Website:** Mobile websites are compatible with a variety of mobile device browsers, providing library newsletters, OPAC search functions, individual borrowing information search functions, book reservation and renewal, a map of the library collection, retrieval of electronic resources, full-text reading, and many other services.
4. **Client Applications:** Two types of client applications are provided (iPhone and Android) which allow for one-stop resource retrieval, borrowing information search functions, and reservations, and they support both streaming and layout reading formats.

Moreover, Tsinghua University Library introduced a two-dimensional code in the development of mobile services. Specific areas for applications include supplying bibliography information (e.g. book name, call number, and shelving location), guidance for the premises and layout of the library, obtaining a reader's manual, etc., so as to create a more convenient environment (Zhang, Zhang, Jiang & Dou, 2013).

Spatial Services

In recent years, the spaces of academic libraries have experienced tremendous change, from collection-oriented spaces to service-oriented spaces. Aside from traditional learning spaces, academic libraries now provide spaces for leisure, discussion, and exhibition. They have further established Information Commons (IC), Learning Commons (LC) and Makerspace, equipped with more advanced facilities, richer resources, and better-qualified staff.

Case Study

Shanghai Normal University Library began its IC service in November 2007. The IC is located on the sixth floor of the library at the Fengxian Campus. It occupies the entire floor, covering a total area of 1,600 square meters. The IC services include books and journals, references, information retrieval, information communication, subject navigation, audio-visual education, and media production, as well as education and training on information literacy. The actual spaces of the IC are divided into eight areas: reference and consultation, individual learning, group discussion, document reproduction, literature

resources, leisure reading, reader training, and audio-visual presentation. In addition, the IC is equipped with rich virtual resources; all databases in the library can be accessed via computers in the IC, and colleges using the IC subject services have set up professional databases and related software that they have purchased on IC workstations, which has enriched the IC digital resources. The IC provides links to subject blogs and receives online reference forms and reservations for discussion rooms. When booking the physical discussion rooms, the users can also apply for virtual ones, so that those who cannot participate on site can better understand the on-site dynamics in real-time and express their viewpoints via virtual rooms (Du & Liu, 2009).

Shanghai Jiao Tong University Library provides Learning Commons services using group-study rooms. Group-study rooms are divided into thematic research rooms, general discussion rooms, and innovative learning rooms, which are limited to use for academic discussions, course discussions, communication training, and innovative group activities. Take the innovative learning room as an example. The aim of this service is based on the planning and organization of innovative activities, as well as the cultivation and stimulation of an innovative mindset, where users are able to conduct open communication, brainstorming studies, exercises in simulated learning, community activities, public-speaking practice, group discussions, experience sharing, and other themed activities. Group-study rooms are available by reservation. This provides users with a one-stop service environment, including a wireless network, movable tables and chairs, projectors, and small bookshelves. The overall environment on each floor is comfortable, equipped with all-in-one self-service machines for printing, copying, and scanning (Wang & Song, 2011).

Software Services

For teachers and students at colleges and universities, the use of various items of software is an indispensable part of their daily research activities. At present, there are several academic libraries that deliver software services to teachers and students. These services provide powerful support for users in their research and learning, including various types of licensed software, as well as training on software use, technical consultation, and more.

Case Study

Peking University Library launched its professional software services in 2009, including the following:

1. **Sharing of Genuine Software across the University:** SPSS, AutoCAD, Zinemaker, NoteExpress, EndNote Online, and other related software have been provided to the university as a whole through shared platforms for genuine software, CD-ROM systems attached to books, and multimedia resource platforms.
2. **Training on Software Use:** This includes two specific types of training. One type is targeted at tools commonly used in the process of academic research, such as Microsoft Excel, Visio, SPSS, NoteExpress, or EndNote Online, and it involves drawing, statistical analysis, literature management, and other related fields. Explanations on the usage techniques of above-mentioned professional software and application examples can help users improve their efficiency in scientific research and dissertation writing. The other training type is related to the use of software such as

Photoshop or iMovie, which involves image processing, video editing, and other related fields. The teaching method mainly involves large classes in the form of explanations by a librarian plus hands-on computer practice. For SPSS, Photoshop, and iMovie, the library also adopts a reservation system allowing five to six persons to provide interactive and personalized small-class training and instruction.

THE DEVELOPMENT TRENDS OF USER SERVICES

To summarize the development of user service positioning and systems, as well as innovations in user service, we can see that academic libraries are actively adjusting their functional positions and continuously exploring new patterns and methods of user service. Based on this foundation, they are also reconstructing the user service system. During a series of processes in transformation and development, there has been an obvious trend of change in terms of the concepts, patterns, contents, highlights, marketing, cooperation, and other aspects of user service.

Concept: From Resource-Centered to User-Centered

In recent years, the resource-centered concept which focuses on library collections has gradually been transformed into a user-centered concept which focuses on users. The people-oriented service mindset, which is driven by user needs, has been strengthened by the practices of academic libraries. In the future, academic libraries will pay more attention to user needs and humanistic care, and will communicate and interact with users with a more proactive attitude. Humanistic and personalized services will become increasingly popular.

Model: From a Uniform and Extensive Model to a Refined and Diversified Model

Traditional library service is focused on the single-ended service of borrowing, reference, and retrieval; the user service policy and models are relatively extensive. With the progress to date, service has become increasingly refined. For example, for different kinds of users, users in different subjects, and users with different needs, libraries adopt an increasingly targeted service model which is personalized and refined, while the corresponding service systems are showing a more diversified trend.

Content: The Growing Influence of Subject Services

The subject service of academic libraries in China was initiated at the end of the twentieth century. Following decades of development, it has gradually come of age. The service content has gradually been extended from early participation in the construction of subject collections, consultation, and communication with schools and departments, to deep integration with the frontline of teaching and research, providing more personalized services for teaching and research, such as user education embedded in professional courses, research support, scientific research assessment, and other services. It is foreseeable that subject service in the future will have an increasingly significant impact among teachers and students, and will become an indispensable core service for users in their research activities.

Highlights: Data Services in the Big Data Era

The arrival of the Big Data era and the widespread application of related technologies have brought about the instant retrieval, accurate analysis, and deep mining of data that is massive, complicated, and multi-structured. This will bring about many areas of growth in the user services provided by academic libraries.

Firstly, libraries will develop scholarly publishing services, and increase open access to scientific research data. For example, establishing institutional repositories and data-sharing platforms for the libraries themselves to store, manage, and share all kinds of academic achievements and scientific research data.

Secondly, libraries will develop services for data gathering and analysis. For example, gathering data of scientific achievements, conducting assessments of the competitiveness of scientific research at various schools and departments, and offering policy support for subject development.

Thirdly, libraries will deeply mine and interpret user data, publishing statistical reports related to library business, and presenting library service content and types in a vivid and understandable style.

Fourthly, libraries will deliver data literacy services to cultivate users' sensitivity to data and their application competence.

Marketing: Publicity and Public Relations in the Age of New Media

University life is colorful and diversified. Students are often swamped by numerous community activities, expert lectures, and competitions; thus, their attention becomes to some extent a scarce resource. Therefore, academic libraries are paying more attention to their own marketing and promotion. They refine activity planning and practices based on research on users' psychology and needs, while also promoting and publicizing library resources and services via various useful channels.

In the age of New Media, the marketing of academic libraries is becoming more diversified, multi-dimensional, and intelligent. New development trends have presented themselves. First, libraries have set up self-media by using popular social networking platforms to approach users through multiple channels, thus enabling libraries to actively interact with users to build an image that is full of vitality and enthusiasm. Second, they pay attention to activity marketing. Ample investigation of user needs, innovative planning, and the integration of resources, services, media, and even sponsorships can help libraries to achieve recognition, promotion, involvement, and use of library services, as well as establishing well-known activity brands. Third, libraries utilize more multi-dimensional channels and means of promotion and publicity, including posters, other paper-based publicity materials, online library homepages, social spaces, videos, and so on.

Cooperation: Increasingly Prominent Role of Services Sharing

In today's open society, cooperation and sharing can create enormous energy, and academic libraries are no exception. User service is a systematic project involving many factors, such as information resources, technologies, and professional staff; therefore, the opportunity for cooperation and sharing is extensive. In the future, the role of services sharing will become increasingly prominent. Shared services, such as interlibrary loans, joint reference, cooperative open publication, unified integration of resources, joint training, and public archive of resources, will increase in popularity. Additionally, there will be an all-round expansion of cooperative partners beyond cooperation among libraries, establishing a more extensive

and closer cooperative relationship with relevant scientific research organizations, public communities, technological fields, publishers, and even individuals. Libraries will strengthen cooperation and openness by sharing information resources, knowledge, and technical achievements, so as to significantly improve the development and excellence of user services.

Chapter 79
Criminal Defamation, the Criminalisation of Expression, Media and Information Dissemination in the Digital Age:
A Legal and Ethical Perspective

Nhamo A. Mhiripiri
Midlands State University, Zimbabwe

Jacqueline Chikakano
Media Institute of Southern Africa, Zimbabwe

ABSTRACT

Criminal defamation and the criminalisation of communication in general often result in severe punishment for the media and other content producers accused and prosecuted for committing such 'crimes'. There are severe financial penalties involved and /or the incarceration of those who are convicted of breaking the law. This chapter studies the existence and feasibility of criminal defamation in largely contemporary Africa, but also making references to 'older' democracies in the Western hemisphere. In short, the chapter critiques criminal defamation and the criminalisation of expression, making a strong legal and ethical perspective quite often using empirical materials from the courts. The inception and proliferation of new digital technologies amongst ordinary citizens also means that besides the traditional media or fourth estate, ordinary non-professional communicators are also highly likely to get into trouble over defamation, criminal defamation and other forms of crimes associated with the criminalisation of communication.

INTRODUCTION

Criminal defamation and the criminalisation of communication in general often result in severe punishment for the media and other content producers accused and prosecuted for committing such 'crimes'. There are severe financial penalties involved and/or the incarceration of those who are convicted of breaking the law. This chapter studies the existence and feasibility of criminal defamation selected contemporary African countries, but also making references to the USA as an 'older' democracy. The chapter critiques criminal defamation and the criminalisation of expression, making a strong legal and ethical perspective quite often using empirical materials from the courts. The inception and proliferation of new digital technologies amongst ordinary citizens also means that besides the traditional media or fourth estate, ordinary non-professional communicators are also highly likely to get into trouble over defamation, criminal defamation and other forms of crimes associated with the criminalisation of communication. Firstly, in a criminal case a prosecutor on behalf of the state brings charges against a defendant, whereas in a civil suit the plaintiff brings suit (Creech, 2007). Secondly, the chargeable offense is considered grave or serious that it can result in the imprisonment of the defendant (Feltoe, 2002, p 12). Criminal defamation and other criminal offences that are linked to utterances and or publication of information is a common and long standing feature of most legal systems. Their existence is justified on the basis that freedom of expression as with other rights, is not absolute and has to be exercised in cognisance of other rights and as such, it can be limited. Even in one of the oldest democracies - the USA - there are debates on whether or not America's First Amendment confers absolute rights of the media and expression, or there are specific justifiable limitations (Packard, 2010).

Criminal charges can be invoked for disturbing public peace through publications in the conventional media (fourth estate) or in the new media (fifth estate). The internet is a fairly easy and accessible medium for committing the publications or communication related crimes, in the same way conventional defamation can be committed against individuals and organisations there. There is need to trace how libel or criminal defamation charges have been instituted in countries of the North and South such as Zimbabwe and Tanzania, and the USA against communicators that use internet and other channels of public communication. When assertions are made that criminal defamation is undemocratic, archaic and backward, is this a statement to dissuade and censure countries of the South that are often viewed as lagging behind in adherence to ideals and tenets of modern democracy? These countries seem to have a higher prevalence of such type of litigation. Are criminal defamation and the criminalisation of expression, including sedition and criminal insults of powerful politicians, a universal phenomenon found even in so-called developed and progressive nations? When a country such as the USA arrests and gives a lengthy sentence to Chelsea Manning for leaking sensitive materials in the so-called Cablegate case, or when it demands the arrest of activists such as Edward Snowden or investigates a man like Julian Assange, what are the ethical and legal implications given that some sections of global society view these accused as iconic proponents of freedom of information? Again are states justified in intruding into the personal communications of all citizens, and alternatively, do 'whistleblowers' such as WikiLeaks have a right to publish personal information which is not of 'public' importance? All these questions have a bearing on criminal libel.

METHODOLOGY

This chapter uses the words 'defamation' and 'libel' interchangeably. This chapter purposively selects archival materials on publication on criminal defamation and other criminal charges pertaining to utterances and publications both in the traditional media and in new internet based media in Africa and the rest of the world. The literature review seeks to establish what has been prevailing especially in older democracies such as the United State of America. Materials are then presented on recent cases where utterances or publications were criminalized with or without successful prosecution in selected African countries such as Zimbabwe, Tanzania, Mozambique and South Africa. The focus is also important especially in instances where criminal defamation arose out of publications on new internet based media platforms such as blogsites and Facebook. The researchers used both published books and the internet to establish conveniently selected cases that were brought before the courts of law in the twenty-first century and what verdicts were passed on criminal defamation and general criminal offenses pertaining to utterances and publications, in digital media of whatever form. The methodology is particularly aware of the nebulous area of criminal defamation and its intersection with other criminal charges like sedition, where 'whistleblowing' and disclosure of state secrets raised controversies on the public's right to know and states inclination to keep 'secrets' or protect the public peace and order. Packard notes that 'defamation … has always been the bane of traditional media, but is now increasingly applied to 'average people' who post damaging accusations on websites, blogs and listservs." (pviii)

Again the methodology of selection of cases might appear 'over-stretched' because there are various technologies used for the different digital media platforms that make communicative action possible. For instance, Packard (2010) outlines the ubiquity of 'digital media' and its equally wide-ranging relationship and implications for media law. Digital media law, just like digital media, "is characterized by it general applicability". Alongside the conventional or traditional media such as newspapers, books, television and radio there is now the electronic forms of the very same 'traditional/conventional' media channels, as well as digital media channels such as websites, web logs, pod casts, vod casts, videos on U-tube, and social networking sites. While the wide-rangingness of media and digital media are openly both beguiling and intimidating from a conceptual point of view, escaping neat definition and demarcation in most cases, the same applies to the possibility of cases or law suits that can arise from the use and infringements of communication on these platforms or channels. For instance, Packard's ambitious book reflexively entitled *Digital Media Law* claims that within the orbit and confines it seeks to address a plethora of media law and digital media law issues and concerns. Packard (2010, p. vii) argues knowledge about media law should not be confined to traditional media organisations since the revolution in the production and access to information through digital media means "(w)ith the right equipment, anyone can produce a website, listserv, blog or video with the potential to reach a mass audience. When *anyone* can become a media producer, *everyone* should know something about media law – both to protect their own rights and to avoid violating the rights of others".

Cases cited in this chapter range from threats of arrests, arrests with or without prosecutions in courts of law, and those that have been tried in courts of law leading to final verdicts. The 'legal' process is intricate and problematic with citable cases wielding different 'legal' status hence the need to cite these diverse cases in their diverse stages of occurrence. What is important is that they appeared in the public domain through publication in the mass media. Zimbabwean cases dominate due to the availability of these to the authors and researchers, but also because Zimbabwe has received incessant media coverage in the last two decades and the Zimbabwe state is also often accused of blatant disregard for media

freedom, much as section 61 and 62 of the new Zimbabwe constitution categorically extend to citizens freedom of information and freedom of expression and freedom of the media (Mhiripiri, 2015). A case is also cited from the African Court on People's and Human Rights in order to ascertain what the overall projection of perception on the issue of freedom of the media and expression is in a court that adjudicates over a continent which is generally viewed as lagging in development and adherents to modern principles of human and media rights. The chapter is also cognizant of the existence of legislation on cyber-crime such as Tanzania's Cyber-Crime Act of 2015.

THEORISING CRIMINAL DEFAMATION AND CRIMINALISATION OF EXPRESSION

According to Steve Forster (2003, p. 436-437) "(a) defamatory remark is one that causes a person to be shunned or avoided, or subjected to ridicule, hatred or contempt. Alternatively, the statement must lower the person's reputation in the eyes of right-thinking members of society". Zimbabwean lawyer Jeff Feltoe (2002) notes that criminal defamation, is qualified from civil defamation on the basis of the gravity or seriousness of the former. However, several other scholars make a distinction on the fact that criminal defamation involves state prosecution of the offending party on behalf of the party whose reputation has been injured, and there is the possibility of imprisonment of the guilty party (Beyene, 2011; Creech, 2007; Crone, 2002: Pember & Calvert, 2005/6). In some instances, state institutions can file criminal defamation suits to protect their own image or reputation in the public perception as was the case in Zimbabwe where some laws prohibited the media and individuals from bringing state institutions into public "disaffection" (Mhiripiri, 2013).

Underlining defamation and criminal defamation is the need to protect reputation. Invariably, it can be protection of reputation and dignity of an individual, an organisation or even state institutions and public officials from reckless or malicious injury to their character and self-esteem in the eyes or regard of other people in society. Criminal defamation, according to Zimbabwean media law scholar Geoff Feltoe, is of 'a serious nature and courts consider factors such as extravagance of the allegation, the extent of the publication and whether the words are likely to have results that may detrimentally affect interests of the state and community' (2002: 12). Kenneth Creech (2007, p. 348) makes a distinction between civil and criminal defamation cases as follows situating the definitions in the US context:

Civil law provides monetary awards for successful plaintiffs. On the other hand, jail sentences are part of the punishment for those who violate criminal law. Many states have criminal libel laws on the books. These laws were designed to punish those who might utter words that provoke riots or otherwise threaten the public order and are rarely enforced today.

The area of defamation, criminal defamation and the criminalisation of media and communication in general are slippery and tricky terrain as it is contextual and situational. For instance, the US government entities do not sue for defamation although public officials and bureaucratic can sue in their own personal capacity. Packard (2010, p. 180) clarifies on the same US system:

Government entities may not sue for defamation under the theory that the government should not be permitted to use public funds to prevent the public from criticizing it. But government officials are en-

titled to sue on their own behalf. By necessity, public officials are subject to greater scrutiny than private citizens, so courts require them to meet a higher standard of proof in defamation cases.

Where the American state permits an individual to sue for criminal defamation the theoretical understanding is that there are critical instances when it is proper for the state to act on behalf of the party harmed by the libel and bring criminal charges against the defendant (Pember & Calvert, 2005/6). The state takes responsibility due to the perceived gravity of the matter and in order to eliminate the possibility of citizens taking the law into their own hands and eventually provoking anarchy.

The Zimbabwe government on the other hand has used legislation to protect the state President and institutions, to such an extent where a public official may claim that their reputation has been injured beyond a personal level, but to extend the injury to the very status of the public office they occupy.

Zimbabwe's Criminal Law [Codification Reform] Act's (Chapter 9:23)(No 23 0f 2004) Chapter 111 on "Crimes against the State") states that speakers, authors and publishers can attract criminal charges if they are deemed guilty of:

30. *Causing disaffection among Police force or Defense forces.*
31. *Publishing or communicating false statements prejudicial to the state.*
33. *Undermining authority of or insulting the President.*

Again, the country's Access to Information and Protection of Privacy Act's Section 80 on Abuse of Journalistic Privilege criminalizes publication of information, which (a journalist) intentionally and recklessly falsified or fabricated in a manner that:

1. *Threatens the interests of defence, public safety, public order, the economic interests of the state, public morality or public health; or*
2. *Is injurious to the reputations, rights and freedoms of other persons.*

These acts explain why several politicians and government officials have sued the media for criminal defamation, although fortunately there have never been successful convictions. The insult laws which protect the image and reputation of the state President have also caused many people to stand trial.

Don Pember and Clay Calvert's book *Mass Media Law* has provided comprehensive material on how libel can be committed on Internet. Indeed scholarly publications that draw empirical examples from the countries of the North still cite criminal charges against both media and individual communicators. In the US nowadays more criminal libel charges are often made against individuals operating websites than journalists. In worse situations, naïve students who use the Internet to criticise their schools have also fallen foul to the law (Packard 2010, p. 193).

Several countries still have criminal defamation statutes which continue to be evoked to control both unprofessional media practices or just to stifle genuine critical media. Yes, indeed, the media are not all saints and can be operated by unscrupulous persons without regard for other people's rights and dignity. For instance, in Kenya there is a 'gutter' press that appears and disappears unceremoniously, and quite often blatantly scandalizes politicians and public figures without respecting the best norms and practices of media. The state has been forced to use criminal defamation and other restraining measures to bring order amongst these. Some of Kenya's fly-by-night publications have been described thus:

Kenya's gutter or alternative press would best be described as "now-you-see-them-now-you-don't" after their nature of appearing only when there is a major scandal involving the nation's politicians or socialites. These papers range from a single A4 sheet to as many as 12 pages. It may be sold on news-stands, but more often on street corners for less than half the price of the daily newspapers. Most are technically and editorially mediocre with occasional but unpredictable flashes of brilliance. Generally, these publications have no fixed address, no known publisher, and tend to focus on rumor and sometimes make very spectacular claims. These papers often draw the ire of the Kenyan government. Three are worth mentioning: The Weekly Citizen, Kenya Confidential, *and* Independent. *The later was recently shut down after the publisher-editor was arrested and jailed for criminal libel. He has since been released on presidential clemency. (Fackler et al, 2011, pp. 632-33)*

In another East African country, Ethiopia, media scholar Zenebe Beyene (2011) notes that "many press defendants were accused of criminal defamation laws and were charged by prosecutors" (p. 724) and actually served time in prison (pp.717- 724). Unlike in the U.S where precedence was set in the *New York Times vs Sullivan* case, in Ethiopia public officials are not open to scrutiny and often win the criminal libel suits. Beyene contrasts Ethiopia with the U.S:

In the United States it is nearly impossible for a public official to win a libel suit. "Public officials and public figures have to prove a higher level of fault than do private individuals." *Government or public officials must prove actual malice to win libel lawsuits. Cases such as* New York Times *vs. Sullivan are evidence of this. Public officials should be open to public scrutiny. (Beyene 2011, p. 721, emphasis as in original)*

While law might be used to restrict speech and expression, it is still prudent to "minimally" use regulatory powers of the state to curtail excesses of expression or the media. Freedom cannot be absolute. Some scholars prefer restrictions confined within the precincts of civil defamation to protect individuals from unreasonable injuries to their reputations (Adam, 2009; Mill, 1967). Seditious libel or expression or media crimes committed directly against the state should also be "legitimately… used to protect democratic institutions from disruptions that would prevent them from operating." In his widely celebrated thesis, *On Liberty*, John Stuart Mill justifies limits on speech where speech, the press, or what we commonly refer to as the media today, might incite rioting or subject an individual or group to risk (Adam, 2009, p.325). These *justifiable* restrictions to speech and expression, must on the whole promote a higher humanism, justice, peace and stability, and they are applicable to both traditional media (the fourth estate) and non-professional mass communicators who constitute what is now known as the fifth estate most of whom operate digital media platforms (Chiumbu, 2010; Mhiripiri & Mutsvairo, 2013).

It is now possible to abuse journalistic ethics and professionalism through social media and citizen journalism, in the same way it is possible to publish litigious materials that constitute all forms of defamation or are just potentially criminal. Social media and citizen journalism are part of what is now defined as the Fifth Estate. This is that emergent space where ordinary people who are not necessarily media professionals who neither work for specific media institutions publish their stories (Hyde-Clarke, 2010). While features of the regular 'Fourth Estate' include institutionalization through bureaucratic media organisations, capitalization, regulation and professionalism, the emergent Fifth Estate is largely

a de-institutionalized, de-capitalized and de-professionalized space. There are also erroneous assumptions that the latter is also de-regulated although cases involving the arrest and prosecution of those who have published supposedly offensive materials on social media shows evidence to the contrary. The Fifth Estate is quite often on the Internet appearing as blog sites or social media networks such as *Facebook*, *Twitter*, *Badoro*, and *Linkedin,* or it is the publications on smartphones using Whatsapp, twitter, etc. In short, professional and non-professional users of the World Wide Web and other digital media must realise that courts regard communications and publications here similarly to what is published or disseminated through so-called traditional media such as books, newspapers and magazines (Pember & Calvert, 2005/6, p. 146). While whistleblowing is traditionally considered a normative role of the media, evidence below shows that courts and the state can be harsh and intolerant to whistleblowers who are not 'journalists' in the conventional sense, but leak sensitive information online or via the media.

ETHICS, CRIMINAL DEFAMATION, AND THE CRIMINALISATION OF MEDIA AND COMMUNICATIONS IN THE DIGITAL AGE

Media ethics are usually compatible with legal expectations except in a few instances. Ethical standards are supposed to bring creditability and respect to the media profession. Professional standards of communication are outlined by most media organisations and civil society. Nonetheless, private citizens who participate in both interpersonal and mass communications are generally expected to respect the best communicative norms and values, notwithstanding that there have been a laxness with regards to how they are penalized if they breach ethical codes. For instance, it is not unusual to find private non-professional communicators publishing certain materials recklessly, even when such materials have no legal repercussions. A good example is how some individuals insensitively publish horrific scenes of violent accidents without giving consideration to how this can be distressing to their 'audiences'. Just because non-professionals are capable of being mass communicators using digital technologies the same ethical expectations that govern the mass media (see Wilkins & Christians, 2008) must be applicable to this new breed of 'mass communicators'. Some countries now have codes of standards for digital media. Voluntary Media Council of Zimbabwe (VMCZ) in 2015 crafted a code of ethics that is applicable to all media houses and those individuals involved in mass communication. This Digital Media Code of Ethics which is widely distributed, including on the VMCZ's website[1]. While there are no remarkable or exceptional characteristics of the code that differ from the best practices expected of traditional media, it is notable that digital media is receiving timely attention and consideration. The emphasis on the technical qualities of the mode of publication seems not to demand any really new ethical consideration worth underscoring due to the very nature of the technology used. The same old ethical requirements for traditional media remain relevant, although there is a renewed emphasis on digital media. It is commendable that ethics and digital media are beginning to receive the attention that they deserve as shown from scholarship from developing countries such as Zimbabwe where media and public communication are often presented as under siege from an over-bearing state system (Chari, 2013; Moyo, 2015.)

Whereas Codes of Ethics for traditional media appear to be targeted at professional journalists and media practitioners, the VMCZ code has a wider application. It is expected to apply over "groups and individuals, traditional media practitioners (print and broadcast), registered and unregistered organiza-

tions/companies that share information using digital media and have agreed to be bound by this Code and have to submit to the disciplinary jurisdiction of the Voluntary Media Council of Zimbabwe (VMCZ)". This new digital media code does not directly refer to 'protection of reputation' or libel or defamation, although it is inferable that these critical issues subsist within the conceptual framework of various ethical clauses.

THE PUBLIC INTEREST AS DEFENSE FOR FORMS OF DEFAMATION

There are several recognised defenses for defamation and criminalisation of the media, paramount of which is the public interest. While countries such as Zimbabwe have declared criminal defamation is unconstitutional and unacceptable in a democratic society, the citizens' right to know crucial information remains pertinent and over-riding. Citizens have to make important decisions in the general conduct of their lives, from making business choices as well as making decisions on the election of political leadership. The Press Complaints Commission Code of Practice of the UK, whilst it has no legal standing, defines 'public interest' from the perspective of the journalist. Public interest includes but is not limited to, amongst other crucial components:

1. Identifying or revealing crime or serious impropriety,
2. Protecting public health, peace and safety,
3. Protecting the public from misleading statements or action by an organisation or organisations,
4. Protecting freedom of expression (Bloy, 2007: 59-60).

The media have however the responsibility to prove that they are serving the public interest when publishing any contentious materials. When the media seem to contradict ethical requirement such as the reporting of sensitive materials leading to the disclosure of identities of minors or victims of sexual assault, the editors must demonstrate that public interest 'overrides the normal standards of journalistic practice such as protecting the interest of the child or of victims of sexual assault. Some information might 'interest the public' but do not carry convincing justification of public interest. It is therefore arguable, in the public interest, to show that a government such as that of the US is becoming too intrusive and overbearing over citizens' right to privacy if that government snoops into the private details or communication of private citizens who do not pose a danger to other citizens or society in general. Therein lie the major controversies of exposures made by people such as Chelsea Manning, Julian Assange and Edward Snowden.

CASES OF CIVIL DEFAMATION OR CRIMINALISATION OF COMMUNICATION AND INFORMATION DISSEMINATION

Chelsea Manning, Julian Assange, and Edward Snowden and the Public Interest

Three computer and internet linked people are remarkable icons of the debate on media law, ethics and social justice in the digital age. These are Chelsea Manning, Edward Joseph Snowden and Julian As-

sange. Manning, who worked in the US army, leaked information to WikiLeaks about US war crimes and other major revelations of public interest. Considered by many as a hero, Manning was apprehended and is serving 35 years in prison for leaking sensitive information. Snowden, an American computer professional and former Central Intelligence Agency employee, also leaked to the mass media classified and highly confidential information from the US's National Security Agency in 2013; and Julian Assange an Australian born computer hacker published the WikiLeaks. Snowden leaked information to *The Guardian* and *The Washington Post*, before the same material was published in *Der Spiegel* and *The New York Times*, following which it was picked up by all sorts of global media. His disclosures made known to the world how NSA with the cooperation of telecommunications companies and European governments willfully subjected world citizens to global surveillance disregarding their privacy. The fight against global terrorism makes governments such as that of the US codify anti-terrorism statutes that empower them to snoop into private citizens communications as a preemptive measure to stop mindless terrorism especially in the wake of the 9/11 attacks. However, this 'noble' action means a majority of innocent law abiding citizens are subjected to constant monitoring thereby compromising their privacy and dignity. The powers of states and companies are therefore questioned when counterposed to the rights and privacy of such innocent citizens. Due to Snowden's disclosures the US Department of Justice charged him for violating the Espionage Act of 1917 for theft of state property. Snowden is currently a refugee in Russia, but his actions triggered a debate on whether he is a hero and whistleblower working in the global public's interest, or a dissident and traitor. Mass surveillance, government secrecy, national security and information privacy became poignant moral, ethical and legal subjects, especially when viewed within the context of anti-terror statutes such as the Patriots Act and cyber-crime acts enacted in various countries.

Besides Snowden, Australian citizen Julian Assange is another controversial notable 'media' figure in the digital era. Assange who describes himself as Editor-in-Chief of WikiLeaks, in 2006 founded with his colleagues the secret information and news leaks site. The site specialised in publishing thousands of protected documents of public interests, documents which Assange described as "a giant library of the world's most persecuted documents"[2]. Again Assange has elicited different responses and attitudes from world leaders and governments, celebrated by some and vilified by others. In Australia his work was considered 'illegal' by the Prime Minister although Australian police noted that Assange had broken no Australian law.[3] The US government purportedly investigated Assange and WikiLeaks with the intention of prosecuting him under the Espionage Act of 1917. When someone engages in hacking and publishing the secret information online, it is possible for complainants – organizations, states and individuals – to sue the perpetrator wherever they are. Writing specifically on defamation Bloy (2007, 17) notes that the internet transcends jurisdictional boundaries because literally anyone throughout the world can access the websites in question; hence the person allegedly defamed can logically sue wherever they believe their reputation has been damaged. The claimant only needs to show that the tort (wrong) was committed in that specific area, and that he or she has a reputation of a sufficient magnitude to protect or uphold within that jurisdiction or area. Both the Snowden and Assange cases definitely pose the problematique of whether global citizens are willing to forego their individual rights in preference over global security, but immediately critiquing the possibilities of states and companies abusing the private information their acquire from 'unknowing' innocent citizens.

Traditional media that have relied on informants who request confidentiality in exchange for vital information leaks also now largely using computers and internet in their news gathering, production and dissemination. This has forced to them to find ingenuous means of concealing certain information from

state surveillances. Some of the efforts are to protect whistleblowers such as Manning and Snowden, but others are merely to protect the media in the digital age when storage of sources and sensitive information is in computer files prone to state surveillance or direct seizure (Lowenthal, 2015).

NEW WIKILEAKS AND EMERGING ETHICAL COMPLEXITIES

Whistleblowing is not always steeped in the values of presenting accurate information to the public in the most responsible manner as Sandra Upson (2016) has divulged in the article "WikiLeaks has morphed from journalism hotshot to malware hub". Since investigative whistleblowing is also bedeviled with the vagaries of personality and state politics, paranoia, fear and other challenges which make online activists vulnerable and frail, such activists can easily degenerate into non-admirable psycho-political states of existence. Assange's case is remarkable. He no longer has an amicable relationship with the public media which partly publicised his radical efforts. He is holed up as a refugee in the Ecuadorian embassy and threatened with a sexual harassment case. The US government's arrest and sentencing of Manning to 35 years in prison unnerved Assange and Snowden. The relationship between Assange and newspapers such as *Guardian* and *Times* soured. WikiLeaks became more critical of conventional journalists. The new WikiLeaks releases are criticised for "wanton release of personal data", disclosing personal details of private citizens who remotely have links with public administration or corruption. WikiLeaks' stance in the US 2016 Presidential run-up is also viewed with suspicion as there seems vindictiveness in bringing down Hillary Clinton at all costs. The sites' discretion and competence in judging what type of content ought to be disclosed has been questioned. Information mismanagement is another indiscretion. Casual visitors to the WikiLeaks sites are also endangered as hackers can install a bot that enables hackers to take over computer files of unsuspecting readers. Some visitors have been forced to pay "ransom" when their files are encrypted and a payment is demanded. Files are infected and WikiLeaks does little to warn its visitors who visit thinking they are going to read 'public truth'. Besides carelessly disclosing the names of Afghans that collaborated with the US military, thereby putting these Afghans lives to imminent danger, the journalists and the public seeking 'truth' from the WikiLeaks files risk emerging infected. Writes Upson; "WikiLeaks has degraded into a malware snakepit".

ZIMBABWEAN CASES

In Zimbabwe limitation of the right to freedom of expression was provided for under the Lancaster house constitution that was adopted at the time of independence from colonial rule in 1980, and is similarly encompassed in the current constitution of Zimbabwe Amendment Act no. 20 of 2013 as is the case with other national constitutions albeit to differing degrees. According to Mhiripiri (2013) in Zimbabwe there were lots of court actions for criminal defamation prior to the rendering of the crime as unconstitutional in 2014. The Zimbabwean Supreme Court ruled in a case in 2014 that the charge is undemocratic, archaic and a disproportionate punishment for any form of defamation. Then, Criminal defamation cases were frequently instituted by public officials and politicians who argued that their reputations were not only injured in their personal capacity, but that there was adverse harm on the integrity of the very offices they occupied.

Despite the 2014 ruling there continued a tense debate with government insisting on the relevance of criminal defamation and the need to retain the offense on the statures. Pro-criminal defamation exponents argued it provided a deterrent to media excess and maliciously reckless communication. Freedom of the media activists argued that criminal defamation is often used in Zimbabwe and other developing nations as an instrument of press censorship in order to brow-beat the media into submission and compliance. Politicians and the public officials holding state position use criminal defamation as a convenient arsenal against pertinent media scrutiny.

There followed an increasing number of cases referred to the constitutional court challenging the constitutionality of various laws that criminalise expression including criminal defamation. Most of these referrals have been in respect of provisions of the Criminal Law (Codification and Reform) Act, [Chapter 9:23] such as section 31 which criminalises the *publication or communication false statements prejudicial to the State*, section 33, which provides for the offence of *undermining authority of or insulting President* and section 96 which provides for the offence of *criminal defamation* among others.

What has been particularly common in the determination of recent cases particularly by the current constitutional court of Zimbabwe, is the fact that while freedom of expression and media freedom are not absolute rights, their limitation has to be carefully balanced to avoid a situation whereby they are severely limited to the extent of eroding the constitutional guarantee altogether. The constitutional court has also emphasized the need to employ the most appropriate and proportionate measures in limiting freedom of expression. Both the old Lancaster House Constitution and the new constitution adopted in 2013 provide that freedom of expression can be limited by a law in the interests of defence, public safety, public order, the economic interests of the State, public morality or public health besides the protection of reputations of other citizens.

Three recent cases in particular, have had extensive effect on the criminalization of expression that is, Constantine Munyaradzi Chimakure, Vincent Kahiya & Zimbabwe Independent Publishers v The Attorney General [Constitutional Application No. SC 247/09], Nevanji Madanhire & Nqaba Matshazi v Attorney General [Judgment No. CCZ 78/12] and recently that of MISA-Zimbabwe & 4 others v Minister of Justice, Legal and Parliamentary Affairs & 2 others [CCZ7/15].

Aside from the MISA-Zimbabwe case, the judgments in these earlier cited cases elicited increased national discourse on the validity of criminalising people's expression such that in 2015 alone, more than three cases were filed or referred to the constitutional court seeking declarations of invalidity of criminal defamation in terms of the obtaining constitution.[4] [5]This was amidst growing confusion of the fate of these laws in light of the fact that on one hand judgments in the aforementioned cases had indicated that the declarations of invalidity of these two cases had been in terms of the former constitution. On the other hand, the state including the minister responsible for Justice legal and Parliamentary Affairs, insisted that the laws remained in force[6].

Despite the uncertainty that lingered on whether the false news and criminal defamation laws survived the declaration of constitutional invalidity, the Zimbabwean constitutional court in aforementioned cases made a number of insightful and key pronunciations regarding the balancing of freedom of expression on one hand and state and public interests on the other and to what extent and by what means the right to freedom of expression can be justifiably limited. The two cases are discussed below briefly. A few other Zimbabwean cases will also be discussed that bring different dimensions to criminalization of other forms of expression, specifically, online expression.

We acknowledge this chapter ought to focus more on the digital media and their interaction with the criminal law or criminal libel, rather than traditional media. However, the cases involving traditional

media can provide a solid background of what has been prevalent before and allude to the implications for social or digital media in some African context. Admittedly, most African journalists have been prosecuted for their publications in traditional media as compared to new media, probably because the latter are a relatively new phenomenon.

Constantine Munyaradzi Chimakure, Vincent Kahiya, and ZimInd Publishers (Pvt) Ltd v Attorney General of Zimbabwe [Judgment No. SC 14/2013]

The two appellants, a journalist and editor of "*The Independent"* a privately owned Zimbabwean newspaper, and the third applicant a representative of their publishing company, were in 2009 arrested and charged for the *publication or communication of a false statement which harms or is likely to harm the interests of the State in the performance of its functions*. The offence is provided for under section 31(a)(iii) of the Criminal Law (Codification and Reform) Act [*Cap. 9:23*) ("the Criminal Code"). This followed two newspaper stories that they had written and published collectively.

After the initial court appearances at the Magistrates court, the trio applied for referral of their case to the Supreme Court claiming that the provision under which they were charged was in contravention of the right to freedom of expression as provided under section 20(1) of the Lancaster House constitution. In trying to determine whether or not there was any infringement of the applicants' constitutional right to freedom of expression, the Constitutional court looked at a number of key aspects relating to the nature and scope of freedom of expression including what follows below.

Scope of Freedom of Expression

The court outlined that the right to freedom of expression as guaranteed in section 20(1) had three dimensions that are intertwined and which should be respected equally[7]. The three were described as;

1. An internal dimension (the formation and holding of opinion, ideas and information);
2. A communicative dimension (the expression of opinion, imparting of ideas and information); and
3. An external dimension (the effect of opinions, ideas and information on the addressee or the audience i.e. on the rights of others or public interests listed in s 20(2) (a) of the Constitution.

It was further clarified that the right to freedom of expression guarantees protection to the communicative process as well as the effect on the audience that is caused by a particular dissemination of ideas or information. Nevertheless, the state may interfere only when the activity or expression poses danger of direct, obvious and serious harm to the rights of others or the public interests listed in s 20(2) of the Constitution.[8]

Protection of Freedom of Expression and Truth

The court also emphasised that limitation of freedom of expression is not per se, derived from the falsity of a statement or publication but more on the actual or potential harm caused. In emphasis of this point, the court pointed that;

What is protected is really the indivisible freedom of everyone to speak even when they may after they have done so be called liars. Anyone has a right to impart or receive ideas and information about the activities of security service institutions regardless of the falsity or truth of the message conveyed, provided no harm or real likelihood of harm to the rights of others or public interest results in breach of law[9].

Permissible Legislative Limitation of the Exercise of Freedom of Expression

The court also noted that any kind of freedom can be abused and thus harm others or the public interest and as such its exercise has to be limited but the measures to limit this right must conform to the principle of proportionality.[10]

The interference imposed in terms of the impugned law must be limited to being a restriction or hindrance of the enjoyment of the exercise of the right to freedom of expression and it must be exclusively directed towards the pursued legitimate aim.

Proportionality of Measures Employed to Limit Freedom of Expression

The applicable penalty was also analysed to see if it was a proportional to the legitimate aim being pursued and the seriousness of the offence and the court went on to hold that the twenty year imprisonment term impossible for this offences was "draconian" and that the only inference that could be drawn from such a lengthy maximum penalty of imprisonment was that it was intended to have a chilling effect on the exercise of the right to freedom of expression by all citizens rather than to simply deter persons from the prohibited acts. Having determined thus, the court went on to hold that;

- The chilling effect of the disproportionate threat of the period of the maximum penalty of imprisonment to which a person convicted of the offence is liable harms operations of a free media.
- By authorising the discretionary imposition of a maximum punishment of twenty years imprisonment for offences amounting to attempts, s 31(a) (iii) of the Criminal Code has a serious inhibiting effect on the exercise of the right to freely criticise public institutions in the performance of their functions.
- A strong constitutional protection of freedom of expression cannot tolerate the imposition of self censorship on free speech and press through fear of lengthy sentences of imprisonment for offences of publishing or communicating false news.
- Taking into account the fact that freedom of expression is peculiarly more vulnerable to the "chilling effects" of criminal sanctions than any other fundamental right as stated by the UN Special Rapporteur on freedom of opinion and expression, penal sanctions particularly imprisonment, should never be applied to offences of publishing false news.
- The higher the level of the maximum penalty of imprisonment the greater the chilling effect on freedom of expression.

With this, the court declared that section 31(a) (iii) of the Criminal Law (Codification and Reform) Act [*Cap. 9:23*) ("the Criminal Code") was in contravention of the right to freedom of expression as provided for in section 20 (1) of the Lancaster house constitution in operation at the time and therefore void.

Nevanji Madanhire and Nqaba Matshazi v Attorney-General [Judgment No CCZ 2/14]

The two an Editor and journalist at "*The Standard* " newspaper at the time, were in 2011, arrested and charged with criminal defamation as defined in section 96 of the Criminal Law Codification and Reform Act following a story written and published by the two Applicants collectively. The offence of criminal defamation criminalises the intentional publication of false material which causes serious harm to another person's reputation. If found guilty of this offence one faces a fine or imprisonment of up to two years or both. Following their arrest and appearance at the Magistrates court, the two applied for the offence of criminal defamation as defined in s 96 of the Criminal Law Code to be declared unconstitutional and struck down and ultimately for the perpetual stay of their prosecution for this offence. The determining the constitutionality or lack thereof of criminal defamation, the court analysed a number of key aspects including the following.

Whether or Not Criminal Defamation Is a Justifiable Limitation of the Right to Freedom of Expression

The court conceded that criminal defamation is one of the permissible derogations or limitations of the right to freedom of expression but aimed at the protection of the rights and reputations of other persons. However while this objective was so observed and well accepted, the limitation of this right to this and such means was questionable in as far as its proportionality to the harm likely to be caused and to the interests as stake. The court thus considered at length whether it was necessary to criminalise defamatory statements in order to protect the said interests. In considering thus, the court made a number of observations including that criminal defamation has a stifling or chilling effect on the right to speak and to know by its very existence. This Judge Patel noted was:

… the more deleterious consequence of its retention in the Criminal Law Code, particularly in the present context of newspaper reportage.... This, in turn, may result in the citizenry remaining uninformed about matters of public significance and the unquestioned and unchecked continuation of unconscionable malpractices.[11]

The court also went on to observe that it is impossible to expect the media to perform its investigative and informative functions without defaming one person or the other

Proportionality of the Penalty

Also scrutinized, was the effect and proportionality of the maximum two year imprisonment sentence. On this, the court noted that the sentence only serves to exacerbate the chilling effect caused by criminalising defamation and further stressed that the sentence was "excessive and patently disproportionate" to the intended purpose of prohibiting the publication of statements that injure the rights and reputations of others.

Adequacy of Civil Remedies

Having declared that criminal measures and the accompanying term of imprisonment were excessive and disproportionate to the objective of protecting the rights and reputations of other persons, the court went on to hold that the offence is not reasonably justifiable in a democratic society and was inconsistent with the freedom of expression guaranteed by section 20(1) of the constitution at the time and therefore void. The court further noted that the country has in place "an appropriate and satisfactory alternative civil remedy ....to combat the mischief of defamation[12]." The essence, the constitutional court in this case emphasized and based its decision on a number of issues similarly observed in the aforementioned case of Chimakure and Kahiya which include that;

- Criminalising defamation results in harmful consequences such as the chilling possibility of arrest, detention as well as imprisonment and that these are excessive in effect.
- While the objective of the criminal defamation offence is to protect the reputations, rights and freedoms of other persons, criminalising defamation is a disproportionate remedy to the objective being pursued.
- The harmful and undesirable consequences of criminalising defamation such as the chilling possibilities of arrest, detention and two years imprisonment, are manifestly excessive in their effect
- The effect of criminal defamation extends to the public as well as it stifles and silences free-flow of information in the public domain resulting in an uninformed citizenry on matters of public significance.
- It is unnecessary to criminalise defamatory statements as the country's civil remedies for defamation afford ample compensatory redress for injury to one's reputation or dignity.

2016: Criminal Defamation Put to Rest

Media Institute of Southern Africa (Zimbabwe Chapter) and 4 Others v Minister of Justice, Legal and Parliamentary Affairs and 2 others CCZ07/15

In February 2015, MISA-Zimbabwe together with three journalists (2nd to 4th Applicants) and one citizen and independent publisher filed a constitutional court application seeking clarity on the status of the criminal defamation offence under the new Zimbabwe Constitution following the Madanhire judgement (CCZ 2/14).

The application was necessitated by the fact that the 2014 Madanhire v Attorney General Judgment indicated that the declaration of invalidity of criminal defamation was in respect of the right to freedom of expression under the previous Constitution of Zimbabwe. Further in that judgment, PATEL J had included a passage that suggested that as the formulation of the right to expression in the new Constitution was different, it was possible that the offence of criminal defamation would be constitutional in terms of the new constitution, thus creating uncertainty on whether the law was still alive or not under the current constitutional dispensation.

At the 3rd of February 2016 hearing MISA-Zimbabwe advanced the argument that by virtue of the declaration that criminal defamation was void, the Madanhire judgment had in effect removed the offence from Zimbabwean law. The State representatives eventually conceded this argument and an order to this effect was granted confirming that criminal defamation is no longer a part of Zimbabwean law.

Online Expression: State v Vikazi Mavhudzi

In 2011, Mavhudzi was charged with contravening section 22(2) of the Criminal Law (Codification and Reform) Act [Chapter 9:23] i.e. "subverting a constitutional government" for allegedly suggesting to the then Prime Minister Mr Morgan Tsvangirai to take over or attempt to take over the government by unconstitutional through a facebook post on the Prime Minister's facebook page. The facebook post in question allegedly read; "I am overwhelmed don't know what to say PM, what happened in Egypt is sending shock waves to all dictators around the world. Worth emulating hey." The charges against Mavhudzi were later discharged the same year for lack of evidence

State v Matsapa

Zimbabwean police arrested Ernest Matsapa in 2016 for circulating a video on social media to a Whatsapp group called Nyanga Free Range. The audio-visual clip was considered as "denigrating the person of" President Robert Mugabe hence Matsapa appeared in the Nyanga Magistrates court facing charges of criminal nuisance for alleging the president was too old and a burden to all Zimbabweans."The audio and video clip has the impression that the President Cde Robert Mugabe is incapacitated and has become a burden to the majority including his family due to diminishing responsibility." Matsapa could be jailed for potentially attempting to destabilize the country through publication of utterances that could cause Zimbabweans to lose trust and confidence in the presidency. Such criminal cases have inherent potential to cause riots, violence and instability.

THE SOUTH AFRICAN APPROACH

Hoho v The State [2008] ZASCA 98 -

In this case which involved a non-media person charged with criminal defamation, the South Africa's Supreme Court of Appeal held that the crime of defamation was consistent with the constitution of South Africa. The Court held that the crime of defamation still exists. In arriving at this decision, the court pointed presented several arguments, amongst which was the drawing of similarities between civil and criminal cases of physical assault before the courts, and that of defamation. The court pointed out that

… there is also a civil remedy available for common assault, yet nobody would suggest that there is for that reason no need for the crime of common assault. There is in my view no reason why the state should oblige and prosecute in the case of a complaint in respect of an injury to a person's physical integrity but not in the case of a complaint in respect of an injury to reputation, which may have more serious and lasting effects than a physical assault.[13]

Motsepe Ntele Cecil v the State [Case No: A816/2013]

In 2014, the South African High Court (Pretoria) delivered judgment in the case of the *Sowetan* journalist Motsepe who had been convicted for criminal defamation relating to a series of articles that he had

published in the paper. Upon his conviction, Motsepe had been fined and in lieu of that fine he would face a ten-month imprisonment term wholly suspended on specified conditions. Motsepe then challenged both the conviction and sentence and the appeal was joined by fifteen *amici curiae* that specifically appealed to the court on the negative effects of criminal defamation on the freedom of the media and on this basis challenged the constitutionality of criminal defamation laws.

From the inception, the court concluded that on analysis, the articles in question were defamatory and that what only needed to be determined was whether or not the requisite intention to defame was present and the unlawfulness of the action by the appellant. After analyzing the facts further, the court concluded that while the appellant may have been reckless in not verifying the facts as much as he should have, recklessness still does not equate to intention and as such, his conviction could not stand. In arriving at this conclusion, the court stressed that; "Once a person thinks that the published words are covered by one of the recognised defences to a claim for defamation, such person lacks the necessary intention required for a conviction on criminal".[14]

AMICI CURIAE APPLICATION

On the other hand, the Amici Curiae's application was to the effect that the common-law crime of defamation is inconsistent with the constitution of South Africa in that it is an unjustifiable limitation to the right to freedom of the media. The application was further to the effect that the crime should be limited to the publication of defamatory statements by other persons who are not members of the media as previous decisions in cases such as Hoho, had not dealt with the impact of criminal defamation on the media and that the impact of the law on the media and on non-media persons differed.

The Amici further contended that the civil remedy for defamation provides adequate means to cure and deter defamation by the media. The application was opposed by the state on the basis that a ruling to that effect would have adverse consequences

The Effect of Criminal Defamation on Freedom of the Media

After considering regional and international standards and case law on freedom of expression, the high court held that;

- The right to freedom of expression is not unrestrained and that it must yield to the individual's right not to be unlawfully defamed and to the individual's right to dignity.[15]
- The request to have criminal defamation declared unconstitutional "undermines the constitution and the promotion of Equality and Prevention of Unfair Discrimination Act.
- The court further noted that the case for repealing of criminal defamation laws at international level was in respect of "extreme" cases of governmental abuse of journalists which in the court's view did not apply in South Africa. Instead, the court relied on the founding of the South African Constitutional Court in Dikoko v Mokhatla 2007 (1) BCLR 1 (CC) at para 141-142 where the court held that the right to freedom of expression must at times be relegated in favour of the right to dignity.

The Need to Balance Freedom of Expression and Other Competing Interests

On this aspect, the court observed that the law of defamation still requires that a balance be struck between freedom of expression and the protection of reputations and while further conceding that criminal sanctions were a drastic remedy to the intended objective that civil remedies, the high court maintained that this was cured by the fact that criminal defamation came with an extensive burden of proof to which the court attributed the low number of prosecutions under that law.[16] Having considered thus the court held that;

- Criminal prosecution of the media for defamation in not inconsistent with the constitution of South Africa.
- Even though criminal defamation limits the right to freedom of expression, such limitation was justifiable in an open and democratic society.[17]

THE MOZAMBIQUE RULING

The ruling in a Mozambique Court is remarkably significant in that it involved publication of material alleged libelous material against a state President. The alleged offending material was originally published on a blogsite then found its way into mainstream newspapers. Prominent Mozambican economist Carlos Nuno Castel-Branco and journalist, Fernando Mbanze, editor of the independent newssheet "Mediafax", were in September 2015 acquitted by a Maputo court acquitted of libeling former President Armando Guebuza. The court action had emanated from a post Castel-Branco published on his Facebook page in November 2013, lambasting then President Guebuza's governance and calling on him to resign. Two papers, *Mediafax* and the weekly *Canal de Mocambique* republished Carlos-Branco's text. Libeling the head of state and other senior political figures is considered a security offence in Mozambique; hence the Public Prosecutor instituted charges against Castel-Branco under the law on crimes against state security. For republishing the article, Mbanze was charged under the vague offence of "abuse of press freedom" under the 1991 Press Law. Initially, the director of *Canal de Mocambique*, Fernando Veloso, was also accused, but since he was in Portugal for medical treatment he was not in the dock, nor was he tried in absentia.

Delivering the verdict a panel of three judges, Presiding Judge Joao Almeida Guilherme, observed that the court analysed in detail Castel-Branco's Facebook post and found nothing libelous in it. Judge Gulherme protected Castel-Branco's freedom of opinion in view of the latter's criticism of Guebuza's governance of the country. Other people could find such criticisms unpalatable, but that did not make them a crime. On the whole, according to the court, Castel-Branco's words fell within the confines of freedom of expression, and were protected by the Constitution. Some words were considered as just criticism notwithstanding that they could be exaggerated. The court was averse to thrust itself on the unsavory "list of the most undemocratic organizations", through convicting the accused, especially when some of the accusations made by Castel-Branco were factually true, such as reference to the appointment of a convicted criminal "to command one of the main police units in the centre of the country". This was a matter in the public domain, Guilherme noted, and Castel-Branco had made "a legitimate criticism and it's reasonable to expect the government to clarify this". The court acknowledged the language used by Castel-Branco might be regarded as "impertinent and vulgar", but the law did not deal with mere imper-

tinence and vulgarity. Since Castel-Branco was ultimately found not guilty, other parties involved in the republication of his text were similarly acquitted. Judge Guilherme concluded that, however tough some people might find the language used in the article, "it is perfectly acceptable in a democracy…. People have the right to give their opinions on how the President is governing the country". The prosecution did not appeal against the ruling. If found guilty Castel-Branco could have faced a jail sentence of up to two years, although international pressure groups such as Amnesty International were already lobbying that he be regarded "a prisoner of conscience". This case is significant because it heralded the first time in Mozambican history that anyone has been prosecuted for alleged libel published on Facebook.[18]

TANZANIAN CASES AND THE ILLUSION OF NORMALCY

Tanzania is typical of countries where the criminalisation of the use of new ICTs seems to have affected ordinary people and citizen journalists more than professional journalists. By professional journalists here, we refer to those persons working in conventional media houses and are recognised news reporters fitting the old definitions and identity of newspersons (Tuchman). A recent doctoral thesis from Tanzania observes that professional journalists work easily within a legislative context where there is a Cyber-Crime Act amongst other pieces of legislation that criminalise certain forms of expression (Hassani 2016). Tanzanian journalists revealed that the Cyber Crime Act has not directly affected them in the immediate present. It is arguable that professional journalists are general conscious and sensitive and cautious about all forms of defamation hence they conduct themselves with either due diligence or they self-censor. The editorial chain of news production can also ensure that potentially litigious publications are eliminated before they attract adverse responses from those who think their reputations have been unduly or maliciously harmed.

Previously Tanzania has used older laws to prosecute for alleged social media transgressions but recently they have on the statutes the Cyber Crime Act of 2015. This act criminalises certain forms of expression as it states,

Any person who publishes information or data presented in a picture, text, symbol or any other form in a computer system knowing that such information or data is false, deceptive, misleading or inaccurate, and *with intent to defame*, threaten, abuse, *insult*, or otherwise deceive or mislead the public or concealing commission of an offence, commits an offence, and shall on conviction be liable to a fine of not less than five million shillings or to imprisonment for a term of not less than three years or to both.

Tanzanian doctoral candidate Abbasi Hassani (2016) has listed social media and defamation related cases in his recent thesis. In spite of some cases having been filed before the enactment of the Cyber Crime Act, there are several recent cases that show that there are levels of criminalisation of publication of materials regarded as offensive in that country. The first case involved a university student and the state, and is referred to as "Mwamunyage case." Benedict Angelo Ngonyani was charged for publishing on 25 September 2016 on social media that Tanzanian Chief of Defence Forces (CDF), General Davis Mwamunyange had died from poisoning. If found guilty Ngonyani is liable to serve three years imprisonment or payment of a fine of TSh5 million or both sentences.

Another notable case with a verdict is that of Isaac Emery Hubakuki, a resident of Arusha in Tanzania. He was charged for insulting President of the United Republic of Tanzania, Dr. John Pombe Magufuli. Hubakuki was arrested and charged at the Arusha Magistrate Court for publishing defamatory materials contrary to section 16 of the Cybercrimes Act. He pleaded guilty as charged. The court sentenced

him to either pay a fine of TSh 7 million or to be imprisoned for three years. Hubakuku paid the fine. Several more young and naïve people have been arrested for insulting the President or spreading false and malicious statement either on internet or Whatsapp.

Some Tanzanian civil society groups have protested about the criminalisation of communications through the Cyber Crimes Act. They a allege the law is overly harsh and potentially incriminates well-intentioned whistle blowers who possess credible information that can be used to prosecute government officials involved in crime or corruption. However, journalists interviewed by Habassi seemed to be comfortable to work in a legal environment where the new act exists (Habbasi 2016). The cosy view Tanzanian journalists present is contradicted by harsh empirical realities presented elsewhere on the continent and throughout the world about how professional journalists using digital media are surviving. We have already noted how Tom Lowenthal (2015) has observed how journalists the world over are under siege and operate under constant surveillance forcing them to "to think and act like spies" especially when practicing investigative journalism using new ICTs. Another report shows the distressing fatality figures of journalists especially those using new media technologies. Writes Catherine Guchera (2016);

According to the Committee to Protect Journalists (CPJ), over the past two decades 780 journalists worldwide were murdered while reporting or investigating stories. Many used digital tools in their daily work, which exposed them to cyber threats as well. This trend is reflected in a recent CPJ report indicating that 109 out of the 199 journalists jailed (in 2015) worked online. Article 19 has also increasingly documented attacks against journalists who work online. In many African countries as elsewhere in the world, laws have been enacted to allow security agencies to intercept communications... The ubiquitous mobile phone with built-in geolocation software makes the user traceable anywhere and at all times. Merely making an appointment can expose both the journalist and his or her source to unwanted surveillance. What is disconcerting is that while state actors and corporate entities have become more and more adept at using surveillance tools, many journalists have yet to learn how to protect themselves online.

Such details are shocking when journalists are made to pay the ultimate prize when criminalisation alone is not deterrent enough.

CRIMINAL DEFAMATION FROM THE PERSPECTIVE OF THE AFRICAN COURT ON HUMAN AND PEOPL'S RIGHTS

Lohé Issa Konaté v Burkina Faso- Application No. 004/2013

The applicant a Burkinabe citizen was charged with defamation, public insult and contempt of court arising from an article he wrote and published in one of the country's newspapers relating to one of the country's prosecutors. He was subsequently convicted and sentenced to twelve (12) months imprisonment and also ordered to pay various amounts in fines and damages including an order suspending the operation of the publishing newspaper for six (6) months.

Konate appealed against both conviction and sentence at the African court on human and people's rights (the African Court) on the grounds that the jail term, huge fine, damages and costs of suit ordered against him violated his right to freedom of expression as protected under article 9 the African Charter

on Human and People's Rights (the Charter) and under Article 19 of the Covenant on Civil and Political Rights (the Covenant). It was further argued on Konate's behalf that criminalising the tarnishing of the image of a public figure was a disproportionate sanction which brought about a chilling effect to the public when discussing public interest issues.

Konate therefore sought the following relief from the African Court among other aspects;

1. A declaration that his conviction and sentence were in violation of the right to freedom of expression.
2. A declaration that Burkina Faso's laws on defamation and insult are in contravention of the right to freedom of expression OR ALTERNATIVELY that the jail term for defamation is a violation of the right to freedom of expression and that Burkina Faso be should amend its laws accordingly.

In arriving at its decision, the court considered a number of key issues including the following;

Justifiable Limitations to Freedom of Expression

The court stressed that while the right to freedom of expression can be limited, it must still be subjected to a lesser degree of interference and that a limitation to this right is not acceptable simply because it is provided by law but rather, reasons for limiting this right must be based on legitimate public interest and the limitation must be *proportionate* to and *necessary* for the intended objective. To this end, any criminal sentence must conform to the criteria of necessity and proportionality and any that do not conform are not in sync with the dictates of the Charter. Having considered all the facts at hand, the African Court held that;

1. Custodial sentences should not be used to remedy violations of the right to freedom of expression and of the media except in "serious and very exceptional circumstances" such as in international crimes among others.
2. All sentences that were imposed on Konate were disproportionate to the pursued aim in the law and were thus in contravention of article 9 and 19 of the Charter and of the Covenant respectively and of the revised ECOWAS treaty.
3. Particularly because of the existence of custodial sentences for defamation in the law.

CONCLUSION

Criminal libel is viewed as archaic and undemocratic but it still subsists even in countries that claim to be leading in espousing principles of democracy. The criminalisation of freedom of expression or freedom to disseminate information is also an ongoing challenge apparent in the US and other states that claim to be 'civilised' and tolerant. In the US it is still possible in a number of states for individuals to institute criminal libel charges. In the digital era both media houses and individuals who have the capacity to communicate on a mass scale ought to be wary of the possibilities of getting sued and prosecuted for different forms of libel or defamation, even in those countries that might claim to have dumped criminal defamation. The criminalisation of communication and publication remain, and at stake is the reputa-

tion of individuals or organisations or the state who claim their rights and interests have been injured. Whether verdicts which correspond with the plaintiff or complainants' alleged injury are issued in any courts of law or not is a matter of the jurisdictional decision and justification of such verdict. It is not always certain that courts will reject to hear and accept the prosecution of parties accused of criminal defamation/libel or any other communication that attracts the criminalisation of communication or publication. Internet users must also remain wary of the possibilities of litigation, and offenses rooted in publications and utterances as 'criminal' can be defined or classified variously in order to charge and penalize originators and distributors of such communication. The several examples cited in this chapter show that defamation and criminal defamation, and alternatively the criminalisation of communication in the public sphere are no longer exclusive to the traditional media, the so-called fourth estate. Individuals who now operate in the emergent 'fifth estate' and with the capacity to communicate and distribute messages and information at a mass scale due to the ubiquity of digital technologies are also prone to getting arrested and prosecuted for defamation and 'criminal defamation' or other criminalizing charges. New ICTs and their uses by both the fourth and fifth estate confirm that "When *anyone* can become a media producer, *everyone* should know something about media law – both to protect their own rights and to avoid violating the rights of others" (Packard, 2010). It remains the states prerogative to use terms such as 'criminal defamation' or "criminal nuisance" to conveniently reject them as archaic, but if the latter is the case, there is never outright assurance that freedom of expression and freedom of the media are not bludgeoned and compromised through other 'criminalising' torts or terminology that can be attended to in courts of law. Precedence might guide the determination of current and future cases on criminal defamation and the criminalisation of communication and publication, but it still remain the prerogative of each individual court attending to a particular case to determine whether defamation or any other offensive publication or utterance can be classified to be a crime.

Theoretical and political correctness posits that criminal defamation is archaic, undemocratic and unjustifiable in the contemporary world. However, in numerous countries practical exigencies make the 'crime' persist at best as a 'theoretical' possibility, and in extreme scenarios as a real punitive instrument or deterrent for possible excesses of the media against either private citizens or public officials. There are instances such as in Zimbabwe where criminal defamation has been categorically struck off the statutes. It remains to be seen if it will not be invoked for blatant and extreme cases of defamination that threaten public peace and stability, or those that 'serious' damage the reputation of complainants or public officials. South Africa, for instance, observes that while it is the standard and norm to repeal extreme cases of governments abusing criminal defamation laws against journalists throughout the world, it did not apply in the country. It is however reassuring those courts even in nation-states generally considered being strict and intolerant such as Zimbabwe criminal defamation has been struck of the statutes. Where it has possibility of reappearing as a suit other considerations also apply in mitigation for the journalists and non-professional communicators. For instance, a reckless journalist will not be heavily penalized if there is no proof of malice or intention in committing the crime, and punishments need also not be disproportionate in the severity to the offense committed. All this is in apparent consideration that communicators are not saints and may flout some legal and ethical tenets of communication even when they purport to serve the best interests of humanity through such actions as raising alarm of transgressions as has been shown in the considerable deterioration in the standards and performance of the new WikiLeaks exposures.

Chapter 80
Reflecting Emerging Digital Technologies in Leadership Models

Peter A. C. Smith
The Leadership Alliance Inc., Canada

Tom Cockburn
The Leadership Alliance Inc., Canada

ABSTRACT

In this chapter, Smith and Cockburn reaffirm the claim that they made in a previous book (Smith & Cockburn, 2013), namely that today's global business environments are characterized by volatility, uncertainty, complexity, and ambiguity, and that leaders must focus less on developing behavioral competencies and more on complex thinking abilities and mindsets. In so doing, leaders must be familiar with emerging digital technologies, their benefits and drawbacks, and utilize these technologies in their practice as appropriate. In their previous book (Smith & Cockburn, 2013), the authors defined flexible and dynamic leadership models that assure successful leadership in the above turbulent contexts, and also described learning related processes that are essential to mastering the ability to learn and adapt at rates consistent with the business complexity leaders face. In this chapter, the authors extend their previous research (Smith & Cockburn, 2013), review newly emerging elements of social digital connectivity that are contributing to global business complexity, and explain how these elements may be applied by leaders to augment the power of the recommended dynamic leadership models.

INTRODUCTION

According to Friedman (2007) the rate of change today is much different than in the past and this has created a new environment that strategic business leaders are increasingly calling a 'VUCA' environment (Lawrence, 2013). VUCA (Wikipedia, 2013) is an acronym used to describe or reflect on the volatility, uncertainty, complexity and ambiguity of general conditions and situations. The common usage of the term VUCA began in the late 1990s and derives from military vocabulary and has been applied in

DOI: 10.4018/978-1-5225-3822-6.ch080

a wide range of organizational and business situations. In today's VUCA environment, organizations of all kinds are facing unprecedented economic demands that they be successful in their given niches whilst operating in increasingly dynamic business contexts, and under ever escalating ethical and sustainability constraints. The further impact of a host of newly emerging digital technologies may well be the straw that "breaks the camel's back" for many organizations. In any event, in face of these complex challenges, "business as usual" is not a viable option, and organizations must change since complacency equates with extinction.

In other words, leaders must develop new capabilities if they are to successfully steer their communities through the newly emerging era of social digital connectivity and global dynamic complexity. As Lawrence (2013) explains in regard to this new VUCA environment, "It is taxing even the most able of leaders who may find their skills growing obsolete as quickly as their organizations change in this volatile, unpredictable landscape. Leadership agility and adaptability are now required skills if organizations are to succeed in this VUCA world." or as Michael Marquardt (2000) foresaw: "Our new century demands new kinds of leadership with new skills. Leadership styles and skills that may have worked in a more stable, predictable environment of the 20th Century will be inadequate in this new era of uncertainty and rapid change, where we can hardly define the problem, much less engineer possible solutions".

In consequence, as organizations reinvent themselves to address constantly shifting opportunities and constraints, so must new relevant leadership models emerge to fit the changed landscape the leaders confront, bearing in mind that such leadership models must be culturally and economically sensitive, and thus country sensitive (Bersin, 2012). Clearly it is a matter of urgency that HR and talent management professionals reframe leadership development activities to accommodate the faster-paced VUCA world, and focus less on behavioral competencies and more on complex thinking abilities and mindsets. As Petrie (2011) asserts "Leadership development should be focused on learning agility, self-awareness, comfort with ambiguity, and strategic thinking" - this is exactly the approach to leadership-development that was described in the book "Dynamic Leadership Models For Global Business: Enhancing Digitally Connected Environments" authored by Smith and Cockburn (2013).

This new leadership development focus is itself made more complex since it is not a one-time event, and the business landscape and available technologies are constantly changing such that leaders may not know at any given moment what manner of organization or context they will have to deal with in the future. In other words, organizations, leaders, innovators, and all the other stakeholders are in a situation where they are co-evolving at an accelerating rate. Leadership is no longer a matter of sailing a calm sea, setting a direction and ensuring it is being followed by an obedient crew - leadership now and for the future is more like trying to survive a tsunami, and is all about having a vision with an uncertain path to its achievement that may only be attempted through flexibility, agility, and adaptability in the collaborative company of fellow stakeholders. In other words, as Cashman (2013) notes: "To succeed in our volatile, complex, ambiguous world, we have no choice but to master our ability to adapt and learn", or as Biro (2013) concluded: "The demands of a collaboration-based, talent-hungry, global, wired economy are evolving so quickly that success depends on nothing less than continuous learning. Fall behind and you may find yourself disqualified from the race." and Biro (2013) further asserted that "Companies of all sizes in all industries are trying to meet the new imperative. Learning and development spending was up 12 percent in 2013, the largest jump in almost a decade. The goal is to integrate learning into a company's culture and processes. There are also training sessions, workshops, conferences, and retreats, but the most successful strategies are those that make learning a continuous process, hardwired into a company's metabolism."

In their previous book (Smith & Cockburn, 2013), the authors defined flexible and dynamic leadership models that are consistent with development of the above capabilities, and also described learning related processes that are essential to mastering the ability to learn and adapt at rates consistent with the business complexity leaders face. The models provide simple, iterative, and reflective tools for leaders in any organization to better analyze their strategic situation, decisions, available options, resources and outcomes, and to enhance or construct flexible action plans. These models are based on the understanding that Smith and Cockburn (2013) have developed from their practice that a leader's ongoing experience represents a significant source for development, but that this is often an untapped resource In order to leverage this resource these authors (ibid) proposed a disciplined, deliberate and systematic process for learning from experience.

In their new book (Smith & Cockburn, 2014), of which this chapter is Chapter 2, these authors present an extension of their first book (Smith & Cockburn, 2013) that deals with further newly emerging elements of social digital connectivity that are contributing to global business complexity, and with which leaders must not only be familiar if they are to be successful, but must also incorporate into their leadership models. In this Chapter, descriptions of the original leadership models are updated consistent with these imperatives, and newly emerging digital technologies plus contributions from other authors in Chapters 3 through 11 are provided that further detail these emerging technologies and their impact on leadership.

In this Chapter 2, the authors first clearly recapitulate and elaborate on details of the proven, flexible, and highly practical leadership process that was detailed in their first book by Smith & Cockburn, (2013). They then show how these models may be augmented to include the impact of the various new and emerging digital technologies. Many of these technologies were not treated in the first book (Smith & Cockburn, 2013), and this new material indicates specifically how leaders may recognize, review, and react to these new factors. The new book is comprised of fifteen chapters, where Chapters 3 through 11 are authored by authorities in the subject matter of a particular chapter. As a whole, and as shown in Figure 1, the book proposes to change the mindset of leaders from command and control, based on the world as clockwork, to one of appreciation of successful leadership through influence, learning and agility based on a world characterized by digital networking, complexity, unpredictability and emergence.

This book will contribute significantly to organizational and management knowledge and participation in global affairs of all kinds, and help ensure successful outcomes in today's unpredictable contexts. The approach does not entail any assumptions as to skills or expertise of users, and is adaptable for all organizations, being comprehensible for both technical and non-technical readers, and so enabling all readers to readily apply the models to their own evolving situations. Further, this book treats current leadership challenges that are not amenable to leadership approaches of the past, and it does so in an accessible manner that effectively empowers the reader to enhance their leadership aptitudes and sustainably develop their organization and staff for the challenges they face now and in the future. The book is potentially appropriate for all classes of current and aspiring leaders, being gender-neutral, culture-neutral, and economy-neutral, and will aid in their day-to-day activities, their career progression, and in the development of emergent capabilities relevant to co-evolution with their environments.

Objectives for this Chapter:

- Review dynamic leadership models recommended in Smith and Cockburn (2013)
- Discuss how emerging digital technologies may be integrated into these models

- Present concluding remarks and explore related emerging trends
- Detail the relevant references

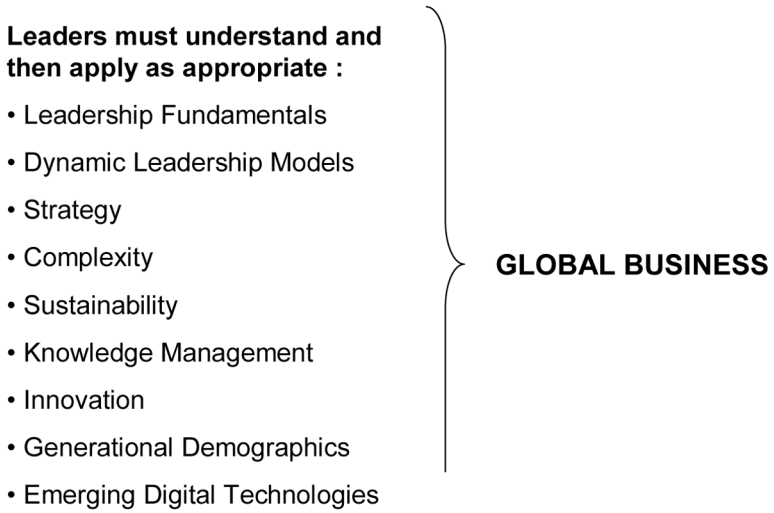
BACKGROUND

Smith and Cockburn (20113, p. 32) state that, in relation to their recommended dynamic leadership models: "To fully equip global leaders nowadays there is a need to build an *enabling* framework across all levels of the organization. We believe that a bold approach is necessary, and *Dynamic Leadership Models for Global Business: Enhancing Digitally Connected Environments* is the result. Like that great leader Alexander in ancient times, it's time to unravel the Gordian Knot (2011), and we propose a foundation for understanding and practicing leadership based on proven ways to deal with complexity. This foundation is particularly relevant to dynamic leadership in digitally connected environments where such leadership is critical to addressing the complexity typical of such situations. Please note that the foundation is also independent of whether one leads in engineering, IT, construction, banking, or a myriad of other disciplines, and is gender neutral." These authors go on to claim that complexity may be very successfully addressed if one's actions are based on "intuitive decisions that in turn are based on extensive experience" (ibid, p. 34), but add that if one does not have extensive experience, "another way to successfully make progress is by taking small steps in an experimental fashion and learning from what seems to get the results one wants and what doesn't." (ibid, p. 34). This is an 'emergent' approach that Snowden (2012) terms "probe, sense, respond" (ibid, p. 95).

In adopting this approach, all chapters in this new book (Smith and Cockburn (2014) add practical supportive detail to the approach illustrated in Figure 1 which summarizes the intent of the previous book (Smith & Cockburn, 2013) and of this book (Smith & Cockburn, 2014).

Smith and Cockburn (2013) devoted chapters to up-to-date research on leadership fundamentals such as strategy, complexity, sustainability, socio-digital technologies, knowledge management, innovation,

Figure 1. A leader's mindset for success in VUCA environments
(Adapted from Smith and Cockburn, 2013)



demographics, and digitally connected networked environments, with the proviso that these are subjects with which leaders must be familiar if they are to lead successfully in our complex global environment. These authors (ibid, 2013) also detailed integrated processes, termed "Dynamic Leadership Models", that facilitate this emergence, but they were not prescriptive regarding specific behaviors, competencies etc. In this way, these authors avoided the trap whereby leadership development is based on competency models derived for a past era, for as Myatt (2013) asserts: "When organizations hire, develop, and promote leaders using a competency-based model, they're unwittingly incubating failure." Rather Smith and Cockburn (2013) emphasized continuous learning, noting that the close links between leadership and learning were established long ago by scholars in organizational behavior (Schein, 1992; Argyris, 1993), and the links continue to be emphasized world-wide today (Grazier (2005). Further, they explained that the leadership processes they described (Smith and Cockburn, 2013; p. 39-55) were designed to take into account the existing knowledge of an individual and provide a framework to further develop this knowledge, or as appropriate, to relinquish previous knowledge and skills that the individual finds counterproductive e. This latter objective has come to be termed 'unlearning' (Becker et al., 2006).

Smith and Cockburn (2013) claim that the learning-based leadership approach they detail is effective and efficient for the complex environments leaders must safely navigate daily, and that their new system is free of the weaknesses of current leadership programs, delivering significant additional personal and organizational benefits at less cost. Smith and Cockburn (2013, p. 39) state thfrom

Although leadership learning has been covered in the past, we believe this is the first time that an overarching process has been fully described that successfully addresses the realities of everyday leadership, and at the same time facilitates many dynamic leadership models to be enacted depending on the digitally connected environments at hand.

Leadership Process Cycle

The four-step learning-based leadership approach advocated by Smith and Cockburn (2013) is described in this sub-section. Here is what this "learning-leadership by doing" might look like:

Follow the four-step incremental leadership process cycle recommended by Smith & Cockburn (2013, p. 39-55), and according to Smith and Cockburn (2013, p. 39-40) also:

- Face reality.
- Continuously reflect alone and with others.
- Recognize the strengths you have and build on them.
- Start from where you are.
- Learn by leading in your particular context.
- Learn from successes and failures.
- Continue to incrementally improve at your best pace.
- Organize in a people-centric way.
- Motivate stakeholder participation.
- Leverage the wisdom of your learning partners.

Step 1

According to Smith and Cockburn (2013, p. 40) "The first step is to understand your leadership role – what are you expected to achieve? In sporting terms, this is your scoreboard, and the win, lose, or draw of your leadership will be judged on its results." Your leadership role may be defined by a variety of people in any given organization but it is critical, according to Smith and Cockburn (2013) that you yourself are very clear on your current leadership role, and furthermore you must constantly review and attempt to change it to better meet your organization's mission, goals and objectives. These authors strongly encourage leaders to develop and have approved such a personal role if one does not exist.

A generic leadership role framework (ibid, p. 40) is said to describe the leader's involvement in:

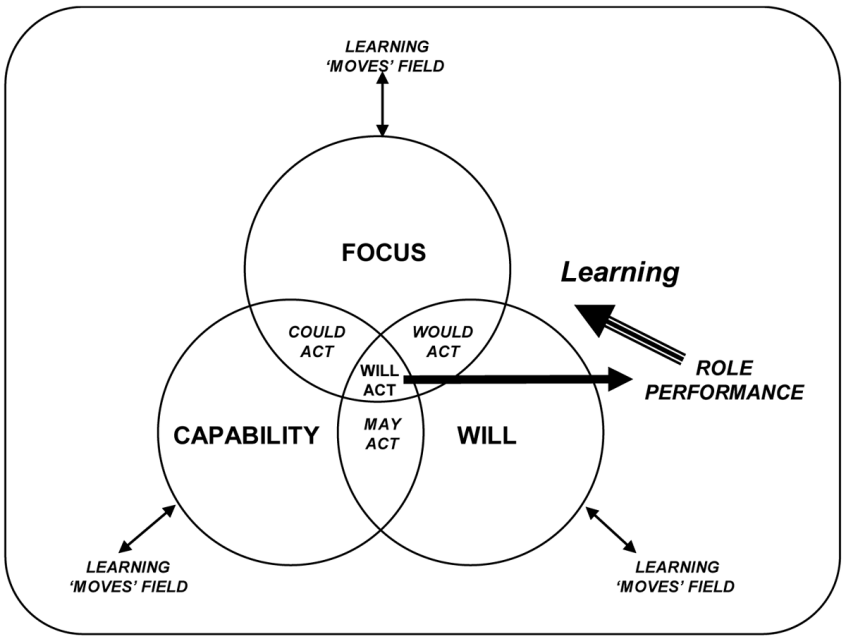
- Defining the organization's mission and identifying the means and outcomes for its achievement.
- Developing the plans to actualize the tasks and activities related to the means and outcomes desired.
- Leading implementation of the plans, sustaining commitment and ensuring cohesiveness.
- Supporting sustainability through openness to change and continuous improvement.

Step 2

The second step involves analyzing how to successfully perform your role. This is accomplished according to Smith and Cockburn (2013, p. 41) using the performance system model presented in Figure 2

In Figure 2, your leadership role performance is pictured as dependent on three fields (Wheatley, 1992, p. 47-57) termed Focus, Will and Capability. The three fields form a dynamic system, and the

Figure 2. Dynamic performance system (reproduced from Smith & Saint-Onge, 1996)



performance level you achieve depends on the interactions and interdependencies of the three fields. According to Smith and Cockburn (2013, p.41):

Focus represents a clear definition and understanding of your role performance to be achieved; Focus is associated with questions such as What ..?; How ..?; Who ..?; Where ..?; When ..?; Why ..? The element Will represents your strength of intent to achieve the performance defined in Focus; Will is associated with your attitudes, emotions, beliefs and mindsets. Capability represents the wherewithal to transform into reality the performance defined in Focus; Capability is associated with such diverse areas as your skills, infrastructure, budgets, tools, physical assets etc. A change in any one of these fields may effect a change in the state of one or both of the other fields.

As Figure 2 shows, current performance potential is represented by the degree of overlap of the circles; optimal performance potential is indicated when Focus, Will and Capability are all in balance and harmony, which would be demonstrated in the figure if all three circles completely overlapped. Imbalance leads to misdirected and wasted efforts as well as loss of performance. Figure 2, where only two model fields overlap and three fields overlap only slightly, is typical of real-life situations. For example, Smith and Cockburn (2013, p. 42) note thfrom

… it is not unusual for a leader to poorly discharge their role because although the leader has a relatively clear understanding of the role performance they are charged to action (strong Focus), the leader has somewhat inadequate interpersonal skills and resources to carry out the actions required (moderate Capability), and no belief in the role's value and so little incentive to carry out the role as given (low Will).

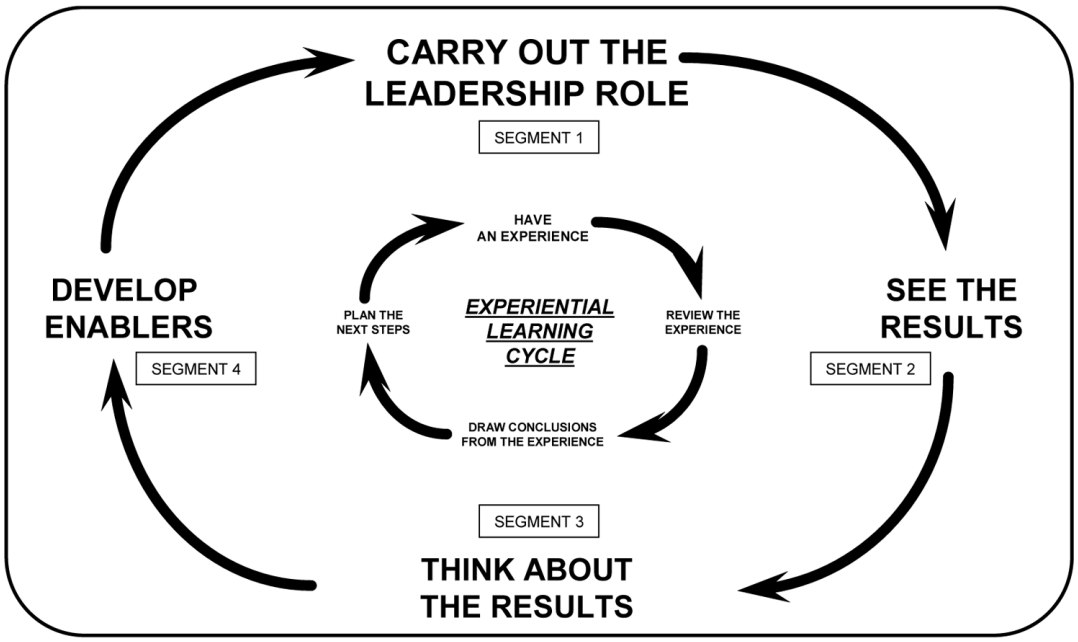
Performance optimization is based on the continual dynamic tuning of the degree of overlap of the three fields. As a leader reflects on the results of their workplace efforts, their learning provides them with the clues regarding how they need to alter their Focus, Will and Capability to attempt to maintain harmony and balance, and thus there optimum role performance; in other words learning and reflection are keys to optimum leadership performance. Smith and Cockburn (2013, p. 42) claim that the necessary learning, and reflection are fostered and greatly facilitated through the kind of collaborative learning associated with the Action Learning approach that these authors discuss in their book (Smith Cockburn, 2013). These authors further claim that a unique benefit of this performance model is its "systemic equivalence of Will versus Focus and Capability and its personal psychological nature." As Popper and Mayseless (2007) point out, this is in contrast to typical leadership instruction where the emphasis is on observable variables rather than on the intra-psychic psychological variables that are truly fundamental to the visible expression of leadership.

Step 3

Smith and Cockburn (2013) state that the third step involves a leader frequently working through a succession of activities in an experiential leadership learning cycle (Smith, 2000; Schewhart, 2012; Kolb (2012; Honey and Mumford, 1992; Deming, 2012); this experiential leadership learning cycle is shown in Figure 3.

In Figure 3, the first three cycle segments refer to any aspect of the leadership role being undertaken. "See the results" and "Think about the results" are segments in which the leader reviews role demands

Figure 3. Leadership learning cycle (reproduced from Smith, 1999)



and actual results versus relevant aspects of the elements Focus, Will and Capability described in Step 2. “Carry out the role”, “See the results”, “Think about the results” and “Develop *enablers*” correspond to “probing, sensing and responding” and are consistent with the ‘emergent’ approach described by Snowden (2012) and Smith and Cockburn (2013, p. 95). Reflection, particularly in segments three and four, facilitates the leader deciding on what s/he needs to do to correct the mismatch between role demands and leadership results. Smith and Cockburn (2013, p. 42) point out thfrom

When time is extremely short, decisions have to be rapid, and the scope for reflection is extremely limited. In these circumstances, reflection may be seen as a metacognitive process in which the practitioner is alerted to a problem, rapidly reads the situation, decides what to do and proceeds in a state of continuing alertness.

Smith and Cockburn (2013, p. 43) explain thfrom

Enablers are comprised of any understanding, knowledge, activity, capability, attitude, characteristic etc. which enables the leader to carry out his/her leadership role more effectively and better achieve intended results. For example an enabler might be as onerous as undertaking a skill training course or as simple as dropping into a colleague’s office to straighten out a misunderstanding.

Some typical enablers highlighted by Smith and Cockburn (2013, p. 43) are listed in Figure 4. Segment number one in Figure 2 then re-starts the cycle with the chosen enabler(s) as part of role execution, and so on repetitively, cycle by cycle.

Smith and Cockburn (2013, p. 44) claim that complexity by its nature must be addressed through experimentation, and that Steps 1 through 3 should be treated in this manner, where iteration of the steps provides the experimentation from which the leader must learn and build experience. Yeo (2010) notes that the intrinsic value of reflection is not simply to seek an immediate solution to a problem, but rather it creates new insights into broader and deeper issues that reflection brings into continued questioning. Smith and Cockburn (2013) also recommend that the leader capture these experimental episodes in a reflective journal that may be used in the future to help in selecting enablers and also maintains a database of events.

In Step 2 of the leadership process cycle it was noted that learning and reflection of the performance system model is fostered and greatly facilitated through the kind of collaborative learning associated with action learning (McGill & Brockbank, 2004). In this regard, Smith and Cockburn 2013, p. 45) recommended that from time to time segments three and four in Step 3 be carried out in the company of one or more (no more than five) trusted colleagues in "learning partnerships" as shown in Figure 5. Action learning in an informal setting is a very effective method for developing learning partnerships; the formal activities of an action learning group (set) need not be followed, but the general principles of questioning, reflection, conjecture and activity planning would be utilized in achieving these results. Action learning (McGill & Brockbank, 2004) was originated by Professor Reg Revans in the 1940's (Revans, 2012) and is used by many notable organizations (Smith, 2001, p. 35) Action learning according to Revans embodies an approach based on comrades in adversity learning from and with each other through discriminating questioning, fresh experience and reflective insight. This seemingly very simple methodology has demonstrated in innumerable cases that its practitioners can affect the complex and often inscrutable processes of natural learning through personal and collaborative reflection. The seven questions listed by Smyth (1991) are also helpful in reflection:

1. What do my practices say about my assumptions, values and beliefs?
2. Where did these ideas come from?
3. What social practices are expressed in these ideas?
4. What is it that causes me to maintain my theories?
5. What views of power do they embody?
6. Whose interests seem to be served by my practices?
7. What is it that acts to constrain my views of what is possible?

Smith and Cockburn (2013) note that simple personal assessment instruments related to the performance model shown in Figure 2 have been used for many years (Tosey & Smith, 1999). Such a personal assessment instrument relevant to the leadership performance discussed here is presented by these authors (ibid, p. 49). In interpreting the assessment results, Smith and Cockburn (2013) encourage leaders to add their own questions to the assessment to help track problem areas or to highlight important aspects of their leadership role. Further these authors caution that it is important to have balance between the three fields rather than have one field significantly better than others e.g. Capability is typically over-developed and Will is typically under-developed. Smith and Cockburn (2013, p. 47-52) provide further comprehensive research and recommendations regarding the tuning of Focus, Will and Capability

- Clearly understand and commit to implications of your role.
- Collaborate in revising your role as necessary.

Figure 4. Some typical enablers In general business situations (Smith & Cockburn, 2013)

- Clearly understand and commit to implications of your role.
- Collaborate in revising your role as necessary.
- Develop an understanding of systems thinking.
- Expand business experience and customer know-how.
- Build organizational savvy - how/who can get things done.
- Increase networking and extend your credibility.
- Widen cross-functional relationships.
- Value people.
- Enhance communication skills.
- Familiarize yourself with the chapter-contents of this book.

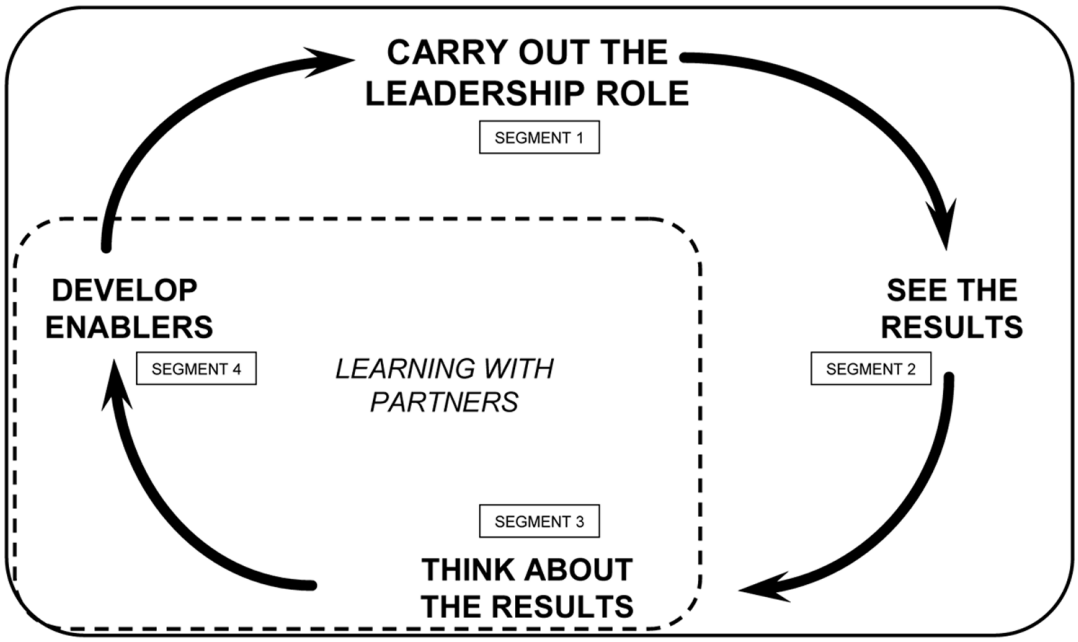
Figure 5. Learning with partners (reproduced from Smith, 1999)



Step 4

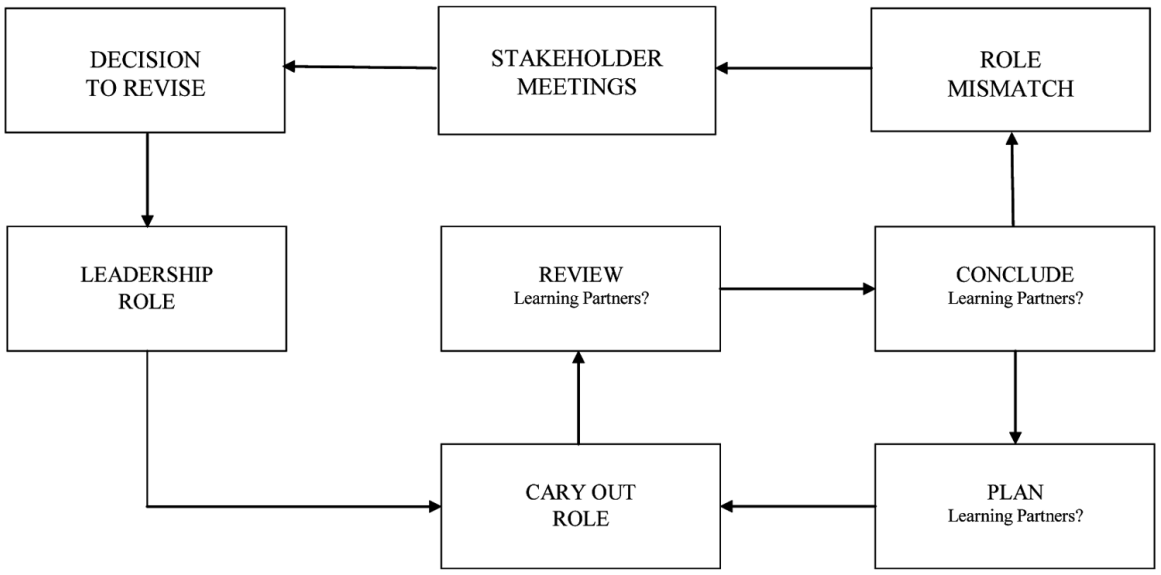
Smith and Cockburn (2013) assert that Step 4 is concerned with operationalizing Steps 1 through 3 to obtain the maximum value.

These authors cite Argyris and Schon (Argyris, 1991) who adopted the position that learning that involves the detection and correction of error is 'single-loop learning' based on a simple feedback loop, where outcomes cause adjustment of behaviors, like a thermostat. It is generally in operation when goals, beliefs, values, conceptual frameworks, and strategies are taken for granted without critical reflection. In other words it is the *uncritical* acceptance of a leader's role description in Steps 1 through 3 of the leadership process approach described so far.

Smith and Cockburn (2013, p. 52-53) claim that an higher order of learning is realized when a leader, upon detecting a mismatch between the target leadership role and reality, questions the goal-structures and rules embedded in his or her role description. This these authors assert, is exemplified when a leaders doubts and queries the relevance of his/her leadership role based on practical results and circumstances (s)he perceive in carrying out Steps 1 through 3 of the leadership process approach described previously. According to Argyris and Schon (Argyris, 1991), this is referred to as 'double-loop learning'. Double-loop learning is more creative, and may lead to alterations in the rules, plans, strategies, or consequences initially related to the problem at hand. Double-loop learning involves critical reflection upon goals, beliefs, values, conceptual frameworks, and strategies. Argyris believed that this way of learning is critical in organizations and particularly to individuals who find themselves in rapidly changing and uncertain contexts - that is in complex situations.

Pardey (2008) claims that there is little new in terms of leadership ideas, and the challenge of today and the future is to adapt leadership styles to fast changing business environments. Smith and Cockburn (2013) state that the more complex, dynamic, turbulent, and threatening the organization's environment,

Figure 6. Steps one through four of the leadership process
(Reproduced from Smith & Cockburn, 2013)



the more significant double-loop learning must be considered in relation to leadership capability (Van Grinsven & Visser, 2011; Smith, 2012), and since the notion of single- and double-loop learning has stood the test of time, application of this concept to Steps 1 through 3 of the work-based leadership process described previously is important and relevant as shown in Figure 6.

Unfortunately, practical experience described by Smith (2011) indicates that many organizations are operating as if they were involved in 'simple' or 'complicated' contexts, rather than the reality of their current highly complex environments. This has potential implication for leadership where the leaders delude themselves in regard to the complexity of the situation they are dealing with, and the understanding of others. Again this is a common problem with leaders (Smith & Saint Onge, 1996; Argyris, 1990; 1993). The latter delusion is particularly relevant in many emergency situations where teams must operate under constrained time horizons and with fluid 'experts' joining and leaving the teams at various points. Riley et al. (2008, p. 8), comment:

...in conventional teams it might be possible that implicit communication is sufficient for team members to effectively communicate with each other. However, in critical teams, our observations show that implicit communication can be ineffective and possibly dangerous for patient safety. For example, we observed many instances in leadership transfer where the leader made certain assumptions that were erroneous.

On the basis of this theory and their own experience, Smith and Cockburn (2013) emphasize the importance of a leader continually evaluating his/her role for relevance given their experience in Steps 1 through 3, and seeking to have it revised as appropriate.

MAIN FOCUS OF THE CHAPTER

Paul Barsch (2013) recounts a story that he attributes to Gillian Tett of the Financial Times who discusses how in western economies 85% of the dollars lent by banks go to supporting existing assets, and not innovation, with only 15% of financial flows going into 'productive investment'.

This is a phenomenon typical of human nature where for example only 15% of a community are natural avid learners of new subject matter with 80% being learners only when 'seriously encouraged' and 5% being 'couch potatoes'. Smith and Cockburn (2013) make the case that given the complexity inherent in today's business world, and the necessity for systemic thinking to address this complexity (Gharajedaghi, 2012), leaders in general are not familiar in any meaningful way with important business and technology topics outside of their own particular discipline. In their efforts to close this gap, these authors devote a chapter to each of the topics that they claim contribute to business complexity and with which leaders ought to be at least familiar; these topics are leadership fundamentals, strategy, complexity, sustainability, socio-digital technologies, knowledge management, innovation, demographics, and digitally connected and networked environments.

In this book Smith & Cockburn (2014) assert that the plethora of emerging digital technologies must be added to this list. These technologies include: information organization and representation;, information use and analysis; information preservation and access; information environments and socio-cultural concerns; social networking; enterprise social software; innovation/collaboration platforms; cloud computing; grid computing; big data; analytics; risk analysis; dashboards; eLearning; mobile technologies; Artificial Intelligence (AI); distributed AI systems and multi-agent systems; games; simulations; Social

Network Analysis and related software; information capture and storage; data mining; potential pitfalls of emerging digital technologies; information security; and information privacy issues. Clearly a daunting list, especially when combined with the topics detailed by Smith and Cockburn (2013). Smith and Cockburn (2014) assert that only very few domains in business or society have remained untouched by emerging digital technologies, and especially social media (Deiser & Newton, 2013). Wikis enable more efficient virtual collaboration in cross-functional projects; internal blogs, discussion boards, and YouTube channels all encourage global conversations and knowledge sharing. This radical change has created a dilemma for senior executives; while the potential for leveraging the power of social media seems immense, the inherent risks create uncertainty and unease. The security concerns raised with respect to this internal and often private privileged information are significant and well founded. In addition, as Deiser and Newton (2013) point out:

…there's a mismatch between the logic of participatory media and the still-reigning 20th-century model of management and organizations, with its emphasis on linear processes and control. Social media encourages horizontal collaboration and unscripted conversations that travel in random paths across management hierarchies. It thereby short-circuits established power dynamics and traditional lines of communication.

These authors in their article detail many aspects of a leader's role that have been redefined in this new digital environment.

Smith and Cockburn (2013) made it clear that they were only recommending 'familiarity' with the topics they covered in their 2013 book, and these authors feel that this proviso should apply to a leader's understanding of emerging digital technologies and their applications. They make the point that expert authorities in these various topics are typically readily available, and the purpose of 'familiarity' is to ensure meaningful dialog between the business leader and the topic expert. Too often in the past technical solutions to business problems have resulted in mismatched 'stitched together' solutions where each side blames the other for the failure of the initiative in practice. This is a particular problem in regard to emerging digital technologies that are rife with acronyms and where senior staff still show disregard for the benefits of the digital era. For example, Toomey (2013) in discussing a government case "Plain Language about Digital Leadership and Governance of Information Technology" states as follows:

The patterns are clear. When the IT agenda is controlled by the IT specialists, and the people who run the government agencies are not engaged, things often go wrong - sometimes horribly. None of the investigations that I have seen describe a significant government IT failure arising from a situation where the business leaders are firmly in control of the IT agenda.

Toomey cites numerous examples of IT-business mismatches, for example Gershon (2009); Reinecke (2009); National Audit Office (2012); Chesterman (2013); and Joyce (2013).

Smith and Cockburn (2014) emphasize that 'familiarity' with emerging digital technologies in the sense outlined above is the aim of their new book - leaders need to be 'broadly read' in these topics and take a learning approach to adoption of these technologies where their successes and failures both provide the learning. Research conducted by Korn/Ferry International, and reported by Cashman (2013) from assessment of nearly 1 million executives, demonstrates that as individuals mount the executive ladder, they need to become increasingly comfortable with uncertainty and sudden change, and as Cashman

states: "As leaders, they have to have the "integrative capability" to weave together and make sense of apparently unrelated pieces of information and ideas, crafting novel and innovative solutions from them".

The focus of this chapter so far has been on recapitulation and elaboration of details of the proven, flexible, and highly practical leadership process that were detailed in the book by Smith & Cockburn, (2013). In this section the authors will demonstrate how these models may be augmented to include the impact of the various new and emerging digital technologies. Although, in many cases the potential for a given digital technology to impact the particular leadership model is treated in isolation from other potentially promising digital technologies, the leader is cautioned that digital technologies often display the greatest synergy when used in combinations in holistic fashion, and digital technologies should not be segmented without situational consideration (Goldner, 2013). In addition, it should not be inferred that this section in any way represents an exhaustive application of emerging digital technologies to these models; each leader, in the spirit of learning and adaption, must reflect on the relevance of emerging digital technologies to application of the models in their environment, and augment the models as appropriate.

Leadership Process Cycle

The four-step learning-based leadership approach advocated by Smith and Cockburn (2013) was described previously in this chapter in the sub-section 'BACKGROUND'.

According to Primus (2013): "Driven by clear productivity and cost benefits, IT and business management are embracing and empowering a mobile, distributed workforce – a workforce that views communications and collaboration technology, rather than bricks-and-mortar offices, as their business infrastructure". This White Paper states that this movement is in response to the need to reduce costs, attract/retain top talent and recruit from around the world by offering the flexibility to work from any location, offer options to local employees who prioritize workplace flexibility, and the need to integrate "independent professionals" into their organizations. As Primus (2013) makes clear, the result is that productivity is significantly enhanced and costs significantly reduced. For example:

Research shows that employees tend to dedicate 60% of the time formerly lost to commuting to additional work activities, and another study shows that 35 per cent of technology professionals…said they would sacrifice up to 10 per cent of their salaries ($7,900 on average) for full-time telecommuting.

Clearly organizations leaders need to factor this trend into their leadership initiatives, and here is what the learning-leadership by doing recommended by Smith and Cockburn (2013) *additionally* might look like in a digitally-aware environment (based on Murray [2013]):

- Foster a culture of digital experimentation.
- Cultivate digital leadership.
- Utilize technology for improved communication, sharing and interaction.
- Communicate your own digital learning.
- Invigorate team meetings through technology (surveys, desk-sharing etc).
- Model 'powering down' to maintain sanity.
- Utilize technology by automating for improved efficiency.
- Encourage personal learning networks and COP.

Step 1

As emphasized earlier in this chapter in the sub-section on BACKGROUND **-** Leadership Process Cycle - Step 1, according to Smith and Cockburn (2013, p. 40) "The first step is to understand your leadership role – what are you expected to achieve? In sporting terms, this is your scoreboard, and the win, lose, or draw of your leadership will be judged on its results." This advice holds true as you attempt to introduce emerging digital technologies into your leadership and workplace practices. If your role does not specifically include introduction of emerging digital technologies into your business environment, great care must be exercised to demonstrate that such digital technology as you do introduce can be seen to be linked to achieving elements of your role that are listed. As stressed in the Step 4 sub-section of BACKGROUND **-** Leadership Process Cycle - Step 4, Smith and Cockburn (2013) emphasize the importance of a leader continually evaluating his/her role for relevance given their experience in Steps 1 through 3, and seeking to have it revised as appropriate, and this holds true particularly when the introduction of emerging digital technologies seems appropriate.

Step 2

As explained earlier, the second step involves continuously learning how to successfully perform your role using the performance system model presented in Figure 2.

In this step mobile phones and tablets have significant potential for enhancing learning and reflection. Maglajlic and Helic (2012) in their research identify a high correlation between communication intensity and learning outcomes. Insightful guidance provided by the Aberdeen Group (2012) includes the use of mobile devices in building leadership capability, plus widespread use of such devices for knowledge sharing and learning. Aberdeen Group's data showed significant increase in the use of mobile tools for internal learning and communication between 2009 and 2011 with further major growth anticipated. An enhanced learning experience was said to be one of the prime drivers for the use of mobile technology with improved learning administration also being identified according to these authors. As more mobile tools are targeted by organizations to their customers etc. the more an organization's leaders may learn with and from these important networks. Aberdeen Group (2012) claim that issues around how to stream content and address interactive activities are becoming more important as users become more sophisticated. As in other areas of complexity, mobile technology is coevolving with learners and their needs.

Analytics is another emerging digital technology that may have a place in Step 2 activities. Bersin (2013) defines the word "Analytics" as the systematic discovery of meaningful patterns in data to support decision-making. In practice (Forbes & Mckiney, 2012) Analytics is typically the process of turning *large quantities* of data into information that is digestible and actionable. It includes tools and processes that analyze large amounts of organizational data, related to finances, employees, transactions, customers, etc. The term includes reporting, Dashboarding (Levy, 2011; IBM, 2013; Dashboards, 2013), predictive analyses and scenario-modeling. Research shows that many companies which have included corporate analytics in their operations have seen a 5 percent to 6 percent increase in performance in comparison with their peers (Forbes & Mckinsey, 2012). Bersin (2013) found, in a study of 741 organizations, thfrom

75 percent of HR leaders agreed that analytics is an important element to their organizations, but 51 percent said they have no plans in place. Another 37 percent reported that they have insufficient resources. In fact, 56 percent said that they have poor skills and only 6 percent rated themselves as highly skilled.

Gaining immediate and appropriate feedback on performance is critical and Dashboards (2013) are becoming more and more highly prized for Business Intelligence (BI) with potential for Step 2 application, although development cost maybe a deterrent. Back in the 1980's, Executive Information Systems (EIS) performed a similar service but today's Dashboards are far more interactive and usable for today's dynamic business requirements. Modern dashboards have the capability to present data and information in summary which makes them very powerful tools for BI, although the question of how to calculate the return on a Dashboard investment can be tricky. However, many of the charts used in older EIS systems were very much like those in use in today's Dashboards since user needs and wants have not changed much over time. What has changed is the availability of more sophisticated technology and more sophistication in the user community. Modern Dashboards meet business needs in a practical and actionable way when they can give quick snapshots of the big picture on one hand while being capable of offering detail on the other. Dashboards are fundamentally intended to provide 'at-a-glance' views of key performance indicators relevant to a particular objective or business process. The most useful dashboards in Step 2 are those designed for analytical purposes that often include context, comparisons, and history, along with subtler performance evaluators.

The spreadsheet is an alternative to the dashboard for certain applications. Spreadsheets are typically used in the form of Microsoft Excel documents. Their advantage is that they are intuitively easy to use and learn, providing detailed numbers, which users can analyze adding their own calculations. Unfortunately, the spreadsheet is often too detailed to give a quick and comprehensive overview of business data, although given their ease of development, they may provide a useful tool to assist in Step 2 activity.

Scorecards may also be developed for use in this step based on the kind of appraisal set out in Smith and Cockburn (2013, p. 49 & p. 265). Such scorecards, for 'at a glance' visualization of the status of Focus, Will, and Capability, have been used in many practical situations (Tosey & Smith, 1999) and are based on transferring the numerical outcomes from an appraisal onto three vectors each scaled from 0 to 10. The use of scorecards implies the use of surveys for the appraisal. Also, surveys in their own right may be used very profitably in Step 2 to help ascertain how others view the manner in which your role is being discharged and to gauge the effect of enablers. Online surveys are now easy to assemble and may therefore be distributed, collected and analyzed very readily. A primer on survey-design for the Internet is provided at Survey (2013) and many commercial s/w 'do it yourself' systems are available.

Membership in relevant social networks also offers access to potentially useful data in Step 2 with respect to for example Enablers that others have found useful, availability of Focus and Capability enhancement opportunities, and also to gain organizational 'savvy' in all areas of practice. With respect to Capability enhancement in particular it is noteworthy, as Arinze (2012) claims that E-Collaboration has come of age in the last decade, with industry and academia using the latest web-based collaborative software to bring together groups of workers, including those in academia, to work on common tasks.

Step 3

The third step, as explained earlier, involves a leader very frequently cycling through a succession of activities in an experiential leadership learning cycle. This experiential leadership learning cycle is shown in Figure 3. The emphasis in this case is on personal learning and reflection, and comments regarding emerging digital technologies recommended in regard to step 1 above are appropriate in this step.

However, as Figure 4 illustrates, it is recommended from time to time that this learning and reflection be carried out in the company of learning partners. As Smith and Cockburn (2013, p. 35 & p.

46-47) explain at length, action-learning is very well suited to the type of learning and reflection that is fundamental to this step. The extent to which a leader wishes to apply digital technology to broaden the circle of their learning partners, or facilitate dialog where these partners are situated at a distance, is an individual matter that the leader must decide. The emergence of ubiquitous digital interconnectivity for social networks has provided a ready means by which public and private conversations may take place across an organization, including very importantly its customers and stakeholders. This is critical to the widespread sharing and generation of knowledge, and to learning and reflection in general. This widespread digital interconnectivity for social networks has already provided a means for action learning to be carried out at arm's length (VAL) between an action learning group's participants (IFAL, 2013).

Dickenson et al. (2010) report findings from their research exploring VAL as an emerging variety of action learning (AL). These authors note that VAL provides value by bringing together geographically dispersed individuals within and across organizations, and possibly across time, and therefore has potential in both education and commercial contexts. At the beginning of this research there appeared to be little evidence of VAL being used, although face to face was well known and practiced. Although there was considerable interest expressed by educationalists and practitioners in adapting AL to VAL, there was a lack of understanding of how to go about it. However the research findings revealed more practice than was anticipated and demonstrated that VAL is a distinct variety of AL, characterized by its virtual, non-f2f nature, and that it has its own strengths and weaknesses. Dickinson et al. (2010) provide a 6-form classification of VAL, consider some of the theoretical questions associated with its practice and explore its potential in the light of emerging technologies. These authors conclude that, like AL, VAL is not singular, but takes a variety of forms, each with distinct characteristics, advantages and shortcomings. It is further reported in a study by Plack et al. (2010) that most of the students engaged in VAL were able to demonstrate reflection on complex clinical issues. Some struggles were encountered and issues were exposed regarding a lack of voice and power that may lead to missed learning opportunities. VAL also facilitates social learning, meaning making, and social reflection in communities of practice [COP] or in broader organizational setting (Wenger, 2000).

Wenger (2000) asserts thfrom

A community of practice can be viewed as a social learning system. Arising out of learning, it exhibits many characteristics of systems more generally: emergent structure, complex relationships, self-organization, dynamic boundaries, ongoing negotiation of identity and cultural meaning, to mention a few. In a sense it is the simplest social unit that has the characteristics of a social learning system.

However, as Wenger (2001) explains, COP are "focused on a domain of knowledge and over time accumulate expertise in this domain. They develop their shared practice by interacting around problems, solutions, and insights, and building a common store of knowledge". That is CoP are typically concerned with the development of best practices through the sharing, and recycling of existing 'accepted' knowledge (Cavaleri & Seivert, 2005), whereas the kind of learning and reflection related to step three relates to expanding the leader's thinking, knowledge, and boundaries, and requires a different supporting mindset from that of sharing existing knowledge (Coakes et al., 2011). However Smith (2003, 2009) quotes Wenger (circa 2007) that COP are formed by people who engage in a process of collective learning in a shared domain of human endeavor: a tribe learning to survive, a band of artists seeking new forms of expression, a group of engineers working on similar problems, a clique of pupils defining their identity in the school, a network of surgeons exploring novel techniques, a gathering of first-time managers helping

each other cope. In a nutshell: Communities of practice are groups of people who share a concern or a passion for something they do and learn how to do it better as they interact regularly. Clearly, Wenger's sense of COP is consistent with individual learning via social interaction and co-participation, and is ubiquitous in ongoing activity, though often unrecognized as such.

Communities of Innovation (CoInv) are a special case of the more general Communities of Practice (COP), and are proposed as places of safety to provide 'Ba' (Nonaka & Konno, 1998), and for challenging organizational norms and innovating; thus changing organizational practices long term. CoInv are a form of COP that leverage the appropriate capabilities of COP, but are very specifically dedicated to the support of innovation. CoInv are an important new social learning concept that was first introduced by Coakes et al. (2009).

Again, the leader must decide if COP or CoInv are appropriate vehicles for learning and reflection in this step. Some practical pointers may be gleaned from work addressing leadership in virtual team environments by Pauleen (2003).

Smith and Cockburn (2013) recommend keeping a personal reflective journal that may be used at a later date to help in selecting enablers or for resolving other performance issues. In the past, such a journal was laborious to compile by long-hand and very difficult to search when one wished to locate a particular incident; digitization has revolutionized the keeping of such a journal and also the capability to search it using keywords (tags). There are many commercial digitized "diary" products on the market; such a well known app is Day One (2013) which is usable via mobile devices and has key word search-ability. Such a digital journal may also be readily backed-up for security purposes by for example Dropbox (2013). Dropbox also facilitates sharing the journal and ensures that the journal is available on all a user's digital devices.

The question of whether a leader should be using Cloud Computing in relation to any of the dynamic leadership models described in this chapter to a large extent depends on (a) the ready availability of cloud computing to realize the capabilities of the emerging technology being applied to the model, or (b) the policies and capabilities of the IT department of the leader's organization, or both (a) and (b). There is no shortage of hype regarding cloud computing, but CNBC (2011) provides clarification that cuts through the rhetoric. For example this source claims that "cloud computing can be grasped on its basic level - anytime, anywhere computing - without the user ever having to know much about the technology" and "In simplest terms, cloud computing involves delivering hosted services over the Internet. The *service end* is where the data or software is stored and the *user end* is a single person or company network." The official definition from the National Institute of Standards and Technology is also provided and reads: "Cloud computing is a model for enabling convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications and services)that can be rapidly provisioned and released with minimal management effort or service provider interaction." Although cloud computing offers cost savings and enhanced use of use, as CNBC (2011) goes on to caution, safety is a bit of a touchy issue, and "By using cloud computing, a company opens a door into its data and that door is an attractive target for attacks."

CONCLUSION AND FUTURE TRENDS

Throughout this chapter, the authors have been discussing how a leader may learn to figure out and achieve his/her role in realizing their organization's vision and strategy, and utilize emerging digital

technologies as appropriate. Social media at leadership levels was once the exclusive domain of digital gurus; however, Twitter, Facebook, and other tools are gradually becoming everyone's responsibility and "We are seeing an increased demand for social savvy candidates across the business -- from human resources to product to customer service," (Holmes, 2013). It must be noted though, that digital technologies provide both credits and debits. The biggest debit associated with these technologies is digital fatigue (Kenyon, 2013). As Deiser and Newton (2013) point out "The Social media has created an ocean of information. We are drowning in a never-ending flood of e-mails, tweets, Facebook updates, RSS feeds, and more that's often hard to navigate." These authors propose that leaders must become proficient not only in the software itself, but also in using the settings that filter important from unimportant information. Unfortunately, this is only a partial solution, since fundamental to social-media is social interaction, and a leader must decide on whether and when to comment and or reply, and in what fashion to apply the information. This is more time consuming than it might appear, since most of such information requires assessment of its source, authenticity, and credibility. In addition, to remain a legitimate player in this social dialog, there is considerable pressure to respond immediately in this social process of creating meaning. Although leaders from the millennial-generation are more adept at handling such rapid digital-dialog, there remain questions regarding their ability to reflect and make meaning from such exchanges (Barry, 2013), and indeed their growing antagonism to digital media (Grensing-Pophal, 2013). This digital fatigue problem is likely only to grow worse in the future, and ultimately the answer lies with the leader developing appropriate discipline and working guidelines.

Good leaders not only demonstrate a clear Focus, and the required Capability, but they have the Will to follow through and persevere in meeting the challenges presented to them. Clearly this is asking a lot of a leader and the situation is further exacerbated by the significantly increasing and important impact of digitization on all business environments, particularly those related to global business. The emerging skill set and expected capabilities of leaders are both wide ranging and continually evolving at an ever-faster pace. Developing the global business perspective and business strategy for the global business phase of Figure 1 means that "one needs to enhance one's understanding of the social, political, technological and environmental forces that are shaping our existence and our children's' future, including an understanding of the links between us and others throughout the world." (Smith and Cockburn, 2013, p. 258-259). There was a time when this involved onerous undertakings to search for relevant information in books, journals, magazines, and newspapers through an organization's library or information service. Progress on the Internet has meant that much of the searching and indexing on given topics are now done for us by commercial organizations to which we can subscribe. In addition, search engine capability provides us with quick and easy access to ad hoc information searches as required, and 'clipping' s/w such as Evernote (2013) and 'sharing' s/w such as Dropbox (2013) facilitate our personalizing retention and sharing of information. Linkedin (2013) through its general postings, networks, and discussion groups also provides an excellent means for professionals to stay up to date on global topics and to pose questions as appropriate. It is reasonable to suppose that such services will become even more user friendly and search question focused in the future. The increasing use of mobile devices will certainly encourage this trend.

In the Main Focus Of This Chapter, the following list of emerging digital technologies was detailed: information organization and representation;, information use and analysis; information preservation and access; information environments and socio-cultural concerns; social networking; enterprise social software; innovation/collaboration platforms; cloud computing; grid computing; big data; analytics; risk analysis; dashboards; eLearning; mobile technologies; Artificial Intelligence (AI); distributed AI systems and multi-agent systems; games; simulations; Social Network Analysis and related software;

information capture and storage; data mining; potential pitfalls of emerging digital technologies; information security; and information privacy issues. The relevance of a number of these technologies to the dynamic leadership models proposed by Smith and Cockburn the (2013) were treated in the previous sections. Two topics in particular, that hold much promise for facilitating the development of agile leaders capable of functioning in VUCA environments, are games and simulations. The successful application of these technologies to leadership-development is not new (Smith, 1996), but their growing sophistication promises much for the future, and leaders are urged to follow emerging trends and products. Balance (2013) supports this recommendation, noting that corporations and other organizations around the world are recognizing that games promote cognitive reasoning and information retention, and that modern games are advanced, immersive and engaging. Another topic that has particular relevance to the broader topic of leadership learning and development is Elearning both in its synchronous and asynchronous forms. E-learning is a broadly inclusive term that describes educational technology that electronically or technologically supports learning and/or teaching. This again is a topic that has a long history, but it is one where enhancements continue to be made, particularly in regard to mobile delivery. Zhang (2003) provides a broad and detailed, if somewhat dated, overview of the subject, and. Wikipedia (Elearning, 2013) and Peacock (2012) provide comprehensive current accounts.

Effective and efficient networking and collaboration within and between organizations are Critical Success Factors for achieving global competitive business advantage, and today's business environments demand updated leadership tools and practices reflecting these factors, focusing on relevance particularly to globalized environments (Hypia & Pekkola, 2011). It is concluded that an understanding and adoption of the dynamic leadership models detailed in this chapter together with a broad familiarity with application of the emerging digital technologies highlighted in this book will satisfy the critical success factors criteria, and will be highly beneficial for both the leader and the organization.

KEY TERMS AND DEFINITIONS

Digital Technologies: Are digital resources that are effectively used to find, analyze, create, communicate, and use information in a digital context. This encompasses the use of web 2.0 tools, digital media tools, programming tools and software applications.

Global Business: Consists of very many companies that operate in several (many) countries and that may use information technology to facilitate the control of operations and performance in each country.

Leadership: Is a process of social influence which sets direction toward a goal and maximizes the efforts of others towards the achievement of the goal.

Organizational Complexity: Is present when there are multiple systems dynamically interacting in unpredictable ways; the outputs of one system are the inputs for another and so on across various scales, from micro levels of individual actors upwards to the macro scale of global business, resulting in the final result being unpredictable and emergent.

Social Digital Connectivity: Refers to the situation in which individuals' professional and private lives are integrated with digital social media platforms like Facebook, YouTube, and Wikipedia, etc., that enable them to make connections by sharing expressive and communicative content in order to enjoy online social lives.

VUCA Environments: Are characterized by volatility, uncertainty, complexity and ambiguity of general conditions and situations.

ABSTRACT

This paper reviews various efforts to define and capture the semantics of multimedia data. These efforts are particularly relevant to the problem of storing, managing and querying the semantic content of such data. Since there is not yet an accepted solution to the problem of how to represent, organize and manage multimedia data and the related semantics by means of a formal framework, this paper aims at providing some major research trends in this area. The focus is on ontologies, which allow the exchange of semantics of multimedia content between distributed information systems. This paper aims at reporting on recent trends in the development of multimedia ontologies.

INTRODUCTION

Audiovisual resources in the form of still pictures, graphical, 3D models, audio, speech, and video play an increasing pervasive role in our lives, and there will be a growing need to manage all these multimedia objects. This is a task of increasing importance for users who need to archive, organize, and search their multimedia collections in an appropriate fashion.

To cope with this situation, much effort has been put in developing standards both for multimedia data (natural and synthetic (e.g., photography, face animation), continuous and static (e.g., video, image)) and for data describing multimedia content (metadata). The aim is to describe open multimedia frameworks and achieve a reasonable and interoperable use of multimedia data in a distributed environment.

DOI: 10.4018/978-1-5225-3822-6.ch081

The development and application of ontologies, as explicit formal knowledge bodies, in the multimedia domain aims at bridging the gap separating the available low-level multimedia descriptors and the noema of the information conveyed by multimedia objects.

The objective of this paper is to report on some recent trends in semantic technologies responding to the challenges of managing and accessing multimedia objects (images, audio, video, 3D material, etc.). After a brief introduction to the role of metadata in the multimedia domain, the need for a common understanding of the semantic relationships between metadata terms from different domains is stressed. The next section highlights the use of ontologies in the representation of the multimedia data, by giving an overview of the most well-known multimedia ontologies. Moreover, guidelines for multimedia ontologies construction are given. The works quoted are by no means exhaustive, but provide some indicative pointers in this direction. Finally, ontology matching is mentioned as "a new vision" of developing multimedia ontologies by reusing available multimedia knowledge resources, and of enabling interoperability between multimedia resources.

METADATA

Metadata are a representation of the administrative, descriptive, preservation, usage, and technical characteristics associated with multimedia objects; they can be extracted manually or automatically from multimedia documents. This value-added information helps bridge the semantic gap, described as: "The lack of coincidence between the information that one can extract from the visual data and the interpretation that the same data have for a user in a given situation" (Smeulders, Worring, Santini, Gupta, & Jain, 2000).

Because of the high cost and subjectivity associated with human-generated metadata, a large number of research initiatives are focusing on technologies that enable automatic classification and segmentation of digital resources. Many consortia are working on a number of projects to define multimedia metadata standards, in order to describe multimedia content in many different domains and to support sharing, exchanging, and interoperability across different platforms. They are distinguished in (Salvetti, Pieri, & Di Bono, 2004):

1. *Standardised description schemes* that are directly related to the representation of multimedia content for a specific domain (like METS, MPEG-7);
2. *Standardised metadata frameworks* that consider the possibility of integrating metadata standards mapped on different application domains, providing rich metadata models for media descriptions together with languages that allow one to define other description schemes for arbitrary domains (like PICS, RDF, MPEG-21).

For example, the vision of MPEG-21 is to define a multimedia framework that enables augmented and transparent use of multimedia resources across a wide range of networks and devices used by different communities. The intent is that this framework will cover the entire multimedia content delivery chain, including creation, production, delivery, personalization, presentation, and trade.

The development of metadata standards will increase the value of multimedia data, which are used by various applications. Nevertheless, there are disadvantages in current metadata representation schemes

(Smith & Schirling, 2006), such as cost, unreliability, subjectivity, lack of authentication, and interoperability with respect to syntax, semantics, vocabularies, and languages (Salvetti, Pieri, & Di Bono, 2004).

It is necessary to have a common understanding of the semantic relationships between metadata terms from different domains. Representation and semantic annotation of multimedia content have been identified as an important step toward more efficient manipulation and retrieval of multimedia. In order to achieve semantic analysis of multimedia content, ontologies are essential expressing semantics in a formal machine-processable representation (Staab & Studer, 2004).

Professional groups increasingly are building metadata vocabularies (or ontologies). A number of research and standardisation groups are working on the development of common conceptual models (or upper ontologies) to facilitate interoperability between metadata vocabularies and the integration of information from different domains.

MULTIMEDIA ONTOLOGIES

It is well known that the word "ontology" generates a lot of controversy in discussions about Artificial Intelligence, although it has a long history, in which it refers to the categorical framing of what is (Poli, 2001, 2002, 2007; Poli & Simons, 1996). Briefly it can be claimed that ontology deals with what can be rationally understood, at least partially. According to this interpretation, science in all of its branches is the most successful and powerful ally of ontology.

One may say that there are material things, plants and animals, as well as the products of the talents and activities of animals and humans in the world. This first almost trivial list already indicates that the world comprises not only things, animate or inanimate, but also activities and processes and the products that derive from them. It is likewise difficult to deny that there are thoughts, sensations, and decisions, and the entire spectrum of mental activities, just as one is compelled to admit that there are laws and rules, languages, societies, and customs. We can set about organizing this list of objects by saying that there are independent items that may be real (mountains, flowers, animals, and tables), or ideal (sets, propositions, values), and dependent items which in turn may be real (colors, kisses, handshakes, and falls) or ideal (formal properties and relations). All these are in various respects items that are.

Ontologies have been applied in many areas, including natural language translation, medicine, standardization of product knowledge, electronic commerce, and geographic information systems, among others. Many of these applications use or will use multimedia data in the immediate future, making the creation of multimedia ontologies a crucial component (Jaimes & Smith, 2003).

A multimedia ontology, informally, is a means for specifying the knowledge of the world through multimedia documents in a structured way such that users and applications can process the descriptions with reference to a common understanding.

Four different levels of information are represented in multimedia ontologies (Euzenat et al., 2004): *signal*, *featural*, *symbolic*, and *semantic* information.

Multimedia ontologies are used for different goals by different applications, including the following (Jaimes & Smith, 2003):

1. **Content Visualization:** They can be used to create tables of content and used for browsing;
2. **Content Indexing:** They can be used to improve indexing consistency in manual annotation systems (e.g., use the term apartment instead of flat), or in the propagation of labels in automatic indexing

systems (e.g., a fece detected imlies a person was detected) (Schreiber, Bubbeldam, Wielemaker, & Wielinga, 2001);
3. **Knowledge Sharing:** Annotated multimedia collections can be more easily shared if they use a common conceptual representation (Carsten & Ansgar, 2010);
4. **Learning:** Collections annotated by different individuals using common ontologies lead to annotation consistency which is of extreme importance in applying approaches based on learning techniques that use annotated collections for training (Fan, Gao, & Luo, 2008);
5. **Reasoning:** Information not explicit in the data may be obtained automatically with the help of ontology (Ouyang & Liu, 2013).

The plethora of the recently produced multimedia ontologies aims at improving search and retrieval, by enabling the semantic interpretation of multimedia data, as well as the interoperability between multimedia resources.

CREATING A MULTIMEDIA ONTOLOGY

The construction of multimedia ontologies is difficult because different correct specifications of the same domain or collection are possible and many decisions have to be made, which depend on the domain, the purpose of the multimedia ontology, the complexity of content and structure that characterizes the multimedia objects, and the user's knowledge.

One can build a multimedia ontology simultaneously for all media. For each concept, all media specific concepts are encoded into the nodes of the ontology simultaneously (essentially the ontology is built in one cycle). Alternatively, one can develop a separate ontology for different media and create a link between nodes for every cross reference.

Ontology construction is usually a manual, iterative process consisting of at least three steps: (1) selection of concepts to be included in the ontology; (2) establishment of properties for the concepts and relationships between concepts in the ontology; and (3) maintenance of the ontology. The ontology can be constructed using a *concept-driven* or a *data-driven* approach. The concept-driven approach does not require any data: the ontology is built from general or domain specific knowledge. In the data-driven approach the ontology is constructed primarily from data, but domain knowledge is also used in manually constructing it. In general, although, fully automatic construction of ontologies still remains a challenging task because automatically selecting *relevant* concepts and relationships is hard, a process useful to automatically build, for example, an image ontology, based on a data driven unsupervisioned approach is composed by the following steps: (1) definition of an initial taxonomy containing a hierarchy relevant concepts' instances of the considered domain, which is performed by experts; (2) information extraction from publicly available image repositories; (3) content based analysis of images and semantic processing of texts; and (4) ontology building (Chianese, Moscato, Persia, Picariello, & Sansone, 2012). An alternative is to use semiautomatic ontology construction techniques, which aim at facilitating each of the steps above.

In the data-driven approach, for example, a semiautomatic construction of a multimedia ontology uses a video collection, and models the concepts, their properties and their relationships. For each of the videos one applies the following steps: (1) automatic scene cut detection; (2) automatic speech recognition; (3) parsing of metadata; and (4) automatic concept analysis. Preprocessing consists of steps one

through three, after which an ontology can be constructed based on textual content alone. Step four forms the basis for manually adding multimedia components to the ontology (Smith, Tseng, & Jaimes, 2003).

Indicative approaches for constructing multimedia ontologies are the ones presented hereafter:

1. In Arndt, Troncy, Staab, and Hardman (2009), a core ontology for multimedia annotation has been built by *re-engineering the MPEG-7* standard for multimedia annotation and using DOLCE as its underlying foundational ontology;
2. In Li, Lu, Yu, and Liang (2011), a multimedia ontology modeling approach based on the MPEG-7 standard is proposed and the *produced ontology is extended to support spatial-temporal relation of multimedia data*;
3. In Martens, Verborgh, Poppe, and Walle (2011), guidelines on how an XML-based metadata format, such as DIG35 standard for digital images, can be *converted into an OWL ontology*, are provided;
4. In Jimenez, Suarez-Figueroa, Mateos, Fernandez-Lopez, and Gomez-Perez (2012), a new ontology in the multimedia domain is constructed by *reusing existing ontologies*;
5. In Mallik and Chaudhury (2012), an *ontology learning scheme* which combines standard multimedia analysis techniques with knowledge drawn from conceptual metadata to learn a domain-specific multimedia ontology from a set of annotated examples, is proposed;
6. In Bannour and Hudelot (2013), *fuzzy description logics are used* as a formalism to represent a multimedia ontology dedicated to image annotation and the inherent uncertainty and imprecision of this kind of information;
7. In Rinaldi (2013), a global approach to define and develop multimedia ontologies is presented, which *uses multimedia data and linguistic properties* to bridge the gap between the target semantic classes and the available low-level multimedia descriptors.

When building multimedia ontologies, one should address the requirements listed below:

1. Multimedia ontologies should be designed to serve one or more of these purposes, accurately and adequately: *Annotation* (e.g., summarization of multimedia content); *Analysis* (e.g., ontology driven semantic analysis of multimedia content, etc.); *Retrieval* (e.g., context-based retrieval and recommendations); *Reasoning* (e.g., application of reasoning techniques to multimedia content); *Personalized filtering* (e.g., delivery of multimedia content according to user preferences); *Meta-modeling* (e.g., ontologies used to model multimedia processes, procedures, etc.);
2. Multimedia ontologies need to describe and represent knowledge for either one or even more of the following top-level hierarchical types of multimedia documents: *Image*, *Video*, *3D Graphics*, *Audio*, *AudioVisual*, *Multimedia presentation*.

They also need to distinguish between annotations describing the information object and these concerning the multimedia document's content (e.g., semantic concepts depicted in an image):

3. Multimedia ontologies should be able to represent *the structure of a multimedia document itself, depending on the type of document and the relations between structural elements*.

Ontologically speaking, possibly the most striking aspect of semantic visual information is its multilayer structure. To provide but a feeling of the multilayered stratification of visual object, one may

consider the case of a portrait, where one may distinguish the following levels: the three-dimensional space in which the subject of the portrait and some elements of the setting appear; the movement of the subject's apparent corpo-reality; the subject's character; his or her individual idea, or the idea that the person portrayed has of him/herself; and the symbolic, or the universal content manifested by the portrait (Hartmann, 1950; Ingarden, 1962).

A *hierarchical structure of multimedia segments* is thus needed in order to capture all possible types of media decompositions and relations. The regions that correspond to semantic objects need to be described in terms of their *location* within the multimedia content.

Ontology should be capable of capturing the low-level descriptor information (in order to semantically express this kind of characteristics associated with a concept, several different audiovisual attributes (e.g., color, shape, texture, motion, localization, etc.) need to be represented, depending on the concept) and to allow for basic and complex data types. Hence, alignment with standards (MPEG-7, TV-Anytime, MPEG-21) is a safe approach in order for the ontology to be of practical interest:

1. Ontology should be rich enough to describe the spatiotemporal relationships between the entities depicted. *Spatial* relations are needed to describe how segments are placed and relate to each other in 2D space (e.g., right and above). *Topological* spatial relations are needed to describe how the spatial boundaries of the segments relate (e.g., touches and overlaps). *Temporal* relationships among segments or events, providing information about the sequence in time, need to be represented, especially when the multimedia object is of type video;
2. Details regarding the description of the multimedia object itself, such as the creation date, the creator, the purpose it was created for, or even its subsequent history, and so forth, should be represented in ontology, because *provenance information* provides rather important metadata of the multimedia document. A multimedia ontology framework should *support annotations* produced by different annotators (humans or not), thus *enabling their linking and further processing*;
3. Due to the large number and wide variety of Web access devices, it has become quite essential for a Web service to *know the required device capabilities* in order to support playback of a media object and other characteristics of the delivery context that influence their presentation;
4. Multimedia ontologies need to be *open* in order to be widely-adopted by multiple and heterogeneous communities;
5. Multimedia ontologies should be designed in a *modular way* in order to minimize the execution overhead when used for multimedia annotation;
6. Multimedia ontologies building require a design that can always be extended, without changing the underlying model and assumptions and without affecting legacy annotations;
7. Multimedia ontologies could be implemented in MOWL (Ghosh, Chaudhury, Kashyap, & Maiti, 2007), which has been proposed as an ontology language that enables the *perceptual modeling* of domain concepts with their media properties; essential for semantic processing of media data.

More requirements for designing a complete and comprehensive multimedia ontology are reported in Troncy, Huet, and Schenk (2011).

Development of multimedia ontologies is still quite an empirical process. Due to that reason research communities involved with ontology-driven analysis, while sharing the same knowledge do not share a mutual consensus. Harmonization approaches, therefore, need to be followed by all these ontology-driven based systems and applications, in order to pave the way toward the development of an integrated

knowledge infrastructure. Achieving ontology harmonization may be difficult and complex in practice. The most significant factors are the efficient modularization of ontologies, the easy linking to other ontologies, and the specification of a minimum set of ontologies to be used for arbitrary applications.

EXISTING MULTIMEDIA ONTOLOGIES

Multimedia ontologies are necessary because the concepts and categories defined in a traditional ontology are not rich enough to fully describe the plethora of events that can occur in multimedia objects. Existing multimedia ontologies are divided in groups, according to their domain of application or their framework (Eleftherohorinou, Zervaki, Gounaris, Papastathis, Kompatsiaris, & Hobson, 2006). Table 1 shows a list of existing multimedia ontologies, grouped according to their domain or framework; the groups of ontologies are:

1. **Content Structure Ontologies:** They focus on the description of multimedia content structure;
2. **Specific Domain Ontologies:** They have been created to serve a particular domain;
3. **Multimedia Upper Ontologies:** Upper level ontologies are intended for more general use and describe higher level concepts that can be refined by domain ontologies, in order to make multimedia-handling procedures more homogeneous;
4. **Multimedia Core Foundational Ontologies:** The role of core ontologies is to serve as starting point for the construction of new ontologies, to provide a reference point for comparisons among different ontological approaches and to serve as a bridge between existing ontologies. core ontologies are typically conceptualizations that contain specifications of domain independent concepts and relations based on formal principles derived from philosophy, mathematics, linguistics, and psychology.

An increasing number of multimedia ontologies are being used in various projects for multimedia processing; examples are given below.

The main goal of *MEPCO* (Kienast, Zeiner, Hofmair, Schlatte, Thallinger, Burger, et al., 2006) is the cross-relation of media campaigns over the media TV, press, and Internet and furthermore the ambitious goal to cross link media campaigns over different countries. What makes a media campaign unique from others is not completely straightforward; however, there are rules that a human uses to determine

Table 1. Existing ontologies, grouped by their domain or framework

Content Structure	Specific Domain	Multimedia Upper Ontology	Multimedia Core Ontology
aceMedia Framework	Medical Image Domain	SWeMPs	CIDOC CRM
AIM@SHAPE	NM2	ZyX	ABC
Music Information	MEPCO	Salero	DOLCE
INA	ImageStore	MPEG-7	WordNet
	Soccer Domain	Semantic User Preference	
	Formula 1 Domain	X3D	
		Modality	

whether a media campaign is new. These heuristic rules will be formally encoded as to describe media campaigns in a generic way. The MediaCampaignOntology (MEPCO) will be based on the upper-level ontology PROTON and will be aligned to media-related metadata standards, such as NewsML and News Codes from IPTC.

ACEMedia extends and enriches ontologies to include low level audiovisual features, descriptors and behavioral models in order to support automatic annotation; a core ontology was described based on extensions of the DOLCE core ontology and the multimedia-specific infrastructure components, the VisualDescriptorOntology, based on an RDFS representation of the MPEG-7 Visual Descriptors, and the multimedia Structure Ontology based on MPEG-7 MDS. Its main aims are the support of audiovisual content analysis and object/event recognition, the creation of knowledge beyond object and scene recognition through reasoning processes, and enabling user-friendly and intelligent search and retrieval.

The *ZyX* ontology provides an ontological description of an abstract multimedia presentation model and is based on the ZyX model by Boll et al. (2000). The ZyX model describes complete or fragments of multimedia documents by the means of a tree. The nodes of the tree are called presentation elements. Each presentation element has got a binding point associated with it. Such a binding point can be bound to one variable of another presentation element, thus creating the edges of the tree. The presentation elements are the generic elements of the model. They can represent atomic media elements (e.g., videos, images, and text) or operator elements which combine presentation elements with certain semantics. There are operator elements that allow for temporal synchronization, definition of interaction, adaptation, and for the spatial, audible, and visible layout (the so-called projector elements) of the document.

Another classification of multimedia ontologies, based on their scope, is represented in Suarez-Figueroa, Atemezing, and Corcho (2013). Table 2 shows a list of the well-known multimedia ontologies designed and implemented for describing multimedia objects, which are defined as combinations of different media objects (text, image, sound, video, animation), shapes and images, visual resource objects (painting works, cultural heritage), audio and music, and ontologies applied for more specific uses, such as athletic events and virtual representation of humans.

Some of these well-known multimedia ontologies are briefly described below:

The *Shape Acquisition and Processing Ontology* (SAP) (Albertoni, Papapleo, Robbiano, & Spagnuolo, 2006) intends to conceptualize the knowledge pertaining to the development, usage and sharing

Table 2. Well-known multimedia ontologies, grouped by their scope

Ontologies for Describing Multimedia Objects in General	Ontologies for Describing Shapes and Images	Ontologies for Describing Visual Resource Objects	Ontologies for Describing Audio and Music	Application Ontologies
COMM	DIG35	VRA Core 3	Music Ontology	MEPCO
M3O	MSO	VDO	Kanzaki's Audio Ontology	AEO
Media Resource Ontology	SAP		Music Recommendation Ontology	VHO
MPEG-7 Upper MDS	CSO			
MPEG-7 Rhizomik	MIRO			
SWintO	PDO			
LSCOM				

of hardware tools, software tools and shape data by researchers and experts in the field of shape acquisition and processing. The fundamental goal of this OWL Full ontology is to formalize the knowledge related to the acquisition and processing of a shape. Its main classes include "Acquisition Device", which represents a system of sensors connected to a storage device for acquiring data, "Acquisition Condition" used to acquire environmental and logistic data, "Shape Type" describing categories of shapes, "Shape Data" conceptualizing the concrete data associated to a shape, "Processing Session", which formalizes either the acquisition phase or the application of a processing procedure, etc. The creation of the SAP ontology was based on the consideration that a digital shape can be created either from a real object or it can be created synthetically.

The *Product Design Ontology* (PDO) (Catalano, Camossi, Ferrandes, Cheuter, & Sevilmis, 2008) aims at guiding researchers and experts in the development of tools and methods for supporting industrial product design and engineering analysis, and formalizing process, tool and shape know-how relevant to the free-form modeling and the engineering simulation phases for training purposes. Its key concepts are the tasks of the product development process and the shapes and tools adopted in the different tasks. For example the concept of "Task" is central to describe the workflow where the different shape representations are used and the different shape processing tools are applied, while the concept of "ShapeRole" of shapes along the product development process has been formalized to interpret the additional information related to the shape which intervenes in a specific task of the design workflow.

The *Virtual Human Ontology* (VH) (Gutierrez, Thalmann, Vexo, Moccozet, Magnenat-Thalmann, Mortana, & Spagnuolo, 2005) aims at organizing the knowledge and data related to research and applications in the field of virtual environments and humans, and especially, the modeling and analysis of virtual human body, and their animation and interaction with virtual objects. It describes complex 3D entities not only at the geometric level, but also at the structural and semantic level. "Virtual Human" is its main class, which has morphology descriptor, individual descriptor, skeleton, geometry, etc. The goal of this description is to simplify the composition of virtual humans by non-experts and to facilitate sharing of useful information by domain experts in order to promote reusability and scalability.

The *Multimedia Metadata Ontology* (M3O) (Saathoff & Scherp, 2009; Scherp, Saathoff & Scheglman, 2012) is a framework for integrating the central aspects of multimedia metadata, that is, the separation of the information conveyed by multimedia items and their realization, the annotation with both semantic and low-level metadata and the decomposition of multimedia content. It provides the means for rich semantic annotation using domain-specific ontologies.

MATCHING MULTIMEDIA ONTOLOGIES

Differences in the scope and purpose of existing multimedia ontologies as well as in their application context result in semantic heterogeneity. For managing semantic heterogeneity among these knowledge resources, that is, handling variations in meaning or ambiguity in multimedia entity interpretation, there is a need for the so-called ontology matching, which is achieved in two steps: (i) finding a set of correspondences between semantically related entities of distinct ontologies, that is, an alignment, and (ii) interpreting the generated alignment according to application needs, such as data translation, query answering, ontology merging (Shvaiko & Euzenat, 2013). To accomplish an ontology matching task one could rely on various types of knowledge used features, such as the instances contained in the ontologies (extensional or instance-based methods), use the relations that hold between concepts of each ontology

(structural methods), measure the similarities of the concept names and their lexical definitions (terminological methods), use background knowledge provided by a reference ontology (semantic methods), or address uncertainty of concepts (fuzzy ontology matching approaches).

Recently, some efforts have been made in the area of multimedia to solve the interoperability problem by applying ontology matching techniques in existing multimedia ontologies. In James, Todorov, and Hudelot (2010) the ontology matching process is proposed as a suitable approach to solve several interoperability issues that coexist in semantic image annotation and retrieval. In Todorov, James, and Hudelot (2013) an extensional matching method is proposed as the most suitable in the case of multimedia ontologies, which often come equipped with sets of annotated images. In Scherp, Eissing, and Saathoff (2012) a step-by-step alignment method is presented, which describes how to integrate existing multimedia metadata standards and metadata formats with the M3O in order to use them in a concrete application, where there is a need to combine and use more than one existing metadata standard or metadata format at the same time. In Castano, Ferrara, and Guillermo (2006) an ontology matching technique is used as a prerequisite step in a methodology for multimedia ontology evolution, in which the ontology needs to be enriched because it does not contain any concept that could be used to explain a new multimedia resource. The paper shows how ontology matching techniques can be used to enforce the discovery of new relevant concepts by probing external knowledge sources using both the information available in the multimedia resource and the knowledge contained in the current version of the multimedia ontology.

CONCLUSION

Multimedia ontologies enable the inclusion and exchange of multimedia content through a common understanding of the multimedia content description and semantic information. They model the domain of multimedia data, in terms of low-level features and media structure descriptions, thus increasing sharing capabilities of multimedia objects. Additionally, such an ontology could also be used as a translator, to integrate multiple, heterogeneous data sources. With the aid of multimedia ontologies the vision of querying and retrieving multimedia content from distributed databases has started to become more feasible.

As final conclusions, we can mention that during this last decade a lot of efforts have been done to deal with the challenging task of definition of ontologies within the multimedia domain, due to the complexity of multimedia data and the related knowledge and the automatic building of multimedia ontologies, since usually low-level features can be automatically extracted, while semantic concepts are manually provided. The trend in recent years is reusing knowledge resources and performing mappings when developing multimedia ontologies with the aims of reducing the time and costs associated to the ontology creation, increasing the overall quality of the produced multimedia ontologies, and enabling interoperability among heterogeneous multimedia knowledge bodies.

Chapter 82
Next Steps in Multimedia Networking

Dimitris N. Kanellopoulos
University of Patras, Greece

ABSTRACT

This chapter presents in brief background knowledge on multimedia communication: multimedia applications and services, network and user QoS requirements, bandwidth on demand, multicasting, media synchronization, adaptive media coding, multimedia streaming, and end-system support for multimedia communication. In the second part, it deals with content delivery networks (CDNs). In the third part, it concentrates on issues for achieving multimedia optimization over heterogeneous wireless and wired networks. In the fourth part, it presents the main approaches for QoS guarantees over the Internet. This part tries to include the important aspects that have significantly impacted the enhancements to the basic Internet architecture and its associated protocols. In the fifth part, the chapter presents future Internet architectures. This is followed by some future research directions in multimedia networking.

INTRODUCTION

Nowadays, industry is making considerable investments to deliver digital audio, image and video information to consumers and customers. Novel infrastructures are quickly being deployed for digital audio, image and video recorders and players, on-line services, and electronic commerce. Multimedia applications are emerging at a fast pace in various sectors such as medicine, education, travel, real estate, banking, insurance, administration and publishing. Such applications are characterized by large multimedia documents that must be communicated within very short delays. Multimedia denotes the integrated manipulation of at least some information represented as *continuous* media data (e.g., video, audio), as well as some information encoded as *discrete* media data (e.g., text and graphics). Multimedia communication refers to the representation, storage, retrieval and dissemination of machine-processable information represented in multiple media types (text, image, graphics, speech, audio, video, animation, handwriting, data files) (Lu, 2000). In particular, multimedia communication deals with the transfer, protocols, services, and mechanisms of discrete and continuous media data in/over digital networks. Such

DOI: 10.4018/978-1-5225-3822-6.ch082

communication requires that all involved components be capable of handling a well-defined *Quality of Service* (QoS) (Kanellopoulos et al., 2009). The most important QoS parameters are required capacities of the involved resources, compliance to end-to-end delay and jitter as timing restrictions, and restriction of the loss characteristics. Precisely, multimedia traffic requires transfer of large volumes of data at very high speeds, even when the data is compressed. Especially for interactive multimedia communication, the network must provide low latency. Continuous media such as video and audio require guarantees of minimum bandwidth and maximum end-to-end delay. The variation in delay (jitter) and loss of data must also be bound. Most multimedia applications can tolerate some errors in transmission due to corruption or packet loss without retransmission or correction. In some cases, to meet real-time delivery requirements or to achieve media synchronization, some packets are even discarded. In general, traditional networks do not suit multimedia communication and are often used to provide error-free transmission. In particular, transmission characteristics of existing Ethernet and Internet Protocols (CSMA/CD, TCP/IP) do not support the low latency, high bandwidth requirements of the audio, video-based applications. Ethernet provides only a bandwidth of 10 Mbps. This is insufficient for most multimedia applications. Moreover, its access time is not bound and its latency and jitter are unpredictable.

From another perspective, different multimedia applications have different QoS requirements. For example, continuous media types such as audio and video require hard or soft bounds on the end-to-end delay, while discrete media such as text and images do not have any strict delay constrains. In addition, video applications require more bandwidth than audio applications. QoS requirements are specified by the following closely related parameters (Lu et al, 2000): (1) bandwidth on demand; (2) low end-to-end delay; (3) low delay variation (or delay jitter); (4) acceptable error or loss rate without retransmission, as the delay would be intolerable with retransmission.

With the advent of high capacity storage devices, powerful and yet economical computer workstations and high-speed integrated services digital networks, providing a variety of multimedia services and applications is becoming not only technically, but also economically feasible. Currently, multimedia networking applications benefit from the rapid development of encoding techniques of multimedia data sources, the effective quality of service (QoS) control mechanisms and the quality of experience (QoE) criteria for system optimization (Cerqueira et al., 2013). In the meantime, interoperability solutions are being proposed to integrate wired and wireless heterogeneous networking systems. Another challenge is ensuring that the multimedia-networked content is fully interoperable, with easy of management and standardized multimedia content adapted for interoperable delivery, as well as intellectual property management and protection (i.e., digital rights management), successfully incorporated in the system (Lian et al., 2009). Therefore, there is an inherent need to present frameworks, standards, techniques, QoS control mechanisms, QoE criteria for system optimization, and other tools that deal with such components in multimedia networking.

In this chapter, we present state of the art research in multimedia networking. In addition, we discuss challenging issues that must be addressed for achieving multimedia optimization over heterogeneous wireless and wired networks. The rest of the chapter is organized as follows. At first, we present background knowledge on multimedia communication: multimedia applications and services, network and user's QoS requirements, bandwidth on demand, multicasting, media synchronization, adaptive media coding, multimedia streaming, and end-system support for multimedia communication. In the second part, we deal with Content Delivery Networks. In the third part, we concentrate on issues for achieving multimedia optimization over heterogeneous wireless and wired networks. In the fourth part, we present

the main approaches for QoS guarantees over the Internet. This part tries to include the important aspects that have significantly impacted the enhancements to the basic Internet architecture and its associated protocols. In the fifth part, we present briefly future Internet architectures. This is followed by some future research directions in multimedia networking.

BACKGROUND

Multimedia Applications and Services

The increasing availability of optical fiber channels, as well as the rapid advancement in VLSI circuits and systems, has fostered a tremendous interest in developing sophisticated multimedia services and applications with an acceptable cost. Multimedia applications can be classified into the following three main categories:

- *Two-way conversational applications*, which are characterized by their stringent requirement on end-to-end delay that includes total time taken to capture, digitize, encode/compress audio/video data, transport them from the source to the destination, and decode and display them to the user.
- *Broadcasting services* where the source is live. The main dissimilarity from the conversational applications is that it is one-way communication and it can stand more delay.
- *On-demand applications* (e.g., video on demand) where the user requests some stored items and the server delivers them to the user. The consumer can select a video or any program on demand. The application consists of interactive features like forward, rewind and pause.

A multimedia network can provide various multimedia services such as:

- *News and reference services*: News on demand is similar to Video on Demand (VOD), but it provides sophisticated news retrieval. Reference services can combine live and achieved video, access to textual data and still photography from various sources. The information is delivered based on filtering criteria kept by the user.
- *Interactive shopping and electronic commerce*: Home shopping provides a customizable shopping environment. Customers are effectively and rapidly focus on the products and services that are of interest to them.
- *Entertainment and games*: Interactive entertainment may become a frequently used service. Games consist of simple applications that are downloaded to the set top device, thus not incurring the significant cost associated with the use of server and network facilities.
- *Distance learning*: Educational interactive programming and distance learning services are provided for e-learning purposes.
- *Video conferencing*: Video collaboration systems can facilitate high-quality video collaboration in a group setting. *Telepresence* is an evolving category of video conferencing that represents the highest end of the visual communications spectrum, providing an immersive communications experience. It is noteworthy that Wu et al. (2014) investigate the problem of packet transmissions in real-time video conferencing from a single source to multiple destinations.

QoS Requirements

In designing and implementing multimedia applications, the characteristics of the application types (discussed above) should be used to provide required QoS, but using network and system resources efficiently. Even though we say that QoS should be guaranteed, the end-user states the degree of guarantees. Usually, there are three levels of guarantees:

- *Hard guarantee*, where user-specified QoS should be met absolutely. Reserving network and system resources based on the peak-bit rate of a stream achieves hard guarantees.
- *Soft guarantee*, where user-specified QoS is supposed to be met to a certain precise percentage. This is suitable for continuous media, as they usually do not need 100% accuracy in playback. This type of guarantee uses system resources more efficiently.
- *Best effort,* where no guarantee is given and the multimedia application is executed with whatever resources are available. More networks operate in this mode.

Different levels of guarantee are used for different types of traffic, and user determines which type of guarantee to use. Besides, the charging policy is related to the level of guarantee and the most expensive is the hard guarantee, while the best-effort is the cheapest. At the source, multimedia data are either captured live or retrieved from storage devices. The transport module accepts these data, packetizes and passed them on to the Internet. At the destination (sink), multimedia data are reassembled and passed to the application for playback of audio/video. Packet processing time differences, network access time differences, and queuing delay difference can cause delay jitter, which has to be removed at the destination before data being played out.

Bandwidth on Demand

Bandwidth on demand refers to data rate measured in bit/s (channel capacity or throughput-bandwidth consumption), which is required in order to transfer continuous media data (e.g., video).The speed of network links and routers in the next generation Internet will be improved radically so that network congestion will be uncertain and QoS guarantees will be provided by design (Kanellopoulos et al., 2009). This endeavor will include optical wavelength-division multiplexing (WDM) technologies, being considered by Next Generation Internet (NGI) initiative (http://www.ccic.gov/ngi/).

Multicast Support

Multicasting is the capability of a network to transmit data simultaneously to many receivers with no need to replicate the data. It is a common requirement of multimedia communication to send data from one source to multiple destinations. Efficient multicasting protocols can reduce bandwidth requirements (Paul, 1998; Wittmann & Zitterbart, 2001). Given the multi-receiver nature of video programs, real-time video distribution has emerged as one of the most important IP multicast applications and it requires bandwidth adaptability. Real-time video multicast applications have to adapt to the dynamic network conditions, but still they offer reasonable playback quality to the receivers. Liu and Zhang (2003) pre-

sented a survey on adaptive video multicast solutions. Since video and shared data are essential to many distributed tasks, audio of sufficient quality is necessary condition for almost any successful real-time interaction.

Media Synchronization

Media synchronization among the streams is very important, but it may be disturbed owing to network delay, delay jitter, and packet loss. Continuous media are characterized by well-defined temporal relationship between subsequent presentation units to be played. A presentation unit is a logical data unit that is perceivable by the user. Media synchronization is the process of preserving the temporal order of one or more media streams. The problem of maintaining continuity within a single stream is referred as *intra-stream synchronization*; whereas the problem of maintaining continuity among the streams is called *inter-stream synchronization*. In multicast communication, it is necessary to output each stream simultaneously at different destinations, and thus *group* (or *inter-destination*) *synchronization control* is required. In this case, streams often fall into a master stream and slave streams. Only the intra-stream synchronization control is carried out over the master stream, and the inter-stream synchronization control is exerted for the slave streams after carrying out the intra-stream synchronization control over each slave stream. It is also possible to apply only inter-stream synchronization control over each slave stream. In general, there are three schemes for group synchronization control:

- The master-slave destination scheme.
- The synchronization maestro scheme.
- The distributed control scheme.

To conclude, all types of media synchronization are necessary for both live streams and for stored media streams presentations. Furthermore, if the media synchronization quality is deteriorated, the *Quality of Experience* (QoE) (ITU-T Rec. G.100/P.10, 2007) may seriously be damaged. To solve such a problem, we need to carry out media synchronization control, which adjusts the output timings of streams at each terminal to achieve high quality of media synchronization. It is noteworthy that Huang et al. (2013) presented a historical view of temporal synchronization studies focusing on continuous multimedia. They demonstrated how the development of multimedia systems has created new challenges for synchronization technologies.

Adaptive Media Coding

Multimedia data should be coded in a way such that acceptable audio/video playback quality is still achieved, when some data packets are delayed extremely or lost. Coding multimedia data into multiple layers is the basic suggestion. Some layers are assigned high priority and they contain essential data to generate basic acceptable basic play out audio/video quality. Extra layers contain data that add additional details (or quality) to the basic quality and are assigned low priority. In the case of system overloading, low priority data are dropped first, leading to little effect to play out quality. This effect is named *graceful quality degradation*, and it can be obtained by the use of error control techniques such as *forward error correction* (FEC).

Multimedia Streaming Protocol

Streaming media is a media format which can play on the Internet by adopting the streaming transmission way, such as audio, video or multimedia files. It can be used for online tutorials and news, online live, online advertising, distance learning, real-time teleconferences and so forth. The *Real-time Transport Protocol* (RTP) defines a standardized packet format for delivering audio and video over IP networks (Perkins, 2003). RTP (Schulzrinne et al., 1996) is used extensively in communication and entertainment systems that involve streaming media. Recently, the usage of RTP has been decreased because delivering data according to the RTP's small packet model is less efficient than using larger data frames. In particular, delivering multimedia content in larger HTTP segments is more effective and has several additional benefits. For example, HTTP packets are being well-conditioned for firewall configurations and outgoing connections. Besides, transport-level Web protocols do not manage any information about session state on the server and there is, therefore, not any additional management cost on content or resources. For these reasons, the popularity and usage of HTTP streaming has risen. Thus, the MPEG group reacted by introducing a new HTTP streaming protocol, named *Dynamic Adaptive Streaming over HTTP* (MPEG-DASH) (MPEG-DASH Part 1, 2012; Sodagar, 2011). This new standard is based on a combination of two components, namely, *media content* and *manifest file*. This combination identifies the stream for any player and destination by means of URL addressing. In the MPEG-DASH context, the media stream is called MP and defines a set of sequences of small HTTP segments. Each sequence corresponds to a short interval of playback time (i.e. periods) of original multimedia content. These periods contain one or several adaptation sets that describe one or more representations of a single stream. These representations define one or more audio or video streams with different parameters or encoding alternatives. For instance, an adaptation set might contain several representations with different bit rates of a same video or audio component. Each representation set is composed of a set of media information segments identified through URLs that correspond to chunks of data managed by the HTTP streaming protocols. These chunks may be discrete files or byte ranges in a single media file stored on a content HTTP server. The manifest file is named *Multimedia Presentation Description* (MPD), and is an XML file that contains the information describing and identifying the periods of a media stream. Precisely, MPD does not contain any media data, but describes the accessible segments and corresponding timing. According to this data model, DASH clients parse the MPD document and select the best adaptation set according to a device's capabilities and a user's profiles. Finally, MPEG-DASH also supports layered codecs such as *Scalable Video Coding* (SVC) (Muller et al., 2012) or *Multiview Video Coding* (MVC) (Vetro et al., 2011). In the case of SVC, each layer is described by a different representation. The SVC layers are structured as one base layer and several enhancement layers that depend on lower layers, down to the base layer. This dependency can be described in MPD, allows an advanced and efficient usage of network resources and supports dynamic adaptation according to network status. It is noteworthy that DASH specification does not prescribe how source coding can be best performed. To this direction, Adzic et at. (2012) proposed an interesting form of video streaming, called *content-aware video encoding*, which takes into account scene changes and content type. Issues worthy of further investigation are: the duration of each video chunk, and the number of video streams to include.

End System Support

End systems must offer mechanisms to handle multimedia data efficiently and effectively such as to provide end-to-end QoS guarantees (Lu, 2000). The end-system support for multimedia communications is required for two reasons. First, the communications protocol stack is implemented mainly in software and it has thousand instructions executed by the end-system. If, for these instructions, the end-system cannot guarantee the execution time, there will be no real-time communications system regardless of how well networking support is offered. Second, if the media data need to be compressed and decompressed before presentation, the processing time should be predictable. If not, a meaningful presentation is not obtained.

Multimedia applications impose the following requirements on the hardware architecture:

- Digital audio and video are very data intensive, and therefore the hardware must have high data transfer throughput and high processing power.
- Parallel hardware architectures are preferred as a lot of multimedia applications have to access several input/output devices simultaneously. In addition, multimedia host computers have usually I/O buses, which support lower transfer rates than of those of high-speed networks (Kanellopoulos, 2009). This situation leads to the problem called "*mismatch in bandwidth*". For the solution of this problem, various network interface units must be implemented.
- The hardware architecture must be scalable to accommodate new input/output devices and applications.
- To support different types of data and applications, the architecture should be versatile and programmable.

Multimedia operating systems should meet the following requirements (Steinmetz, 1995).

- They should use the hardware resources efficiently so that use of these resources is maximized.
- QoS requirements of multimedia applications should be guaranteed by using proper resource management and process scheduling. At the operating system level, one of the main QoS requirements is the guaranteed processing time for each task. It is noteworthy that Lakshman et al. (1998) proposed an integrated QoS management system to manage CPU, network and I/O resources. This cooperative model and architecture, called AQUA (*Adaptive QUality of service Architecture*), enables multimedia end-systems and operating system to cooperate dynamically for adaptively sharing end-system resources. In AQUA, the operating system allocates initial resources such as CPU time according to the user QoS specification. As the multimedia application executes, the operating system and the application cooperate to estimate the resource requirements and QoS received.
- The operating system should execute multimedia applications as well as conventional applications. This has two implications. First, the conventional application-programming interface (API) should be maintained. Second, the conventional applications should not be starved of resources, while QoS requirements of multimedia applications are guaranteed.

User terminal: Because of the large size of multimedia objects and real-time requirements, multimedia terminal or the network should include large data buffers. To restore the temporal relationship of a data stream, stream handlers should be connected to data buffers. To synchronize the possible multiple data streams and to control the stream handlers, synchronization and streaming manager are required. Since multimedia data objects are large, the terminal should also include compression and decompression hardware.

Multimedia Server: The majority of current personal computers, workstations and servers do not perform well for multimedia data, requiring fast data retrieval and guaranteed real-time capabilities. The I/O capacity is usually a severe bottleneck. The main requirements imposed to the multimedia server are the following:

- *Minimal response time*: A crucial factor for the success of multimedia services is the response time seen by the client. The server must be able to minimize response time to live unto the expectations of the user.
- *Fast processing capability*: To guarantee fast response time, clients should be processed fast, while data access rates should be minimized.
- *Reliability and availability*: Multimedia server must be reliable. In particular, the larger the number of users and volume of data handled by the server, the more difficult is to guarantee reliability. To provide fault tolerance, special hardware and software mechanisms must be employed. Since client requests may arrive at any time, the time the server is unavailable should be minimized.
- *Ability to sustain guaranteed number of streams*: Another important factor is the maximum number of data streams that the server can simultaneously handle. This affects the total number of clients the server can serve.
- *Real-time delivery:* To deliver multimedia data, the server should support real-time delivery. This poses profound requirements on the resource scheduling at the operating system level. The server should be able to guarantee real-time delivery for individual streams, as well as for all the streams combined together. For this goal, accurate real-time (multimedia) operating systems have to be developed (Steinmetz, 1995).
- *High storage capacity*: To store multimedia data and a large variety of information, the server must have a large storage capacity. To sustain the delivery requirements of multimedia data, the server may be required to compress and encode video and image data prior to transport or storage. The performance of compression and signal processing should be optimized. This might require special hardware.
- *Exploit user access patterns*: The server should also be able to trap and exploit dynamic user's behavior, minimizing system load and network traffic. For example, by analyzing data access rates and times, popular data could be distributed closer to users in periods of low network load.
- *Ability to handle different types of traffic*: A multimedia server should be able to serve multiple real-time data streams simultaneously, but it must also be able to provide satisfactory service to non-real-time data. It should be able to handle control data encountered, when loading new data from other servers or storage repositories, billing and accounting data and communication between intelligent personal software agents. Agents are autonomous programs selecting and managing data according to user preferences.
- *Cost effectiveness*: A very important requirement that governs the future of a multimedia server is its cost effectiveness. The server must be affordable.

- *QoS requirements*: QoS is a set of parameters describing the tolerable end-to-end delay, throughput, and the level of reliability in multimedia communication and presentation. QoS requirements of clients are an important factor that affects the usage of the server. The server should be able to provide and adapt itself to different QoS requirements, according to the characteristics of the client's terminal, the network connection, and the requested data type.

CONTENT DELIVERY NETWORKS (CDNs)

Content Delivery Networks (CDNs) are playing an important role in future multimedia networking. A CDN serves content to end-users with high availability and high performance. In particular, CDNs provide services that improve network performance by maximizing bandwidth, improving accessibility and maintaining correctness through content replication. They offer fast and reliable applications and services by distributing content to cache or edge servers located close to users. A CDN has some combination of content-delivery, request-routing, distribution and accounting infrastructure. The content-delivery infrastructure consists of a set of *edge servers* (also called *surrogates*) that deliver copies of content to end-users. The request-routing infrastructure is responsible to directing client request to appropriate edge servers. It also interacts with the distribution infrastructure to keep an up-to-date view of the content stored in the CDN caches. The distribution infrastructure moves content from the origin server to the CDN edge servers and ensures consistency of content in the caches. The accounting infrastructure maintains logs of client accesses and records the usage of the CDN servers. This information is used for traffic reporting and usage-based billing. In practice, CDNs typically host static content including images, video, media clips, advertisements, and other embedded objects for dynamic web content. Nowadays, CDNs serve a large fraction of the Internet content, including web objects (text, graphics and scripts), downloadable objects (media files, software, documents), applications (e-commerce, portals), live streaming media, on-demand streaming media, and social networks. CDNs augment the end-to-end transport network by distributing on it a variety of intelligent applications employing techniques designed to optimize content delivery. The resulting closely integrated overlay uses web caching, server-load balancing, request routing, and content services. Below, we describe in brief these techniques.

- *Web caches* store popular content on servers that have the greatest demand for the content requested. These shared network appliances reduce bandwidth requirements, reduce server load, and improve the client response times for content stored in the cache.
- *Server-load balancing* uses one or more techniques including service-based (global load balancing) or hardware-based, i.e. layer 4–7 switches, also known as a web switch, content switch, or multilayer switch to share traffic among a number of servers or web caches. In this case, the switch is assigned a single virtual IP address. Then, traffic arriving at the switch is directed to one of the real web servers attached to the switch. This has the advantage of balancing load, increasing total capacity, improving scalability, and providing increased reliability by redistributing the load of a failed web server and providing server health checks. A content cluster or service node can be formed using a layer 4–7 switch to balance load across a number of servers or a number of web caches within the network.
- *Request routing* directs client requests to the content source best able to serve the request. This may involve directing a client request to the service node that is closest to the client, or to the

one with the most capacity. A variety of algorithms are used to route the request. These include: *Global Server Load Balancing*, *DNS-based request routing*, *Dynamic metafile generation*, *HTML rewriting*, and *anycasting*. Proximity (viz., the capability of choosing the closest service node) is estimated using a variety of techniques including reactive probing, proactive probing, and connection monitoring (Plagemann et al., 2006).

Actually, users are often interested in content, and they have very little (or no) interest in where it comes from. This has led to the research in the area of *Content-Centric Networking*. The content-centric paradigm puts content at the heart of a network's operation and allows hosts to interact with it using a content request/reply model. Therefore, instead of having packets routed to specific hosts, requested are routed to optimal content sources using unique content identifiers. One of the first systems built around this paradigm was *Data-Oriented Networking Architecture* (DONA) (Koponen et al., 2007). First and second generation CDNs have mainly concentrated on improving content availability through network caching and replication, but more recent content network research has looked into providing content support at the same time as still been able to integrate existing systems (Cerqueira et al., 2011). It is noteworthy that Pathan and Buyya (2006) provided a comprehensive taxonomy with a broad coverage of CDNs in terms of organizational structure, content distribution mechanisms, request redirection techniques, and performance measurement methodologies. They studied the existing CDNs in terms of their infrastructure, request-routing mechanisms, content replication techniques, load balancing, and cache management. They also provided an in depth analysis and state-of-the-art survey of CDNs. From another perspective, Almeida and Calistru (2012) discussed the role of CDNs in helping content providers to deliver text, pictures, audio, video, applications and related services to users. They presented the architectural design of a CDN and discussed the main future challenges in terms of coordination, content replication, service and policy management.

MULTIMEDIA OPTIMIZATION OVER HETEROGENEOUS WIRELESS AND WIRED NETWORKS

Multimedia Content Adaptation

The Internet is a heterogeneous and constantly evolving environment in which end-users are making use of different types of client devices like notebooks, desktop PCs, workstations, set-top boxes, TV sets, and mobile devices such as PDAs, cell phones, and hand held devices. All those devices have different capabilities in terms of computational power, memory size, display size, or network capabilities. At the same time, there is a large number of possible media formats for multimedia content. As a result, current end-user devices cannot display all kind of multimedia data. Nevertheless, this does not be conventional to the vision of *Universal Multimedia Access* (UMA) (Mohan et al., 1999; Pereira and Burnett, 2003). According to the UMA vision, any user/device can consume any multimedia content, anytime and anywhere. Displaying multimedia content on heterogeneous client devices is a task of manageable complexity because users have different content/presentation preferences and intend to consume the content at different locations, times, and under altering circumstances, i.e., within a variety of different contexts. Generally, end-users can specify explicit personal preferences, which should be taken into account when servicing the client. The MPEG-21 standard (Burnet et al., 2003) provides mechanisms

that allow end-users to specify explicit, personal preferences on the multimedia content. The MPEG-21 is the ISO/IEC standard which defines an open framework for multimedia delivery and consumption involving all parties in the delivery and consumption chain. Rendering multimedia content in the Internet remains challenging because the content available on the multimedia server can be heterogeneous, e.g. in terms of encoding. For example, a video can be encoded in different formats such as MPEG-1, MPEG-2, MPEG-4, or H.264, using different encoder settings such as spatial and temporal resolution, color depth, or bit rate. Actually, there is a large number of file and encoding formats in which media resources are stored at the multimedia server. A multimedia server must adapt the multimedia resource correspondingly before sending it to the client for the following two reasons:

- The capabilities of the client's device of transforming the resource by itself may be limited.
- Preferences and personalization requirements of the end-users must be taken into account. New opportunities for personalization on the content level are emerged by the new possibilities of annotating the multimedia resources. For example, research efforts based on the MPEG-7 standard (Martinez et al., 2002) allow enriching media content with semantic content annotations, which in turn facilitate new forms of multimedia experience such as semantic-based content selection and filtering. There are some projects (Steiger et al., 2003) that have exploited the extended metadata annotation possibilities available with the new MPEG standards. The *Video Tool Kit* (ViTooKi) project is a representative example (Böszörmenyi et al., 2003).

Conclusively, multimedia content adaptation involves the execution of one or more transformation operations on the content. It uses descriptive information about the content, user preferences, and usage context to provide the variant of content more adequate to the usage scenario (Kanellopoulos, 2010).

QoE for Multimedia Users

Quality of Experience (QoE) is an important indicator for network operators and service providers to help them assessing the user acceptability towards a particular multimedia service or application. As the paradigm is shifting towards user-centric evaluation of service or application performance, the real time estimation of QoE is becoming a necessity for network operators and service providers in order to attract and bind users to their service. In order to support more accurate control and measurement of multimedia quality, novel user-aware and multimedia-aware approaches are required to increase the customer's satisfaction, while simultaneously improving the usage of network resources. In the light of this evidence, Latre et al. (2009) and Takahashi et al. (2008) have introduced *Quality of Experience (QoE) schemes* to overcome the limitations of current QoS-aware solutions regarding multimedia coding unawareness, human perception, and subjective-related aspects. Romaniak et al. (2008) proposed QoE assessment mechanisms and techniques to show how a networking environment can meet the viewer's specific requirements. In addition, Romaniak et al. (2008) presented several studies in video assessment models for future multimedia systems that have focused on Standard-Definition (SD) and especially in High-Definition (HD) content. It is noteworthy that the results of video assessment schemes for multimedia applications are very important and can be used for different proposals, such as: pricing, medium adaptation, and user-based optimizations. From another perspective, Mu et al. (2009) discussed how QoE control schemes can optimize network resources and improve the user perception simultaneously. Currently, the most influential working group in the video quality area is the *Video Quality of Experts*

Group (VQEG) (VQEG, 2014). This group runs test plans that aim at selecting the best quality models that could then be turned into ITU Recommendations. VQEG has recently started to turn its attention to 3DTV video quality metrics and models.

APPROACHES FOR QoS GUARANTEES OVER THE INTERNET

According to Servetto and Nahrstedt (2001), the problem of sending video over IP has essentially two main components: (1) video data compression and (2) design of communication protocols. One approach consists of designing a low bit rate coder, protecting the resulting bit stream with channel codes and using one of the standard Internet transport protocols to transmit the resulting data stream. If the source bit rate is low enough and the channel is not too congested, then it is possible to use TCP, in which case no errors occur and therefore there is no need for channel codes. Otherwise, user datagram protocol (UDP) is used with a constant packet injection rate, and low-redundancy channel codes are used to protect against infrequent lost packets. But this approach is to naive.

Speaking more precisely, supporting multimedia communications over the Internet introduces two major problems: *Fairness* and *Useless Packet Transmission* (UPT). In current Internet, a single FIFO-based queue is used to multiplex both adaptive and non-adaptive traffic at routers. When multimedia applications cross the same router, this may cause fairness problem. UTP is based on the fact that for packetised audio and video, packet loss rate must be preserved under a given threshold for any meaningful communication. Wu and Hassan (2004) have proposed two different management policies for UPT. ITU-T has developed a series of recommendations together comprising the H.323 system (Toga & Ott, 1999) that provides for multimedia communications in packet-based (inter)networks. The H.323 series of recommendations explain systems, logical components, messages and procedures that enable real-time, multimedia calls to be established between two or more parties on a packet network.

In the last decade, Giordano et al. (2003) described the evolution of QoS architectures, mechanisms, and protocols in the Internet, as it was ongoing in the framework of the European Union funded research projects (AQUILA, CADENUS, TEQUILA) on premium IP networks. Bhargava et al. (2005) developed an adaptable network architecture (ADNET) which allows different QoS provision schemes such as active networks, integrated services and differentiated services to co-exist.

In general, the Internet provides the best-effort service to multimedia applications and thus cannot meet the QoS requirements of multimedia communications. However, many research efforts have been made towards providing QoS guarantees. Communication architecture of the Internet is altered or improved to provide QoS guarantees (Kanellopoulos et al., 2009). Three main architectures have been proposed:

- *Integrated service model (IntServ).*
- *Differentiated service model (DiffServ).*
- *Multiprotocol label switching (MPLS).*

Integrated Service Model

The integrated service model (IntServ) is based on resource reservation (Braden et al., 1994). An appropriate amount of resources is reserved for each flow to meet its requirements. Resources including

bandwidth and memory are reserved to meet QoS requirements of an application or communication session (Braden et al., 1997). The following fundamentals are needed to provide QoS guarantees:

- A *QoS specification mechanism* for applications to specify their requirements.
- *Admission control* to determine whether the new application should be admitted without affecting the QoS of other ongoing applications.
- A *QoS negotiation process* so that as many applications as possible can be served. During the QoS negotiation phase, each peer computer must determine whether it can support the desired QoS. If so, certain resources are reserved for this session. If the user is satisfied with the suggested QoS, the session is established. Otherwise, the session is rejected.
- *Resource allocation and scheduling* to meet the QoS requirement of accepted applications.
- *Traffic policing* to make sure that applications generate the correct amount of data within the agreed specification.

In addition, *a QoS re-negotiation mechanism* is required so that applications can request changes in their initial QoS specifications. The actual QoS provided to the ongoing sessions should be monitored, so that suitable actions can be taken in case of any problem in providing specified QoS guarantees. Media scalability and graceful quality degradation techniques should be used together with the above mechanisms to provide satisfactory services to multimedia applications.

Traffic-shaping schemes. Traffic shaping regulates a stream's traffic so that it is simple to describe and police. Traffic-shaping schemes are used, when the traffic pattern is too complicated to describe directly or the traffic is not appropriate for networks to support directly. For example, when video is variable bit rate coded, it may be hard to characterize the coded bit stream.

Admission control, QoS negotiation and renegotiation. When a connection with specified QoS is established, QoS parameters are translated and negotiated among all relevant subsystems. Only when all subsystems are in agreement with and guarantee the specified QoS parameters, the end-to-end QoS requirements can be met.

Resource reservation protocols. A vital part of the IntServ model is the resource reservation protocol at the network layer. A resource reservation protocol transfers information about resource requirements and negotiates the QoS values that users desire for their end-to-end applications. In current IntServ model, only RSVP (Braden et al., 1997) is used as the reservation protocol.

IntServ uses RSVP to make per-flow reservations at routers along a network path. While this allows the network to provide service guarantees at the flow level, it suffers from scalability issues. RSVP is a soft-state protocol, which means that the router's state has to be refreshed at regular intervals, and this adds to traffic overhead. The service classes offered by IntServ are: (1) guaranteed service class, (2) controlled load service, and (3) best-effort service.

Differentiated Services

The main problem of the currently best-effort model on the Internet is that all packets are treated the same although different types of service can be determined in the IPv4 header. The main problem of the IntServ is that there are potentially infinite number of different types of traffic so each router has to store essential information to provide QoS guarantees to each type of traffic. Differentiated services (Black, 1998) take a middle ground between the best-effort service and IntServ. It defines a fixed number of

packet classes. All traffic types/packets are aggregated into these classes and the network/routers provide different services to different packet classes.

Service classification. IPv4 has an underused type-of-service byte in its header. The newer IPv6 has a header byte called traffic class. In DiffServ, the type-of-service (traffic class) byte is re-defined as a differentiated service (DS) field. The first six bits of the DS field is called DS CodePoint, which indicates the behavior each router is required to apply to the individual packet. Packets with the DS CodePoint set to zero receive the same service as they get in the best effort service. Values between one and seven are defined to be backward compatible with the original IP precedence mechanism, to ensure that DiffServ technology can be deployed in the operational Internet progressively. The DS filed can be assigned by the customer (the transmitter process) to indicate the desired service. Alternatively, the ingress router marks the DS field based on multifield (MF) classification. MF classification classifies packets based on the contents of multiple fields such as source address, destination address, type-of-service byte, protocols ID, source port number and destination port number. As a packet moves from one Internet Service Provider (domain) to another, it may be re-classified. Many service classes can be defined. The Internet Engineering Task Force (IETF) working group has defined the following two new services.

- *Expedited or premium service:* to provide virtual leased line service to applications requiring low-delay and low delay jitter.
- *Assured service:* to provide better-than-best-effort services to applications.

In the past decade, Hou et al. (2000) proposed a Diffserv architecture for multimedia streaming applications in next generation Internet.

Multiprotocol Label Switching (MPLS)

In an IP network, each router analyzes the packet's header and runs a network layer routing algorithm. Each router separately chooses a next hop for the packet, based on its analysis of the packet's header and the results of running the routing algorithm. This process introduces some latency, as the routing tables are very big and table lookups take time. Choosing the next hop consists of two steps. The first step classifies the entire set of possible packets into a set of forwarding equivalence classes (FECs). The second step maps each FEC to a next hop. As far as the forwarding decision is concerned, different packets, which are mapped into the same FEC are indistinguishable and travel in the same path. In MPLS, the assignment of a particular FEC is done just once at the ingress router (Armitage, 2000). The FEC to which the packet is assigned is encoded as a short fixed length value known as a label. This label is inserted into the packet by the ingress router. At subsequent hops, there is no further analysis of the packet's network layer header. Instead, the label is used as an index into a table that specifies the next hop and a new label. The old label is replaced with the new label and the packet is forwarded to its next hop. The path taken by the packet is specified by a sequence of labels and is called a label switched path (LSP). The routers that support MPLS are called label-switching routers (LSRs). MPSL is a forwarding scheme and is much faster than IP routing. The label can represent a combination of a FEC and a precedence or class of service. Routers to provide differentiated QoS to different types of traffic can treat packets with different labels differently.

In the next section, we briefly present some of the current research progress on the future Internet architecture.

FUTURE INTERNET ARCHITECTURES

Pan et al. (2011) investigated the key research topics in the area of future Internet architecture. In particular, they discussed many ongoing research projects from United States, the European Union, Japan, China, and other places. Hereafter, we present some of the current research progress on the future Internet architecture.

Future Internet Architecture (FIA) Program: The National Science Foundation (NSF) directorate for Computer and Information Science and Engineering (CISE) administrates Research programs on future Internet architecture in the United States. The FIA program (Future Internet Architecture – N.S.F, 2013) of the NSF is a research umbrella, built on the previous program, called Future Internet Design (FIND). It is noteworthy that FIND funded about 50 research projects on all kinds of design aspects of the future Internet. FIA is the next phase to pull together the ideas into groups of overall architecture proposals.

Named Data Networking (NDN): The initial idea of the Named Data Networking (NDN) project can be traced to the concept of *content-centric networks* (CCNs) by Ted Nelson in the 1970s. The basic argument of the NDN project (Named Data Networking Project, 2014) is that the primary usage of the current Internet has changed from end-to-end packet delivery to a *content-centric model* (discussed previously). The current Internet, which is a "client-server" model, is facing challenges in supporting secure content-oriented functionality. In this information dissemination model, the network is "transparent" and just forwarding data (i.e., it is "content-unaware"). Due to this unawareness, multiple copies of the same data are sent between endpoints on the network again and again without any traffic optimization on the network's part. The NDN uses a different model that enables the network to focus on "what" (contents) rather than "where" (addresses). The data are named instead of their location (IP addresses). Data become the first-class entities in NDN. Instead of trying to secure the transmission channel or data path through encryption, NDN tries to secure the content by naming the data through a security-enhanced method. This approach allows separating trust in data from trust between hosts and servers, which can potentially enable content caching on the network side to optimize traffic.

Mobility First: The Mobility First (Mobility First Future Internet Architecture Project, 2014) project is led by Rutgers University with seven other universities. The basic motivation of Mobility First is that the current Internet is designed for interconnecting fixed endpoints. It fails to address the trend of dramatically increasing demands of mobile devices and services. The Internet usage and demand change is also a key driver for providing mobility from the architectural level for the future Internet. Mobility First aims to address the cellular convergence trend. It also provides mobile peer-to-peer (P2P) and info station (delay-tolerant network) application services, which offer robustness in case of link/network disconnection. In the future, Mobility First has the ambition of connecting millions of cars via vehicle-to-vehicle (V2V) and vehicle-to-infrastructure (V2I) modes, which involve capabilities such as location services, geo routing, and reliable multicast. Ultimately, it will introduce pervasive system to interface human beings with the physical world, and build a future Internet around people. The challenges addressed by Mobility First include stronger security and trust requirements due to open wireless access, dynamic association, privacy concerns, and greater chance of network failure.

NEBULA: NEBULA (NEBULA Project, 2013) is another FIA project focused on building cloud-computing-centric network architecture. It is led by the University of Pennsylvania with 11 other universities. NEBULA envisions the future Internet consisting of a highly available and extensible core network interconnecting data centers to provide utility-like services. Multiple cloud providers can use replication by themselves. Clouds comply with the agreement for mobile "roaming" users to connect to

the nearest data center with a variety of access mechanisms such as wired and wireless links. NEBULA aims to design the cloud service embedded with security and trustworthiness, high service availability and reliability, integration of data centers and routers, evolvability, and economic and regulatory viability. NEBULA design principles include, reliable and high-speed core interconnecting data centers, parallel paths between data centers and core routers, secure in access and transit, policy-based path selection mechanism, authentication enforced during connection establishment. With these design principles in mind, the NEBULA future Internet architecture consists of the following key parts:

- The *NEBULA data plane*, which establishes policy-compliant paths with flexible access control and defense mechanisms against availability attacks.
- *NEBULA virtual and extensible networking techniques*, which is a *control plane* providing access to application selectable service and network abstractions such as redundancy, consistency, and policy routing.
- The *NEBULA core* (NCore), which redundantly interconnects data centers with ultrahigh-availability routers.

4WARD: It is an EU FP7 project (The FP7 4WARD Project, 2014) on designing a future Internet architecture led primarily by an industry consortium. The funding is over 45 million dollars for a 2-year period. 4WARD promotes the innovations needed to improve single network architecture. It also enables multiple specialized network architectures to work together in an overall framework. In particular, the key 4WARD design goals are:

- To create a new "network of information" paradigm in which information objects have their own identity and do not need to be bound to hosts.
- To design the network path to be an active unit that can control itself and provide resilience and failover, mobility, and secure data transmission.
- To devise "default-on" management capability that is an intrinsic part of the network itself.
- To provide dependable instantiation and interoperation of different networks on a single infrastructure.

AKARI: The AKARI project (AKARI, 2015) is supposed to assemble five sub-architecture models:

- An integrated sub-architecture based on a layered model with cross-layer collaboration. That means that we have a logical identity separation from the data plane.
- A sub-architecture that simplifies the layered model by reducing duplicated functions in lower layers.
- A sub-architecture for QoS guarantee and multicast.
- A sub-architecture to connect heterogeneous networks through virtualization.
- A mobile access sub-architecture for sensor information distribution and regional adaptive services.

Through systematic test-bed construction and experimentations, AKARI project aims to establish a new architecture ready for public deployment by 2016.

Future Internet Research and Experimentation (FIRE): FIRE (FIRE, 2014) is one of the European Union's research projects on test beds. FIRE involves efforts from both industry and academia. The FIRE project's research is built on the previous work on the GEANT2 (Gigabit European Academic Networking Technology) project (GEANT2 Project, 2014). GEANT2 is the infrastructure test bed connecting over 3000 research organizations in Europe. FIRE also expects not only to change the Internet in technical aspects but also in socio-economic terms by treating socio-economic requirements in parallel with technical requirements.

FUTURE RESEARCH DIRECTIONS

In the future, a high-speed multimedia network will be mainly wireless at the edges, with access to a high-speed optical backbone infrastructure, including optical switches. One can imagine a network that consists only of wireless access to an optical backbone. Fourth-generation mobile wireless networks offer capacities up to 150 Mb/s to fully mobile users in various environments. In such environments, resource management remains an important issue. Efficient resource management is a hot issue due to: (1) the rapid increase in size of the wireless mobile community; (2) its demand for high-speed multimedia communications; and (3) the limited resources. Additional crucial issues that need to be addressed in future multimedia systems are:

Ubiquitous and seamless mobility support: Multimedia systems can provide ubiquitous support by using intelligent multimedia content adaptation and context awareness techniques. Wireless and cellular networks have improved multimedia applications with mobility. Mobility aspect has added another dimension of complexity to multimedia networks. It opens up questions on a host of complex issues like routing to mobile terminals, maintaining the QoS when the host is in motion, interworking between wireless and wired networks. In addition, the ability of wireless devices to satisfy many of the emerging multimedia applications and user requirements remains an important challenge for designers and manufactures because these portable wireless devices have limited resources (CPU, memory, battery power).

Transport and network levels optimization mechanisms: Novel routing mechanisms and intelligent inter-intra session adaptation are still needed. Cross-layer design methodologies provide great promises for addressing these challenges and achieving reliable and high-quality end-to-end performance in wireless multimedia communications (Foukalas et al., 2008).

Cross-layer optimized wireless multimedia communications: Supporting multimedia applications and services over wireless networks is challenging due to constraints and heterogeneities such as limited battery power, limited bandwidth, random time-varying fading effect, different protocols and standards, and stringent QoS requirements. Cross-layer design methodologies proposals can address these challenges and achieve reliable and high-quality end-to-end performance in wireless multimedia communications. The cross-layer approach transports feedback dynamically via the layer boundaries to enable the compensation for e.g. overload, latency or other mismatch of requirements and resources by any control input to another layer but that layer directly affected by the detected deficiency. Cross-layer optimization removes strict boundaries (enforced between layers of the OSI communication model) to allow communication between layers by permitting one layer to access the data of another layer to exchange information and enable interaction. For example, having knowledge of the current physical state will help a channel allocation scheme in optimizing tradeoffs and achieving throughput maximization. Cross-layer optimization can contribute to an improvement of quality of services under various opera-

tional conditions. Such adaptive quality of service management can be based on a cross-layer control mechanism that will provide a feedback on concurrent quality information for the adaptive setting of control parameters. The developments of the new schemes, mechanisms, and systems associated with the cross-layer designs and protocols will have a significant impact on the next generation of wireless communications and networks.

Highly heterogeneous networking infrastructures and devices: Regarding heterogeneity, multimedia standards can play a major role in the multimedia revolution, because they provide interoperability between hardware and software provided by multiple vendors. However, the production of standards for multimedia communications is beset by the problem that the involved industries have radically different approaches to standardization.

New QoE-based applications: Narrative video assessment schemes for such multimedia applications can be used for different proposal, such as user-based optimizations, pricing, medium content adaptation etc.

Use of Network Coding (NC) to multimedia content distribution: NC is an innovative technique that can achieve the maximum information flow in a network by allowing nodes to combine received packets before retransmission (Ahlswede et al., 2000). Nemoianu and P. Popescu (2013) provided an overview of the joint use of NC and a set of current multimedia techniques. The applications of NC can range from distributed storage, multimedia content distribution with scalable coding, multiple description coding in Peer-to-Peer (P2P) networks, to the applications in wireless networks and the recent trends in cross-layer optimization.

Video coding: In the field of audio/video coding, a large variety of innovative coding algorithms exists, but the most algorithms of them are too complex for implementation.

CONCLUSION

In this chapter, we presented background knowledge on multimedia communication: multimedia applications and services, network and user QoS requirements, bandwidth on demand, multicasting, media synchronization, adaptive media coding, multimedia streaming, and end-system support for multimedia communication. We also discussed content delivery networks (CDNs) and concentrated on issues for achieving multimedia optimization over heterogeneous wireless and wired networks. We provided an overview of technologies required to support end-to-end QoS guarantees over the Internet. In particular, we presented the main approaches for QoS guarantees over the Internet. We outline, that besides the network layer architectures, proper transport protocols such as RTP and application dependent protocols such as *Session Initiation Protocol* (SIP) (Johnston, 2000) are required for multimedia communications. To achieve end-to-end QoS guarantees special efforts are required from all subsystems including end systems and all networking components involved. The communication architectures IntServ, DiffServ and MPLS will inter-operate with each other in the Internet environment. IntServ will be implemented in edge networks where the number of flows is small, while DiffServ will be putted into practice in core of the Internet where the number of flow is high. MPLS together with DiffServ will provide differentiated services and QoS guarantees. Finally, in this chapter we presented in brief future Internet architectures and some future research directions in multimedia networking.

KEY TERMS AND DEFINITIONS

Content Delivery (or Distribution) Networks (CDNs): In the last years, these networks are evolved from infrastructures for Web documents to systems that support multimedia content and different forms of delivery such as streaming and Video on Demand (VoD).

Delay Variation (Jitter): It is a term used for the variation of end-to-end delay from one packet to the next packet within the same packet stream (connection/flow).

End-to-End Delay: It is an important parameter affecting the user's satisfaction with the multimedia communication application. It includes capturing, digitizing, encoding/compressing media data, transmitting them from the source to the destination, and decoding and displaying/presenting them to the user.

Future Internet: Current Internet protocol suite architecture has many shortcomings such as "semantic overload" (viz. an IP address denotes both the identifier as well as the locator of an end-system). Future Internet is a general term for research activities on new architectures for the Internet. Approaches towards a future Internet range from small, incremental evolutionary steps to complete redesigns (clean slate)

and architecture principles, where the applied technologies shall not be limited by existing standards or paradigms such as client server networking. Technical examples for evolutionary approaches include supplements to existing Internet technology, such as Differentiated services.

IP Multimedia Subsystem (IMS): It is an architectural framework for delivering IP multimedia services. In particular, it is a standardized *Next Generation Networking* (NGN) *architecture* for telecom operators that want to provide mobile and fixed multimedia services. IMS runs over the standard IP and uses a Voice-over-IP (VoIP) implementation that is based on a 3GPP standardized implementation of SIP.

Media Streaming: It is a technique for transferring data so that it can be processed as a steady and continuous stream. Streaming technologies are important because most users do not have fast enough access to download large multimedia files quickly in the Internet. With streaming, the client browser (or plug-in) can start displaying the data before the entire file has been transmitted.

Multimedia Content Adaptation: It is the modification/adaptation of multimedia content in order to meet various quality of service (QoS) requirements or different criteria such as the user/viewer's personal preferences, the resolution capability of a mobile device, a geographic target, etc.

Quality of Experience (QoE): A subjective measure of quality perceived by the user in some services types such as video transmission, voice transmission, web browsing, games etc. QoE evaluates the acceptability of a service from the client.

Quality of Service (QoS): QoS functionality enables service providers to guarantee and enforce transmission quality parameters (e.g., bandwidth, jitter, delay, packet loss ratio) according to a specified service-level agreement (SLA) with the customer.

Real-Time Streaming Protocol (RTSP): It is a network control protocol, which is used to establish and control media sessions between end-points. Networked multimedia computers use RTP to control streaming media servers. Clients of media servers issue commands, such as play and pause, to facilitate real-time control of playback of media files from the server.

Real-Time Transport Protocol (RTP): It defines a standardized packet format for delivering audio and video over the Internet. It transfers media streams controlled by H.323, MGCP, Megaco, SCCP, or Session Initiation Protocol (SIP) signaling protocols, enabling it one of the technical foundations of the voice over IP industry.

Resource ReSerVation Protocol (RSVP): RSVP is the network control protocol that allows data receiver to request a special end-to-end quality of service for its data flows. RSVP is a main component of future Integrated Services Internet (viz. Integrated Service Model) and can provide both best-effort and real-time service. RSVP is used by real-time applications to reserve necessary resources at routers along the transmission paths so that the requested bandwidth can be available, when the transmission actually takes place.

RTP Control Protocol (RTCP): It is a sister protocol of the RTP and is used to monitor transmission statistics and QoS information. RTCP provides feedback on the QoS in media distribution by periodically sending statistics information to participants in a streaming multimedia session.

Session Initiation Protocol (SIP): It is a signaling protocol defined by IETF. The SIP protocol is widely used for controlling communication sessions such as video and voice calls over IP. SIP can be used for creating, modifying, and terminating two-party (unicast) or multiparty (multicast) sessions. These sessions may consist of one or several media streams.

Chapter 83
Media Synchronization Control in Multimedia Communication

Mya Sithu
Nagoya Institute of Technology, Japan

Yutaka Ishibashi
Nagoya Institute of Technology, Japan

ABSTRACT

In this chapter, first, we explain media synchronization control. Next, we make a survey of media synchronization control techniques and classify the techniques. Also, we compare group synchronization control schemes. Then, we propose new control called the dynamic local lag control in joint musical performance which has severe requirements on high quality of media synchronization and high interactivity. In the performance, multiple users play their respective same or different types of musical instruments together. However, the media synchronization quality and interactivity may seriously be deteriorated owing to the network delay. By Quality of Experience (QoE) assessment, we demonstrate that the new control can achieve high quality of media synchronization and keep the interactivity high. Finally, we discuss the future directions of media synchronization control.

INTRODUCTION

In this chapter, we explain the state-of-the-art work on media synchronization control in multimedia communication and discuss its future work. In our daily lives, we communicate with each other over a network for various purposes by using multiple media streams such as voice, video, haptic media, and olfactory media (Natarajan, 2003). In multimedia communication, media synchronization among the streams is very important (Blalowski & Steinmetz, 1995). However, the media synchronization may be disturbed owing to network delay, delay jitter, and packet loss. If the media synchronization quality is deteriorated, the quality of experience (QoE) (ITU-T Rec. G.100/P.10, 2007) may seriously be damaged. To solve such a problem, we need to carry out media synchronization control, which adjusts the output timings of streams at each terminal to achieve high quality of media synchronization. A number

DOI: 10.4018/978-1-5225-3822-6.ch083

of researchers have been studying media synchronization control so far (Blalowski & Steinmetz, 1995; Ehley et al., 1994; Ishibashi & Tasaka, 2000; Huang et al., 2013; Boronat et al., 2009).

A survey of media synchronization control was made, and techniques used in the algorithms for the control were classified into four categories (Ishibashi & Tasaka, 2000). However, a number of researches about media synchronization control have been done since the survey (Huang et al., 2013). Therefore, it is time to redo a survey of new media synchronization control techniques including the conventional ones as in (Ishibashi & Tasaka, 2000).

In this chapter, first, we explain media synchronization control. Next, we make a survey of media synchronization control techniques and classify the techniques. Also, we compare group synchronization control schemes. Then, we propose new control called the *Dynamic local lag control* in joint musical performance, which has severe requirements on high quality of media synchronization and high interactivity. In the performance, multiple users play their respective same or different types of musical instruments together. However, the media synchronization quality and interactivity may seriously be deteriorated owing to the network delay. By QoE assessment, we demonstrate that the new control can achieve high quality of media synchronization and keep the interactivity high. Finally, we discuss future research directions of media synchronization control.

MEDIA SYNCHRONIZATION CONTROL

Media synchronization may be disturbed owing to network delays and skews, which are caused by many reasons such as the difference of time in capturing media among terminals, the difference of time in protocol processing, media interleaving, network delay jitter, packet loss, the difference of decoding time at the playout process, and clock difference. Media synchronization control is carried out to compensate for the network delay jitter. We can identify two types of media synchronization control: *Object* (or *event-driven*) and *continuous* synchronization control (Campbell et al., 1992). Object synchronization control means synchronization control among multimedia objects. The control adjusts the beginning output timings of media according to a scenario. Under continuous synchronization control, the output timings (e.g., output times and speeds) among media streams can be synchronized with each other. In this chapter, we focus on continuous synchronization control. Media synchronization control is categorized into three types:

- *Intra-stream*
- *Inter-stream* (Blalowski & Steinmetz, 1995; Ehley et al., 1994; Ishibashi & Tasaka, 1995, 2000; Huang et al., 2013; Boronat et al., 2009, Ishibashi et al., 2003), and
- *Group* (or *inter-destination*) *synchronization control* (Ishibashi et al., 1997; Ishibashi & Tasaka, 1997, 1999).

The intra-stream synchronization control is necessary for preservation of the timing relation in a single stream. The inter-stream synchronization control is required for keeping the temporal relation among media streams. Media streams generally fall into a master stream and slave streams. Only the intra-stream synchronization control is carried out over the master stream, and the inter-stream synchronization control is exerted for the slave streams after carrying out the intra-stream synchronization control over each slave stream (Ishibashi & Tasaka, 1995). It is also possible to apply only inter-stream synchronization

control over each slave stream (Ishibashi et al., 2003). The group synchronization control is necessary to output each stream simultaneously at different destinations in multicast communication. There are three schemes for group synchronization control:

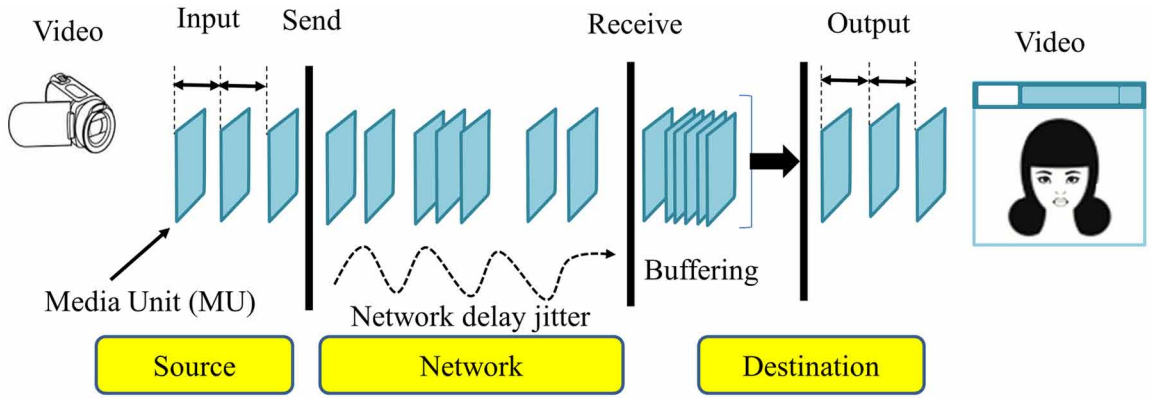
- The master-slave destination scheme (Ishibashi et al., 1997).
- The synchronization maestro scheme (Ishibashi & Tasaka, 1997).
- The distributed control scheme (Ishibashi & Tasaka, 1999).

Intra-Stream Synchronization Control

The intra-stream synchronization control is necessary for preservation of the timing relation between *media units* (*MUs*), each of which is an information unit for media synchronization, such as video frames and voice packets in a single media stream. The input intervals between MUs are disturbed owing to network delay jitter. The intra-stream synchronization control recovers the intervals when the destination outputs the MUs as shown in Figure 1, where the destination outputs MUs after buffering. To recover from asynchrony (i.e., out of synchronization), the *graceful* and *quick recovery schemes* (Ishibashi & Tasaka, 1995) can be used. The graceful recovery scheme recovers from asynchrony gradually so that users hardly perceive any degradation of output quality, and the quick recovery scheme tries to recover as soon as possible. Performance evaluation is carried out for the schemes in (Ishibashi et al., 1995; Ishibashi et al., 1996). The schemes can also be used in inter-stream synchronization control.

There are several types of intra-stream synchronization control such as *Skipping* (Ishibashi et al., 2002), *Buffering* (Ishibashi et al., 2002*), Adaptive Buffer Control* (ABC) (Wongwirat & Ohara, 2006), *Queue Monitoring* (QM) (Hikichi et al., 2002), *Virtual-Time Rendering* (VTR) (Ishibashi et al., 2002), and *media adaptive buffering* (Isomura et al., 2011). In Skipping, the destination outputs only the latest MUs on receiving them. When the sequence number of a received MU is smaller than that of the last-output MU, the destination discards the received MU. In Buffering, the MUs are saved in the destination's buffer for a constant time. When an MU arrives late, the destination outputs the MU on receiving it. QM deletes the oldest MU in the receiving buffer if the value of counter (a counter is set for each MU in the buffer, and the counter is incremented by one whenever an MU is output) exceeds a threshold value, and then the value of counter is reset to zero. In VTR, the *virtual-time* expands or contracts according

Figure 1. MU output under intra-stream synchronization control



to network delay jitters observed at the destination, and media are rendered along the virtual-time axis. ABC dynamically extends the buffering time of MUs according to the network delay under the adaptive buffer approach, which determines the buffering time by observing the network delay, and the time adjustment mechanism, which decides the output time of each MU by adding the buffering time to the generation time of the MU.

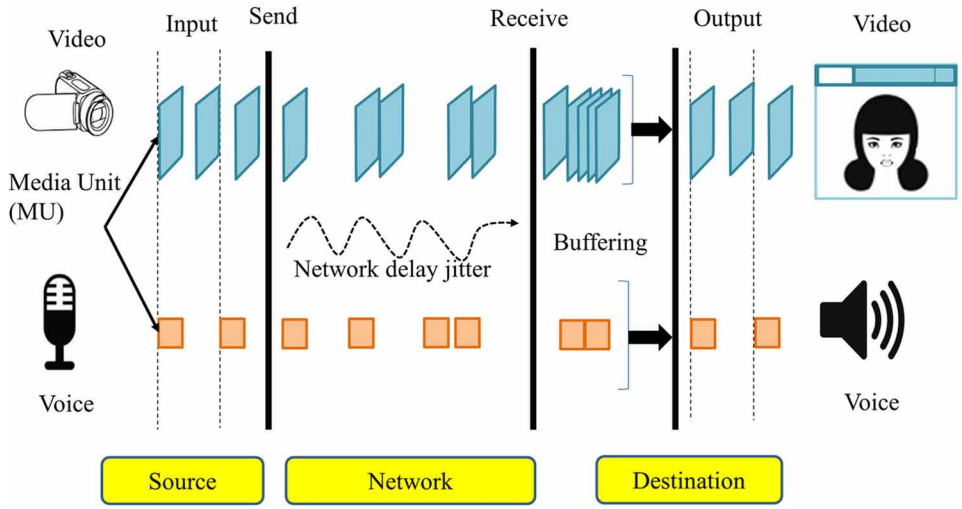
Inter-Stream Synchronization Control

Inter-stream synchronization control is required for keeping the temporal relationship among media streams. Lip-sync is a representative of the inter-stream synchronization, and it means the synchronization between spoken voice and the movement of the speaker's lips. As described earlier, media streams generally fall into a master stream and slave streams. The slave streams are synchronized with the master stream as shown in Figure 2. In lip-sync, the voice is generally selected as the master stream because voice is more sensitive to intra-stream synchronization error than video. Under the inter-stream synchronization control, each slave stream is output in synchronization with the master stream. Therefore, the intra-stream synchronization quality of the slave stream may largely be degraded by the inter-stream synchronization control. To solve this problem, in (Sannomiya et al., 2013), the group synchronization control is used for inter-stream synchronization control by handling all the streams as master streams.

In (Ishibashi & Tasaka, 1995), the inter-stream synchronization control is used for *tightly-coupled media streams* and *loosely-coupled media streams*. As for tightly-coupled media streams, each MU in a media stream is coupled with an MU in another media stream, and the coupled MUs should be output together. To handle the media streams, we need information which relates the MUs to each other as well as timestamps; for example, each slave MU has the sequence number of the corresponding master MU. For loosely-coupled media streams, each slave MU does not need to have the sequence number of the corresponding master MU, and temporal relationship is gotten from timestamps.

VTR and the control in (Ishibashi et al., 2004) are two examples of inter-stream synchronization control. They select one media stream as the master stream and the others as slave streams. VTR carries

Figure 2. MU output under inter-stream synchronization control



out only the intra-stream synchronization control for the master stream. For each slave stream, it exerts the inter-stream synchronization control after carrying out the intra-stream synchronization control. The output time of an MU is determined by using the *target output time* (an instant at which the destination should output the MU under the intra-stream synchronization control when there exists the network delay jitter) determined under the intra-stream synchronization control and the *scheduled output time* (an instant recommended for inter-stream synchronization control) determined from the output time of the corresponding master MU.

Under the inter-stream synchronization control in (Ishibashi et al., 2004), if the synchronization error is outside the *allowable range*, in which users feel that the error is allowable, the error is reduced gradually by advancing or delaying the output timing of media streams until the error enters the *imperceptible range*, in which users cannot perceive the error.

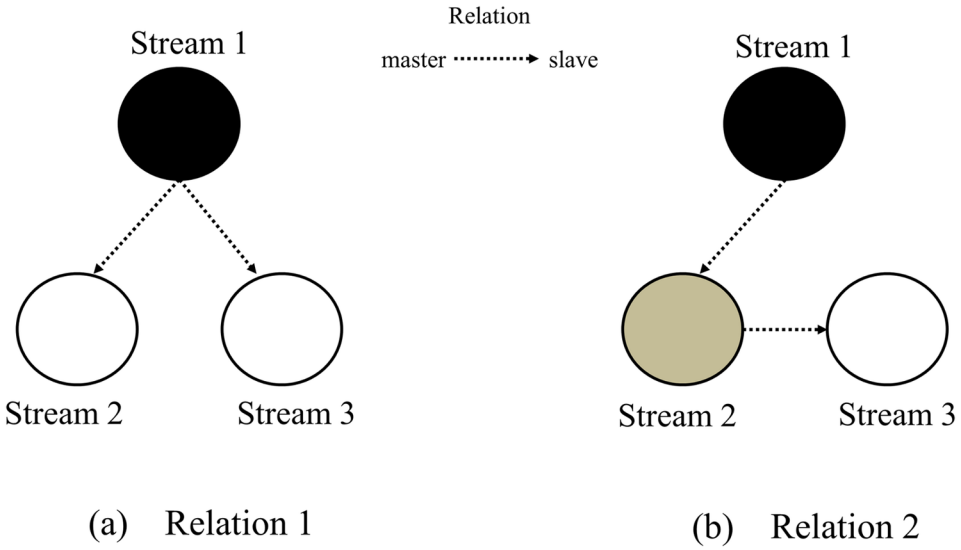
In the above descriptions, all the slave streams stand on an equal footing as shown in Figure 3 (a), where there are *streams 1*, *2*, and *3*; that is, a master stream and two slave streams (called *relation 1* here).

In Figure 3 (a), stream 1 is a master stream, and streams 2 and 3 are slave streams. Other relations such as the relation shown in Figure 3 (b) (called *relation 2 here)* as well as relation 1 are handled in (Takeo et al., 1997). In Figure 3 (b), two slave streams (streams 2 and 3) have a master-slave relation; stream 2 is a sub-master stream of stream 3. A performance comparison of the relations is carried out in (Takeo et al., 1997), where streams 1, 2, and 3 are voice, video, and drawing, respectively. According to experimental results, relation 1 is better than relation 2 for synchronization of voice and drawing; on the other hand, relation 2 is superior to relation 1 for synchronization of video and drawing. In what follows, relation 1 is used.

Group Synchronization Control

Group synchronization control outputs each MU simultaneously at different destinations in multicast communication as shown in Figure 4. The control is required in a number of networked multimedia ap-

Figure 3. Relations between master and slave streams



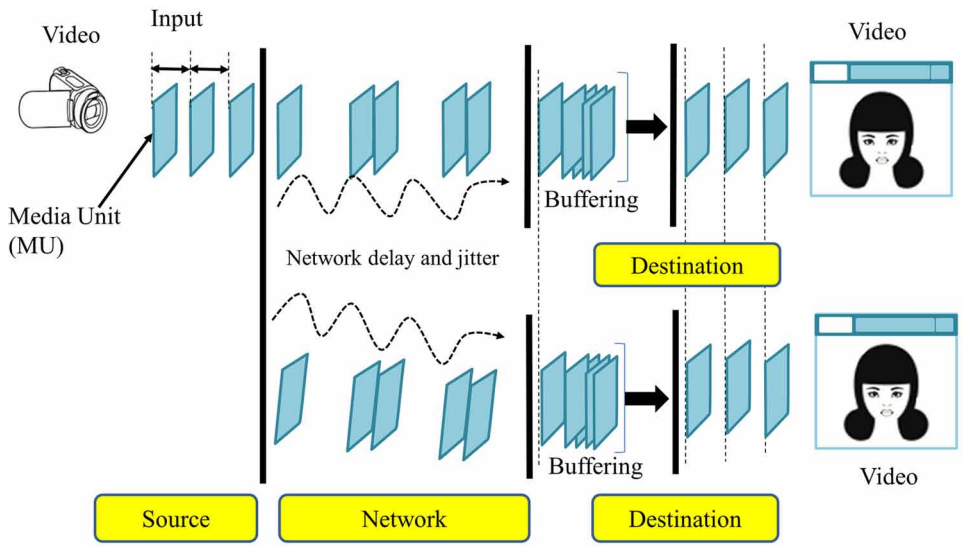
plications. In distance learning, for example, we suppose that a teacher distributes a movie (i.e., stored media) to students, and he/she sometimes makes some comments (i.e., live media) on the movie. In this case, it is necessary to output the stored and live media streams simultaneously at all the destinations. Even if only the stored media is output, each MU of the stream should be output simultaneously at different destinations. This is because the teacher may make some comments on the stream and the students may discuss the content of the stream. If each MU of media streams cannot be output simultaneously at different destinations owing to the differences in network delay and in delay jitter among the destinations, the causality of conversation and the fairness among the students may be damaged. As described earlier, there are the master-slave destination scheme (Ishibashi et al., 1997), the synchronization maestro scheme (Ishibashi & Tasaka, 1997), and the distributed control scheme (Ishibashi & Tasaka, 1999) for group synchronization control.

In the above studies of the Section titled "Media Synchronization Control", live and stored media streams are handled separately. However, we sometimes need to handle both live and stored media streams together. The *joint synchronization scheme* is proposed for inter-stream synchronization between stored video with interactive control and live media (live voice and video) in (Ishibashi et al., 2002). In the scheme, live voice is selected as the master stream, and live video and stored video are selected as slave streams, which are synchronized with the master stream by using VTR. The scheme enables visual search (e.g., fast-forward, reverse, and jump) of the stored video simultaneously at different destinations and adjusts the timing of changing the visual search mode among the destinations by using the synchronization maestro scheme.

MEDIA SYNCHRONIZATION CONTROL TECHNIQUES

A number of media synchronization algorithms have been proposed to meet diverse requirements so far. In this section, we redo a survey of media synchronization control techniques used in the algorithms, and we group the techniques into the following four categories as in (Ishibashi & Tasaka, 2000):

Figure 4. MU output under group synchronization control



- The *basic control techniques*
- The *preventive control techniques* (Minezawa et al., 2007)
- The *reactive control techniques* (Ishibashi et al., 2003)
- The *common control techniques*.

The basic control techniques are needed in almost all the algorithms, and they are indispensable to preserve temporal relationships among media streams. The preventive control techniques are required to try to avoid asynchrony. Thus, the techniques are used before asynchrony occurs. The reactive control techniques are employed to recover from asynchrony after it has occurred. We can employ some techniques as both preventive and reactive control techniques. Such techniques are referred to as the common control.

In order to achieve media synchronization, the four control techniques can be applied either alone or together depending on the type of application at sources or destinations. We focus our classification on techniques used for intra-stream and inter-stream synchronization control. In each of the four categories, the techniques are further classified into two groups by location at which they are employed (called the *source* or *destination control* here). As the other location, the network is used (called the *network control*) as well as the source or destination in (Zimmermann & Liang, 2008) and (Huang et al., 2011). However, in this chapter, we focus on the source and destination control because techniques used for the network control are very few.

Basic Control

Source Control

(a) Attachment of Synchronization Information to MUs

In the basic control, synchronization information such as timestamps, sequence numbers, and synchronization markers (Shepherd & Salmony, 1990) is attached to MUs. The timestamp contained in each MU indicates the generation time of the MU. However, timestamps are not necessarily needed when the generation of MUs is periodic; in this case, the sequence numbers are used instead of the timestamps (Ishibashi & Tasaka, 1995). On the other hand, the synchronization markers are inserted into each media stream at the source for inter-stream synchronization. The markers can be used for tightly-coupled media streams. The destination buffers MUs of streams whose synchronization markers have arrived until all the synchronization markers are collected. Therefore, the quality of media synchronization may seriously be deteriorated if one or more MU with the same synchronization marker is arrived largely late.

Destination Control

(a) Buffering of MUs

When the destination receives MUs, it stores the MUs in the destination buffer to compensate for network delay jitters (Santoso et al., 1993). Then, it outputs them according to the synchronization information. Therefore, each MU waits for output from the buffer when it arrives earlier than the time at which the MU should be output. If we could know the maximum and minimum network delays in advance, we can perfectly absorb the network delay jitter by setting the buffering time to the maximum network

delay minus the minimum one (Santoso et al., 1993). However, we cannot actually know the maximum network delay beforehand in networks like the Internet. Even if we could know the maximum network delay, we may not be able to set the buffering time to such a value because the value is too large and the interactivity is seriously damaged.

Preventive Control

Source Control

(a) Transmission of MUs According to Synchronization Information

For stored media, the source transmits MUs according to synchronization information such as timestamps. This technique is also considered as a kind of traffic control. The technique is employed in the great majority of studies which handle stored media (for example, in (Ishibashi et al., 1995)). For live media, the source transmits each MU with its timestamp on capturing the MU.

This technique is compared with other two transmission schemes in (Nunome et al., 1999), where the technique is called the timestamp scheme. The other two schemes are the file transfer scheme and the switching scheme. In the file transfer scheme, media streams are transmitted as a file. The switching scheme dynamically switches the timestamp scheme and the file transfer scheme according to the network load.

(b) Deadline-Based Transmission Scheduling

The source schedules MU transmission according to their deadline requirements (Ali et al., 2000; Boukerche & Owens, 2005; Lamont et al., 1996; Baqai et al., 1996). If the source knows the MU size, the output deadline, and delay bounds (or delay probability distribution) for each MU, it can schedule MU transmission based on the requirements. Thus, the technique can be employed for only stored media.

(c) Interleaving of MUs

The source interleaves MUs from different media streams to make a single transport stream (ISO/IEC 11172- 1, ISO/IEC 13818-1, 1993, 1994; ITU-T Rec. H.223, 1996). The technique in (Tasaka et al., 1997, Tasaka & Ishibashi, 1997, 1998) improves the quality of inter-stream synchronization, but it may degrade the intra-stream synchronization quality of media streams which are sensitive to the network delay jitter (Tasaka & Ishibashi, 1998). In the real-time transport protocol (RTP) (Schulzrinne, 2003), media streams are transmitted in separate RTP sessions; thus, the interleaving technique is not used. For example, in a teleconference where video and audio are employed, video and audio media streams are transmitted in two RTP sessions.

Destination Control

(a) Preventive Skipping (Discarding) and Preventive Pausing (Repeating or Inserting)

The destination skips (discards) MUs or pauses (repeats) output of MUs depending on the length of the output queue (Little & Kao, 1992; Daami & Georganas, 1997; Kohler & Muller, 1994). It is also possible to insert dummy (noise) data instead of pausing. In (Dammi & Georganas, 1997), when the

buffer occupancy at the destination exceeds a threshold value, the destination discards an MU every two MUs; when the occupancy becomes less than another threshold value, the destination repeats each MU once. For MPEG video, the destination discards some MUs with low priority out of MUs stored in the destination buffer according to the buffer occupancy (Lamont et al., 1996).

(b) Change of Buffering Time With Network Delay Estimation

By estimating the network delays, the destination changes the buffering time of MUs according to the estimated delays (Ramjee et al., 1994; Ishibashi & Tasaka, 1998; Cuevas et al., 1993). This idea is based on that the intra-stream synchronization can be achieved by choosing the buffering time so as to be larger than or equal to the maximum network delay minus the minimum network delay (Santoso et al., 1993). In (Ramjee et al., 1994), where only voice is handled, the buffering time is changed on a talkspurt-by-talkspurt basis; thus, the silence period between the two succeeding talkspurts may be artificially elongated or compressed.

The preventive control techniques are compared for media synchronization of voice and video in (Minezawa et al., 2007); transmission of MUs according to synchronization information (preventive control - source control (a)), preventive pausing (preventive control - destination control (a)), preventive shortening of output duration (common control - destination control (c)), and change of buffering time with network delay estimation (preventive control - destination control (b)) are handled.

Reactive Control

Source Control

(a) Adjustment of Transmission Timing

The source can change the transmission timing of MUs by changing the MU transmission time or by skipping or pausing MUs if the source knows the amount of skews among media streams (Correia & Pinto, 1995; Zhang et al., 2002). When the destination detects a skew, it sends feedback information to the source to change the transmission timing. The source performs this action by changing the transmission period.

(b) Decrease of Number of Media Streams Transmitted

The source decreases the number of media streams transmitted when the source detects that it is difficult for the destination to recover from asynchrony (Ishibashi & Tasaka, 1995; Ravindran & Bansal, 1993). For instance, in lip-sync, the source can stop the transmission of the video temporarily; when the source detects that the destination has recovered from asynchrony, the source restarts the transmission of the video.

Destination Control

(a) Reactive Skipping (Discarding) and Reactive Pausing (Repeating)

When the output timing of the current MU is late, the destination skips some succeeding MUs if the MUs arrives earlier (Ishibashi & Tasaka, 1995, 1998; Tasaka et al., 1996, 1997; Tasaka & Ishibashi,

1997, 1998a, 1998b; Correia & Pinto, 1995; Ravindran & Bansal, 1993; Anderson & Homsy, 1991; Li et al., 1992; Xie et al., 1996; La Corte, 1995; Taniguchi et al., 1996; Fadiga et al., 1998; Kato et al., 1997, 1998; Liu et al., 1996; Courtiat et al., 1996; Yoo, 1998; Yuang et al., 1999). We can also discard late MUs (Ramjee et al., 1994; Chen & Wu, 1996; Cen et al., 1995); however, discarding late MUs makes the average MU rate, which is defined as the average number of MUs output per second at the destination, decrease.

For MPEG video, the condition of picture skipping is changed depending on the picture type in (Tasaka et al., 1997). When the buffer starvation occurs, the destination pauses output of video MUs. This means that for video, the destination continues outputting the previous MU until the next MU becomes available. It is also possible to output other data at this time. These techniques are the most popular because their implementation is easy.

In (Yang, 2002), MUs with the same timestamp from different streams are regarded as a synchronous group. The output time of an MU of a stream is delayed until all the other MUs with the same timestamp from other streams as that of the MU have arrived. If MUs with the same timestamp from other streams do not arrive within the maximum allowable delay bound, the MUs are discarded.

(b) Virtual Time-Contraction and Time-Expansion

In (Ishibashi & Tasaka, 1995, 1998; Ishibashi et al., 1995, 1996; Tasaka et al., 1996, 1997; Tasaka & Ishibashi, 1997, 1998a, 1998b; Fadiga et al., 1998; Kato et al., 1997, 1998), the virtual time-contraction and time-expansion are realized in a form of modification of the target output time. In (Kato et al., 1997), the *slide control scheme*, which changes the amount of the modification of the target output time according to the extent of asynchrony, is proposed and applied to PHS (Personal Handy Phone System) (Kato et al., 1997, 1998). In (Anderson & Homsy, 1991), the Logical Time System (LTS) corresponds to the virtual-time. Only the virtual time-expansion is performed by stopping the LTS temporarily. The virtual time-expansion is also exploited in (Lamont et al., 1996) and (Jha & Fry, 1996). The set-back and advance operations of the PlayOut Clock in (Xie et al., 1996) correspond to the virtual time-expansion and time-contraction, respectively.

This technique differs from shortening and extension of output duration (common control - destination control (c)) in that the former indirectly changes the output timing by modifying the virtual-time (equivalently, resetting the origin of the time axis), while the latter directly does (that is, the origin of the time axis is kept the same).

(c) Master-Slave Switching

The roles of the master and slave streams can be changed dynamically under inter-stream synchronization control (Xie et al., 1996). When the amount of asynchrony for a slave stream becomes large, the destination switches the stream from slave to master and performs the appropriate adaptation. In (Ishibashi et al., 2003b), where voices and videos are output in a 3D virtual space, the master role is switched between media objects, each of which includes a voice and a video, according to the *global importance* of each media object. The global importance is determined by the positional relations among media objects, and it represents how strongly each object attracts observers' attention in a 3D virtual space.

The reactive control techniques are quantitatively compared in (Ishibashi et al., 2003a), where reactive discarding (Ishibashi et al., 2003a), reactive skipping (Ishibashi et al., 2003a), shortening and

extension of output duration (common control - destination control (c)), and virtual time-contraction and time-expansion (reactive control - destination control (b)) are handled. In (Ishibashi et al., 2003a), reactive discarding is different from reactive skipping in that the former deletes all late MUs, but the latter outputs even a late MU if there exists no MU which should be output.

Common Control

Source Control

(a) Source Skipping and Source Pausing

The source skips MUs or pauses output of MUs according to feedback information from the destination (Ishibashi & Tasaka, 1995; Ishibashi et al., 1996; Correia & Pinto, 1995; Ramanathan & Rangan, 1993; Zarros et al., 1996; Biersack et al., 1996; Rangan et al., 1996). It is also possible for the source to insert dummy (noise) data instead of skipping of the destination when the input rate is smaller than the output rate (Zarros et al., 1996). Note that the insertion of dummy data delays the output timing at the destination.

(b) Advancement of Transmission Timing with Network Delay Estimation

Either the source or destination estimates the network delay, and the source advances the transmission timing of MUs according to the estimates (La Corte et al., 1995; Ichikawa et al., 1996; Yamaoka et al., 1995). In order to advance the timing largely, the source may skip multiple MUs at a time. Thus, this technique can be used only for stored media. In the technique, high accuracy of delay estimation is required for high quality of synchronization.

The technique differs from deadline-based transmission scheduling (preventive control - source control (b)) in the following point: It dynamically schedules the transmission of MUs, while deadline-based transmission scheduling statically does. It is also different from adjustment of transmission timing (reactive control - source control (a)); the former schedules the MU transmission according to the network delay estimates, but the latter adjusts transmission of MUs according to the amount of skews.

(c) Adjustment of Input Rate

The source adjusts the clock frequency of input device (i.e., hardware input rate) according to the synchronization quality (Anderson & Homsy, 1991).

(d) Interpolation of Data

We can interpolate data to adjust the effective input rate (Anderson & Homsy, 1991) without changing the actual input rate.

(e) Media Scaling

Media scaling (Delgrossi et al., 1994), which is a type of traffic control, such as dynamic resolution control (Tasaka et al., 1997; Tasaka & Ishibashi, 1998; Fadiga et al., 1998; Katsumoto et al., 1996) of video is carried out depending on network loads. In the dynamic resolution control, the temporal, spatial,

and/or SNR (Signal to Noise Ratio) resolution of video (Wakamiya et al., 1996) is changed according to the network loads. The temporal resolution control can be considered as a kind of source skipping (common control - source control (a)). The technique may be able to include decrease of the number of media streams transmitted (reactive control - source control (b)). In this chapter, the word 'media scaling' is used in the case where the number of sub-streams in a single media stream is changed.

(f) Dynamic Local Lag

Dynamic local lag (Sithu et al., 2013) can be used to synchronize local information with received information at each terminal. The technique dynamically changes the value of local lag according to the network delay from the other terminal to the local terminal.

(g) Selection of Adequate Path

The source selects an adequate path to transmit media streams by taking account of the bandwidth requirements and synchronization requirements. In (Zimmermann & Liang, 2008) and (Huang et al., 2011), the technique is classified as the network control.

Destination Control

(a) Adjustment of Output Rate

The clock frequency of output device (i.e., hardware output rate) is adjusted according to the synchronization quality (Anderson & Homsy, 1991). In (Yuang et al., 1999) and (Liang et al., 1998), the destination dynamically changes the output rate depending on the length of the queue waiting for output.

(b) Interpolation of Data

We can interpolate data to adjust the effective output rate (Anderson & Homsy, 1991) without changing the actual output rate.

(c) Shortening and Extension of Output Duration

In the reactive shortening and extension, the destination shortens or extends the output duration of each MU until the recovery from asynchrony (Ishibashi & Tasaka, 1995, 1998; Ishibashi et al., 1995, 1996; Tasaka et al., 1996, 1997; Tasaka & Ishibashi, 1997; 1998a, 1998b; Cuevas et al., 1993; Correia & Pinto, 1995; Fadiga et al., 1998; Kato et al., 1997, 1998; Yoo, 1998; Kouvelas et al., 1996; Moon et al., 1998). The purpose is to recover from asynchrony gradually without large degradation of the output quality (that is, the graceful recovery scheme). The preventive shortening shortens the buffering time which has been extended by the preventive extension (Minezawa et al., 2007). The output duration of each MU is shortened or extended according to the number of MUs in the buffer. Preventive and reactive extension leads to pausing output of MUs, and shortening of the output duration of MUs includes fast-forwarding (without skipping) of MUs.

This technique can also be used to adjust the output timing of a media stream to that of another stream. For voice, we can make use of the silence period of voice to shorten or extend the output duration of MUs.

Comparison Among Algorithms

In Tables 1, and 2, we make a comparison among the algorithms for intra-stream and/or inter-stream synchronization control in (Ishibashi & Tasaka, 1995, 1998; Ishibashi et al., 1995, 1996; Zimmermann & Liang, 2008; Huang et al., 2011; Ali et al., 2000; Boukerche & Owens, 2005; Lamont et al., 1996; Baqai et al., 1996; Tasaka et al., 1996, 1997; Tasaka & Ishibashi, 1997, 1998a, 1998b; Little & Kao, 1992; Daami & Georganas, 1997; Kohler & Muller, 1994; Ramjee et al., 1994; Cuevas et al., 1993; Correia & Pinto, 1995; Zhang et al., 2002; Ravindran & Bansal, 1993; Anderson & Homsy, 1991; Li et al., 1992; Xie et al., 1996; La Corte et al., 1995; Taniguchi et al., 1996; Fadiga et al., 1998; Kato et al., 1997, 1998; Liu et al., 1996; Courtiat et al., 1996; Yoo, 1998; Yuang et al., 1999; Chen & Wu, 1996; Cen et al., 1995; Yang, 2002; Ramanathan & Rangan, 1993; Zarros et al., 1996; Biersack et al., 1996; Rangan et al., 1996; Ichikawa et al., 1996; Yamaoka et al., 1995; Katsumoto et al., 1996; Sithu et al., 2013, 2014a, 2014b, 2014c; Liang et al., 1998; Kouvelas et al., 1996; Moon et al., 1998), as in (Ishibashi & Tasaka, 2000) in terms of the following six factors; clocks, stored or live media, intra-stream and/or inter-stream synchronization control, master-slave relation, source or destination (location), and synchronization control techniques. Note that the algorithms in (Zimmermann & Liang, 2008; Huang et al., 2011; Ali et al., 2000; Boukerche & Owens, 2005; Zhang et al., 2002; Yang, 2002; Sithu et al., 2013, 2014a, 2014b, 2014c) are newly included in this chapter; that is, they are not handled in (Ishibashi & Tasaka, 2000).

1. **Clocks:** This factor denotes whether clocks are *globally synchronized clocks* or not. If the current local times have the same value and if the clock ticks have the same advancement, they are called globally synchronized clocks, which make synchronization algorithms simpler. If the advance of the clock tick at each source or destination is different from that of the others, or if the current local times are different from each other, we refer to the clocks as *locally available clocks*. To adjust the clocks, we need some protocol such as the Network Time Protocol (NTP) (Mills, 1991). Using NTP, we can adjust the clocks to each other within a few milliseconds. We can further improve the accuracy by using the Global Positioning System (GPS) (Mcneff, 2002).
2. **Stored or live media:** This factor denotes which of stored or live media are dealt with in each algorithm. Stored media are saved in storage devices in advance. Thus, we can tolerate network delays to some extent for stored media. On the other hand, live media have severe time constraints from the generation time of an MU to the output time of the MU. The joint synchronization scheme, which is described in Subsection titled "Group synchronization control", handles both stored and live media.
3. **Intra-stream and/or inter-stream synchronization control:** By this factor, we show if each algorithm performs only intra-stream synchronization control, or both intra-stream and inter-stream synchronization control.
4. **Master-slave relation:** This shows whether there are the master-slave relations among media streams.
5. **Source or destination (location):** The location at which the media synchronization control is carried out is denoted by this factor.
6. **Synchronization control techniques:** This factor denotes which kinds of techniques are used in each algorithm. Since the basic control techniques are employed in almost all the algorithms, we here focus on the preventive, reactive, and common control techniques.

Table 1. Comparison among media synchronization algorithms (1/3)

Algorithm	Clocks	Stored/ Live	Intra/Inter	Master-Slave	Source/ Destination	Techniques
ACME (Anderson & Homsy, 1991)	global	Stored, live	intra, inter	master-slave, no relation		reactive skipping, reactive pausing, virtual time-expansion, adjustment of input/output rate, interpolation of data

GROUP SYNCHRONIZATION CONTROL SCHEMES

Hereafter, we explain three schemes for group synchronization control: The master-slave destination scheme (Ishibashi et al., 1997), the synchronization maestro scheme (Ishibashi & Tasaka, 1997), and the distributed control scheme (Ishibashi & Tasaka, 1999). The three schemes are based on the Virtual-Time Rendering (VTR) media synchronization algorithm to determine the output timing of each MU so that the timing can be the same at all the destinations. We also discuss the merits and demerits of the three schemes as in (Ishibashi & Tasaka, 1999). In this section and in section titled "Media synchronization in joint musical performance", we assume that clocks at sources and destinations are globally synchronized.

Master-Slave Destination Scheme

In the synchronization model of the master-slave destination scheme, there are M (≥ 1) sources and N (≥ 2) destinations which are connected through a network as shown in Figure 5, where relation 1 in Figure

Table 3. Comparison among media synchronization algorithms (3/3)

Algorithm	Clocks	Stored/ Live	Intra/ Inter	Master/ Slave	Source/ Destination	Techniques

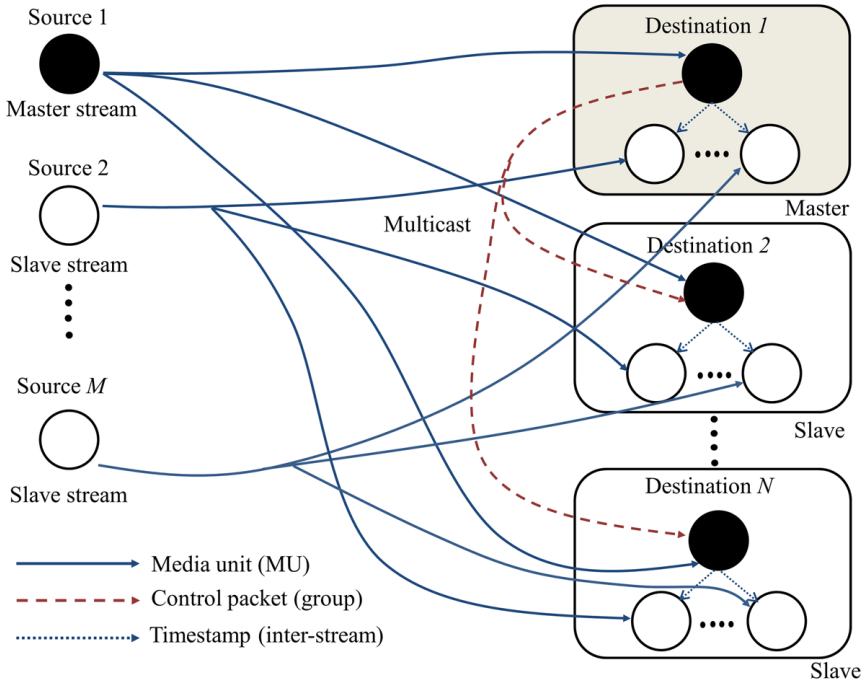
*1 This technique is employed at an intermediate network between the source and destination.

3 (a) is used. Source i ($i = 1, 2, \ldots, M$) distributes MUs of stream i to all the destinations by multicasting. Each MU includes the timestamp, which indicates the generation time of the MU. The streams can be classified into two types; a master stream and slave streams. At destination j ($j = 1, 2, \ldots, N$), the slave streams are synchronized with the master stream according to the timestamps. The destinations are also grouped into a master destination and slave destinations. The master destination may be supposed to be a chairperson's terminal in multimedia conferencing or a teacher's one in distance learning. The slave destinations need to output MUs at the same timing as the master destination in order to get synchronization among the destinations; that is, the slave destinations have to advance the MU output timing as well as to delay it according to the status of the master destination. Group synchronization can be achieved by adjusting the output timing of the master MUs at the slave destinations to that at the master destination. The master destination multicasts a control packet that includes the output time of

Figure 5. Model of master-slave destination scheme



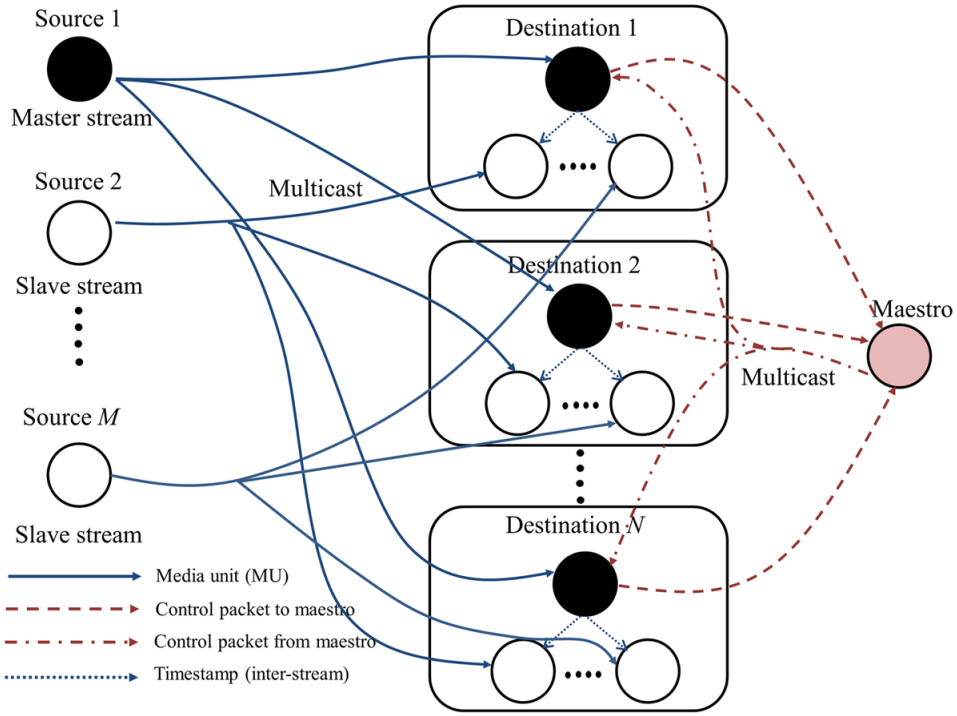
its first MUs to the slave destinations. In addition, when the target output time of the master destination is modified, the master destination notifies all the slave destinations of the modification by distributing a control packet which has the amount of time which has been modified and the sequence number of the MU at which the target output time has been changed. Using received control packets, each slave destination gradually adjusts its output timing of MUs.

If a terminal is a source as well as a destination in the master-slave destination scheme, we can use the local lag control (Mauve et al., 2004; Irie et al., 2009) to get the synchronization among the destinations. In this case, the local lag control can also be used in the synchronization maestro scheme and the distributed control scheme. Local lag control buffers local information for a constant time called the local lag (≥0 ms). We will explain details about the local lag control later.

Synchronization Maestro Scheme

In the synchronization maestro scheme, there are a synchronization maestro as well as *M* sources and *N* destinations, which are connected through a network as shown in Figure 6. The synchronization maestro can be chosen from among the sources and destinations. Each destination notifies the synchronization maestro of the information about its output timing. When the synchronization maestro receives the information about the output timing from each destination, it determines the *reference output timing* (that is, the reference value of the start time or modification time) and multicasts the information about the reference output timing to all the destinations. Each destination gradually adjusts its output timing to the reference output timing. This scheme is used for work in (Ishibashi et al., 2003, 2004; Ishibashi & Kaneoka, 2006; Hashimoto & Ishibashi, 2006; Huang et al., 2012). Two methods (*methods 1* and *2*)

Figure 6. Model of synchronization maestro scheme

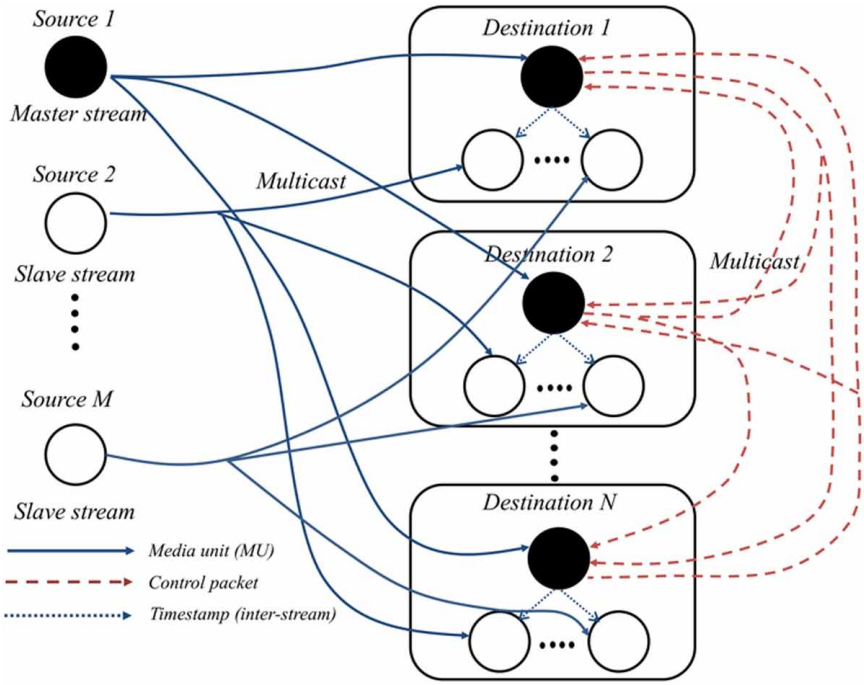


are used for determining the reference output timing in (Ishibashi et al., 2004). In method 1, the latest output timing is used (Ishibashi et al., 2003), and the earliest output timing is employed in method 2 (Ishibashi et al., 2004).

Distributed Control Scheme

The distributed control scheme does not need a centralized control terminal such as the master destination and the synchronization maestro in the master-slave destination scheme and synchronization maestro scheme, respectively (see Figure 7). All the destinations in a multicast group are treated equally. When each destination starts to output the first MUs or modifies the target output time, the destination notifies all the other destinations of the start time or the modification time by multicasting a control packet. Thus, each destination can know the output timing of all the other destinations. The destination determines the reference output timing of MUs from among the notifications. Then, it gradually adjusts its output timing to the reference one. This scheme is employed for work in (Huang et al., 2012; Kurokawa et al., 2007). The adaptive Δ-causality control (Ishibashi et al., 2007), which employs the local lag control and is usually used in networked real-time games, is similar to the distributed control scheme; the control can also be employed for group synchronization. There is at least the following difference between the distributed control scheme and the adaptive Δ-causality control; the former gradually adjusts the output timing at each destination to the reference output timing, but the latter changes the output timing at a time. When the network delays are different between the terminals, the control sets the local lag to the maximum network delay among the terminals (Ishibashi et al., 2007).

Figure 7. Model of distributed control scheme



Comparison of Group Synchronization Control Schemes

The control of the master-slave destination and synchronization maestro schemes is centralized in the master destination and the synchronization maestro, respectively. In such centralized control schemes, if the master destination or synchronization maestro becomes impossible of communications owing to some troubles, no destination is able to carry out the group synchronization control. On the other hand, in the distributed control scheme, even if some of the destinations break down, the other destinations can perform the group synchronization control. Thus, the distribution control scheme has higher reliability than the other two schemes.

The master-slave destination scheme lacks flexibility since the scheme always adjusts the output timing of the slave destinations to that of the master destination. It is suitable for applications in which a single destination has priority over the others. The synchronization maestro and distributed control schemes are more flexible than the master-slave destination scheme since the former two schemes can change how to determine the reference output timing. For instance, the schemes can behave like the master-slave destination scheme by selecting the reference output timing appropriately.

The control speed of group synchronization in the synchronization maestro scheme is slower than those in the other two schemes. The reason is that the former scheme transfers control packets among the destinations via the synchronization maestro, while the latter schemes directly transmits them among the destinations. Therefore, when the network delay is large, the synchronization maestro scheme is inferior to the other two schemes.

Regarding the control overhead, the number of control packets transmitted in the master-slave destination scheme is the smallest among the three schemes, and that in the distributed control scheme is the

largest. In the distributed control scheme, as the number of destinations in a multicast group becomes larger, the number of control packets largely increases. Thus, the scheme is not suitable for the case where the size of a multicast group is large.

The above comparison among the three schemes is qualitative. A quantitative comparison of the schemes is carried out in (Nunome & Tasaka, 2002). Simulation results show that the distributed control scheme provides the highest quality of group synchronization among the three schemes in heavily-loaded networks, while the other schemes can have almost the same quality as that of the distributed control scheme in lightly-loaded networks.

MEDIA SYNCHRONIZATION IN JOINT MUSICAL PERFORMANCE

In this section, we explain media synchronization control for joint musical performance. In joint musical performance, multiple users play their same or different types of musical instruments together. The joint musical performance can be classified into no-interactive performance and interactive performance. In the no-interactive performance, sounds which come from multiple sources are needed to be synchronized at each destination. In the interactive performance, each terminal needs to synchronize local sound with sounds received from the other terminals. We here propose new media synchronization control for the interactive performance, and we demonstrate the effectiveness of the control in a joint haptic drum system (Sithu & Ishibashi, 2013), where multiple users at different places play a drum set in a 3D virtual space by using their independent haptic interface devices.

No-Interactive Performance

Here, we introduce two types of media synchronization control. The first control was used at the opening ceremony of the Nagano Olympics (Yamakita et al., 1998). The second control was applied for a networked chorus to solve problems of the first control (Miyashita et al., 2011).

At the opening ceremony, a networked chorus "Ode to Joy" was carried out at five cities (New York, Beijing, Sydney, Berlin, and Cape Town) via satellites. In this case, there were a conductor, an orchestra, and a chorus group in Nagano, from which voices and video were sent to the five cities. Then, a chorus group in each city sang according to the standard timing shown by video and voice of the conductor. Finally, the voices and video of the conductor, orchestra, and chorus group of each point were received and output at Minami Nagano Stadium in Nagano, where the opening ceremony was held. Before the ceremony, the network delay between Nagano and each city was measured. Then, the largest network delay was chosen as the standard output timing of voice and video, and voices and videos generated at all the cities were output according to the standard output timing at Nagano. In this way, the synchronization of choruses was achieved. However, the method which determines the standard output timing in advance lacks flexibility for variation or jitter of the network delay. This means that when the arrival timing of media is later than the standard output timing, it is impossible to achieve synchronization of chorus; on the other hand, when the standard output timing is much later than the arrival timing of media, the real-time property is damaged.

To solve this problem, the group synchronization control can be applied to chorus with voice and video among multiple terminals. In (Miyashita et al., 2011), the group synchronization control is used to chorus with voice and video among multiple points. There are a terminal used by a conductor, who

shows the standard timing and sings a song, multiple terminals used by singers, who sing the song according to the standard timing, and a terminal used by a listener, who listens to the chorus. The synchronization among voices is achieved at the listener terminal. Voice is treated as a master stream, and video as a slave stream. The intra-stream synchronization control is carried out over voice and video, and the inter-stream synchronization control is carried out over video. At the listener terminal, the group synchronization control is carried out over voices. Virtual-Time Rendering (VTR) (Ishibashi et al., 2002) is used for the intra-stream and inter-stream synchronization control. At the listener terminal, the group synchronization control adjusts the output timing of MUs which are generated at the conductor and singer terminals. The synchronization maestro scheme is adopted for the group synchronization control. Assessment results show that the group synchronization control is effective for sound synchronization in no-interactive performance.

Interactive Performance

In order to get high quality of sound synchronization, we can use the local lag control (Mauve et al., 2004; Irie et al., 2009) in interactive performance. The control buffers local information for a constant time called the local lag in order to be synchronized with received information; thus, it degrades the interactivity. We here explain the conventional local lag control (Irie et al., 2009) and our new control called the dynamic local lag control (Sithu et al., 2013). We also present the dynamic local lag control for two or more terminals. It should be noted that each terminal behaves as a source and destination (see Subsection titled "Master-slave destination scheme"). Then, we illustrate the effect of the dynamic local lag control in joint haptic drum performance.

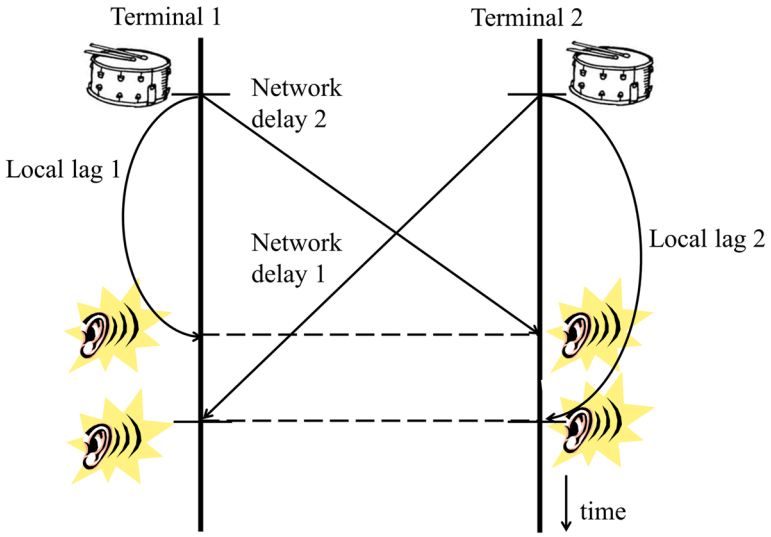
Conventional Local Lag Control

Under the conventional control between two terminals (*terminals 1* and *2*) (Irie et al., 2009), the local lag denoted by Δ ($\geq$0) ms is set to the same value as the network delay from the local terminal to the other terminal. Therefore, the interactivity is degraded when the network delay is large. High quality of sound synchronization can be achieved when the network delay from the local terminal to the other terminal is equal to that in the opposite direction (called the *symmetric delay case* here). In a network like the Internet, the network delay from the local terminal to the other terminal is usually different from that in the opposite direction (the *asymmetric delay case*). In this case, the quality of sound synchronization may be damaged (see Figure 8). In Figure 8, a user at terminal 1 hits a drum at the same time as a user at terminal 2. We call the network delay from terminal 2 to terminal 1 *network delay 1* and that from terminal 1 to terminal 2 *network delay 2*. Also, we call the local lag at terminal 1 *local lag 1* and that at terminal 2 *local lag 2*. Local lag 1 is set to the same value as network delay 2, and local lag 2 is equal to network delay 1. From Figure 8, we see that when network delay 1 is not equal to network delay 2, sound synchronization cannot be achieved at each terminal; that is, each user hears sound twice.

Dynamic Local Lag Control

To solve the problems of the local lag control, we propose the dynamic local lag control (Sithu et al., 2013). The dynamic local lag control dynamically changes the value of Δ according to the network delay from the other terminal to the local terminal. It should be noted that the direction of network delay is

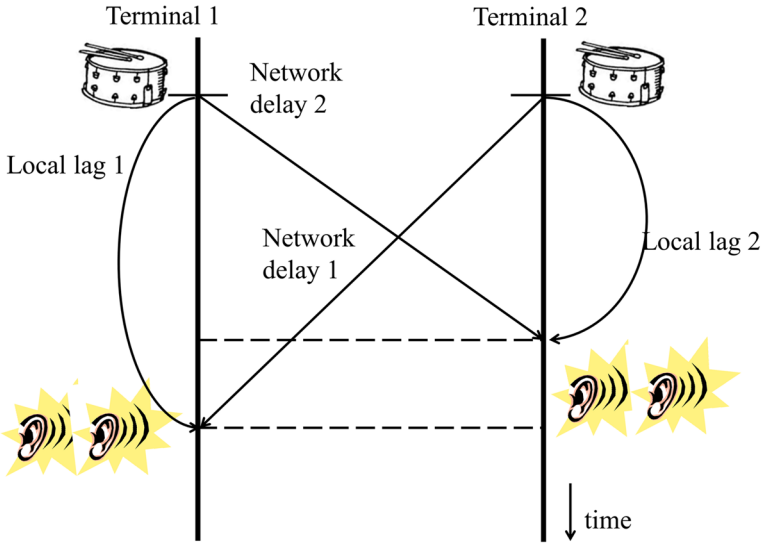
Figure 8. Asynchronization of sound under conventional local lag control



different from that in the conventional local lag control. In Figure 9, where local lag i ($i = 1$ or 2) is set to the same value as network delay i, we see that sound synchronization can be achieved at each terminal; that is, each user hears sound only once. Networks delays 1 and 2 are equal to those in Figure 8. In the dynamic local lag control, the value of Δ is set to the optimum value of local lag from the following equation (Sithu & Ishibashi, 2013):

$$\Delta = 0.637\, D + 6.578, \tag{1}$$

Figure 9. Synchronization of sound under dynamic local lag control



where D is the time interval (called the *MU delay* here) from the moment an MU is generated at the other terminal until the instant the MU is output at the local terminal.

The dynamic local lag control can be used for two or more terminals. The reader is referred to (Sithu et al., 2013) for the dynamic local lag control for two terminals. We here explain the key idea of the dynamic local lag control for three terminals (see Figure 10). We denote the MU delay from terminals i to j ($i, j = 1, 2,$ or 3) by Δ_{ij}. Also, we denote the local lag at terminal i by Δ_{ii}. For simplicity, let us focus on terminal 1. At terminal 1, Δ_{11} is set to the larger value of Δ_{21} and Δ_{31} according to the following equation: $\Delta_{11} = \max(\Delta_{21}, \Delta_{31})$. To synchronize the output time between received MUs, the additional buffering time is added to Δ_{j1} by $\Delta_{j1} - \Delta_{11}$ ($j = 2$ or 3); note that the additional buffering time of the larger one of Δ_{21} and Δ_{31} is zero. It is easy to obtain the control for more than three terminals.

We investigate the effect of the dynamic local lag control with prediction in the joint performance of the networked haptic drum system. As a result, we demonstrate that there exits the optimum value of prediction time according to the network delay. Based on this result, we propose the dynamic local lag control with dynamic control of prediction time, which dynamically changes the local lag and prediction time according to the network delay in the joint performance of the networked haptic drum system (Sithu et al., 2014a).

QoE Assessment of Dynamic Local Lag Control

In order to clarify effects of the dynamic local lag control, we make a comparison between the dynamic local lag control and the conventional local lag control, which has fixed values of local lag, by carrying out subjective QoE assessment on the quality of sound synchronization, interactivity, and comprehensive quality. The synchronization quality means how much simultaneously the sound of one user and that of the other user are outputted. The interactivity is the time difference from the moment a user hits a drum component until the instant the user hears a sound of the component. The comprehensive quality is the weighted sum of the synchronization quality of sound and interactivity; thus, the comprehensive quality is the most important. In the assessment, we use the networked haptic drum system for joint musical performance.

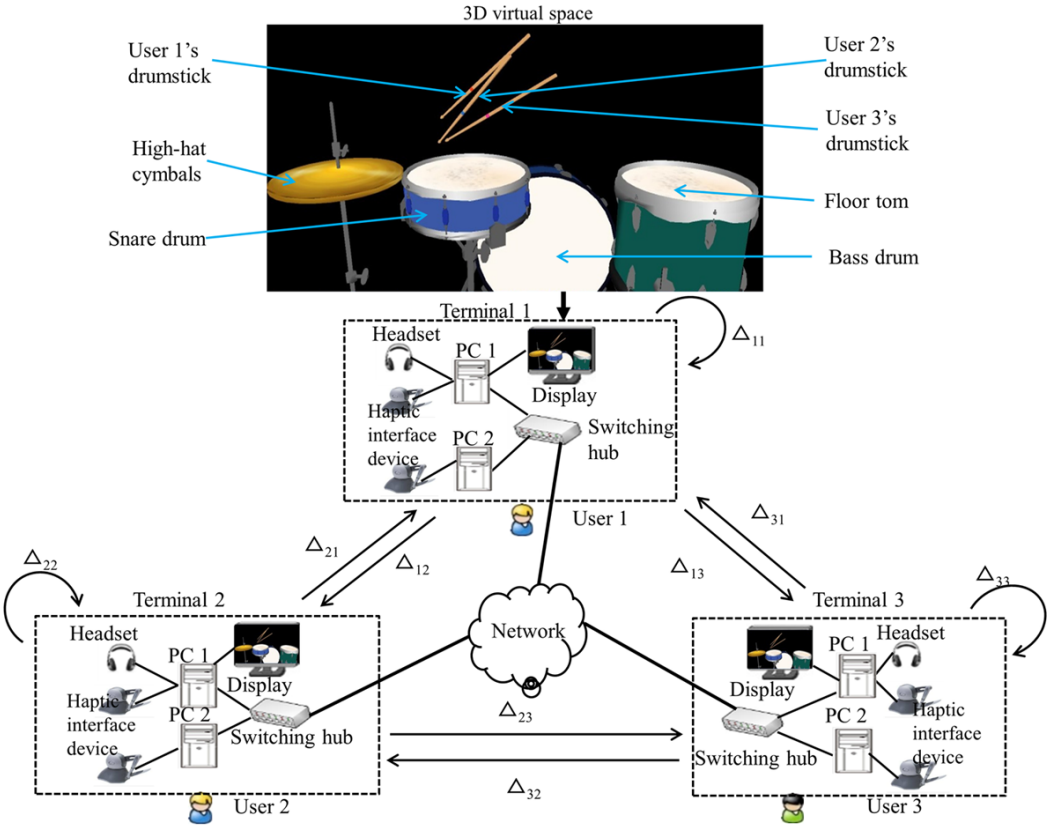
Networked Haptic Drum System

In the networked haptic drum system, users share a drum set which consists of high-hat cymbals, a snare drum, a bass drum, and a floor tom in a 3D virtual space as shown in Figure 10. We explain the networked haptic drum system for three terminals as shown in Figure 10. The system consists of three terminals (*terminals 1, 2,* and *3*), each of which has two PCs (*PCs 1* and *2*) connected to each other through an Ethernet switching hub (100 Mbps). Each PC has a haptic interface device (Geomagic Touch (Geomagic_ Touch, n.d.)). The two haptic interface devices at each terminal are used to move a pair of drumsticks in the virtual space. Also, a display and a headset are connected to PC 1 at each terminal. When each drumstick hits a drum component, the reaction force is perceived through the haptic interface device, and a sound depending on the drum component is generated (Sithu & Ishibashi, 2013).

Assessment Environment

In this subsection, we explain the assessment system of the dynamic local lag control between two terminals (see (Sithu et al., 2014c) for assessment among three terminals). In our assessment system, two

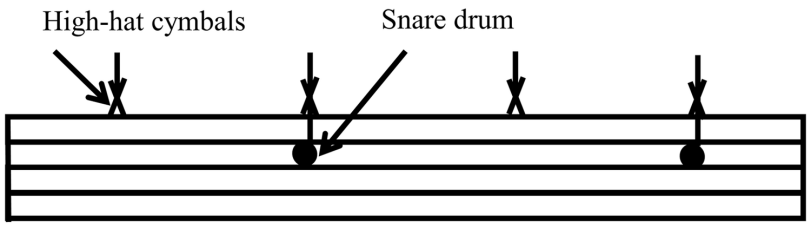
Figure 10. Configuration of networked haptic drum system



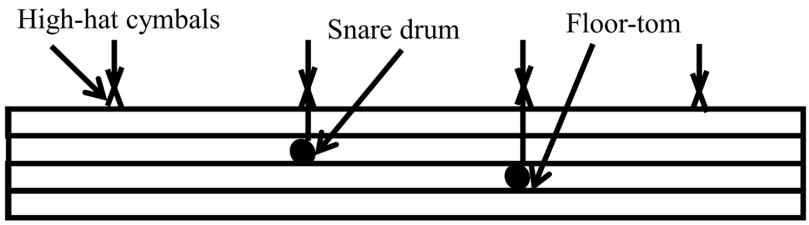
terminals (*terminals 1* and *2*) are connected to each other via a network emulator (NIST Net (Carson & Santay, 2003)) absorbed by buffering under media synchronization control, such as VTR (Ishibashi et al., 2002); we here take account of the jitter by including the buffering time in the constant delay. We handle the symmetric and asymmetric delay cases in the assessment. In the symmetric delay case, we set the constant delay (called *constant delay 1* here) from terminal 2 to terminal 1 to the same value as that (*constant delay 2*) in the opposite direction. In the asymmetric delay case, constant delay 1 is not equal to constant delay 2.

We carried out subjective QoE assessment with 16 subjects (males and females) whose ages were between 20 and 28. We employed two rhythms (*rhythms 1* and *2*) at two tempos (slow and fast) to investigate the influence of drumstick movements. In rhythm 1, each subject hits the high-hat cymbals by his/her left drumstick and the snare drum by his/her right one repeatedly (see Figure 11 (a)). The high-hat cymbals are hit at all the four beats, and the snare drum is done at the second and fourth beats. In rhythm 2, the subject plays the snare drum and floor tom by his/her right drumstick at the second and third beats, respectively, while hitting the high-hat cymbals by his/her left drumstick at all the times (see Figure 11 (b)). In rhythm 1, because the subject hits the same drum components repeatedly, he/she does not need to move their drumsticks to the other drum components. On the other hand, in rhythm 2, he/she needs to move the right drumstick between the snare drum and the floor tom. Rhythm 2 is more difficult than rhythm 1 since each subject needs to move one of his/her drumsticks between the two dif-

Figure 11. Two rhythms



(a) Rhythm 1



(b) Rhythm 2

ferent drum components. The rhythms are used in 8 beats or 4 beats rhythms and popular in jazz and rock music (Music_Tempos, n.d.). As for the slow and fast tempos, each subject hits the drum set at 60 beats per minute (bpm) and 100 bpm, which are often used in fast ballads and slow rock music, respectively (Music_Tempos, n.d.). In the assessment, constant delays 1 and 2, local lags 1 and 2, and the two types of control (i.e., the dynamic local lag control and the conventional local lag control) were selected in random order for each pair of subjects. In the symmetric delay case, we changed constant delays 1 and 2 from 0ms to 150ms at intervals of 50ms in both types of control. In the conventional local lag control, we set local lag 1 to the same value as local lag 2, and the values were set to 0ms, 50ms, 75ms, 100ms, and 150ms. In the dynamic local lag control, the value of local lag was dynamically changed according to Eq. (1). In the asymmetric delay case, we carried out the assessment for several combinations of constant delays 1 and 2 (50ms and 0ms, 100ms and 0ms, 150ms and 0ms, and 100ms and 50ms).

It took 30 seconds for each stimulus. After each stimulus, the pair of subjects were asked to base their judgments about the synchronization quality of sound, interactivity, and comprehensive quality based on the five-grade quality scales (5: Excellent, 4: Good, 3: Fair, 2: Poor, 1: Bad). Each subject gave a score from 1 through 5 to each stimulus. By averaging scores of all the subjects, we obtained the mean opinion score (MOS) (ITU-R BT. 500-12, 2009) as a subjective QoE parameter.

Assessment Results

Figure 12 shows the notation employed in Figures 13 through 15. As an example of assessment results of symmetric delay case, we show MOS values of comprehensive quality for various values of local lag as a function of constant delay in Figure 13. For the asymmetric delay case, we plot MOS values of comprehensive quality at terminals 1 and 2 in Figures 14 and 15, respectively, for four combinations of constant delays (constant delay 1: 0 ms, 50 ms, 100 ms, and 150 ms; constant delay 2: 0 ms). In the figures, we show only MOS values of rhythm 1 at the slow tempo. We do not show MOS values of

Figure 12. Notation in Figures 13 through 15

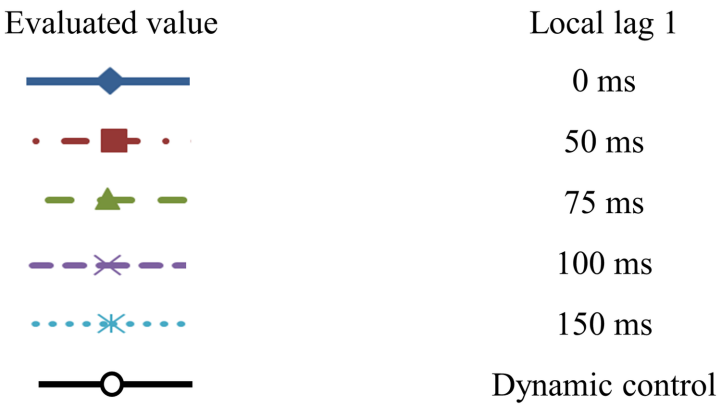


Figure 13. MOS of comprehensive quality for rhythm 1 at slow tempo in symmetric delay case

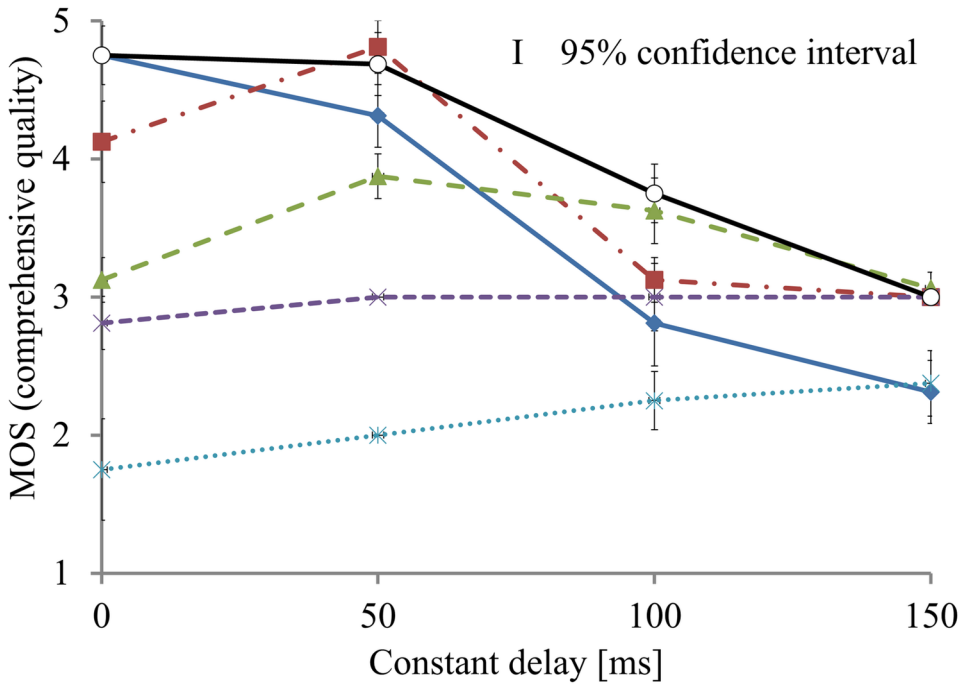

rhythm 2 at the fast tempo because they had similar tendencies to those in Figures 13 through 15 (Sithu et al., 2014b). The 95% confidence intervals are also plotted in the figures.

In Figure 13, we see that the MOS value of the dynamic local lag control is the highest or second highest for each constant delay. We also confirm that there exists the optimum local lag for each constant delay when the local lag is fixed. From the figure, we find that the optimum local lag is the same as the constant delay when the constant delay is smaller than or equal to about 100 ms, but it is smaller than the constant delay when the constant delay is larger than about 100 ms. The reason is that the quality of sound synchronization becomes higher as the difference between the local lag and constant delay

Figure 14. MOS of comprehensive quality at terminal 1 for rhythm 1 at slow tempo in asymmetric delay case (constant delay 1: 0 ms, 50 ms, 100 ms, and 150 ms; constant delay 2: 0 ms)

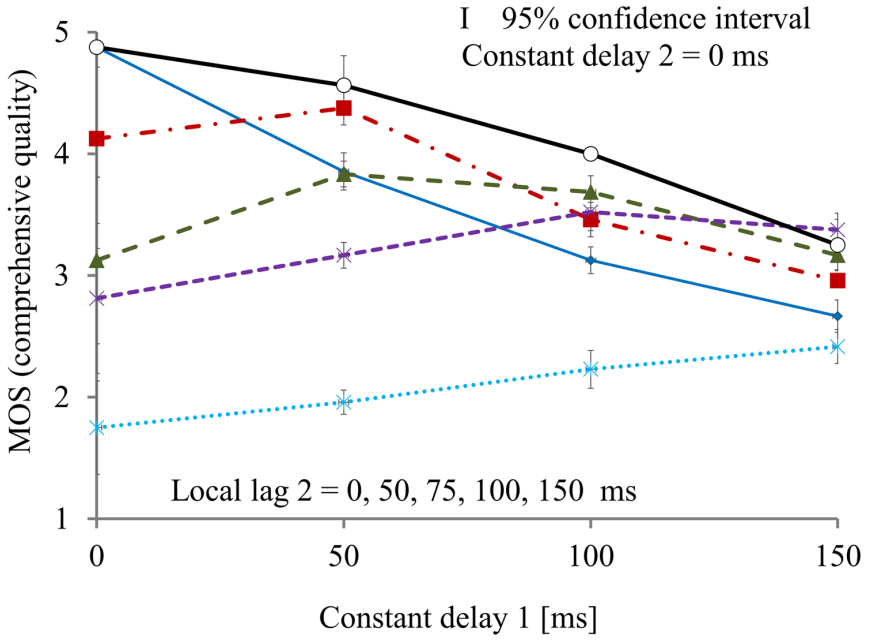

Figure 15. MOS of comprehensive quality at terminal 2 for rhythm 1 at slow tempo in asymmetric delay case (constant delay 1: 0 ms, 50 ms, 100 ms, and 150 ms; constant delay 2: 0 ms)

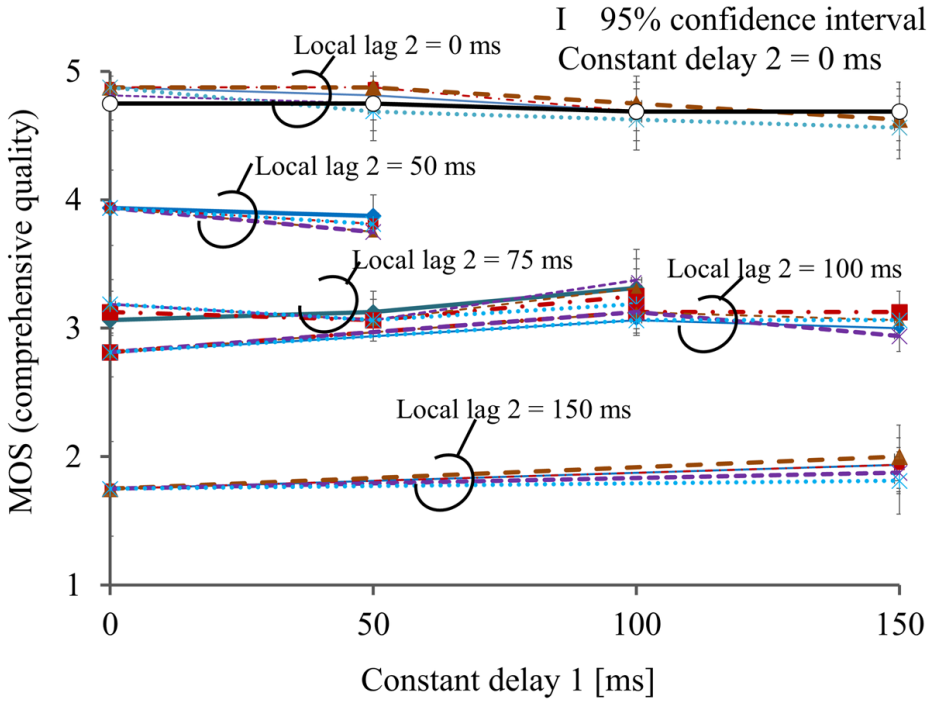

becomes smaller, and the interactivity is more largely deteriorated as the local lag becomes larger. We further note in the figure that the MOS value at the optimum local lag tends to decrease as the constant delay becomes larger.

In Figure 14, we draw summarized MOS values for various values of local lag 2 since the differences among the values were very small. In the figure, we find almost the same tendencies as those in Figure 13. That is, the MOS value of the dynamic local lag control is the highest or second highest for each constant delay 1. Therefore, the dynamic local lag control is effective. Also, when local lag 1 is fixed, there exists the optimum local lag 1 for each constant delay 1, and the MOS value at the optimum local lag 1 tends to decrease as constant delay 1 becomes larger.

Figure 15 reveals that the MOS values of comprehensive quality at terminal 2 hardly depend on constant delay 1. We also see that the MOS value of the dynamic local lag control is the highest or second highest for each constant delay 1. We observe that the MOS values decrease as local lag 2 becomes larger; that is, local lag 2 of 0 ms has the highest MOS values. Furthermore, we find that there are not so much differences among the values of local lag 1.

From the above considerations, we can conclude that the dynamic local lag control is effective.

FUTURE RESEARCH DIRECTIONS

In the future directions of media synchronization control, we can take advantage of the interdependency among multiple media streams which is called *mutually-compensatory property* in (Tasaka & Ishibashi, 2002). Media streams may be able to compensate for each other from a perceptual point of view. For example, in a video telephone system, if the video quality is low, the overall quality can be kept by improving the voice quality. To this purpose, we have to measure the human perception of mutually-compensatory property. The conventional media synchronization algorithms in (Ishibashi et al., 1997, 2004) take account of human perception of intra-stream and inter-stream synchronization errors (Steinmetz, 1996; Murray et al., 2013; Ishibashi et al., 2014; Zeng et al., 2013) but not mutually-compensatory property. Therefore, we need new media synchronization algorithms by taking advantage of the property. We further need to continue our survey since the research area is still growing and new media synchronization control techniques may be found in the future.

CONCLUSION

In this chapter, we explained three types of media synchronization control in multimedia communication: Intra-stream synchronization control, inter-stream synchronization control, and group synchronization control. We made a survey of control techniques used in a variety of media synchronization algorithms and classify the techniques into four categories: basic control, preventive control, reactive control, and common control. We made a comparison among the algorithms in terms of six factors: Clocks, stored or lived media, intra-stream and/or inter-stream synchronization, master-slave relation, source or destination (location), and synchronization control techniques. Also, we explained group synchronization control schemes and made a qualitative comparison of the schemes. Furthermore, we proposed a new control called the dynamic local lag control in joint musical performance. As a result of QoE assessment, we found that the dynamic local lag control is effective.

ACKNOWLEDGMENT

The authors thank Prof. Norishige Fukushima for his valuable discussion.

KEY TERMS AND DEFINITIONS

Adaptive Δ-Causality Control: The control employs the local lag control and is usually used in networked real-time games. When the network delays are different among terminals, the control dynamically changes the local lag to the maximum network delay among the terminals.

Basic Control Techniques: The techniques are required in almost all the algorithms, and they are indispensable to preserve temporal relationships among media streams.

Common Control Techniques: The techniques can be used as both preventive and reactive control ones.

Dynamic Local Lag Control: The control synchronizes local information with received information at each terminal by changing the local lag dynamically according to the network delay from the other terminal to the local terminal.

Group Synchronization Control: The control outputs each media steam simultaneously at different destinations in multicast communication.

Inter-Stream Synchronization Control: The control keeps temporal relationship among multiple media streams.

Intra-Stream Synchronization Control: The control preserves the timing relation in a single media stream.

Local Lag Control: The control buffers local information for a constant time called the local lag ($\geq$0ms) according to the network delay from the local terminal to the other terminal. It should be noted that the direction of the network delay under the local lag control is different from that under the dynamic local lag control.

Mean Opinion Score (MOS): MOS is the average score of all subjects in a subjective assessment.

Media Synchronization Control: The control adjusts the output timings of media streams to achieve high quality of media synchronization.

Preventive Control Techniques: The techniques are required to avoid asynchrony before it occurs.

Quality of Experience (QoE): QoE is the quality of an application or service experienced by end-users, and it is also called the user-level QoS (Quality of Service). A typical example of QoE measures is MOS.

Reactive Control Techniques: The techniques are employed to recover from asynchrony after it has occurred.

This research was previously published in Emerging Research on Networked Multimedia Communication Systems edited by Dimitris Kanellopoulos, pages 25-61, copyright year 2016 by Information Science Reference (an imprint of IGI Global).
