Emerging Trends

Preface

The constantly changing landscape of Digital Multimedia makes it challenging for experts and practitioners to stay informed of the field's most up-to-date research. That is why Information Science Reference is pleased to offer this three-volume reference collection that will empower students, researchers, and academicians with a strong understanding of critical issues within Digital Multimedia by providing both broad and detailed perspectives on cutting-edge theories and developments. This reference is designed to act as a single reference source on conceptual, methodological, technical, and managerial issues, as well as to provide insight into emerging trends and future opportunities within the discipline.

Digital Multimedia: Concepts, Methodologies, Tools, and Applications is organized into six distinct sections that provide comprehensive coverage of important topics. The sections are:

1. Fundamental Concepts and Theories;
2. Development and Design Methodologies;
3. Tools and Technologies;
4. Utilization and Applications;
5. Organizational and Social Implications; and
6. Emerging Trends.

The following paragraphs provide a summary of what to expect from this invaluable reference tool.

Section 1, "Fundamental Concepts and Theories," serves as a foundation for this extensive reference tool by addressing crucial theories essential to the understanding of Digital Multimedia. Introducing the book is "Terms of the Digital Age: Realities and Cultural Paradigms" by Kimberly N. Rosenfeld, a great foundation laying the groundwork for the basic concepts and theories that will be discussed throughout the rest of the book. Section 1 concludes, and leads into the following portion of the book, with a nice segue chapter, "Security in Digital Images: From Information Hiding Perspective" by Mohammed A. Otair.

Section 2, "Development and Design Methodologies," presents in-depth coverage of the conceptual design and architecture of Digital Multimedia. Opening the section is "Media Literacy in the Digital Age: Literacy Projects and Organizations" by Amir Manzoor. Through case studies, this section lays excellent groundwork for later sections that will get into present and future applications for Digital Multimedia. The section concludes with an excellent work by Regner Sabillon, Jordi Serra-Ruiz, Victor Cavaller, and Jeimy J. Cano, "Digital Forensic Analysis of Cybercrimes: Best Practices and Methodologies."

Section 3, "Tools and Technologies," presents extensive coverage of the various tools and technologies used in the implementation of Digital Multimedia. The first chapter, "Making It for the Screen: Creating Digital Media Literacy" by Paul Chilsen, lays a framework for the types of works that can be

found in this section. The section concludes with "Video Authentication: An Intelligent Approach" by Saurabh Upadhyay, Shrikant Tiwari, and Shalabh Parashar. Where Section 3 described specific tools and technologies at the disposal of practitioners, Section 4 describes the use and applications of the tools and frameworks discussed in previous sections.

Section 4, "Utilization and Applications," describes how the broad range of Digital Multimedia efforts has been utilized and offers insight on and important lessons for their applications and impact. The first chapter in the section is "Young Children and Digital Media in the Home: Parents as Role Models, Gatekeepers, and Companions" written by Patricia Dias. This section includes the widest range of topics because it describes case studies, research, methodologies, frameworks, architectures, theory, analysis, and guides for implementation. The breadth of topics covered in the section is also reflected in the diversity of its authors, from countries all over the globe. The section concludes with "Digital Media Affecting Society: Instruction and Learning" by Terry Cottrell, a great transition chapter into the next section.

Section 5, "Organizational and Social Implications," includes chapters discussing the organizational and social impact of Digital Multimedia. The section opens with "What Does Digital Media Allow Us to 'Do' to One Another?" by Donna E. Alvermann, Crystal L. Beach, and George L. Boggs. This section focuses exclusively on how these technologies affect human lives, either through the way they interact with each other or through how they affect behavioral/workplace situations. The section concludes with "Reflecting Emerging Digital Technologies in Leadership Models" by Peter A. C. Smith and Tom Cockburn.

Section 6, "Emerging Trends," highlights areas for future research within the field of Digital Multimedia, opening with "Trends in Managing Multimedia Semantics" by Roberto Poli, Achilles Kameas, and Lambrini Seremeti. This section contains chapters that look at what might happen in the coming years that can extend the already staggering amount of applications for Digital Multimedia. The final chapter of the book looks at an emerging field within Digital Multimedia, in the excellent contribution, "Media Synchronization Control in Multimedia Communication" by Mya Sithu and Yutaka Ishibashi.

Although the primary organization of the content in this multi-volume work is based on its six sections, offering a progression of coverage of the important concepts, methodologies, technologies, applications, social issues, and emerging trends, the reader can also identify specific contents by utilizing the extensive indexing system listed at the end of each volume. As a comprehensive collection of research on the latest findings related to using technology to providing various services, *Digital Multimedia: Concepts, Methodologies, Tools, and Applications* provides researchers, administrators, and all audiences with a complete understanding of the development of applications and concepts in Digital Multimedia. Given the vast number of issues concerning usage, failure, success, policies, strategies, and applications of Digital Multimedia in countries around the world, *Digital Multimedia: Concepts, Methodologies, Tools, and Applications* addresses the demand for a resource that encompasses the most pertinent research in technologies being employed to globally bolster the knowledge and applications of Digital Multimedia.

Section 1

Fundamental Concepts and Theories

Chapter 1
Terms of the Digital Age:
Realities and Cultural Paradigms

Kimberly N. Rosenfeld
Cerritos College, USA

ABSTRACT

This chapter defines terms of the digital age as they relate to digital media literacy. The changing landscape of society is demonstrated through the recalibration occurring in media processes and the cultural forms they generate. These conditions have fostered cultural paradigms unique to the digital age: paradigms aligned with either humanistic or capitalist perspectives, and marketing playing a role with respect to this tension. An analysis of two policies in the form of new curricula reveals that more must be done to prepare, protect, and empower a digitally literate citizenry. The chapter closes with an argument that the first step in this direction must involve both establishing digital media literacy as a discipline as well as deepening and extending current media literacy frameworks.

INTRODUCTION

As we entered the second decade of the twenty-first century, digital technology reached capabilities that opened a new era with its own ecosystem: an ecosystem that is dynamic by nature constantly rearranging, restructuring, expanding, and where new ideas sprout into startups that turn concepts into products. The unceasing innovation, shape-shifting, expansion of possibilities, and excitement around all things digital defines the digital age.

The frenetic rapidity of the information revolution has made defining digital-age terms an endless task. As soon as concepts are clarified, new ones emerge and others become obsolete. Therefore, it would be futile to concretize such terms. Instead, this chapter presents definitions as snapshots of the current times, acknowledging that the terms of the digital age can only be captured as they presently stand. In addition to clarifying ideas that are often confusing, this chapter will also engage the tangible, the intangible, and the barely perceptible aspects of digital life, with the goal of defining terms as they directly relate to digital media literacy. This will involve a journey that begins by establishing several foundational definitions and then moves on to discuss tangible artifacts and the cultural forms they en-

DOI: 10.4018/978-1-5225-3822-6.ch001

able. Next, the chapter critiques the monetization and manipulation efforts underway to push the digital media environment into becoming an integral part of capitalism, and it provides a response in the form of various theoretical frameworks designed to equip the digital citizenry. The chapter also explores the education policies that have been put into practice to implement digital media literacy through a comparison and analysis of two broad-scale curriculum changes in England and the United States. The chapter concludes with the recommendation that digital media literacy be recognized as a discipline as well as a set of skills and offers suggestions for strengthening digital media literacy frameworks.

DIGITAL MEDIA DEFINITIONS

Before defining *digital media literacy*, the notions of a *term* and of *digital media* require clarification. At the most fundamental level, a *term* is a word or phrase used to describe a thing or express a concept. The word *term* will be used here more broadly to refer to various phenomena of the digital age such as changes to culture, identity, and ontology. In *The Medium is the Massage* (1967/2005), McLuhan and Fiore define a *medium* as an extension of some human faculty, either psychic or physical. Their definition recognizes that media extend beyond physical artifacts and products to the less tangible realm of the mind and culture, areas that are examined in this chapter. The definition of *digital media* must begin with an understanding of the unique advantages of their digital nature. One advantage of *digital media* is their flexibility in communication due to their scalability: For example, digital media can be accessed with ease across devices and contexts through *video streaming*. Another advantage is the manner in which they are stored, either as encoded files (MP3 for sound or MP4 for multimedia), on servers (in the cloud), or streamed directly over the Web. Each of these methods provides for a more enduring medium and also makes the portable device a more entrenched actor in virtual life.

Digital environments, however, cannot be accurately characterized without paying careful attention to the multiple, overlapping realities in which the denizens of high-tech societies reside. *Real-life reality* is the world we live in when we are not logged in to cyberspace, while *virtual reality* is the reality associated with interacting in and through cyberspace. In its original conception, *virtual reality* referred to a virtual experience requiring the donning of equipment for moving within 3D virtual environments. This use of the term has largely evolved into references to cyberspace experiences. The idea of reality is further complicated by various interpretations of reality emerging from experiences in the virtual. Such interpretations are different in nature, as illustrated by *augmented reality* and *hyperreality*. Augmented reality is a composite presentation of real life augmented by virtual overlays, usually through a smartphone or tablet. Whereas, hyperreality is a psychological state involving virtual experiences that are perceived to be better than real life (Rosenfeld, 2015).

Conceptually, *digital media literacy* is approached quite differently among scholars; its conceptions vary from instrumental to psychological and sociocultural. In the following, multiple perspectives on the subject are introduced, drawing from important digital and media literacy thinkers, policy makers, and scholars. The Royal Society,[1] an independent body of research scholars composed of the UK's most renowned scientific thinkers (Stephen Hawking and Tim Berners-Lee are fellows) serves as a logical starting point, due to the work they have done on digital literacy. Since its inception in 1660, the Society's mission has been to recognize, promote, and support excellence in science and to encourage the development and use of science for the benefit of humanity. It is not surprising that these scholars use a

scientific perspective to present a definition of digital literacy in terms of instrumental computer skills rather than with reference to an academic discipline. Thus, for the Royal Society advisory group, digital literacy is analogous to the ability to read and write: As they report, it is a "basic skill or ability to use a computer confidently, safely and effectively, including: the ability to use office software such as word processors, email and presentation software, the ability to create and edit images, audio and video, and the ability to use a web browser and Internet search engines. These are the skills that teachers of other subjects at secondary school should be able to assume that their pupils have, as an analogue of being able to read and write" (2012, p. 17). Here digital literacy is described as a fundamental skill that is necessary for accessing all subjects across the curriculum. However, the group argues that digital literacy is not a "subject" in itself: "Neither are reading and writing—but [digital literacy] is an essential skill for all in the modern age" (2012, p. 24). In contrast, computer science is defined as a rigorous subject and discipline, just like mathematics and physics.

The Royal Society's Computing at School group characterizes a "discipline" as a subject that has five distinct attributes. First, it includes a body of knowledge, with widely applicable ideas and concepts as well as a theoretical framework into which these ideas and concepts fit. Second, it uses a set of rigorous techniques and methods to solve problems and to advance knowledge. Third, a discipline has a way of thinking and working that provides a perspective on the world that is distinct from the perspectives of other disciplines. Fourth, it has a stable set of concepts, meaning that a discipline does not "date" quickly. Although the subject advances, the underlying concepts and processes remain relevant and enlightening. Finally, a discipline exists independently of specific technologies, especially those that have a short shelf life (2012). Whether digital literacy counts as a discipline is largely dependent on the lens through which it is viewed. For example, cultural studies theorists take another approach and treat digital media literacy as both a skill and a discipline and add the word "media" to the discussion. Thereby, they refer to digital media literacy as opposed to digital literacy.

On another point, there is no clear agreement among scholars on the use of the term in a singular sense, *digital media literacy* versus a plural sense, *digital media literacies*. Nevertheless, all agree that digital literacy must include media and is therefore more than the ability to use a computer and access the Internet. Furthermore, some scholars discuss digital media literacy in the broader context of media literacy (see Gee, 2010; Pérez Tornero & Varis, 2010), while others draw a distinction between the two (see Buckingham, 2007; Hobbs, 2010). All agree, however, that there is an overlap. Media literacy scholars study how people can become more aware, critical, and mindful of the meanings they give to and get from media (Gee, 2010). They also believe that people can be manipulated by media messages and can use media to manipulate others. To decode messages, it is important to ask whose vested interests are represented and who we are led to believe benefits from the message (Gee, 2010). For Hoechsmann and Poyntz (2012), media literacy is "a set of competencies that enable one to interpret media texts and institutions, to make media of their own, and to recognize and engage with the social and political influence of media in everyday life" (p. 1). According to the National Association for Media Literacy Education (NAMLE),[2] media literacy is intended "to help individuals of all ages develop the habits of inquiry and skills of expression that they need to be critical thinkers, effective communicators, and active citizens in today's world" (2009, p. 1).

Media literacy theorist Douglas Kellner (1998) argues that to foster literacy in the technocultures of the past and the future, a postmodern pedagogy that involves developing multiple literacies in the interrelated areas of critical media literacy, print literacy, computer literacy, and multimedia literacy is needed. Kellner and Share (2007) use the term *critical media literacy* in a way that "expands the notion

of literacy to include different forms of mass communication and popular culture as well as deepens the potential of education to critically analyze relationships between media and audiences, information and power" (p. 4). Thus, for Kellner and Share, digital media literacy must also include a critical component.

Media scholar Henry Jenkins (2008) defines media literacies as "a set of cultural competencies and social skills that young people need in the new media landscape…. These skills build on the foundation of traditional theory, research skills, technical skills, and critical analysis skills taught in the classroom" (p. 6). Jenkins further explains that the traditional approach to media literacy is to address the politics of representation by teaching how to read through media-constructed stereotypes about race, class, sex, ethnicity, religion, and other forms of cultural differences (Jenkins, 2009). However, he acknowledges that in today's media landscape, students must also be taught awareness in relation to "participation" in media environments. Such skills are related specifically to the ability to listen and to respond to a range of different perspectives, defined in two ways: "first, as the ability to negotiate between dissenting perspectives, and second, as the ability to negotiate through diverse communities" (2009, p. 99). The work of Jenkins illustrates that digital media literacy training must also consider training in the area of audience participation.

Renee Hobbs, a prolific and well-regarded American media literacy scholar, defines digital and media literacy as "a constellation of life skills that are necessary for full participation in our media saturated, information-rich society" (2010, p. viii). For Hobbs, these skills include being able to make responsible choices and access information by locating and sharing materials, to analyze messages and create content in a variety of forms, to reflect on one's own conduct, and to take social action. Unique to Hobbs is the addition of "reflection" and "social action" as important elements of digital media literacy.

One of England's most renowned media literacy scholars, David Buckingham, emphasizes broad conceptual aspects of media literacy such as representation, language, production and audience. Although these were initially specific to the pre-Internet television era, Buckingham makes the case that they continue to be relevant in the digital age. For Buckingham, digital media literacy is one type of literacy added to an ever-growing list of other modern "literacies," including economic literacy, emotional literacy, and spiritual literacy (2007). He further argues that digital media literacy goes well beyond the basics of access and technical skill and must include the ability to critically evaluate and use information with the aim of transforming it into knowledge. For Buckingham, this means asking questions about "the source of that information, the interests of its producers, and the ways in which it represents the world; and understanding how these technological developments are related to broader social, political and economic forces" (2006, p. 267). Buckingham brings an acute knowledge of media grounded in his background in traditional media effects. Thus, he highlights the consideration of media sources and the interests of those producing it as components of digital media literacy.

A global, humanist perspective was brought to the digital media literacy discussion by a 2010, UNESCO study titled *Media Literacy and New Humanism*, by José Manuel Pérez Tornero and Tapio Varis. The study asserts that media literacy (which for the authors includes digital media literacy) should be grounded in a new critical media awareness that fosters use of the instruments, codes, and languages that enable information to be received, created, and disseminated. To accomplish this, instruction in media literacy should provide systems for evaluating and selecting information and foster critical views of technological development and media messages as well as their technological contexts. Furthermore, such media awareness must promote citizens' free expression with the goal of strengthening social communication and the right to make decisions autonomously. Finally, they argue that media awareness should foster exchange and mutual understanding among cultures and should stimulate the achievement of universal

rights as well as the acceptance of universal responsibilities. Clearly, digital media scholars view literacy to encompass a variety of practical, critical, and analytical skills.

This chapter uses "digital media literacy" in reference to the development of a unified set of critical, cultural competencies. This chapter also sets out to demonstrate that digital media literacy is both an academic discipline and a skill, as will be explained at the close of this chapter. In this fast paced digital age, media is taking on different forms, thus a discussion of how the digital has changed both media and society is in order to identify the relevance of digital media literacy skills.

Traditionally, the creation of any type of "media" required an exclusive infrastructure that encompassed all the necessary steps from its creation to its consumption. The news, movies, or TV series that were streamed into the home via radio waves were the result of a mechanism that needed to pass through codified stages of a highly bureaucratic process. The creation of content was accomplished using the tools of production under the watchful eye and control of studios, then the distribution step required affiliated local stations located across the country that could diffuse the program, and finally, access to and consumption of these programs were enabled by the television set itself an artifact positioned at the center of the home, the living room. The digital age has changed this infrastructure, rewriting the process from media creation to consumption with both simplicity and multiplicity. Shows are more simply distributed directly to the audience's cable box or modem via the Web. Additionally, the audience can now watch their favorite shows on multiple devices and in various contexts. What was once confined to the living room has extended to people watching at the park, in a car, on the street, at a restaurant, at sporting events, the contexts are endless. This transformation calls for a look at some of the ways that all things digital have affected production, distribution, and consumption habits.

MEDIA LITERACY CONSTRUCTS ALIGNED WITH THE DIGITAL WORLD

Production

The Internet cannot be accessed without tangible artifacts. These artifacts include the devices themselves (e.g., smartphones, laptops, tablets, gaming devices of various forms, and smartwatches) and the infrastructure that allows them to work (including cell towers, fiber optic cables, satellites, and computer programs such as Codec to encode and decode images and sound signals sent over digital data streams). The tangible also extends to sounds and design, for example, ringtones and computer user interfaces. To understand the nature and conditions of these twenty-first century artifacts, it is necessary to analyze their social, cultural, economic, environmental, aesthetic, global, and personal effects. In a book titled *The Ringtone Dialect: Economy and Cultural Form*, Sumanth Gopinath (2013) examines the cultural implications of the seemingly benign ringtone industry. Gopinath highlights important social and cultural issues related to the mobile industry including the musical labor force, ringtones as representations, the geographic dispersion of the political ringtone, as well as the ringtone's narrative functions in cinematic and televisual media. Similarly, Lisa Parks, professor of Film and Media Studies at the University of California, Santa Barbara, examines satellites as they relate to society and culture, including satellite economy, satellite espionage, and satellite images as an extension or another form of the televisual world. Parks recognizes that an entire field of satellite studies is possible, one that would examine satellites as exerting agency in a system of global power relations (Parks, 2005). Gopinath's and Parks' work point to the reality that artifacts of the digital age are tied to institutions, places, people, and agendas (Parks,

2005). The fact that the digital age includes unnoticed aspects of digital life, or, as Parks puts it, "barely perceptible" (2005, p. 5) features of the digital world, illustrates that the tangible and the intangible are not mutually exclusive. The relationship between tangible and intangible aspect of digital society is perhaps one area for which digital media literacy training is most needed.

As David Buckingham (2006) observed, digital media are not just about information hardware and software but also provide new ways of mediating and representing the world and of communicating. In essence, participation in the digital age also involves active engagement in the production process, for which the virtual world has provided a new terrain. The ease of use associated with recent iterations of the portable camera along with the availability of editing software and the ability to upload the result to a global audience have shifted a large part of media production from professionals to amateurs. Production now extends to the tools of the audience thereby changing both production and distribution practices.

Distribution

Social media provide an organic network for distribution to the mass population. As Jenkins noted, "if it doesn't spread, it is dead" (2013, p. 2) largely because social media tools have changed the nature of information dissemination from distribution to circulation. This represents a paradigm shift from pre-constructed message distribution to communities of people who shape, share, reframe, and remix media content in novel ways. Jenkins (1992, 2009) uses the term *participatory culture* to describe a culture in which fans and other consumers are invited to actively participate in the creation and circulation of new content. In essence, social media are self-propagating and provide an extreme level of exposure to a maximum number of global audiences in minimal time. The idea that media are now "spreadable" (Jenkins, 2013) also means that new social logics and cultural practices have enabled and popularized the new platforms.

Social media sites come in different shapes and forms: *Twitter, Vine, Instagram, and YouTube*. No two of these are alike; they are singular in their distinctive formats and use very specific types of medium as their forms of distribution: short texts for *Twitter,* short-form video clips for *Vine,* pictures for *Instagram,* and video clips of all forms for *YouTube.* Each, however, speaks to a particular audience and yields its own individual power in the war for viewership within an increasingly saturated media landscape. Such sites enable community building to the point that the passive consumer cannot help but be transformed into an active producer. Traditional models of production and marketing have had to respond to this change, as they are no longer able to control and manipulate public response as they once did. One area where the audience has taken the reins in influencing distribution is evident in the phenomenon known as *going viral*.

Going viral has been defined in many ways. Nahon and Hemsley (2013) describe going viral as "that which stands out as remarkable in a sea of content" (p. 2). Additionally, Boynton (2009) offers several ways to understand the term. On one interpretation, it applies to videos that are viewed many times, such as any video that has been viewed more than 100,000 times—although it should be noted that there is no exact number of views that determine virality. Another interpretation compares this phenomenon to the biological process behind an epidemic, where infection is spread through contact. In the digital age, this dissemination is triggered through posting to a social network. It starts with a few who are infected coming into contact with others and infecting them, and so on. A third interpretation of *going viral* is a

functional one described in terms of a sigmoid curve, which is a mathematical function having an "S" shape. Something that is going viral begins small and expands over time, such as videos or images that are initially shared among a few individuals and then expand to wider audiences (Boynton, 2009). At the heart of virality lie both the ability and the decision to share information (Nahon & Hemsley, 2013). The act of sharing has also changed the nature of oppositional movements, as seen in the cases of the activist group Anonymous (Olson, 2012), the 2010 Arab Spring Movement (Aday, Farrell, Lynch, Sides, & Freelon, 2012), and the 2014 Hong Kong Protests (Cohen, 2014).

With the empowerment of the masses, as illustrated through the concept of *going viral*, the notion of *audience* has changed into a participant-recipient role. Therefore, the concept of an audience must include consideration of which "audience" along with each audience's unique perspective.

Audience

The ability to disseminate information to an individual site or to entire groups of people with the push of a single button has not only changed consumption, it has also changed the nature of business, marketing, politics, and a myriad of other social functions. The practice of "likes" and online "reviews" demonstrates that audience members are also influencers. A positive or negative rating on *Yelp* can make or break a business, just as a positive *Twitter* review of the Koji food truck in California ignited a food truck frenzy. The practice of rating turns social roles on their heads by creating a new breed of influencers, where not only is the customer a reviewer, but the provider is one as well. For example, drivers for the company *Uber* rate customers on a 1–5 scale. Customers with a score of 4.0, say, might find that drivers are not willing to pick them up (Ephron, 2014). Likewise, the site *Rate My Professor* allows students to rate their college professors on a 1–5 scale in the categories of easiness, helpfulness, clarity, and looks (called *hotness*). The site is so popular that students across the nation use the ratings as a factor in planning their college schedules (Robertson, 2006). Indeed, *The New York Times* reminds users that *Rate My Professor* has its own vocabulary, values, and idiosyncrasies and that success on the site is not necessarily a badge of honor; the top-rated professors on the site are not the top-rated professors in the nation, but only the top-rated professors on *Rate My Professor* (Heffernan, 2010).

The virtual world of likes and reviews has made the digital citizenry subject to both private and public comments as well as their dissemination, regardless of the citizen's social roles and perceived status. This same citizenry needs training in how to contribute to and take from such sites, beyond their face value. They need to understand the composition of a site's users, the complexity or simplicity on which they base their reviews, and the very abstract nature of "good" and "bad." They also need to understand the reality that such reviews can legally be manipulated, as happened during a case against *Yelp* when a federal appeals court ruled that *Yelp* could move or change ratings (The Associated Press, 2014). The idea of review bias applies not just to "likes," but also to the intentions and manipulations embedded within the communication itself.

The empowerment of individuals through digital media is an integral part of the digital landscape. Henry Jenkins (2008) discussed the agency exerted by online fan communities whose acts of sharing and recommending have created a new form of social and economic power. Jenkins aptly noted that "as soon as the conversation shifts to participation, cultural protocols and practices come to mind" (2008, p. 23). These shifts can best be understood through an analysis of modern-day cultural forms.

CULTURAL FORMS, CAPABILITIES, AND HABITS

Cultural Forms

The term *cultural forms* is used across numerous disciplines, including anthropology, cinema/film, literature, ethnic studies, feminist studies, and more, yet most writers use ostensive definitions (examples or demonstrations) rather than direct articulations of the concept. Thus, cultural forms will first be defined, then, they will be explained in the context of the digital age in general and digital media literacy in particular, and finally, their articulation with how they relate to understandings of digital media literacy will be clarified.

The idea of cultural forms can be traced back to the work of English anthropologist Edward Burnett Tylor. His landmark study *Primitive Culture: Researches into the Development of Mythology, Philosophy, Religion, Language, Art and Custom* (1871/2010) begins with the observation that "culture or civilization, taken in its wide ethnographic sense, is that complex whole which includes knowledge, belief, art, morals, law, custom and any other capabilities and habits acquired by man as a member of society" (2010, p. 1). Although Tylor did not use the term *cultural forms*, his description alludes to cultural forms as the components that make up the whole of a culture, including physical artifacts such as art but also extending to capabilities and habits that contribute to the creation of cultural norms and mores: knowledge, beliefs, morals, laws, and customs. Today, the term *cultural forms* is used to describe and represent numerous ideas and tangible artifacts of architecture, prose, verse, music, art, cinema, television, theater, novels, dance, and even food (MacGregor, 2012; Miller, 2002; Minett, 2014; Tietchen, 2014; Wee, 2012). The term has also been used in reference to diverse concepts such as modes of cultural practice (McLeod, 2012), species-specific behaviors (Sahlins, 2010), sites of struggle (Brooks, 1997), and cultural identifications and infrastructures (Danesi, 2013; Yamashiro, 2012).

Furthermore, cultural forms have been identified as polysemic vehicles for familial, economic, political, and cultural relationships and processes (Miller, 2002). For instance, modern-day gift giving now includes digital donations. The website *i-give* enables individuals to enroll in a program that allows a small portion of their payments for online purchases to be donated to a community of their choosing. The vision behind the website is to make all customer transactions benefit social causes that are close to home. Thus, the meaning of gift giving has shifted from something done between close friends and family members to a communal act of philanthropy. Similarly, college students are moving beyond the traditional methods of college funding (i.e., family, government, self) and using crowdsourcing software to fund tuition. Through sites like *GoFundMe*, individuals, as opposed to just recognized charities, can create profiles, explain what they are collecting funds for, and then spread the word through social networks. This brings new meaning to college funding, charity, and storytelling as a vehicle of persuasion (Carrns, 2014).

Tangible digital artifacts themselves are also polysemic, as perhaps best illustrated through the smartphone. The smartphone was initially intended to be solely a communication device, yet today it is a stand-alone game platform, a surrogate TV screen, an e-reader, and a payment device, to name just a few of its uses. The meaning of the smartphone has been extended so as to be associated with each of these new capabilities, whether professional or personal. Another layer of meaning that is projected to others concerns the type of smartphone one owns. The device can convey meanings associated with socioeconomic status, preferences in logic, and lifestyle.

Twentieth-century Welsh philosopher Raymond Williams reminds us "taking the theory of culture as a theory of relations between elements is a whole way of life. We need also, in these terms to examine the idea of an expanding culture, and its detailed processes. For we live in an expanding culture, yet we spend much of our energy regretting the fact, rather than seeking to understand its nature and conditions" (1958/1983, p. viii). This is the very idea that is captured in David Buckingham's recent suggestion that there is a whole range of contemporary forms of communication that require literacies (2006). Thus, to be clear, cultural forms of high-tech societies include not only the tangible artifacts of the digital world, but also the intangible areas of capabilities and habits. Furthermore, ideologies, struggles, polysemic interpretations, and symbol manipulations are embedded within each tangible artifact. Thus, cultural forms represent unsettled territory where meanings are created, changed, and fought over, especially as they relate to longstanding cultural practices that embody values, norms, and mores.

Capabilities and Habits

Turning now to the capabilities and habits of the digital age, it becomes clear that high-tech culture is changing cultural practices as well. With the expansion of communication outlets comes a broadening of real-life reality. For instance, representations now include high-resolution amateur videos captured using small wearable cameras (e.g., the GoPro). Such cameras allow individuals to capture life like never before by rigging a camera directly on the subject. This enables viewers to move beyond a spectator point of view and actually participate in an experience such as skydiving, surfing, or rising to the edge of space. Furthermore, drone images, as seen during the numerous US-led wars in the Middle East, have been dubbed *drone porn* for their wide-view detached shots of bombings as well as the startling graphic close-ups. These images have affected both civilian and military perceptions and experiences of war (Thompson, 2009). Televisual war spectacles also include Google Earth satellite images, where representations of global conflicts and crises are transforming views of these events (Parks, 2009). Such images extend to terrorist groups as well who regularly use the Internet to disseminate graphic videos of prisoner beheadings to incite fear and global intimidation.

The culture of the digital is creating a new form of personhood and multiculturalism, yet the changes are not the same for everyone. In order to map the impact of digital culture on individual identity, it is essential to understand levels of *digital immersion*, which is the breadth and depth of an individual's digital use and time spent in cyberspace. The present moment in history represents perhaps the greatest range with respect to immersion, as a Luddite may still be able to function without entering cyberspace (however, this possibility has been slowly dwindling and will soon be an impossibility). Therefore, the spectrum today begins with nonusers and slowly crescendos. There is the superficial user, one who enters cyberspace mainly to get things done (e.g., checking email, texting, light Internet surfing, shopping, and banking). The intermediate user is one who maintains a stronger presence in cyberspace such as hosting a blog, posting online reviews, and maintaining accounts on several social network sites. A deep user is one who builds and maintains online relationships (e.g., through multiplayer games, online interest groups, dating sites) and may even engage in cyberspace-enabled activities such as hacking or activism. These levels of digital immersion are ephemeral, as technology is moving at such a steady pace that most citizens will eventually find themselves intermediately or deeply immersed. It is not surprising that great strides are being made in the "Internet of Things," where home devices learn about and adapt to humans for their convenience, security, and energy saving. For example, there are thermostats that adjust based on the time one gets up in the morning and clothes dryers that adjust to cooler, slower drying cycles

during times of peak energy use (Lohr, 2014). There are also children's toys such as Crayola's Virtual Design Pro that combine the physical and virtual worlds by allowing children to physically create a car through drawing and coloring and then use a mobile app to import the car into cyberspace and then drive it in the virtual world ("Virtual Design," 2014).

Digital tools allow for new capabilities with direct social implications. A quick snapshot of behaviors around and through digital devices at the time of this chapter's writing reveals several rapidly changing cultural forms, such as *sexting* and the *selfie*. The practice of *sexting*[3] brings to light both the breadth and depth of new cultural practices. It should be noted that although adults and minors alike are implicated in the practice (Brown, Keller, & Stern, 2009; Chen & Hernandez, 2013; Linsey, 2013; Walker, Sanci, & Temple-Smith, 2011), sexting is primarily associated with minors (Brown et al., 2009; McEachern, McEachern-Ciattoni, & Martin, 2012), and it is practiced globally (e.g., in the United States, Australia, Canada, and Papua New Guinea). Sexting is so pervasive that it has reshaped thoughts, policies, and expert opinions about what constitutes normal sexual experimentation and development in the digital age (Brown et al., 2009). For instance, sex education in the digital world now includes smartphone apps that help youth resist sexting requests (Brown et al., 2009; Smith, 2014). Sexting has also expanded and reshaped what constitutes cyberbullying (Siegle, 2010), exploitation and self-objectification, especially of women (Brown et al., 2009), human rights ("PNG Constitutional," 2014), as well as child pornography and sex offender laws (Maddocks, 2014).

Sexting can be considered as a subphenomenon of a larger one known as the *selfie*, as sexting involves self-portraits that are shared online. In 2013, the Oxford Online Dictionary designated *selfie* as the word of the year, defining it as "a photograph that one has taken of oneself, typically one taken with a smartphone or webcam and uploaded to a social media website" ("Selfie Named," 2013). The concept of the selfie and the generation it represents is an "old practice" rediscovered: the control of one's own image. In an interview with the *Sunday Star-Times*, Rex Armstrong, the director of a New Zealand art gallery featuring a selfie exhibit, noted that "selfies might seem like an immediate snapshot of reality but they were as much a deliberate piece of storytelling and fiction, as a self-portrait painted 500 years ago…. We all want to portray ourselves as we would [like to] be seen. The selfie is the subject in control of the image" (Walters, 2014, p. A7). The power of selfies is further evidenced by apps that allow doctoring digital photos to achieve flawlessness ("LINE Launches," 2014; "New Update," 2014) and even extending to "selfie surgery" (Harris & Vega, 2014). Visual imagery can now be manipulated with much more ease and much less expertise than were previously possible. This is also true of videos that are edited to alter reality either through strategic cuts or the use of visual effects. The selfie has also been linked to law enforcement and geopolitics. Burglars revealed their identities to law enforcement officials when they snapped selfies using their victim's smartphone, which unbeknownst to them, was set to automatically upload to the victim's cloud account (Robach, 2014); and in the midst of an international crisis generated by the presence of Russian troops in Ukraine, which was denied by the Russian government, a Russian soldier posted online selfies that were geo-tagged with GPS coordinates—thus giving away his true geographical location (Murphy, 2014).

These new cultural forms expand personal and cultural capabilities, yet they are not without risks. New vulnerabilities are emerging that once again require a digitally literate citizenry; a citizenry taught how to navigate the land mines of the digital age. As Jenkins (2008) noted, it is important to keep in mind that "the interests of producers and consumers are not the same" (p. 58). We are currently in the midst of cultural wars over who will capture the attention and respect of audiences and who will control and influence their behavior through new media: the traditional outlets of show creators and producers,

marketing experts, and corporate gatekeepers (publishers, television networks, and so on) or the convergent fan communities often led by unlikely sorts such as 16-year-old girls who like to shop, males who collect and follow the production and distribution of Air Jordan shoes, or—in the case of Perez Hilton—a blogger with an interest in celebrity culture and a sense of humor. These examples illustrate the rise of the "pro-am," defined by Leadbeater and Miller (2004) as an innovative, committed, and networked amateur working to professional standards. Amidst the flood of original and remixed content from amateur and pro-am users, the marketing community has been working to appropriate this public.

A CONFLUENCE OF TOOLS, CULTURAL FORMS, AND MARKETING

Since large, global audiences have shifted from being accessible only to a very small group of elites to being accessible by the masses, the professional production and distribution industry is at odds with, but also collaborates with, these same amateurs and their communities—as amateurs can help promote or destroy a project, a person, a product, or an event. This has posed a new challenge to the marketing world: to find the formula for influencing a network of web communities with the ultimate goal of making ideas, products, and corporate brands "go viral." The confluence of tools, cultural forms, and marketing constitute a perfect storm for the commodification of the Internet. The target of marketers' new efforts is *earned influence*, a term used to describe positive perceptions achieved through efforts made in such realms as social media (Elliott, 2014). In fact, the Public Relations Society of America has updated the definition of public relations to reflect such changes: "Public relations is a strategic communication process that builds mutually beneficial relationships between organizations and their publics" (Elliott, 2014). The notion of relationship building with a public illustrates the shift from a focus on appealing to individual wants and desires to a focus on earned influence.

Marketing was famously practiced throughout the early twentieth century based on the work of Edward Bernays, who is largely recognized as the father of modern public relations; and now the race is on to use any means (psychology, guile) to create associations in the minds of consumers that provoke them not only to take personal action but also to distribute the decision to do so across their personal networks. As Bernays wrote in his book *Propaganda* (1928/2005), "The conscious and intelligent manipulation of the organized habits and opinions of the masses is an important element in democratic society. Those who manipulate this unseen mechanism of society constitute an invisible government which is the true ruling power of our country" (2005, p. 37). The advertising industry has clearly turned its attention and efforts to power building through cyberspace leaving citizens vulnerable to novel forms of manipulation. Geoffrey Moore, marketing professional and author, noted that "we have embarked upon the world's largest and longest cocktail party, and every issue imaginable is up for grabs." (Moore, 2007, p. vii). This frenzy is not overt rather it is happening through seemingly benign, yet insidious acts.

In an ongoing frenzy to earn influence by capturing viewers, media corporations are inserting themselves into exchanges of grassroots cultural videos and images in the form of inconspicuous product placement and paid endorsements by unlikely agents. In doing so, they are perverting the original intent of this new media while providing a novel doorway to fame. This practice can be seen in the advent of theAudience, a social media publishing company whose business is to manipulate means of cultural discovery over the Web. Their service is to create content that taps into the values and passions a brand shares with its consumers, then amplify it through a network of influencers ("TheAudience," 2014). Culled from various sources such as *Vine* actors, *YouTube* singers, and *Instagram* models, *influencers*

are young, relatable, Internet-popular microcelebrities who are willing to use products and talk about them for a fraction of the traditional celebrity's cost, yet together they reach the same number of fans (Brodesser-Akner, 2014). TheAudience employs a cadre of 6,000 influencers who are all paid for their sponsorship (Brodesser-Akner, 2014). The marketing profession considers this practices to be a new discipline called "conversation marketing," (Gillin, 2007, p. xiii) the creation of a dialog with customers where useful information is exchanged, trust is built and brand loyalty established. In essence, it involves understanding who one's customers are, who influences them and how to engage with those influencers (Gillin, 2007). Conversation marketing is another example of Bernaysian manipulation applied to the Internet. Just as women of the early twentieth century were duped into thinking that smoking cigarettes was an expression of women's liberation as described in the documentary *Century of the Self* (Curtis, Kelsall, & McKinnell, 2002), fans of the twenty-first century are duped into thinking that their favorite Internet microcelebrity is free from hidden agendas.

At the same time, established celebrities such as actors have moved from brand endorsements to branding themselves in the form of online lifestyles and shopping companies, thereby using their star status as a vehicle for associating their values with products (V. Friedman, 2014). The Web serves as another form of mass entertainment, and as with older forms, advertising has become an active agent in the genre. This is also true of the entire entertainment industry, which now has agents and managers representing *You Tube* talent (Barnes & Atkins, 2014). These efforts pose a unique problem, as today's users are living at a time when it is commonly believed that social sharing within the digital world is altruistic, free, and authentic.

A quick overview of the free software (a.k.a. open source) movement can shed some light on this belief. Richard Stallman, a former programmer at the M.I.T. Artificial Intelligence Laboratory, hacker, programmer, and political activist, is also author of the "GNU Manifesto" (2002), a treatise calling for software to remain open and free for programmers to modify, improve, share, and even "cannibalize" parts to make a new program. Stallman's main argument was that "computer users should be free to modify programs to fit their needs, and free to share software, because helping other people is the basis of society" (p. 18). Stallman's work represents another side of two camps existing today, one espousing proprietary ownership of not only software but also the Internet and users' access to it and the other espousing the belief that the Internet was created by the people[4] for the people and should remain open and free. The struggle between the two camps can be seen not only in the advertising world but also in "net neutrality" debates, which concern treating all Internet data equally as opposed to allowing some data to move at faster speeds based on user, site, and platform. The movement of data whether fast or slow has led to another concern: data collection and privacy. Another practice linked to advertising is the collection of huge data sets containing information about all aspects of the citizenry's lives. In other words, any piece of information shared over the cyberspace network is open to collection and analysis. As noted in *The Atlantic,* "Nearly every transaction or interaction leaves a data signature that someone somewhere is capturing and storing" (Furnas, 2012, p. 2). The information captured is known as *big data* and is used in the practice of data mining, which is a repetitive, iterative process in which specialized analytical methods (e.g., classification, regression, and clustering) are employed for pattern discovery and extraction (Fayyad, Piatetsky-Shapiro, & Smyth, 1996). The key component of data mining is *knowledge discovery in databases* (KDD), which is the process of converting data into knowledge that is for sale. One use of data mining is to formulate descriptions and predictions for practices such as the IRS's detection of atypical tax returns on a more sophisticated level, or for traditional companies' targeted

marketing purposes such as sending coupons based on the consumer's most likely time to shop (e.g., just after they are paid). Additionally, tech companies use information gleaned across social networking sites to guide designers in writing programs that encourage more engagement on the sites (Furnas, 2012). A reaction to rampant data collection has inspired the creation of a social network called *Diaspora* that mirrors the original design of the Internet, a network of networks. In the spirit of Richard Stallman's work, *Diaspora* gives its code away for free and invites other programmers to improve it. The goal of the site is to free users' data from the hands of big business (Dwyer, 2014). Magnus Enzensberger (1974) argued that one of the main interests of mass media is to expand and train consciousness in order to exploit it. For him, what was being abolished in today's affluent (high-tech) societies is not exploitation, but the citizenry's awareness of it. It is with Enzensberger's ideas in mind that this chapter argues that there is an urgent need for policymakers and other stakeholders to take bold steps toward producing a digitally literate citizenry.

A DIGITALLY LITERATE CITIZENRY

A digitally literate citizenry is a citizenry that is trained for conscious and critical participation in digital life, a participation that centers on cultural forms related to tangible artifacts, ontologies, and democratic expression. Concrete guidelines must take into consideration the issues raised in the following subsections.

Tangible Artifacts

To be most effective, digital media literacy must address both the conspicuous and the inconspicuous aspects of digital life. To unpack the conspicuous elements of design, user interface, and programming, all students must be taught computational thinking skills. "By computational thinking, I am referring to the "if, then" axiomatic thinking tradition that is characteristic of today's computer programmers" (Rosenfeld, 2015, p. 160). Although media scholars like Sherry Turkle (2009) argue for teaching programming skills, and the national curriculum in England now requires more rigorous computer science training (Department for Education, 2013), there is much more work to be done in tandem with computational thinking skills. Perhaps even more urgent is the need for advanced training in perceiving the barely perceptible. This includes imparting an understanding of how worldviews are shaped through new devices in a form of exposure ranging from highly manipulated selfies and "peer reviews" to raw, unfiltered images of war and terrorism. The citizenry needs to cultivate skills for reading these media in relation to truth, perceptions, social justice, and ethics, as well as rights and responsibilities in a digital, globalized world.

Another tangible reality is the information society's impact on the environment. There is an urgent need for ecopedagogy training, which focuses on how environmental degradation results from sociocultural, political, and economic inequalities, on the intrinsic value of all species, on the need to care for and live in harmony with the planet, and on human aesthetic experiences of nature (Kahn, 2010). However, there is also a need for an ecopedagogy that includes the problems of digital waste and its impact on the environment, countries, communities, and individuals. These problems include biological risks associated with varying levels of exposure for both the high-tech workforces of developing nations and their consumers. Finally, there is a need to weave training in globalization throughout an ecopedagogy,

and all digital media literacy, curriculum. New forms of waste and planetary abuses of both people and resources call for training in globalization in all its forms as well as its impact on the individual, social, cultural, and planetary level.

Ontologies

The very nature of how a person in high-tech society functions is shifting. Those living in a state of deep digital immersion might begin their day checking social networks and reading their news online while simultaneously texting and reading incoming emails and texts. They are accustomed to short communication bites in the form of tweets and texts devoid of visual and audio cues. This has in turn modified conversational skills, even moving some to experience discomfort in face-to-face or telephone conversations, and to a cultural shift in meaning, where the levity of a situation is signified by the method of communication (e.g., texting for less serious topics and face-to-face conversations for more serious topics).

The general population is now exposed to a different way of existing, through digital capabilities and the representations they project. The notion and images of war through satellite and social media capabilities (e.g., war footage uploaded to *You Tube* channels) has already been discussed, and the change is confirmed by the disturbing images of beheadings and other heinous activities disseminated by terrorist organizations. Beyond war and terrorism, a myriad of online communities such as those following extreme sports, politics, or various forms of fandom similarly expose users to new experiences. Virtual reality gear is also changing lived experiences, as personal computer users are able to utilize virtual reality devices to plunge into fully immersive computer-generated experiences such as space exploration and deep examination of the Egyptian pyramids, experiences that seem so real that users almost forget that these are virtual worlds (Goel, 2014). Virtual reality devices have the strong potential to alter storytelling, with the experience of a story shifting from a static, two-dimensional experience to a dynamic, three-dimensional ride (Suellentrop, 2014).

These new capabilities also pose risks such as flawed code that can subject users to great personal and financial risk, for example, the Heartbleed software bug that was used to steal passwords or the Shellshock software bug that could be used to take over a user's entire machine (Perlroth, 2014). Likewise, national and international hacking efforts pose a risk to both corporations and citizens as seen in the data compromise at Sony studios as well as at Anthem Blue Cross, a major health insurance provider in the US (Schmidt & Shear, 2014; Abelson & Goldstein, 2015). Furthermore, smartphones and other GPS devices subject everyday citizens to a variety of forms of privacy infringement, data mining, and tracking by various entities. As one example, car loan lenders can now remotely disable vehicles when buyers are late on a payment. This practice is used for subprime borrowers, who are required to have a "starter interrupt device" put in their car, which allows lenders to track the car's location and movements as well as initiate a digital repossession by disabling the car before the payment is legally deemed delinquent (Corkery & Silver-Greenberg, 2014).

Ideology is another aspect of online life that is not often discussed or readily recognized. The term was coined in 1796 by Destutt de Tracy to refer to the science of ideas. In the twentieth century, "the term has often been employed in a purely descriptive and non-pejorative sense, being used simply to refer to the set of beliefs, attitudes, standards of rationality, etc. that embody the basic values of some social group and that group's conception of the political order appropriate to those values" (Backhurst, 2010, p. 192). Although "ideology" has many meanings, this chapter refers to a form of consciousness caused by a presentation of reality by either those representing dominant interests (tech and corporate

capitalists) or egalitarian interests (open source movement). The ideology behind "free" in cyberspace has many interpretations. For those espousing democratic values, championed by Richard Stallman and the open source movement as previously described, *free* does not imply ownership for the user but rather indicates a genuine expectation of community contribution. In contrast, in connection with the proprietary values supported by most tech companies, *free* is understood as a trade. By consenting[5] to a tech company's terms of use, the user is allowed to make use of the software, application, or platform without paying. This consent, in turn, allows the company unfettered access to and ownership of users' data.

Bullying and exploitation also have new formats in virtual life. Cyberbullying, a term used to describe intentional and repeated harm inflicted through the use of computers, cell phones, and other electronic devices (Hinduja & Patchin, 2014), has received a great deal of attention in recent years due to the number of adolescents who have both reported such harassment and committed suicide over it (Collins, 2008; Hinduja & Patchin, 2010; O'Shaughnessy, 2011). According to a 2014 Pew Research Center report on US Internet users, 40% of all Internet users surveyed have personally experienced online harassment and 73% have witnessed it happen to others (Duggan et al., 2014). This phenomenon is not limited to the United States; the U.S. National Institute of Health studied the prevalence of bullying and victimization across 40 countries and found that although it varies in rate and intensity, cyberbullying occurs in all of them. Thus, the Institute deemed cyberbullying to be a universal public health problem that impacts large numbers of adolescents (Craig et al., 2009). Although bullying is not new among adolescents, its nature has advanced within cyberspace: It can happen "anywhere, anytime, among lots of different children who may never actually meet in person. It is inescapable and often anonymous" (Maag, 2007). The problem is aggravated by apps appropriated in order to harass others, such as *Ask.fm*, a website that lets people anonymously ask questions and leave comments. In 2013, nine teenager suicides were linked to bullying on the site (Bilton, 2014a). *Yik Yak*, another website that lets people post anonymously, has banned middle and high school students from using the site and has disabled its services around schools. Further, the selfie site *Shots* does not allow comments to be posted due to the cyberbullying problem (Bilton, 2014a). Some school districts have taken action against cyberbullying by hiring companies or using online tools to comb the Internet for signs that students are engaging in such behavior. However, the social and legal systems have not yet caught up with the problem, leading to debates about freedom of speech and the right to privacy (Sengupta, 2013). The cyberbullying problem has prompted social media sites to take steps to address this new reality. On *Facebook*, for instance, users can click on an icon to ask for the removal of a harmful post or photo and then provide information about what is happening in the post, how they feel about it, and how sad they are. In addition, they are provided with a text box containing a polite prewritten response that they can send to the person who hurt their feelings. The leader of this project, Arturo Bejar, believes that the success of social media largely depends on solving the cyberbullying problem (Bilton, 2014b).

Democratic Expression

New forms of exploitation are also occurring in the digital world. These include personal information being made public through social media, by criminals, and even by law enforcement agencies (Anderson & Rainie, 2010), as well as personal privacy cases involving cyberstalking (Zeller, 2006). Additionally, sexual predators use instant messaging and Web cameras to meet, lure, and digitally stalk children and share pornography (Brockman, 2006). Exploitation also includes *social engineering*, in which Internet users are tricked into downloading malware that can be used to extract financial gain. Social engineer-

ing messages often appear in e-mails that seem to be from friends and associates, greeting cards, and celebrity photos (Sengupta, 2012). Finally, the right to be anonymous is under attack, with individuals having their photos snapped or their behavior videotaped, uploaded, and gone viral without their knowledge or consent (Kaufman, 2014).

Society pushes back against exploitation through cyber-enabled social and political activism and new media tools. One example is FireChat, an app that enables smartphones to communicate with each other directly, without needing a cellular or Wi-Fi connection. This app was created in direct response to communication problems experienced during the Arab Spring,[6] when hours before a massive protest, the Egyptian government shut down the Internet and attempted to block cell phone texting services (Kanalley, 2011). Three years later, during the 2014 protests that erupted in Hong Kong, FireChat enabled continued connections despite challenges brought about by a strained network (Cohen, 2014). Anonymous, a leaderless, shape-shifting, international cyber activist group, and Wikileaks, a non-profit, global, free press journalism organization, further demonstrate empowerment through use of digital tools and the Web. Both are lauded as modern-day freedom fighters (M. Friedman, 2010; Gellman, 2012) and are equally despised as high-tech terrorists (Fogarty, 2011; MacAskill, 2010), regardless they are the expression of democracy in action. Digital media literacy itself also requires structure to build upon; frameworks should reflect democratic principles to address these growing literacy needs of high-tech populations.

Digital Media Literacy Frameworks

Numerous digital media literacy frameworks exist, often using slightly different terminology to describe the same phenomena. This section synthesizes some of the most well-known proposals for digital media literacy, found in the work of David Buckingham, Renee Hobbs, and UNESCO's José Manuel Pérez Tornero and Tapio Varis. Their combined recommendations advocate for digital media literacy to address the areas of use and access, critical understanding, production, the self, and Web citizenship.

Use and access to media stresses the importance of developing skills for finding and sharing relevant information using media texts and technology tools (Hobbs, 2011). Pérez Tornero and Varis (2010) have conceptualized access to include physical access to media and media content as well as the availability of media in a given setting. Pérez Tornero and Varis also include environmental factors: the educational system, the policies handed down by authorities, and the role of media in both of these.

Another key idea, critical understanding, is the ability to find and select information and then analyze the information, its representations, and the potential effects or consequences of messages as they relate to authority, reliability, and bias (Buckingham, 2006; Hobbs, 2011; Pérez Tornero & Varis, 2010). Critical understanding also includes what Pérez Tornero and Varis (2010) describe as "sophisticated" abilities, such as recognizing opportunities that are offered and using critical thinking, personal autonomy, and problem-solving capacities to understand conditions that are set by the media.

Production, which is at the heart of digital media, needs to be understood with respect to the creation, composition, and generation of content, including how messages can be created and produced using different codes and how they can be disseminated through different platforms. Thus, creative, expressive, semiotic, and social competencies must be taught as part of digital media literacy (Pérez Tornero & Varis, 2010). The understanding of production must also include a broader awareness of the global role of advertising, promotion, and sponsorship, and how these influence the nature of the information that is available in the first place (Buckingham, 2006; Hobbs, 2011). For Buckingham, such awareness should extend to noncommercial sources and interest groups, who are increasingly using the Web as a

means of persuasion and influence. It should also include knowledge about how sites are designed and structured as well as the rhetorical functions of links between sites (Buckingham, 2006).

Paramount to literacy, the self focuses on a need to decode how identity is influenced by media messages and technology tools via their impact on thinking and on behavior—for example, how users are guided or encouraged to navigate and how information is gathered about them (Buckingham, 2006; Hobbs, 2011). This area also includes an awareness of one's own position as a user, which requires understanding how media target audiences, the ideological and cultural orientations they promote, and how different audiences use and respond to new media (Pérez Tornero & Varis, 2010).

Finally, Web citizenship focuses on actions that can be taken on the Web to solve problems at the local, regional, national, and international levels (Hobbs, 2011). For Pérez Tornero and Varis (2010), this equates to fostering new values related to the ability to participate in global decision-making concerning the planet, cosmopolitan patriotism, and the dignity of humanity as a whole.

These ideas show that a great deal of work has already been done globally to delineate the area of digital media literacy. While these ideas are a good first step toward this end, they contain some blind spots that will be addressed at the end of this chapter. Theorizing is instrumental to build sound policies and see their implementation. An analysis of education policies will demonstrate how much is currently being done.

EDUCATION POLICIES IN PRACTICE

England's Computing Curriculum and the United States' Common Core

In a race to adapt education curricula to twenty-first century demands, both England and the United States have adopted new curriculum standards, and 2014 was the year of broad-scale implementation. Although both curricula make significant changes across many disciplines, this chapter's analysis concentrates on digital media literacy. Despite the fact that many citizens are simultaneously living in multiple realities (real, augmented, and virtual), neither of these curricula prepares the citizenry to consciously function within these parallel worlds—although, it should be noted, England has made greater strides than the United States toward this end. Thus, this analysis begins with the stronger of the two curricula. According to Michael Gove, England's education secretary, "Our new curriculum teaches children computer science, information technology and digital literacy: teaching them how to code and how to create their own programs; not just how to work a computer, but how a computer works and how to make it work for you" (Dredge, 2014). As outlined in the final draft of England's National Curriculum Framework (Department for Education, 2013), the overarching goal is to "equip pupils to understand and change the world through logical thinking and creativity, by making links with mathematics, science, design and technology" (p. 188). In this curriculum, *digital literacy* is defined as the ability to effectively, responsibly, safely, and critically navigate, evaluate, and create digital artifacts using a range of digital technologies. Digital artifacts can take many forms, including digital images, computer programs, spreadsheets, 3D animation, and other kinds of representations (Kemp, 2014). England's curriculum addresses digital literacy in a very direct, clear, and consistent fashion, yet leaves out one of the most important parts "media," as discussed earlier in this chapter. Likewise, the curriculum introduced in the United States only sparsely relates to digital literacy and also leaves out "media."

The United States Common Core standards were a response to more than a decade of poor performance compared to Japan, Russia, Singapore, and South Korea on a number of international assessments (Garland, 2013), as well as inconsistent curricula across states. As US Secretary of Education Arne Duncan stated, such standards should be "internationally benchmarked and include the knowledge and skills that students must learn to succeed in college and career" (2010, para. 2). The same rationale guided the creation of the Next Generation Science Standards[7], whose website acknowledges that "if the nation is to compete and lead in the global economy and if American students are to be able to pursue expanding employment opportunities in science-related fields, all students must have a solid K–12 science education that prepares them for college and careers" ("Next Generation," 2014). This is reflective of a recurrent position on literacy to promote shaping future workers rather than most importantly encouraging the need of such knowledge for intellectual enrichment and development of the individual as a citizen.

Consistent with Bowles and Gintis' view in *Schooling in Capitalist America* (1976/2011), such efforts are more concerned with meeting labor force demands than fostering personal liberation and equality. Furthermore, these efforts do not move the digital citizenry out of what Paulo Freire would characterize as the "oppressed." Freire notes that "any situation in which 'A' objectively exploits 'B' or hinders his and her pursuit of self-affirmation as a responsible person is one of oppression. Such a situation in itself constitutes violence, even when sweetened by false generosity, because it interferes with the individual's ontological and historical vocation to be more fully human" (1968/2000, p. 55). A comprehensive digital media literacy curriculum should not be adopted for the sole purpose of college and career readiness. Rather, such a curriculum has a democratic responsibility to free the citizenry from manipulation and traumatization within and through the digital world by fostering consciousness, self-reflection, and agency, thereby allowing citizens to be more fully human. For John Dewey, being fully human includes being a citizen and a true participant in the democratic process. Dewey argued that education should be transformative in order to foster a democratic citizenry and that education should progress alongside society (1916/2009). Modern-day progress calls for a Deweyan response in the form of digital media literacy.

Computer science and information technology are a part of digital literacy in both England's and the United States' curricula. England's computing curriculum is largely based on computer science, an argument built on the idea that studying computer science principles will help to ensure students are prepared for the digital world. Such literacy is achieved through three distinct strands of instruction: computer science, information technology, and digital literacy (Kemp, 2014). The rationale is that pupils who can think computationally are better able to conceptualize, understand, and use computer-based technology and are therefore better prepared for today's world and the future. In the United States Common Core curriculum, the focus is not very different, as all standards are anchored to college and career readiness. This becomes evident as one tries to untangle how the Common Core standards are organized.

The United States Common Core standards for English language arts (ELA), for example, comprise three sections: comprehensive K–5 and two content-area-specific sections for grades 6–12: one for ELA and another for history/social studies, science, and technical subjects. Each of these three sections is divided into strands: K–5 and 6–12 ELA have reading, writing, speaking, listening, and language strands, while the second 6–12 section has history/social studies, science, and technical subject sections that focus on reading and writing within these contexts. Each strand is headed by a strand-specific set of college and career readiness (CCR) anchor standards that are identical across all grades and content areas. In brief, a CCR anchor standard is a skill that high school graduates should have in order to be ready for entry into the world of work or postsecondary education. Anchor standards answer the ques-

tion, "What should a twenty-first century diploma holder be able to do in order to flourish?" Whether the context is kindergarten or 12th grade, an anchor standard is the target. Thus, all grade-specific standards map back to the anchor standards translating the broader CCR statement into grade-appropriate end-of-year expectations. It should be noted that none of the anchor standards directly address digital literacy ("Common Core," 2014).

The Common Core English/language arts standards discuss the strategic use of technology and digital media, as well as the incorporation of research and media skills into the standard (Marcoux, 2012). However, neither the Common Core nor the Next Generation Science Standards include a comprehensive curriculum that directly addresses digital literacy in a meaningful way. This is a tremendous oversight in the age of virtualization. Given the paucity of direction, many school districts supplement the Common Core standards with those from the International Society for Technology in Education (ISTE), a non-profit organization designed to help lead the transformation of digital education. Therefore, the ISTE standards are used as a basis for the present analysis and serve as a clear example of an external organization compensating for Common Core's inadequacies.

For the purpose of this chapter's analysis, Table 1 limits the comparison to the first two of four key stages in England's computing curriculum but includes all of the ISTE standards used in the United States, as these are less elaborate. Both standards treat technology as a tool to be used in society rather than as the humanistic reality that it is. However, England's computer science standards should be recognized for their focus on moving users from surface-level use to a behind-the-scenes understanding of how devices are constructed as well as the logic of how they are made to work. MIT scholar Sherry Turkle considers the same idea in her book *Life on the Screen: Identity in the Age of the Internet* (1997), where she discusses the simulation aesthetic by tracing the progression from DOS-based IBM computers that allowed users to "open the hood" and manipulate an operating system to Macintosh computers that replace this function with simulation via attractive and easily used icons that represent programs and documents. For Turkle, the move to simulation was a liability, not an asset. However, it should be noted that such icons represent an intuitive philosophy that enables self-discovery though accessibility, whereas everyday users may never utilize the "open-box" approach. It appears that England is taking a strong step back from the postmodern superficial acceptance of devices to Turkle's more modernist idea of depth. Teaching students how to understand computer algorithms, how to design, write, and debug programs, and how to understand computer networks enables them to answer questions that Turkle highlights, such as "What makes this work?" and "What's really happening in there?" (1997, p. 42). In the United States, the ISTE curriculum standards hint at this when they suggest teaching the concepts underlying hardware, software, and connectivity. However, these standards fail to provide specifics concerning the level at which these will be taught.

Table 1 also illustrates that both curricula call for students to be trained in a variety of applied technology uses. In England's curriculum, this training is described in terms of how to use technology purposefully to create, organize, store, manipulate, and retrieve digital content. It also includes training in the use of search technologies as well as selecting, using, and combining a variety of software applications (including Internet services) on a range of digital devices to create a wide range of programs, systems, and content that accomplish specific goals, including the collection, analysis, evaluation, and presentation of data and information. For ISTE, training in the uses of technology includes teaching students how to use computers and applications as well as how to use technology for research, critical thinking, problem solving, decision-making, communication, collaboration, creativity, and innovation.

Table 1. Comparison between two national computer technology curricula

Britain **Computing Curriculum***	**USA** **ISTE to Support Common Core****
Key Stage 1: **5-6 year old** **Computer Science** Understand what algorithms are; how they are implemented as programs on digital devices; and that programs execute by following precise and unambiguous instructions. Create and debug simple programs. Use logical reasoning to predict the behavior of simple programs. **Information Technology** Use technology purposefully to create, organize, store, manipulate and retrieve digital content. **Digital Literacy** Recognize common uses of information technology beyond school. Use technology safely and respectfully, keeping personal information private. Identify where to go for help and support when there are concerns about content or contact on the Internet or other online technologies.	**Key Stages:** **Scaffolds across age groups** **Computer Usage** Demonstrate proficiency in the use of computers & applications, as well as an understanding of the concepts underlying hardware, software, and connectivity. Demonstrate the responsible use of technology & an understanding of ethics & safety issues in using electronic media at home, in school, and in society. Demonstrate the ability to use technology for research, critical thinking, problem solving, decision making, communication, collaboration, creativity and innovation.
Key Stage 2: **7-10 year old** **Computer Science** Design, write and debug programs that accomplish specific goals, including controlling or simulating physical systems; solve problems by decomposing them into smaller parts. Use sequence, selection, and repetition in programs. Work with variables and various forms of input and output. Use logical reasoning to explain how some simple algorithms work and to detect and correct errors in algorithms and programs. Understand computer networks including the Internet; how they can provide multiple services, such as the World Wide Web. Appreciate how [search] results are selected and ranked. **Information Technology** Use search technologies effectively. Select, use and combine a variety of software (including Internet services) on a range of digital devices to design and create a range of programs, systems and content that accomplish given goals, including collecting, analyzing, evaluating and presenting data and information. **Digital Literacy** Understand the opportunities [networks] offer for communication and collaboration. Be discerning in evaluating digital content. Use technology safely, respectfully and responsibly. Recognize acceptable/unacceptable behavior. Identify a range of ways to report concerns about content and contact.

**http://commoncore.fcoe.org/subject/technology

Although England's curriculum is clearly more sophisticated, both are centered on technology use and troubleshooting.

Finally, both curricula should be recognized for the steps they take toward training in digital literacy. England's curriculum teaches students to recognize common uses of technology outside of school as well as how to use technology safely and respectfully. Likewise, the ISTE curriculum requires that students be taught the responsible use of technology, including an understanding of the ethics and safety issues

involved in using electronic media at home, in school, and in society. However, these represent only an initial introduction to some of the most basic tenets of digital media literacy. The next section of this chapter outlines the level of training that is needed in this area.

In the case of both curricula, digital media literacy should extend to the creation, production, and dissemination of texts, images, and videos with special attention to social justice, fairness, and democracy. This chapter has made it clear that marketing strategies are making headway on the Web in areas related to privacy, authenticity, and truth. Brazilian educational theorist Paulo Freire argued that "leaders cannot treat the oppressed as mere activists to be denied the opportunity of reflection and allowed merely the illusion of acting, whereas in fact they would continue to be manipulated—and in this case by the presumed foes of manipulation" (1968/2000, p. 126). Both curricula are presumed foes of manipulation yet neither frees citizens from such manipulation. Similarly, Pérez Tornero and Varis (2010) stress that once the capacity for critical thinking has been acquired, the individual is independent and free to think autonomously without the control and guidance of 'guardians,' the authorities that, according to the definition proffered by Kant, "subjugate people's thinking by requiring them to accept veins of reasoning and points of view that are not theirs as their own" (as cited in Pérez Tornero & Varis, 2010, p. 80). A digital media literacy curriculum must provide users with the basis for sufficient autonomy and train them how to live in an absorbing media and technological environment.

Recommendations

These aims are best achieved by teaching citizens to employ logic, critical thinking, rhetorical analysis, discourse analysis, and dialogical skills to uncover and evaluate all aspects of digital life, including the objects individuals use, how they are used, and their implications for personal and social ontology, and to recognize cyberspace as another reality that is both separate from and embedded within real-life reality. Additionally, the barely perceptible aspects of digital life, such as the roles that satellites and ringtones play in social, economic, and cultural life, must be recognized and evaluated, along with the broader area of new forms of waste and planetary abuses of both people and resources, which calls for training in globalization in all its forms and its impact on the individual, social, cultural, and planetary levels.

As a first step in addressing the quality of training in these areas, it will be useful to revisit the Royal Society's notion of an academic discipline and demonstrate how their criteria for a discipline apply to digital media literacy as defined in this chapter. The five distinctive characteristics of a discipline are that it has: a body of knowledge, rigorous techniques and methods, a perspective on the world, a stable set of concepts, and independence from existing technologies. This chapter has shown that digital media literacy includes a large body of interdisciplinary knowledge grounded in work in philosophy, sociology, media studies, communications, anthropology, and education. Moreover, several national and international organizations, collectives, formal institutions, centers, and institutions are working in the field (Pérez Tornero & Varis, 2010) such as the National Association for Media Literacy Education (NAMLE), the Action Coalition for Media Education (ACME), Media Awareness Network (Canada), and the European Media Literacy Forum. This chapter has also demonstrated that the production of knowledge within this field uses rigorous techniques and methods including critical inquiry, critical ethnography, rhetorical analysis, discourse analysis as well as qualitative and quantitative studies. Through its recognition that digital media literacy addresses the needs of an immersed digital population, it provides a perspective on

the twenty-first-century world. This is corroborated by the work of global organizations such as UNESCO and the Global Alliance for Partnerships on Media and Information Literacy, both devoted to promoting national and global media and information literacy (MIL) policies. Additionally, the field of media literacy has a stable set of concepts centered on the ideas of production, distribution, and consumption of media texts. These concepts can be found in the literature and on the websites of several organizations, including the National Association for Media Literacy Education (NAMLE). Finally, the field of digital media literacy is independent of specific existing technologies. Although the focus of its analysis falls within digital life, its subject and methods adapt to meet the changing digital landscape. Because digital media literacy meets the five characteristics of a discipline, it should be recognized as not only a skill but also as a discipline. Such recognition may spur education policy makers and other stakeholders to push for a more comprehensive and sophisticated digital literacy curriculum. Furthermore, agreement on this point would better ensure the inclusion of digital media literacy in twenty-first-century curricula and would extend its conceptualization beyond a mere collection of skills to include philosophical and humanistic training in how to navigate the land mines of the digital age.

The suggestions provided in this chapter align with the existing digital media literacy frameworks but also provide some new ideas for inclusion. The existing principles of the self and Web citizenship can be augmented in several ways. The recommendations for the area of the self-need further development with respect to critically analyzing digital vulnerabilities, including how digital objects are used, how they implicitly guide behavior, and the ways they shape personal and social ontologies, thoughts, and actions. Web citizenship should better cover the ethical, democratic, and fair creation, production, and dissemination of texts, images, and videos with special attention to social justice, fairness, and democracy. The rampant problems of cyberbullying, exploitation, and images of terrorism and war each call for more concentrated training in this area. Additionally, a stronger case needs to be made for training in social justice related to environmentalism and globalization in connection with new forms of waste and planetary abuses of both people and resources. This, in turn, calls for training in globalization in all its iterations and its impact on the individual, social, cultural, and planetary levels.

Two additional areas, nature of reality and critical consciousness, would bring additional depth to the digital media literacy tenets already presented. Nature of reality should be added because guidance is needed for how to live one's life in complex, dual realities (real and virtual) that are not mutually exclusive—for while some aspects may reside in only one or the other of these realities, other aspects cross over. Because this is a new way of living life, training and theorizing are needed to understand its impact on the human condition, including an examination of empowerment, disenfranchisement, and abuses. Critical consciousness training is needed to combat the fact that all actions and transactions in cyberspace are subject to persuasion, manipulation, and even exploitation in the form of sophisticated, inconspicuous, and carefully targeted marketing, impersonation techniques, and other forms of influence (such as cyberbullying and catfishing[8]). Furthermore, privacy, truth, and authenticity are being recalibrated with a population that implicitly acquiesces to infringements and truth manipulation as a fact of online life. Complacency about privacy violation and misrepresentations of the truth, whether these be in images, video, or text, must be challenged by providing guidance on how to think about and deconstruct such practices. Under these new areas, citizens should be taught to employ logic, critical thinking, rhetorical analysis, discourse analysis, and dialogical skills to uncover and evaluate all aspects of digital life, including its barely perceptible aspects and how they influence social, economic, and cultural life.

CONCLUSION

This chapter set out to clarify digital media terms, map the changing landscape of society due to digital life, explore current digital media literacy frameworks, policies, and practices, and suggest areas in need of strengthening. Examining discrepancies in understandings of digital media literacy related to whether it should be considered a skill, a discipline, or both, this chapter mapped several definitions of digital media literacy. These definitions include those of computer scientists and critical theorists to establish that digital media literacy extends far beyond training in media use. This chapter also established that the need for meaningful, persistent, and sophisticated media literacy education is global, as evidenced by the efforts of UNESCO and other international organizations. The chapter aligned traditional media literacy constructs with the digital world to demonstrate the extent to which society has changed in the digital media landscape, providing the reader with insights into ideologies and ontologies related to twenty-first-century production and distribution practices as well as audience participation. All of this points to the need for comprehensive training in digital media literacy.

An analysis of recent curriculum changes in England and the United States revealed that more must be done to prepare, and in doing so protect and empower, a digitally literate citizenry. Although the current digital media literacy frameworks posited by Buckingham, Hobbs, and Pérez Tornero and Varis represent a strong starting point, this chapter argued that some areas of the frameworks need further depth and that additional areas are needed. A strong step in this direction would be to establish in the minds of stakeholders the idea that—as this chapter has argued—digital media literacy is indeed a discipline.

It is especially troubling that both England and the United States rewrote their national curricula with very little attention paid to media literacy for humanity. This oversight might have been excusable during the first decade of the twenty-first century when capabilities on the Internet were at a less sophisticated level; however, in the second decade it is irresponsible. The training these curricula provide, although valuable, keeps the digital citizenry in the position of users rather than fostering broader dialogues and thinking skills around how to live, navigate, and participate in the digital world. It is particularly disappointing that the United States' Common Core curriculum provides so little guidance in this area that many districts are turning to an outside organization for guidance. All of this is quite inexcusable in the present day, and points to the fact that neither of these high-tech societies fully understands that the information revolution is not just about means of economic production. Rather, the information revolution is about the creation of new and altered cultural forms, new ontologies, new iterations of manipulation and exploitation, and perhaps most importantly, a changed citizenry in need of training. This chapter contributes to formalizing the digital media literacy conversation by presenting criteria that complement and supplements the existing theoretical frameworks. This is only a beginning, with the door just opening to an embedded future where digital media literacy will be at the forefront and center of the digital debate.

KEY TERMS AND DEFINITIONS

Barely Perceptible: According to Lisa Parks, the unnoticed aspects of digital life.

Conversation Marketing: A strategy that involves understanding who customers are, who influences them and how to engage with those influencers.

Cultural Forms of High-Tech Society: The ideologies, struggles, polysemic interpretations and symbol manipulations associated with tangible artifacts as well as the intangible areas of capabilities, habits, and ontologies.

Cyberbullying: Intentional and repeated harm inflicted through the use of computers, cell phones, and other electronic devices.

Earned Influence: Positive perceptions achieved through efforts made in such realms as social media.

Influencer: A relatable, Internet-popular microcelebrity who sponsors products with the intent of influencing fan followers' buying habits.

Microcelebrity: A person who has established his/her presence on the Internet through blogging or posting original content that has gone viral and generated a fan following.

Pro-Am: An innovative, committed, and networked amateur working to professional standards.

Selfie: Photograph taken of oneself, typically one taken with a smartphone or webcam and uploaded to a social media website.

Sexting: Subset of the selfie, sexually explicit photos of oneself shared through a smartphone.

ENDNOTES

1. The Royal Society's comprehensive 2012 report titled "Shut down or restart? The way forward for computing in UK schools" analyzed the current state of computing education in England's schools and presented recommendations for improving the situation, many of which serve as the basis for England's 2014 computing curriculum.
2. NAMLE's digital literacy standards are used by many US school districts to supplement the Common Core standards.
3. Sexting refers to sending sexually explicit photos of oneself or others via digital electronic devices.
4. The Internet was created by governments (The United States, Great Britain, France) and spearheaded in the US by the Department of Defense, resulting in the creation of the ARPANET, which would become the Internet.
5. Terms of services are so dense and convoluted that most users do not read them.

ABSTRACT

Wireless sensor networks are an emerging technology that can provide valuable information for a large series of monitoring and control applications. Comprising many monitoring scenarios with different particularities, as industrial management, weather forecasting, home automation, traffic management and rescue operations, just to cite a few, wireless sensor networks bring many possibilities for innovative applications that cannot be addressed by conventional wireless network technologies. When sensors are equipped with cameras or microphones, multimedia data can be retrieved from the monitored field, enriching the perception of the target area. However, the constrained nature of wireless sensor networks imposes many challenges to multimedia transmission, fostering development of optimized protocols. In this chapter, we present the state of the art of multimedia transmission in wireless sensor networks, covering topics as routing, error control, congestion avoidance, real-time delivery, compression and QoS, potentially supporting in the development of wireless multimedia sensor networks.

INTRODUCTION

In the last years, Wireless Sensors Networks (WSN) have been considered for a large series of monitoring and control applications. Employing tiny devices for sensing of some specific information, like temperature, pressure, humidity and luminosity, these networks have fostered the development of innovative ap-

DOI: 10.4018/978-1-5225-3822-6.ch002

plications for industry, home automation, healthcare assistance, weather forecasting, traffic management, battlefield surveillance, tracking, among many other monitoring scenarios (Yick, Mukherjee & Ghosal, 2008). Typically, sensor nodes in WSN are disposable electronic devices commonly equipped with a transceiver, a limited energy supply, a sensing unity and memory and processing resources, although additional modules can be found, allowing distributed information monitoring. However, in order to reduce costs for massive deployment and diminish energy consumption, resource-constrained sensors are expected to be deployed, bringing many communication challenges.

One innovative nature of wireless sensor networks is the possibility to retrieve relevant information from regions with absent infrastructure. In such way, wireless sensor networks could be deployed in wide, hostile or even hard access areas. For that, however, sensors will communicate in an ad-hoc manner where data packets will flow through multiple hops from source nodes toward the network gateway (*sink*). As there is no central unit to coordinate and control communications, sensors are also expected to be self-organizing and protocols must be processed in a distributed way. Due to the inherent constraints of sensor nodes, however, protocols requirements must comply with limited processing, memory and energy resources; energy constraints limit the wireless communication range and inflict controlled use of transmission and processing functions.

For a large group of applications, scalar data gathered from wireless sensor networks are insufficient, even if a large number of sensors is deployed. In order to enrich the retrieved information, sensors may be equipped with inexpensive low-resolution CMOS cameras and/or microphones, allowing multimedia data retrieving. The resulting *Wireless Multimedia Sensor Networks* (WMSN) enhance the understanding of the physical world, by improving monitoring and control applications (Almalkawi *et al.*, 2010).

In general, multimedia transmissions in wireless sensor networks are more stringent than transmissions of scalar data as humidity and temperature, imposing many challenges. And although optimized solutions may be employed, processing and memory constraints may impact the use of buffering techniques by communication protocols, as well as the execution of compression and entropy codes. Such complex scenarios have demanded protocols and algorithms that must be optimized for the particularities of multimedia transmissions in these networks (Akan, 2007).

A typical heterogeneous wireless multimedia sensor network is presented in Figure 1. Visual and audio sensors will retrieve information with different particularities, requiring differentiated services to be provided by the network.

Usually, multimedia transmissions in wireless sensor networks must be energy-efficient and scalable. However, some applications may also require timeliness, transmission fairness and error resilience. The monitoring requirements of the sensing applications will typically define the expected transmission services, which will be associated with some general characteristics, as summarized in Table 1.

As discussed before, multimedia sensor applications may have different transmission requirements. And such requirements do not depend exclusively on characteristics of the deployed sensors and of the monitored field, but also on the expected processing that will be done over the retrieved multimedia data.

MULTIMEDIA MONITORING IN SENSOR NETWORKS

Wireless multimedia sensor networks are an emerging ad-hoc network technology that employs autonomous sensors equipped with a low-power camera and/or microphone to wirelessly retrieve multimedia

Figure 1. A typical wireless multimedia sensor network (source: wmsn.tif)

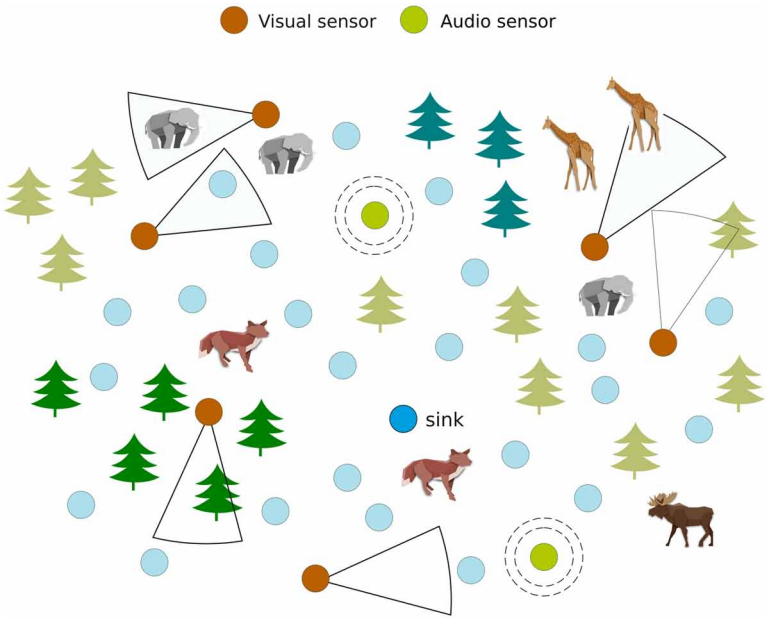

Table 1. Main transmission requirements for WMSN

Transmission Requirement	Short Description
High bandwidth	Some applications many require high transmission bandwidth, especially when visual sources are streaming video. High throughput may severely compromise the energy resources of the network.
Timeliness	Real-time monitoring applications may expect data delivery with time constraints. Critical monitoring applications will often rely on real-time data delivery.
Error resilience	Multimedia sensors may have different relevancies for applications, where high-relevant sources may require error-resilient transmissions. Error recovery may also be required for parts of encoded multimedia data (Costa & Guedes, 2011).
Quality of Experience	The user perceptions of the monitored data depend on many characteristics, but different applications may have different quality thresholds. The network design and operation should try to address such thresholds.

data from the monitored field. The retrieved visual or audio information can be used to compose the monitored information for many surveillance, tracking and control applications. As heterogeneous sensors may be deployed, scalar information, still image, video streams and audio may be available for processing or storage, enlarging the possibilities when developing automatic monitoring and control systems.

There are some general principles of multimedia monitoring, when employing wireless sensor networks. In fact, the way multimedia information is sensed and transmitted will dictate how the network will deal with multimedia data packets. Multimedia data can be roughly divided in three different categories: audio stream, still image and video stream. Audio typically represents human voice or a relevant noise for the application, with transmission rate usually lower than 64kbps. Still images are snapshots of the monitored target or scene, while video represents a continuous viewing created by a greater number

of frames (images), providing a motion sense. In such way, video streams usually demand more communication bandwidth than transmission of still images, turning more stringent video streaming over wireless sensor networks.

Audio Sensing

Sensor nodes may be equipped with a low-power microphone to monitor audio from the monitored field. The retrieved audio may be human voice or some relevant noise for the monitoring application. Generally, the microphone embedded in audio sensors will define an omnidirectional sensing area, resembling scalar sensors. Hence, the sensing and communication ranges are equivalent, which will be, in theory, a circular area.

The sensing paradigm is relevant when computing coverage optimization, sensing redundancy, data compression and localization. Neighbor sensors with omnidirectional sensing areas are likely to retrieve equivalent information, potentially leading to a relation of redundancy. As redundant information may also be exploited for compression and data merging, audio transmission in wireless sensor networks may benefit from the way audio is sensed from the monitored field. Moreover, depending on the network deployment density, transmission errors may be compensated by concurrent transmissions from redundant nodes.

Visual Data Sensing

Camera-enabled sensors retrieve still images or video streams from the monitored field following a directional sensing model. The embedded camera will have a viewing angle, an orientation and a depth of view (Costa & Guedes, 2010), which will define a sector-like area referred as the Field of View (FoV). Thus, visual sensors define a directional sensing of the monitored field, but they communicate according to an omnidirectional communication range.

In practical means, visual sensors will have a unique perception of the deployment area, and two neighbor sensors are likely to retrieve different information. This characteristic changes the perception of sensing vicinity and redundancy, impacting coding, compression and coverage mechanisms. Moreover, the uniqueness of visual sensing makes error resilience a required service, especially when visual sensors are retrieving information from critical monitoring areas.

Data Retrieving

Besides the sensing principles of multimedia data, the application monitoring requirements may also guide the way multimedia will be transmitted in wireless sensor networks. Generally, such monitoring requirements will be associated to characteristics of the deployed sensors and of the monitored field, besides expected uses of the retrieved multimedia data.

While many sensor network applications require passive sensing and reporting, there is a growing need to support real-time streaming. If retrieved information will be used to trigger some action, as for example in an intrusion detection system or in industrial control, multimedia data should reach the network sink as soon as possible, in order to not compromise the effectiveness of the multimedia sensor network. Such applications typically require relatively high bandwidth utilization and impose severe constraints on transmission latency.

Some applications may define a maximal acceptable latency for multimedia data, but such latency may vary according to the type of the sensed data. Zhang *et al.* (2008) propose a mechanism for multipath routing exploiting the relevance of the encoded data for efficient path selection regarding the end-to-end communication delay of transmission paths. In that work, the source stream is split into visual data and audio substreams, giving to each resulting substream a particular priority according to the current monitoring being performed. In other words, the application will have different requirements for transmission latency according to the nature of the retrieved data. For example, in fire monitoring, visual information is more relevant for the application and the audio stream could be transmitted over transmission paths with higher average end-to-end delay (worst paths). Real-time requirements can also be defined concerning scalar data and the network should try to address the transmission requirements in order to keep the monitoring quality in an expected level. In a different perspective, real-time requirements may be set for any source nodes, regardless of the type of sensed data (Costa & Guedes, 2013).

Real-time delivery is not only related to transmissions through paths with lower average end-to-end delay, but also to the processing parameters in intermediate nodes. Sensor nodes may implement some QoS policy when relaying packets, providing faster transmission for high-relevant data. This will be usually performed employing prioritized transmission queues. When facing congestion, such QoS-based queues would be also useful to preserve real-time requirements.

However, for some wireless multimedia sensor networks, real-time transmissions may not be required. For example, some applications may retrieve multimedia data for storage or offline processing. Typically, such applications will be most concerned with energy-efficiency for network lifetime prolonging.

Besides timeliness, the way sensed data is retrieved will directly impact multimedia transmissions. Multimedia sensors may be idle for long periods of time, but they may suddenly start transmission of sensed data when they are requested. Such a behavior can be also expected when an event occurs or when sensors are scheduled for periodic transmission bursts. These three data retrieving paradigms are shortly described as follows:

- **Query-Based:** The sink may request data transmission from source nodes at any time during the network lifetime, and the requested sources will strive to attend the solicitation. For that, some specialized query message should be transmitted to some or all source nodes, requesting data transmission. Of course, query-based transmission may cause congestion in relaying nodes when the transmission rate of source nodes suddenly increases.
- **Triggered-Based:** Multimedia transmissions may be triggered by the occurrence of some relevant event, as fire, an accident or unauthorized penetration into a monitored area. Typically, only source nodes that can sense regions affected by the event will start transmission (or increase current transmission rate), but applications may define any monitoring behavior.
- **Clock-Based:** Sensor nodes may be configured for periodic transmission of multimedia data. For example, some nodes may be scheduled to transmit one image snapshot every second, continuously. In a different way, such schedule may indicate periods of time for transmission of sensed data, interleaved by idle intervals.

All these three paradigms may also impose different demands for real-time transmission, according to the application monitoring requirements. In fact, low transmission latency and jitter may be required for any type of data retrieving paradigm, and even triggered-based transmissions may be performed

without time constraints, in the case a fast response is not required for the monitoring application. Once again, definitions concerning the expected transmission service must always consider the particularities of each monitoring and control application, in order to achieve higher transmission efficiency.

MULTIMEDIA CODING

Wireless multimedia sensor networks may be employed to retrieve any combination of audio, still images, video streams and scalar data from an area of interest. Specialized source nodes may be deployed to retrieve a particular type of data or multipurpose sensor nodes equipped with a low-power camera and a microphone may be employed, resulting in different configurations of homogeneous or heterogeneous networks. Whatever the case, when multimedia information is sensed from the monitored field, the way audio, image and video will be encoded and compressed will impact the transmission rate, the energy consumption and packet relaying over sensor nodes.

Sensed multimedia data have to be digitalized and packetized before transmission through the network. When received at the destination, the media is converted back to its analog form, preferably as close as possible to the original media. This coding process is performed by specialized multimedia codecs.

Different media types require different codecs, which will exploit the particularities of the media to achieve more efficient data compression. As sensor nodes are resource-constrained and battery-operated, the employed codec should not be complex enough to drain the processing, memory and energy resources of source nodes. On the other hand, high compression efficiency will reduce the amount of information to be delivery over relaying sensors, potentially reducing energy consumption for data transmission. However, higher compression efficiency requires higher computational power. This tradeoff should be properly handled in wireless multimedia sensor networks, according to the expected transmission throughput, error resilience, end-to-end delay, energy consumption and quality of reconstructed media at the destination.

In general words, multimedia codecs employed in traditional Internet-based networks should be used carefully in wireless sensor networks, since they are not designed for energy efficiency. In fact, there are three main design issues that should be considered when employing multimedia codecs in sensor networks, as follows:

- **High Compression:** Uncompressed raw multimedia data requires high transmission bandwidth. As energy efficiency will be a major concern in most cases, lossy or lossless compression should be applied over sensed data.
- **Error Resilience:** Wireless links are error-prone, especially in noisy environments. The employed coding technique should provide some error resilience, improving the attainable quality of transmitted multimedia data.
- **Low Complexity:** Multimedia encoding is performed by source nodes, optionally using some additional sensors to share the processing burden. However, sensors are expected to be resource-constrained. High-complex codecs may demand excessive energy consumption or be even prohibitive. Thus, such codecs should be avoided, even if they achieve high compression rates.

For many codecs, processing will be done at the origins, what may rapidly deplete the resources of source nodes. As an alternative, multimedia data may be encoded in a distributed way, employing many

nodes to process an amount of information. An example of how distributed visual data compression may be exploited in wireless sensor networks is described in (Wu & Abouzeid, 2005). That work argues that individual nodes may not have sufficient computational power for source encoding of all collected visual data, especially for large images, turning in-network image compression potentially advantageous. And even if source nodes can satisfactorily handle image compression, distributed in-network processing may provide fairer energy consumption when exploiting idle nodes. Nevertheless, when all or part of raw multimedia data is compressed by nodes other than the source, specialized protocols have to be employed to deliver the tasks among the nodes and coordinate the distributed compression.

Another strategy to reduce energy consumption is shifting the processing burden to the destination (*sink*), which is expected to be resource-full. In the Distributed Video Coding (DVC) technique, the encoders are less complex than the decoders. The main idea of codecs based on distributed video coding is to consider the source statistics at the decoder, exploiting spatiotemporal information in data retrieved by multimedia sensors (Aaron *et al.*, 2004).

Each type of media will require different coding strategies. For example, images may be encoded using progressive or wavelet-based algorithms, while many popular video codecs are based on predictive coding to achieve compression exploiting the motion nature of video streams. For audio coding, the monitoring requirements will indicate what type of audio should be retrieved, since some relevant noises may be outside the frequency that can be discerned by humans (and considered by voice codecs). In such way, codecs for VoIP applications may be not effective for some audio monitoring, unless properly adjusted.

Table 2 lists some of the most popular multimedia codecs that can be employed in wireless multimedia sensor networks.

Besides the employed codec, some coding parameters will also affect multimedia transmission in WSN. Still images may be colored or grayscale, where a pixel may be typically represented by 1, 2, 3, 4 or 8 bytes. Transmission of 64-bit colored images will usually demand much more communication bandwidth and energy than transmission of 8-bit grayscale images. Moreover, visual data may be represented in different resolutions, where images or videos will be typically small due to the resource-constrained nature of wireless sensor networks. Table 3 presents some common formats for images and videos in WSN, that are variations of CIF (Common Intermediate Format) and VGA (Video Graphics Array) resolutions.

Table 2. Some popular multimedia codecs

Codec	Media	Short Description
JPEG	Image	Codec exploiting Discrete Cosine Transform (DCT) for efficient lossy compression.
JPEG2000	Image	Codec exploiting Discrete Wavelet Transform (DWT) for more efficient lossy compression.
H.263	Video	Video transmission for low-bit rate networks.
H.264	Video	Codec very suitable for video streaming, supporting low-bit rate transmission and better error resilience.
G.711	Audio	Uncompressed voice codec for high-quality audio transmission
G.726	Audio	Audio codec for digital telephony with acceptable high quality at low transmission rate.

Table 3. Common resolutions for image and video in WSN

Format	Resolution (Pixels)
SQCIF	128 x 96
QQVGA	160 x 120
QCIF	176 x 144
SCIF	256 x 192
QVGA	320 x 240
CIF	352 x 288
VGA	640 x 480
4CIF	704 x 576
16CIF	1408 x 1152

When streaming video, another relevant coding parameter is the number of frames per second (fps). Higher video quality will be typically achieved for higher values of fps, but more packets will be transmitted over the network when more frames per second are used to encode video. A reasonable value for fps can be borrowed from videoconference systems in Internet, where 15fps is the minimal recommended value for video streaming. However, visual monitoring by sensor networks may have different requirements of video quality, due to the limitations of multimedia transmissions in WSN.

In short, the desired quality of received data by the sink will vary according to the monitoring applications, but it is reasonable to conceive that many applications will only need low-quality versions of audio, image and video, especially when sensed multimedia data is used only to complement scalar information.

TRANSMISSION PROTOCOLS FOR WIRELESS MULTIMEDIA SENSOR NETWORKS

Transmitting multimedia data in WSN is indeed a challenging task, either due to the large amount of data to be transmitted or due to the real-time nature of some multimedia monitoring applications. Nodes are resource-constrained, imposing demands for energy-efficiency and limiting the use of complex algorithms. Therefore, when designing protocols for wireless multimedia sensor networks, there are some principles that must be properly considered, guiding the development of MAC, routing and transport layer protocols.

MAC Protocols

Wireless multimedia transmissions may demand high bandwidth and low latency, which may be accomplished employing appropriate MAC protocols. The natural solution for wireless sensor networks was to use IEEE 802.11 protocol to provide MAC services, especially due to its high transmission rate. In fact, 802.11 standard is suitable for multimedia transmissions, but it is not designed for energy efficiency.

In such way, it is expected that modern wireless sensor nodes will communicate employing protocols whose major concern is energy preservation.

Energy saving is usually achieved alternating active and inactive periods of transmission. A sensor node will periodically sleep to reduce energy consumption, waking up for packet transmission and reception. This behavior is required because energy is consumed even when sensors are in an idle listening state. Of course, such procedure will reduce the network throughput, potentially impacting multimedia transmissions. Protocols as IEEE 802.15.4 (Baronti *et al.*, 2007) and T-MAC (Dam & Langendoen, 2003) define dynamic sleeping periods for wireless sensor networks, but they have no special concern for multimedia content. When images and other multimedia data have to be transmitted using commercial sensor motes, a big challenge is then to adapt the reduced communication bandwidth (IEEE 802.15.4 supports a maximum transmission rate of 250 kbps) to the transmission requirements of multimedia sensing.

When multimedia transmissions became a design challenge for wireless sensor networks, MAC protocols were extended to copy with the new presented requirements. For example, IEEE 802.15.4 standard defines a TDMA GTS (Guaranteed Time Slot) for fast transmission without previous request for transmission slots. For multimedia transmissions, these slots could be exploited to assure some level of real-time data delivery and there are some investigation works that propose extensions on GTS for higher throughput (Koubâa *et al.*, 2008).

Routing

There are many issues related to packet relaying and routing in wireless sensor networks that may particularly affect multimedia transmissions. Source nodes will transmit packets through single or multiple multihop paths toward the sink. A relevant issue for multimedia transmission is to select the best transmission paths, concerning throughput and latency. In general, there are two different types of transmission paths available for WMSN. First, one intermediate node may belong to more than one path, depending on the nodes position after deployment and the available paths discovered by the routing protocol. In such case, nodes will process traffic from more than one source, composing braided-paths. A different approach is to model node-disjoint paths, where intermediate nodes will be dedicated to a specific traffic. Some specialized protocols are used to define transmission paths, following different approaches (Abazeed *et al.*, 2013). And each of these paths will have different impacts on multimedia delivery in sensor networks.

For multimedia transmissions, multiple node-disjoint paths are a reasonable option to achieve high throughput in wireless sensor networks. In (Zhang *et al.*, 2008), the proposed algorithm finds the best paths for multimedia streaming in WSN, considering a set of available node-disjoint paths, where the best paths are those with lower end-to-end transmission delay. Doing so, efficient load balancing is performed to increase the attainable transmission bandwidth. In a different way, when employing braided-paths, prioritizations algorithms may be used to guarantee efficient multimedia transmissions, acting in relaying nodes that receive traffic from more than one source node.

In this context, a very relevant issue is packet prioritization. In short, prioritization approaches may be based on local or global QoS. In local QoS, the relevance is valid for a limited scope. For example, some parts of encoded multimedia data may have higher relevance for the reconstruction process, as in DWT-based images. When regarding global QoS, however, the defined levels of relevance have significance that is valid for the network as a whole, as for example when sensors are differentiated by their potentials to retrieve significant data for the monitoring functions of the considered application (Costa &

Guedes, 2013). Whatever the case, the QoS of transmitted packets may be considered in relaying queues of intermediate nodes, for prioritized transmissions. Such a prioritization would then benefit transmissions with time constraints or even avoid congestion and subsequent packet dropping.

Transport Protocols

In a different way of transport protocols in Internet, transport protocols for wireless multimedia sensor networks must be designed for energy-efficiency and, optionally, for error-resilient transmissions with low delay and jitter. Moreover, well defined concepts as end-to-end transport-layer communication should be revised in order to achieve higher efficiency. Transport protocols in WSN may operate in a hop-by-hop basis, where intermediate nodes can process packets during transmission.

Transport protocols for wireless multimedia sensor networks are mainly designed to support congestion control, loss recovery or both services, according to the applications monitoring requirements. Congestion control may be performed only on congested nodes or over an entire communication path to face the cause of congestion or even to relieve congested nodes dropping excessive packets. In some cases, the dropping policy may regard the relevance of data packets, firstly choosing to discard lower relevant packets. Furthermore, loss recovery by transport protocols may be available to compensate packet losses during transmissions. In short, transport protocols may retransmit corrupted packets, may send redundant duplicated packets or employ correction codes.

When intermediate nodes or wireless links get congested, multimedia communications may experience packet dropping, transmission delay and energy depletion. In WSN context, congestion mitigation may be classified in three categories (Costa & Guedes, 2012): (1) Rate adjustment, (2) load distribution and (3) congestion avoidance. In rate adjustment, the transport protocol tries to reduce the current transmission rate in order to relieve congested nodes or the communication path(s), probably reestablishing the original rate after congestion. In a different way, the load distribution approach may increase the transmission rate over paths that are not congested, decreasing the load at congested path(s). At last, congestion avoidance strategies try to anticipate a congestion situation, changing the current transmission configuration. A practical way to predict or detect congestion is checking the relaying queue of intermediate nodes (Yaghmaee & Adjeroh, 2008).

Typically, packets are dropped when the network faces congestion, when bit-errors occur during packet transmission over wireless links or when intermediate nodes fail or run out of energy. After loss detection, error recovery may be employed through retransmission, redundancy or correction codes. When packets are dropped, the sink or intermediate nodes can request the retransmission of the packets carrying the lost data, in an end-to-end or hop-by-hop fashion. In WSN, hop-by-hop retransmissions may reduce energy consumption avoiding undesired transmissions through some multihop links. In a different way, redundancy will add information in advance, either into data packets (as an additional header) or creating replicated packets. Replicated packets increase the probability of successful packet reception, but they also increase energy consumption (Naderi *et al.*, 2012). When redundancy is implemented adding information into data packets, correction codes are employed in different levels of complexity, where corrupted packets may be recovered processing the codes (employing, for example, Reed-Solomon algorithms).

Camera-enabled sensors are likely to have a unique view of the monitored field, turning error recovery into a desired service in order to preserve sensed information. Moreover, motion compensated video coding is especially sensitive to loss because of temporal error propagation. Thus, visual monitoring will be usually more concerned with error recovery than audio streaming in wireless sensor networks,

since neighbor audio nodes may often retrieve equivalent information and many audio codecs provide some error resilience.

Whatever are the provided services, transport protocols for multimedia transmissions in wireless sensor networks will have to deal with the stringent requirements of multimedia monitoring applications, along with the resource-constrained nature of sensor nodes.

MULTIMEDIA-BASED OPTIMIZATIONS

Multimedia data sensed by source nodes have to be digitalized and transmitted to the sink over one or more multihop transmission paths. The energy and processing constraints of the sensor nodes, as well as the nature of the wireless links that interconnect them, restrict the attainable bandwidth of the communication path(s) and impose a considerable packet loss rate. Hence, in wireless multimedia sensor networks, it is crucial to optimize communications in order to minimize energy consumption and to maintain an acceptable quality for the application.

An efficient way to optimize multimedia transmissions in WSN is to exploit the characteristics of multimedia coding techniques. When following a cross-layer design, such characteristics may alter the operation in transport, networking, MAC and physical layers, influencing procedures for congestion control, error recovery, multipath selection and energy preservation. In short, protocols following cross-layer design disrupt the concept of modularized layers, which reduce the overhead and optimize the jointly design of network protocols (Costa & Guedes, 2011).

Multimedia coding techniques are used to compress the original data, reducing the required transmission rate. In spite of that, some characteristics of multimedia coding may be exploited to optimize the network operation. As an example, DWT coding technique defines different relevancies for the encoded data, since original images are decomposed into separate subbands. As these subbands have different importance for reconstruction of original images, packets may be prioritized according to their payload.

In fact, the expected optimizations may be performed in source nodes or over intermediate nodes of transmission paths. In source nodes, for example, more relevant data may be transmitted through the best transmission paths, while low relevant data may be silently discarded in source nodes when network faces congestion. On the other hand, in-network optimizations may be concerned with packet relaying, assuring higher priority to most relevant packets.

Table 4 presents some common multimedia-based optimization approaches.

Table 4. Some common multimedia-based optimizations

Optimization Approach	Example
Transmission rate adjustment	When necessary, source nodes may avoid transmitting packets containing less relevant encoded data, decreasing the current transmission rate.
Congestion control	Less relevant packets may be discarded in congested queues, reducing the negative impact in the perceptual quality of the received media.
Error recovery	A correction code can be employed to protect only the most relevant parts of the encoded data.
Differentiated MAC transmission	Based on the relevance of multimedia data after encoding, MAC protocols may provide a differentiated treatment in terms of reliability and channel access.
Multipath routing	Prioritized packets can be routed through the best paths or the multipath routing facility may be used to transmit redundant high-relevant packets to protect them from errors during transmission.

Wireless multimedia sensor networks are strongly influenced by the adopted coding technique. The source transmission rate, the energy consumption over transmission path and the error resilience of the communication depend on the way multimedia data is encoded and decoded. In fact, audio, images and video streams have different coding characteristics. Hence, multimedia-based optimizations must properly consider the particularities of the employed media, in order to attain higher efficiency.

Although some quality loss may be experienced in multimedia-based optimizations, when lower-relevant information is not of much concern, data retrieving is somehow improved, enhancing the overall efficiency of multimedia transmissions.

Audio Optimizations

Audio typically represents human voice or some noise relevant for the application, with transmission rates usually lower than 64 kbps. When applications are only concerned to human speech, typical VoIP codecs can be borrowed to process audio data. However, some relevant noises may be outside the frequency range that can be heard by humans, requiring proper audio codecs. Whatever the case, there are some particularities of the coding process that can benefit multimedia transmissions.

Audio sensors may be continuously transmitting audio data sensed from the monitored field. In this context, even silent periods may be transmitted, consuming energy resources of the network. For some applications, however, some silent periods and "comfort" noises may be spared and source sensors or intermediate nodes may choose to discard packets containing this type of information.

Other relevant issue is loss compensation. Some algorithms for VoIP applications allow parts of reconstructed audio at destination to be recovery from some packet losses, employing interpolation techniques over successfully received data. In the wireless sensor network context, such algorithms could allow low or moderate packet discarding at source nodes to reduce energy consumption, at the cost of some quality loss that can be tolerable by some monitoring applications.

Image Optimizations

Images are snapshots retrieved by camera-enabled sensors. Typically, image transmissions require less bandwidth than video streaming, but it still requires proper treating especially when dealing with error resilience and real-time delivery. Monitoring applications designed for snapshot retrieving may impose different demands for image quality, which may range from highly-compressed SQCIF grayscale images to high-quality large colored images. Moreover, some applications may be designed to sense infrared or ultraviolet images, with specific visual coding requirements.

Most image encoding algorithms for WSN will be classified in progressive or wavelet-based categories (Costa & Guedes, 2011). In the first case, images are compressed through multiple scans with progressively increasing details. The first scan shows the image at the equivalent of a very low quality setting, and following scans gradually improve the quality. Progressive coding based on DCT can reduce spatial (among neighboring pixels) and spectral (among different color planes) redundancy, decreasing the amount of bits to be transmitted over the network. On the other hand, wavelet-based image compression employs DWT and involves two-dimensional wavelet decomposition of the original image, generating low and high frequency subbands.

When defining image-based optimizations, characteristics of the coding technique can be exploited to generate data with different levels of relevance. For progressive coding, source nodes may transmit only low quality scans, in order to save energy. For wavelet-based images, the separate subbands may be exploited to define different transmission priorities. Whatever the case, most relevant data for the reconstruction of the original image must to be always preserved over lower relevant data.

Other possibility for image-based optimizations is exploiting the content of gathered images, instead the coding characteristics. In (Cheng & Shang, 2007) the most relevant parts of image snapshots receive high-quality encoding, since they are most relevant for the application. The remaining parts (e.g. background details) are then encoded with huge compression (e.g. 100:1), reducing the overall size of the encoded image. At the destination, all parts of the same image are reassembled, resulting in different visual qualities of regions of the same image. Doing so, the reconstructed image is suitable for the application requirements and energy is saved when fewer data packets are transmitted, enhancing efficiency when compared with transmissions of images with uniform high-quality compression.

Video Optimizations

Video streaming in sensor networks is resource-demanding by nature. Actually, the same constraints in terms of delay and quality considered for image transmissions may apply for video streaming, with addition of some extremely relevant characteristics, as high bandwidth demand. In this context, efficient video compression is highly desired, but processing, memory and energy constraints of visual source nodes will generally forbid the use of complex coding algorithms.

The coding process of raw video may follow different approaches, achieving high or low compression. A usual approach is to consider information of the scene, such as motion and variation of luminosity, for higher compression. Most Internet video codecs are based on predictive coding and it is natural to try to adapt such codecs to video streaming in wireless sensor networks. Those codecs exploit the data statistics to reduce the transmission rate, performing intra-frame and inter-frame coding. In fact, video-based optimizations in WSN have considered predictive encoding because the inner characteristics of such codecs are very propitious for cross-layer optimizations.

In (Politis *et al.*, 2008) it is proposed a multipath predictive-encoded video transmission in wireless sensor networks. The proposed approach discards less relevant frames (containing complementary details) in order to decrease the source transmission rate, dynamically adjusting the transmission flow when the attainable bandwidth is insufficient. Other optimization approaches that have been proposed in the last years also employed predictive coding when relaying and recovering video data packets (Costa & Guedes, 2011), where error recovery, congestion control and security have been optimized following different approaches.

Optimizations on video streaming may be also performed considering the relevance of retrieved information. For example, in an intrusion detection system, no data may be transmitted in the absence of a relevant event, significantly saving energy. Following the same perspective, optimizations may define different levels of quality for segments of the transmitted videos, employing different number of frames per second or color schemes. A typical optimization could start high-quality video streaming only on the occurrence of relevant events or on scheduled time.

ADAPTIVE MULTIMEDIA TRANSMISSIONS

The overall performance of wireless multimedia sensor networks can be considerably enhanced when some network optimization solutions are employed, addressing issues as energy efficiency, reliability and delay-aware data transmission. Although many optimizations are based on characteristics of multimedia coding, the performed optimization has only significance for the source stream. In a different way, some optimization approaches will be concerned with a group of sensors and their transmission behaviors, which may adapt to the current monitoring context.

Multimedia sensing may have different monitoring contexts along the time, which may be reflected in different levels of global QoS. In other words, sometimes it does not matter the way multimedia data is encoded, but the significance of the sensed data for the application. For example, source nodes may have different sensing relevancies, or they may be assigned to different relevance levels in the occurrence of critical events. Sensing coverage may also be optimized to achieve equivalent monitoring with fewer active sources. In all these cases, the way multimedia is sensed and transmitted is considerable changed, whatever is the employed codec.

The potential of source nodes to retrieve relevant data may be exploited as an innovative parameter of global QoS. And such potential is a direct function of the expected targets to be monitored, instead of only the deployed network characteristics, resulting in a new paradigm for prioritization (Costa & Guedes, 2013). Doing so, packets from different source nodes may have different priorities for the network, since data from the most significant source nodes are more important for the application quality. For example, in industrial control applications, multimedia sensors that gather information from critical areas, even in normal operation, are more relevant and should receive prioritized treatment by the network.

Frequently, a critical situation needs to be monitored with higher visual quality and the retrieved information needs to be delivered with lower end-to-end delay than usual transmission. In the occurrence of a critical event, as a bomb explosion, multimedia sensors that retrieve data from the area of interest must be quickly assigned to a higher relevance level. In the network perspective, there will be part of the network that is retrieving more relevant data or that is transmitting with stringent requirements for high bandwidth and low latency. In such way, the network as a whole should try to assure enough resources for the most relevant information, whatever are the data types or employed codecs.

Besides sensing relevance, the optimal configuration of multimedia sensors may result in monitoring of equivalent information for the application. This may be common in wireless visual sensor networks, where source nodes gather information following a directional sensing model. In this scenario, the use of optimal orientations may select a small group of visual sensors that still can view the same targets originally viewed by the initial sensors. For example, different optimization algorithms are proposed in (Ai & Abouzeid, 2006), aiming at the computation of the initial orientations of visual sensors in order to cover as many targets as possible, activating the minimum number of sensors. Doing so, fewer data packets will be transmitted over the network, potentially reducing energy consumption and assuring higher throughput and lower delay.

Data compression is often desired in multimedia transmissions, but the expected benefits are more evident for resource-constrained networks. In short, compression is aimed at finding the most concise representation of an original signal, which still has an acceptable quality level. In general, multimedia algorithms that achieve high compression are complex and may demand considerable energy of source nodes. Moreover, some codecs do not provide error resilience, which may be particularly prejudicial for wireless multimedia sensor networks. As an alternative to traditional methods, compressed sensing is a

new paradigm that allows monitoring with fewer measurements than traditional methods (Pudlewski & Melodia, 2010). The idea is to sense data in a compressed form, instead of sensing data in a high rate and then compressing the sampled data. For wireless multimedia sensor networks, compressed sensing allows the development of low-complex video and image codecs. Besides energy saving when fewer data packets are transmitted, compressed sensing has an inherent resiliency to link errors, due to unstructured visual data representation.

Although bringing different results, the discussed approaches are good examples of how multimedia monitoring may adapt to different monitoring contexts. The same network may even apply different monitoring paradigms for different areas of interest and for different source sensors. The response to critical events, the sensors meanings and compression approaches should be considered as dynamic characteristics of the network, which need to adapt to different monitoring contexts and sensors configurations to achieve higher efficiency.

FUTURE RESEARCH DIRECTIONS

Multimedia transmissions in wireless sensor networks still present many challenges that will foster the development of new solution and optimization approaches. There are many relevant topics that will guide future researches in this area, comprising relevant issues as energy-efficiency, real-time transmission, security, error resilience, mobility and availability.

Many cross-layer optimization approaches exploiting characteristics of multimedia coding have been proposed in the last years. In this context, the way multimedia coding techniques evolve may impact optimizations in WMSN. With new codecs being developed, bringing different results in terms of computational complexity, data compression and error resilience, new options will be available for multimedia transmissions. And some coding techniques may be more suitable for resource-constrained sensor networks.

As energy efficiency should remain a major concern for the upcoming years, multimedia-based algorithms in wireless sensor networks should be designed to reduce energy consumption while achieving the desired optimization.

Multimedia sensors may be embedded in mobile nodes. Sensors mobility may allow a large variety of innovative monitoring applications where multimedia sensing will adapt to different scenarios. If sensors are embedded in robots, drones or cars, optimized algorithms should be employed to dynamic positioning of multimedia sensors. In a different perspective, new algorithms should be developed to adapt the network topology and routing algorithms when mobile source sensors are deployed. For example, if low-power cameras are embedded in glasses, and people wearing those glasses are passing by in random directions, the sensor network should adapt to efficiently retrieve the desired information.

Other relevant research issue is sink mobility. As multimedia sensors may gather a lot of information, a mobile sink might move over the monitored field retrieving sensed data. If transmissions happen only when the sink is near, energy is saved over the network when avoiding some packet relaying. And this scenario could be even more complex if multiple mobile sinks are deployed, although the achieved performance might be significant.

Directional coverage by visual sensors also imposes many challenges that still require proper investigation. In this context, sensing redundancy should be properly addressed, since redundant nodes could

be exploited to extend the network lifetime and to reduce data transmissions. In general, if less source nodes are activated, fewer data packets are transmitted over the network.

Generally, new challenges in transmission rate adjustment, energy preservation, congestion control, error recovery, multipath transmission and in-network compression should still arise, requiring additional research in multimedia-based and context-aware optimizations. Some of these challenges may be more stringent in specific monitoring applications, especially when concerning heterogeneous multimedia sensor networks.

CONCLUSION

Wireless sensor networks have been one of the main research topics in digital communications. Composed of many low-cost battery-operated devices with sensing and computing capabilities which cooperatively communicate in a wireless manner, WSN allowed a variety of innovative applications for sensing in wide, hostile or even hard access areas, as battlefield surveillance, industrial control, environmental monitoring, rescue operations, home entertainment and pollution detection, among many others. When sensors are equipped with inexpensive low-resolution CMOS cameras and/or microphones, multimedia data can be retrieved from the monitored field, allowing a new scope of applications. The resulting wireless multimedia sensor networks enhance the understanding of the physical world, improving scalar monitoring and control applications and fostering the development of new multimedia-based sensing functions.

In this chapter, we covered the most relevant topics concerning multimedia transmissions in wireless sensor networks. The main design issues for these communications are discussed, concerning topics as multimedia monitoring, multimedia coding, QoS, routing, error recovery and congestion control. In fact, the covered topics are relevant when designing multimedia transmissions in resource-constrained sensor networks, supporting in planning, deployment, configuration and management of WMSN. Furthermore, the discussed strategies for optimizations may guide future developments in these networks, significantly benefiting the use of practical multimedia monitoring applications and new research in this area.

KEY TERMS AND DEFINITIONS

CIF: A common image resolution often used on videoconference and video streaming systems.
Depth of View: The distance between the nearest and farthest objects that can be sharply viewed.
DCT: Discrete Cosine Transform allows progressive-based image coding.
DVC: A video coding paradigm that shifts complexity to the decoder side.
DWT: Discrete Wavelet Transform allows wavelet-based image coding.
Field of View: The area viewed by a camera-enabled sensor. It has a direction of viewing.
Jitter: Time difference in packet arrival time.
Latency: The overall time for processing and end-to-end transmission. However, it is usually a synonym of transmission delay.
QoS: Quality of Service, indicating the expected quality for some service or application.
Sink: A resource-full node that is the gateway of the network. A WSN may have one or more sinks.
TDMA: A popular modulation scheme where transmission is performed in time slots.
Throughput: A measure of the successful message delivery, associated with the transmission bandwidth.
VGA: A common resolution often used to indicate the visible area of screens.
VoIP: Voice over IP, standing for voice communications in Internet.
Wireless Multimedia Sensor Networks: A network composed of resource-constrained sensors equipped with a camera or a microphone for multimedia data monitoring.
Wireless Sensor Networks: A network of resource-constrained sensors and optionally actuators.

Chapter 3
Past-Blogging:
Defining a Practice

ABSTRACT

In this paper, the authors conceive past-blogging as a narrative practice which is based on a specific media format. The practice can be initially defined as an account of past events developed according to blogs' most common characteristic: the reverse chronological order of published posts, in which the most recent posts appear on top of the page. Past-blogging practices give rise to cultural products developed in various digital media platforms, especially in journalistic and educational contexts. In order to understand this phenomenon, the authors conducted an empirical and qualitative analysis of 34 cases in which content producers narrate past events by reenacting them or telling their history as if they were happening in the present. The sample – composed by different categories of events, platforms, narrative strategies, motivations for the content production and participation of audience – demonstrates how historical events have been represented within digital media.

INTRODUCTION

Media play a significant role when it comes to creating representations of historical events. News companies, radio stations, magazines and online news portals often produce special coverage during celebration periods, such as anniversaries of relevant historical events. This practice ranges from broadcasting documentaries, interviewing witnesses and historians to offering interactive features, like newsgames. In Ebbrecht's (2007) words: "When history becomes a current event, because of anniversaries or rising

DOI: 10.4018/978-1-5225-3822-6.ch003

public interest in specific historic topics, media has the role of communicating and emphasizing the importance of remembrance." (p. 223).

However, there are still practices and media formats that ought to be studied so that an understanding about contemporary representations of historical events can be reached. In this paper[1], we propose the study of what has been called "past-blogging"[2] practices, which will be empirically studied through specific media formats used by journalists, educators and bloggers in general. We aim to identify the characteristics associated with the practice of past-blogging, defined here as the act of live blogging past events, as if they were happening in the present. They are, at the same time, retrospectives and reenactments of historical events produced in digital media, especially on social networking sites and journalistic platforms. In other words, producers of historical content blog about the past using digital communication strategies to compose a narrative in the present. By appropriating the already established term "live blogging", which is also related in many ways to the practice we analyze here, we elaborate on the idea of past-blogging.

The research questions guiding our investigation are: What elements define the practice of past-blogging? What do these media formats reveal about the way history is represented nowadays in the context of digital media? In order to address these questions, we have analyzed the content of 34 cases of past-blogging practices, aiming at identifying common elements among them.

In this paper we first contextualize the perspective from which we describe blogs and social media as environments where memory practices take place. Then we present the case studies we have undertaken in order to identify differences, similarities and patterns among past-blogging practices and respective platforms. Finally, we discuss the results and propose future developments for this research.

PLATFORMS, USES AND PRACTICES

The use of blogs to narrate events is directly linked to its origin as "web" navigation "logs" (Blood, 2000). Since these tools were initially created by hand using html, the most recent entry used to be added to the top, with all other messages being pushed down the page. That led to the emergence of one of the most classic features of the blog format: the reverse chronological order (new entries on the top, older entries on the bottom).

Initially, blogs were used for personal purposes, such as for navigation logs or personal diaries. But over the time they started to be recognized as a medium for news. Blogs started to be seen as spaces for news especially during the Iraq War, with warblogs being used to report what was happening on the scene (Recuero, 2003; Wall, 2005). This use is directly related to historians' use to blog about contemporary history and current affairs (Cole, 2011). "Historians addressing current affairs can function journalistically, doing information-gathering, presenting analysis and synthesizing or aggregating large numbers of narrow articles" (Cole, 2011, p.669). These digital platforms started to be used because they allowed for agile, easy and flexible ways of publishing and sharing news and messages. Today one can find blogs focused on various topics and communities of interest, from cosmetics, fashion and health care to tourism, education and scientific popularization - just to cite a few examples. We are here concerned with the appropriation of blogging practices in regard to historical events.

News events are occurrences that take place in the everyday routine that are important and different enough to be transformed into news (Rodrigues, 1996). Using a blog-like structure to narrate news events as they happen is an appropriation of the format, a practice commonly referred as "live blogging"

(Thorsen, 2013, Thurman & Walters, 2013). Live blogging is employed in the coverage of events that entail breaking news, like unexpected natural disasters, or scheduled and planned series of messages about big events, like Oscar and World Cup (See Typology of Live Blogs at Guardian.co.uk in Thurman & Walters, 2013) or even academic conferences. Historical events are mainly transformed into news events when their anniversaries are celebrated or when a present event news piece recalls them. When a new terrorist attack happens, for example, other previous similar events are evoked by the media. Live blogging platforms are commonly employed to narrate breaking news events, while historical events are presented in past-blogging practices and respective media formats.

Blogs can be seen as a particular type of format for relaying history. Other formats are possible, such as books or movies (Lähteenmäki and Virta, 2016), in which history is retold in written discourse or through live action pictures. Every format has its specificities, allowing for some appropriations as well as denying others. While films are a popular way of presenting history, it may not be historically accurate, as some adaptations have to be made to fill in gaps in history. The live blogging format, for instance, has some specificities, such as the fact that it allows for participation of the public that is accessing the feed, or needs some adaptation in terms of language and discourse so that history is relayed as something that is taking place in the present. There are other technical possibilities that enhance the format, such as the possibility of adding historical photos, or adding links to sources where users can find more information about the event that is taking place. Temporal differences can also be noted – the movie will take place on its duration (90 minutes), the novel can be read all at once, but the live feed may take as many days as it took for the history to unfold (Lähteenmäki and Virta, 2016). As Lähteenmäki and Virta (2016, p.10) state, "different forms of representation can carry out different aspects of representation better than others (a photo of a landscape seems to offer more to its viewer than a verbal description, for example)." It is in this sense that we look at past-blogging practices and its respective media formats.

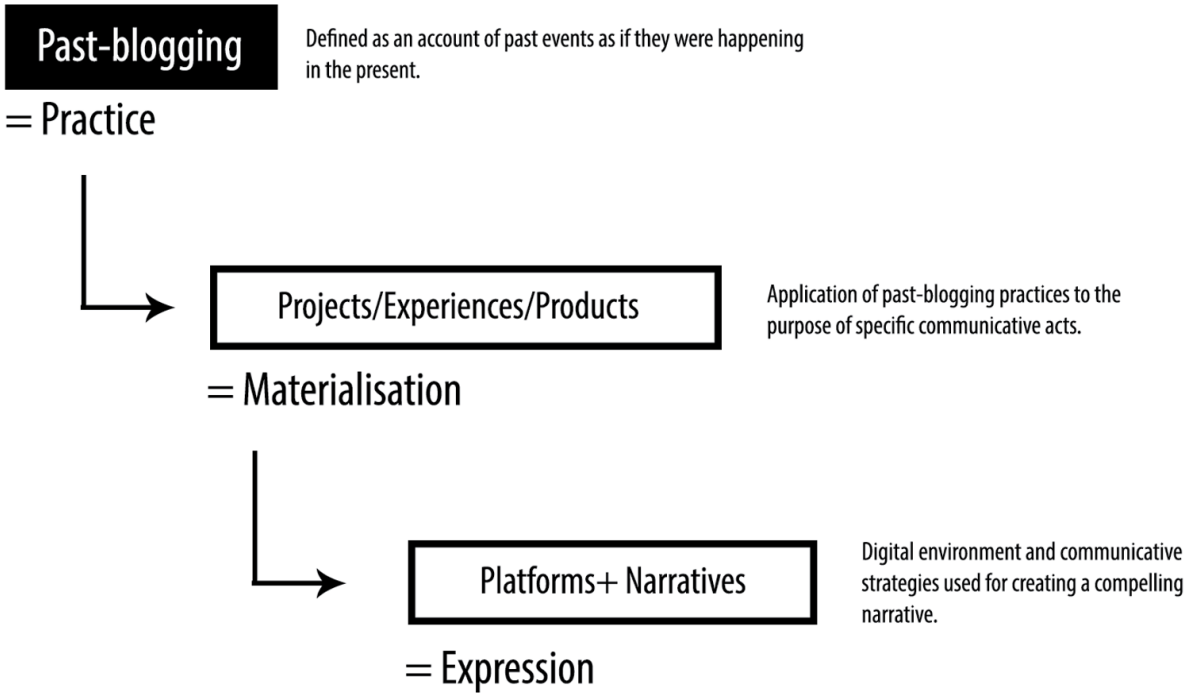
PAST-BLOGGING

Here we are especially interested in the media formats derived from past-blogging practices, which can be defined as the practice of live blogging past events. Journalists and educators often use these formats in order to narrate and reenact historical events. History is presented in a compelling way, raising awareness of the past event in the present historical context. One of the effects to history of such a communicative practice is the production of "a present past updated through narrative." (Bonsanto, 2014, p. 8) strategy. The use of the format also stimulates participation as blogs and other similar tools allow for comments and other forms of interaction and feedback. Figure 1 shows a systematic view of the concept.

In this research, we regard past-blogging in a much broader sense that goes beyond the blog platform and also encompasses other tools sharing some of the core characteristics of blog (such as in using a common feed where posts are delivered in a reverse chronological order). Examples include social network sites such as Twitter and Facebook. This sense of temporality presented in blogs, as well as in Twitter timeline, Facebook news feed and live blogging platforms used by news portals, seems to work well when it comes to the retrospective representation of historical events. The content presented in past-blogging practices follows the order and time in which important moments of historical events took place. This gives a sense of synchronicity and accuracy to the proposed narratives, especially to reenactments.

Past-blogging can be also described as modes of narrating the past that are ascribed in the affective turn of the field of history (Agnew, 2009). By narrating the past as if it was happening in the present

Figure 1. Structure of the concept of past-blogging



moment, the normal flow of a Twitter timeline is interrupted, for example. This characteristic challenges a fundamental issue for the construction of narratives, the context of production and reception of the account. At the same time, the possibility of "experiencing" a past event through its narration brings history closer to people, promoting a "sympathetic identification with the past" (ibid., p. 302; Collingwood, 2005, p. 189). This can be especially observed in past-blogging practices identified as reenactments of historical events. In such cases, one can often see the simulation of characters' performances, and the description of historical sites and situations. According to Agnew (2009 p. 300), media products that use reenactments as a communicative strategy share a "concern with personal experience, social relations and everyday life, and with conjectural and provisional interpretations of the past". Bonsanto (2014) has specifically studied the narrative effects produced through the past-blogging practice performed by Folha de São Paulo in 2014. His discussion about the sense of topicality of past events produced by journalistic accounts sheds light on important implications of past-blogging practices for those experiencing such a narrative.

Turning the past into something more gripping does not rely just on news. Social actors working in educational sectors, especially history teachers, have been struggling for getting and keeping their students' attention:

The stories of the past presented in media, especially on television, are far more visceral than those presented in the classroom. Further, whereas the classroom teaches history with careful attention to objectively presented facts, the media may encourage the personal and emotional connections with the past that are associated with collective memory. (Edy, 1999, p. 72)

In a very mediatized and immersive context, the alternative pointed out by several scholars and teachers (Kansteiner, 2006; Naujoks, 2014) seems to be the incorporation of such media into educational environments. These uses of the past (Ricoeur, 2004) for educational and journalistic purposes (Edy, 1999, p. 83) are also part of the past-blogging phenomena. Since these practices are part of a "process of the present appropriation of history" (Ebrecht, 2007, p. 222), it turns out to be necessary to understand how they are produced and what are the elements constituting them.

A similar reflection about the appropriation of digital technologies for the production of historical accounts has been undertaken by Lähteenmäki and Virta (2016). This case study on the past-blogging product about Finish Winter War[3], produced by YLE – Finland's national public service broadcasting company –, confirms and complements various aspects presented in the overview we aim at providing. The authors refer to the phenomena as "relaying history: transporting portrayals of past events to the present time and format of social media to highlight and elevate their significance in Finnish history and encourage others to use the platform for similar purposes." (p. 5). Through the project @Sota39 (@WinterWar1939, the twin project in English), the paper analyses the "Twitterification of history" (p. 19), and covers a wide range of implications the use of digital media – in this case, Twitter – brings to the work of historians. Besides that, a deep look into interactions between audience and professional content producers is also taken. The complementariness of that study and ours lays on the fact that both problematize the same phenomenon from slightly different perspectives. While Lähteenmäki and Virta (2016) draw focus to the consequences of writing historical accounts through a different/new technology, we intend to examine how this narrative genre intervenes in the very act of producing digital content itself. This distinction becomes clear if one looks at the nomenclatures chosen in both studies: past-blogging on the one hand and "relaying history" on the other. Of course these are two sides of the same coin, since "history is a term that means both what happened in the past and the varied practices of representing that past, media are historical at several different levels." (Gitelman, 2006, p.5) Together they provide a full contribution for internet studies and history scholarship.

Hence, what we propose here is an overview that covers a range of examples, their form, and production process. A look into news reports about past-blogging experiences reveals that some characteristics are common between them. For instance, in terms of preparation, they usually demand a lot of time, a combination of sources, and the elaboration of posts in advance, so they can be posted exactly at the time/day intended (Bradshaw, 2015; Fleegel, 2015; Sawers, 2011). Some coverages even used tools to schedule posts for a specific time or date (Fleegel, 2015; Sawers, 2011). In terms of tone and language used, the most successful cases relied on retelling the story through a specific (Long, 2012) point of view, based on historical facts.

Current linguistic marks or new interpretations are also added to the narrative, as if the past events were taking place as present time Twitter breaking news (Rogers, 2013). The purpose is usually to illustrate to people how things worked out as they took place (Crymble, 2010; Sawers, 2011). The topics of these past-blogging practices are mostly major historical events, approached when they complete a new milestone (such as when they are celebrating 10, 20, 50 years, and so on), which inspire massive commemorations and moments of reflection. The participation of the public can help enhancing the narrative as they give suggestions in terms of sources and content (Bradshaw, 2015; Schuessler, 2011), as well as provide feedback (Bryant, 2011) and help giving visibility (Fleegel, 2015) to the content produced, by sharing and commenting on it.

METHODS

Previous exploratory observations indicated that several journalist and educational past-blogging practices were taking place on the Web. In order to construct a representative sample of cases to be analyzed, we used Google search engine and looked for results including the keywords history, reenactment, live tweeting, live blogging and retrospective. The combination of these terms directed us to blog posts, news reports and even podcasts[4] in which past-blogging practices were discussed. By following the hyperlinks of those search results, we managed to gather 34 different cases of past-blogging practices within multiple platforms. These methodological procedures proved to be effective and allowed us to map enough cases for a qualitative study.

The past-blogging examples we have collected refer to the events listed in Table 1, which presents the frequency of occurrence of each event, as well as the historical periods they represent and some other

Table 1. List of past-blogging projects analyzed

Event	Frequency (#)	Purpose	Platforms
1847 trek of the Mormon pioneers	1	Educative	Twitter
1848 attempt at German unification	1	Educative	Twitter
American Revolution	1	Educative	Twitter
Battle of Britain	1	Journalistic	News portal
Battle of Gettysburg	1	Educative	Twitter
Battle of Quebec	1	Educative	Blogspot

World War I	1	Journalistic	News portal
World War II	7	Journalistic/Educative	Typepad, News Portal, Twitter, Facebook

characteristics. These projects materialize past-blogging practices in the sense that they represent specific examples on how historical reenactments took place in various platforms and for a variety of purposes.

This sample covers 24 different events[5] that have had international, national or local repercussion. The historical periods are also varied, ranging from contemporary events (September 11) to the Ancient and Middle Ages (Byzantine Empire). In this sense, the timeframes represented seem irregular, considering that the Fall of the Berlin Wall took one day and the World War II lasted six years. These dissimilarities point to the flexibility and multiplicity of applications provided by the platforms where past-blogging practices take place.

After selecting the cases to be analyzed, we identified the main characteristics of each case. We conducted our empirical observation during the first week of February 2016 (Feb 01-07). For each of the 34 occurrences, we identified and described the approach used in the product (i.e. minute by minute, most important actions taken by certain characters), platform (i.e. Twitter, Blog), verb tense used on the narrative, motivation (reason why the product has been created), identity of the narrator(s) of the story, participation of the public (how active and engaged they seem to be), and sources used (materials used for the description of the event).

One of the most significant limitations of this methodological procedure is the selection process. There is no effective way of finding examples of past-blogging practices in a systematic way, especially because this is a format that is still being developed. Thus, we had to work with a random sample containing examples in English and Portuguese. In order to contribute to the field and promote the study of these practices, we have made available a collaborative directory[6] where multiple cases can be shared by anyone.

RESULTS

The qualitative analysis of the past-blogging cases provided us with an overview of this practice. As we are dealing with a media format that has been explored by very few scholars (Bonsanto, 2014; Lähteenmäki and Virta, 2016) – as far as we are aware now –, we propose a description of its features and elaborate a comprehensive definition. The results show patterns among the cases studied, as well as trends and particularities in the narration or reenactment of past events in the present.

Events

Most of the cases represent contemporary historical events. Among them, two events, World War II (7 times) and September 11 (2 times), share similar characteristics, such as the international repercussion. Their content has also inspired a great amount of cultural and media products, such as films (documentaries and fiction) and books (novels, academic, etc.). Past-blogging is a practice that gives rise to a new format for the mediation of these historical events.

Despite the diversity of events, two main themes embrace them: politics and conflicts with a national or international background. National events include the Sinking of Titanic (twice), the Military Coup in Brazil (twice), the Parliament Fire in London (1834), US Civil Wars (twice), the American Revolution, 1848 attempt at German unification, the Battle of Gettysburg, the State funeral of Winston Churchill, and the Battle of Quebec. Despite the immediate national reference, many of these events have also had an international impact. At the international level, we can mention the First spaceflight to the Moon,

D-Day (WWII), Fall of Berlin Wall, and other cases about WWI and WWII. Finally, the local level was represented in the Declaration of the Juliana Republic (Santa Catarina, Brazil) and in the LA Riots. One particular case deals simultaneously with three events: WWI, WWII and Cold War. As said before, the scale of these events is not watertight, though we adopted these categories for analytical purposes.

Some cases are not based on a recent historical period, but in the middle ages, ancient times or even in a mythological past. Considering this temporal distance, in some cases, past-blogging producers have to find alternative sources or narrative strategies for storytelling. That is why certain contents depend on the imagination and silences along with voices surrounding the past (Salmi, 2011). These aspects give room to new ways of accounting history: "Could it not also mean seeing the past as a world of possibilities? Then history would not be a closed entity but would remain open, potential, and a scientific account of it would have to include a place for the possible as well as the actual." (Salmi, 2011, p.178). Taking these statements as premises, we look for evidence to answer the following question: What are the potentialities of digital media platforms explored by producers of past-blogging narratives?

Platforms

Different features provided by digital media also play a key role in the way narratives are constructed. Within the analyzed sample, the most common platform is Twitter (21 cases). Some of the past tweeting practices (a specific type of past-blogging) incorporate features of the platform into the narrative, such as hashtags, lists grouping various characters represented by different profiles, the use of mentions "@", incorporation of pictures, and so on.

News portals also present their own past-blogging formats. In the online version of the British newspaper The Telegraph, a series of past-blogging narratives (5 cases) have been produced. The journalist Laurence Dodds has been responsible for editing most of the past-blogging products, including the Fall of Berlin Wall[7], the State funeral of Winston Churchill[8], the Battle of Britain[9], the D-Day[10], and the Battle of Waterloo[11]. No special layouts have been created, so journalists use the same structure of a normal article to work on past-blogging narratives. What makes this format special, though, is its content. Archival material, such as newspapers scans, video reports and pictures that were produced by The Telegraph in 1989 during the Fall of the Berlin Wall, for example, are integrated to the minute by minute narrative, a characteristic of digital journalism practices. Similarly, Folha de São Paulo –project that explicitly uses the term past-blogging– has employed the usual "minute by minute" template used in live news coverage to produce the past-blogging narrative about Brazilian Military Coup[12].

Three cases have been produced within blog platforms. The topics approached by these blogs are diverse. The website World War II Today[13] focus on the account of the War and even the posts' dates are replaced with the date of the original event[14]. This aspect has not been observed in the other two examples. The blog Grasping History[15], on the other hand, presents a special section for its past-blogging experiment. The scholar J. Bradford DeLong publishes messages on a daily basis related to what was happening on the same day in World War I, II, post war period or Cold War. The author does not explain the reason for choosing one or another event each day and this seems to be made randomly. The third case refers to a series of posts about the Quebec Siege produced in Christopher Moore's personal blog[16]. From August to September 2009, Moore narrated day by day the most relevant moments of this event. These series of posts were identified with the same tag, which allows readers to go back to these specific texts, including a similar title (Live blogging the Quebec siege + stage of the account).

Another platform used to this purpose was Facebook. As in other cases, a page dedicated to World War II[17] is updated with daily messages reminding its followers of what was happening in the context of WWII on the same day. Facebook's interface also appears on the meme about WWII created by Humor School[18].

The creative appropriation of platforms enriches the analyzed cases. Even those examples based on existing structures - news portal, Twitter - explore potentialities of digital media and promote new socio-technical processes for narrating the past.

Narrative Strategies

To understand how these narratives are constructed, we turned to the subjects responsible for conducting each past-blogging product. In most cases, the narrative is conducted either by omniscient narrators or by the voice of characters involved in the story, which are represented by different profiles on Twitter, for example. Fictionalization is one of the strategies applied to the narratives. In the case of the US Civil War[19], for example, the narrator is a fictional journalist who was able to report the event as it was happening. On the other hand, professor and journalist Jeff Jarvis used his personal Twitter account[20] to tell his own witnessing experience on September 11, 2001 in New York.

These narrative strategies, together with the "real time" effect promoted by the use of verbs in the present tense as well as the synchronicity of past and present events, are supposed to promote an empathetic and engaging reception of the accounts. In this sense, the excitement and tension experienced by those who participated in the represented events when they took place are frequently translated into minute-by-minute narratives (like in @TitanicRealTime[21], the Hijack of the flight of UA93[22], 1894 Parliament Fires in London[23], among others). Bonsanto (2014) provides a relevant reflection about the narrative genre produced by Folha de São Paulo in its past-blogging about the 1964 Brazilian Civil-Military Coup. In his words, past-blogging practices promote a "temporal articulation by updating time through the narrative" and, as an outcome, opening space for looking at "the past as something new." (p. 7)

The use of the voice of original characters, which come to life in the form of Twitter profiles, for example, shows that past-blogging narratives also intend to reenact the past. This has been especially visible in the projects developed by Twhistory[24] initiative. On the reenactment of the sinking of Titanic[25], characters such as Captain Smith (@Capt_Smith) and the telegraphist of the ship Jack Phillips (@J_Phillips1912) interact via tweets and mentions (by using the @username syntax). During this reenactment the audience could follow the event through a list of tweets especially organized by Twhistory (Jensen et. al., 2010), where all the actions performed by the characters (each one in a different profile) were centralized. In another past-blogging experience[26], focused on the minute-by-minute "live tweeting" of Titanic tragedy, we observed the use of hashtags (#) like #crew, #captain, #BoatNo1, #firstclass and so on. These two cases show how the same event can be framed through different narrative strategies, even if the same platform is employed.

Humor is also a category identified in some of the analyzed cases. The entertainment website College Humor has creatively proposed the reenactment of the World War II as if it was happening in 2011. Each country (USA, Russia, and Germany) and some individuals (i.e. Adolph Hitler and Joseph Stalin) involved in WW II were depicted as Facebook users. In the fictional News Feed, countries exchange political and bellicose threats in an informal way, imitating language, slangs and behavior characteristic of many Facebook users. The post on the website has become a well-known meme, which still circulates within various social media.

Motivations and Public Engagement

Moreover, the analyzed cases also display information about motivations that inspired scholars, educators and journalists to create past-blogging experiences. More than half of them have been launched in commemorative periods, especially the anniversaries of the events. In these periods, events are put on the public agenda by media (i.e. special reports on magazines, websites, newspapers, TV News, etc) and other cultural products (books, documentaries, etc). All these aspects contribute to draw the attention of audiences to those events.

Some past-blogging projects have been produced for more generic reasons, such as the interest of the author in a certain event. The most exemplar case here is the Twitter Profile "WW2 Tweets from 1944"[27], a successful[28] past tweeting project created in 2011 by historian Alwyn Collinson. After noticing the way witnesses and participants of the Arab Spring were narrating those events, he realized that a similar strategy could be used to engage internet users with the past. By using a micro-history approach, his tweets are filled with biographical data. The main intention, in his own words (Collinson, 2012, online), is to show the "human face of history", because "people don't want to care about history, unless we give them a personal touch". Furthermore, the author believes that by taking his followers out of the comfort zone of historic distance, he can prompt "visceral connections" between history and people.

This same perspective is put into practice by educators who have developed past-blogging projects with their students, such as the Cuban Missile Crisis[29] and the 1848 attempt at German unification at St. Paul's Church[30] or Redemocratização[31]. The gain, in these cases, would be the pedagogic effects of engaging students with the content learned in an immersive way.

The participation of the public in some of the analyzed cases is also evidence that past-blogging projects promote a connection between people and history. As Lähteenmäki and Virta (2016, p.4) state, with public participation, "the narrative shifts to a more inclusive way of writing history". Frequently the public can interact with the author of the narrative, leave comments or share information. The catchphrase "rich get richer and poor get poorer", however, is useful to explain why certain past-blogging projects have more visibility and participation than others. Participation can also take part when users help disseminating information (Rainie & Wellman, 2012), by sharing or reposting content from past-blogging experiences. In the cases analyzed, we identified that products created by news portals (The Telegraph, The Guardian, Folha de São Paulo), private companies (The History Press) as well as individuals who have had space to advertise their narratives in traditional media (Alwyn Collinson) are more likely to receive likes and reactions from the public.

In the case of the Twitter Profile "WW2 Tweets from 1944", some followers have sent messages to the author about their personal experiences with the war or suggestions of content. Criticism, however, is among the actions taken by the public. Despite being a popular newspaper, the reenactment proposed by The Guardian on September 11 10th anniversary is one of the most known (Bryant, 2011) past-blogging projects which failed. The news portal received lots of criticism from its audience and had to give up the special past tweeting coverage[32] of the event. At the same time, other initiatives representing the same events have succeeded, like the personal account tweeted by Jeff Jarvis[33].

Time, Memory and Preservation of Historical Accounts

The entanglement of different historical and technological temporalities also affects the narrative construction. As stated before, past-blogging practices promote, in certain circumstances, an interruption in the "always new" flow of information that constitutes social networking sites' timelines. Very often "old" news is also shared on Facebook as if they were new – especially due to the lack of attention of users who don't check the publication date before forwarding it to their networks. In the case of past-blogging practices, these ruptures seem even more radical, because the topics reported are recognized as "historical" –a further past. They contrast more deeply with the content of the last updates of friends and pages one receives every minute. As Lähteenmäki and Virta (2016, p.3) note, "When the content is blended into the real-time feed where it is mashed up with tweets about current issues, its historical roleplay is emphasized." Further studies in regard to the reception of past-blogging products will be able to track this kind of reaction more accurately.

If on the one hand these ruptures occur, on the other potentialities reside on the context where these narratives circulate, especially when they are produced on social networking sites. As stated before, historical accounts have been, for a long time, produced through different media, such as books, documentaries, films, and plays. These formats have been appropriated as means through which history is popularized and disseminated, as well as negotiated and disputed. History, in this sense, "is no less of a cultural production in the past than it is in the present." (Gitelman, 2008, p. 212) Some of the analyzed cases in this essay reflect it, as some contents are produced from the participation and interaction between different actors. Active participation in the representation of the past leads to memory work.

Cultural and communicative memories (Assmann, 1995) are also intrinsic to past-blogging practices. Cultural memories refer to events that belong to a further past, preserved mainly by institutions such as museums and cultural products – American Revolution and Sinking of Titanic –, for example. The use of archival material and the exchange of knowledge coming from formal education (school textbooks and master narratives) can be inscribed here. Communicative memories, however, fit with events whose witnesses are still able to share their own direct or indirect experiences. September 11 and Brazilian Military Coup past-blogging practices are some of these cases. Public responses and the aggregation of personal accounts – via messages using project's hashtags, for example - shape and diversify these narratives. Some past-blogging initiatives, like The Telegraph's Fall of the Berlin Wall, could also have profited from this kind of public participation, but the platform used is based on a top-down approach, where not even comments are allowed.

Understanding this memory dimension of past-blogging also reveal its relevance in terms of preservation of cultural knowledge. While some letters, books and diaries written during and about the Second World War can still be recovered and analyzed, digital products don't have necessarily a long lifespan. Today's digital past-blogging are products that present current views about the past, and hence are potential memory platforms that will potentially inform future generations about early 21st Century society's ideas about the past. However, it is possible to argue, together with Lähteenmäki and Virta (2016, p.2) that "While most of these tweets [as well as other past-blogging formats] remain online for later viewing, these bits of information are fragile in form as they are constantly evolving with new references and can even disappear if not deliberately preserved for future use". (p.2). That said, envisioning the real value of these practices in terms of long-term memory products seems an important task.

FINAL REMARKS

The recognition and development of new forms of accounting for the past is an important move for today's society. Digital media is gradually taking part in more facets of social life, including the construction of historical narratives and memories. Past-blogging is certainly a practice that contributes to the renovation of historical narratives. Blogs, as well as other platforms used with this same purpose, are compelling platforms to narrate contemporary history (Cole, 2011).

Apart from the urge for change impelled by digital and social media, the field of history itself reinforces this claim. The affective turn as well as the consolidation of micro-history point to the need of renovation in these narratives. In order to engage readers, students and other people interested in learning about the past, strong, entertaining and compelling storytelling strategies ought to be elaborated. By representing the unfolding processes of historical events (in "real time", minute by minute, day by day) or reenacting the events giving voice (and profile pages) for historical characters, past-blogging projects concentrate on the experience of the past (Agnew, 2009). In the process of developing past-blogging practices one has to think of their readers: What facts will be of relevance for them? What is the correct tone for communicating the past (humor, emotion, factual, etc.)? How to approach and interact with the public? While selecting the content to be published, the author is also framing and proposing a specific reading of the past. This can, in some cases, be a source of criticism, since other ways of interpreting the past are always at stake.

In this study, we observed creative appropriations of established digital media. The blog format, especially the use of its traditional reverse chronological order (Blood, 2000) for accounting past events, is the characteristic that embraces all the analyzed cases. Using live-blogging to present events is a common product of journalistic websites (Thorsen, 2013) and when they start to be used for the narration of past events, new potentialities become visible.

History and journalism also become closer in past-blogging projects for different reasons, such as in the newsworthiness that past events acquire from these practices, or in the new expressive manifestations they allow. Anniversaries of events, for example, transform them again into news events (Rodrigues, 1996). Novel uses of news outlets' archival material also arise and the roles journalism plays in the account of history and the production of memory (Zelizer, 2008) are made even more evident.

While practicing past-blogging, though, educators and historians also become closer to the objective and fast-paced language of digital journalism. If the competencies of these professionals meet at certain point, accurate and engaging narratives will probably proliferate. Ultimately, the integration of history into everyday life media points to new possibilities of popularization and engagement with the past. Storytelling techniques employed by advertisers and the entertainment industry find room for enhancing historical consciousness as well as highlighting the connections between past and present.

Future studies could make an effort to further document this and other practices of contemporary forms of accounting the past through digital and social media. Other questions still need to be addressed so that an understanding of this and other practices can be achieved. How these practices impact the assessments of history and social memory? As time progresses, will present live blogging projects be consumed as past-blogging sources, such as pre-internet newspapers are today?

Chapter 4
Digital Resource Management Strategies

Sarojadevi K.
Karnataka University, India

Padmamma S.
Kuvempu University, India

ABSTRACT

Digital technologies have transformed the shape of the libraries in recent years. Digital literacy has grown exponentially, and digital devices have proliferated personal computers, servers, mobile phones, tablets, laptops and mobile wireless devices. Library users, in the new era of information and communication technology environment expects to access traditional print material and more concentrated on digital information resources. So, in order to meet the user demands traditional libraries are vigorously changing their shapes and moving towards digital libraries. Obviously there may be changing in the nature of duties and responsibilities of a library professional. Since, managing of digital resources in the library is entirely different from physical print assets of a traditional library, there is a need of systematic and unique premier framework of strategic planning, innovative policies, establishing, collecting, licensing, sharing, and monitoring of digital information resources and this challenging task is called Digital Resource Management.

INTRODUCTION

With the dawn of internet, has brought revolution in availability and accessibility of scholarly and scientific communication and opened gateway to world literature. Innovations are drastically changing information technology, information resources are migrating from print to electronic form. These days, literature on electronic format is more easily available than the printed versions with added features of search ability and availability. Hence for these two reasons, e-resources keep count over the printed material, though printed materials has its own advantages. There has been an exponential growth in the use as well as number of electronic resources like electronic journals, CD ROM's commercial and free databases, and resources available from the internet and other computer based electronic networks.

DOI: 10.4018/978-1-5225-3822-6.ch004

Accessibility of e-resources has considerably changed the interactions between users and library staff. Since flexibility of accessing information resources through internet or web based is easier. User can access digital resources anywhere & everywhere, authorized, authenticated and multiple accessing of same resource simultaneously. This leads to shift of print resources to digitalized resources. Already users have had access to a various research publications on DVD/CD, both paid and free online databases. In the past few years libraries were purchasing individual copies and made access through standalone machines. Now days on expanding serving the digital resources through library web based consortium networking services for digital resources to their users with the help of internet. The innovations of ICT and www bring in new ideas for the institutional library community. The new paradigm started due to the advanced infrastructure of ICT and advanced e-publishing, e-journals. These help to grow digital resources like video, audio, e-books and e-journals. In order to facilitate easy access of information with fast and accurate, many publishers, researchers and academicians' are working towards users interface.

Now a days libraries are more serious towards the management of information resources than in the earlier past, due to information explosion, widespread use of information and communication technology, proliferation of information resources in different formats, like books, journals, CD's, DVD,s newspapers, research reports have contributed top the flow of information. This has led to challenges towards storage, efficient retrieval and effective use of information. So, to establish ICT infrastructure, defining new policies, creation, capturing, organizing of digital collections, budget constraints, staff-training, licensing, practical and trails on digital resources, monitoring, migration from print to digital, fact based report generation etc need a systematic framework and is termed as digital resource management strategies.

DIGITAL RESOURCES/ ELECTRONIC RESOURCES/DIGITAL FORMATS

Digital resources are defined as digital, electronic, streaming video, audio recordings, CDs, DVDs, VHS recordings, and subscription databases. Digital Resources are defined as material (data/or programs) encoded or manipulated by computerized device.(AACR-2000) Electronic resources refer to those materials or services that require a computer for access, manipulation, or reproduction including, but not limited to, numerical, graphical and textual files, electronic journals, bibliographic or full-text databases and Internet resources.

Today the users limit their search only to such resources or databases which are available in full text. Hence these e-resources have become most common medium of scholarly communication. More and more scholarly publications are being made available on-line. According to Barker, there are three types of documents used in digital resources.

1. **Static:** Static are the most basic, they contain fixed information and never change their form(such as traditional online data)
2. **Dynamic:** Dynamic documents also contain fixed information but also able to change their outward form, the way embedded materials if presented to users (such as multimedia CD-ROMS)
3. **Living:** Living documents are able to change their form (outward appearance) and these embedded information. (such as information on the web) Devi and Devi (2004)

Need:

- World wide accessibility if permitted.
- The information available in digital form is very easy to handle and transit.
- Electronic preservation is very useful in case of frequent use.
- The data in digital form can be edited, processed and distributed in a very simple manner.
- The security of information is most important factor to preserve the documents in digital format.
- Very large amount of data can be kept and preserved safely in digital form in a very limited space.
- A large amount of information can be send from one place to another place at low cost through email.
- Digital preservation reduces printing cost, low cost is involved in mass replication.

TYPES AND FORMAT OF DIGITAL RESOURCES

The digital resources of library, includes the following, which should be acquired by library as per their requirement, information and communication technology infrastructure facility, man power and financial provision etc. The three important formats of e-journal are available which are Online e-journals, CD-ROM journals, and Networked journals and other digital resources include e-books, e-papers, e-reports, e-content pages, e-clippings, in-house web based and online databases. It is very difficult task for collection of management of print assets in special libraries like mass media libraries and telecast libraries. However converting them to digital form preserve it in CD-ROM/DVDs for a long time.

- **Online E-Journals:** Pay and use bases subscribed online hosts are the online e-journals they are not considered as part of the library collection and are accessed through internet. Typical e-journals serial directory provide separate listing of serials available on online and on DVDs versions.
- **CD-ROM/DVD E-Journals:** These digital resources are available on the optical media for storage of information. User or librarian cannot erase or record data or information into it. DVDs and CD-ROM contains huge amount of digitized data. Examples are AGRIS, ADONIS etc. DVDs are most useful in special libraries like museum libraries, mass media libraries, telecast and All India Radio stations libraries since they have got e-clippings, multimedia based digital resources.
- **Networked Journals:** Various reputed national and international journals available in e-versions and are accessed through mailing list, newsgroup, discussion forums, blogs, and are distributed through E-mail, FTP or Public cloud computing technology. When librarian receives abstracts of new arrivals alerts, can extract full-text resources can be downloaded using FTP from the web portals.
- **E-Books:** Most of the publishers are coming up with digital format along with the print format. Multiple library users can access same E-book concurrently .There are lot of advantages of e-books: Less space, no maintenance and including animations, multimedia, easily coping and disseminated. E-books also contain vast amount of information. Now international publishers of scholarly journals like Emerald insight, Springer, Taylor & Franchise, Willey international, Elsevier science are stepping in to e-books publications and made their name in academic and research world.

- **E-Reports:** Old and precious research reports, reusable print assets and publications of research scholars, scientists reports, are now scanned and converted them into .PDF, JPG or BMP format and made available through their library website or through cloud computing technology and made available to their users. These are the part of library collection, classified based on subject categories & archived and store in server computer database.
- **E-Content Pages:** Most of the librarians provide browsing facility to extract required digitalized form of e-book pages, conference proceedings, workshop outcomes, seminar summaries etc. traditional search leads to excessive physical search and leads garbage or junk file accession. However this textual content may be scanned and stored in cloud technology or in a local library server and made availability in the form of PPT, PDF, JPG, TIFF, ZIP etc.
- **E-Clipping:** The special library collections are multimedia, clippings, digital photos, audio recordings, online newspapers clipping, news clipping in telecast libraries etc belonging to this category. These are popularized by specific users like scientist, engineers, reporters, editors, doctors and research scholars.
- **Online Databases:** It is an online collection of sequence of similar records organized and integrated in single file and often made available through computer based data, rich number of high quality e-databases not only bibliographic but also full text resources is available and growing in their number to meet the user demands. Such databases provide information to the research scholars and scientist for their specific field.
- **In-House Databases:** In this category, current back volumes of serials, thesis, experts previous exams question papers Seminar reports, academic project reports, research proposals are included. These are created by individual libraries and made available through intranet.
- **Web Based Resources:** Apart from the above categories of digital resources there may be availability of information through wikis, news groups, blogs and are containing fruitful information. (Pandey. 2002)

EMERGENCE OF DIGITAL RESOURCE MANAGEMENT

Swain etal. (2003) discuses, that the present day scenario, management of change is very crucial. There are two types of factors leading to change in the libraries, the one is internal and the other is external factors. Internal factors can be introduction of new service, application of ICT in libraries, book purchase policy, marketing strategies, cordial relationship between library staff etc. The external factors outside the libraries influence in a huge way. Such changes arise due to political and economic environment, legal and government policies of parent organization, drastic advancement in technology, change in information needs of users etc.

The popular belief that the new technology will replace human labour by robots is utterly false. Actually the new technology will employ more people who are highly skilled and highly trained (Drucker, 2008, pp. 1-18).

The revolutions of ICT affected every footstep of present library system. So, these technologies influenced institutional libraries & are facing many challenges, to overcome these challenges successfully traditional library management need to be redefined. In today's situation of library management may be

redefined as: "A dynamic, highly intellectual human activity of creating and maintaining a digital collection by using various resources and by performing various managerial functions to serve efficiently and effectively to meet the library user's demands of locally and remotely by introducing advanced suitable techniques, technologies and fact based practices."

MANAGEMENT OF DIGITAL RESOURCES IN MEDIA LIBRARIES

Management is defined as "the work of creating and maintaining environment in which people can accomplish goals efficiently and effectively." Management of technology encompasses the management of research, product and process development.

The three jobs of management: managing an organization or library; managing managers and managing workers and work, can be analyzed, studied and appraised separately. A management decision always affects all three jobs and must take all these three into account. And the most vital decisions of the future of digital resources are made often as decisions of the present, be it on budget, ICT infrastructure, subscription or renewal of digital resources, usage, maintenance, standards or service to the users (Drucker, 2008, pp. 1-18).

Media libraries hold collections of print and digital media. Audio visual materials play an important role in disseminating required information to the people within few seconds. In order to meet the needs of the users effectively, digital media libraries has to use a combination of advances in technology and have the ability to design, build, manage and use global electronic networks for establishing digital libraries throughout the world (Moghaddam, 2010).

Technology responds to needs and opportunities and the provision of resources. It is necessary to manage the digital resources in a systematic and well organized manner. So question arises why management of digital resources? What are the policies? How management strategies provide the library to serve in a better way with professional passion? The points listed below necessitate the need of digital resources management strategies:

- Users' service through greater access to accurate digital information sources and globalised reach.
- Concurrent access of same information resource by multiple users.
- Enhanced information resources and knowledge satisfaction among users.
- Less bulky than print resources and more economical and safer means of storing and keeping track of digital information resources.
- Easier access to digital information resources like old reports, e-Journals, e-Books, Online databases and even audio visual materials etc,
- Reduces errors and eliminating the ennui of long and repetitive manual processing.
- Greater accountability and transparency in operations by monitoring.
- Improved efficiency and effectiveness in administration and management of digital resources as it has unprecedented access to real-time information.
- More reliable security for sensitive and confidential information.
- Appropriate knowledge-based action and intervention can now take place in a timelier manner.
- Library networking through web based architecture.
- Digital collection enhances the R & D efficiently and accurately. (Devi and Devi, 2013)

STRATEGIC MANAGEMENT

A successful organization needs to develop effective strategies for achieving their mission and strategic planning is the organized process for selecting these strategies. Strategic management is generally considered as the process of formulating, implementing and evaluating strategies for an organization.

According to Drucker (1954) "Management is about setting yourself objectives and then break these down in to more specific goals or key results".(pp.18-25)

A strategy could be.

- A plan or course of action or a set of decision rules making a pattern or creating a common thread;
- Concerned with the resources necessary for implementing a plan or following a course of action;

According to George S. Odiorne, "Management by objectives can be described as a process Whereby the superior and subordinate managers of an organisation jointly identify its common goals, define each individuals major area of responsibility in terms of results and use these measures as guides for operating the unit and assessing the contribution of each of its member."

In the words of Koontz, O'Donnell and Weihrich, "Management by objectives is a comprehensive managerial system that integrates many key managerial activities in a systematic manner, consciously directed towards the effective and efficient achievement of organisational and individual objectives."

Chandler (1962), who made a comprehensive analysis of the interrelationships among the environment, strategy, and organization structure has defined the term strategy as the determination of the basic long-term goals and objectives of an enterprise and the adoption of the course of action and the allocation of resources necessary for carrying out these goals".

The Professors at Harvard Business School, viewed the term strategy as the pattern of objectives, purposes or goals and major policies and plans for achieving these goals, stated in such a way, so as to define what business the company is in or to be and the kind of company it is or it is to be.

According to Glueck (1980) strategy is a unified, comprehensive, and integrated plan relating the strategic advantages of the firm to the challenges of the environment. It is designed to ensure that the basic objectives of the enterprise are achieved.

The word strategy has entered in the field of management more recently. At first the word was used in the terms of Military science to mean what a manager does to offset or potential actions of competitors. Originally the word strategy has been derived from Greek "Strategies" which means 'general'. The word strategy, therefore, means the art of the general. When the term strategy is used in military sense it refers to actions that can be taken in the light of action taken by opposite party. Strategic Management is a systematic, organized and professional approach that allows the management of digital resources to focus on achievable objectives and to attain the best possible results to increase the organizational digital library performance to achieve organization *goal* (Ruth, 1983).

To provide vision for the future, leadership and an agreed framework for the conduct of business in an ever more rapidly changing and globally competitive environment organizations or institutions whether small or big are obliged to plan their activities. In many organizations the very notion of strategy has become devalued what is being rejected is strategy as pedantic planning ritual. Strategy as foresight architecture and intent and organizations redefinition to create new competitive space, is the greatest value added that senior management can contribute

THE 21ST CENTURY CONTEXT FOR STRATEGIC PLANNING:

The subject of corporate marketing strategy and its role in achieving a competitive edge has assumed greater significance in recent years for four important years:

1. The first is the context of global uncertainty and continuous change that followed from the major international economic crises of 1973, 1979 and 1991-92 and the associated political and environmental upheaval.
2. The second reason driving strategic thinking is the remarkable development of ICT in the 1990s. Information and Communication Technology (ICT) has facilitated the globalization of trade through the instant exchange of information so that changes in prices, product offers and international currency rates are now subject to continuous 24 hours changes and competitors and all stakeholders, creating a volatility that changes the whole nature of forecasting.
3. The third also driven by the information revolution is the ability of companies to step across traditional industry boundaries with supermarkets, banks, dot.com companies etc., entering the field of travel distribution.
4. The fourth is the continuing growth and expansion in travel and tourism of a small number of large, transnational and global organizations locked in fierce competition for market share and sales revenue.

These four reasons are especially powerful in 'information rich' at international level. These new approaches heighten the need for corporate vision, leadership, coordination and support at the same time restricting the direct operational involvement of staff (Venkadesam et al., 2004).

DIGITAL RESOURCE MANAGEMENT STRATEGIES

There is a proliferation of e-resources and it is difficult to make right selection out of so many available resources which have very subscription rates. Therefore through evaluation of the product has to be made before purchase or subscribed for proper utilization. Digital resource management strategies may be considered as managerial level or top level management that makes a framework and policies about how to establish, collect, organize and manage the digital resources with the help of operational level strategies or middle and low level management to achieve excellence in organizational goal of a digital library. "DRM activity might therefore be called the 'brains' behind well managed digital library services. The Holy Grail of ERM is management of the entire lifecycle, with support for the following kinds of tasks:

- Discovery of new products.
- Product evaluation and comparisons.
- License negotiations.
- Ordering and renewal.
- Tracking license terms.
- Point of use information about license terms and technical support.
- Creation of web gateways.

- Individual title access through catalogues, searchable title lists and link resolves.
- Overlap analysis of database products.
- Usage analysis.
- Access management.
- Proxy services.

Various facets involved in the digital resources management strategies are:

Requirement Assessment

User's information needs has to be taken care. Comprehensiveness, scope, subject coverage, accuracy, availability in time, scholarly, extensive content, updateness etc of the product has to be checked. Communicating with libraries and library users already referring the digital resources and its reviews will help for prediction or decision and evaluation and also duplication and data hampering of existing digital resources may be avoided.

Periodical feedback from users and decision of the library committee are important factors for taking decision for licensing / purchasing / acceptance or rejection of e-databases. Migration from existed or additional computer hardware, software and speed of the internet should be taken care while managing digital resources.

Interacting with Vendor

Interaction with trade parties or vendors regarding negotiate pricing, licensing, security facts (authentication & authorization). The vendors should be supportive to various search operators, user-friendly and instant customer services and compatible with existing hardware and software.

While negotiating for subscription of e-database there are some important aspects to be considered: whether it is in print format or digital format, online DVDs and online access through website and price list and comparative statement can be done which is quite expensive. But content, access, cost, taxes are also tough considerable points.

Trial of Digital Resources to Be Procured

A trial enables the librarian to offer the e-resource to some or all users – who may include users, librarians, research scholars alike and then base a decision on their feedback. During the trial process, the librarian distributes the digital resource in the specific areas of the library environment through intranet, notifies the relevant audience, and obtains feedback. Librarians pay considerable attention to specific issues while testing digital resource. The librarian provides institutional list of IP addresses to the trade parties for enabling the access. The librarian can proceed for the approval of the products after completion of the trial and its usage appraisal.

Acquisition of Digital Resources

Suppose library committee decides to finally purchase and subscribe to the resource, Library professional carries out an acquisition process that somewhat resembles the process for print resources; obviously an extended detail is necessary to know by librarian.

However, an additional level of detail is required, such as, information about the license and the availability of the resource to various populations of users. Also, when a library is acquiring e-journals as part of a package from an e-resource aggregator, such as EBSCO, the librarian needs to know which journals are covered by the package and for what period of time; ideally, the librarian would have the option to pay one lump sum for the entire package or to pay separately for each title. Furthermore, the print and electronic formats may be linked in such a way that cancellation of the print format would invalidate the license agreement for the electronic format. Another issue is how to handle the distribution of a payment between the licensor of the package and one or more interface providers.

Keeping in mind the requirements of the institutions and ensuring technical feasibility of the product, the librarian has to negotiate with the vendors with necessary amendments before its final acceptance. After going through above mentioned formalities one can proceed for final purchase.

Access to Procured Digital Resources

Once final access is provided by the trade parties, users should be informed about the availability of digital resources and they should also be informed about various aspects of licensing issues. To ease the access the librarian has to provide link to library website, create alphabetical list of the resources. Notify the product through e-mail, in-house notifications, campus circular etc.

User Support and Promotional Activities

Demo of the product supplied by the trade parties should be incorporated in the orientation programme, user education, usage training, license/lease agreement and providing contact details of the library staff on websites. Feedback from the users regarding the product from time to time should be taken seriously and incorporated in the library evaluation activities.

Monitoring the Usage of Digital Resources

Any changes or modifications in the usage pattern made by the trade parties, at their convenience, should be eagerly monitored along with popularity of the product among professional colleagues. User report provided by the trade parties should also be considered.

Cancellation/Relegation/Renewal

In case, the usage of the database or product decline considerably due to inferior quality or access problem one has to think of some other options. If the product cost outgrows its benefits, its circulation is stopped by the vendor or support services altered then one has to go for cancellation. But if the services of the product are highly satisfied and beneficial to both the users and the institutions then it is best to proceed further for the renewal. (Singh, 2010).

STRATEGIC PLANS TO OPTIMIZE THE DRM FLOW CONTROL

While defining new policies for digital library, Library professionals should keep in mind about various management issues like *Human resources management, disaster* management, Training, copyright management, security management, preservation management, finance management etc. So following are the strategic plans to optimize the DRM flow control:

- Monitoring the preservation implications and priorities for preservation of different information Resources,
- Store and organize digital resources and ensure high security, automated checking, archiving and back up with adequate disaster preparedness and recovery procedures,
- Document collections including file formats, software and hardware dependencies,
- Classify these digital resources based on its content and functionality,
- Record preservation of metadata that facilitate effective and efficient management, and
- Develop appropriate pathways to access these resources in conformity with its authenticity, intellectual property rights (copying, storage, modifications and use of specific resources) and cost effective as well.

INTERNAL DIGITAL RESOURCE MANAGEMENT

Digitalization and digital access are integral part of the library activities. Library & information centers are currently in a transition phase from traditional print to digital information collections. Traditional libraries are changing to digital library form and some are already in progressive stage. The traditional libraries already existed print asset are to convert them into digital form, which has to be converted to digital form, organized, retrieved and disseminated among the users. Hence internal digital resource management proposes creation, discovering, preserving, archiving, implementing through web based automation of existed print materials to digital format by utilizing existed technical staff, information technology environment, to achieve enhanced productivity of the library. The digital content management requires important functions like:

- Innovation (Trail based sample conversion of physical asset);
- Creation (Scanning, OCR, Metadata creation);
- Discovery (Indexing, searching of metadata standards);
- Preservation (archiving, migrating, collection, dissemination tools);
- Management (Adding/Deleting/Modifying collection, Monitoring, usage report generation. Venkadesam, S et al. (2004).

THE ROLE OF LIBRARIAN IN THE STRATEGIC MANAGEMENT OF DIGITAL RESOURCE

Storage, preservation and dissemination is becoming a skilled task The different types of skilled professionals include the domain experts, computer experts, training experts and users who are I need of

different formats of knowledge which includes text document, images, graphics, animations, audio and video recordings and multimedia digital resources. The digital librarian should be responsible for the following duties in digital resource management strategies; Gray, Sharon(2002).

- Establish, organize, manage the digital knowledge and information and in the digital library.
- Disseminate digital resources and provide digital reference services and electronic information services.
- Provide information mining from the emerging knowledge warehouses.
- Handle the responsibility of massive digitization, preservation for a long term planning.
- Deliver training to supporting staff and users for usage and maintaining of digital resources and to navigate for effective searching.
- Decision making in critical situations like natural disaster.

COPYRIGHT AND LICENSING

A major assumption of the information age is that information will be available to all for a free. But the contents are protected by copyright law whether they are published on paper or on the internet. Copyright law is a national law and Berne Convention of 1886 brings the principle international treaty. Article9(2) of the Berne Convention for the Protection of Literary and artistic Works provides that countries may allow for exceptions to the author's exclusive right or reproduction in certain special cases, provided that such reproduction does not conflict with a normal exploitation of the work and does not unreasonably prejudice the legitimate interest of the author. Under this Article, libraries can digitalize the content but uploading the same for public access requires permission of the copyright owner. So depending on the license terms and conditions, the resource has to be provided to the user. Digital resources have problems at creation as well as management levels. Copyright, legal and financial issues are to be handled properly. There are large number of terms and conditions which are to be settled during purchase of digital resources. Media libraries are privately owned corporate libraries providing services and collections to their specific users only and pay-per use of information or licensing fees may apply for the required information. Dr. Kaul, H.K.(2012)

SUMMARY

Stepping in to a digital library by library professional is witnessing a drastic change in information Technology. Library users are demanding more digital resources and customized search. To establish a digital library there must be necessity of a professional framework called digital resource management. It is defined as organizational top level process consisting of important activities such as defining new policies, planning, organizing staffing, directing coordination, monitoring, reporting, managing financial issues etc. to achieve organizational goals and objectives of any organization. So, management of digital resources consists of systematic outline to ICT Infrastructure for long term digital collection, selection, creation, acquisition, evaluation, licensing, access and promotional activities. It is the combination of digital resource systems, sufficient and proper allocation of staff, adoption and standardization. Strategic planning, policy making and documenting workflow and procedures are interrelated activities that are

hallmarks of professionals. Library professionals should work towards creating, innovating policies, documenting their workflow and planning in all areas of digital resource management. Digital resources have not been able to replace printed material. Peter Drucker (2002) has rightly stated that online edition delivered over the internet to be printed out by the subscriber for readability. UKOLN project has coined the phrase 'hybrid information environment' which is likely to continue in the present 21st century (Samantaray, 2010).

Chapter 5
Security in Digital Images: From Information Hiding Perspective

Mohammed A. Otair
Amman Arab University, Jordan

ABSTRACT

Due to the swift growth of the using of the digital multimedia in the internet these days, the security in digital images has become a very important issue. Lately, significant attentions are given by many researchers in the field of the security for digital images, and several image encryption techniques have been developed to improve the security levels of these images. Different techniques can be applied to protect intellectual property rights for digital images and prohibit illegal copying. The aim of this chapter is to introduce the most important techniques that have been developed to implement the security in digital images such as digital watermarking and image steganography.

INTRODUCTION

Image processing can be defined as "the manipulation of an image for the purpose of either extracting information from the image or producing an alternative representation of the image" (Rafael & Richard, 2002). Image processing has several stimuli that may be categorized into the following:

- To implement the security levels to face attacks versus the images such as: copyright violations or image integrity.
- To eliminate undesirable components those are distorting the image or to improve the pictorial information in order to be interpreted by human.
- To elicit useful description and representation by showing the images in a more evident shape.

Digital images have been lately implemented in many several fields and disciplines. However, with some types of computer programs, those images and its data can be duplicated or modified easily. If these duplications or modifications are illegal, then they will make us questionable when considering the digital images as proof in a legal issue. The differentiations between digital images and the nature

DOI: 10.4018/978-1-5225-3822-6.ch005

of texts, the traditional textual security techniques are not adequate to be implemented on the digital images for two major causes (Alireza & Woo, 2011):

- The size of text format is mainly much smaller than image. Thus, to secure and encrypt the data of image, the traditional techniques of cryptosystems require much time to be implemented.
- When the text is decrypted, then the resulted text must be matched with the original text. However, this issue and rule is not necessary to be always true with the images.

With the growing use of multimedia applications such as image processing applications, the security has espoused a significant manner on the storage of images and communication. In the literature of the security of multimedia information system, there is no comprehensive or thorough review for two causes (Shiguo et al., 2009):

- The variety and intricacy of security issues and the congruous protection in the multimedia information system could be varied.
- The nature of multimedia systems is emerging continually, which fetch emerging security threats and their solutions continually as well.

The sharing of digital data became easier than ever because propagation and existence of: computer networks, storage tools, and imaging devices. Such type of sharing data; however, the questions on "how sensitive information can be protected?" have increasingly needed to be answered. For instance, when the user of digital camera in the mobile-phone needs to enhance and improve his private picture with one of the online image processing applications. The user who owns the picture concerns the privacy of his picture. At the other side, the online application (image processing website) concerns the issues of the protection by improvement the technologies against any attacks. The goals of image security are mainly found to ensure the following issues:

1. The originality of the image, and proprietorship of the creator or the sender of the image.
2. The safety of the data image, by ensuring that the image had not been changed.
3. Privacy, by protecting the proprietorship and content of the data.

Recently, digital media protection will be a mandatory issue with the growing of distributed multimedia systems. This is specifically significant for the protection and implementation of some types of intellectual rights such as copyright. The protection of copyright includes the authorization of image proprietorship, and it may include the recognition of unauthorized or illegal copies of a digital image. In order to prohibit the unauthorized or illegal distribution or copying the digital media like images, many number techniques were needed. In the case of placing the digital images on the internet imposes them at danger of steal and replacement especially when no protection techniques were used.

One of the most important techniques which enforce such sensitive data, images and copyrights is an image watermarking (Chang et al., 2002 ; Ruanaidh et al., 1996 ; Shih & Wu, 2005). Another science or technique to do the same task is cryptography by securing data which dismantles it using some encryption algorithms (Highland, 1997 ; William, 2003). Steganography is developing and a very robust technique for securing data because it does not provide evidence to doubtful. It can be defined as "an art and science of hiding data in other innocuous medium" (Artz, 2002 ; Wang & Wang, 2004 ; Altaay et al, 2012).

Three mandatory characteristics must me imposed by security of images, as mentioned in (Fridrich et al, 2002):

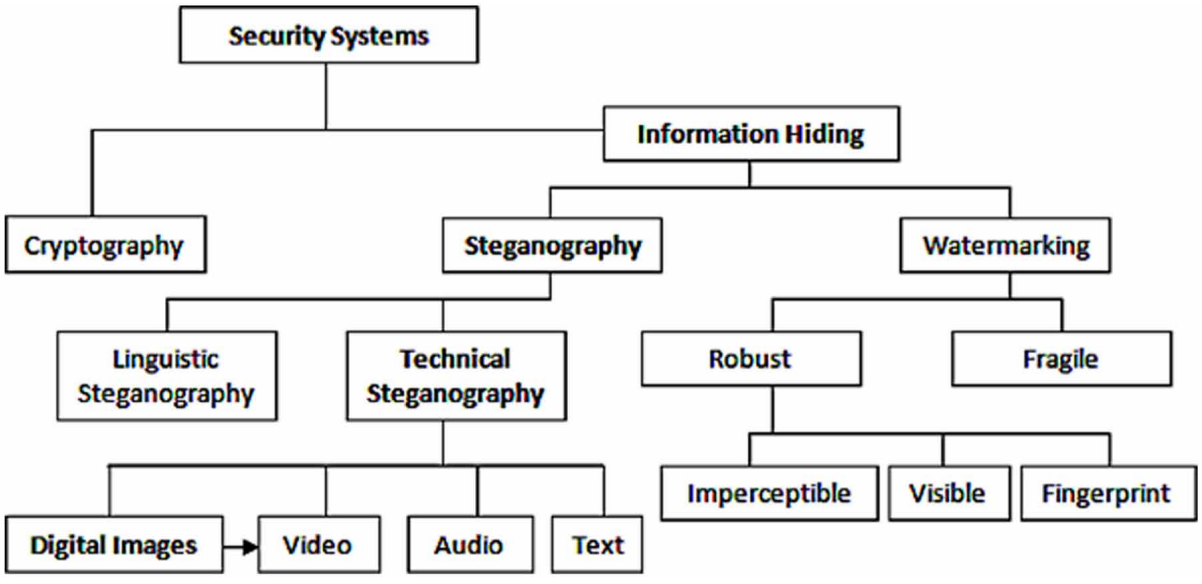
- **Confidentiality:** The images will be used and accessed by only the authorized persons.
- **Reliability:** Can be taken from two perspectives:
  - **Integrity:** An unauthorized person will never alter the image;
  - **Authentication:** It can be examined if the image belongs exactly to the right and authorized source or person.
- **Availability:** An image should be able to be accessed and exercised by the authorized persons in the normal situations within reasonable time.

Background

This chapter provides an analysis and criticizes the various current techniques under the two main information hiding techniques: watermarking and steganography. Different popular criteria and guidelines depicted from the literature. Figure 1 shows the most techniques, types, and classifications that will be discussed in this chapter.

This chapter swivels about the watermarking and steganography in digital images and does not introduce of steganography such as: linguistic, audio, video. Additionally, cryptography will not present because its carrier and the secret data are a text based, with some minor extensions to the digital images. So, it is beyond the field of this chapter.

Figure 1. The overall disciplines of information hiding
(Chaddad et al, 2010).



Digital Watermarking

In order to protect digital images, concealed confirmation notes and copyright comments can be added by the technique of digital watermarking (Rafael & Richard, 2002; Cox et al, 2002). In image watermarking, information in images can be embedded based on some characteristics of the images such as the redundancy of the images and the perceptual feature of human. Because of the low vulnerability of the human visibility to slight modifications and the elevated resilience of digital images, a very few number of persons can percept these slightly added modifications.

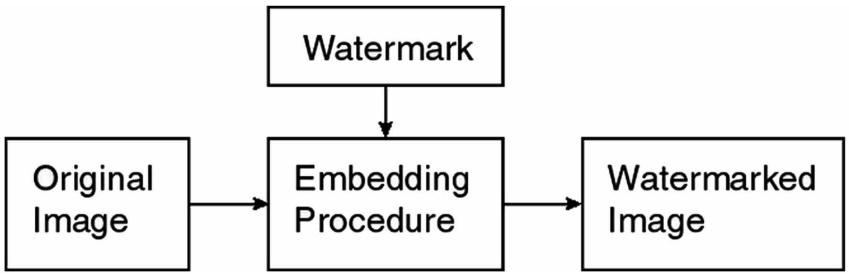
It is very important to embed hidden information within an image to make sure that the protection of the copyright is achieved. Only entitled person with the protection of the copyright can access this information of the image. The best method to do this is to put the information of copyright into the image by intelligently adjusting the chrominance and luminance values of the specific pixels. Keeping the watermark secret and its location could provide an additional protection. If this information found by an unauthorized person, then he will never understand its meaning.

To protect the digital images, many techniques are found such as: authentication, encryption can be utilized along with the image. Figure 2 depicts the procedure of general embedding watermarking technique.

The optimal characteristics of a digital watermark have been mentioned in many papers (Cox et al, 1997; Swanson et al, 1996 ; Pitas, 1996). These characteristics involve:

1. To prohibit retardation of the original image, a watermark should be not noticed by humans.
2. A watermark should not be statistically discovered or eliminated.
3. The extraction process of watermark should be short and simple. At the other side, the detection process should be time consuming.
4. The detection process of watermark should be very precise. In other words, minimize the possibility of false positives (detecting spurious watermark) and minimize the possibility of false negatives (missing real watermark).
5. Several watermarks can be generated, in order to mark too many number of images.
6. Watermarks should be arduous to several types image processing such as: compression, additive noise, and filtering.
7. The right proprietor of the image should be determined by the watermark.

Figure 2. General image watermarking procedure



Several watermarking techniques as in (Berghel & O'Gorman, 1996; Cox et al, 1995; Macq & Quisquater, 1995) have to recognize a perfect differentiation via many watermarking characteristics such as: the computational cost, robustness and quality.

Watermarking and steganography are very similar from different perspectives. Both of them require to entrenched information within a cover message with slight to no devolution of the object. However; watermarking -in order to achieve a robustness characteristic- needs a further requirement. An optimal steganographic system would entrench a huge magnitude of information, quite securely without noticeable devolution to the object. However; at the other side, an optimal watermarking system would entrench a magnitude of information. This added information should not be changed or eliminated without producing the object quite unusable.

Digital Image Watermarking Classification

Most of the significant classifications of watermarking based on several watermarks (Petitcolas et al, 1999) are given as follow:

1. **Visible Watermarks:** When the user cannot read the image, the watermark is considered as invisible watermarking (the watermarked image cannot be read using the same as the original image).
2. **Invisible Watermark:** Invisible watermarking, where the watermark is invisible to the user (it cannot be read through regular image reading).
3. **Fragile Watermark:** It can be defined as tamper-proof watermarks. This type of watermark is crashed once it is processed. It is intended to be crashed when it exposure to any shape of processing or even copying. It means that if the watermark is not found, then means that this copy of the image is an illegal copy.

Classification of Image Watermarking Techniques

The frequency sensitivity can be referred to the response of the eye for some frequency changes such as: spatial, time, or spectral. Spatial frequencies are distinguished as textures or patterns, and spatial frequency sensitivity is always defined as the sensitivity of the human vision to luminance alters (Friedman, 1993). It has been shown that a human eye is being very sensitive to luminance alters in the mid-range spatial frequencies, and this sensitivity minimized at lower and higher spatial frequencies. The techniques of the digital image watermarking may be classified into two main categories:

1. **Spatial Domain Techniques:** These techniques of watermarking can also be implemented using color separation. The watermark will be displayed in only one of the color bands, in such cases. This will make the visibility of the watermark is perfect and it will be very hard to discoverable under normal situations. However, the hidden mark displays instantly when the colors are detached for specific processing tasks such as printing. This makes the document which contains the mark not useful for the printer and the watermark can be eliminated from the color band. These types of techniques are mainly used in the commercial field like journalists.
2. **Frequency Domain Techniques:** In compared with the spatial-domain techniques, the frequency-domain techniques are more broadly implemented. The main objective in this classification is to embed or insert the watermarks into the spectral coefficients for the image. The mainly used trans-

forms as in (Friedman, 1993) are: the Discrete Cosine Transform (DCT), Discrete Fourier Transform (DFT), and Discrete Wavelet Transform (DWT). The characteristics of the human visual system is better seized by the spectral coefficients is considered as the main reason for watermarking in the frequency domain. By other words, the low-frequency coefficient is considerably perceived and the high-frequency is believed inferior. To gain a trade-off between robustness and imperceptibility, most techniques embed watermarks in the midrange frequencies.

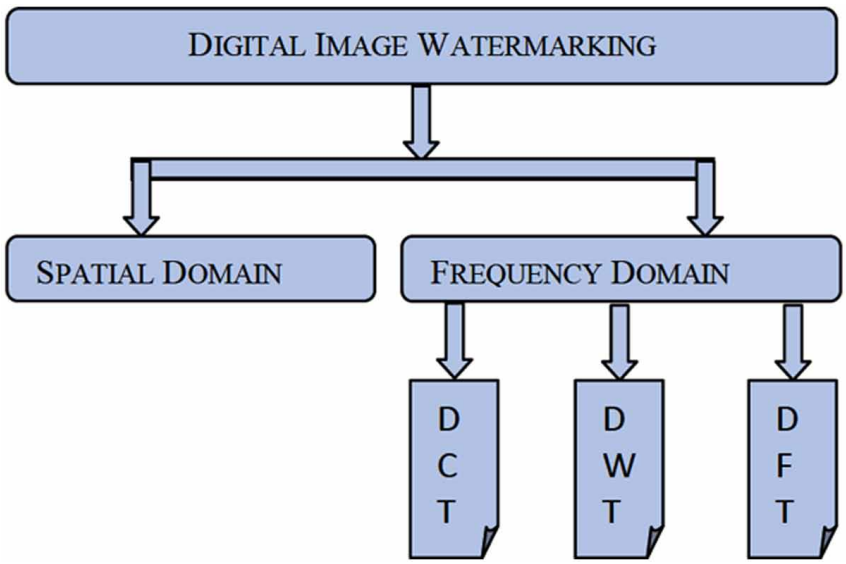
Figure 3 shows the operational fields of Digital Image Watermarking. The spatial domain will come after the wavelet or frequency transformation domain from the robustness and compatibility perspectives based on the common standards of image compression. The frequency domain involves different types of transformations such as: Discrete Wavelet Transform (DWT), Discrete Cosine Transform (DCT) and Discrete Fourier Transform (DFT).

Characteristics of Watermarking

In the digital image watermarking, the concepts: characteristics, properties, requirements or attributes can be used interchangeably. The applications and their purposes of the digital image watermarking will determine their characteristics. These characteristics should be considered once the watermarking system is designed. The main characteristics of the digital image watermarking are given as in (Ming-Shing & Din-Chang, 2001 ; Sin-Joo & Sung-Hwan, 2001):

1. **Invisibility:** When a watermark is embedded within the image, then it will be invisible and the content will contain the hidden watermark inside. A hidden watermark can be discovered by only the owner or an authorized person. These watermarks are used for different applications such as: author or content authentication and it could be used for detecting illegal copying.

Figure 3. Digital image watermarking classifications
(Jobenjit & Shivani, 2013).



2. **Robustness:** An embedded watermark should not be affected or destroyed by an image processing or forgery attacks. Even if an attack removed the visible watermark, then it could be restored by the backup invisible watermark. The original image incorporates the visible watermark into, whereas the watermarking system adds an invisible watermark to this image. Consequently, it can be considered as a watermark within another one which creates binary watermarked images. Thus, a robust watermarking can be developed using this technique. In order to achieve more robustness levels, watermark could be added to different locations inside the image. So, it could be retrieved and restored easily if more than one or more watermarks were removed.
3. **Security:** Generally, a watermark must be confidential and not discoverable by any user except the owner or an authorized person. Moreover, there watermarks should be accessed by those authorized persons. Using cryptographic keys a very important characteristic can be achieved in the watermark and security at the same time. So, the algorithm of digital watermark and its details could be propagated globally. A signal of specific watermark is associated with a particular number which uses to express and embed a watermark. This particular number is must be kept secretly and it could be used to make sure who is the authorized and the owner of digital image. The invisibility will be foible or weak when there are many constraints and restrictions on the robustness. Consequently, when the watermarking system is being designed there should be a significant consideration and trade-off between the invisibility and robustness (Brajesh et al, 2013).

Applications of Digital Image Watermarking

There are many number of image watermarking applications, the main applications as indicated in (Hartung et al, 2005 ; Jobenjit & Shivani, 2013) are given in the following:

1. **Fingerprints:** In such applications, information about the authorized receiver is embedded into the image. Several watermarks are embedded into each published image in the fingerprint application and enable the owner of the image to control and place the images that are unauthorized acquired or altered. Linking distinct information about each published copy of the digital image or content is known as fingerprinting, and a suitable solution for such applications is a watermarking because it could not be visible, known or even isolated from the contents (Kougianos et al, 2009). Adding or embedding information about the legal usability of the image will prevent an illegal copying or using of that content (Keshav & Dheerendra, 2010).
2. **Image and Content Authentication:** In these applications, the main objective is to discover alterations to the image. Different image attributes like edges could be used in order to compare with the existing images to detect any differences. A message authentication technique can be applied as a digital signature to solve these types of problems which derives from cryptography science. Digital signature mainly performs several types of content summary. Tampering could be detected and considered when any portion of these summaries had been altered. The rule of digital signature here is to make the detection process.
3. **Medical Applications:** On the MRI and X-ray images (reports), the patients' names are printed by a visible of watermarking techniques. The patient can gain benefits and take the right treatment by the significant task that offered from these reports. If two reports for different patients are mixed up, then this may result a catastrophe (Coatrieux et al, 2006).

4. **Copyright Protection:** A watermark can be embedded into the image to achieve a copyright of information. If there is a disagreement on the proprietorship, then to know who is the right owner? The watermark will be extracted as evidence and it will be used to resolve this trouble (Jain & Xiang, 2005).
5. **Broadcast Monitoring:** This kind of monitoring is applied mainly in the advertising field in order to ensure that the material broadcasted as the commitment and agreement between different parties such the client advertisement firm (Yusof & Khalifa, 2007).
6. **Tamper Detection:** Tamper detection can be detected by using fragile watermarks. If this watermark is crashed or even altered, it denotes existence of tampering and then this will make a digital content is questionable.
7. **Content Description:** Captioning and labeling of the host image and other further information can be embedded into this type of watermark. For such types of applications, the watermark capacity should be comparatively huge and it does not include constraints or restrictions on the robustness requirement.

Drawbacks of Existing Watermark Systems

1. The main trouble of most of the watermarking systems is that there is no system that can face most of the image attacks or manipulations. These systems are completely sophisticated to be performed timely.
2. **Digital Fingerprints:** The main issues with concern to this application are: Legal Issues, Security Concerns, and Technological Compatibility.
3. **Encryption:** Electronic devices are used to store encrypted information of criminals, or they used secure channels.

Attacks on Digital Image Watermarking

A watermarked image could be modified by mistake or intention. Thus, the robust feature should be found with the watermarking system in order to discover and elicit the watermark. A modification or alteration is considered as an attack that can be performed to distort the quality of the image by adding some deformations. The classifications attacks of the digital image watermarking can be categorized into: non-geometric and geometric attacks. If the watermark is weak, then the attack will be successful and the watermark will be considered as a watermark with a very low acceptable limit (Jobenjit & Shivani, 2013).

1. **Geometric Attacks:** A group of parameters that can be implemented on the image are known as geometric attack. In other words this type of attacks is mainly basic geometric mutations or transformations within an image. Geometric attack may involve: cropping, rotation, scaling, translation, warping, etc.
2. **Non Geometric Attacks:** It involves different signal image processing steps such as: printing, averaging, filtering, sharpening, brightness, scanning, gamma correction, addition of noise, compression of image, etc.

Image Steganography

Steganography is a hiding information technique for digital media such as images in order to hide the presence some or all of the information. In this case, cover media is the digital media without hidden information; whereas the stego media is with (Birgit, 1996). Steganography can converge both authorized and unauthorized weal. The target of communication in steganography is a concealed message and the cover data means how it can be sent. The secret and hidden information as along with the cover data could take any shape of the media such as: audio, image, video or even text. It is well know that the Information security is a very critical subject in all computerized systems around the world and it will remain. Digital Steganography as in (Shuozhong, 2005 ; Bailey & Curran, 2005 ; Kahn, 1996) is considered as of the major trigger that can be used to implement the securing level on the data. Using steganography, the secret information are hidden within signals as an insignificantly information.

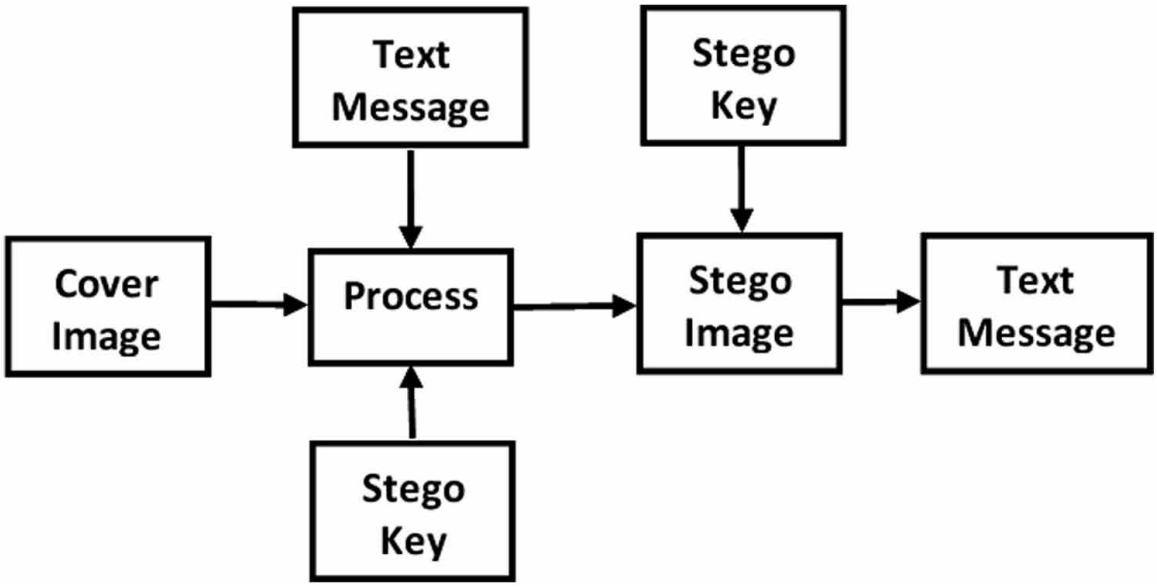
The steganography depends on the reality of the observation and senses of the human that are not enough in compare with computerized systems. Thus, the human senses such as: hearing or vision does not have the ability to discover very slight or teeny alterations in visual or auricular scenes that makes a steganography a very strong technique to hide the important information (Birgit, 1996).

Steganography (Cox et al, 2007) is implemented as a secure communication channel by hiding the secret information into some multimedia materials (such as images) and then sending them to recipients insignificantly. Only the intended recipient who engaged the transmitter has the ability to discover these multimedia materials and then grab the secret information from. The main difference between Steganography and watermarking is that the multimedia material (such as images) can be detected to know if it was altered and doubtful by a third party. This phenomenon is called steganalysis. This third part has the ability also to decide to eliminate these illegal modifications if they are occurred. The steganography algorithms will be considered a robust algorithm when it has the strong resistance level to the primary and ultimate steganalysis techniques.

A cover image is used in steganography as the carrier of concealed message and should have regular and unhurt presence without arousing any type of mistrust. The cover image could be called as stego image if it has the hidden message and then use it for discovering the message at the recipient side (Jamil, 1999; Munuera, 2007 ; Sanjay & Kanak, 2012). The secret key that could be simple or composite, with the usability to insert message into the cover image and discovering message which embedded from the stego image is called stego key. This key can be created by achieving some computations based on some criteria such as (the size of the cover image and its texture) or it can be generated randomly. The general procedures of steganography are presented in Figure 4. The features of the cover image that are using to conceal the message in it are referred as embedding domains. Transform domain techniques or spatial domain techniques can use these features and characteristics. In the past, the image pixels are altered and manipulated straightly for embedding. However and recently, before the images really embedding, the message should be transformed mathematically (Ratankirti et al, 2013).

As mentioned that the main idea in steganography is that it depends on the reality that human does not have the ability to know if an image file or a sound or even a portion of text really comprises concealed information. Steganography is a very efficient technique for protecting information especially when the unauthorized receiver of information or assailant does not understand or discover that the digital media (images) given before them really includes concealed information because when this is discovered, steganography unlock itself up to assault and forfeits its most powerful feature: innocuousness, which represents the detection feature of steganography.

Figure 4. General skeleton of steganography
(Sanjay & Kanak, 2014).



Classification of Image Steganography

The existing steganographic methods were classified in (Brajesh, et al, 2013) as follows:

1. **Transform-Based Steganographic Methods:** In these methods, the signals will be mapped to other types of domain like Fourier transformation or even DCT (Pevny & Fridrich, 2007); the gained co-efficient are modified.
2. **Palette-Based Steganographic Methods:** The steganographic message will be hidden within the indices or the palette bits. The number of colors should be taken in account to be sure it will not exceed its allowable limit, when the image file format has been used.
3. **Spatial Domain-Based Steganographic Methods:** Least Significant Bits (LSB) is the mainly used steganography type in many applications like uncompressed file like BMP or TIFF. In a specific layer, the modification on the least significant bit will result a hidden secret message.

The Requirements of Steganographic Techniques

Three main requirements could be applied to estimate and evaluate the steganographic performance techniques as listed and discussed in (Bin, et al, 2011):

- **Security:** Active or passive attacks may be considered as the most trouble with the steganography. If the presence of the secret message can only be evaluated with a possibility less than or equal random appraising key in the existence of several steganalytic systems, then under these systems, steganography could be evaluated as a secure technique. However, in the other cases steganography will claim as insecure.

- **Capacity:** In order to be valuable in carrying secret message, the concealing capacity supplied by steganography technique must be a high as much as possible. The capacity may be provided in ultimate measurement like the secret message size, or it may be a comparative value (e.g. the bits in each pixel, or the secret ratio message) which is known a data embedding rate.
- **Imperceptibility:** Visual artifact scenes could be served by stego images. It will be better when the stego image has a very high value of fidelity when compare to others under the same circumstances of the capacity and security. If the consequent stego image seems unhurt, then this characteristic has to be persuaded for the custodian not having the authentic cover image in order to contrast.

Types of Attacks on Image Steganography

Steganalys is be defined as the attacking steganography science in a combat that never stops. It simulates the existing founded or developed science of Cryptanalysis. A steganalysis system can be created by steganographer in order to evaluate the robustness of his algorithm. Steganalysis can be performed via implementing several techniques or step of image processing such as: translating, cropping, rotating, and filtering. Additionally, it can be performed deliberately by specific program that explores the structure of stego image and evaluates its statistical characteristics such as first and second order statistics (Chaddad et al, 2010). Based on available information for analysis, there are various types of attacks. They can be categorized into six main categories as in (Gangadhar et al, 2013):

1. **Stego-Only Attack:** The stego-image is only available for analysis.
2. **Cover Attack:** The authentic cover and stego images are both obtainable.
3. **Message Attack:** At some point, the concealed message at sometimes could be known to the attacker. But it could be useless for the attacker.
4. **Chosen Stego Attack:** Where the stego-image and steganography tool are already known.
5. **Chosen Message Attack:** Steganalyst generates a stego-image from steganography tool from a chosen message.
6. **Known Stego Attack:** algorithm is known and both the authentic image and stego-image are obtainable.

Steganalsysis can be mainly categorized into universal and specific steganalsysis based on to the tools of targeted steganographic. Universal steganalsysis is known as blind or universal blind steganalsysis, while specific steganalsysis is found to discover some specific steganalsysis. Without steganography algorithms, universal steganalsysis can discover the presence of secret message and workable than the other type of steganalsysis.

CONCLUSION

Steganography is an approach and science that can be used to secure information by hiding messages within some types of covers and suitable multimedia carrier that will never known by attackers. These cover files could take any file format of digital data such as audio or image files. It depends on the

proposition that if the attribute is visible, then this means that there is an obvious point of attack, thus the main target is mainly to hide the very presence of the embedded data.

Over the past decade, digital image watermarking is an increasing research topic that has received considerable interest from the researchers. For copyrights of different electronic materials and media, the watermarking is a very significant domain. With proliferation of digital images on the Internet, sometimes a watermarking is mandatory option. Digital watermarking is the processing of information along with a digital signal. A watermark is a minor image, which is embedded into the host or original image, and results a protected image. It behaves as a digital signature, providing the image a type of originality or proprietorship and it makes the image very resistance to the attacks.

KEY TERMS AND DEFINITIONS

Cryptography: The art of protecting information by transforming it (encrypting it) into an unreadable format, called cipher text.

Digital Watermarking: A kind of marker covertly embedded in a noise-tolerant signal such as audio or image data. It is typically used to identify ownership of the copyright of such signal.

Discrete Cosine Transform (DCT): A finite sequence of data points in terms of a sum of cosine functions oscillating at different frequencies.

Image Processing: The manipulation of an image for the purpose of either extracting information from the image or producing an alternative representation of the image.

Image Steganography: The art or practice of concealing a message, image, or file within another message, image, or file.

Information Hiding: A technique to prevent system design change. If design decisions are hidden, certain program code cannot be modified or changed.

Steganalysis: The study of detecting messages hidden using steganography; this is analogous to cryptanalysis applied to cryptography.

Development and Design Methodologies

Chapter 6
Media Literacy in the Digital Age: Literacy Projects and Organizations

Amir Manzoor
Bahria University, Pakistan

ABSTRACT

Time has come to equip people communities around the world with digital and media literacy skills. In order make informed decisions, people need ability to access, analyze and engage in critical thinking about the daily messages they receive on a variety of issues such as health and politics. Today's "connected homes" provide people access to latest information and communication technologies. To become an effective participants in the information society of 21st century, people need not only acquire the multimedia skills but also the ability to use these skills effectively. One way this can be achieved is by including digital and media literacy in formal education. The objective of this chapter is to examine the media literacy programs working across the world to equip citizens to analyze and evaluate incoming information. In addition, the chapter provides some specific recommendations to bring digital and media literacy education into formal and informal settings.

INTRODUCTION

During 2009-2010, Ukrainian people saw an unusual set of bulletin boards in a collection of public places. "The person who uncovers that which was hidden–that's a real journalist," read one, against an image of a curtain being pulled back to reveal the word "truth." Another, showing different colored pens writing different letters and numbers, declared that "True news means various views on a single event." These billboards were a rare attempt to teach concepts of media literacy directly to a population at large, that is, anyone who happened to be passing by. The target was the practice of what Ukrainians call jeansa, or hidden advertising, in which a company or politician pays money to a media outlet to get a puff piece, presented as real journalism (Burgess, 2013).

DOI: 10.4018/978-1-5225-3822-6.ch006

Many educators have been wary of the well-publicized hype about the unsubstantiated benefits of digital media in education because of their own real-life experience spending six hours a day with children and teens whose lives are more or less infused with cell phones, iPods and laptops. They know that simply using digital media tools is no educational panacea. A recent study of students in grades 5–8 showed that those from disadvantaged families got lower math and reading scores once the Internet arrived in the home (Knight Commission, 2012). Duke University analyzed test score of over 1500 US students to compare children's reading and math scores before and after they acquired a home computer. They then compared those scores to those of kids who never acquired a home computer (Vigdor & Ladd, 2010). The test scores of low-income kids who got computers at home declined more than children who did not get computers. For middle-school students, social networking, YouTube videos and online games can be a potent distraction from homework and other activities.

Even young people themselves are recognizing some limitations of life online. Some are concerned that screen interaction will replace face-to-face social relationships and others wonder if online civic acts are merely "token activism," creating an illusion of civic engagement while actually distancing people from their causes. "Such nuanced stances reveal that teens and adults are engaged in thoughtful consideration of the civic potentials of online life" (Global Kids, The Good Play Project and Common Sense Media, 2009, p. 17).

Whether we live in a democratic society or a one-party state, the ability to examine information and evaluate media messages is a vital skill set in our era. Media literacy can be defined as the skillful application of literacy skills to media and technology messages. There's a lot of stakeholders in the concept of digital literacy such as technology business, government at the state and local level in the world of education both in K-12 and in higher education as well as stakeholders in the activist community, the library community and creative community. Everyone seems to have a reason as to why all citizens in the around the world to be capable confident users and creators using a full range of digital media tools and technology. According to ALA Digital Literacy Task Force, digital literacy is the ability to use information and communication technologies to find, evaluate, create, and communicate information requiring both cognitive and technical skills.

Essential Competencies of Digital and Media Literacy

According to Chu, Lau, Chu, Lee, and Chan (2014), following are the essential competencies of digital and media literacy.

1. **Access:** It refers to finding and using media and technology tools skillfully and sharing appropriate and relevant information with others
2. **Analyze and Evaluate:** It refers to process of comprehending messages in which a user critically analyze the message quality, veracity, credibility, and point of view. It is done while considering potential effects or consequences of messages.
3. **Create:** It refers to composing or generating content using creativity and confidence in self-expression, keeping in view the purpose, audience, and composition techniques
4. **Reflect:** It refers to application of social responsibility and ethical principles to one's own identity and lived experience, communication behavior and conduct
5. **Act:** It refers to individual and collaborative work by a person to share knowledge and solve problems and participate in the community. The problems to be solved can be in the family, the workplace

and the community, and participation in the community can be at local, regional, national and international levels.

Media Literacy and Civic Engagement

For a long time, media literacy has been an important part of thoughtful civic engagement. The digital revolution has made media literacy even more critical. The explosion of digital media and social networking platforms has transformed citizens into publishers and broadcasters. Today, a truly media literate citizen is someone who not only understands the meaning behind the messages he or she encounters, but also has the ability to create quality content and distribute it in a variety of forms in order to become part of society's larger dialogue.

In countries all over the world, whether democratic or one-party states, governments are promoting media literacy as a vital skill set. Media development organizations uniformly say that it is a vital part of their work. Both programming and spending patterns among funders suggest that media literacy programs are a still small but growing focus of overall media development work.

Improving digital and media literacy require nothing less than national community education effort. Sorting through the flood of information most of us encounter daily requires new knowledge and critical-thinking skills. To participate fully as citizens, people need to be able to not just consume media messages but also create and share them. To fulfill the promise of digital citizenship, citizens must acquire multimedia communication skills and know how to use these skills to engage in the civic life of their communities.

As the global movement for media literacy education emerged in the early 1990s, there were many questions and opinions about what media literacy was all about. For the most part, media education activities were limited to grassroots efforts — an innovative teacher here, a pioneering school district there; some efforts were concerned about issues, like violence in the media or tobacco advertising; others were focused on skills, like video production and enabling young people to produce their own media.

Increasingly, media literacy projects are moving not only beyond broadcast to social and mobile platforms, but also into the realms of digital and beyond media literacy training. Producers of such projects recognize that in order to participate fully in the new media world, children, and adults need to be able to access, analyze, evaluate, and communicate messages in a wide variety of forms.

This new reality means that media literacy programs need to reach a vast audience. The objective of this chapter is to examine the media literacy programs and campaigns working across the world to equip citizens to analyze and evaluate incoming information.

CURRENT STATE OF MEDIA LITERACY PROGRAMS AND THEIR SPONSORS

To support the development of digital and media literacy competencies for all citizens, a comprehensive community education movement is needed. Local, regional, state, and national initiatives are essential. There are some key audiences and locations where this work must occur, including children and youth, new immigrants, special education students, juvenile offenders, and senior citizens, in schools, universities and colleges, libraries, youth media and local access centers. To achieve the buy-in necessary for success, initiatives must capitalize on existing local programs and resources and enroll new stakeholders, including educational leaders, members of the business community, and members of professional as-

sociations who are motivated to develop and sustain programs. We would take a snapshot of the current state of media literacy programs and their sponsors and revisit some of the questions that this new area of media development is raising.

Even as media literacy is seen as permeating most everything that media development groups do, it is rarely a stand-alone objective in programming. There are no media literacy line items on their budgets. And few practitioners have evaluated these programs to see what their overall impact has been. In part, this may reflect the fact that media literary is often viewed as a component within a broader program.

It is also a relatively small part of spending on media development, albeit a growing one. Spending by U.S. media development implementing organizations on media literacy is estimated to have risen from 0.2 percent of all media development spending in 2006 to 4.3 percent in 2011, the most recent data available. This is still a negligible amount when one considers that U.S. government funding for media development as a whole represents only about 0.4 percent of all U.S. foreign assistance (ISSU.com, 2013).

Media literacy is also undergoing a major change in the way it is defined. In its traditional definition, "media literacy" meant equipping citizens to evaluate incoming information for bias and accuracy, and it remains a crucial competency for participation in democratic society. But the advent of digital media and social networking platforms has made each of those citizens a potential publisher. In response, notions of media literacy have evolved to include the ability to create quality content and distribute it so as to become part of society's larger dialogue (ISSU.com, 2013).

Yet, in the world of media development NGOs, there are few programs that attempt to target entire populations. Instead, media literacy growth is more commonly treated as occurring through traditional training programs. By its nature, teaching content creation also imparts the skills of good consumption. Many of the activists who attend, say, an NGO seminar teaching how to blog responsibly in a time of political crisis won't make a career in the media, but whatever they do they'll be smart consumers of media for the rest of their lives. Another school of thought is that training programs will spawn high-quality content that will make people understand that not all content is created equal.

Practitioners are only beginning to digest the scale of the challenge. Citizens across the world are not only consumers of media but also have become major producers of media, and this means that media literacy programs need to reach a vast audience. So far, these programs are scattered across the world and have a long way to go before they have the size and scale to be truly effective. And while we may have to wait several more years before the impact of these programs is measurable, we have been able to surface a number of different, and at times innovative, approaches to promoting media literacy.

Here is a sampling of various programs and organizations around the world.

UNESCO

UNESCO might be called the grandparent of the international media literacy movement, with work extending back more than four decades. Its current programs draw their inspiration and authority from a declaration drafted by delegates from 19 countries at a meeting in Grunwald, West Germany, in January 1982. Language from that document can today feel dated, but if you add Pinterest or texting to the examples, it feels entirely modern:

We live in a world where media are omnipresent: an increasing number of people spend a great deal of time watching television, reading newspapers and magazines, playing records and listening to the radio. In some countries, for example, children already spend more time watching television than they do attending school. (UNESCO, 2001, p. 18)

The declaration went on to say that educators must not ignore this trend and should work to promote "a critical understanding of the phenomena of communication" as a "preparation for responsible citizenship." Ordinary people need to know how to analyze media products and use them both for the acquisition of information and for creative expression. The delegates made four recommendation to the world's education systems including encouraging research about media literacy education and increased cooperation across borders to develop media education, initiation of comprehensive media education programs from the pre-school to university level, and development of training courses for teachers.

Another UNESCO conference, in Alexandria, Egypt, in 2005, broadened the concept into a human right by noting that:

Information Literacy lies at the core of lifelong learning. It empowers people in all walks of life to seek, evaluate, use and create information effectively to achieve their personal, social, occupational and educational goals. It is a basic human right in a digital world and promotes social inclusion of all nations. (Sarah Devotion Garner, 2006, p. 3)

Today, promoting this kind of education is a major part of the daily business of the Paris-based UNESCO, led by the newly founded Global Alliance for Partnerships on Media and Information Literacy. In 2011, after years of work involving teachers, academics, expert reviewers, field tests, and editors, UNESCO published a model curriculum for national school systems. The curriculum provides detailed direction for classroom examination of theoretical subjects such as what information is and how it shapes society. It also contains a lot of practical material: definitions of computer terms; tips for avoiding online scams; and tips on how to convey meaning with particular camera shots and angles. It's now offered in multiple languages. UNESCO is now working with close to a dozen countries to adopt or pilot the curriculum.

In June 2011, educators and officials from the Moroccan government, UNESCO, and Islamic and Arab educational organizations came together to discuss ways to promote media literacy. They issued a detailed declaration calling for such steps as bringing media literacy into the curricula and using it to foster local cultures. UNESCO is also collaborating with partner organizations to develop and launch two online media and information literacy (MIL) courses, one targeting teachers, policy makers, and professionals, the other the public at large. Working with the UN Alliance of Civilizations, UNESCO has drawn eight universities around the world into an academic network on media literacy. To help countries that want to move toward greater media and information literacy, UNESCO is also working to publish a comprehensive framework known as the MIL Policy and Strategy Guidelines. These will include suggestions on what policies to employ, step-by-step implementation processes, and specific resources such as model policy statements.

For 2012-2103, UNESCO set itself some MIL objectives: At least 15 national teacher training curricula will have integrated MIL; at least 12 citizens' media groups (of which at least three are women's groups) will have been formed; and at least 50 public service broadcasters will have applied UNESCO's guidelines for promoting user-generated content.

Neighborhood Incubators

In Armenia, Internews (an international non-profit organization whose mission is to empower local media worldwide) helped finance six InfoTuns (community media centers). These InfoTuns tends to attract a cadre of young activists to take online courses, including in media literacy.

Internews also supported a media website and a mobile museum with exhibits on such subjects as how Soviet news organizations covered the great Spitak earthquake of 1988. Through work like this, general media literacy advances. The program was also looking at classroom instruction, working with the Armenian education ministry to integrate a media literacy curriculum into teacher training and school curriculum.

Restraining the Police Baton

In 2008, men undergoing training as police officers in Afghanistan began receiving a handbook that included two drawings: One showed an angry policeman beating a journalist; the other showed the policeman and journalist working together, each happy with the other. The drawings aimed to build in the mostly illiterate recruits what might be called a specialized form of media literacy: awareness among police that journalists are not spies or provocateurs but should be left to do their work, even assisted.

In conflict zones around the world, select NGOs are working to try to defuse traditional mistrust that exists between journalists, police and military forces. The police in northern Iraq were more afraid of a camera than a gun. To confront attitudes like these, sponsored workshops were organized that brought Iraqi officers and journalists together.

There will be times, of course, when journalists can't avoid conflict with police (reporting on police corruption, for instance). But the idea is to reduce the many unnecessary sources of tension. In addition to Afghanistan and Iraq, countries that have hosted such programs include Ivory Coast, Somalia, Pakistan, Egypt, and South Sudan. Through seminars and other training, one can hope to instill in local journalists the notion that they have responsibilities too. They must behave professionally toward police and soldiers, for example, act as objective observers, and avoid character assassination and emotional rants.

Student Newspapers in China

Student-edited publications are hardly a tradition in the Chinese education system. During 2011-2012, 13 high school newspapers emerged in China's Gansu province. The newspapers were produced by students and teachers who underwent training at American-style "summer camps" and in the schools. The project was approved by provincial, not national authorities. Subject matter included cafeteria food, sports events, teen dating, pollution from neighboring factories, and safety hazards caused by nearby construction. At some schools, principals agreed to sit for interviews, a rare opening up of officialdom. There was probably self-censorship too, as students journalists steered clear of taboo political subjects. For this project, media literacy was the first goal from the start and the hope was to get students to see that there is a different style to newspaper writing and to create demand for that kind of information.

Reaching the Young People of Cambodia

Overseen by BBC Media Action, Loy9 is a project to promote media literacy in youth of Cambodia. A 2010 survey found that Cambodian young people consumed a lot of media and trusted almost all of it. They seemed highly open to being misled by media, whether it was one-sided news or karaoke videos that carried damaging messages about gender (Giraud & Huot, 2012). Loy9, pronounced "loy prambuon" in Cambodian, is a slang for something like "well done!" or "awesome!" The program comes in TV, radio, Internet, and telephone dial-in versions. In broad terms, the goal is to promote participation in civic life by young people, particularly those living in rural areas. This might be accomplished e.g. through a TV serial drama in which a young man runs for election as youth representative on a commune council. With music, brightly colorful animations, and ebullient hosts, Loy tries to cover, in a fun and entertaining way, even some serious subjects. The TV version, aired on Cambodia's two most widely watched terrestrial networks, draws up to 2 million viewers. The idea behind Loy was not only to impart skills to the young people in the village, but also to make a point to the broader audience that behind every video are people who have a particular message they want to convey and choose to show some things and not others. Subjects of direct relevance to media literacy also come up. One show began with the question of why people cry when watching movies that they know aren't real.

Using Game Design in Education: Globaloria

Globaloria, a project of World Wide Workshop Foundation, is a social learning network for designing web-games. The project employed project-based learning where participants created educational games for their personal and professional development, and for the benefit of their communities. Globaloria is suitable for students at all levels and does not require any prior web design or programming experience. Globaloria ran two pilots in West Virginia and in Texas where schools integrated Globaloria curriculum into their school curriculum. The key success factors of Globaloria were the participatory structure of the program that supported learning by doing, partnerships with government, education departments, private and public foundations, local businesses, and institutes of higher education, and the culture of transparency and collaboration that Globaloria brought into schools.

Community Partnerships: The Digital Connectors Program

The Washington DC-based Digital Connectors Program by One Economy identifies young people from diverse low-income backgrounds and provide them technical training. The training helps these young people (called digital connectors) build leadership skills and prepares them to enter the 21st century workplace. Participants give back to their community by training family members and residents on how to use technology effectively.

Adobe Youth Voices

The Adobe Foundation's program, Adobe Youth Voices, is designed to provide youth in underserved communities with the critical digital communication skills. With these skills, youth is expected become active and engaged participants of their communities. Participants use cutting-edge multimedia tools to create various pieces of media (such as videos) and share their ideas about topics that interest them, such as religious and cultural identity and environmental degradation. These works are then shared through a global network of over 500 participating organizations web sites worldwide.

BBC School Report

BBC School Report can be considered as one of the most ambitious news literacy programs ever developed. This program offers training to children in U.K. schools to learn about the practice of journalism and news production. Children learn and develop community-based television and radio news reports. The mission of this project is to engage young people with news, by giving them chance to make their own news in order bring their voices to a broader audience base. Another aim is to provide children with awareness of values behind content creation, such as fairness, accuracy, and impartiality. The program helps students develop skills of gathering information, teamwork and time management, while providing an opportunity to discuss the responsibilities involved in broadcasting to a worldwide audience.

Center for News Literacy

The Center for News Literacy of Stony Brook University train students to use critical thinking skills. With these skills, students are able to judge the reliability and credibility of news and news sources. Experienced journalists are recruited to become News Literacy Fellows and help launch new undergraduate courses that meet the needs of the host universities. The center was working to develop curriculum for high schools and the general public. It was also working to develop a National News Literacy website through which students can collaborate on news literacy projects.

City Voices, City Visions (CVCV)

This is a project of the University at Buffalo's Graduate School of Education. This project aims to work in collaboration with the schools to help bring digital and media literacy to teachers and students and help students meet higher learning standards in literacy and the academic disciplines. CVCV promotes student academic achievement and empowerment using digital media tools. The works created by students and teachers are shared with public to benefit a large number of people.

Common Sense Media

This San Francisco-based non-profit organization (www.commonsensemedia.org) provides independent information and tools about media and technology in the home. The objective is to educate families to make informed choices and have a voice about the media they consume. The Common Sense Media website includes reviews and ratings of various types of media (such as movies, games, mobile apps, websites, books and music) by professional reviewers, parents and kids. The website also provides re-

source materials specifically designed for parents and educators. The organization has also developed a curriculum, focused on digital citizenship, to train students become responsible, peaceful, and safe digital citizens. The curriculum's main focus is on digital ethics and responsibilities. The curriculum uses engaging classroom activities to tackle issues like privacy, cyber-bullying, and online identities.

Digital Media (DigMe)

This program of Roosevelt High School in Minneapolis uses digital media to train students on critical thinking, building meaning, and demonstrating understanding across the subjects. The curriculum is aligned with the national standards in Media Literacy and 21st Century Skills. Students are engaged in reading, writing, analyzing, and discussion activities. Students design and produce projects that demonstrate learning using digital media tools.

Finding Dulcinea, IFC Media Project, and Know the News

Finding Dulcinea is a project that offers contextual background information on news and current events and analysis of how sites with inaccurate and misleading information can be made to seem credible. IFC Media Project is a television series that examines US news media in a bid to uncover the truth about the news. The series provides in-depth reporting on controversial topics facing today's media such as the impact of the economic downturn on the news industry. Know the News is an online learning tool for journalism students and citizen journalists. It explores the issues that shape television news, including bias, authorship, and authenticity, ethics, and media ownership. The website of the tool provides information to help users think critically about TV news by framing news coverage in a global context.

Global Kids and Kids Voting

This organization uses digital media to train students on global awareness and civic engagement. Students develop digital literacy skills, engage in online dialogues and participate in civic action. Kids Voting is a media education program to get students involved in civics. This program offers education curriculum for use during an election campaign. The program integrates civics education and preparation for voting with newspaper reading and media analysis. The program encourages students to analyze and critique political advertisements, news stories, and candidate debates. According to McDevitt and Chaffee (2000) when students are involved in such programs, there is increased student tendency to read newspapers, pay attention to political campaigns, and discussion on campaign-related issues with peer and parents.

National Association for Media Literacy Education (NAMLE)

NAMLE is a US-based organization dedicated provide all people the skills needed to critically analyze and create messages using the wide variety of contemporary communication tools. NAMLE brings together many media literacy practitioners and advocates from diverse fields to bring high quality media literacy education to all.

National Writing Project (NWP)

The NWP is a US-based nationwide network of educators whose mission is to impart the teaching of writing and learning in schools and communities. NWP provides excellent professional development programs to teachers across disciplines and at all levels. NWP offers in all 50 states of USA a special program called "Digital Is". Through this program, educators can share work and practice and think about elements that support effective digital writing and learning of students in a variety of learning environments.

Powerful Voices for Kids

This is a collaborative program that offers a comprehensive media literacy and technology integration program for children and educators, in-school and after-school mentoring, and a research and assessment module. The program aims to strengthen children's thinking abilities and communication skills using language and technology tools to make their voice powerful enough to contribute to the quality of life around them.

Project Look Sharp

This program provides materials, training and support for the effective integration of media literacy with critical thinking into classroom curricula at all education levels. Professional development programs are offered to educators. The material provided enable teachers to integrate critical analysis of news media into their curriculum.

Project New Media Literacies

This program explores ways to train young people with the social skills and cultural competencies needed for full participation in an emergent media society. This program provides resources for educators and learners to integrate the new media literacies into their learning environments.

Salzburg Academy on Media and Global Change

It is a summer education program for students and faculty. This program was created by the International Center for Media and the Public Agenda at the University of Maryland. The program explores media's role in global citizenship, with examination of news media effects on understanding of cultures and politics and capabilities to better cover global problems and report on possible solutions. Students and faculty work together to create a series of curriculum materials to explore these issues. Students learn to identify what news is and how media decide what information matters. Students monitor, analyze and compare media coverage of people and events and understand media's role in shaping global issues.

Silver Surfers Day

This event is hosted by the Office of Communications, the British national government agency responsible for communications regulation, specifically for older people to get a nice introduction to the Internet and practices about sharing photos, online banking, finding other health-related information or other activities specific to their needs and interests.

St. Louis Gateway Media Literacy Partners

This is a collaborative partnership among educators, parents, media professionals and citizens to raise awareness of the importance of media literacy and media literacy education, including the connection between digital and media literacy skills and economic development. The partners in program share the costs of developing programs and services for the community and host events.

The News Literacy Project and Youth Media Reporter (YMR)

This is an educational program to bring experienced journalists into school classrooms. The journalists teach students the critical thinking skills they need to be smart consumers and creators of credible information across all media. Students learn to distinguish verified information from raw messages, spin, gossip and opinion. Students are encouraged to seek news and information to become well-informed citizens and voters. The Youth Media Reporter (YMR) is a professional multimedia web-based for practitioners, educators and academics interested in youth media. The journal documents the insights and leading lessons in engaging young people across all media.

PBS News Hour Student Reporting Labs

This program (http://www.studentreportinglabs.com) is a collaborative partnership between high schools and public media professionals to create investigative video reports. The program provides a flexible curriculum that combines digital and media literacy, media production, news and current events and journalism education.

Admongo

It is an online gaming project launched by Federal Trade Commission (FTC) of USA. This project aimed at helping kids become more discerning consumers of information through analysis of advertisements. The project provides a curriculum and a fun way to look at advertising in the classroom. However, the project lacks meaningful engagement because students are not encouraged to critique or analyze advertisements.

State of Deception: The Power of Nazi Propaganda

The US Holocaust Memorial Museum launched an initiative to impart teaching of digital and media literacy skills by using its exhibit called "State of Deception: The Power of Nazi Propaganda". Under this imitative, teachers participated in a digital and media literacy online workshop that introduced the exhibit and key media literacy concepts through a combination of webinars, lesson plans and online discussions.

Emerson Literacy Education and Empowerment Project (ELEEP)

Emerson Literacy Education and Empowerment Project (ELEEP) is a project of Emerson College, USA. The goal is to engage college students, in collaboration with young youth in the community, and peer to peer mentoring that involves civic engagement empowerment self-efficacy, and agency. It is meant to be gathering of all future leaders and is meant to teach them the foundational skills and competencies in health and media literacy. Students can use their voices when they enter into more formative stages of adult. Being media literate is a good way to filter out the good and the bad media in order to be more informed of what's going on.

DIGITAL MEDIA LITERACY IMPLEMENTATION: ISSUES AND CHALLENGES

Educators and community leaders face many challenges and issues when developing a plan of action for implementation of digital and media literacy program. First, they need to move beyond a tool-oriented approach. Second, they need to address various risks associated with media and digital technology. They also need to expand the concept of literacy, strengthen people's ability to establish credibility and quality of the news, and bring news and contemporary issues into formal education.

Moving Beyond a Tool-Oriented Approach

A great concern is whether people will be able to transfer their self-developed skills in digital media to people beyond their communities (Vadhiyanathan, 2008). The same people who have skills to search for information using digital media tools for youth today that their formal education includes digital media literacy so they are able to experience under broader range of cultural and civic learning that is essential for their intellectual, cultural social and emotional development.

Many schools have made significant investment in technology use. However, teachers still don't make use of digital and media literacy past of their instructional practices. There exists various reasons for this. Some teachers consider using PowerPoint presentation as effective use of digital media, while some don't have time to incorporate digital and media literacy into their instructional practices.

It is obvious that introducing technology in the school alone cannot be sufficient for digital and media literacy education. Schools face many hurdles to achieve their targets of digital and media literacy education and access to high speed broadband internet is one of them (Levin, 2010). The internet filtering implemented at many schools puts serious limitation on teachers and students to access many types of digital media including social media. According to US Department of Education, despite availability of computer in a classroom, more than 50% teachers were not able to display a website to their students because a data projector was not available. Most US student used computer to perform basic tasks such as write documents and make Power point presentations (US Department of Education, 2010).

It is a mistake to take the amount of money invested on technology or number of people enrolled in online learning programs as proxy of digital and media literacy education. Similarly, just providing youth with access to digital technology cannot automatically make them digitally literate. Across a wide range of socioeconomic state in developed world we see parents buy their kids digital devices, including computers laptops and mobile phones. The computer is dominant entertainment device in most homes of developed world (Kaiser Family Foundation 2010).

Professor of English John Sutherland from University College in London, a very outspoken voices among those who believe the technology is killing the art of reading and writing, thinks that "Facebook encourages narcissistic blabbering, video and PowerPoint have replaced carefully crafted essays, and texting has dehydrated language into "bleak, bald, sad shorthand" (Clive Thompson, 2009, p. 1). In a study of writing at Stanford University (Heaven, 2009), researchers followed a group of about 190 students at Stanford for almost 6 years and asked them to contribute all of their writing (anything else they wanted to) to an electronic database. Analyzing about 15,000 pieces of writing that included almost every type of writing (such as emails in 11 languages, text messaging of all kind, journaling, poetry, and PowerPoint presentations), researchers found that students become good writers when they get into colleges. Steady improvement in writing across the college years was also noted. By the time students get the college they understand who their audiences are. Students seem to understand the purpose of writing as they know if they are writing to a college professor that they are not on Twitter. They just know that and they adjust their writing accordingly. The sample of students chosen matched up very well to the demographics of the Stanford class as a whole which meant it was very diverse. The students in the humanities wrote a lot more and had more opportunities for writing than students in the sciences. Gender was not found as a factor that affected student writing. A very important finding of the study was that most students reported liking writing that made something happen in the world that's how they defined good writing. They want writing to do something. They wanted to be active, performative, and make something happen. Students mentioned good writing is writing that make something happen such as a series of posters for an AIDS walk that might raise $60,000 for AIDS research or a poster that would go up on campus demanding a raise in wages for temporary workers. Internet has had huge impact on student writing because now audiences are everywhere in fact it's hard to tell who is a writer and who is an audience anymore. This is because the interaction is so instantaneous that if sometimes someone is receiving a message he is creating message at the same time. So the sense of having a real audience at the other end of your writing is what makes the social networking sites so popular with students and so helpful in terms of getting them writing even more and more because they know they are writing to real people at the other end. While teachers complain of high school students use of Internet speak, such as LOL or WTF, a national study of US college students didn't find a single instance of Internet speak in students' writing. It can be seen that something may be happening between the end of high school and the beginning of college. Students in college seem to know and they know Kairos, they know what's timely what's appropriate in a particular place and time.

Few people think that computers can also be used as a research tool to search for information. However, most people don't have the knowledge and skills required to use the computer for this purpose (Hargittai & Walejko, 2008). A child's experience and approach towards technology can be predicted by analyzing the parents' behavior and attitude towards technology (Pew Internet & American Life Project, 2009).

Research shows that the probability of content creation by students, whether online or offline, increases if at least one of the parents holds a graduate degree. "While it may be that digital media are leveling the playing field when it comes to exposure to content, engaging in creative pursuits remains unequally distributed by social background" (Hargittai & Walejko, 2008, p. 256).

For these reasons, merely using digital technologies in teaching is not sufficient to develop digital and media literacy competencies. It is essential that teacher make use of dialogue and Socratic questioning while teaching about media and technology. It would help promote critical thinking in student about various choices to make when they consume, create, and share messages. As Buckingham (2007, p. 113) points out, "Rather than seeing the web as a neutral source of 'information,' students need to be asking

questions about the sources of that information, the interests of its producers and how it represents the world." Kids Voting program is USA is an example of such program that works to develop these critical thinking skills in US children and teens. Student are involved in news reading and media analysis (Mcdevitt & Cheffee, 2000). Research shows that use of engaging digital and media literacy projects as part of teaching increases the information retention capacity of student and also increases their ability to analyze the context and quality of information websites (Berry & Wintle, 2009; Pinkham, Wintle & Silvernail, 2008).

Game design can be used to develop digital and media literacy skills by involving students in game design help them understand the constructed nature of digital environment and its role in shaping personal and social action. By becoming designer of the game, student gain a deep understanding of the choice available in the structure and function of technology tools.

The digital and media literacy provides competencies learners need to interact with audience beyond their friends, family and experience true participation in community that help them clarify their ideas about the world from different lenses and developing a sense of connectedness to the people around them.

Managing Risks Associated with Digital and Media Literacy

Digital and media literacy competencies can also help address potential risks associated with mass media and digital media such as risks associated with identity theft. In 2009, 10 million US citizens were victims of identity theft often because "they couldn't distinguish an email from their bank from an email from a predator" (Rothkopf, 2009, p. 5). However, this example is just the tip of the iceberg.

Many people are pro-social and contribute to a social network while others exploit digital technology for evil uses. In the developed world, concerns about the negative aspects of media and technology increases and decreases over time. Staksrud, Livingstone, Haddon, and Ólafsson, (2009) identify three types of risk associated with the use of mass media, popular culture and digital media:

- Content risks (i.e. risks associated with exposure to potentially offensive or harmful content).
- Contact risks (i.e. risks associated with people engagement in events such as harassment and cyber-bullying).
- Conduct risks (i.e. risks associated with activities such as misinforming people and illegal downloading).

In developed world, some people completely ignore any risks associated with digital media, mass media and popular culture. While some feel a mix of fear, anxiety and optimism about the risks and opportunities. This situation reflects the need to both protect and empower both kids and youth regarding media and technology and to address the transformative social potential of the Internet in the context of child and adolescent development (Ito et al., 2008). One example is the case of sexuality where empowerment and protection benefits children, youth, and their families as children and youth can use the Internet and social media to get accurate information about sexual health and experience extended forms of sexual expression and experimentation including live chat. Pornography is a multibillion dollar industry. Prevalence of pornography in the lives of youth is far more significant than realized and it can be used to exploit the youth (Witherspoon Institute, 2010). In USA alone, about 15% of teens aged between 12-17 received sexually explicit images from people they knew personally (Pew Internet and American Life Project, 2009). In 2008, up to 35% children and youth in USA were victims of electronic

aggression such as sexting and cyberbullying (Centers for Disease Control and Prevention, 2008). These examples clearly show the intersection between human needs (such as power, intimacy, trust, and respect) and ethical challenges of social participation in the digital world. This is why the link between empowerment and protection is so strong.

Digital and media literacy will not be a solution for social problems and it will not relieve companies and producers of their social responsibility. As Jenkins et al. (2006, p. 19) rightly point out, the one key goal of media literacy education is to "encourage young people to become more reflective about the ethical choices they make as participants and communicators and the impact they have on others." Online media can be used as an amplifier for small groups of people to make a disproportional amount of noise. Despite talk of media as a source of information it can be a generator of gossip, misinformation, and prejudice. Take example of Lisa Clinton, an American citizen working in Doha, Qatar. She was travelling on 18th of December, 2009 from her friend's house to her house. The distance was about one kilometer. The 18th December was Qatar National Day. It took her more than 3 hours to get home. She was so upset for this inconvenience, due to disturbance on the roads due to National day, that she wrote an article on qatarliving.com, a website for news and updates about Qatar. The article brought significant criticism from Qatar nationals as they thought it as an attack on their culture and traditions. An anti Qatarliving page on Facebook was created. A clear polarization was observed as the American supported the Lisa Clinton's stance while Qatar nationals strongly criticized. As a result, Lisa Clinton was socially isolated and lost her job contract in Qatar. She tried posting an apology on every website she thought appropriated but it was too late probably. The most probable reason for this unpleasant series of events was the negligence of webmaster of qatarliving.com who failed to monitor the site content. If he would have monitored the site content, he could immediately remove Lisa's article and comments that came through to stop further disturbance. This one example shows that media, online media in particular, needs to be more closely regulated and be accountable. In this way, the media can play a more destructive than positive role in our globalizing societies. Middle East region is composed of many minorities. Liza's story tells us that we need to train to be tolerant when using media.

Expanding the Concept of Literacy

Digital and media literacy does not replace or supersede print literacy. With the passage of time, the concept of literacy is expanding. Today, literacy is called that ability to share meaning through symbol systems. Print is one of these symbol systems. One need significant investment of time and effort to master print literacy. As such, effective instruction in reading and writing is becoming more important. To read well, people need decoding and comprehension skills and knowledge base to interpret new ideas. To write well, one needs to know how words are used together to form ideas and arguments. Digital media has the ability to get people engaged in learning and to help them pay attention. Motivation and engagement are enhanced through integration of popular culture and digital media and technology in learning. But this is not the sole purpose for implementing digital and media literacy into the curriculum. When used properly, mass media and digital media can support the acquisition of literacy competencies. The concepts of audience, purpose, and point of view must be applied to digital media, popular culture, and print text. By participating in digital and media literacy activities, children and young people can also learn public speaking and advocacy and become able to express themselves effectively (Alvermann, 2004; Hobbs, 2008; Gainer and Lapp, 2010).

Today, online reading is fundamental to digital and media literacy. Online reading requires many interrelated practices such as how to use search engines, read search engine results, and quick reading of web pages to locate the information required. Many people lack these skills (Coiro, 2007) and do not look at relevance of websites to the purpose and goal of the web search.

Digital and media literacy education requires and supports skills of reading, comprehension, and writing. Students' participation in media literacy education programs can strengthen these competencies (Hobbs, 2007). Since long, to promote reading and writing skills, teachers have been urged to make literacy experiences more relevant to students' interests and everyday life.

As pointed out in a report of US Department of Education "Look for opportunities to bridge the activities outside and inside the classroom. Tune into the lives of students to find out what they think is relevant and why, and then use this information to design instruction and learning opportunities that will be more relevant" (U.S. Department of Education, 2008, p. 28).

People do develop many skills informally by using digital media with peers (e.g. in social groups). However, a connection between print literacy and digital media literacy is a must to transfer those skills to new contexts (such as informal to formal and narrow to broad context) (Salomon & Perkins, 1989). Digital and media literacy education can help in such transfer.

Strengthening People's Capacity to Access Message Credibility and Quality

In search of information online, many people give up before they find the required information. People use a small number of search strategies repetitively irrespective whether they find required information or not. According to Cheney (2010, p. 1), "students typically use information that finds them, rather than deciding what information they need"

Many people use a very superficial criteria for assessing the quality of a message and adolescents and young people are likely more susceptible to digital misinformation. But few people, both children and adults, verify the information they find online. Many people tend not to critically analyze information they find from whatever source. Digital media can play a very important role to uncouple the credibility and authority in novel ways. Family, peers, and friends have always influenced one's decision about what to trust. Today, these decisions, as well as our ideas of credibility and reliability, can also be shaped by participation in online communities (Metzger, 2009).

Even for adults, assessing credibility of information is difficult because so many sources of information are available. A simple tactic commonly used to evaluate credibility of a source is the graphic design of the sources. If graphic design looks right, that implies source is credible. Information on Internet is usually context deficient where information about authorship is often unavailable. Search engine aggregate information from multiple sources. With hyperlinking, it is even more difficult for users to follow and evaluate sources (Harris, 2008; Metzger, 2007). This shows that the immediate and immersive digital media also discourage users to be reflective and analytic in their thinking when analyzing the credibility and reliability of the sources of content. This is important because skillful use of digital information can enhance the process of checking the facts and compare the sources.

In order, pay attention to the quality of media messages, people need self-awareness and a general understanding of human perceptual and cognitive process. It is our natural tendency to trust sources as credible only when they reinforce or match our existing beliefs and distrust information that challenges our opinions. This tendency should be emphasized in media and literacy education because it can help

people become more open and receptive to diverse sources and beliefs and address the problems of political polarization and provide a balance between extreme and moderate points of views.

In source stripping, one detaches the content from its source forgetting where information was learned (Eysenbach & Kohler, 2002). Digital and media literacy education increases people knowledge of human information processing, self-awareness, and self-reflexivity. With this knowledge, people can counteract tendencies such as source stripping. Research and assessment tools are needed to help develop best instructional practices that could help develop people's ability to evaluate quality of information they receive from various sources of media.

Integrating News and Current Events

Civics-oriented education, that used every day journalistic resources, has been declining (Hobbs, 1998). Young people avoid reading news because to them the news is a significant source of stress. The news reminded them how insecure the world is and make them feel unsafe and threatened. When they do read news incidentally, they prefer news about entertainment, music, celebrities, and sports (Vahlberg, Peer & Nesbit, 2008). Some researchers think that children or young people should not reach or watch the news because it is not good for them (American Academy of Child and Adolescent Psychiatry, 2002). Violent news content has been shows to induce more fear reactions. Violent news content creates persistent worrisome thoughts in the minds of children and young people (Kaiser Family Foundation, 2003; Cantor & Nathanson, 1996).

Using news and content events in the classroom can be controversial. In the USA, the President Barack Obama's back-to-school speech for school children was heavily criticized as propaganda. In addition, the present media age is marked as competition for and fragmentation within the news audience. We cannot make simple assumptions about the trustworthiness and authoritativeness of sources of information. In a highly polarized, political climate, teachers are hesitant to use news and current events in the classroom (Hobbs, et al 2010; Hobbs, 2001). As Mihailidis (2009, p. 9) pointed out that "Making the connections between media literacy, freedom of expression, and civic engagement can reposition media literacy as the core of new civic education".

In the UK and Western Europe, news and information programs for children and young people are considered public service. But in USA, it is purely a commercial venture. Research showed that teens learning of current event knowledge, through these news programs, occur only when teachers support this learning by asking questions (Johnston, Brzezinski & Anderman, 1994).

Some newspaper industry programs, such as US-based Newspapers in Education (NIE) program, provide newspapers to schools through advertising sponsorship and other donations. However, these programs have declined substantially as newspapers revenues continue to plumped (Arnold, 2010). For communities with very limited resources, access to quality journalism has been an additional expense for school. As Bazalgette, Harland and James (2008, p. 81) observed for USA and UK that "It has proved difficult to support, develop and sustain teaching about broadcast news because of the ephemerality of the subject matter and the effort involved in bringing current TV, radio or Internet news into the classroom".

The use of news media in the K-12 classroom is limited. Regular engagement with news and current events may support the development of learner's background knowledge, build connections between the classroom and culture, and help them appreciate how audiences understand and interpret messages differently (Levine, 2008).

PRACTICAL/MANAGERIAL IMPLICATIONS AND RECOMMENDATIONS

To support the development of digital and media literacy competencies, a comprehensive community education movement is needed. Initiatives at various levels of government are needed. Developing infrastructure and human resources for digital and media literacy education is a lengthy process that requires identification of key audiences and locations to work on. A buy-in from audiences is necessary for success. Initiatives targeted to gain this buy-in need to capitalize on existing local programs/resources of media literacy education. New stakeholders (such as members of professional associations) should be identified and taken on board.

Community Initiatives

Since community leaders often lack awareness of digital and media literacy initiatives, increasing the awareness of digital and media literacy initiatives can help develop effective leadership, promote coalitions/partnerships, and build organizational capacity for sustainability of initiatives. For community initiatives, existing resources in digital and media literacy should be identified. Identification of existing resources would help identify existing resources, core values and priorities of local programs of digital and media literacy education, underserved populations, and gaps in existing programs and services. Small grants should be offered to community sponsors to integrate digital and media literacy competencies part of the existing education programs. Sponsors of community initiatives should offer small grants to develop pilot programs of digital and media literacy competencies targeted to serve specific underserved populations that are in great need of such education. The sponsors or their partners should organize annual community events aimed at increasing awareness of various programs of digital and media literacy education, promote networking, and develop community-level leadership. Schools should utilize their summer programs to impart digital and media education to communities especially children belonging to low-income communities. These summer programs can help blend fun and education and keep children involved in learning. According to Finn (2010), lack of summer learning is a significant factor behind the achievement differential between low-income and high-income youth. National networks of summer learning programs can be built-upon these summer programs. These summer programs can also attract teachers to include digital and media literacy instructional practices into their classroom teaching. Engaging students in activities based on mass media and digital media, the classroom teaching can help students build positive relationships with their peers, and adults, use technology for learning, and develop critical thinking and communication skills. Recent media graduates and professionals may be used as resource persons for these summer programs. That would also provide them with an excellent learning opportunity and build civic awareness. Broadband Internet adoption rates are still relatively low even in developed countries. Many factors are cited by non-broadband users such as access, relevance, lack of digital literacy, and cost. High speed Internet is very important for digital media. Flexible short-term Internet training programs should be developed for busy adults.

Teacher Education

To bring digital and media literacy education into the classroom, knowledgeable and skilled teachers are needed. Across the globe, silos exist between the departments in most colleges and universities. There exist little to no interface between faculty at schools and communication. The lack of incorporation of

digital and media literacy education in the classroom teaching is the most significant factor why most schools leg behind in equipping their students with latest digital and media training. Faculty at most schools of communication have specialized digital media skills. However, the faculty have little experience in developing non-specialized digital media programs that could serve the needs of underserved populations including children and youth. In order inspire teachers to incorporate digital and media literacy education into their classroom teaching, rich digital and media literacy training must be provided to the teachers. That could help universities build interdisciplinary bridges that bring students and teachers together for co-learning opportunities. Meaningful teacher development would also help in this regard. Training of teachers may also be provided online and should include instructional practices of digital and media literacy education. A rigorous evaluation should be part of this training that assesses the impact of training on teacher's classroom teaching practices and knowledge/skill development of students. The resources of news media can be used to strengthen digital and media literacy skills. Today, access to both print and TV news is available 24 hours a day. Emerging online services are available that can help people use, analyze, and share news content. In this regard, technology companies can contribute by volunteering their expertise and resources. Many innovative online tools are available that teachers and students can use to analyze news content as part of their general education. However, a very small percentage of faculty members utilize these tools. Media and technology companies can give small grants to develop partnerships between developers of these tools and key educational groups in a bid to promote the use of these tools. Teachers and students can develop examples of effective use of these tools in instructional practices. If well-publicized, these examples could support the growth of digital and media literacy education across disciplines.

Research and Assessment

To offer a compelling evidence of the need of digital and media literacy is the first step to establish importance of digital and media literacy. For people with well-developed digital and media literacy skills, it would be a mistake if they expect others have levels of skills and competency. One reason people may lack such competencies is non-awareness of the value of these competencies. Compelling test results can help establish value of these competencies. In order measure progression of learning, measures of digital and media literacy would be needed. In this regard, online testing facilities can be developed exclusively for digital and media literacy. Benchmarks of assessment should be developed. These benchmarks would also help establish need of new programs and measure effectiveness of existing programs. Similar to students, teachers also learn best if given opportunity to observe and analyze the peer practices. An online repository of audio/video excerpts of digital and media literacy learning could be a valuable source for teacher education programs around the globe. Besides excerpts, this repository should contain teacher-created lesson plans and other teaching materials. A feedback mechanism regarding this online repository should also be established so that users can provide their feedback so that this repository could be improved on regular basis. This resource could also be used to identify best practices by identifying the most effective instructional practices. This resource could also be used as an effective test to measure teacher's ability to incorporate digital and media literacy skills into their instructional practices. Documentation of instructional practices, in relation to the use of news and current events in the context of digital and media literacy is needed. This will help build a knowledge base to help researchers and educators determine best approaches to use news and current events in the classroom.

Program Outreach, Visibility, and Engagement

Social norms of people interaction with technology continue to emerge as the participation in the digital culture spreads across the globe. To strengthen participants' capacity to effectively participate in this digital culture, participants need to know how to engage with the information. This engagement can be effective when participants understand the role of digital and media literacy in their ordinary lives. An education-entertainment initiative can also help raise the visibility of relevance of digital and media literacy in everyday life. Besides mirroring social reality, entertainment can also help shape popular opinion. With modest investment in such education-entertainment initiatives, social and ethical norms regarding use of digital and media literacy could become part of social norms of ordinary lives of people. Community education programs for digital and media literacy must put youth on the center stage with help from local/national celebrities to bring people attention to these programs.

To foster the development of digital and media literacy, professional associations needs to be developed further. That would enable educators to share experiences about "what works," and establish relevancy of digital and media literacy education to a wide range of stakeholders. A leadership conference for educators can raise the visibility of digital and media literacy among policy makers and other stakeholders and could help bring new leaders into the field.

Measuring Program Success

Evaluating success of digital and media literacy initiatives is a challenge. There exist no standard tools for assessment of digital and media literacy skills. Digital and media literacy initiatives vary in their scope and size and follow different approaches to evaluate program success. While no organization implements a comprehensive evaluation plan, some key themes can be identified (Donnelly, 2011).

First, digital and media literacy initiatives must empower users to make their own meaningful choices, critiques, and content. To be successful, digital and media literacy initiatives must set clear goals, and evaluate their success using a clearly-defined criteria.

Second, the media literacy programs must also focus on how successful their learners are in both understanding media concepts and their applications of concepts demonstrated by a piece of media production such as a short film.

Third, digital and media literacy initiatives must set feedback mechanism for both teachers and students to obtain a comprehensive understanding of how well a given initiative worked.

Fourth, most of the data collected in the digital and media literacy initiatives is qualitative and can take many forms, including case studies, interviews of students and teachers, and students' assessments. External evaluators should be hired for analysis of this data to ensure depth of analysis as well as objectivity.

Fifth, the evaluation data should be published to inform researchers and teachers of best practices. It can be done e.g. by publishing video case studies and providing a toolkit that outline lessons learned from the program. Sharing information and developing shared practices and lessons learned would help ensure development of the field and success of future digital and media literacy programs.

FUTURE RESEARCH AREAS

Media forms and contents continue to diversify. As such, the skills required to understand, assess, and evaluate the media has become increasingly diverse. Future research is needed to evaluate media literacy demonstrated across different communication contexts. This would help place media literacy in the context of new users of media. Another area that needs further investigation is the activities/choices of youth regarding digital media. This knowledge is central to the understanding of youth media literacy.

Increased diversification of media has increased scope of impact and influence of social, cultural, and other contextual factors on the development and improvement of media literacy. Future research is needed to explore the perceptions and role of various stakeholders in fostering media literacy. It would also help make appropriate policy and educational recommendations.

Youth develop skills to engage in particular communication activities. They use their skills and time to pursue interests which are part of their identity. It is still a formidable challenge "to identify the types of contents, modes of engagement, skills and literacies, and opportunities for participation that we as a society wish to encourage and enhance" (Livingstone, 2002, p. 243). Future research can investigate this issue further.

As mentioned earlier, the change in writing of students, between the end of high school and start of college, is something which is very interesting. A future investigation into this phenomenon can enhance our understanding of the role of students as content creators.

CONCLUSION

A global movement for digital and media literacy education is developing all over the world .European Union identified media literacy as a priority in their agenda for 21st century. Media literacy includes all forms of media including conventional (TV, newspaper etc.) and non-traditional (Internet and all other technologies of digital communication). Media literacy has become the fundamental competency for both media professionals and non-professionals (such as teachers, students, parents etc.). In both European Union and USA, issue of media literacy has been recognized as a critical issue for social and cultural development. In United States, researches argue that most US citizens are yet to experience the true transformative potential of the Internet. Internet can change lives and now its time to pay attention to develop those human competencies and skills that people would need to become effective participants in the digital age of 21st century.

It is now obvious that technology alone is not a savior. Technology, Internet and related communication technologies, will not be sufficient to improve education. Use of modern digital technologies cannot make people become smarter or enhance their digital literacy and other skills needed to be successful.

In fact, novel digital technologies can hinder the process of human development because of technology's potential to offer many time-consuming distractions. These distractions can interfere with regular activities of people. A study by Duke University found that most US citizens used computers at home mainly as entertainment devices. A shift in this approach is not possible until unless an active, learning-oriented approach is cultivated in the society.

It is expected that an increased appreciation of the delicate balance of protection and empowerment in the use of digital media will ultimately lead people better manage their increasingly connected lives. Making digital and media literacy part of education, imparted both in and out of the school, can bring

many fruitful results. First, parents can gain understanding of balancing the protection and empowerment of their children when they use digital media. Parents can give attention to balancing their children activities related to digital media with other activities of play and learning. Second, people will gain understanding and ability to ask critical questions (such as source, purpose etc.) about various messages they receive (e.g. blogs and political opinions). Third, teachers will be motivated to use engaging instructional methods in their teaching. These methods will be helpful not only connect literature with science, health and history but also bridge the learning of classroom and outside world. Fourth, people of all ages will become responsible and their communication behavior will reflect respect for others and a sense of personal accountability for their online and off-line actions. Fifth, students will learn to use digital media tools to create and compose authentic messages for real audiences. Students will learn and develop skills and knowledge to become an effective communicator. Sixth, people from all walks of life will be able to find, share, and use information to solve problems of their everyday lives. People will be able to provide meaningful participation and social actions in their communities and nation.

In the process of enhancing media literacy, teamwork, collaboration, and social responsibility will flourish. Students will learn to use digital media tools to locate required information quickly. Media professionals increasingly recognize the need of consumers that are more active, engaged, intentional, and have a strategic orientation regarding their use of media. An opportunity to promote quality media products will automatically emerge when people have high expectations of quality media products (such as news). Supporting digital and media literacy for all people is essential in the formation of coalitions and partnerships across globe.

KEY TERMS AND DEFINITIONS

Citizen Participation: Citizen Participation refers to the process of providing private individuals an opportunity to influence public decisions.

Civic Engagement: Civic engagement means working to improve the quality of life in a community. This can be done through both political and non-political processes.

Digital Learning: Digital learning refers to learning that is facilitated by technology and gives learners some control over time, place, path and/or pace.

Digital Literacy: Digital literacy refers to the ability to use digital and communication technology to locate, evaluate, use and create information.

Information Literacy: Information literacy refers to one's ability to assess the need of information, find the required information, and evaluate, use and communicate this information.

Media Creation: Media creation refers to the creation of content in any field of communication, entertainment or information.

Media Literacy: Media Literacy refers to one's ability to access, analyze, evaluate and create media in a variety of formats.

This research was previously published in the Handbook of Research on Media Literacy in the Digital Age edited by Melda N. Yildiz and Jared Keengwe, pages 249-274, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

Chapter 7
Information Overload as a Challenge and Changing Point for Educational Media Literacies

Sonja Ganguin
Leipzig University, Germany

Johannes Gemkow
Leipzig University, Germany

Rebekka Haubold
Leipzig University, Germany

ABSTRACT

This article deals with the concept of information overload as a crucial element of the changing information environment. Against this background, the authors discuss an alternative process for the conceptualisation of educational media literacy. By combining two nationally-based concepts on media literacy (German and Anglo-American), the yield of such a transnational approach will be demonstrated. The first section is dedicated to a historical overview. Based on the observation that humanity is currently dealing and always has dealt with information overload, leads to the necessity of coping with said overload. To this end, the second section will present and didactically reduce both discourses to their essentials. The third section provides a possible conceptualisation of both concepts and practical application of the combined approach for scholastic learning. The aim of this paper is to stimulate an international exchange on media literacy.

THE CHALLENGE OF INFORMATION OVERLOAD

Clay Shirky, media professor at New York University, said at the Web 2.0 Expo in New York in 2008, "It's not information overload. It's filter failure" (Shirky, 2008). This paper aims at demonstrating, that humanity is and always has been dealing with information overload. From an educational standpoint, the solution to so called information overload "revolve[s] around the principle of taking control on one's

DOI: 10.4018/978-1-5225-3822-6.ch007

information environment" (Bawden & Robinson 2009, p. 187). Digital media change the information environment. This is due to many factors, including the changing places of knowledge and their authorities or simply the technological basis of digital media. It is the responsibility of education media literacies to tackle these factors and to give adequate recommendations for action related to information appropriation with digital media. This understanding of information overload leads directly to the discussion about information literacy.

The present chapter outlines the possibilities to cope with information overload by bolstering the competencies of media users. Therefore, the authors will discuss an approach to face the changing information environment for educational media literacies without abandoning originally educational ideals. The first section is dedicated to a historical overview of the said information overload. The approach points out the theoretical foundation of the German theorem of competence as well as Anglo-American literacy research. To this end, the second section will present and didactically reduce both discourses to their essentials. By using the information landscape in digital media, the possibilities of a mutual complement of both specific nationally-characterised approaches will be demonstrated in the third section. Furthermore, this section provides practical application of the combined approach for scholastic learning. The authors assume that combining both concepts will result in an important contribution to the research field. Combining the German literacy approach with the Anglo-American one means integrating subject-orientated ideals into a concept which is naturally based on users' activities in the media environment. The subject-orientated ideals refer to the confident and independent handling of digital media, which implies a reflexive distance to the way information is generated by digital media. This distance enables the use of digitised information in relation to subjective demands and living environments. This criterion of literacy is called media critique (Ganguin, 2004, 2006, 2014). The pragmatical approach can be used to identify specific "top-down"-challenges caused by the way digital media have changed the manner of generating and presenting digitised information. The management of information will continue to prefer pragmatic solutions. But for an educational approach on information literacy, which tries to implant idealistic values on education, the scope of digitised information should extend to looking for possibilities to use the current state of the information landscape.

Information Overload History

People have been discussing communication or information overload since and during the rise of each new media. The authorities, who foster or inhibit information overload, are changing, with it, and so the structures and challenges for the users do. Therefore, the chapter is dedicated to emerging challenges for media literacy because it is not just necessary what or which, but also *how* digital media are and how they are dealt with by people.

People have been exposed to an overload of information, from which they need to make selections, since the dawn of humanity. Whether the invention of letterpress printing, the telephone, or photography, people have faced a "regretted inability to read" (Bawden & Robinson, 2009, p. 182), listen or watch. The rise of digital media, where watching, listening and reading are familiar practices and especially with the implementation of the social web as a user-generated database, gives the impression that this 'regretted inability' is growing immeasurably to an information overload. Stimulus satiation as sensory overload does not necessarily depend on media, but media visualise them and improve their transparency, making the information quantifiable, showing them "in cold print". For this, media are reproductions of reality as well as they are part of reality throughout their possibilities to act with them, both techni-

cally and content-related (including trading). With media, empirical reality becomes a cultural encoded continuum, which could be seen when the brothers Grimm wrote down oral fairy-tales for instance, or also since the point where it has been possible to take photographs of single elusive situations. Media "are constructed complexes of habits, beliefs, and procedures embedded in elaborate codes of communication" (Anderson & Curtin, 2002, p. 24) and concerning, places of information-collection such as libraries are obtaining "bodies of knowledge and per se published science" (Schanze, 2001, p. 234).

The rise of each new media is driving the process of information overload forward. Developing graphic characters, in addition to oral tradition, information was collected through several media. With the invention of Gutenberg's movable-type printing, a media system and cultural practice was rising around 1440 upon which today's mass media is based. With the Protestant Reformation, people started to address and reach a broad audience with their written information. When the "press" was reacting to public-orientated current incidents, the information increased further. Distribution of newspapers via post led to a wider dissemination of information. Broadcasting enabled the reception of cross-border channels. In the advent of the First World War, the appeal was extended to the entire population, who became interesting as voters (Stöber, 2003a, p. 150). Already Otto von Bismarck (1869) sharpened his statement about the various sources of information, saying that in the past there was the proverb "He is lying as if it were printed. In the future, it will perhaps come to the saying: He is lying as if it were telegraphed." (Stöber, 2003b, p. 240).

By looking at the past, it can be noted that such gatekeepers who were lying as if it were printed or telegraphed were always present, fostering or – sometimes unintentionally – inhibiting information overload. One of the first medial information overloads in the Gutenberg age was inhibited by religious authorities. The clergy started controlling the new mass media early on, which preserves unity of faith (for both Protestants and Catholics alike). Pope Innocence VIII established a prior censorship in 1487. It was needed to make clear that instances like this always have influenced information and thoughts but it was not as visible as censorship is today; it was not "in cold print". Furthermore, economic motivations are on display in "Postdebits", which inhibit information overload in newspapers, leading to the high prices of media, e.g. so that broadcasting or telegrams do not "overwhelm" the people or their material availability (Stöber, 2003b, 140). For this, on the one hand, censorship inhibits information overload and on the other hand, it ensures that the 'right' information are overloading.

Later, the influence of the church decreased and politics gained the upper hand over moral, ethical or aesthetic censorship. In contrast to print media, films were *ab inicio* established in and classified as commercial law; in Anglo-America as well as in Germany. In Prussia, the local Berlin police were responsible for film-censorship until 1906, whereby they used the General Land-Law from 1794 as a foundation for their actions. Also in the USA, the state – especially the local Chicago police – protected the moral order for films starting in 1907 (Stöber, 2003b, p. 64). The states collected taxes and started to educate journalists and moviemakers as gatekeepers on a subordinate level. During the Second World War in Germany, the transition of the National Socialist German Workers' Party (NSDAP) led to convictions and expropriations to an all-embracing centralization and nationalization of media and with it to censorship. It could therefore be said that the information overload controlled and inhibited thinking about the radical handling of mass media. The burning of books on 10th May 1933, where socialist, Jewish or other not system-compatible media were destroyed symbolically and materially, the unification of mass media under the Reich's Ministry of Public Enlightenment and Propaganda, or the punishments for receiving foreign broadcasts (Kohl & Hasse, 2001, p. 174) are some examples of establishing an ideological information overload.

The beginning of governmental influence also simultaneously strengthened media as an economic product. Nevertheless, what was regarded as improper by the church, was continued by governmental power, as well as the economic system that carried on governmental functions such as youth media protection and taxes.

All those gatekeepers have in common that they are using their power in a culturally pessimistic way. The main focus is on moral and ethical aspects along with law and order, which are important factors for the retention of the power of the authorities. Societal values need to protect, which means protecting people who cannot protect themselves. In the past these were women, the youth and children as well as the lower class(es), who needed to be kept separated from media, at least from the authorities' perspective (Barth, 2002, p. 82). They had a deep concern for information overload (already the rising use of the telephone caused immediate excitement) (Stöber, 2003b, 62). On the assumption that behaviour patterns are copied one-to-one by these groups, fear increases with each new media. Youth media protection was and is an overload inhibit factor because the youth need not select what already has been filtered. In Switzerland, censorship of films forbids young people (until the age of 18), from visiting the cinema until the middle of the 1960s. In the United States, youth media protection was more advanced in 1930 because media censors in the U.S. attached conditions to parental support. The control measures were compiled as a non-governmental department in 1922, and served as an early encapsulation of non-governmental censorship. In Germany youth media protection was orientated on the model of the U.S., but instead of accompanying the action of the children, their information overload should be inhibited through age-limits. The linear cause-effect assumptions are typical for views of new media (from the "Werther-Effect" up to "killer games"). Besides too much information, the authorities' concerns were also shifted to the concept of aesthetic habits such as "wrong" or "false" content. This moral assessment goes in hand with economic worries of how the old media will continue. Since governmental influence is decreasing because of the developments during the Second World War – where propaganda and nearly total control of media emanated from the states – the economy has become more powerful and thus technical and "false" appropriation are in the focus of information and information overload. The view on information overload is changing due to society facing worse consequences of controlled media and connecting with new developments in digital media.

Digital Information Overload Regarding History

Digital adventages and, especially the rise of the user-generated internet, foster information overload. Digital information overload means now, for example, participation because no licences, privileges, permission to print or publish, limit people. No index of opinions restricts creating information. Fewer barriers (except technical obstacles) such as profession access-control or frequency allocation prevent publication. Wikipedia as non-commercial could be called a digital world library. Information are arranged and managed, linked and stored there for usage; the reader pass is an internet connection.

Apparently it seems like, censorship currently does not inhibit access to and the flow of information. The economy presents the power structure which determines aesthetic, moral, as well as technical standards, "wrong-and-right" use or marginalised people. The power of censorships has changed from the Catholic point of view to market logic. Gatekeepers are neither popes nor ministries. Alphabeth Inc., Microsoft Cooperation, Oracle Cooperation, IBM, Apple Inc., Facebook Inc., Electronic Arts, Sony or Vodafone Group Plc are some of the new commercial information "overloaders" and overload inhibiters.

They develop and filter, code and decode, buy and sell publishing, organise and manage information or companies, software or management systems, like the clergy or governments did in the past.

Nevertheless, who has the power and where information comes from, is not as necessary as it is to confront who is pulling the strings and for which purpose. Culturally pessimistic ways of thinking are repeated with the rise of digital media. The telephone disrupted and violated privacy in 1902 like smartphones do today. This, however, seems more like a question of politeness and conventions than of overload. In telephone books, the telephone book authors react to this deficit with recommendations for action (Stöber, 2003a, 198); nowadays an equivalent concept is internet "netiquettes". The accusations that media make people stupid and violent occured with the rise of books for women and youth. These books are/were often scolded as trashy and smut literature (Scholz, 2004, p. 17). Today videogames or smartphones run this same gauntlet. At least early propaganda papers were used to spread the word to opponents of reformation (Stöber, 2003a, 140). They had a similar structure and aim as the present filter-bubbles generated by algorithms e.g. from Google Analytics.

Nowadays, the thought of information overload through books is greeted with smiles and smirks. This has probably come to be due to the well organised and developed structures of administration and management for written texts such as libraries, archives or museums. Furthermore, the fact that censorship or youth media protection for books is not a point of discussion, shows how times and opinions about media can change. This could also be the fate of the supposed problem called information overload: it is not just the mass of information (quantity), but more the way the information is handled (quality), and organised. In the case of digital media, filtering and selecting as well as digital media's authority/reliability become high priorities. Furthermore, these issues demand innovative skills, abilities, attitudes and know-how of the users themselves; the aim is for users to *participate* and not just *use* new media. While neither information overload nor structures of power are new concepts, media make the structures visible and offer the possibility to conceptually grasp power structures if users are able to cope with media challenges. To find out *how* digital media are dealt with by people, media appropriation needs to be in the central focus. Media literacy is thus the path for a participated, self-determined subject in a mediatised world.

THE CHANCE OF EDUCATIONAL MEDIA LITERACIES

The condition of a permanent possibility to engage with multiple information activities with media electronics is actually a brand new status. Considering the limited possibilities in the last centuries for lifelong learning, the current opportunities trend to a new approach to literacy. Apparently, this allows for the vision of the so-called overload as a chance for low-threshold access to a wide range of information.

Digital media is metaphorically not a library but an information supply service. Therefore, the question of how to handle information overload begins with the question of how to handle information and leads to the question of how information is distributed and presented. This section illustrates an approach to answer this question from the application of the German theorem of competence and the Anglo-American models of educational media literacies. The pointed outline follows methodically Gustav Grüner's concept of the vertical reduction (1967, pp. 414-421). The vertical reduction allows one to reduce the huge amount of contributions in both concepts and to simplify them "in a way that the crucial aspects of the concepts are still valid" (Futschek, 2013, p. 1).

The German Theorem of Competence

The German theorem of competence is very much based on the work of Dieter Baacke. Media competence[1] has to enable subjects to engage in reasonable decision making with media technologies (Baacke, 1980, p. 287). According to Baacke, the theorem of competence became integral to the social sciences in the 1970s. Baacke extended Chomsky's linguistic competence theorem and Habermas's communicative competence theorem to a very first media competence theorem. With his hypothesis that mass communication and personal communication stick together, the former influences media socialisation (Baacke, 1980, p. 333). On the basis of this principle, mass communication can foster or inhibit the yield of media competence. Baacke concluded that media competence enables people to reasonable solutions with the objective of an empowered citizen (1980, p. 287).

Due to the increasing proliferation of personal media in the 1990s, the boom of the term media competence had started. In particular, in educational policy context, the term was often used as a key qualification for the information age. As a consequence, more and more models and definitions of media competence appeared. This is to the detriment of a content-related specification of media competence. By means of a content analytical study in 1999, Harald Gapski identified 104 different definitions of media competence for the period from 1996 to 1999. His work highlighted the subject-orientated origin, with its idealistic and universal claim (2001, p. 208, 242).

The more widespread use of digital media and an increasing mediatisation of society has led in the past years to new challenges relating to the German discourse on media competence. The term "Web 2.0" is repeatedly used as a decisive argument for a renewal of media competence models (Gapski & Gräßer, 2007, p. 11; Süss, Lampert, & Wijnen, 2013, p. 131). Furthermore, other aspects have been mentioned: the technological base of personal computers (Zorn, 2011, pp. 176-183), the permanent availability of media via mobile devices, a converging digital media landscape, new processes of knowledge construction (Pscheida, 2010), new ways of presenting information, enhanced possibilities for producing content (Sutter, 2010, p. 47), the opportunity for "informational self-determination" (Gapski & Gräßer 2007, p. 25), questions regarding privacy issues and semioticised algorithms (Zorn, 2011). All these aspects were brought into the discourse on media competence only as fragments.

With this scale of new challenges, the question arises whether older models of media competence respond to the specific characteristics of digital media. At least to subsume the challenge caused by digital media under the established models is debatable. This point of discussion is traced back to the deductive approach of the German media competence models (Herzig & Grafe, 2012, p. 93). The established models are divided into several dimensions, which the respective author or authors claim to be appropriated. Those models are not based on empirical work, but on the theoretical position of the author(s). Thus, the media competences representing dimensions are not necessarily those required practically. This means that every deductive model inevitably has to subsume what are given by theoretical derived dimensions. With this in mind, it can be noted that the German media competence models operate strongly idealistically.[2] Hence, the theorem of competence, which was originally developed as a manner of acting with media (Baacke, 1998), appears in an idealistic, normative and theorised way. Consequently, the dimensions of media competence models appear to be abstract. If the theorem of competence intends to refer to human actions as central principle for solving tasks, the specific of digital media has to be identified. Especially the way digitised information is generated and presented plays a decisive role for the conceptualisation of media competence.

In this regard, the German discourse on media competence offers no pragmatic approach. In 1996, Dieter Baacke postulated that media competence comes up with an empirical emptiness that needs to be filled. About twenty years later, this is still an urgent demand. For an operationalization of media competence, the German theorem of competence is tainted with its idealistic theorized origin. Therefore, the following sector focuses on the Anglo-American models of educational media literacies, which is based on a pragmatic foundation. This enables educational media literacies to identify specific "top-down"-challenges caused by digitized information.

Anglo-American Models of Educational Media Literacies

In contrast to the German discourse of media-competence, the theoretical foundation of media literacy is based on the concept of pragmatism. But first of all, it has to be taken into account that there is not only one approach to or definite use of the term "literacy". On the one hand, there are several disciplines operating with the term, each of them in its own way. On the other hand, the term mostly relates to a specific application, for instance, library, computer, technology, visual, critical, new media or digital. Thus, every syntagma has its own scope.

In the German speaking discussion, Christian Swertz and Clemens Fessler came up with a proposal to sort out this matter. Swertz and Fessler discussed a "general distinction between information literacy and media literacy" (2010, p. 1). In this context, information literacies refer to technical skills whereas medial literacies are based on an educational understanding of a reflective and self-actualizing media reception and production (Swertz & Fessler, 2010, p. 27). This distinction seems to be comprehensible at first glance, but the interpretation of both concepts and their application in science are not clear. The connection between those two concepts is not disjointed. The following examples illustrate this point: Renee Hobbs, for instance, sees in digital and media literacy the ability to "create content in variety of forms, making use of language, images, sound, and new digital tools and technologies" (2010, p. VIII). Information literacy in turn, comes for the BIG6 Skills, developed by Eisenberg and Berkowitz, with a self-actualizing reception:

"The examination and assessment of the information problem-solving process" (1990, p. 9) is an integral component of this model. To pick up two more examples: The PLUS model by Herring (2004) contains "the ability to reflect on the process" (p. 74) whereas the 'Seven Pillars Model', developed by SCONUL (Society of College, National and University Libraries) defines a literate individual as able to, "critically appraise and evaluate their own findings and those of others" (2011, p. 9). By including the ability of critical evaluating, these understandings of information literacy go beyond the technical skill definition by Swertz and Fessler. Thus, the general distinction between information and media literacy might not be able to represent the English speaking discourse of literacies. This analysis leads to the conclusion, to search for common grounds within the discourse on information literacy.

The BIG6 and PLUS models mentioned above are divided into six and four stages respectively. Beside those popular stage models, there is another point of view which Daniel Bawden pointed out: "This viewpoint [sees] information literacy less as a series of competences to be mastered and more as a set of general knowledge and attitudes to be possessed" (2008, p. 22). Notable examples are the set of seven key characteristics by Bruce (1997), the definition of ALA (American Library Association) or the eight competencies by the CILIP model (2012) as well as the already mentioned SCONUL model (2011). The general distinction between the stage models and the set of competencies results reserved to the former is characterized by a process, meanwhile the latter is an interaction between the respec-

tive competencies. Such a distinction refers to the process that Lankshear and Knobel offered for digital literacies when they distinguished conceptual from standardised operational definitions (2006, p. 13). One example of conceptual definitions is provided by Paul Gilster. He identifies four key competencies: knowledge assembly, evaluating information content, searching the internet, and navigating hypertext (1997, p. 130). This is surely a fundamental difference. But at the substantive level, both approaches are very similar, and thus they include the abilities to identify a need for information, to locate, use, evaluate and organize these aspects. All of these abilities mentioned above refer to idealistic or operational standardised actions by the individuals.

The same approach can be seen within the media literacy discourse. One of the most cited definitions of media literacy is the following succinct sentence formulated in 1992 by the Aspen Media Literacy Institute: media literacy "is the ability to access, analyze, evaluate and create messages in variety of forms" (Livingstone, 2004, p. X). In 2003, this definition was supplemented by two more competencies named "reflect" and "act" (2003, p. 15). Another popular approach has been proposed by W. James Potter, who identified seven skills of media literacy and furthermore a summary of three tasks of information processing. To give a brief overview, the skills contain actions such as "breaking down the message", "judging the value", "using general principles" and the information process is divided in three actions, named "task", "goal" and "focus" (Potter, 2004, pp. 36-38). Besides these two elements, Potter's approach contains the subject perspective by adding to his media literacy model the personal locus.

The personal locus is composed of goals and drives. The goals shape the information-processing tasks by determining what gets filtered in and what gets ignored. The more you are aware of your goals, the more you can direct the process of information seeking. And the stronger your drives for information are, the more effort you will expend to attain your goals. (p. 35).

In this sense, the personal locus is a control mechanism of the information process operating with the knowledge structure in a person's memory.

Thus, both approaches of media literacy and those of information literacy mentioned above operate with human actions. This, to break it down, is due to the theoretical foundation of the literacy discourse, which is based on the concept of pragmatism.[3] The philosophical concept of pragmatism understands the principle of acting as the decisive factor for solutions of life tasks. The literacy discourse and so, as this section has shown, most of the media or information literacy approaches are highly influenced by idealistic or operational standardised actions by individuals. Of course, there is a general distinction in the focus of every approach between technological skills and critical understandings. But also the critical abilities tend to appear in idealistic or operational standardised actions[4]. This concept can be traced back to the pioneering work for media literacy that has been done by Len Masterman. In one of his definitive works "Media Awareness Education: Eighteen Basic Principles" (1989) he claimed that "the central unifying concept of Media Education is that of representation. The media mediate. They do not reflect but re-present the world. The media, that is, are symbolic sign systems that must be decoded. Without this principle, no media education is possible. From it, all else flows" (Masterman, 1989). This is a fundamental distinction to the German discourse of media competence, where the core principles are based on an idealistic and subject focused perspective ("bottom-up").

The following section extends the descriptive manner of this article to an exemplary approach on a theory-based educational understanding of information literacy in the digital age. Therefore, the German perspective of media critique will be combined with a technical based perspective on the semiotisation

of information, which is the crucial prerequisite for idealistic or operational standardised actions. Solving tasks by actions implies the situational context, which frames the actions. The pragmatic approach can be used to identify specific "top-down"-frames caused by the impact digital media has on the way digitised information are generated and presented.

THE CHANGE OF EDUCATIONAL LITERACIES

This section deals with the conceptualisation and practical application of both concepts presented in the previous section. As exemplary for the German discourse, the difficulties in operationalisation of the subject-orientated, idealistic and abstract theorem of competence will be shown by the concept of media critique. By including the digital characteristic of semiotised information, the mutual combination of both concepts is going to become accessible. The section ends with the practical application of the combined concepts in scholastic learning.

Media Critique

This section on media critique aims to outline the necessary inclusion of digital characteristics. The ability to engage in media critique demonstrates a cognitive process that centres on evaluating media based on certain criteria (Ganguin, 2004). This process requires knowledge of both the process of understanding and decoding media language as well as analytical ability in order to even be able to criticize media. These requirements are stipulated firstly in relation to one's self in the form of reflection, for example of media influences.

One problem with the empirical investigation of media critique is the fact that, theoretically, if a person is critical of media, he is not only critical of one medium but generally critical of all media. Thus it is truly a hallmark of competence that competence depicts a meta-trait that provokes situationally adequate action where the situational should be the medium itself. However, the phrase 'should be' implies that this is not in line with reality. It cannot be deduced that only because someone can critically appropriate newspaper content that this same person can simultaneously approach other media critically. This thus poses the question of whether the ability to carry out media critique is a generalized ability that can ideally more or less be applied to all media equally or whether there are certain requirements that lead to differing competencies depending on the medium, i.e. are media specific.

In this context, when dealing with the socialization process of young people, it is centrally important when dealing with communications media for them to learn how to understand language, symbols and develop the ability to interpret images. According to Piaget, this ability refers to the preoperational stage, the stage of thought in symbols that runs from the second to the seventh year of life. In this case, the ability to decode information requires a thought process that plays a major role in the semantic development of language and thus also of media language. Since a person has to be able to decode information and media symbols in order to understand media language since these symbols can take various forms, this process of information is collected under the heading of coding or 'symbol system'. For this reason, this text will use the term decoding ability.

Symbol systems can, for example, be verbal, pictorial or numerical. This can lead to the thesis that, for example, a book with its language, which I naturally have to decode, addresses very different senses and abilities than a film. In a textual decoding process, a person has to translate symbols into words,

words into sentences and sentences into concepts and information. For this reason, one could postulate that it is 'easier' to watch T.V. than to read a book since a book requires at least the abilities of reading, text comprehension and interpretation. Thus the path to different information processing systems has to be different for different media and therefore the decoding ability is dependent on the decoding level of a particular medium.

Additionally, many media use certain symbols or metaphors. The identification of the patterns among them is a challenge in many cases. Since some codes are not obvious but rather are frequently hidden within the dramaturgy, one first has to discover them as codes and then identify them. Many media also invoke particular symbols that are often references to other medial codes. Additionally, every culture and society has certain symbols and signs that are integrated encrypted within medial depictions in order to, for example, underline and clarify certain issues. We often always associate the same particular meaning or interpretation with certain symbols (for examples flags) so that frequently a verbal explanation of the symbols is no longer necessary since we already know what they mean. We have, however, gained this knowledge through experience in the socialization process. In this manner, a previous cultural understanding is needed when dealing with the decoding of symbols. Otherwise, one cannot recognize and decode them.

Digital media thus work with digital codes and are especially distinguished by their increased richness of information such as, for example, multimedia or virtual reality. The increasingly blurred division between sender and receiver plays an important role here. This leads to new challenges in the implementation of media critique since frequently the offers that are on hand in, for instance, the internet, are produced unfiltered and with a greater diversity. With television there is usually a long production and certification process involving many parties that eventually culminates in broadcast publication. In the internet, each and every individual person can publish whatever he/she wants, whenever he/she wants. Therefore, due to a lack of publication monitoring, it could be ascertained that every claim becomes information and thus the power of publication becomes decentralized. In this regard, Ramonet talks of a "democratic censorship":

As opposed to autocratic censorship, it [democratic censorship] is no longer based on the oppression and curtailment of data, on their abridgement or the prohibition to publish them but rather to the contrary on their accumulation, on the oversaturation and on the excess of information. (Ramonet, 1999, p. 35)

One result of a lacking supervisory body in the internet therefore is an excess of information since anyone can publish anything. This excess of information that a medium has to offer can represent a reason for selectivity. Due to the diversity of offerings, people have to differentiate and select among them and must decide more on their own; this is the case if they cannot subsume them under a prescribed generalization. The increasing relevance of media-specific critique thus arises from the circumstance that digital media exhibit increasingly stronger media characteristics that stand in contrast to the familiar world of most users and demand an increasing, independent competence for assessment from their users.

Therefore, in this sense, it can be verified that media dependence is one problem related to the ability to decode information in the sense of media critique. This is the case since different media use different systems of symbols and encoding and play with quantitatively as well as qualitatively different signs and symbols that are often hidden, although especially digital media, due to their excess of information, display a high level of decoding as well.

The Semiotisation of Information

In the previous section, it has been already explained that media competencies depend directly on the symbolic system of media technology. This statement refers directly to Len Masterman's conclusion about what distinguishes media education from other disciplines: "The media, that is, are symbolic sign systems that must be decoded." (1989, para. 2). Obviously, information overload is a repeatedly used term related to new media technology such as the transformation of oral to literate culture, the rise of printed books or, as we can see, the digital age. The focus on the information landscape needs to be much more than identifying main issues or potential problems. Trying to understand specific characteristics of the current essence of information has to face the question, "how is information scattered and presented?".

This topic refers to a wide range of scientific discourses. To name only a few: psychology, corporate communication, health communication, library science, information studies, science and technology studies, empirical educational research and communication and media studies. The fact that information overload appears as a crucial object of investigation is based on the mediatisation of all social areas. The mediatisation is characterised by an advancement from analog to digital technology. Tackling the root of information overload as a phenomenon in the digital age leads to the influence of digital technology on the way information emerges nowadays. As already mentioned, this article focuses on a media educational perspective on the mass of information media users encounter in modern society. As there is a myriad of possible approaches to the digital information landscape, this section takes one particular point into consideration. This will be the semiotisation of information in the digital age. On the basis of this aspect, the chance for educational literacies to combine media-specific aspects with subject-related ideals can be illustrated.

Information presented by digital media is totally semioticised. This is not necessarily something new in communication and media studies. Printed words semioticised oral words and radio or television engineering use electromagnetic waves for semioticised information transfer. But what is the special issue with digitised information? The digital code is not only exclusively a representation of information (Masterman, 1989), but also an interpretation through an algorithmic language. The algorithmic language is the basic feature of digital media, as already Lev Manovich pointed out: "New media may look like media, but this is only the surface" (2001, p. 48). All media reduce objects into syntactical characters, which is indeed a first step of semiotisation. Furthermore, and in contrast to print, radio or television, digital media operate automatically through algorithmic language. Thus, every representation (the surface) is based on machine-interpreted data and so on an abstraction of the interface from the algorithmic language. This process can easily be demonstrated by the adaption of a website related to the user. For example, while searching for a specific article someone intends to buy, the algorithmic language interprets personalised data and offers a customised output of information. Computers perform operations through a programming language. Thus, every process of information emergence and presentation has to be reduced to an operationalised form.

If educational media literacies, especially information literacy, orient themselves towards the specific features of digital media, they need to face those challenges. To find these potential features, this chapter recommends identifying them through empirical investigation rather than theoretical investigation.

How the digital technology influences the information process through algorithmic language has been exemplarily pointed out by Andrea Kohlhase's (2008) work. Kohlhase has shown that the user's benefit from information presented by semantic technologies tends to be more voluminous as the designer of the relating algorithmic code intended them to be. This is due to semantic data extending ordinary data

by including the kinds of relationships between the various data elements. Information generates new information, which is one reason for the impression of an information overload. "If the machine is thus empowered, a new set of questions arise naturally, e.g. the semantic currencies" (2008, p. 37). Such currencies can easily be seen as part of the new information environment. Among others, Kohlhase summarises in this aspect the following two currencies (pp. 7-8):

1. **Handover of Semantics (HoS):** A discrepancy between potential and reality of content collaboration. Formalising knowledge down to a machine's level offers no direct or indirect, but just potential value.
2. **Formalisation of Knowledge (FoK):** Capturing knowledge from a Knowledge Management standpoint not only means obtaining any representations but formalised, contextualised representations. Thus the problem of formalising knowledge is transformed into a knowledge representation problem in which the modification of representation is in focus, particularly the translation into semantic data formats.

Now, both of these criteria can be assigned to either stages or sets of educational media literacy models. For this purpose, the above mentioned information literacy models are listed and compared in Table 1.

Table 1. Anglo-American models on information literacy with the assigned competence criteria

ALA (2000)	SCONUL (2011)	Bruce (1997)	PLUS (2004)	BIG6 (1990)	CILIP (2012)
Determine the extent of information needed	Identify (FoK)		Purpose (FoK)	Task definition	A need for information
Evaluate information and its sources critically (HoS, FoK)	Scope (HoS, FoK)	Information technology conception (HoS)	Purpose (FoK)	Information seeking (FoK)	The resources available (HoS, FoK)
Access the needed information (FoK)	Plan	Information sources conception (FoK)	Location	Location and access (FoK)	How to find information (FoK)
Use information	Gather (HoS)	Information process conception (HoS)	Use (HoS)	Use of Information	Ethics and responsibility of use
	Manage, Present	Information control conception		Synthesis	• Work with or exploit results • Communicate or share findings • Manage findings
Understand issues surrounding the use and access, and use of information ethically and legally (HoS)	Manage, Evaluate (HoS, FoK)	Knowledge construction conception	Self-evaluation	Evaluation (HoS, FoK)	Evaluate results (HoS, FoK)
Incorporate selected information into one's knowledge base		• Knowledge extension conception • Wisdom conception			

Both criteria, the Handover of Semantics (HoS) and the Formalisation of Knowledge (FoK), can be assigned multiple times. Those "top-down"-issues have to be known by the users and therefore they are central criteria of information literacy. This procedure allows for the combination of specific features of digital media with educational ideals. Moreover, it constructs an operationalised model of information literacy.

Summary of the Description Mentioned Above

1. Digital media are semioticised.
2. Semioticised digital media operate with automatic algorithms.
3. Digital media represent machine-interpreted data.
4. Specific features of digital media should be adopted by educational media literacies.
5. Operationalised model of information literacy can be constructed.

The strategy and necessity of combining specific features of media with educational ideals also take place in formal learning processes. How they are addressed to pupils in an application-related way is described in the following section.

Source Criticism as Scholastic Scope against Information Overload

Bringing both perspectives of media literacy and media competence together is just the first step needed in an approach about participating subjects and thus dealing with a supposed information overload. To give an example, the focus of this section deals with the challenges of selecting medial information nowadays. Thereby media criticism and particularly source criticism is a desirable ability, which should be reconsidered to avoid the idea of information overload through digital media. Especially turning the gaze towards schools and their responsibility (and theoretical aim) raising self-determined subjects.

An advantage of medial information – caused by the fact that media are mediators and cultural content – is that structures (of power) are "in cold print" and thus indicated visually. They can be analysed and criticised. With the invention of script and later book print, educational institutions established and cultivated the praxis of medial information. Especially schools feel and take responsibility for passing on this culture to the next generation and aiding in their appropriation. Pupils learn to write and read letters – as semiotic symbols of languages – followed by reading and understanding texts as well as interpreting poems or prose texts during their school careers. But analysing movies, games or radio features are not included in the curriculum; neither of student teachers nor pupils. In the 1920s attempts were made to integrate telephony in scholastic learning because it was seen as a "culturally basic ability" (Stöber, 2003a, p. 202). This attempt failed because the usage was told as a matter of course, regardless of whether that not just technical, but also changes of communicative frames and skills such as nonverbal communication or protection of privacy. During the rise of the medium of film, scholastic learning integrated film as a mediator as well as their content became an object of criticism which was formed and established in the "educational film movement" in the 1920s. Meanwhile the praxis of criticism disappeared in the curricula, and media (as film) are more used as mediators than issue of debate, a destination, which has been attributed to each new rising medium. However, it would be even better to integrate media and their content culturally critically into each school subject, which has been demanded strongly since 1992. In

regard to information overload, one criteria of literacy should be media criticism, especially criticism of sources because in an information overwhelmed situation it is needed to select for participation.

One access could be adapting source criticism from historical source criticism, like history teachers let students evaluate pictures or texts. A common approach for this practice orientates itself on Borowsky, Vogel, & Wunder (1989) and divides historical critique of sources into source criticism on the one hand with description of source, outer and inner critique and on the other hand interpretation of sources, including analysis of content, context and solution.

Adding Digital Sources, This Procedure Changes

1. **Own Purpose:**
    a. At first – referring to media literacy –, a step before the first step needs to be added, where the pupil must determine the purpose of searching for and criticising information as well as the extent of the information. To achieve this, it is necessary to have an overview about where, how and what can be looked for and to understand what is needed.
2. **Source Criticism:**
    b. **Description of Source:** The second step resembles the evaluation of information and its sources. It is important to know which sources are how and where available, which is followed by the question if the content is the same and everything depends on whether using the internet is possible or not. Usability and the ability to analyse are important in order to distinguish information. Usability itself presents a structure where power can be manifested.
    c. **Outer Critique:** Decoding plays a decisive role for outer critique. Describing the source in its connection with the seeker, the asked questions, which locate the pupil in time, space and into society and in relation to the sources, could be which sources are serious, how are the sources connected or which structures of power refer to them. An aspect for digital media which had never existed before appears: searching in books or libraries, in picture books or encyclopaedias, does not leave any traces behind. Looking up information in digital media, so called digital fingerprints can be easily collected through cookies or personalised settings. Therefore, it is important to know who is collecting what information and who works together with whom. Not just data protection, but also copyrights are a more diverse topic to know about.
    d. **Inner Critique:** Multimodality describes well what traditional source criticism applies to a source's content. Digital information offers diverse modalities which can be – depending on usability – opened. To choose a source targeted, media appropriation skills and abilities are necessary. For digital information this means decoding as well as technical equipping. For example, it is impossible to listen to an audio-track in a very noisy environment similar to the way it is impossible to listen to an audio-file without headphones or the ability to push a play-button. Moreover, it is important to know where it is possible to find which kind of mode of the same content. In a library, books are arranged by content; all library books with similar topics are grouped together. This is not possible in digital sources like it is in traditional print media libraries. In digital sources, due to the unlimited content available, it is possible that the same topics are on completely different sites without any links.

3. **Interpretation of Source:**
    e. **Content:** The passing on of semantics is crucial for digital content. As described above, reading and understanding texts is learned in school from the first year onwards, whereas understanding and interpreting a picture or the content of films, games or apps needs to be tapped autodidactically.
    f. **Area of Statement and Embedded Context:** Understanding digital content should lead to literacy programming language, editing images, cutting audios and visual material, filtering or search engine optimisation. Through learning by doing, structures and symbols can be seen, reflected upon and understood. Encoding allows a view on structures of power. Discovering contexts and understatements, knowledge about economy, market and media history as well as source history could be instructive.
    g. **Solution and Summary:** The best source with the best information is useless if the pupil is not able to manage and present it. Therefore, passing on semantics, decoding reflection skills, and the critical power of judgement are required. A written or audio text can be read out, if it is not possible to present it, but a picture or film is useless if the pupil does not know how to integrate it into his/her presentation.
4. **Subject-Related Solution:**
    h. A critical reflection on one's personal standing regarding media, its sources or more generally, to the society in which media is embedded, produces results additional to the media-centred approach. A question could be, how media appropriation has changed within the information seeking process, how can it be adapted further, or how it has changed values, skills and abilities. Regarding digital media, changes of a filter-bubble and whether one's own presentation and reproduction of the information is clarified in its licence could be reflected upon. This approach could be developed further and concretely applied for every teaching subject and each medial device. For example, the reflection of each source a teacher is using, and how it has been found – beyond history lessons – would provide grounds for media criticism.

Some General Issues can Already be Combined

Issue 1: In a mediatised world, media need to be regarded as cultural practice, which demands an integrated media-education within each school subject.

Issue 2: Digital media information occurs in diverse forms such as texts, graphics, diagrams, pictures, films, banners, sound, audio, vibration, and so on. How to read a picture or react to a sound needs to be appropriated, in the same manner reading and understanding a text is. Therefore, scholastic education needs to expand the portfolio from books and texts to multimedia, which requires diverse strategies for each medial device and each medial content.

Issue 3: Criticising medial information, requires understanding of it. For digital media, more challenges are added through their semiotic structure of content, where understanding means decoding as well as encoding.

Issue 4: With digital semiotic, topics such as protection of data and privacy are accompanied.

Issue 5: Critique can refer to aesthetical or moral aspects or regard power structures such as censorship or filtering methods.

Media critique is understood as a complex multidimensional construct, consisting of the abilities to perceive, to decode, to analyse, to reflect and to judge medial content in its specific presentation (Ganguin, 2004, p. 4). For this, objective criteria are as essential as subjective ones, which results in subjective norms and values of a single person. Therefore, experience, observation and theoretical exploration are required to form media-specific knowledge. Knowledge about digital media is simultaneously consequence and precondition for learning processes and with it the basis to live and act independently in a mediatised world. Informal knowledge cannot be sufficiently achieved, e.g. about objectives and means of global media companies, if the information about it must be critically questioned; first the motivation is needed and secondly the ability of source criticism is necessary. For this reason, media criticism should take its place in formal learning processes, according to reading, writing, counting and interpreting. Establishing media criticism in schools is necessary because self-organisation and self-determination substitute the need of a 'digital-media-librarian' who arranges the information. On the pragmatical side, the media literacy/media-competence of criticism also prevents and avoids existing filtering and selecting systems from remaining undisputed and exercises their power.

CONCLUSION

Every change of the information environment has (re-)emerged new problems with regard to media behaviour. One driving force for that is certainly the wide-spread distribution and popularity of digital media. The discourse on educational media literacy has always been in response to the latest new media technologies. After a phase of irritation, anxiety and pedagogical prevention, follows a phase in which the possibilities of self-determined activities with media are highlighted. (Hüther & Podehl, 2010, p. 116). This paper interpreted the information overload as a crucial element of the changing information environment. Instead of spreading fear, this chapter applies a cultural-critical approach. It is then possible to reflect upon an adequate conceptualisation of educational media literacies for the new information environment.

The approach presented here is based on a transnational procedure. Due the global impact of digital media, the authors believe in the yield of an international exchange related to the discourse on media literacy. As the chapter has shown, both approaches presented on media literacy have their own characteristics. The German-speaking discourse on media competence is especially dominated by a subject-orientated and idealistic theorem of competences according to Habermas and Baacke. Important as the orientation on pedagogical ideals may be, German media education has not yet been able to conceptualise a media (or information) literacy model suitable for the digital age. The section on media critique has outlined the necessarily inclusion of digital characteristics.

In contrast, the Anglo-American discourse on media literacy follows the tradition of American pragmatism. The action model of pragmatism follows a problem-solving approach implying the definition of the situation and thus the information environment. Almost all models in the Anglo-American discourse operate with media activities by their users. There is, however, a lack of the specific characteristics of digitised information in those models. How easily they can be assigned to the models proposed, has also been showed.

It can accordingly be concluded that a possible conceptualisation of information literacy based on a pragmatical approach might be useful to identify specific feature of digital media. This "top-down" approach, can be added later on with educational ideals ("bottom-up"). Beginning the conceptualisation of

media literacy from the actual requirements of media users is an unusual approach for the German media literacy discourse. Identifying specific features of digital media with Anglo-American media literacy models and adding them later on with educational ideals may be an alternative approach for educational media literacy and a contribution for the transnational exchange of media literacy.

KEY TERMS AND DEFINITIONS

Discourse: A discourse combines all relevant factors the topic of the discourse is dealing with. Amongst others, this may consist of the historical background, cultural and power characteristics, communicative practices, the constellations of actors or the disciplinary orientation. The discourse shapes and forms all topics included with its own characteristics. Thus, every interpretation reveals the discourse and depends on it.

Information Literacy: Information literacy describes the handling of information in and facilitated by media with educational values. This includes self-determined, reflective and purposive activities. Moreover, all factors relevant to handling the information (the information environment) are taken in account. Approaches to information literacy can be assigned to either library science, empirical educational research or holistic approaches to research.

Media Critique: The ability to engage in media critique demonstrates a cognitive process that centres on evaluating media based on certain criteria. This process requires knowledge of both the process of understanding and decoding media language as well as analytical ability in order to even be able to critique media. The general competence of media critique then has to be implemented through performance in concrete, media-critical action in which there are media-specific requirements so that the required level of media critique can differ from one medium to the next.

Media Literacy: Media literacy describes the handling in and with media through educational values. This includes self-determined, reflective and purposive activities. Moreover, all relevant factors for media activity (the media environment) are taken into account.

Pragmatism: Pragmatism is a philosophical paradigm focusing on specific acts. Through the problem-solving processes, thinking results and can be expressed with language. Pragmatical approaches integrate the definition of the situation and contextual factors. Thus, pragmatism stands aloof from the rationalistic paradigm.

Semiotisation: Semiotisation describes the process of a syntactical reduction and semantical abstraction of sensual perceptions through media. Every media technology (e.g. print, radio, television, digital media) semioticise sensual perceptions (e.g. noises, colours, movements, touches) to mediatise them. Media technologies work with the use of syntactical reduction. Furthermore, digital media operates with semantical data, containing semioticised information about the syntactical data. This enables digital media to interpret and abstract data to new information.

Theorem of Competence: The theorem of competence is the foundation of German media competence discourse. It has been brought into media education by the work of Dieter Baacke and refers to enlightenment ideals, such as autonomy, emancipation, critical ability and self-determined activities.

ENDNOTES

1 Media competence is literally translated from the German term “Medienkompetenz”. This is not comparable with the term “competence” used in the Anglo-American discourse on media literacy.

2 For example, Baacke (1996): media critique, media knowledge, media use and media creativity; Pöttinger (1997): perception competence, use competence and action competence; Schorb (1997): assessment, knowledge, acting (translated by the authors).

[3] Gerhard Tulodziecki already pointed out the relation between literacy and pragmatism: "the understanding of literacy is based for example on insights of cultural studies or on the concept of pragmatism and is a modern concept of education in an information and knowledge society." (2012, p. 50).

[4] One Exception is the approach by Bruce (1997), who constructed an evidence-based model that abstracts the action to higher categories.

Chapter 8
Creating Global Classrooms Using Universal Design for Learning

Victoria Brown
Florida Atlantic University, USA

ABSTRACT

Media and digital content has become an integral part of our lives. Digital content has expanded the opportunities for accessing information for individuals with special needs and classrooms with culturally diverse students. Because the digital content is taught through multiple modes, it provides access to information previously available only through print formats. By incorporating universal design into the classroom, the students are using media and digital literacy skills, preparing them for the global world in which they live. In this chapter, a description of universal design will be provided, how to use the digital and media content to create a classroom that honors diversity, and how to use universal design for teaching different languages. The concepts of universal design and the global classroom are pulled together through project or problem-based learning. Finally, a glimpse into the future classroom technology is provided.

INTRODUCTION

Friedman (2005) in his book describes ten technology innovations that flatten world. The massive investment in fiber connections, followed by the bursting of the technology bubble, bridged the way for an inexpensive communication infrastructure connecting the continents of the world. These connections allowed us to begin to work and to collaborate in ways that were not possible before by instantly sharing information globally (Friedman, 2005). As the world flatten, the reliance on technology for communication, collaboration, and sharing increased. By 2014, 90% of American adults owed cell phones, of which 58% of those were smartphones. Tablet computers are frequently used, with 42% of adults owning these devices (Pew Research Center, 2014). The Pew study also reported that the usage of smartphones extended beyond telephone conversations. The devices were being used for retrieving

DOI: 10.4018/978-1-5225-3822-6.ch008

information, listening to music, using the global positioning system (GPS) for information related to location, and interacting with social media.

For individuals with disabilities, the digital revolution which started as the world became flat was instrumental in opening up the possibilities to the world. First, the information they were able to access increased. Secondly, they were able to gain independence in acquiring that information. With the increasing number of assistive technology tools and better utilization of the digital tools, educators wondered if they were able to support more of the students in their classes in accomplishing educational goals. To answer this question, CAST, the Center for Applied Special Technology, developed Universal Design for Learning (UDL). CAST was founded in as a not-for-profit organization to explore uses for technology in expanding opportunities to access the general curriculum for all people, especially those with disabilities. Universal design for learning (UDL) examines ways to use technology to increase the opportunities for students in accessing the information available to them and reaching the educational goals of the instructor or teacher.

Digital literacy skills are necessary in making the guidelines that are outlined in the UDL model work well for children which have special learning needs. First the digital literacy skills will be described. Then the principles of universal design will be discussed with examples of how the two approaches come together. The different types of assistive technology will be discussed that are used to support individuals with disabilities and non-English learners. Finally, project-based learning brings the principles outlined in the universal design together with the digital literacy skills create powerful learning environments.

Digital Media

With available technology tools, digital media is readily accessible from the palm of the hand. The increased availability of inexpensive, smaller devices allows classrooms to participate within the global community. Digital media introduces students to a variety of ways for interaction with the easily interchangeable and transformable material for creation of new content. Because of the flexibility of digital media, students with special needs are able to access information that once was difficult for them to use in paper-based formats. Not only has access improved, students with disabilities can interact independently with the information.

Digital literacy is becoming an essential skill for all students as more media options are available in digital formats. Digital literacy is the students' ability to use media in a digital format to access information, evaluate, and analyze that information, then create and share new products to communicate (Heick, 2014; Media Smarts, ND; US Digital Literacy, 2014). Becoming experts in the use of digital literacy skills opens the door to other forms of literacy that are essential for students: civic literacy, health literacy, environmental literacy, information literacy, and media literacy (Partnership for 21st Century Skills, 2011).

By using digital media skills, students are able to utilize forms of literacy for non-text based instructional material increasing the options available for them to learn. However, digital literacy skills for students with a disability or who are non-English speaking enable them to access instructional material and global information by providing alternatives to paper-based text (Rose, Meyer & Hitchcock, 2005). Below is an expanded explanation of the following subsets of digital literacy skills: (a) accessing digital media, (b) evaluating and analyzing digital media, (c) producing media, and (d) creating and sharing media (Digital Literacy, 2014; Heick, 2014; Media Smarts, ND).

Accessing Digital Media

Digital media is powerful because of the students' ability to select the form of media in which to use information or their instructional materials. Although print materials are still available, many of those sources are being replaced with the digital forms that are pulled from the cloud to a personalized mobile device. Books, magazines, or newspapers are purchased online and available from computers, smartphones, laptops, or tablets. Even movies are purchased and viewed from the cloud.

Evaluating and Analyzing Digital Media

As students access the digital media, they need to be able to analyze and evaluate the content they are reading or viewing. What is the source of the information? What is the obvious message portrayed? Does the message contain underlying messages? What should the reaction to the information be? What are the implications of that message? In other words, not everything published on the internet is true. Analyzing those messages is important for all students as they encounter increasingly numbers of digital resources in their internet searches.

Producing Media

The newer tools allow us to quickly create digital media. Movie cameras and text editors are part of the smartphone. Young children can now create the media content with the touch on a screen. With those same devices, they can share their creations. These tools are allowing individuals with disabilities to quickly express themselves as alternatives to the pen and paper options.

Creating and Sharing

Connectivity in real time allows students to immediately share their creations with family and friends through the personal social media sites. They can now access information from around the globe, then interact with that content by posting and sharing their ideas. Through these interactions, students are able to influence events around their community and across the world. With this power comes a great responsibility to interact with the media as a global citizen respecting the culture, traditions, and feelings of others who are accessing the same social media platforms. At the same time, the new tools for creating content have become easier to use. These new tools provide alternative ways of demonstrating achievement of academic goals over and above pencil/paper activities and tests. Students who struggle with expression of what they have learn in traditional formats are now able to do so using digital literacy skills in creating and sharing.

ISSUES, CONTROVERSIES, AND PROBLEMS

The evolving technology has been invaluable for increasing ability of the individuals to access the information or to enhance their ability to learn. Through the use of assistive technology, students with disabilities, as well as, English language learners (ELLs) can use the technology to assist them by having the electronic text read to them. Word processors with voice recognition systems allow students

with fine motor challenges to compose stories and essays. In our global world, students with physical difficulties can reach out through their social networks to participate as active global citizens. ELLs are able to access translators and interactive tutorials to assist them in accessing information in primarily English-speaking educational environments. Students with visual disabilities in both visual and visual perceptions require more audio based media to acquire information. Other students with audio disabilities or audio perception challenges benefit from visual aids or text captions on videos to comprehend the world around them. Occasionally, students experience challenges for a variety of reason in social settings. This students can use digital media skills to access their instructional materials from environments that feel more comfortable.

Two major studies determined the prevalence rates of individuals with disabilities in the United States. In a study by Boyle et el (2011), parents reported that 15.04% of the children in the United States between the ages of 3 to 17 had a diagnoses of a disability according to 1997-2008 National Health Interview Surveys. Brault (2012) analyzed data from a survey conducted by the Social Security Disability Insurance Program between May to August 2010 to determine the prevalence of disabilities within the noninstitutionalized population living in the United States. Results indicated that 56.7 million, or 18.7%, of the overall population had a disability.

The Individuals with Disabilities Education Act (IDEA, 2004) identified 13 different categories of disabilities that are entitled to a free appropriate public education in the least restrictive environment. Those categories are mental retardation, hearing impairment, speech or language impairment, visual impairment, serious emotional disturbance, orthopedic impairment, autism, traumatic brain injury, other health impairment, specific learning disability, deaf-blindness, or multiple disabilities.

Although a person with a special need or disability is often viewed as having unique needs, disabilities exist along a continuum. For example, many of us have a slight visual impairment that glasses or contact lenses can compensate for the vision loss. Glasses allow the user to view instructional material previously not available. For some individuals, the visual disability is more severe, so glasses or contact lenses do not provide enough assistance. These students require alternate means of presentation of the material to see or hear instructional material. Another point to keep in mind is that any one of us can become temporarily disabled very quickly. If we break a bone, we can experience the same challenges that a person with a permanent mobility disability or an ear infection may experience temporary hearing lose. Addressing the needs of an individual with a disability can assist anyone that has a less severe form or a temporary disability.

Digital Divide

In the last decade, concerns have been mounting about differences in performance in school attributed to a growing digital divide. A disconnect occurs between those with access to technology and those without (Davis, Fuller, Jackson, Pittman, & Sweet, 2007). Overtime, the digital divide definition has changed from access to the frequency of technology use and the nature of the technology available for use in the home (Jackson et al, 2008). If children from lower socioeconomic status have access to technology, it is often outdated with inadequate software combined with limited access to the internet (Davis el al, 2007). This limited access attributes to fewer communication opportunities between parents and teachers, with parents less likely to use email or instant messaging (Lazarus & Lipper, 2005).

Primary language other than English is another factor that contributes to the digital divide. Most websites available on the internet are predominantly English (Zehr, 2001). The numbers available in

Chinese and Spanish are growing, but those available in other languages are limited. Because of the limited number of websites in non-English languages, families whose primary language is not English often do not value computers. As a result, Spanish-speaking homes are less likely to have internet access (Garland, 2009-2010).

The socioeconomic dynamic of the family is another contributor to the digital divide. As of May 2013, 9 out of 10 college graduates could access the high-speed internet from home as compared with 37% of adults who had not completed high school (Zickuhr & Smith, 2013). Income appears to be another divider with households under $50,000 less likely to have home broadband (Zickuhr & Smith, 2013). Wealthier families have the latest technology gadgets and faster internet speeds within their homes. The newer technology is easier to use, and older computers are not able to utilize the latest features when browsing the internet.

Students who have access to technology have definite advantages over those who do not. A series of studies have correlated the use of computer programming with improved test scores. For example, correlations were found with students who spent longer periods of time on computers at school, while those students who used computers at home for educational purposes scored better on the Programme for International Student Assessment mathematic assessment (Organisation for Economic Co-Operation and Development, 2005). Correlations were also found between the length of time children use information technology with grades and grade point averages. Jackson et al (2009) attributed the higher achievement to the increase diversity of activities students engaged in the longer they spend on the computer.

Slow network speeds make accessing some content online challenging. Web content frequently contains multimedia and video content which is difficult to view using low bandwidth. African Americans and Latinos view the lack of broadband at home as a major disadvantage in keeping up with local community events and news and information, using government services, improving or enriching their lives, obtaining health information, and finding jobs (Smith, 2010). With slow network speeds or no internet access, schools are the only place where these students are able to use technology.

With increased immigration into the United States, a growing number of students in the classrooms their primary language is not English. In 2011-2012, 9.1% of the students attended English as a second language, high intensity language training, or bilingual education classes (Kena, et al, 2014). The western states reported higher numbers, with 10.1% of students in these programs. These students fell into two at-risk categories for limited access to technology at home: minority and low socioeconomic status. With the lack of access at home, using technology at school is the only way for these students to develop digital media skills.

Mobile technology is beginning to reduce the digital divide gap because of the reduced cost of owning a cell phone or a smartphone over a computer. As of January 2014, 90% of Americans owned a cell phone, of which 58% were smartphones (Pew Research Center, 2014). However, the U. S. Census Bureau (2014) data indicated that 78.9% of households had a computer. For 7.3% of those living in the United States, the internet connection was too expensive. Although cell phones or smartphones are being used to access the internet, that access is much slower than connecting to the internet through a service. The content display is limited, causing some difficulty in multitasking across different programs and websites. As a result, access to information is still limited.

SOLUTIONS

Before the advent of the internet, individuals with disabilities were very dependent upon others to translate the world for them. For example, visually impaired individuals would need to have a friend to read those items that were not in braille or a deaf person would have needed a sign language interpreter. Although, they may still need these types of supports today, digital media can certainly substitute for many of these activities allowing greater independence. To gain access to the digital media, assistive technology is available to assist a students with a disability, special needs, or English as a second language to access digitized instructional material.

Assistive Technology

IDEA (2004) defines assistive technology as "any item, piece of equipment, or product system that increases, maintains, or improves the functional capabilities of a student with disabilities". Children identified in IDEA have a disability that interferes with their ability to learn have an individual educational plan (IEP) that is reviewed yearly. The classroom teacher participates as a member of the team of individuals who is providing services. In this role, the teacher is often asked to sit in on this yearly meeting to share how the child is progressing.

Process of Selecting Assistive Technology

Classroom teachers are often required to participate on an IEP team that decides on the educational program for a child with special needs. The IEP team is required to evaluate the need for assistive technology. The team examines the unique educational needs of the student. Then the team decides if a technology is available that will enhance the student's ability to access presentations of instructional material, provide alternate means of expression, or to increase motivation. Understanding how technology supports students with disabilities allows the teacher to become an active participant in the selection of the technology during IEP meetings for use in the classroom.

At the IEP meeting, the team uses a process to determine the need for assistive technology. As a part of that process, the team must consider the strengths of the child; the concerns of the parents to enhance the child's education; the results of the most recent evaluation of the child; and the academic, developmental, and functional needs of the child (Mittler, 2007). Five factors should be part of the process: (a) the needs of the child or youth, (b) an understanding of the technology or service, (c) the technological expertise of the student, parents, and teachers, (d) the match between the student's needs with his or her environment, and (e) the cultural values of the family (Jones, Hinesmon-Matthews, Lezlee 2014). These factors are important to ensure the adoption of the assistive technology by the student and by those who support the student. For example, using a smartphone would not be viewed by the students as different by the other students. The more ubiquitous the technology the more likely the student will adopt it. The closer the technology is to what the other students are using, the higher the adoption rate. The student's attitude is important in the acceptance of the technology solution (Carney & Dix, 1992).

As the team identifies the assistive technology required for the student to use the digital media, the teacher needs to have a process of organizing the classroom to provide opportunities to access the digital instructional material. The principles of universal design serve as a bridge between digital media, the assistive technology, and the student. Through the principles, students utilize digital literacy skills expanding their opportunities to learn new content, interact with that content, and demonstrate their new knowledge.

What is Universal Design?

Universal design for learning (UDL) allows all students, regardless of their strengths and weaknesses, to access the general education curriculum. The guidelines advocated in the model are based upon the latest cognitive research which allows the application of the model to extend beyond those with special learning needs. The central practical premise of UDL is that a curriculum should include alternatives and should be flexible enough to make it accessible and appropriate for individuals from different backgrounds, learning styles, abilities, and disabilities in widely varied learning contexts. The "universal" in universal design does not imply one optimal solution for everyone. Rather universal reflects an awareness of the unique nature of each learner and the need to accommodate differences, creating learning experiences that suit the learner and maximize his or her ability to progress. UDL provides a framework that helps teachers to differentiate their instruction through carefully articulated goals and individualized materials, methods, and assessments.

Within the global classroom, assistive technology in combination with universal design is used in two ways. The first way is to access the global curriculum by learners with diverse backgrounds and by students with disabilities. The second way is to use the technology to create a classroom that honors diversity within the global classroom and within the unique differences of students.

Cognitive Research

UDL is based upon the latest information available in brain research. The brain is a complex organism which converts sensory information into electrical impulses. The electrical impulses create pathways through the brain. The impulses actually cause our bodies to respond to the sensory information or it can store that information in different locations in the brain. To assist in understanding these brain functions, The Center for Applied Special Technology (now called the National Center on Universal Design for Learning) identified three systems which support the learning processes within the brain. The systems were described in The Universally Designed Classroom: Accessible Curriculum and Digital Technologies book (Rose, Meyer & Hitchcock, 2005). Below are the descriptions from that book.

- **Recognition Networks:** Specialized to sense and assign meaning to patterns which enables the identification and understanding of information, ideas, and concepts.
- **Strategic Networks:** Specialized to generate and oversee mental and motor patterns which enables the planning, execution, and monitoring of actions and skills.
- **Affective Networks:** Specialized to evaluate patterns and assign them emotional significance which enables engagement with tasks and learning about the world.

Educational Principles of Universal Design

Based upon the three networks for learning processes, the National Center on Universal Design for Learning (2012) developed three educational principles to base decision making in the classroom and provide guidelines for utilizing technology to enhance student performance. These principles used in a global classroom enhance the learning experiences of all children. Global classrooms are accessing the global communities and information using transformable digital media. Therefore, the digital media bridges the educational principles of universal design and the reaching out and connecting to the world. The principles are described below:

Multiple Means of Representation

The multiple means of representation principles is closely related to the recognition network. By using multiple forms of media, students are able to access information regardless of the source of disability. By offering combinations of audio and visual aids, understanding of text can be enhanced or can replace print-based text.

Multiple Means of Action and Expression

The multiple means of action and expression principle is closely related to the strategic network by promoting how students learn. Providing different means of interacting with the information gives alternatives to paper and pencil for students with physical challenges which affects the movement of those with challenges in strategic learning behaviors or poor organizational abilities. Replacing writing with audio files, movies, or pictorial representations allows the students to express themselves overcoming these challenges.

Multiple Means of Engagement

The multiple means of engagement principle is closely related to the affective network. Several factors can affect the willingness of students to engage with learning experiences, including their interest, ability to sustain effort and persistence, and to self-regulate their learning. Students' neurological makeup, cultural background, and knowledge base are examples of factors that can prevent or enhance students' willingness to interact with learning experiences. Providing choice for these students allows them to select how they are going to interact or increase their choice of topics within the content area. Choices are easier to provide when using digital material.

Advantage of Applying the Principles

Creating classroom instructional experiences using these principles provides the students with a wide variety of options. Students drive their learning by selecting instructional materials that meet learning needs, interacting with instructional materials, and engaging with relevant content. Keeping in mind that all disabilities are exhibited along a continuum, the variety of learning experiences benefit all the students.

Digital media has several advantages over traditional material. Digital media is versatile and transformable. Digital media can be marked or tagged in HTML and networked together. The result is in-

creased flexibility in the presentation, expression, and engagement with the learning material. Digital media are versatile, allowing content to be displayed in many formats: text, still image, sound, moving image, combinations of text on video, sound in text, video in text, and more (Rose et al, 2005). Students in a 21st century global classroom are using the media to analyze information, evaluate the relevance of information in order to understand, and produce with digital tools to create new knowledge. The flexibility of the digital media enhances the classroom activities in a global classroom, allowing greater access by the students.

Because digital media is transformable, both students and teachers have flexibility as they build the activities in the global classroom. Students are able to change the appearance of text or images, adjust sound volume, turn off graphics, and so forth, simply by selecting a different browser, changing browser settings, or using a different computer. Marking or tagging text allows teachers, trainers, and students (with only a small amount of training) to alter content, accommodating different needs or preferences. Markups made in text can be shown or hidden, amended, expanded, or deleted. The same store of information can be marked in different ways for different students. It can also be unmarked and re-marked to suit the evolving needs of any particular student (Rose et al, 2005).

Assistive Technology to Support Multiple Means of Presentation

One of the challenges students may experience is viewing the instructional materials, such as text and images. A variety of options are available to access printed text for students with visual disabilities. Converting printed material into digital text allows for modifications, and accommodations to be made to the text. Selecting the best options are dependent upon each student's unique strengths. Digital documents are easy to modify by enlarging or changing the font of selected text. This approach is frequently used to modify teacher-created materials and tests. Text readers added to a computer or to mobile devices read aloud any type of text on the screen, including websites and documents to the student. The National Instructional Materials Access Center (NIMAC) converts instructional material upon request to files that are accessible by individuals with disabilities, including braille, audio, and digital text. Finally, mobile devices have truly come a long way in providing options for students. The e-book software now comes with audio options built in so anyone can have a document or a book read aloud to them. Mobile devices offer convenience over and above any computer or laptop by providing mobility. Furthermore, any Word document can be read by using the text-to-speech options from the ribbon.

Some students have visual perception challenges with normal vision. As a result, these students are unable to follow text or lines. For these individuals, the ability to quickly modify e-text is highly beneficial. Adding white space by adjusting the line spacing in a paragraph or by increasing the character spacing of a font can increase readability on any document. Page backgrounds can also be changed in combination with font color to increase visual contrast.

Assistive Technology to Support Multiple Means of Interaction

Communication is important in the acquisition of information or knowledge and invaluable in education. However, students can experience challenges in hearing and in speaking. Communication tools are essential in assisting these children in both the alternative presentation and the expression. For individuals on the severe end of the spectrum, communication boards are very helpful. Communication boards have pictures or words (depending on the students' cognitive abilities) that the students can point indicating

what they wish to say. The boards have elaborate libraries of images, allowing the students to put together extensive sentences quickly. The boards also contain simple picture libraries that indicate basic needs, allowing the students to communicate food preferences, free time activities, or personal needs.

Broadmaker is a widely used tool to facilitate communication. Teachers can use a template with thousands of potential pictures displayed on a mobile device, computer, or paper. The created boards are used by the students to point at the pictures for visual communication with others. Visual schedules and calendars communicate the activities for the day with the students. The boards are useful for teaching vocabulary or making associations with the text representation of the word which encourages the development of basic reading skills.

Students who require visual materials for their communication needs can use a variety of technology to expresses themselves. Picture libraries found in Boardmaker, Kid Pix, or Microsoft Office promote the creation of personalized picture storybooks or animations to represent the students understanding of content. Nonverbal students, using multimedia, can create an animated model of a volcano exploding and label the parts of the volcano as a class presentation option or as a replacement for a traditional test. They might also benefit from paint programs or other creative expressions, such as Comic Creator (comic book creation software) or Voki which creates an animated speaking character.

Another group that benefits from communication support is those students with fine motor challenges. These individuals struggle with using pencils and pens to write clearly. An easy technology solution is to allow the students to create documents on a word processor. Using speech-to-text software, the students can dictate what they want to write, the software then creates a document with the words. Smartphones are coming out with many voice options, including the ability to dictate memos and text messages. Voicethreads allow students to participate in online discussions through recorded audio or video files. Additionally, students can create audio or video podcasts to post online rather than writing their responses.

Livescribe pen is helpful in taking notes. The pen has cameras and microphones embedded into the device. This allows audio to be recorded as the individual writes. The cameras records the writing or pictures simultaneously with the audio. The program then associates the audio with a location on dot matrix paper. A person with fine motor challenges can write only keywords or symbols during a lecture, then replay the portions of the lecture by tapping on the page. By posting the Livescribe files online, the student is able to easily share with classmates or replay the lecture.

Assistive Technology to Support Multiple Means of Action and Engagement

Engagement can take many different forms. Technology is reenvisioning interaction with content as a learning strategy. New tools allow teachers to quickly create instructional materials that allow students to interact. The students become actively involved with their learning rather than passively receiving information. Mobile devices put the learning power into the hands of the students.

Multimedia instructional development tools are evolving quickly. Teachers can quickly add multimedia and interaction to current lecture presentations. The interaction with these materials gives those students who struggle with attention the means to stay engaged with the material. The interactions motivate the students to continue working through difficult concepts. The development tools are responsive, allowing the products to display on computer screens, tablets, and smartphones. With the increased accessibility, the instructional products are available from home or school. Students can use the products for review and assistance with their homework.

Microsoft has just released an add-on, OfficeMix, for its popular presentation tool PowerPoint. The add-on allows the teacher to do two things. One feature inserts a voiceover using a webcam to the presentation as either audio or video. Through video or audio, teachers share insight about the material on the presentation, which is then embedded into the slides. This allows the students to see or hear their teachers explain the instructional material. OfficeMix also enhances the presentation by adding quiz questions which allowing the students to check their comprehension.

Interactions can also take the form of simulations. Brain-pop and GeoGebra are great examples of programs with animations for students to interact inside the lessons. Students can use the simple simulations to assist them in developing basic math and scientific principles. Furthermore, website searches can locate simulation content that is free on almost any topic. For example, a search for interactive water cycles will provide several simulation options.

Educational games are another great way to provide alternative means of engagement. Teachers can create crossword puzzles, hangman games, flashcards, or use premade games located on website. The games are available in the online textbook resources and the learning management systems or gradebooks. Students can make their own games to share with their classmates as another fun alternative.

Gamification is another way to engage students with learning. Gamification involves rewarding students as they proceed through a series of learning materials. Students can earn points for their learning accomplishments, which allows them to level up to more challenging material. Learning management systems are now including gamification reward systems through achievements, badging, and certificates. Students can earn achievements or badges for their Mozilla Backpacks. Many social media sites now display the badges that are earned.

Connecting Global Education to Universal Design

Classrooms that incorporate global education into their classrooms are learning about the interconnectedness of problems and issues across the globe. Digital media promotes this understanding by expanding the availability of different perspectives at the same time the giving alternative ways of learning the content and interacting with that content. At the same, time students need to use their digital literacy skills to evaluate and interpret the information they are accessing. Students are able to view those issues through the perspective of different groups of people involved in the issue (Tye & Tye, 1992). Technology advancement was very important in breaking down regionalism to create a seamless global commercial network (Friedman, 2005). We became aware of each other and how we can work across the world to create products and solve problems. Because some problems span across cultural and national borders, we need to become knowledgeable about issues and people from around the world (Xanthopoulos, 2005).

Classrooms that are using the principles of global education use digital media to implement and interact with the curriculum. Because of the forms of curriculum being used in the global classroom, the integration of the universal design principles are easily integrated into the classroom activities. Multiple means of presentation, action and expression, and engagement are the core of the instructional activities with the global classroom. Technology can be used to create an awareness of different cultures in three different ways. The first way is by exploring primary source material. The second is by connecting to individuals from around the world using social media. The third way is by creating content to share with the world. At the same time, universal design principles are being utilized.

Using Primary Source Information/Multiple Means of Presentation

Primary source information is readily available in ways that previous had not been accessible before. Banks (2006) suggested that the best way for us to develop an understanding of each other is by exploring different perspectives. Ethnic groups have created primary source content as a way to preserve their cultural heritage through digital storytelling. By searching the web, surfers can find rich accounts of personal experiences of individuals within different periods of time. Through these websites, students can explore historical events through the different perspectives of the ethnic groups involved creating deeper understandings of those events.

Using primary source information is an excellent way of applying the multiple means of presentation principle. Through primary source information, the students are able to use the computer to access information that is relevant to the topic being taught in the classroom. The primary source information is rapidly being converted into different forms of media. Paper is converted to digital text that is accessible by readers. Museums and organizations interested in preserving culture are creating online multimedia experiences for students to increase their reach. Students have options for developing an understanding of the context of the topics being taught.

The Irish Views of the Famine website is a rich example of personal accounts of past events brought to life through digitized primary sources. The website contains a simple compilation of resources, including personal diaries kept by Robert Whyte, 1847 Famine Ship Diary, and Gerald Keegan, Summer of Sorrow. Both diaries describe a typical journey across the Atlantic Ocean during the 1800s by immigrants from Ireland to the United States. The site also has links to newspapers detailing the effects of the potato famine. From these primary sources, students can develop an understanding of the social and political impact of the potato famine. The papers contain stories describing the food riots and massive death counts in Ireland. These simple links provide a context to the motives and the challenges the Irish faced as they began their new life in the United States. Because these resources are available on the internet, text readers can access the content and provide different formats for the information addressing multiple means of presentation. Students can develop an understanding of immigration issues to the United States outside of or instead of a textbook.

Museums are using a combination of technology and internet access to expand their reach beyond the physical displays. The result is highly interactive websites which simulate stories of immigrants to the United States. For example, the Tenement Museum New York is a restored tenement building. The virtual tour introduces the residents of the building and provides floor plans of their apartments. Students participate in simulations of the tenants' lives. The Smithsonian is another example of primary source material being made available with multiple means of presentation. The website provides an educator's tab. Through that tab, teachers have access to online exhibitions. The exhibitions have great visual appeal with both text and video embedded around digitized historical items. The online exhibitions extend the collections displayed beyond the museum itself. Most museums now have websites with multimedia that can enhance the students' knowledge about the topics within the classroom. The website provides alternative means of presentation and engagement and at the same time, promotes a deeper understanding of the subject.

Global Issues/Multiple Means of Action and Engagement

Staying connected to the global events is easy and accessible from mobile devices. For younger students, news stories are available from websites, such as DOGO news, National Geography, and Time for Kids. Major newspapers now have great websites for children to access, including CNN Student News, KidsPost, The Learning Network, and PBS News Hour for Kids. Deciding which news feeds to follow is more of a challenge than locating good ones for the older students. Most news outlets have places to post comments and observations for another level of interaction with the content. Remember, the websites are accessible with text readers for those students who struggle with reading or viewing the material.

Students can connect with each other to share their perspectives with each other in a safe online environments created by PenPal Schools or ePals. These websites allow classrooms of students to connect as pen pals with each other. The sites have a classroom matching tools to assist teachers in locating classes with similar size and interest. Space is available to post assignments for the students to work on together.

Pairing the pen pal experience with web-conferencing tools is another way for children to experience how they are part of a global world. Classrooms connect using webcam for face-to-face conversations. Skype or Google Hangouts function seamlessly allow children to share their work or to work collaboratively with each other. All of these tools work on mobile devices, so it is easier for small groups of children to interact in spontaneously building experiences they will remember. These visual methods of interaction eliminate the need for pencil and paper, allowing individuals with physical or writing disabilities to interact with these types of learning experiences.

Capturing and sharing cultural experiences are important in the global classroom. Digital storytelling enables the students to interact with cultural heritage and important background in understanding many global issues. Young (2010) described the experience of taking in digital cameras and printers into villages across Africa to capture daily life which the villagers shared with each other. The technology allowed them to preserve their lives and embrace technology. Digital storytelling allows the students multiple means to interact with content and multiple means of expression. Rather than reading a text-based account of the world around them, they are interacting and creating experiences at the same time, expressing what they are learning in creative ways.

Creating Content/Multiple Means of Engagement

Global classrooms are designed to engage students by allowing the students to create and share digital content. Digital literacy skills are very applicable for the universal design principle of multiple means of engagement. For students with special needs, the ability to create allows them alternative means of expression simultaneously. Microsoft is releasing an app called Sway. Sway allows students to gather content they may have written, movies they have recorded, or pictures they have taken into one place. The content is then easily formatted into an attractive presentation format viewed from any device. Students share the link to their Sway presentation through texting or email. The app makes the ability to communicate and to share ideas that are generated in a global class easily, creating an excitement about learning.

Valuing Diversity in the Global Classroom

Technology is a valuable tool for teachers in addressing diversity in the classroom. Through the vast resources available, students can explore their heritage using primary sources. Many websites are available about the different countries with rich descriptions of history and cultural traditions. Many museums now have websites that share electronic versions of historical documents which describe the passage from Europe or Africa to the United States. Other museums have ethnic focuses that share what life would have been like for individuals at different time periods. Through these vast resources, students can explore their own cultural heritages. These same resources can be used to develop an understanding of different viewpoints of ethnic groups about historical events. For example, what did the Indians think about the Great Expansion as the pioneers crossed the plains to build new homes in their hunting grounds?

Another way to value students' culture is to capture their family's stories through digital storytelling. The children can interview their family members about experiences growing up. Using audio or video, these stories can be captured in the native language of the family members. Treasured family pictures can be added to the stories to create a movie or slide show.

Technological Accommodations for Non-English-Speaking Students

Students who are unable to understand, speak, or read English are at an immediate disadvantage in an English-speaking classroom. Technology is available that can assist them in understanding what is going on in the classroom. The technology can promote learning the language in an immersive setting, allowing students using the tools to adapt to the learning environment.

Electronic text will be very helpful for students with a different primary language as they are learning English in two ways. First, students are able to listen to the audio files or podcast to develop conceptual understanding about the content as they are learning to read for comprehension from web-based information using text readers. Furthermore, audio recording assist in pronunciation of words (Scutter, Stupans, Sawyer, & King, 2010). Second, electronic text that is available on the computer can be converted to any language using internet-based translators. The programs are not perfect, but the results are better than not being able to learn the content at all.

Software applications, called apps, are coming onto the market for mobile devices that can translate words into and from any language. The apps allow the user to type in a word. The app then translates the word and pronounces it. Other apps will convert spoken words from one language to another language. These new tools will enhance the ability of teachers to talk with students who do not speak English. The new voice programs on the smartphones are able to go a step further. The translators can now "hear" a sentence and "speak" the translation, providing instant communication options. WordLens is an Android app that uses the mobile devices camera to "read" text. The text is then displayed in the desired language.

Teaching English

Technology is an invaluable tool in assisting children in learning a second language. Several tools are available online for teaching English. These online resources are great for children to learn English using the tutorials independently, while classroom teachers continue to lead the other students in other instruction. Through the use of these resources, the teachers is able to apply the concepts of multiple

means of presentation, interaction, action and engagement to assist children to learn regardless of their primary language within the classroom.

Conveying instructions to children who speak another language is difficult. The best accommodation is to pair the instruction with visual cues. Several programs are available for teachers to quickly design visual cueing guides. Expression of needs or knowledge can be difficult for students who do not know English. These students need alternative forms of expressing their thoughts or ideas. Again, technology can offer these children an outlet. The Inspiration products and the Kidspix are applicable for these purposes. Any program that will allow the use of images or movies to express ideas rather than words is appropriate.

Education Planning in a Universally Designed Classroom

The challenge in using universal design in the development of units and lessons is addressing alternative modes of presentation and expression while at the same time providing flexible methods of engagement. Traditional classrooms often offer one approach to the presentation of the material, paper-based interaction with the material, and pencil and paper assessments. With the increase of digital media in the classroom, these classrooms can begin to offer different options. A good model for delivering those options is project-based learning or problem-based learning often referred to as PBL.

PBL is a student-centered instructional approach that empowers learners to learn the content as they conduct research, integrate theory and practice, and apply knowledge and skills to develop a solution to a problem (Savery, 2006). PBL complements the global classroom. Global classrooms frequently research global problems, such as climate change, human rights, or socioeconomic issues. PBL is based on problems for which student develop research-based solutions. As the students design the solutions, they then present the solutions for those problems to classmates, other students, family, or friends.

Research has indicated that the integration of the PBL and technology promotes higher-order thinking skills and improves standardized test scores. Both of these skills are important as schools are being held accountable to standards. For example, fourth and eighth graders who experienced mathematics instruction based in higher-order thinking skills, project-based learning, and manipulatives were associated with higher performance on the mathematics National Assessment of Educational Progress (Wenglisky, 2008). Additional, students from classrooms that taught science through projects that took a high degree of initiative scored better on the National Assessment of Educational Progress (Wenglisky, 2008). After reviewing thousands of articles on PBL, Moursund, Bielefeldt, and Underwood (1997) determined that PBL increased student motivation, increased opportunities to use problem-solving skills, improved library research skills, increased opportunities for collaboration, and increased resource-management skills.

PBL is closely tied into the use of digital media. Students are able to use the digital resources available from the internet or from the media center to conduct their research. Students are using their 21st century communication skills as they connect to research partners. Then the students use their digital media skills as they produce products to share with classmates, families, or friends.

PBL is a learning process with the students moving through nine steps to complete the project. Because projects are extensive, implementing requires careful monitoring to ensure timely completion. Teachers using this instructional strategy should keep this in mind as they plan the curriculum throughout the year. The time spent on the projects are worth it. Students have the opportunity to use their decision making, deductive reasoning, and critical thinking skills throughout the project (Stix & Hrbek, 2006). Prepara-

tion to teach a PBL unit is also time consuming; however, the time in the classroom is better utilized as the students work on the project, the teacher is able to guide the students through the learning process.

The process within PBL has approximately nine steps. Depending on how extensive the project is or the age level of the students, the teachers needs to make decisions about using all of the different steps. Below are the nine suggested steps (Stix & Hrbek, 2006):

1. Set the stage the project.
2. Establish the forum for display or competition.
3. Accumulate and analyze the background information needed.
4. Negotiate the criteria for project evaluation.
5. Gather the materials required for the project.
6. Guide the students in the creation of the project.
7. Prepare to present their project.
8. Present the project.
9. Reflect on the process and the evaluation of the project

Combining these nine steps with technology potentially can produce results in improving academic outcomes. The Center for Applied Research in Educational Technology through research has identified six ways that technology influences positive student educational outcomes: (a) when the technology supports the curriculum objectives being assessed, (b) when technology increases the opportunity to collaborate, (c) when the program adjusts for the student ability and prior experience and then gives the teacher a report on the student's performance, (d) when the technology is integrated into the typical instructional day, (f) when student design and (g) implement projects on content that is being tested, when the educators of the school community support technology (International Society for Technology, 2005a)

By using PBL in the global classroom, students with disabilities and English as a second language are able to participate in the projects. Throughout the project, the students are being assessed on their progress toward achieving their academic goals of addressing flexible methods of engagement. Students can select the modes of presentation of the material used on the assessment. Finally, students will have alternate modes of expression as they present their projects that demonstrate what they learn throughout the unit of study. Throughout the project, students are engaging in the instructional materials in alternate ways as compared with a lecture situation. Students are actively conducting their own research, organizing, and presenting their findings.

Readymade projects are available on global issues through various platforms. Kids Go Global applies explore, act, inspire to projects on disaster relief to green projects. The organization provides participating schools safe places to post digital media online through webpages, blogs, project pages, and picture galleries. GlobalSchoolNet.org has online expeditions that can be used to start discussions about global issues in the classroom. The site provides resources to enhance the global classroom experiences, including accessibility tools. iPoPP, a worldwide e-learning platform for multi-lingual, project-drive collaboration, provides tools for connecting and evaluating global projects.

FUTURE RESEARCH DIRECTIONS

Emerging Technologies for Universal Design Classrooms

Understanding how the new technologies will be implemented into a global classroom that uses UDL and what features will enhance or create barriers for the students with disabilities or English as a second language to interact in a broader world will drive the research of the future. The new technology will continue to be more ubiquitous and intuitive. At the same time, it brings us together in personal and meaningful ways.

To predict the future of the assistive technology, the National Center for Technology pulled together thought partners to analyze patterns and identify key areas of growth in this field. The group identified four themes in the future considerations of assistive technology. The first is convergence of various systems or devices into a single platform, particularly into a mobile device. The convergence will create intuitive ubiquitous applications of technology for students with disabilities. The second theme is customizability and universal design. The mobile devices have applications and features that allow matching the students with their needs, creating the "I" experience. The third theme is portability in order to increase independence. The mobility of the devices offers flexibility. The students do not have to go to the technology; the technology goes with the student. The fourth theme, interoperability, is the ability for a device to move across platforms. This theme has emerged, but not exactly as predicted. Software solutions are designed to perform across the platforms. Responsive web designs and the use of HTML 5 have allowed for interoperability (Gray, Thomas, & Lewis, 2010).

Emerging Collaboration Technologies for Universal Design Classrooms

Future classes will have opportunities for collaboration in nature unambiguous ways. A variety of different tools for collaboration are available with different price points. A newer technology is the collaboration table. Groups of children, four to six, are able to gather around collaboration tables using touch technology. At the tables, children interact in creative ways as they combine their individual creations into larger projects or through predesigned learning experiences. The collaboration tables use touch technology on a flat surface. The tables act as giant tablets where students actually share at the same time as they create and interact with each other. Currently, this technology is targeting the early elementary grades (Blossom, 2010.). To enhance the touch screen technology, electovibrations are under development. As a finger moves across the surface, children will receive a rubbery, bumpy, or vibration sensation allowing them to feel textures on the screen (Johnson, Adams Becker, Estrada, & Freeman, 2014).

Another form of collaboration available for older students is screen sharing through the internet. A large flat screen has a device with software associated with it. The software allows students to connect using any device (laptops, tablets, or smartphones) to the screen. Because the device uses a URL to connect, students from other locations share what is on their device. The screen itself can display four different devices at one time. Right now, the best way to connect is to use video-conferencing tools si-

multaneously with the collaboration tools, such as Google Hangouts, or Skype. All of these programs are available for free. Through this type of software, students are able to work collaboratively with classmates from around the world in real time. For a detailed description of this technology check out AirMedia.

Collaboration walls are another great way of connecting global classrooms. These walls are giant tablets on a wall using gesture and touch screen technology for interactions. The large 84 inch, smartboards accommodate two individuals at the wall at the same time. Placing two of these boards at different locations expands the interactions to four students, two at each location. Projects are displayed in both classrooms with the class members quickly sharing their ideas in a real-time collaborative workspace.

Emerging Interfaces with Technology for Universal Design Classrooms

Interfacing with technology is advancing as well. Corning is developing glass technology based upon miniature hardware of the device reducing the visual interference with the display. This allows the user to look through the glass and interact with their environments using infrared technology. Glass also allows us to convert almost any surface into an interactive workspace. For a vision of this technology, check out the video "A Day Made of Glass 2" (Corning Incorporated, 2012) for the educational applications of this technology. The link is available in the online resources section at the end of this chapter.

Another possible interface with technology that is emerging is wearable technology. Sensors are imbedded into watches and jewelry. Right now the watches are being used to enhance healthy choices by tracking steps and other movements. Another wearable technology is glasses. Although Google has just pulled the Google glasses from the market, Google wanted time to rethink how the devices can be used. The product was not viewed as cool, had problems with battery life, and generated concerns about privacy (Eadicicco, 2014; Haque, 2015; Swearingen, 2015). HoloLens is a similar product by Microsoft. However, the lenses are not designed for outdoors, which may lead to successful adoption. The HoloLens is designed to allow the user to work and play more effectively by imposing three dimensions on objects and surfaces to create virtual experiences (Berinato, 2015). How these devices can assist individuals with disabilities will create many opportunities for research.

Opportunities for Research

Opportunities for future research in the universal design and the assistive technology to support students with disabilities will be interesting to explore. The assistive technology field is changing as rapidly. Whether it is working with available technology to adapt it to the needs of the students or creating software or devices that meet specific needs of students, research and development for these products will enrich the lives of these students. Through these new products, the students will have improved access to the digital information and higher demands on their digital media skills.

One example of new technology under development is electovibrations. Electovibrations will allow students with visual impairments to feel the interactions as they move their hands over an electronically enhanced surface. As the technology becomes ubiquitous, students with cognitive disabilities will also benefit as the vibrations will provide an alternative to interacting with the material multiple means of action and interaction. All students may be able to develop deeper understanding of content as they are able to feel the differences being created the technology. Students will be able to feel the typography of a map and changes in mathematical calculations to objects they are creating as compared with flat, paper-based worlds that require reading comprehension skills.

Other challenges will present themselves as new technology emerges. How will students with emotional disabilities and poor social skills successfully navigate the social demands of collaboration activities? Will they develop the social skills needed to interact and share at collaborative spaces? How will the visual nature of the displays be adapted to meet the needs of students with visual impairments? Will students learning a second language develop their language skills quicker in these language-rich environments which will contain visual cues about the conversations?

A continual challenge in conducting research on technology is the adoption cycle of an emerging technology. New technology is being created so quickly that researchers do not have time to truly research the impact of the technology before another new and improved product is on the market. Blogs by teachers and developers are often the best way to stay current on new technologies for the classroom. *Tech&Learning* is an online magazine that uses teacher language to evaluate new classroom technology with great ideas for how to use the technology in the classroom. More tech-savvy teachers may want to follow CNet, which is a combination of a blog site with online video channels. Experts share their insights of technology that is currently available. Flipboard is an app that has a technology online magazine that pulls in feeds from various blogs on the technology. It is a great app for busy teachers wanting a quick review of the latest tech news.

CONCLUSION

Friedman's (2005) description of a flat world gives us a vision of an interconnected world is which the children of the 21st century will live and work. Ensuring that these children learn within global classrooms promotes the development of the media literacy skills they need. Global classrooms include all children as universal design principles of multiple means of presentation, action and interaction, and engagement. Technology allows teachers to engage children using the media literacy skills. Although Friedman believed the world is flat, the world has many dips, valleys, and mountains. Through the communication and collaboration tools, students can explore the different cultures of the world and learn about students through connected classrooms.

Is technology the answer to all problems? No. However, technology can be the tool that allows us to engage one another. Students with disabilities or learning in a secondary language can use these new technology tools to access the information around them. As educators, we should continue to understand the benefits and the challenges technology brings to our classrooms.

KEY TERMS AND DEFINITIONS

Assistive Technology: Technology tools that enable individuals with a disability to assist them to access curriculum or to accomplish daily activities with minimal assistance.

Collaborative Technology: Technology tools that allow individuals to work together on projects either in the same room or from different locations.

Digital Divide: Economic and social inequality created in society by the lack of access to or use of technology tools.

Digital Media: Information available in electronic formats, including text, images, video, and audio that allows it to be transformed, modified, and combined.

Primary Source: Documents, video, or other material created in the past at the time of events.

Universal Design: Carefully designed lessons that provide flexible presentation of materials, interactions with the information, and engagement with the content.

Chapter 9
Networked Multimedia Communication Systems

Piyush Kumar Shukla
University Institute of Technology RGPV, India

Kirti Raj Bhatele
University Institute of Technology RGPV, India

ABSTRACT

This Chapter simply contains multimedia - an integrated and interactive presentation of speech, audio, video, graphics and text, has become a major theme in today's information technology that merges the practices of communications, computing and information processing into an interdisciplinary field. The challenge of multimedia communications is to provide services that integrate text, sound, image and video information and to do it in a way that preserves the case of use and interactivity. A brief description of the elements of multimedia systems is presented. User and network requirements are discussed together with the pocket transfer concept. About Multimedia communication standards a general idea is also given. Multimedia transport over ATM and IP networks discussed in brief. The issues pertaining to multimedia digital subscriber lines are outlined together with multimedia over wireless, mobile and broadcasting networks as well as digital TV infrastructure for interactive multimedia services.

INTRODUCTION

The precedent years have seen an expansion in the usage and the field of digital media. Industry is making considerable investments to deliver digital audio, image and video information to consumers and customers. A novel infrastructure of digital audio, image and video recorders and players, on-line services, and electronic commerce is quickly being deployed. Abreast major corporations are converting their audio, image and video archives to an electronic form. Digital media offers several discrete advantages over analog media: the quality of digital audio, image and video signals is higher than that of their analog counterparts. Editing is easy because one can access the exact discrete locations that should be changed. No loss of fidelity happens while copying. A copy of digital media is alike to the original. Digital audio, image and videos are easily transmitted over networked information systems.

DOI: 10.4018/978-1-5225-3822-6.ch009

These advantages have opened up numerous new possibilities. Multimedia consists of Multimedia data and set of interactions. Multimedia data are casually considered as the collection of three M's: multi-source, multi-type and multi-format data. The interactions among the multimedia components consist of intricate relationships without which multimedia would be a simple set of visual, audio and other data. Multimedia and multimedia communication can be seen worldwide as a hierarchical system. The multimedia software and applications offer a direct interactive environment for users. Whenever a computer in need of information from far-off computers or distant servers with that scenario, multimedia information must travel through computer networks. As the amount of information involved in the transmission of video and audio can be significantly huge, the multimedia information must be compressed before it can be transported through the network in order to lessen the communication delay. Limited delay and jitters like constraints are used to make sure a reasonable video and audio outcome at the receiving end. That is why, communication networks are undergoing constant up gradation and improvements in order to provide multimedia communication capabilities. In order to connect local terminal computers and other equipment with each other, Local area networks are used and wide area networks and the Internet connect the various local area networks together. Improved standards are constantly being developed in order to provide a worldwide information expressway over which multimedia information will travel. Multimedia communications is the field referring to the representation, storage, retrieval and dissemination of machine-process able information expressed in multiple media, such as text, image, graphics, speech, audio, video, animation, handwriting, data files. With the advent of high capacity storage devices, powerful and yet economical computer workstations and high speed integrated services digital networks, providing a variety of multimedia communications services is becoming not only technically but also economically feasible. In addition, the broadband integrated services, digital network (BISDN) has been given special attention as a next generation communication network infrastructure which will be capable of transmitting full motion picture and high speed data at 150 and 600 MB/s and voice as well as data throughout the world (Mouftah, 1992). At first, the concept of multimedia communication modeling will be described, together with user and network requirements, packet transfer concept as well as multimedia terminals. The second part deals with multimedia communication standards. Finally, we will concentrate on multimedia communications over networks. Multimedia transfer over ATM networks is described. This is followed by multimedia over IP networks. Special issues relating to multimedia over wireless will be discussed.

Improvement in the quality of video and audio is always being demanded. The increasing demands pose great challenges in developing multimedia applications in the areas of content creation, usage and sharing of media experiences. Additional challenges come from communication systems; handovers between different networks are especially challenging in mobile devices. We identify and analyze the requirements that a distributed multimedia application may enforce on the communication network. Due to the vastness of this field, we do not claim that this list is exhaustive, but we have tried to include all the important aspects (from our view point) that have significantly impacted the enhancements to the basic Internet architecture and its associated protocols. Recent advances in communications technologies have witnessed a growing and evolving multimedia content delivery market based on information gathering, manipulation, and dissemination. It is a fact that personal communications, computing, broadcasting, entertainment, etc. have turned into streams of multimedia content, and the various communication and network technologies have become the means to carry that content to a wide variety of terminals. Unlike traditional communication systems, a fundamental challenge for present and future communication systems is the ability to transport multimedia content over a variety of networks energy-efficiently at

different channel conditions and bandwidth capacities with various requirements of quality-of-service. There are many issues need to be addressed such as signal processing, collaborations, power management, flexible delivery, specialization of new content, dynamic access, telecommunications, networking, etc., due to the multi-disciplinary nature of the applications in advanced multimedia communications.

The objective of this chapter is to carry together the state of the art research contribution that describes original and unpublished work addressing the new emerging techniques on multimedia communications. Particularly, we solicit research papers on addressing challenging issues existing for enabling mobile multimedia communications over heterogeneous infrastructure for realizing next generation networking and computing. For example, ubiquitous multimedia is a requirement in next generation networks, such as multimedia adaption in wireless network; multimedia services in ubiquitous circumstance; improving distributed multimedia communication through location awareness, action awareness, user awareness, etc. On the other hand, due to the limited computational power, memory and battery energy in wireless and portable terminals, power efficient design also plays important role in next generation mobile multimedia applications. The table consisting of some of the frequently used acronyms in the field of Networked Multimedia communication is given below in table 1.

MULTIMEDIA COMMUNICATION

Multimedia Communication is simply the transfer of information or data over the network, in which the information or data may be, consist of one or more of the following types: Text, images, audio and video, etc. Applications in medicine, education, travel, real estate, banking, insurance, administration and publishing are emerging at a fast pace. These applications are characterized by large multimedia documents that must be communicated within very short delays. Computer-controlled cooperative work, whereby a group of users can jointly view, create, edit and discuss multimedia documents, is going to be characteristic of many transactions (Cox, 1998). Some glamorous applications in multimedia processing include: distance learning, virtual library access and living books. The students learn and interact with instructors remotely via broadband communication network in distance learning. Virtual library access means that we instantly have access to all of the published material in the world, in its original form and format, and can browse, display, print and even modify the material instantaneously. Living books supplement the written word and the associated pictures with animations and hyperlink access to supplementary material (Rosenberg, 1992). Applications that are enabled or enhanced by video are often seen as the primary justification for the development of multimedia networks depicted by figure 1.

Much of the work on packet video has considered fairly homogenous networking scenario (Bojkovic, 1996). It would be a proper if a single type of video service dominated in the networks. However, it is not a valid assumption for the traffic issues. First, video will not constitute a uniform service with easily determined behavior and requirements. Secondly, video will not share resources with streams of only the same type. This means that multiplexing in the network should be evaluated for a heterogeneous mix of traffic types. In business areas, there is a potential need for various kinds of new communication system, such as high-speed data networks between geographically distributed local area networks (LAN's) high definition still picture communication and TV conferencing or corporate cable TV services. The new paradigm of the BISDN application system as a result of the integration of multimedia processing by workstations and multimedia communication by BISDN is shown in Figure 2.

Table 1. Different Acronyms used in the field Networked multimedia communication

S.No	Acronym	Description
1.	ADPCM	Adaptive Differential Pulse Code Modulation
2.	ADSL	Asymmetric Digital Subscriber Line
3.	AE	Area Directors
4.	ATDM	Asynchronous Time-Division Multiplex
5.	ATM	Asynchronous Transfer Mode
6.	AV	Audiovisual
7.	BISDN	Broadband Integrated Services Digital Networks
8.	CATV	Cable Television
9.	CLEC	Competitive Local Exchange Carriers
10.	CTI	Complete Timing Information
11.	DBS	Direct Broadcast Satellite
12.	DDL	Description Definition Language
13.	DSL	Digital Subscriber Line
14.	DSM	Digital Storage Media
15.	GSM	GSM Global System for Mobile
16.	HDTV	High Definition Television
17.	HFC	Hybrid Fiber Coax
18.	IAB	Internet Architecture Board
19.	IEC	International Electro technical Commission
20.	IESG	Internet Engineering Steering Group
21.	IETF	Internet Engineering Task Force
22.	IPN	Integrated Packet Network
23.	ISOC	Internet Society
24.	JPEG	Joint Photographic Experts Group
25.	LMDS	Local Multipoint Distribution Service
26.	MBS	Mobile Broadband System
27.	MVPD	Multichannel Video Program Distribution
28.	NTI	Null Timing Information
29.	NTSC	National Television System Committee
30.	PAL	Phase Alternating Line
31.	PCM	Pulse Code Modulation
32.	PVR	Packet Voice Receiver
33.	PVT	Packet Voice Transmitter
34.	QoS	Quality of Service
35.	RFC	Request for Comments
36.	SHDSL	Single pair High speed DSL
37.	SIF	Standard Source Input Format
38.	TCP	Transmission Control Protocol
39.	TR	Technical Report
40.	UDP	User Datagram Protocol
41.	UMTS	Universal Mobile Telecommunication System

Figure 1. Multimedia communication

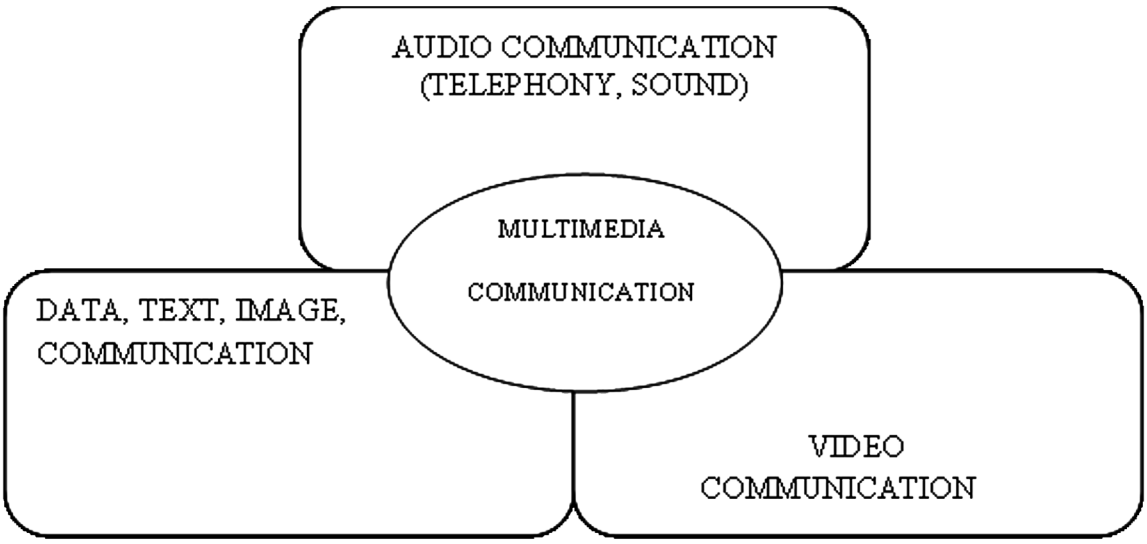

Figure 2. Elements involve in multimedia communication systems in person to person communication and person to machine modes

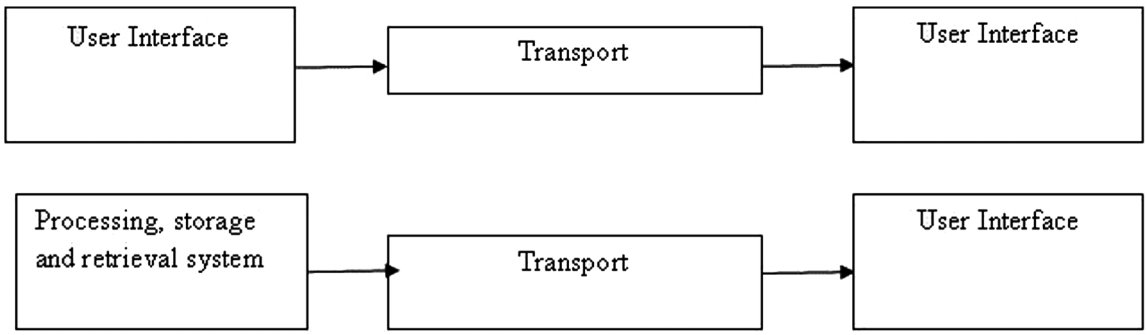


A multimedia communication model is strongly influenced by the manufacturer-dependent solutions for personal computers and workstations including application software on the one hand and by the intelligent network concept on the other (Jayant, 1993). A layered model for future multimedia communication comprises five constituents:

1. Partitioning of complex information objects into distinct information types for the purpose of easier communication, storing and processing. This comprises data, video or audio taking into account the integration of different information types not being excluded.
2. Standardization of service components per information type, possibly with several levels of quality per information type.
3. Creation of platforms at two levels: a network service platform, and a multimedia communication platform. The first level hides the transport networks and network building blocks from an application designer's or user's point of view. The second level provides communication support on

the basis of information structure and information exchange building blocks for a large number of applications.

4. The definition of "generic applications" for multiple uses in various multimedia environments and different branches meeting common widespread needs.
5. Specific applications: electronic shopping, tele training and remote maintenance, based on special information building blocks and utilizing the network service platform, the multimedia communication platform as well as including generic applications.

With regards to the capability of the available resources in each case, the multimedia communication applications must be scalable in order to run in a constant manner across different network and terminal types and capabilities.

There are two key communication modes in which multimedia systems are generally used: person-to-person communications and person-to-machine communications. The key elements of multimedia systems are presented in Figure 2. As it can be seen both these modes have a lot of commonality, as well as some differences.

In the person-to-person mode shown in Figure 2, there is a user interface that provides the mechanisms for all users to interact with each other and a transport layer that moves the multimedia signal from one user location to some or all other user locations associated with the communications. The user interface creates the multimedia signal and allows users to interact with the multimedia signal in an easy-to-use manner. The transport layer preserves the quality of the multimedia signals so that all users receive what they perceive to be high-quality signals at each user location. Examples of applications for the person-to-person mode are teleconferencing, video phones, distance learning and shared workspace scenarios. In the person- to-machine mode, shown in Figure 2, there is again a user interface for interacting with the machine, along with a transport layer for moving the multimedia signal from the storage location to the user, as well as a mechanism for storage and retrieval of multimedia signals that are either created by the user or requested by the user. The storage and retrieval mechanisms involve browsing and searching to find existing multimedia data. Also, storage and archiving in order to move user-created multimedia data to the appropriate place for access by others. Examples of applications for the person-to-machine mode include creation and access of business meeting notes, access of broadcast video and document archives from a digital library or other repositories.

MULTIMEDIA COMMUNICATION OVER NETWORKS

There are basically nine types of communication networks that are used to provide multimedia communication services. With the increase in transfer of multimedia information over the past few decades has resulted in many new multimedia processing and communication systems, being put into service. The increasing availability of optical fiber channels and rapid advancement in VLSI circuits and systems has fostered a tremendous interest in developing sophisticated multimedia services with an acceptable cost. Today's fiber technology offers a transmission capacity that can easily handle high bit rates. This leads to the development of networks which integrate all types of information services. By basing such a network on packet switching, the services (video, voice and data) can be dealt with in a common format. Packet

switching is more flexible than circuit switching in that it can emulate the latter while vastly different bit rates can be multiplexed together. In addition, the network's statistical multiplexing of variable rate sources may yield a higher fixed capacity allocation.

1. Packet Video

Asynchronous transfer of video signals which often is referred to as "packet video" can be defined as the transfer of video signals over asynchronously time-division multiplex (ATDM) networks, such as IP and ATM. The video may be transferred for instantaneous viewing or for subsequent storage for replay at a later time. The previous case has requirements on pacing so that the received video data can be displayed in a perceptually continues sequence. The last case can be seen as a large data transfer with no inherent time-constraints. Apart from the requirement on pacing, there may also be bounds on the maximum transfer delay from camera to monitor, if the video is a part of an interactive conversation or conference. These limits are set by human perception and determine when the delay starts to the information exchange. Parts of the signal may be lost or corrupted by errors during the transfer. This will reduce the quality of the reconstructed video and if the degradation is serious enough, it may cause the viewer to reject the service. Thus, packet video common topics are to perform coding and make sure the asynchronously transfer of video signals under quality constraints.

The synchronous transfer mode combines the circuit switched routing of telephony networks with the asynchronous multiplexing of packet switching. This is accomplished by establishing a connection (fixed route) through the network before accepting any traffic. The information is then sent in 53-octet long cells. The switches route calls according to address information contained in each cell's 5 -octet header. Traffic on a particular link consists of randomly interleaved cells belonging to different calls. The network guarantees that all cells of a call follow the same route and hence, get delivered in the same order as sent. The intention is that ATM networks should be able to guarantee the quality of service in terms of cell loss and maximum delay, as well as maximum delay variations.

The internet protocol differs in two major respects from ATM as there is no pre-established route and the packets are variable length (up to 65535 octets). IP does not give any guarantees on the delivery of the packets and they may even arrive out of order if the routing decision changes during the session. These issues will be addressed by the introduction of IP in conjunction with the resource reservation protocol RSVP. IP often called Internet Protocol (version 6), packets contain a 24-bit flow identifier in addition to the source and destination addresses which can be used in routers for operations like scheduling and buffer management to provide service guarantees. Delay and some loss are inevitable during transfers across both ATM and IP networks. The delay is chiefly caused by propagation and queuing. The queuing delay depends on the dynamic load variations on the links and must be equalized before video can be reconstructed. Bit errors can occur in the optics and electronics of the physical layer through thermal and impulsive noise. Loss of information is mainly caused by multiplexing overload of such magnitude and duration that buffers in the nodes overflow.

2. Multimedia Transport over ATM Networks

As previously stated, multimedia it denotes the integrated manipulation of at least some information represented as continues media data, as well as some information encoded as discrete media data (text and graphics). Multimedia communication deals with the transfer, protocols, services, and mechanisms

of discrete media data and continues media data (audio, video) in/over digital networks. Such communication requires that all involved components be capable of handling a well-defined quality of services (QoS). The most important QoS parameters are required capacities of the involved resources, compliance to end-to-end delay and jitter as timing restrictions, and restriction of the loss characteristics. A protocol designed to reserve capacity for continuous media data, transmitted in conjunction with the discrete media data over, for example an asynchronous transfer mode - local area network (ATM-LAN) is certainly a multimedia communication issue (Orzessek & Sommer, 1998). The success of ATM for multimedia communications depends on the successful standardization of its signaling mechanisms, its ability to attract the development of the native ATM applications, and the integration of the ATM with other communications systems. The integration of ATM into the Internet world is under investigation. If there will be ATM applications such as video on demand, then there is also the need for a "side-by-side" integration of ATM and Internet protocols. It can be very well understood that the ATM/BISDN in wired networks is behind the success of wireless ATM (WATM). When ATM networks become a standard in the wired area, the success of WATM will be realized.

3. Video Over Wireless ATM Networks

Wireless ATM (WATM) has become the direct result of the ATM "anywhere" movement because of the success of ATM on wired networks. WATM can be seen as a solution for next-generation personal communication networks, or a wireless extension of the BISDN networks. There has been a great deal of interest recently in the area of wireless networking. Issues such as bit error rates and cell loss rates are even more important when transmitting video over a wireless network. A very high performance wireless local area network which operates in the 60 GHz millimeter waveband can experience cell loss rates of 10^{-4} to 10^{-2}. To provide adequate picture quality to the user, some form of error correction or concealment must be employed. One option is to use the MPEG-2 error resilience techniques and to modify the MPEG-2 standard slightly when it is used over wireless ATM networks. This technique is known as macro blocker synchronization (Zhang, 1997). In macro block resynchronization the first macro block in every ATM cell is coded absolutely rather than differentially. This allows for resynchronization of the video stream much more often than would be possible if resynchronization could only take place at the slice level. It would be relatively simple to incorporate this method with the existing MPEG-2 coding standard by adding an interworking adapter at the boundary between the fixed and wireless network (E. Ayanoglu). A second proposal for improving error resilience in wireless network is to use forward error correction (FEC) methods. In addition, improve performance can be achieved by using a two layer scalable MPEG-2 coding scheme rather than one layer (Ayanoglu, 1993).

4. Multimedia Over IP Networks

Multimedia has become a major subject or theme in today's information technology that combines the practices of communications, computing, and information processing into an interdisciplinary field. In this Internet era, IP based data networks have emerged as the most important infrastructure, reaching millions of people anytime, anywhere. They serve as an enabling technology that creates a whole new class of applications to enhance productivity, reduce costs, and increase business agility. Anticipating

that multimedia over IP will be one of the major driving forces behind the emerging broadband communications of the 21st century; we address the challenges facing the delivery of multimedia applications over IP in a cost effective, ubiquitous, and quality guaranteed manner.

5. Packet Voice

In Packet voice, the phenomenon of packets witching offer several potential advantages in terms of performance when compared to circuit-switched networks. Major advantage is efficient utilization of channel capacity, particularly for "bursty" traffic. Well not as bursty as interactive data, speech exhibits some burstiness in the form of talks parts (Brady, 1990). It is actually on the sensitivity of the speech detector average talk's part duration depends but it is well known that individual speakers are active only about 35-45 percent in typical telephone conversations. Although by sending voice packets only during talk's parts, packet switching offers a natural way to multiplex voice calls as well as voice with data. Another major advantage is that call blocking can be a function of the required average bandwidth rather than the required peak bandwidth. In addition, packet switching is flexible. For instance, packet voice is quite capable of sustaining priority traffic and point to multipoint connections. Network capabilities in traffic control, accounting and security are enhanced as the packets are processed in the network. Continuous speech of acceptable quality must be reconstructed from voice packet that experience variable delays through the network. Imposing an additional delay is all required for compensating of the variable delay component in the reconstruction process. Hence, packet should be delivered with low average delay and delay variability. Speech can tolerate a certain amount of distortion (e.g., compression, clipping) but is sensitive to end-to-end delay. The exact amount of maximum tolerable delay is subject to debate. It is generally accepted to be in the range of 100-600 ms. For example, the public telephone network has a maximum specification of 600 ms. In order to minimize packetization and storage delays, it has been proposed that voice packets should be relatively short, on the order of 200-700 bits, and generally contain less than 10-50 ms of speech (Listanti, Villani & Gold, 1983). Network protocols should be simplified to shorten voice packet headers (e.g., on the order of 4-8bytes), although timestamps and sequence numbers are likely needed. Since a certain amount of distortion is tolerable, error detection, acknowledgements, and retransmissions are unnecessary in networks with low-error rates. Flow control can be exercised end-to-end by blocking calls. In addition, network switches can possibly discard packets under heavy traffic conditions. In this case, embedded coding has been proposed whereby speech quality degrades gracefully with the loss of information (Bially, 1980).

6. Integrated Packet Networks

The economies and flexibility of integrated networks make them very attractive and packet network architectures have the potential for realizing these advantages. However, the effective integration of speech and other signals such as graphics, image and video into an integrated packet network (IPN) can rearrange network design properties. Although processing speeds will continue to increase, it will also be necessary to minimize the nodal per-packet processing requirements imposed by the network design. Data signals must generally be received error-free in order to be useful. The inherent structure of speech and image signals and the way in which they are perceived allows for some loss of information

without significant quality improvement. This presents the possibility of purposely discarding limited information to achieve some other goal, such as the control of temporary congestion. One of the goals in integrated packet network is to construct a model which considers the entire IPN (transmitters, packet multiplexers and receivers) as a system to be optimized for higher speeds and capabilities (Patr, DaSilva & Frost, 1989).

In summary, the advantages gained by taking a total system approach to integrated packet network are as follows:

1. A powerful overload control mechanism is provided.
2. The structure of speech is effectively exploited.
3. Extremely simple per-packet processing for overload control is allowed.
4. Only one packet per speech segment is required.
5. Receiver speech synchronization is simplified.
6. Reduced per-packet error processing at packet multiplexers is possible.

7. Video Transmission over IP Networks

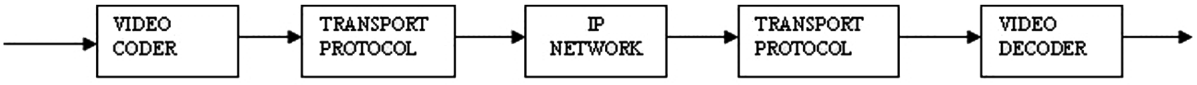
The problem of sending video over IP has essentially two main components: video data compression and design of communication protocols as illustrated in Figure 3 (Servetto & Nahrstedt, 2001).

One approach consists of designing a low bit rate coder, protecting the resulting bit stream with channel codes and using one of the standard Internet transport protocols to transmit the resulting data stream. If the source bit rate is low enough and the channel is not too congested, then it is possible to use TCP, in which case no errors occur and therefore there is no need for channel codes. Otherwise, user datagram protocol (UDP) is used with a constant packet injection rate, and low-redundancy channel codes are used to protect against infrequent lost packets.

8. Multimedia Over Digital Subscriber Lines

The Internet is responsible for changing the way we work, live and spend time with all its applications. However, today the Internet is confronted with a major problem. Increasing demand for access has produced bottlenecks and huge congestion, which resulted degraded internet speed. These restrictions has simply forced the existing technology of traditional telephony to new and innovative heights with the emergence of Asymmetric Digital Subscriber Line (ADSL) technology. With the advent of the High speed ADSL simply eliminate bottlenecks, granting all subscribers quick and reliable access to Internet content. Telecom service providers have yet to realize the full potential of ADSL. Traditional telephone and Internet services are only the beginning, while the ability to offer broadcast video services is a reality.

Figure 3. Structure of a video streaming system



Cable TV operators are beginning to offer voice and data services. There is increasing competition from Competitive Local Exchange Carriers (CLEC) and other carriers, making it imperative that traditional telecom service provides video services. By offering a range of services, established service providers can generate additional revenue and protect their installed base. Direct Broadcast Satellite (DBS) providers, particularly in Europe and Asia, are offering a compelling Multichannel Video Program Distribution (MVPD) service (Merriman, 2000).

A key factor contributing to the successful deployment of Asymmetric Digital Subscriber Line (ADSL) access systems has been the facility for overlying data services on top of existing voice service without interfering with the voice service. For the users this basically offers:

1. Always-on service capability. There is no need to dial up as the Internet Protocol (IP) connection is always available and the office networking model in which network resources are available all the time.
2. Virtual second voice line. Unlike when the user is connected through a modem, the voice line remains available for incoming and outgoing calls. For the operator, the service overlay allows ADSL to be installed throughout the network, irrespective of what types of narrow band switches are installed. After the initial success of ADSL, it became apparent that it could be used to offer multiple phone lines together with a greater range of services (e.g., Virtual Private Networks VPN) targeted at specific markets. This has been made possible by the high bandwidth of ADSL, backed up progress in voice compression, echo canceling and digital signal processing technologies. ADSL offers a high data bandwidth, of which a portion can be used to offer additional voice services integrated with the data services. Symmetric Digital Subscriber Line (DSL) techniques, such as Single pair High Speed DSL (SHDSL) cannot be deployed as an overlay to existing analog telephone services, so the delivery of voice and data services using asingle facility requires voice to be carried directly on the DSL link. The techniques used to transport voice and data in an integrated way over DSL-whether ADSL or SHDSL - are referred to as Voice over DSL (VoDSL). With VoDSL, two main market segments are of interest to service providers. The first is small to medium sized businesses, a significant percentage of which need to be able to send and receive data of around 500 kbit/s. The voice needs of these customers are typically met by 4 to 12 outgoing plane lines. Using, for example, Adaptive Pulse Code Modulation (ADPCM) voice coding, at peak times these phone lines consume only 128 to256 kbit/s of the ADSL bandwidth, which is typically in excess of 2 Mbit/s downstream and more than 500 kbit/s upstream. The second market interested in VoDSL services is residential users who will appreciate the extra two to four voice lines that VoDSL offers (Verhoeyen, 2000). ADSL will be delivering multimedia services to millions of users. The transmission of digital multimedia data requires the existing systems to be augmented with functions that can handle not only ordinary data. In addition, the high volume of multimedia data can be handled efficiently only if all available system services are carefully optimized.

9. Internet Access Networks

Asymmetric digital subscriber line (ADSL) offers asymmetric rates of transfer of data to and from the Internet. The uplink rates can go up to 768 Kbit/s and down links rates are 6-8 Mbit/s, depending on the length and condition of the local loop - the wiring between the customer's premises and the telco central office. Cable companies bring analog TV signals over optical filters to their neighborhood distribution

points, a head ends, whence the signals are distributed to residences by coaxial cables. The combination of fiber and coaxial cable, which can carry high-speed data as well as TV signals, is known as hybrid fiber coax (HFC). Each distribution point typically serves 200-500 residences. The extent of the network of a cable TV operator is measured in terms of homes passed - that is, the number of homes adjacent to which the operator's cable passes, regardless of whether those homes have been signed up as customers. Realistically, cable modems are capable of passing data upstream at speeds of 200 kbit/s to 2 Mbit/s, and downstream at speeds up to about 10 Mbit/s. Cable modems, capable of operating at higher speeds than ADSL, have some serious drawbacks. The cable link to a residence is shared among many users, so that if many of them decide to log onto the Internet at the same time, achievable communications speeds may plunge. Because the lines are shared, a hacker may be able to drop on a neighbor's connection to the Internet or on an intranet - a security problem that may be serious to some users. Consequently, a customer who happens to be a road warrior will be unable get access into the Internet at airports or hotels through his laptop computer at his usual data rate. If he is able to connect at all, it will be through a dial-up modem at a much lower speed.

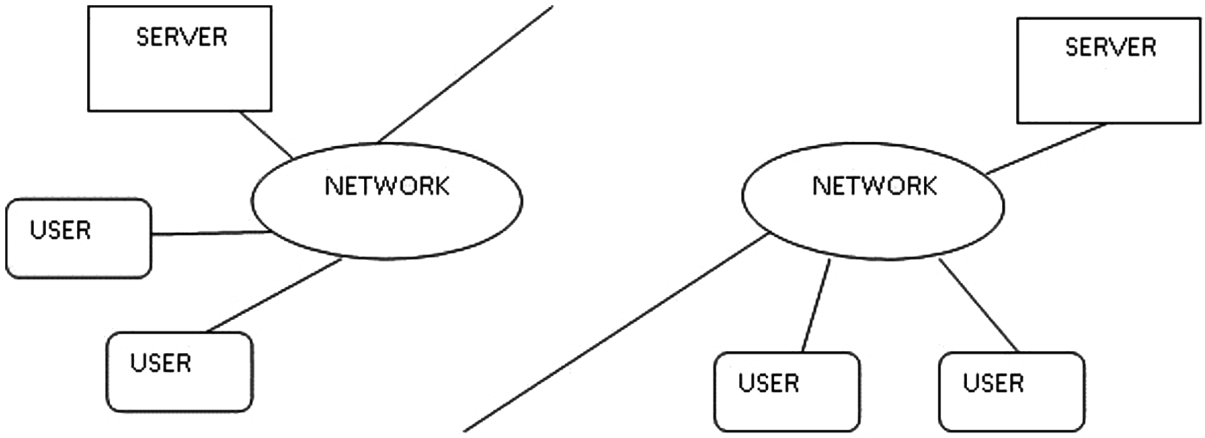
MULTIMEDIA COMMUNICATION SYSTEM ARCHITECTURE

A multimedia communication system consisting of both the communication protocols which are used to transport the real-time data and also the distributed computing system (DCS) within which any applications using these protocols must execute (Constantine & Papandreou, 1998). The presented architecture attempts to integrate these communications protocols with the DCS in a swift fashion in order to ease the writing of multimedia applications. Two issues are recognized as being necessary to the success of this integration: namely the synchronization of related real-time data streams and the management of heterogeneous multimedia hardware. The synchronization problem is solved by defining explicit synchronization properties at the presentation level and by providing control and synchronization operations within the DCS which operate in terms of these properties. The heterogeneity problems are addressed by separating the data transport semantics (protocols themselves) from the control semantics (protocol interfaces). The control semantics are implemented using a distributed, typed interface, scheme within the DCS (i.e., above the presentation layer), whilst the protocols themselves are implemented within the communication subsystem. The interface between the DCS and communications subsystem is referred to as the Orchestration interface and can he considered to lie in the presentation and session layers. There are three types of Multimedia Communication System Architecture depicted in figure 4.

AUDIO-VIDEO CONFERENCING

The emergence of videoconferencing as a new means of communication with many applications such as tele meeting, remote education or telemedicine is quite evident. When two or more people communicate synchronously by means of audio, video and very often, using data applications such as electronic whiteboards or chat then it is known as a videoconference. Videoconferencing plays a very significant role in the various application fields as it is a direct way of supporting co-operation. It allows simultaneous communication for geographically dispersed participants, and it accomplishes this task without imposing a rigid structure on the communication, thus leading to interactions that resemble as close as

Figure 4. Types of multimedia communication system architectures



possible natural communication in a face-to-face situation. Videoconferencing communication is thus a key issue in multimedia cooperative systems (Bellido, Fernández & Pastor, 1996).

The mounting facilities available in videoconferencing systems are also important. From systems that allowed a uni-directional communication between two sites, we are now in a situation where it is possible to have several users engaged in a N to M communication. The potential utility of videoconferencing has increased with the help of systems electronic whiteboards, transfer of documents and window sharing. The term multimedia conferencing has been proposed to illustrate the merging of the different data applications to basic audio and video communication. In the project LEVERAGE [Lev01], for instance, a multimedia conferencing system has been developed, to support task-based foreign language learning, collaboration and interaction between students present in Paris, Madrid and Cambridge. The EDUBA project (Pastor, Fernández & Bellido, 1995) is another example where Videoconferencing is used in learning scenarios.

Till recently, the finest way to access to videoconferencing (or multimedia conferencing) has been the use of equipment based on the H.320 standard [H.320]. The equipments and protocols needed to support videoconferencing over narrowband ISDN (Integrated Services Digital Networks) is simply defined by the H.320 is an ITU (International Telecommunications Union) standard. The quality of videoconferencing (Okubo, 1997) is improving day by day with the deployment of broadband network technologies and advances in the techniques for audio and video compression. Below there is a analysis and comparison among different alternatives available to support videoconferencing over broadband networks is given. Specifically, the ITU recommendations H.321, H.310 and H.323 ([H.321], [H.310] and [H.323].

1. First Standard

The standard H.320 has been considered as the very starting point for the current development of videoconferencing systems. It is the first standard ("Recommendation" in ITU terminology) to provide a total system for videoconferencing, allowing the interoperation of equipment built by different manufacturers. H.320 is supported by narrow-band ISDN (N-ISDN), which provides digital channels with different bandwidths: 64 kbit/s (B channel), 384 kbit/s (H0 channel) and 1536/1920 kbit/s (H11/H12 channel) [27]. The Recommendation stipulates several other Recommendations in which constituent elements,

such as audio coding, video coding, multimedia multiplexing and system control, are defined. For audio coding, G.711 [G.711] is the basic standard, but other Recommendations define different qualities with different bandwidth requirements. For video coding and compression, ITU-T defines the H.261 standard, which can work from 64 kbit/s to 2 Mbit/s in multiples of 64 kbit/s.

2. ATM for Videoconferencing Systems

The advent of broadband network technology has created the requirement to use these technologies to support videoconferencing which requires high bandwidth. As ATM is the chosen technology for future broadband ISDN, therefore the ITU-T concentrated on the standardization of videoconferencing systems in ATM environments. Some characteristics of ATM make it an excellent supporting infrastructure for videoconferencing systems, among them (S Okubo, 1997):

1. Flexibility in bandwidth usage.
2. Availability of high bandwidths.
3. Service integration.
4. Variable bit rate capability.
5. Use of Cell Loss Priority.
6. Multipoint distribution.
7. Flexible multiplexing.

However, there are also some drawbacks:

1. Cell loss.
2. Cell delay variation (Jitter).
3. Packetization delay.

3. Adapting to Broadband Networks

The H.321 simply defines the technical specifications for adapting H.320 terminals to broadband ISDN environments. This recommendation allows the interworking of terminals over broadband ISDN and terminals over narrowband ISDN. To facilitate interworking, the basic technologies used for audio and video codification and compression are also G.711 and H.261, the same as in H.320 (*ITU-T Recommendation H.320, ITU-T Recommendation H.321*).

4. Taking Full Advantage of Broadband

Recommendation H.310 has been recently approved. H.310 covers the requirements for systems and terminals to carry out audiovisual communications over ATM networks. These recommendation defines uni-directional and bi-directional terminals and classifies different types of terminals, depending on the ATM Adaptation Layer used (AAL1 or AAL5). H.310 standard apart from covering conversational services such as videoconferencing does also covers retrieval, messaging, video-on-demand, broadcast TV, video transmission and surveillance services (*ITU-T Recommendation H.310*).

H.321 is integrated in H.310 as one of the operating modes, providing interworking with other networks. H.310 also solves some of the limitations of H.321 by defining a Native ATM mode. Though it keeps the basic H.261 and G.711 as the coding for interoperability in video and audio respectively, it also defines the use of MPEG audio and video, which will provide a better quality in Native Mode operation (*ITU-T Recommendation G.711*). The H.310 protocol reference model, which consists of the following protocol, stacks (*ITU-T Recommendation G.711, ITU-T Recommendation H.261*):

1. Out-of-band network access signaling stack for DSS2 signals.
2. In-band communication control stacks for H.245 messages [H.245], in charge of logical channel signaling and capabilities exchange.
3. H.320/H.321 interoperation mode stack using H.221 multimedia multiplex.
4. H.310 native mode stack using H.222.1/H.222.0 multimedia multiplex.
5. T.120 stack for data applications.

MULTIMEDIA COMMUNICATION STANDARDS

A multimedia standard is likely to provide support for a large number of applications. These applications render into specific set of requirements which may be very different from one another. One theme common to most applications is the need for supporting interactivity with different kinds of data. Communications mean standards but the production of standards for multimedia communications is beset by the problem that the many industries having a stake in it have radically different approaches to standardization. Standards play a major role in the multimedia revolution because they provide interoperability between hardware and software provided by multiple vendors. Some of the multimedia communication standards are discussed below:

1. MPEG-1 (Coding of Moving Pictures and Associated Audio)

The MPEG-1 is actually the first standard developed by the group and was the coding of the combined audio-visual signal at a bit rate around 1.5 Mbit/s. This was aggravated by the hope that was becoming apparent in 1988 to store video signals on a compact disc with a high quality comparative to VHS cassettes. Coding of video in 1988 at a such low bit rates had become possible all because of the decades of research in video coding algorithms. The video coding algorithms however, had to be applied to sub sampled pictures – a single field from a frame and only half of the samples in a line - to show their effectiveness. Also coding of audio, as separate from speech, allowed reduction by 1/6 of the PCM bitrate, typically 256 Kbit/s for a stereo source, with virtual transparency. When audio and video streams are encoded with the constraint of having a common time base, resulted into a single stream by the MPEG system layer. MPEG-1 formally known as ISO/IEC 11172 is standardized in five parts. The first three parts as Systems, Video and Audio. Two more parts complete the suite of MPEG-1 standards. Conformance Testing, which specifies the methodology for verifying claims of conformance to the standard by manufacturers of equipment and producers of bit streams, and Software Simulation, a full C-language implementation of the MPEG-1 standard (encoder and decoder) (ISO/IEC IS 13818-1).

2. MPEG-2 (Generic Coding of Moving Pictures and Associated Audio)

The MPEG-2 families of standards simply summarize the compression technologies and bit stream syntax that enables transmission of audio and video in broadband networks. Although these standards also describe the aspects needed to multiplex programs, enable clock synchronization and setup logical network links carrying video and audio content. MPEG-2 is, in many cases, associated only with video compression, which is certainly one of the most important parts of its functionality (Tseng & Anastassiou, 1996). In total, there are eight different parts of the MPEG-2, covering the different aspects of digital video and audio delivery and representation. Table 2 contains the different MPEG-2 parts.

MPEG-2 can be seen as a superset of the MPEG-1 coding standard and was designed to be backward compatible to MPEG-1 and every MPEG-2 compatible decoder can decode a valid MPEG-1 bit stream. Many video coding algorithms were integrated into a single syntax to meet the diverse applications requirements.

3. MPEG-4 (Coding of Audio-Visual Objects)

Multimedia communication is the possibility to communicate audiovisual information that is natural, synthetic, or both, is real time and non real time, supports different functionalities responding to user's needs, flows to and from different sources simultaneously, does not require the user to bother with the specifics of the communications channel, but uses a technology that is aware of it, gives users the possibility to interact with the different information elements, lets the user to present the results of his interaction with content in the way suiting his needs.

In order to reach its own target, MPEG-4 follows an object based representation approach where an audio visual scene is coded as a composition of objects, natural as well as synthetic, providing the first powerful hybrid playground. Therefore, the objective of MPEG-4 is to provide an audiovisual representation standard supporting new ways of communication, access, and interaction with digital audiovisual data, and offering a common technical solution to various service paradigms -Telecommunications, broadcast, and interactive – among which the borders are disappearing. MPEG-4 will supply an answer to the emerging needs of application fields such as video on the Internet, multimedia broadcasting, content-based audiovisual database access, games, audiovisual home editing, advanced audiovisual communications, notably over mobile networks, teleshopping, remote monitoring and control (ISO/IEC JTC1/SC29/WG11). The fully backward compatible extensions under the title of MPEG-4 Version 2 were frozen at the end of 1999, to acquire the formal International Standard Status early 2000. Some work, on extensions in specific domains, is still progress. MPEG-4 builds on the proven success of three fields:

1. Digital television,
2. Interactive graphics applications (synthetic content),
3. Interactive multimedia (World Wide Web, distribution of and access to content).

4. MPEG-4 VTC and JPEG-2000 Image Compression Standards

The rising use of multimedia communication systems and image compression requires higher performance and new features. JPEG-2000 is an emerging standard for still image compression. It is not only intended to provide rate distortion and subject image quality performance superior to existing standards, but also

to provide functionality that current standards can either not address efficiency or not address at all. The compression advantages in JPEG-2000 are a direct result of the inclusion into the standard of a number of advanced and attractive features including progressive recovery, lossy /lossless compression, and region of interest capabilities. These features lay the foundation for JPEG- 2000 to provide tremendous benefits to a range of industries. Some of the applications that will benefit directly from JPEG-2000 are: image archiving, Internet, Web browsing, document imaging, digital photography, medical imaging and remote sensing (Koenen & Pereira, 2000).

Functionally, JPEG-2000 includes many advanced features:

Image compression must not only reduce the necessary storage and bandwidth requirements, but also allow extraction for editing, processing and targeting particular devices and applications. JPEG-2000 allows extraction of different resolutions, pixel fidelities and regions of interest, components, and more, all from a single compressed bit stream. This allows an application to manipulate or transmit only the essential information for any target device from any JPEG-2000 compressed source image.

1. Component precision: 1 to 127 bits/sample (signed or unsigned).
2. Each component may have different precision and sub sampling factor.
3. Image data may be stored compressed or uncompressed.
4. Lossy and lossless compression.
5. Progressive recovery by fidelity or resolution.
6. Tiling.
7. Error resilience.
8. Region of interest coding.
9. Random access to image in spatial domain.
10. Security.

Some of the technology highlights for JPEG-2000 are:

1. Wavelet sub-band coding.
2. Reversible integer-to-integer and nonreversible real to real wavelet transforms.
3. Reversible integer-to-integer and nonreversible real to real multi component transforms.
4. Bit-plane coding.
5. Arithmetic coding.
6. Code stream syntax similar to JPEG.
7. File format syntax.

5. MPEG-7 Standardization Process of Multimedia Content Description

MPEG-7 formally named “Multimedia Content Description Interface” is the standard that describes multimedia content so users can search, browse and retrieve the content more efficiently and effectively than they could by using existing mainly text-based search engines (ISO/IEC JTC1/SC29/WG11, Doc.N3752). It is a standard for describing the features of multimedia content. The word “features” or “descriptions” represent a rich concept that can be related to several levels of abstraction. Descriptions vary according to the types of data. Furthermore, different types of descriptions are necessary for different purposes of categorization. MPEG-7 will specify a standard set of descriptors that can be used to

describe various types of multimedia information. Also, MEPG-7 will standardize ways to define other descriptors as well as structures for the descriptors and their relationships. This description will be associated with the content to allow fast and efficient searching for material of user's interest. A language to specify description schemes i.e. a description definition language (DDL) will be standardized, too. Audiovisual (AV) material that has MPEG-7 data associated with it can be indexed and searched for. This material includes: still pictures, graphics, 3D models, audio, speech, video and information about how these elements are combined in a multimedia presentation. Special cases of these general data types may include facial expressions and personal characters (ISO/IEC N4041, *MPEG-21*). There are people who want to use the audiovisual information for various purposes. However, before the information could be used, it must be located. At the same time, the increasing availability of potentially interesting material makes this search more difficult. This challenging situation led to the need of a solution to the

Problem of quickly and efficiently searching for various types of multimedia material of interest to the user. MPEG-7 standard wants to answer to this need, providing this solution (Okubo, 1997). MPEG-7 is rather different from the other MPEG standards, because it does not define a way to represent data with the objective to reconstruct the data as faithfully as possible, like MPEG-1, MPEG-2 and MPEG-4 did. The increasingly pervasive role that audiovisual sources are destined to play in our lives and the growing need to have these sources further processed make it necessary to develop forms of audiovisual information representation that go beyond the simple waveform or sample-based, frame-based (such as MPEG-1 and MPEG-2) or even object-based (such MPEG-4) representations. This necessitates forms of representation that allow some degree of interpretation of the information's meaning, which can be passed onto, or accessed by, a device or a computer code. The people active in defining MPEG-7 standard represent broadcasters, equipment and chip manufacturers, digital content creators and managers, telecommunication service provides, publishers and intellectual property rights managers as well as researchers.

6. MPEG-21 Multimedia Framework

The objectives behind initiating MPEG-21 are as follows:

1. In order to understand if and how various components fit together.
2. To discuss which new standards may be required, if gaps in the infrastructure exist and, once the above two points have been reached.
3. To actually accomplish the integration of different standards.

The digital market place, which is founded upon ubiquitous international communication network such as the Internet, rewrites existing business models for trading physical goods with new models for distributing and trading digital content electronically. In this new market place, it is becoming increasingly difficult to separate the different intellectual property rights which are associated with multimedia content (ISO/IEC JTC1/SC29/WG11, Doc.N3752).

The latest MPEG project MPEG-21 Multimedia Frameworks has been started with the prime objective to enable transparent and augmented use of multimedia resources across a wide range of networks and devices. The basic elements of the framework are:

1. Digital Items, structured digital objects with a standard representation, identification and metadata within the MPEG-21 framework.

2. Users of all entities that interact in the MPEG-21 environment or make use of MPEG-21 Digital Items.

The meaning of User in MPEG-21 is very broad and is by no means restricted to the end user. Therefore an MPEG-21 user can be anybody who creates content, provide content, archive content, rates content, enhances or delivers content, aggregates content, syndicates content, sells content to end users, consumes content, subscribe to content, regulate content, facilitates or regulates transactions that occur from any of the above. The work carried out so far has identified seven technologies that are needed to achieve the MPEG-21 goals. They are (ISO/IEC JTC1/SC29/WG11, Doc.N3752):

1. Digital Item Declaration: a uniform and flexible abstraction and interoperable schema for declaring Digital Items.
2. Content Representation: how the data is represented as different media.
3. Digital Item Identification and Description: a framework for identification and description of any entity regardless of its nature, type or granularity.
4. Content Management and Usage: the provision of interfaces and protocols that enable creation, manipulation, search, access, storage, delivery, and reuse of content across the content distribution and consumption value chain.
5. Intellectual Property Management and Protection: the means to enable content to be persistently and reliably managed and protected across a wide range of networks and devices.
6. Terminals and Networks: the ability to provide interoperable and transparent access to content across networks and terminal installations.
7. Event Reporting: the metrics and interfaces that enable Users to understand precisely the performance of all reportable events within the framework.

DISTRIBUTED MULTIMEDIA SYSTEMS

Distributed Multimedia Systems is an area of active commercialization and research. This technology can be seen as the next generation technology for computers and communication networks. A distributed multimedia system combines a variety of multimedia information resources over a network into an application used by the client. In this manner, the user can access different remote information sources and services. The system is based on the interaction between the user and the application. The user can control the data flow. Which means that multimedia system is made interactive as if it were on the same system? Therefore this type of system is different from the conventional broadcast system. In such services typified by Cable television, clients can neither control the programs they view nor schedule the viewing time of the programs to suit their preferences. The user in such systems is flooded with irrelevant information, without a possibility to choose only the information of the interest. This kind of distributed environment is capable of serving a large number of end users to concurrently access a large number of repositories of stored data and also with the option of manipulating the environment by making the broadcast interactive. The enormous communication bandwidth required, the Quality of Service (QOS) demanded a careful design of the system in order to maximize the number of concurrent users while minimizing the cost needed to obtain it. The main component of a distributed multimedia system consists of major 3 components: Information (content) providers, a wide area network, and a

multimedia client. There are many design issues in building each of the components. The breakthrough achieved in Digital Information Compression has helped to transmit the digital information in real time.

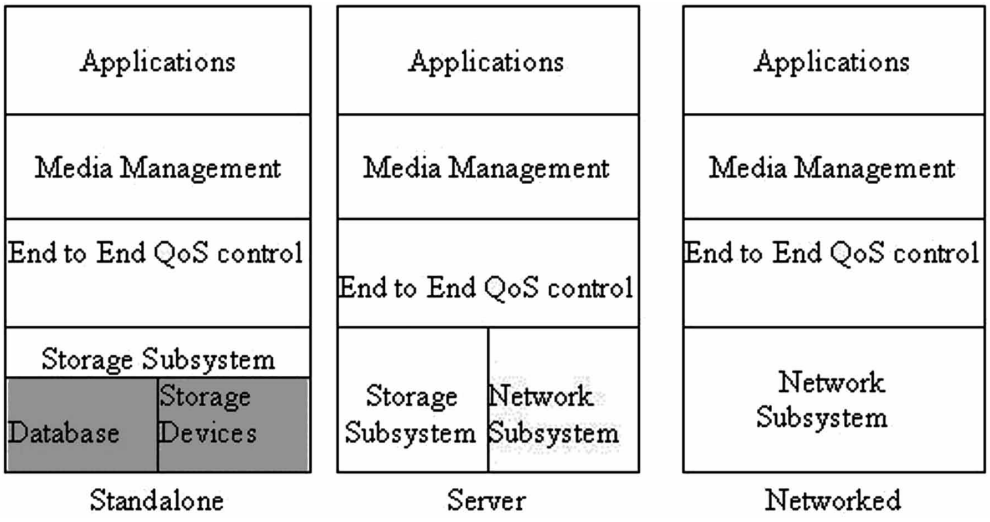
1. Architecture of Distributed Multimedia System

A distributed multimedia system consists of three different basic components: an Information server, a wide area network and a multimedia client on the user site. The user interface or the multimedia client deals with the issues related to presentation and manipulation of multimedia objects and the interaction with the user. The network provides the communication mechanism between the user and the server. The server is responsible for managing multimedia databases and also composing general multimedia objects for the user. The composition of the object is a complex process of integrating and synchronizing multimedia data for transport, display and manipulation. The system usually consists of multiple users, servers and networks as depicted in the figure 5.

2. User Terminal

A Multimedia terminal consists of a computer with a special hardware such as a microphone, high- resolution graphics display, stereo speakers, and a network interface. The user interacts with the system via a computer keyboard, mouse or a hand held remote control. Many of the user terminals still resemble traditional computers. Because of this, additional development work is required before the terminals can meet the requirements of the multimedia data and the user. Because of the large size of the multimedia objects and real - time requirements the multimedia terminal or the network should include large data buffers. To restore the temporal relationship of a data stream, stream handlers should be connected to the data buffers. To synchronize the possible multiple data streams and to control the stream handlers, synchronization and streaming manager is required. Since multimedia data objects are large, the termi-

Figure 5. Architecture of distributed multimedia system



nal should also include compression and decompression hardware. Well some of these issues would be discussed later on.

3. Network and Communication

Multimedia communication differs from the traditional communication. The multimedia traffic requires transfer of large volumes of data at very high speeds, even when the data is compressed. Especially for interactive multimedia communication the network must provide low latency. Continuous media as video and audio require guarantees of minimum bandwidth and maximum end-to-end delay. The variation in delay referred to as jitter, and loss of data must also be bound. Traditional networks are used to provide error-free transmission. However, most multimedia applications can tolerate some errors in transmission due to corruption or packet loss without retransmission or correction. In some cases, to meet real-time delivery requirements or to achieve synchronization, some packets are even discarded. Some of the differences in the traditional and multimedia communication are given in table 2.

The increasing popularity of the Internet and the fact that the infrastructure already exists suggest that the Internet could be used for distributed multimedia systems. The telephone and common antenna TV (CATV) cable networks are also a possibility to support interactive multimedia at user homes due to their wide deployment. From the above discussion we have noted that the Traditional networks do not suit multimedia communication. Transmission characteristics of existing Ethernet and Internet Protocols (CSMA/CD, TCP/IP) do not support the low latency, high bandwidth requirements of the audio video based applications. Ethernet only provides a bandwidth of 10 Mbps. This is inadequate for most multimedia applications. Moreover its access time is not bound and its latency and jitter are unpredictable. New protocols which are considered for carrying multimedia data include the 100 Mbps Ethernet Standard, Distributed Queue dual bus (DQDB), Fiber Distributed Data Interface (FDDI) and Asynchronous Transfer mode (ATM). The first three have bandwidths of the order of 100 Mbps. ATM enables a bandwidth of 155 – 622 Mbps depending on the characteristics of the network.

FDDI in its synchronized mode has low access latency and low jitter. FDDI also guarantees a bounded access delay and a predictable average bandwidth for synchronous traffic. However, Due to its high cost FDDI is at the moment used primarily for the backbone networks. Asynchronous Transfer Mode (ATM) is rapidly emerging as the future protocol for multimedia communication. ATM provides great flexibility in the bandwidth allocation by assigning fixed length packets called cells, to support virtual connections. ATM can also increase the bandwidth efficiency by buffering and statistically multiplexing

Table 2. Comparison in between the traditional and multimedia communication

S.No	Characteristics	Data Transfer	Multimedia Transfer
1	Data rate	Low	High
2	Traffic pattern	Burst	Stream oriented, highly burst
3	Reliability requirements	No loss	Some loss
4	Latency time requirements	None	Low (for example: 20ms)
5	Mode of communication	Point to Point	Multipoint
6	Temporal relationship	None	Synchronized transmission.

burst traffic at the expense of cell delay and loss. For the Internet, the Internet Engineering Task Force (IETF) is working on a TCP/IP interface for ATM.

4. Multimedia Server

Current personal computers, workstations and servers are designed to handle traditional forms of data. Their performance is optimized for a scientific or transaction – oriented type of workload. These systems do not perform well for multimedia data, requiring fast data retrieval and guaranteed real time capabilities. The I/O capacity is usually a severe bottleneck. Some of the requirements for Multimedia Server are as follows:

1. Minimal Response time: A crucial factor for the success of multimedia services is the response time seen by the client. The server must be able to minimize response time to live unto the expectations of the user.
2. Fast Processing Capability: To guarantee fast response time, clients should be processed fast and data access rates should be minimized.
3. Reliability and availability: Like any other server, multimedia server must be reliable. The larger the number of users and volume of data handled by the server, the more difficult is to guarantee reliability. To provide fault tolerance special hardware and software mechanisms must be employed. Since client requests may arrive at any time, the time the server is unavailable should be minimized.
4. Ability to sustain guaranteed number of streams: Another important factor is the maximum number of data streams the server can simultaneously handle. This affects the total number of clients the server can serve.
5. Real-time delivery: To be able to deliver multimedia data, the server should support real-time delivery. This poses profound requirements on the resource scheduling at the operating system level. The server should be able to guarantee real-time delivery for individual streams as well as for all the streams combined together. For this accurate real-time operating systems have to be developed.
6. High storage capacity: To be able to store multimedia data and a large variety of information the server must have a large storage capacity. To sustain the delivery requirements of multimedia data, the server may be required to compress and encode video and image data prior to transport or storage. The performance of compression and signal processing should be optimized. This might require special hardware.
7. Quality of Service (Qos) requirements: The Quality of Service (Qos) is a set of parameters describing the tolerable end-to-end delay, throughput, and the level of reliability in multimedia communication and presentation. Qos requirements of clients are an important factor that affects the usage of the server. The server should be able to provide and adapt itself to different QoS requirements, according to the characteristics of the client's terminal, the network connection and the requested data type.
8. Exploit user access patterns: The server should also be able to trap and exploit dynamic user behavior, minimizing system load and network traffic. For example, by analyzing data access rates and times, popular data could be distributed closer to users in periods of low network load.
9. Ability to handle different types of traffic: A multimedia server should be able to serve multiple real-time data streams simultaneously, but it must also be able to provide satisfactory service to non-real-time data. It should be able to handle control data encountered when loading new data

from other servers or storage repositories, billing and accounting data and communication between intelligent personal agents. Agents are autonomous programs selecting and managing data according to user preferences.

10. Cost effectiveness: A very important requirement governing the future of multimedia servers is the cost effectiveness. The server must be affordable.

5. Current Trends in Distributed Multimedia Systems

Some of the Distributed Multimedia Systems are as follows:

1. Video on Demand: The consumer can select a video or any program on demand. The application consists of Interactive features like forward, rewind and pause.
2. News and Reference Services: News on Demand is similar to VOD but it provides sophisticated news retrieval and reference services that combine live and achieved video, access to textual data and still photography from various sources. The information is delivered based on a filtering criteria kept by the user.
3. Interactive shopping and electronic commerce: Home shopping will provide a customizable shopping environment. Customers will be effectively and rapidly focus on the products and services that are of interest to them.
4. Entertainment and games: Interactive entertainment may become a frequently used service. Games will consist of simple applications that will be downloaded to the set top device thus not incurring the significant cost associated with the use of server and network facilities.
5. Distance Learning: Educational interactive programming and distance learning are areas where the research is going on. Current indications are there that these may become popular but not have sufficient commercial use to the providers.

SOME OF THE ADVANCE PROJECTS IN THE WORLD CREATING A REVOLUTION IN THE FIELD OF NETWORKED MULTIMEDIA SYSTEMS

Research programs on future Internet architecture in the United States are administrated by the National Science Foundation (NSF) directorate for computer and Information Science and Engineering (CISE). The Future Internet Architecture (FIA) program of the National Science Foundation (NSF) is built on the previous program, Future Internet Design (FIND). FIND funded about 50 research projects on all kinds of design aspects of the future Internet. FIA is the next phase to pull together the ideas into groups of overall architecture proposals. Some of the Advance Projects are as follows:

1. Named Data Networking (NDN)

The Named Data Networking (NDN) project is led by the University of California, Los Angeles with participation from about 10 universities and research institutes in the United States. The initial idea of the project can be traced to the concept of content-centric networks (CCNs) by Ted Nelson in the 1970s. After that, several projects such as TRIAD at Stanford and DONA from the University of California at Berkeley were carried out exploring the topic. In 2009 Xerox Palo Alto Research Center (PARC)

released the CCNx project led by Van Jacobson, who is also one of the technical leaders of the NDN project (*Named Data Networking Project*).

2. Mobility First

The Mobility First (Mobility First Future Internet Architecture Project) project is led by Rutgers University with seven other universities. The basic motivation of Mobility First is that the current Internet is designed for interconnecting fixed endpoints. It fails to address the trend of dramatically increasing demands of mobile devices and services. The Internet usage and demand change is also a key driver for providing mobility from the architectural level for the future Internet. For the near term, Mobility First aims to address the cellular convergence trend motivated by the huge mobile population of 4 to 5 billion cellular devices; it also provides mobile peer-to-peer(P2P) and info station (delay-tolerant network[DTN]) application services which offer robustness in case of link/network disconnection. For the long term, in the future, Mobility First has the ambition of connecting millions of cars via vehicle-to-vehicle (V2V) and vehicle-to-infrastructure (V2I) modes, which involve capabilities such as location services, geo routing, and reliable multicast. Ultimately, it will introduce pervasive system to interface human beings with the physical world, and build a future Internet around people. The challenges addressed by Mobility First include stronger security and trust requirements due to open wireless access, dynamic association, privacy concerns, and greater chance of network failure.

3. NEBULA

NEBULA (NEBULA Project) is another FIA project focused on building cloud-computing-centric network architecture. It is led by the University of Pennsylvania with 11 other universities. NEBULA envisions the future Internet consisting of a highly available and extensible core network interconnecting data centers to provide utility-like services. Multiple cloud providers can use replication by themselves. Clouds comply with the agreement for mobile "roaming" users to connect to the nearest data center with a variety of access mechanisms such as wired and wireless links. NEBULA aims to design the cloud service embedded with security and trustworthiness, high service availability and reliability, integration of data centers and routers, evolvability, and economic and regulatory viability. NEBULA design principles include, reliable and high-speed core interconnecting data centers, parallel paths between data centers and core routers, secure in access and transit, policy-based path selection mechanism, authentication enforced during connection establishment. With these design principles in mind, the NEBULA future Internet architecture consists of the following key parts:

1. The NEBULA data plane (NDP), which establishes policy-compliant paths with flexible access control and defense mechanisms against availability attacks.
2. NEBULA virtual and extensible networking techniques (NVENT), which is a control plane providing access to application selectable service and network abstractions such as redundancy, consistency, and policy routing.
3. The NEBULA core (NCore), which redundantly interconnects data centers with ultrahigh-availability routers.

4. *4WARD*

4WARD (The FP7 4WARD Project) is an EU FP7 project on designing a future Internet architecture led primarily by an industry consortium. The funding is over 45 million dollars for a 2-year period. The key 4WARD design goals are:

1. To create a new "network of information" paradigm in which information objects have their own identity and do not need to be bound to hosts (somewhat similar to the goal of the NDN project).
2. To design the network path to be an active unit that can control itself and provide resilience and failover, mobility, and secure data transmission.
3. To devise "default-on" management capability that is an intrinsic part of the network itself.
4. To provide dependable instantiation and interoperation of different networks on a single infrastructure.

Thus, on one hand, 4WARD promotes the innovations needed to improve single network architecture; on the other hand, it enables multiple specialized network architectures to work together in an overall framework.

5. Future Internet Research and Experimentation (FIRE)

FIRE (FIRE: Future Internet Research and Experimentation)is one of the European Union's research projects on test beds and is like a counterpart of GENI in the United States. FIRE was started in 2006 in FP6 and has continued through several consecutive cycles of funding. FIRE involves efforts from both industry and academia. It is currently in its "third wave" focusing on providing federation and sustainability between 2011 and 2012. Note that the FIRE project's research is built on the previous work on the GEANT2 (Gigabit European Academic Networking Technology) project [11], which is the infrastructure test bed connecting over 3000 research organizations in Europe. FIRE also expects not only to change the Internet in technical aspects but also in socio-economic terms by treating socio-economic requirements in parallel with technical requirements.

SUMMARY

In the field of telecommunication network, research is focused on post ISDN architectures and capabilities such as an integrated packet network and broadband ISDN. The economics and flexibility of integrated networks make them very attractive, and above all the packet network architectures have the potential for realizing these advantages. However, the effective incorporation of speech and other signals such as graphics, image and video into an integrated packet network (IPN) can rearrange network design priorities. Although processing speeds will continue to increase, it will also be necessary to minimize the nodal per-packet processing requirements imposed by the network design. This is a motivation for new switching concepts like fast packet switching and ATM. Data signals must generally be received error free in order to be useful, but the inherent structure of speech and image signals and the way in which they are perceived allows for some loss of information without significant quality impairment. This allows the possibility of purposely discarding limited information to achieve some other goal, such as the control temporary congestion. Multimedia communication standards have to depend on compromises

between what is technologically feasible and what is theoretically possible. The success of the Standards in the market place is possible only if the cost performance ratio is well balanced. This is specifically true in the field of audio/video coding where a large variety of innovative coding algorithms exist, but may be too complex for implementation. Over the Internet, streaming of video faces many technological as well as business challenges and new codec's, protocols, players and subsystems are developed and came into existence to address them. Since its inception in early 1990s, the concept of streaming media has gone through a dramatic growth and transformation from a novel technology into one of the mainstream manners in which people experience the Internet today. The arrival of concept of streaming media comes at a time when basic multimedia technologies have already established themselves on desktop PCs. Streaming media is a technology that enabled the user to experience a multimedia presentation on-the-fly while it was being download from the Internet. The provision, bandwidth on demand with strict QoS guarantees is a fundamental property of ATM networks that makes them especially suitable for carrying real time multimedia traffic. Statistical multiplexing of VBR connections within the backbone network allows effective aggregation and capacity engineering. Anticipating that multimedia over IP will be one of the major driving forces behind the emerging broadband communications, addressing the challenges facing the delivery of multimedia applications over IP are a great importance. In order for the Internet to allow applications to request network packet delivery characteristics according to their needs, sources are expected to declare the offered traffic characteristics. Admission control rules have to be applied to ensure that requests are accepted only if sufficient network resources are available. Moreover, service-specific policing actions have to be employed within the network to ensure that nonconforming data flows do not affect the QoS commitments for already active data flows. One generic framework that addresses both the video coding and networking challenges associated with Internet video is scalability. Any scalable Internet video coding solution has to enable a very simple and flexible streaming framework. The fine-grained scalable framework strikes a good balance between coding efficiency and scalability while maintaining a very flexible and simple video coding structure.

With the advent of common uses of the Internet, the demands for real-time and low-rate voice over IP applications are growing rapidly. Since the delivery of packets is not guaranteed in the IP networks, it is necessary to deal with the audible artifacts, which are caused by burst packet losses. Packet loss degrades the speech quality of the analysis-by-synthesis coders seriously since the loss parameters not only affect the current speech frame, but also produce the so-called error propagation problem resulting from corrupted filter memory. This packet loss problem can be solved by using different model parameters. Digital Subscriber line (DSL) technology offers unprecedented scalability for interactive video services. Itis the basis for the point-to-point architecture that is the key to providing a combination of interactive video and broadcast services. The implementation of video services is a high priority for telecom providers. Delivering voice services over digital subscriber line offers a lucrative opportunity for both established and emerging services. Data broadcasting in support of multimedia applications requires efficient use of bandwidth resources in order to maximize the availability of play out content. From the data delivery point of view, the digital TV infrastructure provides a broadband digital distribution network, data transport protocols and digital terminals on the user premises. A number of advances in the network technology have proved a boon to the advances in Distributed Multimedia Systems. Some of the Advance Projects related to the development of the Networked Systems are discussed in the last section of the chapter.

KEY TERMS AND DEFINITIONS

Asynchronous Transfer Mode: *ATM* is a high-speed networking standard designed to support both voice and data communications.

Internet: Global computer network providing a variety of information and communication facilities, consisting of interconnected networks using standardized communication protocols.

Multimedia: Multimedia means that computer information can be represented through audio, video, and animation in addition to traditional media (i.e., text, graphics drawings and images).

Network: A of interconnected (cable and/or wireless) computers and peripherals that is capable of sharing and between many.

Protocols: Protocol is the special set of rules that end points in a telecommunication connection use when they communicate.

Terminal: In data communications, a terminal is any device that terminates one end (sender or receiver) of a communicated signal.

Chapter 10
Developing Digital Competences of Vocational Teachers

Sabine Seufert
University of St. Gallen, St. Gallen, Switzerland

Nina Scheffler
University of St. Gallen, St. Gallen, Switzerland

ABSTRACT

In the context of corporate learning digital media and digital tools have become more accepted than in the field of education systems. Particularly vocational schools are obviously under pressure to deal with changes due to digitalization in many sectors and professions. One reason why technology-based learning is still underdeveloped in schools could be the insufficient digital competences of teachers. Presently most teachers gain their knowledge on how to use digital media for learning and teaching informally. In the implementation of formal educational efforts, a low practical feasibility in specific working context as well as time and financial aspects are criticized. Present research shows that non-formal and informal learning should be better linked in order to develop teachers' digital competences sustainably. The present contribution introduces a necessary framework to include informal learning processes in teacher education at vocational schools and furthermore fosters a school culture of learning together and from each other.

1. INTRODUCTION: DIGITAL COMPETENCES IN VOCATIONAL EDUCATION

Digital competences have become interdisciplinary and cross-generational cross-functional skills (Weiss, 2012), which employers usually already require of trainees and employees during and at the latest after their training. For this reason, there are growing calls to ensure sufficient media literacy for young people in the education sector. The aim of media education is to enable learning in schools with and through media and, through their integration in the curriculum and the development of technical and interdisciplinary skills, to contribute to constructively-oriented learning (Mayrberger, 2007, 2012). In

DOI: 10.4018/978-1-5225-3822-6.ch010

addition, digital media provide ways to strengthen hands-on learning approaches in the classroom and integrate informal modes of learning into formal learning. In this sense, digital media perform a bridging function through their direct relevance to the students' lifestyles and serve "as a cultural resource enabling them to participate and become involved in social processes [...] and develop personal world views and their identity" (Herzig & Grafe, 2009, p. 193, quoting Mayrberger, 2012, p. 401). The aim of media education is therefore to help individuals, in general and in a professional context, to use media knowledgeably, self-responsibly and critically (Seufert & Scheffler, 2014) and shape training rooms as well as learning and educational processes independently based on digital media (Mayrberger 2012, p 403; Spanhel, 2009). In this context, (vocational) schools and teachers play a key role.

2. PROBLEM AND RESEARCH QUESTION

Digital media have established themselves far more quickly and effectively in work and everyday life than in education (Weiss, 2012, p. 3). It is hoped that the use of media will improve learning efficiency, facilitate greater orientation to the future professional needs of learners and accompanied personality development in a digital society, etc. Digital media therefore are already part of vocational training at different levels: as part of the everyday life and work of students and teachers, as a method or as content in vocational school teaching. Especially the methodological and didactic use of digital media, often subsumed under the term eLearning, dominates public debate. Overall, however, the use of digital media and eLearning in vocational schools has only played a minor role to date (Wilbers, 2012, p. 38).

However, due to the growing importance in companies and thus the commercial part of the training, vocational schools are coming under increasing pressure to also address the implications of digital media for education and training. "In this area, vocational schools are facing a permanent and extremely differentiated need to adapt that is not seen in this scope or diversity in any other kind of school" (Wilbers 2012, p 40). Common teaching practices are seen as a central barrier to innovation. This is because whether or not media enter the classroom depends not only on the technical prerequisites, but also on the skills and the willingness of the individual teachers to try out new forms of teaching. So far, however, school routine is dominated by traditional forms of teaching, in which the tutorials, smaller individual and group work and lectures are predominant (Euler, 2012, p. 21). New teaching concepts, such as media-supported, problem-based learning or project forms featuring wikis or weblogs can only be integrated into such models to a limited extent.

Moreover, teachers addressing new digital skills such as the competent handling of online information are often entering uncharted territory in their respective fields (media education). In this context, teachers are increasingly demanding the teaching of media-specific qualification goals. However, what skills teachers need to acquire remains rather sketchy and is largely limited to the use and operation of the ICT (Blömeke, 2005). Furthermore, it is obvious that formal seminars, such as one-day training workshops in how to use ICT, are not sufficient and effective to develop teachers' digital competences. In order to be able to plan and design suitable education training measures for teachers initially requires a systematic approach for the professional development of teachers at vocational schools. The main research question of this paper focuses on this critical issue:

How to design a systematic approach for digital competences development (rather than the planning of selective training measures) from the perspective of both teachers and the school management?

In order to pursue the leading research question, the following questions structure the acquisition of knowledge:

- What skills do teachers in schools require when using digital media?
- What fundamental approaches to organising the skills development of teachers exist when dealing with digital media?
- How can formal and informal learning approaches be interlinked to facilitate the competence development of teachers in vocational schools, in particular in order also to promote the self-organisation of teachers?

The next section explains the applied research methodology; the fourth section provides an overview of the findings: 1) the required skill-set for teachers in digital times 2) general approaches to define and pursue digital competence frameworks and 3) forms of competence development by combining informal and formal learning (emerging alternatives to the dominant "training model" of teachers' professional development); and the last section concludes the paper by discussing the results and providing recommendations for future research.

3. RESEARCH METHODOLOGY

The main goal of the research presented in the paper at hand is to develop a conceptual framework for teachers' professional development focused on digital competencies in vocational schools. In order to achieve this goal a two-year research project has been established in cooperation with a secondary school in the German speaking part of Switzerland. The project is based on a methodological combination of literature analysis, model development and empirical model testing with focus on information literacy (IL) as part of digital competencies:

1. To get an overview of existing IL research a systematical literature analysis has been performed by focusing on the following research questions: Which terms exist associated with IL and how is IL defined in the literature? Which are the salient conceptualizations and measurement models of IL? Which methods are applied in order to examine IL?
2. Based on the findings of the literature research, and by combining and extending existing models, the 7i Framework for measuring IL has been created.
3. The 7i Framework for measuring IL has been tested in five classes at a Swiss secondary school involving 10 teachers.

The results of the literature analysis and model development are presented in detail in Stanoevska et al. (2015a) and Stanoevska et al. (2015b). A parallel research stream connected to the project was devoted to the analysis, design and evaluation of the necessary skills development of the involved teachers following a method mix:

1. Further literature analysis has been conducted in the field of teacher education with focus on digital competences. One main model to develop digital media skills of teachers represents the TPACK

model developed by Koehler and Mishara (2009). This model offers a framework to further specify the required skills to integrate IL in teaching practice.
2. The teachers have been involved as practitioners in the design research process by sharing their knowledge and expertise from a subject-specific perspective.
3. At the end of the project, an intensive focus group discussion has gained more insights in the question on what are necessary skills and support offerings for teachers to develop and permanently update their digital skills.

In summary, empirical practice reflection within the mentioned research project as well as a profound literature analysis provide the main research methods for the design of teachers' professional development.

4. RESULTS

4.1. Vocational Teachers in the Digital World: Competence Requirements and Dimensions

Teachers are increasingly demanding the teaching of media-specific qualification goals. However, what skills teachers need to acquire remains rather sketchy and is largely limited to the use and operation of the ICT (Blömeke, 2005, p. 76). In order to be able to plan and design suitable media education training measures for teachers initially requires a concrete discussion and formulation of the required skills (Petko & Döbeli Honegger, 2011, p. 157).

According to Blömeke (2005), media education skills encompass two core tasks, derived from the basic tasks of "teaching" and "educating": the use of media or media didactics (learning with media) and media education (learning about media). When performing media education tasks, it is necessary to take into account both the media-specific requirements of the learners on the one hand and, on the other hand, the respective school environment, infrastructure and support structures. In summary, five dimensions of media education skills can be deduced (Blömeke 2005, p 77-79).

1. **Media Teaching Competences:** Teachers are able to address the subject of media in the classroom and can teach the learners to approach the subject of media critically.
2. **Media Pedagogy Competences:** Teachers are able to meaningfully use media as a method in terms of content and objectives and support teaching and learning processes with the aid of media.
3. **Socialisation-Related Competences in the Media Context:** Teachers take into account the media-specific learning requirements of the learners when preparing the lessons, are able to identify learning progress and can adequately assess and evaluate this. This includes understanding the media learning and living environments of the learners.
4. **Teacher's Own Media Competences:** Teachers are able to competently use and actively shape media for themselves. The teacher's own media skills form the basis for all subsequent tasks.
5. **School Development Competences in the Media Context:** Teachers are able to help shape and develop the institutional framework for media education and advise students and parents on media education issues.

The first core task describes the ability to "use media in appropriate teaching-learning forms in a circumspect way" – in other words the ability to shape lessons using media. Vocational training serves as link between theory and practice. Therefore, it seems to be relevant to link a digital medial practice with a significant vocational content. Media teaching skills, as one of the core areas of media education competences (Blömeke, 2005, p. 91) thus builds on the experiences of the learners and teachers with digital media in the context of the living, learning and working environments. The understanding of media didactics illustrated here is supplemented by Mayrberger (2012) by a further aspect, namely "the delimitation of formal teaching and learning processes using digital media". Following Blömeke (2000), a person skilled in media didactics is, according to Mayrberger (2012), capable of using (digital) media in the classroom to create and reflect on student-centred learning environments, exploiting their specific potential to the full, and to critically assess the impact of integrating digital media on the formal and informal learning, and address the delimitation" (Mayrberger 2012, p 405).

Table 1 illustrates how learning processes in school-based vocational training can be supported using digital media and Web 2.0 applications.

4.2. Generic Approaches to Developing Digital Competences of Teachers

Schools face the challenge of how to organise the permanent upskilling of teachers in the use of digital media. Basically, there are two ideal approaches: subject-based approach vs. action-based approach or product- vs. process-oriented curriculum models.

4.2.1. Subject-Based Approach or Product-Oriented Curriculum Models

Using this system, learning offers are structured according to subject-specific or thematic structures. Thus, "technology courses" are often offered in schools to train teachers in the use of new learning platforms or tablet PCs.

In terms of the promotion of media didactic skills of teachers, one example of a product-oriented model is the TPACK model developed by Koehler and Mishara (2009). The model offers a framework for concretising a required knowledge base for teachers for using technologies meaningfully for teaching and learning. Based on the observations in Shulman's pedagogical content knowledge (PCK) model (Shulman, 1986, 1987), the authors assume that the development of both technological pedagogical knowledge (TPK) and technological content knowledge (TCK) (together TPACK) is a prerequisite for successful technology-based teaching. The knowledge base (content, pedagogy and technology) form the core of the "technological, pedagogical and content knowledge" (TPACK), whereby the focus is particularly on the interaction and interfaces between the areas. The authors extend Shulman's model by the requisite technological knowledge and defined altogether the seven Knowledge Areas (Table 2).

In so doing it becomes clear how complex the model is to apply in practice. The relevant context varies depending on the teacher, students, technological conditions, subject, content, and the teacher's understanding of teaching and requires a constant readjustment of teaching concepts. As already mentioned, this is generally the case but is further enhanced by the use of technologies. It is not possible to derive generally-valid standard solutions for teaching with technology as a subject of further training. Rather, skills are required that allow teachers to solve everyday problem situations flexibly and appropriate to the situation and to promote an understanding of teaching with technology. "There is no 'one best way' to integrate technology into curriculum. […] Teaching successfully with technology requires continually

Table 1. Learning with digital media in vocational training. (Adapted from: Seufert, 2012, p. 37)

Areas of vocational training	Pedagogical perspective	Examples	Exemplary facets of a Web-application
Media experiences of students and teachers			
Digital media as a part of students' living environments	Dealing with media mainly takes place in informal contexts (In interaction with peers)	Computer gambling addiction, smartphone, classroom disturbances	Facebook (Cybermobbing, teacher as a "friend")?
Digital media as a part of teachers' working and living environments	Dealing with media usually informally	Media use for preparation of classes	Yammer as a community platform
Digital media as a method of teaching and learning in classes			
Enrichment of classes through integrating forms of e-learning	Integration of media elements as a teaching / learning method in classes	Electronic text books, e-Exams, educational videos	Open Resource educational videos (such as "Explainity")
Using Learning Management Systems (LMS)	Using digital media as an opportunity for communication in class	Placing learning tasks, communication across learning places	Facebook as a learning platform
Pedagogical „redesign" of courses in general	Designing media-based educational courses	Information-based problem solving, project-based learning forms	Preparation of a wiki as joint project work, Blogs as an reflection tool
Digital media as content, intentions and methods in classes			
Development of media literacy	Critical and reflected use of digital media	Information literacy: dealing with internet resources, Net-Guidance-measures	Facebook: how to stay safe online
Training how to use digital media in profession	Active and creative design of digital media, assessing and questioning media developments and trends critically	Using application software for professional specific tasks, reflection changes in the world of work by digitalization critically	Social Media platforms as a marketing tool
Training experts within the field of digital media	Professional competences: creating digital realities and productive activity	Programming languages, ARIS-process-modelling	Facebook Development, e.g. API, Debugging
School-development competencies in dealing with digital media			
Framework for competent use of digital media	Teachers design and develop institutional frameworks for working with digital media in the fields of education	Developing curricular modules to integrate information literacy: active exchanges between teachers	collection of examples for use blogs as reflection method and tool
Consulting relevant Stakeholders	Advise students, parents and teaching operations in media pedagogical terms	„Netiquette" or the guidelines in use of Social Media, development of "digital self-competence"	Social Media guidelines to coordinate efficiently among learning places

Table 2. TPACK model - knowledge area, guiding questions, mastery and limitations

Knowledge Area	Description	Guiding Questions	Mastery and Limitations
Content Knowledge (CK)	Knowledge about the teaching subject and topic (theories, concepts, ideas etc.) of the respective subject area.	What content is relevant to understand the topic and should be treated in this lesson?	Master of the content in the specific subject area to reach a high level of quality.
Pedagogical Knowledge (PK)	Knowledge about processes and methods of learning and teaching as pedagogical principles and indicative targets. This means an understanding about processes how students gaining new insights or how they could be stimulated or motivated.	What kind of pedagogical principles should be used in this lesson?	Master of classroom strategies, use of learning theories, different types of methods, evaluation methods.
Technological Knowledge (TK)	Knowledge, which is more than a pure application knowledge. Rather it means a broad understanding of possibilities for technology-based communication, information processing and problem solving.	Which technologies should be used in this lesson?	Master of different kind of technologies and capable to provide use technologies for learning processes.
Technological Content Knowledge (TCK)	Knowledge about the way how technologies and content interact which each other. Furthermore teacher need to know which specific tool is the most adapted to convey the content or otherwise how the content determined a useful technology.	Does the use of technologies will support representing the content on multiple ways or will they help for a better understanding?	Use technologies to enhance the understanding of content but neglected learning theories. So it is modern but limited.
Pedagogical Content Knowledge (PCK)	Knowledge about different opportunities to teach a specific content and with taking into account the students' prior knowledge, education guidelines on curricula and requirements.	Does the underlying pedagogical principles foster the understanding of the topic or stimulate a deeper learning?	A 20th Century classroom with strong content and well implementation of pedagogical theories. But in the 21th Century it is obsolete because of neglect technologies.
Technological Pedagogical Knowledge (TPK)	Knowledge how teaching and learning could change and influence each other. It needs an understanding about the restrictions and affordance of technologies as well as the resulting pedagogic-didactic consequences within a disciplinary context.	Are the pedagogical principles and selected technologies well matched?	Focused using technologies for learning and helps learners to use it in different ways. But the learning activities could take them away from the actual learning content.
Technology, Pedagogy, and Content Knowledge (TPACK)	Knowledge of the interaction and interfaces of content, technology and pedagogy in terms of the specific context (like previous knowledge or legal and technological conditions). It needs an understanding in how these domains and contextual parameters interfaces.	Does the selected technologies foster the underlying pedagogical principles and can the interaction of both contribute to a better understanding of the content?	A masterful 21th Century classroom, which considered the learning contents, based on good learning theories provide by technologies.

creating, maintaining, and re-establishing a dynamic equilibrium among all components. […] This is the kind of deep, flexible, pragmatic, and nuanced understanding of teaching with technology we involved in considering TPACK as a professional knowledge construct" (Koehler & Mishara, 2009, p. 67).

Based on the defined areas of knowledge of the TPACK model, the corresponding educational goals can be derived for describing a skills profile. The respective knowledge must be put in an application-specific context. The advantage of such an approach lies in the exact definition of the necessary knowledge

base, the necessary skills and attitudes. This enables overlaps in the basic knowledge base to be avoided. The disadvantages include in particular the fact that teachers may not be able to derive any practical relevance for their lessons. Thus, for example, courses are often not geared towards the integration of technical knowledge in specific teaching situations, which therefore makes it difficult for teachers to apply a hands-on approach.

4.2.2. Action-Based Approach or Process-Oriented Curriculum Models

While product models are structured according to a substantive, subject-based structure, process-specific models favour an action-based approach. Process-oriented curriculum models are process-oriented and geared towards accomplishing a process, in the sense of complete action. A process-based model emphasises especially learning from work and life experience and aims to enable learners to independently cope with professional situations. Here, learning objectives are open and contents relate more to empirical knowledge and knowledge that is to be newly generated in the specific situations (Sloane, 2002, p. 9). Based on a process curriculum, requirements, objectives, content and skills development measures are recorded and derived from reconstructed areas of activity - from the situations encountered by the learners in their living environments.

Euler, Hasanbegovic, Kerres, & Seufert (2006) illustrate an example of such an action-based approach in their evaluation report for the determination of measures for the development of e-training skills for lecturers. Following Kerres, Euler, Seufert, Hasanbegovic, & Voss (2005), a competence analysis was performed for ten exemplary e-learning scenarios and the requirements determined arranged in a skills/competence grid as an analytical tool (TARGET state). The CURRENT state was determined by means of questionnaires and interviews. The difference between the CURRENT and TARGET state served as the basis for deriving suitable skills development measures (see Table 3).

In the first column of the table above (Table 3), three possible areas categorise the use of digital media. Within these areas, it is possible to deduce specific learning scenarios and required competences. In the process-based or action-based approach, application situations are defined at the outset, to which the content to be taught, the required knowledge or the skills to be developed etc. must be assigned.

The aim is to create a comprehensive media education skillset and to enable teachers to apply and address digital media meaningfully and appropriately in the classroom in different situational contexts. Knowledge itself is only the basis for successfully doing so (Euler & Hahn, 2004, 2014; Euler et al., 2006). That is to say, teachers need a complex system of knowledge (know what), skills (know how) and attitudes (know why) to be able to successfully employ digital media in teaching. In addition to the knowledge and skills required by the teachers and organisational support structures, the extent to which technologies will be able to establish themselves in learning and in the classroom depends fundamentally on a positive basic attitude on the part of the teachers (Petko & Döbeli Honegger, 2011, p. 157). Therefore, the attitudes and beliefs of the teachers play an equally important role. Although Koehler & Mishara (2009, p. 61) point out: "Moreover, this knowledge is unlikely to be used unless teachers can conceive of technology uses are consistent with their existing pedagogical beliefs," a corresponding skills development is not apparent in their model. In an action-based approach, the necessary attitudes are explicitly highlighted.

In addition to product- and process-oriented models, curricula can be developed on the basis of more flexible models that can be understood as a further form of an action-based model. In this context, informal learning opportunities are especially important. This aspect will be discussed in more detail below.

4.3. Forms of Competence Development: Combining Informal and Formal Learning

Common teacher training practices are in themselves a major barrier to why the digital media teaching skills of teachers are only developing to a limited extent. Like their students, most teachers learn how to use digital media less in formal learning situations, but rather informally in practice. Teachers often simply lack the time to attend a course or to work on a self-learning programme every time (Weiss, 2012, p. 3). As numerous studies show, teachers generally seem to develop their skills predominantly informally in the context of their teaching practice, in exchange with colleagues and through critical, individual reflection (Hoekstra, Korthagen, Brekelmans, Beijaard, & Immants, 2009; Meirink, Meijer, Verloop, & Bergen, 2009) Learning in informal contexts takes place alone or with others outside of institutionalised teaching environments. In contrast, learning under formal conditions takes place in training and further education institutions where professional teachers endeavour to learn how to teach, assess and if necessary even to certify. At voluntary further education events for teachers the fact that the individuals who generally attend usually already have a certain level of expertise is often criticised and they often return to school disappointed because what they learn is difficult to put into practice for lack of time and money. In addition, school-based training courses (SBT) that are tailored to the needs

Table 3. Competence requirements derived from technology-based learning (Adapted from Euler et al. 2006)

Use of media	Technology-based Learning		Required competences
Digital media … in „in-class training“	1	Teacher-centered lessons with use of media	For the presented scenarios, competences are specified for the following action areas: • Professional competences • Social competences • Self-competences And for activities: • Knowledge • Skills • Attitudes
	2	Cooperative learning with digital learning resources and tools	
	3	Testing of learning success with e-assessment	
… as a **supplement** to „in-class training“ … as a significant **extension** to „in-class training“	4	Self-regulated learning by e-tutoring	
	5	Reflective learning in discussion forums	
	6	case-based learning with web resources	
	7	Discovery learning with computer-based simulations	
… as a **replacement** for „in-class training“	8	project-oriented learning with digital media	
	9	Online learning with video conferencing system	
	10	Dialogue-based learning with virtual classroom	

of a school are very widespread. However, some research studies show that even here formally organised school-based events also have a limited impact (Jurasaite-Harbison, 2009; Richardson, 2003). Therefore, the international research literature on the education and training of teachers increasingly focuses on workplace-integrated learning, which takes informal learning into account more (Hoekstra et al., 2009; Zwart, Wubbels, Bolhuis, & Bergen, 2008), One key finding is that formal and informal learning should be more closely interlinked for the skills development of teachers. A promising approach would in particular appear to be the search for interfaces between learning in formal and informal contexts (Engestrøm, 2004).

The following section focuses on the importance of the skills development of teachers in this context. Heise (2007) particularly emphasises the importance of largely self-directed further education in this professional field. To support and strengthen these desired informal learning activities, it would appear absolutely essential to create an environment conducive to communication within the school organisation. The targeted encouragement of professional discussions before classes begin or during breaks and the use of free periods for detailed reflection, for example on critical practical situations, can make an important contribution to triggering and promoting informal learning among teaching staff (Heise, 2009). However, not all teachers will be willing or able to collaborate with their colleagues on the preparation and follow-up of the classes. On the contrary, a certain proportion of teachers usually work alone, which might make a different kind of support necessary than would be required for teachers that already cooperate or collaborate with one another (Hoekstra et al., 2009). A concept to promote informal learning *tailored individually to the aims and objectives of teachers* could therefore generate added value for curriculum and school development.

In the field of media literacy, for example, the pressure on teachers to seek further education has increased immensely due to the constant and rapidly advancing technological development.

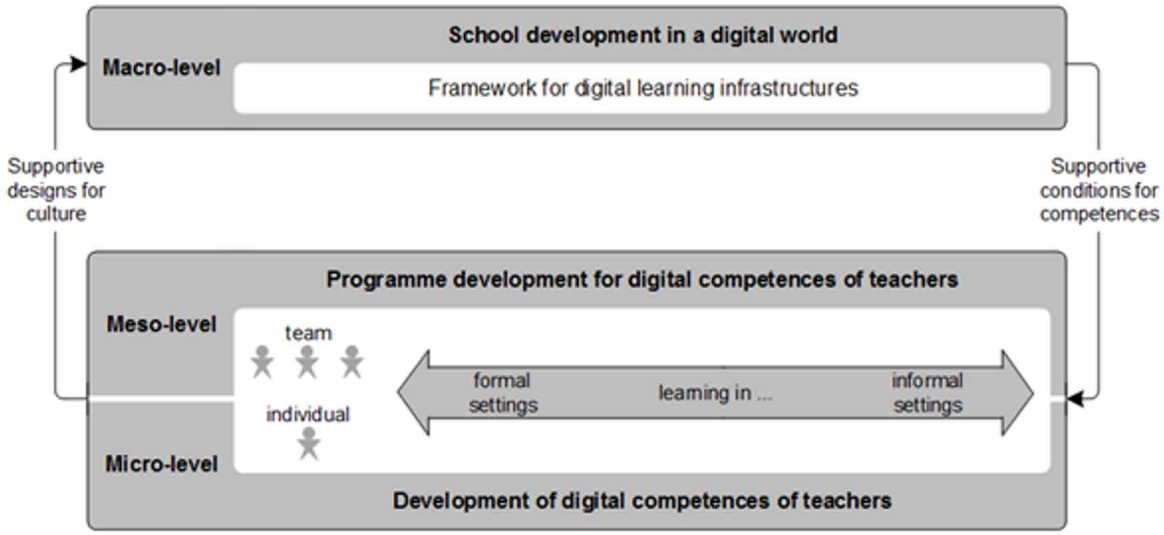
4.3.1. Skills Transfer

How might skills development measures for teachers which integrate learning in informal contexts be structured in practice? As explained above, "standardized" training programs have little impact on teacher education. In order to change teaching practice alternative training formats should be integrated into the portfolio. Some examples are outlined below (see illustration in Figure 1).

4.3.2. Transfer-Oriented Training

School-based training (SBT) is basically nothing new. However, it is now often combined more than was the case in the past with measures that support the transfer of what has been learned (such as preparatory phases and follow-ups). Effective results can for example also be achieved with more open learning environments, such as Engestrøm's Change Laboratory® (2004). In such a framework it would be possible to re-design courses in a professional association and hence combine the skills development of teachers with innovative strategies for curriculum development in schools (Engestrøm 2004, p 12). Whether or not the transfer of training or further education into the everyday life of teachers succeeds largely depends on individual factors (Hoekstra et al., 2009). An open mind towards new ideas and the willingness to adopt and implement innovative proposals is the prerequisite for initiating and implementing change processes in school routine. How teachers learn informally differs from one individual to the next (Hoekstra et al., 2009). This aspect should be borne in mind when developing further education

Figure 1. The integration of digital media to foster teacher's competences using the example of the TPACK-model



concepts and should lead to a sense of openness with respect to the curriculum, so that it is possible to adapt learning processes to the individual needs. One significant added value provided by the required openness is the ability to obtain feedback on the learning progress. For example, Zwart et al. (2008) suggest providing teachers with a "peer coach", who can help them reflect upon what has been learned (Hoekstra et al., 2009).

4.3.3. Moderating the Reflection Processes Regarding Teaching Practice

Critical, individual reflection upon one's own teaching basically represents a central impetus for the skills development of teachers (Meirink et al., 2009). A change in thought structures and hence upskilling is possible especially when the teacher experiences cognitive dissonance, i.e. inconsistencies between their own perception and how they actually experience critical teaching phases (Lipowsky, 2011, p. 410). This raises the question as to what extent such learning options can be promoted in order to initiate appropriate reflection processes. The findings of the group led by Zwart et al. (2008, p 990) show that informal talks with students from the perspective of an observer offer a valuable learning option. Other examples involve mentoring programmes in which students act as trained mentors and assist the teacher in teaching with notebooks. "Reverse mentoring" is currently enjoying growing popularity even in business. Trainees who are familiar with and able to use digital media critically act as mentors for senior managers and help them find their way in the new digital world. It remains to be seen whether this is merely a short-term fad, or whether it will become established as an element of a changing learning and management culture. Reverse mentoring could also be an approach for the school learning environment to compensate for any lack of media skills on the part of teachers by using the potential of the *digital natives*. In this way the students' resources could contribute to the informal skills development of the teachers.

Furthermore, other forms of mentoring, such as near-peer shadowing, are capable of triggering reflection processes among teachers and thereby promoting the informal skills development (Meirink et al.,

2009) Experimenting with new teaching methods (whether adapting a theoretically recognised concept, copying a colleague's method or developing one's own new idea) and even the immediate feedback from a colleague contributes substantially to the informal learning of teachers (Hoekstra et al. 2009; Meirink et al. 2009, p 90). In this regard, mentoring programmes can be orchestrated in different ways, i.e. the proportion of informal and formal elements of the learning process vary greatly (Colley, Hodkinson, & Malcolm, 2003). The degree of refinement of the framework, such as the concrete *learning setting, the place of learning or the general process,* influences the "predictability of chance" in the further education for teachers and generates an added value for the school organisation and the learners.

4.3.4. Self-Initiated Learning in Communities of Practice

The idea of the near-peer mentoring entails a practice-oriented community of people (community of practice according to Wenger (1998), who are informally linked with each other, are faced with similar tasks, and shape the practice in this community through a self-organised exchange. "Professional Learning Communities" in the teaching profession have long been a popular research field (Hord, 1997; Stoll, Bolam, McMahon, Wallace, & Thomas, 2006), but the effects of professional learning communities have yet to be researched in detail (Lipowsky, 2011, p. 408). The basic consensus in the literature seems to be that community-internal characteristics – such as high motivation for self-development and student focus – are required in order to address a deeper level of reflection in teachers as compared to a conventional training seminar (Lipowsky, 2011, p. 408). The literature on collegial reflection illustrates the added value of such working relations (Hoekstra et al., 2009; Meirink et al., 2009). Communities of practice increase the circle of possibilities for reflection and, provided the aforementioned conducive group characteristics exist, are another instrument of informal skills development of teachers. A beneficial environment for the successful interplay within the community of practice, such as the time window for the professional exchange, must be provided by the school.

Not only networking internally within the teaching staff, but also the search for forms of more intensive cooperation between learning locations, is a field that is still relatively young in Switzerland and has yet to be implemented systematically (Dubs, 2003). Schneider & Mahs, (2003) provide one example of a concept of continuous self-qualification and cooperative self-organisation for the skills development of teams of trainers (trainers, teachers, professional services). Here, team meetings represent an important measure in the course of which training modules and further education per se can take place in a self-organised way through the multiplier principle (Schneider & Mahs, 2003, p. 300). More recent examples support learning cooperation using Web 2.0 to bridge the gap between learning locations (Beiling, Fleck, & Schmid, 2012). However, experience with knowledge forums (Kremer, 2003, p. 416) reveals that work within the forum has so far encountered considerable problems; there is often a lack of motivation to cooperate at the various locations. The formation of networks in relation to the outside world thus also has a bearing on the internal relationship between the participating organisations, ("which is why knowledge forums cannot become bridges between the organisations, yet bridges are built without ensuring the access," (Kremer, 2003, p. 416). Even when using Web 2.0 applications, the relevant prerequisites for success are therefore not so much technological as cultural factors that represent incentives for participation in the community of practice. The above-mentioned promotion of a climate that is conducive to cooperation within the school influences the informal learning activities of the teachers (Heise, 2009). The availability of time and virtual and real rooms fosters proactive action by the practical community (Overwien, 2009).

Based on the above examples, it is clear that the combination of formal and informal learning is possible in particular using two different approaches. "This can be done independently by the learner (e.g. through documentation, checklists, learning diary) and/or with support (e.g. learning process support, group discussions). By means of constructive and critical reflection on one's own experiences, the mere "gaining of experience becomes an effective learning experience that supports one's own skills development" (Rohs, 2007, p. 77). Alternatively, however, significance is attached to the *structuring* of the self-organisation of learning processes on the continuum between formal and informal. With this approach, self-organised learning is promoted in daily school routine through staffing, methodological or medial structuring aids. This makes it possible to tap experience of organised forms of learning gained in the course of everyday teaching practices for the acquisition of skills (for example through the parallelisation of project and learning tasks or observational tasks to focus the attention of the students).

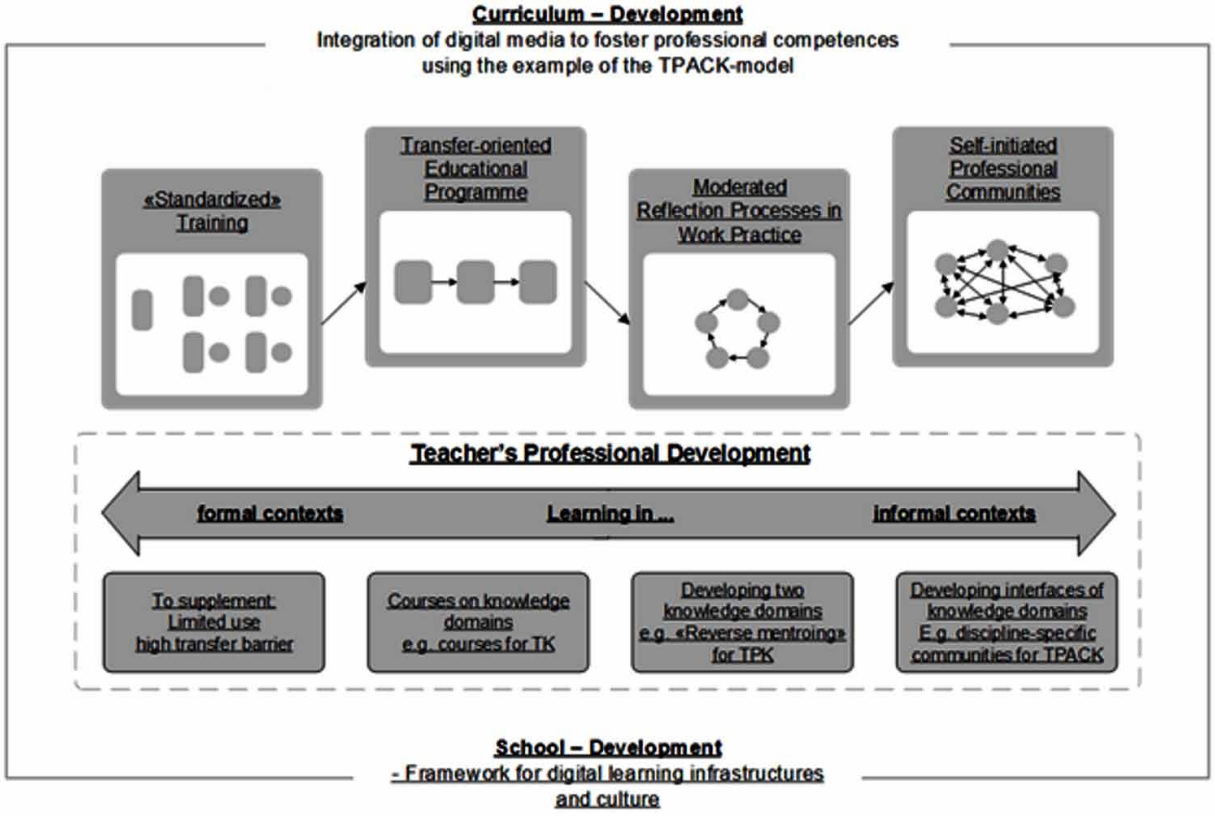
5. CONCLUSION AND FUTURE TRENDS: SYSTEMATIC COMPETENCE DEVELOPMENT: CREATION OF BASIC CONDITIONS FOR LEARNING OPPORTUNITIES

The skills development of teachers, in particular in order to test and learn new teaching concepts, is inextricably linked to curriculum and school development. As already stated in the introduction, school routine is currently dominated by more traditional forms of teaching, in which innovative educational approaches are almost impossible to realise. "Such teaching practices are therefore the central impediment to the integration of e-learning in everyday school life" (Wilbers, 2012, p. 38).

The skills development of teachers for vocational training in the competent use of digital media therefore requires considerable efforts in the schools. Consequently, it is doubtless not enough to organise a new blended learning course as a further education offer for teachers, which is usually held as a one-time event. Hence the new further education course will continue to be out of place in the school. On the contrary, it appears all the more important that support initiatives for the skills development of teachers are based on this context and are simultaneously embedded in innovation strategies and quality development processes in schools (Schneider & Mahs, 2003; Seufert, Lehner, & Tödtli, 2013). As a result, curriculum development, staff training and school development measures must be coordinated in order to implement education reforms (Stoll et al., 2006). The development of a school culture in which students and teachers alike attach great importance to learning together and from each other is of central importance (Hord, 1997; Stoll et al., 2006). In this context, based on the learning organisation by Senge (1996), Hord (1997, p. 1) stresses the importance of community building for continuous learning ("communities of inquiry and improvement", p 120.) In the context of a comprehensive literature review, Hord (ibid.) identified in particular the following five success factors for promoting conditions conducive to learning in a school: 1) supportive and participative management, 2) shared vision and values, 3) collective creativity, 4) shared, personal practice, 5) supportive conditions that determine when, who and how the teachers meet regularly as a unit in order to initiate learning processes, take decisions, solve problems and work creatively, which is ultimately what characterises a professional learning community.

For a sustainable integration of digital media in a vocational school-system it needs besides a digital competences development program – in teams or individual, in informal or formal settings (Micro-level and Meso-level) – also a comprehensive school development and a framework for digital learning infrastructures. Figure 2 illustrate that both school development and digital competences programs should

Figure 2. Connection between skill, school and programme development. (Seufert, 2013, p. 294)



be mutually supportive. The usage of digital media in vocational schools has a strong disruptive effect: students bring their own devices in schools. It is natural for them to use it as instrument for learning, working and living. Schools and their teachers are not prepared yet for the necessary radical change in acquiring knowledge and bridging the gap between schools and the working environments in companies. Radical changes are needed to think over existing practice in teacher education at the school workplace. Therefore, the future perspective should focus on school and curriculum development supporting teachers as a professional learning community.

Developing a learning-conducive school culture can be regarded today as one of the key challenges for the successful implementation of educational innovation and continuous quality improvement processes. To enable technology to become firmly established as a method and subject in school routine in the long term, appropriate framework conditions are required at the organisational level. At the macro level, schools must create conditions that allow learning with digital media. On the one hand, this involves providing the technological infrastructure, and on the other, rooms in which the personal training (both formal and informal) of teachers is possible. In this context, an appropriate learning culture must be established, which promotes learning with and from each other as well as the testing of new forms of teaching with digital media. According to Kerres & Heinen (2012, p. 28), in addition to the creation of "digital learning infrastructures", a shared vision and accompanying internal communication structures need to be established by the stakeholders, with the school management playing a pioneering and leading role.

At the same time, learning takes place not only in the school context, but also at home, in the workplace, or in interaction with peers. Following Blömeke (2005), teachers who have school development skills, contribute to the development of institutional digital conditions and educate students and parents in digital media education terms.

Chapter 11
Interactive Multimedia:
Increasing the Study in Primary Education

ABSTRACT

One of the important characteristics to be considered when developing multimedia educational materials is interactivity. The purpose of this study was to check whether the proposed multimedia's interactivity influenced the performance of 5th graders in a controlled environment and using Portuguese questions from the Brazil Test (Prova Brasil) as inputs. Those assignments were given to two groups of students, where one group had access to activities implemented via software featuring different interactive resources and a second group carried out the same activity in a plain environment, without the aid of multimedia resources. As a result, this chapter compares the performance of each group of students and relates them to the levels of interactivity, thereby demonstrating the latter's influence over the number of correct answers in the activities. Additionally, this chapter provides elements for the preparation of a second study phase.

INTRODUCTION

It is widely known that education is one of the cornerstones in the construction of a society. Based on such assertion, it is plausible to take a more in-depth look into the activities involved in our educational context. The evolution of technology has enabled significant progress in teaching practices, as well as

DOI: 10.4018/978-1-5225-3822-6.ch011

influenced the development of teaching materials, which have moved on from linear printed media to digital ones with the introduction of computers in school environments.

An increasingly more popular trend is the use of multimedia resources as a tool to support the teaching and learning process. Several movements in Brazil have been encouraging teachers to get training so they may have theoretical subsidies and tacit knowledge to reframe their teaching practices following this line of action, and take digital materials and resources to the classroom.

Institutions of higher education have a relevant role in the formation and development of skills and abilities of professionals to interact in a multicultural market, also marked by globalization and information technology and communication (ICT). These professionals, in turn, may also prepare other professionals to work in the various levels of education.

As examples of such movements we have the creation of UAB (Open University of Brazil - http://uab.capes.gov.br/index.php), an education system comprising a group of public universities that takes higher education to people who might otherwise not have access to a university education.

The system UAB was created to answer to the local high education requirements. Once a need is detected this system works as a linking agent among the high educations institutions, the estate and county governments. Establishing which qualified institution will be responsible for a defined seminar at any certain county or micro region through the support of remote educational presential centers. Following are some of the different types of courses and seminars offered by the Brazilian UAB:

1. **Bachelors, Graduate Degrees, Technical and Specialization Seminars:** These courses are intended for initial and continued formation for teachers of public education network or general public (social needs).
2. **Specialization Courses in Program of Media in Education:** Courses offered for the purpose of providing continuing education focused on the pedagogical use in distance education, different technologies of information and communication.
3. **Librarian Degree:** Bachelor's program for the training of staff to support the implementation of the courses at the attending supporting poles supporting attendance of the UAB system.
4. **Specialization Courses for Teachers, in Partnership with the Department of Continuing Education, Literacy and Diversity (SECAD / MEC):** Courses offered at post-graduation courses, lasting 360 hours and certification for graduates. Given the current legislation, this program is intended to prepare teachers for cross-cutting themes of the basic education curriculum.
5. **National Training Program in Public Administration - (PNAP in Portuguese):** Courses offered at the undergraduate level - Bachelor's degree, and post-graduation courses - expertise for the creation of a national profile of the public administrator, providing management training to use a common language and understand the specifics of each public sphere: local, state and federal.

In the context of this discussion, UAB contributes to the offer of specialization programs such as Media in Education and Specialization in Information and Communication Technologies, both dedicated to training basic education teachers in the use of media and different technologies in the classroom.

In the on-site or virtual classroom, the multimedia educational materials (MM) provided may comprise a combined variety of media, such as: text, images, audio, animations etc. We believe the sensible use of various media, when combined with different forms of interactivity, may positively contribute to learning (Schwier & Misanchuk, 1993; Mayer, 2002). In this context, the multimedia proposed must be part of a teaching plan that considers the particularities of the student group.

Some studies provide evidence of the value of interactivity in the teaching and learning process. According to Domagk, Schwartz & Plass' research (2010, p. 1025), depending on the field of application, which includes the educational one, interactivity is a word carrying different meanings and taxonomies. Through the concepts they adopted, some studies, such as Piaget's (1974), Schwier & Misanchuk's (1993), Sims' (1997), Lemos' (2002) and Primo's (2005) are a great help to set the words interaction and interactivity apart.

The main goal of using educational materials is to encourage students to learn. Using efficient subsidies for that purpose bolsters the design of quality education, where a multimedia material can carry different media styles, formats, and concepts. Regarding multimedia materials, "active-learning hypothesis (Jonassen, 1996; Mayer, 2001) predicts that learning should increase when learners use interactive as opposed to non-interactive multimedia systems," according to Evans & Gibbons (2007). In that aspect, a question remains implicit: how much using these resources or not helps students understand and assimilate the contents studied.

This chapter narrates the results of a pilot study included in the second phase of a doctoral research project and some of the developments taking place after that study. Based on the design of an interactive multimedia material, the goal of this study was to check whether the proposed multimedia influenced student performance in a school environment, using Brazil Test (Prova Brasil) questions as subsidies (PDE, 2008). The following options were outlined as specific goals of the pilot study: 1) testing the levels of reactive and proactive interactivity with a multimedia material; 2) checking whether such levels influence the correct and wrong answers in the activities; 3) getting the students' feedback about the material proposed.

This pilot study on interactive multimedia is based on research by Evans & Gibbons (2007); Domagk, Schwartz & Plass (2010), and Wang, Vaughn & Liu (2011). It is different from the aforementioned research in terms of the audience it is meant for, its application site, and type of content proposed. It was carried out in a public school context with 5th graders aged 10 to 16. Our pilot study uses the word interactivity and the guidance from authors who consider the words interactivity and interaction to be synonymous, that is, they refer to the exchanges taking place between person and computer.

This chapter is organized as follows: section 2 provides the background and a literature review encompassing the topic of multimedia and interactivity, in addition to an explanation about the Brazil Test and briefly introducing the school through its political pedagogical project. Section 3 addresses the methods adopted to carry out the study. Section 4 describes the pilot study implementation and presents the decisions for the second study. The pilot study results are presented in section 5. Finally, section 6 describes our final considerations.

This study is part of the Doctoral Thesis of the author of this chapter and is developed through the Post Graduate Program in Computer Education, at the Federal University of Rio Grande do Sul, Brazil. The author is an active teacher in basic and high Education (UAB - Open University of Brazil). The study involves a long period of data collection with students in activities at the computer room, respecting the school routine, and the program proposed by the teacher. This work is done with hypotheses that require analysis of the use of interactive multimedia and their effects, when used in educational activities of reading and writing with fifth year students of elementary school.

BACKGROUND

This section presents the literature review that supported our pilot study, which encompasses research into the use of multimedia and interactivity. This section also discusses relevant issues regarding the Brazil Test (PDE, 2008) and the choice of the activities used in our study.

Interactive Multimedia

Digital educational materials may be presented in multimedia (MM) form. Such MM stimulates some human senses (for instance, hearing and sight) given the fact it comprises a variety of media (such as text, images, audio, animations etc.). However, each medium "has particular strengths and limitations" (Schwier & Misanchuk, 1993, p.3).

Through his cognitive theory of multimedia learning, Mayer (2002) presents eight principles (multimedia, contiguity, coherence, modality, redundancy, personalization, interactivity, and signaling) that guide the design of teaching materials. The multimedia principle (Mayer, 2002) states that, people learn more deeply from words and pictures than from words alone. The principle of interactivity states that when learners control the multimedia presentations, they learn more (Mayer, 2002).

In his practical contributions, Mayer's study (2012) once again points out that images and charts should not be randomly incorporated to texts in multimedia educational materials. Words may be narrated or written and images may be animated or static. The assumptions in the cognitive theory of multimedia learning include: the dual-channel (visual and auditory), limited capacity, and active processing. According to the dual-channel assumption, humans process visual and auditory information through different channels. The limited capacity assumption states that each of these channels (visual and auditory) has a limited capacity to assimilate information at one time, averaging 5 to 9 chunks of information. The active processing assumption predicts that active learning is processed as humans select and organize relevant information in coherent mental representations that are integrated to other knowledge. Sensory memory, working (short-term) memory, and long-term memory are the three types of memory considered in multimedia learning: through a multimedia representation that may include images and/or words, the sensory memory is engaged through the ears and/or eyes of those interacting with the multimedia material. The working memory is short-term. For learning to be meaningful, the information sent by the sensory channels (hearing and sight) through words and images are sent to the working memory, providing a verbal and pictorial model. Sensory memory selects the relevant words and images. Those selected images and words are organized into models by the working memory. When the verbal and pictorial models (sensory and working memories) are integrated to preexisting knowledge, the long-term memory is engaged.

In addition to the principles proposed by Mayer (2002 and 2012), we consider that the instructional design of educational multimedia can be to different levels of interactivity which, along with the other elements making up such multimedia, constitute interactive multimedia (IMM). Activities which include more than one type of media and allow students the ability to choose, select and/or write, among others, are interactive possibilities for multimedia digital educational materials.

Many studies dedicated to interactivity and aimed at the teaching and learning process bring several concepts and taxonomies for interactivity, such as research by Wang, Vaughn & Liu (2011); Domagk, Schwartz & Plass (2010); Primo (2005); Sims (1997); Lemos (1997); and Schwier & Misanchuk (1993).

Based on the interactivity classifications researched by Thompson & Jorgensen (1989), Lucas (1992) and Hannafin (1989), should be mentioned as Schwier & Misanchuk (1993) proposes an interactivity taxonomy for instructional multimedia. In this taxonomy, interactivity is presented in three levels (reactive, proactive, mutual), five functions (confirmation, pacing, navigation, inquiry, elaboration) and transactions (these are directly connected to the type of hardware/technology used for which the MM is meant). The levels are hierarchical and may show up combined in interactive multimedia (IMM). According to the author, "in order to fully describe an interactivity taxonomy, we must also consider the transactions used to interact with the program. Transactions are the physical actions carried out by a learner during interaction" (Schwier & Misanchuk, 1993, p.13).

Evans & Gibbons' study (2007) provides evidence about the use of interactivity. The researchers' purpose was to establish whether there is evidence that interactivity improves the learning process, using computer-based multimedia systems. To define interactive system, the authors adopted the computer-based interaction model designed by Evans & Sabry (2002) and which involves three actions: initiation, response, and feedback. They applied the multimedia learning principles (Mayer, 2001) and Mayer & Anderson's experiments (1991) with animated narrated lessons on tire pumps and narrated lessons about lightning designed by Mayer & Moreno (1998). Evans & Gibbons' study (2007) used a multimedia lesson on how a bicycle tire pump works using text and images. The multimedia has an interactive version and a non-interactive one. The non-interactive version featuring little or no interactivity to complete the lesson is a computer-based version of the experiment described by Mayer & Gallini (1990). However, Evans & Gibbons (2007) added two additional stages to approach the creation of vacuum and air compression in the cylinder, thereby differing from the original proposal. The interactive multimedia features text, image, and sound effects. The study conducted before-and-after knowledge tests, besides statistically treating the data. That study's results showed that students using the interactive lesson delivered significantly higher performance in the knowledge transfer test than those using the non-interactive lesson.

The results obtained by the studies of Wang, Vaughn & Liu (2011) expanded Evans & Gibbons's theory (2007) about the effects of interactive instructional materials. As they studied the effects of the program's animation, interactivity and complexity, they considered the need to provide students with other supports, such as using instructional strategies for better learning. In the case of educational interactive animations, greater caution should be exercised as they believe greater interactivity increases the program's complexity and may decrease the students' ability to use the program (Wang, Vaughn & Liu, 2011, p. 310).

The study by Domagk, Schwartz & Plass (2010) presents a unifying model named INTERACT (Integrated Model of Multimedia Interactivity). This model integrates the influence of the environment and the learner's activities, a system of connections and concepts that make up interactivity. In the given context, the interactivity process is represented by the cycle of feedback messages that connect its six components in a learning environment. That study and the proposed model highlight the importance of the instructional project and supply an interactivity basis for digital educational material designers. It offers a process approach that enables the design and evaluation of specific interactive components for their multimedia applications. However, according to the authors, the study requires future research into the dynamics of relationships taking place between the six components of interactivity.

In his studies, Primo (2005, p. 13) advocates the interaction between individuals. Based on the interaction between the interactants, he proposes two major groups of computer-mediated interaction: the mutual interaction stemming from the relational negotiation between the subjects ("the interactants come together around continuously proposed problems" – free translation) and the reactive interaction

that "depends on exchange predictability and automation" (free translation), depending on the resource or software used.

From Piaget's perspective (1974), knowledge depends on the actions between the subject and the object, which lead to the interactions between them. In the cyberculture context, according to Lemos (1997), digital interactivity is not inscribed in the physical form of the object but in the microelectronic supports that constitute the technological objects. In such context, interactivity can be seen from the perspective of the dialogue between human and technological object (Lemos, 2002).

Sims (2000) gives interactivity its pedagogical dimension. In his study, the author relates the approach to interactive constructs and learning theories, and proposes a classification that confirms interactivity as a viable mechanism to support learning. He presents four dimensions – learners, content, pedagogy, and context – and connects them to the prescriptions of interactivity. However, the pedagogy dimension, which may suggest interactive constructions, was the chosen one, given it fits the purpose of this section. Sims (2000, p. 48) says the pedagogical dimension is also critical, "as it will determine the extent to which the learner is able to move (navigate), test (explore) and maneuver (self pace) through the product."

For the pilot study reported in this chapter, we adopted the interactivity concept proposed by Schwier & Misanchuk (1993), who consider it a result of the actions between user and system. To that end, we created an interactive multimedia educational material based on the multimedia and interactivity principles presented by Mayer (2002). The interactivity levels proposed in the multimedia were defined according to Schwier & Misanchuk's taxonomy (1993) and encompass the reactive and proactive levels.

Later on, the interactivity levels initially proposed in the pilot study, including Sims' taxonomy (1997), were further looked into to set up a new array of interactive multimedia created to be used in a second study.

The multimedia created present activities based on some of the contents included in the studied school's curriculum and some previous Portuguese questions in the Brazil Test (PDE, 2008), relative to the 5th grade.

Assessments, Brazil Test *(Prova Brasil)*, and the Questions Chosen

PISA (Programme for International Student Assessment) is the largest study in the field of public and private education, and its main focus is to gauge student performance in Reading, Math and Science. Some of the countries assessed include Italy, England, Portugal, the US, Brazil, Chile, France, Switzerland, Canada, Finland, Peru, Ireland, Argentina, and others. The study is meant to assess 15-year-old students, assess their readiness for real-life situations, and gauge their Math, Science and Reading skills. Brazil is among the participating Ibero-American countries. This international study has shown the wide differences in educational outcomes by students from different countries, and also the students' reading difficulties in other countries.

According to the PISA assessment (2009, p. 106) of the main factors associated to Brazil's performance, Brazilian students "have great problems with language skills, and that affects school performance in all areas, etc.". Hence, one of the goals in Brazilian education must be to improve reading skills.

Although the Brazilian PISA score remains low, it has improved. However, the challenges to be tackled in a country the size of Brazil are massive. The Brazilian Government has proposed different targets and actions in an attempt to improve performance in education assessments.

The "Anísio Teixeira" National Institute for Education Studies and Research (INEP) coordinates the Brazilian education assessments at the different levels. Pursuant to information contained on the INEP

website, the Basic Education Assessment System (SAEB) comprises two processes: the National Basic Education Assessment (ANEB) and the National Academic Performance Assessment (ANRESC), according to Ordinance # 931 of March 21, 2005. ANEB reports are published under SAEB's name. The assessment corresponds to a sample of public and private schools in every unit of the Federation and focuses on education system management. ANRESC is published under the Brazil Test *(Prova Brasil)* name and is more extensive and detailed than ANEB, while focusing on every school unit.

The Brazil Test (ANRESC) is held every two years in all public schools with more than 20 students enrolled in the grade, in printed form, and aimed at:

1. Helping improve education quality, decrease inequalities, and democratize public education management;
2. Developing an assessment culture that encourages society's control over education processes and outcomes (PDE, 2008, p. 8).

This assessment is split into two major targets: the subjects of Portuguese (Reading) and Mathematics (Problem Solving). With respect to the Portuguese Language, as published by INEP:

The fact that we assess reading only does not diminish the importance of these evaluations, considering reading is essential for students to develop other fields of knowledge and consequently exercise their citizenship. – free translation (PDE, 2008, p. 21)

In the 5th grade, the Portuguese language matrix of the Brazil Test comprises two dimensions: the subject-matter of knowledge (with six topics or themes) and competence (with descriptors that indicate the abilities to be assessed in each theme or topic). This test exclusively assesses reading skills, divided into five content blocks: reading procedures; implication of the support, gender and/or enunciator in text comprehension; relationship between texts; coherence and cohesion in text comprehension; relationship between expressive resources and effects of meaning and linguistic variations.

This assessment requires knowledge to be constructed in different levels of comprehension, analysis and interpretation. Multiple-choice questions comprise three parts: the text, the statement that necessarily poses a problem or consists of a problem-situation, and answer alternatives for the problems, considering only one of them is correct and the others, incorrect, albeit plausible. The students' reading proficiency is assessed through their performance. The pedagogical interpretation of those results by managers and teachers is essential to overcome the difficulties evidenced by this assessment (PDE, 2008).

In 2011, the early grades in the school studied obtained a score of 189.4 in the printed standardized evaluations of the Brazil Test of Portuguese language.

Some Portuguese language questions from the previous 2007 and 2009 Brazil Tests were selected for the pilot study to be included in the proposed multimedia. The study presented in this article did not mean to compare digital materials (interactive multimedia) against paper-printed materials. The chosen questions were previously analyzed by the 5th grade Portuguese Language teacher from the school studied. According to the teacher, the students had not worked on the questions selected from the Brazil Test.

Briefly Knowing the School through its Political Pedagogical Project

According to the information contained in the researched School Policy Project (PPP), their community is located in a neighborhood in the outskirts, most are poor workers, unemployed or underemployed, have no professional qualification, performing duties related to domestic services and civil construction. Many families receive some type of government assistance. The villas occupy a mainly invaded land and are precariously built by the residents themselves. Children and young people are exposed to situations such as unemployment, lack of security, lack of monitoring by parents or guardians, lack of values, boundaries and discipline.

In this context, full of social problems, the school seeks to adapt its program. Teachers need time to study and planning. The knowledge base is considered the most important and aims to provide conditions for the student to be an agent of change. The school believes that the curriculum must always be committed to the practice of democracy and associated with the social context of the learner, expanding their knowledge through activities that encourage cooperation, participation, collective learning and citizenship, in this sense, cite Paulo Freire and the Pedagogy Autonomy (1996).

Each shift school is organized according to their characteristics. The early years, from the first to the fifth year, work on the morning shift and the classes have a dedicated teacher dedicated. The final years, from the sixth to the ninth year, work in the afternoon. The program is based on disciplines with modules of 60 minutes each. Youth and adults education (EJA) is done at night, the program is a discipline developed in stages, with modules of 65 minutes, offering reclassification and a module with semi-weekly attendance.

The activities in the computer room are understood as another learning strategy. In this context, the technologies of computerization serve to broaden the didactic action in the process, serving as an instrument of inclusion and quality of higher education. The School believes computer science is important to the lives of students in a competitive world, but computer science in education works with technology in a context, not as something stationary and isolated. Incorporating the technologies of computer science and communication in school is an action that requires for its implementation, of the mobilization of the whole school, covering the area of pedagogy in the classroom and extends to the different approaches existing in diversity school integration in the administrative and educational sectors.

In addition to the municipal and national legislation aimed at the Brazilian education in his Political Project (PPP), the School research highlights the works of Saviani (1983), Gadotti (1994), Freire (1996), Libâneo (2001), Nóvoa (1995) Perrenoud (2000) and Vasconcellos (2002).

METHODS

This qualitative and quantitative study examines the data collected and the observations made by the researchers during their analysis of 5th grade classes from a public city school. The purpose of the investigation was to set a parameter and identification by relating learning to a given level of interactivity. The students were analyzed based on their work on interactive multimedia activities in a computer science room, the scores obtained in them, and the data collected from an opinion poll. For the pilot study

we selected questions from the Brazil Test related to the Portuguese Language. Later on, we proposed new interactive multimedia related to 5th grade and Brazil Test contents.

Our research lab was a public school in the city of Santa Maria, Rio Grande do Sul, Brazil, located in an underprivileged area in the outskirts of town. This school serves students from kindergarten to 9th grade, besides Youth and Adult Education, and has approximately 400 students. The Computer Science Room is equipped with 37 computers using the Educational version of the Linux operating system, and 1 laser printer. The educational activities carried out in the computer science room are previously scheduled and planned by class teachers (generalists and specialists) and the teacher who coordinates the computer science room. The subjects selected for this study are morning-shift students from four 5th grade groups, in a total of 92 students between 10 and 16 years of age. The experiment was approved by the school's Ethics Committee and the parents authorized their children to participate. Fifth grade teachers signed the informed consent form.

IMPLEMENTATION

In 2011, we conducted our exploratory research and pilot study (implementation phase 1). In 2012, we met with 5th graders on a weekly basis for activities in the computer science room. Phase 2 of our research is being implemented in 2013.

Exploratory Research: Surveying Indicators

We conducted an exploratory study with teachers and students in the first semester of 2011. With the teachers, among other things, our purpose was to check the possibility of using interactive multimedia in the educational context and learn about the students' difficulties to master (reading and writing in) Portuguese in the 5th grade. With the students, our exploratory study was meant to determine the presence and use of technologies in their everyday school and home lives. For this study, we prepared questionnaires containing open-ended, semi open-ended, and closed-ended questions.

The results of our exploratory survey with teachers showed that, among other things, computers are seldom used in teaching activities dedicated to the audience studied. The teachers stated they mostly use printed and mimeographed materials and printed-out copies supplied to students, and the use of digital educational materials is the last alternative. The teachers said students have trouble reading and writing. The teachers consider that the use of interactive multimedia (IMM) as a teaching tool can bolster learning when the MM provides means of interaction that encourages students to learn. It is a viable activity, provided it is well planned and sets defined goals.

In turn, our exploratory survey with students revealed the media they see the most at school are, in order, sound equipment and computers, followed by TV and DVD. At home, the media the students use the most are: TV, DVD, CD, sound equipment, computers, cell phones, PlayStation, cameras, the radio, Game Boys, MP4 and video games.

Once we had such data, we established the multimedia contents for the experiments and moved on to the first phase of implementation and use of interactive multimedia.

Implementation: Phase 1

The first implementation phase was called pilot study. That study was conducted in October 2011 with four 5th grade groups in the aforementioned school, and its purpose was to test our research model. After designing an interactive multimedia (IMM) material, this study was meant to check whether the proposed multimedia's interactivity influenced student performance in a school environment, and was carried out over a total of four hours.

In this phase of our research, the basis of the multimedia contents provided to students in a proactive and reactive manner was carefully selected from Portuguese Language (PL) questions included in the Brazil Test for 5th grade students. The school's Portuguese Language (PL) teacher took part in this pilot study, helping us choose the questions and analyze their format to ensure the textual contents corresponded to the cognitive level of the students participating in this study.

We sought to encompass Mayer's (2002) principles of multimedia and interactivity in the activities we planned. We created a multimedia material classification taxonomy adapted from the one proposed by Schwier & Misanchuk (1993). In this study, the interactivity level of the material used in the classroom with the students was characterized as either Reactive or Proactive, and we discarded the Mutual level described in the author's original proposal.

For the Reactive Multimedia (control group), we defined characteristics such as instruction based on a simple text, which may contain a scroll bar. Practice through the multiple-choice activity, where the correct answer was to be selected (practice defined according to the type of interactivity proposed). Simple navigation in the application, through (next and back) buttons. The Proactive Multimedia (test group) had the following characteristics: instruction based on a text containing hyperlinks, images, bookmarks, and buttons. An initial menu for choosing the activity. Practice through the multiple-choice activity, where students had to select the correct answer. Immediate feedback at the end of the activity, including a performance report. Access to internal and external help pages.

The two types of interactive multimedia defined (Figure 1 and Figure 2), with different levels and characteristics, were provided to four 5th grade groups, identified as Blue, Orange, Yellow, and Green. On the day the experiment was conducted, 62 students were present. The Yellow group was represented by 8 boys and 5 girls; the Green group was also represented by 8 boys and 5 girls. The Blue group was represented by 11 boys and 6 girls, and the Orange group was represented by 11 boys and 8 girls.

The software tool we used to conduct our study was BrOffice version 3.3.0, implemented on an array of previously developed macros to provide the participants with the desired level of interactivity.

Before the students began their activities, the multimedia was presented to each class. At that time, upon request, we provided explanations about the questions and use of the tools. Each class was given 50 minutes, equivalent to one class period, to carry out the activity proposed. The classes were randomly separated, and the first two groups (Blue and Orange), with a total of 36 students present, received the Proactive material including an interactive framework which assisted them in different ways in their completion of the assignment. The second group of students (Yellow and Green), with 26 students, received the same assignment as the previous group. However, the material supplied did not contain interactive resources, this material was called Reactive.

Figure 1 shows the Proactive multimedia interface, allowing us to analyze the first question in the assignment given. Each student answered three questions similar to the one illustrated in the Figure. For this book chapter, we chose to keep the images of multimedia created with text in Brazilian Portuguese. The colors of the images have altered, according to rules of publishing.

Figure 1. Presentation of the interactivities available in the proactive question (reading and interpretation)

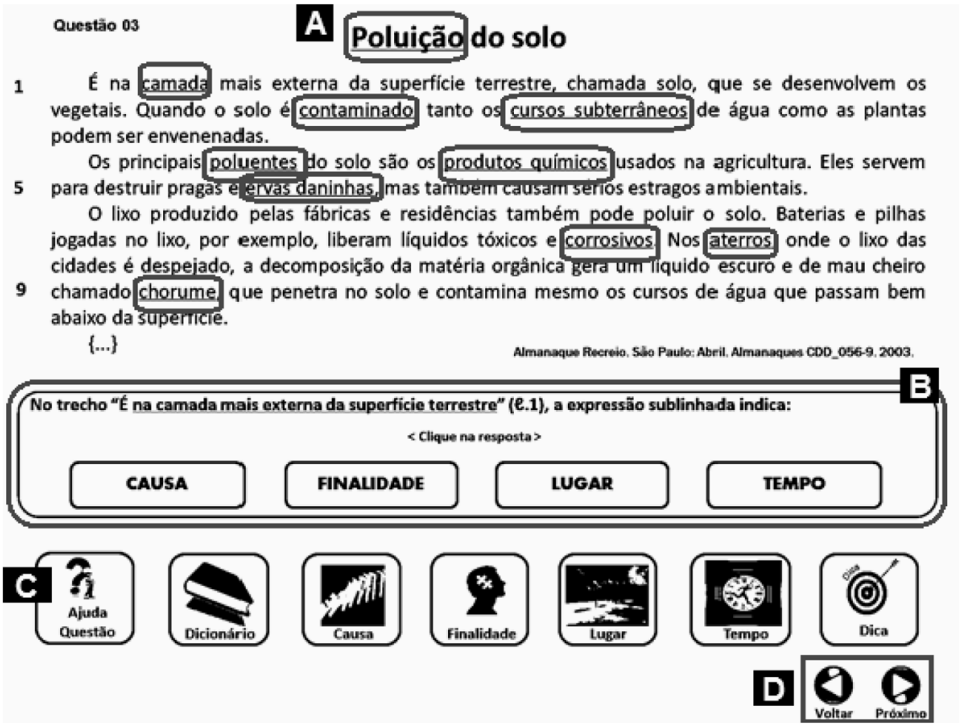

Figure 2. Reactive question (reading and interpretation)

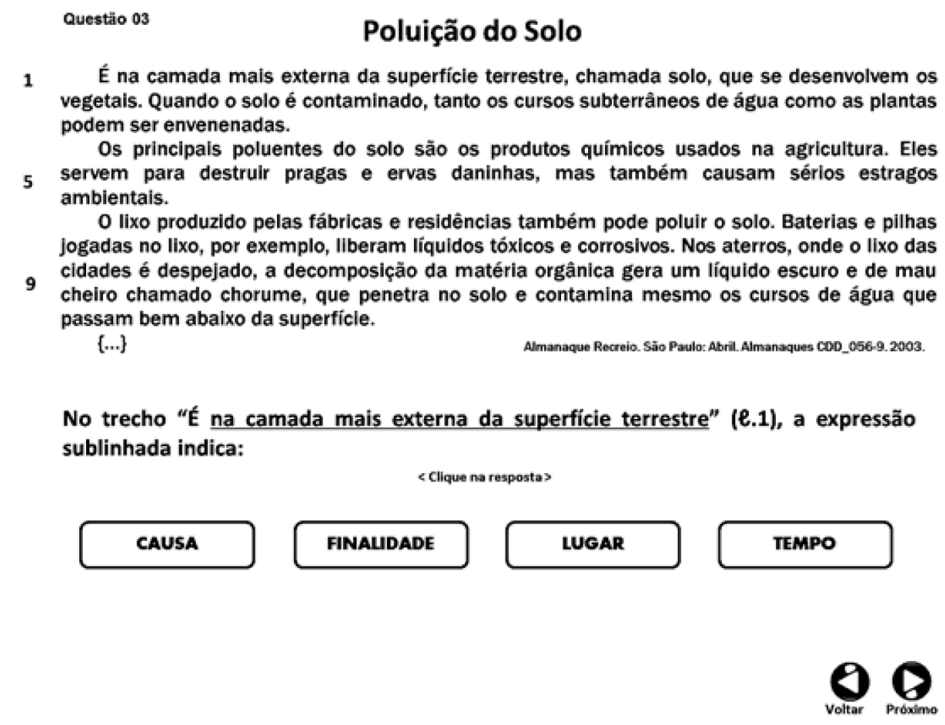

Figure 1 also highlights the array of interactivity solutions available for the assignment.

A. Hyperlinks to external pages – Internet.
B. Buttons for answer selection.
C. Set of multimedia resources – encompassing help about the questions, available from the very application, external links, dictionaries, and tips.
D. Navigation buttons.

With respect to the Reactive multimedia, the students answered the questions through their interaction with a simple material based on running text with no type of multimedia resources to help them complete the assignment. Figure 2 shows the screen containing the interface used by this group.

At the end of their reading comprehension activities, the students were asked to answer an Opinion Poll available via Google Docs in order to clarify important points for the evaluation of the assignment results. Some of the items in that questionnaire included: Do you have a computer at home?; Do you have Internet access at home?; How many times do you use a computer in the week?; Did you feel confident using the computer to complete the assignments?; and others.

After the end of the experiment with the students, we collected the data from the computers used by the students for subsequent analysis. We conducted our qualitative and quantitative analyses based on the results obtained from the multimedia activities and the opinion questionnaire made available through Google Docs.

Implementation: Phase 2

The studies and data collected until then were used as the basis to propose a second study phase encompassing the expansion of the contents and a new group of interactive multimedia (IMM). The participants are the new groups of students enrolled in the 5th grades at the school studied, upon authorization from their parents or guardians. This new group of multimedia is being applied in 2013.

For this phase we created two study groups (Evans & Gibbons, 2007): the control group (Reactive multimedia, similar to that in the first experiment) and the test group, which gets multimedia with some of the interactivity levels (Proactive multimedia). The interactivity levels proposed now encompass the taxonomies by Sims (1997) and Schwier & Misanchuk (1993).

Researchers such as Wang, Vaughn & Liu, 2011, recommend prior multimedia training for students to understand how to use them. Based on that idea, in 2012 and part of 2013 we conducted weekly educational activities in the computer science room with the students from the school studied, using different types of websites and interactive media other than the ones used in this study.

The different types of interactivity in each MM have been extracted from a taxonomy based on studies by Sims (1997) and Schwier & Misanchuk (1993). The eight cognitive principles proposed by Mayer (2002) constitute important guidelines for our interactive multimedia project.

For this second phase, we planned other multimedia encompassing some of the contents defined by the teachers from the school studied. We are also going to use once again multimedia containing Brazil Test questions related to reading.

Given the large number of readily available MM, there is the possibility of selecting and using media (such as video, for instance) from repositories and reference libraries to design an IMM.

We planned three groups of multimedia using different types of media, contents, and interactivity (Table 1). The multimedia groups are undergoing construction and testing.

The software used to create the interactive media is Macromedia Flash 7, belonging to company Adobe Systems Incorporated. Figure 3 shows the posting dates for the different versions of multimedia created and corrected, as well as the image of a new version of the multimedia addressing the syllable division content and posted to a website created for testing.

The final versions of the tested, approved multimedia will be made available on an open page for students to access them on the day of the final experiment. In this second phase of our study, the multimedia experiments are once again going to be conducted in the computer science room, which is part of 5th graders' weekly routine activities. We will also be administering before-and-after knowledge tests (Evans & Gibbons, 2007, Wang, Vaughn & Liu, 2011, and Mayer, 2012). Educational activities making use of educational multimedia will be planned along with 5th grade generalist teachers and the teacher coordinating the computer science room. The activities in the computer science room are carried out in 50 minute lessons for each class and are aided by student monitors. Computer science room student monitors are students from the opposite school shift that volunteered to help their peers learn how to use computers and Internet tools. Those students are selected and advised by the teacher coordinating the computer science room. In 2013, the final experiment will be conducted on several dates, given the

Table 1. List of contents, interactivity levels, and type of media for the second experiment

Contents	Type of interactivity Sims (1997); Schwier & Misanchuk (1993)		Type of media
Reading and interpretation (Brazil Test)	Hyperlinked	Reactive (control group)	Simple text
		Proactive (test group)	Text and images
	Object	Reactive (control group)	Simple text
		Proactive (test group)	Video and text
Syllables	Object	Reactive (control group)	Simple text
		Proactive (test group)	Text and images
Adjectives	Non-immersive contextual	Reactive (control group)	Simple text
		Proactive (test group)	Text and images
			Video and text

Figure 3. Image representing the site where the new multimedia versions are hosted for analysis – multiple-choice proactive question (syllables)

computer science classes take place every two weeks. After finishing using the multimedia, the students are going to answer an opinion poll.

The data collected from the before-and-after tests and the activities proposed via the interactive multimedia will also undergo qualitative and quantitative analyses.

PILOT STUDY RESULTS AND DISCUSSION

Once the computer science room activities included in the pilot study were completed, the data from the students' answers were collected by means of a script and grouped for a detailed analysis of said students' performance. Hypotesis h0 and h1 were established for the analysis of data gathered from pilot study. According to h0, proactive multimedia was not more successful than reactive multimedia, but proactive multimedia did showed more successful than reactive multimedia as per h1.

At first, we conducted a descriptive statistical analysis based on the numbers of hits and misses by the groups of students making up the proactive and reactive groups. The results from that analysis are given in Table 2.

By comparing the results shown in Table 2 we see that the average hits by students using the interactive multimedia material (Proactive) to help them complete the activity was 0.65 point higher than the score

obtained by students who were given the interaction-free assignment, called Reactive. In both groups there were students who did not get any of the answers right; however, several cases were found where students got all of them right. The Proactive group's standard deviation was 0.09 higher compared to the Reactive group, that is, the former group showed greater performance variability.

Upon a simple chart analysis, we can find the percentage of hits by Proactive and Reactive students. Students given access to the Proactive material answered 64% of the questions correctly, against the 42% of hits by students given the Reactive material. Such representation allows us to infer that students working with the Proactive material learned more from their assignments.

A more specific analysis of the students' results shows a few differences within inside the participating groups. Chart 1 presents the hit and miss percentages of students working on the Proactive materials. We see that the orange group (79% hits), performed considerably better than the blue group (47% hits). Chart 2 shows the group working on the Reactive material was more even, with the yellow group getting 41% of the answers correctly and the green group, 44%. Such representation allows us to infer that students working with the Proactive material learned more from their assignments.

Table 2. Pilot study descriptive statistics

	Proactive		Reactive	
	Hits	Misses	Hits	Misses
Average	1.920	1.080	1.270	1.730
Standard Deviation	1.052	1.052	0.962	0.962
Standard Error	0.175	0.189	0.189	0.175
Minimum	0	0	0	0
Maximum	3	3	3	3

Chart 1. Proactive group's hit/miss percentages

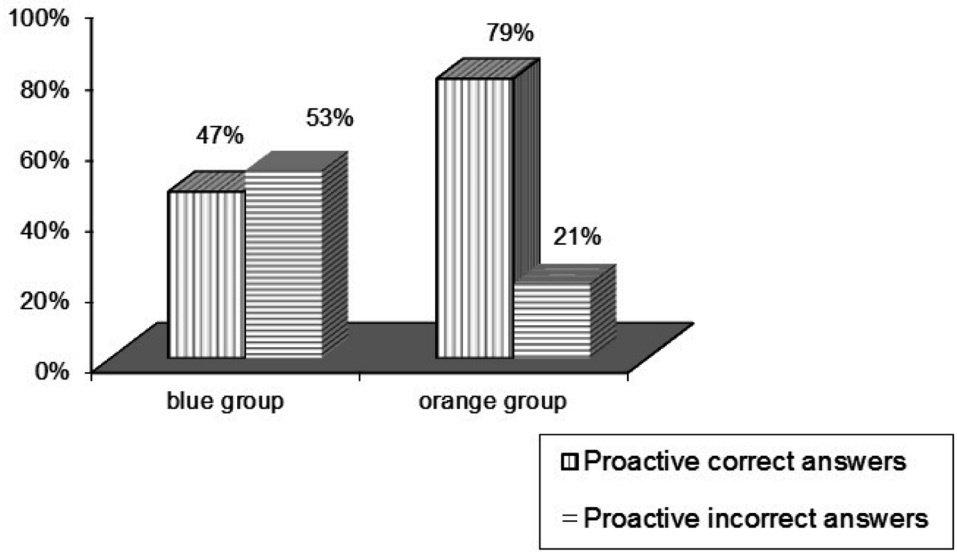

Chart 2. Reactive group's hit/miss percentages

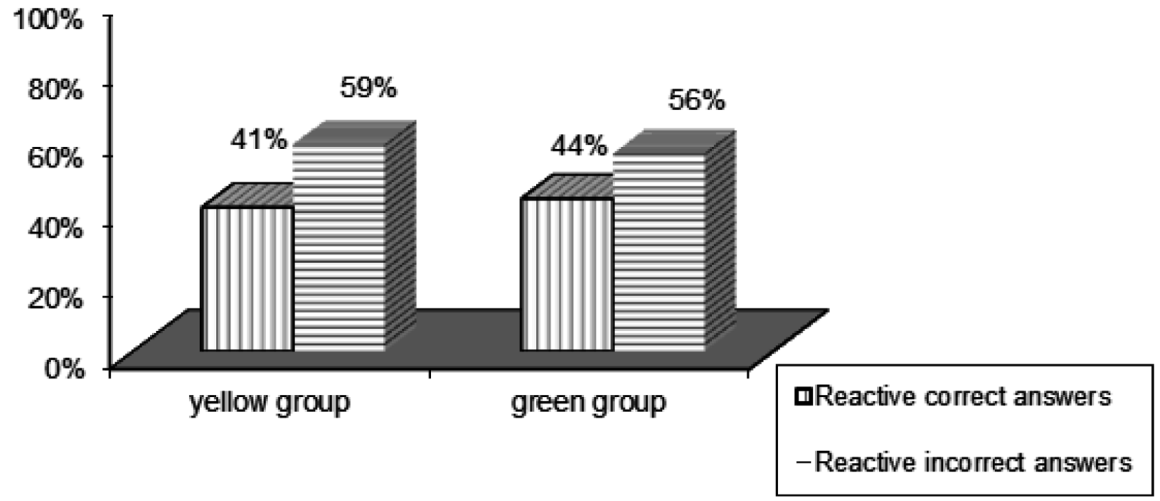

The frequency histograms for each group of students showed that five students missed all the questions, a sharp contrast to the rate of Proactive group students who got two and three answers right, 12 and 13 students, respectively. In the Reactive group, that number drops to three students who got two questions right and four students who "aced" the assignment, that is, three questions.

Via the Kolmogorov-Smirnov test we found that the data do not follow a normal distribution, considering the test's statistics showed significant results ($p=0.00$) at the 5% level for both hits and misses. Based on those results, we chose to conduct a non-parametric test to compare the hit and miss averages obtained by Proactive and Reactive groups. Therefore, to ensure this study's statistical treatment, we decided to replace the student's t-test with Mann Whitney's U test.

The statistic result of the Mann Whitney's U test for the difference between the two samples' averages, both for hits and misses, was $p= 0.014$, that is, the samples showed a significant difference ($p<0.05$). Hence, the pilot study statistical analysis also confirms our study's hypotheses (h0 and h1).

An important fact to be considered when evaluating the results obtained is the criteria that may influence such results, such as the students' familiarity with computers and the Internet, that is, how confident they are using the equipment. In such context, a quantitative analysis of the opinion questionnaire the groups filled out may bring relevant contributions. In that sense, two important issues were evaluated.

We found that 54% of the students in the Proactive group have a computer at home, while 47% in the Reactive group do. It is plausible to assume that the great disparity between the groups was not the product of that factor, considering that a difference of a mere 7 percentage points was seen in that analysis. On the other hand, we found a balance in the percentage of students who have Internet access at home. That observation shows that using virtual environments is not something new for the students in both groups.

CONCLUSION

At the end of this research phase, we concluded that the students' assessed performance showed considerable discrepancies between the groups that completed assignments with or without the aid of interactive multimedia resources. The discussion of the results in the previous section- confirms such statement. The various multimedia elements made available for proactive assignments served as efficient aids for students to achieve greater success in their tasks. The selected media options such as text & images, only text and interactivity proposed for the digital activities will also contribute to the results obtained. The activities described as reactive, i.e. running text, required a higher degree of concentration and prior knowledge from students regarding the topic addressed in each question, considering running text was the only aid the students had to complete the activity. A few factors that might have influenced the results were discarded after an evaluation of the opinion questionnaire filled out by the students at the end of the activities.

The results obtained so far are compatible in some aspects with those indicated in the studies by Evans & Gibbons (2007) and Wang, Vaughn & Liu (2011), and confirm the principles of interactivity and multimedia proposed by Richard Mayer. Based on Evans & Gibbons' work (2007), we chose to split the research groups and the statistical treatment adopted. We also followed the authors' guidelines regarding the statistical treatment and therefore adopted the student's t-test. As explained in the previous section, we felt the need to expand the study and change the statistical treatment, and studies are being conducted in that respect. The purpose is to explore the effects of interactivity in a real-world classroom along with teaching strategies, instead of in a lab, respecting the students' prior knowledge regarding a specific subject (Wang, Vaughn & Liu, 2011).

The use of the BrOffice tool with programming resources (macros) allowed the researchers to develop an interactive material according to the standards deemed pertinent by the authors mentioned in this article, in the first part of our research: the pilot study. We are currently working on the design of new Macromedia Flash-based educational materials. We have expanded the types of multimedia and the interactivity levels to be studied.

The results achieved up to this point reinforce the need to present and explain the multimedia material before the experiment. The fact the researcher was frequently at the school brought positive aspects to this study. For instance, the students are more familiar with the activities being carried out in the computer science room and use the materials included in the research more naturally.

One of the negative aspects detected so far is the issue that regular teachers hardly ever use technology in their classes. Technology-wise, we have found the extremely slow speed of the Internet connection provided by the government to the school and the lack of regular equipment maintenance and software updates. The computers are no longer under warranty. At this time, there are no plans to replace or recycle them, and the hardware will soon become technological scrap.

Finally, we consider that the greater contact by the audience studied with computers and the Internet, as shown by the opinion poll, and the fact of planning and giving assessments such as the Brazil Test (INEP/MEC) using multimedia resources thoroughly related to the subject of study may be motivating factors and help students perform better. We would like to point out that it is important for the audience studied that activities be prepared and explained in an intelligible manner that considers the students' age and cognitive level.

In the next phases of this study, we are going to look deeper into our statistical analysis by using data from the new experiments encompassing the new types of educational multimedia, before-and-after knowledge tests, and the opinion questionnaire filled out by the students.

Technologies exist at the school with some limitations. Due to the geographical location, Internet connection has low speed. This Internet low speed was a limitation for the study since it was not possible to use multimedia material with videos or animation.

The study is not finished yet and the data gathering within the school will continue until 2013 end. The study is rich in information about the students' usage of technologies, in spite the economical and social limitations of the population inhabiting the outskirts area. The investigation time and work within the school is very important and revealing.

It was found in the public school searched that most higher education teachers, do not demonstrate sufficient knowledge or skills for planning and pedagogical use of ICT in their teaching and learning dynamics. This reality implies not only the lack of use or wrong use of ICT in educational activities with students by teachers. However, this perspective in particular, is not exclusive of the School researched (ICT Education in 2010 and 2011) and drives greater attention from institutions, especially of Higher Education ones, to correct any faults that may be in the teachers formation programs. Here is another important contribution of this study.

KEY TERMS AND DEFINITIONS

Grade School: Is one of the Basic Education levels in Brazil. The Primary Education is mandatory and free. It is divided into Early Years (from first to fifth year) and Final Years (from the sixth to ninth grade).

Interactive Multimedia: Material that carefully combines different media types and levels.

Interactivity: In this study, interactivity is the result from the actions between the user and the multimedia.

Multimedia: Term that refers to media mix.

Multimedia Educational Material: Expression including educational materials combining different media, eg: text, images, audio, animations.

Multimedia Learning: A term which refers to learning that results from the careful selection of media combination.

"Prova Brazil" (Brazil Test): Is a diagnostic evaluation in large scale, aiming to evaluate the quality of education in Brazil. It is base on standardized tests and socioeconomic questionnaires. Developed by the National Institute of Educational Studies Anísio Teixeira (INEP/MEC).

Chapter 12
Transforming Digital Literacy with Culturally Diverse, Personalized Learning

Patricia Donohue
San Francisco State University, USA

Kevin Kelly
San Francisco State University, USA

ABSTRACT

The chapter reports on the research and efforts of two faculty members in an Instructional Technologies (ITEC) Master's program to transform their undergraduate and graduate courses into culturally sensitive personalized learning experiences in media literacy education. The 20-year-old ITEC program needed upgrading to meet the paradigm shift in new technologies and global education that its students would enter on graduation. Cultural and social justice issues have been the mission of the University for 40 years and that dimension of media literacy education was missing from the ITEC curricula. Researchers found that introducing techniques of gamification, heutagogical methods, and universal design for learning principles into their online and blended-learning courses provided a way to help students personalize their learning experience and interact more engagingly with each other, and to master the media literacy skills being taught.

INTRODUCTION

This chapter describes our improved understanding about how to teach digital literacy and why to undergraduate and graduate students. We are faculty in the Instructional Technologies (ITEC) Master's program San Francisco State University (SF State). The program is part of the Department of Equity, Leadership Studies and Instructional Technologies in the Graduate College of Education (GCOE). The ITEC program prepares pre-service and in-service teachers, corporate trainers, and a variety of other students in instructional design[1] (ID) using technologies. We were both Master's students in the ITEC program in the 1990s, graduated with our Master's degree in Education: Instructional Technologies and

DOI: 10.4018/978-1-5225-3822-6.ch012

went on to doctoral programs before returning to SF State. We both held administrative positions and currently are faculty. We both have experience in teaching in various environments and have business experience serving the education sector.

We came to our current knowledge of the critical importance of personalized, culturally relevant approaches to teaching digital literacy when we tried new methods in two of our courses that flipped the learning control from us as instructors to our students. We came to see an effective digital literacy curricula must incorporate two approaches:

- **Personalized Learning:** Addresses individual learners on the basis of their learning styles and needs, and empowers a self-directed learning process.
- **Culturally Diverse Learning:** Addresses the cultural/ethnic background of experience, personal perspective, and point of view of every learner. It often infers a broad swath of diverse learners.

Digital Literacy education requires each learner to grasp unfamiliar terminology, learn skills for unfamiliar tools and interfaces, and apply complex ideas and skills to digital interactions. Digital Literacy involves sophisticated skills and knowledge (see Hinrichs & Coombs, 2014). We realized we could not begin to teach the full set of digital literacies to our students without addressing each individual's ability to learn and practice them. Our courses would need to re-shape instruction to address culturally diverse, personalized learning perspectives so that we could enhance our learners' experiences and thereby their retention of the complex digital literacies covered.

We knew from our combined experiences in teaching instructional technologies that students responded with more energy and greater interest when they interacted with newer technologies such as games, augmented reality, Wii remotes, and multiple-player or collaborative online challenges. We also knew that many of these technologies would leave some students behind for multiple reasons, such as disinterest in games, lack of technology access, or lack of accommodation for disabilities. Our students must learn the technologies taught in the program and as instructional designers must learn how to incorporate the technologies into instruction. We knew we had to shape our courses to new realities: that technologies for learning were rapidly emerging, that current student expectations about technologies had changed, and that students' skillsets were different, especially their knowledge of how to operate and apply the newer, emerging technologies. We established the following goal for our studies that would seek students' increased knowledge in digital literacies by applying methods to improve their personal learning and by giving them culturally relevant experiences in the courses.

The following pages present two case stories from the ITEC program – the case of ITEC 299, *How 2 Lrn w Ur iPod*, a digital literacy general education (GE) course for undergraduates, and ITEC 830, *Designing Learning with Emerging Technologies*, an advanced graduate course for preparing ITEC students

Table 1. Changes to courses; Table shows modifications to course methods to improve student retention and digital literacies

Methods	Changed	Goal
1. Gamification mechanics 2. Heutagogical strategies 3. UDL principles	1. Personalized Learning & 2. Culturally Diverse Learning Experiences of students.	To improve retention and application of digital literacies

in instructional competencies for using emerging technologies to best advantage in their instructional designs. The stories offer rich description of our efforts to improve the digital media literacy curricula of our two courses to become more culturally responsive, personalized, and student-centered. We report what we observed ourselves and heard from students. The first story covers the case of ITEC 299 that prepares undergraduate students in how to learn and teach themselves using today's technologies. The course is delivered entirely online asynchronously. The second story covers the case of ITEC 830 that prepares students in using emerging technologies. This course was given a heutagogical modality to encourage students directly to learn new technologies. The second story also touches on related discoveries from two additional ITEC courses: ITEC 800, *Theoretical Foundations of Instructional Technologies*, and ITEC 860, *Distance Education.*

Significance of the Research

Developing 21st-Century skills (Partnership for 21st-Century Skills, n.d.) and global competencies are recognized today as required skills for preparing students to become more fluent with the digital, global communications' world they encounter when they graduate. However, students' cultural knowledge and worldview deeply impacts how they interpret what they learn (Michie, 2004). In today's classroom, the use of information communication technologies (ICTs) dominates much of the delivery of instruction and information. As a result, students need to be prepared in the effective and appropriate use of online and 21st-Century technologies to be successful in the classroom or training room and as global digital citizens.

Cultural and personalized attention to digital literacy instruction was the focus of the Association of College and Research Libraries' (ACRL) publication of a set of Diversity Standards for information literacy (ACRL, 2012) and has garnered the attention of researchers in education (e.g., Hobbs, 2005; Michie, 2004). Recognizing these two needs in addressing digital literacy, our pedagogical methods tapped into current pedagogies that incorporate both approaches (cultural and personalized attention in the learning environment): gamification, personalized learning methods, universal design for learning (UDL), cultural strategies in the curricula, and metalearning techniques that help students with deep thinking.

Students need to know how to comprehend context, evaluate implied values, and break down assumptions before any lessons can impart meaningful learning (Lorenzo & Dziuban, 2007). When digital messages are hidden in subtext, skewed to one interpretation, or outright deceptive, the viewer/listener needs effective skills for analysis – skills that are learned. However, before a viewer/listener can analyze subtext, he/she must know how to parse through his/her own cultural and personal context, values, and assumptions. An effective digitally literate person understands the role that he/she brings to interpretation of a media or digital content. We turned to the methods mentioned above to help prepare students for the five competencies outlined by Hinrichs and Coombs, Critical Digital Literacy Explained (2014):

1. **Persona:** The identities we inhabit in the digital world.
2. **Using:** How to use the tools and techniques of digital literacy.
3. **Decoding:** How to cipher and decipher the messages in the digital world.
4. **Meaning Making:** The pro-active role of the learner and user in understanding digital messages.
5. **Analysing:** Analyzing the context of the digital world.

Our pre-study investigations showed that ITEC students were not learning the digital literacy skills sufficiently and some of the reasons seemed to be large differences in students' knowledge and expertise with the technologies and the inability of the courses to address many students' learning needs. We recognized that effective teaching of digital literacies meant teaching learning literacies first. We needed to prepare students in the metalearning and deep thinking techniques that digital literacy requires and we would have to meet students on their individual personal and cultural ground if they were going to understand what these literacies meant and how to use them. We would need to encourage self-efficacy in learning new technologies and prepare students to teach themselves to decode, analyze, evaluate and make meaning (see Hinrichs & Coombs, 2014 framework) of the digital sites and messages they encountered.

The three methods we studied – Universal Design for Learning principles, gamification mechanics, and heutagogical approaches to instruction – are methods that focus on strengthening students' capacity to learn and retain content. This was our goal – to improve students' retention of the digital literacy skills covered in the courses. It also speaks to the following significances in our research.

The ITEC program prepares instructional designers for industry and in education. Students must be well versed in how to manage their way around existing and emerging technologies, how to comprehend the digital implications in their instructional designs, and how to build digital competencies in learners. ITEC is the only program in the GCOE that focuses on preparing educators in a comprehensive program of skills' development, fluency with, and application of technologies for learning. The program was one of the first in the university to develop and apply the HyFlex^2 (Beatty, 2006) model of blended learning delivery throughout its courses. In 2014, the ITEC program required all courses to be offered in HyFlex, thereby living up to what it taught.

There are two other points of significance to our research. The first is that while ITEC has spent 20 years teaching educators how to use technologies in their instruction, it has spent less time on the concept of digital media literacy (see Definitions) and the breadth of knowledge and skills that it covers. The second is that despite the facts that social justice has been embraced by the University for decades, is a commitment of the ELSIT department and the GCOE as testified in their mission statements, that the ELSIT department offers an Equity and Social Justice M.A. program, and SF State was the first to create an Ethnic Studies program in the U.S., ITEC has never directly addressed ethnic, cultural, racial or bias issues in the design of instruction, in the applications of media and technology to learning, or as a major component of digital media literacy.

Research Objectives

Our goals for our course work have been defined above as the learning and retention of knowledge in three digital literacy areas. Our pre-assessment of learning needs showed us that many students – graduates and undergraduates – were under-prepared for either role, to learn or teach with technology. Clearly a stronger preparation in digital literacies was needed. We set three objectives for ourselves to reach our goal of improving digital media literacy education for our undergraduate and graduate students:

1. Instill in students an awareness of personalized learning and cultural literacy when using, and designing instruction with, technologies.
2. Evaluate the effectiveness of gamification, heutagogy, and UDL to improve student engagement, content understanding and knowledge retention.
3. Evaluate the application of digital media literacy in online and blended-learning environments.

BACKGROUND

The Case for Digital Media Literacy Education in ITEC

Most educators today have a clear sense that K-12 students need to be better prepared for a digitally literate world and that both students and their teachers only partially understand what that means (Lorenzo & Dziuban, 2007; Lorenzo et al., 2006; Menton, A., 2014; ICT Literacy Panel, 2002; Kubey, 2004; Partnership for 21st Century Skills, n.d.; Pew Research Internet Project, 2014). Most K-12 teachers know that digital media literacy is a critical 21st-Century skillset, but they often do not have a full understanding about how to teach these skills. Complicating this situation is teachers' lack of knowledge about the cultural literacy that undergirds and defines media and technology use, much less how to address it in digital media literacy education – a fact that Paulo Freire (1970) would point out needs swift correction.

The job of the ITEC program is to prepare classroom teachers and a variety of other instructional design professionals, including corporate trainers, global online learning specialists, and software developers working in educational product development. Digital literacy preparation in all contexts is vital. ITEC prepares students in the design of instruction using a variety of media and technologies from across a changing panorama of choice. The ITEC student's objective is to find those technologies that can support and enhance the learning they are designing. They need to know the digital competencies required by each. Students are confronted when they enter the program with the fact that they may be very fluent in social media, mobile applications, ICTs and other technologies they use on a daily basis, but have never considered how technology may help people learn. Most ITEC students are at a loss at first to consider what goes into designing an instructional experience that uses technology to improve the learning tasks. It was obvious when we analyzed our current program and its historical record that we needed to more effectively prepare students in a digital and media technology fluency.

We had gaps. ITEC students needed to learn the three digital literacy areas identified in our goals. They needed to learn how to teach those literacies to others. More importantly, they needed to learn, as did we, how to address the cultural implications of digital media use and how to raise the cultural awareness of others. Media literacy has become a required passport for digital citizenship in the global education marketplace today. We clearly needed to raise the bar on 21st-Century skills we were bringing to ITEC students and to credential and education candidates, as well as to those who were going to go into corporate training in companies anywhere in the world. The big question was how to raise ITEC students' cultural awareness in themselves and in their designs. The three methods chosen focused on individualizing and personalizing instruction in non-threatening and engaging ways, thereby opening the door to reflect on and observe cultural implications across the digital landscape.

Digital Media Literacies Addressed

Information literacy has been defined as the "basis for lifelong learning" (Association of College and Research Libraries, ACRL, 2000, p.2) by the ACRL in their report, *Information Literacy Competency Standards for Higher Education*. The global information society that has evolved today makes information technology the primary source for access and processing of information. The technology also inserts a medium between the sender or developer of information and the receiver, opening up potential gaps for miscommunication (Shannon and Weaver, 1949). The ACRL report notes that information literacy has "broader implications for the individual, the educational system, and for society" (p.3). Quoting the

National Research Council 1999 report, *Being Fluent with Information Technology*, the authors explain, "fluency with technology focuses on understanding the underlying concepts of technology and applying problem-solving and critical thinking to using technology" (NRC, 1999, p.3). The report makes a distinction between information literacy (a focus on content, communication analysis, information searching and evaluation) and information technology fluency (a focus on deep understanding of technology and graduated increasingly skilled use of it" (p.3).

George Lorenzo and Charles Dziuban (2006) in, *Ensuring the Net Generation is Net Savvy* raised the question of whether educators should be concerned with information literacy or the greater need for *Information Fluency* and *New Media Literacy* (or digital literacy with new media). However, the new media literacy, they explain, comes with a darker side that makes it more important than ever, even suggests urgency, that students become better informed:

Media products entertain us, inform us, and help us stay connected to our community and the world. But not all is positive. Public relations spin, hyper-commercialization, violence packaged as "entertainment," news bias, digital photo manipulation and other issues provide many reasons why both children and adults need media literacy education. (Lorenzo and Dziuban, 2006, p.4)

They explain that students are in greater need of information fluency as described by the 1999 National Research Council report, *Being Fluent with Information Technology*. FIT students as described below in the Definitions section, are persons who are "able to express themselves creatively, to reformulate knowledge, and to synthesize new information" (Lorenzo and Dziuban, 2006, p.4).

There is little disagreement today over what *Media Literacy* means (see Definitions below). The problem in identifying what we should be teaching is that the meaning of media literacy has evolved over the years as technology and media have changed. The Center for Media Literacy (2001) reports agreement on the original meaning of media literacy in the United States derived from a 1992 Aspen Media Literacy Leadership Institute, as, "the ability to access, analyze, evaluate and create media in a variety of forms" (Par. 2). The National Association of Media Literacy (2014) later adopted a small but significant change in the definition to be, "the ability to access, analyze, evaluate and COMMUNICATE INFORMATION in a variety of forms." This change signals a large shift in our classroom attention on what we teach students, even to the point of recognizing we may need to prepare students as much for information and communication fluency as for literacy. We determined that we needed to focus on literacies of media and technology use, cultural inclusion in media and technology use, and application of these literacies in an online environment (See *The Online Challenge* below). The skills and competencies identified in the Definitions section below were targeted in our investigations.

ITEC students are learning how to build their technology fluency so that they can use and tap into the power of technology to improve learning through instructional design. However, to be information fluent, an ITEC student needs first to be fully digitally literate in all the five dimensions that Hinrichas and Coombs (2014) identify in their framework. An ITEC student should be able to identify a learning need, determine a technology that can assist in meeting that need, and then design a learning experience that incorporates best practices and integrates the technology into meeting that learning need. An ITEC student must work to improve their own media literacy and information technology fluency, learn to pay attention to and teach media literacy to their learners (classroom or corporate), and design instruction

that uses media literacy as well as pays attention to what each learner brings to the learning context from their own background, history and experience. Digital Media Literacy is the foundation stone of skills and understandings that are needed before any learner, teacher, or instructor can expand into information culture or information literacies. The ITEC student's charge could be: First know the technologies and the skillsets they require. Then use them effectively to learn more.

The Case for Addressing Cultural Literacy in ITEC

ITEC courses have historically taught media use for designing learning, but without attention to the cultural implications in the instruction they design. The proliferation of technology has bred numerous learning systems and methods of information search and dissemination. This onrush has surpassed ITEC's ability to keep up with all the new technologies, making media literacy education increasingly critical for ITEC students. In order to bridge the knowledge gap between knowing how to use technologies and being fluent in their application, we realized we needed to address a cultural digital gap. One missing ingredient in our digital media literacy education efforts, as previously noted, has been preparing ITEC students to understand the cultural impacts on learners. Cultural response deeply affects how instruction is interpreted, students' understanding of the instruction, and their recognition of the importance of what they are learning (Michie, 2004; Smith & Betancourt, 2007; Agarwal-Rangnath, 2014; Sieck, 2013; Ross, 2005; Causey, et al., 2000).

We approached the inclusion of cultural awareness in the ITEC curricula from Michie's (2004) article "What is a Culture Broker" that views the teacher as a "culture broker." She suggests there are two conflicting views of teacher as culture broker coming through the literature: 1st) the role of teacher should be "filled by someone from the Other and that teachers are better off searching for the best person to fill the role"; or, 2nd) any teacher can, "develop a set of skills to become more proficient in their cross-cultural classroom, with the implication that upon attaining them they would have achieved the role of culture broker" (par. 5). A critical concept for us was recognizing her criticism (quoting McKinley, 2001):

[the] Assumption that western science teachers only need to learn how to deal with pedagogical aspects of cross-cultural differences, rather than dealing with the teachers' views of their students' abilities as learners or the validity of their knowledge. The second criticism is that if white teachers can learn to become culture brokers, then seemingly there may be no role for indigenous people in the educational enterprise. (Michie, 2004, par. 9, in What is a Culture Broker)

Our question became: How do we incorporate cultural brokering from a diverse faculty to a highly diverse student population across all ITEC courses?

The ITEC program has always been a diverse program, crossing ages (from 21-71 years of age), cultures, nationalities, ethnicities, and varying levels of knowledge and skills. Over the past decade, the international student population has steadily expanded, bringing in Mainland Chinese, Japanese, Southeast Asian, Middle Eastern, Arabic and Israeli students, and students from Russia, Southern Europe and the Baltic countries. The international student enters the program with different cultural understandings and values towards media use, media products, and how to teach. From our experience, we noted that they have a different knowledge of other technologies and less about American-based technologies. They

are often more skilled and aware of search and research methods than their U.S. counterparts. They also struggle the most with language comprehension in a program that is highly technical in digital tools and pedagogical theory. In addition to this range of diversity, there appears to be an increasing gap between those who enter with little to no technology skills and those who enter already using several advanced technologies. We also noted there appears to be no common digital literacy attributes across our population.

The same struggles and lack of literacy common ground is also reflected in domestic students. At SF State, the dominant cultures, in addition to the minority Caucasian students are Latino/a's, Asian American and African American. The result in our view has been that this expanding diversity has lost its common ground: students do not work as well in groups, do not engage smoothly in discussions, and have difficulty understanding what digital instruction means, much less how to create it. Informal feedback from students in recent semesters indicated students wanted to learn more new technologies (than they were currently getting) and how to apply them effectively to boost their teaching and training efforts – in the US and abroad.

The challenge for teaching cultural literacy in our courses we determined was the necessity to build common ground for communication.

The Online Challenge

SF State is being challenged to go fully online as much as possible. The California State University System (CSUS) has experimented with online learning initiatives for a few years and currently offers faculty grant incentives for proposing online courses that can be implemented across all campuses. Fueling the online drive are erratic enrollments in ITEC's F2F attendance. ITEC has been teaching online and in blended learning formats for many years, but up until the past 2-3 years, an ITEC course was most likely to have a majority of students in the classroom with a few students in the online synchronous system. For the past year or so, we have noticed that percentage has flipped.

For this study, we recognized the increase of global education issues, cross-cultural misunderstandings and an increase in online learning presented us with new challenges. Comprehension of material or solving a communication misunderstanding is difficult face-to-face but cannot be solved at all or as easily in an online environment. Separate the teaching, the learner, and the instructional mentor and the communication challenges triple. This year our ITEC efforts have included experimenting with how to raise and encourage the participation of all students in the program's blended-learning environment, and how to, given that environment, encourage students' deeper thinking about technology – its uses, drawbacks, applications, and powers to affect human behavior.

We were already familiar with methods for teaching media literacy online but needed to improve our attention to media literacy education. Teaching issues and impacts of cultural awareness in the online context proved to be a greater concern. Addressing culture would mean applying communication solutions. It would mean:

Greater attention in classes to the cultural issues;

Adapting the LMS (iLearn) interactions to accommodate cultural recognition of issues and possibly including a space for offline chatting;

Adding a new cultural dimension to the Instructional Design frameworks taught in the program.

CHAPTER FOCUS: A STUDY OF TWO CASE STORIES

Methodology

The research we began in fall 2014 investigated how effective the pedagogical applications of gamification, heutagogy and universal design for learning practices could be in engaging learners in course content and helping them to think more critically about what they were learning. We added to our course contents development of metacognition or metalearning skills and media literacy fluency. We also began at different levels in our courses to investigate development of a cultural literacy in students' work that could be translated to the increasingly online environment.

To conduct our research, we chose a participatory case study approach that would allow getting as close as possible to student thoughts and understandings on the two issues of concern: media literacy education and cultural literacy awareness. We chose the three applications of gamification, heutagogy, and UDL in the courses because we had already been working with these pedagogical techniques and found them to be effective at giving students the personal and 21st-Century skills to engage in teamwork, sensitive communications, and deep or critical thinking on content that traditional methods of instruction did not accomplish. We wanted students engaged; we wanted them to "get" metalearning techniques; we wanted them to be capable and willing to think deeper about issues raised. The pedagogical techniques were effective in helping students build self-efficacy around content learning, and a sense of autonomy and control over their individual learning. If these strategies worked, we assumed we could transform our online course environments to show a cultural inclusiveness in discussions and possibly an excitement about applying new technological achievements to the design of instruction for a deeper learning.

Our observations to-date have shown positive results in our methods and in what students have learned. The two case stories below outline our research.

ITEC 299 Case Story

Instructor: Dr. Kevin Kelly

How 2 Lrn w ur iPod - Lessons from a Course About Metacognition

About the Class and its Students

How 2 Lrn W Ur iPod is a large section, fully online course in the Instructional Technologies Department at San Francisco State University, serving 150 to 300 students per semester. The class satisfies General Education requirements related to lifelong learning and development. As a result, it attracts a diverse group of students. Over the last five years, students in the class have belonged to almost every major, including pre-service teachers in Elementary, Secondary, and Special Education. Similarly, students at every grade level—freshmen to super-seniors—and representing different age brackets—recent high school graduates to returning adult students, including retirees over 65—have enrolled and participated. Further, at San Francisco State, students speak over 100 languages other than English as their first language at home. This sometimes makes basic literacy as important as media and technology literacies. Last, but not least, students enter the class with varying levels of technological experience.

The highly interactive class uses constructivist methods to help students improve their learning, with or without technology. When the department chair asked Dr. Kelly to create the first-ever undergraduate course for the department, he conducted a needs assessment to determine what skills undergraduate students need most to succeed academically. He found that most higher education students have not learned how to learn. Further, even those students who are savvy about using different technologies for communication or entertainment have little idea about how to use those same technologies for learning purposes. Therefore, the class lessons and activities focus on multiple forms of literacy.

Developing Global Competencies through Multiple Literacies

First and foremost, students learn to evaluate digital information for reliability, validity, and bias, since they consume, use and cite resources and content created by a wide range of people. They are taught to check sources, check facts, ask questions of content providers and conduct peer evaluations. They are given different scenarios to evaluate so that they can see where information is biased or unreliable. Since the course is about learning how to learn with technology, the course content changes every semester. New technologies emerge, while some technologies disappear after they lose support or funding from their creators. Studies of the brain uncover new facts about how humans learn. With no regular textbook available, the instructor creates short mini-lectures and provides links to resources that he vets first. As the class follows Universal Design for Learning principles (described in more detail below), the instructor finds resources provided in media formats other than text. In order to encourage exploration, students are asked to support any arguments they make by finding information above and beyond the information and links that have been provided. However, before the students may begin any of this work, they must complete an activity on evaluating web-based information so they are prepared to question facts and ideas they find.

The course itself is built around developing technology literacy. Students learn how to use as many as thirty mobile, computer, and web-based technologies to facilitate learning improvement in any and all subject areas. They investigate personal learning with mobile devices, such as smart phones, tablets, and clickers; mobile apps and services; subscription services, such as microblogs (e.g., Twitter) and blogs; and individualized environments, such as intelligent tutors and electronic portfolios. They explore collaborative learning through social tools, such as discussion forums, wikis, and online phone services (e.g., Skype); and social environments, such as social networking sites (e.g., Facebook), massively multiplayer online games (MMOGs), social bookmarking sites (e.g., Diigo), and virtual worlds. They research interactive learning through tools and practices that generate different types of media, such as lecture capture, podcasts, screencasts, digital storytelling, digital comics, concept maps, virtual labs, and media sharing sites (e.g., Flickr).

Succeeding in the course is possible only if students develop media literacy. To perform preliminary research, students learn to access and analyze multiple forms of media, including text-based media (e.g., blog posts, infographics), audio-based media (e.g., podcasts), video-based media (e.g., vodcasts, screencasts) and more. After they have gotten a good understanding of a topic, they must demonstrate their knowledge by creating and using those same forms of media.

Applying Universal Design for Learning Principles

After just one, highly successful and over-enrolled semester, our department chair changed the class format from hybrid to fully online, with a primary goal of increasing enrollment. Recognizing it would be more difficult to accommodate more students' needs with fewer opportunities for direct interaction, the instructor turned to Universal Design for Learning (UDL). The UDL mantra is "teach every student." As a result, he redesigned the course based on the three core UDL principles—multiple means of representation, expression, and engagement.

To apply the principle of multiple means of representation, the instructor presented course content in different formats. In a simple example, mini-lectures were created for each course module. The instructor would make presentation slides, record the presentation as a screencast, save an audio-only version (i.e., mp3), and share his notes. Over time, he has worked on generating transcripts for each mini-lecture as well. This UDL strategy is also supported by education thought leaders like Michelle Pacansky-Brock, who found that students voluntarily opted to consume course content in different media formats. "40% chose to read the lecture, 15% listened to the lecture, 30% did both, and 15% toggled between reading and listening throughout the semester" (Pacansky-Brock, 2013, para. 12). Sharing content through different media formats supports the "teach every student" approach.

With respect to multiple means of engagement, the instructor offers several options to motivate students to persist and engage in class activities. We use a number of technologies—Twitter, social bookmarks through Delicious and Diigo, forums, wikis and more—to collaborate and build a learning community. Students apply what they learn by using media and technology strategies for academic, work-related, and personal aspects of their own lives. The instructor encourages them to help each other with issues they have as they use new technologies or familiar technologies in new ways.

When it comes to multiple means of expression, the instructor allows students to choose from different pathways to show what they know. They use multiple media formats and technologies to communicate with me, with each other, and with people outside the class. As a class, we discuss strategies for managing information about themselves and what they are learning. Students have regular opportunities for self-assessment, so they can monitor their own progress and take actions to correct mistakes. For peer review and instructor evaluation, we use rubrics that allow students to submit their work in different formats, such as essays, online presentations, screencasts, or videos.

Applying Gamification Strategies

As the class grew, the instructor sought to increase student engagement and motivation further. He turned the online class into an online learning game through several gamification strategies (Donohue, Kelly & Wilcox, 2015). Students begin by choosing their own learning paths—Learning Warrior, Learning Sage or Learning Guide—based on their personal goals—personal growth, new knowledge, or helping others.

Once they select a learning path, students complete "Quests" and Quest activities related to information, technology and media literacies for metacognition, or learning improvement. As they go through these Quests, they are asked to apply what they learn about learning with media and technology to other

classes they are taking concurrently. The Point Accrual grading system was adopted —i.e., there are twice as many possible points than they need to get an A+ grade. Everyone starts with zero points and earns points as they go as they would in a game. If students make mistakes, they can go earn more points elsewhere. Many students are thrown out of their comfort zone by this new grading scheme, since most other classes follow traditional grading schemes that subtract points from fixed totals.

The majority of Quests address using either metacognitive strategies or specific technologies to improve learning. Level 1 activities let learners show they can describe what the metacognitive strategy or technology is, what it does, and how it can be used for learning. Level 2 activities let learners show that they can use the strategy or technology for specific learning activities and evaluate or debate how effective that technology is for them. Level 3 activities let learners show that they can plan, execute, and reflect on personal growth activities that use a specific strategy or technology for learning in their lives and report what happens. Students may attempt as many activities as they want, in whatever order they like, to reach their goals and desired grade.

Other gamification strategies include levels, challenges, a leaderboard and gifting. Students earn badges to recognize achievement as they progress along their learning paths from Apprentice to Grand Master. They can also earn points by helping their peers.

Asking Students to Demonstrate Multiple Literacies

As we approach the last month of the semester, we begin the Student Perspective Quest. Through this Quest, students have an opportunity to share their thoughts about what they have learned with the rest of the world. First, the entire class compiles media and technology literacy strategies and solutions for every field of study represented collectively by all of the students. For example, a future high school math teacher shared a mathematical formula reference app for iPads and other tablets. Likewise, a future elementary school teacher shared a web-based, educational game that provides grammar and spelling practice for children in Kindergarten through eighth grade. Then the students break into small groups to answer questions about using a specific technology to learn. The teams submit these drafts for peer review, edit the drafts based on the feedback, and then submit final drafts for a class vote. Starting next semester, the projects that best represent the technologies from a student's perspective—i.e., as they pertain to supporting learning—will be posted publicly, as a way to share students' conclusions about technology literacy with teachers at all levels.

At the end of the semester, the students synthesize their individual experiences by presenting a collection of information in an electronic portfolio, or ePortfolio, to show that they have reached the seven learning outcomes for the class. For each learning outcome, students have the opportunity to submit a reflection that answers specific Synthesis Questions. Moreover, in accordance with UDL principles (Kelly, 2014), students may choose to submit each reflection response in any media format they choose—e.g., text with images, online presentations, audio, video, or multimedia—to demonstrate further mastery of the outcomes. If they choose formats that do not include a writing component, such as a screencast, then they must include a narration script.

ITEC 830 Case Story

Instructor: Dr. Patricia Donohue

First Lessons that Shaped an Understanding of the Power of Heutagogy

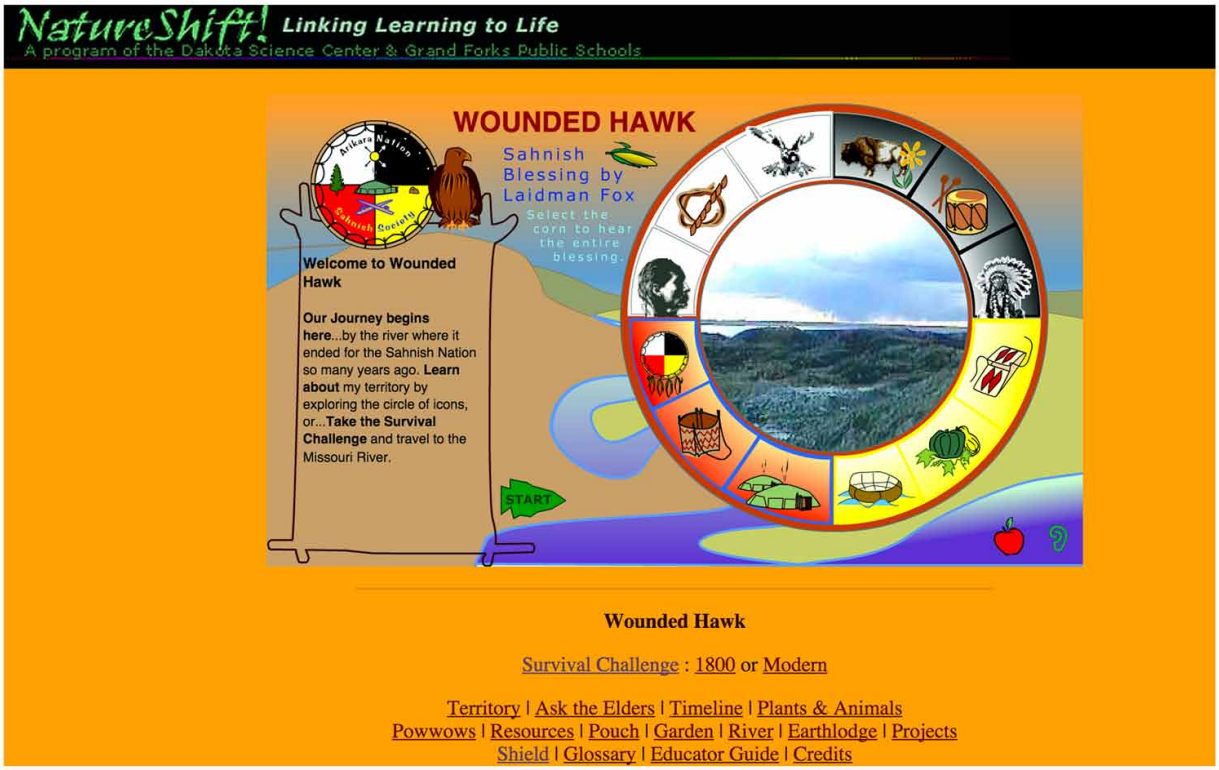
There was a missing component in the ITEC curricula that caught the attention of the instructor from the time she started teaching in the program in the fall of 2008. While ITEC curricula addressed multiple technologies and a broadly diverse student population, there was no recognition paid to the impacts of culture in teaching people how to use or how to teach others to use technology wisely in instruction. The instructor was convinced that ITEC needed to do more than talk equity and social justice. ITEC faculty needed to develop a transformational knowledge about how instructional technologies would be taught inclusively with deeper thinking about the implications for preparing students and future teachers for a globally interactive online world. Preparing ITEC students for a global digital literacy meant understanding the cultural and media literacies to be taught and to be used. The heutagogical approach relies on the principles of Personalized Learning as students must identify their own learning goals, pursue them, and deliver findings.

A Sahnish Lesson

This issue was brought to the instructor's attention from her time as Principle Investigator (PI) on a grant to prepare teachers in culturally responsive science and mathematics teaching using new technologies. The *NatureShift! Linking Learning to Life* project (www.natureshift.org) was a U.S. Department of Education TICG (Technology Innovation Challenge Grant) program with two goals; the first was taking new technologies for science and mathematics to rural schools across North Dakota and preparing teachers in their application using the *NatureShift* inquiry model. The second goal was to offer the same instruction through a website that teachers anywhere could use as a resource. The grant involved five major statewide partners in developing five science and history learning modules. One of the partners was the Sahnish Nation whose elders wanted to partner on the grant as a way to bring tribal knowledge to their young people and teach them a technology and media literacy not available at the time. They became the developers of the *Wounded Hawk* module because they would have the control to prepare and teach new learning in the right way. The image below (Figure 1) shows the website entry to *Wounded Hawk* module. Design of the entry page was one of the first of many lessons learned about culturally appropriate instruction. The designer who had prepared the home page used a Tic-tac-toe style of presentation where students and teachers could click on a square to access different activities in the module.

"Oh, No! That will never work!" said the elder who came to review the site. Sahnish children would not accept a square image as an entry point for learning. Learning was always associated with the Sun Wheel. The elders sat with the instructional designer and the web artist to create what is seen below. The entry is not only constructed as a sun wheel, but the learner who arrives seeking knowledge is blessed by an elder, and flown by Hawk into the wheel of knowledge to begin their teaching.

Figure 1. Entry screen to the Wounded Hawk module, designed for culturally relevant instruction in media literacies, new technologies, and STEM curricula; available at http://www.natureshift.org/Whawk/index.html



A Lesson of Mixed Ethnicities and Missed Communication

The second influence arose from several experiences with ITEC course teams who were assigned projects with clients. Students on a couple teams were of mixed ethnicities with clients from different cultural backgrounds. The challenge of working for a real client on a project with a time deadline always adds pressure for the students, yet in four years of doing client-based courses, the end products always were exceptional. It came as a surprise to discover these two teams had almost insurmountable problems related to issues of cultural misunderstandings that – it should be added – they had not been prepared in the course to address. One team worked successfully with their client but experienced severe communication problems on the team that required separation of team members from each other. The second team had a member who disagreed over the cultural appropriateness of instructional materials for the client and proceeded to argue, in-class and online, with the team member who had been the designer. The instructor and team members negotiated through a resolution without involving the client but it was disastrous for the members of the team and could have been worse if the client had been involved.

A Literacy Gap in ITEC Foundations

Prior to the fall of 2014, the instructor noticed that in spite of increased technical skills, students continued to demonstrate a lack of understanding about: a) Information security, intellectual property, and copyright issues, b) effective online and reference search techniques, and c) comprehension of the mediated nature of technologies, especially when it came to learning – an understanding at the heart of the ITEC program. The ITEC 800, *Theoretical Foundations of Instructional Technologies*, course covered the three classic theories of Behaviorism, Cognitivism and Constructivism. It also prepared students in new learning theories such as Connectivism, social learning and experiential learning theories and instructional concepts such as situated and distributed cognition – all with the idea of designing instruction effectively using those theories with appropriate technologies to impact learning. Out of the 18 members of the course in Fall 2014, seven were international students, four were returning Caucasian adults in professional careers, one domestic student was of Asian heritage, two were Latinos, one was a Latina undergraduate student and the remainder were of unknown ethnicity. Nevertheless, all 18 students demonstrated gaps in their knowledge of digital media literacies and the technologies they were required to use in the course. During the course, the instructor added a unit on media literacy and digital citizenship, and included instruction on the cultural implications for learning. Badrul Khan's (2001) *Web-Based Training* chapter on his *8 Dimensions of eLearning Framework* was added to the course to supplement the standard text and numerous online resources. This addition introduced new ITEC students to an integrated set of guidelines for online instruction that considered dimensions such as ethics and culture when designing online learning, not previously covered in other 800 courses. The capstone project was also changed to a personal project that was meaningful to each student. Students were given practice in blending instructional theory and technology in three smaller design projects where they were asked to focus on Behaviorist methods for one, Cognitivist methods for another, and Constructivist methods for a third. The practice designs prepared students to think critically about how to explain the integration of theory and technology into a learning activity.

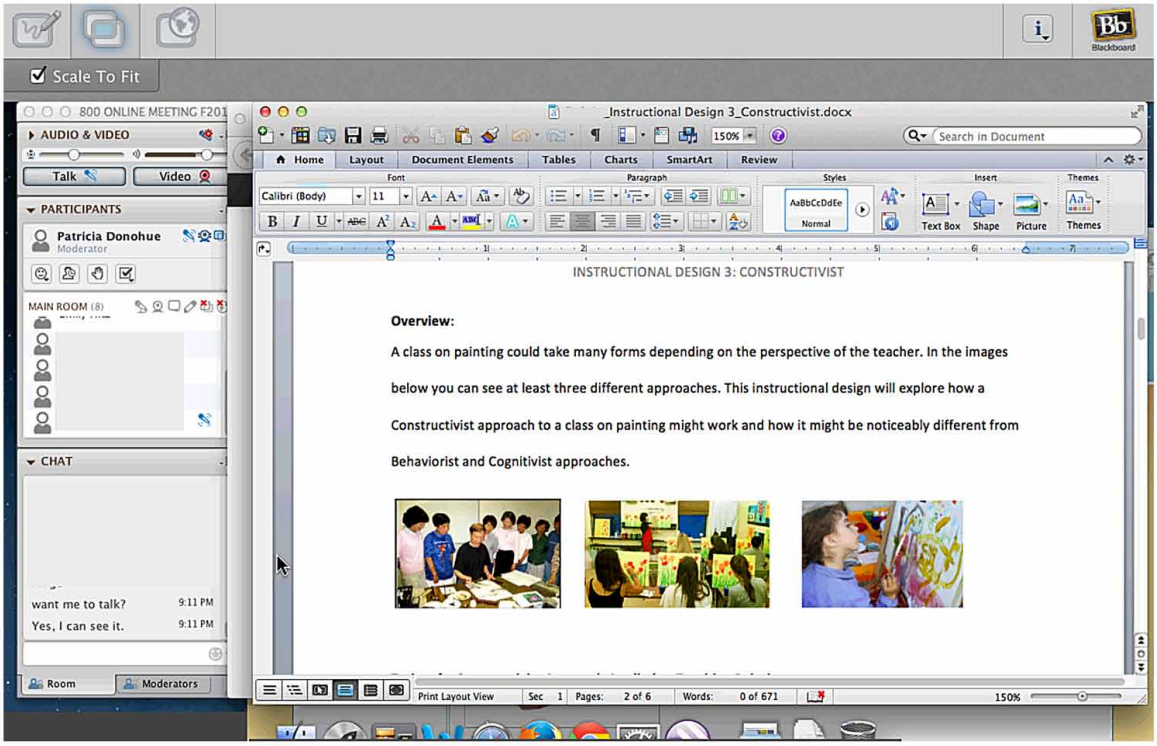
What Students Learned in ITEC 800

The instructor held a focus group towards the end of the 800 course with students before they had completed and presented their capstone projects. Students had presented their Constructivist based project designs before the focus group. The students revealed in the focus group the degree to which they had achieved an understanding of the uses of technology in learning. They also alluded to what they had "absorbed" about cultural relevance in their learning designs. Some comments are given below (names are changed for privacy).

Steve's Design: The first design was from Steve who is an elementary teacher and an online attendee. He shared his design over Blackboard Collaborate (Figure 2) with the class members in-person and online. He explained his Constructivist lesson and the principles he teaches:

S | I start from students' own suppositions about how to do painting. In the second picture, Teachers interact with students by seeking questions and respecting the students' "point of view." In the third picture, motivation is shaped by targeting students' interests and the relevance of the lesson to their personal lives.

Figure 2. Screen capture of Steve's online presentation of his Constructivist lesson



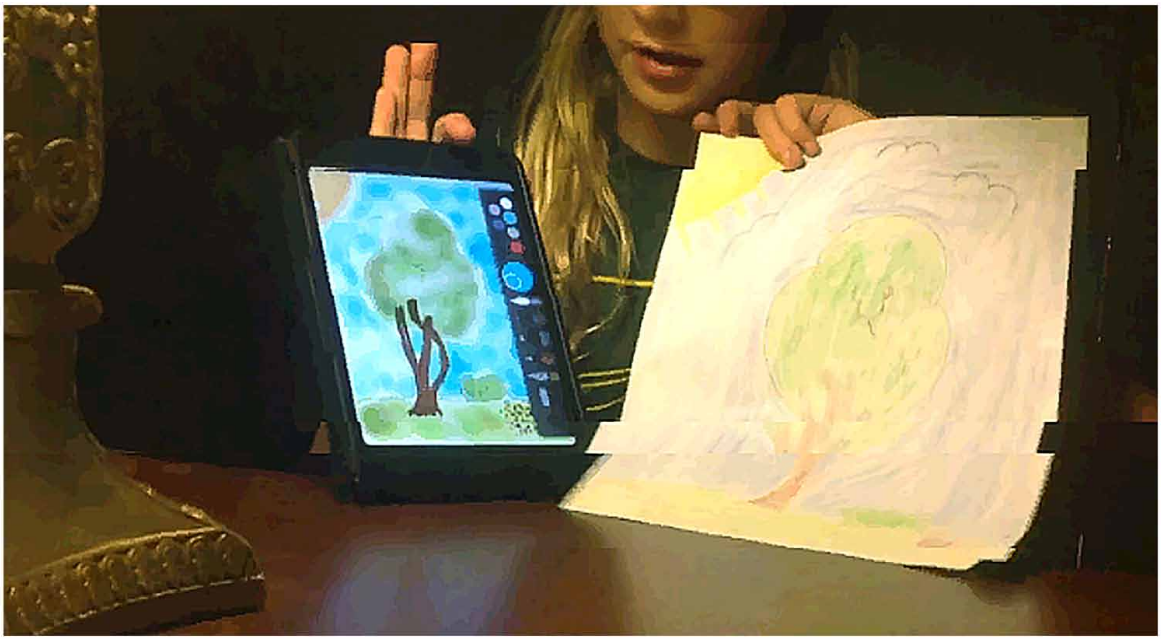
Steve's explanation shows a deep understanding of cultural and individualistic implications for his instructional design, a level of awareness not noted in prior 800 courses.

Melissa's Design: A second design was from Melissa who is a returning adult making a career change. She was neither familiar with many technologies nor with teaching when she entered the program. She had been very unsure of her Constructivist lesson but ended up doing a video of what her daughter learned through discovery learning how to transfer a skill at painting to the iPad. Melissa used two new technology tools (Figure 3), Prezi and video, to present her lesson to class members in-person and online:

M | I wanted to see if showing her the device and the application but letting her explore the application on her own would engage her and help her learn. The video shows my daughter explaining what she learned on her own: "So, you have to figure out how to change what you drew into something different using the tools. So I used crayons and changed to paintbrush and marker tools … it was hard but not difficult. I had to change the, the colors and on the application the colors are not right, so you have to figure out what to do.

Melissa demonstrated a new self-efficacy around the use of technologies and a sophisticated knowledge about how learning theories integrate with technology use to improve learning. As an adult learner, Melissa did not want to be told how to learn. She wanted to know what to do and then took the assignment to a new level of self-knowledge with just some encouragement.

Figure 3. Screenshot of Melissa's video showing her daughter's painting and its translation into the iPad application, Paint



What the ITEC 800 Foundations Class Revealed

A focus group question, "what are the things you think a young person needs to be digitally literate?" produced some interesting responses:

1. Knowledge of digital citizenship.
2. How to build a website.
3. Young children need motor skills first, like hand-eye coordination.
4. Understanding how the different technologies work together.
5. Analyzing what has gone wrong when technology breaks. Barbara explained:
   | I found in general, a lot of people know how to do things digitally, but have no idea how things happen. So, when it breaks down, they go "what do I do now?" It's broken!" And I think in addition to that, it's how do we ask the question? Digital literacy is about, "I can't figure out how to do something, but how do I ask the question to get help?" Online it is different how I would ask for help than in the traditional setting. Ask an expert; well, what if I can't find an expert; do I just email the professor immediately? What are the alternative steps to deal with my understanding?
6. Organizing your digital world. Franklin said:
   | for me it's like from when I was young, just trying to organize … how to set up files and folders … the software is hard enough, and there's navigating to what you want. I mean, I've seen adults' desktops just trying to wade through files and folders … (laughter and jokes) … I mean kids need to know that, it gives them an idea how to set up a work flow. It's a big skill later.

Barbara adds:

| so these are things that students really need to learn. They don't actually understand the structure. So, "it's on my desktop." But if you look through your desktop this way and you can't find it. It's like not understanding how it really works. I mean I've tried to do the Linux thing and it's "can you just TELL me where the folder IS?' (laughter).

ITEC 830: Design for Learning with Emerging Technologies

ITEC 830 is one of a three-course set that may be chosen to meet one of the ITEC program requirements. Because of a scheduling snafu, there were only eight students enrolled in the Fall of 2014. All eight students were well-established students in the program. It is noteworthy that of the eight students, three males were Caucasian, two females were Latina, two females were Asian (one American, one mainland Chinese) and one male was African American. The course requires students to investigate new technologies on their own, to create a sample instruction and present the technology to their peers with an explanation on how the technology impacts learning, and defending why it is an emerging technology. Given the small number of students in the course, the instructor decided to run the course along the lines of a doctoral seminar. Each week consisted of reviews or demonstrations of different types of technologies and how they could enhance the learning process, followed by deep discussions on what surfaced during the class or on topics the instructor brought in for the evening. The instructor told the class in the beginning with reminders during the weeks that followed that this course section was being run quite differently than normal. The instructor was running the course as a co-teaching experiment, that she was there to learn as well as instruct and students were there to instruct as well as learn. This nearly complete heutagogical approach was a leap of faith to see what students might learn. In addition to a personal project and several "demos," a third requirement was to produce a journal – preferably a journal using a media or technology. Throughout the course, the instructor kept a journal as did the students, and the instructor presented mini-demos as did the students.

What the ITEC 830 Class Revealed

Three quarters of the way through the course, the instructor used an evening to hold a focus group with the students on what everyone thought about how the course had worked. The instructor began by telling the students a large lesson she had learned over the course of the semester about failing to give timely feedback to students. That generated a large response including use a rubric on the demos so you can get feedback right away, and have students get feedback from peers. The discussion then led to a question about what worked in the class. Respondents agreed:

1. Bring in experts to show new technologies.
2. Have teaching moments where everyone can learn some new technology (like the Captivate class).
3. Specific comments suggested:

   Nancy | one of the things that is good about doing the mini demos as you go is that you get to learn some new things really well, and you get to learn about other people's technologies that you never knew or would not have learned yourself. Like M—'s Google Docs, I never knew lots of those tips that she showed.

Nancy | So can I go back to the feedback thing? You mentioned needing to get adults feedback sooner; but you kind of respond to us as a whole, and every class you try to say something positive [general agreement]. When you're trying to be creative and not succeeding, that is more important to us, to encourage. [laughter and agreement].

Daniel | Yeah. One of the things that really struck me was, more than emerging technologies, one of the things I'm learning is working and learning together. Kids minds are ever changing and one of the things I keep stumbling across is that the importance is always focused on the people, on learning. So you have this emerging technology and all this stuff but when you dig through the learning features and the way it works, and all, it comes down to what can we do to make people feel empowered to take this on itself and learn **on their own** trusting the facilitators. The reading comes back to this. That's one of the things I didn't realize I was going to get from this course that we are really empowering people to take responsibility to go with their own natural instincts for learning.

Ann | One of the things I'm relating to is last week's conversation …[joking and laughter because there was no class, but three people showed up and had a great discussion]. It connects with the Veletsianos' point about distance learning because this is something I've had to do a lot of reflection on. I'm taking another course and it is entirely online; I hate it.

Daniel | okay, I have to take agreement. I just hate online only learning.

Ann | …and I hate to say that because I love to learn. But, I don't love to learn in that format. I'm not motivated. I really read a lot of material, the Vygotsky stuff and Veletsianos. When he was writing about this distance learning thing it really hit me, "wow, this really doesn't work for me… that I'm not a digital native. So I go through all his reasons and wonder why is this not working for me, and there were several things But one of things I go back to our discussion last week when M— said it really does work for her.

A | So we were having this compare and contrast moment. So it was really revealing for me. And I said, "Really?" [laughter]. So it's something in my reflection journal.

The seriousness and depth of thinking in the fall 2014 830 class and the extensive discussions and sharing, were beyond what had occurred in the course in prior semesters. The result is that the approach is being used in the spring 2015 course. Many of the students' recommendations have been implemented. To date, students are responding very favorably to the course structure and individualized challenges.

Solutions and Recommendations

ITEC 299 Lessons learned

Support Students in Producing Media Formats That are New to Them

Students are well-versed in consuming different types of media—sometimes simultaneously. Anecdotes about college students portray them on both laptops and mobile devices while watching television. In her research, Pacansky-Brock (2013, para. 12) found that "30% of [her] students chose to listen and read [lectures] at the same time." On the other hand, students do not have as much experience producing dif-

ferent types of media. It is important to support students in this process, by providing links to tutorials and easy-to-use tools that you have reviewed or used yourself. The tutorials should cover all parts of the process—picking a technology, creating drafts, editing, and saving in different formats. Also, model creating your own resources in different media types if you want students to do the same.

Share the Significance of Multiple Literacies with the Students

We often hear the phrase, "Use the right tool for the job." The same holds true for media and technology. Encourage students to select the best media format for the knowledge or skills they are trying to demonstrate, even if creating something like a screencast or audio file will require a little more effort. This may include giving students guidelines for choosing what media format to produce. For example, they should consider making concept maps to depict relationships among course concepts. Provide real-world examples of how information is conveyed in different fields, such as visualization strategies for large amounts of data.

ITEC 830 Lessons Learned

The ITEC 830 course was designed to use heutagogical principles to encourage student autonomy and increased efficacy with technology tools new to the students. This proved to be positive for the quality of the student work received, as seen in the above case story, and in the quality of thoughtfulness students provided in their feedback. The same was seen to a lesser degree in the ITEC 800 interactions. Towards the end of the 830 course, a focus group discussion with class members revealed many personal stories about what they learned. Discussion in ITEC 800 revealed similar stories. Students were reminded during both discussion sessions that the courses were being recorded as all ITEC courses are. While that always makes students somewhat alert to what they are saying in the classroom, it is so commonplace after a few weeks that it does not appear to have had much impact on students' responses; other than students are reluctant to say anything overtly negative in open class to the instructor. Given that non-negative bias, student comments showed a depth of thinking and understanding about the topics raised, pulling from their own experiences and their learning in the courses to seriously contribute to the discussions. This proved to the instructor the benefits of a heutagogical approach in bringing students closer to their own learning, and the benefits of a personalized, culturally-sensitive approach in giving all students encouragement to voice their opinions about their skills with technology.

Media Literacy Lessons

Students were introduced in both the 800 and 830 courses to the Digital Citizenship tutorial from Commonsense Media and afterwards they were asked to take the Digital Citizenship test, self-correct themselves and post a reflection on what they learned and thought was important. Students in both courses noted with surprise how much they did not know about digital literacy. They also had opportunity to take a Copyright quiz from Gavilan Library that is given to pre-service teachers and surprised themselves about their confusion in this area.

Several students in the 800 course are elementary teachers in public schools. They had much to say about the vagaries of teaching media literacy in a complex information world. They recognized that what

they needed to learn was the same as what their students needed to learn. Other students were thoughtful and highly specific about the uses of technologies, recognizing after reflection that there was much they did not know and that as educators they needed to be more fluent for preparing their students or their company employees to function in the global digital world.

Autonomy Lessons

Students in the 830 course confirmed the helpful nature of their autonomy in the course. They recognized that without it, they would not have been able to explore as well the effectiveness of the technologies they researched. They made a point to recommend the positive nature of the instructor's feedback during class sessions as just the right touch to encourage them to be creative and expose their work to criticism. Students in the 800 course did not have past history in ITEC for comparison, but the quality of their practice projects, compared to prior courses, showed more courage and creativity in their technology explorations and in their reflectiveness on their own work.

Plus and Minus from ITEC 860

A third course taught during fall 2014 was ITEC 860, *Distance Education*. That course was changed from an internal class design project to a distance learning experience for clients. Students were given a great deal of autonomy in how they approached their projects with clients and that provided two lessons. The first was that the teams needed more instruction in how to function and communicate on a team and they also needed to practice the skills. A few instances of miscommunications on the teams set them back briefly in their work. The second lesson learned from the course was that students highly valued being trusted to manage their own sections of the course LMS on an equal footing with the instructor. They noted that they were able to learn from the modeling of the LMS structure and from being able to practice how to set up their own instruction.

FUTURE RESEARCH DIRECTIONS

ITEC Program Future Research

The information from the fall 2014 studies will provide a baseline to conduct empirical studies in future ITEC courses on students' understanding of media and cultural literacies and how to teach them. This will provide richer data from which to formulate guidelines and best practices for student preparation in digital media literacies in the Instructional Technologies program.

Additional research possibilities for the ITEC program lie in online education. Because the program has been a leader on campus in online delivery methods and the university is currently seeking ways to grow its online offerings, the ITEC program should conduct a full empirical study of its students' use and experiences in online course attendance. A review of best practices for incorporating media literacy and cultural literacy into online instruction in ITEC courses would supplement the study proposed above. This knowledge would be beneficial for the university as a whole and to the Graduate College of Education.

ITEC 299

Future goals include integrating a cultural literacy component, wherein the students explore how media and technology are used for learning in other parts of the world. Dr. Kelly has plans to introduce elements of culturally responsive pedagogy to accommodate students who may require additional types of support to complete and achieve success in a fully online course. As a class he says he will seek to connect with groups of students in other countries and share course findings about using media and technology for learning.

Additionally, he will provide support mechanisms for students who may be at risk academically. These strategies will include virtual office hours, and a more thorough effort to provide alternate media formats for primary course content. Dr. Kelly has taught some of the same media and technology literacy strategies as a series of workshops for middle and high school students, as well as related seminars for K-12 parents and teachers. He intends to develop more structured curriculum for K-12 students, professional development for K-12 teachers, and valuable information for K-12 parents.

ITEC 830

A research possibility that emerged from the ITEC 830 case study has been the implementation of a new course with a proposal for a Studio Learning Laboratory. The course and its physical laboratory will give students complete autonomy in designing and conducting self-directed project-based learning. Students have expressed a desire to have a 'maker space' for digital tools and technologies. The course will give students the opportunity to design their own digital learning concept and take from idea to design to testable prototype. It will also provide a place to test further findings on the heutagogical approach and to see what projects students conceive to come out of their ITEC program learning.

CONCLUSION

We introduced the focus of the chapter as improving the teaching of critical digital media literacies in the ITEC program by incorporating personalized learning and culturally diverse learning approaches. We studied this in two different ITEC courses: an undergraduate course that teaches media literacies and exposure to a volume of media tools and technologies, and a graduate course teaching instructional design using a volume of emerging technologies. The pedagogical methods of Gamification, Heutagogy, and Universal Design for Learning were evaluated across the two courses for their impact on improved student retention of content by using personalized learning and culturally sensitive approaches.

This research is significant because the ITEC program prepares pre-service teachers and corporate trainers in design of instruction using technologies, especially new emerging digital technologies. In a world that has seen a paradigm shift in technologies for education and the workplace, teachers and instructional designers must rapidly learn the digital media literacies associated with these new venues of learning. K-12 students also need to learn 21st-Century skills and global competencies to function in this evolved digital world. The research has shown that personalized learning and cultural sensitivity is critical in conjunction with new technologies to engage students in individual learning so that they gain metalearning skills to be effective digital media and technology evaluators. The researchers set three objectives for themselves; to:

1. Instill in students an awareness of personalized learning and cultural literacy when using, and designing instruction with, technologies.
2. Evaluate the effectiveness of gamification, heutagogy, and UDL to improve student engagement, content understanding and knowledge retention.
3. Evaluate the application of digital media literacy in online and blended-learning environments.

The Background introduced the 20-year history of the ITEC program and its leadership in blended learning approaches on the campus. It also identified that students were not receiving thorough preparation in digital literacy or in how to teach it. This is one of the prime functions of the ITEC program. The need to address cultural literacy and diversity issues in ITEC curricula was identified as contributing to the lack of digital literacy preparation. Thirdly, the online challenge was introduced revealing issues for ITEC courses in cross-cultural misunderstandings and communications impinging on students' ability to learn.

The chapter discussed what was done and learned in the gamification of the undergraduate ITEC 299 course. Application of gamification and Universal Design for Learning approaches were able to personalize the large class experience for students, exposing them to global competencies and multiple literacies that they need in life.

The ITEC 830 course described the power of personalization through application of a heutagogical approach. Earlier lessons about the inappropriateness of cultural content and communication difficulties from mixed ethnicities in ITEC courses were shown to be overcome through raising student awareness of cultural implications and giving them freedom to self-learn. The result as shown in the ITEC 830 course was greater sensitivity to learner perspectives and recognition of the deeper complexities of digital literacies.

We found that gamification mechanics could improve students' experiences in an online course to keep their interest and involvement. We also found that gamification does not appeal to all students and an effective method for structuring an online course for success is to offer multiple methods for completing the course. We did find from both case stories that giving students greater self-autonomy, when support structures are in place, produces higher quality work, more critical thinking and reflection and may help keep students engaged in a course, especially for retention in an online course.

ITEC 830 students made several astounding discoveries (to them) about the need to keep instruction focused on student needs, that greater learning occurs when students are free to explore their own questions, and personalized learning requires faster and more frequent feedback for students to benefit from their freedoms. Students also considered the pros and cons of online learning and concluded that it works for some but not everyone. One of the biggest gaps in online learning is the lack of spontaneity and creativity when humans are together in the same space that cannot happen in online courses. In true creative fashion, students thought there might be ways to develop that creative exchange online that have yet to be found.

KEY TERMS AND DEFINITIONS

Cultural Literacy and Competence: A congruent set of behaviors, attitudes, and policies that enable a person or group to work effectively in cross-cultural situations; the process by which individuals and systems respond respectfully and effectively to people of all cultures, languages, classes, races, ethnic backgrounds, religions, and other diversity factors in a manner that recognizes, affirms, and values the worth of individuals, families, and communities and protects and preserves the dignity of each (ACRL, 2012, par. 6).

Heutagogy: Self-directed learning (Hase and Kenyon, 2001). The authors describe heutagogy as lying on the extreme of a continuum of learner-centered control over learning from pedagogy to andragogy to heutagogy.

Information Fluency: Persons who are Fluent in Information Technology (FIT) are "… able to express themselves creatively, to reformulate knowledge, and to synthesize new information" (Lorenzo and Dziuban, 2007, p.4).

Information Literacy: The set of skills needed to find, retrieve, analyze, and use information (ACRL, 2012).

Media Literacy: A 21st century approach to education. It provides a framework to access, analyze, evaluate, create and participate with messages in a variety of forms — from print to video to the Internet. Media literacy builds an understanding of the role of media in society as well as essential skills of inquiry and self-expression necessary for citizens of a democracy.

Personalized Learning: Bray and McClaskey (2015) define personalized learning as: *an ecosystem that supports achievement by every learner.*

Personalized Learning – Industry: Educational Technology Research & Development special journal issue on *Personalized Learning* (ETR&D, 2012) describes personalized learning as: *behaviour [sic] tracking of learners and learner analytics … [to align] learning processes with personal cognitive attributes of learners*. While it is true that digital systems in the form of intelligent tutors or intelligent learning systems can individualize the learning process, we would argue that they do not *personalize* the learning experience.

Universal Design for Learning (UDL): *A process of making course concepts accessible and skills attainable regardless of learning style, physical or sensory abilities.* The three Key Principles of UDL in course design *address multiple methods of: Representation, Engagement, and Expression*. In other words, we believe the UDL principles encourage instructors to provide multiple pathways for students to review content, stay engaged, and show what they know.

ENDNOTES

[1] Instructional Design is a broad field that masters the science (and art) of designing instruction for delivery of a learning outcome. The field includes several frameworks and models for developing instruction. Today, design nearly always includes the integration of technologies for addressing learning needs. The ITEC program focuses on learning, using, and preparing students to use what are called "instructional technologies." For ITEC, the term instructional technologies refers to any media or technology used instructionally.

[2] HyFlex is a term that describes a student-centered method of delivering instruction. It identifies a *Hybrid* method of blended learning including online and face-to-face (F2F) instruction, and offers students the *Flexibility* to choose which method they wish to use. The ITEC form of HyFlex allows students to select each week any one of three methods to attend class: (1) In person, (2) Online synchronously through webconferencing, or (3) Online asynchronously through the learning management system by completing additional work.

Chapter 13
Cognitive Approach to Improve Media Literacy: Mind Puzzles

Zekeriya Karadag
Bayburt University, Turkey

Yasemin Devecioglu-Kaymakci
Bayburt University, Turkey

ABSTRACT

This chapter starts with an exploration of the media literacy literature and its place in the developing 21st century. The literature suggests that media literacy should be considered as one of the capstones for the skills needed for the 21st century citizens. In terms of developing media literacy skills, scholars look at the concept from either cognitive or social perspective, and the review reveals that both of them are closely related to each other. Moreover, the study asserts that cognitive and metacognitive skills play a significant role in developing the media literacy and the skills for 21st century. Then, the chapter presents a city-wide activity done in Bayburt, Turkey. It is our assumption that the case presented here may be an inspiring example for whom may want to explore different approaches.

If you're not careful, the newspapers will have you hating the people who are being oppressed, and loving the people who are doing the oppressing. - Malcolm X

INTRODUCTION

By adopting the quote of Malcolm X to the internet media, particularly social media, one could easily argue that, "If you're not careful enough, the digital media will have you hating the people who are being oppressed, and loving the people who are doing the oppressing." That is; the information presented in social media might lead you in an opposite direction. Anyone spending some time in social media can easily confront with the same posting with different titles or the same picture but different captions. Hu-

man beings are exposed to a continuous and increasing bombarding by digital media, printed media as well, in our daily life. This is a bombarding of information coming through a number of media channels, such as TV stations, radio channels, newspapers, internet websites, YouTube videos, email lists, social media channels, etc. It is rather challenging to distinguish the truth and hearsay under the bombarding of such a heavy traffic of information. Indeed, the traffic is getting worse and more aggressive with the support of the innovation in technology.

Spencer (2012) talks about 684,478 pieces of content shared on Facebook, in every minute. This information may help us to anticipate the amount of information flow over social media. People, who are surfing on the internet, always confront with lots of information and use or share all these information without actually assessing them. How many of us pause a second before sharing any information being shared by a friend? Very rarely! People usually assume that the information, seen on the internet –for example, their friend's wall on Facebook –is supposed to be true. Is it really so? What if, that friend has already made the same assumption and shared the information seen on another friend's wall? Would the content be shared on your wall be harmful to someone else? How frequently do we assess this case?

It has been speculated that the youth are raised in the digital age have been negatively affected by mass exposure of digital media and that they should be protected from harmful content. However, there are many young people playing with digital content and alter it or create new ones. Even if they do not become part of re-creating the content, they help them get spread out through their personal contacts. Therefore, how could the content be spread, if, not created, by youth be harmful to themselves? Well, the discussion in the previous paragraph could be one answer addressing this issue. Still, we need to find a way to overcome this challenge. What should we do, protect or engage? What should be the best strategy?

- To reject the challenge, protect our children from digital media, or
- To embrace it, help them learn living with digital media?

The authors of this chapter definitely prefer the latter and suggest engaging the youth to learn how to cope with emerging and evolving conditions. However, this is exactly where the problem emerges for many people because this new world is under a continuous attack of mass media, both digital and printed –although our primary concern is digital media and an evolving world with the support of technology. No one is really sure what strategy should be followed because we still try to understand the structure and the consequences of the change. This is true to any of us, including even technologically savvy people; it is rather challenging to predict what the future will look like. Moreover, this challenge is not a new challenge; it has been a challenge for the decades since the internet was introduced.

There is another concern that media shapes our lives and takes the control of our actions. Is it really so? If so, how could this happen? In order to reply this *how* question, one should also answer *wh*o creates media and *what* makes media so powerful? Then, we can put further questions on the table: In order to help 21st century citizens shape their *own lives*, what actions should we take to provide educational opportunities? One effort to achieve this goal would be to provide a better media literacy education (Flew & Smith, 2011; Kamerer, 2013; Potters, 2008). Many agree that providing better media literacy education is a primary goal.

However, it is not an easy task to provide adequate and efficient education for new generations. Many educators trying to educate today's youth had been raised in a world with comparatively limited technology. Therefore, they are still at the stage of an attempt to understand the change, which has been triggered by technology. Despite the challenge we experience, it is our responsibility to educate today's

youth for the future world, which is a mystery to many of us. Still, we should find a way to educate the youth for the future. This mission is conceived as to make people ready for the 21st century, and, as a result, some private and governmental institutes put their effort forward to explore the challenge and to develop solutions.

For example, Partnership for 21st Century Skills (P21) is a "unique public-private organization formed in 2002" (P21a, 2014, p. 2) and explores the skills needed for the 21st century by collaborating with employers, educators, parents, policymakers and community leaders to build a consensus on what these skills would be and to suggest a framework to be incorporated in educational settings. They issued a call to policy makers and educators, identifying three dimensions of citizenship as civic, global, and digital and recommended three actions:

- Developing "the knowledge and skills that empower the youth to be informed, engaged, and active citizens,"
- Reflecting "global forces, challenges, and opportunities" and,
- Full understanding of "the prevalence of the digital space." (P21b, 2014, p. 6).

Their position, as the authors of this chapter, seems to improve youth's awareness on new challenges and develop youth's cognitive skills to become better citizens.

This chapter is concerned to understand the relationship between new media practices in our daily life and evolution in young people's expectations. In a broader sense, the concern is to understand the interwoven and evolved relationship between media practices and the ways people cope with and to contribute to the formation of 21st century citizens by sharing our experience with citywide Mind Puzzles activity. In order to predict the future, we believe that, one should better understand what has been done in the past and today, uncover the relationships among practices, and make connections between results and practices. We, the authors of this chapter, position media literacy holistic in scope, following the decomposition of the dimensions of media literacy we direct our attention to a particular strand. How do we contribute to the improvement of youth cognitive abilities, which might lead them to be more responsible citizens of 21st century? Could our experience with Mind Puzzles be a contributing factor?

Despite the fact, that aforementioned topics and questions are too broad to cover in one chapter only, our attempt will stay at the level of reviewing fundamental relationships and raising more questions about the future direction. The intention is to look at the challenges and opportunities through cognitive perspective only. We are aware of the existence of unpredictable challenges and opportunities one may confront in the future, and therefore, we believe that the improvement in their cognitive abilities may help 21st century citizens find their *own way* of coping with unexpected scenarios. That's why we position ourselves, for the sake of this chapter's context, to inquiry cognitive effects of current experiences and seek opportunities to improve awareness and cognitive abilities of youth to help them find their own solutions. The opportunities to increase the awareness on what responsible citizen means and on how the popular elements of emerging technology can stand to empower the 21st century citizen may provide them a mean to develop their own perspectives.

The following sections review recent innovations and changes in ICT, the practices of communication, and the amount of data production and reproduction. In order to pause for a moment and reflect on what we have in our hands, the changes will be evaluated with the guidance of the McLuhan's tetrad, more specifically tetrad of media effects (McLuhan & McLuhan, 1988). The following questions are a version of McLuhan's Tetrad to the Media Literacy:

- What capabilities do digital media extend? What potentials do social media and mobile communication intensify and accelerate?
- What medium or habits of people do digital media obsolesce? What habits of people were faded into the ground, become less granted?
- What might be reversed when the use of digital media and its partners reach to its limit?
- What do digital media retrieve that had been obsolesced earlier?

These questions will guide our exploration of capabilities and current effects of digital media and challenges we have been confronted as well as the role of media literacy education to overcome these challenges. The exploration will continue looking at a recent experience in Bayburt, a small city located in the northeast of Turkey, with an intention to understand the possibility of remediation of challenges.

BACKGROUND

The last decades have been witness to enormous changes, particularly in technology. Technological innovations –particularly on the Internet and Communication Technologies (ICT) –have our daily lives evolved and transformed. This transformation has been appreciated by many governmental and non-governmental institutions and encouraged them to take actions. For example, the International Telecommunication Union continuously makes an effort to understand and describe this evolution: "The availability of information and communication technology (ICT) infrastructure and the uptake in its use – continue to grow. The internet, in particular, is transforming society, with a growing amount of information and a large number of tools available." (ITU, 2014, p.1)

While the society being transformed, new terminologies have been introduced: Net Generation, X Generation, and Y Generation! Many people, including the authors of this chapter, believe that daily practices, beliefs, and even cognitive abilities of this new generation have been evolved through a continuous *interaction* with the ICT. The word interaction is emphasized on purpose because both ICT and people affect each other through this transformation process. For example, on the one hand, people become more visual and read manuals less than it has been ever before because ICT tools provide visual manuals –tutorials – and menus. On the other hand, ICT tools offer more visual tools because people demand visually equipped means. Thus, a continuous interaction keeps the cycle works.

However, we are still unsure of the dimensions and the degree of this evolution. Scholars from education, psychology, sociology, economics, and computer science have been involved in many research projects to explore the evolution and understand new society in order to better serve for their future. Attempts to make websites and blogs more visual, as mentioned above, emerged from understanding of the demand of the new generation. Even in cell phones, it is very easy to see the shift from entry-typing menus to visual menus. We have iconic lists of menu items rather than pop-up menus. While talking about the ICT and its use in daily life, we should better clarify the distinction between invention and innovation.

"An invention is a new idea or new theoretical model, while innovation is the implementation of this invention in a market or social setting." (Storsul & Krumsvik, 2013, p. 14). The development of the ICT could be taken an example for invention whereas the implementation of the new ICT tools into our daily life, including digital and physical society as well as informal and formal learning settings, should be considered as innovation. We believe that people should be aware of the capacity and the volume of the ICT tools and the internet use to better understand how innovation rapidly changes the environment.

How are certain habits and information spread out so fast? How do people hear about a protest occurring at a particular place in the world, even seconds after the incident happens?

The following sections may help the readers to refresh their minds on some numerical facts. The next section will present some key numbers from the ICT industry to help us understand the trend. Similarly, the following section will talk about how people use the internet.

Key Numbers from ICT

The number of internet users throughout the world has been increasing dramatically; the number of users which was about one billion in 2005 is almost tripled, reaching 3 billion in 2014, in the last decade. Although the figures illustrate that almost two-thirds of internet users are from developing countries, the percentage of people going online to the population in developed countries is much higher. ITU (2014) report reveals that 78 percent of the population living in developed countries is online whereas the percentage is only 32 for developing countries. Fox and Rainie (2014) claim that 81 percent of Americans (US citizens) is online and that the internet usage strongly correlates with the income and level of education. Their finding seems to explain why developing countries have less internet penetration.

An OECD report (2001) identifies two types of the digital divide, such as the opportunity to access digital tools including internet, what is also called first digital divide, and the ability to use digital tools, also called as second digital divide. "While the gap between the 'haves' and the 'have nots' has continued to narrow since the 1990s, it is also evident that there is a proportion of the population that continues to lag behind." (Haight, Quan-Haase, and Corbett, 2014, p. 506). In this chapter, we concern the second type of digital divide primarily because we believe that it is mainly rooted in the lack of adequate digital, or media, literacy education.

While talking about the total number of people using the internet is increasing, a closer look at the ITU (2014) data reveals that this increase is stemmed mostly in developing countries. The number of users in the developed countries is increased about 50% (from 616 million to 981 million) whereas the number of users in the developing countries is moved from 408 million to about 2 billion (1,942 million) for the last decade (ITU, 2014). These numbers in increases help us conclude that the number of people using the internet will be more in the future because the number of the users in the developing countries is still unsaturated. Moreover, we may also expect more democratization in both internet access and internet use in the very close future.

Another critical key information drawn from (ITU, 2014) data is the tendency of preferring the mobile-broadband access comparing to the fixed-broadband access. Data reveals that the mobile-broadband penetration is exceeded 2 billion as of 2014. 55% of this access comes from developing countries, meaning that more people from developing countries become the global citizens of the new world. In other words, more people start using the internet and contribute to the increase in the amount of information created and shared online. Interesting enough, it is identified that people who have lagged the internet adoption are more likely the users of mobile devices, mobile-broadband subscriptions (Pachler, Bachmair, & Cook, 2010).

The mobile-broadband subscription is very common in the Bayburt University, a recently established university in the northeast of Turkey. It seems quite reasonable for students to prefer mobile access because they are mobile in most of their time. However, this does not appear to be the only reason. They prefer mobile access because they might prefer staying connected and communicating to each other

continuously. Unfortunately, we have less evidence that they employ this opportunity to invest in their development although they are supposed to be teachers to be role models for their students.

Internet Use

How does the increasing number of the internet users reflect on the amount of information produced, or re-produced, delivered in a particular period? Spencer (2012) posted an infographic on the visual news website, pointing out some interesting facts, happening in every minute of a day (table 1).

These numbers are the facts from 2012 and that 217 new users get mobile access in every single minute, and the online interaction –interaction on the web –among people would be much higher in 2014. The ITU report argues that more and more people are having online access as time goes. The more people get internet access; the more information gets into the circulation on the web, which is actually a good news if we are sure that all information on circulation is correct.

It is a challenge to recognize the fake information that is being circulated on social media networks. Even the same picture could be used to support a number of claims. When it is asked to those sharing that piece of fake information, they usually admit that they circulate the information without really evaluating them. How could those people be engaged in being aware of what they are doing? How do those people develop a habit to properly evaluate all information they share before doing that? Awareness and responsibility seem to be the keywords; however, being responsible is not always enough to take the right action. One needs to develop proper skills and accumulate correct information to be able to act responsibly.

Blank and Groselj (2014) published an empirical research paper based on the Oxford Internet Surveys' 2011 data. They grounded their analysis on the understanding of "(1) amount, (2) variety, and (3) type of Internet use" (p. 416). In the research, 48 different activities were identified as the activities to be done on the Internet as well as on the classical media, from emailing to online shopping or reading, and organized under certain categories: Entertainment, Commerce, InfoSeek, Socialization, Email, Blogging, Production, Classic Mass Media, School and Work, and others. Results revealed that 73 percent of participants described themselves as the Internet Users and that Emailing (93.5%) and Information Seeking (85.7%) are the leading two activities done on the internet. Interestingly, 78.3% of participants declared that they had used Classic Mass Media, which is listed on the third. The rest of the activities and their frequency of use are as follows: Socializing (61.2%), Commerce (59.8%), School and Work (48.1%), and Entertainment (46.3%) while Blogging (30.1%), Production (23.4%), and Vice (20.9%). The last three seem interesting because although these three activities are performed comparatively less than the previous ones, people doing these activities perform the other activities too on a daily basis. For

Table 1. One perspective of the online activity for a minute

WordPress users	publish 347 blog posts
Web Developers	create 571 new sites
Instagram users	share 3600 new photos
Facebook users	share 684,478 pieces of content
Email users	send 204,166,667 emails
YouTube users	upload 48 hours of new video

example, people do Production perform 6.3 other activities, which is a maximum for the measurement of the variety of activities. Similarly, people do Blogging perform 5.9 other activities while people using School-and-Work perform 5.3 activities. In contrast, people use Emailing perform 4.1 other activities. This is an interesting result drawn from the study as put forward by Blank and Groselj (2014):

Notice the inverse relationship between participation in type, and amount and variety of use. People who participate in the least popular activities – vice, production, and blogging – have both the highest variety and also the largest amount of use. This suggests that people who do niche activities are likely to be more active and do more things than people who do the popular activities. (p. 429)

A similar research done in Turkey illustrates interesting contrasts, it may be because the study was done in 2013 and only children were included in the study. However, it seems still important to review the results because our goal is to understand the current situation rather than to compare one with another. The study reveals that the children start using the internet as of age 9, as an average and that about 60% of children use the internet at home. The age group of the participants is declared as 6-15, and their way of internet use looks as follows: Homework and learning (84.8%), playing game (79.5%), and information seek (56.7%) while social media (53.5%) (Sirin, Oktay, and Altun, 2013, p. 23).

Having said that inventions in the ICT and innovations in the digital media grow increasingly and attempt to close all existing gaps, it may be a good idea to assess the current situation in the aforementioned context. In order to assess the current situation, let us apply McLuhan's tetrads. First, we need to look at *what is intensified*. It seems that communication opportunities and means to share information are intensified. As a result of easy access to these opportunities and means, people have the chance to accumulate more information than ever before. In addition, people have more chance to create and build new knowledge in various disciplines. Secondly, *what becomes obsolete* should be explored. The existence of the enormous amount of information makes people reluctant or overwhelmed to evaluate them. It is because evaluating all the information flowing down from a number of media channels demands an excessive amount of time and high level of skills. Thus, people start relying on certain information channels, such as TV channels or certain friends on social media. In case they realize that the information that they get and pass forward is not true, they start losing their trust to others. For this reason, trust may become obsolete as a result of overloaded information. Thirdly, we need to reflect on *what is retrieved that was previously obsolesced*. The world population is increased, and people have started living in almost every corner of the world, comparing to certain intellectual centers before and fewer populations living in those places. That is; more people live in an isolated manner. Recent inventions and innovations made communication easier and faster for everyone, even for the people living in extremely inaccessible places. Fourthly, we should understand *what is produced or emerged when it is pushed to its extreme*. On the one hand, we have an increasing bombarding of information flow. Many people have already started struggling on the amount of communication, such as emails, WhatsApp messages, text messages, as well as the information coming through multiple media channels, including social media networks. That is; some people have already been pushed in the extreme bombarding of information. On the other hand, the fake nature of some of the information, even if circulated by some trusty person or channel, has already led people losing their trust in the information they get. Time management and digital media literacy skills become getting more and more critical.

Individual people and societies have always had a problem with information. For millennia, the information was one of generating enough information about important aspects of life, then providing people with access to that information. But with the rise of the mass media, especially over the past half century, the problem has shifted from one of gaining access to one of protecting ourselves from too much information. (Potter, 2008, p. 5)

Prior to moving forward to theoretical considerations and a particular case we will discuss, we cover the formal and informal educational settings in the next section. Currently, many people in different countries have started questioning the formal education and admitting that schools are not the only places to get education. Demands from these people make homeschooling and online schooling more popular. However, we will take these alternative schooling options aside and look at certain settings, social media, as informal learning options.

FORMAL VS. INFORMAL EDUCATION

Many teachers may experience challenge while trying to implement current innovations in their classroom. Share (2010) talks about a project, called SMARTArt (Students using Media, Art, Reading, and Technology), which allows "students from kindergarten through fifth grade worked with teachers and artists to analyze media and create their own alternative representations of everything from violence, to advertising, to their community." (p. 53) Student artifacts included paintings, writings, photographs, and animations, and the project was funded for three years. In order to learn how they were using what they learned from the project, the participant teachers were interviewed two years after the grant was ended. Although all teachers admitted the importance of media literacy and implementation in school curricula, they also spoke about a decrease in implementation because of school policy. For example, a drop in school standardized test score occurred in one of the schools, and the district put the school on a Watch List. Most importantly, computer lab was closed upon a change in school administration.

It is quite common to hear similar stories in various countries, in various districts, and in various schools. In a similar story from Turkey was spoken by one of our former students. The story took place at a school in a small city located in the east part of Turkey. The school was announced as the sister school of a bigger school in Istanbul and provided technological support to establish a brand new computer lab. However, the school administration returned computers back by claiming that they do not NEED them at all.

Despite the unpleasant reaction to the implementation of the ICT and the Media Literacy in school curricula and contrary perspectives against the ICT tools in some places, there has been encouraging stories going on. Asthana (2010) talks about a project, called Cybermohalla, took place in India. "Cybermohalla is an experimental project designed to enable democratic access to information and communication technologies among poor young women and men in Delhi, India." (Asthana, 2010, p. 14) The project provided an environment for the participants to explore and express their creativity as well as talk about the social and moral issues they experienced. They were encouraged to become media makers through exploration of the issues they faced and communication of their perspectives with others not only to better understand the context, but to act responsibly.

The main difference in these stories is not only, of course, the acceptance or success of the experiences, but the context that the experiences took place. The first stories took place in school whereas the

last one is a story from outside of school setting. Despite the similar stories resisting in implementing the ICT into school curricula in formal education settings, it seems that informal settings are more flexible for innovations. There are two main clarifications we need to make: First, not all formal education settings demonstrate resistance to the ICT implementation. For example, many schools in Turkey attend to the national coding competition. Second, the contemporary informal settings are mostly online. Taking the advantage of cost effectiveness into consideration, people prefer online settings such as Pbworks, Facebook, Twitter to set up interest groups to work on a specific content.

How would it be possible to support formal education with the informal education opportunities taken place on social networking sites? To what extent do people accept informal settings as learning places? The blended education involving formal and informal settings has been suggested one of the themes while describing short term solvable challenges in the NMC Horizon Report (The New Media Consortium, 2015). The report points out the existence of a variety of informal learning environments, such as "museums, science centers, and personal learning networks." (New Media Consortium, 2015, p. 22) Similarly, Cartelli (2012) puts forward that a considerable amount of learning takes place in informal settings including internet resources such as Facebook. In order to better understand the opportunities provided by social media, we need to understand the structure and affordances of these places. We should take one step back and look at how these landscapes could be acceptable by the community.

In fact, the community and social networking sites are evolving together. Many environments and habits have already been changed, evolved, or transformed. Mihailidis (2014) argues that our physical surrounded communities are not the only communities we communicate and that the communities and the ways we communicate each other are continuously affected by how we think about community and communication. "In mediated spaces, a new landscape continues to emerge. Supported by the growth of mobile and social media technologies, new digital platforms now encompass large, diverse, collaborative, and interactive networked communities. They are not limited by demographic or physical boundaries." (Mihailidis, 2014, p. 1) Many people, including the authors of this chapter, involve in the overseas projects and establish new collaborations through internet.

Social Media and Evolving Communication Habits

This section talks about the ways youth use social media and about how their methods of communication have been evolving. New opportunities associated with mobile phones, such as affordable Facebook plans, help them stay connected almost all the time. "We live in an environment that is far different from any environment humans have ever experienced before. And the environment changes at an ever increasing pace." (Potter, 2008, p. 6) The change has been accelerated by the innovation and broad acceptance of Web 2.0 tools. For this reason, one should understand the concept of Web 2.0 and then start exploring digital media because this new generation of web content dominates internet usage (Flew and Smith, 2011).

"As we have seen, new media is a rapidly evolving and complex assemblage of technology, social uses, and business models. While much remains up in the air and the future is far from certain" (Flew & Smith, 2011, p. 23), it seems hard to anticipate what skills we need to develop for 21st century citizens. Indeed, we live in an environment, which is an amalgam of physical and digital spaces. Although some may consider the online space is completely out of physical space, many accept the online –digital –space "the online aspects of regular life." (Flew & Smith, 2011, p. 55) Our personal experience, limited to communication with our students at the Bayburt University, demonstrates that most students keep offline and online communications simultaneously. For example, they keep talking about the same topic,

which was started in the classroom, when they are on Facebook or in a group chatting on WhatsApp. Similarly, they may keep a conversation active when they come to the classroom even if the conversation was started online, either on Facebook or WhatsApp.

What makes the Web 2.0 widely acceptable has also been explored by researchers. Flew and Smith (2011) describe their advantages as being user-friendly, decentralized controlling, connecting many-to-many, being cost-effective, and the last but not the least, the chance to evolve and change in time and the possibility of modification with respect to one's own needs or preferences. The one own preferences include political, educational, entertainment and gender-based, and intellectual preferences. They can play with background themes and colors and use avatars and their own pictures as the profile pictures.

The chance to make modifications and implementations engaged people to create their own interest groups and be the part of content developers of those spaces. This is how a new concept emerged: *participatory media culture*. "One of the great promises of new media has always been that it could create a more participatory media culture." (Flew & Smith, 2011, p. 107) Social network analysts put forward that, (1) actors and their actions are interwoven and dependent to each other's, (2) relationships among actors controls the source of information flow, (3) the descriptive structure of the space defines the dependency level of each individual, and (4) preferences identifying the space limit the relations among actors (Wasserman & Faust, 1994).

In terms of popularity, wide acceptance and the integration of our daily life, social networking sites or social media has become one of the major actors in our life. Some scholars studying digital divide claim that this media is going to be the source of third digital divide. **"**The education divide continues to persist in terms of internet access, level of online activity, and SNS usage." (Haight, Quan-Haase, and Corbett, 2014, p. 514) Social media is not only and simply a platform for transmission of information, but an interactive environment allowing people to produce knowledge through discussions and to develop the identity shaped through discussions. Their continuous connection seems to have a number of effects located on a spectrum. Getting informed and ready to accumulate more knowledge is found on the one end while distracted from current tasks and disconnected from her physical surroundings is placed on the other end.

However, some concerns arise around this emerged media and evolved habits. "In these spaces [mediated digital spaces], the lines between news and entertainment, facts and fiction, truth and hearsay are less distinguishable." (Mihailidis, 2014, p. 1) The concern becomes particularly significant when the medium is anonymous, and no control exists in the space. This matter brings the challenge addressed in the introduction section on the table: How should we educate our children so that they could be aware of fake information being circulated in social media networks? How should we educate them to avoid misguiding their peers by sharing this false information?

Looking from McLuhan's perspective, social media definitely *intensifies* the communication among the participants sharing the same interest environment. The easy access to mobile tools allowing one to take pictures and share them with others makes regular library use or note-taking and writing, which demands a significant cognitive skill, *obsolete*. People using the library had privilege of living and studying at an uninterrupted and undistracted place. The notifications coming to mobile phones may *retrieve* interruption and distraction even if people are in the library like places. When social media use and control of our life are *pushed to their extremes*, it may result in chaos and suffer from the existence of technology. People may start not using –or at least limit using –technology and its social media component.

Games and Digital Games

Games have been a specific industry in computer technology and been developed with the support of both hardware inventions and software innovations. "Over the past 30 years, the games industry has evolved a multi-layered structure in which games development, distribution, platforms, and users have found themselves in shifting and interconnected arrangements." (Flew & Smith, 2011, p. 127) Despite the resistance against games, particularly video games, by number of educators, psychologists, and parents, the industry has reached tens of billions of dollars of revenue, meaning that millions of users.

Digital games take resistance by those people who usually believe that gamers are asocial people, mostly young boys, living in dark rooms and playing games for hours and hours. However, research and evidence in current data demonstrate that gamers have various online and offline communities, meeting and playing in a number of social and public settings. Some games ask users to get connected through local area networks and play in groups and against other groups (Flew & Smith, 2011; ESA 2014). The data claim that 42 percent of gamers play with their friends while 50 percent play with their family members (18 percent with parents while 32 percent with other family members). We have similar experiences in the Bayburt University. We do not see much gender gap in involving games, including online games.

ESA 2014 data reveals that 59 percent of Americans play video games, and the average age of game players is 31, being 39 percent of players are more than 36 years old. In contrast to the stereotype for the gender of players, data suggests that 48 percent of players are women. The types of games played online are mainly the Casual/Social games (30%), Puzzles, Board Games, and Card Games (28%), and Action, Sports, and Strategy Games (24%). The order for the mobile games remains the same with slightly different numbers: Casual/Social games (46%), Puzzle, Board Games, and Card Games (31%), and Action, Sports, and Strategy Games (11%).

Games or Puzzles, particularly mind puzzles, could be an excellent tool to help children improve their competencies in various skills. We would like to take the attention of the readers, for the sake of this chapter, to a more specific portion of games industry: Mind Games and Mind Puzzles. The names, as well as the content, vary a lot depending on the country and culture. Therefore, it is good to define the term briefly. We use the term for the puzzles demanding cognitive skills, thinking mathematically, developing strategies, evaluating possibilities, and demanding problem-solving skills. Sudoku, Clouds, Easy as ABC, Four Winds, Skyscrapers are some of the puzzles mentioned on the World Puzzle Federation Website (WPF, 2014).

The World Puzzle Federation organizes world puzzle championships in a different country each year. The federation calls issue for the championships and asks country representatives do selections in their own country and bring competitors to the worldwide competition. The championship for the year 2015 will be in Sofia, Bulgaria. Besides the paper-and-pencil materials to play these games, a number of websites offer online platforms to play them all. Moreover, many game developers create free applications to allow gamers to download in their cell phones and play accordingly.

Escape Games are another genre of Mind Puzzles, usually played in teams although there are online and mobile versions to play individually. The game is played at a particular place, typically in a locked room or the like, asking gamers to find their ways to escape from the place. "Being locked in a room and battling for a way out might make some feel like they've been jailed — or worse — but for a growing number of Torontonians it's becoming part of their Friday night fun." (Deschamps, 2014)

What opportunities may these Mind Games and Escape Games provide to improve their skills to get better 21st citizens? Would Mind Games, including Escape Games, serve a context to improve people's cognitive abilities? What are the possibilities to integrate these mind puzzles and media literacy?

THEORETICAL CONSIDERATIONS

In the previous sections, we set the stage better to understand the dimensions of technological inventions and digital media innovations in our daily life as of the end of 2014. We looked at the number people having internet access as well as number of people performing online activities and types of leading online activities. In addition, we also looked at the social media and digital games. It is not because they seem to be the major components of digital activities, but related to the themes that we will ask the reader's attention for the rest of the chapter.

What does media literacy or digital literacy mean? Based on our daily experience, there are three types of social media followers: (i) those who are reading everything on the social media but do not contribute at all, let us call them *read-only people*; (ii) those who are reading and sharing but commenting, call them *semi-active people*; and (iii) those who are continuously sharing and commenting, on social media, particularly Facebook, call *fully-active people*. Which of these groups of people look more digitally literate? Would there be any consensus on digital literacy? More importantly, why is being digitally literate so necessary for the 21st century?

Media Literacy

What is Media Literacy? In order to set the stage for further discussion, it might be better to look at its definition first. Tyner (2010) states, "*Media literacy* is the term most commonly used in North America, especially in relationship to media education for youth." (p.3) Media has been located at the heart of daily life and has been affecting a number of the abilities of the human being. These abilities include cognitive abilities such as analysis, evaluation, synthesis; emotional abilities such as love, hate, anger; and moral abilities such as judgment on good or bad. Potter (2008) describes media literacy *multidimensional* while explaining these abilities and how these abilities affect our perspective.

"Taking control is what media literacy is all about." (Potter, 2008, p. 9) There is an enormous flow of information coming from a number of media channels. It is the person's responsibility to evaluate them all and to take the control of his or her own life rather than to leave the control of political and personal perspectives, professional or general knowledge, and even beliefs to the media. For example, mass media usually states that digital games are for boys only. However, data declared by ESA (2014) puts forward that the ratio of women to men playing digital games is almost the same. This is true even for the small city where we live in Turkey. We have been observing that the number of girls playing Facebook games, particularly Mind Games such as Sudoku, is similar to the number of boys if not more than that. "You are able to build the life *you* want rather than letting the media build the life *they* want for you." (Potter, 2008, p. 9)

One of the concerns raised by researchers is the existence of fake and faulty messages exposed by mass media. No matter what the reason or the source is, media literacy should be a state of prevention against this exposure. By prevention, we do not mean that banning some or all mass as a method, rather we suggest first creating awareness and then supporting with an adequate media literacy education.

We, probably many others, do believe that banning media also hinders our and also youth's intellectual improvement. For example, the authors of this chapter enjoy the information exchange occurring in some specific Facebook pages. The *GeoGebra 1xjBRET* is such a page bringing GeoGebra fans from different parts of the world and helps them exchange ideas and provide support for those needed. It is like an online fan club or sometimes even an online learning environment.

Similarly, a friend of us, Levent Kocoglu – a high school friend of the first author –has decided to take a worldwide trip on his motorcycle and created a fan page on Facebook, Kocoglu (2014). He aimed to be the first Turkish person taking a worldwide tour by motorcycle. He has many followers from various countries, getting more and more because new friends have been added to his list. He regularly updates his current position including a live link to follow his position online and shares pictures, videos, and comments to his *Facebook friends*. Rather than having friends from his close neighborhood, he has many friends from all over the world. This example could be counted as a counter example for those who claim that social media makes people asocial.

Why should we miss such an excellent opportunity to follow a high school friend's world tour or an opportunity to review mathematical artifacts created and posted by someone from Indonesia while listening to the Sufi Music on the YouTube? However, the criticism against mass media exposure is also a reality. Facebook conversations and dealing with fake messages and information could waste one's time even if they are not harmful to those who are not literate enough to cope with these issues.

Potter (2008) claims, "[m]edia literacy is a process, not a product" (p. 13) and puts his claim on a three-leg chair. He suggests that the process has three components, what he calls as *building blocks*. Personal Locus is the first component, responsible for "determining what gets filtered in and what gets ignored." (p. 12) For example, we, as the university professors who are responsible to improve our academic knowledge and to be the role model for our students, should be aware of the content of the information that we share and the comments that we make on any posting. Moreover, we should follow pages related to our academic interest to demonstrate that it is possible to use social media responsibly and effectively. Moreover, since the authors of this chapter are the professors at the Faculty of Education, whose students are the prospective teachers; we assume that they may, actually they do, take our actions as the role models and adopt in their professional life. This makes our responsibility rather elevated, and this responsibility will be discussed later in this chapter.

The second component is the knowledge structures, which are organized information pieces in one's mind. "Information is the essential ingredient in knowledge structures." (Potter, 2008, p. 13) Information may be described as the pieces of data attracting our attention. Before attracting our attention, they are in their primitive forms, called data. Cognitive psychologists describe the information as some kind of data that we start processing in the working memory of our mind and locating it in our long-term memory as knowledge (Baddeley, 2007; Masssaro & Cowan, 1993; Matlin, 2005). The ability to process the information is the third component, called skills, of the media literacy. The knowledge structures, relying on Potter's explanations, have two roles: (1) intellectual artifacts accumulated by the person and (2) a set of guide to filter the new information and let it go through the process and become knowledge.

Information is composed of facts. Facts by themselves are not knowledge any more than a pile of lumber in a house. Knowledge requires structure to provide context and thereby exhibit meaning. Think of messages as the raw materials and skills as the tools you use to do something with the raw materials. That "something" is in the service of attaining the goal of pulling the information out of the messages and

turning that information into knowledge, that is, to reconstruct the information so that it will contribute to our knowledge structures. (Potter, 2008, p. 14)

We prefer adopting Potter's description of media literacy by putting more emphasize on skills. Although we appreciate the importance and the role of personal locus and knowledge structures in developing and improving media literacy, we put more emphasis on media literacy, acronyms with skills, by following on his vision of media literacy as a process. Potter (2008) argues that, "[s]kills are tools that people develop through practice" (p. 15) and describes the skills as verbs such as analyzing, evaluating, grouping, inducing, deducing, synthesizing, and abstracting. This description of skills as verbs supports our argument if he does not take the media literacy in a broader sense.

Exploring Media Literacy Framework

It seems that media literacy framework is a working framework because many scholars, including some institutions, approach the framework from a different perspective and take the term in a different context. It is quite understandable and appreciable that each of these approaches has a specific value and contributes to the building an overarching framework. In this section of the chapter, we will revisit these approaches and reflect on each from our own perspective and our experience. It is important to note that our context reflects the social media experiences at the undergraduate level or up.

Potter (2008) suggests seven skills relevant to media literacy, analyzing, evaluating, grouping, inducing, deducing, synthesizing, and abstracting by stating that the skills are also usable and developable out of media literacy context. Therefore, his main approach to these skills is not to develop them but to be able to implement them in media literacy context.

"*Analysis* is the breaking down a message into meaningful elements." (Potter, 2008, p. 16) This skill is used to delve into the message itself to better understand the components and relationships among the components. For example, we expect our undergraduates to ask several questions when they confront an online message. *What*, *who*, and *why* questions are the main questions they could ask. Here are some possible forms of questions to ask: *What does the message contain? Who created this message or who shared this information? Why is this message posted?* However, our experience does not provide us any evidence that students really attempt understanding of rather than relying on what is posted.

"*Evaluation* is making judgment about the value of an element." (Potter, 2008, p. 16) Following delving into the message and asking questions –analyzing them, -one becomes ready to evaluate them through a comparison of the message elements to some standard, meaning knowledge structures s/he developed earlier. Depending on meeting of their knowledge structure standards, people could accept or reject the message, meaning that commenting or sharing with others versus ignoring or deleting.

"*Grouping* is determining which elements are alike in some way –determining how a group of elements is different from other groups of elements." (Potter, 2008, p. 17) For example, students should be encouraged to share their messages in the right groups if the message is not commonly interested. That is; a message regarding political issues should not be posted on the Mind Games page. The admins of some pages make these rules clear and accessible by posting on the top of the page while some expect the members have a common sense.

"*Induction* is inferring a pattern across a small set of elements, [and] then generalizing the pattern to all elements in the larger set." (Potter, 2008, p. 17) People sharing a common goal, in a group, for example, should develop an understanding of commonalities of the postings and goals; and then start

contributing to the group page by finding new elements or commenting on current postings. These efforts may support the developing of the participatory culture, which is one of the main features provided by Web 2.0 tools.

"*Deduction* is using general principles to explain particulars. When we have faulty general principles, we will explain particular occurrences in a faulty manner." (Potter, 2008, p. 18) Once people develop an understanding of responsible use of certain social space, they should be able to distinguish the actions that do not fit into the general principles.

"*Synthesis* is assembling elements into a new structure." (Potter, 2008, p. 19) This skill is particularly useful when people construct their own values or knowledge structures. In order to synthesize a new knowledge structure, one should go through several of the aforementioned stages such as analyzing, evaluating, and grouping.

"*Abstracting* is creating a brief, clear, and accurate description capturing the essence of message in a smaller number of words than the message itself." (Potter, 2008, p. 19) This skill is relevant to see the main idea of the message and assess if it is worthy to analyze or take care of it. Most of the time, people may only scan messages and ignore them if they find them unnecessary to analyze.

Kamerer (2013) talks about five communications, which were taken from a Hobbs (2011) work: Access, Analyze, Create, Reflect, and Act. This list seems to be more hierarchical, meaning that one comes after the other. *Access* should be understood as the opportunity to go online and become part of online community, which is more related to infrastructural issues. Once students access to the platform, they are supposed to *analyze* the messages through critical thinking point of view. People who are able to access to the online platform should also *create* their own messages if they feel confident in doing that. In order to create effective messages, one should be aware of the capabilities of the medium as well as responsibilities of creating and sharing, which could be considered as *reflect*. In order to *act* at various levels, in-groups, inter-groups, or even national and international levels, people should develop a strong understanding of context and content.

Both Potter's (2008) and Hobb's (2011) frameworks demonstrate different perspectives in terms of audiences. The Potter's framework seems reflecting more cognitive skills and provides an individualistic perspective while Hobbs' framework looks like more collaborative and relevant for social context. Although they both emphasize the importance of analysis and synthesis (creating) Hobb's framework seems to be more aware of about the group needs and possibly the sensitivity for some cultural issues, and therefore, suggests reflection.

Mihailidis (2014) presented three different frameworks in his book. The first one, what he calls arguments, consists of critical thinkers, creators and communicators, and agents of social change. "Common to the skills of engaged citizens is the ability to act as critical thinkers –able to access and analyze information on which democratic participation." (Mihailidis, 2014, p. 42) This seems a particularly important skill for new generation living in social media era because they do not consume the information that they gather from a static media, such as their parents had done for newspapers, rather they are supposed to take information, process, and contribute to it. Is it always the case? Well, not really. At least, our own personal observation, many scan rather reading and pass the information with little contribution or no contribution at all. What we mean by *little contribution* is to tag the posting with some supporting words, such as *aynen* in Turkish, literally meaning *I completely agree.*

Mihailidis (2014) also claims that, "[p]roposed definitions of 'good citizenship' also rely on individuals' ability to act as effective *creators* and *communicators*" (p. 43). He examines this perspective in the political context, which we believe that, *not limited to*. The features of social media allow users

to reinterpret the messages and their content and use them while reflecting on them or communicating with them. This also could be a way to learn new content for those young people. However, they usually put less emphasis on reinterpreting as mentioned above.

The third argument proposed by Mihailidis (2014) is being the "agents of social change" (p. 44). Today's youth, who are expected to be engaged citizen of 21st century, is also supposed to advocate their opinions after analyzing and reframing the content of the messages rather than being the passive consumers of message flow. They are expected to be aware of their role in reconstructing their future. It seems that Mihailidis' arguments for the media literacy framework is much closer to what was suggested by Hobb in terms of audiences because both demonstrate a social constructive perspective. However, the latter puts more emphasis on critical thinking and change –contribution to change.

Mihailidis (2014) then elaborates on the arguments and suggests a 5C model for media literacy. "I have identified five competencies that I think are central to media literate collaborative efforts in networked culture." (p. 61) His 5C model involves curate, critique, contribute, collaborate, and create. These competencies seem demanding more collaborative work suggested for online communities only. Again, critical thinking and collectively creating seem to be particularly emphasized.

Later in his book, Mihailidis (2014) suggests a framework, taking media literacy to improve new generations' abilities who are supposed to live in a networked society. "This framework builds on the work of media literacy pioneers who have been exploring and developing models to advance media literacy in classrooms and society in general." (Mihailidis, 2014, p. 128) The 5A's of the model represent access, awareness, assessment, appreciation, and action in a continuum. He details the content of continuum as, "access to media, awareness of media's power, assessment of how media cover international and supranational events and issues, appreciation for media's role in creating civic societies, and action to encourage better communication across cultural, social, and political divides." (p. 130) His perspective in suggesting this framework illustrates more individualistic approach and aims to strengthen the skills of individual.

National Association for Media Literacy Education (2007) declares six core principles for media literacy, illustrating a couple of themes with special emphasis. For example, critical thinking, process nature of the media literacy, contribution to and integration of individual skills and competencies to collective knowledge, and engagement and collaboration seem to be ones with particular attention.

- Media Literacy Education requires active inquiry and critical thinking about the messages we receive and create.
- Media Literacy Education expands the concept of literacy to include all forms of media (i.e., reading and writing).
- Media Literacy Education builds and reinforces skills for learners of all ages. Like print literacy, those skills necessitate integrated, interactive, and repeated practice.
- Media Literacy Education develops informed, reflective and engaged participants essential for a democratic society.
- Media Literacy Education recognizes that media are a part of culture and function as agents of socialization.
- Media Literacy Education affirms that people use their individual skills, beliefs and experiences to construct their own meanings from media messages. (p. 3)

Buckingham (2009) discusses similar issues in his plenary paper at the European congress on media literacy. "Media literacy, it seems, is a skill or a form of competency; but it is also about critical thinking, and about cultural dispositions or tastes." (p. 15) His description consists of all media forms, all age groups as well as creativity and collaboration. Moreover, he takes media literacy –education for Europeans – as a collaborative, creative, and progressive effort and suggests all people and institutions being part of this action.

It seems that almost all agree on the critical thinking, social communication skills, and collaboration as important parts of media literacy. Therefore, the question concerns to develop and improve these skills, whatever their names would be. In fact, formal education taking place in schools also states the importance of these skills and seeks strategies to improve the competencies of children in these skills.

Critical Thinking

The review of the literature reveals that media literacy is a process of constructing a number of skills. The innovations Web 2.0 tools, particularly social media platforms have caused a major shift in media literacy. As a result of this shift, educators need to take collaborative and cooperative works into account. This is rather challenging for many teachers and educators because they also need to move their strategies from the psychological perspective to the sociological perspective, integrating with critical thinking theories (Share, 2010).

Dwyer, Hogan, and Stewart (2014) argue that critical thinking is "a metacognitive process, consisting of a number of sub-skills (e.g. analysis, evaluation and inference) that, when used appropriately, increases the chances of producing a logical conclusion to an argument or solution to a problem" (p. 43). Their definition emphasizes two main points, one being the high-order thinking skills having dimensions while the other is the possible effects. The dimensions stated by Dwyer, Hogan, and Stewart are parts of media literacy skills mentioned in the previous sections. The only difference lies in the social interaction perspective, which is reasonable because critical thinking theory is a study area of philosophers'.

Having said that critical thinking is a metacognitive process, it should have some self-monitoring and self-regulation dimensions. This necessity brings the importance of learners' awareness of their personal skills and needs as well as learning objectives. This perspective is stated by Dwyer, Hogan, and Stewart (2014): "in order to improve CT [critical thinking] ability, students must be aware of what it is they are supposed to be learning; and likewise; their teachers must also be aware what it is they are supposed to be teaching" (p. 44).

We may be far from a comprehensive understanding of critical thinking before reviewing the consensus statement declared by a group of experts after working on various perspectives of the theory. A group of academics explored the theory in a series of meetings supported by American Philosophical Association in 1990 and organized by Facione. Then, they came to a consensus on the following statement:

We understand critical thinking to be purposeful, self-regulatory judgment which results in interpretation, analysis, evaluation, and inference, as well as explanation of the evidential, conceptual, methodological, criteriological, or contextual considerations upon which that judgment is based. CT is essential as a tool of inquiry. As such, CT is a liberating force in education and a powerful resource in one's personal and civic life. (Facione, 1990, p. 2)

The statement consists of six core skills, with some sub-skills for each: Interpretation, analysis, evaluation, inference, explanation, and self-regulation. *Interpretation* refers to comprehensive understanding of cases, meanings that are carried by messages, contexts, and the overt and covert meanings of concepts and processes. *Analysis* covers examining ideas and arguments as well as detecting arguments while *evaluation* is suggested to point out assessing arguments and claims. All of these concepts are almost the same concepts mentioned in media literacy frameworks above and may be familiar to many of us in regular daily contexts. The other three skills sound elaborative skills. *Inference* demands more cognitive abilities to query evidences, to conjecture alternatives, and to draw conclusions. In media literacy context, inference may mean asking questions such as what if I pass this information to my friends or what if I comment or not comment on this posting, etc. *Explanation* sounds like the advocating the acts, stating results, presenting arguments, and justifying procedures. In this sense, explanation demands more metacognitive skills because the sub-skills mentioned here could be performed through self-monitoring. Similarly, *self-regulation* is another metacognitive skill allowing one to regulate his or her actions after self-monitoring (Dwyer, Hogan, & Stewart, 2014).

ELABORATING ON ALTERNATIVES

Literature states that media literacy is a set of perspectives to interpret the media messages and that media literate describes the person who is able to judge media messages as accurately as possible to get inform herself and to spread out the reliable information through her own social environment (Kamerer, 2013; Mihailidis, 2014; Potter, 2008). In order to better help new generations act like the responsible citizen, it has been recognized by various governmental institutes in various countries that children should be educated properly and that they should be provided enough chance to develop skills they need for 21st century.

Upon briefly reviewing the skills youth may need for the 21st century, we will talk about our experience on Mind Games in a small city located at the north east of Turkey. One may find the relation between media literacy and 21st century skills unclear. However, improving critical skills from the cognitive approach may help us identify the close relationship.

21st Century Citizenship

"The world is getting smaller." This Turkish proverb does not take "getting smaller" in physical sense, rather it points out that the opportunities to get connected with people living abroad and to access information easily, and even to be able to travel for shorter periods of time. Technology people invent new tools and develop opportunities for us to make the life easier and to create more options. However, it is rather challenging to anticipate what the next will be. How will be the life and possible job opportunities for our children 25 years later? How do people communicate 25 years later by considering that we did not have cell phones and WhatsApp 25 years ago? How do technological inventions change the daily life and what skills will be needed for the people, who are five years old now and when they come to their 30s? What kind of education do we provide for our 5-year-olds to train them for 25 years ahead of today?

WhatsApp, a 5-year old technology, has about 500.000 users all around the world and changes our communication habits a lot (http://blog.whatsapp.com). It is incredible to know that doctors living in Mumbai, India help patients with heart attacks by sharing their ECG through WhatsApp and help save

the lives (Shelar, 2013). The ways we live, communicate, and interactive with others evolving and changing. It is quite difficult to anticipate the future! So, the questions still remain unanswered: How do we educate our 5-year-old so that she could easily adapt herself to the 21st century?

In terms of curricular content, our 5-year-old may not need what the formal education offers at the school when s/he becomes 30. However, they will probably need the skills to help them adapt themselves to that environment. "An increasingly international, interdependent and diverse world rewards people with global competencies and understanding, such as the ability to make local-to-global connections, recognize divergent perspectives, think critically and creatively about global challenges, and collaborate respectfully in heterogeneous forums." (Partnership for 21st Century Skills, 2014b, p. 9)

That is; our 5-year-old may need critical thinking skills, thinking creatively and respectfully. We are not even sure what language they are going to speak. However, we should educate them to have enough skills to learn a new language in very short period and to adopt their lives into their rapidly changing environments. In other words, we need to educate them for a world, which is completely unpredictable for us. The following experience emerged during a brainstorming by the authors of this chapter, and the next section will talk about our experience and what we have learned from that experience.

Mind Games in Bayburt

In this section of the chapter, we break with the perspective that puts technology at the center and present an alternative perspective not necessarily associated with technology but applicable to the technology supported contexts, as well. It takes a more explorative approach to 21st century skill development and provides strategies for developing critical thinking in teacher education context.

Undergraduate students attending to the Faculty of Education in Turkey have to complete some volunteer work as part of their course work. In 2013 Spring semester, we, the authors of this chapter, encouraged two other university professors to join us to organize a citywide event. First, we had to take care of funding, which was solved with the support of Bayburt University. Bayburt University funded the project completely, except prizes. We got support for the prizes from local people.

We believe that it is worthwhile to provide some contextual information about Bayburt and Bayburt University to help readers better understand the challenge we had to overcome. Bayburt is a small city located in the northeast of Turkey, with a population of 33,000 people, including university students, slightly more than 5,000. Most of the residents are under-educated and live in low socio-economic conditions. Students coming to Bayburt University are usually under-achievement group of the students based on Turkish university entrance exam. Their mathematics and science background is significantly low comparing to the other undergraduate students studying at the other Turkish universities. The answer given by one of the university students to a questionnaire may give an idea to the reader about the level of students: "I have seen Sudoku in some newspapers. However, I never looked at it in detail when I saw the numbers because I have always been very bad with numbers and mathematics."

The case was not encouraging among university students, at all. 175 undergraduate students worked on the project. Only a few of them had little information about basic Sudoku, so-called classic Sudoku. None of them knew anything about variants of Sudoku, Kendoku, Tangram, Quarto, or Mangala. This was the another challenge for us because we had to train them in very short period and even we were not experts of these games, except the first author, who had been involved in some activities as solver but not trainer. Therefore, we decided to get professional help from the Turkish Mind Team (TMT). The TMT

consists of a group of talented people, solving the mind puzzles, create new puzzles, organize educational activities to promote mind puzzles, and present Turkey in the International Puzzle Championships.

However, we had limited amount of money for the training; it was impossible to provide first-hand training for all university participants, a total of 175 students. Therefore, we develop a strategy and asked volunteers for a weekend training program offered by the Leader of Turkish Mind Team, Ferhat Calapkulu. 50 students attended the program on the last weekend of March, 2013, learned solving a number of Mind Puzzles. We called this first group of students as the *education leaders*. Following the training weekend, these education leaders were grouped in pairs and assigned to a group of 5 peers to help them solve Mind Puzzles. This was a great opportunity for them to learn collaboration as well as to take responsibility for each other. We called this period as the *internal training period*.

The reason, why we assigned each pair of students to 5 students, was to provide education leaders opportunities to collaborate and support each other during their internal training period. They were asked to complete this training session in their spare times in two weeks. Upon completing this internal training period, we had two groups of students with varying levels of expertise and experience: The 50 students –the first group,-who got training from Ferhat Calapkulu, were better solvers because they got training from an expert, and they trained their peers. The second group of 125 students, who got their training from their peers, had no teaching experience; therefore we called them as *assistant educators*.

After completing internal training, we encouraged students to go to the schools for external training. Since this external training was planned as after school program, some school administrators preferred weekdays while others on weekends. The external training program was planned in two stages:

- Explaining how to solve Mind Puzzles,
- Mind Puzzle solving sessions.

The role of the education leaders was to explain each Puzzle to Grade 5-7 students at the beginning each session. Then, those Grade 5-7 students were encouraged to solve their own Puzzles in the Mind Puzzle solving sessions. These sessions were the sessions that assistant teachers were involved in training. During these sessions, they, education leaders and assistant educators, helped students work on the one-on-one basis or in small groups because there were at least two assistant educators and one education leader in each classroom. This external training was completed in three weeks. On the last day of external training, school-wide competitions were organized to select students for the city-wide competition.

A two-day festival was organized in Bayburt University at the end of May, 2013. During the festival, there were mainly two types of activities: (1) Activities open to everyone and (2) the competition. For the festival, we set up 10 stations of Mind Puzzles controlled by our assistant educators. Since these activities were open to all students at any grade and attending to the festival, many were unfamiliar with activities. In these activities, we used concrete materials, so-called manipulatives to engage them in learning and trying the Mind Puzzles.

For the competition, 300 students were selected at the end of the external training in the schools and invited to the University for the Citywide Competition. 100 students from each Grade competed with each other on the first day of competition under the control of Ferhat Calapkulu, the leader of TMT, with the support of 50 education leaders. On the first day, the best 10 out 100 students from each grade won the competition and were invited to the final stage on the second day. The second day the first 3 students of each Grade level were selected as the champions of the Bayburt city. The festival was completed by the Prize Ceremony.

Reflection on the Experience

What have we learned from this experience? It seems that it is a good idea to organize our reflections based around two major themes: (1) University students' perspective and (2) Elementary students' perspective.

To our knowledge, it was the first collaborative effort that the undergraduates of our university had ever experienced. First, the education leaders had experienced in taking responsibility to train their peers. Since the success of the project strongly depended on their internal training, they were all aware of the challenge. Based on personal observation, they took their responsibility seriously and put a great effort to make it success. Second, they all experienced how a learning model could be developed to survive with a limited financial support. Third, they all experienced learning and teaching of Mind Puzzles. This last experience led some of our graduates to work on this specific area of education.

In terms of elementary students' perspective, they all got a chance to learn the Mind Puzzles. This could be a significant chance for some because there is a good reason to believe that these games may help them improve their creativity. Our personal conversation with some school teachers and principals support our claim. More importantly, some elementary students stated that it was the first time for them to visit a university and be part of an activity.

FUTURE RESEARCH DIRECTIONS

As the researchers, we had not been aware of the potential of Mind Games in supporting creativity. We knew that these games may have some contribution to improving students' problem-solving skills. The project helped us reflect and explore further on the relationship between creativity and Mind Games, and the contribution to developing 21st century skills in this regard.

One suggestion for the future research direction could be to explore the relationship between cognitive ability and communication in social media. How do the people who are good problem solver or Mind Puzzle solver communicate in social settings? Are they mostly read-only people, semi-active people or fully-active people?

In terms of the potential of material perspective, we would like to see the Mind Puzzle or Digital Game preference of the people whose activity in social media is at various levels.

CONCLUSION

Currently, we have a generation growing up in the technology era, although there is still some degree of the digital divide in some parts of the world. We have been educating this emerging generation with the guidance of the last century educational theories and models. In contrast, we ask them to live in 21st century. Despite the fact that this is an obstacle of our formal education system in many countries, it seems that we do not have much chance to alter the system. It is because no one really is sure about what the best education system would be. What education system is the best one that can develop our next generation's 21st century skills? Even worse, we are unsure what skills will be most important for the 21st century.

Still, we –educators –need to find and suggest some directions and provide some guidance for the future. As the authors of this chapter, we discussed the possibilities to help next generations improve

their cognitive skills. We intend to propose a self-regularity method supported with enough cognitive abilities may help them find their own solutions whenever and wherever they confront with them. With this intention in mind, we shared our experience with readers by assuming that the experience might inspire the readers.

KEY TERMS AND DEFINITIONS

21st Century Skills: 21st Century skills are the skills that citizens of the 21st century may employ in their daily lives.

Formal Education: Formal education is an educational model to deliver a pre-defined curriculum and offered by institutions.

Informal Education: Information education is an educational model emerges spontaneously and does not necessarily have a pre-defined curriculum, rather the content emerges during the process.

Innovation: Innovation is the implementation of an idea in our life by a unique procedure.

Invention: Invention is to introduce a new idea, process, or model on a specific topic.

Media Literacy: Media literacy is the ability to assess and deconstruct the meaning of the messages conveyed in media.

Mind Puzzles: Mind Puzzles are the puzzles demanding cognitive skills such as mathematical thinking, analyzing, and problem-solving.

This research was previously published in the Handbook of Research on Media Literacy in the Digital Age edited by Melda N. Yildiz and Jared Keengwe, pages 351-373, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

Chapter 14
Developing Digital Empathy: A Holistic Approach to Media Literacy Research Methods

Yonty Friesem
Central Connecticut State University, USA

ABSTRACT

In the Digital Age, when technology offers many solutions and distractions at the same time, we should use media literacy research to address these advantages and challenges through a holistic approach. This chapter introduces digital empathy as a holistic framework combining empathic design and empathic listening to bridge the traditional protectionist and empowerment approaches in media literacy research. Digital Empathy is a mixed methods approach that has been developed through a longitudinal study. It is an inclusive model that addresses the participants and the researcher's cognitive, emotional, and social skills through empathic design and empathic listening. Using a longitudinal case study of a month-long media literacy summer class with underprivileged high school students, the chapter describes digital empathy, not only as a pedagogical approach, but also as a holistic research method that will advance media literacy scholarship.

INTRODUCTION

Digital and Media literacy research explores human ability to access information, analyze media messages, create media, reflect upon her/his use and act responsibly (Hobbs, 2010). There are two main approaches to media literacy research: protectionism and empowerment (Buckingham, 1998). This chapter calls for using an empathic methodology to advance media literacy research making it more valid and to address ethical issues. The described longitudinal case study of a summer program helped me develop the framework of digital empathy as a research methodology. Digital empathy is the result of my efforts to design a research framework to address cognitive, emotional, and social skills while using digital media.

Digital empathy explores the ability to: analyze and evaluate another's internal state (empathy accuracy); have a sense of identity and agency (self-empathy); recognize, understand, and predict other's thoughts and emotions (cognitive empathy); feel what others feel (affective empathy); role play (imagi-

DOI: 10.4018/978-1-5225-3822-6.ch014

native empathy); and be companionate to others (empathic concern), via digital media (see Table 1, Friesem, 2015). My goal in this chapter is to: a) introduce the traditional protectionist and empowerment approaches to media literacy research; b) offer a new framework for media literacy research methods using digital empathy; c) showcase the use of digital empathy as a media literacy research method using one longitudinal case study.

The app generation (Gardner & Davis, 2013), which is increasingly engaged with mobile technology, experiences problems with her/his sense of identity, intimacy, and imagination. It seems that instead of promoting a deep connection and reciprocal interaction, our digital engagement is commercial and superficial making us emotionally detached from each other (Turkle, 2011). In other words, we are connected to our devices and not to the people around us, which put us in a state of "present shock" (Rushkoff, 2013).

One of the solutions for this problem is empathy. Empathy can help people develop: richer analysis and evaluation skills (empathic accuracy), stronger sense of identity (self-empathy), deeper intimacy (cognitive empathy, affective empathy), greater imagination (imaginative empathy), and better collaboration skills (empathic concern). Going back to McLuhan's (1994[1964]) theory of technology as an extension of man, reiterate the question for the digital age: how do we interact with each other via technology? While media literacy research explores human interactions and understanding of others by using media tools, we should consider combining it with empathy scholarship. Combining recent studies on empathy with media literacy practice and research can help us bridge the gap between the humanistic potential of digital devices and the actual media consumption.

The field of media literacy is influenced by both communication scholarship (Livingstone, 2004) and education scholarship (Alvermann & Hagood, 2000). As a young field, media literacy has many tensions that led different scholars and practitioners to define it using different lenses (Hobbs, 1998). The common US definition for media literacy was formulated at the 1992 Aspen Institute where it was described as "the ability of a citizen to access, analyze, and produce information in a wide variety of forms" (Aufderheide & Fireston, 1993, p. 6). However, the digital revolution in the last twenty years calls for an updated definition. This is why Hobbs (2010) modified the definition of digital and media literacy as "the ability to make responsible choices, access information… analyze messages… create content… reflect… and take social action" (p. viii). Her addition of social and emotional factors to the traditional cognitive definition opened the door for a holistic approach to media literacy research. Still, a range of different approaches according to a discipline (communication or education, Kubey, 1997) and purpose (protectionism vs. empowerment, Buckingham, 1998) proliferates.

The Media Literacy Tent

In order to study media literacy using digital empathy as practice and research method, we need to understand the different approaches in media literacy research that developed from both Communication and Education disciplines. Communication and Education scholars are part of the Social Sciences, which means that they explore social phenomena to understand and explain the world around us (Singleton, & Straits, 2010). Communication includes: quantitative research such as media effects (represented by Gerbner & Gross, 1976; Potter, 2012), investigating outcomes of media consumption; qualitative research, such as audience research (Jenkins, Clinton, Purushotma, Robison & Weigel, 2006) and media practi-

tioners who study how their participants produce media messages (Tyner, 2003); and mixed methods exploring case studies of media literacy practices (Soep, 2006). In Education, we find descriptions and evaluations of media literacy programs (Burn and Durran, 2007), historical research (Moody, 1993), and transformative research (Vasudevan, 2008).

Media literacy has been compared to a big tent where different research methods and practices fall under either protectionist or empowerment approaches (RobbGreico & Hobbs, 2013). Media effects research as part of the Communication discipline, represents the protectionist approach and is more likely to use quantitative methods to examine the impact of media messages through a survey or an experiment (Scharrer, 2005; Primack, Gold, Land & Fine, 2006). Research on production represents the empowerment approach that usually applies such methods as ethnography to examine experiences of media production using observations and interviews (Ito, et al. 2013; Niesyto, Buckingham & Fisherkeller, 2003). In the Education discipline, critical media pedagogy represents the protectionist approach that typically uses mixed methods to evaluate critical thinking of students by analyzing their skills, coding their work, and conducting interviews (Goodman & Cocca, 2014; Kellner, 1995). Participatory and civic engagement research represents the empowerment approach, which commonly uses phenomenology or action research to describe the relationship between composing messages, interacting with media, and the social outcomes (Halverson, 2010; Kahne, Middaugh, & Allen, 2014).

Protectionist and empowerment approaches to media literacy use different methods to explore how mediated social experiences affect the individual and society. In both disciplines, when applying protectionist approach, media literacy research looks at the way media literacy skills can help to gain control over media messages by analyzing and evaluating these messages; when applying the empowerment approach, media literacy research looks at the way media literacy skills can promote self-expression, agency, and communication by producing media. While media literacy research as an interdisciplinary field bridges Communication and Education disciplines, it has yet to bridge the gap between the protectionist and empowerment approaches. Now more than ever, it is time to bridge between the protectionist and empowerment approaches to promote a better understanding and explanation of human interactions and interpretation of their digital use.

In this chapter, I suggest using two empathic practices that can bridge between protectionist and empowerment approaches and advance media literacy research in the Digital Age. "The possibility of empathy between observer and respondent is one of the advantage that the social sciences have over the physical sciences" (Guba & Lincoln, 1981, p.140). In addition, Guba and Lincoln explained how empathy and objectivity are complementing each other. Patton (2002) described how the researcher can be at the same time empathic and neutral. While neutral means being nonjudgmental, being empathic means communicating understanding, interests, and caring. This is why, researching media literacy empathically prevents the researcher from looking at the participants as those who need to be protected from media or those who are empowered by it. Using empathy-based research design applies nonjudgmental inquiry of participants' digital engagement. In order to find the method for empathic neutrality, Merriam (2001) suggested using case study to establish rapport between the researcher and the participants using interviews, observations, surveys, and analysis of documents and artifacts. More specifically, I will introduce the practice of empathic design combined with empathic listening as a holistic method to research media literacy that I call digital empathy.

Digital Empathy

Digital empathy is a set of cognitive, emotional, and social skills as well as a process, through which a person can analyze, evaluate, reflect, project, predict, feel, sympathize, engage, and role-play through mediated communication with digital technology. This complex concept encompasses various psychological and sociological definitions of empathy. Holistically, empathy combines cognitive, emotional, and social skills and processes that help one better interpret and interact with the other (see table 1, Friesem, 2015). It is important to point out that empathy is not a unified framework. There are multiple approaches that define empathy differently. Historically, empathy as a psychological and sociological term was coined more than 100 years ago as a translation to Theodor Lipps' German word "Einfühlungsvermögen" ("feeling into"). For Lipps "empathy not only plays a role in our aesthetic appreciation of objects. It has also to be understood as being the primary basis for recognizing each other as minded creatures" (Stueber, 2014). Since then, empathy has broken into fragmented silos. Digital empathy is my attempt to recover Lipps' holistic definition adapted to the Digital Age. In this section, I will explain the six psychological, social, moral, and educational aspects of empathy as it evolved from Lipps' definition and how it relates to media literacy research.

Empathic Accuracy: Analyzing and Evaluating

Empathic accuracy is a successful attempt of empathic inference. It is a fundamental dimension of social intelligence that can be measured. It applies perspective taking as data gathering, analysis, and evaluation. In the last twenty years, Ickes (2009) developed a method to measure video-cues interpretation. During each video recording at several points, the filmed individual reported her/his thoughts and feeling. Later on, the same individual explained her/his thoughts and feeling at the same accuracy points while watching the video she/he featured. The correlation created the database from which the actual

Table 1. Digital empathy

Empathy	Definition	Digital Media Literacy
Digital Empathy	"The cognitive and emotional ability to be reflective and socially responsible while strategically using digital media" (Friesem, 2015)	Access, analyze, create, reflect, act (Hobbs, 2010)
Empathic Accuracy	"'Reading' other people's thoughts and feeling" (Ickes, 1997, p. 2)	Analyze
Self-Empathy	"A process in which the individual adopts an attitudinal stance of nonjudgment and openness toward the self" (Neff, 2003, p. 90)	Reflect
Cognitive & Emotional Empathy	"Knowing another person's internal state, including his or her thoughts" and "feelings and coming to feel as another person feels" (Batson, 2009, p. 4-5)	Access, analyze, act
Imaginative Empathy	"The tendency to imaginatively transpose oneself into fictional situations" (Davis, 1996, P.57).	Analyze, create
Empathic Concern	"The underpinnings of compassion and connection in social relations" (Zahn-Waxler, Robinson & Emde, 1992, p. 1083)	Create, act

Note: Table is adapted from Friesem, Y. (2015). Digital Empathy. Retrieved from www.digitalempathy.net

research participants were to infer at these accuracy points what were the thoughts and feelings of the filmed individual. Similar to media literacy scholars who research media effects, empathic accuracy research method can help increase the validity of the research. This branch of media literacy measures the participants' ability to take the authors' perspective and interpret the meaning of the media message.

Self-Empathy: Reflecting

Self-empathy combines self-consciousness and mindfulness as the ability to reflect on oneself. While some scholars use a self-reported survey (Greco, Baer, & Smith, 2011), others use observations and dialogue to foster and measure self-empathy (Jordan, 1997). Individuals who can be self-aware and mindful are more likely to be thoughtful consumers and creators of media messages. In addition, not only do these individuals have a strong sense of identity due to their high level of self-empathy, but also they can voice their opinions and build a strong sense of agency as media literate people. Media literacy scholars who are interested in individual outcomes of consuming or composing media messages should use reflective practices of mindfulness to validate their results.

Cognitive and Emotional Empathy: Projecting, Predicting, and Feeling

While cognitive empathy is the ability to understand others' perspective, emotional empathy is the ability to feel others' feeling (Shamay-Tsoory, Aharon-Peretz, & Perry, 2009). In their neuroscience study, Shamay-Tsoory et al. found two independent but overlapping systems. From a neurological perspective, the ability to identify, analyze, project, evaluate, predict, and respond is separated when it comes to thoughts and emotions. However, from a psychological and sociological perspective, it is harder to separate these overlapping systems of cognitive and emotional empathy. Zahn-Waxler, Robinson, and Emde (1992) examined both cognitive and emotional empathy of twins combining interviews, observations, and survey to triangulate the data. Cognitive and emotional empathy can help validate how digital interactions are made, perceived, and affect others. Composing media messages and communicating them to others effectively demands a high level of cognitive and emotional empathy. Media literacy scholars who are examining participatory culture should emphasize the mediated social interactions through the lens of cognitive and emotional empathy to increase their validity.

Imaginative Empathy: Role Playing

When interpreting or composing fictional situation, one must have the ability of imaginative empathy. It is highly relevant to the work of media literacy that explores digital texts and online games to show how identity can be formed using imaginative empathy toward fictional characters (Tronstad, 2008). Research of imaginative empathy can vary from clinical interviewing and observations (Kaine, 1999) to content analysis (Scott, 2014). In fact, at U.C.L.A. Brain Mapping Center, students are investigating how using imaginative empathy promotes the understanding of digital networking (Iacoboni, DeLiema, & Hoyer, 2014). Media literacy researchers should use measurements to evaluate the ability to role play and imagine fictional situation. Using interview, observations, and/or content analysis, media literacy researchers can estimate the level of the imaginative empathy of the consumers and/or producers to increase their research validity.

Empathic Concern: Sympathizing

In many cases empathy is mistaken as sympathy (empathic concern). However, "sympathy refers to the heightened awareness of another's plight as something to be alleviated. Empathy refers to the attempt of one self-aware self to understand the subjective experiences of another self" (Wispé, 1986, p. 314). In their experiment, Batson, Eklund, Chermok, Hoyt, and Ortiz (2007) examined responses of individuals to hypothetical situations in their psychology lab. Regarding media literacy research, empathic concern is a key component to phenomena such as cyberbullying. Depending on the nature of the digital engagement, it can promote either emotional detachment or on the other hand, empathic concern. Furthermore, media literacy researchers should be empathically concern about their subject as they evaluate their digital consumption and production. Being empathically concerned does not mean to project the researcher' subjectivity and skew the data. On the contrary, it means to be more attentive to and caring about their research subjects as human individuals with emotions. This is an ethical issue that can be practiced while keeping neutrality, as I will explain later.

Empathy and Media Literacy

Since empathy is a "universal human necessity for functioning in an interpersonal world" (Bohart, & Greenberg, 1997, p. 437) now, more than ever, it is crucial to combine research methods of both empathy and media literacy. I would like to suggest that each empathy construct as seen in Table 1. (Friesem, 2015) can be applied to media literacy research. With case studies, media literacy researchers can empathize with the participants through surveys, interviews, observations, reflections, and content analysis of participant' artifacts. Evaluating media literacy is an assessment of five media literacy skills: access, analyze, create, reflect, and act (Hobbs, 2010). For that purpose, the five empathic constructs (empathy accuracy, self-empathy, cognitive and emotional empathy, imaginative empathy, and empathic concern) all together can offer cognitive, emotional, and social methods to measure and evaluate the five media literacy skills using empathic design and empathic listening.

Reframing Media Literacy Research

With the intention to bridge the two disciplines (Communication and Education) as well as the two approaches (protectionist and empowerment), we need to reframe media literacy research as a holistic method combining cognitive, emotional, and social concepts. Applying digital empathy would increase the validity of media literacy studies along with ethical values and better practices. Applying a holistic method would go back to McLuhan's (1994[1964]) media theory. Since its inception in the 1960's, media literacy research, influenced by McLuhan, had connected to social responsibility and civic engagement (Culkin, 1964). Nowadays, our use of digital devices as a mediated communication process require us to use our empathic abilities to thoughtfully access, analyze, create, reflect, and act. The empathic abilities can be assimilated into media literacy research using the following holistic approach, merging two empathic practices into media literacy research methods.

The first, *Human-Centered Design* (IDEO, 2014) is a five steps process developed by a design firm that reframed empathic design (Leonard & Rayport, 1997) for educators (discovery, interpretations, ideation, experimentation, evolution). Redefining for educational context, the toolkit connects empathic design as it enhances learning. These steps can be applied to a research process as well. The process

starts with discovering a challenge or a research problem. By empathically reviewing previous research, the researcher can define the issues and how it was addressed so far. Then, ideate or in other words articulate the research question and the research path and its methodology. The researcher can frame the research question imagining her/his audience. Imaginative empathy can help frame the experiment or the data collection. Last, the results can evolve into action and solution to the problem in other settings as we acknowledge the differences by emphasizing with various recipients. While human-centered design offers many activities to emphatically re-frame design process, it does not address research methods, especially how to validate the findings.

Bohat and Greenberg (1997) described the three Rogerian steps to validate thoughts, feelings, and interactions "one must have unconditional positive regard for the clients, one must be able to empathically grasp the meanings in their communications and actions, and one must be able to respond genuinely" (p. 435). To put it simply, in order to have empathic interactions, one must listen without judgment, ask for clarifications, restate the others' statements, and validate that what they understood is what the other meant. McKee (2014) used Goffman and Goffman's (2007) longitudinal research that showed the effectiveness of empathic listening as four linear steps: listen, ask, restate, and validate.

Both the five human-centered design steps and the four empathic listening steps are not just about being more cognitively, emotionally, socially, and morally aware; this is purely good research practice. In the following section, I will showcase the use of these two empathic practices as part of a longitudinal case study. During four years, our research team used surveys, observations, interviews, autoethnographic reflections, and content analysis of students' media production. Applying case study in education (Merriam, 2001), our research team explored and tested different methods to collect data and analyze it as the project developed. Over time, we came to the conclusion that the empathic practices of our media literacy study were the most effective ones to help us understand the benefits and challenges of the media literacy program to students' outcomes, teachers' instruction, and the learning process.

CASE STUDY IN MEDIA LITERACY

In the last four years, the Media Education Lab at the University of Rhode Island provided media literacy classes for twenty underprivileged high school students as part of a month-long summer academy that familiarized students with the University campus. We studied the effects of the program in a longitudinal study using human-centered design and empathic listening practices. As we developed our

Table 2. Digital empathy as media literacy research method and media literacy

Empathic Design	Empathic Listening	Media Literacy Research
Discovery	Listen, Ask, Restate	Literature Review and Exploration
Interpretations	Listen, Ask, Restate	Planning
Ideation	Listen, Ask, Restate, Validate	Teaching
Experimentation	Listen, Ask, Restate	Data Collection
	Validate	Analysis
Evolution	Restate, Validate	Findings

Note: Table is adapted from Friesem, Y. (2015). Digital Empathy. Retrieved from www.digitalempathy.net

research design we explored different components that became a structured research method I called digital empathy. Using surveys, observations, interviews, authoethnographic reflections, and students' artifacts, we were able to (1) evaluate the program effectiveness; (2) find changes in students' attitude and behaviors in regard to their media literacy skills; (3) portray best practices of media literacy instruction. Upon receiving the University approval for the research, the legal guardians of the students, the students themselves, as well as all the instructors and staff were introduced to the research and signed on consent forms. While all legal guardian signed on the forms, four students chose not to sign since they felt uncomfortable participating.

Discovery: Literature Review and Exploration

Our team varied in their educational experience and media literacy training. Furthermore, the unique context, offering a university level class to underprivileged adolescents challenged us as both instructors and researchers. At first, we looked at the existing literature to create the program. We did not know what variables interested us besides evaluating the program effectiveness. Our priority was to teach. First, we tried to learn about our future students by interviewing the national and local program organizers. Second, we studied the literature. Third, using empathic practices such as gathering information and understanding what are the needs of each stakeholder, we created a coherent curriculum to teach a 36 hours class in digital media using analysis and production to introduce media literacy practices (Friesem, Greene, Provorova, Tierney, & Hobbs, 2012). While brainstorming, we looked at the topics that we were asked to teach, wanted to teach, along with what works according to the literature.

Interpretations: Planning

Our instructional team agreed that the most relevant and useful frame was *Digital and media literacy: Connecting culture and the classroom* (Hobbs, 2011). As the lead instructor, being the experienced teacher, I provided a lesson plan template. Each instructor was in charge of specific topics. Our team prepared for the program during two months and met regularly to review the lesson plans. In addition, we reviewed each other's instruction as we modeled our lesson while the other team members gave each other feedback. This was not part of our research, rather our preparations for the program. Nevertheless, retrospectively, I saw it as the first two steps according to human-centered design to empathically discover and interpret what are our needs. In the next two years, being familiar with the students, with the program, and having confidence in our own instruction, we were looking for new areas to discover and interpret. Using the same lesson plan frame, we explored the interjection of informational and computing literacy in the second year, social justice, activism, and marketing in the third year, and reflective production in the fourth year.

Ideation: Teaching

Arrogantly, in the first year, we considered ourselves highly prepared to teach the first class. Though we conducted interviews and reviewed the literature, we neglected to ask the students themselves, ahead of time, what they wanted. Our twenty underprivileged students came to this program to learn college readiness since they had difficulties in high school that none of the instructors were familiar with. Each

teenager student in the program had been gone through many challenges in their short lives that made most of them question authority and mistrust strangers. While our discovery and interpretation phases, using empathic practices, were good on paper, we needed to find strategies to offer the students trust and meaningful relationships in order to proceed with our lessons plans. We decided to have two strategies that would become the core of our work in the program. We found that trust issues were divided into the interactions between the students themselves and with us as the instructional team.

Peer empathic feedback was developed to address the students' trust with each other (Friesem, & Greene, 2013). In order to have a meaningful discussion using positive reinforcement reflection, each student's work was given a sandwich feedback (praising, criticizing, and praising). However, some students were not always receptive. We decided to make two major changes. First, students were given a beginning and ending statement to fill out: what I love about your video is… Second, instead of criticism in between, they offered an empathic suggestion using first person to state that this is their own opinion putting themselves in the other students' shoes: if I were you I would… Over the four years, we observed positive change and anticipation practice the peer empathic feedback by the students. For some students with emotional disorders it was very difficult to hear the suggestion though they were not criticized. Still, the peer empathic feedback was successful as an instructional tool as well as a research one. It was helpful as a validation tool, as I will discuss later.

Empathic listening was the other strategy used to address the tension between the students and the new instructors. Like the peer empathic feedback it developed during the four years and was used according to the instructors' personality and familiarity with the students. During the first year, the program introduced the students to cinematic techniques by collaboratively producing thirty-second commercials. Then, the students, in the same groups, created music videos in which they could express their creativity. The third video assignment was a manifest of their social responsibility. Offering the scaffolding to video production enabled them to gradually express their voice and interests. Using media literacy pedagogy, we listened, asked, restated, and validated their thoughts and emotions. The second year they designed personal websites. The third year they created digital campaigns. The fourth year, they produced reflective videos. The students used their own ideas that they articulated in the first year during their storytelling class. Our empathic listening was merged with media literacy pedagogy to teach how to use the tool and at the same time made sure we were attentive as well as trustworthy for our students. Like the peer empathic feedback, it was a highly useful instructional process that was effective to collect data and validate the analysis.

Experimentation: Data Collection

We used surveys for program evaluation. We used Baron-Cohen and Wheelwright's (2004) *Empathy Quotient* as pre and post-test. However, this survey was design in the UK to evaluate the psychiatric state of an individual on the autism spectrum focusing on cognitive empathy. The results showed no changes in the cognitive empathy of the students. The emphasis solely on measuring cognitive dimension using surveys changed in the second year. While looking at the students' grade, attitudes, and media literacy competencies using surveys, we also triangulated with qualitative methods such as observations and interviews.

To capture students' interactions we used ethnographic observations. Each research assistant documented in her/his own way at least one dimension of empathy. Our observations were focusing on em-

pathic practices such as: collaboration (Friesem, E., 2014), critical thinking, civic engagement, agency (Greene, 2014), and roleplaying (Friesem, J., 2014). As we sat in the classroom, writing observation notes or video recording, we made sure that the students gave permission and knew what we were documenting. Using empathic listening, we were participant observers, documenting our engagement with the students as they learned about media literacy. To make sure that we were accurately documenting our observations, we would constituently listen to the students and ask them about their work, restate what they answered, and validate that we understood them correctly.

We conducted group interviews and had each student, who agreed to take part in the research, be interviewed each year. The semi-structured in-depth interviews were either video taped or audio taped according to students' approval. As we shifted during the four years from program evaluation toward examining media literacy skills and empathic practices, our questions changed as well. Being in the classes and knowing the students for a year or two helped us build relationships of trust while receiving deeper answers. These relationships might be perceived as a validity threat. However, the empathic listening helped us stay neutral and empathic (Patton, 2002). We made sure we were not letting our own personal bias dominate the data collection but rather making sure students were fully heard and understood. Ginsburg's (1997) clinical interview combines Piagetian and Vygotskian practices of engaging and assessing students' knowledge with ethical practices to make sure the interviewer is mindful of the young interviewee. Following Ginsburg's checklist for the interviewer, we made sure to listen, ask, restate, and validate the answers.

During the data collection, we continued to reflect. We met after every class and reviewed the challenges and successes of our instruction alongside with the data collection processes. We found that our own voices and perspectives as both researchers and instructors were extremely valuable, just as Holt (2008) stated: "autoethnography can encourage empathy and connection beyond the self of the author and contribute to sociological understandings" (p. 26). We could choose to either videotape ourselves or write a short reflection. Each week, we posted in our online closed blog our reflections. It helped us better understand what each one of us was going through, but also to triangulate observed situations from different angles. For example, one student started to argue in class and then left. We were able to better understand why after hearing a staff member mentioned that the student received troubling news from home. Hearing and reading the reflections helped us acknowledge our subjectivity as teachers and researchers. By being open about our own subjectivity and practicing self-empathy, we were able to be neutral and empathic, differentiate our thoughts, feelings, attitudes, and behavior from the students.

Last, we examined students' artifacts including videos, songs, video games, storyboards, written assignments, websites, blogs, and posts in social networks. Looking at their peer empathic feedback practice, sharing thoughts, and working together, helped us to look at their cognitive and emotional empathy as well as their empathic concern. Their ability to picture their target audience showcased their imaginative empathy. As we collected or reviewed their work, we listen to their explanation applying Iackes' (1997) empathic accuracy practices with videos. With class discussion, other students and instructors could ask questions. Using the peer empathic feedback, the students, instructors, and researchers restated and validated the purpose of the media message.

The data collection in each year combined analysis as suggested by Merriam (2001). This is a case study since it was one media literacy program that was evaluated holistically. It was related to the context of the University and it addressed current trends in education and media literacy. Using these mixed methods we were able to look at students media literacy skills, empathic practices, and develop digital

empathy research methods. While the process was framed as human-centered design process (discovery, interpretations, ideation, experimentation, evolution), the data collection implemented empathic listening process (listen, ask, restate, validate).

Validation: Analysis

As stated before, I believe that only holistic data collection and analysis with mindful introspection can represent valid results. Empathy is a useful practice to make sure participants agree with the researcher's interpretations and reception of their actions, thoughts, and feelings. Empathic practices are the key to making sure that you truly listen, observe, and interpret the person in front of you. Empathy helped us understand our students as we got to know them and work with them during the media literacy program. As researchers, triangulating our data and verifying our interpretations, made sure we not only analyzing accurately our students' work, but also ethically representing them while helping them advancing their media literacy skills.

Evolution: Findings

We found that students demonstrated an increase in each one of the digital and media literacy competencies (access, analyze, create, reflect, and act) after each year. The students became more proficient in locating credible information using different search engines, posting and sharing thoughtfully on social networks, editing on various software, and operating skillfully different cameras. As they practiced analyzing media messages from professional videos, websites, and their peers' work, students were able to increase their critical thinking as demonstrated by their detailed answers to the five media literacy critical questions (Hobbs, 2011). First year, they were able to produce three group videos. Second year, they were able to design websites. Third year, they created digital campaigns using videos, websites, and social networks to create awareness for civic action on social issues that concerned them. This was their collaborative effort to share a solution to a social problem. They reached out to caregivers who could offer support and used the digital platforms to connect with teenagers who needed help. Fourth year they created videos to reflect on their development in the program.

During the four years, we gradually developed effective empathic practices with media literacy such as peer empathic feedback and empathic listening. In addition, students' analysis skills using empathic accuracy and imaginative empathy demonstrated their understanding of their own audience and the target audience of professional videos. While working collaboratively on their civic engagement project, they demonstrated cognitive and emotional empathy as well as empathic concern for each other. This is not to say that all went smoothly without group dynamics that developed into conflicts.

Like all research, especially case studies, the context of the research is particular. While our results cannot be generalized, some of them can be transferred (Creswell, 2014). Practicing empathy as instructors and researchers cannot be practiced all the time by everybody. Many find it exhausting, being attentive all the time and practicing active listening (Stebnicki, 2008). Others find the applications and definitions confusing (Bloom, 2013). Nevertheless, the results showed that for our students as well as for us, as both instructors and researchers, applying digital empathy as holistic research method promoted critical views (protectionist approach) and creative expression (empowerment approach).

CONCLUSION

By applying digital empathy as a media literacy research design, we were able to explore the students' media literacy skills and empathic interactions from both protectionist and empowerment approaches. The complexity of the different cognitive, emotional, and social components with a mixed methods approach contributed to the richness of the findings as it can be seen in different publications (Friesem, E., 2014, Friesem, Y., 2014, Friesem & Greene, 2013, Friesem et. al., 2012, Greene, 2014). At the same time, further research is needed to test the method in different settings with different populations. Our media-saturated environments allow more people to consume and create media. While some see it as a social challenge, we can see how more and more populations can benefit from digital empathy.

It is time for media literacy research to return to its roots using a holistic method that combines protectionist and empowerment approaches to increase the validity of its research in the Digital Age. Now more than ever, it is important to find the human experience while the researchers remember to have a rapport with their participants. Empathic design and empathic listening provide a framework for research design that allows the media literacy researcher to apply ethics of care while keeping neutrality. The analysis of media messages, their production, and their effects on our students and us should be studied holistically as we are emphasizing and keeping neutral.

ACKNOWLEDGMENT

I would like to thank Edwin Rutsch, founding director of the Center for Building a Culture of Empathy, for his insightful remarks and constant support. The center's website cultureofempathy.com is a fruitful resource for information regarding empathy.

KEY TERMS AND DEFINITIONS

Digital Empathy: Holistic approach to teach and research media literacy in the Digital Age. It combines cognitive, emotional, social, and moral aspects of digital and media literacy.

Empathic Design: Five-stage process that looks at the participants and community experience to explore better ways to designing produces and processes. The key components are perspective taking and role-playing to better understand other's point of views that leads toward an inclusive approach.

Empathic Listening: Active process of hearing and providing feedback in order to validate the other's perspective. In education as well as research this four-stage practice is important to have better communication and establish trust.

Empathy: Ability and process of an individual communicating with others to understand and acknowledge their thoughts, feelings and behaviors. Holistically it combines the cognitive, emotional, and social parts of the mind as we interactive with others.

Empowerment Approach to Media Literacy: Approach that looks at media as a tool to empower individual and/or communities through expressive composition of texts.

Protectionist Approach to Media Literacy: Approach that looks at the need to be critical media consumers in order to take control of the media messages that we are surrounded by.

Tent of Media Literacy: Overview of the media literacy field according to the US definition, two approaches, and practices.

This research was previously published in the Handbook of Research on Media Literacy in the Digital Age edited by Melda N. Yildiz and Jared Keengwe, pages 145-160, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

Chapter 15
The Social Media "Information Explosion" Spectacle:
Perspectives for Documentary Producers

Friedrich H. Kohle
Edinburgh University, UK

ABSTRACT

The semantic web, social media and the amount of user-generated content continues to grow at a staggering rate. Social Media significantly contributed to the information flow during the Arab Spring, the Occupy and Wall Street movement continue to maintain a global online presence using social media technology. But is the social media information explosion really a unique event in media history? How did story telling evolve into social media? In order to place social media in its historical context and anticipate digital native expectations, we explore the origins of narrative and storytelling from the perspective of a documentary producer. How did past media technologies prepare the way for social media? How do digital natives perceive the world via social media and what do they expect from today's documentary producer? What are the viewing habits of digital natives? What do previous 'information explosions' have in common with social and digital media? These are essential questions for media and documentary producers navigating their way through the vast maze of social media technology and the semantic web, in addition to traditional media.

1. THEORETICAL FRAMEWORK

Social media is defined by Kaplan & Haenlein (Kaplan, Andreas M. & Haenlein, Michael 2010). Readers should be familiar with the work of Marshall Mcluhan's (1994) media theory and Briggs and Burke's (2009) history of media.

DOI: 10.4018/978-1-5225-3822-6.ch015

2. BACKGROUND

A physicalist approach was taken to investigate the origins and evolution of media technology and the impact of social media on documentary filmmaking. However, a reductionist explanation as to how social media moves us, remains elusive. A dualist position offers a better explanation into phenomena such as catharsis, but still leaves many questions unanswered. As a result, the author of this paper has come to view social media as an extension of our senses (Mcluhan 1994) and consciousness. What exactly is it that touches our inner world when watching a flash mob play 'Here comes the Sun' in a Spanish unemployment office? (Carne Cruda, 2012), Neuroscientists can measure the activity of our brain during catharsis, yet they cannot determine what *it* is that moves us to tears during those moments. Here we conclude that the 'hard problem' of consciousness (Chalmers, 1995) equally applies to social media *content* as an extension of our consciousness, and as such its deeper purpose remains hidden. Yet throughout history and across all media technologies, storytelling has been the key driving factor. Without compelling content there is no social media.

3. INTRODUCTION

The Internet and social media are frequently referred to as the 'information explosion'. Social Media is ubiquitous and significantly contributed to information dissemination during the Arab spring. It continues to be a major platform used by grass root movements such as Occupy and Wall Street. It is swiftly becoming a tool documentary filmmakers rely on during all production phases, i.e. 'Mon Petit', (Mon Petit, 2012) which tells the story of wheelchair-bound Albert Casal, hitchhiking from his native Barcelona to New Zealand. The producers of 'Mon-Petit' have learned how to apply social and digital media to develop, produce and distribute content. Without social media the production of 'Mon-Petit' would not have been possible in this form. Governments too are learning to use social media, but for different reason: propaganda and surveillance. Authorities find it increasingly difficult to censor the amount of user-generated content online when compared to traditional forms of documentary production. Facebook now exceeds 1 billion members (Shaughnessy, 2012).

But is social media really a unique 'information explosion'? Investigating media history from a physicalist perspective, we draw comparisons to today and put social media into its historical context in order to explore current perspectives for documentary producers. Are we witnessing a paradigm shift or another evolutionary step in the development of media history? Can a reductionist theory fully explain the impact of social media? The documentary "God, Church, Pills & Condoms" offers insight into the methods used to develop, produce and distribute content online and examine online behavior of stakeholders and audiences. A survey conducted among 2nd year undergraduate students at NHTV (NHTV, 2013), University of Applied Sciences, Breda, Netherlands sheds further light onto changing viewing habits of digital natives. Results of this paper provide media and documentary producers with an overview of social media in its historical context, a better understanding of audience behavior and insight into emerging trends.

4. RESEARCH METHODS

We investigate the evolution of social media into its current form using a variety of multi-disciplinary literary sources. We applied and tested our findings using our documentary "God, Church, Pills & Condoms" (Kohle. F, Cuevas. A, 2013), examine online behavior in today's video-verse and compare results with research papers in the field for further discussion, including a survey conducted among 2nd year undergraduate students at NHTV, University of Applied Sciences, Breda Netherlands which investigates changing viewing habits among digital natives.

5. RESULTS

Social Media and the information explosion: Terms such as *the* "information explosion" are often used to describe the impact social and digital media has on society and culture. *This* term is *by no means* a new *term:* it was first coined during the print revolution (Briggs/Burke 2009). *Instead the term 'information explosion' is better defined as a* recurring pattern throughout history. However, social media significantly distinguishes *itself from* previous information revolutions in a number of ways:

1. *The social media revolution is moving forward faster in time than any other previous 'information explosion'.* The rate of growth of social media its and corresponding public spheres (Habermas 1974) is expanding at an exponential rate globally.
2. *Social media no longer requires editorial approval by an elite, nor can censorship effectively be applied by a single state (Kohle 2012), (Bondebjoerg 2009).* Digital natives are used to not only consume content; they are capable of generating an increasing amount of online content without effective censorship.
3. *Social Media is part of a paradigm shift of similar magnitude as the invention of language (Dunbar 2003), (Corbalis 2009).* The invention of writing, printing and broadcast technologies, can be interpreted as an evolutionary process rather than a paradigm shift, whereas social media encompasses all previous forms of media.
4. Viewing habits are changing (Kohle/Cuevas 2010, 2012): *digital natives are quickly adapting to the opportunities the participatory web and social media offers.*
5. *Content development, business models, production and distribution strategies are transforming at an ever-increasing speed (Puttnam 2013).* Producers and directors are challenged to constantly evaluate and develop content and new ways of reaching their audiences.
6. *Digital natives expect instant dialogue with the makers of a programme.* Projects need to feature a number of narratives across various platforms to really meet the growing expectations of their audiences. The narrative among digital natives is rapidly developing and needs to be better understood by producers.
7. *Programme-maker need to carefully consider their target audiences, small or big, and design the programmes relevant transmedia strategy accordingly.* A linear narrative in the form of a film still features prominently in the media vocabulary of a digital native; but digital natives also expect to engage with gamified and transmedia content as well as opportunities for feedback and contribution.

6. DISCUSSION

Origins of Social Media

By nature stories require language, writing and images. Without these elements we lack the means to tell stories and engage with social media. We examine evolution of these elements from prehistory to present day from a physicalist position to provide a contextual background. Is there a repeating pattern in the evolution of the above elements? How does technology influence story telling? What can we learn from media history?

Language

Children have an "Instinct of Inventiveness" (Locke/Bogin 2006) enabling them to invent language even if linguistically deprived. As speech evolved our brains adapted to this new tool. Memory improved as we developed the capacity to speak and refer to events in the past. This ability for 'Mental Time Travel' requires two types of memory: semantic and episodic memory. Episodic memory (Tulving 2002) is more interesting to us as by nature, it lends itself to a narrative structure. The concept of time provides the basic elements needed for story telling: past, present and future. The most basic definition of a story requires a beginning, middle and end with the narrative unfolding over a period of time. Without the invention of language these basic elements needed for a narrative would not exist.

Narrative is needed for all consequent forms of media – and for that reason we submit that language was a paradigm shift, a real game changer in the history of storytelling. *Oral* story telling remained the key instrument of communicating information over distances and time for mankind until writing was invented. Stories passed on verbally over generations maintained their basic plot structure accurately but adapted to the cultural and social circumstances of the time (Cvorovic 2006). The invention of language can be considered the first prehistoric 'information revolution'. The ability to use tools while explaining their use, led to the development of pedagogy (Corbalis 2009) – a key tool regarding the dissemination of information.

Rock Art, Cave Paintings and Early Writing

As speech and language continued to evolve, man began to explore new and more abstract forms of expression and communication, such as rock art and cave paintings. In February 2012 cave paintings were discovered in Spain, which are estimated to be 42000 years old (Pike/Hoffmann 2012). Archaeologists and Anthropologists are debating if these cave paintings were created by the first anatomical modern humans or Neanderthals. The paintings depict hunting scenes, animals, the night sky and silhouettes of hands. Unlike speech, which once spoken leaves no permanent record other than in our own memory, rock art and cave paintings remain visible, forming a permanent external record.

Whichever species left behind some of the earliest records of human creativity, the question remains as to what motived early cave dwellers to decorate their environment in this way. 26 cave symbols (Ravilious 2012) are shared across caves in southern France by early man, implying that this 'creative explosion' took place earlier, perhaps even before the arrival of modern man in Europe. From rock art and cave paintings it is but a small step towards proto-writing (Merola 2007), (Lauinger 2011): a picture system dating back 30-35000 years. (See table 1)

Table 1.

	Approximate Dates Years ago	Event
Lower Paleolithic	2.5 million – 400.000	Invention of Language: 1st 'Information Explosion"
Middle Paleolithic	200.000 – 45.000	Arrival Homo Sapiens: "Creative Explosion"
Upper Paleolithic	45.000 – 10.000	Rock art, Cave paintings: 2nd "Information Explosion"
Neolithic	10.000 – 7.000	Invention of Proto-writing: 3rd "Information Explosion"
Chalcolithic	7.000 – 3.500	Cuneiform writing
Antiquity	3.500 - 600	Invention of the Alphabet: 4th "Information Explosion"
Medieval	600 - 1500	
Early Modern	1500 - 1800	Invention of the Printing Press: 5th "Information Explosion"
Industrialization	1800 - 1900	Invention of Broadcast Technologies: 6th "Information Explosion"
20th Century	1900 - 2000	Invention of the Internet & Social Media
21st Century	2000 - now	Social Media: 7th and current "Information Explosion"

Dunbar provides evidence suggesting that the human brain, when compared to other hominids, is capable of a social network encompassing some 200 contacts: a size inadequate for prehistoric permanent settlements exceeding that number. It became necessary for early man to overcome this biological limitation for cognitive evolution by cultural means (Watkins 2010), i.e. monumentalism and *storytelling*. This enabled early men to evolve from a hunter-gatherer group and develop the agricultural skills needed to form permanent settlements.

The formation of tribal settlements undergoing a cultural and spiritual process can be found in early cave paintings: some of the cave paintings in Southern France and Spain are located deep inside cave systems with no natural light available. To venture that deep into the caves, the creators of those paintings deliberately sought out a location isolating them from the outside world. It is reasonable to argue that this is intended because the creators of those paintings wanted to invoke a spiritual experience, an experience not unsimilar to the one a contemporary cinema induces on today's cinema visitor.

With external influences reduced to a minimum the viewers' attention is drawn entirely to the big screen – or cave wall enabling catharsis. A physicalist position reaches the limits of what can be explained at this point. Why is catharsis necessary? How can physicalists explain what it is like to experience catharsis? Media, as an extension of our consciousness, cannot be explained by reductionism alone. Werner Herzog's "The Cave of forgotten Dreams" (Herzog, 2012) investigates the Chauvet cave paintings in Southern France, highlighting just how deep the paintings are located inside the cave. In consequent interviews Herzog also refers to Chauvet as a form of 'proto-cinema'.

The role of the storyteller and painter changed significantly: he or she is no longer master of a narrative forming part of an invisible oral domain. The creators of cave paintings are very much in control of a physical and artful process projected onto a cave wall: a process that repositions the painters and their role as storytellers within the tribe. Karl Marx and Friedrich Engel's Communist Manifesto (Marx

& Engels, 1969,p. 98-137) offers an interesting perspective on the evolution of early communes and elites and the consequent class struggle, which persists until today. Critics are quick to point out that Marxism neglects the spiritual dimension in man (Brentlinger 2000) already on display in those early cave paintings.

The Alphabet

Documenting history, accounting for resources, trade agreements and accounts of battles lost and won, eventually led to the invention of the Alphabet. (Andis, 2012) This in turn gave rise to an 'information revolution' in antiquity. Who exactly invented the alphabet is still subject to discussion (Goldwasser 2010), but we know that Phoenicians played a major part in spreading the alphabet across the Mediterranean Sea as part of their trade activities.

The alphabet gave rise to a new form of writing: Greek writers repositioned the storyteller with a strong philosophical perspective. Antiquity gave the storyteller a voice, which did not exist before; a form of storytelling that is still found today, i.e. auteur cinema finds its early roots in Greek narrative history. Conflict and war are important *factors in* the evolution of media. As tragic as it seems: without war and conflict, media would not have developed into its current form. Conflict in the Middle-East has been described by many sources (biblical, Egyptian, Phoenician, Greek) for thousands of years. Between 700 and 588 BC nineteen Mediterranean conflicts are accounted for (Conflict History, 2012), with the amount of conflicts steadily increasing in recorded history.

Table 1 provides an overview of the various past media-'revolutions'. There is much debate about the exact timing of the *given dates.* Evidence suggests that Neanderthals were capable of speech including the creation of rock art and cave paintings. Even hominids such as Bonobo apes (Benson, J, Greaves, W., O'Donnell, M, Tagliatlatela, J. 2002) have demonstrated the potential for language, though this remains a hotly debated topic among linguists. Creativity is not a trade exclusively reserved to Homo Sapiens, though some members of the species Homo Sapiens would like to claim otherwise (Pagel 2011).

The Printing Press

It would take a few more millennia before the arrival of the next major 'information explosion': Gutenberg's printing press. Even though printing technology had been developed a millennium before Gutenberg in China, *t*he alphabet combined with Gutenberg's press, suited the literate European elite and middle classes in the 14*th* and 15*th* century Europe best, at a the time when Europe was ravaged once again by conflict.

Culturally and socially Europe was starving for new ideas, which eventually led to European Reformation and Enlightenment. The printing press also gave rise to a new problem: copyright infringement. Briggs and Burke (2009) provide an interesting account of the cultural and political background during enlightenment. To avoid prosecution Amsterdam printers named a non-existent Cologne printer as the publisher of one of the most printed books of all times: the bible. The bible would not remain the most popular book, soon romantic stories and poetry would generate revenues in the form of James Thomson's "The Seasons" published by Alexander Donaldson. Thomson's poetry soon became a copyright landmark case: on February 22, 1774, the House of Lords in the United Kingdom decided in the case of Donaldson v. Becket (Rose 1988) that copyright is not perpetual, but limited in duration, thus leading to the development of today's copyright law.

It can be argued that the media tools of creativity, used by the best writers and artists *of the time* to create prose and art, such as the alphabet and the printing press, are byproducts of thousands of years of Middle-Eastern and European conflict. Unlike language though, print technology was controlled by the elite. As power struggles continued to take their toll across Europe, the next information revolution would take place this time not thousands, but merely a few hundred years later. With each 'information revolution' the arrival of the next revolution occurred sooner, such as the invention of broadcast technologies.

Europe was beginning to lose grip on her colonial domains and once again she was ravaged by major world wars, as broadcast technologies evolved from Marconi's radio transmitter into *Film and* Television.

The scientific process, which made broadcast technologies possible, spanned some 200 years; a very short time when compared to the time needed to invent speech, writing, the alphabet and printing. During that time the world experienced nearly 900 documented conflicts, double the amount accounted for during Gutenberg's period. History tells us that past information revolutions are not associated with less but more war and conflict. The Internet too is a military invention, with its origins in the cold war: Arpanet (Mowery 2001). Since 1990 the world has experienced 322 documented conflicts, rising in speed and occurrence along with the 'new' information revolution: the Internet and social media. Conflict and media are intrinsically linked, and during times of war new forms of media technologies emerge as a matter of life or death.

As was the case with the invention of language itself, writing and the Alphabet, printing and broadcast technologies, social media requires the audience to develop a new form of media literacy, giving rise to different forms of social, political and cultural awareness. Unlike previous media revolutions, social media encompasses all of the above, providing a platform almost entirely reserved for user-generated content. Content is available instantly, globally and on a variety of screens and devices. 'Mon Petit' and 'God, Church, Pills & Condoms' are excellent examples of how social media provides a platform to guide and shape user generated content during development, production and post-production stage. Social Media was the exclusive tool used to distribute 'God, Church, Pills & Condoms'; consequently it was accepted into Cinemalaya and the Hanoi Film Festival in 2012.

How Are Digital Natives Experiencing Social Media?

A total of 26,000 hits were registered on the YouTube site since July 2011 for our documentary "God, Church, Pills & Condoms". Throughout production, post-production and distribution on the festival circuit, we made various short clips available online for stakeholders and the public, steadily building up an audience. Statistical data shows that a great deal of traffic was generated by YouTube Philippines, as the political stage surrounding the documentaries topic, controversial health care legislation, is set there. Filipinos around the world have been watching and commenting on the film on the projects *F*acebook and *Y*ouTube page, at times engaging in passionate online debates. Data collected from both sites show that audiences, especially digital natives, are increasingly accessing content in a "video-verse": 14.6% of viewers access content via smart phones.

42.4% of digital natives enrolled as 2*nd* year undergraduate students at NHTV, International University of Applied Sciences, Breda, watch mainstream news and factual programming most of the time. 53% obtain their news from the Internet. Print ranks bottom of the list at 12%. Social media and Internet have become the main source of information for digital natives. 81.1% of participants surveyed claim that mainstream news has more impact on their opinion forming process, with only 18% stating that internet and social media have most impact on their opinion. For 54% of participants the internet and social media

has significant impact and combined 72% of all digital natives surveyed consider the internet and social media as a source that has the most if not significant impact: a figure not far away from the 81% still holding on to mainstream news as the main source of information for opinion forming.

Mainstream broadcasters are competing with Social Media, broadcasting user-generated content during unfolding events such as the Arab Spring; they will need to do more to engage and retain digital natives. Experts in a studio interpreting and explaining events to the audience are not enough to satisfy the critical mind of a digital native, which increasingly develops the cognitive tools and ability to generate and react to user-generated content on a regional and global scale. News are no longer solely obtained top-down from a mainstream broadcaster such as CNN, the BBC and others worldwide, who begin to incorporate social media into the existing paradigm, slowly adapting to a new a new form of media literacy.

Digital natives engage and expect to be engaged with programme makers and their content at home, at school and while travelling. Using our documentary "God, Church, Pills & Condoms" we applied social media strategies during development, pre-production, production, post-production and distribution. We examined viewing habits via YouTube, Facebook and the impact of social media combined with real-world events such as the Cinemalaya Festival setting. *"God, Church, Pills & Condoms" is* now in distribution and social media still plays a major part. During development, pre-production, production and production of *"God, Church, Pills & Condoms",* social media was and still is crucial to engage with stakeholders and audiences on a global scale.

This significantly contributed to its success. Stakeholders for all of the above are able to interact, comment and suggest content at any time. Data from all of these sites confirms that digital natives and many digital immigrants are quickly accustomed to the new video-verse. A real-world setting is nevertheless required. Events in the virtual social media world need to be firmly rooted in events taking place in the real world. The premiere at the Cinemalaya Film Festival of *"God, Church, Pills & Condoms"* was not only sold out, it drove traffic to the projects social media sites. YouTube's and Facebook's statistics section provides an excellent overview of demographic and location data. Data is easily accessed online and suggests that the programme continues to contribute to an ongoing debate in the real as well as virtual world in the Philippines. To underline that point, 'Mon Petit' features two digital natives and accompanies them on their journey to New Zealand. 'Mon Petit' would not have been possible in this way, without social media communication between the production team and the protagonists: content and narrative structure could not have evolved accordingly. Social Media is changing the way content is developed, produced and distributed.

Digital Natives and Revolutionaries in the News: Are the Elite Concerned?

A 16-year-old girl in the Netherlands published her birthday on Facebook and did not mark the event as private. (BBC, Facebook party invite sparks riot in Haren, 2012) As a result some 3000 party visitors descended upon the small village of Haren causing havoc. A 15-year-old Dutch boy was sentenced to a year of juvenile detention for the murder of a 14-year-old girl. (BBC, Teenager convicted of Facebook murder, 2012), The boy was recruited by another teenager as a contract killer over a row on Facebook. These two cases are well documented but are by no means isolated. Cyber bullying and consequent teenage suicides are increasingly making headline news. (BBC, Teenager's death sparks cyber-blackmailing probe, 2013) (Gadkari, 2013), (Arkin, 2013) (Ensor, J., 2013) (Warren, L., Quigley, R., 2013) Schurgin, Clarke-Pearson (2011) make specific recommendations to pediatricians dealing with the negative effects of social media in children.

These examples serve to demonstrate the level of understanding digital natives have of social media and their ability to utilize social media for their purposes. They demonstrate how digital natives have adapted regarding the use of social and digital media to obtain their goals based on some of the strongest motivators in existence: aggression and murder. The above examples highlight how social media transformed life in a quiet small Dutch village into an evening of terror and violence. For a 14-year-old girl, application of social media ended in her death. A 17 year old teenager committed suicide because of cyber-bullying. Digital natives are well aware on the how to use and abuse social and digital media. Parents, teachers, media professionals and the government –all digital immigrants- are lagging behind current developments.

There is no real guidance available to digital natives on the use of social media. Bullying is not new, but cyber-bullying is a practice which has yet to be dealt with by lawmakers, who are struggling to keep up with this new development. Tragic as these events are, they confirm Mcluhan (1994, p.7): the message has not changed: the media is the message. On a global scale, grass root movements such as Occupy, Wall Street and 15M in Spain as well as Wikileaks must present an even scarier scenario to the elite. Over the last few years various Northern African governments were toppled and social media played a crucial role in news reporting as well as providing intelligence to governments, rebels and terrorists alike. Governments and their secret services are taking social media very serious. Recent events surrounding Syria once again demonstrate this reality all too well. While the public was stunned by user generated content coming out of Libya, digital natives and immigrants alike have learned to view the same more critically: the Occupy and Wall Street movements have become permanent platforms providing alternative information to users and mainstream broadcasters.

Will Social Media Replace Traditional, Linear Forms of Documentary Production?

The invention of the broadcast and cinema industry did not eliminate or reduce the popularity of the book. Book sales have increased since the arrival of the Internet. An even greater availability of TV channels, programmes and movies than ever before is available to the consumer. History shows us that broadcast technologies did not make books obsolete, nor did the arrival of the Internet. PWC predicts a healthy 3% growth for the UK Entertainment and broadcast industries and for the global economy a 4.9% growth rate is forecast (PWC, 2012). *Linear documentary narratives will still have a market.*

But there is concern about the future size of that market. More vocal critics of social media and digital technology, such as Prof. Dr. Spitzer (2012) argue that the development of cognitive functions is impaired by inappropriate use of social and digital media. They argue that social and digital media need to be regulated and better understood before it is introduced to children and teenagers as they are still developing their cognitive skills.

*The term 'digital dementia' (*Ryall, J., 2012) (Daily Mail, Digital Dementia on the rise as young people increasingly rely on technology instead of their brain, *2013) has made it into mainstream press, describing a correlation of the loss of cognitive functions among digital natives and digital immigrants alike and their use of social media. This is a development documentary producers should be concerned about as they depend on their audiences cognitive abilities to critically view and review programmes presented. Society as a whole needs to be concerned about claims made by Prof. Dr. Spitzer (2013) and his South Korean colleagues Lee, Choi, Lee, Jung and Kwon (2012).*

Internet addiction is comparable to gaming addiction – except unlike gaming, the internet is accessible without any noticeable restrictions. Average consumption of media of a digital native stood at 7 hours and 38 minutes per day in 2010, tendency up. (Rideout, J., Foehr, U., Roberts, F., 2010) Similar results were published by Strasburger, Jordan and Donnerstein (2010) who also made concrete recommendations to schools, the entertainment and advertising industry, as well as researchers and government bodies, on how to deal with the consequences of social media abuse. The scope and extent on how the social media narrative will unfold online is yet to be determined and documentary producers need to understand the evolving digital native language and culture better to maintain their audience ties.

How Does Social Media Differ from Previous 'Information Explosions'?

An elite cannot control the invention of speech, like social media, effectively. The introduction of the alphabet led to a repositioning of the storyteller in antiquity, the print revolution provided the means to develop 'public spheres', followed by the broadcast and cinema industry. But an elite was able to control distribution all of the above effectively, except speech. User generated content on social media networks is free of that limitation; web2 and social media technologies are instant, provide interaction and are nearly impossible to censor and control.

This new freedom requires a change in behavior by content creators and their audiences. During the print revolution the Catholic Church was not enthusiastic about a literate church body. Instead the church preferred the bible to be in Latin to ensure believers receive church dogma administered and interpreted by a priest. Literacy, a result of the print revolution, changed all that and took the class struggle to another level. The print revolution enabled the rise of the middle classes. Today no financial risk is involved in starting up a blog, YouTube channel or Facebook page. There is no editorial office, no government censor who can effectively stem the flood of information published on social media every minute of the day. Social media is taking the class struggle to the next level: without censorship, global and immediate, featuring an increasingly social media literate digital native audience. Julian Assange, Wikileaks and the Dutch village of Haren are the more obvious examples. Digital natives are not merely adapting to social media, they are developing into a generation of social media literate users and content creators capable of challenging the status quo of the existing system.

7. CONCLUSION

What Does All This Mean for Media Producers?

The tools at the disposal of the media producer have developed over thousands of years. Story telling did not just begin with the invention of the printing press or film camera. And it is still the key element all media technologies have in common: all require a form of narrative, the audience is craving for stories. The perspective of today's filmmaker builds on an epistemology established over centuries; from simple pre-historical records to a new perspective in antiquity, mankind always maintained, documented and told stories about their trading ventures and wars. From history we learn that the tools used by storytellers have changed, the stories have not. Mankind is engaged in an ever-increasing number of violent conflicts. And without war and conflict, the media technology we use to criticize violent conflict would not exist. The most talented and most creative writers, film & TV directors are using social media to touch people

in new and unexpected ways, for example the flash mob performance in a Spanish unemployment office broadcast on Youtube.

Understanding the Past:

Documentary film-makers need to better understand the historical origins of the tools they use in order to submit stronger and better arguments, and to better describe the human condition. A physicalist and reductionist position can explain how social media evolved. Today's information explosion is not a new phenomenon and confirms Mcluhan's (1994) assertion that the "medium is the message": whatever it was that drove early cave dwellers deep into their caves to paint and wonder about the resulting painting is equally touching people when they view the flash mob in a Spanish unemployment office. Story telling is a unique phenomenon which can be explained by the needs of a community to pass on traditions, historical events, form part of our collective memory, entertain and more importantly provide catharsis. A unique story telling perspective and a gripping story will do most of the work when combined with the most suitable media production and distribution tools.

Understanding the evolutionary pattern of previous 'information explosions' helps to understand the current situation. With the arrival of each new media technology, users of that technology needed time to acquire the skills needed to develop the necessary media literacy. Only then did it become possible to use the new technology to its full potential. Social media is still in that stage of development. Its full potential has not yet been realized, users and content creators are equally challenged to acquire the social media literacy skills and understand the evolving social media narrative. The task ahead entails to explore the unfolding social media narrative and to actively participate in it.

Copyright infringement too is not new to social media. The *Donaldson vs. Becket* (Rose) landmark ruling in the United Kingdom serves as a reminder of the ongoing legal argument about authorship. Briggs and Burke (2009) provide an excellent account of the history of media. Social and digital media however are not merely another evolutionary step in the history of media. Social media is part of a global paradigm shift, it is changing business models regarding existing and new media production and distribution. Viewing habits of digital natives are changing, abuse of social and digital media has an impact on the way the adolescent brain is developing, digital immigrants are challenged to keep up with developments. Social media is used and abused to spy on entire populations, has a significant political role, i.e. in the Arab Spring and Occupy movement and is transforming how information is disseminated in media and education.

Current events in Syria only demonstrate this point to clearly: social media had a significant role during the Arab Spring. But since the Arab Spring has begun, social media has developed into a permanent platform for users who in a very short time have learned to become 'social media literate': users are increasingly able to distinguish whether or not a government has evidence to invade another country or not. Movements such as Occupy and Wall Street provide a lively platform on which topics such as this are discussed every day. Users of social media platforms no longer just 'follow' government propaganda, but come to their own conclusions based on the evidence they find online. Social media is making the world more transparent – and at the same time provides the elite with the tools needed for mass surveillance. Documentary producers need to remember that and develop a greater awareness of the history of social media, which ironically would not have evolved into what it is today without war and conflict.

Facing this uncomfortable truth is necessary if social media is to develop its full potential as the one and ultimate information revolution empowering the 99% of humanity. Producers now have the oppor-

tunity to deliver content to a global audience – directly, and touch people in a profound way. Since the conception of speech mankind has been busy inventing and creating new media forms such as writing, print, broadcast and now social media. History teaches us that the arrival of a new media form does not extinguish previous media technologies; and a reductionist explanation of social media does not explain how social media touches our inner lives. Understanding the past, the technology, changing viewing habits are key aspects of this paradigm shift. Business and funding models too are changing. Crowd-funding sites such as Kickstarter (2013) and IndieGoGo (2013) feature an increasing portfolio of successfully funded documentary projects. Documentary forms are changing too, introducing more interactivity. (Doclab, 2013)

However, the one element that all media technologies have in common though remains in place, whether it be the spoken or written word, radio, TV or film, drama or documentary, Facebook or Youtube: content. Audiences want a good story. Narrative construction and plots may offer more options and interactivity, but technology alone will not make a bad story a huge success. It may help make a mediocre story break even. But a great story will be a success, if the tools needed to tell the story are well understood and applied.

ACKNOWLEDGMENT

I would like to thank the students participating in our survey, Joma Sison, Chairperson, International Coordinating Committee, International League of Peoples' Struggle, and Chairman, Board of Directors, Stichting International Network for Philippine Studies (INPS).

Conflict of interests: the authors of this paper declare that their research has been entirely self-funded.

Chapter 16
Exploring the Liminal Between the Virtual and the Real

Dew Harrison
University of Wolverhampton, UK

ABSTRACT

The creative application of digital technologies is accelerating as artists, designers and technologists continue to experiment and explore ways to create new aesthetic fields, semantically enhanced communication and innovative relations between people and machines. Our virtual worlds meet the real material world through the interdisciplinary research of computer scientists, digital media technologists, artists, designers and culture theorists. This chapter explores ways of bringing the virtual to the real through a range of differing conceptual positions and research approaches while demonstrating the creative interplay of variable media and online platforms for producing liminal works which cross the boundary between the analogue and the digital. The intent is to provide insights and examples of creative practice employing new technologies in innovative and unusual ways to generate exciting new work and offer new pathways for digital media research and development. The chapter presents relevant theoretical frameworks and examples of current practice in the area of digitally enabled transitional spaces for artists, theorists and curators, as well as researchers working both in the field and beyond to those working with new technologies, social media platforms, and digital/ material culture.

INTRODUCTION

In considering the dialogue between the virtual (digital) realm and the real world as a semantic space for creative exploration, there are many different approaches from researchers in adjacent fields concerned with new technologies and virtual platforms. I have been investigating this interstice between two worlds as a liminal space of transition and transformation for over 5 years now, and have convened 4 panels of specialists to present at ISEA – Inter-Society of the Electronic Arts (2 panels in Belfast UK and Istanbul, Turkey), CAA – US College Art Association, New York and in October 2014 at the UAAC – Universities Art Associations of Canada, Toronto. Papers from those panels were then published in edited volumes

DOI: 10.4018/978-1-5225-3822-6.ch016

with IGI Global (Harrison, 2013), the most recent of these being 'The Handbook of Research in Digital Media and Creative Technology' published in February 2015.

The seven artist perspectives are given here as a series of synopses, they have been selected from those panelists and authors from the events mentioned above in that their work examples the broad range of activities currently underway in exploring the liminal. Beginning with Barbara Rauch and her e:Motion lab where she morphs animal and human facial expressions to explore recognition and our sense of self. Lorna Moore then follows with her work facilitating the deep engagement with ourselves by momentarily experiencing our 'other' now afforded by new technologies. Another artist, Alistair Payne, approaches an understanding of the Virtual through Deleuze which has expanded his practice as a painter into a multi-medial and interdisciplinary position. Where Payne's work has extended to include aspects of virtuality through incorporating digital video with his paintings in material installations. Ian Gwilt is exploring the transformation of digital code into material objects through 3D printing and rapid prototyping. Suzette Worden is interested in the microscopic unseen material world of 'meaningless matter' made visible by artists through nanotechnology and digital virtuality when engaging with the earth sciences. Maggie Parker works with the imaginary landscapes and virtual worlds of game scenarios, her work proposes that such environments should enhance their unreality by keeping an abstract aesthetic that does not simulate familiar earth landscapes and cities. The paper ends with a solely theoretical investigation of virtual and real spaces by digital artist Garfield Benjamin, who bravely navigates between Deleuze and Zizek (Lacan) to situate the subject/self.

7 SYNOPSES

Dr Barbara Rauch

Dr Rauch - runs the e_Motion research project which integrates 3D visualization, haptic technology and rapid prototyping as a window into the Autism Spectrum Disorders (ASD) mind. Through the ground-breaking researchers such as Simon Baron-Cohen (Baron-Cohen, 1985) we have learned that ASD falls along a broad spectrum, and high-functioning autistics like Temple Grandin have taught us that they are handicapped not by their ASD, but by the fact that they learn in different ways from 'neurotypicals'. It is now well known that many ASD people are visual thinkers and learners, and this project utilizes state-of-the-art but 'approachable' digital technologies that will allow the autistic person to speak with distinct and enhanced visual voices. This differs from art therapy in that it will lead to a better understanding of how ASD individuals think and feel, through visualization.

Dr. Rauch joins collaborators Dr. Stuart Shanker and Prof. Jason Nolan, to work on studies in ASD, emotion, education and communication. The project is still in its early stages of production, however it has initiated the outlines and hypothesis of a promising cross-disciplinary study that also introduces a PLAY method for emotion rehearsals. On using the interface a productive buffer zone will be created to test out approaches, responses, anxieties and reflections in the difficult task of reading emotions in another person's face. Using Paul Ekman's understanding of universal emotions, (Ekman, 2013) expressions of the face can be read across cultures. His classification of basic emotions into a list of six distinct expressions (anger, disgust, fear, happiness, sadness, and surprise) was later extended to include guilt, contempt, shame and others. Rauch added contempt to the original six basic expressions and to select distinct facial images of the human face that demonstrated happy, sad, disgusted, afraid etc. Furthermore

being interested in the evolutionary aspect of emotions, not unlike Darwin's interrogation of expressions of emotions in animal and man, a fox's neural expression was included in the image database for morphing. This model will now be used in a study to test facial expressions and mimicry in the autistic person but has also led to Rauch's creative works that include 'emotional degrees' (animation), 'interFaced' (sculptures), and 'friends' (hybrid digital representations of merged faces).

Dr Lorna Moore

Dr Moore is a video performance artist placing her practice at the interstice between the real and the virtual. She is interested in what happens to our perception of self when we move across the boundary between the corporeal self and the live digital image as other, and argues that her work draws the performer/participant through the video frame were both participants are immersed in each other. Both performers are suspended in the belief that the live digital image of the other performer is a part of their own corporeality. The work involves two participants wearing a Head Mounted Display System linked to a live video feed. Each performers live video feed is swapped over via a real-time video programme so each participant sees through the eyes of the other performer. The aim of the work was to perceptually swap the bodies of two performers to bridge the gap between the performer and the performed, subject and object.

Moore presents personal accounts of users' experiences engaging with her headsets which she declares is an inter-corporeal experience. She then explains this phenomenon through the lens of psychoanalyst, Jacques Lacan and his work on the 'Mirror Stage' (Lacan, 1973), phenomenologist Maurice Merleau-Ponty and his writings on the Chiasm (Merleau-Ponty, 1968), and anthropologist Rane Willerslev's research on mimesis (Willerslev, 2007). These positions provide new insights into the relationship between the corporeal Self and the digital Other providing platforms to account for the blurred boundaries between these modalities. She is intrigued by the way the material body is stretched across these divisions

Figure 1. Barbara Rauch Goethe dreaming of Schiller. Paper. 2013.

highlighting the way digital media acts as catalyst in this in[bodied] experience of be[ing] in the world. Moore states that the purpose of her work is to provide alternative ways of thinking about the body and its relationship to video performance to understand the way digital media is having an impact on our perception of a single bounded self and how various selves can be shared through innovative ways of using technology. Her piece In[bodi]mental presents an alternative viewpoint of the self/other divisions and positions these modalities as a shared experience.

The findings from her work has seen the emergence of an augmented self which phenomenologically stretches the materiality of the lived body beyond the parameters of a single self were we share an inter-corporeal experience. Moreover we see the way the digital body and the actual feed into each other via the real-time video technology. Her work focuses on be[ing] rather than becoming and looks to find new ways to immerse the viewer/participant within the artwork. An exploration into real-time video technology is demonstrating that we can experience an overlap between subjects were the binary oppositions between self and other are no longer clear cut divisions but are now emerging as blurred modalities of be[ing] in the world. Moore's findings have revealed that when we interact with our real-time video image we do experience a merger between the body and the real-time video image (see figure 2). This is most powerful when there is a disruption in the proprioception of the body through the immersive experience, accompanied by a feeling of the uncanny. She argues that when we experience the uncanny we are somewhat closer to an unfamiliar part of self we have rekindled during the performance – a hyperreal experience of self-discovered through the other via the technology. For a moment, an uncanny nanosecond of time, we now how it feels to be someone else, we can reach out, cross the divide, and touch our virtual 'other'.

Figure 2. Lorna Moore In[bodi]mental, The Public, West Bromwich, UK. 2011.

Dr Alistair Payne

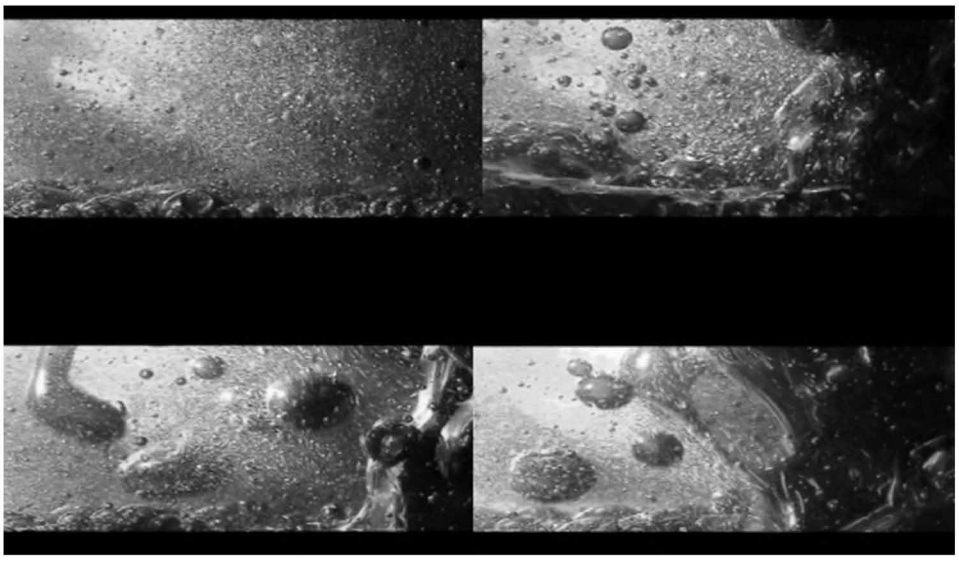
Dr Payne explores understandings of the virtual within his practice as a painter which has enabled him to move his work into new areas of expansion. In effect his investigation into Gilles Deleuze's notion of 'the virtual' instigates an interdisciplinary approach towards painting where *external* connections and relationships are introduced and developed. This equates to the opposite position of the internal critique of medium particularity or specificity and will radically alter the way in which painting can be created and consequently thought. Research into the 'virtual' and interdisciplinary practice driven from concerns within painting, effectively constitutes a new methodological model for thinking through the space of painting. In contrast to prior methodological models used, primarily within the critique (or theorisation) of painting, an investigation into Deleuze's methodological processes creates a more open position within which to redefine the limits or constraints of painting. The virtual therefore acts as an instigator for change, which effectively destabilises the pre-formity attached to medium specific practices. It is for this reason that The virtual forces external relationships and connections to come to the fore in order to radically alter and transform the physical and conceptual constructs of different disciplines, and provides a model for thinking through interdisciplinarity within, and from, other media. Alongside this understanding of the virtual and its direct affects upon artistic practices, is how it encounters the hybrid and metamorphosis as key elements of change.

This method for actualising change is based upon an examination of the notion of the virtual / actual according to Henri Bergson and Deleuze (1991). The virtual is bound into the process of becoming, but not a becoming through a systematic (or concrete) dialectical method, this is an open-ended becoming, where the virtual can be seen as series of potential. Deleuzian philosophy (Deleuze, 2001) is based within the virtual; it is the virtual that constructs the actual and the actual that is defined by its virtual intensities. These virtual intensities are the becoming actual of the virtual and this is not used as a way of defining the actual in the sense that it will subsequently have its own identity but rather it is a method for opening the actual to continual and further virtualities. Deleuze's notion of the virtual allows for a 'spacing', a slippage or the 'bringing forth' of potential within painting as a formless condition. The development of this methodology situates painting as a virtual element, an element which itself contains the potential for change within the work through integration and transformation. The virtual can be used as a way of re-thinking or re-negotiating the space of theory within which the practice can be actualised. It necessarily incorporates interdisciplinarity by forcing connections and proposing ways of re-structuring new, transformative and different dynamic forms of practice. Including the digital and cyberspace.

Prof Ian Gwilt

Dr Gwilt, in his investigation into Digital data and material objects, explores how the creation of physical artifacts based on data extracted from computer generated virtual spaces can change the way we read, interpret and respond to digital information. In an era where the visualization of complex digital information is increasingly being used to shape our social, political and economic environments, Gwilt examines what happens when you use big data to drive the parameters and form of a physical object. By asking the question why should we consider translating digital data into a physical form, and what happens to how we understand, respond and relate to digital information when it is presented in this way, he considers whether or not data driven objects are simply a novel visualization technique or a useful tool that can be used to add insight and accessibly to the complex language of digital big data

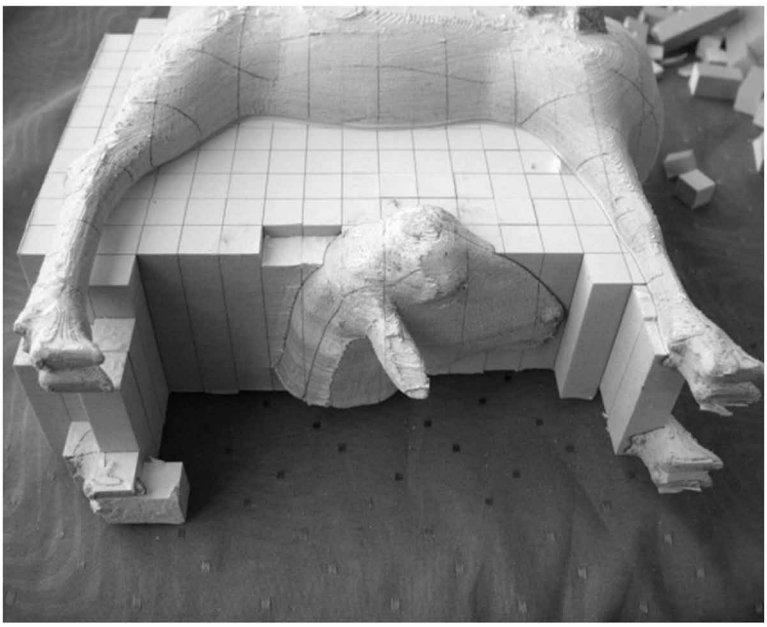
Figure 3. Alistair Payne Lost Angels (Film still), looped DVD, 9 mins 28 sec. 2010.



sets. He understands the new constructs of digital data as concretized into physical form, remediated from information sources such as, mobile phone coverage records, crime statistics and temperature patterns. These tangible translations change our relationship to screen-based content, and seek to reveal how by encoding digital information into a physical object we can establish a different way of reading data through spatial, temporal and material variations that sit outside of the computer-monitor and the digital environment. The making strategies for these digitally informed objects such as rapid prototyping techniques help us to gain insight into a set of new 'data objects' that draw from the visual language of the computer and are 'made real' in physical space.

As computing technologies become more located and related to place and social contexts the potential for the digital to augment and interact with material culture become more opportune. In terms of information visualisation this closer relationship drives the desire for data visualisations that speak to both our real-world and digital connections. The materialisation of digital data is facilitated by the development of a number of new manufacturing technologies such as computer controlled laser cutting, 3D printing and rapid prototyping techniques which allow for the translation of digital data back into physical forms. Gwilt has examined a number of various materialised objects created by artists/sculptors and designers, and also creates pieces himself. His findings indicate that the data driven object needs to be considered in light of the existing issues and conversations which are already taking place in the discipline of information visualisation. These dialogic objects have the ability to capitalize on the inherit traits found in both digital and material culture to communicate their message. By combining these attributes into a hybridised form a new way of looking at the digital/material relationship and how we can communicate through it will hopefully emerge. Gwilt looks at the different ways in which we interact with objects using touch and our other senses, and consider what these types of embodied interaction might mean in terms of how we comprehend any underlying data and information. He is particularly adept at articulating digital material hybridity, distributed technologies, communities of use, and the implications for how we receive, understand and consume big data.

Figure 4. Ian Gwilt – Trophy (showing LOM fabrication process detail) Artist: Brit Bunkley. 2006.



Prof Suzette Worden

Dr Worden's work concerns the often invisible materiality of rocks and minerals, and virtual space, where artists engage with the earth sciences as a source of inspiration and as a provider of data about the natural environment (see figure 5). This rich source of data may arise from: the conditions of the atmosphere, to physical formations; from small scale to gigantic formations; extremes of heat and cold; and the interaction of all these in time and space. Additionally, the models, visualisations and explanations of these phenomena by scientists can include aesthetic characteristics that are appreciated by a wider audience than immediate scientific peers. When we are concerned with digital environments, the discussion is most often centred on visualisation, which includes reference to objects with a material or physical existence and also to mental constructs. These constructs and models can be directly observable or become visible through an instrument or device. Visual characteristics can also be translated from a non-visual state into constructed data, as a 'conceptual' translation. With digital environments becoming so central to everyday life there is often slippage between the values attributed to analogue and virtual spaces. This can happen where there is slippage between the virtual and the real, or symbol and matter; where there is a reversal of values. As Bruno Latour (2008) has noted: "How did we succeed in having the whole of philosophy reduced to a choice between two meaninglessnesses: the real but meaningless matter and the meaningful but unreal symbol?"

In many cases of creative work, this slippage or reversal is intentional and becomes, for the viewer, an intriguing and rewarding aesthetic and emotional experience. Using examples related to the earth sciences, Worden investigates the ways in which creative works demonstrate the movement of ideas and concepts to and from the physical to the digital. She asserts that artists who engage with the earth sciences have been able to explore all kinds of information about the natural environment, including information about the atmosphere, extremes of physical formations across immense dimensions of time and space,

Figure 5. Suzette Worden – zero@wavefunction, Singapore. Artist: Victoria Vesna in collaboration with nanoscientist James Gimzewski. 2002.

and increasingly 'invisible' realms of materials at the nanoscale. This is a rich area for identifying the relationship between digital and material cultures as many artists working with this subject are crossing boundaries and testing out the liminal spaces between the virtual and the real. Not only is this a rich area for current experimentation but often these artists offer a critique of historical formations or provide a critique of theoretical concepts. Many of the works chosen for examining their interest in the field of earth sciences also demonstrate a strong sense of awareness of the importance of a 'sense of place' that refers to the values associated with cultural memory and the construction of heritage. This makes the resulting slippage culturally rich and suggests that interpretation must also include consideration of the construction of 'texts' and whether authorship is intentional or the result of audience participation. She is interested in distinctions between what is presented in an artefact, and what might be constructed by the audience, and examples creative works that take us from the digital to the physical where they make specific reference to geology, studies of rock formations and technologies supporting mining activities and resource industries. Worden has a particular investment in the paradox of invisibility within 'real' physical worlds as against the revealing and transformational potential of narrative within digital spaces will be highlighted for its creative potential.

Dr Maggie Parker

Dr Parker is a fine artist undertaking an investigation into the virtual worlds of computer game design, and classifies 'haute games' as aesthetically driven in that they are formulated to identify virtual environments creating unique, alternative 'blendings' with participant-players and assemble a framework for developers to pursue, when producing original computer game genres (see Figure 6). She sees a real need to inform both the practice and theory of Game Studies with an artistic aesthetic and an understanding of the impact of gaming on the psychological and emotional states of players or participants. Parker

Figure 6. Maggie Parker Star World. 2005.

understands creative practice as a non-verbal experience that involves a different kind of thinking and considers that, by engaging in play, access to emotional and cognitive experience is enabled. She argues that virtual space, as a medium, is both powerful and engaging; a 'meaningful space'. Haute games set up situations to evoke emotional responses from viewers, relating philosophy and theories, utilising and facilitating personal intuition and rigorous perception to create pieces of work.

In querying why we have to complete tasks in every game, Parker suggests that there is room for alternative game interaction that generates cognitive possibilities, to provide alternative and beneficial outcomes for players. Her more recent work is focused on an application for mobile phone and tablet technology, her *Digital Book of the Dead* being a contemporary version of the Egyptian Book of the Dead. Parker's version brings interactivity enabled by game technology plus integrated augmented reality technology into a museum setting, to enable knowledge of other cultural concepts to be disseminated within Museum, classroom and community areas. However an earlier piece 'Star World' better demonstrates the potential of using software as both an artistic interpretation and an alternative method of game-design. The Star World's environment contains wholly imaginary, aesthetic elements to experiment with alternative texturing. It became a virtual-environmental empirical test-bed, as well as an art piece, based on personal interaction and engagement. Parker considers that this double functionality is a function that game studies scholars and computer-game designers should take into consideration, in the future. She sees that computer games provide a unique opportunity to experience intangible fantasies and create engagement with emotions which are able to be played out in real-life. Participants in her Star World identified in various ways the hexagon objects placed in the environment, naming them as hexagons, birds, geese, space ships, fifty-pence pieces and others. In total the hexagons have so far had 29 differing descriptions.

Dr Garfield Benjamin

Dr Benjamin is a researcher who considers the subject as the 'gap' between virtual and real states. Digital media has called into question the appearance of 'reality', forcing all theories of contemporary culture to take into account the possibility of other spaces with which the (physical) human subject can engage. Within the many varied, and often incongruous, theories of digital technology and its culture there are two strands of the discussion that have emerged in which the very terms of the field are challenged. These are centred on the problematic notion of 'virtual reality' that has dominated cultural depictions of the digital world, usually taking either 'virtual' or 'real' in an expanded definition to draw out a deeper understanding of the fundamental differences, connections and interdependency between physical and digital spaces. Digital media has called into question the appearance of 'reality', forcing all theories of contemporary culture to take into account the possibility of other spaces with which the (physical) human subject can engage. There is a need to expand and intersect current discussions of the relation between virtual and real by exploring the antagonisms that arise through developing both sides of the term. Benjamin readdresses the term 'virtual reality' in the context of ongoing debates in philosophy, technology and creative practice in a discussion of subjectivity in contemporary digital society, to insist on a constant re-evaluation of the terms used in such a discussion and their ramifications for its application in digital media and creative technologies. He redefines the term 'real' along Lacanian lines (Lacan, 1977), particularly as applied to cultural phenomena by Žižek (Zizek, 2009), he then includes writers such as Gunkel (Gunkel 2010) who have furthered this notion, drawing out the real across physical and digital worlds as the hidden causality (for example, quantum wave functions, DNA or bits of computer code) that underpins the appearance of objective reality. This real is inaccessible and terrifying, embedded within the psychoanalytical construct of contemporary subjectivity. Counter to this development is the more common expansion of the term 'virtual', often taking into account the definition developed by Gilles Deleuze (Deleuze, 1969) as a surface that is not actual but with which the subject can engage. This has been applied to digital media as an alternative to the conflation of 'virtual' as 'digital', as is implied in the labels 'virtual reality' or 'virtual worlds', to instead connect the fluidity of digital surfaces to consciousness in a relation consistent with other generative effects within the structures that form the idealist element in Deleuzian philosophy.

To form a critical overview of past and current discussions of virtual reality in the field of digital media, suggesting innovative modes of interrogating the creative potentialities of digital media, he references cultural artefacts that embrace an expanded view of the digital or confront the transition between physical and digital modes of 'virtual reality', including digital art works, computer games and avatar-mediated spaces. This research will then offer a new definition of virtual reality, a challenge to established modes of thinking digital media, and a call for a constant re-thinking of the terms with which we construct our engagement with digital technologies within our subjective position between ever more permeated virtual realities.

CONCLUSION

The ways of exploring the liminal space existing between virtual and real states are numerous, diverse and highly creative. For this chapter seven approaches from the art world have been collated from four panels convened by the author with papers then published in edited volumes with the intent of interrogat-

ing the transition from the real to the virtual where the interface is understood as a transformative space of creative transcendence. Social media and digital technology is reconfiguring our relationship with the world and is also affecting how artists make their work and relate with their public. Now technologies can help to position art into the everyday of people's lives and activities, outside the gallery space. Digitally enabled new spaces have opened up where artists can engage with audiences in a participatory experience. Digital media provides virtual platforms where accessing them means stepping from one world to the other, a conceptual moving from one state of being to another. Contra to human-to-avatar experience, virtual objects are transformed into a solid materiality by crossing this threshold. The threshold is then a magic alchemical space, an interstice between the real and the virtual, a moment of change, of becoming other. The examples given in this chapter go some way to articulating an overview of the creative approaches to this ongoing exploration of the interstice between worlds.

ABSTRACT

This chapter draws from a one-year qualitative investigation of a ninth-grade English classroom in a new technology-rich high school. The study explores the question, What identities did students compose as they alternately resisted and embraced the use of digital media in the writing classroom? Presenting a case study of one student, Shane, the chapter traces the ways in which he responded to the teacher's invitations to use digital media, thereby discursively crafting particular identity performances in on-site and online communities. Analysis identifies a number of tensions specific to the use of authentic audiences and purposes in the 21st century digital writing classroom and reveals three identity performance categories: Shane the comedian, Shane the subversive, and Shane the artist. In analyzing the ways in which social networking tools, literacy practices, and identity performances converge in the classroom, the chapter challenges dominant pedagogical assumptions about using new technologies in the schools to engage learners.

INTRODUCTION

Since you're here, why don't we take an adventure into my mind? But I hope you're ready, because it's one crazy, crazy place in there. - Shane, Literacy in Our Lives Video Project

With this introduction, Shane, a ninth-grade student in a new technology-rich high school, summoned his classmates to view a video he made to fulfill the first major project in his English class, the *Literacy in Our Lives* project. Becky, Shane's teacher, asked students to develop videos, both as a way to introduce themselves to one another and to document the literacy practices they used in their everyday lives both in and out of school. In so doing, Becky hoped not only to sensitize students to the ways in which they already were proficient readers and writers of text, but also to signal that reading and writing in this classroom community, and across the school, meant using digital media and developing the 21st century literacy practices needed for postsecondary education and the workplace of the future (National Council of Teachers of English, 2008). In asking students to share their videos with each other in an online forum, she hoped to form a classroom community that functioned equally effectively in online and on-site contexts.

But just as Becky had specific goals and a particular audience in mind for the project, so too did Shane. He crafted his introduction to the video to prepare the audience for "an adventure," thereby heralding his own arrival in this classroom community and school, staking his claim for attention. In preparing his peers to watch the video and to foray into his mind, "a crazy, crazy, place," he braced viewers to expect the unexpected, creating anticipation that Shane's video would be both different from the others and entertaining. He was right on both counts. While his classmates typically pursued a literal approach to this literacy project, documenting their favorite books, movies, and songs, Shane took the assignment to a new level by writing an original script complete with a montage of goofy images accompanied by old, corny songs. He created a spoof of the creative—yet tortured—artist stereotype, with the voice-over of a stern taskmaster insisting upon obedience to school rules while the camera documented Shane breaking them. He declared himself a serious gamer and pretended to throw a laptop on the floor, overcome by feigned anger when his online opponent insulted him. He included a clip in which he was standing on a street corner with white loose-leaf paper in his hands, yelling at passing cars, "Buy my writing! Buy my writing! Doesn't anyone want to buy my writing?"

We do not know if Shane made any money pitching his words that day, but we do know he garnered the class's attention, his teacher's, and ours. This chapter features a case study of Shane, drawn from a one-year qualitative case study of a ninth-grade English classroom in a new technology-rich high school, exploring the research question: What identities did students compose as they alternately resisted and embraced the use of digital media in the writing classroom? This chapter traces the ways in which Shane responded to Becky's invitations to use digital media while discursively crafting particular identity performances in on-site and online communities. The next section explains why we selected Shane and his teacher, Becky, for this study.

CASE STUDY PARTICIPANT SELECTION

We relied upon purposive sampling techniques to select our focal student and teacher because we wanted to understand how teachers and students used digital media to compose texts and identities. We wanted to work with an exemplary teacher who valued writing and new technologies in the classroom, and we

wanted to focus on students who were highly invested in writing and technology and at least somewhat social so that we could trace the relationships among writing, technology, and student identities. Becky was widely recognized as an excellent teacher, for she was a National Board Certified English Teacher, one of the first in the state. Becky was widely known in her district as a teacher-leader in developing innovative uses of digital media, and prior to our study, she had been an invited member of a multi-year funded project exploring the uses of new technologies in English classes. Because she taught at a new, technology-rich school in her district, we knew that she would infuse digital media into class activities routinely, providing us with abundant opportunities to explore issues, processes, and products related to using new technologies in the English classroom. She was also among a select group of National Writing Project (NWP) teachers invited to participate in the NWP task force commissioned to develop frameworks for assessing multimodal products, i.e., texts that used visual, graphic and audio elements as well as linguistic signs. In short, she was a widely respected English teacher known both locally and nationally for her progressive uses of technology and for her expertise as an English teacher.

After several weeks in Becky's ninth-grade class, we selected Shane as one of our case study students. Because we thought that a very social person who was also a committed writer and technology user would teach us the most about how student identities were mediated by the discursive and digital, we focused on Shane. His *Literacy in Our Lives* video convinced us that he was definitely social, and a serious writer and technology user to boot. Despite his obvious investments in writing and technology, Shane had contradictory reactions to Becky's invitations to write, and we wanted to understand why. Moreover, his work across various social networking media demonstrated inconsistency in quality and quantity, and his engagement in class waxed and waned as well. At times he enthusiastically immersed himself in writing projects, and at other times he grumbled. We wanted to understand Shane's behaviors of engagement and resistance. We believed that Shane could provide us a window into understanding why a strong writer who relished the limelight would subvert his teacher's efforts to share work on social networking sites, especially when those efforts occurred within the context of a school with a technology mission. Moreover, we wanted to understand the identities Shane constructed through his multimodal and linguistic texts, and how those identities were mediated by discourse and varied across social contexts. In the next section, we situate our study against the backdrop of current literacy research and theory.

NEW LITERACY STUDIES AND COMPOSITION PEDAGOGIES

Digital technology practices pervade virtually every aspect of contemporary daily life—how individuals outside of school learn, communicate, reflect on, produce, consume, create identities, and share knowledge in routine matters (J. P. Gee, 2012). Researchers use the term *New Literacy Studies* (Coiro, Knobel, Lankshear, & Leu, 2008; Hull & Schultz, 2002; Lankshear & Knobel, 2006; New Media Consortium, 2005) to refer to the expanded and multiple practices and ways of knowing associated with digital media (Gee, 2009; Mills, 2010). From this perspective scholars emphasize a shift from static, decontextualized notions of literacy to broader views that understand communication as an array of dynamic social practices situated in a variety of contexts, and those contexts shape and limit possible meanings. Scholars use the term *multiliteracies* to emphasize that what counts as literacy varies and is always situated (Kress, 2003).

Just as the conception of literacy has expanded with New Literacy Studies, so too has the notion of text. Text from this perspective is constituted not only by linguistic signs, but also by audio, graphic and multi-media elements. In order to produce and to decipher multimodal texts, individuals must recruit semiotic resources and the cultural meaning-making possibilities available to them (Kress & van

Leeuwen, 2001). Producing and interpreting such texts involves global as well as local texts, resources, audiences, and purposes (Gee, 2007; Lankshear & Knobel, 2006; Lewis & Fabos, 2005; Street, 2003), reinforcing the notion of multiliteracies.

Within a New Literacy framework, the teaching and learning of writing requires not only broader conceptions of text and literacy, but also more complex renderings of composing processes in the stages of writing (i.e., brainstorming, drafting, revising, editing, and publication). Hicks argues that the digital writing classroom is built upon the same five principles as the writing workshop: student choice, revision, author's craft, publication and assessment, but "through a digital lens" (Hicks, 2009, p. vii). However, incorporating visual and audio elements, a writer is no longer limited to producing print texts. From a new literacies perspective, he argues, writers can, for instance, use technological resources in all stages of the composing process, whether gathering data through RSS feeds, Google, Facebook, or brainstorming ideas and drafting collaboratively using Google Docs.

Besides offering new resources for writing, new media makes available social networking options that enable writers to have actual audiences, instant audiences, and multiple audiences, providing authentic contexts for sharing drafts and finished texts. Digital media researchers (Jenkins, 2004; Thomas, 2006) have supported the argument that students posting in authentic, online venues gain valuable literacy skills.

Writers in the digital workshop can assess the demands of the rhetorical situation with virtual and face-to-face audiences, strategizing voice, content, and style in relation to the multiple audiences of their work. Those audiences enable teachers to sidestep the age-old problem of writing for an audience of one, the teacher. Composition teachers and researchers argue (Kahn, 2009) that writing for authentic audiences motivates students to care about the final product. In sum, by using information and communication technologies, teachers can enrich a writer's standard repertoire for all stages of the writing process, and writers can work in an authentic, nonlinear and recursive fashion, utilizing the stages of writing processes as they see fit, rather than in a lockstep, mandated sequence. New technologies serve to reinforce key principles in writing instruction: writing for *authentic* audiences and *actual* purposes, writing for an *array* of audiences and purposes, writing with the demands of the rhetorical situation—the purpose, audience, and context—intentionally governing content and style, and writing with nonlinear and recursive stages determined by the writer, not the teacher.

The emphasis on technology in literacy classrooms can also be found in the National Council of Teachers of English (NCTE) definition of 21st century literacies (National Council of Teachers of English, 2008). At the heart of the 21st Century Literacies statement is recognition that information and communication technologies are vital to English classrooms. The February 2013 version declares that:

Active, successful participants in this 21st century global society must be able to…develop proficiency and fluency with the tools of technology; build intentional cross-cultural connections and relationships with others so to pose and solve problems collaboratively and strengthen independent thought; design and share information for global communities to meet a variety of purposes; manage, analyze, and synthesize multiple streams of simultaneous information; create, critique, analyze, and evaluate multimedia texts; attend to the ethical responsibilities required by these complex environments. (National Council of Teachers of English, 2008, 2013)

As the policy encourages use of technology and emphasizes multiple literacies and multimodal texts, it resonates with New Literacy Studies principles and declares priorities for the profession. The NCTE policy statement invites and challenges us to rethink our goals in literacy education (National Council of

Teachers of English, 2008). No longer limited by the geo-physical confines of institutional spaces, with increased access to information, knowledge, and networking, students in 21st century learning contexts work within learning ecologies to connect the local with the global (Brofenbrenner & Evans, 2000; Nardi & O'Day, 1999; Walters & Kop, 2009). The 21st Century Literacies Position Statement challenges teachers to utilize the practices and processes that students will need in postsecondary education and the workplace.

Researchers also argue that bringing the out-of-school digital media practices into schools reaps benefits for learners. For instance, the argument goes, teachers can use new media to engage learners resistant to traditional literacy class work (Ito et al., 2009). Also, when students use social networking practices to communicate with various audiences and purposes, they strengthen their reading and writing skills. Cultivating digital media and 21st century literacy skills in classrooms can cultivate new modes of participation that can change the teacher-centered patterns of classroom discourse cited in the research (Applebee, 1993; Cazden, 1988). Proficiency in information and communication technology may not only enhance student engagement with school-based literacy practices, but also prepare students for successful participation in postsecondary education, gaining the 21st century literacies they need for school, citizenship, and the workplace.

Situating our study within a New Literacy Studies framework informed by 21st century literacies and contemporary composition pedagogy, we can explore the ways in which texts, literacies, and identities are constructed and interpreted with social networking technologies. While this section has suggested how literacies, texts, and digital composition processes resonate within New Literacy Studies, the next section explores perspectives on identity that are salient to the study.

IDENTITIES

Because this chapter focuses upon how a student performs identities as he produces and interprets text, it is important not only to define *text* and *literacies*, but also to define *identity performances*. Poststructuralists, feminists, postmodernists, and other scholars in cultural studies have rejected the idea of a singular, monolithic subject with a stable identity (Alcoff, Hames-Garcia, Mohanty, & Moya, 2006; Blommaert, 2005; Moya, 2002), instead arguing that individuals assume various identities that change as social contexts change, and therefore are "performatively constituted" (Butler, 1990, p. 25). That is, we perform different identities within different socially defined spaces that are imbued with cultural norms, power relations, and ideological forces, and lead to varying expectations for different players in different roles (Holland, Lachiotte, Skinner, & Cain, 1998). This allows for a "performance approach to identities, which focuses on identity as a form of socially meaningful practice" (Blommaert, 2005, p. 208).

Gee argues that identity is socially constructed. "Being recognized as a certain 'kind of person,' in a given context," is the key to identity, but individuals have "multiple identities" constructed by "their performances in society" (Gee, 2000b, p. 99). Particular identities are constituted in specific social situations, according to Gee, and each identity issues from one or more of the following four categories:

1. **The Nature Perspective:** The individual's biological traits determine "the kind of person" one is (Gee, 2000b, p. 102), for example, the identity of being a twin.
2. **The Institutional Perspective:** An identity that is sanctioned or authorized by a role or position in an institution that one holds, for example, the identity of a university professor.

3. **The Discursive Perspective:** A quality of the individual constructed through and contingent upon communication with others, for example, possessing charisma.
4. **The Affinity Perspective:** Traits revealed in one's discursive practices that show an individual's allegiance to, access to, and participation in a group with shared interests, for example, engaging in online discussions about one's passion for a specific athletic activity.

Gee's framework gives us an understanding of how identities can be seen as dynamic, discursive, socially situated performances that mediate and are mediated by literacy practices.

When the identity performances of youths using digital media are discussed in theory and research, the notion of "digital natives" is frequently invoked. Prensky (2001) argues that technology has become essential to young people's lives and identities, and that their dependence on digital technologies for entertainment, socializing, and information gathering and sharing makes them distinct from older generations, the "digital immigrants" (2001, p. 4). Prensky's argument resonates with a growing body of scholars who have attempted to document the distinct technological needs and expectations of emerging generations of young people (Bennett, Maton, & Kervin, 2008; Hawkins & Oblinge, 2006; Jenkins, Purushotma, Clinton, Weigel, & Robison, 2006).

DATA COLLECTION AND ANALYSIS

Shane's case study is drawn from a yearlong qualitative case study of an English classroom in a new technology-rich high school during the 2010/2011 school year, exploring the research question: What identities did students compose as they alternately resisted and embraced the use of digital media in the writing classroom?

There were five categories of data included in this larger study. A member of our research team videotaped 24 hours of small group and large group discussion during the six-week unit, which constituted our first set of data. Our second data set included the Twitter feed from all fifty students in the class. Each student was assigned a character from *The Things They Carried* (O'Brien, 1990), a book about the experiences of American soldiers in Vietnam. Each was asked to tweet in character at different points throughout the novel. The Twitter feed was the result of approximately four hours of in-class tweeting produced over the course of the unit. Twenty-five poems written in pairs by all fifty students were also included in the data set. Towards the end of the unit, students wrote poems about the experiences of the soldiers in *The Things They Carried.* Students were required to incorporate some of their own and/or their classmates' tweets into their poems. The fan fiction projects completed independently by all fifty students constituted our fourth data set. Students were invited to write fan fiction pieces in which they created potential prequels or sequels to *The Things They Carried.* Finally, we collected Ning postings from all fifty students in the class. The class Ning was used as a site where students responded to reflective prompts that Becky posted. Students also used the Ning to post their fan fiction projects and poems, and provide feedback to one another in response to these pieces of writing. Students posted an average of two times each week on the Ning.

For Shane's case study and this chapter, we relied on the following data, a subset of the data set for the larger study:

- Shane's tweets.
- Shane's poem.
- Shane's fan fiction project.
- Classmates' Ning postings in response to Shane's work.
- Shane's Ning postings and reflections.
- The thirty-eight minutes of classroom video footage in which Shane appears.
- The video project described in the introduction for the *Literacy in Our Lives* unit at the beginning of the year. While most students posted their videos on the Ning, Shane posted his on YouTube.
- A twenty-minute interview with Becky in which she shares her impressions of and experiences with Shane.

Our data analysis involved using qualitative coding procedures informed by grounded theory (Charmaz, 2006; Strauss, 1987; Strauss & Corbin, 1998). We began by engaging in open coding in order to conceptualize and label our data. We used writing "incidents" (Charmaz, 2006, p. 53) as the unit of analysis for our initial coding; we coded Shane's poem, fan fiction piece, each of Shane's individual tweets and Ning postings, and each Ning posting written by one of his classmates in response to Shane's work as single incidents. Shane developed his *Literacy in our Lives* video with eight discrete episodes, each with a different storyline, setting, and focus. Each episode was coded as a distinct incident. We also coded the transcript of the combined thirty-eight minutes of classroom video footage in which Shane appears and is engaged in conversations with classmates. Each of Shane's contributions on the video was coded as a single incident.

Our initial open coding aimed to capture the various identities that Shane performed in response to the Becky's writing invitations. When possible, we used in vivo codes (Charmaz, 2006) taken directly from Shane's own discourse. Following our initial open coding, we engaged in the process of selecting and identifying core categories, systematically relating them to other categories. Categories were determined inductively using the constant comparative method (Charmaz, 2006; Glaser & Strauss, 1967). Interpretative memos written by the researchers and the use of our "team meetings as memos" (Strauss, 1987, p. 130) helped with both the identification of categories' properties as well as the need to integrate categories with other categories (Charmaz, 2006; Glaser, 1998). The research team ultimately identified three categories to describe the various identities that Shane performed: (a) Shane the comedian, (b) Shane the subversive, and (c) Shane the artist. Below we describe the ways in which each of these identities is performed within (and against) specific pieces and modes of writing.

Shane the Comedian

Shane the comedian might be best illustrated by his *Literacy in our Lives* video project in which Shane reveals insights about himself as a writer. As the video unfolds, viewers quickly realize that the script he has written to guide his video narrative about himself as a writer is completely tongue-in-cheek. At one point, for example, Shane speaks directly to the camera and introduces himself as a "gamer" who likes to "use his… writing to communicate with people [his online opponents] to see how they react to things." In the next scene, we see Shane sitting at his laptop pretending to be in the throes of an intense battle with an online opponent, when he stops suddenly, pretending to have read an offensive message

sent to him by his challenger, to which he responds, "What? Oh, *I'm* the noob? No *you're* the noob, kid!"—employing a term that, according to urbandictionary.com, refers to a gamer who uses "cheap tactics." Pretending to be insulted by a critical assault upon his character, Shane feigns indignation, his ego injured, all to produce humor.

Shane's identity as a wit with a somewhat mordant sense of humor would be, according to Gee's identity framework (2001), a discourse identity—one that relies on acknowledgement and endorsement of others, as Shane himself cannot achieve such an identity on his own. By definition, a discourse identity necessitates that others recognize and sanction that identity. Shane capitalizes on the social networking tools that Becky has incorporated into the unit to help him establish and sustain this identity. He also employs his comedic identity to help him negotiate another – that of Shane the subversive.

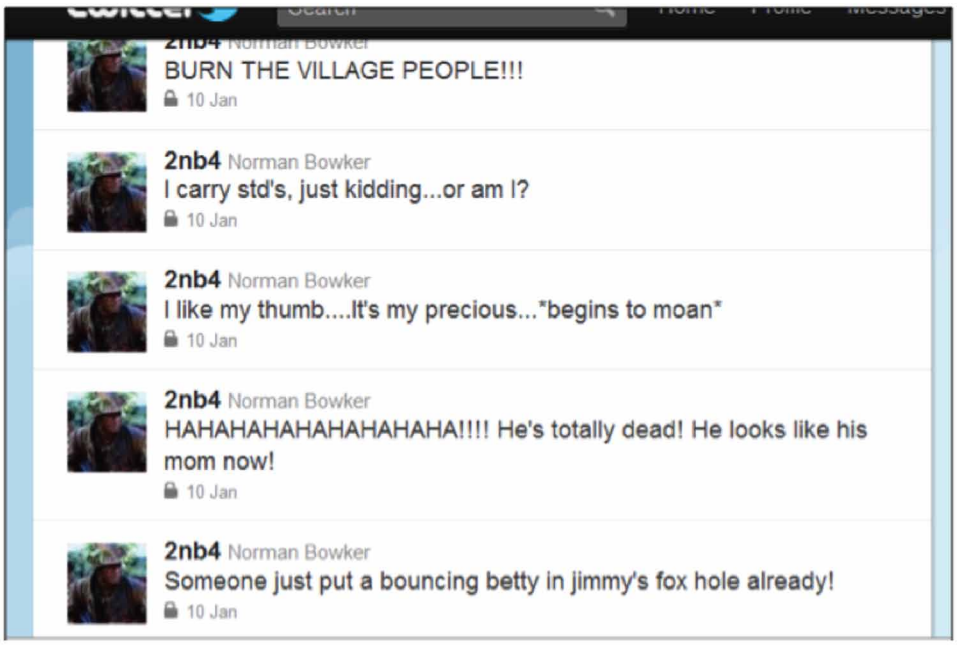
Shane the Subversive

Shane the subversive is often enacted by Shane the comedian. As he works to achieve the status of class clown, he engages his wit to forge an identity of one who can undermine while apparently engaging in school literacy practices. This can be illustrated by a segment of Shane's *Literacy in our Lives* video project. In this segment, Shane appears to be writing in a notebook and greets the viewer by saying, "Oh, hello. I didn't see you there. I was just doing some serious writing on the American Revolutionary War… This is my best work yet." In this excerpt Shane parodies the "serious" academic writer investigating a "serious" intellectual topic, the Revolutionary War. However, he is mocking writing assignments on boring school topics, such as the Revolutionary War, when he says dryly, "my best work yet." In so doing, Shane positions himself as a comedian and subversive in the class, one who will complete assignments, but on his own terms. As a subversive, he taps an audience of those alienated from school, those who have felt disengaged from and bored with school writing, and those who would rebuke rather than embrace identities as academics.

Shane's use of parody to achieve subversion resurfaces in the unit on *The Things They Carried* as well. One of Becky's goals for the unit, developing empathy for the experiences of those in war, was cultivated by inviting students to assume the persona of characters in the book, walking in their shoes as they read. Using Twitter, each student/ character was to write to other student/characters, responding as events in the text unfolded. Shane tweeted as Norman Bowker, a soldier in *The Things They Carried.* (See Figure 1) Unlike Norman Bowker, Shane amuses himself and others by inserting a series of one-liners into the conversation. He uses tweets to shock and amuse readers: "BURN THE VILLAGE PEOPLE!!!" This comment does not reflect Norman Bowker's sympathies, but does represent Shane's attempt to invoke humor by taking an idea to its extreme. He pushes the idea of a soldier's commitments to serve his country to the level of absurdity, issuing an endorsement for slaughtering innocent people that can only be perceived as ridiculous. Shane pushes the boundaries to produce humor by adding sexual innuendoes as well. "I carry std's, just kidding…or am I?" Norman Bowker, a very private person, would not be inclined to discuss this topic, sexually transmitted diseases, or his status as a carrier, in a public forum. Nonetheless, Shane can't resist the opportunity to entertain himself and his peers with inappropriate comments, and his next tweet ups the ante on inappropriate dialogue by suggesting masturbation: "I like my thumb…It's my precious…begins to moan."

Shane's tweets suggest the work of a creative spirit seeking to entertain his peers with a series of parodies of soldiers—over-the-top one-liners, off-color and out of character for Norman Bowker, his assigned character. Nonetheless, he invokes the thumb, villages burning, Jimmy's fox hole and dead

Figure 1. Shane's tweets from the perspective of a character in The Things They Carried



soldiers in his Twitter feed, legitimately referencing the text even as he subverts the Twitter activity, ostensibly complying with the assignment. Shane's identity performances in the Twitter activity resonate with those of his video, his literacy practices leveraged for the roles of subversive and comedian.

Shane does not always employ comedy to communicate subversion, however. He did take an oppositional approach at times. For example, in one of Shane's Ning prompts, Becky asked students to reflect on the ways that Becky used Twitter in class for the character role play. In response, he unapologetically and candidly stated, "I don't play those games." Shane's resistance to tweeting was fueled, at least in part, by his frustration with the assignment. Reflecting on the Twitter activity in the class Ning, Shane said:

I think [tweeting in character] a waste of time, and we shouldn't do it. I have learned how Twitter is basically useless within these situations. It will not be taken seriously, and I do not blame anyone for doing so. It would have been better to write short stories in the mind of what we thought would have been our character. I will never know why the class thought it was a good idea to use Twitter.

Shane elaborated that the distinguishing features of Twitter—140 letters per message—and of the assignment—responding as a character, rather than a reader—were too constraining, producing artificial discourse that couldn't be taken "seriously." As a result, Shane took the liberty of using the Twitter activity to reinforce his subversive identity.

Shane used his writing on the Ning, in Twitter, and in his video to perform resistance to many of the attributes ascribed to that of the typical "good student" who complies with the teacher's wishes and expectations. In so doing, Shane refused what Gee calls the institutional identity, one available to Shane by the "laws, rules, traditions, or principles" of school (Gee, 2000a, p. 7).

Shane the Artist

Shane the artist is best illustrated through his work on his fan fiction project and poetry assignment. Shane's fan fiction piece was five pages single-spaced, more than twice as long as any other fan fiction piece created by his classmates. The text was also remarkably rich in details with a raw intensity that, while unpolished and a bit awkward at times, showed his promise as a writer and his ability to empathize with the military:

The sounds of blade meeting skin and bone was so clear, if you closed your eyes you could see what was happening like an echo of sound to a bat showing the way. Our squad and enemy's squad were only half their numbers when this collision began. In just seconds of the collision the path was blood soaked, no longer a light brown dirt color it's now a dirty dark blood trail.

Shane's use of vivid imagery renders a graphic image of death involving all of the reader's senses: "The sounds of blades meeting skin and bone" compels readers to hear the sounds and view the violence of battle, "this collision," producing a "blood-soaked" path, "dirty" and "dark," with the vestiges of battle. Although Shane's piece was twice as long as most others, it drew feedback from 25 of his classmates when posted on the Ning. Only one student's project attracted more feedback, drawing comments from 28 students. Shane's classmates responded to his fan fiction project with overwhelming praise:

- This is awesome. i [sic] always love your stories, shane [sic]. there [sic] my favorite. please [sic] be a writer when you grow up.
- if [sic] you do not become an author i'm [sic] going to punch you in the face [sic] you do just as good writing as some of the books that im [sic] reading now and they were written by old people [sic] i [sic] think you should try to write as much as possible [sic]

Student responses suggest that Shane has made a name for himself as a writer early on, i.e., "I always love your stories," and "If you don't become an author, I am going to punch you in the face." As Gee says, his peers "recognized" (2000, p.99) him as a writer, and Shane was clearly pleased to receive the accolades: "Thank you! Every time I hear things such as what you said it inspires me to write even more." This dialogic episode illustrates what Gee refers to as "discourse-identity," that is, traits rendered only because of and through dialogue (2000, p.101). Shane stands as the artist because his peers valued his work, their praise convincing him that he was, indeed, a serious and talented writer.

Once students finished the Twitter activity, they worked collaboratively to create a poem in response to *The Things They Carried*. While the poem that Shane and a classmate composed clearly provided Shane with an opportunity to enact his creative artist identity, he also used it to engage his subversive talents. Although the poetry assignment required students to incorporate their own and their classmates' tweets from the Twitter activity, Shane's poem, entitled "I Fall Forever," did not comply with these instructions. The following excerpt reveals the poem's somber tone:

- After war there's never a good story to come back with.
- You don't value life any more nor any less.
- The home you expected to come back to has been burned.
- You only have a new perspective upon death.
- You realize how it surrounds you and how futile you are in its gaze.

The poem represents a serious attempt at capturing the feelings of the soldiers as they return from war; and this text, as well as the fan fiction text, embody those sentiments. When asked to comment on the class Ning about his favorite part of *The Things They Carried* unit, Shane explained:

The main thing I loved overall was the poetry section of this project… The main thing I love to do is write [sic] and especially poetry at the moment. When I'm able to be creative, it seems like the perfect project to me. I would love to have more creative writing projects like this in the future… The more I write it seems as though the more creative I become and the more my mind evolves into something outstanding.

Shane, the artist, revels in sharing his work with others, not just to have an authentic audience, but also to relish the accolades that the audience can bring. Having received numerous compliments from classmates on his fan fiction project on the Ning, Shane responded to his admiring fans with gratitude. Throughout the unit, when extended writing invitations by Becky that he considered suitable for a serious writer, such as the fan fiction project and the poetry assignment, Shane thrived on his fandom, relying heavily on their feedback for motivation and inspiration. As with his comedic identity, Shane used social networking tools to discursively construct an identity as the artist, a gifted writer.

DISCUSSION

Shane's case study traces the ways in which social networking tools, literacy practices, and identity performances converge in the classroom, challenging dominant pedagogical assumptions about using new technologies in the schools to engage learners. The prevailing logic is that students who are digital natives are proficient using new media tools for literacy practices outside of schools; so if teachers bring those tools into the classroom, then those students will become engaged with school literacy practices, and the problem of failing students will be largely resolved. Shane's case helps clarify the fallacy of this thinking. This line of reasoning assumes that literacy practices are defined by the practices themselves and not altered by the contexts in which they are used. Prensky (2001) would likely consider Shane to be a digital native, given that he self-identifies as a gamer, posts videos on YouTube, and ostensibly engages in the types of digitally mediated leisure activities that we associate with the "iKid Generation" (Stevens, 2012). However, when invited to tweet within the context of a class assignment, the identities he performs in his writing are not those that one would associate with the tweets of a digital native. The identities that a tweeter performs when tweeting, for example, are not dictated by the online space – Twitter.com – but rather by the context in which he or she is tweeting (i.e., a class assignment). The social norms of leisure tweeting (e.g., expressing one's opinions in a way that allows for strong identity performances) were in direct conflict with the ways in which Twitter was appropriated in Becky's classroom, where a strict adherence to the assignment guidelines would have disallowed any self-expression or strong identity performances of one's own. Shane, of course, found a way to challenge those constraints and registered his lack of engagement with the Twitter assignment even as he ostensibly completed it, reinforcing his identity as a subversive and comedian.

As K-12 educators clamor to find meaningful ways to engage student in digital literacies (Downes & Bishop, 2012; Prensky, 2010), a number of experts warn against attempting to motivate students simply through the introduction of conspicuously "trendy" forms of new literacies in formal institutions (Lankshear & Knoebel, 2004). In fact, research suggests that young people do not necessarily want to use technology in institutional settings such as schools in the same manner as they do at home (Loh-

nes & Kizer, 2007). As Tapscott and Williams (2008) assert, young people's "appetite for authenticity means that they are resistant to ill-considered attempts by older generations to 'speak their lingo" (p. 54). Shane's refusal to tweet in character serves as a testimonial to this point.

"Authentically" appropriating literacy practices into new spaces defined by very different historical, social, and cultural norms (i.e., schools) seems like a paradox. Consider fan fiction writing, for example. Fan fiction, or any kind of fandom, for that matter, by definition must materialize from the fans themselves. It is a social practice that is not bound by external rules, but rather governed by internal appeals (Jenkins, 2008). Those who engage in fan fiction are members of what Gee refers to as "affinity groups" (Gee, 2001, 2007). In such groups, "people are committed through their immersion in practice [and are] recruited as resources for the group, *not as identities that transcend the affinity group itself*" (Gee, 2007, p. 207, emphasis added). Within these parameters, a fan fiction writing invitation that is governed by "external rules," in which students are positioned as "fans" of a text that was chosen for them, and that, as with Shane, could be used as a way to showcase one's talents, ostensibly for the purposes of forging an identity as a writer that "transcends" those of the other participants, are not the same practices in which members of fanfiction.net (an online site where millions of fan fiction writers produce and consume fan fiction) engage.

This raises another question: How can educators appropriate digital tools and practices into their classrooms in ways that are neither inauthentic nor incongruous with the cultural norms of the native spaces of those practices and the social identities of their students? Teachers are being challenged to find ways to support their students in developing 21st century literacies that are essential for succeeding in a digital world (International Reading Association, 2009; National Council of Teachers of English, 2008). According to numerous scholars (Gee, 1999; Helsper & Eynon, 2009; Jenkins et al., 2006), these literacies are not natural by-products of the ways in which most "digital natives," students, are using digital technologies outside of schools. How, then, can teachers appropriate digital practices for their classrooms in ways that don't sabotage their authenticity and that don't lead students to feel frustrated and alienated? These are the issues that Shane and his multiple identity performances challenge us to consider as we conceptualize what it means to compose in 21st century classrooms.

Chapter 18
Evaluation of Situations Causing Split of Attention in Multimedia Learning Environments via Eye-Tracking Method

Duygu Mutlu-Bayraktar
Istanbul University, Turkey

Servet Bayram
Marmara University, Turkey

ABSTRACT

In this chapter, situations that can cause split of attention in multimedia environments were determined via eye tracking method. Fixation numbers, heat maps and area of interest of learners were analyzed. As a result of these analyses, design suggestions were determined for multimedia environments to provide focusing attention to content without split attention effect. Visual and auditory resources should be provided simultaneously. Visual information should be supported with auditory expression instead of texts. Images such as videos, pictures and texts should not be presented on the same screen. Texts provided with pictures should be presented via integration to each other instead of separate presentation of text and picture. Texts provided with videos should be presented via integration to each other instead of separate presentation of text and video. Images should be given via marking important points on images to increase attention.

1. INTRODUCTION

In learning environments, many studies revealed that learners showed higher learning performances in the environments with audio-based animations than in static environments (Plass, Heidig, Hayward, Homer and Um, 2013; Lin, Hung and Chang, 2013; van Genuchten, Scheiter and Schüler, 2012; Kühl, Scheiter, Gerjets, & Edelmann, 2011). In the studies performed by Huff, Bauhoff and Schwan (2012), Cierniak, Scheiter and Gerjets (2009), Liu, Lai, and Chuang, (2012), they found out when text and pictures were

DOI: 10.4018/978-1-5225-3822-6.ch018

not integrated together, applied test scores of people learning with split attention effect decreased. On the other hand, simultaneous presentation and presence of semantic harmony between them should be considered when animation and narration is used together (Širanović, 2007; Mayer, 2009).

In multimedia, presentation of texts visually rather than aurally prevents split of attention (Bayram and Mutlu-Bayraktar, 2012; Schmidt-Weigand, Kohnert and Glowalla, 2009; Seufert, Schutze and Brunken, 2009). It was highlighted that learners needed more expressive education and guidance to manage split attention situations better (Agostinho, Tindall-Ford and Roodenrys, 2013). In addition to these, it is emphasized that preparation of effective presentations in multimedia has positive effects on prevention of cognitive load, focusing of attention correctly and emotional and perceptual processes such as motivation and these effects are reflected on perception and transfer performances (Plass et al., 2013; Moreno & Park, 2010; Plass, Moreno and Brünken, 2010).

1.1. Split Attention Effect

Attention is loudly and clearly to embrace one of objects or thoughts appeared simultaneously in the mind. When it comes to attention, it is understood to give up others in order to deal more effectively with some things (James, 1983). Attention is defined as concentration of mental effort on sensory or mental events by Solso, Maclin and Maclin (2008).

Diversification of stimulants while providing information to learners is effective in terms of attracting attention. However, attention is divided while providing these stimulants and mental efforts of individuals can be directed to different parts (Mayer, 2001).

People can learn better in the environments that words and pictures are integrated and provided close to each other physically and formally. In the environments which information is provided from multiple sources, split attention effect does not arise in the case of that sources are quite clear and they are integrated without any need for further explanation (Ayres and Sweller, 2005). Extra information that is not integrated with other sources decreases learning performance of student and constitutes unnecessary memory space. In Web-based education, more effective results are obtained when verbal and visual information is provided together. Presentation of this information close to each other without separation prevents split of attention (Sweller, 2004).

While learners are studying information from multi-source presentations, giving information as integrated provides learners to understand better. Information that is not presented in accordance with this principle causes split of learner's attention for two different tasks. For instance, it is thought that trying to read text results in split into two different tasks while animation is operating (Sorden, 2005). In addition, learners watching visual contents have to simultaneously combine number of features such as perception-oriented style, form or direction with movements of objects moving from one place to another on screen. It is stated that movements and changes in objects draw attention and prevent to focus on actual content (Hillstrom and Chai, 2006). Besides these, it is emphasized that preparation of effective presentations in multimedia, prevention of cognitive load and accurate focusing positively affect learners' emotional and perceptional progresses such as motivation and it is reflected on cognition and transfer performances with this effect (Plass et al., 2013; Moreno and Park, 2010; Plass, Moreno and Brünken, 2010).

In presentations that texts and pictures are provided together, it is known that giving text below picture as an explanation is enough, but it is thought that more effective results can be obtained when text is integrated to picture. In this case, picture and text is put into information process. In presentations that

animation and expression is provided together, simultaneous presentation and semantic harmony between them should be considered (Širanović, 2007; Mayer, 2009). The first study about split attention was carried out for geometry education by Tarmizi and Sweller (1988). In the study, samples were described via two types of geometric forms. Performances of problem-solving strategies with the samples that were provided with geometric shapes integrated directly with information and the samples that information was given below shape with stages were compared. In the second environment which shape and text were provided separately, it was found that attention of learners was divided between shape and text and they needed to make more effort due to cognitive load when compared to other environment.

Eye tracking method which is one of the innovations used to put forward the principles considered for prevention of split attention effect in multimedia learning designs having text and picture combination provides to obtain more precise results from studies. In recent studies, it is emphasized that eye tracking method should be used to provide findings based on more precise evidences (Liu, Lai and Chuang, 2011). It appears that eye tracking method is quite effective especially in multimedia learning environments that visual and verbal information is provided together (Yang, Chang, Chien, Chien, and Tseng, 2013; Molina, Redondo, Lacave, and Ortega, 2013; Alkan, 2013). In many studies based on multimedia learning environment theory, data are based only on test results and comments remain incomplete in terms of cognitive processes. Especially in studies carried out about attention, lack of eye tracking data causes not to obtain clear results. Comments about design according to only expression of individual or test results are not enough to explain cognitive processes. Therefore, eye-tracking method is used in the studies aiming to examine multimedia learning environments (Mason, Tornatora and Pluchino, 2013; Bayram and Mutlu-Bayraktar, 2012; Liu, Lai and Chuang, 2011). For this purpose, results have been strengthened via eye tracking method within the scope of the study.

1.2. Eye-Tracking Method

Eye tracking method provides eye movement data about focused areas while people following content on screen, objects that they ignore and they are disturbed (Underwood and Radach, 1998; Russell, 2005). Eye tracking measurements are quite valuable in terms of supporting and verifying the results previously produced in multimedia studies. Moreover, eye movements deeply provide qualitative and quantitative data about processing information by users. This method helps to find individual differences via tracking eye movements and to interact with source provided (Liu, Lai ve Chuang, 2011).

1.3. History of Eye Tracking

When we look at the history of eye tracking methods, studies about examination of eye movements were performed via direct observations in the 1800s. Then, eye movements were tracked on an aluminum indicator using a kind of contact lens. The first eye tracking more convenient than other methods was developed via a principal based on use of beam reflected from eye and recorded as a film. Buswell examined eye movements about reading and viewing picture in his two different studies (Buswell, 1922; 1937). New studies about eye tracking were carried out in the 1950s and 1960s. Experiments were carried out especially about attention and related issues (Yarbus, 1967).

In the 1970s, new researches especially about ‘reading’ were performed in studies about eye tracking (Rayner, 1998). In the study about eye tracking carried out during problem solving process by Hunziker (1970), visual problem solving displayed on glass plate was filmed.

Researches that were performed in the 1980s and 1990s and were thought to provide a base for recent eye tracking studies presented new findings about eye tracking method (Posner, 1980; Deubel and Schneider, 1996; Hoffman, 1998). In the 2000s, studies performed with measurements giving better results with developing technology prove or reject findings of studies previously carried out (Liu, Lai and Chuang, 2011; Russell, 2005). With this method, it is one of the most effective methods to perform usability tests of items such as user interface, menu, graphic (Bazar, 2009; Byrne, Anderson, Douglass, & Matessa, 1999) and web sites (Tüzün, Akıncı, Kurtoğlu, Atal, & Pala, (2013), Faraday, 2001; Goldberg, Stimson, Lewenstein, Scott, & Wichansky, 2002). Upon reviewing previous studies, it is seen that measurements of eye movement variables used to measure and define individual's cognitive activity are used most commonly (Mutlu-Bayraktar & Bayram, 2013, Yang et al., 2013; Jarodzka, Van Gog, Dorr, Scheiter, & Gerjets, 2013).

Screening path of eye, duration spent for looking at various images, focusing areas of visual attention and number of winks are obtained with eye tracking method.

1.4. Eye Tracking Systems and Data Obtained

Eye movements are related to cognitive operations in the brain, so that it provides to obtain information about these operations and processes via observing and interpreting eye movements (Biedert, Buscher and Dengel, 2009). It is quite important that experimental environments prepared with this method measuring cognitive processes should be natural and they should be in a way that participants will not feel like they are in experimental environment. Simple-to-use eye-tracking device located away from should be preferred to the device mounted on head (Namahn, 2000). Within the scope of this study, it was integrated under the monitor in Human-Computer Interaction laboratory and unnoticed eye tracking device was used.

Definitions of some terms used for eye tracking data were listed below (Jacob and Karn, 2003):

Fixation: Fixing eye, looking at object or areas generally with 2-degree distribution threshold and minimum 100-200 ms duration.
Gaze Duration: The duration that eye looks at a certain point via keeping on.
Scan Path: Roaming pattern of fixed gaze on screen (See Figure 1).

Area of interest: Attractive picture or visual environmental area that researcher specifies (See Figure 2).

Heat map: The screens are rated with colors on heat maps according to gaze duration and number (See Figure 3).

In addition to these data, images are obtained from video records saved by cameras found in HCI laboratory. It provides important information via enabling to observe individuals' reactions and behaviors in video and via being an information store including visual and audio sides.

Eye tracking method provides eye movement data about areas paid attention, subjects ignored and irritating things when people follow content on screen (Underwood and Radach, 1998; Russell, 2005). Eye tracking measurements are quite valuable in terms of support and confirmation of the results produced in previous multimedia environment studies. Moreover, eye movements deeply provide qualitative and quantitative data about processing of information by users. This method helps about finding individual differences and interacting with presented source via tracking eye movements (Liu, Lai and Chuang, 2011).

Figure 1. Scan Path Data

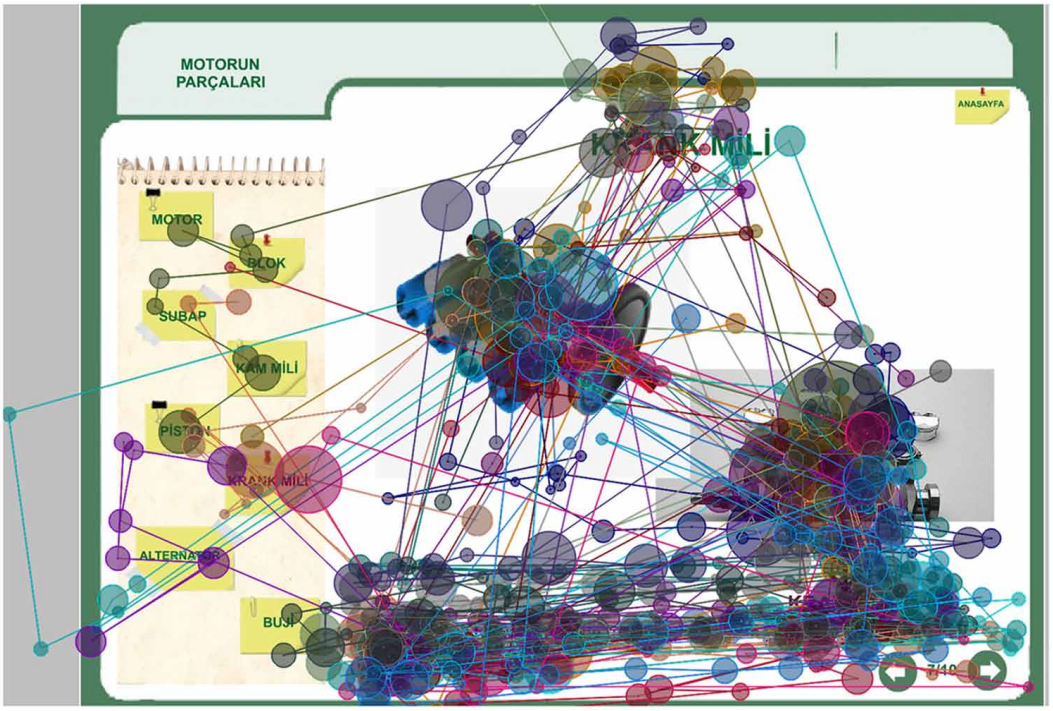

Figure 2. Area of Interest Data

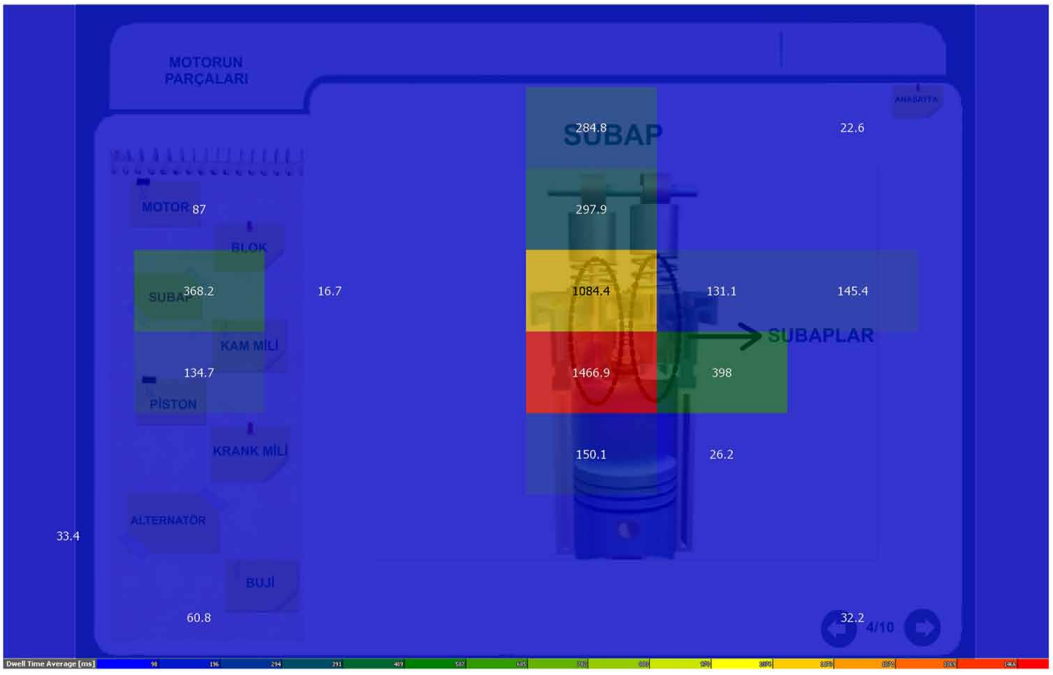

Figure 3. Heat Map Data

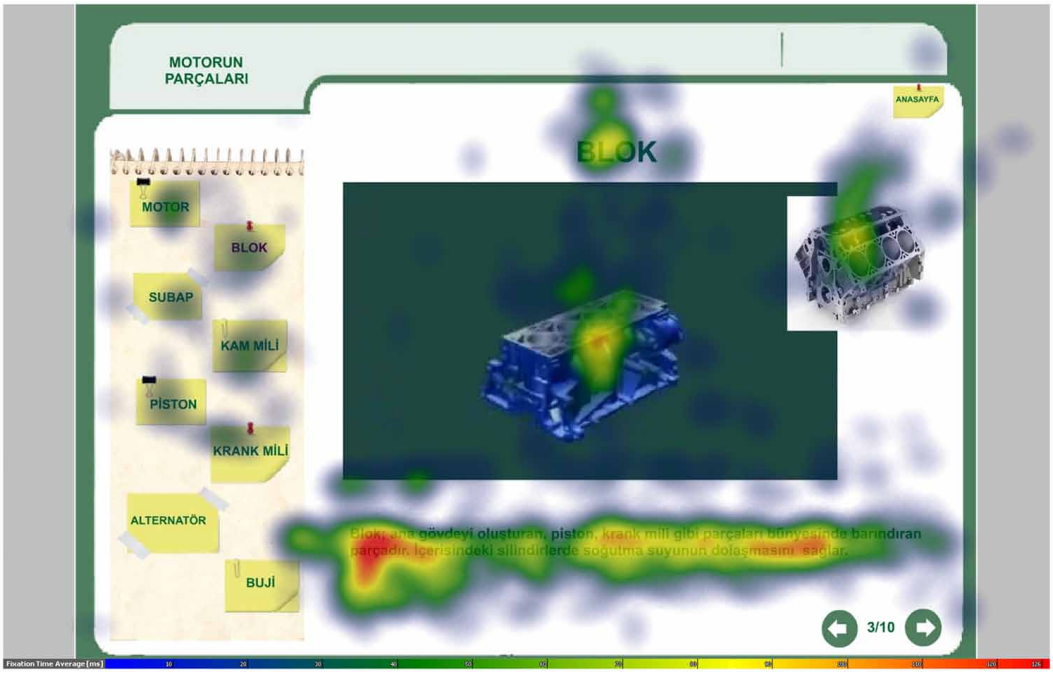

Eye movement is related with cognitive processes in the brain, so that it provides to get information about this processes and steps in the brain via observing and interpreting eye movements (Biedert, Buscher & Dengel, 2009). It is really important that experimental environments prepared with this method measuring cognitive processes should be natural and they should be like that participants should not feel they are in experimental environment. Simple-to-use eye-tracking devices located away should be preferred over head-mounted device (Namahn, 2000). Within the scope of this study, an unobtrusive eye tracking device integrated under screen was used in Human-Computer Interaction laboratory.

According to the presentations performed via using information types individually (audio, visual) in learning environments, it was revealed in many studies that the presentations using double information type were more effective (Mayer and Moreno, 2013; Van Genuchten, Scheiter, and Schüler, 2012; Florax and Ploetzner, 2009; Mayer and Moreno, 2002). In addition, presentation of this information near to each other prevents splitting of attention (Crooks, Inan, Cheon, Ari and Flores, 2012; Sweller, 2004, Schmidt-Weigand and Scheiter, 2011). For this purpose, the following research questions were examined.

1. What are the areas on which learners focus more in focused attention multimedia?
2. What are the areas on which learners focus more in split attention multimedia?
3. How are the heat maps of learners during the use of multimedia in focused attention type?
4. How are the heat maps of learners during the use of multimedia in split attention type?

2. METHOD

In the method of the research was survey model. Survey models are the researches that aim to describe past or present situation as it exists and are performed with larger samples according to other researches (Karasar, 2007).

2.1. Study Group

Overall, 27 women and 20 men, total 47 students from Marmara University voluntarily participated in the study. All of the participants were undergraduate students who participated in the project management course in Computer Education and Instructional Technology Department. Students did not participate in earlier experiments in the Human Computer Interaction Laboratory. Their mean age is 21.5. They voluntarily took part in the experiment for extra 10 points about their exam.

2.2. Multimedia Instructional Materials

2.2.1. Focused Attention Multimedia Learning Environment

In this medium, the "motor" lesson contents were prepared as per the Multimedia Instructional Design Principles of Mayer (2009) with the aim of eliminating the presence of split attention causes. This instructional media has been designed as visual and audio kinds with the goal of focused attention, in order to enable the realization of recall. The presentation types have been diversified by supplementing visually presented information with audio explanations. With the aim of focusing attention, images were presented as separate from the video during scenes of video explanations. The information presented in images was thus presented with the objective of offering the explanation in audio and enabling focusing on the image and the explanation. The information presented in the images were supplemented with audio and presented in progression. The texts relevant to the images were presented in an integrated manner to the explained images. The material was designed to allow the self-pacing of the student. The students were presented with operation instructions for perusing the material (See Figure 4).

2.2.2. Split Attention Multimedia Learning Environment

In this medium, the "motor" lesson contents were prepared in audio presentation according to the possibility of the occurrence of split attention effect. Images and texts were added into the scenes containing information presented in the videos. The audio information was prepared to present different sections than those presented as texts. The text descriptions of the images were presented spatially distanced from the images themselves. The application's preparation allowed the student's self-pacing. The students were presented with operation instructions for perusing the material (See Figure 5).

2.3. Eye Tracking Measures

Eye tracking data can provide valuable information about the attention processes of the learners. The participants studied these materials and they were tested individually at the Marmara University Human Computer Interaction Laboratory. It will be completed.

Figure 4. Screenshot of a Presentation from Focused Attention Multimedia

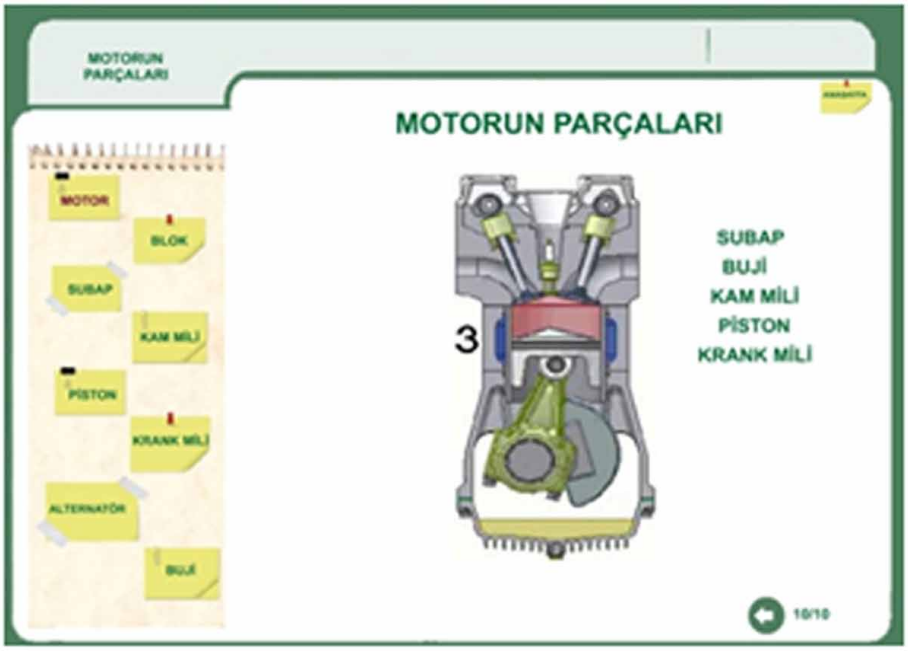

Figure 5. Screenshot of a Presentation from Split Attention Multimedia

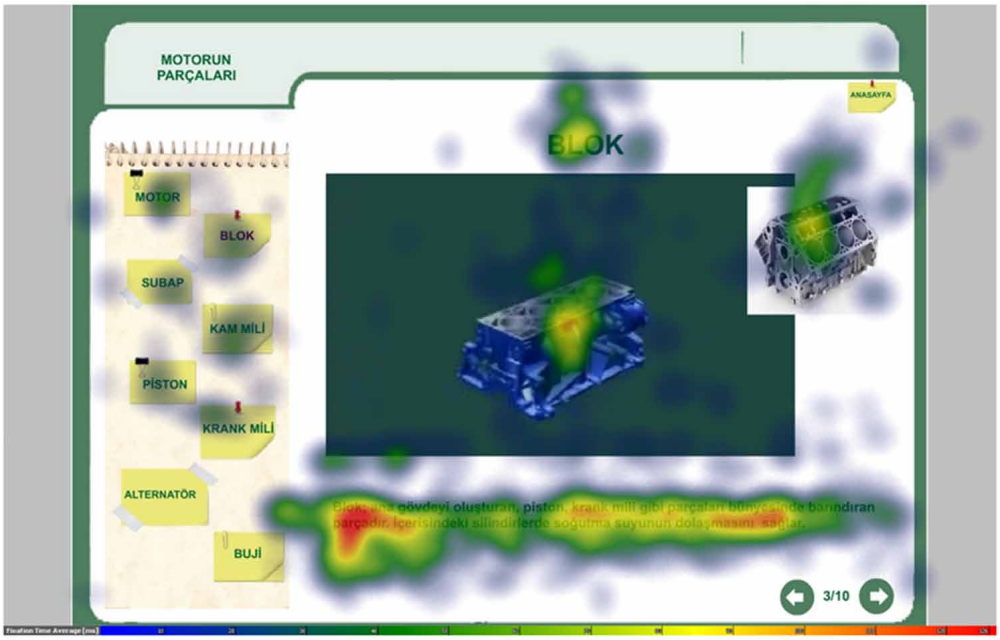

In this study, SMI Experiment and Begaze 2.4 programs were used for measuring eye-movement data. After calibration, participants were presented with multimedia learning environments.

2.4. Tools Used During Eye Tracking

The experiments were carried out in Human-Computer Interaction Laboratory used in Computer and Education Technologies Department of Atatürk Education Faculty of Marmara University. Units used in the laboratory:

2.4.1. Cameras

In the test room, one remotely controlled dome camera serving to observe all movements of user, where camera looks at is not understood due to translucent plastic cover on it and one mobile camera serving to show keyboard use (See Figure 6).

2.4.2. Eye Tracking Device and Test Computer

There is an eye-tracking device that gives information about where, how long and how many times user looks at the screen and simultaneously records eye movements during test process. It is connected to a test computer which is linked to the device and user will perform the experiment and to another computer which is found in observer's room and records screenshots of user (See Figure 7).

2.4.3. Observer's Computer

It is found in control room and there is also a computer which screenshot is recorded by software such as Noldus and computer connected to cameras (See Figure 8).

Figure 6. Cameras

Figure 7. Eye-Tracking Device and Test Computer

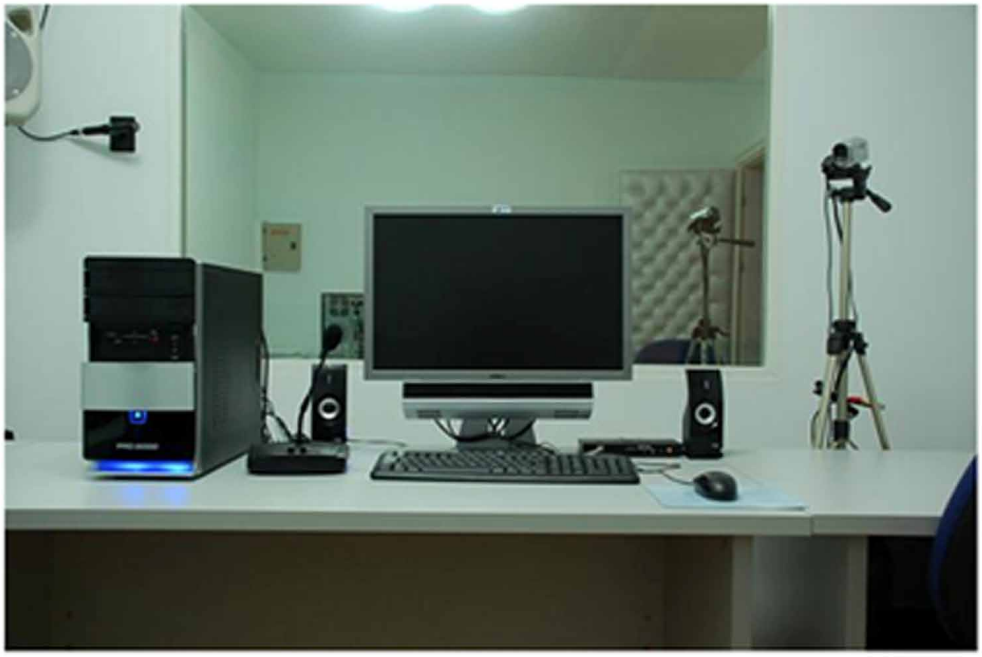

Figure 8. Observer's Computer

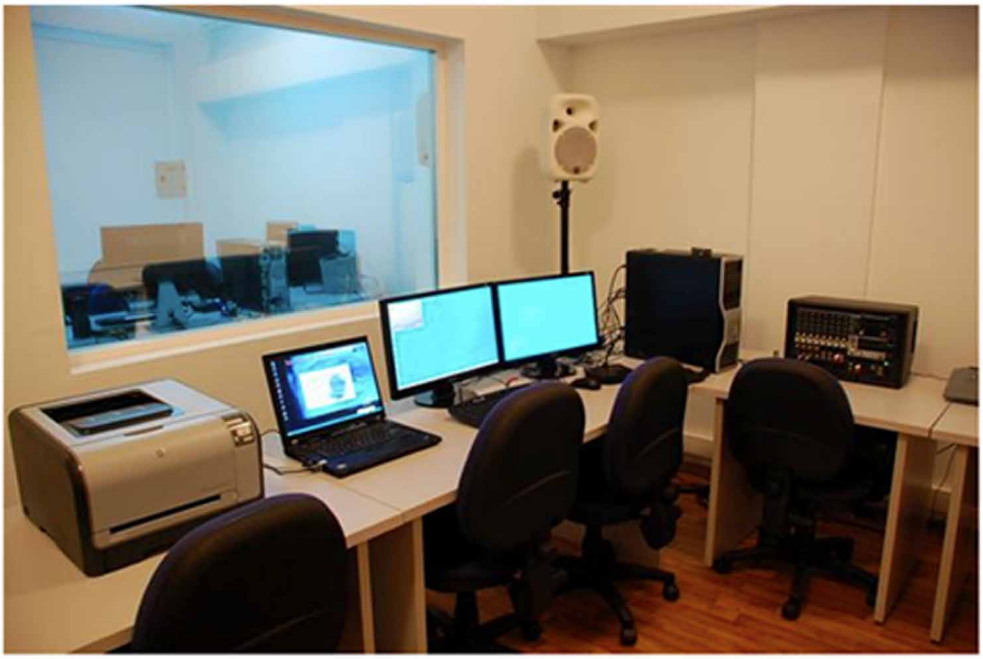

2.4.4. Control Unit

There is a control unite which controls 360° pivotable cameras and is connected to monitor showing both image taken by camera and screenshots of computers of observer (See Figure 9).

2.4.5. Microphone and Amplifier

There are microphones in test room and control room for communication between user and observer. Audio recording resolution is amplified by amplifiers (See Figure 10).

Figure 9. Control Unit

Figure 10. Microphone and Amplifier

2.4.6. Sound Isolation

It should be performed to be protected from harmful effects of noise and to create proper use conditions via isolating test room from unwanted sounds during test.

2.4.7. One-Way Mirror

Observers follow behaviors of users via one-way mirror that separates test room and control room.

2.5. Experiment Process

Learners were taken into experiment process in HCI laboratory in the Department of Computer Education and Instructional Technology of Marmara University. The experiment was previously recorded as screen recording with 'SMI Experiment' program in test computer mounted with eye tracking device. This process was performed only once during the research and each participant was studied via this experiment. The experiment was started after calibration of eye. Then, eye movements of students studying focused and split multimedia environments were recorded with eye tracking devices found in HCI laboratory (See Figure 13). The records which were recorded via Experiment 2.4 program and showed

Figure 11. Experiment Process

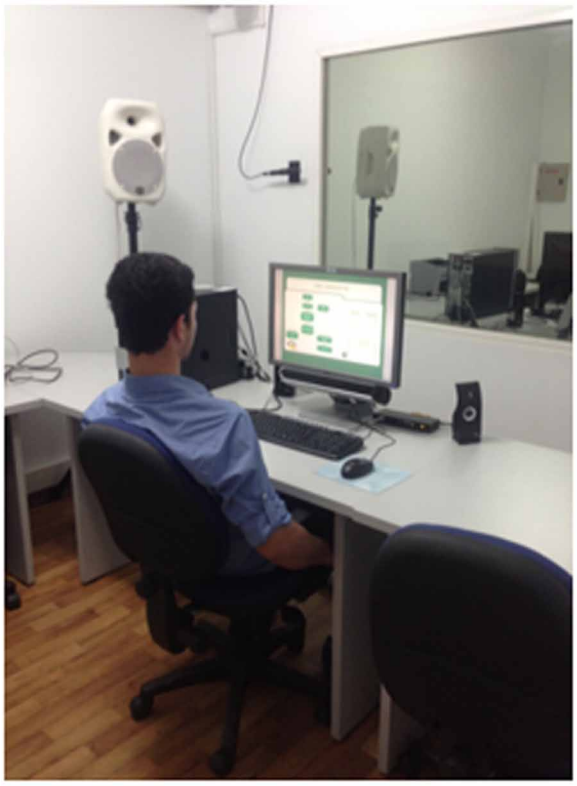

Figure 12. Color Transition for Fixation Number

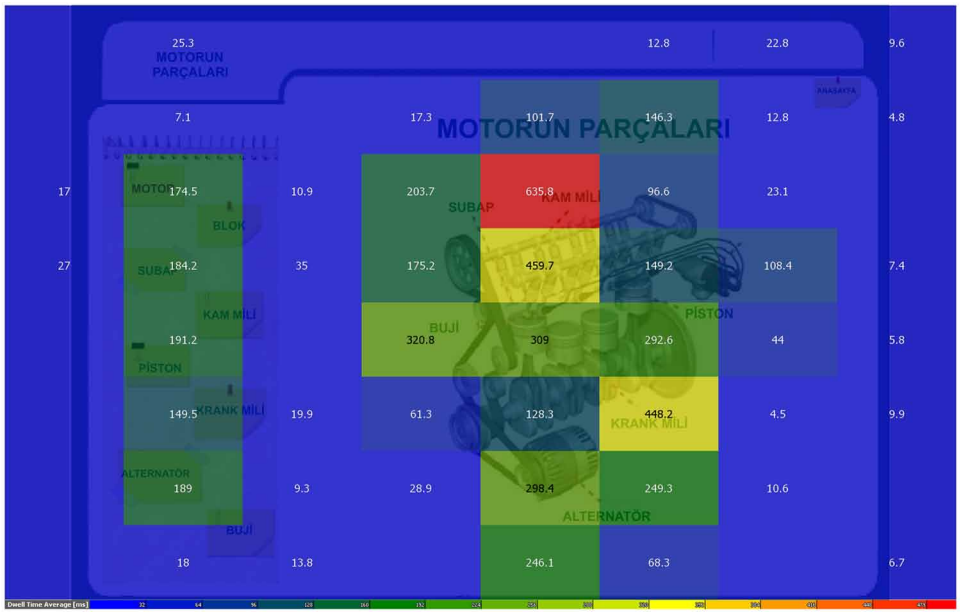
Figure 13. Fixation Numbers Belonging to the Screen in which Texts were Integrated to Pictures in Focused Attention Multimedia



eye and mouse movements were analyzed via Be Gaze 2.4 program. Fixation, duration and heat map values were examined in the analyses.

3. FINDINGS

In the first research question of the study, eye-tracking data was analyzed to determine the areas on which learners focused more in multimedia designed according to focused attention.

While fixation numbers were detected via eye-tracking device, the duration between stage opening and moving to other page was accepted as beginning. Fixation numbers were detected during the duration between these two times. While the areas having more focus are marked with red on the screen according to total focusing numbers on the screen, the areas with less focus are marked with blue.

On the screen which names of motor parts were presented as integrated into picture and video, it was aimed that students focused on both of them without any split of attention between text and picture.

When eye tracking data was evaluated, it was seen that students mainly focused on pictures, then on texts and menu buttons (See Figure 13).

On another focused multimedia screen that audio expression and video were used, it was aimed to make fixation on actually described part in the video via images. So that it was aimed to prevent split of focuses of learners on other objects in the video. When eye tracking data of this screen is evaluated, it is found that learners focus more on the object described in the video. Then, they focus on name of the object and menu buttons (See Figure 14).

In the second research question of the study, Eye-tracking data was analyzed to determine the areas that learners focused more in multimedia designed according to split attention. When eye tracking data obtained for the screen used for video, text and audio expression is evaluated in multimedia learning environments which emergence of split attention effect is possible and motor and its parts are described, it is seen that learners focus more on texts and fixation numbers are more in texts than in picture or video. It is seen that learners' attentions are split between picture and video and use of texts as well as audio expression makes focusing difficult. This situation affected learner performance as a result of emergence of effect of extremeness (See Figure 15).

When eye tracking data belonging to the screens that names of motor parts in picture or video are presented without integration into pictures is evaluated in multimedia learning environments which emergence of split attention effect is possible, it is seen that attentions of learners are split between picture and text. It is found that they focus more on texts then on picture and buttons according to fixation numbers (See Figure 16).

Figure 14. Fixation Numbers Belonging to the Screens which Described Object is Marked in Focused Attention Multimedia

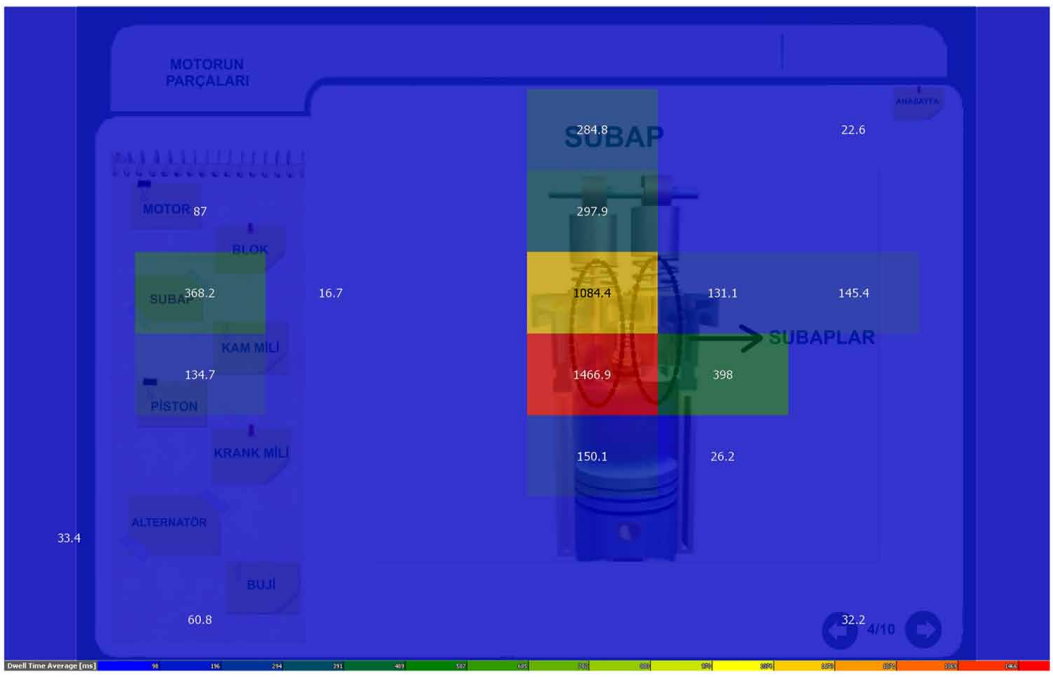


Figure 15. Fixation Numbers Belonging to the Screen which Video, Text and Audio Expressions are Present in Split Attention Multimedia

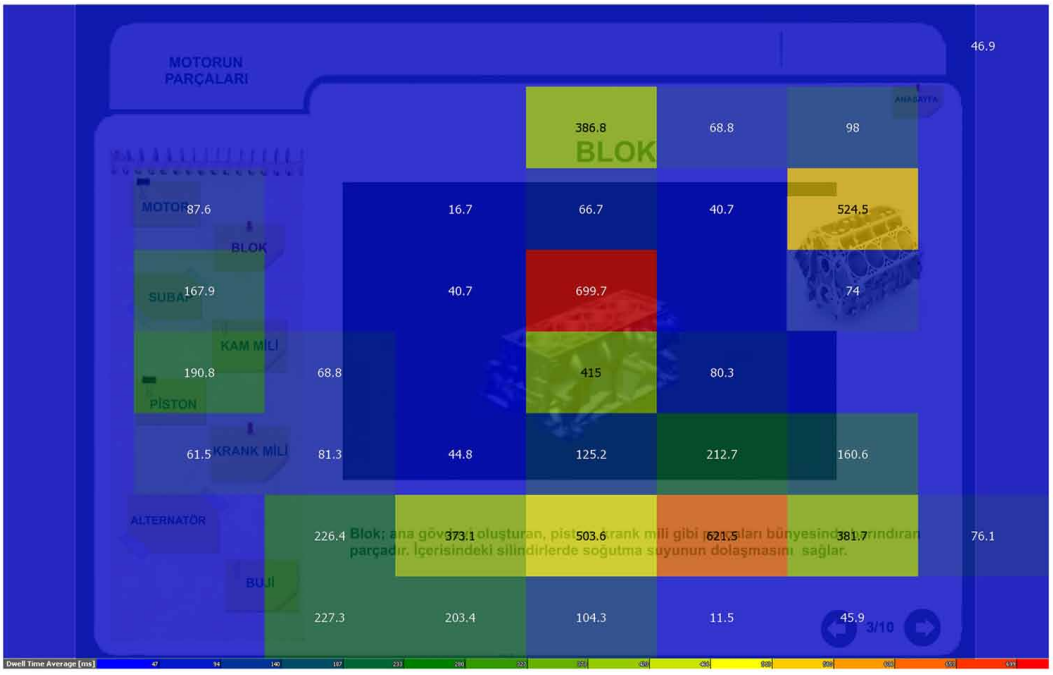

Figure 16. Fixation Numbers Belonging to the Screen in which Texts are Separately Presented from Video in Split Attention Multimedia

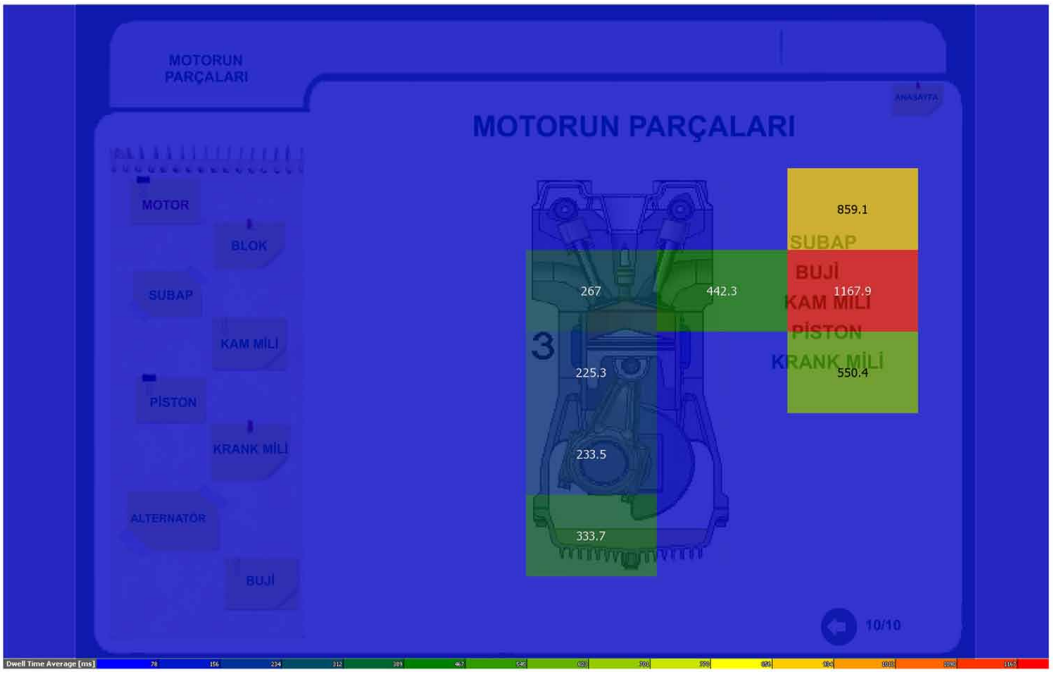


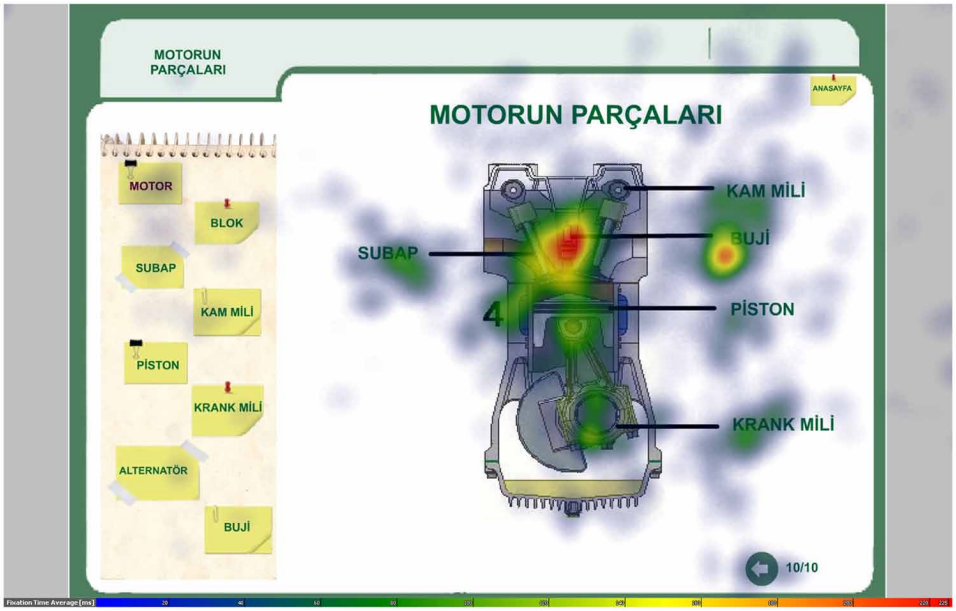
In the next research question of the study, eye-tracking data was analyzed to determine heat map during use of multimedia in focused attention type by learners. Another analysis type for processing the data obtained from eye tracking is heat maps. The screens are rated with colors on heat maps according to gaze duration and number. After opening screen, the most focused area on interface for related objects can be detected. While heat map images on the screens were being obtained, the duration between stage opening and moving to other page was accepted as beginning. Heat maps were established with constant gazes during the duration between these two times.

While the areas having more focus are marked with red on the screen, the areas with less focus are marked with blue. Color transition for heat maps are presented in Figure 17.

On the image in focused attention multimedia, it was aimed that learners focused on both the text and picture without attention split on the screens which texts containing names of motor parts were integrated into the picture. When heat maps are evaluated according to eye tracking data, it is seen that learners focus more on pictures then on texts and menu buttons (See Figure 18).

Figure 17. Color Transition for Heat Map

Figure 18. Heap maps belonging to the screens which texts are integrated into pictures in focused attention multimedia



In focused attention multimedia, it was tried to perform focusing via marking on actually described part in video. Therefore, it was aimed to prevent attentions of learners to split into other objects in video. When the heat maps about the eye tracking data belonging to this screen are examined, it is seen that learners focus more on the object marked in the video. Then, they focus on name of the object and menu buttons (See Figure 19).

Eye tracking data was analyzed to determine heat maps in the progress of use of multimedia by students in split attention type. When heat map about eye tracking data obtained for the screen that video, text and audio expression were used was examined in multimedia learning environments which emergence of split attention effect is possible, it is seen that learners focus more on texts than on picture or video. It is seen that learners' attentions are split between picture and video and use of texts as well as audio expression makes focusing difficult. This situation affected learner performance as a result of emergence of effect of extremeness (Figure 20).

When heat map belonging the screens that are presented as names of motor parts in picture or video are not integrated into pictures is evaluated in multimedia learning environments which emergence of split attention effect is possible, it is seen that attentions of learners are split between picture and text. It is found that learners focus more on texts, then on picture and buttons (See Figure 21).

In focused attention multimedia, the part was marked in the video to increase focusing on motor part being described with the video. This marking was not performed in split attention multimedia. In this situation, focusing is dispersed on the video and it is not focused on the part being described (See Figure 22).

Figure 19. Heat Map Belonging to the Screen in which the Object is Marked in Focused Attention Multimedia

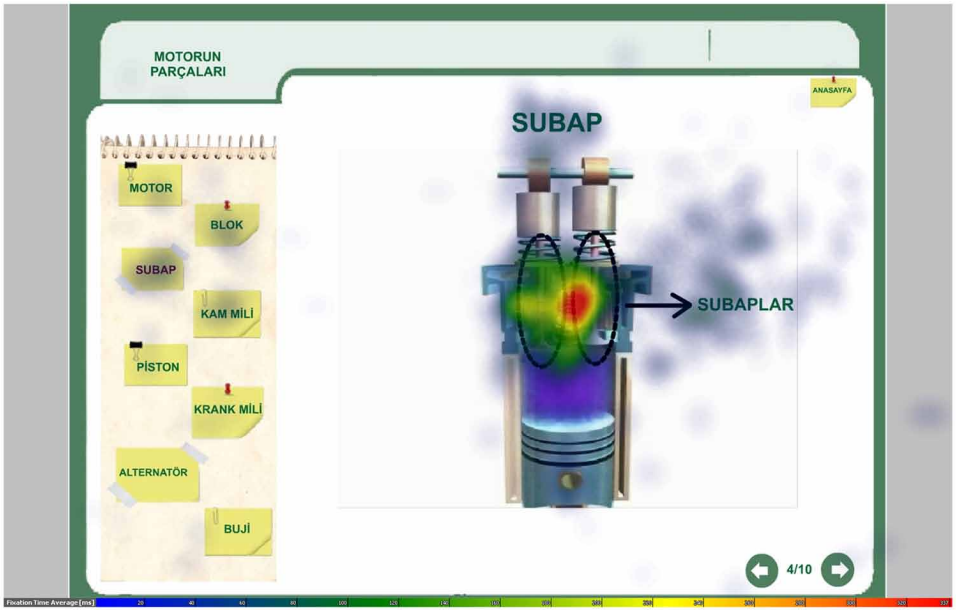


Figure 20. Heat map belonging to the screen that video, picture and audio expressions are present in split attention multimedia

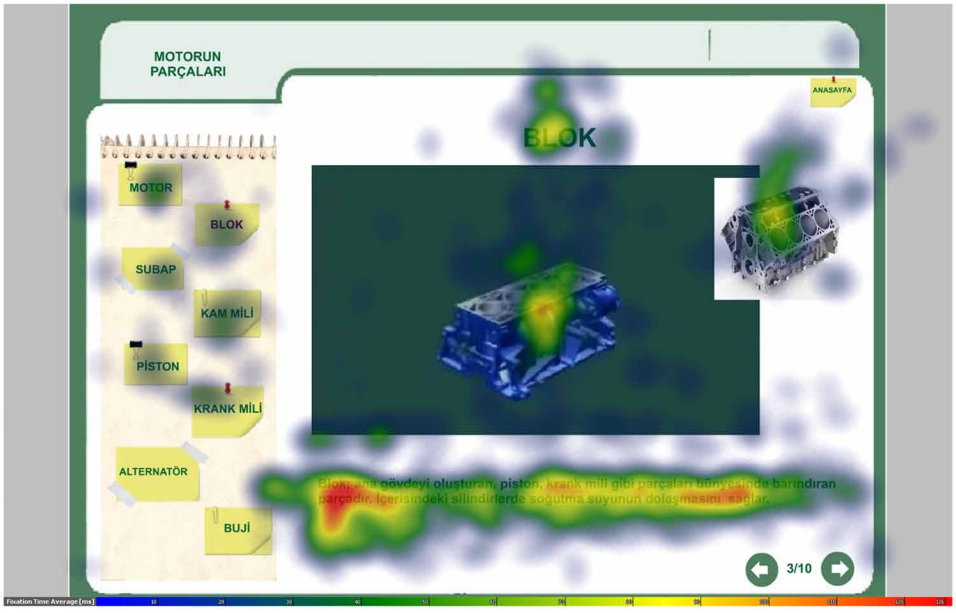

Figure 21. Heat Map belonging to the Screen that Texts and Pictures are Separately Presented in Split Attention Multimedia

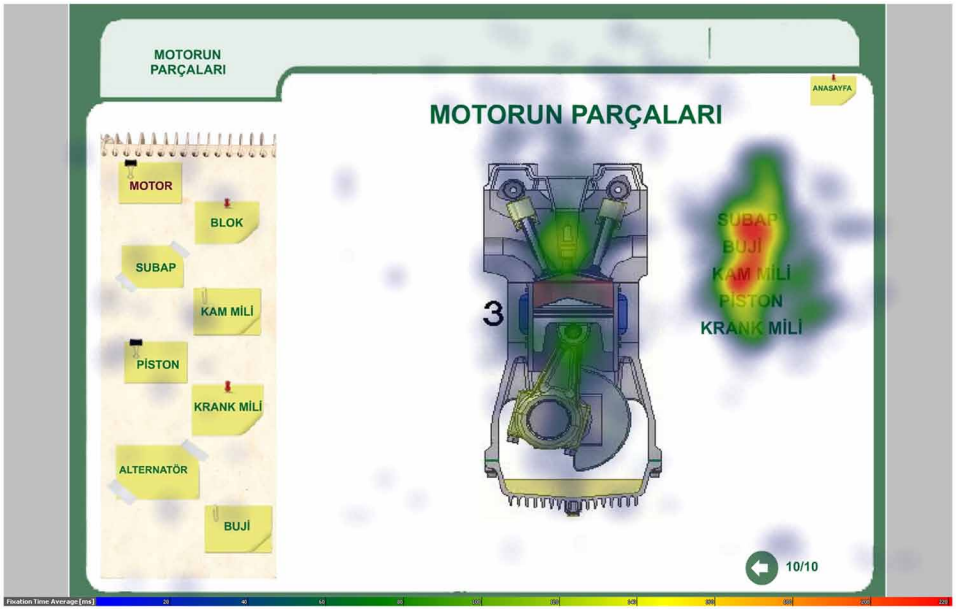

Figure 22. Heat Map Belonging to the Screen that is Presented without Marking the Object in Split Attention Multimedia

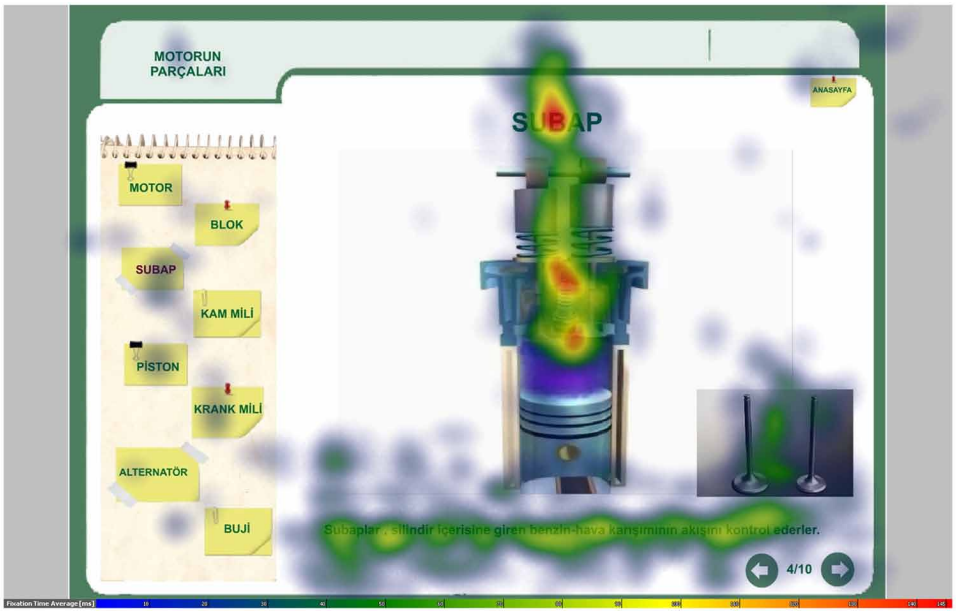

4. RESULTS

Use of different sources such as picture, text and audio in learning environments enriches education environments. Especially online learning environments as tools assisting rapid development and spread of knowledge support learning. In developing online learning environments, interactive learning process is generated between content and learners. Environments used aim to provide configuration of knowledge via keeping students active during learning process.

In e-learning environments, many studies revealed that learners showed higher learning performances in the environments with audio-based animations, also text and pictures were integrated together (Plass, et al., 2013; Lin, Hung and Chang, 2013; van Genuchten, Scheiter and Schüler, 2012; Liu, et al., 2012; Huff, Bauhoff and Schwan, 2012; Kühl, et al., 2011). On the other hand, simultaneous presentation and presence of semantic harmony between them should be considered when animation and expression is used together (Širanović, 2007; Mayer, 2009). In this study, it was similarly found out that restoration performances of learners were higher in the environments with presentation of integrated visual and verbal presentation type information than in the environments without this integration. On the other hand, simultaneous presentation and presence of semantic harmony between them should be considered when animation and expression is used together (Širanović, 2007; Mayer, 2009).

According to eye tracking data obtained about the screens which picture, video and texts are presented together, one of the results is that learners focus more on video or pictures in focused attention multimedia. Focusing on video and pictures by learners was provided without split of attention. In the study performed by Yang et al. (2013), the results showing that average fixation time and average data processing time are longer in areas with pictures show parallelism with the study. On the other hand, in

the study carried out by Liu, Lai and Chuang (2011), they revealed that learners focused better on video in the environments that texts were presented with narration, rather than visually.

It was found that markings made to aim drawing attention to a certain point on images had contributions to recall performances of learners. In the study carried out by Chen, Wang, Chen and Chen (2014), it was seen that learners showed better performances with the use of visually emphasized presentations and visual markings. In two studies performed by Ozcelik, Arslan-Ari, & Cagiltay, (2010) color coding method was used in learning environments prepared via using markings and its positive effects were presented among the results via eye tracking data. Increase in learning with color-coding was performed with accurate positioning of pictures and texts related with each other concurrently.

KEY TERMS AND DEFINITIONS

Attention: The nervous system function that provides selecting only in need stimuli.

Eye-Tracking Method: It's a eye movements data collection method used for while individuals follow the content on-screen where pay attention to the areas, which elements are ignored, to determine what they are uncomfortable.

Focused Attention: It is the concentration of attention on a specific part of the information.

Multimedia: It's a media where words (as textual and narrative) and images (photographs, animations or videos) as they are used together. It's an environment which text, image, audio, animation, video or a combination of these used together.

Multimedia Learning: For the presentation of certain learning content text, graphics, animation, photography, video and audio of the different symbol systems complement each other in a way that is integrated.

Split Attention: Attention is divided between two simultaneous inputs.

This research was previously published in Design Strategies and Innovations in Multimedia Presentations edited by Shalin Hai-Jew, pages 337-367, copyright year 2015 by Information Science Reference (an imprint of IGI Global).

ABSTRACT

This chapter addresses the relationships between social inclusion and digital divide(s), mainly focusing on the conceptual frameworks that provide the basis for rethinking the relationship between technological, social, and human factors. Redefining the digital divide has deep consequences on the theoretical and empirical framework we apply to the digital divide and to the related social inclusion processes. It is widely acknowledged that the label digital divide can be partially misleading, because it is mostly emphasizing a binary dimension (haves vs. have not) and a mere technological dimension. In order to achieve a clear operational definition of the digital divide, we should avoid some misleading myths characterizing the debate and focus on the complex relationships between technological, social, and human factors (a dichotomous conceptualization, a narrow understanding of the technological factors involved, a technological deterministic approach), adopting, instead, an enabling technology approach. Therefore, the authors introduce a multilevel model for analyzing digital divides (Comunello, 2010), with a main focus on new media literacy (the model considers not only mere technology availability, but also real access, advanced reception practices, technical skills, content production, networking skills). Finally, they review some empirical methods for studying the digital divide, trying to underline how a more nuanced framework for analysing the digital divide can be adopted by empirical research.

INTRODUCTION[2]

The digital divide is an internationally recognized issue today: unequal diffusion of ICT (Information Communication Technology) is a problem of global relevance in a world where social systems were radically changed by Information Technology. Knowledge, production, finance, education, social and

DOI: 10.4018/978-1-5225-3822-6.ch019

political relations are affected by this technological revolution. Nevertheless, the presence of such technologies has created new social inequalities.

Providing a specific definition of the digital divide is a complex task. Scholars have been trying to identify specific dimensions in order to analyse such increasing gaps in the distribution of ICT (Servon, 2002). These do not only refer to differences between the North and the South of the world, but also to differences to be identified within the more developed societies: the so-called social divide (Norris, 2001). Such inequalities are determined by geographical context (whether urban or rural), socio-economic status, educational level and ethnic origins. The digital divide has been originally identified with disparities in technology access, dividing so-called haves and have not, according to a binary logic that could be applied to either subjects or countries (James, 2003). Afterwards, the concept of the digital divide underwent a conceptual and empirical transformation. Digital divide today is a multifaceted concept, embracing to a number of dimensions: not only technology access, but also literacy, contents and services are other important elements to be considered (DiMaggio, Hargittai, Neuman & Robinson, 2001; Gunkel, 2003; Warschauer 2003, 2007).

Theoretical and empirical experiences made it possible to modify the frameworks used for analysing the digital divide in the international context. Scholars underline that 'standard recipes' cannot be applied to different contexts: in order to reduce the gap between technologically advanced countries and poorer ones, a context-aware framework has to be adopted (Rodriguez & Wilson, 2000; Wilson 2004; Wilson & Wong, 2007).

Equally, when addressing so-called intra moenia divide (the social divide, in Norris' 2001 words), the analysis has gradually shifted from a quantitative approach, aimed at detecting the presence of ICT and its availability to individuals, to a qualitative approach, aimed at identifying to what extent the lack of such technologies is heavier for the disadvantaged. Nowadays, scholars are focusing on how ICT can contribute to reducing social marginalization (social exclusion) and to increase community cohesion (social inclusion).

The main objective of this work is to highlight how ICT can strengthen the processes of social inclusion. In contemporary societies, both social inclusion and social exclusion are not only based on economic marginalization, but also on relational and cultural exclusion; the cohesion of a social system is highly dependent on the participatory dimension, from both a civic and political perspective. Moreover, socio-cultural integration strongly depends on how inclusive the social context is.

In order to operationalise such theoretical concerns, we will introduce a multilevel model for analysing the digital divide, focusing not only on technology access, but also on digital literacy. We will also review some empirical methods for studying the digital divide, trying to underline how empirical research can benefit from a more nuanced framework for analysing the digital divide.

ACCESS AND BEYOND: ENABLING TECHNOLOGIES[3]

It is widely recognized that, after more than 15 years of debates, the very notion of the digital divide needs to be reconsidered (Selwyn & Facer, 2010). A rising number of scholars are questioning the label digital divide, adding in their books' titles expressions like rethinking, redefining, reconceptualizing or beyond (Warschauer, 2003, 2007; Mossberger, Tolbert & Stansbury, 2003, etc.), or proposing the idea of a second order digital divide (Hargittai, 2002; van Dijk & van Deursen, 2010), going beyond the dichotomous first order conception; others introduce new concepts, such as digital inequality (DiMaggio

& Hargittai, 2001), zones of silence (Potter, 2007, or use it combined with other expressions, such as digital exclusion (Selwyn & Facer, 2010).

We certainly agree with these authors: for a better understanding of our topic, we need to abandon any techno-centric approach and any dichotomous vision that can be found in traditional digital divide literature. We would, therefore, need more analytical definition. Nevertheless, as many authors do, in this chapter we will continue using the label digital divide, mainly with regards to its recognizability and its widespread adoption even outside academia, in order to maintain an adequate level of consistency and comparability between different researches, and to keep a shared means of communication with policy makers and activists worldwide.

Similar concerns may appear as a mere theoretical matter, without any practical relevance. On the contrary, theoretical concerns can have deep consequences on the frameworks adopted by policy makers. Adopting a techno-centric perspective (or a dichotomous vision of the digital divide) will lead to projects that will hardly meet their intended users' needs. As Warschauer points out,(the) same types of problems occur again and again in technology projects around the world, which too often focus on providing hardware and software and pay insufficient attention to the human and social systems that must change as well for technology to make a difference. (Warschauer, 2003, p. 6)

By addressing such conceptual issues, we have to be fully aware that "Perhaps the greatest gap is the wisdom gap – the gap between the information revolution's inherent complexity and our capacity to comprehend it. We need a multidisciplinary and comprehensive framework for analyzing the information revolution" (Wilson, 2004, p. 36).

For a better understanding of the digital divide, the main elements to be reconsidered are, in our opinion, the following: (a) the widespread dichotomous conceptualization, that juxtaposes information haves and information have nots; (b) a narrow vision of the digital divide itself, that identifies it with mere technological access (or the lack of it); (c) a narrow vision of technology, that identifies ICT with a small set of devices (namely, personal computers) and conduits; (d) a techno-centric and technological deterministic perspective, that under-emphasizes social and human factors involved in technology adoption and usage. As we will see, these points are strongly related to each other.

Before introducing the enabling technology perspective, which in our opinion helps to conceptualize the complex relations between technological, social and cultural factors, we will briefly discuss the preceding points. (a) The dichotomous vision of the digital divides, that juxtaposes (information) haves and have nots, has been introduced at the very beginning of the debate (NTIA, 1995). The have nots model claims technological deprivation and proposes a framework where people are either in or out, (b) implicitly assuming that the only dimensions to be considered are technology availability and access. This leads to oversimplifying frameworks for technology projects (assuming that the only important element is providing technology to people), and to their consequent frequent failures (as described, among others, by Warschauer 2003; Raiti, 2007 Medhi, Sagar & Toyama, 2007). As Dahms (2010) points out,

The concept of the 'digital divide' should be seen as part of the problem rather than as part of the solution. Therefore, the sooner this concept - and with it the binary categories and the 'one size fits all' simplified model of 'development' - is discarded, the better. (Dahms, 2010, p. 440)

Following Warschauer, conceptualizing the digital divide in dichotomous terms "can be patronizing because it fails to value the social resources that diverse groups bring to the table" (Warschauer, 2003, p. 7). More recently, reflecting on the challenges of participatory cultures, with a special focus on young

people in western countries, Jenkins et al. (2009) also refuse any binary dichotomy: "We would be wrong [...] to see this as a simple binary: youth who have technological access and those who do not" (p. 13).

As van Dijk (2005) points out, we are dealing with a "spectrum of access, ranging from those with full access using the best available technology in a mass market, in the developed countries (broadband, these days) to the truly unconnected" (van Dijk, 2005, p. 32). At least with regards to the western world, where there seem to be few barriers to mere technology access, but also in growing areas of so-called developing countries, the have nots category should be integrated with the want nots model, where the so-called motivational access plays a major role. Surely, deprivation and lack of motivation are difficult to distinguish. Nevertheless, some of the categories of non-users introduced by van Dijk (2005) show that access to technology cannot be considered a linear process. The dropout category (firstly studied by Katz & Rice, 2002a & 2002b), for example, describes people who have used the internet in the past, but no longer do so. They have had material access to technology, and may be even still living in a connected household, but stopped using it, mainly due to motivational ("not interesting") or literacy-related ("too hard or complex") problems (Katz & Rice, 2002b, pp. 75–78).

The want nots category identifies people who are not materially deprived, but who are nevertheless excluded from every advantage deriving from internet use. If we were to consider them only from a dichotomous perspective (haves vs have nots), most of them would belong to the haves category, as technology is mostly available for them, especially if they are living in western countries. They are digitally and even socially excluded (for the difference between the two concepts, see Selwyn & Facer, 2010), even if they would be hardly be included in the have nots category. That is why we need a more nuanced model, considering not only technology availability and formal access, but also the wide variety of variables that contribute to real digital inclusion. We will introduce a multilevel model for analyzing the digital divide in the following paragraphs.

For a better understanding of the concept, moreover, we should consider the digital divide as a moving target. (c) We cannot adopt a narrow vision of technology, identifying ICT with a small set of devices (namely, PCs) and conduits. What can be considered as a new technology changes at a dramatic speed, and we cannot limit policy or scholarly interventions to a limited set of technologies. What used to be an important driver of digital inclusion at the beginning of the digital divide debate (dial up internet connections, end-nineties personal computers), for example, constitute today, at least in the western world, the basis for digital exclusion. Today, in western societies, the public debate identifies the digital divide with the lack of broadband connection (Cooper, 2010; Davison & Cotten, 2010; Jackson et al, 2010), while some governments are already studying how to implement Next Generation Access Networks (NGAN) (for a first, influencing research on NGAN, addressing challenges, opportunities and possible business models and project financing strategies, see Caio, 2008). Moreover, we live in the era of Ubiquitous Computing (Weiser, 1993; Greenfield, 2006), where multiple devices guarantee constant connectivity, anytime and anyplace, with a growing importance of mobile communication (see Castells et al., 2007; Katz, ed., 2006). Therefore, our analysis cannot only focus on personal computers, but should also consider every device guaranteeing to its user connectivity, access to information and digital inclusion. Many ICT4D projects, even in developing countries, are nowadays based on mobile communication (and even on the mobile internet, see Castells et al., 2007, pp. 215-243).

If the goal is social inclusion, instead of simply providing hardware and software to target populations, moreover, a wide variety of further technology should be considered. Older technology, such as broadcast media, can effectively be applied for providing useful information to people who do not access

the internet on a regular basis. Namely, healthcare information, education programs, information on agriculture and trade has been broadcasted through television and radio throughout the world.

Furthermore, ad hoc technologies, specifically designed for their intended users' needs, can represent effective solutions for context-specific problems. The Simputer, for instance, represents an example of how ad hoc technologies can meet local needs: its software is designed to facilitate illiterate people using them, adopting an intuitive (and culture-specific) graphical interface and speech-recognition software. An important role in meeting local (social and cultural) needs, indeed, is played by user interface design. The (western) concept of user-friendliness, for instance, cannot be universally applied to every culture in the world: what can appear as completely friendly and intuitive to a western user could sound obscure and counter-intuitive to users belonging to different cultures (on context-specific and text-free user interface design, see Molony, 2007 Medhi, Sagar and Toyama 2007).

Adopting a more nuanced conceptualization of the digital divide, instead of the widespread dichotomous vision (a), refusing to assume mere technology availability or access as the only goals of any digital inclusion project (b), rejecting the idea of universally optimal equipments, that should be provided worldwide (c), refusing any technological deterministic approach: all these points are grounded on the enabling technologies approach, identifying technology domestication processes (Silverstone & Hirsch, 1992; Kraut & Brynin, 2006; Haddon, 2007). Following Silverstone (1999), "Technologies, it must be said, are enabling (and disabling), rather than determining" (p. 21). Technology access is not a priority in itself: it becomes a priority if it enables social inclusion and if it addresses people's needs.

In Keniston's words,

If ICTs are useful at all, it is as a potential instrument in meeting other human, social, cultural, economic, or political purposes […]. Information technologies should be introduced when (and only when) they constitute the most effective available way of meeting basic human needs and fulfilling fundamental human rights. Information and communication technologies can have a positive role in development. But ICTs are neither a panacea nor necessarily the first line of attack in combating poverty, misery, injustice. (Keniston, 2004, pp. 21-22)

RETHINKING DIGITAL DIVIDE AND SOCIAL INCLUSION[4]

Both social inclusion and exclusion are directly connected to the individual's possibilities of having better or worse standards of living, as they indicate the difference in the ability to gain access to material resources and reveal inequalities between social actors in terms of socio-economic status.

The concept of social exclusion generated as complementary to the underclass research studies was carried out by Myrdal (1963) and was immediately included in sociological analysis. Its consideration as an area of intervention for sociological practice implies a shared understanding of what it means to be included within specific social contexts (Paugam, 1996; Borghi, 2002). Both areas of study are related to the rise of the welfare state and the welfare society. Within the general debate on poverty, social inclusion and exclusion are rather complicated to be empirically analysed, since they are based on relational and social categories.

The concepts of social exclusion and inclusion have remarkably evolved over time and refer now to the most important spheres of social life, from the macro-economic to the micro-relation levels. In his research studies on social inequality, Myrdal started to analyse social exclusion by examining the loss of

access to relative prosperity and the end of the aspirations for the future. Wilson (1991), by expanding this setting, created a dichotomous view of social exclusion, focusing not only on marginal economic positions, but also on social forms of isolations; Silver (1993 & 1996) carried out basic comparative research studies on exclusion, based on its opposite, i.e. belonging and participation (social inclusion); moreover, social problems engendered by migration flows have been increasingly addressed (Engbersen, 1995).

Research studies on inclusion have been centered on two specific areas: the individual level (social exclusion or inclusion perceived as failure of the subject; Wilson, 1996) and the social system level (social exclusion or inclusion perceived as a problem faced by state institutions). During the '90s, research studies on the individual level began to analyse not only the subjective socio-economic status, but also the changing perception of inclusion and the sense of unease generated by the label of exclusion (Dubet & Lapeyronnie, 1994). When examining exclusion, particular attention should be given to social isolation, a phenomenon that has a double effect on identity: it reduces social contact and/or limits relations to a small circle.

Dynamics of social inclusion/exclusion aim to analyse the impact that these processes have on the most basic dimensions of social life (Bourdieu, 1980). The integrated analysis of exclusion from fields such as political participation, cultural practices (understood as patterns of behaviour and socially recognized values), and the labour market is an important challenge for sociological investigation. Today, social inclusion presents itself as a multidimensional concept that affects different spheres of individual sociality: therefore, it is not only related to economic resources, but also to the quality of social relations, the degree of cohesion and the sense of belonging to a community (Phipps, 2000).

Contemporary research studies divide social inclusion into five categories (personal, social, cultural, political and economic inclusion) that can provide emotional and material resources; without them, the subjects could be significantly disadvantaged in terms of quality of life (Bourdieu, 1986; Lin, Cook & Burt, 2001). ICT constitutes an essential inclusion tool, for at least three reasons: it provides the above mentioned resources; it allows people, who are potentially at risk of exclusion, to make up for the shortage in the categories above; it affects both the macro-social and the individual sphere (Durieux, 2003). It should be emphasised, though, that individuals can experience different degrees of social inclusion in their lives and deal with some of the five categories at different life stages and for longer or shorter periods of time (Abrams, Hogg & Marques, 2005).

The strong link between ICT and social inclusion in contemporary societies has been analysed by wide ranging literature covering politics, culture, education, labour market institutions, social relations, physical well-being (Cummings & Kraut, 2002; Selwyn, 2004; Selwin & Facer, 2007). According to Van Dijk (2005), people that are excluded from the digital world, and thus excluded from the participatory perspective, are destined to become second- or third-class workers, students, or consumers. If these premises are taken into account, providing an adequate access to ICT becomes one of the main tasks for governments in contemporary societies. This could ensure a growing number of individuals the beginning of a virtuous process of inclusion and, more importantly, the experience of a social inclusion "diet", which could allow them to find their own way to take part in social life. On the contrary, the inability to exploit these technologies condemns the individual to a process of progressive social exclusion (Castells, 2001). In the case of the European Union, the Riga Declaration emphasises the importance of ICT for social inclusion as well as the need to expand its access as an essential part of the fight against exclusion.

Social inclusion is determined by a number of factors, which can be analysed from different perspectives, as in the case of studies on education, social welfare, and social psychology. Moreover, it is complicated to clearly separate the above-mentioned categories, since they often influence one another,

as in the frequent connections between economic status and personal well-being or between inclusion and culture. Social mobility limitations, especially from an economic and educational perspective, have a major role in exclusion processes, mainly if associated with other variables such as gender and urbanization levels. Marginalization and exclusion related to socio-economic status and education are more difficult to overcome than the forms of exclusion that can be experienced in other fields (namely, social and cultural exclusion), where changes are more likely to happen over the long term (Helsper, 2008).

According to the Oxford Internet Surveys (OxIS), the relations between social exclusion and ICT can be studied using five specific dimensions and using a series of related sub-sectors (Dutton, Helsper, 2007). Namely: personal resources, with three sub-sectors related to health, psychological well-being and individual values; cultural resources, with four sub-sectors corresponding to gender, ethnicity, religion, social generation and language; the social area, divided into two sub-sectors related to relationality and to the scope/range of personal interests; the political area, which includes both civic and political participation; the economic area, divided into sub-sectors such as employment, income, education and urbanization. A sub-sector can be defined as a branch of a large body of research. Sub-factors can explain ICT-related social inclusion only if they are all taken into account; on the one hand, this approach enables scholars to avoid 'access tyranny', understood as a dichotomous assessment of ICT diffusion that only considers the degree of technology access in a given social context; on the other hand, following the five C model in digital inclusion (Bradbrook & Fisher 2004), i.e. connectivity, capability, content, confidence and continuity, such an approach emphasises qualities such as experience, knowledge and individual skills.

While most scholarly work is currently focusing on included subjects, exploring internet diffusion or access, it would be necessary to study subjects who experience a complete digital exclusion, or subjects that are in need of 'mediators' in order to access digital technology (Anderson, Brynin, Gershuny & Raban, 2007). Finally, scholars are sometimes facing intermittent users (van Dijk, 2005): people that use ICT in no continuous way, creating discontinuous contexts of digital inclusion and exclusion (Anderson, 2007).

E-INCLUSION BECOMES, THEREFORE, ONE OF THE KEY POINTS OF PUBLIC POLICIES ON SOCIAL INCLUSION

Besides aiming at reducing isolation and social exclusion (by providing an increasing use of ICT, easier access and increased useful services to customers), these policies will increasingly look at using technology to promote integration and social cohesion (Smith, 2009).

A MULTILEVEL MODEL FOR ANALYZING DIGITAL DIVIDES[5]

In order to operationalize the conceptual framework proposed in the preceding pages, we have introduced a multilevel model for analyzing digital divides, focusing on five main steps (for a broader illustration of the model, see Comunello, 2010)[6]:

1. Technology availability (or formal access).
2. Real access.
3. Reception practices.
4. Technical skills and content production.
5. Networking skills.

As the internet becomes part of our everyday life (Wellman & Haythornthwhaite, 2002), formal access (technology availability, at the micro and macro levels) has to be considered, to some extent, a prerequisite, but it does not guarantee real access (the second level of the proposed model), as shown by the already mentioned *dropout* category (people with formal access who stopped using the internet, Katz & Rice 2002a & 2002b; van Dijk 2005). In fact, while macro-level formal access can be considered as a prerequisite, micro-level formal access derives from a mixture of macro-level conditions, socio-economical considerations and motivational elements (van Dijk, 2005), the last being strongly related to the following steps of the proposed model. Van Deursen and van Dijk (2008), for instance, while introducing a multilevel model including material access, motivational access, skill access and usage access, underline its cumulative and recursing nature. Surely, these characteristics also apply to our model.

For technology to really make the difference, anyway, even real access is not enough. This is particularly true if the main goal of any technology project is not technological availability itself but, instead, social inclusion.The third level of the proposed model focuses on the skills that are related to reception practices. To effectively use new media, a large variety of competences are involved, including not only traditional literacy (reading and writing), but also information processing, multi-tasking, hypertextual reading, multimedia reception.The fourth level introduces the skills involved in production, both referring to technical skills (software programming) and to content production skills, that are showing a rising importance in relation to the growing attention surrounding *user-generated content*, grassroots information, etc.

Finally, the fifth level refers to the vast field of computer-mediated-communication, and to the ability to use technology to interact with other people for personal, political, economic purposes, for knowledge creation and dissemination, or for maintaining long distance ties. While the increasing popularity of social network sites (boyd & Ellison, 2007; boyd, 2008; Lenhart, 2009) shows that there is a growing interest in articulating and managing digitally-mediated social relationships, networking skills do not only apply to such kinds of platform: they refer, instead, to the broad variety of technologically-mediated environments that enable social relations (including synchronous and asynchronous platforms, such as email, chat and instant messaging, etc.). Following Rheingold (2002), "A new kind of digital divide ten years from now will separate those who know how to use new media to band together from those who don't" (p. xix).

As we will see in the following paragraph, the third, fourth and fifth levels all refer to different aspects of the broader concept of new media literacy that represents one of the core elements for fostering social inclusion through digital media.

NEW MEDIA LITERACY AND DIGITAL INCLUSION[7]

For digital technology to really make the difference, from a social and cultural point of view, formal and effective access is not enough. What really matters is how people use technology, what purposes are ICTs used for, users' awareness levels, peoples' ability to fully participate to information society (or to participatory culture, Jenkins et al., 2009), in broader terms. Advanced reception practices (our third level), technical skills and content production (our fourth level) and networking skills (the fifth level) all need high levels of what has been defined as *new media literacy*.

While techno-enthusiasts have tried to separate digital skills from the traditional meaning of literacy (arguing that for twenty-first century society traditional alphanumerical skills tend to lose their importance), new media literacy also includes traditional competencies. Following Jenkins et al.,

New media literacies include the traditional literacy that evolved with print culture as well as the newer forms of literacy within mass and digital media. Much writing about twenty-first century literacies seems to assume that communicating through visual, digital, or audiovisual media will displace reading and writing. We fundamentally disagree. Before students can engage with the new participatory culture, they must be able to read and write. (Jenkins et al., 2009, p. 19)

In fact, for people to acquire a full citizenship in our society, the very concept of literacy has to be reconsidered, also including digital literacy. Indeed, the set of competences commonly defined as new media literacy should be identified with a broad definition of "twenty-first century literacy" (Jenkins et al., 2009, p. 20).

The importance of new media literacy has been underlined both by scholars adopting a *second level digital divide* perspective, and refusing dichotomous models (Di Maggio & Hargittai, 2001; Hargittai, 2002; Warschauer, 2003; Selwyn, 2004; van Dijk, 2005; Warschauer, 2006; Dunn & Johnson-Brown, 2007; Hargittai, 2008; Dunn, 2010) and by digital media scholars focusing on young people's attitudes towards technology and proposing media education as a central element of any educative process (among others, Livingstone, 2003; Buckingham, 2003; Jenkins et al., 2009, Livingstone & Helsper, 2010).

Van Deursen & van Dijk (2010, pp. 280–281) underline that little scientific research has been carried out on the topic; most of it has been realized in small educational contexts, asking interviewees to self-assess their skills. From the few large-scale empirical researches, however, emerge "dramatic differences of skills among populations, also among populations of countries with broad new media diffusion" (van Deursen & van Dijk, 2010, p. 281).

As we deal with a constantly changing environment, it is hard to identify a specific set of competencies that constitute the core of new media literacy. Considering the growing importance of user-generated content, for instance, so-called web 2.0 (O'Reilly, 2005) is surely shifting the focus from mere reception practices and technical skills to content production skills, while the increasing popularity of social network sites and computer-mediated-communication environments (growingly used in personal and professional relations), is emphasizing the importance of networking skills. Scholars have tried to introduce operational definitions of digital literacy: while there is an overall agreement on macro-categories, we are still looking for a shared definition of a concept that is at least partially co-evolving with technological and social innovation.

Warschauer (2003) suggests that the main skills needed to work with computers and the Internet are the following: computer literacy (a term that appears to be oversimplifying), information literacy (a variety of skills in manipulating information, involving both technical skills and broader competencies), multimedia literacy, computer-mediated-communication literacy. Dunn & Johnson-Brown (2007) define information literacy as the variety of skills needed to retrieve, access, critically evaluate and effectively use information. Van Deursen & van Dijk (2010) propose a framework including:

- **Operational Skills:** The skills to operate digital media;
- **Formal Skills:** The skills to handle the specific structures of digital media, such as menus and hyperlinks;
- **Information Skills:** The skills to search, select and evaluate information in digital media;
- **Strategic Skills:** The skills to employ the information contained in digital media as a means to reach a particular personal or professional goal. (van Deursen & van Dijk, 2010, p. 281).[8]

While preceding authors mainly focus on new media consumption and on computer-mediated-communication, Livingstone also emphasizes information production. Following her perspective, media literacy can be defined as "the ability to access, analyze, evaluate and create messages across a variety of contexts" (Livingstone, 2003, p. 3). In Livingstone's words, information production was a key element even in (traditional) media literacy, because through it people acquire a better understanding of the medium. Moreover,

The internet par excellence is a medium which offers hitherto unimagined opportunities for ordinary people to create online content. To exclude this from a definition of media literacy would be to greatly under-utilize the potential of the internet for the public. (Livingstone, 2003, p. 3)

Focusing specifically on (Western) young people's awareness of participatory culture, Jenkins et al. (2009) suggest that digital literacy should not only include traditional literacy, but also technical skills ("They need to know how to log on, to search, to use various programs, to focus a camera, to edit footage, to do some basic programming and so forth"). Like Livingstone (2003), Jenkins et al. underline the continuity between traditional (mass) media literacy and new media literacy: students should "acquire a basic understanding of the ways media representations structure our perceptions of the world" (Jenkins et al., 2009, p. 20).

Jenkins et al.'s, definition of participatory culture[9], in fact, includes elements that deal with the fourth and the fifth levels of our proposed model: (digital) content production and technologically-mediated social relations are core elements of contemporary culture. Therefore, twenty-first century literacies do not only include the competencies listed above: they "should be seen as social skills, as ways of interacting within a larger community, and not simply an individualized skill to be used for personal expression" (Jenkins et al., 2009, p. 20). According to authors, core media literacy skills can be summarized as follows: "play, simulation, performance, appropriation, multi-tasking, distributed cognition, collective intelligence, judgment, transmedia navigation, networking, negotiation" (Jenkins et al., 2010, p. 56).

Some scholars have repeatedly emphasized young people's *innate* digital skills, rhetorically opposing a new generation of *digital natives* with former generations of *digital immigrants* (Barlow, 1997; Palfrey & Gasser, 2008; Prensky, 2001; Tapscott, 1998 & 2008). They assume that digital natives can acquire these skills naturally, on their own, without any adult intervention. In fact, recent empirical research has shown great skill divides even among young people, underlining that the acquisition of a high level of new media literacy is hard to obtain without any guidance; moreover, adults and teenagers share a wide range of new media usage practices (Bennet, Maton & Kervin, 2008; Buckingham, 2008; Herring, 2008; Ito, 2008; Margaryan & Littlejohn, 2008; Lenhart, 2009; Jenkins et al, 2009[10]). The above mentioned skills are complex and cannot be acquired naturally. Beetham, McGill & Littlejohn (2008) propose a *learning literacies* framework, encompassing "the range of practices that underpin effective learning in a digital age" (Beetham, McGill & Littlejohn, 2008, p. 8), addressing a set of competences that are

continuously changing. Jenkins et al. (2009) and van Dijk & van Deursen (2010) propose effective means to overcome digital skill divides, even among young people, in order to broaden digital inclusion and strengthen twenty-first century participatory culture.

MEASURING THE DIGITAL DIVIDE[11]

Empirically studying the digital divide appears to be highly problematic. First of all, the digital divide has different consequences in different parts of the world. Secondly, while it is relatively simple to measure technology availability, it is far harder to produce reliable measures for levels three, four and five of our proposed model.

As technology availability has to be considered a prerequisite for further levels of digital inclusion, monitoring ICT penetration worldwide, using quantitative methods (Chinn & Fairlie 2006 & 2007), is surely a priority. On the other hand, however, a deeper understanding of digital inclusion, especially in developed countries, requires in-depth studies, based on qualitative approaches, about individual or group non-inclusion (Hargittai, Robinson & DiMaggio, 2003; Wilson, Wallin & Reiser, 2003). As we have seen in the preceding paragraph, providing a precise definition of digital literacy is a particularly complex task. Even more complex is measuring people's literacy levels. Similarly, the very concept of digital inclusion is hard to define and measure properly. In the following paragraph, we will review some empirical methods for studying the digital divide, focusing on approaches that adopt complex frameworks for analysing the digital divide, thereby refusing any dichotomous vision of the topic.

It is certainly not easy to understand how these technologies expand worldwide, how they fit in different social contexts, which differences between countries they further, nor it is easy to understand what phenomena of cultural, social or economic convergence are in place. Most of the research studies carried out so far (strongly affected by the data available) consist of descriptions of (a) ICT diffusion, (b) specific issues affecting disadvantaged countries (such as the diffusion of telecenters and internet points), (c) and innovative/successful local projects.

Such analysis has failed to identify a standardized definition of the digital divide. Moreover, over fifteen years of investigation have shown that different social systems relate to ICT differently: each country seems to follow its own way of approaching technologies. This is not only due to various social or economic reasons, but also to the influence of a heterogeneous set of variables including demographics and different geographical environments. We are therefore forced to study two hundred countries with two hundred different ICT diffusion experiences: often, interesting research studies are reduced to a fragmented description of initiatives that are not always successful or completed (Wilson, 2004). Rather than pursuing a 'standard recipe' for the analysis of the digital divide, we need instead a flexible framework that can be adapted to different backgrounds and experiences based on a unique research methodology; such a framework is to be used both operationally and comparatively in the analysis of ICT diffusion (Anzera, 2005).

As far as the first (merely quantitative) approach is concerned, Calderaro (2010) specifies the main techniques to study ICT availability or access. He refers to the following variables: number of Internet users, Internet Penetrator Index (number of internet users compared to the population of a country), relations between GDP per capita and number of Internet users, geographical distribution of Internet Hosts, distribution of Internet Protocols (IP). While these procedures may be able to analyse certain phenomena related to the digital divide, a great deal of criticism can be raised against the deterministic

idea that a rise in technology access is enough for the digital divide to be bridged. Moreover, it would be legitimate to raise doubts on both the validity and the methodological relevance of some of the data considered (Alampay, 2006; Cammaerts, Van Audenhove, Nulens, G. & Pauwels, 2003; DiMaggio, Hargittai, Celeste, & Shafer, 2004; Hargittai, 2003; Warschauer 2003).

Indeed, in digital inclusion research, this approach proved to be too simplistic; due to the multidimensionality of the concept, a research study on the digital divide needs to be carried out in conjunction with other social and economic indicators of social malaise. Barzilai-Nahon, Gomez & Ambikar (2010), for example, proposed a conceptual framework for detecting the digital divide, known as ICI (Integrated Contextual Iterative approach), that is based on the integration of several variables and the contextualisation of ICT in a given social context. This approach proved to be particularly useful in identifying unique factors that have a high impact in a particular social system, emphasising the importance of certain variables over others.

Following Wilson and Wong (2007), the digital divide should no longer be considered as a *neutral* process, that only depends on technology access; on the contrary, it has to be related to negotiations and political discussions. Their approach, known as NTN (Negotiating The Net), assumes that ICT policies are essential for evaluating the expansion of ICT and the increased use of the internet in various social contexts. The term negotiation, as understood by Boyer et al. (2005), defines an interaction between multiple parties in which a number of heterogeneous actors try to reach a mutual agreement on a matter of common interest. The actors involved can be very different, representing not only government institutions, but also economic, bilateral, multilateral institutions, NGOs, research institutions, etc. There are of course many other important variables related to these processes, such as technological progress, GDP per capita, existing infrastructures, education level, etc. Nevertheless, according to NTN, the first element to be considered, in order to explain the spread of ICT, is the political one, to be understood as government action (e.g. the implementation of policies that can facilitate access to technologies).

NTN is not the only approach to consider political variables as central. The World Bank and USAID have long recognized that the crucial element to be taken into account when examining ICT diffusion rates is indeed political action. Nevertheless, NTN creates a framework for the analysis of negotiations, known as CNI (Critical Negotiation Issues), which, to date, is not taken into account by any other similar approach. This framework does not only guide scholars in conducting individual case studies, it also enables them to look at different research studies in a comparative manner. CNI establishes a number of issues with which each country, sooner or later, will be faced with; it also includes issues that are expected to affect the actors involved in the negotiations. Depending on how they are addressed, these issues are supposed determine how ICT will spread in a given country. The CNI framework consists of four main categories (public policies, access, national models for ICT development, key technologies in development processes). They correspond to strategic issues of major importance, in which twelve critical categories are contained: public policies relate to privatization, liberalization and market regulation; the access category is linked to issues concerning the monopoly of prices, as well as access regulation (access restrictions) and physical access to ICT; the national model of ICT development is related to the ICT integration strategy in the development process of a country and is connected to the following: the degree of adhesion to Information Society, universal access to ICT, the ability to set up consistent policies and their implementation. Being very much in use in the context of developing countries, the CNI structure highlights relevant socio-political aspects, in comparison with the old models known as "technology first".

These two examples show that the digital divide can be understood only if considered as one out of various aspects of social inequality, and not as an isolated factor; the analysis of the digital divide must therefore be supported by other social, economic and political variables and must not only be related to technology access and its deriving benefits (Mossberger, Tolbert & Stansbury, 2003).

This empirical pattern is also valid for the analysis of the dynamics of social inclusion and digital inclusion. As mentioned above, Van Dijk (2005) proposed a research scheme that identifies four main areas: *motivation, material, skills and use*. Following such a framework, analysing digital inclusion means addressing multiple social issues, without limiting the analysis on single ones. The analysis of the *motivational* sphere, for instance, examines the reasons that lead a person to use ICT and, at the same time, helps to identify the motivations that make individuals refuse using such technologies; the *material* sphere is divided into physical access to digital technologies and conditional access, involving elements such as fees, passwords, belonging to an organization, etc; *skills* deal with competence degrees in the use of ICT; lastly, the *use* dimension examines factors such as time, number of applications used, use of broadband and possible creative/active use of the Internet. This pattern may foresee the presence of other variables which may be of interest in studies on digital inclusion; such factors can be the quality of internet connections, the identity of the subject, the self-perception of their skills in handling ICT (Eastin & La Rose 2000), the ability of applying to ICT skills that are not directly technology-related (transferable-skills), the location from which people access technology (Helsper, 2008), the protection of their data over the Web, the anxiety related to ICT use (Durndell & Haag, 2002).

Research studies carried out in the past, as well as more recent investigations, suggest that the empirical analysis of the relation between social inclusion and digital inclusion can be achieved only by working on a multidimensional basis. The use of such an approach is motivated by the urgency to assess and address the issues related to the digital exclusion, as its effects may become increasingly harmful; contemporary societies, reflecting Merton's 'Matthew effect' tend not only to favour those who experience a stronger digital inclusion, but also to further implement their potential. Therefore, using multidimensional methodologies ('beyond technology access') is essential if we are to avoid a dangerous enlargement of the *digital-inclusion divide.*

FUTURE TRENDS[12]

As we have seen above, new media literacy is an essential point to overcome the so-called *second level digital divide*. New media literacy is a moving target, constantly evolving according to technological and social innovation. Participatory cultures, for instance, request a more complex set of competences than previous digital environments. In the preceding paragraphs, we have introduced a multilevel model for analyzing digital divides. According to the recent literature reviewed above, levels four and five are acquiring a growing importance.

For a better understanding of the social and cultural issues involved in digital inclusion, we need a *flexible* definition of new media literacy that should be able to evolve consistently to technological innovation, without losing the analytical detail needed to design appropriate new media education interventions. Moreover, we need more research on this topic, in order to better identify (and quantify) the digital skills divide, covering context-specific, age-specific, cultural-specific divides. We also need to experiment and evaluate digital literacy programs, in different contexts and adopting different methods, to define the most appropriate ways to define the basis for a broader digital inclusion.

Finally, we need to better integrate multidimensional theoretical frameworks and empirical research; we need to experiment and evaluate complex research methods, based on the theoretical frameworks proposed above. We need to further develop empirical research on digital inclusion, integrating quantitative and qualitative approaches, in order to acquire a deeper understanding of the phenomenon; and we need to formulate more specific hypothesis and research questions, in order to empirically verify and validate such theoretical frameworks.

CONCLUSION

If we adopt an enabling technology perspective, emphasizing social inclusion instead of digital media availability, and refusing any dichotomous vision of the digital divide, we need to adopt multidimensional frameworks for analyzing the digital divide. New media literacy, indeed, plays a major role in fostering a full and effective access to digital technology, contributing to digital inclusion.

From the perspective of social inclusion, digital inclusion is a matter of great importance on which public policies will be remarkably focusing in the near future; indeed ICT, by improving the quality of life of some subjects, increases the marginalization of other individuals or social groups. Nevertheless, social exclusion and digital exclusion, although apparently destined to coincide in the long term, are not the same thing. Social inclusion, in fact, can not be only determined by a wider access to technology, nor can digital inclusion be analysed separately from other factors that contribute in creating either social welfare or marginalization. When studying the digital divide, we need to take into account the links between ICT diffusion and a series of social, economic and political aspects of society. Similarly, the evaluation of digital inclusion requires considering multiple aspects, such as community context, financial resources, domestication strategies, socio-cultural variables, and ICT availability and use.

There is no magic formula to examine the relation between ICT and social inclusion; only an integrated approach, taking into account the specific characteristics of the addressed social groups, can highlight relevant aspects of this phenomenon.

KEY TERMS AND DEFINITIONS

Enabling Technologies: Technologies that enable a wide range of Information Society services or activities, contributing to address people's needs.

Label of Exclusion: A process involving young people that are subjected to cultural exclusion and experiencing alienation and low self-esteem.

Networking Skills: The skills involved in using technology as a tool for communication and social relations (e.g.: using technology for interpersonal communication, or to build and manage social networks).

New Media Literacy (or Digital Literacy): The ability to use new media (or digital media), with regard both to reception practices and to active content production and distribution.

Qualitative Research Approach: Research method based on the idea that social phenomena can be studied gathering and analyzing information in as many forms, chiefly non-numeric, as possible. It tends to focus on exploring, in detail, small numbers of cases that are considered interesting or illuminating, and aims to achieve 'depth' rather than 'breadth'.

Quantified: Measured, expressed numerically and analyzed with statistical methods.

Quantitative Research Approach: Research method based on the idea that social phenomena can be.

Social Divide: The observation of the hiatus between the information rich and poor in each nation.

Technology Availability: The opportunity, at a micro or a macro level, to materially access technology at reasonable prices, whether at home, at work, at school or in public places (public institutions and/or commercial outlets).

Chapter 20
"Virtual Reality" Reconsidered

Garfield Benjamin
University of Wolverhampton, UK

ABSTRACT

The term 'virtual reality' is used widely in contemporary culture to evoke the false worlds of the imagination digital technology has enabled us to create. However, the term itself remains ill defined, particularly amidst recent developments in theories of virtuality and reality that have left contradictory marks on VR. The phrase 'virtual reality' has become problematic, and is in need of a reconsideration for its continued relevance. This chapter assesses the term throughout its development and in the context of other theorisations such as cinema and cyberspace that have dominated recent digital theory. Taking the Deleuzian expansion of the Virtual and the Lacanian expansion of the Real, the chapter interrogates the constituent processes of VR to suggest a new mode of conceiving the technologies in terms of a parallax between virtual-real and physical-digital within contemporary thought, which will then be applied to a conceptual framework for digital creative practices.

INTRODUCTION

Within the many varied, and often incongruous, theories of digital technology and its culture there are two strands of the discussion that have emerged in which the very terms of the field are challenged. These are centred on the problematic notion of 'virtual reality' that has dominated cultural depictions of the digital world, usually taking either 'virtual' or 'real' in an expanded definition to draw out a deeper understanding of the fundamental differences, connections and interdependency between physical and digital spaces. Digital media has called into question the appearance of 'reality', forcing all theories of contemporary culture to take into account the possibility of other spaces with which the (physical) human subject can engage. There is a need to expand and intersect current discussions of the relation between virtual and real by exploring the antagonisms that arise through developing both sides of the term. This chapter will therefore readdress the term 'virtual reality' in the context of ongoing debates in philosophy, technology and creative practice in a discussion of subjectivity in contemporary digital society, to insist on a constant re-evaluation of the terms used in such a discussion and their ramifications for its application in digital media and creative technologies.

DOI: 10.4018/978-1-5225-3822-6.ch020

The expansion of the term 'virtual' often takes into account the definition developed by Gilles Deleuze (2004a; 2004b) as a surface that is not actual but with which the subject can engage. This has been applied to digital media as an alternative to the conflation of 'virtual' as 'digital', as is implied in the labels 'virtual reality' or 'virtual worlds', to instead connect the fluidity of digital surfaces to consciousness in a relation consistent with other generative effects within the structures that form the idealist element in Deleuzian philosophy. Anna Munster (2006) emphasises the role of affect by placing the virtual as a part of the materiality of the digital. While this work and others take important steps towards establishing the problematic of embodiment, the focus on the materiality of the digital obscures its relation to consciousness and leads back into limited use of the term 'real'. There is a clear Deleuzian influence in Munster's work, and both Deleuze and Félix Guattari are referenced heavily in relation to the virtual, as well as notions of flow, diagram and time. Between the two expanded terms, however, there remains little crossover in current literature. Rob Shields (2003), Brian Massumi (2002) and Andrew Murphie (2002), for example, all utilise the Deleuzian virtual while persistently conflating it with the digital, and largely fail to mention the real outside of its direct and 'common sense' connotation of the physical.

How the individual relates to the plethora of potential realities available in contemporary society and its philosophies (physical, digital, social, semantic, oneiric) can be understood in redefining the term 'real' according to Lacan (1977), particularly as applied to cultural phenomena by Žižek (2008a). Writers such as David Gunkel (2010) have furthered this notion, drawing out the real across physical and digital worlds as the hidden causality (for example, quantum wave functions, DNA or bits of computer code) that underpins the appearance of objective reality. This real is inaccessible and terrifying, embedded within the psychoanalytical construct of contemporary subjectivity. Throughout the field, the antagonism between virtuality and reality persists as a theoretical pariah between physical and digital reality, media and creative processes. Žižek's (2012) own discussion of the matter simply places Deleuze's virtual as Lacan's real. While acknowledging the importance of the reality of the virtual opposed to 'virtual reality', Žižek confuses the nuances of the two processes within consciousness and their functions in the generation of contemporary subjectivity, creativity and society. The antagonistic relation between the real and the virtual, in the expanded sense of both terms, will form an integral method of analysis throughout the chapter, and reconciling Žižekian and Deleuzian philosophies will provide an informative step towards understanding the relation between virtuality and reality.

This chapter will separate and explicate the two expanded terms, defining the Real as the presupposition governing the way reality 'really' appears to us and the virtual as the forces outside of actualisation that nevertheless impact upon reality. From this theoretical exposition, a discussion can be raised concerning the redefinition of our relation to digital technologies under such terms. Digital media in general and virtual reality in particular are commonly associated with processes of simulation. Indeed the phrase 'computer simulation' dominates the lexicon of many technological applications with a focus on representing the physical world within digital space. However, in the context of this expanded set of terms, the digital appears as a simulation-of-simulation. That is, where simulation is, according to Baudrillard (1994), an appearance with no link to reality, the appearance on the computer screen is precisely defined by the reality of computer code.

This turn – in which digital space can stake at least an equal claim to reality as the physical universe amidst the breakdown of material certainty seen in quantum physics, genetics and poststructuralist linguistics – enacts an ontological levelling between physical and digital worlds, and in particular their manner of appearance to human subjects. Both of these processes are present within physical and digital worlds, necessitating a separation of the virtual from the digital and the real from the physical, towards

a consideration of the shifts between spaces that construct contemporary subjectivity. This shift will be explained according to Žižek's (2009) ontological notion of parallax, applied to the differences between physical and digital worlds, in order to theorise a creative and subjective application of digital technologies. When both terms, virtual and real, are viewed in their relations to one another occurring within consciousness, it is their differing modes of assemblage that defines the parallax of the digital. This is based on the manner of subjective presupposition underlying each 'reality': matter for physical, code for digital. Levelling these realities enables freer modes of discussion to emerge across cultural artefacts in physical and digital media, constructing a critical space for a more open debate of the creative application of digital technologies.

The chapter will thus form a critical overview of past and current discussions of virtual reality in the field of digital media, suggesting innovative modes of interrogating the creative potentialities of digital media. While the discussion will focus on the role of VR in relation to the individual consciousness, as a creative extension of thought and alternative realm for the mind to inhabit, VR exists also as a site of potential social exchange. The critical and creative use of VR, however, extends beyond the mere interaction between individuals that constitutes the social arena. The multiplicity of a collective assemblage of creativity demonstrates the same fundamental relations as the internal assemblage of the individual subject across physical and digital worlds. The discussion will therefore apply the individual subject to a collective subject of enunciation of a potential future post-individual society whereby VR offers new spaces of blurred boundaries for minds to move freely and for creative potential to emerge between individual consciousnesses. This will draw towards concluding remarks that offer a new definition of virtual reality, a challenge to established modes of thinking digital media, and a call for a constant re-thinking of the terms with which we construct our engagement with digital technologies within our subjective position between ever more permeated virtual realities.

ORIGINS AND DEVELOPMENT

In order to assess and reconsider the position of virtual reality today, and its impact on future directions for technological innovation, artistic creation and thought, the development of the term and its scholarship must first be traced in a critical history of VR as a technology and virtual reality as a term. While there were pre-digital attempts at constructing mechanical immersive displays, the beginning of this history as a working VR technology using computers rests in 1965 with Ivan Sutherland's revolutionary, if unwieldy, 'Sword of Damocles' project. While not labelling his device as VR, Sutherland described a vision of the potential for this new technology:

A looking glass into a mathematical wonderland…There is no reason why the objects displayed by a computer have to follow the rules of ordinary physical reality…The ultimate display would, of course, be a room within which the computer can control the existence of matter. (Sutherland, 1965, pp. 506-508)

The aim was to create not replications of physical space, nor even imaginary worlds, but the rearrangement and redefinition of reality itself. Despite this revolutionary vision, it took over twenty years for the term virtual reality to emerge, coined and popularised by Jaron Lanier in the mid-1980s (Heim, 1998, p. 16). Where Sutherland had emphasised control over matter, Lanier's focus was on the mind, resulting in an image of VR as part of the increasing array of computerised communication tools, specifi-

cally for the sharing of the imagination in multisensory, immersive constructs (*Ibid.*). The ontological implications of VR were first considered directly by Michael Heim in *The Metaphysics of Virtual Reality* (1993), which sought to define this "new layer of reality" (p. 118). While the terms virtual and real are not developed beyond the simple opposition of digital and physical, the various constituent processes, potentialities and perils of VR are situated in the text's position regarding VR technology's early development. Heim's placing of the virtual as a supplementary or expanded dimension of conventional reality echoes the early work in cybernetics, which sought to expand human intellect (Ashby, 1957; Licklider, 1960; Engelbart, 1962), drawing some initial remarks on the impact of VR technologies in redefining our modes of thinking.

However, the ontological expansion of VR remained in the minority, as futuristic visions of technology were quickly subsumed by practical application. Increasing availability led to an interest in VR from not only technologists and theorists, but from the finance and entertainment industries. Howard Rheingold's text, *Virtual Reality* (1992), displays this tension, with an optimistic outlook on the use of the technology limited by reducing the manipulation of matter to staging physical reality (in, for example, surgery or particle physics), reducing creative expression to its entertainment value. Further work on the nature and impact of VR technology appeared in texts by, for example, Alan Wexelblat (1993) and the National Research Council (Durlach & Mavor, 1995). In this latter text, "some psychological considerations" (pp. 93-110) focuses on the nature of control, reducing the human to an operator, and the construction of telepresence, reducing subjectivity to a measure of 'realism' against illusion, in technologies designed largely for communication over creativity. While the collection does acknowledge the need for studies of human behaviour and the implications of VR on social structures, the project of scientists serving industrial and governmental aims creates the impression that any such developments would be rapidly patented and/or weaponised.

These developments in technology and our conception of it were drawn swiftly into the exploitation of VR by business (in, for example, Thierauf, 1995; Chorafas & Steinmann, 1995) to improve communication and productivity through the manipulation of the mind by corporate interests: not a cybernetic expansion but a machinic reduction of humans to productive devices, a lasting stain on the evolution of the virtual. This reductionist tendency, of both VR technology and its relation to human users, is furthered in Frank Biocca and Mark Levy's collection (1995), which focuses on VR as "a tantalizing communication medium" (p. vii). While this simply places the virtual as a digital space of whimsy opposed to physical Reality, it recognised the limitations of VR technology of the time, with its "look and feel of a prototype" (Biocca, Kim & Levy, 1995, p. 13), and highlighted the constant need for innovation, even placing the early VR dream as an unachievable goal, a "techno-Godot" (*Ibid*.) for which we will always be waiting. While this is framed in a discussion of VR as an entertainment tool, the consideration of social implications overtly introduced the role of desire in our relation to VR, shedding a critical light on the earlier vision of Sutherland as the constant striving by humanity for control over the reality in which it resides.

The first critical reconsideration of the term appeared in Heim's later text *Virtual Realism* (1998), which criticised the "pale ghosts of virtual reality, invoking "virtual" to mean anything based on computers" (p. 3). Yet he was not attempting to expand or develop the term but, rather, to insist on a purer definition as "a technology, not simply a nebulous idea" (p. 2). Within his "pragmatic interpretation of virtual reality as a functional, non-representational phenomenon that gains ontological weight through its practical applications (p. 220), however, emerges a negotiation of the relation between virtuality and reality. Thus, while this middle ground of 'virtual realism' between techno-utopian idealism and fear of a loss of reality to technology may reduce the conception of VR to a technological position under the

domination of the 'primary reality' of physical human experience (p. 218), Heim's discussion formed an instructive step in discussions of the term, opening up the value judgements of the technology's potential impact. The importance of our social and cognitive relation to VR began to emerge even within the limitation of the label. Heim's bold claim for a definition of "the "real" virtual reality" (p. 6) based on "immersion, interactivity and information intensity" (p. 7) reveals the need to bridge the "intrinsic remoteness from direct human experience" (Heim, 1993, p. 18) with, not only accurate graphical rendering that leads to the techno-Godot of "data idealism" (Heim, 1998, p. 139) lost in a spiraling desire for perfect sensory replication, but new modes of thinking our relation to technologies, further emphasizing their role in shaping human thought.

The lack of expansion of the VR label itself throughout the 1990s – even by Heim, the so-called 'philosopher of cyberspace' (Lovink, 1994) – did little to alleviate the need for Peter Fisher and David Unwin (2002) to state that "although, and perhaps because, 'virtual reality' is a very trendy term, neither 'virtual' nor 'reality' is either well defined or strictly appropriate" (p. 1). Even this criticism of the term, in a text applying VR as a tool for the field of Geography, states the problem but not the solution, settling again on a strictly technological definition: "the ability of the user of a constructed view of a limited digitally-encoded information domain to change their view in three dimensions causing update of the view presented to any viewer, especially the user" (*Ibid.*). The increasing recognition, for example by Richard Brice (1997), of the "interdisciplinary nature of multimedia and VR development" (p. 6), led to a splintering of VR across fields, necessitating the perpetuation of a simple, technological, practical definition that could be applied in engineering and design contexts. William Sherman and Alan Craig (2003), for example, lay out a design-based approach focused on the application of technology with clear aims (a convincing and 'realistic' immersive experience) and a limited consideration of theoretical positions (other than perhaps the informational theory approaches that appear as an unquestioned truth of computer science) in favour of a practical manual. The notion of 'understanding' VR is here the ability to follow design conventions in achieving successful business-serving outcomes, constructed from a view of 'realism' as a debate between a full simulation of physical realism (adhering to all the rules and limitations of our own physical world) and a visual realism that allows for 'magical' occurrences and the staging of imaginary situations (Sherman & Craig 2003, p. 384), referred to as a clearly defined and restricted scheme of the "realism axis…a continuous line proceeding from highly verisimilar to highly abstract" (p. 213) against which the virtual (and VR in particular) can and should be measured.

However, this scientific positivism applied to a practical design mentality demonstrates that even within the constant limitation of the term virtual reality there is a process of contextual specification that results in a variation of its implications and use. This problem had been identified as the increasing tendency towards "as many 'virtual realities' as there are researchers actively involved in VR" (Brodlie et al., 2002, p.7), an acknowledgement by other fields (here Geography) of their problematic interaction with VR due to the interdisciplinary, fragmented and ill-defined nature of virtual reality as a term. However, the response to such issues is often a lowest common denominator of accepted conventions, highlighting but accepting the limited the view of the term(s) outside of their application to specific relevant aspects of other fields. Indeed, the term virtual reality became largely reduced to such a limited scope as a specific technological tool throughout the early 2000s, and by the mid-2000s had become subsumed in the widening array of terminologies and theoretical trends through which digital technology was being discussed. As a unified term, it appeared that virtual reality had lost its impact, after its sensationalist and liberal use in advertising and its fear-mongering distortion in cinema and popular culture (for example, the oft-cited dystopic view of an oppressive future under the machinic regime of

sentient VR in *The Matrix*). The position of VR in relation to these emerging and developing terms must therefore be interrogated before the constituent elements of virtuality and reality can be renegotiated towards a contemporary context.

OTHER PERSPECTIVES

With the general positioning of VR as a specific technology within the increasingly diverse manifestations of digital media, it is necessary to situate the term in the context of other conceptual formulations of the digital against the physical world, in terms of our interaction with, relation to and position between both spaces. The domination of mass media by the cinematic tradition, with its inclusion of the 3-D immersive technologies and photo-realistic computer graphics that could leap developments in VR greatly forward, has entrenched its hegemonic position over explicitly digital media in general and VR in particular. As Nicholas Gane and David Beer (2008) have suggested, VR has never been able to overcome the dominance of the screen (p. 57), not only in terms of the physical necessity of screen-based apparatus but also in terms of the structures of the digitised gaze. Lev Manovich (2001) carries this filmic view further into his theoretical framework of digital media and VR technologies, writing that "with a VRML interface, nature is firmly subsumed under culture. The eye is subordinated to the kino-eye. The body is subordinated to the virtual body of the virtual camera" (p. 83). This reduces VR technologies to a subservient role within interactive cinema, referencing the trend that of the "virtual camera" in computer interfaces that uses cinematic language and techniques as a visual toolkit for digital representation (pp. 80f; 298f), subsuming the virtual and the computer generated images associated with VR under the cinematic process. This fusion of distinct processes within filmic mass media engrains the dominance of cinematic language that limits a new, genuinely digital mode of thinking. Manovich doesn't expand term virtual, but rather conflates virtual with digital[1] and echoes earlier design-based texts by referring to the 'reality effect' as a marker of reference to the physical world. Manovich (2013) repeatedly displays a preoccupation with "view control" (p. 75) and imposing (or constantly reasserting, forbidding any development of new language) a cinematic language on the digital. While he does admit another way of working in, for example games (pp. 193-4), this is placed as secondary to his filmic project as a practitioner and theorist of interactive cinema placing cinema as "*the* cultural interface" (Manovich, 2001, p. 86). Alexander Galloway (2012, p.1) acknowledges both Manovich's influence and limitations, as does Mark Hansen (2004, p. 33) in highlighting Manovich's clear investment in cinema as a theoretical framework. The failing of Manovich's framework demonstrates the wider shift away from writing about VR in itself towards its inclusion as part of 'new media'. While this has, despite Manovich's own limited use of the terms, led to the expansion of the notion of the virtual in VR, as part of the general development of debates concerning the virtuality of digital technologies and cultures, it has diminished the critical attention to VR in general as its own term. The term 'new media' has sought to supplant specific discussions of digital technologies and their social and cognitive uses in an attempt to construct a common language that has succeeded only in a mass conflation and limitation of terms under pre-established fields.

This shift into 'new media theory' has been characterised by an increasing obsession with embodiment. This view is already seen in Heim's (1998) definition of VR in relation to 'virtual realism' focusing on "substituting the primary sensory input with data received produced by a computer" towards a state where "the user identifies with the virtual body and feels a sense of belonging to a virtual community"

(p. 221). This emphasises telepresence and artificial reality incorporating a full body immersive experience detailed and accurate enough to create a suspension of disbelief. This suspension is apparent in Katherine Hayles's (1999) conception of virtuality, reasserting Donna Haraway's position (1985) in an explicitly (digital) technological context, as "the cultural perception that material objects are interpenetrated by information" (Hayles, 1999, p. 13). The focus on the body has penetrated VR in the form of the avatar, the embedding of the gaze into a representation of the human form to replace the lost physical frame in digital space. This system of interface now dominates digital environments such as Second Life, as well as the computer game medium with the third-person view and focus on the avatar in popular MMORPGs such as *World of Warcraft*. Mark Hansen (2006) appears to make some progress in establishing the emerging need to discuss "a fluid interpretation of realms…a mixed reality stage", yet limits himself to "the central role played by the body in the interface to the virtual" (p. 2). This is based on the same error as Hayles in defining the virtual as a filling of (physical) space with information rather than either the creation of new spaces (as is the conventional design/technological view of VR) or a mode of viewing and creating spaces within thought (as is presented and elaborated in this chapter). Anna Munster (2006) makes a conscious and purposeful effort to reinsert the body and affect into the digital, placing virtuality as a part of materiality rather than as a force of framing and function in relation to our perspective on a given world. This work, with its focus on "the point of intersection that digital flows have with issues of embodiment" (p. 24), remains entrenched within the materiality that furthers the dominance of physicality of the digital in any system where embodiment becomes the key concern. This tendency has coincided with the development of new media as a term (see, for example Hansen, 2006), drawing the focus even further away from the specificity of terms such as virtual reality in the fusion of cinematic and embodied gazes as the presiding cultural interface.

There is a clear Deleuzian influence in Munster's work, and both Deleuze and Guattari are referenced heavily in relation to the virtual, as well as notions of flow, diagram and time. While this begins to question and expand the notion of the virtual in virtual reality, it does so only through its emphasis on embodied materiality and the dominance of the 'real' reality of the physical. This move is seen also in the work of Massumi (2002), who engages with a more explicit confrontation with the virtual. Here the problematic role of the body is emphasised in the relation to the virtual, when he writes that "a word for the "real but abstract" incorporeality of the body is the *virtual*." (p. 21). Massumi makes a necessary move into the body as a conceptual tool rather than material object, but adds a series of conflations between the Deleuzian conceptual Body without Organs and the specific physical body; and between the virtual as a function of thought and as digital technology. Within a scheme of the body, the division of virtual and real cannot escape an alignment with physical and digital, and all its attendant hierarchies. Žižek (2012), cultural philosopher of the elusive Lacanian real, is instructive here in the struggle against what he labels the "imbecilic inertia of material reality" (p. 127). We must broaden our scope of the body, and materiality in general, to reconsider the relation of VR to consciousness and subjectivity. A starting point for this shift appears in Žižek's (2009) statement "I never "am" my body" (p. 227), in direct opposition to Maurice Merleau-Ponty's (2002) claim of the body as "our general medium for having a world" (p. 146), an oft quoted trope in scholarship concerning the body and the digital. This entails a move beyond the embodied view of technology as a prosthetic for humanity, in a return to the early conceptions of cybernetics as a tool for expanding intelligence, in the context of this expansion of virtuality and reality as relations of consciousness. As Massumi (2002) describes the postbiological self-modifications of the obsolete body in the art performances of Stelarc, our task is that of "extending intelligence beyond the earth" (p. 99): the positioning of the mind itself as a virtual reality in a physical digital hybrid.

Such a consideration of cybernetics, which underpins the fundamental relation between human consciousness and its extension by both the technologies themselves and the symbolic realms they bring into being, draws into focus the implications of VR as sensory feedback, evident in early conceptions of information processing including a human subject within the system. While stemming from a limiting view of VR, from the fields of design and engineering, the alignment with the early cybernetic vision of expanding the human mind suggests an innate step towards the cyborg subject as a technological posthuman (although perhaps, here and more generally, a cognitive superhuman). By reinserting Sutherland's aim of the control of the human mind (via computer technologies) over matter, we approach what Nick Bostrom and Anders Sandberg (2009) conceive as "intimate links between the external systems and the human user through better interaction…less an external tool and more of a mediating "exoself"… embedding the human within an augmenting "shell" such as wearable computers or virtual reality" (p. 320). Yet this state is not merely applicable in a digital environment, for the same virtuality is present in the physical world. Beyond the confines of embodiment, the embedding of a subjective perspective, demonstrated in VR, within any 'reality' always creates a 'shell' of augmentation, be it a sensory or abstract construct, allowing for interaction with a world through the mediation of thought. By expanding the human mind, we can expand the potential environments with which humanity can interact. Indeed, the lesson of early cybernetics is that we must first rethink the relation of thought to itself if we are to engage with the abstract and alternative worlds that VR could enable (rather than the anthropocentric reality mimicking our own current situation that often dominates VR culture). While this is in danger of recalling the fictional extension of abstract spaces for increasing intelligence exemplified to disastrous consequences in the 1992 film *The Lawnmower Man*, the quest for transcending both the current limits of human thought and the barriers between human and computer, physical and digital, reaffirms the role of VR as a 'techno-Godot'. This constant process of desire for expanding ourselves alongside the development of technology enforces a constant questioning of the terms by which we are operating, thus the influence of cybernetics on VR has and could still assert the need for a rethinking of our relation to such technologies and the spaces they can create.

The impact of cybernetics and the need to reconsider our conceptions of space in VR leads to a discussion of the cultural influence of cyberspace. While cybernetics has suffered a limiting conception as prosthetics (after Haraway and with the need for practical applications such as replacement limbs for the privileged physical human body), and VR has been limited in scope through its connection to specific technologies, cyberspace has undergone the opposite process. Emerging as a term (Gibson, 1984) at approximately the same time as virtual reality, cyberspace has become a greatly abstracted notion that is perhaps itself in need of further reconsideration in a contemporary context. However, while VR's reinterpretation has often been a simplification to enable a more precise use across disciplines, the interdisciplinary nature of cyberspace has been discussed and developed in its cultural role. Nevertheless, simultaneously symbolising the transmission of information across global computer networks and the imaginary spaces with which we envisage contemporary virtuality, cyberspace has, like virtual reality, succumbed to a commodification in advertising and mass media that has rendered its position disparate, imprecise and confused. John Perry Barlow (1996) claims cyberspace as an independent "civilization of the Mind", while Manovich (2001) rejects the notion of a singular cyberspace, stating that "virtual spaces are most often not true spaces but collections of spaces…there is no space in cyberspace" (p. 253), and Don Ihde (2012) suggests that cyberspace is merely "the technological capacity to bring the remote near" (p. 326). The underlying 'reality' of cyberspace is tackled more directly by Žižek (1999), stating that "how cyberspace will affect us is not directly inscribed into its technological properties;

rather it hinges on the network of socio-symbolic relations which always-already overdetermine the way cyberspace affects us" (p. 123). This acknowledgement of the impact of pre-existing structures of culture and thought (for example, the pressures of industry and defense on the development of technologies, or the determination of digital interfaces by the cinematic tradition) suggests a need to *re*think the conditions under which cyberspace is constructed. This is furthered by David Gunkel's insistence on the need to 'hack' cyberspace as a term:

Cyberspace is, from the moment of its fabrication, radically indeterminate. It comprises an empty signifier that not only antedates any formal referent but readily and without significant resistance receives almost every meaning that comes to be assigned to it. (Gunkel, 2000, p. 815)

The term cyberspace itself, as well as its continued and developing use, must be constantly reconsidered. The same applies to virtual reality in its role beyond a specific technology, as the process of creating new and alternative spaces for the mind to inhabit. This relation to the mind spreads from the individual to the collective and indeed to its function within society as a whole. Thus, in order to constantly 'hack' the terms under which the discussion of VR occurs, we must reconceive the framework within which we think such (physical, digital and cognitive) spaces in order to rethink and redefine the role of these technologies in the future of our society.

The position of VR and other computer technologies in society brings into question the availability of and access to such technologies and the inclusion or exclusion of individuals from the emerging cultures surrounding them. The 'digital divide' was first discussed in a series of three reports by the US Department of Commerce (1995; 1998; 1999) that recognised the unequal access to both computer technology and internet infrastructures across various different boundaries and social divisions. The 2003 World Summit on the Informational Society brought the necessity of a resolution to the digital divide to the global arena:

We are also fully aware that the benefits of the information technology revolution are today unevenly distributed between the developed and developing countries and within societies. We are fully committed to turning this digital divide into a digital opportunity for all. (World Summit on the Informational Society, 2003)

While this statement sets out the intention to overcome the inequalities created by computer technologies, the social implications of the massive global increase in technology remain a key division in contemporary society. Such a situation places VR firmly within the realm of the technological 'haves', and any cognitive advantages or conceptual freedoms that the technologies enable remain the purview of an elite few. The causal relation of the technology to such divisions, however, is questionable. The vision of early cyberneticians and VR technologists and theorists is of an improved society, expanded intellect and ultimately control over reality for all human beings. David Gunkel (2003) had again, and in the same year as the World Summit, suggested the need to rethink the conditions and assumptions under which we define these technologies, stating that "the 'digital divide' is originally and persistently plural…there is not one digital divide; there is a constellation of different and intersecting social, economic, and technological differences" (p. 504). This disruption of a simple binary between 'haves' and 'have nots' emphasises the complex integration of technology within society, and the pre-existence of societal inequality that placed the technologies in an always already divided world. We might also extend

these notions to VR itself. There is not one virtual reality (or concept of) for us to access as an alternative space but rather a series of processes, each of which forms a virtual reality in the ever expanding multiverse of subjective experience. Gunkel explains that "it is, then, not a matter of finding the 'right' theory and applying it consistently, but of using theory dynamically to open the 'digital divide' to critical reflection" (p. 517), which again emphasises the need to constantly rethink our relation to and conditions for technologies such as virtual reality. Rather than the establishing of a rigid binary hierarchy, as can be seen in the persistent privileging of the physical over the digital, of 'real' reality over virtual reality, there is at work a hyperbolic expansion of the digital metaverse: an increasingly complex web of access, censorship, ownership and subversion through which humans struggle to navigate. This new mode of plural reality requires a not only new set of technological tools and literacies, but a new mode of consciousness concerning the underlying Reality of contemporary virtual society: a new understanding of our relation to virtual reality.

THE VIRTUAL

The first step in a genuine reconsideration of virtual reality must be a renegotiation and new understanding of its constituent conceptual components. The virtual, often conflated with the term 'digital' in contemporary culture and theory, has received a great deal of attention in expanding its definition and impact beyond and within digital technology. The work of Gilles Deleuze (2004a) has here been of greatest relevance to the field in developing the term as a relation of abstract processes to human thought and its relation to the world. His definition of the term places a strong link to the mental realm of the Idea as "pure virtuality" (p. 349). Deleuze emphasises the virtual as a series of relations within an Idealist construction, suggesting an alternative space or mode of viewing the world built on difference as a process. He further states that, in the passage from Ideal to material, "the actualisation of the virtual… always takes place by difference, divergence or differenciation" (p. 265). Thus conceived, the virtual appears as the manifestation of thought itself, the differential relations that bring specific thoughts into being as the coalescing of an Idea. Within Deleuze's linguistic constructions of society and reality, this virtuality is not a part of the material universe, nor our knowledge of it, but rather an adjacent space of the mind in which consciousness occurs as a process. Therefore, "whatever totalizations knowledge may perform, they remain asymptotic to the virtual totality of *langue* or language" (Deleuze, 2004b, p. 58), that is, no matter how detailed an image of the actual material universe we may strive to achieve, the virtual remains forever approaching yet separate from such a space. Massumi (2002) elucidates this as the limits of consciousness, as a construction of language shaping thought, writing that "it is only by reference to the limit that what approaches it has a function: the limit is what gives the approach its effectivity, its reality. The limit is not unreal. It is virtual. It is reality-giving" (p. 147). This supports and expands Deleuze and Guattari's (2004b) own definition of the virtual as being "real without being actual, and consequently continuous…an "alternative continuity" that is virtual yet real" (pp. 104-5). In this development and elaboration of Deleuze's theoretical position in collaboration with Guattari, there emerges the space, separate from the material world, of a "virtual cosmic continuum of which even holes, silences, ruptures, and breaks are a part" (p. 106). This complete reality in itself, in the space of the abstract and the Ideal, displays the "virtual continuum of life" (p. 122) that forms the differentiating relation of consciousness to the world.

In the relation of the virtual realm of the Idea to consciousness as a linguistic construct,[2] Deleuze and Guattari write that "the abstract machine of language is not universal, or even general, but singular; it is not actual but virtual-real; it has, not invariable or obligatory rules, but optional rules that ceaselessly vary with the variation itself, as in a game in which each move changes the rules" (p. 110). This machinic functioning of the virtual brings it close to the common usage of the term (in, for example, the conventional definitions of VR) as synonymous with digital, but Massumi (2002) warns us "not to confuse the digital with the virtual" (p. 142), and it is in Deleuze and Guattari's placement of the virtual as a process that constantly changes its own rules[3] that we see an overt confrontation with the rigidity of binary logic. Whereas the language of computer code precisely defines digital reality as a necessary condition of its ability to function, the virtual in consciousness acts as the underlying process of abstraction that allows thought to occur as such in free singularities detached from actualisation. The problematic relation between virtual and digital lies in the implications of Deleuze's opposition of the virtual to the real. Shields (2003) states that "the virtual is often contrasted with the 'real' in commonsensical language by many writers who have not paused to examine the implications of the terms they are using" (p. 19), yet Shields himself offers only a one-sided expansion of these terms focusing, as the title of his text suggests, on the virtual under an application of Deleuzian theory to economics and risk, opposing the virtual to the concrete in economics and to the abstract in culture (pp. xvi; 17) while still struggling with an inconsistent conflation of digital and virtual when speaking of online communities and environments. The move beyond the 'commonsensical' has occurred unevenly, searching for a term against which to situate the virtual.

Munster (2006) offers a similarly confusing manoeuvre (p. 90-1), taking the Deleuzian opposition of the virtual to the actual rather than real in contrasting realism to fantasy and the imaginary. While Massumi (2002) also warned against the reduction of the digital from "really apparitional" to artificiality or simulation (p. 137), there is often in his work a conflation of the 'real' with analogue in writing about materiality and physicality. This establishes a clear hierarchy within thought, expressed as the "excess of the analog over the digital" (p. 143) and the structure under which "digital technologies have a connection to the potential and the virtual only through the analog" (p. 138). Massumi even goes so far as to write of the "superiority of the analog" (p. 133), seeming to suggest that the digital is explicitly *not* virtual, but rather that the virtual is inherent to all physicality (and only physicality, or only appearing in the digital as an extension of the physical). While the reality of the digital is computer code (possibility rather than virtuality), our experience of it (the way it appears to consciousness) relies on the shift from static data to information as flow. Here the virtual re-emerges as a function of difference in our relation to the digital world. Munster (2006) opposes "the reductive maneuver [sic] of situating digital technologies as the cause of virtual experiences…in the early cyberculture frenzy surrounding high-end VR technologies" (p. 92), but in separating the virtual processes in both physical and digital spaces she replaces virtual abstraction with the dominance of the actual physical body. In emphasising the role of the virtual apart from its common usage in digital media, Munster, Shields and Massumi bring about a reduction of the virtual to only the physical, and by extension reduce the virtual to one part of the real (in the conflation of real with physical/material). We can oppose this with Haraway's (1992) suggestion that "the virtual is precisely not the real" (p. 325), which displays the counter operation of reducing the virtual (conflated with the digital) to an effect, counterfeit or state of paranoia in which articulation (which can be seen in as the Deleuzian function of the virtual) grinds to a halt. Murphie (2002) operates a levelling effect under a discussion of virtuality, stating that "'everything is real', especially VR. Or real 'enough'" (p. 193). This 'real enough' epitomises the assertion of a limited and familiar view of the real

even within the questioning of reality under new regimes of virtuality. These opposing views all operate through an uneven reduction of the virtual in relation to the real: the virtual as part of the real; the digital as part of the analogue; the artificial against the 'real' physical world; or everything subsumed under an approximate 'reality'. Gane and Beer (2008) highlight this problem of drawing together different theories which place the virtual as simulation (p. 108), as the hyperreal which blurs its boundaries with the real (p. 12). The virtual, in itself and particularly in its relation to discussions of digital technologies (in general as well as more explicitly its impact on VR), requires further consideration and a definition built in contact with an expansion of the real.[4]

This chapter defines the virtual as the role of consciousness in perpetuating itself; the subject as process; the function-function of consciousness in which the subject imagines and posits its own functioning. This function forms an axis of becoming, based on the desire that leads always towards the real, yet never achieves its goal, in what Deleuze would call the virtual as an asymptote or attractor to the real. While this Deleuzian virtual must be taken into account as a function of immateriality operating within the Ideal realm of thought – as the substance of cognition – its position within a schema of real and actual that relies too heavily on objectivity limits its direct transferral onto the terms brought into question across the physical-digital divide. The virtual here is more closely placed as the enunciating position of thought, a "statement of desire" (Deleuze, 2004b, p. 17) for both reality and consciousness of it. Within this structure, the subject "imagines himself to be a man merely by virtue of the fact that he imagines himself" (Lacan, 1977, p. 142). It is the functioning of consciousness that bars the subject from itself. This is the grand illusion of consciousness, covering over the inherent alienation of the subject from itself, concealing the position from which the human subject views a given reality with the surface of consciousness upon which such a reality appears. The virtual thus takes on the role of the big Other, the structure of desire that is always-already in the unconscious (p. 130). This is the predicate for the enunciating subject which exists only within its own symbolic structures of thought. It is the virtual that makes consciousness always-already false and, somewhat paradoxically, enables the subject to conceive of the substance of objective reality that obscures the internal positing of the assemblage of worlds, thus Žižek's (2007) conclusion: "reality always-already was virtual" (p. 193). Indeed, all worlds are formed and all of subjective reality defined by the constant process of desire as the virtual functioning of consciousness. As desire, what Deleuze and Guattari (2004a) define as "a process of production without reference to any exterior agency" (pp. 170-1), the virtual both sustains the illusion of objectivity in relation to the subject and enables the subjective self that "exists only on the basis of the misrecognition of its own conditions" (Žižek, 2008b, p. 73). The virtual is the function-function of consciousness [f(f(…))], its functioning *as such* essential to the assemblage of worlds and the creative formation of subjective reality.

THE REAL

There is still a need to reinsert a rupture between the virtual and the real, to assess the antagonism within the term virtual reality. To do this will first require an expanding of the term 'real'. While the virtual has been elaborated and expanded in the wake of Deleuze, both in itself and in relation to digital technology in general and VR in particular, Gunkel identifies the absence of such consideration for the real:

It is often assumed that the problem with 'virtual reality' – the concept, its various technological deployments and the apparently oxymoronic phrase itself – has been our understanding, or perhaps misunderstanding, of the virtual. The real problem, however, is not with the virtual; it is with the real itself…What is needed is an examination of the common understanding of the 'real' that has been operationalized in these various discussions and disputes. (Gunkel, 2010, pp. 127-9)

There is here the need for a new understanding of the real, and the understanding that is suggested is that of Lacan, particularly as interpreted and applied culturally by Žižek (2009). This is a conception of the real as "a pure antagonism, as an impossible difference which precedes its terms" (p. 24), based on Lacan's (1977) placement of the real as an encounter, but an encounter in which "reality is in abeyance" (p. 56). This internal antagonism inherent to reality is the paradox whereby, as the real is approached, it disappears. The real is therefore the reality of the unconscious, the traumatic kernel beneath the limit of virtuality that forms the surface of consciousness.

In this construction of consciousness and the unconscious, the real and the virtual take on a mutual dependence that underpins the need to sustain their antagonistic relationship. Gunkel (2010) states that "for Žižek, then, the real is already a virtual construct, and the difference between the real and the virtual turns out to be much more complicated and interesting" (p. 138), and it is this difference that must be confronted to re-establish the particularities of the term virtual reality. If for Deleuze the virtual is real, then under a Lacanian interpretation the real is also virtual. The interdependence of the two terms, and the inclusion of a mark of each within the other, highlights the simultaneous formation of the two as the simultaneous formation of the conscious and unconscious parts of the human mind. The construction of thought that generates a world that is to be thought, to be contained within thought and without which thought has no object to think, is a looped causality of differentiation that posits itself as the division between virtual and real. If the virtual and real contain one another, and cannot exist separately, it is because the unconscious arises automatically within and as a condition for the surface of consciousness upon which a world (a 'reality') appears. Lacan (1977) writes, "that which makes us consciousness institutes us by the same token as *speculum mundi* [literally, 'mirror of the world']" (p. 75), emphasising the problematic role of the subject inscribed in its own gaze, the loss and stain of reality from which we are excluded even as we leave an ontological mark upon its appearance to consciousness. This is what underpins Žižek's description of the subject as the void within our perception of the world, the stain in the gaze as the constitutive gap in substance (2007, p. 40) or empty structure of the real (2009, p. 8), that is the objectification of the real as lost, the inherent and always failed attempt of virtual consciousness to observe its own unconscious reality.

However, in the context of the digital in general, and VR in particular, the expanded conception of the real in relation to the virtual remains problematic within Žižek's theoretical position, derived from his resistance to digital technology in favour of a materialist dominance of the physical world. While he states that "the crucial point on which the consistency of Lacan's position hinges is thus the difference between reality and the Real" (Žižek 2008a, p. 214), when speaking of the digital Žižek often conflates real and 'real'. With a focus on what Tom Boellstorff (2008) similarly articulates as the fact that "it is not that virtual worlds borrowed assumptions from real life: virtual worlds show us how, under our very noses, our "real" lives have been "virtual" all along" (p. 5), the embedding of virtuality in physical existence and placement of the real as an unobtainable lost causality highlights the framing of reality as a fantasy. Within a critique of the digital resides a desire for and loss of a genuine sense of 'reality'

that perhaps speaks as much to Žižek's own structure of fantasy concerning contemporary ontology as much as the problematic relation between digital worlds and reality. He writes:

In so far as the VR apparatus is potentially able to generate experience of the 'true' reality, VR undermines the difference between 'true' reality and semblance. This 'loss of reality' occurs not only in computer-generated VR but, at a more elementary level…we are dealing with the loss of the surface which separates inside from outside….outside is always inside: when we are directly immersed in VR, we lose contact with reality. (Žižek, 2008a, pp. 133-4)

A development of his position is required if a productive relation of the real to digital technology is to emerge, expanding his critique beyond the physical-digital hierarchy that draws too close to a conflation of physical and real (of actual reality and Lacanian 'reality') as the object cause of desire in his ideological analysis. To situate the real as the reality of a complex social system such as the contemporary digital world, Gunkel (2010) insists upon "a conceptualization of the real that realizes that the real is itself something which is open to considerable variability, ideological pressures and some messy theoretical negotiations." (p. 139). In specific relation to the symbolic realm of the digital, Žižek defines the conditions for the underlying reality of computer code:

… bytes – or, rather, the digital series – is the Real behind the screen; that is to say, we are never submerged in the play of appearances without an 'indivisible remainder'… the emergence of the pure appearance which cannot be reduced to the simple effect of its bodily causes; none the less, this emergence is the effect of the digitalized Real. (2008a, p. 132)

This positioning of the digital real as the underling binary operations presupposed beneath the 'pure appearance' of the interface screen informs our relation to digital computers. We do not perceive the functioning of code, yet it determines our entire digital reality. This functions as the lost object cause of desire, perpetually outside of our perception while defining the conditions under which a perception of the digital can occur. In the endless variation of 1 and 0 in binary logic, this reality is the difference between something and nothing, the inherent lack in the emergence of reality. Across digital and physical planes, this is the hidden nature of reality beneath perception and outside of our virtualising cognition of the contemporary metaverse.

To more specifically assess the real in its relation to the virtual, this chapter defines the real as the void of the contemporary subject, as both the gap within consciousness and the gap of the physical-digital divide. The real, as defined by this chapter, is not only the later Lacanian real (in, for example, Lacan, 1977), but more specifically the *objet petit a* as the objectification of the void and its role in drive. If subjective reality is a void around which worlds form, then the real is the absent or quasi-cause at the heart of the parallax that determines the manner in which reality appears to the subject. This real is not an objective reality, but rather the excessive lack within the subject that presupposes an external causality. However, if, as Žižek (2000) states, "all presuppositions are already minimally posited" (p. 119), then the real is that which is presupposed as lost, what Žižek (2008a) labels the "coincidence of emergence and loss…*objet petit a*" (p. 15). Throughout Žižek's interpretation of Lacan, the real as *objet a* is the excess and lack of an underlying 'real-ity': excess in terms of a mystical beyond or supposed causal force 'without' the subject; lack in its unattainable nature derived from its positing 'within' (and objectification of the void of) the subject. From this position, the real functions according to the logic

of that which is expressed. This is Deleuze's (2004b) conception of sense which "brings that which expresses it into existence" (p. 190), "is essentially produced" (p. 109) and "is always presupposed as soon as *I* begin to speak; I would not be able to begin without this presupposition" (p. 35). Sense manifests the real as a functional logic: that which is expressed, yet cannot be directly confronted; the object of the proposition that is not included in it; the quasi-cause of the void-function. The real is the objectification of unknowable flux within consciousness, and through Žižek (2006) we can thus conclude that "reality is never directly 'itself'" (p. 241). In this way the real portrays a void-function within consciousness, the inaccessibility of the void of subjective reality. The underlying reality of a given consciousness or world is thus formed of its presuppositions within consciousness.

VIRTUAL REALITY

Žižek's discussion of the physical and digital defines Deleuze's virtual precisely and only as Lacan's real. This attempt to draw together the two theorists who are often considered opposed, while acknowledging the importance of the reality of the virtual over 'virtual reality' (Žižek, 2012, p. 3), conflates the nuances of the two processes within consciousness and their functions in the generation of the subject. The antagonistic relation between the real and the virtual, in the expanded sense of both terms is integral to reconciling Žižekian and Deleuzian philosophies as well as the term virtual reality, in a necessary move towards a theory of the digital founded upon the antagonistic relation between virtuality and reality. Deleuze (2004a) states that "the virtual is not opposed to the real; it possesses a full reality by itself" (p. 263), and without opposition we are not seeking a resolution or synthesis of the two terms. Rather, it is the relation of a paradoxical antagonism that is sustained in both physical and digital realities in their difference as such. This difference resides in the subjective perspective from which we denote one world or the other: two modes of thinking our relation to the universe through the interplay of virtual reality. The utopian vision of early VR, as an ideal space in which a freed mind controls all reality, has fallen out of favour amidst the photorealistic aim of mass consumption in digital entertainment. This is a transition towards the reduction of digital environments to what Cline (2012) portrays dystopically as both "an escape hatch into a better reality" (p. 16) and "a self-imposed prison for humanity…a pleasant place for the world to hide from its problems while human civilization slowly collapses" (p. 120). However, it is precisely this more direct (and perhaps abstracted) expression of consciousness that can connect subjectivity with a self-conscious modification of its relation to and definition of virtual reality. The antagonism between virtual and real is less an opposition than a paradox, underpinning the difference between physical and digital modes of thinking and being. Deleuze (2004a) emphasises the role of "difference as the reality of a multiple virtual field, and the determination of micro-processes in every domain, such that oppositions are only summary results or simplified and enlarged processes" (p. 278 [n]). This suggests the need for a new mode of viewing antagonism beyond the problematic opposition of virtual and real.

Between physical and digital worlds, as two modes of being and of consciousness, lies the subject: a perspective caught adrift in the void of both realities. A given world is a specific self-organisation or assemblage of virtual and real. It is the specific ordering and condensing of the functions of consciousness, creating a different knowledge and experience of a world, which brings about the perceived changes between physical and digital realities. This shift in epistemological position that creates an ontological difference between worlds is what we have seen in Žižek's (2009) conception of parallax (p. 17), here

interpreted not as a shift between individual objects *within* social reality but as a parallax *between* realities themselves from within consciousness. Throughout Žižek's work (for example, 2008a) the basis for this framework of parallax and its relation to a machinic consciousness appears in the proliferation of the "always-already" of posited-as-presupposed conditions (p. 184), as well as the Lacan-inspired role of fantasy in cyberspace (Žižek, 1999, p. 104-123) and as "a screen masking a void" in reality (Žižek, 2008b, p. 141). This structure of fantasy supporting the virtual-real relation is of crucial importance in assessing the formation of the physical-digital divide within consciousness. Fantasy, then, becomes the illusory structure between desire and drive that allows the virtual to cover over the void of the real in the continued functioning of consciousness on the surface of the subject. What a critical approach of parallax aims for is the insertion of a ""minimal difference" (the noncoincidence of the one with itself)" (Žižek, 2009, p. 11), under which a distance to our own subjective position can be achieved and the subjective real exposed. To break through the structures of fantasy in relation to digital technology is the task of this conception of virtual reality, confronting the smooth functioning of consciousness in such a way that makes clear simultaneously the parallax relations to physical and digital worlds within subjective reality. By approaching the antagonism between virtual and real, a critical distance can be inserted within consciousness as it beholds its position in the void of parallax between physical and digital worlds. But how do physical and digital worlds form in the relation between virtual and real? Deleuze (2002) equates the actual and the possible to existence and essence (p. 110), expanded into a relation with consciousness by Massumi (2002) when we writes that "intelligence stretches between the extremes of thought-perception, from the actual to the possible, dipping at every connection into the vortex of the virtual" (p. 98). It is the simultaneous relation between virtual-real and existence-essence (as actual-possible, which we will call here 'existence-meaning' as a more appropriate conception of the digital world built entirely upon symbolic structures without a pre-existing noumenal value). Between these two axes is the shifting perspective of parallax that forms the virtual-reality of both physical and digital worlds: the structure of desire and the lost presupposition of a universe for the contemporary subject to inhabit.

The physical mode of subjectivity emerges when existence combines with the real, the world as it appears with an absent causality. Following the phenomenological dictum that existence precedes essence, virtual-meaning then occurs as a constructed truth within consciousness and its social relations. The entrance of consciousness into the physical world marks the initial passage from nothing to something, our first concrete existence must be founded upon the objectification of the void in the real. This is the assemblage real-existence, whereby the presupposition of a causal relation between reality and appearance instigates appearance itself as reality, and not only an object's or image's reality but also our own physicality as subjective being. This appearance, objectification and externalisation of the physical leads back into consciousness through the process of signification, the human desire for communication. This is where virtual-meaning is formed, in the process combining the conditions of truth with the functioning of consciousness. As Žižek (2008b) states, "the multitude of 'floating signifiers'…is structured into a unified field through the intervention of a certain 'nodal point' which 'quilts' them, stops their sliding and fixes their meaning" (p. 95). The virtual, as desire and the big Other, acts as this condensing point upon and against which meaning can be certified, wherein "by the mere act of speaking, we suppose the existence of the big Other as guarantor of our meaning" (Žižek, 1991, p. 153). Our interpretation of the physical world relies upon this virtual-meaning. Signification must become manifestation and the subject must form itself in a relation to symbolic truth and presuppose an external validity to such truth in order to engage in the use of individual visual, linguistic and cultural signifiers. This process of

creating a symbolic structure based on a presupposed external physical reality is the cycle of the physical world, whereby each moment passes from perception to thought before the virtual returns to cover over the real as signifiers define the framework for future observations and the signified world expands within a virtualised consciousness.

Conversely, the digital subject condenses when the real combines with meaning, the absolute truth in code. This binary causality only ever has indirect contact with the subject, through layers of programming language and operating systems that are constructed to enable communication. This is brought into virtual existence, not as a simulation but, rather, a simulation-of-simulation; the appearance of appearance instigated by a conscious intentionality linked directly to the underlying machine code (in its most basic form this is the act of 'turning on' the digital device). This inversion of essence before existence still maintains the originary quasi-causality of the real followed by the process of the virtual. The digital world is not built from material substance, but from the abstract and absolute code of the machinic computer. Such a formal, logic-based realm can be considered the fulfilment of McLuhan's (2001) vision of electric technology as "pure information without any content to restrict its transforming and informing power" (p. 57). Binary logic is built upon the purely formal numbers one and zero, exemplifying Deleuze's pure difference and Žižek's minimal difference, functioning as the coalescence of meaning with the real in the fundamental positing of a digital universe. virtual-existence then appears as a realm of the imaginary in the superficial light of the interface screen. The purity of such a 'perfect' imaginary world based on formally 'perfect' logic fails at the very moment of engagement. The subject as physical being is seldom able to detach itself, neither sensorially nor cognitively, from its analogue existence. Memories of 'real' places seep in, 'realistic' graphics hook our imaginations back into already established functions of (false) consciousness, concealing what Manovich (2001) insists as a position in which "synthetic computer-generated imagery is not an inferior representation of our reality, but a realistic representation of a different reality" (p. 202). Here Baudrillard's (1994) scheme of the final phase of simulation proves instructive as "its own pure simulacrum…no longer of the order of appearances, but of simulation" (p. 6). While VR is often viewed as such a mode of simulation, the apparent virtuality of existence in the digital is constructed directly from the real of computer code, precisely defined by an absolute reality. Thus VR spaces are not an imaginary realm of pure appearance but rather an appearance of appearance concealing the truth of binary logic. A further phase of the image must be added in the context of VR: the mask of appearance *is* reality. This is the operation that Žižek (1991) identifies as unique to humanity, in which we "deceive by feigning to deceive" and therefore "effectively *become* something by pretending that we *already are* that" (p. 73). In digital environments this is the process by which we accept the clear virtuality of existence, in the opacity of the interface under a necessary suspension of disbelief, creating a mask of appearance that hides the direct causal relation between the reality of code and the 'virtual reality' on screen. Here we move beyond pure simulacrum as a result of simulation, towards a simulation-of-simulation. It is for this reason that the placing of VR as a tool for accurately 'simulating' physical reality entirely misses the point of the function of virtual reality at an ontological level. We should not consider virtual-existence as an illusory or imaginary interpretation of physical real-existence, for the relation of real to virtual does not here imply a judgement of truth. Rather, the digital image should be regarded as an illusion of appearance, the simulation-of-simulation whereby phenomena precisely are their signification in the primary causality of computer code. The virtuality of existence returns to the real in concealing such presupposed code beneath the sensory data that appears on screen, a shift from signification of something in reality to a reality of signification as such. In the wake of the poststructuralist breakdown of symbolic structures, and subsequent resurgence

of a nostalgic fetishisation of physical materiality, it is tempting to view digital environments such as VR as an empty signification of pure appearance, the epitome of Baudrillard's simulacrum. In the interplay of expanded notions of virtuality and reality, however, the apparent 'virtuality' of the digital is the appearance of virtuality itself; the illusion of VR is the structure by which it appears as pure appearance.

AN ART OF PARALLAX

Within this expanded notion of virtual reality, integral to our conception of both physical and digital worlds, a re-application to digital technology is required if the theoretical developments are to inform our relation to actual technologies and their use in contemporary and future society. As Deleuze and Guattari (1998) suggest, the task is that of "acting counter to the past, and therefore on the present, for the benefit, let us hope, of a future" (p. 112), a sending forward of ideas as an infinite critique of society rather than a specific set of practical activities. This application of a futuring of thought can occur most strongly in new modes of understanding creative practices. There has long been a strong link between VR and art. Not only does the generation of digital worlds require a creative input at the visual level, but VR theorists quickly identified the critical role of artistic practices in the social impact of the technologies. Nicholas Negroponte (1996) identified that in VR and other digital technology "the real opportunity comes from the digital artist providing the hooks for mutation and change" (p. 224), and Heim (1993) has also suggested that "perhaps the essence of VR ultimately lies not in technology but in art" (p. 124). These statements highlight the necessity of creative interventions to rethink our relation to technology and thus evolve our future relation to both physical and digital worlds. Here we see that Žižek's (1999) call to "traverse the fantasy in cyberspace" (p. 102), while emphasising the need to overcome the structures of fantasy between the virtual and the real, does not go far enough. Rather than, as he suggests, using VR as a place in which to stage and confront the psychological issues of our physical selves, there is now the need in our increasingly digitised society to traverse the fantasy *of* cyberspace, to view the parallax of the physical-digital antagonism and our position within it. The critical power of digital art lies not in creating specific sensational worlds but in challenging the mode of viewing the worlds it creates, building an analytical encounter into the frames it constructs, and through this to challenge our subjective viewpoint on all worlds.

This process by which art can make visible the parallax perspective that defines our individual virtual realities is always a process of re-framing. Žižek (2009) explains that "the minimal parallax constellation is that of a simple frame: all that has to intervene in the Real is an empty frame, so that the same things we saw "directly" before are now seen through the frame" (p. 29), and it is the role of art to make clear such a frame through which the virtuality of our perspective can be penetrated in order to make contact with the subjective real that underpins our experience of any given world. The artist of parallax views both sides of an antagonism at once, portraying simultaneously two perspectives with no common language (p. 129). In relation to the virtual reality of digital and physical modes of thinking and creating, this entails the construction of new perspectives from which to view and gain critical distance towards the interplay of virtual and real in the inversion of existence and meaning. Baudrillard (1994) states that "the universe of simulation is transreal and transfinite: no test of reality will come to put an end to it - except the total collapse and slippage of the terrain, which remains our most foolish hope" (p. 103), but in the digital simulation-of-simulation the territory is always-already collapsing and slipping into new assemblages across global computer networks and the many realms of cyberworlds we create.

The role of art in using VR to confront the virtual reality of the contemporary subject and contemporary society can thus be defined as the construction of a position from which to view our own parallax perspective on the physical-digital multiverse. Žižek (2009) states that, for the artist of parallax, "the only action available to him is self-destruction, which is itself a symbolic statement, the only work of art available to him" (p. 128). To unleash a kernel of the real, to bring an objectification of the parallax position into view by simultaneously staging both sides of the antagonism, requires a process of representing, externalising and stripping down (staging and traversing) the structures of desire and identity in subjective virtual reality, destroying the shell of consciousness to see what remains as our position from which the world is viewed and from which thought is thought. This is described by Murphie (2002) as humanity's ability for "extracting the world from the world" (p. 194) through conscious perception (and its disruption by or antagonism with the unconscious). Between the narcissism of excessively attempting to view oneself (as the position from which one views the world(s)) and the destruction of the fantasy supporting the virtual reality of such a self, we approach what appears as a nihilistic solipsism. If it is the subjective viewpoint, the parallax perspective, that constructs physical and digital worlds within thought, then to view the structures of virtual reality necessitates a gesture of withdrawal. This removal of the self in creative digital practices is an attempt to view one's own presuppositions, the always-already there of the subjective position, and thereby view the formation of parallax and the structures of fantasy supporting the smooth continuation of virtual reality. Deleuze (2002) describes "a pure Artist" as one form of the "human being who precedes itself" (p. 11), and in the physical-digital parallax the VR artist must precede its own perspective, the construction of its virtual reality and the fantasy of digital technology, in order to create new experiences through which we might rethink our relation to virtual reality, new technologies and the many worlds they create. For the potential of radical creative collectivity, transitioning from the individual consciousness to the social in what Deleuze and Guattari (1998) hail as a 'people to come' (p. 218), this is the imagining and staging of future perspectives of a genuinely cybernetic post-individual and posthuman consciousness through which the critical and creative power of VR might enact the revolutionary potential that filled its early conceptions, re-emerging in new forms of psychological, social and artistic constructs around new understandings of the framing of the discussion.

CONCLUSION

This chapter has raised new questions concerning the definition of virtual reality. By tracing the history of the term through the technological and cultural developments that have expanded VR into everyday language, the problematic nature of the label virtual reality has been shown to have always included a series of internal tensions surrounding its constituent components of virtuality and reality, and external tensions in relation to other aspects of digital technology. Recognising the hostility of VR theorists, technologists and creative practitioners towards the vague inclusion of virtual reality as a tool for marketing a broader range of digital media and its permeation of the physical world, while opposing the simplified definition of VR as a specific technology not taking into account the cultural expansion and impact of the term, a critical history of virtual reality theory has revealed in the simultaneous expansion and dissolution of the inherently interdisciplinary field of VR research a persistent problem with the limitations of presupposed assumptions concerning the virtual and its opposition to the real. Taking this in its broader cultural context, the impact of other parallel theories and terms has been discussed to situate VR in and

against other theoretical developments of digital technology. The dominance of cinematic theory on VR technology and its inclusion in contemporary culture has been reassessed in order to assert the need for new theories of digital media, and VR in particular, as a cultural and ontological regime in itself. The alternative and more general term 'cyber' has been traced through the concept of a cyberspace back to the earlier developments of cybernetics as an expansion of the human mind, situating VR technologies in their creative potential for constructing spaces of the Ideal. Issues of access to VR and other information technologies were discussed, and their causal role challenged as symptoms of wider societal inequalities, to raise the concerns over the viewing of digital technology in terms of social binaries. These developments have established the need to both assess and move beyond the antagonism of virtuality and reality in reconsidering VR as a technology and a conceptual framework.

The virtual has been analysed in the Deleuzian tradition, drawing out the machinic processes of the Ideal that are at work in both physical and digital modes of existence and thought. Deleuze's conception of the virtual was outlined and elaborated to establish the evolving context of virtuality in contemporary society, while later developments by Massumi and others brought the debate into the discussion of VR technology. Within this extension of virtuality, however, was revealed a reliance on a limited notion of the real, and the opposition of virtual to actual rather than real placed the virtual as part of a broader and more common sense 'reality'. The virtual was therefore redefined in a specifically machinic, functional approach to consciousness as a surface of the Ideal upon which worlds are thought, enabling an antagonism with the real in the processes of thought that allow virtual reality to emerge. The real itself was then questioned under a Lacanian definition, expanded by Žižek and Gunkel in their discussion of cyberculture, reinserting an antagonism between virtual and real without reducing either to earlier common sense and limited notions. The real was explicitly defined as the unconscious, the unknowable void of subjectivity, and placed in a relation to the desire of the virtual as underlying and presupposed drive, Lacan's *objet petit a*. Within Žižek's theory, however, the Lacanian real is placed as the Deleuzian virtual, thus this discussion redefined each term individually to allow the specificity of their antagonism (internal to consciousness) to re-emerge.

With the constituent parts redefined, a new mode of viewing virtual reality was then suggested to provoke not an opposition of virtual and real but, rather, a sustained antagonism within our conception of any 'reality' and the relation of thought to it. Žižek's concept of parallax was instructive here in establishing the ontological implications of subjective epistemological shifts, the relation between the constantly evolving landscape of the virtual surface of consciousness around the void of the real in the unconscious as the position from which consciousness is thought. The unrepresentable position from which the parallax perspective is seen and thought was placed as the emergence of all virtual realities. The emergence of physical and digital worlds was delineated along the inversion of existence and meaning (as a broader term for essence more directly applicable to digital ontologies) as the shifting perspective of digital parallax. The alignment of these two states with virtual and real processes of thought was posited as an original framework of viewing physical and digital ontological difference within consciousness, asserting the subjective viewpoint, and its problems, as the key to our understanding of virtual reality today. The dilemma of representing the position from which parallax (as well as physical and digital worlds) is thought was postulated as the task of contemporary creative practices that engage with digital (including the conventional VR) technologies. This drew further psychoanalytic techniques into a framework of making clear the reality of the subject and society, stripping down the virtual surfaces to represent simultaneously both sides of the antagonism: the surface of physical-digital worlds and the underlying presuppositions that differentiate them and allow them to form. The task was

proposed for contemporary digital artists to 'precede themselves', to bring out the position from which the information society is thought and, fundamentally, to persist in the questioning of the terms under which thought and art occur.

This chapter offers a contribution to our understanding of virtual reality as a technology and a conceptual framework for society and its future development. The discussion is by no means exhaustive, and indeed it is hoped that the arguments presented inspire further elaboration, disagreement, and productive antagonism that continues the reconsideration of the term and its use in creative practices. The resolution of the oppositions between Deleuzian expansions of the virtual and Lacanian developments of the real requires further discussion and resolution, both in terms of the often contradictory, yet linked, theoretical positions themselves, and in their application to digital technology, culture and art. The questions, developments and new positions outlined here are intended as a call for further questioning in theory and a renewed focus in practice on the use of VR technologies and their framing of contemporary society.

KEY TERMS AND DEFINITIONS

Consciousness: Thought as a machinic process; the self-positing of the subject as a virtuality in thought; the gesture of the cogito; the surface assemblage of the subject.

Cybernetics: 'Steersmanship'; the study of systems with a circular causal feedback loop; the expansion of human intellect with machines; the understanding of understanding.

Cyborg: The human subject between physical and digital worlds; the self-aware expanded cybernetic consciousness; the resolution of the internal antagonisms of the cyborg can be considered a state of posthumanism.

Digital Divide: The disparity in access to technology and information along geographical, ethnic or economic lines.

Existence: The conditions for being; the gaze and the appearance of external objects it denotes; an observed world (either physical or digital).

Meaning: Essence; signification; less what is communicated than the conditions of truth that enable communication; information as this shared process of flow.

Parallax: The relative displacement of objects by a change in perspective; the ontological change in objective reality created by an epistemological shift in subjective position.

Real: The objectification of the void of the contemporary subject, as both the gap within consciousness and the gap of the physical-digital divide. This is linked to the Lacanian *objet petit a* and the perpetual drive of the loss as such that defines desire.

Subject: The perspectival position from which consciousness is thought; the assemblage of consciousness around this parallax void; the individual or collective potential for creative activity and shaping the future of human society.

Virtual: The role of consciousness in perpetuating itself; the subject as process; the function-function of consciousness in which the subject imagines and posits its own functioning. This appears as desire, always moving towards contact with the unattainable Real.

ENDNOTES

[1] Or, rather, reduces the digital to one manifestation of the virtuality of cinema as the logical extension of painting using Deleuze only for his work on cinema (a trend that dominates the elaboration

of the Deleuzian virtual), seeing the necessary development as an expanding of Deleuze's temporal focus towards a spatial consideration which itself only furthers the subsuming of VR by cinema.

2 Here is where Deleuze's "ultra-nominalism" (Norris, 1995, p. 133) develops from Lacan's (2006) view of the prior existence of language in the subject, found by psychoanalysis in the unconscious (p. 413), towards a virtualised simultaneous occurrence of language as the limit of consciousness and the unconscious, the differentiating process that brings thought into being.

3 The 'ideal game' was previously defined by Deleuze (2004b) as "without rules, with neither winner nor loser, without responsibility…this game is reserved then for thought and art" (p. 63).

4 The mutual expansion and re-definition of virtual and real in this chapter would ideally require a reading of both sections 'simultaneously'. However, to construct a linear argument they will be defined separately, the virtual prefiguring the real, before being drawn together in a more detailed discussion of their relation.

Design Principles for Crisis Information Management Systems:
From Closed Local Systems to the Web and Beyond

ABSTRACT

Since Hurricane Katrina, a lot of research has gone into improving disaster management through the use of crisis information management systems (CIMS). There has been much interest in how to design dynamic CIMS, particularly with respect to web-based emergency management systems. In the authors' research, they set out to design and develop a distributed web-based training and research tool for emergency managers and scholars. In order to develop their training system, they needed to simulate the CIMS that emergency managers use during a crisis and with which they could run training and research simulations. This raised the question: What exactly is a CIMS, and how does one design one? In order to answer this question, the authors engaged in nine months of field research at the Miami-Dade Emergency Operations Center in Miami-Dade County, FL. Through their field research and the emergency management experience of one of the authors, they identified several additional design principles for CIMS in today's technological and communication landscape. This paper outlines the resulting recommendations.

INTRODUCTION

A crisis is defined as "any event that threatens to, or actually does, inflict damage to property or people." (IS -1, n.d.). Crises can be small or large in scale. In large-scale crises, there usually is a significant probability of extreme danger and highly unpredictable outcomes (Leadership in Crisis, 2010). Small- or large-scale crises can occur at any time, and the consequences can be enormous. At the height of the H1N1 influenza outbreak between 2009 and 2010, 61 million people became infected with this virus. In addition, H1N1 caused approximately 274,000 hospitalizations and 12,500 deaths (CDC, n.d.). In 2004, the Indian Ocean earthquake and tsunami affected approximately 5 million people in Indonesia, Sri Lanka, India, and the surrounding areas. Over 280,000 people died, and more than 1 million people were displaced (World Health Organization, n.d.). In the US, Hurricane Katrina was one of the most expensive and devastating natural disasters in American history (Rabkin, 2005). Over half a million people were affected by the hurricane, and the US energy infrastructure was severely damaged (Rabkin, 2005). In 2012, Hurricane Sandy swept through the Northeastern United States. Seventy-two people died and 8.5 million people lost power. More than 650,000 houses were damaged or destroyed (Blake et al., 2013). Hurricanes Katrina, Sandy and other crises clearly show the importance of disaster preparedness. Indeed, much can be improved, especially with respect to training and collaboration among federal, state, and local governments (Agrait et al., 2004; Auf der Heide, 1989; Dorasamy & Raman, 2011; Holguín-Veras et al., 2007; Rabkin, 2005; Waugh & Streib, 2006). Specifically, one area that can be improved is the design of crisis information management systems (CIMS) (Catarci et al., 2011; Grant, 2008; Gryszkiewicz, 2012; Gryszkiewicz & Chen, 2012; Onorati et al., 2011; Turoff et al., 2004).

The remainder of this paper is structured as follows. We begin by discussing differences between CIMS and general information systems. Next, we discuss how CIMS has grown with technology and co-evolved with the web. Following this, we review current theory on the design of crisis information management systems. After that we present our recommendations for CIMS. Finally, we conclude with implications and future directions of CIMS.

BACKGROUND

Evolution of CIMS: Similarity to and Differentiation from Information Systems

What is a crisis information management system? A CIMS is a vehicle that aids in storing, retrieving, analyzing, and organizing information; managing resources; maintaining situational awareness; supporting a common operating picture; establishing and maintaining command and control; facilitating decision-making; and collaborating with other emergency managers and agencies to aid in orchestrating response efforts. CIMS are computer-based software systems and they are, in effect, a specialized type of information system (IS).

IS grew out of the business and management domain (Hirschheim & Klein, 2012). IS historically has been based on designs to provide support for components of the organizations dealing with different types of decisions and processes requiring different types of information, such as transaction processing, accounting and finance, mid-level decision-making, operations management, and strategic planning (Davis & Olson, 1985; Keen & Scott Morton, 1978). Central to these types of systems, and similar to CIMS, was the ability to create and maintain a situational "image" of the firm's status, driving decisions

as events unfolded, such as product demand, pricing decisions, resource deployment, and operational and strategic changes in operational missions, often in the form of databases (Everest, 1986; Martin, 1975). The form of any IS system, consequently, reflects the demands of the environment within which it operates. However, the unique informational demands of crises necessitate system characteristics that are foreign to most non-crises IS.

The roots of CIMS were not in the business sector, but grew out of the public welfare and is the result of harnessing advanced technology applied to the emergency management domain. In fact, CIMS are critical to the public welfare during a disaster. Whereas IS applications may have financially expensive consequences for the organization if not used correctly (e.g. bad investment, regulatory fines, lost customers, etc.), they rarely result in the loss of lives. CIMS, on the other hand, are often used in life-threatening, time-critical situations, and improper use can lead to putting lives at risk.

Another differentiation between CIMS and IS is that IS tends to serve large numbers of users from one organization, while CIMS typically serves a few individuals from many organizations. Characteristic IS applications are often used frequently by the users (but not always), while a CIMS application is used infrequently by its users. As such, typical IS applications, since they are often used infrequently, can get away with being more complicated and having a steeper learning curve. As discussed in the next section of the paper, CIMS, on the other hand, must be very easy to use and to learn.

Additional differences include, but are not limited to: CIMS need to have the ability to add and delete user accounts and modify access controls quickly and easily (within minutes). CIMS need to be malleable and easy to adapt to the current situation. Often times, unforeseen events arise in crisis, and the system needs to be able to adapt easily to a large variety of situations. CIMS need to integrate training systems into them and they should be especially familiar to the emergency managers. CIMS today are typically web-based and distributed, and they have built-in means of access control for information. This enables easy information sharing between various distributed agencies. CIMS need to be inclusive for many types of users; emergency response involves the public, volunteers, businesses, non-profit and non-governmental organizations (such as Catholic Charities, American Red Cross, Salvation Army), donors, first responders, emergency managers, elected officials, and coordinating government agencies. CIMS are used to manage all phases of emergency response; they are used in day-to-day and in crisis situations. CIMS need to maintain situational awareness and a common operating picture to help emergency managers make decisions and manage the response. CIMS is enhanced by integrating social networking, mobile-based GIS, digital media and digital volunteers. Finally, CIMS need to have backup solutions in case of electronic or communication infrastructure damage during an emergency.

IS, on the other hand, do not need to have such critical time restraints on access controls. IS does not necessarily need to be able to adapt to many different situations, and it does not need to be so familiar to the users. IS does not usually span across numerous distributed organizations, so it does not necessarily need to be web-based. IS are typically used in normal day-to-day non-critical operations. Finally, IS can have backup systems, but typically are not as critical if they loose power for a few hours.

Another difference between CIMS and IS is that IS typically has had four distinct levels of application: workers, middle managers, senior managers, and executives. CIMS, on the other hand, may serve three or all four of these types of users in one system at the same time. Finally, IS may be designed for one particular purpose and function. CIMS, on the other hand, is used for a variety of purposes. Indeed, with crisis information management systems, emergency managers need to be able to accomplish a wide variety of functions (see next section).

Evolution of CIMS: Growing with the Technology: A Change in Paradigm

The paradigm outlined in this paper differs from previous paradigms of Emergency Information Systems. There are several reasons for this. First, before the present time, the infrastructure was not available yet to support intense web-based operations. Additionally, personal computers were not as prevalent in many organizations. As late as 2000, as outlined by Jennex (2004), the Y2K emergency management website was congested and non-responsive from too many hits during the Y2K rollover. In contrast, Internet infrastructure was fairly successfully tested and used in the recent Exercise24, in which video (high volume Internet traffic) and geographic information systems were tested and were found to be fairly responsive to a massive quantity of Internet users (Howe et al., 2011). Today, the communications infrastructure can support many more individuals. This coincided with a large portion of the North and Southeastern United States turning to WebEOC, a distributed, web-based management system (WebEOC, n.d.). Additionally, previous CIMS paradigms were template based and used email and voice communications as the main communication methods. Modern CIMS, on the other hand, has many additional elements.

According to an article in Risk Management in 2002 (Davis, 2002), the best CIMS include most of the following features:

- Incident tracking, logging and reporting;
- Automated SOP checklists and plans;
- Resource management (with full database functionality);
- Central command and control;
- Messaging and communications function with tracking;
- Documentation of response actions;
- Contact lists;
- Internet, intranet/VPN and wireless;
- Radio, cellular and satellite;
- Appropriate member participation;
- Automated journaling;
- Access to plans and data;
- Mapping;
- Role-based staff management;
- Linking capability to access Internet sources for weather and event intelligence;
- Hand-held compatibility;
- Fully configurable and scalable;
- Compatible with existing infrastructure, databases, software and e-mail;
- Status boards;
- Executive briefings.

E-Team, one of the leading commercial CIMS, provides the following functionality[1] (E-team, n.d.):

- Incident reporting and tracking;
- Situation reporting;
- Resource and asset management;
- Action planning;

- Critical infrastructure reporting;
- Hospital and shelter status;
- Personnel management;
- Procedures and checklists;
- Intelligence gathering and dissemination;
- Tip reporting;
- Duty and call logs;
- Organization charts;
- CATS hazard modeling interface;
- Crystal Reports interface;
- Real-time messaging and chat.

WebEOC, another leading commercial CIMS, provides similar functionality, including:[2] (WebEOC, n.d.):

- Managing Users;
- Status Boards;
- Exchange information with other WebEOC customers;
- Checklists, Contacts, File Library, Sessions;
- Messages;
- Mapping;
- Audit Logs;
- Import/Export Data (CSV);
- CAP Messaging;
- Status Board/ Form Building Tool;
- Reporting Tool;
- Creating and Running Simulations;
- Chat;
- Remote Boards, Scroller, Alerting, Calendar, Twitter, NWS Weather.

WebEOC further enables users to "manage multiple incidents and daily events, assign and track missions and tasks, provide situation reports, manage resources and prepare incident command system (ICS) and incident action plan (IAP) reports." (WebEOC, n.d.)

Finally, another change has contributed to the paradigm shift in the last 10 years. The pervasiveness of smart phones, tablets, even cheaper computers, and the creation of social media have enabled the public (these can be both victims and observers of the crisis) to participate in the crisis response by sending information about the disaster to others electronically in real time.

Evolution of CIMS: From Closed Local Systems to the Web and Beyond

The use of crisis information management systems to aid in emergency management is a fairly recent initiative. In fact, it is still growing and evolving. The evolution of CIMS mimics the evolution of the web. Like the web, CIMS began its development with systems that centered on organizing, storing, and retrieving information. These early systems used tools such as Microsoft Word, Excel, Access, and

email (Jennex, 2004). Next, we begin to see the emergence of information management systems to aid in maintaining a common operating picture and decision support. These systems were closed and isolated; each organization had its own system, but they were not necessarily connected with other systems in other jurisdictions (Jennex, 2004). Examples of these types of systems include custom emergency information systems (EIS), Sharepoint, E-Team, and WebEOC.

Hurricane Katrina marked a changing point in using information technology to aid in emergency management. Officials realized that they could harness information technology to a greater extent in the relief efforts. Systems began to focus on interconnecting closed, local systems with each other (Nelson et al., n.d.). Here we see the emergence of crisis information management systems federations. Examples of these types of systems include enhanced versions of E-Team, WebEOC (with a WebFusion augmentation), and Sahana Eden (Sahana Software Foundation, n.d.).

The Haiti Earthquake in 2010 marked another pivotal point in emergency management. Organizations began using Web 2.0 technologies, digital media, and smart phones in the emergency response. Web 2.0 technologies feature wikis, SMS/texting, social media, and other social networking and collaboration tools such as Flickr, Facebook, and Twitter. Additionally, through the use of the web, digital media, and smart technologies, emergency managers began leveraging the public in collaboration and participation in the response efforts. "Web 2.0 principles are strikingly applicable to disaster relief since a stricken population can offer the most immediate information about its own conditions. These principles advance the ability of individuals to dialogue and partner with relief agencies, rather than being consigned to the role of passive victims […] Information may be gathered and assembled in an open, democratic fashion." (Nelson et al, n.d). Web 2.0 systems bring together existing trends in information technology for the humanitarian response. These systems include increased usage of digital media technologies and smart phones and tablets by responders to manage humanitarian information, enhanced reporting and distribution of information through local mass media to help aid recipients, and customized innovative digital media tools and platforms applied to coordinate new forms of collective action and problem-solving (Nelson et al., n.d.).

A third pivotal area that emerged in the wake of the Haiti earthquake is with respect to remote public volunteers, also known as digital volunteers (Starbird & Palen, 2011). In addition to formal emergency response, these digital volunteers use Web 2.0, smart phones and tablets and social media tools to self-organize participation in the response. This self-organizing participation in emergency response is also known as crowdsourcing. Tools digital volunteers use to aid in the response include social media, SMS, and reporting and mapping services such as Ushahidi, GeoCommons, and OpenStreetMap (Okolloh, 2009; Perng et al., 2013; Starbird & Palen, 2011; Sutton et al., 2013; Zook et al., 2010).

SUMMARY OF CURRENT CIMS DESIGN PRINCIPLES

In a foundational paper in 2004, Turoff et al. describe principles for the design of a dynamic emergency response management information system (DERMIS), based on premises derived from the historical experiences of the former Office of Emergency Preparedness (OEP).

Another paper by Onorati et al. (2011) describes interaction principles for Web Emergency Management Information Systems (WEMIS). Onorati et al. analyze a set of common and frequent characteristics of WEMIS. They analyze the PIE (Program, Interpretation, Effect) formalism (Dix et al., 2004) with

respect to CIMS and introduce another characteristic to the formalism. The resulting characteristics are observability, predictability, reachability, transparency and meta-communications.

In another pivotal paper on Emergency Response Systems, Jennex (2004) discusses experiences with Emergency Information Systems during the Y2K rollover. In this paper, Jennex advocated that a CIMS should consist of "a database, data analysis tools, normative models, an interface, trained users, methods to communicate between user and between users and data sources, protocols to facilitate communication, processes, procedures, and contingency plans used to guide the response to and improve decision making during the emergency, and a central emergency response command structure."

One of the principal recommendations from Jennex is that training be accomplished on the CIMS and that different organizations be able to work together as one coherent team using a centralized command structure. He also notes that there should be a common terminology among emergency managers. Some of these concerns have been addressed through the adoption of the incident command system, the creation of the Department of Homeland Security in 2002, and the adoption of the National Response Framework in 2008.

Ghoerghe and Vamanu (2001) were early advocates of incorporating Geographic Information Systems and satellite capabilities into CIMS. Gadomski, Bologna, Costanzo, Perini, and Schaerf (2001) advocate using artificial intelligence to create an intelligent decision support system (IDSS) to aid emergency management decision-makers.

In a paper on process management and geo-collaboration among first responders, Catarci et al. (2011) outline 5 requirements for CIMS for first responders. Specifically, these apply to process management systems (PMS), which are systems that first response leaders have on their PDAs that aggregate data from several sources to better orchestrate the crises among first responders. First, they advocate for wireless mobile networks for these systems. Second, since first responders may not have knowledge of the local area, PMSs should be integrated with Geographic Information Systems (GIS). Third, PMSs should allow for large process specifications that are specialized by time according to the specific situation. Fourth, PMSs need to be adaptable; they need to be able to adapt the process execution to possibly changing circumstances and contingencies. Finally, PMS "client tools must be extremely usable and intuitive [...] Systems should be so intuitive that they can be easily mastered after few interaction sessions." (Catarci et al., 2011).

In a paper on Emergency Management Information Systems, Grant (2008) describes a checklist for comparing CIMS. This checklist was derived from a Crew/Operator Support Policy (COSPOL) study funded by the Netherlands. In this report, Grant identifies functions that command and control (C^2) information systems utilize when managing a crisis. They do not list the entire system functions, but for the monitoring and control subset of C^2 information systems, they note data acquisition, situation analysis, and planning and scheduling as part of a command and control crisis information management system.

More recently, Gryszkiewicz and Chen (2012) describe how to integrate various concepts of temporality in crisis information management systems. Specifically, they describe 6 design principles:

- Make temporal relationships between asynchronous activities salient;
- Make information about past crises, and past crisis management events in ongoing crises, easily accessible;
- Add create/last-modification time-stamps to information;
- Indicate how events and activities may develop;
- Give support for emerging information sources.

Gryszkiewicz (2012) adds two more temporal design principles: support the pace of the users' tasks and work, and allow for different users being responsible for the same tasks over time. The first principle allows the system to work more quickly or slowly depending on the needs of the users. For example, in some cases, it may be more efficient to have an online chat with another person rather than to publish and subscribe to messages. The second principle allows for continuity among different shifts of workers to access the information for which they are authorized in order to change over more quickly and accurately during long lasting crisis events.

FOUNDATION FOR ADDITIONAL DESIGN PRINCIPLES FOR MODERN CIMS

Under a grant from the National Science Foundation, researchers from Florida International University, Emory University, and the University of Notre Dame, in conjunction with the highly regarded and experienced Emergency Operations Center in Miami-Dade County, FL, set out to design and develop a training system for emergency managers and for researchers. (Becerra-Fernandez et al., 2007; Nikolai et al., 2009; Nikolai et al., 2010; Nikolai et al., 2015; SimEOC, n.d.). In order to build this system, we needed to simulate the software that the emergency managers were using at the emergency operations center in day-to-day operations and during the management of disasters, and to understand how this system fits within the context of decision and information flows during a crisis.

For nine months, one of us (Nikolai) worked as an intern at the EOC alongside the emergency managers, thus situating herself within the context of the organization (Suchman, 1987). During this time, she participated first-hand in three operational activations – the response to the Haiti Earthquake of January 2010, Super Bowl XLIV, and the Pro Bowl of 2010. Additionally, she documented changes that were taking place with respect to CIMS and how Miami-Dade began developing collateral systems to augment the current software in use at the EOC. Drawing on the detailed information gained over the nine-month period (exercises, training, interviews) supplemented with experience of this author and of another author, who a focused literature review, we propose 12 design principles relevant for CIMS in today's emergency response environment (described below).

Additional Design Principles for Modern CIMS

Design Principle 1: CIMS Should Be Easy to Learn On-Demand

In the middle of a crisis, personnel are dealing with the crisis. Few organizations have the time or resources to train new personnel; their foremost concern is on stabilizing the crisis, not on training individuals (Nikolai, 2009-2010; Sniezek et al., 2002; Turoff et al., 2004; Westfall et al., 2009). In fact, during Exercise Golden Phoenix in 2008, the request from the military liaison regarding technology was "Four buttons max, please. The feeling was that if it required an engineer to operate, it was a distraction and potential danger during a crisis." (Westfall et al., 2009). In addition, liaisons who gather to manage a crisis may be limited in their training with respect to a CIMS. There are several reasons for this. First, the current practice of training through simulation exercises requires that individuals physically have to come to the EOC or other locations to gather for exercises (Nikolai, 2009-2010; Jiri and Björn, 2009). This limits organizations in time, personnel, and budget in the number and type of training exercises that

they can engage in (Nikolai, 2009-2010; Westfall et al., 2009). Additionally, during our field research, we observed that there can be a high rate of turn-over of the liaisons of the organizations, the EOC staff, and other coordinating agencies and elected officials (e.g. the mayor, commissioners, governor, US representatives). This means that often the individuals and organizations must form teams in the middle of a crisis, sometimes by individuals who do not know each other and who have never worked with each other before, or with whom they work on a very infrequent basis. These individuals need to be able to gain access to a system and learn the system within minutes.

An example of this type of situation occurred in the Haiti Earthquake of 2010 (Nikolai et al., 2010). In particular, the Miami-Dade EOC became the lead support agency in charge of coordinating local support to the repatriation efforts. In collaboration with the Miami-Dade EOC, Miami International Airport, the State of Florida's Division of Emergency Management, Homestead Air Force Base was tasked with accomplishing the repatriation. Since Homestead Air Force Base is located approximately 40 miles away from the Miami-Dade EOC, coordination had to be accomplished via remote technologies. The Miami-Dade EOC had to set up and give access to select officials regarding particular information about the crisis. In addition, the Base EOC needed to give access and exchange information about the repatriation of citizens and what kind of medical or special needs assistance victims needed to Miami-Dade EOC staff. Using WebEOC, the Miami-Dade EOC was able to create a status board for viewing access to repatriation status information (with updates occurring in real time) by their Command staff, Homestead Base emergency management staff and other response officials. On the other end, the Homestead personnel had to pick up and learn the CIMS (WebEOC) in a matter of minutes. They also were able to access and update status boards remotely through a remote web-based login.

Design Principle 2: CIMS Should Have the Ability to Add and Delete User Accounts and Modify Access Controls Quickly and Easily, Especially During a Crisis

Since crises may lead to unforeseen needs, CIMS need the ability to expand and contract easily. Each incident has different needs (e.g., resources, personnel, processes, organizational structures) and may require the formation of teams that were not expected in order to manage the crisis. Sometimes new individuals come into the crisis or the exercise who have never been trained on a CIMS (Nikolai, 2009-2010). This is especially helpful in the case of multijurisdictional incidents. In the Haiti earthquake example, the Miami-Dade EOC had to set up and give access to the Homestead Air Force Base EOC. As another example, in 2010, the National Football League's Pro Bowl and the Super Bowl were held in Miami. The Miami-Dade EOC was activated to monitor both events. During the activation, the EOC needed to coordinate with guest state and federal officials who came down to Miami to assist in monitoring the events and to be available in case of an emergency. In addition to regular personnel, Miami-Dade had to set up access and access controls for these guests.

Design Principle 3: CIMS Should Be Easy to Adapt to the Current Situation

What makes managing a crisis so complex is the fact that one cannot plan for everything (Catarci et al., 2011). Crises are often unexpected or they stem from normal situations that unfold in unexpected ways or ways that are beyond the scope of the planned resources available to address them (Leadership in Crisis, 2010). Often individuals and organizations must form teams in the middle of a crisis. Emer-

gency managers and CIMS must be able to adapt to the situation. In the Haiti crisis, Miami-Dade had to create new types of unforeseen status boards and reports in the middle of the crisis. They also had to grant access to particular information to a new group of people as well as to maintain restrictions on the information that the new members had access to.

Design Principle 4: CIMS Should Be Web-Based and Distributed (and Have a Means of Access Control for Information)

This does not mean that the underlying hardware necessarily has to be built into the web or located in different geographic areas, but rather the CIMS should provide an ability for coordinating organizations who may not be in physical proximity to the CIMS to log in to a web-based client and access information for which they are authorized. Again, in the situation with Haiti, the Miami-Dade EOC had to coordinate with the Homestead Air Force Base EOC, which is located approximately 40 miles away from the Miami-Dade EOC. Local EOCs need to coordinate with tribal, state, regional, and federal EOCs and agencies as well. Through the use of their established CIMS, the state of Florida was able to establish interconnected regions with its 67 counties for resource and mission tracking. Through WebEOC Fusion, an augmentation to WebEOC, the Miami-Dade EOC was able to connect and share information with neighboring counties and with the Florida state EOC and other coordinating agencies.

Design Principle 5: CIMS Should Integrate Training Systems into Them or At Least Make Systems Similar to Those with which Emergency Managers are Familiar and which They Use Regularly

This is similar to Turoff et al.'s first DERMIS premise and Jennex's recommendations about training with respect to EIS. However, instead of training *on* a system, organizations should train *with* the system (although training on the system needs to happen as well). That is, training should not be actuated as an event that is distinct from operational use. Rather, training is a capability that is built into the system as a component of usability. Use of the system is best mastered in the context of how it is used in practice. CIMS, for example, may include an integrated training component that simulates a disaster. An example of such a CIMS is WebEOC.

Design Principle 6: CIMS Need to Be More Inclusive for More Types of Users

Managing a crisis is a multi-agency, multi-governmental, and sometimes international activity (Nikolai, 2009-2010; Miami-Dade EOC Activation, 2010, January; Miami-Dade EOC Activation, February; Waugh & Streib, 2006; Zwass, 2010). Emergency response involves the public, volunteers, businesses, non-profit and non-governmental organizations (such as Catholic Charities, American Red Cross, Salvation Army), donors, first responders, emergency managers, elected officials, and coordinating government agencies. At the governmental level, it may involve coordination among local, tribal, state, federal and international agencies (Nikolai, 2009-2010; Nelson et al., n.d.). Current research identifies many CIMS for first responders (Incident Commander (Incident Commander, n.d.), RimSim (Campbell & Weaver, 2011), WORKPAD (Catarci et al., 2011)). However, there is a general lack of CIMS for emergency

managers. This should include not just emergency managers and first responders, but also the public, victims, volunteers, non-governmental organizations, businesses, and elected officials. A more integrated, holistic approach to the design of crisis information management systems is needed.

Design Principle 7: CIMS Should Be Designed for Use throughout the Entire Emergency Response Lifecycle

Experts generally agree that there are four main phases of emergency response: mitigation, preparedness, response, and recovery (FEMA, 1996; Waugh & Streib, 2006). Mitigation and preparedness occur on a day-to-day basis. Response occurs during a crisis and recovery occurs following a crisis. Mitigation involves taking actions to reduce potential loss from disasters. For example, this involves reinforcing buildings to ensure that they will not collapse from the winds of the hurricanes or the shaking of the ground during an earthquake. Preparedness involves establishing procedures and the roles and responsibilities of emergency personnel and jurisdictions that will be involved during an emergency. It also involves training personnel. In the response phase, emergency personnel assist the victims and try to reduce the possibility of further loss of life and property (IS-1, n.d.). Recovery involves efforts to restore the community to normal operations. In the short term, emergency workers restore vital systems to an acceptable minimum operation. Once this is accomplished, long term recovery can begin. In the long term, recovery may go on for months or even years until the affected community returns to its previous or an improved condition (FEMA, 1996; IS-1, n.d.). CIMS should integrate the activities from each phase of the emergency response lifecycle.

Design Principle 8: CIMS Need to Integrate Advanced Geographic Information Systems (GIS) Into the Common Operating Picture

This is not new (it was advocated by Gheorghe and Vamanu in 2001) but the advances in technology recently have made it more possible to be easily and widely implemented. Additionally, "The support for context awareness is crucial […] [A] given user, particularly in larger events, is likely to work in a variety of contexts, either because of physical relocation or because of changes in the context itself. […] Therefore, users cannot be assumed to have local knowledge of the geography and resources of the area. Consequently, [CIMS for first responders] should be integrated with Geographic Information Systems, which allow users to gain a deep knowledge of the area." (Catarci et al., 2011) While this is especially true for first responders, it applies to emergency managers as well. During the Super Bowl and the Pro Bowl activation at the Miami-Dade EOC in 2010, for instance, federal and state emergency managers came to the EOC to coordinate actions and to be present in case of an emergency. These emergency managers were not necessarily familiar with the area before coming to Miami. For the public, GIS can be used to locate relatives and victims of the disaster and to mark the locations of shelters. During the Haiti earthquake, for example, victims used a GIS aware website to request help. Through the GPS and GIS, first responders and relief workers were able to find them. For emergency managers, GIS is used to maintain a common operating picture and gain a better understanding of the situation, to coordinate actions, and to aid in better situational awareness and decision-making. GIS also enables information filtering and visualization of the area in need. For example, with an overview map, users can click on an event and get more details about the event (see Figure 1).

Figure 1. A GIS aware application used by the Miami-Dade EOC. Clicking on a particular location marker on the map brings up information and pictures related to the area.

Design Principle 9: CIMS Need to Integrate Social Networking, Mobile-Based GIS, Digital Media and Digital Volunteers

CIMS also will need to learn how to harness and perhaps even direct the self-organizing digital volunteers who mobilize during a disaster. Coinciding with this, emergency managers need to learn how to wade through the massive quantity of information originating from social media outlets while avoiding information overload distractions from various platforms (e.g. smartphones, tablets, computers, websites and other applications) (Howe et al., 2011).

Small-scale collaborations of social networking began during Hurricane Katrina, where wikis were used for collective memory, to located missing persons, to organize volunteers, and to locate emergency housing. One of the first large scale collaborations of social networking and digital media grew out of the humanitarian response to the Haiti earthquake in 2010. Although there were several limitations and technical problems, different digital media technologies, networks and communities were able to overcome their differences and work together to aid in relief efforts to an extent that had not been seen before. (Nelson et al., n.d.).

Examples of the use of digital media were crowdsourcing, the creation and updating of local maps for areas for which maps were out of date, humanitarian media response and local coordination, and coordinating to build a people-finder platform (Nelson et al., n.d.). SMS, or short message service, was used for a variety of applications. One immediate priority was to help victims discover what was happening around them and where they could go for help (Nelson et al., n.d.). Citizens and victims were able to request help by way of text message short code to relief workers. In addition, SMS allowed citizens to send public health alerts to relief workers, for example, concerning water sanitation and food shortages

in relief camps. SMS was also used in a broadcast capacity by the humanitarian relief organizations. Humanitarian relief organizations broadcast public health messages to the population about relief services, general health, hygiene, vaccines, sanitation, malaria, and HIV/AIDS. During the recovery, the Red Cross used SMS in other countries to raise money for the relief efforts (American Red Cross, 2010).

Another problem that digital media was able to help with was in updating outdated maps for the region. In some cases, maps had never been created for particular areas. In others, rural populations had migrated into urban areas so quickly that maps became outdated. Still in other areas, some locations did not appear on any maps. In some situations, relief organizations initially relied on maps based on GPS coordinates which were incorrect (Nelson et al., n.d.). Using a combination of crowdsourcing, geo-tagging, and local personnel on the ground, volunteers were able to create updated maps for the relief workers.

One application that came together during the crisis was Ushahidi, a crisis-mapping platform that was adapted to provide emergency and rescue data. Another application that evolved was OpenStreetMap. OpenStreetMap is built entirely by volunteers who survey with GPS, digitize aerial imagery, and collect existing public sources of geographic data. After supplementing the existing maps with the volunteer inputs and updates from people on the ground with hand-held GPS devices to mark spots, OpenStreetMap became the primary map for responders. A third application that became useful in the aftermath of the Haiti earthquake was Google Earth. Various websites set up and streamed information into the Google Earth database, which then was used to locate missing individuals. Volunteers from around the world translated information and helped write code to create systems for processing data from various websites and forums. Another source of digital media are wikis and RSS feeds. Wiki's were set up to maintain collective memory and to share best practices and lessons learned from the Haiti. Ushahidi developed an RSS feed for the U.S. Coast Guard to help them retrieve emergency information that required immediate assistance. (Heinzelman & Waters, 2010; Nelson et al., n.d.; Zook et al., 2010).

Another example of utilizing digital tools and technologies and social media effectively to manage a disaster was in Exercise24 (X24). X24 and X24 Europe was a two-day and three-day-long simulation that was conducted in September 2010 and March 2011, respectively. Seventy-nine different countries speaking thirty-three different languages located on every continent except Antarctica, participated virtually in the exercise. In X24 Europe, ninety-two nations were involved. The goals of the exercise were to:

1. Demonstrate the use of no/low-cost, off-the-shelf social media, crowdsourcing, and collaboration web tools to gather, coordinate, and share actionable real-time information to build situational awareness to help victims of a natural disaster and help save lives;
2. Establish dialogue and build relationships between European partner nations, international organizations, and public/private partners regarding the use of online tools, make them more effective, and streamline cyber information sharing in preparation for the next real-world crisis;
3. Address the virtual flow of information and activities of international organizations during the first 180 days of a natural disaster;
4. Encourage all formal and informal groups across the globe to actively participate or observe the exercise on–site in San Diego, CA or virtually on the web.

While, this was only an exercise, the results were highly successful, and they show that integrating digital technologies and social media and self-organizing various agencies and the public is valuable in the management of disasters (Howe et al, 2011).

Design Principle 10: There is a Need for a More Integrated Set of CIMS

CIMS need to be able to interact with each other on a local, regional, national and international level. Examples of systems that are able to connect local, regional and national, levels are E-Team and WebEOC (with a WebFusion enhancement). However, there is still much work in terms of CIMS integrating the emergency managers, humanitarian responders, non-governmental organizations, businesses, donors, elected officials, and other types of users. Rather than a closed, local crisis information management system held by disparate emergency operation centers, emergency managers need to be able to integrate diverse systems in sometimes ad hoc or unanticipated ways during a crisis. One of the first examples where this took place was in the Haiti Earthquake disaster in 2010 (Nelson et al., n.d.). With their CIMS, the state of Florida was able to establish situational awareness of resource needs regionally with the various counties that were aiding in the earthquake response.

Another example was in the X24 and X24 Europe simulation. Individuals and agencies from 79 and 92 countries, respectively, were able to come together, albeit to manage a simulated disaster, using integrated tools and technologies (Howe et al, 2011).

Design Principle 11: CIMS Need to Have Backup Solutions

CIMS perform a large variety of functions, and they are critical to managing a disaster. In small-scale or routine crises, power will most likely still be operational. Such was the case with Miami-Dade County as a coordinating EOC during the Haiti Earthquake efforts of 2010. It is also the case with many hurricanes that come through Miami-Dade County. In other cases, such as large-scale crisis that overwhelm the resources of local emergency managers, often electricity and communications infrastructure are damaged (Goodchild & Glennon, 2010). There needs to be a backup system in place. This system can consist of a combination of satellite and radio communications (Jennex 2004). It can also consist of one or two computers with word, excel, access, or some other management software on it. In the worse case, it can even consist of paper and pencil forms, templates, spreadsheets, standard operating procedures, and checklists.

Design Principle 12: CIMS Should Have a Means of Interoperability with Each Other

This can be accomplished with a set of data exchange standards, both for operational use and for training. With respect to data exchange standards for operational CIMS, one method in use is the comma separated values (CSV) format. In WebEOC, for example, one can put data into a CSV format and then import it directly into a status board. One also can export the data in various formats as well. This proved extremely useful to quickly and accurately exchange information during the Haiti earthquake, the Super Bowl of 2010, and Pro Bowl of 2010. As emergency managers were organizing the repatriation efforts, the Miami-Dade EOC has several spreadsheets of information that they had collected on the status and special needs of the individuals being repatriated on the Homestead bound flights from Haiti. They were able to create a status board for the coordination efforts and import this information with perfect accuracy in a matter of minutes. Another option is XML. XML is a markup language that allows users to define a set of rules for encoding documents in a format that is both human readable and machine readable (w3schools.com, n.d.). XML standards for emergency management are just starting to emerge. There are several promising standards that make use of XML. These are outlined below.

- *People Finder Interchange Format (PFIF)* (PFIF 1.0 Specification, 2005);
- *ComCARE Vehicular Emergency Data Set (VEDS) and Automatic Crash Notification (ACN) Initiative* (Vehicular Emergency Data Set, 2004);
- *Common Alerting Protocol (CAP)* (Cover Pages, 2009);
- *Emergency Data Exchange Language (EDXL)* (Emergency Interoperability Consortium, 2005);
- *National Information Exchange Model (NIEM)* (Cover Pages, 2009);
- *SAFE: Tsunami Warning Markup Language (TWML) and Cyclone Warning Markup Language (CWML)* (Cover Pages, 2009);
- *The Homeland Emergency Response Exchange (HERE)* (HERENetwork, n.d.).

IMPLICATIONS AND FUTURE DIRECTIONS OF CIMS

Since Hurricane Katrina, research has focused on improving crisis management through the use of information technology. Yet, there is still a great need for improvements with respect to crisis information management systems, and how they integrate with the web, digital technologies, and the public. Research is providing insights into how we view crisis management itself, how organizations interact, and how communities react. CIMS will continue to advance with technology, particularly with the web and digital technologies. The web enables enhanced interconnectivity among information management systems, digital volunteers, and the public. As the digital technologies evolve, we will see more advanced distributed systems as well as advanced cloud-based systems. Digital technologies also enable enhanced connectivity and collaboration among emergency officials and the public. Some of the biggest improvements will be in social media, smart phones and tablets, and geographic information systems. Additionally, emergency managers will need to learn to harness and possibly direct digital volunteers. Along with crowdsourcing, digital technologies, and larger, more connected systems, we will see more effective interoperability and data exchange standards, both for operational use and for simulations and training.

CONCLUSION

In this paper, we discussed design principles for crisis information management systems. We began by differentiating CIMS from the broader IS community. Next we reviewed trends in the evolution of CIMS, especially with respect to advances in technology and the web. After this, we reviewed seminal papers on the design of effective dynamic emergency management systems and web based emergency management systems. In the subsequent section, we identified additional design characteristics of CIMS. There is still a great need for improvements to CIMS, especially with respect to creating distributed, adaptable CIMS with appropriate access controls. More work also needs to be done to incorporate greater collaboration between emergency managers, humanitarian responders, non-governmental organizations, businesses, donors, elected officials and the public. Emergency managers need to learn how to integrate digital volunteers into the emergency response. There also needs to be improvement with respect to connecting various regions of CIMS together as well as better integration of social media, smart phones and tablets, and geographic information systems. Finally, a key area that needs improvement is data exchange standards for quick and accurate exchange of operational and training data. In the future, CIMS will continue to see large growth and evolution with advancing web and digital technology.

ACKNOWLEDGMENT

We sincerely thank the Miami-Dade EOC for sharing their time and insights with us throughout this project, especially David Perez, Frank Reddish, Soheila Ajabshir, and the Logistics Section. We also thank the University of Notre Dame Zahm Research Travel Fund, the National Science Foundation (Award Number CNS-0855164), and the U.S. Department of Education (GAANN Fellowship Award Number P200A090044) for their support of this research.

Chapter 22
Data Mining-Based CBIR System

Shruti Kohli
Birla Institute of Technology, India

Vijay Shankar Gupta
Birla Institute of Technology, India

ABSTRACT

Multimedia mining primarily involves information analysis and retrieval based on implicit knowledge. The ever increasing digital image databases on the internet has created a need for using multimedia mining on these databases for effective and efficient retrieval of images. Contents of an image can be expressed in different features such as Shape, Texture and Intensity-distribution (STI). Content Based Image Retrieval (CBIR) is the efficient retrieval of relevant images from large databases based on features extracted from the image. The emergence and proliferation of social network sites such as Facebook, Twitter and LinkedIn and other multimedia networks such as Flickr has further accelerated the need of efficient CBIR systems. Analyzing this huge amount of multimedia data to discover useful knowledge is a challenging task. Most of the existing systems either concentrate on a single representation of all features or linear combination of these features. The need of the day is New Image Mining techniques need to be explored and a self-adaptable CBIR system needs to be developed.

INTRODUCTION

Data mining is the process of extracting useful non-trivial knowledge from huge data repositories. These techniques have gained popularity in various application domains including medicine where a huge amount of data is available in the form of medical images. However, the subjective analysis of these images by radiologists is vulnerable to inter and intra-observer variability. These variations depend upon image quality as well as the expertise of the radiologists. Computer-aided diagnosis (CAD) systems are therefore employed as second readers to improve upon the precision in diagnosis; thereby enhancing the survival rates. Hence, there is a considerable interest among researchers to develop medical image mining techniques to design efficient CAD systems using medical images obtained through various imaging modalities, like X-Ray, Computed Tomography (CT), Magnetic Resonance Imaging (MRI) and Ultrasound (US).

DOI: 10.4018/978-1-5225-3822-6.ch022

Images are the effective medium for presenting visual data in many applications of industry and academia. With the development of technology, a large amount of images are being generated every day. Therefore, managing and indexing of images become essential in order to retrieve similar images effectively. In conventional systems, images are generally indexed with textual annotation. However, as the database grows larger, the use of keywords based method to retrieve a particular image becomes inefficient. Besides, skilled manual labor is required to annotate every single image with appropriate keywords. As consequences, it becomes a time-consuming and tedious task. Seeing these limitations in the conventional system, content based image retrieval (CBIR) systems came into existence. Content-based image retrieval (CBIR) or Content-base visual information retrieval (CBVIR) is an application of computer vision technique. In CBIR, retrieval of images is based on their visual attributes / features such as color, texture, and shape etc (R.Senthil Kumar et al., 2013). In CBIR, each image that is stored in database has its features extracted and compared to the features of the query image. It involves two steps:

- **Feature Extraction:** The first step in the process is extracting image features to a distinguishable extent.
- **Matching:** The second step involves matching these features to yield a result that is visually similar (Shadma Parveen et al., 2013).

Based on the matching criteria, images can be retrieved from a larger database efficiently. This technique can be used successfully in the following areas:

- **Security Check:** Finger print or retina scanning for access privileges.
- **Medical Diagnosis:** Using CBIR in a medical database of medical images to aid diagnosis by identifying similar past cases.
- **Crime Prevention:** Automatic face recognition system, used by police forces.
- Automated Inspections system for the manufacturing industries.

NEED OF MULTIMEDIA MINING

Recent explosion in the quantity of multimedia data stored in social networks and other multimedia sites has engendered the need for new and better techniques for accessing data specifically images. Indexing and retrieval are at the core of multimedia system design— the knowledge potential of huge quantity of multimedia data may lay unexplored in the absence of effective tools for easy access to the collected information. Once collected, the data must be organized efficiently. The object of the retrieval process is to obtain limited information to meet the needs of a user at a particular time, within particular domain applications. Often it is extremely difficult to achieve this objective in actual practice. A major challenge, therefore, lies in developing techniques that can “interpret” the multimedia contents in large data collections so efficiently as to extract all information items relevant to the user query (Meenakshi Shruti Pal, et al.,2013). Multimedia mining deals with the extraction of implicit knowledge; in other words, it looks for multimedia data relationships or other patterns that are not explicitly stored in multimedia files. Multimedia mining is more than just an extension of data mining; it is an interdisciplinary endeavor that draws upon expertise in computer vision, multimedia processing, multimedia retrieval, data mining, machine learning, database and artificial intelligence. Rapid progress in digital data acquisition and

storage technology has led to enormous and fast-growing volumes of data. Valuable information hidden in this data cannot be extracted without the aid of powerful tools because of the overwhelming size and volume of the data. Multimedia mining systems that can automatically extract semantically meaningful information (knowledge) from multimedia files are increasingly in demand. Generally, multimedia database systems store and manage a large and varied collection of multimedia objects such as image, video, audio and hypertext data. To achieve it, we need tools for discovering relationships between objects or segments within multimedia document components; e.g. classifying images based on their content, extracting patterns in sound, categorizing speech and music, and recognizing and tracking objects in video streams. In general, the multimedia files from a database must be first pre-processed to improve their quality. Thereafter they undergo various transformations and a process of features extraction to generate important features from the multimedia files. With the generated features, mining can be carried out using data mining techniques to discover significant patterns. These resulting patterns are then evaluated and interpreted in order to obtain knowledge for the final application.

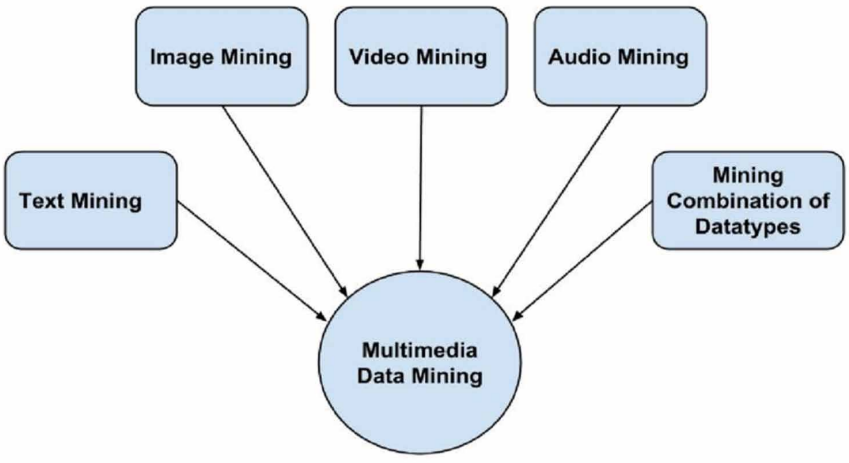
With the recent advances in electronic imaging, video devices, storage, networking and computer power, the amount of multimedia has grown enormously, and data mining has become a popular way of discovering new knowledge from such a large data sets. Note that to mine multimedia data we must mine combination of two or more data types such as text and video, or text, video and audio. One solution is to develop mining tools to operate on the multimedia data directly.

INTRODUCTION TO MULTIMEDIA DATA MINING

Multimedia Data refers to data such as text, numeric, images, video, audio, graphical, temporal, relational and categorical data. Multimedia data mining refers to pattern discovery, rule extraction and knowledge acquisition from multimedia database (Dianhui Wang, et al,2007). Figure 1 illustrates multimedia data mining, in particular, various aspects of multimedia data mining (Bhavani Thuraisingham,et. al, 2001).

Tremendous benefits of traditional data mining are proven for structured data. Now it's time for extending the mining techniques for unstructured & heterogeneous data.

Figure 1. Multimedia data mining



POTENTIAL APPLICATIONS OF MULTIMEDIA MINING

It is well known that multimedia information is ubiquitous and often required, if not essential in, many applications. Consider the application areas of MDM and related industries who are users of technology.

Multimedia Data Mining in Digital Libraries (Sanjeevkumar R. Jadhav,et. al. 2007) — the digital library retrieves collects stores and preserves the digital data. For this purpose, there is a need to convert different formats of information such as text, images, video, audio, etc. The data mining techniques are popular while conversion of the multimedia files in the libraries.

Multimedia data mining for traffic video sequences (Shu-Ching Chen,et. al .2001) -- The analysis & mining of traffic video sequences to discover important but previously unknown knowledge such as vehicle identification, traffic flow, queue detection, incident detection & the spatio temporal relations of the vehicle at intersection, provide an economic approach for daily traffic monitoring operations.

Multimedia data mining approach for automated event analysis of suspicious movements -- Many government organizations, multi-nationals companies, shopping malls, banks and etc are using surveillance system to monitor movements of employees, visitors, machines etc. An ultimate objective of such surveillance system is to detect suspicious person based on their movements to maintain security and avoid any casualty.

- **Application in Medical Analysis:** Application of Data Mining Techniques for Medical Image.
- **Classification Media Production and Broadcasting (Latifur Khan,et. al.,2007):** Proliferation of radio stations and TV channels makes broadcasting companies to search for more efficient approaches for creating programs and monitoring their content.
- **Multimedia Data Mining**: On What Kind of Data Multimedia data mining is being put into use and studied for databases, including multimedia databases and unstructured and semi structured repositories such as the World Wide Web.
- **Multimedia Databases:** Multimedia databases include video, images, and audio and text media. They can be stored on extended object-relational or object-oriented databases, or simply on a file system.
- **World Wide Web:** The multimedia is becoming increasingly available on the World Wide Web which can be viewed as a large, distributed, multimedia database.

However the data is unstructured and heterogeneous. Data in the World Wide Web is organized in inter-connected documents (Manjunath T.N et al. 2010). These documents can be text, audio, video, raw data, and even applications.

IMPORTANCE OF CONTENT BASED IMAGE RETRIEVAL (CBIR)

In late 1990's, Content-based image retrieval was introduced by T. Kato. It has been used as an alternative to text based image retrieval. IBM was the first, who take an initiative by proposing query-by image content (QBIC) (HuiHui Wang,et al,2010).CBIR involves the following four parts in system realization: data collection, build up feature database, search in the database, arrange the order and results of the retrieval.

Image retrieval has been an extremely active research area over the last 10 years, but first review articles on access methods in image database appeared already in the early 1980s. The growing number of digital image acquisition and storage systems in clinical routine raises demands for new access methods. Still, most picture archiving and communication systems (PACS) only use textual information to access a patient's image data, which has been mainly entered manually. Content-based image retrieval (CBIR) depends on automatically extracted content-descriptions for each images as well as their storage and comparison upon a query. The vast majority of users do not want to retrieve images simply on the basis of similarity of appearance. They need to be able to locate picture of a particular type of object, phenomenon or event (Armitage,et.al,1997). He(Gudiva,et.al,1995) have drawn a useful distinction between retrieval by primitive image feature (Such as color, texture or shape) and semantic feature (such as the type of object or even depicted by the image) he (J.P.Eakins,et.al,1998) has taken this distinction further, identifying three distinct levels of image query each of which can be further subdivided.

Level 1: Retrieval by primitive features. Such as color, texture, shape (e.g. "Find all pictures containing yellow or blue stars arranged in a ring").
Level 2: Retrieval by derived attribute or logical feature. (e.g. "Find pictures of a passenger train crossing a bridge").
Level 3: Retrieval by abstract attributes (e.g. "Find pictures illustrating pageantry").

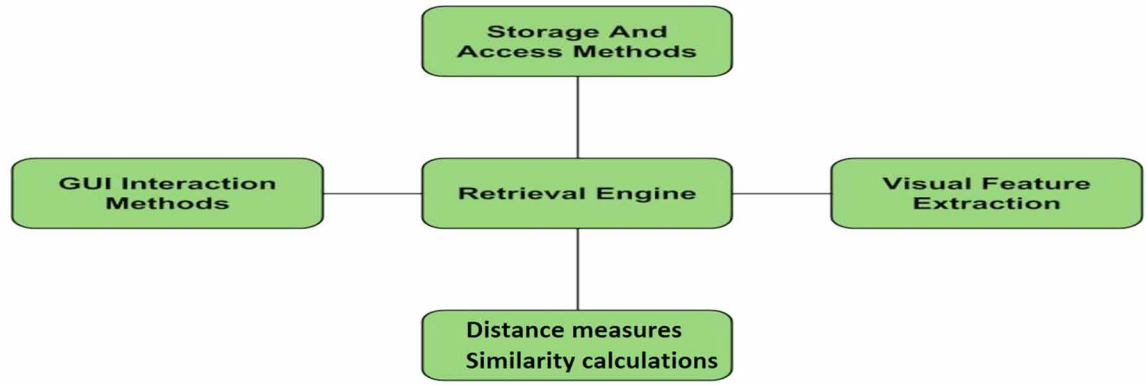
CBIR is important for the features employed by the image retrieval systems include color, texture, shape and spatial are retrieve automatically. Similarities of images are based on the distances between features.

Over the past ten years or so, significant progress has been made in making computers learn to understand, index, and annotate pictures representing a wide range of concepts. Image mining deals with the extraction of implicit knowledge, that is, image data relationship or other /patterns not explicitly stored in the images. Image mining is more than just an extension of data mining to the image domain. The cardinal role of image mining is to discover the means of an effective processing of low-level pixel representations, contained in a raw image or image sequence, to arrive at high-level spatial objects and relationships. (Amol P Bhagat et al.,2013) (R.Senthil Kumar,et al.,2013) The focus of image mining is on the extraction of patterns from a large collection of images. While there seems to be some overlap between image mining and content-based retrieval (since both deal with large collections of images), image mining goes beyond the problem of retrieving relevant images. In image mining, the goal is to discover image patterns that are significant in a given collection of images and the related alphanumeric data (Amol P Bhagat,et al.,2013) . The fundamental challenge in image mining is to reveal out how low-level pixel representation enclosed in a raw image or image sequence can be processed to recognize high-level image objects and relationships (Shadma Parveen et al.,2013).

Most of these systems have a very similar architecture for browsing and archiving/indexing images comprising tools for the extraction of visual features, for the storage and efficient retrieval of these features, for distance measurements or similarity calculations and a type of graphical user interface (GUI). This general system setup is shown in Figure 2.

Although early systems existed already in the beginning of the 1980s (N.S.Chang,et.al,1980) the majority would recall systems such as IBM's Query By Image Content (QBIC) as the start of content-based image retrieval (M.Flickner,et.al.,1995),(W.Niblack,et.al,1993). The commercial QBIC system is definitely the most well known system. Another commercial system for image (J.R.Bach,et.al,1996) and

Figure 2. The principal components of all content-based image retrieval systems



video (A.Hampapur,et.al,1997) retrieval is virage that has been well known commercial customers such as CNN. CBIR is an image search systems that search for image by image content (ie) Keyword-based Image/Video Retieval (eg) Google image search, YouTube.

TYPES OF CBIR BASED IMAGE RETRIEVAL

The need for the CBIR has extremely increased in many application areas such as medical, crime prevention, biomedicine, military, culture, commerce, education, entertainment, and also in web image classification and searching. Existing general purpose content based image retrieval systems roughly comes under these categories:

1. **Region-Based:** The Netra and Blobworld are two earlier region based image retrieval systems (P.Jayaprabha,et.al, 2012). During retrieval, a user is provided with segmented regions of the query image, and is required to assign several properties, such as the regions to be matched, the features of the regions, and even the weights of different features (Feng Jing,et.al, 2005).
2. **Object-Based:** Object-based image retrieval systems retrieve images from a database based on the appearance of physical objects in those images. These objects can be elephants, stop signs, helicopters, buildings, faces, or any other object that the user wishes to find. One common way to search for objects in images is to first segment the image in the database and then compares each segmented region against a region in some query image presented by the user (Derek Hoiem,et. al. 2004). Such image retrieval systems are generally successful for objects that can be easily separated from the background and that have distinctive colors or textures.
3. **Example-Based:** Users give a sample image, or portion of an image, that the system uses as a base for the search. The system then finds images that are similar to the base image.
4. **Feedback-Based:** System shows user a sample of pictures and asks for rating from the user. Using these ratings, system re-queries and repeats until the right image is found (Masashi,et.al, 2009).

CBIR METHODOLOGIES

CBIR system can be used in one of two ways. First, exact image matching, that is matching two images, one an example image and the other, image in image database. Secondly is approximate image matching, that is finding most closely match images to a query image provided. CBIR involves the following four parts in system realization: **Data Collection**, **Build up Feature Database, Search the Database, arrange the order** and deal with the results of the retrieval (NidhiSinghai,et.al,2010).

- **Data Collection:** Using the Internet spider program that can collect webs automatically to interview Internet and do the collection of the images on the web site, then it will go over all the other webs through the URL, repeating this process and collecting all the images it has reviewed into the server.
- **Build up Feature Database:** This system is based on indexing. Firstly we analysis the collected images, then extract the feature information. Currently, the features that use widely involve low level features such as color, texture and so on, the middle level features such as shape etc.
- **Search the Database:** The search engine will search the suited feature from the database and calculate the similar distance, then find several related webs and images with the minimum similar distance.
- **Process and Index the Results Index**: The image obtained from searching due to the similarity of features, then return the retrieval images to the user and let the user select. If the user is not satisfied with the searching result, he can re-retrieval the image again, and searches database again.

METHODS FOR FEATURE EXTRACTION

The different methods based on features are used to extract the images. The main features based methods are described as following:

1. **Color:** Color is the feature of content based image retrieval systems for retrieve the image. First a color space is used to represent color images. The RGB space where the gray level intensity is represented as the sum of red, green and blue gray level intensities (AmitKaul,et.al,2009). Variety of color spaces include, RGB, LUV, HSV (HSL), YCrCb and the huemin-max-difference (HMMD) (MicheleSaad,et.al,2008).Common color features or descriptors in CBIR systems include, color-covariance matrix, color histogram, color moments and color coherence vector . The Color Structure Descriptor (CSD) represents an image by both the local structure of the color and the color distribution of the image or image region.
2. **Texture:** The ntion of texture generally refers to the presence of a spatial pattern the has some properties of homogeneity (AmandeepKhokher,et.al,2011). Directional features are extracted to capture image texture information. The six visual texture properties were coarseness, contrast, directionality, line likeness, regularity and roughness.

Two classes of texture representation method can be distinguished:

- *Structural methods* including morphological operator and adjacency graph, describe texture by identifying structural primitives and their placement rules. They deal with the arrangement of image primitives, presence of parallel or regularly spaced objects.
- *Statistical methods* include the popular co-occurrence matrix, Fourier power spectra, Shift invariant principal component analysis (SPCA), Tamura feature, Multi-resolution filtering technique such as Gabor and wavelet transform, characterize the texture by statistical distribution of the image intensity.

Spectral approach is done by Fourier transform of an image then group the transformed data in a way that it gives some set of measurements.

3. **Shape:** Shape is also one of the important features of an image. Generally we can divided the shape into two categories, region-based and boundary-based. In the late years we just uses only the outer boundary of the shape while the current uses the entire shape region (AmitKaul,et. al,2009),(YongRui,et.al,99).

The most successful representatives for these two categories are Fourier descriptor and moment invariants.

1. **Fourier Descriptor:** The fourier descriptor is to use the Fourier transformed boundary as the shape feature. Some early work can be found. To take into account the digitization noise in the image domain, Rui et al. proposed a modified Fourier descriptor which is both invariant to geometric transformations and strong to noise.
2. **Moment Invariants:** The main motive of moment invariants is to use region-based moments which are invariant to transformations, as the shape feature. The Hu identified seven such moments based on his work. Many improved versions emerged in this method. Based on the discrete version of Green's theorem, Yang and Albregtsen proposed a fast method of computing moments in binary images. Some facts that motivated the most useful invariants were found by extensive experience and trial-and-error, Kapur et al. developed algorithms to systematically search and generate for a given geometry's invariants (Meenakshi Shruti Pal, et al.,2013).

APPLICATION OF CBIR IN MEDICAL

It is important to explain the needs and to discuss possible technical and methodological improvements and the resulting clinical benefits. The goal of medical information systems have often been defined to deliver the needed information at the right time, the right place to the right person. In order to improve the quality and efficiency of care processes, such a goal will most likely need more than a query by patient name, series ID or study ID for images. For the clinical decision-making process it can be beneficial or even important to find other images of the same modality, the same anatomic region of the same disease. DICOM headers have proven to contain a fairly high rate of errors. Take example as the field anatomical region, error rates of 16% have been reported. This can hinder the correct retrieval

of all wanted images. Clinical decision support techniques such as case-based reasoning or evidence-based medicine can even produce a stronger need to retrieve images that can be valuable for supporting certain diagnoses. It could even be imagined to have image-based reasoning (IBR) as a new discipline for diagnostic aid. Besides diagnostics, teaching and research especially are expected to improve through the use of visual access methods as visually interesting images can be chosen and can actually be found in the existing large repositories.

R.Senthil Kumar et al. (2013) shows how CBIR can be helpful in the Medical Application due to ever increasing image database. Digital images are produced in a huge amount by the Radiology, Cardiology, and by the Pathology departments. A need has been arisen to build a system which can handle such a huge number of digital images.

For the medical purpose, the system should deliver the right information to the right person in the right time. So, an efficient and accurate system is required to fulfill the need. According to this, CBIR can be successfully implemented in diagnosis of disease by retrieving similar images of the past cases. Also, CBIR is useful in other field like Teaching can be augmented with the CBIR. In research work the researchers have more options. The low level features (color, texture & shape) have been used for retrieval of the images.

There are also several other departments where CBIRs have been implemented. A categorization of images from various departments has been described. A classification of dermatologic images, cytological specimens have already been described. Pathology images have often been proposed for content-based access as the color and texture properties can relatively easy be identified. Within the radiology departments, mammographics are one of the most frequent application areas with respect to classification and content based search. The negative psychological effects of removing tissue for false positive patients have been described of one of the principal goals to be reduced. Ultrasound images of the breast are used. Another active area is the classification of high resolution computed tomography (HRCT) scans the lung as done by the Assert project. Magnetic resonance images (MRI) of the brain are used to demonstrate the image search algorithm. CT brain scans the search for medical tumors by their shape properties (after segmentation) have been described. Functional photon emission tomography (PET) images and spine X-ray are used for retrieval. Table 1 provides the brief view of various image and the systems that are using these images.

Table 1. Various image types and the systems that are using these images

Images Used	Names of the System
HRCTs of the lung	ASSERT
Functional	PET FICBOS
Spine X-rays	CBIR2
CTS of the head	MIMS
Mammographics	APKS

CURRENT ISSUES WITH CBIR SYSTEMS

The central problems regarding the retrieval task are concerned with "interpreting" the contents of the images in a collection and ranking these according to the degree of relevance to the user query. This 'interpretation' of image content involves extracting content information from the image and using this information to match the user's needs. Knowing how to extract this information is not the only difficulty; another is knowing how to use it to decide relevance.

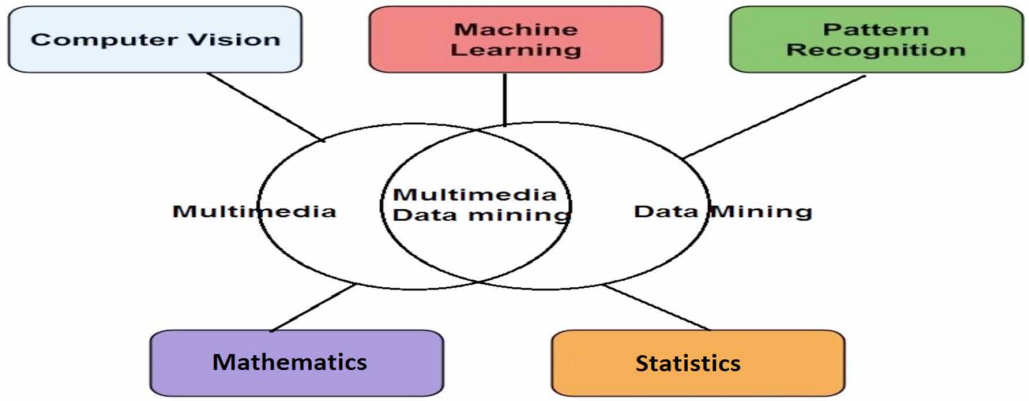
The decision of relevance characterizing user information need is a complex problem. To be effective in satisfying user information need, a retrieval system must view the retrieval problem as 'human-centered', rather than 'computer-centered'. In a number of recent papers, (Shadma Parveen, et al., 2013), (R.Senthil Kumar et al., 2013), (Ramadass, 2013), (Meenakshi Shruti Pal et al.,2013) an alternative to the computer centred predicate was proposed. This new approach is based on a human-computer interface which enhances the system to perform retrieval tasks in line with human capabilities. The main activities in this approach consist in analyzing a user's goals from feedback information on the desired images, and adjusting the search strategy accordingly. Here, the user manages the retrieval system, via the interface, through the selections of information gathered during each interactive session, to address information needs which are not satisfied by a single retrieved set of images.

The human-computer interface has been less understood than other aspects of image retrieval, partly because humans are more complex than computer systems, since motivations and behaviors are more difficult to measure and characterize. Recently, studies have been conducted to simulate human perception of visual contents via the use of the supervised analysis method. "Themes" are derived from similarity functions through the assignment of numerical weights.

DATA MINING IN CBIR

Multimedia database systems store and manage large quantities of multimedia data sets such as audio, video, images, graphics, sounds, text, documents and hypertext data. This multi-media information does not have a uniform structure and a unified approach. Multimedia data is usually multi-dimensional and unstructured or semi- structured, with each medium having its own characteristics, its own way of presentation of information (Nandish Chauhan,et al. 2013) . Apart from presenting information independently, each medium can also express a different characteristic of the same event, so that the media taken together describe the existence, development and result of an event in its entirety. So, there have to be features of information, attributes and the relationships in multimedia data sets that are not within our intuitive grasp. Multimedia data mining (Figure 3) involves intelligent data analysis, aimed at finding these features, attributes and relationships in order to construct models for making decisions, taking countermeasures and achieving fusion analysis. "Based on the data stored in them, multimedia databases are used in content-based image retrieval, sound delivery system, video on demand system, World Wide Web and identifying the password command voice based user interface, etc. Multimedia Mining focuses on the following five fronts: Image Mining, Video Mining, Audio Mining, Web Mining and Multi-Media Integrated Mining. Image mining involves the introduction of data mining technology into the image field of study, to discover the information and knowledge hidden in a large quantity of image data. It is the process of identifying hidden, valid, novel, potentially useful, and ultimately understandable semantics of information and knowledge from extensive image data"(Nandish Chauhan et al.,2013).

Figure 3. Multimedia data mining



The typical data mining process consists of several stages and the overall process is inherently interactive and iterative. The main stages of the data mining process are (1) Domain \understanding; (2) Data selection; (3) Data pre-processing, cleaning and transformation; (4) Discovering patterns; (5) Interpretation; and (6) Reporting and using discovered knowledge (Amol P Bhagat et al,2013).

DATA MINING

Data mining, the extraction of hidden predictive information from large databases, is a powerful new technology with great potential to help companies focus on the most important information in their data warehouses. Data mining tools predict future trends and behaviors, allowing businesses to make proactive, knowledge-driven decisions (Gaurav et al.,2014). The automated, prospective analyses offered by data mining move beyond the analyses of past events provided by retrospective tools typical of decision support systems. Data mining tools can answer business questions that traditionally were too time consuming to resolve. They scour databases for hidden patterns, finding predictive information that experts may miss because it lies outside their expectations.

Most companies already collect and refine massive quantities of data. Data mining techniques can be implemented rapidly on existing software and hardware platforms to enhance the value of existing information resources, and can be integrated with new products and systems as they are brought online (Gaurav et al.,2014). When implemented on high performance client/server or parallel processing computers, data mining tools can analyze massive databases to deliver answers to questions such as, "Which clients are most likely to respond to my next promotional mailing, and why?"

Data mining techniques are the result of a long process of research and product development. This evolution began when business data was first stored on computers, continued with improvements in data access, and more recently, generated technologies that allow users to navigate through their data in real time. Data mining takes this evolutionary process beyond retrospective data access and navigation to prospective and proactive information delivery. Data mining is ready for application in the business community because it is supported by three technologies that are now sufficiently mature:

- Massive data collection.
- Powerful multiprocessor computers.
- Data mining algorithms.

Commercial databases are growing at unprecedented rates. A recent META Group survey of data warehouse projects found that 19% of respondents are beyond the 50 gigabyte level, while 59% expect to be there by second quarter of 1996.1 In some industries, such as retail, these numbers can be much larger. The accompanying need for improved computational engines can now be met in a cost-effective manner with parallel multiprocessor computer technology. Data mining algorithms embody techniques that have existed for at least 10 years, but have only recently been implemented as mature, reliable, understandable tools that consistently outperform older statistical methods.

In the evolution from business data to business information, each new step has built upon the previous one. For example, dynamic data access is critical for drill-through in data navigation applications, and the ability to store large databases is critical to data mining (Gaurav et al.,2014). The core components of data mining technology have been under development for decades, in research areas such as statistics, artificial intelligence, and machine learning (Gaurav et al.,2014). Today, the maturity of these techniques, coupled with high-performance relational database engines and broad data integration efforts, make these technologies practical for current data warehouse environments.

DATA MINING TECHNIQUES

The most commonly used techniques in data mining are:

- **Artificial Neural Networks**: Non-linear predictive models that learn through training and resemble biological neural networks in structure.
- **Decision Trees**: Tree-shaped structures that represent sets of decisions. These decisions generate rules for the classification of a dataset. Specific decision tree methods include Classification and Regression Trees (CART) and Chi Square Automatic Interaction Detection (CHAID).
- **Genetic Algorithms**: Optimization techniques that use processes such as genetic combination, mutation, and natural selection in a design based on the concepts of evolution.
- **Nearest Neighbour Method**: A technique that classifies each record in a dataset based on a combination of the classes of the k record(s) most similar to it in a historical dataset. Sometime called the k-nearest neighbour technique.
- **Rule Induction**: The extraction of useful if-then rules from data based on statistical significance.

Many of these technologies have been in use for more than a decade in specialized analysis tools that work with relatively small volumes of data. These capabilities are now evolving to integrate directly with industry-standard data warehouse and OLAP platforms.

USAGE OF DATA MINING TECHNIQUES TO DEVELOP CBIR

Researchers have worked on developing such CBIR systems. (Nishchol,et.al,2011) He proposed a CBIR System named STIRF (Shape, Texture, and Intensity-distribution with Relevance Feedback) that uses a neural network for nonlinear combination of the heterogeneous STI features. Further for the different applications and users based upon relevance feedback. Prior to retrieval of relevant images, each feature is first clustered independent of the other in its own space and this helps in matching of similar images. Testing the system on a database of images with varied contents and intensive backgrounds showed good results with most relevant images being retrieved for a image query. The system showed better and more robust performance compared to existing CBIR systems. Keywords: Multimedia Data Mining, Image Mining, Content Based Image Retrieval, Multimedia Information retrieval.

In Enhanced Multistage Content-based Image Retrieval (Nandish Chauhan,et al. 2013) explained that Search criteria is based on three-layer feed forward architecture. First layer consists of comparison of color feature, the second layer consists of comparison of texture feature and the last is comparing of shape feature.

In Web Based Image Retrieval System Using Color, Texture and Shape Analysis Comparative Analysis (Amol.P.Bhagat et al,2013) research work shows the client-server functionality, searching images without any compatibility issue. For the retrieval of images, primitive features images have been used. The working principle of various systems like QBIC, Netra Image Management System, and Kingfisher has been explained. In Sketch4Match - Content-based Image Retrieval System using sketches, it is explained that Human is a visual type (Shadma Parveen et al.,2013). The human can recall the visual information more quickly than the textual information since the text is the human abstraction of image. In this paper a user interface is proposed with some drawing area in which the user draws a color sketch or a blob. Features of the color sketch are extracted. The extracted features are matched with the features of stored image and on the bases of similarity matching the images are retrieved. A further refinement process can be employed until get the desired result.

The Content Based Image Retrieval System (CBIR) (H. R. Kang,et.al,1997) is based on the visual content of the Image. Desirable features can extracted based on the visual content of the Image. The development of the Image Mining technique is based on the Content Based Image Retrieval system. Colour, texture, pattern, image topology, shape of objects and their layouts and locations within the image, etc are the basis of the Visual Content of the Image and they indexed. The Several features that are used in the Image Retrieval system are the following. The popular amongst them are colour of the Image, What is the Texture, The Contours i.e. (shape), image topology, on which layout or the Background is Image depicted, region of interest etc.

Colour Features: One of the features that are used is the colour of the Image, since it has very strong co-relation with the underlying objects of the Image. The colour of an Image is very robust to background, orientation, scaling and texture of the Image. In the terms of Digital Imagery the Colour Pixels is the Combination of (RED, BLUE and GREEN). It is well known fact that any colour combination of these three colours can produce any colour. The HSV colour space is depicted below, because that is widely used in the CBIR community. The Red, Blue and Green pixels can be considered as r, g, b and holds in the range of closed intervals [0, 1] and these normalized values r, g, and b are used to transform into the HSV space. Transformation of RGB to HSV colour space can be accomplished by the following set of equations [1]: $V = \max(r, b, g)$

Colour Histogram: The overall distribution of colours can be done with the help of Colour Histogram which is the basis of characterization of the Image. Color histogram is a representation of the distribution of colors in an image. For digital images, a color histogram represents the number of pixels that have colors in each of a fixed list of color ranges that span the image's color space, the set of all possible colors. The color histogram can be built for any kind of color space, although the term is more often used for three-dimensional spaces like RGB or HSV

Colour Coherence Vector: The colour coherence vector-based (G. Pass, et.al, 1996) approach was designed to accommodate the information of spatial colour into the colour histogram. Here we can classify each pixel in an image, based on whether it belongs to a large uniform region or not. For example, we can consider a region to be uniformly coloured if it consists of the same colour and the area of the region is above a certain threshold (say, 2%) of the whole image area. We refer to the pixels in these regions as coherent pixels.

Texture Features: Texture is a very interesting image feature that has been used for characterization of images, with application in content based image retrieval. A major characteristic of texture is the repetition of a pattern or patterns over a region in an image. The elements of patterns are sometimes called textons. The size, shape, colour, and orientation of the textures can vary over the region. The difference between two textures can be in the degree of variation of the textures. It can also be due to spatial statistical distribution of the textons in the image. Texture is an innate property of virtually all surfaces, such as bricks, fabrics, woods, papers, carpets, clouds, trees, lands, skin, etc. It contains important information regarding underlying structural arrangement of the surfaces in an image. When a small area in an image has wide variation of discrete tonal features, the dominant property of that area is texture. In this method the co-occurrence matrix is constructed based on the orientation and distance between image pixels. Meaningful statistics are extracted from this co-occurrence matrix, as the representation of texture. Since basic texture patterns are governed by periodic occurrence of certain Gray levels, co-occurrence of Gray levels at predefined relative positions can be a reasonable measure of the presence of texture and periodicity of the patterns. Using this co-occurrence matrix, the texture features metrics are computed as follows (R. Jain,et.al,1995).

TECHNIQUES USED IN MEDICAL IMAGE RETRIEVAL

The various techniques that are currently – used or that have been proposed for the use in medical image retrieval applications.

Query Formulation: Most systems in CBIR use the query by example (s) QBE paradigm which needs an appropriate starting image for querying. This problem of a sometimes missing starting image is known as the page zero problems. If text is attached to the images then the text can be used as a starting point. The starting point does not need to be further defined but the images of the case can be used directly. The use of sketches has already been proposed in generic image retrieval and it has also been proposed for the use in medical applications. Consisting the difficulty in exact drawing and the need for some artistic skills and time, this method will only be applicable for a very small subset of queries, such a tumor shapes or spine X-rays where outline are possible directly in the images (R.Senthil Kumar et al., 2013). For general image retrieval sketches are too time consuming and the retrieval results often not exact enough.

Text: Many systems propose to use text from the patient record or studies to search by content. The use of text for queries is undeniable efficient. The combination of textual with visual features or content and context of the images does have the most potential to lead to good results. Besides the free text that is frequently used for retrieval, medical patient records also contain very valuable structured information. Such as age, sex and profession of the patient. This information is just as important as free text to put the images into content (R.Senthil Kumar et al., 2013).

CONCLUSION

In recent years there has been tremendous growth in the quality (resolution and color depth), nature (dimensionality) and throughput (rate of generation) of the images acquired and this trend of upward growth is likely to continue. This poses ever changing challenges to image retrieval research. With the advent of very large-scale images (e.g., Google and Yahoo!, Facebook, LinkedIn, Flicker), and high resolution, high dimension biomedical and astronomical imagery, often captured at high throughput, image retrieval research faces an immediate challenge of incorporating the ability to make high resolution, high-dimension, and high-throughput images searchable by content. Meanwhile, we do hope that the quest for a robust and reliable image understanding technology will continue. Together these will constitute the agenda for future research. The future of CBIR will depend on the progress made in each aspect of image retrieval, and the extent to which the individual user benefits by it.

Chapter 23
Serendipity on a Plate

Michael Johansson
Kristianstad University, Sweden

ABSTRACT

This article will present and discuss the design thinking, methods, processes and some examples of work that demonstrates how, together with different co-creators, one sets up a work practice using digital 3d objects and images. That in different ways and formats helps us to explore how a database, a set of rules can be used in a dialogue with artistic work practice and how such a process can be used to create images and animation in a variety of design and art projects. The main example is a project called Conversation China that still is in its making, here one works with rather complex processes, involving several digital analogue techniques as the basis for creating the images for a 150 pieces porcelain dinner set. The author's interest in this work is how the intention of the artist or designer is transferred and later embedded in the procedural or algorithmic process and how this intent is organized and set up to secure an desired outcome, mixing the possibilities of the digital media object with manual editing and artistic craftsmanship. What this article tries to put forward is how we designed and set up environments for working with non linear and procedural media, their different expressions and forms by using explorable prototypes and design thinking?

FOUR PROJECTS

Already in early 90's when I worked with a Swedish company Advisors to improve visual representations in a virtual reality setting for cognitive therapy using advanced computer graphics system provided by Silicon Graphics and Softimage. I became familiar with the visual qualities and rendering techniques of virtual objects and 3d worlds. During these experiments I became interested in how to put together different 3d objects from a database into complex spatial configuration to improve the overall immersion and of the virtual world itself. In this process, errors in compiling the different objects created stunning visual results and led me into creating a system for randomly explore a limited database of 3d objects. The project was called VET, Vacuum Extropia Theory. The project was supported by the Swedish art council and presented at an exhibition. In VET the idea was by animation, cluster different 3d objects and use a virtual camera to automatically explore 3d environments and worlds (see Figure 1), in theory,

DOI: 10.4018/978-1-5225-3822-6.ch023

Figure 1. Image vsfär 197 from VET

algorithms are repeatable and should produce identical results every time, but by stressing implementation and limitations of software and the computer itself I intentionally caused and looked out for errors and flaws that produce interested visual expressions.

Boom

At that time the tools still where very simple and the different outputs from the computer where limited. I could clearly see that the software I used, and still do could produce good visual results, but to achieve the kind of complexity I was looking for I knew I had to be patient and to spend time to build all the models I needed. So in parallel I started to write scenarios and simulate various computer programs never written, as a ground for visual exploration in a series of paintings

Here you can manufacture a world for its future inhabitants in a couple of hours, since it will not take you any longer to enter BOOM into your computer. In the years to come the program will undoubtedly have a great influence, especially upon the thinking and lifestyle of man. The principal reason for this is the fact that the concepts and methods of the program are so tantalizing and accessible. What you do is that you provide a data memory with a set of facts, and then you load this memory with mathematical data. There are an infinite number of parameters to set for the user. Everything from the way in which the cholesterol level of a certain president will develop during a certain period of time to the background radiation of the universe.

Abadyl

The city of Abadyl has been described and written about in several articles and papers before, and is today my main art project where I conduct most of my work. The city of Abadyl is created and constantly re-generated by using the lack of information as a resource for worldmaking. By providing ambigu-

ous fragments as a starting point, it serves as a vital part in the creation of a space where we can be in a constant dialogue with, a large database of material that is interlinked through the architecture of a city, regardless of its incompatibilities. That space is a continuously evolving platform for staging both immediate and long-term projects. The method establish a multidisciplinary common ground for a art practice, interaction design and technology development, through an investigation of philosophy and criticism in a dynamic material. The approach is to create an environment which facilitates artistic work practice in complex production environments such as those of digital media, supporting invited artists, researchers, companies, and students. We establish a ready-made, fictitious gravity well that others can easily transfer their knowledge into. Abadyl is all about using a generative logic that both limits and expands creativity (Boden, 1997). The fundamental parameters of this logic guide what can and cannot be included in a fictional but plausible universe. Our concern is not so much with a consistent, watertight universe, but rather what can be generated inside a framework of a large number of predetermined real and fictitious parameters.

Endgame

Endgame is a storytelling game using the 100 different objects that is included in the framework of the city of Abadyl (see Figure 2). Establishing a game setting similar to fragmented storytelling, often used in games such as Bioshock. Here the players must find fragments during the progression of the game and piece them together by writing short stories. In End Game the objects become constraints and the foundation for the players to fill in the gaps. Endgame attempts to as pointed out before to understand and redefine our world in a situation where information is lacking. This lack of information is used as a

Figure 2. Endgame

resource. To help our co-creators in End game and later in Conversation China we borrowed the dramatical model from Joseph Cambell and Christoffer Vogler to secure a narrative progression. (Campbell, 2004; Vogler, 2007)

The human dilemmas in that Campbell's captures in his hero's journey structure are conditions that always will have relevance. So if one instead look on the hero's journey as a series of dilemmas that we through our human condition constantly face, we have a series of situated action that can be represented over and over again and still be relevant to us, in understanding our human endeavours. Each part has one of the objects name written on one side and a coloured patterns on the other. With one word of an object written on top of it, and a coloured pattern on the back side. It also contains 100 notes card where the story fragments are written during play, and 100 action card which have the players exchange/steal/loose story fragments. In the end each player tell their gathered story and the best story is chosen by voting amongst the players, that story is put into the log book of the game itself. Afterwards all of the story fragments created will used to create a new collective story based on the story fragments of choice.

Design Thinking

One of the central question in all of the past project described is:

What if you know all of the facts and parameters used in a project, how can they still help producing unforeseen and surprising outcomes?

To be able to answer this and at the same time take full advantage of the digital media object there are some important ingredients that must work and play together. First we have to ask ourselves how do we use digital media object as a "design material"? Digital materials are usually more complex and flexible, less transparent and tangible. But above all, it is more cumbersome to learn and produce than most realize. So I believe that increased complexity in creative development calls for both disciplinary depth and integrative skills. Secondly I adopt the mindset that the primary result of a design process is not only a design concept, but the knowledge acquired during the process, knowledge which can in turn be applied to produce a concept.

The design process can thus be viewed as a process of learning. Knowledge acquisition in the space of the unknown entails a design process based on knowledge acquired through phenomena such as luck, uncertainty and chaos, ambiguity and surprise. Our strategy that we already developed in 2008 was to create new perspectives that put traditional roles of production and research in the area of digital media objects aside to better bridge and mix the different professions in new ways. (Lundh, 2008) The overall goal with this set-up or approach was to look at how we can build a narrative and interactive framework, and create a testing and production environment for the different projects we are working on. We also saw a need to develop a format for creating and sharing knowledge in-between different professions and stakeholders in this process – from tests through rehearsals and prototypes into the finished productions, so the co-creators and participants could work closer together exchanging knowledge and experiences between a broad range of discipline, to support the quest for a surprise somewhere in between databases, artistic intentions, algorithms and narratives.

Design Fiction

The past two years I have in different constellations tried to map out a model that helped us reached the fold of the known and into unknown territory, not only as a theory but as a design practice, and also make a contribution to the area of Design Fiction. As artists and designers in particular we have the nature and nurturing to explore, create, and tell stories about possible worlds. Design has its roots in the application of artistic discipline to the engineering of technology, in the form of pattern making for mass production, and as styling for product marketing. Later, design has come into its own as a creative discipline and an origin of innovations rather than only something slapped onto existing ones. Design is one activity of creating the future, not solving old problems as much as inventing new opportunities, still with strong ties to empirical science and engineering but also with the story telling of branding and marketing. In parallel, industries and design have evolved from producing products, to services, and recently to experiences, expressing basic human tenets to create and tell stories. This of course is at the core of fiction, helping us make sense of what it means to be human, how to plan and live our lives, and to find some purpose behind our journey. Science fiction expands on this in a speculative and perhaps ultimate manner, leaving our known world to verge into the fringes of the unknown and beyond.

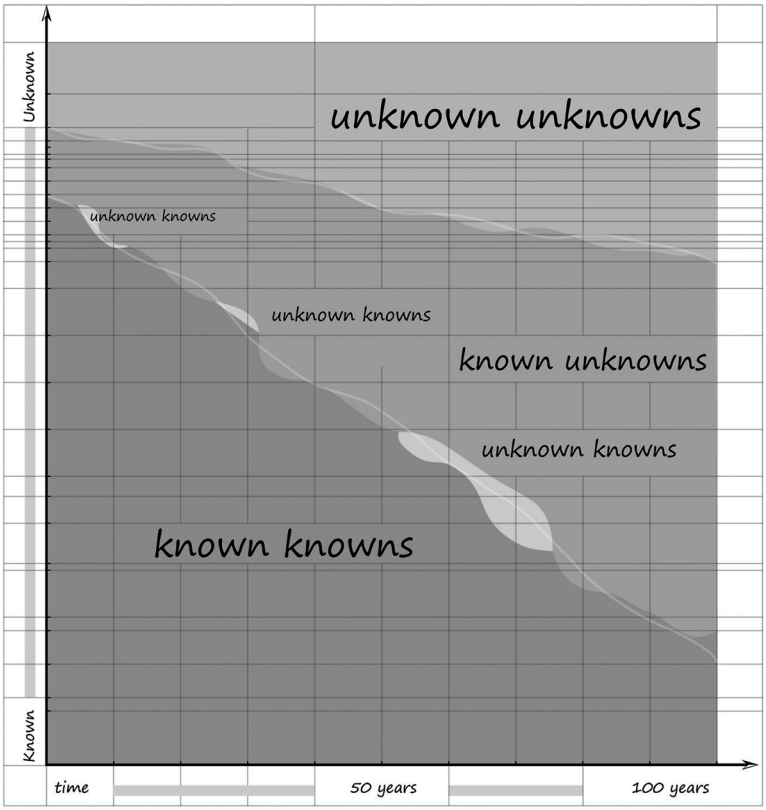
Design fiction as the notion of the "conflation of design, science fiction, and science fact" (Bleeker, 2009) is interesting then as a space of tension and entanglement between what is and what could be. In design fiction we have the space to apply design to science fiction, or science fiction to design. For example, methods like scenario planning used by futurologists have been borrowed by science fiction writers to extrapolate from the present into the future. Industrial designers working in the Detroit automotive industry have not seldom ended up designing spaceships for Hollywood, while researchers in aerospace technologies or ubiquitous computing have also consulted for science fiction movie productions. And there is a long history of science fiction influencing innovations, attitudes and values in our own, real worlds. The emergence of design fiction is one sign of this interplay being acknowledged and appreciated as having a potential for experience design in general. One question is then how to actually work in practice in this space of tension and entanglement between science fact and science fiction, and especially how to encourage the use of science fiction in design, away from derivative, predictable output and towards speculation and tinkering based on the opportunities afforded by the unknown (see Figure 3).

The Database as Material

With all of the above described project it is clear that by trying to combine different digital media objects, mostly 3d objects in the computer and then translated them into physical objects in a constant feedback loop of production, the use of technology is not only that of the tool. Because electronic and digital media have also raised consciousness of an incidental flux in our culture where cultural production combines fragments, dislocates them and re-combines again. The concept of sampling takes its older relative the montage some giant steps further. Montage is a kind of juxtaposition where you disrupt elements to put them in new combinations, the sampling technique works on a more genetic level (Johansson & Linde, 2004). Since all media objects share the same foundation (Manovich, 2001) it is therefore possible to mix them on many different levels.

Here the digital media object can challenge ideas from the physical way of working with qualities that is very hard to achieve in the physical world with physical tools, and in that conflict new expressions can be developed. Hybrid creations have become a method for working with cultural production

Figure 3. Epistemological model of the universe. Copyright Michael Johansson and Kristoffer Åberg, progression over time borrowed from Stross, C. (2013).



not only with different elements of form and how these are generated, but also blending the identities of the creators as well. So there is a demand that challenge their differences and incompatibilities rather than merging them together into one. And by letting them evolve in different media and materials the final hybrid will host an interesting comprehension of different perspectives. Lev Manovich idea of the database as something that "represents the world as a list of items and it refuses to order this list", is an intriguing challenge. Digital media objects just dwelling around waiting to be accessed and ordered, when someone wants to use the databases for making a statement, demonstrate a perspective or telling a story.

Is there a conflict between database and narrative? Or is it the different representations used when a user by interface and interaction extract the bits and pieces from a database by constantly link them together into sequences that are fundamental different, that are more spatial than narrative in its execution?

The "user" of a narrative is traversing a database, following links between its records as established by the database's creator. An interactive narrative can then be understood as the sum of multiple trajectories through a database. A traditional linear narrative is one, among many other possible trajectories; i.e. a particular choice made within a hyper-narrative. (Manovich, 2001)

For an artist or designer to work with databases the question to ask is how to design the trajectories through a database and what kind of representation to use to make them present and by doing so create user engagement playing with the parameters. What kind of Interaction Gestalt (Lim, Stolterman, Jung, & Donaldson, 2008) is needed. "In this regard, the challenge here is to create a language that helps a designer understand which attributes are to be considered in order to create a certain gestalt that in turn will result in desired user experiences." Artist working with digital media should take this into account when they plan and execute the order of the elements when inviting someone to co-create an image, a sequence of movie-clips in a film or how 3d models are explored and/or compiled into a navigable and interactive space for further explorations. Similar to (Certeau, 1984) idea about Spacial Stories, Our approach is to by representation facilitate possible trajectories through our database, and let the co-creators and participants move and interact with our framework and maps of Abadyl and have them create different outputs as performative acts in which they can become the storymaker.

For a single artist or even for a small group of people this is a demanding and time consuming activity that needs both experience and planning. Our strategy has always been to develop our content in open and generic file formats so it won't be captured in a certain generation of technology, and to secure that the developed material is not restricted in use of a single software. The content also has to be manually or machine wise analysed and then meta tagged in order to call for their attributes and fit them into a specific sequences and/or formations that match the intended use and at the same time host something surprising both in relation to form and content. So every time a search in the database is done and an artwork recreated it will be different because the underlying model, it´s objects and the characters have changed and will be recreated, expressed and re-represented again.

By trying to establish a friction between the personal and dynamic way in which people experience moving and interact through space in a daily life, and how our framework, maps and scenarios support a similar act, and at the same time have the co-creators develop and alter the parameters of the maps and scenarios themselves. The framework of Abadyl can be looked upon as a place of static objects where each co-creators have each their subjective input that create a flux and friction in which the lifeless and abstract place can come alive and become an animated, changeable and concrete space. Which literary scholar Mieke Bal defines as follows: it should contain both an actor and a narrator; it also should contain three distinct levels consisting of the text, the story, and the fabula; and its "contents" should be "a series of connected events caused or experienced by actors or the procedural compiling it." (Bal, 1997). Since Abadyl in itself is not a text based project, that like hypertext try to establish different possible trajectories through a database of text by hyper-links. We have instead borrowed a generative logic, a logic that both limiting and expanding creativity amongst the co-creators. We have chosen to focus more on the generative itself in this logic; using 3d objects stored in a database, rules and procedural models to put together the different 3d objects into new assemblages/hybrids and interaction procedures to let co-creators and audiences interact with the construction of the Abadyl framework and at the same time explore and experience its parameters that we made present for the co-creators. It is not about these parameters resulting in a watertight consistent universe, but the main interest is in what can be generated from a number of predetermined accessible parameters. To be able to fully make us of a database it must first host relevant content that also needs to be created and adjust to fit a certain project ideas and intentions.

Walk Your Talk

An examination of the functions of intention in the making of art begins with the contrast between inspirationist and rationalist perspectives on artistic creativity. Intentions are necessary to art-making and are linked to the assumption that a work of art is always evaluable in terms of one kind of potential artistic value—artistry or virtuosity. Intentions are linked to artists' projects, to the distinction between complete and incomplete works of art, as well as to the several senses of 'fragment' in critical discourse. (Livingstone, 2005)

Creativity is often looked upon as a value separate from process or method. But creativity detached from the rendering of an intentional outcome is meaningless. For the artist as well as the designer, creativity is a 'tool' with a purpose. It is therefore subordinated the artist's intentions and ideas. One tends to forget that the actual realization of the artwork in a specific material often is a very monotone and demanding process, and also context specific. Therefore, the artist soon learns how to handle the time frame between idea and completion – as well as the importance to spend time there. The finished artwork will then signal creativity precisely because it has managed to bridge the uncertain space between idea and completion, and because of that, has not given up the artworks intentions, and established the necessary friction that makes creativity spark.

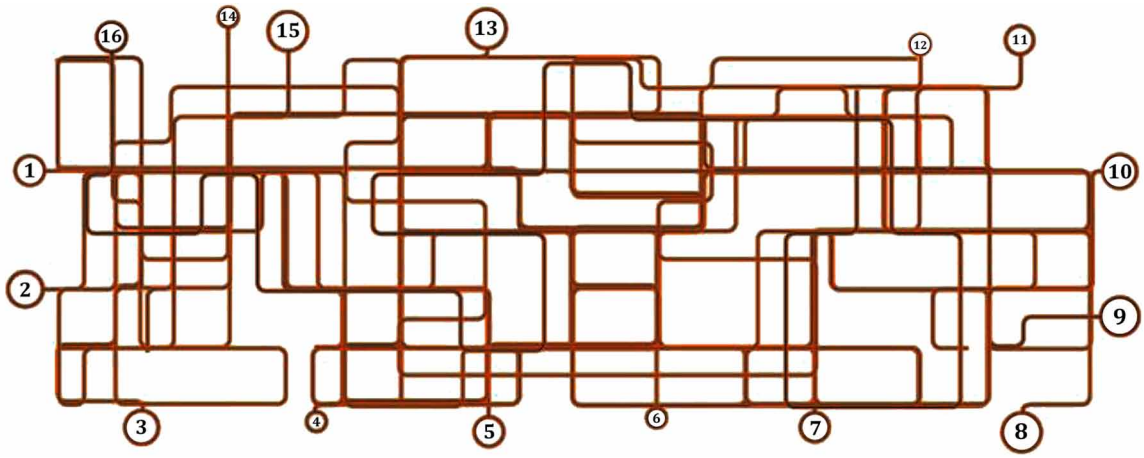
Conversation China

In 2008, I started collaborating with my friend and colleague Gertrud Alfredsson around sixteen stories based on everyday heroes in the City of Abadyl. The purpose was to use them as the basis for creating the images for the porcelain dinner set, that all in all will be 150 pieces, and later explore them in a series of dinner events to evaluate their ability to spark conversation around a dinner table with invited guests. Using the Abadyl Partitur we sent in sixteen fictitious heroes into it. The rules was that each character had to "hit" 23 objects and that the objects should be hit and crossed by at least one hero and that each object never would be used more than five times. We also made a rule that during the process informed us which objects the heroes could use, based on the characters movement, into something we called story routes. All of these story routes was developed into a specific dilemma for each hero and scenarios written based on the journey that each hero managed their way through. The story routes established a kind of mental map that enable us (me and the co-creators) to explore and transform Abadyls and our own conceptual spaces in imaginative and new ways, and in the end a series of stories about sixteen characters life's and dilemmas in the city of Abadyl. So for the first time we had someone walking the streets of Abadyl (see Figure 4).

Game the Rules of Play

Conversation China was the first project in Abadyl that fully challenged and used that framework, influenced by the artists and Architects that will be mentioned later in this part. By doing so, also affected how this framework could be further developed and redesigned. If one look at Abadyl as a sort of conceptual space (Boden, 1997), a latent unprecedented space, that by exploring it through different methods and processes in cooperation with others in a constant feedback loop it changes its way of working as well as its presence. It is important that our framework is so open that we can influence it and use it in different

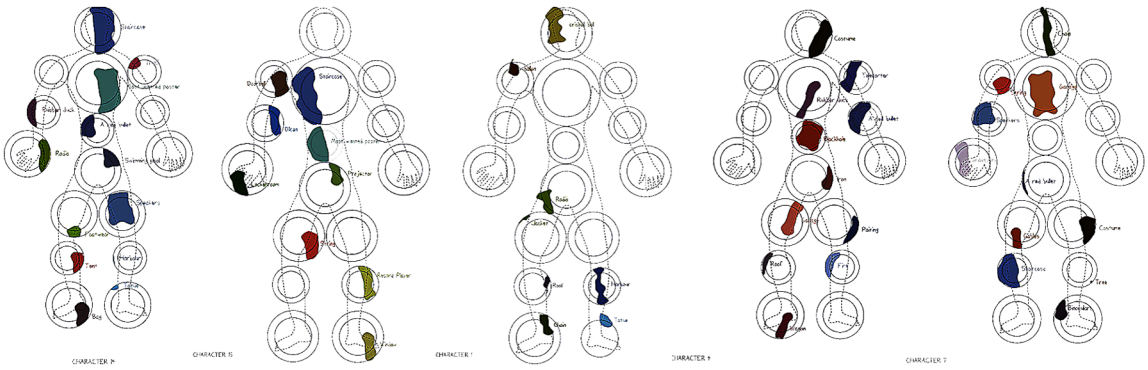
Figure 4. The final sixteen storyroutes created in collaboration with Gertrud Alfredsson



ways again and again by the use of the generic file formats of the content in our database. By constantly be able to change and manipulate our underlying model, game the rules of play, we can better define our final and intended outcome of the project itself. In conversation china most of the initial work were carried out on printed paper, following a set of instructions. Each session let the co-creator connect the city of Abadyl's objects into story routes. By playing with Abadyls framework in the conversation china project it will sometimes expose itself inconsistent, the conceptual constraints captured in the three numbers 7, 16 and 100 become elastic and therefore cannot serve as absolute constraints any more. So by consequence they have to be pinpointed back in new position where they can continue and maintain their autonomy and still be backward compatible.

Something that also have a significant influence on each plate in the dinner set is that each plate is a part in an overall structure, Figure 5. So by combining the plates one could actually create several different characters, this was achieved by introducing a combination of thin lines and an array of distortions of the patterns and main images, but also to break up the traditional structure of patterns and main images, as they were under influence of something else.

Figure 5. Lines and distortion layout on characters



This process also made help us specify the sixteen heroes on a very specific parameter, the length of them.

To be able to both set up and play with the rules at the same time adds an additional level of design thinking. Similar to the parametric and procedural playfulness described in Pamphlet Architecture 27 Tooling (Aranda & Lasch, 2005).

A complex global pattern arises as a result of many individual entities acting independently of one another, and according to a very simple set of local rules…

Changes the underlying model of the world, and add new objects and methods without having to completely rewrite the code…

Be able to run multiple scenarios, based on different assumptions and focusing different aspects of the underlying simulation…

Change parameters within a scenario, and to replay a scenario with a clear indication of what factors are held constant across runs…

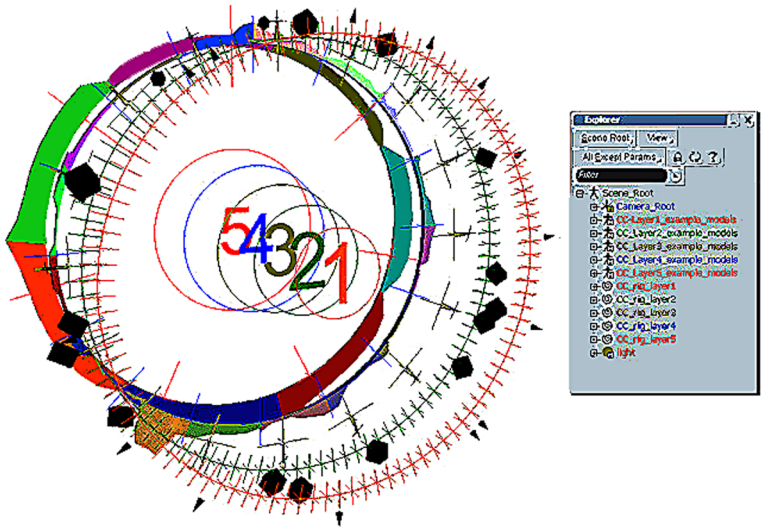
This flux should be seen as a possibility because if some of the parameters are changed so it will not be backward compatible there is an opportunity to run some scenarios of the former projects again and find out new things in relation to both that scenario, project and Abadyl itself. Abadyl should be seen as something that is constantly regenerated and that constantly incorporate it owns memories, findings and experiences and therefore never will be exactly the same. It is a constant dialogue between Abadyls framework, its constraints and the findings in this environment that also shapes itself through this work over time:

Furthermore if worlds are as much made as found so also knowing is as much remaking as reporting. All the processes of worldmaking I have discussed enter into knowing. Perceiving motion, we have seen, often consists in producing it. Discovering laws involving drafting them. Recognizing patterns is very much a matter of inventing and imposing them. Comprehension and creation go on together

We made up and found our world in the conversation China project as a work practice by using ideas and concepts from art and architecture. So on the conceptual and programmatic level Sol Lewitts' statement "The idea becomes a machine that makes art." was central for us and many others as a way to generate art and capture its execution in a concept, a scenario or a script. In the conversation China the "machine" was the 3d rig we built that layout the sevens scales of the objects accordingly of décor on the different porcelain plates and objects (see Figure 6):

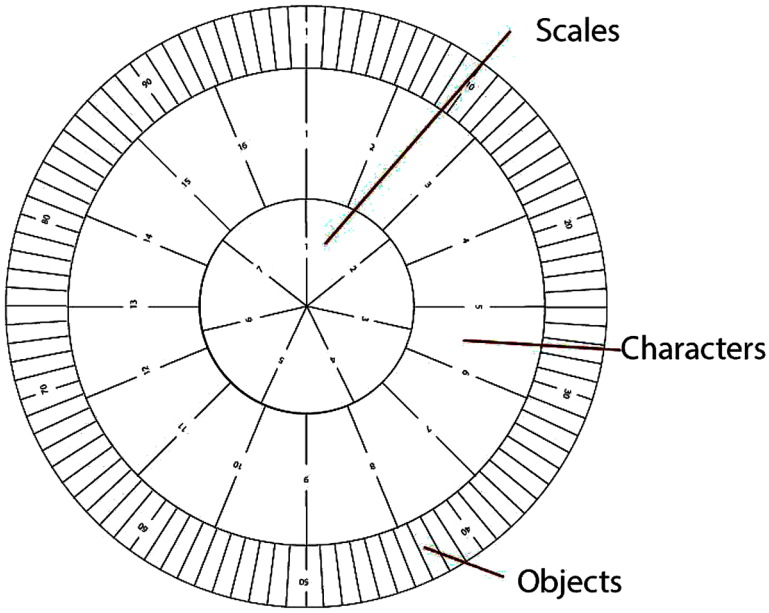
1. Environment.
2. Building.
3. Room.
4. Furniture.
5. Tool.
6. Interface.
7. Idea.

Figure 6. 3d rigg built in Softimage and link to databse using ICE and Python script



To strengthen qualities in the digital media object we borrowed a programming idea from Berhard Tschumi that formalized an aspect of generative logic to enhance new combinations or other relationships (see Figure 7) (Tschumi, 1991). A description how the different layers of 3d objects should be treated as 3d and also as rendered images, in a combination of Boolean operands and virtual camera filtering

Figure 7. By turning the different part of the rig based on the numbers 7, 16 and 100 the rig can produce many different expression for each character's dilemma



and post-production techniques. His work outlines a method which operands we have used before for multiple combinations and substitutions that exist simultaneously, including the following three concepts:

- **Cross-Programming:** The use of a space not as intended;
- **Trans-Programming:** The combination of disparate programs;
- **Dis-Programming:** Disparate programs that contaminate each other. These operations offer possibilities of combinations and permutation of existing programs as well new programs.

As the artist Mark Tansey we are not interested in "doing pictures of things that actually exist in the world. The narratives never actually occurred." (Danto, 1992). We are instead interested in visually combining disparate 3d models from our database into monochrome decors and images that will be rather complex, mystic or surprising in its presence. Similar to Tanseys term "technophor" a metaphorical technique for connecting subject matter and ideas. But going from static 3d models into action also needs to be addressed in a project like this. Therefore we built a underlying structure based on motifs, oppositions and problem that by combination of the different 3d model could create and pose the main characters on the plates and objects, that involves establishing trajectories and points of collision in the database between a variety of its content.

For the décor we used a much more simple and mechanical approach with some underlying matchingmaking. The method we mostly employ here refers to what Claude Levi-Strauss was calling *bricolage*: a thinking-experimenting which rather than devising something brand new, is solving problems by re-organising what is available, at hand. An approach by which objects are not expressly defined and reduced to a sole function, but continually can be made to generate something else, develop hidden potential. A method which applicability in no way is confined to resolute, practical problems, but which can well be used visually.

To summarize this, Sol Lewitt idea of "That irrational thought should be followed absolutely and logically. The process is mechanical and should not be tampered with." Was used to build the 3d rig (see Figure 8). Bernhard Tschumis operands to describe methods how overlapping objects generated by the rig could be transformed and distorted. Mark Tanseys term "technofore" is used for by meta tagging the objects create associations on the pictorial level, and also pose the different characters into action and finally a montage technique inspired by "bricolage" that in manually editing and compose the décor and central images of each porcelain object.

CONCLUSION

Through the years I have worked together with several different co-creators with 3d worlds and artefacts as our surface of communicating and testing our ideas and concepts that are generative rather that produced. Generative in the sense that they have nor original nor final form from the beginning. They are sprung out of a chain of association through our work process and methods that generates new forms, which in its turn recombines into new stories. My idea is not intended to fully automate the process of novel image making, instead I propose an dialogue that takes into account all new possibilities using digital material, that in the end help us to put forward (if we succeed) interesting images which parameters we can tweak and change in order to get the intended result on a level where the artist themselves in the end can complete the work an address its intent in the final form. One cannot underestimate the

Figure 8. Example of the seven layers put together from the 3d rig

impotence of facilitating forms and ways to interact that creates relevant dialogues with all aspects of the digital material and its creators.

The friction created by letting artefacts evolve in specific materials and media specified by us in a project like Conversation China, help the co-creator capture interesting and comprehensive perspectives, that through artefact creation incorporates surprising visual and technical proposals and expand and influence the framework of Abadyl. Working with the imagery or artefact generated as a source of communication let co-creators explore this area by complex connections through iterating between artistic intentions/screen writing, digital generated expressions, physical objects and script/code writing. The key here for the co-creator is the ability to work in ambiguity – to explore different possibilities without too early jumping to conclusions. This negative capability as Keats defines it, "is when man is capable of being in uncertainties, mysteries and doubts without any irritable reaching after fact and reason." The artefacts also act as generators while they generate new and unforeseen processes, which extend into new and likewise unforeseen contexts. Where the co-creators disseminate their knowledge into the artefact and framework, also extracting something which can inform their own future practice.

APPENDIX

Spill

With the idea of design fiction, we continue to ask and explore how intent can be critical to the design process as well as the final result that is rendered between the procedural techniques and the artistic intention.

Chapter 24
Quality of Experience Factors for Mobile TV Users

Dimitris N. Kanellopoulos
University of Patras, Greece

ABSTRACT

This chapter helps the professionals involved in the Mobile TV industry to methodically engineer the Quality of Experience (QoE) of Mobile TV users. Its objective is to investigate the factors that influence the QoE of Mobile TV users. It also discusses the issues for strategic implications for the Mobile TV industry. We retrieved and categorized the majority of the critical works focusing on QoE for Mobile TV users. Then, we considered them and proposed a comprehensive road-map for improving the QoE of Mobile TV users. We present an approach to produce improvements to the Mobile TV customer experiences. This chapter proposes a seven-stage "road-map" to improvement, which develops the existing models. This study remains to be seen how the presented QoE factors– both amongst technologies and Mobile TV actors – will affect the potential for Mobile TV amongst various types of users. The proposed road-map can help to bridge gaps between other studies that have either focused on QoE for mobile TV or have addressed frameworks for mobile TV.

INTRODUCTION

Nowadays sophisticated devices such as smart phones are available in the telecommunication markets. Users can access telecom services at any Universal Personal Telecommunications (UPT) terminal on the basis of a personal identifier (user mobility). For this reason, networks supporting user mobility provide suitable services according to the user's service profile. In the context of mobility, consumers use their mobile applications for fun, games, music, at work etc. and distribute these applications to their community. Some consumers also use their cell phones for invoking various mobile multimedia applications such as Mobile TV. Mobile TV provides television-like content through a mobile device and holds a limelight as the next killer application of wireless technologies. Mobile TV brings together two contemporary social developments:

DOI: 10.4018/978-1-5225-3822-6.ch024

(1) Enhanced end-user mobility, and
(2) Novel forms of access to media content.

In the business landscape of mobile TV, there are several actors already involved (Marilly et al., 2007):

- *Broadcasters* who provide TV channels.
- *Aggregators* who bundle TV channels into clusters.
- *Broadcast network operators* who provide access to their own broadcast networks (terrestrial, satellite or cable) to deliver the TV channels or clusters to end-users.
- *Mobile operators* (operating a cellular network).
- *Mobile service providers* (operating a mobile portal) who are now offering Mobile TV programmes in a unicast mode.
- *Content providers*, advertisers or even access service providers (ASPs)/Internet service providers (ISPs) who directly offer content to be delivered through the network.

Mobile TV is mainly consumed in leisure time. As a consequence, users do not want to spend much time to find out how to use it. Therefore, usability issues are major concerns of mobile TV users. So, much research focuses on results clarifying the users' needs and motivations regarding Mobile TV. According to Repo et al. (2004) the commercial success of a TV product depends on the users' requirements and its viability. Schuurman et al. (2009) summarized the literature regarding Mobile TV. In particular, they conducted a meta-analysis on user-studies from mobile TV-trials, surveyed a panel of 35 trial as well as non-trial mobile TV-experts and conducted a user study with 405 respondents. They compared the views from these four sources regarding context (possible mobile peak times, usage duration and usage goals) and content for Mobile TV. This comparison left them with a better understanding of different views regarding Mobile TV, which paves the way for a more user-centric approach. According to Buchinger et al. (2011) a *User Centered Design* (UCD) must be applied to any Mobile TV product. UCD involves users in the design and development process for a better understanding of their needs, tasks and expectations (Hanington, 2003; Eronen, 2003). Eronen (2003) states that for new devices and applications, the focus of Human Computer Interaction (HCI) research has to shift more to user experiences, which are relevant for the use of the product according to user's needs.

The aspects of UCD correlate with the understanding of User Experience. According to Hassenzahl and Tractinsky (2006) *User Experience* is a "*consequence of a user's internal state (predispositions, expectations, needs, motivation, mood, etc.), the characteristics of the designed system (e.g. complexity, purpose, usability, functionality, etc.)*". Jumisko- Pyykkö et al. (2008) state that for mobile phones, the user interface and its usability often depend on the usage model and its layout "*and the context (or the environment) within the interaction occurs*". Consequently, based on these factors improved design solutions for Mobile TV can be developed and then evaluated by their usability, and the level they satisfy user needs.

Quality of Experience (QoE) is a subjective measure of a customer's experiences with a service such as TV broadcast. QoE systems try to measure metrics that customer directly perceives as a quality parameter. For example, a potential metric for Mobile TV is the time for a new channel to be played when changing channel on Mobile TV. QoE takes into account the effective *Quality of Service* (QoS), but also considers every factor that contributes to overall user value such as suitability, mobility, flexibility,

security, cost, personalization and choice. QoE differs from QoS which attempts to objectively measure the service delivered by the vendor, while QoS measurement is most of the time not related to customer, but to media. QoS allows the measurement of network parameters, and the detection of changing network conditions such as congestion or availability of bandwidth. This information is utilized in resource management by prioritizing traffic. Nevertheless, QoS processes are not always sufficient, since they do not consider the user's actual perception of both network performance and service quality. Efforts of standardization to define QoE are still at an early stage. The ITU-T Recommendation G.1080 defines user requirements for Quality of Experience for Internet Protocol Television (IPTV) services (ITU-T Study Group 12, 2008). The recommendation contains the following definition: ''*Quality of experience (QoE) is the overall acceptability of an application or service, as perceived subjectively by the end user. QoE includes the complete end-to-end system effects (client, terminal, network, services infrastructure, etc). Overall acceptability may be influenced by user expectations and context*''.

Various studies (Harper et al., 2006; Chipchase et al., 2007; Petrovic et al., 2006) have considered the factors that define the success of mobile multimedia services. The common finding of these studies is that content is one of the basic critical aspects for the success of Mobile TV. End-user acceptance and success of Mobile TV are highly dependent on content, as the end-user can be considered rather technology-agnostic. However, which are the other QoE key factors for Mobile TV? Based on the UCD approach, we must focus on various issues concerning Mobile TV. Such issues are:

- What kind of Mobile TV service and content should be made?
- Where and when will Mobile TV be consumed?
- How should it look like and how it will be consumed?

The aim of this Chapter is to consider the above issues and the impact of QoE factors on the success of Mobile TV. This Chapter aims to help the professionals involved in the Mobile TV industry to methodically engineer the QoE of Mobile TV users. Its objective is to investigate the factors that influence the QoE of Mobile TV users. These factors are involved in the design of customer experience improvement programmes of Mobile TV industry. The Chapter describes the ways in which customers/users can be directly engaged in the design and improvement process. Moreover, it provides a road-map that professionals (e.g., content providers, advertisers) of the Mobile TV industry can use as base for improving their customers' experiences.

QoE FRAMEWORKS

Agboma and Liotta (2012) developed a QoE-based management framework for the construction of QoE models for different types of multimedia contents delivered onto three typical mobile terminals—a mobile phone, PDA and a laptop. A statistical modelling technique was employed which correlates QoS parameters with estimates of QoE perceptions. These correlations were found to be dependent on terminals and multimedia content types. They demonstrated the application of their framework and prediction models in QoE management strategies using examples. Fiedler et al. (2010) provide a theoretical view on QoE and propose mathematical mapping functions between QoE and QoS. From another perspective, Moller et al. (2009) propose a taxonomy of QoS and QoE aspects that consists of three layers:

- QoS-influencing factors.
- QoS interaction performance.
- QoE aspects of pragmatic nature.

To the best of our knowledge, no method for assessing QoE has been standardized yet. However, some QoE frameworks have been proposed recently. In particular, Geerts et al. (2010) have built a framework that is linked with appropriate QoE measurement methods. In their proposed scheme, different layers of context and user expectations are taken into account. Furthermore, changes in use over time are integrated in their model. This aspect appears to be very helpful for describing the existing developments in Mobile TV. De Moor et al. (2010) provide a comprehensive examination on the QoE in combination with a real procedure for measurements. In their framework, software agents measure single quality aspects and overall results are based on users' feedback. Wu et al. (2009) presented a detailed framework focusing on the relation between QoE and QoS parameters in distributed interactive multimedia environments. In particular, they defined three QoE terms:

- *Flow*: This term defines the psychology in which a person has the feeling of full involvement in the process of the activity under the assumption that the request is high enough to require the full concentration of the person. This dimension of cognitive perception influences the exploratory behavior of a user. For example, users may explore unexpectedly the Mobile TV applications without having any goals at all.
- *Telepresence*: It allows users to have the feeling as if they are present or even visually present (e.g. video conferencing). For this purpose, performance gains should be achieved. In other words, users' performance for solving tasks must be increased. Telepresence depends on the environment of the mobile application and the task requirements define the performance gains.
- *Acceptance:* It is "*the degree to which a person believes that using a particular system would be free of effort*'' (Wu et al., 2009). It depends on the factors perceived ease of use and usefulness (e.g. if the navigation of Mobile TV is easy to use and includes useful features). Technology adoption is the adoption or acceptance of a new mobile multimedia application or feature (e.g., to navigate the Mobile TV channels with the use of speech and the acceptance of this feature by users). If we study early consumers' adoption of Mobile TV, valuable information for its survival can be offered. Jung et al. (2009) examined the influences of cognitive concentration (or flow experience) and media content on consumers' acceptance of Mobile TV. In particular, Jung et al. were based on the theoretical assumptions of the technology acceptance model (TAM) and their results are threefold. First, their results suggest that cognitive concentration (or flow experience) and content have a significant role in consumers' intention to use hedonic information technology. Second, their results show that content has a critical impact on cognitive concentration. Finally, their results support the use of the extended TAM as an explainer to the context of hedonic information technology.

Based on the framework of Wu et al. (2009), Buchinger et al. (2011) present a novel framework that represents the influences on performance gains of mobile multimedia applications together with exploratory behaviors and technology adoption.

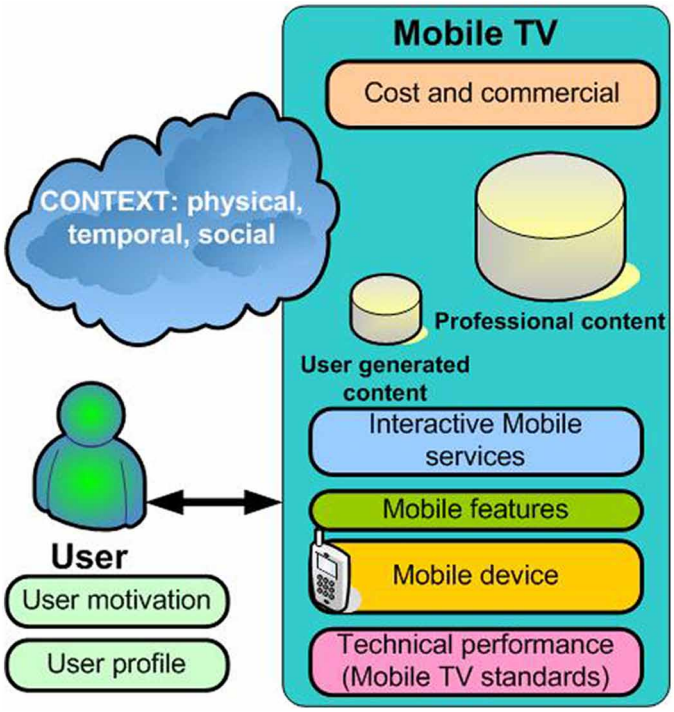
QoE KEY FACTORS FOR MOBILE TV

Previous studies (Buchinger et al., 2011; Knoche and Sasse, 2009; Chipchase et al., 2007) have identified QoE key factors of Mobile TV. These factors are often involved in any *User Centered Design* (UCD) approach of Mobile TV. In such UCD approaches, user plays an essential role and influences other key factors (Figure 1). The QoE key factors of Mobile TV are:

- *User*: The profile of typical users and their motivation to consume Mobile TV.
- *Mobile device*: The desired features of mobile devices for watching Mobile TV.
- *Context*: Where, when, and for how long we consume Mobile TV.
- *Interactive Mobile TV services* and their features: Which interactive Mobile TV services are feasible?
- *Content*: Can we distinguish the content types requested by consumers?
- *Technical performance*: What technical parameters (Mobile TV standards etc) affect the quality of Mobile TV?
- *Costs and commercials*: How can we finance Mobile TV? Are users willing to pay certain fee types and amounts of money?

The provided content, the cost model and the context of Mobile TV influence the behavior of user. For example, if a user wants to watch sports, it is required that the desired content is available. His acceptance to watch the sports channel can depend on the cost model (e.g., "pay per view"). Moreover,

Figure 1. QoE key factors for Mobile TV



the context (e.g. in the morning, day light, environmental noise) in which user wants to watch the sports must be considered. On the other hand, the mobile user behavior is also influenced by:

- *The design model of the mobile device*.
- *The interactive mobile services* and features that are developed for mobile TV applications.
- *Technical performances.* For example, if users do not watch a Mobile TV channel because interactivity is not supported (viz. adaptation and personalization are not feasible), a possible solution would be to design a new interactive Mobile TV service. Additionally, the content, the context, the design model and the cost model influence indirectly the development of the mobile services as well as the technical performances and vice versa.

User

The user is the most significant factor for the achievement of a mobile TV service. Therefore, it is imperative to analyze the user's needs and expectations. In particular, we must consider user profiles of Mobile TV as well as specific issues concerning user motivation.

User Profiles

A user profile includes information about the typical users' gender, age, work, culture, leisure time activities and their relationship to ICTs. Actually, consumers of Mobile TV can be divided by age, occupation, technological-orientation, and even by type of hardware owners (e.g., smartphone, MP3, laptop or cell phone owners) (Frank, 2009). Menon *et al.* (2005) argue that Mobile TV is attractive to one sixth of the users and in particular to users between 18 and 44 years of age in Latin America, Asia and Eastern Europe. Mobile TV attracts early adopters globally. Although young consumers (ages 18–29) are mainly interested in mobile multimedia applications, therefore also 50% of users aged between 30 and 39 (Frank, 2009). In another study, Svoen (2007) remarked that mobile phones are widespread among young people (ages 8–15). Jumisko- Pyykkö *et al.* (2008) revealed that users can consume 3D movies on mobile devices in order to shorten waiting times, be up to date with the daily news while get entertained or being on the move. They showed that the typical Mobile TV user is a well-educated male, aged 23–35 years. Three main user profiles for interactive television are defined in (Eronen, 2001):

- *Comfort-Lovers*. These users prefer to use easy-to-handle services and their median age is 36 years.
- *High-Fliers.* Such users want to read personal content on their own screen and they are strongly technological-oriented. Their median age is 29 years.
- *Pioneers.* This type of users wants to have the newest electronic entertainment possible. The median age of pioneers is 21 years.

Rice and Alm (2008) focused on the requirements of older adults in order to propose an interactive TV interface for older adults. They pointed out that older users (average age 71 years) prefer larger buttons, voice-activated devices and a simple interface with limited functions. This is due to the fact that older users frequently have difficulties in understanding the technical language. According to Simmons (2010) consumers can be divided into five types:

- The *basic planners* who use their cell phone only in case of emergencies.
- The *pragmatic adopters* who use their phone mainly for calling.
- The *mobile professionals* who are attracted by the extra features and retrieve information in several ways.
- The *social connectors* who use the phone to stay connected with their friends.
- The *mobirati* who use their phone for every day life tasks.

Dominant aspects of users' profiles of Mobile TV are consumers' affinity and their motivation to use it. For example, Svoen (2007) showed that the quality of the device (e.g. size and sound), the number of channels, as well as the user's comfort (e.g., sofa) are crucial factors. Additionally, Svoen (2007) revealed that young people use a broad variety of mobile services, while girls use mobile phones as their favorite medium additionally to computers.

Lee *et al.* (2010) examined the nature of four categories of Mobile TV adopters: current, potential, continuous non-, and discontinuous user groups (sample size $N = 214$). They incorporated the users' profile attributes such as demographic characteristics, perceived general adoption attributes, perceived value-based adoption attributes, motivational needs, mass media use, and content interest. The non-adoption rate of Mobile TV of the continuous non-, and discontinuous user groups is higher than the adoption rate of the current and potential user groups. Less than half of the respondents ($N = 34$) who had used TV on a mobile device were unwilling to use it again in the next twelve months, and almost half of those ($N = 102$) did not have the intention of using it within the coming year. The results suggest that the discontinuous group seems to have been dissatisfied with the actual Mobile TV use when compared with their expectations and evaluations, while the potential user group is more likely to have high expectations and positive evaluations before the adoption and use of Mobile TV. All user groups were unwilling to pay the fee, despite the current and potential user groups perceiving the exceptional values. No differences were found in the personality trait of innovativeness and mass media use behaviors among the four groups.

User Motivation

For what reasons do people want to use Mobile TV? The main motivations are the following:

- To kill time while waiting, i.e. for a public transport.
- To kill time during extended waiting periods, i.e. waiting for friends in bars, or in a car.
- To be entertained.
- To be always up to date, i.e. with popular events or news.
- To relax, i.e. at home in the bedroom or in the bath.
- To create a private sphere or to feel less lonely, i.e., lunch break at work.
- To own, share and exchange content.
- Novelty, the desire to be the first, or create and consume personalized content.

Several studies (Chipchase *et al.*, 2007; O'Hara *et al*., 2007; Carlsson and Walden, 2007; Oksman *et al*., 2007; Repo *et al.*, 2004) show that the main motivation for younger people to use Mobile TV is to kill time during waiting periods. According to Lievens *et al.* (2000) users prefer to use their mobile phone to watch videos during a short period (e.g. waiting for a bus) instead of watching it on a laptop,

because it takes more time to start it. From another viewpoint, Menon *et al.* (2005) state that persons, who possess a multimedia or Mobile TV device will mostly use it as such. This means that the motivation for a Mobile TV device use is just the fact of having such an opportunity. Svoen (2007) pointed out that the main motivations for younger people to use television on the whole is to relax, watch their favorite shows/movies or use it as background medium. Bernhaupt *et al.* (2008) showed that watching TV is often a background activity at home, while Chipchase *et al.* (2007) noticed that people use Mobile TV to relax. From another perspective, Zillman (2000) believes that the trend of media entertainment tend to personalized content. The possibility to personalize contents represents one reason for the increasing reputation of Mobile TV. Sodergard (2003) showed that Mobile TV is attractive because people like to use their own personal TV at home. Consumers use Mobile TV to get a closer interaction with television content.

Mobile Device

There are four technical aspects of a mobile device, which are very important for a Mobile TV user.

- *TV buttons.* A study conducted by Knoche and Sasse (2009) pointed out that users prefer to use special TV buttons on the phone, and they are not willing to navigate through menus. The involved subjects also expressed their need to have a quick and simple sound management.
- *Sound controls and headphones.* Mobile TV users often have to turn down or mute the sound rapidly. The common outcome of two studies (Miyauchi *et al*., 2008; Vangenck *et al*., 2008) conducted in different countries is that "*the involved subjects did not want to use headphones when consuming Mobile TV."* The main reason is that some people do not prefer to carry more than the mobile device with them; others may want to remain in contact with their surrounding. However, some users accept headphones. For example, almost all Finland Mobile TV users use headphones in transport and public places (Oksman *et al*., 2007). It is noteworthy that the majority of Finish mobile customers are already used to wearing headphones when listening to music on the way. The enthusiasm to wear headphones actually represents an open issue that must be further explored. The implications of such studies are quite significant as they may concern a variety of issues. For example, content for a major user group must be produced in an entirely different approach, when headphones are preferred. If consumers use their headphones, the sound perception still represents a problem. If a user commutes, the loudness and shape of environmental noise always changes and it is possible to mask the sound of accessible content.
- *Screen and phone size*. According to Knoche and Sasse (2009) users want the screen to be as large as possible, but their phones not to be too big. Petrovic *et al.* (2006) state that users prefer larger image sizes and landscape-oriented use of the display. From another viewpoint, users (mostly female) do not want the weight and size of the handset to be increased (Knoche and McCarthy, 2004).
- *Battery and memory.* Several studies (Knoche and Sasse, 2009; Petrovic *et al*., 2006; O'Hara *et al*., 2007) have pointed out that the limited battery life is the main barrier. Actually, high battery consumption of Mobile TV compromises mobile phone functionality. The receiver part of the device can be put into a low-power sleeping mode, when it receives not interesting transmission slices. In the light of this evidence, special time slicing schemes for DVB-H transmission have been developed that result to power savings of up to 90% (Nokia, 2008). Time-slicing means that

the data representing a particular service are delivered to the handheld device in bursts at given intervals of time. Concerning memory, a lot of space is required for Mobile TV applications and limited memory may have a negative influence on the usage behavior (Kaasinen *et al*., 2009).

Context

In this section, we shed light on which Mobile TV services should be used when, how and where. Mobile TV providers should explore such issues carefully as well as the cultural background of the users they want to reach their product.

Physical context: Studies performed in Austria, Germany, and Japan reveal that Mobile TV is primarily consumed on the go or during waiting time. On the contrary, other studies performed in the UK, Belgium and South Korea point out that consumers want to watch Mobile TV at home. In the studies performed in the UK, USA and Belgium, the most likely location of Mobile TV use is at home. According to Chipchase *et al.* (2007) in South Korea, Mobile TV is mainly consumed at home and while commuting. Such an observation is highly culture depending, and thus it does not reflect a general trend. It is noteworthy that Mobile TV consumption occurs mainly during waiting time and in public transportation in studies performed in countries having some common characteristics. These common characteristics are:

- Public transport is used a lot; and
- The education to behave in a polite way is not so strong as in the UK and Belgium.

Context awareness: Context-awareness is an important topic in mobile multimedia services as such services are consumed in different places differing in their environmental background conditions. Contemporary mobile phones are equipped with special sensors that can detect motion, current viewing conditions or even loudness changes of environmental noise. For example, a light sensor can collect data representing the current viewing conditions. When users watch Mobile TV content in dark conditions, the brightness can be increased. In another case, when users commute, changes from silent to noise areas may occur. Therefore, it is important to switch to a higher loudness level. On the contrary, when returning to more silent places, the selected loudness must be readjusted. Sack *et al.* (2010) proposed a compensation method for loudness and auditory masking. Their method improves the quality of experience drastically. Chen and Kotz (2000) stated that many other parameters could be collected to improve the knowledge on the users' context. Kanellopoulos (2009) proposed an ontology-based context model that supports context reasoning and context management for adaptive multimedia applications. His model is flexible as it provides a general framework that can be applied to any multimedia application. Moreover, his model is extensible as it provides mechanisms to add new multimedia domain specifications such as Mobile TV specifications. Hummel *et al.* (2008) presented a procedure on integrating environmental information in usability evaluation. Finally, Gossa *et al.* (2008) considered performance improvement due to intelligent systems such as *Proactive Replica Placement* based on *Mobility Prediction*.

Temporal context: Almost all recent studies agree about Mobile TV usage durations and prime times. If we know when Mobile TV is expected to be watched and for how long, we can create satisfactory programmes and be prepared for high bandwidth peaks. According to Petrovic *et al.* (2006) Mobile TV content must be short, initially starting by approximately 10 minutes. In addition, Orgad (2006) estimates that the total amount of consumption per day ranges between 5 and 40 minutes. The waiting time differs from traditional TV peak hours (Carlsson and Walden, 2007). Kaasinen *et al.* (2009) explain that this

happens as consumers watch Mobile TV, while travelling or at work to catch up with the latest news. According to Carlsson and Walden (2007) the most popular prime time to watch Mobile TV is early in the evening, before supper. Finally, Kaasinen *et al.* (2009) show that the consumption of Mobile TV does not impact the usage of other media, and that it is often used as an extension to the traditional TV.

Social context: Viewing mobile videos can be divided into *individual* and *collaborative viewing*, which are influenced by various social factors (Sørensen and Nicolajsen, 2010). The possibility of users to create their own videos with mobile phones and sharing them can encourage social activities for collaborative viewing. Users may be motivated to create videos for their own purpose or to use them as communication medium (Reponen *et al.*, 2010). In order to support social activities between users in collaborative viewing new interfaces and technologies are required. For example, sensing technology, computer vision, and artificial intelligence techniques can open new ways to design new interfaces for controlling TV sets (e.g. with the help of the use of speech, gesture, tangible objects) (Vatavu, 2010). Introducing new interfaces will change the behaviour of mobile user and the usage of mobile multimedia applications. To enable content exchange between mobile devices and allow more storage capacity, we must improve the design of mobile devices in various aspects (docking solutions with speakers/large displays, integrated technologies) (Mitchell *et al*., 2010).

Interactive Mobile TV Services

Betting, voting, advertising and shopping services are some examples of interactive Mobile TV services, which are based on the concept of personalization. Lets' assume a personalized shopping service proposed to the end-users for different products to buy according to the end user's profile, localisation or context (e.g. mood, noise, activities, place). In another example, during an advertising campaign of a certain product, personalized links can be suggested to special product information that best fits the end-user profile. From another perspective, it can be offered to end-users voting services that include only those votes/questions that best fit the end-user's profile. The attributes of user's profile and the localisation can be used to succeed personalization and adaptation. Such attributes could be the age, gender, area of interest, social category, TV programmes watched, most frequently service used, terminal characteristics etc.

The EU projects *Daidalos*, *ePerSpace*, *Wireless World Initiative* (WWI), *Mobilife*, and *Eures*com project P1308 (*Frapesa*) have focused on the personalization of the interactive Mobile TV services. For example, the *IST Mobilife* project considers profile management, context, presence and availability, security and privacy issues. The Mobilife project also brings advances in mobile applications and services within the reach of users in their everyday life. Marilly *et al.* (2007) present use cases, technologies and a functional architecture supporting the adaptation and personalization of interactive Mobile TV services.

Rich media technologies are required in order Mobile TV become interactive for advertising, shopping and betting services as well as for content access to a wide range of terminals. The rich media format technologies allow the interactivity to be provided with appropriate personalization and adaptation. The most promising rich media technologies are: (1) MPEG LASeR; (2) MPEG4/BIFS; and (3) Windows media.

Blanco-Fernandez et al. (2011) propose a system that broadcasts user-generated audiovisual contents for handheld devices in a mobile network based on the DVB-H broadcasting standard. Their system offers diverse added-value services to new active users, such as:

- Multi modal access (via Web or by client applications running locally in handheld devices) to digital contents;
- Exploitation of return channels to transmit interactive contents that enhance the user's experience, and
- Annotation, sharing and personalized distribution of audiovisual contents.

In particular, their system adopts well-known technologies for broadcasting and semantic annotation of audiovisual contents, as well as emergent technology from the so-called Web 2.0. A prototype of their system has been experimentally evaluated with a group of students from the University of Vigo, who were enthusiastic about the personalization capabilities offered by their TV system for a mobile setting.

Shin (2006) investigated the prospect of *Digital Multimedia Broadcasting* (DMB) from the technical, economic and regulatory issues and whether the market is evolving an equitable, open, and competitive environment. Especially, Shin (2006) explains how DMB will evolve and stabilize in next generation network environments by applying concepts of open access policy to the emerging technology of DMB.

Mobile network operators are facing significant barriers to access premium content creating bottlenecks in the construction of business models. Therefore, content regulation is essential for the development of mobile television platforms. Evens *et al.* (2011) outline the strategic importance of content in the development of sustainable business models for mobile broadcasting services and discuss the implications of bundling strategies and regulations for the viability of these emerging platforms.

Content

Mobile TV users consume content that can be categorized as professional or user-oriented.

Professional content: Many studies found out that the most interesting genres are news, music, sport, and live broadcasts (Petrovic *et al.,* 2006). On the other hand, it must be mentioned that the selection of channels on Mobile TV is regularly too limited (Kaasinen *et al*., 2009). There is also a relationship between users' age and the content they consume. Younger people prefer sports and Music TV, while users older than 25 years prefer news (Carlsson and Walden, 2007). From another viewpoint, Kaasinen *et al.* (2009) showed that users do not often watch new-piloted channels and they prefer the mainstream broadcast channels. That means that if they have a preferred channel for watching a specific sports channel, they would also like to have it on Mobile TV. The content of Mobile TV must be specifically transcoded. For example, it needs to be adapted to the small screen and opposed viewing conditions. In addition, content must be adapted and fully personalized to the needs of users. According to Chorianopoulos (2008), personalization of the content can be achieved by adopting two possible approaches:

- *The content-based filtering approach*. In this approach, predictions concerning the interested items are based on the user's previous preferences. The user gets a selection of items, which may be of interest to him.
- *The collaborative filtering approach*, in which predictions are based on ratings from ("similar") users who share the same rating patterns with the active user.

User generated content: Roibás and Johnson (2006) state that users would like to create their own content and to share it with other users in mobile communities. Actually, mobile phones can be used as tools for creating and editing personal multimedia content. In addition to that, users can contribute their

applications to the community via tools such as *App Store* or *Market*. Juhlin *et al.* (2010) state that the trend to allow users to broadcast video from mobile devices to a web page as social medium has grown in popularity since 2005. A novel architecture for media content selection and organization has been presented (Cesar *et al.,* 2008). In this architecture, users can personally enrich the content by adding drawing or text comments.

TECHNICAL PERFORMANCE OF MOBILE TV SERVICE

Mobile TV Standards

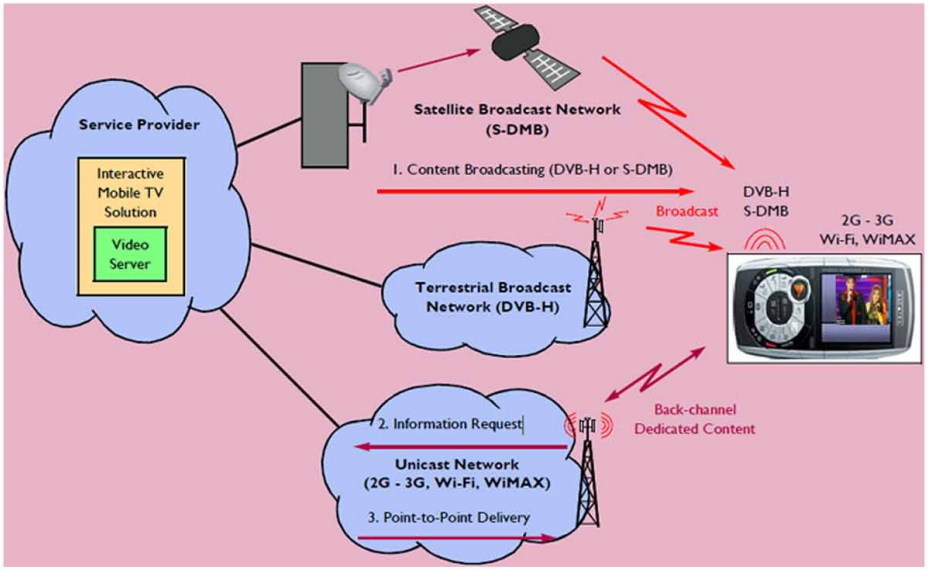
In Europe, the most frequent format to deliver Mobile TV is the *Digital Video Broadcasting for Handheld* (DVB-H) as it offers high downstream data rates (ETSI, 2004). DVB-H is an international standard, which offers broadcast data services to mobile handheld devices. Its main enhancements to conventional *Digital Video Broadcast-Terrestrial* (DVB-T) systems include the addition of time-slicing and an extra stage of error correction, referred to as *Multi-Protocol Encapsulation-Forward Error Correction (*MPE-FEC) at the link layer. ETSI (2008) has also specified the satellite-based DVB version. In DVB-H, time slicing is implemented to reduce power consumption of small handhelds. In Asia, Mobile TV is delivered mainly by using the *Digital Multimedia Broadcasting* (DMB) format. ETSI (2005) has specified the satellite-based DMB (S-DMB) and the terrestrial mode DMB (T-DMB). In the United States, the Qualcomm company has developed the *MediaFLO* format that represents a competitive alternative to DVB-H. It is noteworthy that FLO stands for *Forward Link Only*, and thus the transmission path is one way (Qualcomm, 2008). Finally, the 3GPP(2008) has specified the *Multimedia Broadcast/Multicast Service*.

In the technology landscape of Mobile TV, several aspects have to be considered:

- Mobile broadcast technologies could be terrestrial (DVB-H, T-DMB, MBMS), satellite (S-DMB) or hybrid satellite/terrestrial (DVB-SH);
- The frequencies that can be allocated to Mobile TV channels depend on the regulation rules of each country – available frequencies are a critical resource that may have a strong impact on the selection of the broadcast technologies;
- The unicast network, used for the back channel to get the requested content once the interactivity is triggered, can be a GPRS/EDGE, 3G or an upcoming WiMAX network (Figure 2);
- Some other critical technologies, such as DRM, are mandatory for content providers to deliver their added value content safely in the network.

At the network level, the mobile broadcast landscape is still shifting as the technical, regulatory and business options have not yet been made and could also be country dependent. Therefore, to decrease the integration costs of the solution by avoiding specific assimilations for each business model, an ideal Mobile TV architecture must be flexible and based on standardized interfaces. Since mobile TV services mostly consist of real-time video data, very stringent demands in terms of quality of service (QoS) are imposed on the broadcast operator's primary distribution network.

Figure 2. Co-operation between unicast and broadcast networks (adapted from Marilly et al., 2007)



Other Functional Parameters

- *Channel switching and response time.* Channel switching delays are caused by time slicing techniques applied to save power consumption. Such delays are annoying to the users of Mobile TV. Chipchase *et al.* (2007) confirmed that mobile users do not want to wait to long for the appearance of the new channel. To solve this problem, Robitza *et al.* (2010) propose an interesting scheme: *pre-loading of content such as commercials and playing them locally while waiting for a response*. Having transmissions over satellite (DVB-SH and S-DMB) the response time becomes higher (50 seconds) and thus the delayed presentation is likely to be severely annoyed.
- *Text quality.* Mobile TV quality depends on text quality. When transcoding a video from standard TV to Mobile TV, the text size from news tickers usually becomes too small. If we just increase the text size of a news ticker, the perceived quality can be significantly improved (Knoche *et al*., 2006).
- *Frame-rate.* If bandwidth is limited, video encoding must satisfy the bandwidth restrictions, and also to optimize the perceived quality of the video. This compromise often depends on the content to be encoded. Buchinger and Hlavacs (2006) found out that good picture quality with a low frame rate returns generally better results than high frame rate with lower picture quality. For news and comic contents containing little motion, the frame rate should be reduced to 5 frames per second (fps), while for a typical advertisement and soccer game, a value of 10 fps should be used.
- *Viewing distance.* Knoche and Sasse (2008) evaluated that preferred viewing distances are between 25 and 50 cm. The posture of people within a given environment determines to a certain degree the Mobile TV distance. From another perspective, the size of the mobile device must be combined with appropriate resolution. For example, preferred size for 120x90 for device with 116-ppi display is 32.6 mm.

- *Region of interest.* The *regions of interest* (ROI) of a video are important aspects of subjectively perceived quality estimation. The quality of the ROI has a large impact on the quality perception of Mobile TV content. On the contrary, background quality has low impact on the quality perception of Mobile TV. Therefore, it has been proposed to automatically detect the foreground and background of the video. Then, it is advised to treat them differently by allocating more encoding bitrate to the foreground (FG) and less to the background (BG). For example, we can apply a "blur function" with lower saturation to the BG, and the "blur function" with higher saturation values to the foreground (Buchinger *et al.*, 2009).

Costs and Commercials

Commercials finance mainly the Mobile TV services. However, users often skip commercials, if interactivity is provided instead of simple broadcasting. Vangenck *et al.* (2008) state that people are not willing to pay much for Mobile TV. Users would accept to pay for an average 9.7 euros monthly and they would prefer "pay per view" payment instead of paying for packages of channels (Kaasinen *et al*., 2009). The model of flat fees is acceptable by Mobile TV users for flat fee ≤ 5 euros per month. Frank (2009) reveals that even early adopters would reject to pay for content (42%), and they would prefer to watch adds (71%). Miyauchi *et al.* (2008) point out that reduction of noise and interruptions for advertisements are important aspects to consider, if users have to pay for Mobile TV. This happens because users would not pay for it, if the TV reception conditions are not good enough.

Implications of Mobile TV Use

The development of Mobile TV changes the concepts of space and time in media use. The implications of Mobile TV are not the same for all kinds of users and in all countries. In order to understand the social and technological implications of Mobile TV in its early stage, we must investigate whether there is a demand for the service in the target country and a business model to support it. In particular, we must examine the situations in which the use of Mobile TV is profitable for the user in each country. For this reason, various user studies should be consulted in each country. The technological and social implications of Mobile TV depend mainly on the exploratory behavior of Mobile TV user, which in turn forms various Mobile TV scenarios. For example, we can study if Mobile TV users can adopt olfaction-enhanced Mobile TV and whether such kind of Mobile TV is feasible. Kumar (2007) states "*the Mobile TV scenario can change overnight for technology providers, chip and handset manufacturers, and service providers based on decisions about technology, regulation, and spectrum and of industry bodies such as the Open Mobile Alliance or 3GPP and 3GPP2*". Mobile TV scenarios generate many business models of Mobile TV (DigiTAG, 2007). The four major business models are (DigiTAG, 2007):

- Model 1: Broadcaster-led approach with mobile telecom operator.
- Model 2: Mobile telecom operator-led approach with broadcaster.
- Model 3: Independent DVB-H service provider approach.
- Model 4: Mobile telecom operator-led approach.

According to Buchinger *et al*. (2011) the exploratory behavior of Mobile TV user is strongly dependent on technology adoption and performance gain issues.

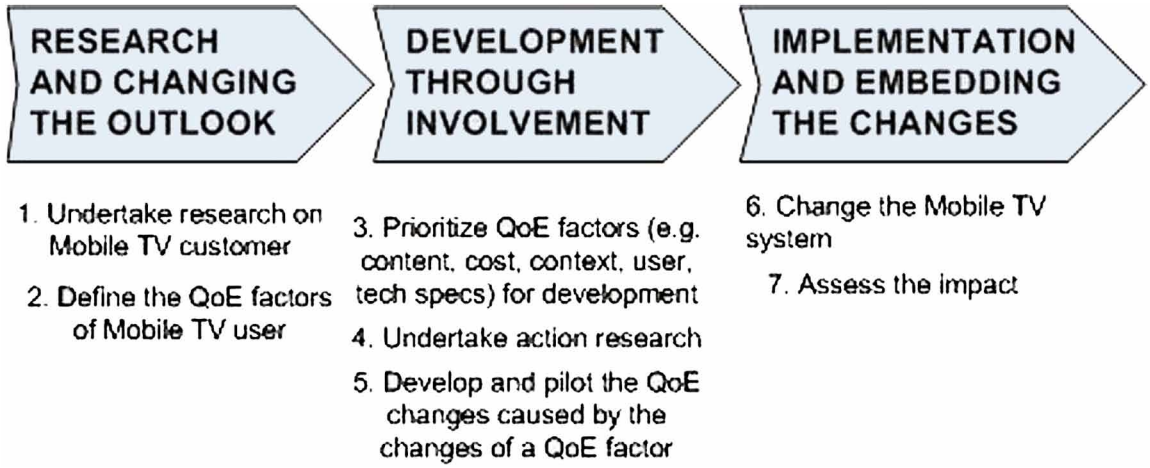
Technology Adoption. Choi and Totten (2012) investigate the effects of cultural differences (individualism vs. collectivism) on the acceptance of Mobile TV by identifying self-construal (independent vs. interdependent) as a possible antecedent of the *Technology Acceptance Model* (TAM). Surveying 817 university students in Korea and the United States, the study found that TAM is consistently stable across countries, and that individual-level cultural orientation had significant effects on the model as a direct antecedent of TAM. However, the relationships between self-construal and TAM variables were rather mixed. As hypothesized, interdependence was more important for Koreans' subjective norms and perceived usefulness, whereas independence was more important for Americans' subjective norms. Unexpectedly, however, the direction was reversed in the case of perceived ease of use. Moderating effects of country culture also appeared in the relative effects of perceived ease of use and usefulness on attitude. Perceived ease of use was more important than attitude in the US, while perceived usefulness mattered more in Korea. By adding self-construal as an antecedent variable, the study effectively explains how users' individual value orientation shapes TAM. This approach can provide deeper understanding for the adoption of new technology and suggest marketers better strategies for directly dealing with consumer characteristics in promoting mobile TV technology.

Performance Gains. As we mentioned before, the technical performance of a Mobile TV service depends mainly on the adoption of Mobile TV standards and various other aspects such as: (1) the frequencies that can be allocated to the Mobile TV channels; (2) the unicast network used for the back channel to get the requested content once interactivity is triggered; and (3) DRM issues. It is noteworthy that frequencies for allocating Mobile TV channels depend on the regulation rules of each country – available frequencies are a critical resource that may have a strong impact on the selection of the broadcast technologies. *Channel switching and response time; text quality; frame rate; viewing distance* and *region of interest* are some of the technical parameters that determine the wide-scale implementation of Mobile TV.

A ROAD-MAP FOR IMPROVING THE MOBILE TV CUSTOMER EXPERIENCE

This Chapter provides a road-map, which actors of Mobile TV industry can use as a base for improving their customer experiences. In this road-map (Figure 3), we have clear objectives in seven areas (customer-user, mobile device features, interactive Mobile TV services, content, context, costs and commercial, technical performance specifications) and use them to assess the benefits of improving the customer experience. There are several contributions for practitioners. First, it has identified the critical importance of outlook change in Mobile TV customer experience design. Second, it has highlighted the importance of involving Mobile TV users in the improvement programmes of Mobile TV industry, not simply as providers of information but through direct involvement as part of the Experience Teams. Johnston and Kong (2011) have investigated how organizations actually go about designing and improving their customer experiences. In particular, they proposed a ten-stage general road-map for improving the customer experience. The road map proposed by Johnston and Kong (2011) is general, and thus we adopted and specialized this road-map in order to finalize our seven-stage road map for the Mobile TV domain. We suggest a seven steps approach for improving the QoE of Mobile TV users.

Figure 3. Seven-stage road-map for improving the Mobile TV customer experience



(1) *Undertake research on Mobile TV customer*. At this stage, the received and desired QoE of Mobile customer-user is understood.
(2) *Define the QoE factors of Mobile TV user*. The experience team using facilitated sessions achieves this action.
(3) *Prioritize QoE factors* (e.g., content, cost, context, user, technological specifications) for development. At this stage, QoE factors for change are indentified.
(4) *Undertake action research*. Here, we have bottom-up mindset change and ideas for improvement. Key-tools that can be used are: observation, emotion mapping and walk-through audits. External "benchmarking" can also be implemented.
(5) *Develop and pilot the QoE changes caused by the changes of a QoE factor*. At this stage, we have idea generation, pilot testing, assessment and implementation.
(6) *Change the Mobile TV system*. The experience team is responsible for changes (e.g. measures, training, re-design of the system).
(7) *Assess the impact of the changes*. The greatest outcome is an increase in understanding of the Mobile TV service from a customer's point of view.

CONCLUSION

Mobile TV services must take into account user's needs, tasks and expectations. The user interface of mobile phones and its usability for Mobile TV often depend on the usage model and its layout as well as the context (or the environment) within the interaction occurs (Jumisko-Pyykko *et al*., 2008). In addition, the *Quality of Experience* approach adopted by the Mobile TV can explain how overall acceptability may be influenced by user expectations and context. In this Chapter, we presented the following aspects that should be considered to create a successful Mobile TV service:

- The profile of user watching Mobile TV.
- The acceptance of a mobile phone in order the user consumes multimedia content.

- How Mobile TV service can be improved by context awareness?
- What Mobile TV services are preferred and which are their features?
- What content users want to share and modify on their mobile devices?
- Which are the factors that influence the technical performance of the Mobile TV service?
- Cost and commercials. Users can skip commercials when interactivity is provided on Mobile TV. However, commercials are necessary for financing the service. The problems of fee types and the interplay of commercials are not solved yet.

FUTURE RESEARCH DIRECTIONS

The literature review shows that further investigation is required to answer the above questions adequately. We believe that the '*Living Lab*' concept is very promising for further research. The '*Living Lab*' concept is emerging in a user-centered (UCD) approach adopted recently for information and communication technologies (ICTs) innovation research. Schuurman *et al.* (2011) present a concrete application of Living Lab-research into the possibilities of Mobile TV, a notable example of ICT-innovations that incorporates the convergence of mobile phones and television. Their research was carried out within Flanders' mobile TV trial 'MADUF' and echoes a long tradition of interactive and digital TV trials. They proposed an analysis of the strong points, weaknesses, opportunities and threats of Living Lab-research based on this case study. This way, they contend that a Living Lab-approach seems proper for innovation research into Mobile TV in particular, but that certain issues remain to be tackled in order to optimize this kind of research.

The advent of olfaction-enhanced Mobile TV. Ghinea and Ademoye (2011) first coined the term "Olfaction-enhanced multimedia applications", which defined it as "*combining computer-generated smell with other media to enrich the users' experience and perception of a multimedia presentation or application*". In particular, they focused on investigating the user perceived experience of olfaction-enhanced multimedia applications, with the aim of discovering the quality evaluation factors that are important from a user's perspective of these applications. Enhancing Mobile TV with olfactory stimuli can create a more complex—and richer—user multimedia experience, by heightening the sense of reality and diversifying user interaction modalities. Nevertheless, olfaction-enhanced Mobile TV still remains in infantile stages. A few olfactory-enhanced multimedia applications have been presented, with olfaction being used towards a variety of goals, including notification alerts, enhancing the sense of reality in immersive applications, and branding. Kim *et al.* (2006) designed an olfactory display system called "*FragrantMemories*" that enables users to easily create fragranced home movies. In addition, they conducted an evaluation experiment to verify the need for olfaction enhanced broadcasting in TV using their "*FragrantMemories*" system. The results of their evaluation experiment verified that there is an increasing demand for TV broadcasting to include the transmission of olfactory data signals. An interesting olfaction-enhanced display system has been implemented in (Matsukura *et al*., 2009a; Matsukura *et al*., 2009b). This display system focuses on the technical aspects of olfaction-enhanced displays and uses computational fluid dynamics (CFD) to calculate odour distribution and subsequently use an *odor blender* (Nakamoto *et al.*, 2008) to generate the odor with the concentration determined by the calculations. Finally, Pornpanomchai *et al.* (2009) implemented a simple olfaction-enhanced multimedia display system and investigated the usability and efficiency of their system.

Achieving quality of olfaction-enhanced Mobile TV from the users' perspective will be crucial to the success and continuity of Mobile TV. Specific attention needs to be given when synchronizing other media content with olfactory data. Ghinea and Ademoye (2010) present the results of an experimental study carried out to explore and investigate the temporal boundaries within which olfactory-data output in an olfaction-enhanced multimedia application can be successfully synchronized with other media objects from an end-user perspective. Results show the presence of two main synchronization regions, and that olfaction ahead of audiovisual content is more tolerable than olfaction behind content.

KEY TERMS AND DEFINITIONS

Context Awareness: It is a term that is used for devices that have information about the circumstances under which they operate and can react accordingly. Context aware devices may also try to make assumptions about the user's current situation.

Context: A central concept in ubiquitous computing literature that can be understood as the background and specific circumstances of a subject.

Device Interactivity: Facilitation of one-way and two-way communication through applications.

Digital Multimedia Broadcasting: (**DMB**): It is a digital radio transmission technology developed in South Korea for sending multimedia such as TV, radio and data-casting to mobile devices such as mobile phones, laptops and GPS navigation systems. Some times, DMB technology is known as mobile TV.

DVB-H: (**Digital Video Broadcasting - Handheld**): It is one of three prevalent mobile TV formats. It is a technical specification for bringing broadcast services to mobile handsets. DVB-H was formally adopted as ETSI standard EN 302 304 in November 2004.

Mobile TV: Watching TV on a mobile phone. There are several mobile TV air interfaces competing for prime time. Digital multimedia broadcasting (DMB) is based on the digital audio broadcasting radio standard; digital video broadcast-Handheld (DVB-H) is the mobile version of the international digital TV standard, and forward link only (FLO) is based on QUALCOMM's popular CDMA technology.

Quality of Experience: (**QoE**): It is a measure of a customer's experiences with a service (mobile TV, web browsing, phone call, TV broadcast etc.). QoE focuses on the entire service experience, and is a more holistic evaluation than the more narrowly focused user experience (focused on a software interface) and customer-support experience (support focused).

Ubiquitous Media Environment: A future media environment supporting device independent, anytime, anywhere publishing.

User Experience (UX): It is a term used to describe the overall experience and satisfaction a user has when using a product or system. It most commonly refers to a combination of software and business topics, such as selling over the web, but it applies to any result of interaction design.

User-Centered Design (UCD): It is a design philosophy and a process in which the needs, wants, and limitations of the end-user of an interface are given extensive attention at each stage of the design process. UCD is a multi-stage problem solving process that not only requires designers to analyze and foresee how users are likely to use an interface, but to test the validity of their assumptions with regards to user behavior in real world tests with actual users. Such testing is essential as it is often very difficult for the designers of an interface to understand intuitively what a first-time user of their design experiences, and what each user's learning curve may look like.

Chapter 25
Digital Transformation in the Public Sector:
Electronic Procurement in Portugal

Isabel da Rosa
Universidade de Lisboa, Portugal

João de Almeida
Independent Researcher, Portugal

ABSTRACT

Digital transformation in the public sector is an inevitable requirement for governments due to the growing complexity and interconnections of information systems, and to the demands of citizens, who are becoming better informed and are increasingly looking to more agile and innovative services. However, despite the willingness of many governments and public institutions, the results do not always tally with the original objectives. In the case of public procurement in Portugal, it could be said that digital transformation experience had an unexpected success in the European context, through a business model that is still quite unique in Europe. This result is much owed to the strong political determination, the experience gained from pilot projects, and to the involvement of many stakeholders, who contributed, in a consistent and innovative way, to the definition of the system. The system is not perfect: there are many challenges that need to be addressed in the coming years. Yet, it has enabled the Portuguese public administration to significantly grow in the digital era, so that today the State has a database containing structure information about public procurement, which is a unique case in many countries.

INTRODUCTION

Digital transformation (DT) – the use of technology to radically improve performance or reach of enterprises – is becoming a hot topic for companies across the globe. (MIT Center for Digital Business and Capgemini Consulting, 2013)

DOI: 10.4018/978-1-5225-3822-6.ch025

The era of digital transformation is here to stay. It is happening in our lives in ways we have not even begun to grasp, but it is there. One need only think about the proliferation of social networks, and in particular on how they influence relationships, impact on electoral results, etc. But, if this is a very obvious example, many others are not so obvious, albeit equally relevant.

While the public sector is no exception to this avalanche of transformations the world has witnessed, it is not always agile enough to successfully drive this transformation process. Moreover, the confidence of citizens in the public administration ability to reinvent and modernize itself today seems more lost than ever, as the result of the austerity measures and economic instability that has already dealt a cruel hand on some countries and had its repercussions on many others, through globalization and the interdependencies that have been established.

According to a survey conducted by Accenture, European citizens across five countries were asked how confident they felt about their governments' ability to deliver services that will meet the needs and expectations of citizens in the future. More than 62% said they were not confident. To stay connected to their constituents, public leaders both at Member State and European levels need to usher in a new accountability framework (Masson, 2014).

In the specific case of public procurement, according to an OECD recommendation, public procurement is a crucial pillar of strategic governance and services delivery for governments. Because of the sheer volume of spending it represents, well governed public procurement can and must play a major role in fostering public sector efficiency and establishing citizens' trust. Well-designed public procurement systems also contribute to achieving pressing policy goals such as environmental protection, innovation, job creation and the development of small and medium enterprises (OECD, 2015).

If digital reform is added to an effective reform of public procurement, which today one cannot forgo, then there would be an opportunity for transforming public service. Portugal was, in this field, a surprising and unexpected case study. In fact, without making it explicitly known, the Portuguese government made the bold decision of making e-procurement compulsory on 1 November 2009 through a solution based on Cloud service resources.

The purpose of this article, which as part of studies on digital transformation seeks to explain the reasons why the Portuguese model is so effective, is to understand that decision and put it into context.

With this in mind, the article is divided into the following sections: introduction, background on digital transformation, description of the Portuguese case in respect of the legal reform and the implemented electronic system, analysis of the case in the context of digital transformation, lessons learned and current challenges, and, finally, the conclusions.

BACKGROUND

According to the declaration on the digital transformation of European industry and enterprises stemming from the conference on the digital transformation of European industry and enterprises, held in Brussels in February this year, digital technologies are currently driving the 'fourth industrial revolution' (Conference on Digital Transformation, 2016).

Empowered by digital investments, disruptive business models and improved production processes, European companies are generating international market opportunities with new products and services. In today's globalized world, the transition to a digital economy is essential for Europe's competitive edge

and to deliver much needed economic growth and jobs. This is what drove the analysis of electronic public procurement in this current turmoil.

To this end, and although the topic of digital transformation has exponentially increased in many fields over the last two years, in particular in consultancy and in the academy, this work has focused on the analysis carried out by George Westerman and co-authors in his recent work on the leading role of digital transformation.

The rationale behind this choice is that this analysis is essentially based on the activity of companies worldwide and, on the other hand, because this is a quite diversified business sector. This study explains that successful transformation is a clear, two-fold framework: where to invest in digital capabilities, and how to lead the transformation.

The authors' attention was most captured by the component of how to lead the transformation because in the case of Public Procurement the decision about "what" – to implement electronic public procurement – was a political decision. So, how to implement Electronic Public Procurement is where the challenge lies and is related to the field of leadership. Leadership capabilities are essential to achieving true digital transformation; they turn digital investment into digital advantage.

The four key elements of leadership (Westerman, Bonnet, & Mcaffe, 2014) are:

- **Creating a Digital Vision:** Digital transformation starts when you create a transformative vision of how the organization will be different in the digital world;
- **Engagement of Employees:** Engaging employers means getting everyone moving towards the same direction;
- **Creating Governance System:** Establish the right model digital governance model is critical, since it acts as the rudder to steer digital initiatives in the right direction;
- **Creating IT/Business Synergies:** Building strong relationships between IT and business people and the right digital skills will help to build and continually reap the benefits from a well-designed digital platform.

E-Procurement Concept - e-Procurement refers to the use of Internet-based (integrated) information and communication technologies (ICTs) to carry out individual or all stages of the procurement process, including search, sourcing, negotiation, ordering, receipt, and post-purchase review. While there are various forms of e-Procurement that concentrate on one or many stages of the procurement process, such as e-Tendering, e-Marketplace, e-Auction/Reverse Auction, and e-Catalogue/Purchasing, e-Procurement can be viewed more broadly as an end-to-end solution that integrates and streamlines many procurement processes throughout the organization (Vaidya, Sajeev, & Callender, 2006)

THE 2008 THREE PILLARS PUBLIC PROCUREMENT REFORM

Strongly motivated by the need to conform the Portuguese public procurement system to the EU law, especially Directives 2004/17/EC and 2004/18/EC, the 2008 reform was based on three essential pillars: a new public contracts code as the primary public procurement law, an institutional framework based on the National Public Procurement System and a fully-fledged e-procurement system.

Public Contracts Code

EU regulations on Public Procurement aim to promote transparency, fairness and a competitive public procurement across the EU's single market, fostering business opportunities and generating economic growth and job creation.

In the case of the 2004 EU directives package (Directives 2004/18/EC and 2004/17/EC) that regulated the procurement procedures for major contracts (Bovis, 2006) until 2014, they addressed the creation of an internal market for public procurement and were based on the Treaty provisions related to the single market. The aim of these directives was not to provide a general framework for implementing other objectives, such as ensuring best value for taxpayers' money, preventing corruption, or ensuring transparency and accountability (Arrowsmith, 2005), which, as in other aspects of procurement policy, should still be considered a matter to be dealt with at Member State level. This explains why so many Member States have set their own regulations and requirements applicable to contracts the value of which is below the Directives' thresholds.

Approved by Decree-law 18/2008, the Portuguese Public Contracts Code (PCC) primarily aimed at transposing the above mentioned EU 2004 procurement directives into the national legal system.

Public procurement contracts, including supplies, services, works, and works and services concessions are regulated by the PCC and all entities classified as contracting authorities by the EU directives fall within the scope of and must comply with it. These include the central government, the regional and local authorities and the bodies governed by public law (regardless of their public or private nature).

However, the PCC went further than the minimum mandatory scope of the required transposition by promoting a major shift in the Portuguese public procurement system, as the legislator made use of its relative freedom to regulate contracts below the Directives' thresholds and opted to set out, in many ways, a similar framework for contracts above and below the Directives thresholds (Almeida & Fautino, 2009) and set an innovative and bold public procurement model to foster non-discrimination, competition, transparency and accountability in public procurement contracting (Tavares, A gestão das aquisições públicas: guia de aplicação do Código dos Contratos Públicos, 2009).

Drawing on the external pressure of the EU to transpose the 2004 Directives, it should be emphasized that the Code eventually became the decisive instrument of change towards a new paradigm based on e-procurement in 2008. In tandem with the supplementary legislation described in Table X below, the Code added a new DNA to the Portuguese public procurement system – the use of electronics in the contract preparation phase (until the award of the contract) and the disclosure of procedures and opening of the procurement market to society, guaranteed through the combination of electronic means of data transfer and of e-procurement platforms (transactional system component) with the availability of a single public contracts portal, the BASE Portal.

No other innovation brought in by the 2008 Code can be considered more striking than the transformation into a fully-fledged e-procurement system. While it had been promised for the entire UE since the "Manchester Declaration" (ministerial declaration approved unanimously on 24 November 2005, Manchester, under the auspices of the United Kingdom EU Presidency) with the assumed target of "By 2010 at least 50% of public procurement above the EU public procurement threshold will be carried out electronically", Portugal had already achieved 91% of this target in 2010 (IMPIC, I.P., 2011).

Reality has shown the appropriateness of the legislator. The new legislation has introduced an unparalleled level of transparency, at a time when most Portuguese people believed that contract formation

procedures, even open tenders, were "rigged" and did not satisfy the principle of equal treatment or, at best, the system did not promote competition and prevented or made it hard for new players to enter the system, especially SMEs. While it is true that electronics on its own does not necessarily open doors to an ideal world, there is however a recognition that it removed from contract formation procedures most discriminatory practices and, when supported by a portal such as BASE, it served most of the interests of stakeholders involved in public procurement, either those on the demand and supply side, or the inspection bodies and society in general (the right of scrutiny over the management of taxpayers' money).

The most striking aspects of this reform are that its adoption is mandatory, even though "electronics" and "paper" were allowed to coexist during a transitional period, and the legal enforcement by which contracts are void if formed through non-electronic media.

Even if from a technological viewpoint this profound change posed no major, let alone insurmountable difficulties to any EU Member State, the fact is that only the mandatory nature of its adoption now prescribed in the 2014 Directives was to bring about change and, from the limit dates set at EU-wide level, the following causes were said to have slowed down the process:

- A relative distrust of public powers and economic operators on the degree of openness and increased facilitated access to domestic/national markets by international market players (protectionist tensions), for example, in that e-Procurement enables some context costs associated to the physical location of companies and of target markets of their products and services be close to irrelevant (once language difficulties are sorted out, e-procurement makes it financially feasible, perhaps even interesting, for a Finnish architecture office to bid in a public works tender launched by a municipality in the Portuguese hinterland, or, conversely, for a Portuguese software company to bid in a public tender for the selection of a system to monitor the marine environment around Helsinki. There is no need for teams to travel to the sites, and there are no communication costs involved, for e.g., costs for shipping documents and mock-ups);
- Poor promotion of the e-Procurement system as regards aspects other than contract awarding (up to the e-tendering phase) that deal with the integrated management of public organizations (the interfacing with public finance management and other areas, applications and tools used in the management of public organizations, ERPs, CRMs, etc., with the aim of increasing their efficiency);
- The classical resistance to change, perhaps more noticeable in some sectors of public administration rather than in private economy, which is much more exposed to more demanding global levels of competition and faces the key challenge of innovation as an "approach" to survival.

Against this background, one of the questions most often heard among stakeholders in the early years of the reform was: "What about Portugal? Is the decision to take the lead the right one?

While it is true that the national public market provided (even) easier access to economic agents from other EU countries, nonetheless the pioneering role of Portugal in this area:

- Increased transparency, providing more and better methods of preventing corruption;
- Afforded more competition between economies of scale (better prices and savings);
- Prepared the Portuguese companies, in particular the SMEs, to access electronic public procurement markets, which, in adopting the new 2014 Directives, will become the rule in the Single Market, and

- Enabled the formation of a cluster of service providers linked to e-procurement, from e-platform operators to public procurement consultants (as "e-public procurement" is turning into "public procurement").

By introducing, in 2008, electronics as the new (mandatory) paradigm in the public contracts formation in Portugal (See Table 2), the Code and its supplementary legislation impacted tremendously on the public procurement lifecycle and helped change workflows, processes and working methodologies of both contracting authorities and economic operators. To some extent the Code brought Portugal to a leading position and prepared the country well in advance for what the EU came to set as targets for the use of electronics in 2014, through Directive 2014/24.

National System of Public Procurement

The National Public Procurement System (NPPS) was established in 2007 while the preparatory work on the new Public Contracts Code was already being finalized. Its main aim was the optimization of

Table 1. 2008 reform legislative package

	LEGAL ACT	SUBJECT MATTER
A	Decree-Law 37/2007 (DRE, 2007)	Defines the National System of Public Purchases (NSPP) and creates the National Agency for Public Procurement (NAPP) as the entity responsible for the system's management
	Regulation 330/2009 (DRE, 2009)	Regulates the functioning of the National System of Public Procurement
B	Decree-Law 18/2008 (DRE, 2008)	**PUBLIC CONTRACTS CODE** (PCC) – new primary public procurement law
C	Decree-Law 143-A/2008 (DRE, 2008)	Electronic Platforms and data communication forms
	Order 701-A/2008 (DRE, 2008)	Approves the key standard forms related to contract notices and contract award notices that are published in the "*Diário da República Eletrónico*" (e- Official Journal)
	Order 701-B/2008	Setup of an Advisory Committee in charge of monitoring the application of the Public Contracts Code
	Order 701- D/2008	Defines the model of statistical data to be reported by contracting authorities
	Order 701- E/2008	Defines the model of the data reports to be completed and provided by contracting authorities in/through the Public Procurement Portal www.base.gov.pt
	Order 701- F/2008	Regulates the setup, operation and management of the Public Procurement Portal (www.base.gov.pt)
	Order 701-G/2008	Sets out the requirements and conditions of use of electronic platforms by the contracting authorities and regulates their terms of operation
	Order 701- H/2008	Approves the mandatory content of the execution project of public works and the procedures and standards to be adopted
	Order 701- I/2008	Establishes the "Observatory of Public Works", and approves its operational rules
	Order 701-J /2008	Defines the model of statistical data to be reported by contracting authorities

A – Setup of central purchasing system and body **B** – Code of Public Contracts (transposing the EU 2004 Directives into the national legal system) **C** – Specific e-Procurement and implementing provisions

Table 2. Key deadlines set forth by Directive 2014/247EU

Key deadlines set forth by the Directive 2014/24/EU	
E-Noticing, including all procurement documents,	18 April 2016
Full e-procurement including e-Tendering for Central Purchasing Bodies	18 April 2017
Full e-procurement including e-Tendering for other public contracting authorities	18 October 2018

purchases of categories of goods and services likely to be centralized, led by the National Agency for Public Procurement (ANCP), the nature and policy instruments of which are those typical of a Central Purchasing Body (CPB), in addition to some policy-making and coordination powers besides those relating to centralized purchases. The NPPS, led by the ANCP until 2012 and based on a network of Ministerial Purchasing Units, comprised the affiliated entities (direct administration services and public institutions) and voluntary entities, who joined the system through accession agreements for purchasing purposes under framework agreements provided by the CPB (Municipalities and Municipality-Owned Companies, Regional Authorities, State Owned Companies).

More recently, through Decree-Law 117-A/2012, of 14 June, the ANCP merged with other two entities (GERAP, set up to deal with some shared services in the field of human resources and public finance management, and the IT Centre for Public Administration, which had been until then a unit within the Ministry of Finance) into a new body of public law, the Agency for Shared Services in the Public Administration (eSPap).

So, the institutional framework has significantly evolved within the last 10 years (2007-2016) as the key competences and responsibilities of the public procurement system have been assigned to seven different public bodies throughout this period. Figure 2 shows the evolution of actors and distribution of key functions:

- **National Public Procurement System (NPPS):**
  - **ESPAP**: Former ANCP (Ministry of Finance) – Manages the National System of Public Procurement and acts as a generalist central purchasing body.
  - **UMC**: Ministerial Purchasing Units (one per Ministry).
  - **SPMS**: Central purchasing body for the Health Sector.
- **National Information System and Regulation:**
  - **IMPIC** (**Ministry of Planning and Infrastructures):** Public Contracts Portal (BASE) and Electronic Platforms Regulation.
  - **GNS (National Security Office):** Accreditation of Security Auditors.
- **Private Electronic Platforms Operators:**
  - 6 licensed to operate in the Market (May, 2016).
- **National Auditing Authorities:**
  - Court of Auditors.
  - Inspectorate-General of Finance, Ministerial Inspectorates (Sectoral).
  - Competition Authority.

The key entities who contribute to the strategy and policy making, implementation, monitoring and control of public procurement in Portugal can be grouped under the following four functions as shown in Figure 1.

The Portuguese institutional framework does not comprise an independent Review Body as in other countries. In case the request for review is rejected by the Contracting Authority (CA), the Economic Operator (EO) has to make use of the judicial system through the Administrative Courts.

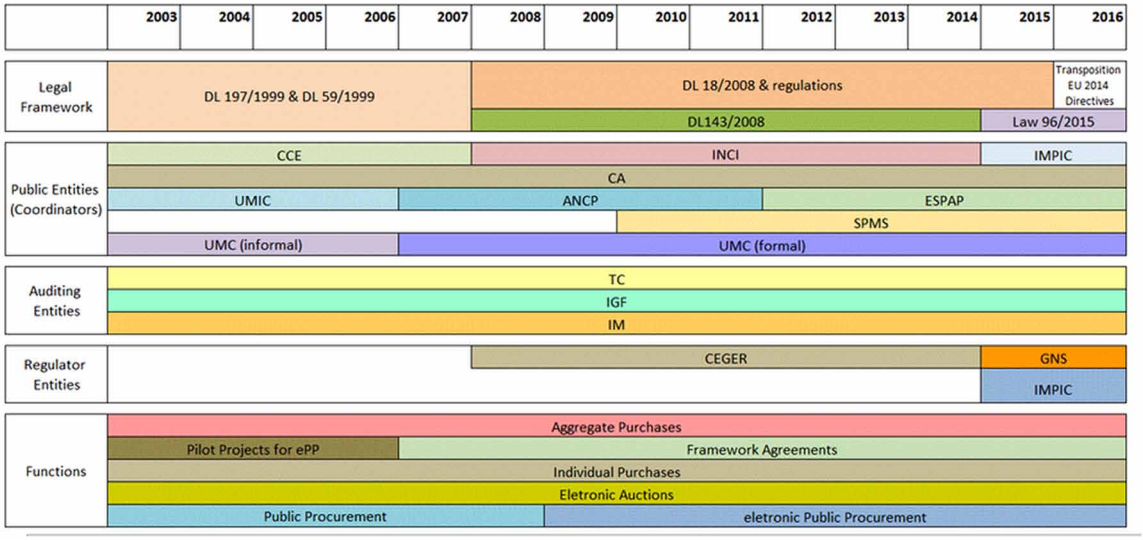
The Star of the Reform: E-Procurement System

It must nevertheless be noted that the most remarkable aspect – and incidentally more lasting – of the 2008 reform was precisely the setup of a fully-fledged e-procurement system which proved to be the "star of the reform" and the reason why it was referred to as the "Portuguese case" at international level. In fact, from a substantive viewpoint of the legal reform, in addition to some creative solutions (for example, the swapping of the sequential order of eligibility and awarding, the harbinger of the EU solution adopted by Directive 2014/24/EC), most of the legislator's solutions were circumscribed by the European directives. Where the legislator surprised the most was precisely in respect of e-procurement – due to the change in strategy, anchored within a short transitional period during which paper and electronics coexisted, followed by the imposition of electronics in the formation process of almost all public contracts.

It comes as no surprise that the more skeptical prophesized the deadlock of the public administration, claiming that it was not prepared for such a revolution, and alerting to the possibility of the breakdown in the supplies of essential utilities to schools, security forces, prisons, etc. None of those catastrophist scenarios have materialized.

Although the great turning point in the public procurement national system occurred in 2008, with the adoption of the new PCC, the fact is that the profound changes that became visible in that year had been in the pipeline since 2002.

Figure 1. 2016 KEY public entities in public procurement governance



The Roadmap

In fact, it all started with the setup of the Knowledge Society Agency (UMIC) by Resolution of the Council of Ministers No. 135/2002, of 20 November, and the assignment to this new body of the task to devise and propose a strategy for development of information society and electronic government in Portugal, as well as an implementation plan covering the period from 2003 to 2006.

In June 2003, the Council of Ministers approved, among a set of strategic documents aiming at stimulating the changeover towards an information society, the National Plan of Electronic Procurement, the first roadmap towards the adoption of a fully-fledged e-procurement system in Portugal. Until 2007, this national plan encompassed the implementation of 8 (eight) pilot projects completed in 8 (eight) ministries through the use of the 4 (four) B2B platforms (Business to Business) that existed in the private market at the time. It should be stressed that the scope of the pilot projects was limited to internal preparatory tasks, e.g. the collection and aggregation of needs for joint procurement or conduction of e-auctions as an allowed method under the negotiated procedure at the time.

By showcasing the potential benefits of a broader e-procurement system, the implementation of these pilots has been critical to induce a structural change both at the level of procedures and working methodologies and, more importantly, the attitudes towards public procurement management which was calling for a new mind-set to be adopted by the key stakeholders.

The positive impact of pilot projects went well beyond the sole "electronic perspective" of matters and solutions - where the conduct of e-auctions deserves to be highlighted - and has significantly contributed to initiate a broader transformation. It was, indeed, within the pilot projects that a number of contracting authorities experienced, for the first time ever, a different collaborative atmosphere enabling them to share and aggregate needs, to setup the first specialized units within ministries and other contracting authorities in charge of managing the procurement and setting the minimum standards for the public consumption of some pre-selected cross-cutting categories of goods and services.

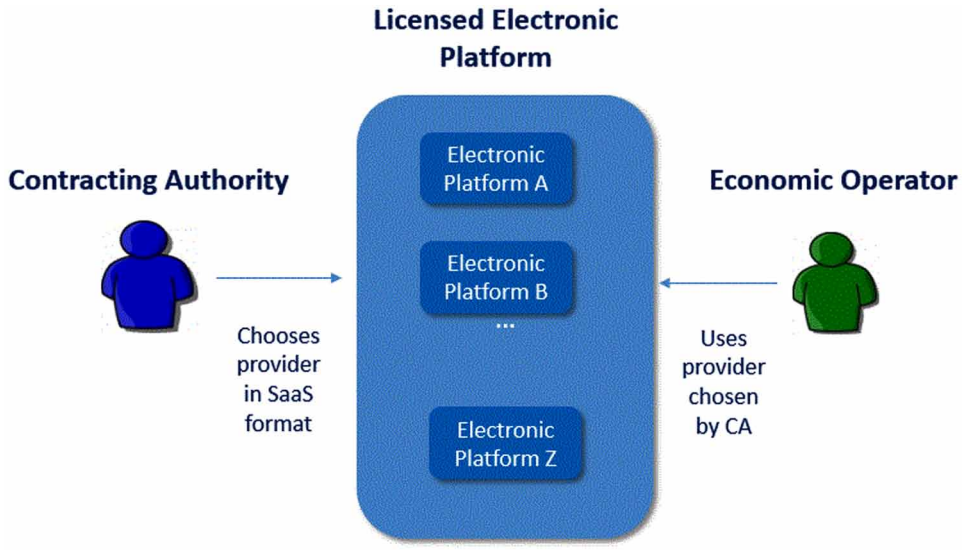
Key Features of the System

In clear contrast with a much less ambitious attitude adopted by the majority of Member States, and following a transitional period of one year, the electronic procurement became mandatory in Portugal as of 1 November 2009.

The PCC made, itself, a bold and comprehensive commitment to electronic procurement (Tavares, 2010) and translated into the legal provisions a solid, determined and ambitious political decision about a new public procurement system highly anchored in the use of electronic communications as a means to make it more transparent and efficient.

The rule is, in fact, that all public procurement procedures in Portugal must be performed electronically, from the publication of the contract notice to the publication of the contract award notice and the contract itself: all tender documents must be produced, published, notified and stored electronically; all economic operators must submit their applications, tenders, documents, requests for clarification, claims, etc., electronically; all communications between these two parties must be done electronically. Additionally, for all procedures encompassing the publication of notices, the contract formation phase must run on a certified electronic platform, i.e., the contracting authority documents must be published, notified and stored on an electronic platform; all economic operators must submit their applications, tenders, documents, requests for clarification, claims, etc., through an electronic platform.

Figure 2. The Portuguese e-public procurement framework



The implementation of this model required the availability of electronic platforms and the Portuguese legislator opted to rely on a market of electronic platform operators (instead of a model based on a single public platform). Decree-Law 143-A/2008, of 25 July, and Ordinance 701-G/2008, of 29 July, were adopted with the aim of regulating the activities of platform operators, and the key features and functionalities these platforms should be ready to offer in order to be granted the licence to operate.

The Law 96/2015, of 17 August 2015, (DRE, 2015) repealed DL 143-A/2008 and introduced the legal definition of electronic platform as "a technological infra-structure that consists of a number of computer applications, resources and services required for the operation of electronic procedures relating to national public procurement, and through which these procedures are carried out" (Article 2(e)).

The National Security Office (NSO) is the organisation under the Presidency of the Council of Ministers responsible for certifying electronic platforms in terms of electronic security. In May 2016, six certified electronic platforms were allowed to operate in Portugal.

The second pillar of the Portuguese e-public procurement model is the public contracts portal: portal BASE. This portal is a centralised database that contains extensive information about all public contracts and is automatically fed by the DRE - electronic official journal (www.dre.pt), the electronic platforms and by contracting authorities, depending on the type of procedure and the phase within the procurement cycle.

The Business Model

Simultaneous with the decision on mandatory electronic public procurement, Portugal also opted for a decentralised approach to e-procurement platforms, in contrast to several countries across Europe where e-procurement implementation models relied on the mandatory use of a single national platform (Assar & Boughzala, 2008) (European Commission, 2009). The CAs may select the most suitable platform

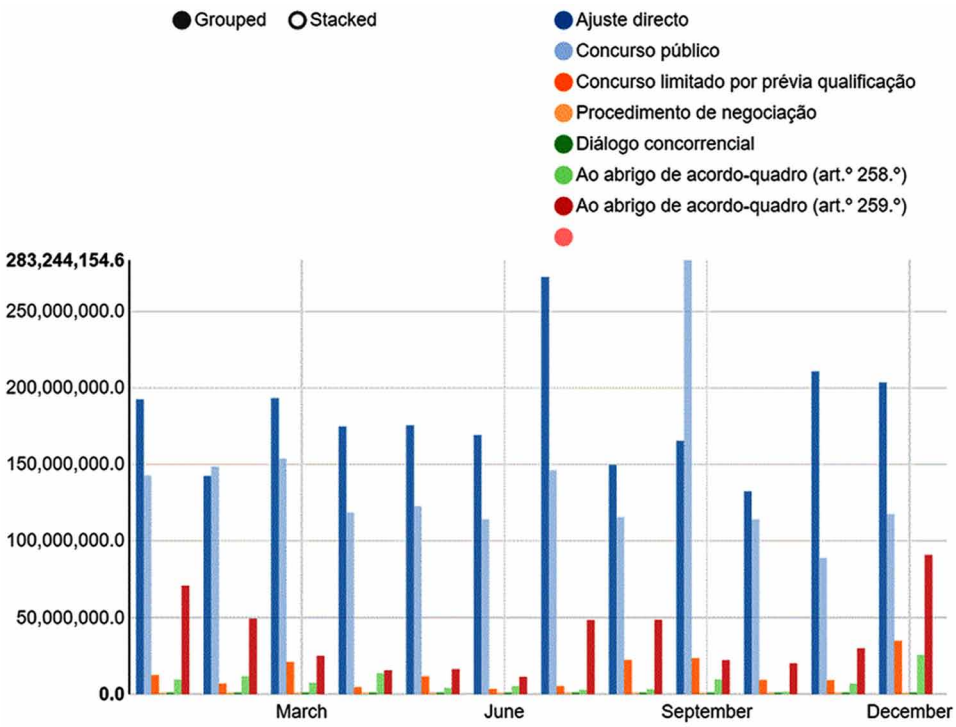
from a set of electronic platforms licensed by a Supervisory Board offering general and differentiated services, whose list is available on the public contracts portal (IMPIC, IP, 2016) and EOs must be registered and use the various platforms at the same time (see Figure 3). In the decentralised approach, the e-procurement platform market is regulated and each member must comply with strict security and safety requirements (Betts, et al., 2006) (Polemi & Papastergiou, 2006). As expected, the existence of several platforms increased competition and stimulated the development of more capable solutions, integrating business processes, promoting green procurement, boosting collaboration and enhancing electronic supply chain management (Arantes, Aguiar Costa, & Valadares, 2013).

As explained further ahead in this paper, this very option may have been among the critical success factors that allowed the public procurement system to overcome the difficulties raised by a slight high political rotation with concrete impacts at the level of the Public Administration and several strategic changes within a slightly short period of time if we consider the structural kind of reforms at stake. Notwithstanding, as in any other alternative, its practical deployment has shown positive and negative aspects that are recognised at both national and international levels.

On the positive side, it is important to stress that the model:

- Allows a very fast "Time to Market";
- Promotes a competitive market among private electronic platform operators;
- Fosters innovation as a result of such competition and as a result of a more demanding public client;

Figure 3. SaaS business model



- Requires a low initial investment and entry cost for public entities;
- The accreditation process regarding the security requirements of the platform and the operational conditions of the provider exempts Contracting Authorities from worrying about this complex task they are not prepared for and have no resources to undertake by themselves.

On the negative side, the following coud be highlighted as weaknesses of the model:

- Each economic operator must use multiple e-platforms;
- Lack of interoperability among e-Platforms;
- Difficulty to prevent some risks of anti-competitive behavior and conduct (both relating to the scope of services to be rendered and prices) from platform operators which was calling for a better regulatory framework. The Law 96/2015, of 17 August 2015 has responded to this challenge and today a proper enforcement scheme is in place.

New Levels of Transparency and Accountability

In its unique view of the electronic model of the information system, the Public Contracts Code provides for the establishment of a Web Portal to register contracts awarded under its legal framework.

One of the main reasons that supported the creation of this type of solution was the fact that direct awards - a fairly frequent type of public procurement procedure where suppliers can participate by invitation - were considered a black box within public expenditure. To avoid that, it became mandatory to disclose these contracts through a Web-based solution. Besides promoting transparency in the conduct of these procedures, which in the past were only known to the participating entities, the legislator wanted also to ensure its effective enforcement by determining that if this type of procedures were not disclosed on the Portal, the corresponding contract would not be paid. This enforcement mechanism significantly contributed to contracting authorities being more careful when complying with the regulations and, as a consequence of a much higher degree of compliance, the accuracy and completeness of information has increased significantly.

It should be noted that this type of information on the internal operations of the Public Administration had never come under the public eye in such a direct manner before. Such a transparency brought into direct awards induced a "silent revolution" in the behavioral culture of people and organizations and prompted a quite exacerbated scrutiny of the data published on the Portal in the early days of its existence.

Also of utmost importance was the need to provide a single information repository regarding all public procurement procedures enabling policy makers and market operators, from both demand and supply sides, to have a 360º view over the system. This aspect was quite visionary at that time, and not all stakeholders understood the implications of this measure, which was the establishment of a centralized repository of the life cycle of public contracts, in addition to the decentralized model of transactions processed through private platforms.

For the first time ever, it became possible to trace public contracts from the pre-award phase up to the post-award phase within an integrated information system.

The Public Contracts Portal: A Contracts Register

The public contracts Portal, called and known as "BASE", is a complex information system that automatically collects data, via the Internet, from various sources and from the electronic forms completed by contracting authorities in the reserved area. The system comprises a database the purpose of which is to centralize in a single repository the information from the entire Portuguese public administration. Accessed at www.base.gov.pt, it has a reserved access area for contracting authorities who, using the same link, can access their data either introduced directly by them or fed into the system by the electronic platforms. Its public component comprises also a specific subsystem for procedures related to works and public works, called the Public Works Observatory. The data entered in the Portal since August 2008 are an extremely valuable asset, enabling the Portuguese public administration to analyze information in many different ways, to profile public expenditure and its evolution across different macroeconomic scenarios and already significant time series, to carry out forecasts and analyses and, last but not least, to monitor compliance with the PCC in quantitative terms. By the end of May 2016, there were around 645 000 contracts registered in the system. Since August 2013, the uploading of the image of the document itself became mandatory.

Several stakeholders play a relevant role in interacting with the system's architecture, especially as regards the forwarding of information concerning the transactions related to the contract formation phase. Once electronic public procurements in the contract formation phase became mandatory, since 1 November 2009, electronic platforms have had to be used for all public procedures. Although electronic platforms are not mandatory in the case of direct awards, electronic means do have to be used. Transactions made on these e-platforms must be automatically forwarded to the BASE Portal through an interoperability system, for which a feasible technological solution had to be found, consisting of a number of *Web services* for the safe transmission of reported data.

One of the relevant stakeholders is the Portuguese printing house and mint (INCM - Imprensa Nacional Casa da Moeda), as it is responsible for the authentication system and the automatic transmission of notices concerning public procurement procedures. Cooperation with that entity is, therefore, particularly relevant. Firstly, because system developments in the user authentication component were no longer necessary, thus reducing efforts and implementing a good practice by reusing existing solutions. Secondly, not only because of the visibility of notices on a portal dedicated to public procurement, but also because integration with INCM has a very strong impact on the database: the integration of public notices automatically generates the procedures. As to the contracting authorities, they are responsible for ensuring the registration and execution of contracts using the forms available in the BASE reserved area. However, plans are in the pipeline to ensure the automatic transmission of this information in the future by developing *Web services* connected to the internal systems of each entity.

The BASE Portal keeps extensive information about most public procurement procedures and contracts, some of which is public and available online in real time, and some is stored and analyzed for reporting and policy purposes.

The model is a very simple one and is shortly described as follows:

For procedures conducted upon invitation, indicated by red arrows on Figure 4, all documents including the invitation to tender, contract specifications/requirements and respective tenders have to be transacted through electronic channels. While the use of electronic platforms is not mandatory for procedures by invitation, indicated by yellow arrows on Figure 4, still many contracting authorities are opting for electronic platform services to manage them. In any case, regardless of the means of communication effec-

Figure 4. Key processes run through the e-platforms, official journal and BASE Portal

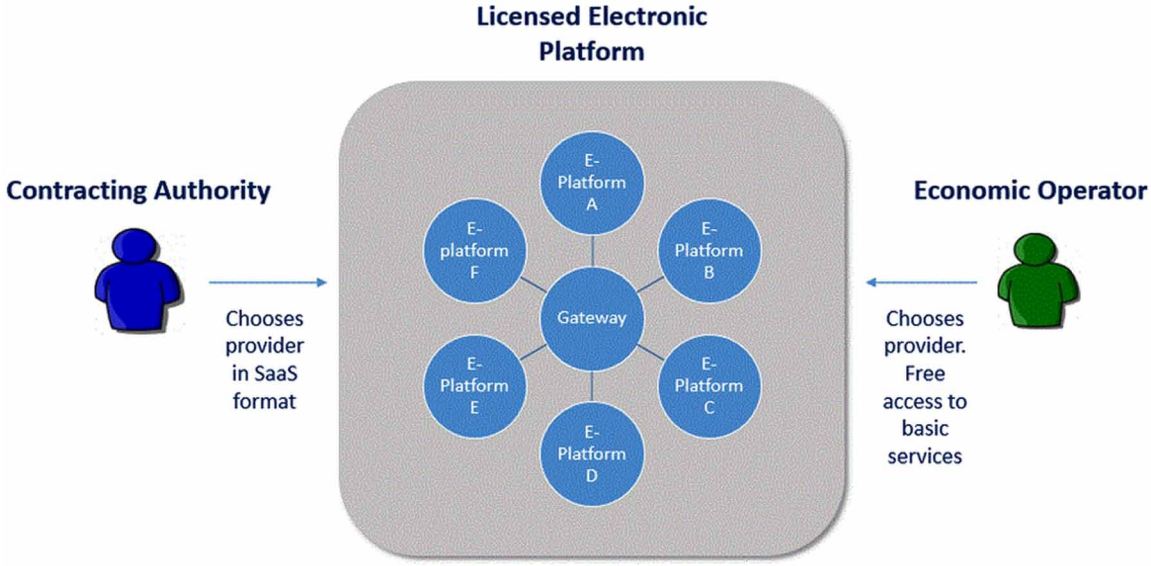
tively used, the publication of the contract information on the BASE Portal by the contracting authority is always mandatory in order to ensure completeness of information. This information includes, among others, details about the contacting authority, the economic operator, as well as the subject matter and the value of the contract. An important aspect of the publication of this information relating to contracts originated by a direct award (red arrows) is that, according to the PCC, the contract is null and void if the information is not published on the BASE Portal.

For procedures open to the competition (yellow arrows), some additional information is to be sent to the Base Portal. As defined in the legal framework, all notices are published in the electronic official journal DRE (www.dre.pt) by registered contracting authorities. The DRE sends a copy of the notice to the BASE Portal, by automatic means, and immediately registers the procedure into the database. From this moment onwards, contracting authorities (using the same login credentials as for accessing the DRE) can manage the procedure and contract related information in BASE Portal. Economic operators can both access notices on the DRE, or on the BASE Portal. In the last case some structured criteria are available for search. As mentioned before, it is mandatory that all published procedures are conducted through/within a certified electronic platform. The electronic platform automatically feeds the BASE Portal, through a *web services* infrastructure, with information about the procedures and contracts of the client contracting authority. The technical and functional documentation for the *web services* is public available on BASE as recommended in the legal regulation (IMPIC, IP, 2016).

In the public interface, it is possible to find a statistic area, in which some graphics and global amounts can be calculated in real time, organized by type of procedure, type of contract and by year.

Figure 5 shows an example of a graphic related to global amount per type of procedure distributed along 2015.

Figure 5. Sample statistical graphic generated by BASE Portal in the public interface



It is possible to find in the media many references to data published on the BASE Portal as well as on other tools such as the DADOS.GOV Portal, which contains the open format files published on the public area of the BASE Portal.

A Special View on Public Works: The Observatory - OOP.INCI.PT

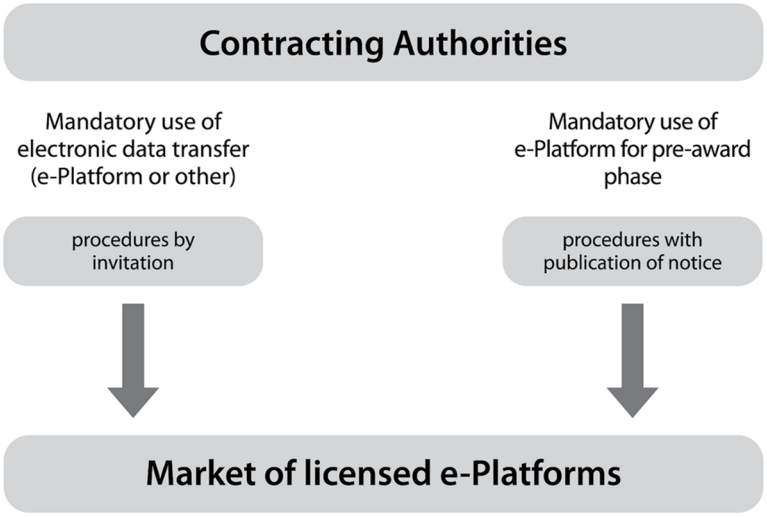
Contracts related to public works have always have always been the subject of special attention from various governments. The Public Contracts Code introduced significant changes in this area and provides for the creation of a Public Works Observatory (PWO) - Ordinance 701-I/2008, of 29 July - with the aim of monitoring the most relevant aspects of the execution of public works contracts.

The PWO is a special information filter within the BASE database that ensures the access and visualization of a set of data, as well as the analysis and dissemination of the corresponding statistical data related to public works contracts. The PWO is a relevant working tool for all entities that develop studies and need various statistical data on the public works market.

It comprises an information search system allowing a quick access to data related to the contract formation phase, including the invited tenderers (where appropriate), the applicants (where appropriate), the tenderers and the contractors. Moreover, during the contract execution phase the current status of each contract and the causes for deviation from its agreed deliverables, deadlines and cost can be traced throughout. All this information builds on the data entered in the BASE Portal by the contracting authorities, either during the contract formation phase, with the transmission of the Contracting Report (an embedded xml form), or during the contract execution phase, through the transmission of the Annual Summary Report (where appropriate) and the Works Completion Report.

The PWO is a valuable instrument for analyzing the public works sector, providing important quantitative inputs to policy-making in this extremely important field of public procurement.

Figure 6. Public works observatory main page



CASE ANALYSIS

As described above, the entire reform of the public procurement system in Portugal took place over several years and assumed a new shape in 2008 as a result of the legal reform that led to the publication of the Public Contracts Code, an integrated legal instrument applicable to the procurement of goods, services, public works and concessions. Although this legal instrument came into force in mid-2008, part of its scope, i.e., e-procurement, was only enforced almost a year later, in November 2009.

An important issue had a significant effect throughout the entire process: phased implementation, on a step-by-step basis.

The prior period that led the government to adopt the measures of the Code, which we know today, was essential to decision-making. For that reason, the study has taken the key success factors of digital transformation – creating a digital vision, engagement of employees, creating a governance system, and creating IT/business synergies – and analyzed the conditions associated with these factors in the Portuguese case that led to the measures that are still in force in Portugal.

As regards creating a digital vision – this vision, defined in 2004, marks the beginning of the system's reform through 4 pilot projects in 8 ministries. At the time, the solution to use tried and tested B2B tools available in the market and to not develop any central solution for the State seemed bold and very risky. The only way to assess whether this vision was feasible or not was to test it in the field. The vision, however, had been delineated and its potential had to be evaluated. These were Cloud service-based solutions for State services with everything that this entails in many aspects, and which are still the topic of lively debates in many areas. This vision was delineated by the UMIC mission unit with good political coverage at the time.

As regards the engagement of employees – this was decisive for the success of the pilot projects and underlined the government's decision to make electronic procurement compulsory. A large number of people from dozens of public institutions participated voluntarily in several specific working groups: legal analysis, product standardization, aggregated purchases, technical definition of specifications for IT

solutions, etc. The heads of services and units were involved and these groups engaged multidisciplinary teams organized throughout a network covering the whole public administration, working intensely for 3 years. While the effect of the involvement of people was felt in different ways, they all agreed that this was a period of thorough team work in which people worked towards the same goal.

As regards the creation of a governance system – the establishment of a new unit (UMIC) and, most importantly, its statute of task-force strongly impacted on how the reform strategy unfolded. First, because it was assigned to a new institution, thus overcoming possible conflicts in previously existing institutions that were dealing with the same matters before and could feel targeted by the changes. Secondly, the fact that the political coverage of this mission unit was quite far-reaching helped to spread the message that this was a high priority issue in the government's agenda. Lastly, because it enabled the strategy to be centrally managed at top level in the government structure, with operationalization being carried out by the institutions under the coordination of UMIC.

As regards creating IT/business strategies – the pilot projects were decisive for the government's decision to make e-procurement compulsory and, above all, for choosing a model based on private providers, a solution hitherto highly innovative in the public sector in this area.

Moreover, besides supporting the implemented model, it also enabled the design of what later became the architecture of the Portuguese electronic system. This experience clarified two major issues:

- The providers must be technically and functionally in line with the legal framework;
- The State needs a solution to safeguard what is most important: data.

The certification of electronic platforms by a public entity solved the first of these issues, while the second issue was resolved through a system implemented to gather the information on public contracts: the Public Contracts Portal.

It is right and proper to say that the digital transformation in public e-procurement was much influenced by the government's strong emphasis on modernizing its processes and services provided to citizens.

LESSONS LEARNED AND CHALLENGES AHEAD

What Made the 2008 Reform a Success

The positive results of the 2008 reform would not have been achieved had the legal, institutional and technological issues not been properly adjusted. The entire strategy behind the reform took into consideration the need to establish and nurture an alliance between the Government and other stakeholders in the public procurement system – an alliance which often had to overcome "counter-reform" tensions which, albeit outnumbered, nevertheless fueled a near-state of anxiety during the originally planned transitional period (Jul 2008 – Jul 2009) and especially during its extended period (Jul 2009 – Nov 2009). The following positively contributed to the situation:

- The political determination to tread the path outlined in the roadmap, with the legal requirement to mandatorily adopt electronic media once the transitional period ended and to report sanctions if "procurement on paper" happened to be used, i.e., resulting in a null contract and possible disciplinary penalties imposed to the heads of the contracting authority);

- The testimonials of organizations that had already fully migrated to the new paradigm (nobody was really experiencing any disruption or catastrophe as anticipated by those more skeptical about the change – on the contrary, the feeling of a "breath of fresh air" in public procurement and the opportunity for public procurers (demand side) to participate in a transformational process and to reposition their badly recognized profession came into play and acted as the "new ally" in the reform. Showcasing has proved to be the last and decisive selling argument to bring more and more entities and professionals to the new system;
- The response of e-platform operators, who, besides their obvious interest in being part of the change led by public stakeholders, offered technically reliable solutions and allocated adequate resources to the "problem-solving front" that is to be expected within such a vast and fast transformation.

Seven years of a mandatory electronic public procurement system have proved that a cloud-based architecture, based on software as a service model, can successfully meet the business needs.

Security accreditation of operators proved to be a key point in the whole process because without this fundamental requirement it would be very difficult for Contracting Authorities to define these criteria in the procurement procedure.

The knowledge required for this purpose is vast and complex and, in Portugal, as in many other countries, knowledge of ICT varies greatly from one public entity to another, being scarce in most organisms, especially the smaller-sized ones.

What's Next for Portugal?

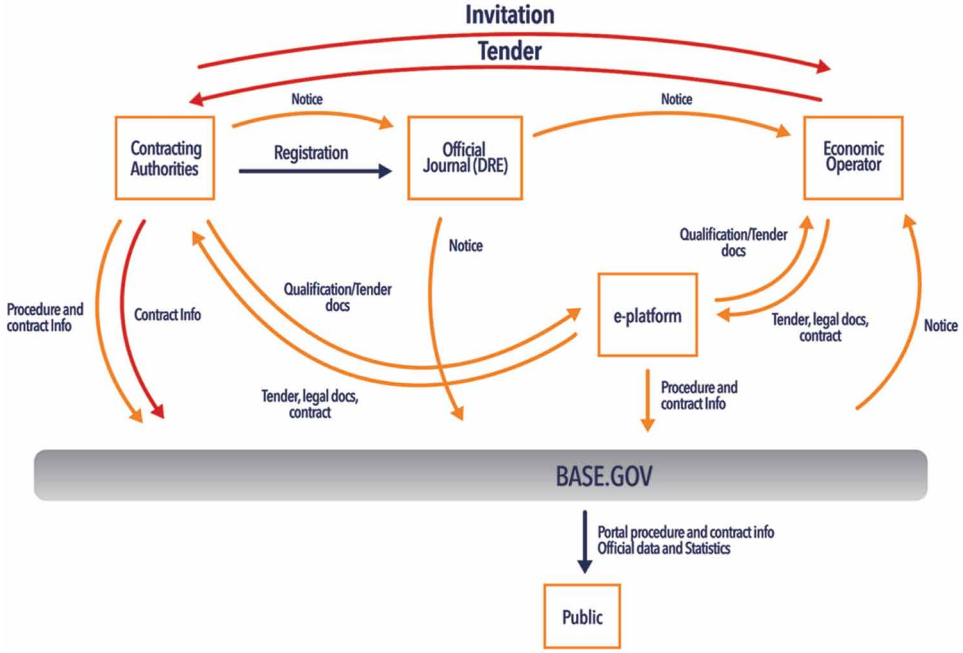
However, soon the Portuguese government realized that technical accreditation was not sufficient as the existing rules do not allow the imposition of sanctions in the event of infringement by the electronic platform operators, so it became crucial to update the legal framework to regulate this market.

Law 96/2015 not only sought to resolve this issue, but also resolved the issue, widely discussed in Europe, of the interoperability between e-Plaforms. The overall purpose here is to grant the economic operators the possibility of choosing the e-Platform they will use in a given procedure or transaction. To some extent, it aims at extending the principle of free choice, which today benefits only the contracting entities, to economic operators (supply side/suppliers).

This component of the legal framework will be further detailed by means of an Order to be published as soon as the ongoing architectural design phase is completed. If Portugal addresses this issue, it will have taken another giant step as leader in the development of public procurement solutions, because this will be a crucial point in the implementation of the European single market. However, it is also obvious that the maturity of this market is still relatively small for sufficient comfort to the solutions that currently foresee.

There is a tendency to increase measures, at European level, towards standardization to further consolidate an interoperability architecture, such as the creation CEN's Project Committee 'Electronic Public Procurement' (CEN/TC 440) which will proceed with the development of technical specifications that are intended to support electronic public procurement processes and their accompanying information flows. The deliverables being drafted in this Project Committee will provide business interoperability specifications and vocabulary in relation to e-Procurement, e-Notification, e-Tendering, e-Ordering and e-Fulfilment (CEN - CENELEC, 2016). Indeed, more than technology, interoperability is subject to the standardization of services and activities, which is still in its very early stages. In addition, the creation

Figure 7. Interoperability model



of a database with information from public contracts proved to be a fundamental part of the system. This piece of the puzzle allows the government to hold on to the information that would otherwise be kept only in private solutions, and hold a set of data analysis tools which can be applied according to the objectives.

It turns out that while there is still much to do in respect of reliability and data integrity, Portugal has reached in this field a fairly high level of development, hardly compared with other countries.

In this area, it has been proved that the system will benefit very much from automation mechanisms for data transfer under development. This is also a huge challenge for the Portuguese public administration because it implies more internal interoperability and the enforcement of the only-once principle.

CONCLUSION

The implementation of e-procurement in Portugal was, without any doubt, unusual within the European Union.

To some extent, it can be said that this was perhaps due to the following reasons:

- First, because it was the first country to adopt compulsory e-procurement for the pre-award phase;
- Because the model was based on solutions in Cloud Services, when few dared to do so at the time;
- Because it set forth in Europe a level of transparency in public contracts unheard of before;
- Because it introduced the certification of e-platforms;
- Because the architecture of the electronic system is based on an interoperability network between private and public systems;

And, finally, because despite the various unusual circumstances, what came out of it was a true and profound digital transformation.

There have already been repercussions from the learning acquired from the implemented model. In 2015, the e-procurement system was reformed and e-platforms became a regulated activity supervised by the State, in addition to the technical accreditation process already implemented.

This diploma makes room for an interoperability solution to cater for the principle of free choice of platform for Awarding Entities, and also for Economic Operators. Its future implementation could represent a major leap forward in interoperability across borders.

Finally, this profound revolution process began and was prepared with the establishment of UMIC in 2003 and with the implementation of pilot processes in 8 Ministries of the Portuguese Public Administration.

The rationale behind the implemented model has its roots in this history of unparalleled strong leadership and vision.

In the light of digital transformation, it can be said that:

- It was essential to define a clear vision of the model to be implemented, and to carry out tests;
- The engagement of people as a team was the driving force behind the strong sense of unity;
- Having a mission unit with clear capacities and power to coordinate the pilot projects led to this governance structure being accepted and coordinated by all stakeholders; and
- The experience of pilot projects enabled the system's architecture to be designed as it is today, by integrating several private and public elements in harmony.

To briefly summarize it, leadership in this case, as in many others, was without a doubt a differentiating and decisive factor in the achieved results.

Chapter 26
Managerial Orientations and Digital Commerce Adoption in SMEs

Margarietha de Villiers Scheepers
University of the Sunshine Coast, Australia

Donald Kerr
University of the Sunshine Coast, Australia

ABSTRACT

This chapter determines the relationships between managerial orientation factors, such as entrepreneurial alertness, learning goal orientation, and digital efficacy, on the adoption and outcomes of digital commerce in Small and Medium-Sized Enterprises (SMEs). A survey of Australian SMEs was conducted, and 109 useable responses were received. The results describe owner/manager views of digital commerce use and business outcomes such as growth and efficiency resulting from adoption. Hierarchical regression analysis reveals that managerial orientations related to entrepreneurial alertness scanning and search as well as learning goal-orientation predict growth outcomes resulting from using digital commerce. Being able to see connections, make associations, and search for new opportunities is significantly related to efficiency stemming from digital commerce adoption. The findings contribute to the knowledge of digital commerce adoption, its outcomes, and how these relate to managerial orientations of entrepreneurial alertness, learning, and digital efficacy.

INTRODUCTION

The digital landscape present many opportunities to alert entrepreneurs, from those that seize opportunities to create new firms in the virtual world to those who use digital technologies and tools to enhance business efficiencies, improve customer service, achieve significant cost savings and improve external network relationships with partners, stakeholders and suppliers (Jones, Simmons, Packham, Beynon-Davies & Pickernell, *in press*; Kaplan & Haenlein, 2010; Simsek, Lubatkin, Veiga & Dino, 2009). While the adoption of digital technologies by small and medium sized enterprises (SMEs) could

DOI: 10.4018/978-1-5225-3822-6.ch026

provide numerous business-related benefits (Nguyen, 2009) and is seen as essential for future economic progress in Australia (Department of Broadband, Communication and the Digital Economy 2008), not all SMEs are keen to adopt new technologies. In fact Love, Irani, Standing, Line and Burn (2005) argue that reality is more complex for SMEs, with a myriad of factors influencing adoption, not simply cost-benefit-risk evaluation metrics. Similarly, Fillis, Johannson and Wagner (2004) propose that individual firm and managerial orientations play a key role in seizing digital opportunities. Valliere (*in press*) shed more light on the question as to why some SMEs are more likely to see digital opportunities, take action to exploit, and implement digital commerce than others through his conceptualisation of entrepreneurial alertness, as a managerial orientation.

Entrepreneurially alert owner/managers are more likely to notice environmental changes or internal triggers (Fillis *et al*, 2004) and in making sense of these triggers, may infer an opportunity to adopt digital commerce and seize the benefits it offers (Daniel & Wilson, 2002). Other managerial factors that influence digital commerce adoption include competencies (Nguyen, 2009), attitudes (Fillis et al, 2004) as well as learning and digital efficacy (Yi & Hwang, 2003). Simsek *et al*, (2009) find that an entrepreneurial alert information system enables SMEs to facilitate entrepreneurial action, while Yi and Hwang's study (2003) outlines the importance of learning goal orientation and self-efficacy for digital commerce adoption. While numerous authors have studied the barriers, benefits, costs (Love et al, 2005; Daniel & Wilson, 2002) and managerial competency factors (Fillis et al, 2004; Jones et al, *in press*) of SMEs related to information technology adoption, we're not aware of studies which relate entrepreneurial alertness to the adoption of digital commerce. Examining information technology adoption from a managerial orientation lens, which include entrepreneurial alertness, learning focus and digital efficacy enables us to gain a better understanding into SME owners/managers' behaviour, which is sometimes described as an enigma (Love et al, 2005). Thus the purpose of this paper is to determine the relationship between entrepreneurial alertness, learning goal orientation and digital efficacy as managerial orientations to the adoption and outcomes of digital commerce for SMEs. As such this study contributes to the digital commerce adoption literature, highlighting the role of entrepreneurial alertness, learning and efficacy for SMEs.

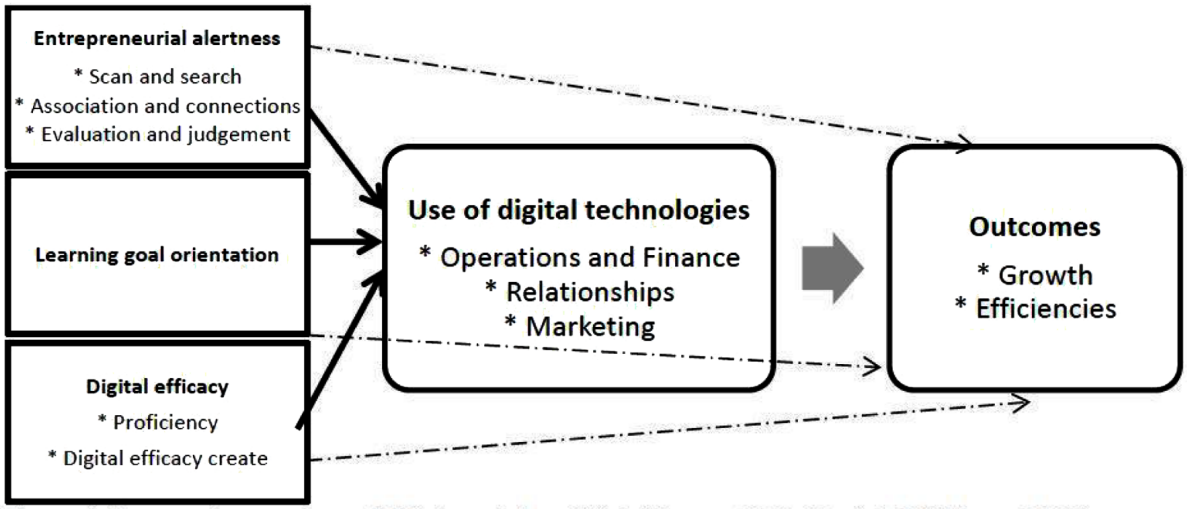
This study proceeds by first reviewing the literature regarding managerial orientations expected to influence digital commerce adoption, in particular entrepreneurial alertness, learning, digital efficacy, and adoption use and outcomes. There-after the method and results of the study is presented and hypotheses assessed, finally the discussion and conclusion highlights the key findings and implications of the study.

THEORETICAL BACKGROUND

Research Model and Hypotheses

Figure 1 presents the proposed research model. This model is based on the e-commerce adoption model (Daniel & Wilson, 2002) which postulates that technology use and outcomes are influenced by learning goal orientation and digital efficacy (Yi & Hwang, 2003). In this study we've added entrepreneurial alertness, since this construct can also be related to the use of digital technologies and outcomes from the use of those technologies. More specifically we take these constructs usually applied at an individual

Figure 1. Proposed research model (adapted from Yi & Hwang 2003; Daniel & Wilson, 2002)



level and extend these to the firm-level. This model in this paper explicitly studies technologies firms are currently using, and not those they are planning to adopt. It is expected that as firms use digital technologies, they should realise certain business outcomes such as growth in sales and customers, as well as increased efficiencies (Daniel & Wilson, 2002).

Adoption Use of Digital Technologies and Outcomes

A number of studies have shown that SMEs can use digital technologies for wide ranging business-related reasons such as customer (Daniel and Storey, 1997; Poon and Swatman, 1999; Wilson, Daniel, Sutherland, McDonald & Ward, 2001); competitors and supplier (Porter, 2001; Daniel & Wilson, 2002) as well as internal efficiency reasons (Poon & Swatman, 1999). This wide ranging number of reasons indicates that digital commerce is not a simple innovation, but rather a cluster of complex innovations which firms can choose to adopt (Daniel & Wilson, 2002). Therefore firms can choose between a number of alternative actions such as not adopting any technologies (Jones et al, *in press*); adopting a number of technologies related to operational and financial systems, internal communication and information sharing, or networking and relationship building, or marketing (Love et al., 2005), or they could integrate all of these technologies (Daniel, 2003). Based on the level of adoption use of digital commerce technologies, varying outcomes may result from this adoption (Nguyen, 2009). It is expected that the higher the level of perceived benefits, the more likely firms would be to continue using digital technologies, since they are aware of changes and may receive updates and learn more about new technologies. Daniel and Wilson (2002) show that the most important benefit SMEs in the UK derived from technology adoption was improved internal knowledge sharing; improved competitive position; enhanced efficient service and the ability to attract new customers. Not all firms decide to adopt these technologies, one of the reasons firms decide not to adopt digital commerce may be linked to the fact that they are not alert to digital opportunities.

Entrepreneurial Alertness

Entrepreneurial alertness plays a critical role in individuals' and firms' discovery and evaluation of opportunities (Kirzner, 2008) and might help explain why some firms are more likely to seize opportunities and act entrepreneurially than others (Simsek et al., 2009). Lack of theoretical clarity and measurement issues stalled research progress of this concept, however Tang, Kacmar and Busenitz (2012) recently proposed a validated measure of entrepreneurial alertness, while Valliere (*in press*) has enriched the theoretical foundations and antecedents of the concept. Therefore the time is ripe to extend the concept of entrepreneurial alertness to a firm-level orientation related to digital opportunity perception and technology adoption; and examine whether some SMEs, who are more entrepreneurially alert than their peers, are more likely to adopt and realise the benefits from available digital opportunities.

Tang *et al* (2012) conceptualise alertness as having three complementary dimensions: scanning and search for new information in the digital realm; connecting previously-disparate information regarding digital changes in the market place; and evaluating whether the new information represents an opportunity. These three dimensions work in a process like fashion where firms first become aware of gaps or shortcomings by actively looking for new bits of information, second creatively associate these disparate bits of information with existing knowledge and schema (Valliere, *in press*) and then finally make evaluations and judgements about the dynamism perceived and decide whether the opportunity is a general one, or one they would like to adopt and exploit (McMullen and Shepherd, 2006).

The first dimension, scanning and search, enable SME owner/managers to look for digital ideas to solve resource problems, improve customer service as well as improving relationships within their networks, with suppliers for example. SME owner/managers develop both tacit knowledge from experience, conversations and digital interactions with stakeholders, and explicit knowledge codified in firm and market reports and other formal documents (Tang *et al*, 2012). Owner/managers might also purposefully look for answers to questions about the value of digital technologies, possible cost savings and efficiency improvements (Jones *et al, in press*). Information gained through this scanning and search process would be added to existing cognitive frameworks and experiences (Valliere, *in press*). Those SME owner/managers who actively scan and search the digital environment are therefore more likely to use new technologies and also more likely to realise the beneficial outcomes these technologies may offer, thus:

H1a: Alert scanning and search is positively related to use of digital technologies.
H1b: Alert scanning and search is positively related to business growth and efficiencies of digital technologies.

The process of connecting and associating new stimuli with existing knowledge and coming to new insights represents the second stage, namely association and connection. In this stage information that supports existing beliefs are more easily incorporated into an existing schema, while negative data may be weighed, considered and either be rejected or the existing schema might be adjusted to accommodate this information (Fiske and Taylor, 1984). This process enables SME owner/managers to see the 'big picture' rather than consider each piece of information separately; therefore pattern-recognition (Baron and Ensley, 2006) plays an important role here. Scanning and search and association will happen continuously as the owner/managers works through the problem or new idea enrichment. As firms use digital technologies new stimuli regarding these technologies would be associated and connected with

existing schema. Furthermore growth and efficiency outcomes realised from digital adoption would further enhance the connection and association process, thus:

H2a: Alert association and connection is positively related to use of digital technologies.
H2b: Alert association and connection is positively related to growth and efficiency outcomes of digital technologies.

In the evaluation and judgement stage owner/managers might perceive the existence of digital opportunities, however they might decide that these are third person opportunities, in other words they believe the opportunity exists for someone else to exploit (McMullen & Shepherd, 2006); or if they decide it is a first person opportunity, they themselves might exploit the opportunity or adopt the digital technology. This evaluation and judgement stage of entrepreneurial alertness seem to be critical in the entrepreneurial alertness process (Tang *et al*, 2012). In the evaluation and judgement stage SMEs would decide through the use of digital technologies, whether to pursue and adopt further technologies. Additionally the outcomes are also expected to influence future evaluation and judgement for further digital adoption, thus:

H3a: Alert evaluation and judgement is related to use of digital technologies.
H3b: Alert evaluation and judgement is related to the outcomes (growth and efficiencies) of digital technology use.

Learning Goal Orientation

Entrepreneurial learning has been shown to promote entrepreneurial behaviour, despite severe time, attention and other resource limitations SMEs face (Ravasi & Turati, 2005). Experiential learning, commonplace in SMEs, is closely linked to all three dimensions of entrepreneurial alertness, from scanning and search, association and idea generation to evaluation and judgement (Corbett, 2007). Specifically owner/managers, who are highly motivated to learn (high learning goal orientation), attempt tasks to investigate the novelty of emerging technologies, find out how things work or to improve their skills. In the case of digital commerce adoption owner/managers with high levels of learning goal orientation would be more driven and energised to master new technologies. Such owner/managers believe digital ability is an incremental competency that can be improved continuously by experimenting with new technologies, thereby acquiring knowledge (Wood and Bandura, 1989). They look for perplexing tasks that provide opportunities to enhance their expertise and skills and are not fazed by mistakes. These they view as a normal part of the learning process.

Learning goals have been related to a number of adaptive outcomes, including higher levels of efficacy, task value, interest, positive affect, effort and persistence, learning strategies, as well as better performance (Printrich, 2000). Individuals with a high learning goal orientation are more likely to stick to a task, persevere and even increase their efforts until they achieve their goals. These are typically the individuals in an organisation who feel compelled to help and solve technological problems, for a challenge or enjoyment. In SMEs it is expected that firms, which support and encourage individuals with high learning goal orientations, will make more use of digital technologies, since these individuals will be encouraged to master new digital tools. Additionally it is expected that individuals with high learning goal orientations will experience benefits from the challenge of the task and develop self confidence in using and mastering new technologies. Therefore, we hypothesize that:

H4a: Learning goal orientation will be positively related to the use of digital technologies;
H4b: Learning goal orientation will be positively associated with the outcomes derived from digital technology use.

Digital Efficacy

Self-efficacy (ESE) refers to the self-confidence owner/managers have that they hold the required abilities to be successful, which plays an important role in determining their level of motivation in pursuing opportunities (Kickul, Wilson & Marlino 2004). Wood and Bandura (1989) noted that "to be successful one not only must possess the required skills, but also a resilient self-belief in one's capability to exercise control over events to accomplish desired goals." Many studies have validated the relationship between self-efficacy and challenging tasks in various contexts such as entrepreneurial intentions (Kickul et al., 2004), images of an opportunity (Mitchell & Shepherd, 2010), complex decision making (Wood and Bandura, 1989), computer skill acquisition (Gist, Schwoerer & Rosen, 1989; Mitchell, Hopper, Daniels, George-Falvy & James, 1994), and user acceptance of technology (Agarwal, Sambamurthy & Stair, 2000; Venkatesh, 2000).

According to Marakas, Yi and Johnson (1998), computer self-efficacy (CSE) is a multi-level construct relevant to application based digital technologies, but also on a general level. This type of efficacy is based on an individual's judgement of their efficacy across specific applications or at the overall domain of general computing (Pavlou & Fygenson, 2006; Yi & Hwang, 2003) and can serve as a proxy for managerial competencies (Bassellier, Reich & Benbasat, 2001). We extend this concept of computer self-efficacy to the more general domain of digital commerce and examine digital efficacy at a firm level by determining the range of individuals within an SME who are confident of their digital technology skills to perform operational tasks as well as those who are confident to create new digital artefacts for the firm using existing digital tools. Depending on the performance of these daily operational tasks (which is seen as digital proficiency) and creating new digital artefacts such as websites or social media pages the efficacy of the firm overall should improve or weaken their overall motivation to adopt digital technologies and solve problems (Wood & Bandura, 1989). Yi and Hwang (2003) find that computer self-efficacy is positively related to increased use of digital technologies. According to social cognitive theory (Bandura, 1982) encouraging experiences and positive incidents tend to enhance efficacy, therefore it is expected that positive outcomes experienced through increased digital use will strengthen digital efficacy.

H5a: Digital proficiency is associated with use of digital technologies.
H6a: Digital efficacy is positively related to the use of digital technologies;
H6b: Digital efficacy is positively associated with the positive outcomes derived from digital technology use.

METHODOLOGY

This studied surveyed SMEs in Australia, using a questionnaire to determine the adoption of digital commerce and the influence of managerial orientations such as entrepreneurial alertness, learning goal orientation and digital efficacy on digital commerce adoption.

Population and Sample

The population of interest for this paper is SMEs using or developing digital commerce technologies. In Australia SMEs are defined as firms employing less than 200 employees aligned to the Australian Bureau of Statistics (ABS) guidelines (Wiesner, McDonald & Banham, 2007). Specific industries of interest were tourism, communications, retail and wholesale and services, since these industries were identified as experiencing significant pressures to adopt digital commerce.

A random sample of 1 000 SMEs was drawn from the Instant Mailing Lists database (commercial database company). Criteria to select these firms were less than 200 employees, from the specified industries, and representative of all Australian states. Each firm was contacted telephonically, informed about the aim of the research and invited to participate. Consenting firms were sent the questionnaire either by post or with a link to the online version. Data collection was undertaken in October to December of 2012. In total 125 responses were recorded (total response rate of 12.5%) Of these 16 were rejected as incomplete, therefore the 109 useable responses (effective response rate of 10.9%) and were used as a basis for the findings of this study.

A little more than half of firms (52.8%) in the sample are micro-enterprises, employing less than five full-time employees, while 15.8% employ between 5 to 20 employees, 8.7% between 20 to 50 employees and the rest 50 to 199 employees. The majority of firms (46.5%) in the sample have been in existence for longer than 15 years, while 5.5% of firms had done business less than 3 years and close to a third (33.8%) indicated that they have been in existence between 3 to 15 years. The majority (37.8%) of firms indicated that their turnover was between $1 to $5 million per annum, while 23% indicated a turnover exceeding $5 million; and 5.5% reported their turnover to be less than $100 000 per annum. The firms in the sample varied between serving mainly business customers (25.9%) on the one hand to serving mainly final consumers (28.3%) at the other, with most concentrating on sales within Australia (55.1%). Only 10.2% of firms in the sample indicated that they sold more than 70% of the products or services outside the country. Firms across all states were targeted for the survey; however most respondents (28.3%) were based in Queensland, followed by 18.1% in Victoria, 15.7% in New South Wales and 10.2% from Western Australia.

The method of determining non-response bias adopted in studies such as Goode and Stevens (2000) was adopted for this study. In this method the earliest responses received were compared with the later responses. The useable responses were split into two equal sets of 54 responses according to the dates on which they were received. No significant differences were found for any of the eight sections of the instrument. It is therefore concluded that the responses received are unlikely to contain non-response bias.

Measurement Instrument

The research was carried out using a questionnaire which firstly explained the aim of the study, eligibility, voluntary nature and a simple definition of digital commerce that we preferred respondents keep in mind when completing the survey. The questionnaire contained seven sections. Section 1 to 4 explored the reasons, use, outcomes and integration of digital commerce adoption, while Sections 5 and 6 focused on entrepreneurial alertness, learning goal orientation and digital efficacy, as managerial orientations. The final section of the questionnaire collected general firm information (size, age, industry). This paper uses data related to adoption use of digital technologies, outcomes, entrepreneurial alertness, learning goal orientation and digital efficacy.

The survey instrument was piloted with 23 SMEs. Ambiguous and repetitive questions were removed or adapted and the layout was also changed to facilitate responses. Despite these changes, the questionnaire proved to be a bit long for some respondents and incomplete responses suggest respondent fatigue.

Digital commerce adoption was measured by actual use of digital technologies, rather than adoption intentions or the technology features or platforms utilised, in accordance with Daniel, Wilson and Myers (2002) in their study of e-commerce adoption of UK SMEs. Respondents were asked to indicate whether they were using, developing or not using a particular digital tool in their firms (Daniel & Grimshaw, 2002). These digital technologies resorted into three main areas: finance and operations; outward relationship-type of activities and marketing activities. Outcomes from adoption of digital technologies was measured on a 4 point Likert scale and resorted into two factors related to growth and efficiency (Daniel, 2003). The dependent variables were measured using existing scales, for example entrepreneurial alertness using a 4 point Likert scale and items proposed by Tang et al (2012), learning goal efficiency on a 4 point Likert scale adapted from Yi and Hwang (2003)'s study and Brett and VandeWalle (1999), and digital efficacy on a 5 point scale adopted from Hsu & Chiu (2004).

Data Analysis

The data were analysed using IBM SPSS V21. Descriptive statistics, reliability coefficients and correlations were calculated for the variables. While descriptive statistics provide a general picture of the data, the Cronbach alpha coefficients provide a measure of the internal consistency of variables, while the correlation analysis allow for an initial test of the hypothesis. Hierarchical regression analysis was used to further test the hypothesised relationships between the constructs, while controlling for industry.

RESULTS

Table 1 shows the mean and standard deviation for the dependant and independent variables. The Cronbach alpha coefficient is shown in italics for each construct. The coefficient scores meet Nunnally's (1978) threshold for internal consistency, with the independent variable entrepreneurial alertness' three dimensions scanning and search (0.77), association and connection (0.88) and evaluation and judgement (0.84) showing acceptable reliability. This was also the case for learning goal orientation (0.78); and proficiency (0.88) and digital efficacy (0.76) as measures of a firm's digital confidence. The dependent variables, use of digital technologies' three dimensions operations and finance (0.79), relationships (0.77) and marketing (0.73); as well as growth (0.74) and efficiency (0.76) outcomes, indicated internal consistency.

The mean scores for the constructs of entrepreneurial alertness showed that most SMEs rated themselves highly on scanning and search (3.02) and then evaluation and judgement (2.99). In terms of firm digital confidence, firms who were using digital commerce showed high levels of proficiency across all staff working for the firm (3.91), while digital efficacy which included items related to creating web sites or social pages, had a lower mean score (2.44) indicating that fewer individuals in firms have this level of confidence. Use of digital commerce was particularly prevalent for marketing (3.59) and operations and financial (3.54) activities, as can be expected since many SMEs make use of financial packages for accounting purposes. Only those firms who used digital commerce answered the questions about

Table 1. Descriptive statistics and correlation analysis

the resultant outcomes. Generally SMEs indicated more growth (2.79) outcomes realised from digital commerce, than efficiency outcomes (2.63).

Correlation Analysis

The correlation analysis shown in Table 1 provides an indication of the relationships between constructs and the dimensions of the constructs.

The three dimensions of entrepreneurial alertness are significantly associated with one another, with scanning and search and association and connection showing the strongest correlation (0.643; $p<0.01$). The dimensions evaluation and association (0.499; $p<0.01$) also a show significant correlation, as well as scanning and search with evaluation and judgement (0.365; $p<0.01$). This is in line with Tang et al's (2012) measures and supports the argument that entrepreneurial alertness is a conceptual process, starting with scanning and search as a divergent process, converging in evaluation and judgement; as the action orientated dimension of entrepreneurial alertness.

Digital proficiency and efficacy was also significantly correlated (0.437; $p<0.01$), yet distinct from proficiency, meaning the ability and confidence to use a digital application. In contrast digital efficacy was related to the creation of digital artefacts such as creating a website or social pages, indicating advanced knowledge and confidence.

In our study use of digital technologies were divided into three main areas: operations and finance, relationship or outward bound activities and marketing. Operations and finance was strongly and significantly associated with marketing activities (0.666; $p<0.01$) and then with outward relationship activities (0.630; $p<0.01$). Outward relationships and marketing was also significantly correlated (0.490; $p<0.01$),

supporting the notion that firms progressively adopt digital technologies across all the range of business activities. The resulting outcomes from digital commerce, growth and efficiency, were also strongly and significantly related (0.702; $p<0.01$).

An initial assessment of the relationship of entrepreneurial alertness' three dimensions showed significant correlations with learning goal orientation, that is scanning and search (0.544; $p<0.01$), association and connections (0.393; $p<0.01$), and evaluation and judgement (0.258; $p<0.01$), of which scanning and search the strongest. This seems logical since the purpose of scanning and search is to learn more about different opportunities of challenges, in contrast association would be more closely linked to creative, divergent thinking and evaluation and judgement to decisions and actions.

Entrepreneurial alertness was significantly correlated to proficiency and digital efficacy in terms of scanning and search (0.212; $p<0.05$; 0.254; $p<0.05$ respectively) and association and connections (0.207; $p<0.05$; 0.227; $p<0.05$ respectively), however evaluation and judgement was not correlated to proficiency or efficacy. For the use of digital technologies the correlation analysis showed that scanning and search was significantly correlated with operations and finance (0.299; $p<0.05$), relationships (0.337; $p<0.01$) and marketing (0.249; $p<0.05$), while association and connection was correlated to operations and finance (0.326; $p<0.05$) and relationships (0.255; $p<0.05$), but not marketing. Evaluation and judgement was only correlated to relationships (0.245; $p<0.05$). Much stronger associations are shown with the outcomes from digital commerce. For growth outcomes both scanning and search (0.623; $p<0.01$) and association and connection (0.502; $p<0.01$) show significant correlations, however evaluation and judgement do not. For efficiency outcomes all three dimensions show significant associations, scanning and search (0.542; $p<0.01$), association and connection (0.581; $p<0.01$) and evaluation and judgement (0.303; $p<0.05$).

Learning goal orientation which indicates a high level of motivation to master new digital technologies was significantly associated with proficiency (0.343; $p<0.01$) as well as digital efficacy (0.326; $p<0.01$), since it is expected that these two constructs would increase as more employees are willing and energised to learn to use new digital technologies. Learning goal orientation was only correlated to the use of digital technologies to build relationships (0.352; $p<0.01$), but not operations and finance or marketing. This is possibly due to the fact that learning orientation is seen as a preparation step which is associated with relationships, but not with routinized activities such as operations and marketing, already mastered by most employees. Significant relationships were shown with outcomes from digital commerce, especially for growth (0.665; $p<0.01$), but also for efficiency (0.305; $p<0.05$). As Wood and Bandura (1998) suggested positive outcomes realised from these activities strengthen learning goal orientation.

Proficiency was not associated with the adoption of digital commerce for operations and finance or relationship digital activities. Proficiency showed a weak, significant correlation to marketing activities (0.205; $p<0.05$). Digital efficacy was not correlated to operations and finance or relationship adoption activities, however it was significantly correlated to marketing adoption activities (0.273; $p<0.01$). Proficiency was not related to the outcomes from digital commerce, however digital efficacy was significantly correlated to growth (0.385; $p<0.01$) and also efficiency (0.313; $p<0.05$).

The use of operations and finance technologies was significantly related to efficiency (0.396; $p<0.01$), as was also the case for marketing digital technologies (0.331; $p<0.05$). Both growth (0.524; $p<0.01$) and efficiency (0.428; $p<0.01$) outcomes were realised through the use of relationship type technologies.

Hierarchical Regression Analysis

Hierarchical regression analysis was used to assess hypotheses 1 to 6 which proposed that managerial orientations: entrepreneurial alertness, learning goal orientation and digital efficacy (independent variables) would be related to adoption use of digital technologies and outcomes from digital commerce adoption. Hierarchical regression allows us to control for industry, which has been shown to influence investment and outcomes in information technology adoption (Love et al, 2005).

Adoption Activities

When looking at adoption use of digital commerce the following relationships were ascertained using hierarchical regression analysis. Operations and finance activities showed no significant relationships with entrepreneurial alertness, learning goal orientation or digital efficacy. These type of activities are often routinized and digital technologies used here can be related to the advice and support provided by external stakeholders such as accountants, who Berry, Sweeting and Goto (2006) and Mole (2002) find provide business, emergency, and financial management support in addition to statutory advice, and have a significant impact on SME decisions. Therefore the owner/manager's orientation related to entrepreneurial alertness, learning or digital efficacy does not seem to influence the adoption of operational and financial type technologies.

Relationship adoption activities focused on supplier and competitors actions. Hierarchical regression analysis showed that learning goal orientation (β=0.283; $p<0.10$) was marginally significant in relation to relationship adoption activities, explaining an additional 4% of the variance in this variable, after controlling for industry. Therefore H4a which stated that learning goal orientation is positively related to the use of digital technologies is tentatively accepted, since this hypothesis only holds for relationship adoption activities. Entrepreneurial alertness and digital efficacy was not related to relationship adoption activities.

For marketing related activities only the scanning and search dimension of entrepreneurial alertness (β=0.293; $p<0.05$) was a predictor for marketing use, with this construct explaining an additional 6.5% of the variance in marketing adoption activities after controlling for industry. Therefore H1a which stated that alert scanning and search is positively related to the use of digital technologies is partly accepted, particularly for marketing related activities.

Therefore hypotheses 2a and 3a which postulated that the alert association and connection and evaluation and judgement dimensions of entrepreneurial alertness are related to the use of digital technologies is rejected. Hypothesis 5a which suggested that digital proficiency is associated with the use of digital technologies is rejected as well as H6a which claimed that digital efficacy is positively related to the use of digital technologies for marketing related activities. As Love et al (2005) suggested industry influences digital efficacy.

Outcomes from the Use of Digital Commerce

In this study two main types of outcomes resulting from digital commerce use were studied, namely growth and efficiency. The results of the hierarchical regression analysis are shown in Table 2.

To analyse growth outcomes, we first entered industry as a control variable. This base model was marginally significant (R^2 = 7%, $p<0.10$). The addition of the predictor variables made a significant

contribution over and above the base model (ΔR^2=70%; p< 0.01). In the full model, there were significant coefficients for alert scanning and search (β =0.344, p<0.05) and learning goal orientation (β =0.401, p<0.01). These results partial support hypotheses 1b and 4b respectively. The effects for the remaining managerial orientation variables of alert scanning and connection, evaluation and judgement and digital efficacy were not significant and therefore hypotheses 2b, 3b and 6b were not supported.

In the results for efficiency outcomes, the base model was not statistically significant (R^2=1.5%, p>0.10). The addition of predictor variables made a significant contribution over and above the base model (ΔR^2=39.8%; p<0.01). In the full model alert association and connections had a significant coefficient (β =0.419, p<0.05) and alert scanning and search a marginally significant coefficient (β =0.270, p<0.10). The predictor variables explain 33.4% of the variance in efficiency outcomes. These results provide partial support for hypothesis 1b and 2b, where it was suggested that alert scanning and search and alert association and connection would be related to efficiency outcomes. Hypotheses 3b, 4b and 6b were not supported, since alert evaluation and judgement, learning goal orientation and digital efficacy were not significantly related to efficiency outcomes. Therefore the efficiencies realised from the adoption of digital technologies can in part be explained by SME owner/managers making association and connections to see how different technologies are integrated and also by alert scanning and search for new digital opportunities.

DISCUSSION

The findings from our study suggest that the adoption of digital commerce is influenced by a complex number of interrelated factors, as Jones et al (*in press*) and Love et al (2005) also confirm. SMEs do not uniformly adopt digital technologies, citing reasons such as client preferences and resources for non-adoption, while the literature provide a wide-ranging number of reasons categorised into macro factors, industry and sectoral factors, as well as firm and managerial factors (Fillis *et al*, 2004; Love *et al*, 2005).

In our study the adoption of digital technologies was grouped into three main use categories, namely for operations and finance, outward relationship and marketing activities. Operation and finance digital activities was not related to entrepreneurial alertness, learning goal orientation or digital efficacy, possibly due to the fact that business advisors, such as accountants may recommend the use of these systems thus reducing the influence of owner/manager's orientation towards opportunities, learning or digital efficacy. The use of digital technologies for relationship activities was related to learning goal orientation, but not entrepreneurial alertness or digital efficacy. In SMEs where the owner/manager and employees are open to new digital technologies and willing to learn about how to use and realise the benefits there-of, it seems that digital technologies will also be used to enhance relationships with external stakeholders. In these cases SMEs are motivated and driven to improve relationships with suppliers and use technologies to find information on competitor activities, possibly adding value to the firm's competencies. Marketing activities such as advertising and after sales service was partly explained by the scanning and search dimension of entrepreneurial alertness. As marketing activities involve direct relationships with customers, SMEs may often become aware of opportunities through interactions with clients and searching for solutions for client problems, thus clients may partly drive the use of digital commerce for these types of activities, as supported by other studies (Daniel & Wilson, 2002; Love et al, 2005).

Adoption of digital technologies results in various outcomes, such as growth in customers and efficiency improvements from the use of these technologies.

Outcomes related to growth refer to increases in customer numbers, more meaningful customer interactions, growth in customisation of services, identification of business opportunities and more effective advertising. These growth outcomes are explained by entrepreneurial alertness and learning goal orientation. Entrepreneurial alertness, specifically scanning and search explain the variance in growth benefits, after controlling for industry effects. Valliere (*in press*) provide a framework to explain how entrepreneurial alertness, as an opportunity spotting talent starts with entrepreneurial attention focused on a consequential aspect for an individual. Applied to this study, SME owner/managers who are focused on realising growth outcomes from their investments in digital commerce will habitually look for environmental changes and assess whether these changes represent digital opportunities, in other words they lower their activation threshold for these opportunities. Taking this further Valliere (*in press*) suggests such owner/managers incorporate the richness of their experiences from digital adoption, associate these with other emerging opportunities and are primed for action to unlock beneficial outcomes of digital commerce, therefore more entrepreneurially alert owner/managers should realise more beneficial growth outcomes from digital commerce, than others who are not 'tuned into' these outcomes. As for learning goal orientation, the motivation and energy to learn about the productive use of digital technologies hold customer, communication and advertising benefits for firms. Since these firms are aware of these beneficial outcomes, they commit the learning effort to realise these benefits. Thus in essence these two managerial orientation factors suggest deliberate mental and exertion efforts by SMEs to realise these growth outcomes.

Efficiency outcomes are related to working smarter, realising time savings and improving efficiencies in the supply chain for the SME. Our findings show that association and connection and scanning and search, dimensions of entrepreneurial alertness explain a significant portion of the variance in efficiency benefits, after controlling for industry. The association and connection dimension of entrepreneurial alertness allows for divergent thinking, considering multiple options and possibilities to make connections and see a larger picture. This dimension is strongly linked to creativity and generating novel solutions to problems. In the context of our study this suggests that SME owner/managers often struggle with achieving efficiencies, especially in small firms, however connecting various useful 'bits' of digital technologies through association and connection allow them to realise these sought-after efficiencies. To enable SMEs to fully realise these efficiency outcomes, firms also go further to scan their environment and search for further digital opportunities. Supported by social cognitive theory that success from these experiences also enhance efficacy, this seems to be a positive, reinforcing cycle for digital adoption.

This study holds implications for theory and practice. On a practical level despite resource limitations inherent in small firms, SME owner/managers should be aware that they themselves represent an immense resource. The owner/manager has a tremendous influence on the decision to use, actual activities and resultant outcomes that result from the adoption of digital commerce. While technologies are merely tools which if used appropriately can lead to beneficial outcomes such as increases in customers, improved products and better relationships with external stakeholders, this requires significant effort in terms of learning and strategic focus, unfortunately as Jones et al (*in press*) correctly point out small firms focused on survival and a short-term orientation fail to see the benefits from digital commerce, since these have a longer-term payoff. Despite these challenges many micro and small firms are using 'free' or cost-effective technologies such as collaboration sites, file sharing directories, online surveys, network forums and database technologies to realise growth benefits, that fit their own strategic approach and management style in their business. Being alert to and discovering new digital opportunities seem to be contingent on using and experiencing the beneficial outcomes technology adoption brings.

Theoretically this study enriches our understanding of how entrepreneurial alertness relate to the adoption and outcomes of digital commerce, building the theoretical foundation of Valliere's (*in press*) schematic model of influences on entrepreneurial alertness. This study also extends the concept of digital efficacy and examines it from a firm-level perspective and not merely an individual level perspective. While our study have focused on cognitive, motivational factors which influence adoption of digital commerce and the outcomes there-of, a number of other established models such as the technology adoption model (TAM) (Davis, 1989; Pavlou Fygenson, 2006), diffusion of innovation and perceived attributes of innovation (Rogers, 2003) also help to explain SME technology adoption, therefore this study is not without its limitations.

Caution should be exercised when generalising these results, since limitations from the research design may influence the findings. This chapter focuses on a small sample and this should be extended and tested in other contexts. Future research should focus on more qualitative explorations of Valliere's (*in press*) model of entrepreneurial alertness, focusing on the antecedents and digital opportunity exploration. Additionally comparing the motivational processes of adopters and non-adopters would yield valuable insights. This study also suffers from recall bias and self-reporting, inherent in a survey research design. Future research should focus on using experimental and conjoint analysis designs, which could provide more robust results.

CONCLUSION

The purpose of this study was to determine the relationship between entrepreneurial alertness, learning goal orientation and digital efficacy as managerial orientations to the adoption and outcomes of digital commerce for SMEs. The findings show that a high level of learning motivation was significantly related to the use of relationship enhancing digital technologies. Scanning and the search for digital opportunities was significantly related to marketing activities. Entrepreneurial alertness, specifically scanning and search and the motivation to learn how digital technologies deliver value tend to predict the growth outcomes that result from digital commerce adoption. Association and connection as well as scanning and search of entrepreneurial alertness explain the variance in efficiency outcomes, after controlling for industry. These relationships suggest complex interactions between a number of variables, showing that the adoption of digital commerce is a function of numerous factors, as Nguyen (2009) highlighted. For SME owner/managers however this study emphasises the facilitating role digital commerce can play to realise beneficial growth and efficiency outcomes for the firm, provided these firms are entrepreneurially alert can make the commitment to learn and make these technologies work for them.

KEY TERMS AND DEFINITIONS

Digital Commerce: The electronic buying and/or selling of goods and services.

Digital Efficacy: Is the capacity to produce an effect, in this case some improvement in the digital effectiveness of an organization.

Entrepreneurial Alertness: Is the ability that some people have to recognize competitive advantages in markets.

Hierarchical Regression Analysis: Regression analysis where the researcher determines the order that variables are entered into the regression equation.

Self-Efficacy (ESE): Is the measure of the belief in one's own ability to complete tasks and reach goals.

SME: Small to medium enterprises.

Chapter 27
Digital Competence:
A Net of Literacies

Edith Avni
Toward Digital Ethics Initiative, Israel

Abraham Rotem
Toward Digital Ethics Initiative, Israel

ABSTRACT

This chapter presents a proposal for a conceptual framework of digital competence, which is a civil right and need and is vital for appropriate, intelligent study and functioning in the real world, through means that technology and the internet offer the citizen. Digital competence in the 2010s is a multifaceted complex of a net of literacies that have been updated, reformulated and transformed under the influence of technology. The framework of the digital competency includes eight fields of digital literacies. At the top of the net is digital ethics literacy, outlines the moral core for proper use of technology; at the base are technological literacy and digital reading and writing literacy, comprising the foundation and interface for all the digital literacies, and in between are the digital literacies in these fields: information literacy, digital visual literacy, new media literacy, communication and collaboration literacy and social media literacy. These interconnected literacies compose a synergetic complex of the digital competence framework.

INTRODUCTION

Digital competence (hereafter Dcom) is a right and necessity of humans and citizens, which is fundamental for proper, intelligent functioning in the real world in the 2010s with technological means.

ICT, which has become an almost inseparable part of every aspect of our lives, has vastly changed the ways we communicate, use language, information and knowledge, think and solve problems, work, consume, and relate to culture and leisure. As a result, the knowledge and skills required by every citizen, student and graduate of the education system for coping with daily needs, functioning optimally in society and the labor market, and surviving in the competitive world, have changed. Dcom also comprises a key

DOI: 10.4018/978-1-5225-3822-6.ch027

to suitable scholastic skills in the K-12 educational system as well as a basis for acquiring an education and for continual learning and developing throughout life.

Dcom is a complex, multifaceted capability of a complex of traditional, familiar literacies that technology has tinted with digital features, reshaping the current character of literacies and adding new skills that were nonexistent in the pre-digital age. These digital literacies include knowledge, performance skills and high-level thinking skills, viewpoints, and values, for which the common denominator is intelligent, efficient application by digital means and on the internet, in accordance with the needs of the student and citizen in the 2010s.

Dcom refers to almost every aspect of modern human functioning, the intrapersonal aspects alongside the interpersonal ones (Pellegrino & Hilton, 2012). In each of the literacies, functioning moves along a continuum of personal and collective-social context, in which one can discern the rising trend of shared-social use on the timeline. The abilities emphasizing more personal functioning are primarily the technological literacies: digital reading and writing, information and visual literacies. The abilities emphasizing more shared-social functioning are the communication and collaboration, new media, and social media literacies.

The importance of digital competence to digital citizenry as an answer to society's contemporary needs, the business world, and the educational realm, raises the need for modernized conceptualization of its framework. Over the years, corresponding to the incorporation of ICT and socialization in routine life, a variety of digital abilities have been characterized and conceptualized that have focused primarily on technological starting-off points; while the essence of abilities required by the student and citizen are based on traditional literacies that have been refashioned in the technological context. Limitations of these former conceptualizations include focusing on narrower aspects rather than the broad, comprehensive complex of required skills, as well as focusing on technology itself without sufficiently dealing with appropriate, astute implementation for the benefit of humanity and society. Because of the rapid development of technological means, these limitations have led to considerable difficulty in updating required skills in accordance with lifestyle in the digital age.

The conceptual framework proposed here has been constructed with the understanding that digital competence and scholastic qualifications have become integrated, interwoven, imminent essences. In effect, there is *no meaning or relevance today* to learning skills that stand alone outside the context of technology. For the past decade many countries have seen the necessity of giving priority to providing their young learners and older citizens with a digital competence. Initiatives for encouraging digital literacy have been increasing, among them government bodies in the United States (National Telecommunications and Information Administration, 2014) and education committee (The European Commission, 2014), Measuring Digital Skills across the EU (2014) and located at aspects of schools, education systems, and teaching associated (Fraillon, 2014). One such outstanding project is Education 2020 (Cross, Hamilton, Plested, & Rez, 2013), an initiative for young learners, which has been adopted by many countries in the belief that educational systems should not only accept necessary changes but should lead as an ecological and synergetic system, in conjunction with communities and study networks.

The goal of constructing a conceptual framework of updated, digital competence for the 2010s is to analyze and present the essence, terms and content of the abilities needed for complex, multifaceted literacy functioning in the digital age. Such a defined, comprehensive framework will aid in raising public and educational awareness of the topic. We can achieve this by using clear anchors, a common, agreed-upon language and better understanding of the fundamental principles to serve the public and educational discourse with all the relevant factors and components of knowledge literacy, which com-

prise a basis for setting out a policy for acquisition and implementation of the digital literacies and their integration in educational work.

Construction of an updated Dcom framework necessitates both a critical attitude and intellectual humility with regard to its components and content, owing to awareness of the uncertainty of innovation, change, and dynamic development of the insights involved therein. We must admit that we do not yet actually know how a young person, born into and growing up in the digital age, experiences reality, both cognitively and emotionally, whether by use of devices attached to his/her body or through the digital glass, as a metaphor for the digital landscape. Nor do we know how an older person or "digital immigrant" (Prensky, 2001), in the digital environment and without human support, will experience transparency, accessibility, loss of privacy, instant communication, use of web applications and software, deciphering of digital messaging and so on. Thus, we must be open to reception of new knowledge and skills and abandonment of less relevant or important ones for today's world.

Acquiring digital competence is a dynamic, developing process lasting a lifetime. The challenge of implementing it for both students and older citizens offers developing, spiraling learning by classification of the target communities into levels and emphasis on what is relevant for them. In the educational system, the definition of a conceptual framework offers merging of the dimensions of digital literacy with innovative pedagogy and technological learning environments as is appropriate for the scholastic range and characteristics of disciplines. Dcom, in the same way that it is implemented in the daily routine of life, is integrated into a synergetic system that makes significant, authentic, scholastic progress possible for all learners. This is done in up-to-date study tracks conducted in a variety of ways throughout the day, wherever the student is to be found, as part of managing his/her life in the digital age.

BACKGROUND: FROM LITERACY TO DIGITAL COMPETENCE

The abilities required for optimal functioning of the individual in society change and evolve, according to the period and culture in which he/she lives. The concept of literacy has changed and developed over the years, and today, in the 2010s, it refers to the complex, multi-dimensional facets of competence required for a lifestyle incorporating digital means.

In order to clarify the framework of digital competences, we will distinguish among these concepts: literacy, digital literacy, and digital competence.

Literacy

In times past, the concept of literacy related to the ability required of a person to receive, decipher, create, and disseminate messages of various types, as was customary in the culture and period in which he or she lived. From this traditional perception of literacy, as the command of basic skills like reading and writing, the concept of literacy has broadened and now refers to an "[…] expanding set of knowledge, skills and strategies that individuals build on through life in various contexts, through interaction with their peers and the wider community" (OECD, 2013, p. 9).

In a wider meaning, "The term literacy implies a universal need, a condition that must be met to enable full and equitable economic and social participation. We view literacy as a tool that may be applied to simple or more complicated contexts […]. In its broadest sense, literacy is a dynamic tool that allows individuals to continuously learn and grow." (National Research Council, 1999, p.16).

Digital Literacy

Integration of ICT in daily life has led to the transformation of the concept from "literacy" to "digital literacy". Earlier, narrower definitions of digital literacy stressed the technological aspects, such as: Computer Information Literacy – CIL (Fraillon & Ainley, 2013), Information and Communication Literacy – ICT (Partnership for 21st Century Skills, 2014a), as well as other concepts such as cyber literacy, electronic literacy, new online social literacy, internet literacy, technological literacy, and mobile literacy (Lee, Lau, Carbo, & Gendina, 2013). Having digital literacy requires more than just the ability to use software or to operate a digital device; it includes a large variety of complex skills such as cognitive, motoric, sociological, and emotional skills that users must master in order to use digital environments effectively (Eshet, 2012). A more comprehensive definition is found in reference to "New Media" literacy (Ito, Horst, Bittanti, Boyd, Herr-Stephenson, Lang et al., 2008; Manovich, 2001) in the sense of access from every digital device, at any time and place, to any platform of content and information, and interactive and creative participation in information in cyberspace.

Today, digital literacy (2014) comprises a broader perception of capabilities required by the digital citizen or student, in a reality in which technology shapes conduct in the life of the individual and society. The distinctions among the various fields of digital literacy have become vague because of the fact that many aspects of digital functioning interface on the screen. The literacies form a net and are no longer separate, but are components of an umbrella of interconnected and overlapping literacies that, together, comprise a freestanding field (UNESCO, 2013). Digital literacy is no longer seen as a technology-focused literacy; rather, technology constitutes a common denominator for a broad net of multifaceted, pluralistic, interconnected, contextual, and dynamic abilities that create a new synergy among themselves (Lee et al., 2013).

Comprehensive description of digital literacy is also offered by Hall, Atkins, & Fraser (2014): "Digital Literacy refers to the skills, attitudes, and knowledge required by educators to support learning in a digitally rich world. To be digitally literate, educators must be able to use technology to enhance and transform classroom practices, and to enrich their own professional development and identity. The digitally literate educator will be able to think critically about why, how, and when technology supplements learning and teaching". While the digital student copes with such an explosion of "information" as data and facts in the public domain, the main issue is constructing the "knowledge," which refers to what we know, how we personally understand it, and how we can apply it.

Digital Competence

Dcom expands the concept of digital literacy into a multidimensional framework of capabilities, which comprises a comprehensive, integrated approach to the essence of the citizens' and students' characters in the 21st century and defines the conditions for his or her optimal functioning in society and culture.

The use of terminology of "competence" is far more extensive than the skills and strategies entailed in a specific literacy. Competence expresses the digital citizen's ability to successfully meet crucial requirements of life in the 21st century in a personal, proactive manner. These complex challenges and tasks, in their ever-changing contexts, require one to recruit and design cognitive and psychological resources (OECD 2002, 2005). The cardinal place of technology in these aspects requires formation of an up-to-date framework in which technology is interwoven in all the components of the net of literacies.

Dcom is defined by The European Parliament and The Council of the EU (2006) as one of the eight crucial qualifications for learning throughout life and participating in the information society. The wide-ranging nature of Dcom described in the document involves "The confident and critical use of Information Society Technology (IST) for work, leisure and communication. It is underpinned by basic skills in ICT: the use of computers to retrieve, access, store, produce, present, and exchange information, and to communicate and participate in collaborative networks via the Internet."

In the report "Digital Competence in Practice: An Analysis of Frameworks," Ferarri (2012) expands on the content of Dcom: "Digital Competence is the set of knowledge, skills, and attitudes (thus including abilities, strategies, values, and awareness) that are required when using ICT and digital media to perform tasks; solve problems; communicate; manage information; collaborate; create and share content; and build knowledge effectively, efficiently, appropriately, critically, creatively, autonomously, flexibly, ethically, reflectively for work, leisure, participation, learning, socializing, consuming, and empowerment."

Dcom should thus be viewed as a whole complex of abilities that are part of the skills of the 21st century, as a key to the skills required by every graduate of the educational system and every digital citizen. Ferrari (2013) states in "A Framework for Developing and Understanding Digital Competence in Europe:"

"Digital Competence can be broadly defined as the confident, critical, and creative use of ICT to achieve goals related to work, employability, learning, leisure, inclusion, and/or participation in society. Digital competence is a transversal key competence, which, as such, enables us to acquire other key competencies (e.g., language, mathematics, learning to learn, cultural awareness). It is related to many of the 21st Century skills, which should be acquired by all citizens, to ensure their active participation in society and the economy."

In Ferarri's report, a framework is proposed of Dcom that refers to the following fields: information, communication and collaboration, content and creation, security, and problem solving. This last includes identifying digital needs and resources, reaching intelligent decisions about adapting tools to a goal or need, and finding solutions by digital means through creative use of technology, such as solving technical problems.

The importance of Dcom is not merely in its capabilities for multi-faceted literacy functioning appropriate for the society and culture in real life, but also for nurturing and training active, critical, young learners who, as they mature, will be aware of the power of this competence and will see it as an important means of expression and empowerment, acquisition of knowledge, development, and consolidation of personal and social-cultural identity, finding suitable employment opportunities and advancement in life.

The proposed framework of Dcom comprises a net of literacies based on updating the literacies valid for every period and context, with the addition of the technological layer, which affects their shaping such as digital literacies, and expands the range of abilities with new capabilities derived from the use of technology.

Ethics as the Core of Digital Competence

Dcom is not only an ability, but also comprises a modern-world view and civil awareness; therefore, at the core of the net of literacies lie the ethics of the digital citizen.

The change generated by ICT is not only a technological revolution, but also a social and ethical change that far exceeds one new technology or another (Bynum & Rogerson, 2004). Digital culture is

global; its community is composed of digital citizens; it is fashioned as a complex tapestry of technology, its producers and users, its methods of use, and its social context.

The concept "digital citizen" is a modernized adaptation of the classical concept of "citizen" in the reality of the digital age. "A digital citizen refers to a person utilizing information technology in order to engage in society, politics, and government participation." (Mossberger, Tolbert & McNeal, 2011). Proper citizenship in the society of information and integration in the social communications culture, in which online presence has become an indivisible part of life, dictates ethics as a common denominator that lies at the base of the competences required in order to function in the digital age. Ribble (2014), in his proposal for an outline of the competences required of the digital citizen, emphasized the ethics of REP (Respect, Educate, and Protect) as the core of values and as a starting-off point for the digital citizen.

Dcom is manifested through ethical functioning, both personal and social, of the digital citizen. Included among the *personal* aspects of the ethical use of technology are the values of rectitude, equity, responsibility, credibility, protection of intellectual property, and privacy policy. The *interpersonal* aspects relate to respect for others, sharing, tolerance, and protection of rights such as freedom of expression, as well as values of global ethics such as social responsibility and social conduct that contributes to shared communities. These interpersonal core values are also the moral base for functioning in the global, pluralistic world, in which there are encounters that cross various social and cultural borders, requiring inclusiveness, openness to listening, and tolerance of a variety of opinions and voices. The importance of ethics increases with the expansion of collaborative communities, which break down traditional boundaries and norms, and with the increase in the perception of global sharing and the wisdom of the crowd as a social value and economic asset. Dcom, in this sense, is not a goal in itself but is rather a means of nurturing active citizenship.

Ethics in Dcom is inevitable, because of the adult citizen and the young student coping with a variety of ethical issues arising from the use of technology, which require ethical knowledge and the ability to make moral judgments. On the digital plane in which activity is interactive, public, shared, and social, there are many dilemmas such as property rights and copyrights as opposed to sharing and freedom of information, and freedom of expression as opposed to protection of privacy. The need to strengthen the crucial role of digital ethics also arises from occurrences of negative phenomena entailing exploitation of opportunities that technology presents, among them cybercrime and cyberbullying; these must be eradicated in order to protect the society functioning according to the rules and norms of conduct for the benefit of its citizens (Avni, 2012; Avni & Rotem 2009, 2010; Rotem & Avni 2008, 2010, 2011, 2012).

An ethical-educational perception views ethical literacy as a starting-off point for digital competence and as a transformative means with potential for effecting positive social change and advancing a free, egalitarian, just society. In the net of literacies of the framework of digital competence proposed here, ethical literacy constitutes "super-literacy," which is both situated above the net of literacies and is interwoven among its components.

Dcom can be defined as: *A human and civil need and right, vital for the intelligent, appropriate functioning of the personal, social, and professional aspects in the lives of all the citizens in society in the real world, by means offered in the current era by modern technology.*

CONCEPTUALIZATION OF DIGITAL COMPETENCE IN THE NET OF LITERACIES

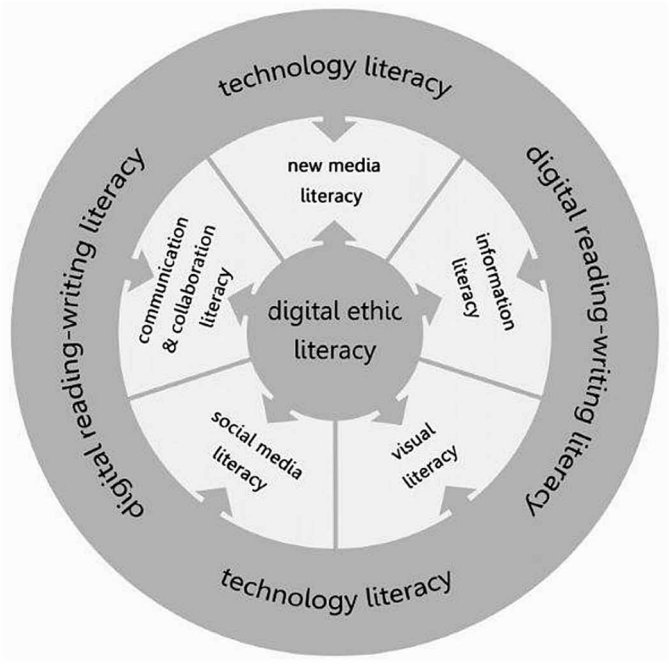
General Description

Conceptualization of digital competence currently required for the student and graduate of the educational system is vital for building a basis of knowledge for educational-public discourse, for defining updated goals of education and study, and for characterizing ways of implementing them. In accordance with the above survey and reasoning, a conceptual framework of digital competence is proposed here, in which technology gives modern meaning to the net of literacies needed by the digital citizen and student in the 2010s.

The digital competency framework proposed in this article encompasses eight realms of digital literacies, organized according to the following structure (Fig. 1):

1. *Literacy of digital ethics*, positioned at the top of digital competence and enveloping the net of digital literacies, in which ethics comprises the crucial component of perceptions, viewpoints, and values, essential for suitable application of technology by humans in every dimension of digital competence.
2. *Technological literacy and digital reading and writing literacy*, comprising a functional basis and interface for all the digital literacies included in digital competency.
3. **Fields of Digital Literacies**: Information literacy, visual literacy, new media literacy, communication and collaboration literacy, and social media literacy.

Figure 1. Framework of digital competence in the 2010s



Premises for selecting areas of digital literacy:

1. Inclusion of a complex of abilities needed by the digital citizen and student, required for optimal, suitable functioning in life in the age of ICT.
2. Modernization and adaption of the classical, familiar, pedagogically proven literacies of former times, for relevant needs and emphases of modern digital literacy.
3. Addition of new aspects of knowledge, skills, and values arising from the new technological means and use.

Digital Ethics Literacy

The literacy of digital ethics is the moral-behavioral base of technological use, and is integrated as an immanent part of each one of the other digital literacies.

Digital Ethics Literacy: Background

Digital ethics is a new field derived from an overall view of ethics as an essence and a moral foundation of human society since time began. Characteristics such as accessibility, transparency, interactivity, publicity, and sharing raise new, ethical issues. Principles like freedom of information, freedom of expression, perception of privacy, property, and so forth have become part of the digital citizen's routine in daily life. Digital ethics relates to ethical, responsible, cautious behavior in the digital plane, based on knowledge of the law, moral values, observation of the rules, awareness of dangers on the internet, and protection rights.

Alongside the benefits that digital means bring the citizen, they also cast him or her into a whirlwind of uncertainty and confusion, set traps in his or her path and expose him or her to injury. Society has not yet found effective ways to deal with these ethical challenges, which cast in doubt the perception of civil and public rights. Thus, it is important to raise awareness of the proper use of technology and to avoid dangers by developing the ability to guard against other people's malicious intentions that might damage a person's body, dignity, reputation, or property.

The foundation of literacy of digital ethics is *ethical literacy*. Ethical literacy is the personal ability of the individual to operate in the routine of his or her life with a conscious, moral standpoint, and to reach ethical decisions made in consideration of his or her obligations both to society and to himself or herself (Avni & Rotem, 2011).

The literacy of digital ethics is the interface between digital literacy and ethical literacy. It includes a complex of abilities for use and exploitation of digital means for the benefit of the individual, while relating morally to a variety of ethical aspects and issues. It is based on acquired knowledge that refers to protection of human dignity in every context on the background of characteristics of the digital age. Among the central issues are: the right to privacy, the right to a person's control over information about himself or herself, his or her decisions, and his or her personal space vis-á-vis freedom of information and freedom of expression (Birenhak, 2010); protection of intellectual property with respect to the principle of the public's right to derive pleasure from works that are part of its heritage and cultural world. The citizen possessing literacy of digital ethics can reach ethical decisions on the basis of moral judgment and critical thinking, through deliberation on a variety of possible options in a given context; his or her ethical behavior is manifested in digital stages.

A citizen's digital competence, therefore, must include the main components of digital ethics. In British Colombia's Digital Literacy Framework report of the American Library Association (2013) the components of the literacy of digital ethics are detailed, providing a full picture: internet safety, privacy and security, digital relationships and communication, cyberbullying, digital footprint and reputation, creative credit and copyright, legal and ethical aspects, and understanding and awareness of the role of ICT in society.

Digital Ethics Literacy: Definition

The ability of a person to operate in a proper, ethical manner though digital means and on the internet, through morally dealing with ethical aspects and issues entailed in the use of technology, and the ability to protect him/herself and other internet users from traps and improper use. (Avni & Rotem, 2011)

Abilities Included in Digital Ethics Literacy

- **Awareness**: The ability to comprehend human, social, and cultural issues concerned with use of technology for better or worse, and acquaintance with principles of legal and ethical behavior within the digital environment.
- **Online Presence:** Management of digital presence and fingerprints the user leaves, coming from awareness of his or her true, personal identity and consideration regarding the way to represent himself or herself online. This includes understanding of the importance of a personal label and the ability to have online influence.
- **Technological Means:** Proper, personal use of technological means, apparatuses, programs, applications, and the internet, while guarding the principles of the dignity of the individual and his or her property. For this purpose, technical tools and methods are necessary for securing information on one's personal computer and in the virtual, public space.
- **Intellectual Property:** Comprehension of the value of guarding one's intellectual property and copyright. Knowledge of laws and rules for protecting copyrights on the web, regulations for use and permission for use of materials belonging to others on the web.
- **Privacy:** Understanding the principle of the right to privacy and of the person's right to control over his or her personal information, personal space with regard to the right to freedom of expression. Making decisions regarding sharing of personal information, understanding the privacy of another when publishing information about him or her on the web, avoiding exposure of personal information of people that one does not know, activating mechanisms for guarding privacy and securing information, familiarity with mechanisms, and rules for securing information.
- **Connections:** Developing sensitivity to methods of interpersonal communication on the web. Having the ability to distinguish between a positive connection or relationship and an inappropriate one on the web. Recognition of the internet as a global space; consciousness of respect for different cultures and inclusion of the other.
- **Harm:** Awareness of cyberbullying and causes of its increase and severity, such as anonymity and mass distribution. Avoidance of deliberate, malicious injury caused by elements such as incitement, racism and distribution of hateful messages; opposition to distribution of injurious information, either personal or public.

- **Protection:** Familiarity with methods of production against harm on the internet. Ability to identify and know how to defend oneself against dangerous or injurious situations on the web, including: impersonation, identity theft, bulling, incitement, phishing, addiction, unpleasant or threatening situations; avoidance of discourse with and conveying personal details to unknown people; recognizing insecure environments, using help channels and mechanisms for personal and technical reporting when discerning injury, threat, or danger.
- **Collaboration:** Understanding the value of sharing, being part of an online community and contributing to collective wisdom, regarding the potential risks of sharing information.

Technological Literacy

Technological Literacy: Background

Technological literacy is an updated extension of computer skills required for intelligent operation of computer technology, information, and communication for personal use and for full participation in the global, digital society. This ability constitutes a crucial foundation for wise application of the other digital literacies included in Dcom. Technological literacy includes use of technological aids – tools, services, applications, and communication – for personal, academic, professional, and social needs. These updated, technological competences are vital in order to link the personal world of every citizen and student – which is implemented today through a personal computer or other device – to social conduct and to a variety of aspects of the reality of online life. It is highly important for the digital citizen to be able to manage him or herself through use of technology for personal needs, for professional development and acquiring an education, and for his or her overall social needs.

Technological literacy is based on three principles (Media Smarts, 2010):

1. **Use:** Necessary knowledge and skills for using a variety of digital applications and the ability to constantly adapt to relevant, new, frequently updated technological tools and to learn to use them by making them compatible with the user's needs in his or her work environment.
2. **Critical Understanding:** Comprehension of the effective, proper use of digital means, among them digital media and information, by acquaintance with the consequences of use of technology on perceptions, beliefs, and emotions of a person on the environment and on the personal health of the user, and taking actions leading to minimization of problems arising from them.
3. **Production:** The knowledge and ability to produce content and communicate via digital technology as an active consumer and producer in digital society.

Technological Literacy: Definition

The attitude and ability to properly and effectively use digital technology in daily use as needed. Technological literacy includes: accessibility to technological means; selection of means in accordance with needs; technological operation by acquaintance with the basic principles of actions and functions; ability to constantly learn and adapt to new means by adjusting to changing needs; intelligent, proper use including development of awareness of the consequences of use of technology on the environment and on health, and acquaintance with methods and tools to minimize their potential harm.

Abilities Included in Technological Literacy

- **Accessibility:** Access to computer hardware and personal digital devices; knowing how to use resources such as programs and wideband services.
- **Acquaintance and Use:** Familiarity with the principles of current, common human-computer interfacing. Knowledge and skills of the use and operation of devices, applications, programs, tools, services, browsers, means of communication by smartphones and internet and auxiliary applications; differentiating between hardware and software. Management of applications, operational set-ups and systems, installing programs, program updates, means of protection of hardware and software, restoration and backup.
- **Management and Ensuring Security of Personal Information:** Management of personal information, files, data, and personal online space using technological means and services that are compatible with the user's needs and his or her work environment. Intelligent, secure storage of digital information, enabling easy, accessible retrieval. Conducting backup in cloud computing and personal devices. Awareness of security, management of passwords and permission to access, including restoring access permission. Use of devices preventing illegal entry into one's computer and eliminating viruses.
- **Digital Communication:** Acquaintance with and use of means of communication in various media, including tools and services for storage and collaboration.
- **Cloud Computing:** Use of clouds of services, apps, tools, and information on the web, without dependence on personal digital devices.
- **Personalizing and Interfacing:** Operating a personally adapted technological infrastructure for personal needs. Producing interfaces and synchronization of information among personal, digital means, computer, tablet, smartphone, etc.
- **Navigation:** Intelligent, critical navigation among the multitudes of tasks and variety of digital tools.
- **Production:** Processing, creating and producing information products, wisely choosing the appropriate digital means.
- **Health and Ergonomics:**
    - **Minimizing Electromagnetic Radiation:** Consciousness of the consequences of use of technology on the environment and one's personal health, identification of possible risks and dangers, and taking steps to minimize them, with emphasis on usage habits that minimize harm caused by cordless electromagnetic radiation and by the electric network (ELF).
    - **Suitability of Furniture and Lighting Fixtures:** Making furniture and lighting suitable to the work environment according to conventional recommendations for ways to minimize physical damage, such as placement of the computer, height, distance, support, etc.
    - **Physical Awareness:** Taking care to position one's hands correctly, avoidance of unnatural posture and lack of physical exercise for extended periods of time.
    - **Avoidance of Visual Overload:** Awareness of the danger of damage to eyesight caused by prolonged focusing on the computer screen; importance of frequent blinking and resting one's eyes.
- **Ethics:** Awareness of the implications of the use of technology on personal and social, ethical issues, with emphasis in the field of civil rights and protection.

Digital Reading and Writing Literacy

Digital Reading and Writing Literacy: Background

In times past, the concept of "literacy" was a synonym for the basic meaning of reading and writing; at a later stage, it also included understanding and deciphering of written messages in local, cultural contexts. As a central condition for optimal learning and functioning as a citizen in modern society, even before the age of digital technology, the concept was found in every educational aspect and discourse dealing with civil welfare (Street, 1984).

Digital means have expanded the traditional concept of literacy as relating to a printed or handwritten text; it now relates to dynamic, multimedia, digital texts, by means of which humans absorb knowledge, produce, share, and communicate (Rotem & Peled, 2008). As opposed to the written or printed text, the digital text appears on a screen, organized units of text that are connected by links branching out to one another and to and from other resources of information and digital media. Digital text is interactive and allows for constant editing and updating; it is publicized in a variety of digital environments, among them e-mail, text messages, websites, discussion groups, social networks, smartphones and digital books.

Digital reading and writing literacy, as a foundation stone for the digital competence of every digital student and citizen, requires activation of different abilities and skills than those needed for traditional reading and writing, and includes collective, design and ergonomic challenges that are unique to the digital text. The reader is active and forms the experience of interactive reading by reasonable selection of the method for navigating a text and by use of a variety of digital aids such as dictionaries, search functions within the text and information resources. Gathering information from the digital text requires scanning of large quantities of material and instantaneous evaluation of its credibility. Thus, critical thinking has become an important component of reading literacy. Because the distinction between the receiver and the producer in digital text is often unclear, it frequently happens that the reader also becomes a writer. During the digital writing process, familiarity with a variety of tools and applications is required, including use of the keyboard and means of writing, processing, editing, and producing a text in various forms, applications, and formats (OECD, 2013). Digital reading and writing are also a process entailed in human connection and in social and cultural discourse that takes place in an increasing diversity of social platforms, on which there are exchanges of interpersonal or public messages. Social interaction requires dealing with legal and ethical aspects, including protection of privacy and freedom of expression.

The importance of this literacy is described by The European Commission (2001) as being the "key to all areas of education and beyond, facilitating participation in the wider context of lifelong learning and contributing to individuals' social integration and personal development." Reading and writing literacy is vital as a foundation for studying and learning in the framework of the educational system; it comprises a crucial condition for successful functioning in most fields in life.

Digital Reading and Writing Literacy: Definition

The ability required to read, decipher, write, and produce interactive, linked, multimedia, digital text effectively, characterized by a variety of representations and designs, including decentralization and sharing.

Abilities Included in Digital Reading and Writing Literacy

- **Characterization of Text:** Familiarity with the attributes of both traditional and digital texts; recognizing the contexts in which it is appropriate to use the different types and levels of text.
- **Accessibility:** Accessibility to create text on different platforms such as a computer screen, smartphone display, tablet, website, application, message board, social network, digital book.
- **Navigation:** Navigating among units of linked, digital texts that branch out through the information-rich space; using discretion regarding the proper track for reading purposes and critical consideration of suitability to the readers' needs.
- **Analysis, Deciphering and Comprehension:** Ability to extract information from a text and research a text by using designated means and applications.
- **Writing and Editing:** Acquaintance with means of digital writing in the required language, among them using the keyboard, touch and sound activation, copying and editing text, adding objects, creating links, updating, and proofreading.
- **Documentation and Management:** Documenting and managing digital text by means of storing, saving, securing, keeping records of different versions, restoring, following up on changes, comparing.
- **Creation and Production:** Creating a linked digital text, interactive, and multimedia.
- **Design:** Designing a digital text appropriate for the writing goals, target community and platform, using a variety of editing and designing methods.
- **Textual Representation:** Selection of different modes of presenting the text and converting it to the various forms appropriate for the goals for presenting information, the target community, and the tools available to the presenter.
- **Production and Publication:** Producing and publicizing by various means and digital environments, in accordance with the writing goals, the recipients, and different publication platforms.
- **Ergonomics and Accessibility:** Dealing with the ergonomic aspects of use and study of the text, including provision of special needs accessibility.
- **Collaboration:** Familiarity with characteristics of shared writing and awareness of the implications of involvement in writing and editing in a decentralized, shared environment, dealing with norms and conventions in writing on the web.
- **Ethics:** Awareness and comprehension of the legal and ethical aspects relating to writing and publicizing on personal and social platforms, such as protection of privacy, freedom of expression, and fair use of network sources.

Information Literacy

Information Literacy: Background

Information, a key resource to people, society, and the economy, has become accessible to all through the internet. The citizen has become not only a consumer but also a producer and distributor of information. The shared spaces allow information sharing and constructing collective knowledge. Coping with information is a vital asset for the personal advancement of every citizen, for development of social and cultural resources and for professional and economic achievement. Compared to traditional processes of accumulation of edited, arranged, controlled knowledge, in the current environment containing a wealth

of information, one requires a complex, astute ability to use the huge quantities of knowledge, far greater than those available in the previous generation, in a proper, critical, efficient manner, in order to derive benefit, reach decisions or solve problems.

A decade ago, UNESCO, in its Alexandria Proclamation (2005), proclaimed that information literacy is a vital precondition for efficient participation in the information society and is one of the basic human rights and a means to reduce inequality among people. The organization defined information literacy as a key to enabling effective access to production and transmission of content and to its use for economic, educational, and medical development as well as all other aspects of modern society (Horton, 2013). In the "Nine components of digital citizenship" (Ribble, 2014), aspects of information literacy are emphasized in the following fields: digital commerce, digital communication, and digital access.

The roots of information literacy are found in the previous era of computer technology (Zurkowski, 1974). Reference is made to an assortment of skills required for efficient use of information from different sources: to identify, locate, retrieve, store, organize, edit, analyze, process, distribute, and publicize information, in accordance with the purposes of the use of information.

The customary, widely quoted definition of information literacy is that of the American Library Association – ALA (1989): "the ability to recognize when information is needed and have the ability to locate, evaluate, and use effectively the needed information".

Information literacy constitutes an approach that strives to develop an autonomous learner who is self-directed in his or her studies, who knows how to construct knowledge for him/herself, to think critically and to solve problems. It occupies a central place in the definitions of "21st century skills" (Partnership for 21st Century Skills, 2014b) and in the framework of digital competence (Ferrari, 2013). Different versions of standards and characteristics have been developed for it, based on the principles set by the American Library Association – ALA (2014): Know, Access, Evaluate, Use and Ethical/Legal.

Information literacy is a basic academic ability. People who are information literate are those who have learned how to learn. Learning in an information-rich, technological environment forms the set of critical skills for optimal learning and the dimensions of information literacy necessary to cope with the new characteristics of information.

Information Literacy: Definition

The ability to recognize when information is needed and to effectively locate, evaluate, and use the needed information

Abilities Included in Information Literacy

- **Accessibility to Information:** The ability to obtain and consume digital information and participate in its transmission on the internet.
- **Identification and Definition of Need:** Defining the question/problem/issue and focusing on it by surveying the information.
- **Presentation of Information:** Acquaintance with various formats for presenting information, in accordance with the need (e.g., textual, visual, vocal, audio-visual, artistic, scientific information) and manner of usage.

- **Sources of Information:** Familiarity with a variety of information resources, among them different types of information and different repositories of information sources; distinguishing among them according to their features, purposes, and target audiences.
- **Search Methods:** Familiarity with and selection of methods and means to find and retrieve information according to the information required and the character of the sources:
  - Identification of key features and formats for the purpose of focusing and filtering the process of finding information.
  - Familiarity with the mechanisms for finding information such as navigation bars, hyperlinks, site guides, internal search engines.
  - Filtering out and focusing on desired information via search engines by defining relevant terms and operators.
  - Help from human services and/or digital agents to find information.
  - Gathering data with digital tools for preliminary inquiry, data collection, and building databases.
- **Evaluation of Information:** Critically evaluating the quality of the information, its relevance, credibility and scope, according to the purpose and goal, and by means of comparison and cross-checking with additional sources.
- **Information Management:** Managing personal and shared information by designated tools and methods.
- **Processing and Analyzing of Information:** Use of methods and means for comparing, merging, processing, editing, and analyzing information in order to reach conclusions, make decisions, find solutions, and produce a suitable product of information.
- **Creation of a Product:** Consolidating, constructing, and presenting an edited, designed product of information in accordance with the goal, character of information, target community, circumstances, and platform for presentation, through operation of suitable digital means.
- **Presentation and Publication of Information:** Presenting the product of information clearly and in a style suitable for and supportive of the target community; publicizing it via digital means suitable to the purpose, characteristics of the information, target community, circumstances, and tools available to the user, by implementing effective presentation skills and methods to activate the target community.
- **Distribution of Information:** Distributing digital information to the intended target communities and relevant platforms by using distribution means and advertising strategies, branding, image, market analysis, and market promotion.
- **Ethics:** Awareness, comprehension and relating to responsibility to follow laws and rules of ethics regarding accessibility to and use of information, such as intellectual property, copyrights, fair use of open or free sources, freedom of expression, privacy, and information security.

Digital Visual Literacy

Digital Visual Literacy: Background

Since the dawn of human society, visual representations have served as a means for transmitting information, messages, and meanings. Digital means have expanded the possibilities of traditional, written texts into updated language and culture, including a dynamic, representative variety of data, information,

and messages. *Infographics*, as a general title for visual representation and illustration of information, was largely in the possession of advertising people and graphic artists and was intended primarily for conveying commercial themes. With the rising use of digital, visual media, it has become accessible to all. Visual culture, which enables anyone to produce a digital, visual text with its diversity of representations and platforms, has become common property (Morgan & Van Dam, 2008). Visual images in the digital environment play a major part in a variety of personal, professional, and social fields. Daily experiences, occasions, and events are conveyed by many media via digital photos, graphics, and video clips. Advertisements, games, computer applications, smartphones, user interfaces, operational instructions for electronic and other devices, digital content, and computerized media environments are currently presented through visual images. The availability of powerful design tools enables every individual to easily create designed graphic information in a variety of ways and means of expression. Visual representations have the power to convey ethical, humane, and social messages, and to express ideas, feelings, values, and worldviews.

The growing use of visual components in digital text has increased the need of the student and citizen to develop his or her visual literacy that will enable him or her to consume, comprehend, and use digital, visual images for thought, study, expression, creation, and production. The language of visual images requires the ability to decipher, understand, and derive meaning from visual messages as well as the ability to create and produce them. This ability deals not only with identification of visual components but also with comprehension of the context in which they appear, awareness of the viewpoint and specific intentions of the creator, identification of the target community, and comprehension of the possible effects of the images upon it. In addition, visual literacy relates to the skills of critical viewing and consumption of visual messages, avoiding being deceived or led astray by manipulations. Visual literacy of the digital citizen is manifested primarily in digital commerce and digital communication (Ribble, 2014). For the student, visual literacy constitutes an important element in learning and an effective way of handling styles of presentation and internalization of information, which increase understanding and motivation to learn.

Digital Visual Literacy: Definition

The ability to read, understand and analyze critically and to derive meaning from messages expressed in digital, visual texts; to communicate and convey visual messages efficiently; to produce expressions of visual messages by judging and selecting the way to represent them.

Abilities Included in Digital Visual Literacy

- **Deciphering of a Multidimensional, Visual Text:** Deciphering different types of digital, visual texts including three-dimensional, static, and dynamic text. The ability to analyze and understand visual, multimedia information by integrating its details into a meaningful, interpretational piece of work. The ability to read visual, user interfaces, and understand visual instructions.
- **Critical, Visual Reading:** Critical reading, evaluation, and interpretation of meanings and messages of visual texts through awareness of the ease of manipulation in processing, editing, and publishing visual information.
- **Production of a Visual Text:** Creating, processing, and designing a text by means of visual representations, among them graphics, photography, graphic organizers and tools of production, and

editing, by correspondence of the digital, visual text's configuration to the context, goals, intended recipients, and publicizing platforms.

- **Conversion and Correspondence of Information Representations:** Converting information, data, ideas, and messages into visual expression by means of digital tools.
- **Ethics:** Awareness of ethical, legal, social and economic issues included in the very meaning of creation, its copyrights and the use of visual images.

Communication and Collaboration Literacy

Communication and Collaboration Literacy: Background

Communication literacy is the ability to use a variety of means of communication intelligently according to need. Educational discourse about communication literacy is relatively new. Beginning in the 1970s, a link has been made between communication and literacy, the intention of which is the ability to communicate in the context of reading and writing. Communication literacy in the digital age is based on integration between information and communication technology and ways of communicating between people (Approaches to Information and Communication Literacy, 2007). In the online space, there is widespread communication going on between the personal and the social, on a variety of platforms and through diverse means. Each channel of discourse has its own unique features, intended goals, diverse target communities, and rules for appropriate discussion. Digital means offer a new, interactive dynamic between creators of knowledge and messages and their consumers, and enable new channels of active expression, exchange of information and ideas, learning, and personal development through social involvement.

The integration of technology in daily life has greatly increased the need to instill communication literacy, the ability to decipher and produce messages conveyed though digital channels, in every student and citizen. Components of basic communication skills include verbal, aural, and visual communications; nonverbal communication including ways of expression such as gestures; textual communication including various genres in the writing places on the web, and visual communications including a variety of visual representations (Communication Skills, 2014). At the basic level of literacy, this refers to the ability to decipher, produce, and convey messages via communications means. At the advanced level, this refers to comprehension of the place and contribution of communication in processes of creating meanings and in designing reality, as a platform for activity using digital communication services. The European Parliament and The Council of the EU (2006) has adopted this ability as the first of eight basic skills required by every individual for personal development, self-fulfillment, active civil participation, social belonging, and employment.

Digital communication constitutes a basic condition and foundation for sharing within personal, professional, and social contexts. One of the main challenges is to train the citizen and student living in the global environment to effectively communicate and share knowledge and ideas, to learn from colleagues and experts, to produce collaborate outcomes through teamwork with nearby or distant partners, and to actively participate in collaborative communities that cross borders and cultures. A person who is literate in communications and collaboration, who knows how to use, and is capable of using, tools and services of a variety of digital communications for his or her various needs, is conscious of the rights of those photographed and of the responsibility for their appropriate, secure use.

Communication and Collaboration Literacy: Definition

The ability to communicate in a variety of means of digital communication and to conduct efficient interaction that crosses boundaries and frameworks – whether interpersonal or collective, private or public, synchronous or asynchronous – by adapting the discourse to the characteristics of means of communication. The ability to share information and messages, using collaboration digital tools for personal and social needs, and to participate in online communities and networks, with ethical awareness of global citizenry.

Abilities Included in Communication and Collaboration Literacy

- **Characterization of Means of Communication:** Recognition of the attributes of the various means of communication, understanding of contexts and how it is fitting to use each of them according to need, goal, and target community. Evaluation of the efficiency of means of communication and awareness of their influence.
- **Accessibility and Operation:** Accessibility to diverse means of communications and ability to handle them.
- **Transmission of Messages:** Effective expression of ideas, opinions, and messages using a variety of forms and contexts by digital means of communication.
- **Collaboration:** Cooperation, exchange of information and efficient, respectful teamwork that appreciates each individual's contribution to the team, using digital means of communications and collaboration.
- **Dynamic Communications – Cloud Services:** Use of cloud computing and dynamic, mobile communications to derive meaning from messages and to publicize and share information.
- **Global Citizenship:** Use of means of digital communications to expand the network of acquaintances and connections crossing geographical boundaries; development of global consciousness and the practical meanings derived from them.
- **Ethics:** Protection of rights and appropriate rules of behavior such as property, privacy and freedom of expression, by awareness of the personal and social implications of behavioral norms in communications and in crossing borders.

New Media Literacy

New Media Literacy: Background

Media literacy in the 2010s has undergone significant changes, principally consolidating most means of media on a digital platform on the screen. This is the new media, in which a variety of media channels and different types of information, sharing, and social services are displayed together. The new media in the digital arena constitutes the "*Where*" (Peña-López, 2009) – publicized platform of the interpersonal, private, and public flow of information, messages, and communication. The new media is described by Jenkins (2006) as "media ecology". Ito et al (2008) explain the uniqueness of the term: "We have used the term *new media* rather than terms such as *digital media* or *interactive media* because the moniker of 'the new' seemed appropriately situational, relational, and protean, and not tied to a specific media platform."

The new media offers and creates interactive, multi-sensorial activation by means of a powerful integration of words, graphics, and sounds. In this respect, Ito et al (2008) claim that young people develop, through personal experimentation, a wide variety of new forms of literacy, among them personal adaptation of the media for their own needs: selection of definitions, consumption of video clips, creation of new genres of presentation, remix editing, hybridizing, computer video games, sharing of information and knowledge, and even taking on traditional roles of adults, such as public and political involvement and social criticism.

Traditional media literacy has focused on the critical, efficient consumption of information and messages on the various communication channels, through awareness of the effect of structuring and forming messages on the perception of reality. Because there is interaction in the new media with a large community whose members have changed from being media consumers to being producers of content and active partners in media, literacy has expanded to active consumption and production of content and messages by involvement of the individual in the interactive, social, online medium. Self-expression, conveying of messages in a variety of platforms, and construction of collective meaning, are important aspects for the digital citizen in a democratic society, which offer ethical, social consciousness, and responsibility for content and the ways it is distributed.

Gaming as an Updated Component of New Media

Expansion of new media literacy to a diversity of forms and modes of use has elicited new abilities, which until now have not been part of the educational-public discourse concerned with literacy competence required of the citizen and student. One of the abilities that has had an increasing place in our daily life is the digital game (Zimmerman, 2009), which offers personal enjoyment or social entertainment through gaming communications crossing borders of both place and partners. Furthermore, digital gaming is currently used for teaching and learning through experiences, challenges, and motivation and as a model for action in the real world. Gaming abilities involve complex aspects of reading and writing, advanced thought, problem solving, creativity, deciphering of various kinds of visual messages, psychological aspects of competition, and cooperation in social-ecological relationships of human interaction.

New Media Literacy: Definition

The ability to consume messages from a variety of digital media channels in a personally adapted and critical manner, to demonstrate involvement in interactive social media, and to produce and publicize communicative messages that have collective significance in social and cultural contexts.

Abilities Included in New Media Literacy

- **Characterization of Media Means:** Recognition of the attributes of new media channels consolidated on the screen or digital platform; acquaintance with modes of presenting, disseminating and publicizing information; evaluation of the effectiveness of media methods, and awareness of their influence on the user.
- **Active Viewing:** Critical consumption of messages and derivation of information and meaning from them by active viewing, research and synthesis, entailing comprehension of the goal sought in publicizing the messages and the effect of their form on the perception of reality.

- **Navigating, Managing and Updating:** Handling attentiveness among many simultaneously appearing media channels, applying discretion in choosing how to navigate among them. Acquaintance with tools and methods to receive constant communications information via manual and automatic update tools.
- **Processing, Editing and Producing:** Familiarity with tools and skills for use of media files, downloading, editing, processing, and production of media, and publicizing messages on a variety of digital media platforms.
- **Gaming:** Personal and social gaming by use of digital processes.
- **Updating and Involvement:** Constant but controlled updating of what is going on in the social and cultural media environment; involvement in interactive media for personal empowerment and social contribution.
- **Ethics:** Awareness of the variety of options for expression and use of various media and their implications, taking legal and ethical responsibility with regard to accessibility and use of media.

Social Media Literacy

Social Media Literacy: Background

The increased conduct through online social media offers empowering of personal, educational, professional and social processes that are vital for every citizen and learner who participates in a collaborative community. Social media are a complex of internet services enabling multidirectional communication in shared social places by sharing a variety of contents, including text, photographs, video, music, and internet sites. Among the online media places are social networks, apps (online applications) for sharing photos, videos and music, online discussion boards, Wiki, Twitter, blogs, and a variety of collaborative games.

The use of social media in effect expands existing social reality to a rich, diverse expanse of human information and communication in a shared, digital environment; thus, involved, meaningful activity in relevant social services is currently available to everyone. Goodman (2014), for example, points out the vital importance of the abilities needed by every digital citizen in the social media context – among them, the use of media for commercial needs, understanding and coping with propagandist media, being conscious of the effect of censorship and media ownership on information published in the social media, and identification of stereotypes in communications.

Social media literacy involves the ability to make intelligent choices of relevant places for collaborating and managing online presence through awareness of how to design a personal profile and its consequences for social interaction. This literacy includes intrapersonal, interpersonal, and social skills. Among the personal skills are self-orientation, time management, definition of limits, emotional management, self-expression, expressing opinions, designing messages, reflection and evaluating messages, creativity, reputation management, and aggression. The interpersonal and social skills include attentiveness, sensitivity, tolerance, sharing, communication, community management, discourse management, exchange of opinions, dealing with dilemmas, coping with criticism, giving and receiving feedback, social and sometimes commercial publicity, through ethical awareness that is personal, social, and global. Competence of the digital citizen, as a person who is literate in social media in the digital world, is manifested in consciousness of the right to free access to the web, to digital commerce, and to relevant laws and rules – among them, personal security mechanisms and prevention of injury (Ribble, 2014).

Social Media Literacy: Definition

A complex of qualifications that enable interconnectedness and interaction among people via communication and sharing of information. These competences allow one to communicate in a suitable manner, to be involved, to cooperate and participate actively, to give and take, in the social environment of communication and sharing of content. A person who is literate in social media forms his or her personality, worldview, and manner of social conduct, among other ways through tools for collaborating and managing information found on the web.

Abilities Included in Social Media Literacy

- **Characterization of the Social Media Environment:** Recognition of types of online social media places in order to make a wise selection: essence, platform, recipients, structure, types of pages, interfaces, conditions for use, manner of conduct.
- **Operation:** Registration, constructing a profile, definition of privacy, friends, interest groups, levels of collaboration, monitoring notices, posting and uploading information to various media.
- **Online Presence:** Construction of a personal identity, designing a profile, management of a reputation, participation in and management of a presence by awareness of consequences of digital fingerprints left by the user on the web.
- **Communication and Interaction:** Definition of circles of communication, management of notices, and responses by choosing suitable communication channels (wall, chat), wording appropriate for the community, and the characteristics of the social media.
- **Timing:** Setting of timing of updates. Intelligent, critical expression by understanding the proper timing and frequency of promulgation of messages.
- **Interfaces:** The ability to interface social media with mobile devices such as smartphones or personal tablets.
- **Intelligent, Critical Use:** Understanding modes of transmission in social media, circumstances of success in communication, and distribution of messages through analysis of data and statistics. Critical evaluation of relevance and reliability of information and messages conveyed via the social network and its implications for the user and the information he or she shares. Awareness of the immediate, public, shared, social platform used by many who are interactive partners, and its implications on motivation for writing.
- **Ethics:** Awareness of legal and ethics aspects on the social network: copyrights, fair and decent protection of privacy, limits of freedom of expression, understanding the significance of distribution of injurious messages and information and avoidance of such actions. Awareness of defense mechanisms such as identification of impersonators and acquaintance with mechanisms for reporting injury.

Solution and Recommendations

The proposed framework of Dcom offers ways to deal with the vital need to define and describe distinct conceptualization, broad awareness and clear guidance in feasible ways, in order to be able to implement them and instill them in citizens and students, This need includes supply, the current lack of efficient methods of control, and evaluation. Presently, the main challenge is to progress from terminology to

action, in order to instill all aspects of Dcom in the population – not as something that is nice to have but as a competence that is vital and essential to have.

Over the years, Dcom has been a hazy, protean term bearing various names and referring to different things. Along with this, there has been a widespread, mistaken assumption regarding the "illusion of knowing" that must be uprooted: in fact, young people born into the technological age are not necessarily digitally literate simply as a result of it. They do not necessarily construct knowledge as a result of using digital literacy. Gathered data from almost 60,000 Grade 8 students in more than 3,300 schools from 21 countries or education systems within countries - suggest that the knowledge, skills, and understandings described in the CIL scale (Computer Information Literacy), can and should be taught. Regardless of whether or not we consider young people to be digital natives, we would be naive to expect them to develop CIL in the absence of coherent learning programs (Fraillon, 2014).

Command of digital skills achieved through daily activity with computerized systems is far from constituting broad Dcom. Dcom is a complex, multifaceted field, part of personal development and empowerment. The process of acquiring it, both as a means and as a goal, does not happen circumstantially but rather requires deliberate, explicit study and experience. Therefore, both the social system and the educational system have the obligation to provide it.

Formal policies and messages presenting Dcom as a goal of highest importance raise the awareness and crucial nature of the subject, but are not a substitute for immanent integration in the routine of training and learning. A program of action that includes a variety of methods of implementation as an answer to the various target communities, as well as the allocation of appropriate funding and other resources, must be put together and integrated into the daily routine.

Instilling Dcom in citizens and students should be conducted through a variety of channels and paths of action, via synergy among partners connected with the various aspects of digital culture, such as government offices, economic bodies, organizations,, and educational systems. Suitable opportunities for training and experimenting in digital literacy must be developed and offered alongside deliberate, methodological study. For this purpose, it is important to supply access to available, professional mediation, relevant teaching materials, guidance, and exercises to the target communities. It is very important to demonstrate and present these materials in digital texts that will provide authentic experience in the reality of a lifestyle interwoven with technology.

In the educational system and in training Dcom should be implemented according to a number of principles:

- **The Principle of Integration:** Integrating the digital literacies in teaching programs by correlating fields of literacies to characteristics of the disciplines. According to this principle, the teacher is responsible for integrating aspects of Dcom into his or her work as well as demonstrating literacy work in his or her teaching and modeling literacy in his or her personal and professional conduct.
- **The Principle of Technological Focusing:** Instilling basic aspects of digital literacy, with the emphasis on technological literacy, as a field that stands on its own; alongside an updated definition of literacies, with the emphasis on digital reading and writing, and teaching it as an integral part of language and linguistic studies.
- **The Principle of Variation:** There must be variation in the aspects of digital literacies learned in each grade at school. In academic programming, which of the aspects are taught in each grade level must be decided. Some of the activities should be focused and short-term, in accordance

with their circumstances, and some of them are to be long-term and include complex, multifaceted processes and products.

- **The Principle of Spiraling:** Dealing with Dcom is not a one-time activity, but rather recurring during the different stages of study over the school years in the form of a spiral, with, expansion, and depth.
- **The Principle of Achievement:** Student achievement in the field of Dcom should be measured through a system of appraisal and evaluation.
- **The Principle of Modeling:** Dcom should become an immanent part of all academic conduct, including through indirect demonstration, routine conduct by the administrative and teaching staff and their requirements from the students, through integration of connected vessels and modern, technological methods, and means of teaching and learning.
- **The Principle of Authorization:** In order to emphasize the importance of Dcom in the academic, and employment world and to ensure sufficient competence for proper functioning by the public at large and by students, it is recommended to define a precondition to be required for authorization – a kind of license that is compulsory for completion of every training course, degree, etc., and that attests to the Dcom of the citizen or student.

FUTURE RESEARCH DIRECTIONS

Dcom is a complex, dynamic, developing field that offers many channels of research focusing on the effect of technological services, means, and tools on the behavior and conduct of the citizen and student. It is important to treat the framework of Dcom as a broad, open, dynamic expanse requiring constant updating, but at the same time include a clear, defined content of knowledge, skills, and abilities to wisely and properly use each aspect of Dcom. It is imperative to be open to research, to learn the new, developing language of young people born into the digital age, and at the same time, to research the effect on migrants – older citizens who must learn how to integrate technical processes into their personal and professional lives. Research on the methods of technology use in daily occurrences, on the essential knowledge required, the skills and viewpoints involved in ICT, and the ethical issues entailed in use of technology, will enhance the conceptual framework and instillment of Dcom.

In the educational field, it is recommended to research the ways the relevant educators and organizations deal with imbuing and nurturing Dcom, learning from successes and expanding support mechanisms, mediation, and teaching materials accordingly. It is important to formulate ways to evaluate the different dimensions of digital literacy, and to construct assessment rubrics for evaluation of the model.

It would be interesting to examine the effectiveness of instilling Dcom by comparing the various ways of teaching, such as, for example, teaching Dcom as a separate, distinct, focused field as opposed to integrating it in the disciplines of the an academic program.

CONCLUSION

This chapter deals with a proposal for a conceptual framework of Dcom, which constitutes a human and civil need and right that is essential in order to wisely and properly function in the world in the 2010s through means offered by technology. Digital citizens and students today need complex, multifaceted

qualifications, which until now have not yet been defined in a clear framework, have not been part of public and educational policy and civil consciousness, and are not instilled in a distinct, concrete manner in the public composed of citizens and students. The very fact of defining the essence and content of this competence is likely to contribute to the understanding of the essence of intelligent, proper functioning with literacy in the complex of possibilities offered by technology in the digital age.

In this chapter, a new view is presented of the literacies entailed in use of technology, as a synergetic complex. Dcom as presented here constitutes a *net of literacies* that do not focus on technology but on the forming and changing caused by the very presence of technology; on the knowledge, performance skills, thinking skills, viewpoints, and morals involved in conduct in a digital environment, which is the environment in which we now live and work. In this updated net, technology tints the familiar, traditional literacies in digital hues, that can be found in technological, digital reading and writing, information, visual, new media, communication and collaboration and social media, forming the updated character of literacies and the wise, efficient functioning with them. Alongside the conventional literacies, new abilities are integrated, which are derived from technological attributes that were non-existent before the digital age.

The net of literacies proposed here is based on the existing concepts of types of competences and literacies; it attempts, as far as possible, to provide content, interpretation, and updating to these concepts, and in this way to rely on the proven pedagogical principles that have been sufficient for every time and context, and to add to them a level of characteristics of new abilities that are relevant for current use of technology.

The structure of the proposed net consists of three layers:

1. **Digital Ethics Literacy:** Stands at the top of the net of literacies in which ethics constitutes a vital component of perceptions, viewpoints, and morals that are essential for proper application of technology by humans in every dimension of digital literacy.
2. **Technological Literacy and Digital Reading and Writing Literacy:** Constitute a basic foundation and functional interface for all the digital literacies and which are anchored as an inseparable part of them.
3. **Dimensions of Digital Literacies:** In accordance with main fields that information and communication technology touches. These dimensions range from the connection with the personal use of technology to the interpersonal, social collaborative connection: literacy of information, digital visual literacy, literacy of new media, literacy of communication and collaboration, and literacy of social media.

The importance of consolidating a framework of Dcom lies in the proposal of clear anchors that enable formulation of a common, agreed-upon language to serve the public and educational discourse, including all the relevant authorities, to serve as a foundation of knowledge for creation of a unified policy on the subject and to constitute a sturdy, accepted basis for instilment and evaluation of a complex of updated knowledge, competences and skills regarding the literacies required by citizens and students in the 2010s.

KEY TERMS AND DEFINITIONS

Communication and Collaboration Literacy: The ability to communicate in a variety means of digital communication and to interact effectively, crossing interpersonal and collective, private and public borders and frameworks, synchronous and asynchronous, fitting the discourse to the characteristics of the means of communication. The ability to share information and messages by collaborative digital tools for personal and social purposes and to participate in communities and online networks through ethical awareness and global citizenship.

Digital Competence: A civil right and need, vital for appropriate, intelligent study and functioning for the personal, social and professional aspects of all citizens in a society in the real world, through means that modern technology offers the citizen.

Digital Ethics Literacy: The ability of a person to operate in a proper, ethical manner though digital means and on the internet, through morally dealing with ethical aspects and issues entailed in the use of technology, and the ability to protect him or herself and other internet users from traps and improper use.

Digital Reading and Writing Literacy: The ability required to read, decipher, write and produce interactive, linked, multimedia, digital text effectively, characterized by a variety of representations and designs including decentralization and collaboration.

Digital Visual Literacy: The ability to critically read, understand and analyze and to produce meaning from information and messages presented in visual, digital texts, to communicate and transmit visual messages effectively, to create and produce presentations expressing visual messages, by consideration and selection of how to present them.

Information Literacy: The ability to recognize when information is needed and to effectively locate, evaluate and use the needed information.

New Media Literacy: The ability to critically and suitably consume messages in a variety of digital media channels, to be involved in interactive social media, to produce and publicize communicative, public messages bearing collective meaning in social and cultural contexts.

Social Media Literacy: A complex of qualifications that enable interconnectedness and interaction among people via communication and sharing of information. These competences allow one to communicate in a suitable manner, to be involved, to cooperate and participate actively, to give and take, in the social environment of communication and sharing of content. A person who is literate in social media forms his/her personality, worldview and manner of social conduct, among other ways through tools for collaborating and managing information found on the web.

Technological Literacy: The attitude and ability to properly and effectively use digital technology in daily use as needed. Technological literacy includes: accessibility to technological means; selection of means in accordance with needs; technological operation by acquaintance with the basic principles of actions and functions; ability to constantly learn and adapt to new means by adjusting to changing needs; intelligent, proper use including development of awareness of the consequences of use of technology on the environment and on health and acquaintance with methods and tools to minimize their potential harm.

ABSTRACT

Robustness and security are difficult to be solved by conventional two-dimensional (2D) digital watermarking technology. In recent years, three-dimensional (3D) digital watermarking has become a new hotspot in optical information security. This paper presents a new improved security 3D digital watermarking method based on computational integrated imaging cryptosystem. Firstly, 3D digital watermarking is generated and encrypted by computational integral imaging cryptosystem that is implemented with smart pseudoscopic-to-orthoscopic conversion (SPOC) model. Secondly, discrete wavelet transform algorithm is applied to embed and extract the 3D digital watermarking. Finally, the extracted watermark is decrypted,

DOI: 10.4018/978-1-5225-3822-6.ch028

and3D digital watermarking is displayed by integral imaging system. The feasibility and effectiveness of the proposed method is demonstrated by experiment. A primary implication of encrypted processing is that the majority of integral imaging cryptosystem will be encryption-in-the-loop applications, and the majority of system will improve the security and robustness of 3D digital watermarking. The new method is able to meet the requirements of robustness and security. Image quality and display quality achieve these criterions of the human visual model. The proposed method can be applied in the aspects of cloud computing and big data.

1. INTRODUCTION

With the rapid development of modern communication technologies, threats on network information security are increasing, people are not only concerned about the multimedia information should not be illegally copied, distributed and tampered, but also pay more attention to security and confidentiality of information transmission. Digital watermarking provides secure means for copyright protection, content authentication, encrypted communication, and digital forensics of multimedia products. Watermark images is embedded into cover images in spatial domains (Cox, & Kalker, 2008; Abbas Cheddad, & McKevitt, 2010; Tang Qing sheng, & She Kun, 2005; Shen Chang-Xiang, 2007). Currently there are various methods for embedding and extraction of digital watermarks. The methods fall into two types: spatial domain methods and transform domain methods. In spatial domain methods, it is easy to realize embedding and extraction of digital watermarks but with weak robustness. In transform domain methods, watermarks are processed in transformed frequency domains, with better robustness and invisibility. To the best of our knowledge, transform domain technology of digital watermarking has become a new hotspot in digital watermarking research. Common transform domain methods are Discrete Cosine Transform (DCT) algorithm, Fast Fourier Transform (FFT) algorithm, discrete wavelet transform (DWT) algorithm, and so on. It becomes a new research hotspot on information hiding with optical techniques. Digital holography (Takai, & Mifune, 2002; Matoba, & Javidi, 2009) and random-phase encoding (Kishk, & Javidi, 2002; Peng, & Yu, 2006) are two major optical information hiding techniques. Digital holography is a technique (Takai, & Mifune, 2002; Matoba, & Javidi, 2009) to record with interferometer method the space phase of an object in intensity modulation form. Random-phase encoding, however, realizes information encryption via optical transformation processing (Kishk, & Javidi, 2002; Peng, & Yu, 2006) of random-phase marks and lens. Xiang Peng et al. introduced a 3Ddigital watermarking algorithm based on virtual optics (Peng, & Yu, 2006; X. Peng, & D. Zhang, 2005). The algorithm realizes embedding and blind extraction of 3D digital watermarks utilising the morphological variation of virtual Fresnel diffraction in 3D space. To enhance robustness and security of digital watermarks, multi-image digital watermarking was proposed in (Giakoumaki, & Koutsouris, 2006). The 3D digital watermarking algorithm is based on wavelet decomposition. Various watermark information is embedded into various wavelet subbands, watermark data may be digital signature and personal information of the copyright owner. This method, which can be also applied in image communication and copyright protection of images, significantly improves robustness of digital watermarks. The invisibility of watermarks, however, decreases as the watermark information accumulates. Processing time of watermark embedding and extraction will be extended.

Optical image encryption techniques have attracted significant interest as they offer the possibility of high-speed parallel processing of 2D image data, of hiding information in many different dimensions, i.e. of multiple degrees of freedom (Matoba, & Javidi, 2009; Refregier & Javidi, 1995). Refregier and Javidi (1995) proposed double random phase encoding technology based on $4f$ systems, which opened a new field of optical information security research, and since then, different transform domain algorithms have been proposed to improve the security level of the optical information hiding with double random phase encoding. Researchers are trying to make progress on these issues.

Integral imaging is a major technique in the next generation autostereoscopic display (Lippmann, 1908; Hong, & Lee, 2011; Xiao, & Javidi, 2013). In 2007, researchers from Korea including Dong-Choon et al. (2007) found that integral imaging could be applied in the research of digital watermarking. Information hiding could be realized if attacks were under control. The quality of reconstructed images would be significantly degraded by the interference between adjacent pixels because the reconstruction method to calculate integral imaging was actually cascading pixel reconstruction. Researchers including Yong-Ri Piao (2009) introduced a moderate image encryption method, in which pixels of cover images were scrambled using integral imaging and pixel scrambling techniques. Elemental images (EIs) were recorded, captured, and generated by a lenslet array. Researchers such as Chaochao Ji et al. (2012) proposed a content controlled stereoscopic display technique, in which various pixels were extracted from EIs and then reconstructed and displayed with integral imaging system. Observers could see different 3D scenarios from different view angles and directions. Privacy protection was realized. EIs generated by a computer were embedded into cover images in cellular automata transform domain utilizing the characteristics of the human vision system (Xiao Wei Li & Seok Tae Kim, 2014). The work, however, failed to analyze the impact of geometric distortion attack on watermarks. The literature (Muniraj & Lee, 2014) presents a new method for 3D scene acquisition via reconstruction with multispectral information and its Fourier-based encryption using computational integral imaging, by which the field of view, resolution, and information security are increased, respectively. Double random phase encryption (DRPE) in the Fourier domain is employed on Bayer formatted elemental image to encrypt the captured 3D scene. But the quality of watermark images was degraded with these algorithms which were presented in (Xiao Wei Li & Seok Tae Kim, 2014; Muniraj & Lee, 2014).

This paper proposes a new 3D digital watermarking method based on discrete wavelet transform and integrated imaging technology. 3D digital watermarking is generated and encrypted by computational integral imaging cryptosystem that is implemented with SPOC model. Secondly, DWT algorithm is applied to embed and extract the 3D digital watermarking. Finally, 3D digital watermarking is identified and showed by integral imaging system. The feasibility and effectiveness of the proposed method is demonstrated by experiment. The new method is able to meet the requirements of robustness and security. The quality of image can meet these criteria of the human visual model. The new method has some advantages of optical imaging systems such as multi-dimension, high design freedom, and high robustness. A primary implication of encrypted processing is that the majority of integral imaging cryptosystem will be encryption-in-the-loop applications, and the majority of system will improve the security and robustness of 3D digital watermarking. New idea and solution are introduced to copyright protection of 3D multimedia digital products. The work also promotes a promising approach to information hiding based on optical techniques.

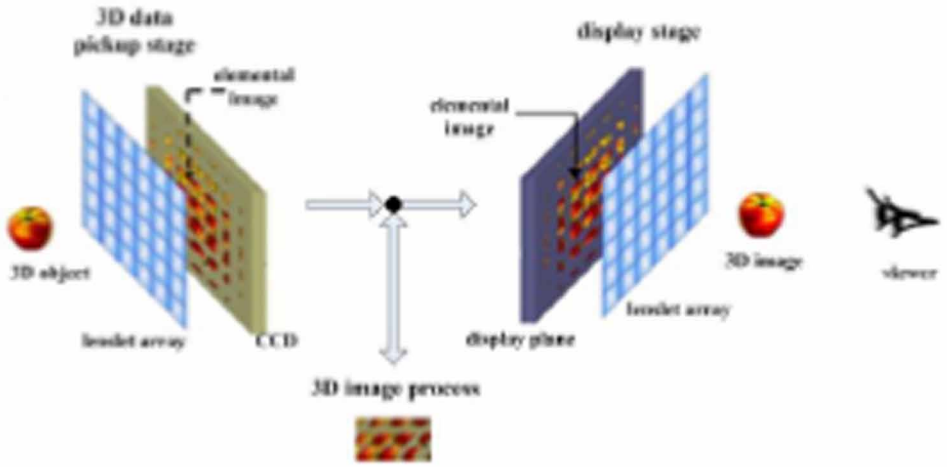
2. THE PRINCIPLE OF INTEGRAL IMAGING

Integral Imaging has been one of the promising autostereoscopic display technique which is capable of displaying 3D scenes in full natural colour utilising a lenslet array. It was proposed by Lippmann in 1908 (Lippmann L, 1908). Human vision is only by glancing around the scene and building up a large number of two-point comparisons that our brain constructs a map of the relative distances of many locations. These random-dot stereograms are formed by these relative distances. Stereopsis is fused by stereo pair images that are reconstructed with the random-dot stereogram from the left and right eye views. At Bell Labs, in 1959, Bela Julesz showed that the visual system is able to match patterns of dots that to a single eye appear chaotic and without structure, to form stereo images. Slight lateral displacements of the dots are interpreted as parallax and produce depth information (Russ John. C, 2011). Figure 1 shows the integral imaging consists of two processes, 3D data pickup, optical 3D reconstruction.

In the process of pickuping, rays from 3D scenes contain direction and intensity information, and form images through the recording lenslet array. Then spatial-sampling is completed by the 2D image detector behind the lenslet array. Finally, digital EIs are generated on the detector array. The elemental image corresponding to each lenslet is, essentially speaking, a microfiche projection image and intensity information distribution diagram of a 3D scene in a specific direction.

In the process of reconstruction, EIsare displayed on a large-size monitor (such as LCD and screen) and lighted by an illuminant. Illumination rays contain information of EIs. Reverse convergence of the rays happens through a reconstruction lenslet array the same as the recording process. Flat images along the output plane and relevant to depth are reconstructed by a computer according to a mathematical model relevant to the parameters of reconstructed images such as detail, gray scale, colour, and projection. Then stereo images of a scene are reconstructed at the same position as the original 3D scene (Arimoto, & Javidi, 2001; Hong, & Javidi, 2004; Stern, & Javidi, 2006; Xiaorui Wang, & Qingfeng Bu, 2009; Xiaorui Wang & Qiang Guo, 2010; Park, & Lee, 2009). Light field conversion can conducts pseudoscopic-to-orthoscopic conversion, generates a new set of EIs that suits the display characteristic and permits control of the depth of the reconstructed image. The SPOC algorithm can meet these requirements. A general SPOC is also reported (H. Navarro, & G. Saavedra, 2010), of which the depth order and the

Figure 1. The scheme of integral imaging system



display parameters can be controlled simultaneously. It is an updated version of SPIM in their previous paper (Martínez-Corral, & Javidi, 2005). Huan Deng et al. (2005) proposed a two-step pickup method by using an extended primary lens array. The research group of the authors studied integral imaging reconstruction calculation based on SPOC and made progress (Martínez-Corral, & Javidi, 2005; Huan Deng, & Fang-Ning Wang, 2011).

3. NEW 3D DIGITALWATERMARKING METHOD BASED ON INTEGRAL IMAGING

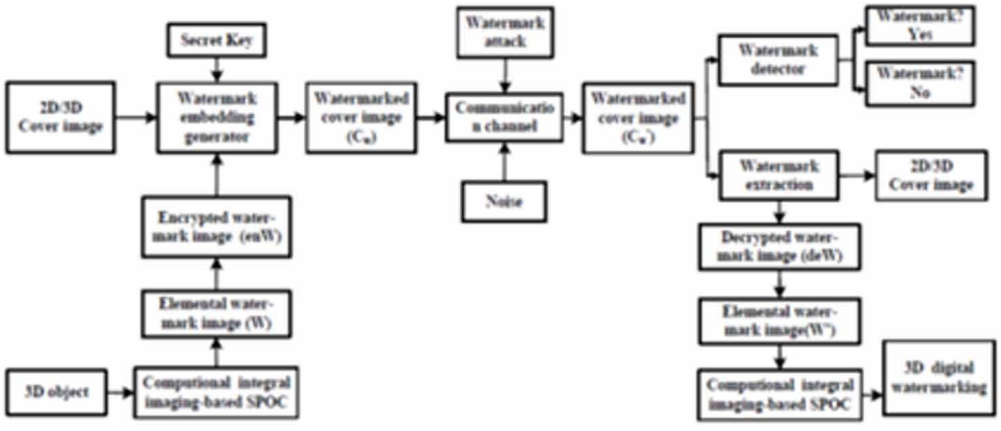
As shown in Figure 2, the 3D digital watermarking system based on integral imaging consists of the generation, encryption, embedding, extraction, decryption and display, etc. of 3D digital watermark.

3.1. Generation and display of 3D Digital Watermark

EIs are both used by cover image and watermark image which are generated by integral imaging system. The generation process of EIs is as follows: firstly, a 3D design software, such as 3DS MAX, is used to design a target model in a 3D scene; secondly, 3D graphics library Direct3D is used to generate EIs of the 3D model utilising the virtual camera model and the integral imaging system (Xiaorui Wang, & Qingfeng Bu, 2009; Xiaorui Wang, & Qiang Guo, 2010) based on the SPOC model. These images are then selected as cover images and watermark images. It is noteworthy that the most effective information hiding can be realized only when the size constraint relation between the cover images and watermark images as well as the watermark embedding and extraction algorithm are both considered.

To display 3D digital watermark images in the best quality, various display modes and methods are to be selected according to various applications. There are three display modes of integral imaging 3D display, real mode, virtual mode, and focused mode. Display methods consist of all-optical integral imaging display, combined display with LCD and lenslet array, combined display with multiple projectors and lenslet array, and so on. Combined display with multiple projectors and lenslet array can increase the number of orbs of light corresponding to each lens and improve the display quality of 3D images without reducing the pitch of the lens or increasing the number of projectors. Thus, this paper selects combined display with multiple projectors and lenslet array as the observation technique for experimental results.

Figure 2. The diagram of 3D digital watermarking system



3.2. Encryption and Decryption of 3D Digital Watermark

According to diffraction theory and Fourier optics theory, the general expression of discrete Fresnel diffraction transform is as the formula (1), which can describe discrete Fresnel diffraction process in digital space, abbreviated as DFD (Goodman, J.W., 2005; David Voelz, 2010).

Therein, A and B represent the two planes which separate spatially in the direction of propagation, the spacing between the planes is denoted as z_{AB} . m and n represent the sampling number of two adjacent orthogonal pixels. λ represents the wavelength of incident light. ξ, η represent two variables of the Fresnel transform domain. $DFD[-]$ represents the discrete Fresnel diffraction transform. C is a complex constant whose value may be calculated by the formula (2).

$$
\begin{aligned}
&DFD[A, B, m, n; z_{AB}, \lambda] \\
&= C \bullet \exp[j \frac{\pi}{\lambda z_{AB}} (m^2 \Delta\xi^2 + n^2 \Delta\eta^2)] \\
&\times \sum_{k=0}^{N-1} \sum_{l=0}^{N-1} U_A(k,l) \exp[j \frac{\pi}{\lambda z_{AB}} (k^2 \Delta {x_0}^2 + l^2 \Delta {y_0}^2)] \\
&\times \exp[-j2\pi (\frac{km}{N} + \frac{\ln}{N})]
\end{aligned}
$$

where $C = \dfrac{\exp[j2\pi z_{AB} / \lambda]}{j\lambda z_{AB}}$

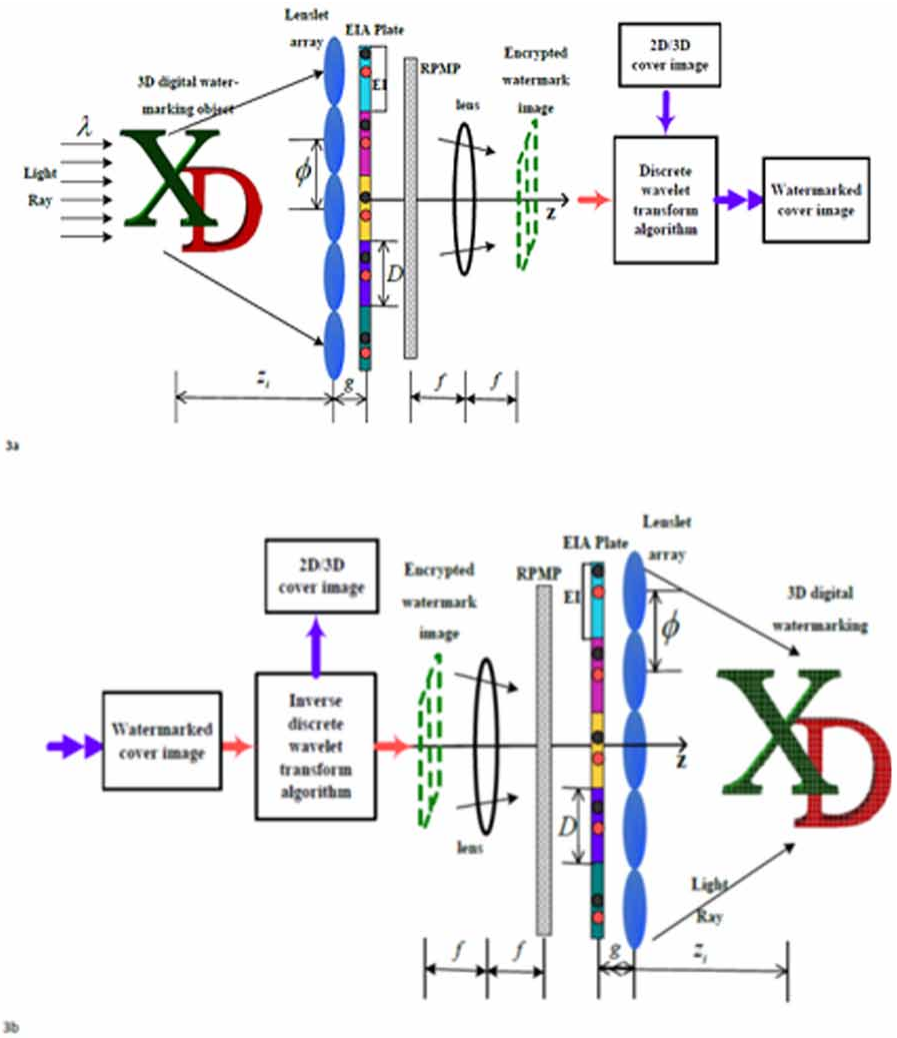
As shown in Figure 3(a), the encryption process of integral imaging cryptosystem. The subsystem is consisted of the acquisition record, beam splitter, random phase mask plate (RPMP), the imaging lens, encrypted watermark image, and so on. $Z_i, i = 1, 2, \cdots j \in Z^+$ represents the distance between the different planes, g represents the distance between the pinhole array and elemental image plane, D represents the size of EIs, φ represents pinhole spacing, the focal length of the imaging lens ρ is f , the function of RPMP is $R(x, y)$, the spectral transmittance function is $T(s, t; f)$. Thus, the transformation process of encryption in the frequency domain can be described by the following mathematical models, for example, the formula (3) is the mathematical model of integral imaging cryptosystem, while the optical field distribution for the rear surface of the imaging lens can be determined by $W_e(\omega, \gamma)$, and the relevant encrypted watermark image will be.

$$
\begin{aligned}
&W_e(\omega, \gamma) = DFD\{DFD\{[W(x, y) \bullet R(x, y), \\
&L(x, y), s, t; f, \lambda]\} \times T(s, t; f)\}
\end{aligned}
$$

where $\alpha_1 + \alpha_2 = 1, \alpha_1, \alpha_2$ is encryption weighting coefficient. $\bullet$ and $\times$ denote the operation.

As shown in Figure 3(b) is the decryption process of integral imaging cryptosystem. The process consists of 3D optical image decryption and display. The authorized users receive the correct watermarked cover image, and the encrypted watermarking $W_e(\omega, \gamma)$ is extracted from it at first. The watermark image $W^{'}$ would be calculated by the mathematical model of decryption process with the formula (4). Therefore,

Figure 3. The schematic of integral imaging cryptosystem (a) The encryption process (b) The decryption process



in the accordance to the optical Fourier transform theory (Goodman, J.W., 2005; David Voelz, 2010), the watermark cipher text images is decrypted into the plaintext image, the watermark plaintext image can be reconstructed on the elemental image planes. Finally, we can adopt the integral imaging reconstruction display system to restore the 3D optical watermark images transferred by communication link.

$$W^{'} = IDFD\{IDFD[W_e(\omega,\gamma), L^{'}(x,y),$$
$$s,t;z_R,\lambda]\times T^{*}(s,t;f)\}\bullet R^{*}(x,y)$$

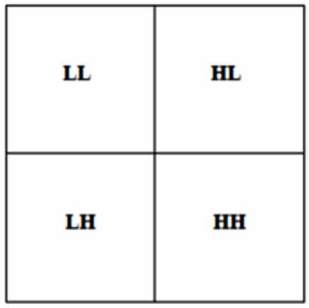
where $IDFD[-]$ represents the inverse discrete Fresnel diffraction transform. $*$ denotes the complex conjugate operation.

3.3. Embedding and Extraction of 3D Digital Watermark

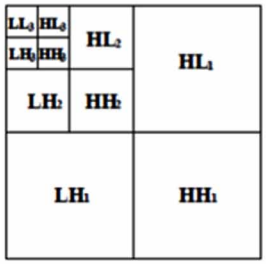
Wavelet transform is an analysis method of signal time-scale or time-frequency. The important feature is the capability of multiresolution analysis. The wavelet analysis method is a good local property in both time and frequency domain. That is to say, the window size is fixed but the shapes can be changed. The time window and frequency window can also be changed. What's more, Wavelet transform has higher adaptability. Compared with the Fourier transform, it has the advantage of good localization property. The signal can be denoted in the local time domain and local frequency domain. The wavelet transform is applied for abnormal phenomenon in the midst of transient normal signal detection and denotes its composition. The method has been widely used in the fields of signal analysis and image processing.

Under the different scales, wavelet transform decomposed the two-dimensional signals or images into three high frequency detail subband details step by step. Generally speaking, they are divided into horizontal subband HL_i, vertical subband LH_i and diagonal subband HH_i and a low frequency approximation subband LL_i, where level $i = 1, 2, 3$. Then, the low frequency approximation subband is decomposed iteratively into HL_{i+1}, LH_{i+1}, HH_{i+1} and LL_{i+1}. As shown Figure 4(a) one-level decomposition and 4(b) three-level decomposition. Low-frequency subband LL_i is the wavelet decomposition under the largest scale, the minimum resolution of the optimal approximation of the original image. There are high frequency resolution and low time resolution in the subband. The statistical characteristic of the subband is similar to the original image. The most of the energy is focus on this subband. High frequency subband is the details information of images under different scales and different resolutions.

Figure 4. Subband labeling schemes for discrete wavelet transform (a) One-level decomposition (b) Three-level decomposition



4a



4b

There are higher temporal resolution and lower frequency resolution than other subbands. The lower resolution is, the higher will be in the proportion of the useful information. That is to say, an image is decomposed into several layers by wavelet transform. For the same image, the low frequency subband LL_i of the image is the most important. The LH_i and HL_i take the second place. Decomposition for different layer, the bigger is layer number. The low frequency subband is the more important than others. After the image is transformed by discrete wavelet transform, the values of each frequency subband will be calculated with wavelet coefficients. According to the importance of each wavelet sub image, the values of the digital watermarking are embedded into low frequency approximation coefficients of the binary images.

Digital watermark embedding and extraction algorithm based on DWT is designed and realized in this paper. The main idea of the algorithm is to realize the hiding of watermark information by first respectively performing DWT decomposition of Red, Green and Blue (RGB) channels of cover images, then selecting the low frequency subband of each channel to be respectively embedded into the RGB channels of watermark images, and finally performing watermark information into transformation coefficients by DWT and inverse discrete wavelet transform (IDWT) embedding algorithm.

In the process, firstly, RGB channel decomposition is explicitly executed. Secondly, the data should be fused with the RGB channel of watermarked image after the digital watermarking is embedded/extracted. So the image could be obtained in high quality.

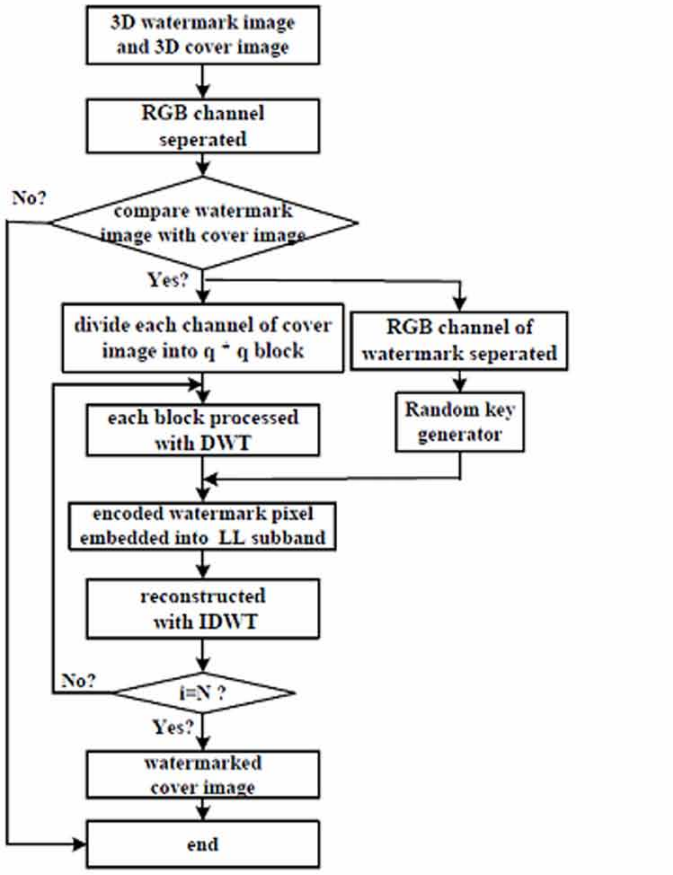
Main steps of 3D digital watermark embedding algorithm are shown in Figure 5 (a).

I. Separate RGB three channels of cover images.
II. Separate RGB three channels of watermark images.
III. Judge the size constraint relation between cover images and watermark images. Continue the following procedures if a cover image is larger than its relevant watermark image in size and thus meets the embedding condition. Otherwise, the program ends and returns the prompt of failure to meet the embedding condition.
IV. Partition each channel of cover images.
V. Perform DWT decomposition of each partition.
VI. Respectively embed in iterative method watermark images and their corresponding to pixels in the channel into DWT decomposed Low Low (LL) subbands to realize the embedding of watermark information into transformation coefficients under the control of random keys.
VII. Perform IDWT reconstruction of image partitions with watermarks embedded.
VIII. Repeat steps (V) to (VII) until watermark images are fully embedded and generate watermarked cover images.

Thus, the embedding algorithm can be described as follows:

Presume that a cover image with three channels separated is $C_{RGB}(x,x,3) = (C_R : C_G : C_B)$ and a watermark image with three channels separated is $W_{RGB}(y,y,3) = (W_R : W_G : W_B)$. If $C_{RGB} > W_{RGB}$, perform $q * q$ partitioning. The partitioning of images is:

Figure 5. The flowcharts of embedding and extracting algorithm of 3D digital watermarking system based on integral imaging



$$J_{i,R} = (q,q), i \in (0,[x/q])$$
$$J_{i,G} = (q,q), i \in (0,[x/q])$$
$$J_{i,B} = (q,q), i \in (0,[x/q])$$

Finally, finish the embedding of digital watermark data.

$$J'_{i,R}(x,y) = IDWT[DWT(J_{i,R}(x,y))_{LL} + \alpha J_{i,R}(rkey \times x \bmod q, rkey \times y \bmod q)],$$
$$J'_{i,G}(x,y) = IDWT[DWT(J_{i,G}(x,y))_{LL} + \alpha J_{i,G}(rkey \times x \bmod q, rkey \times y \bmod q)],$$
$$J'_{i,B}(x,y) = IDWT[DWT(J_{i,B}(x,y))_{LL} + \alpha J_{i,B}(rkey \times x \bmod q, rkey \times y \bmod q)]$$

In the formula, α represents the intensity factor of the embedded watermark. $rkey$ represents random key.

As shown in Figure 5 (b), main steps of 3D digital watermark extraction algorithm are briefly as follows:

I. Separate RGB channels of watermarked cover images which hidden watermark information.
II. Perform $q * q$ partitioning of each channel.
III. Perform DWT decomposition of each partition.
IV. Extract q number of watermark embedding values in every $2 * 2$ zone of low frequency subbands.
V. Calculate the average value of q number of watermark embedding values.
VI. Repeat steps (III) to (V) until all watermark information is extracted.
VII. Reconstruct watermark images according to the average value calculated in step (V).

4. EXPERIMENTAL RESULTS AND DISCUSSIONS

According to theoretical analysis, the experimental process is composed of four procedures.

4.1. Generation of 3D Digital Watermarks

The performance of the proposed algorithm is tested over a various number of images. As shown in Figure 6, respectively generate XD model and ball-stick model utilising the collecting part of integral imaging. Select ball-stick EIs as the cover images, with sizes from 256*256 pixels, 512*512 pixels, 1024*1024 pixels, to 2048*2048 pixels. Select XD EIs as watermark images, with sizes from 64*64 pixels, 128*128 pixels, 256*256 pixels. Portable Network Graphic (PNG) is the format of cover imagesand watermark images.

Figure 6. EIs of ballstick and XD models (a) cover image (b) watermark image

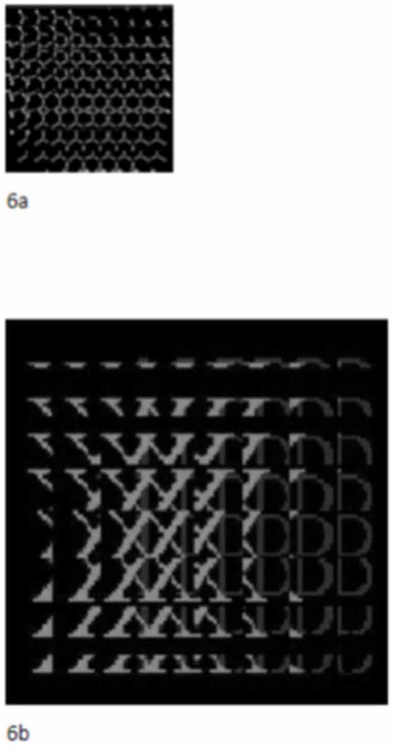


Figure 7. The light field image in front surface of lens and cipher text image (a) the light field image in front surface of lens (b) cipher text image

4.2. Encryption and Decryption of 3D Digital Watermark

In accordance with the principle of section 3.2, the plaintext XD elemental image array(EIA) is transformed into the ciphertext images with the mathematical model of the 3D optical image encryption. Figure 7(a) represents the optical field distribution of the front surface of the lens, Figure 7(b) represents the generated cryptograph image. It should be noted that, after the complex amplitude distribution calculation, the modular square calculating should be done on the complex amplitude distribution to get the light-field intensity distribution images.

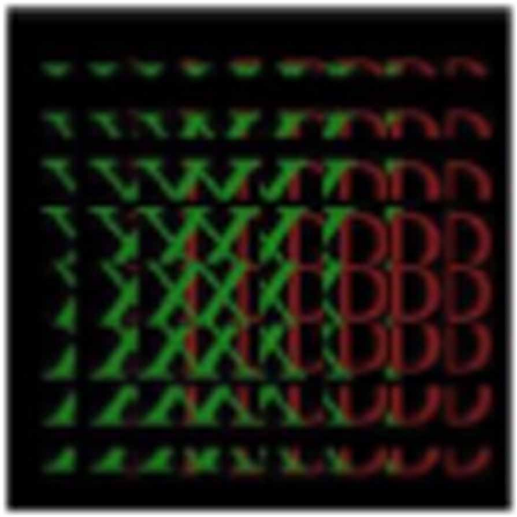
Assuming that the contribution of the random phase mask in the encryption process has been defined, the decrypted and restored plaintext images are as shown in Figure 8.

4.3. Embedding and Extraction of 3D Digital Watermarks

Perform DWT decomposition of the cover images and watermark images utilizing the embedding algorithm. Partition images $4*4$. Repeatedly embed a pixel of watermark images in every $2*2$ zone of LL subbands of cover image to finish the embedding process and get cover images with watermarks.

In engineering applications, it is an important problem that how to select the optimal wavelet function. Different wavelet function can be applied in wavelet analysis process. For one engineering problem, the results would be varied widely when different wavelet function is used in the program. However,

Figure 8. The decrypted image and displaying image of 3D optical image



because the orthogonality of the wavelet basis function, it is eliminated the wavelet space caused by redundancy link between two points. It becomes smaller in calculation error. The nature of the signal itself is characterized by the results of time-frequency domain function of DWT transform. Now, for the engineering problems, optimal wavelet function is determined by practical error between the process result of wavelet analysis and theoretical results. Therefore, the Haar wavelet basis function is used in our work. Because the Haar function is a compactly supported, orthogonal wavelet basis function. Haar function is also a simple function. The quality of reconstructed image is improved by its orthogonality and symmetry, decomposition and reconstruction.

To extract watermarks, calculate the mean of the four embedded values in the a bove mentioned $2*2$ zones to get the mean of a corresponding pixel of a watermark. Then reconstruct images and recover watermark images with correct keys.

To objectively evaluate the quality of watermarked images, Peak signal noise rate (PSNR) is used to measure the watermark invisibility. That is, the greater the PSNR is, the higher the quality of the watermarked image is.

$$PSNR = 10\log_{10}(\frac{C^2}{MSE}\max)$$

In the formula, $C^2_{\max}$ represents the maximum grey scale of an image.

$$C^2_{\max} \leq \begin{cases} 1 & ,double\ precision \\ 255, & 8bit \end{cases}$$

$$MSE = \frac{1}{MN}\sum_{x=1}^{M}\sum_{y=1}^{N}(S_{xy} - C_{xy})^2$$

In th formula, M, N represents the size of the image pixel array. S_{xy} and C_{xy} represents the pixel size of a watermarked image and cover image.

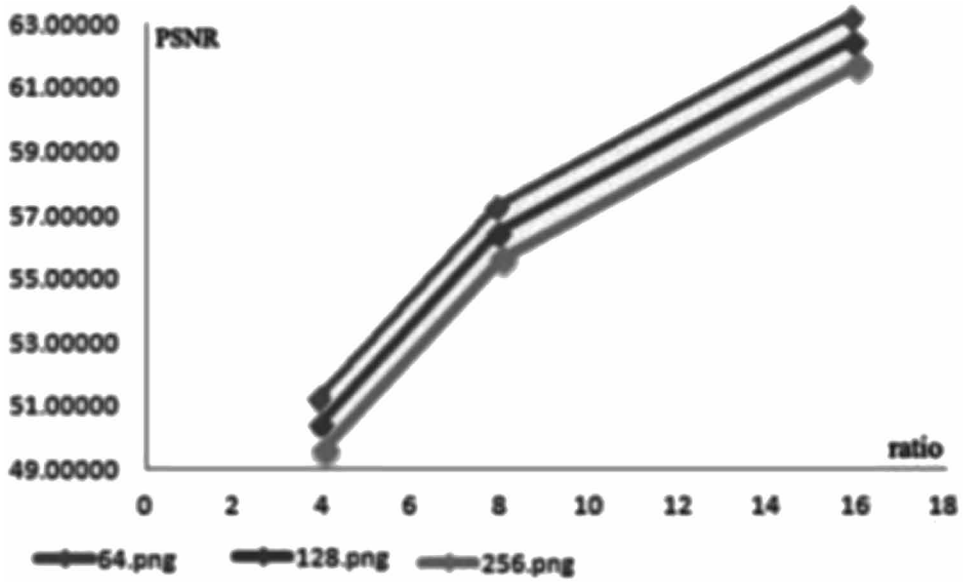
After measurement of experimental samples, the PSNR curve of various 3D digital watermarks is shown in Figure 9. The horizontal axis is the size proportional relationship between watermarked images and cover images. The vertical axis is the PSNR value. The larger the PSNR value is, the less image distortion is. If PSNR is larger than 30dB, it can be considered that the PSNR is a reasonable value (Dong-Choon Hwang, & Eun-Soo Kim, 2007). Human eyes cannot recognise the distortion at this level. The value is, thus, generally considered as an acceptable distortion standard.

According to the Fidelity formula (5):

$$Fidelity = 1 - \frac{\sum_{i=0}^{N-1}\sum_{j=0}^{M-1}(f(i,j) - f_s(i,j))^2}{\sum_{i=0}^{N-1}\sum_{j=0}^{M-1} f^2(i,j)}$$

In the formula, $f(i,j)$ represents the pixel data of the original image. $f_s(i,j)$ represents the pixel data of the reconstructed image. According to the measurement of experimental samples, fidelity values are all no less than 0.9966, i.e. the approximate value of fidelity is 1. This means that the extracted and reconstructed images are of high fidelity with original images. As the experimental values reveal, the applied algorithm is feasible and correct.

Figure 9. The PSNR curve of different 3D digital watermarking



4.4. Display of 3D Digital Watermarks

Corresponding 3D digital watermark images of EIs can be recovered in the reconstruction algorithm of the integral imaging system. 3D images are reconstructed along the output plane to generate images of different depths on various depth planes. Then the most optimal position and the best pixel are selected as the position of the image point to determine 3D images with the best image point (Stern & Javidi, 2006; Xiaorui Wang, & Qingfeng Bu, 2009; Xiaorui Wang & Qiang Guo, 2010). As shown in Figure 10, 3D digital watermarks are observed with the combined display which is accomplished by multiple projectors and lenslet array in real mode display using reconstruction display technique based on SPOC algorithm. From the perspective of integral imaging image quality evaluation and actual experimental conditions, the resolution, depth, and field of view of the reconstructed 3D digital watermark images all meet the requirements of the HVS model and comply with the subjective quality evaluation criteria for integral imaging images. Low display quality and resolution of 3D images can be affected by the characteristic parameter and resolution of projectors, technological level of the lenslet array, and so on. A portion of the 3D image reconstruction plane exceeds the image depth range. Thus, images are fuzzy and of low resolution. Security and robustness are critical in the application of digital image information hiding. For digital watermarking, techniques, such as anti-intentional and anti-tampering, detection of intentional tampering, and resistance of malicious attacks represented by geometric attack, are to be urgently resolved. EIs from integral imaging are of good The picked-up EIs have a hologram-like characteristics of data redundancy, and the orders of the pixel scrambling as well as the pickup conditions of the EIs can be used as the keys to decrypt the original image, so that its robustness against various types of attack expects to be dramatically improved. 3D images after the cropping or shading of 3D digital watermarks are respectively shown in Figure 11. As the results reveal, integral imaging can effectively recover embedded 3D digital watermarks. The 3D digital watermarking system can improve the capability of 3D digital watermarks to resist cropping and localized tamper attacks because 3D digital watermark-

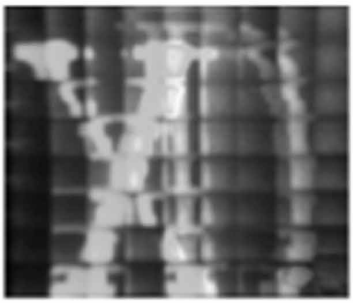
11a



11b

ing, similar to holographic imaging, has spreading effect, i.e. the extracted EIA watermark information is a group of overlapping EIs. The overlapped images contain various brightness and direction information of 3D digital watermarks. Embedded watermark images can be reconstructed and recovered to the largest extent to authenticate copyright information using reconstruction algorithm and a portion of the 3D watermark information. Traditional 2D digital watermarking systems use 2D images as watermarks. These systems are, however, vulnerable to various attacks such as noise, cropping, and distortion. Experiments have been conducted to analyse the robustness of the 3D digital watermarking system based on integral imaging to resist noise attacks. Three types of noise attacks are considered: uniform noise, Gaussian noise, and cropping noise. 2D "X" and "D" were embedded into ball-stick cover images in a traditional watermark algorithm. Watermarks were extracted in the experimental conditions mentioned above. New and traditional watermarking methods were compared in terms of performance. As shown in Figure 12, three solid lines represent the PSNR of 2D watermarks. According to the experimental results, the PSNR values of the new method on average increase by 5.27 dB compared to traditional 2D watermarking. In addition, the attacked 3D digital watermarks can be extracted and authenticated using the reconstruction algorithm. As shown in Figure 13, the 3D images meet the HVS feature requirements. The attacked images are, however, of some degree of distortion and obvious quality decrease. Thus,

Figure 12. The contrastive PSNR curve after different noise attacks

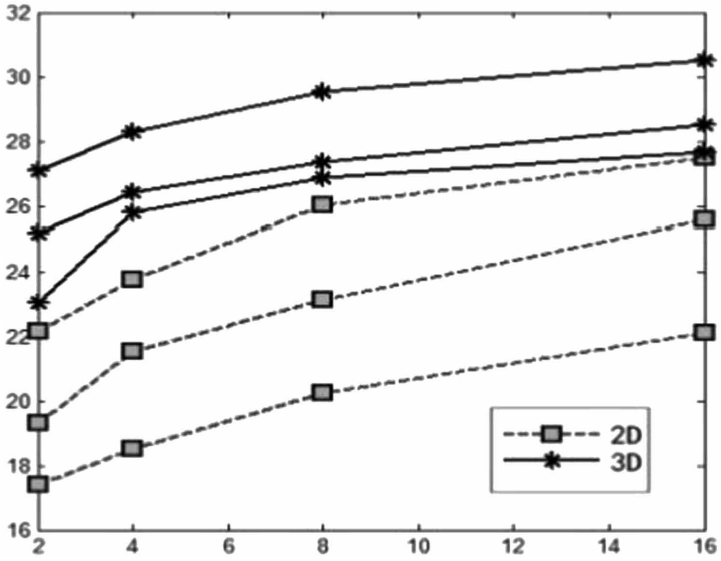


Figure 13. 3D digital watermarking display after noise attacks (a) uniform noise attack (b) Gaussian noise attack

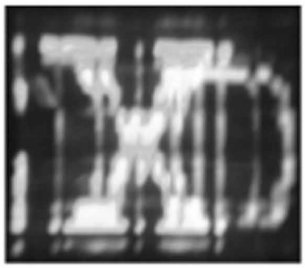
13a



13b

proposed new 3D digital watermarking has some advantages of high feasibility, robustness, tamper-resistance, and attack-resistance.

The new method can enhance security. 2D EIs look meaningless. They can become a group of meaningful and depth-related watermark images and be applied in copyright authentication (Dong-Choon Hwang, & Eun-Soo Kim, 2007) via integral imaging reconstruction and display on the output plane. The imaging system is closely associated with the settings of optical device parameters in the process of reconstruction in integral imaging system and the recording of EIs. Once an illegal user tampers EIs, the reconstruction quality of 3D digital watermark images will be significantly reduced. Moreover, original 3D watermark information may not be recovered and displayed. In the new method, the optical device parameters and functionality parameters of integral imaging system can be used as keys. In the embedding algorithm, the modulation parameters for watermark embedding level can also be used as keys. Multiple keys synthesizing the above mentioned keys will enhance security. It could be more difficult to crack.

By redistributing signal energy and diffusing hidden signal energy embedded into transformation coefficients in spatial and temporal domains, the DWT embedding and extraction algorithm applied in the new method effectively resolves the contradiction between imperceptibility and robustness of information hiding. Thus, the new method can meet robustness and security requirements.

Through the experimental analysis, we found that there are two disadvantages that are long time consuming and weak real-time performance for the DWT embedding and extracting algorithms. In the experiment, the execution time is 8.22 min from the embedding process to extracting process.

5. CONCLUSION

This paper introduces a new 3D digital watermarking method based on discrete wavelet transform and integrated imaging. Information hiding of 3D digital watermarks is realized based on the DWT embedding and extraction algorithm. The feasibility and effectiveness of the proposed method is demonstrated by experiment. A primary implication of encrypted processing is that the majority of integral imaging cryptosystem will be encryption-in-the-loop applications, and the majority of system will improve the security and robustness of 3D digital watermarking. The new method is not only able to meet the requirements of robustness and security, but image quality and display quality achieve these criterions of the human visual model. The proposed method opens up a new research perspective for the copyright protect of 3D digital multimedia products. Although Integral imaging is a major technique in the next generation autostereoscopic display, most of the basic ideas and 3D digital watermarking algorithms were proposed more than tens of years ago or even 100 years ago, none of them are without critical issues that are obstacles to catching a mass market of the integral imaging. Future, we will optimize the DWT algorithm. The efficiency will be improved in the aspect of computational. The property of the real-time performance will be also enhanced.

ABSTRACT

This paper reviews the existing methodologies and best practices for digital investigations phases like collecting, evaluating and preserving digital forensic evidence and chain of custody of cybercrimes. Cybercriminals are adopting new strategies to launch cyberattacks within modified and ever changing digital ecosystems, this article proposes that digital investigations must continually readapt to tackle cybercrimes and prosecute cybercriminals, working in international collaboration networks, sharing prevention knowledge and lessons learned. The authors also introduce a compact cyber forensics model for diverse technological ecosystems called Cyber Forensics Model in Digital Ecosystems (CFMDE). Transferring the knowledge, international collaboration, best practices and adopting new digital forensic tools, methodologies and techniques will be hereinafter paramount to obtain digital evidence, enforce organizational cybersecurity policies, mitigate security threats, fight anti-forensics practices and indict cybercriminals. The global Digital Forensics community ought to constantly update current practices to deal with cybercriminality and foreseeing how to prepare to new technological environments where change is always constant.

DOI: 10.4018/978-1-5225-3822-6.ch029

1. INTRODUCTION

Nowadays, cybercrime continues to grow at accelerated rates due to global connectivity and the advancements of networks, information exchange and mobile technologies. Furthermore, digital investigators and prosecutors need to understand how cybercriminals behave in order to assimilate their modus operandi including Techniques, Tactics and Procedures (TTP) of criminal hacking.

Cyberattacks continually increase its sophistication to avoid detection, monitoring, remediation and eradication. The proliferation of digital devices has attracted countless possibilities to commit cybercrimes or to utilize these devices to perpetrate common crimes.

Cybercriminals are continually launching cyberattacks that tend to grow in sophistication, the adoption of anti-forensics techniques and the use of procedures to avoid cybercrime detection and tracing.

In 2015, the IC3-FBI received over 8,000 complaints with a combined loss of around $ 275 million, the IC3 dealt with 3,463,620 cybercrime complaints during a period of six years (2010-2015) and they estimate that only 15% of the cyber victims file a complaint. According to their Internet Crime Report (2015), the top 5 cyber victimization by country occurs in the USA, UK, Nigeria, China and India mostly linked to non-delivery of products or payment, 419 schemes, identity theft, online auctions, personal data breach, cyber extortion, employment fraud, credit cards, phishing and cyber harassment. The IC3 follows specific procedures to fight cybercrime including detection, victim complaint, mitigation, liaison with industry/law enforcement, cybercrime analysis, deterrence, investigation, prosecution and prevention.

McAffee (2014) estimated that cybercrime costs $ 400 billion to the global economy on an annual basis, but this can easily reach a maximum of $ 575 billion. Stolen personal information could cost $ 160 billion per annum, G20 nations experience most financial losses due to cybercrime activities especially the USA, China, Japan and Germany. Developing countries are only experiencing small losses yet this trend will likely change in the future as business use Internet for commercial purposes particularly mobile platforms and network connectivity. Nevertheless, most cybercrime activities go unreported on the organizational level to avoid further impacts like harming business operations, customer relationships and company reputations. The cybercrime effect targeting end users is not different when it comes to the theft of personal information.

For years, digital forensics methodologies and practices have not been evolving at the same rate that cybercriminality exploits Information and Communication Technologies (ICT) vulnerabilities. In our paper, we evaluate existing methods and how is necessary to revisit cybercrime and digital investigations operations to cover a vast number of technological environments. Our proposed Cyber Forensics Model combines the most relevant phases of digital investigations and targets multiple environments in digital ecosystems.

Arief et al. (2015) argue that because cybercrime losses are normally presented using surveys, these surveys do not provide a representative sample of the losses. Furthermore, surveys can be distorted and it does not exist an authoritative source for calculating cybercrime losses as many incidents are never reported to not lose reputation. They highlight that the number of cybercrime losses is arguable but what is undeniable is the rising threat of cybercrime. In order to examine how cybercrime operates, we ought to comprehend the attackers, the defenders and the victim's environments.

This paper studies in Section 2 the new digital ecosystems for cybercriminality; the literature review in Section 3 compares 26 Digital Forensic methodologies organized in three periods (1984-2006; 2007-2010 and 2011-2016). Section 4 highlights the importance of Digital Forensic investigations; Section 5 presents an overview of Digital Forensics tools and in Section 6 we emphasize the importance of digital

evidence to prosecute cybercriminals. In Section 7, we propose our Cyber Forensics Model in Digital Ecosystems (CFMDE) and Section 8 includes concluding remarks and future work.

2. DIGITAL ECOSYSTEMS FOR CYBERCRIMINAL

According to Cano (2016), cybercriminals modus operandi has been elevated from traditional cyber operations to cybercrime digital ecosystems where they take advantage of logic infrastructures, digital platforms and highly connected users. He defines a Criminal Digital Ecosystem (CDEco), as the group of relationships between local and global participants that interact to create a flexible network to engage in criminal activities by exploiting vulnerabilities of cyber victims; above all, aiming at specific goals under full anonymity and leaving untraceable digital evidence when possible.

He argues that the intent of the cybercriminal's actions is set on five premises:

1. Maximum effectiveness with minimum effort;
2. Maximum anonymity, with the minimum possible evidence;
3. Maximum legal ambiguity, with minimal technological knowledge available;
4. The use of free digital platforms, assisted by specialized communities;
5. Using cryptocurrency as payment. Being Bitcoin, the digital currency mostly used for hacking communities and underground operations in the Deep Web.

Cyber investigators must adapt to the way cybercriminals operate, by developing new skill set based on data analytics, revisiting the search and collection phases of digital evidence and analyze the hacking scenario design aimed to comprehend these new criminal digital ecosystems.

3. DIGITAL FORENSIC METHODOLOGIES

Digital forensics (DF) is defined as the use of scientific methodologies to preserve, collect, validate, analyze, interpret, document and present evidence from digital devices for civil or criminal investigations, to prove and prosecute cybercrime.

We studied 26 models and frameworks related to digital forensics investigations for digital crime and cybercrime (Table 1,2 and 3). Starting from its inception with the Politt Process (1984) until one of the latest, the Digital Forensics Cybercrime Ontology developed by Talib et al. (2015).

Table 1 highlights an overview of digital forensic methodologies from 1984 until 2006.

While there are many options out there for cyber investigators to choose from and follow a specific framework or model, there isn't a globally accepted or an universal digital investigation methodology.

In Table 2, we present the DF methodologies in the 2007-2010 period.

With the adoption of new technologies, it is necessary to adapt DF practices and we have to keep in mind that the cyber threat landscape will keep growing as well (Table 3).

By studying the aforementioned digital forensic methodologies, we were able to detect similar patterns when comparing all its different phases. In Table 4, we compared the similarity of DF methodologies in the identification, investigation, collection, analysis and presentation phases.

As shown in Figure 1, we depict the number of DF methodologies that share similar phases.

Table 1. An overview of digital forensic methodologies (1984-2006)

Digital Forensic Methodology	Phases
Politt (1984): Computer Forensic investigate process	Acquisition, identification, evaluation and admission
Kruse and Heiser (2001): Basic computer investigation model	Assess, acquire, analyze and report
Digital Forensic Research Workshop -DFRWS (2001): DFRWS Investigative model	Identification, preservation, collection, examination, analysis and presentation
Casey (2001): Six-step model	Identification/assessment, collection/acquisition, preservation, examination, analysis and reporting
Reith et al. (2002): Abstract Digital Forensics Model (ADFM)	Identification, preparation, approach strategy, preservation, collection, examination, analysis, presentation and returning evidence
Carrier et al. (2003): Integrated Digital Investigation Process (IDIP)	Readiness, deployment, physical crime scene investigation/digital crime scene investigation phase. The digital crime scene investigation phases are preservation, survey, document, search for digital evidence, scene reconstruction and presentation
Ciardhuain (2004): Extended Model of Cybercrime investigations	Awareness, authorization, planning, notification, search, collection, transport, storage, examination, hypothesis, presentation, proof/defense and dissemination
Baryamureeba et al. (2004): Enhanced Digital Investigation Model (EIDIP)	Readiness, deployment, traceback, dynamite and review
Beebe et al. (2004): A Hierarchical, Objectives-Based Framework for the Digital Investigations Process	Preparation, incident response, data collection, data analysis, presentation and incident closure
Rogers et al. (2006): Computer Forensics Field Triage Process Model (CFFTPM)	Planning, triage, usage/user profiles, chronology/timeline, Internet and case specific evidence
Kohn et al. (2006): Framework for a Digital Investigation	Preparation, investigation and presentation
Kent et al. (2006): Four-Step Forensic Process	Collection, examination, analysis and reporting
Ieong (2006): FORZA- Digital Forensics Investigation Frame	8 layers: Contextual investigation, contextual, legal advisory, conceptual security, technical preparation, data acquisition, data analysis and legal presentation
Venter (2006): Process Flows for Cyber Forensics Training and Operations	Inspect & prepare scene, collect evidence & evidence information and debrief scene & record seizure information

Table 2. An overview of digital forensic methodologies (2007-2010)

Digital Forensic Methodology	Phases
Freiling et al. (2007): The Common Process Model	Pre-incident preparation, detection of incidents, initial response, formulate response strategy, investigate the incident and reporting
Khatir et al. (2008): The Two-Dimensional Evidence Reliability Amplification Process Model	Five major phases (Initialization, evidence collection, evidence examination and analysis, presentation and case termination). Under two dimensions that include 16 sub-phases and umbrella activities (computer tools utilization, case management/team setup, preservation/authenticity and documentation)
Selamat et al. (2008): Digital Forensic Investigation Framework	Preparation, collection and preservation, examination and analysis, presentation and reporting and disseminating the case
Perumal (2009): Digital Forensic Model on Malaysian Investigation Process	Planning, identification, reconnaissance, analysis, result, proof & defense and diffusion of information
Pilli et al. (2010): A Generic Framework for Network Forensics	Preparation and authorization, detection, incident response, collection, preservation and protection, examination, analysis, investigation and attribution, presentation & review

Table 3. An overview of digital forensic methodologies (2011-2016)

Digital Forensic Methodology	Phases
Agarwal et al. (2011): Systematic Digital Forensic Investigation Model (SRDFIM)	Preparation, securing the scene, survey & recognition, documenting the scene, communication shielding, evidence collection, preservation, examination, analysis, presentation and result & review
Ambhire and Meshram (2012): Phases model	Planning phase, scene phases (Identification, collection and preservation) and the lab phases (Examination, analysis and report)
U.S. Department of Justice (2014): Process model	Collection, examination, analysis and reporting
Prayudi et al. (2015): Digital Forensics Business Model	Identify purpose of digital investigation, identify principles for handling evidence, identify object involved in the digital forensics activity, recognize environment and how digital forensics activity works and construct a business model of digital forensics
Jain et al. (2015): Digital Forensic Framework	Plan, authenticate, gather evidence, categorize cybercrime, report and future update
Talib et al. (2015): Comprehensive Ontology Based-Investigation for Digital Forensics Cybercrime	180 classes, 179 subclasses and 84 instances related to digital forensics crime cases. Digital forensics phases are readiness, investigation, physical crime scene, digital crime scene, presentation and deployment
Jadhao et al. (2016): Digital Forensics Investigation Model for Social Networking Site	Check, analyze context, scan suspicious words, call heuristic method, call knowledge base rule, report to E-crime department and check connection

Table 4. Similar phases in DF methodologies

Identification Phase (6)	Investigation Phase (5)	Collection Phase (13)

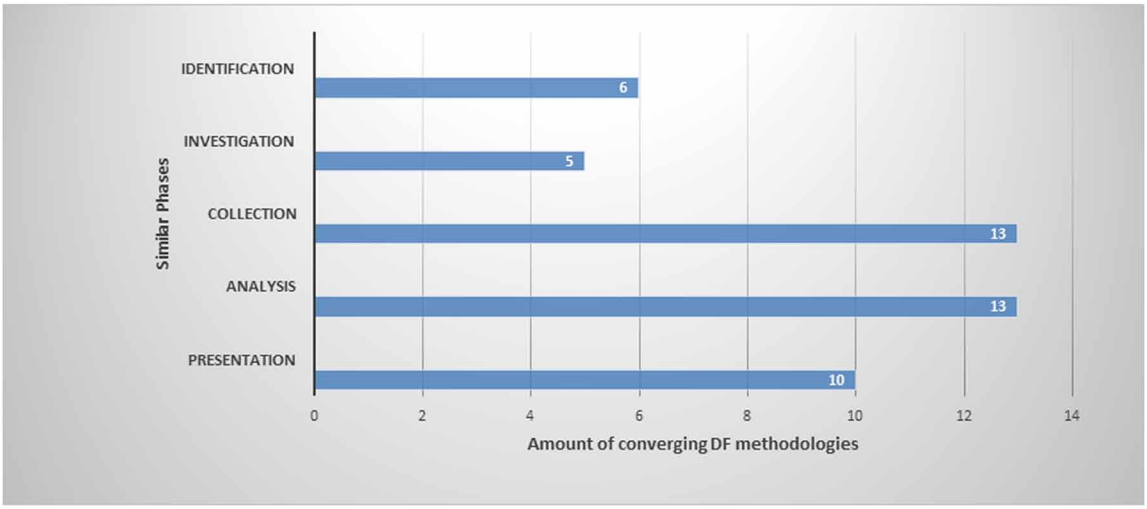
4. DIGITAL FORENSIC INVESTIGATIONS

According to Sindhu et al. (2012), a digital forensic investigation is an inquiry into the unfamiliar or questionable activities in the cyberspace or digital world. ISACA (2013) points out that cybersecurity investigations or forensics analyses are merely based on previous assumptions and hypotheses that will

Figure 1. Converging phases in DF methodologies



require further testing; a specific scenario will require flexible cyber investigative responses for the verification of the cybersecurity incident, a complete analysis of the cyberattack and investigation of persistent attacks like Advanced Persistent Threats (APT).

There are three existing categories of digital investigations:

1. **Internal investigations:** These investigations are sponsored by organizations or corporations and are treated as corporate secrets;
2. **Civil investigations:** These investigations are initiated when intellectual property is at risk. Possible attacks include intrusions, denial-of-service (DoS) attacks, malware, malicious communication, cyber harassment and abuse of resources;
3. **Criminal investigations:** Cybercrimes include the computer or the computer data as the objects, the computer as the instrument or tool of the act, or it is used to intimidate cyber victims. Some cybercrimes include cyberfraud, cyberextortion, child pornography, cyberespionage, identity theft, cyberstalking, cybertheft, data breach, online gaming, phishing and revenge porn.

5. DIGITAL FORENSIC TOOLS

Graves (2014) classified digital forensics software tools in two categories: Basic and functional. These software tools are organized as follows:

- Basic Categories:
  - Operating system utilities;
  - Open source applications;
  - Commercial applications and suites;
- Functional Categories:
  - Physical interception;

- Memory capture and examination;
- Application analysis;
- Network capture and analysis.

We also added further tools and techniques for mobile device forensics (MF), Cloud computing forensics, physical forensics and anti-forensics tools (Table 5).

While there are no right or wrong criteria when selecting DF tools, each cybercrime investigation scenario can utilize one or several categories of tools that could be either open source applications or commercial suites. The most comprehensive forensic tool taxonomy comes from the 'Computer Forensics Tool' – NIST, that basically contains twenty-six categories classified by functionalities:

- Cloud Services;
- Deleted File Recovery;
- Disk Imaging;
- Email Parsing;
- File Carving;
- Forensic Tool Suite (Mac Investigations);

Table 5. Digital forensic tools

Categories	Tools, Utilities and Techniques
Operating systems	Windows: Regedit, event viewer, sysinternals, autoruns, EFSDump, PendMoves, PSFile, PSList, PSService, Roorkit-Revealer, Streams and Strings
	Linux: Disk Dump, GREP, Linux Disk Editor and PhotoRec
	Mac OSX: GREP, HEAD, Finder and Spotlight
Open Source apps	Safecopy, Metaviewer, Hash, Filematch, Disk Explorer for NTFS, Disk explorer for FAT, DriveImageXL, Captain Nemo, DriveLook, Disk Investigator, Directory Snoop and Winhex
Commercial applications and suites	AccessData: EDiscovery and SilentRunner Guidance Software: Encase Forensics and Neutrino Paraben: P2 Commander, Forensic Replicator, Decryption Collection and Lockdown Pinpoint Labs: SafeCopy, Metadiscover and PG Pinpoint X-Ways: WinHex, Capture and Trace
	Windows: AccessData, Guidance Software, Paraben and X-Ways Forensics/Investigator Linux: The Sleuth Kit, Forensic or Rescue Kit (FoRK) and FCCU Forensic Boot CD
Mobile Device Forensics (MF)	For Operating systems including Android, Blackberry, iOS, Maemo, Symbian, WebOS and Windows Mobile
Cloud Computing Forensics	There are many existing challenges to overcome in terms of legal issues, jurisdiction, data replication, multi-tenancy, location transparency, remote data acquisition, large data volumes, distributed/elastic data handling, data ownership and chain of custody for cloud digital forensics investigations
Hardware tools	Phillips, flat, nut and torx screwdrivers Tweezers, 3-claw part grip, nose pliers, write protected interfaces, plastic scribe, digital camera, antistatic bags, Faraday shield, presslock bags, adhesive labels and forensics workstations/laptop
Anti-Forensics	To fight anti-forensics techniques like datahiding, artefact wiping, trial obfuscation and attacks against the cyberforensic process/tools. EFS, TrueCrypt, Onion routing, Burneye, rootkits, Slacker, FragFS, RuneFS, KY FS and Data Mule FS and BGP (Border Gateway Protocol). Memory injection, buffer overflow exploits, Userland Execve, Syscall proxying. The use of CDs, bootable USB tokens and virtual machines to run code without leaving digital traces.

- Forensic Tool Suite (Windows Investigations);
- Forensics Boot Environment;
- GPS Forensics;
- Hardware Write Block;
- Hash Analysis;
- Image Analysis (Graphics Files);
- Infotainment & Vehicle Forensics;
- Instant Messenger;
- Media Sanitization/Drive Re-use;
- Memory Capture and Analysis;
- Mobile Device Acquisition, Analysis and Triage;
- Peer-to-Peer (P2P) Analysis;
- Password Recovery;
- Remote Capabilities / Remote Forensics;
- Social Media;
- Software Write Block;
- Steganalysis;
- String Search;
- Web Browser Forensics;
- Windows Registry Analysis.

Furthermore, The Software Engineering Institute (SEI) from the Carnegie Mellon University has developed the Digital Intelligence and Investigation Tools (DIID) with restricted access tools exclusively for law enforcement agencies (Live View LE, CCFinder, CryptHunter and ADIA) and unrestricted free access tools (AfterLife, Live View, DINO, LATK and CERT Linux Forensics Tools Repository). SEI also offers a wide range of methods and tools in the areas of acquisition support, cybersecurity engineering, cyber risk and resilience management, digital intelligence and investigation, insider threat, measurement & analysis, network situational awareness, performance & dependability, risk management, secure coding, smart grid, software architecture, software product lines, system of systems and vulnerability analysis.

And last but not least, digital investigators using freeware or shareware must be aware that some tools may be inacceptable for courts, lawyers and judges in terms of validating credibility, functions, reliability and acceptance of the digital evidence conclusions. The US National Institute of Standards and Technology (NIST) hosts the Computer Forensics Tool Testing Program website to help improving quality, for knowledge sharing and to understand tool capabilities. In addition, the Computer Forensics Tool Catalog features tool searching, tool taxonomy access and vendor access for continually updating information about the tools.

6. DIGITAL EVIDENCE

Modern society has citizens that are well connected with technology through digital devices. Starting a crime or cybercrime investigation will lead to access these digital devices that contain potential digital evidence.

According to Davidoff et al. (2012), digital evidence is any documentation that satisfies the requirements of "evidence" in a proceeding, but that exists in electronic digital form. NIST also includes digital evidence in the form of information on computer, audio/video files and digital images but it helps to recognize people's faces, image/video analysis and to solve common crimes and cybercrimes as well.

In order to detect and obtain digital evidence, cyber investigators must follow certain principles like maintain intact the cybercrime scene, always avoid unnecessary risks, record everything in a chronological order and follow the proper chain of custody.

The Scientific Working Group on Digital Evidence (SWGDE) provides best practices for computer forensics specifically for collecting, acquiring, analyzing and documenting digital evidence found in computer forensic examinations.

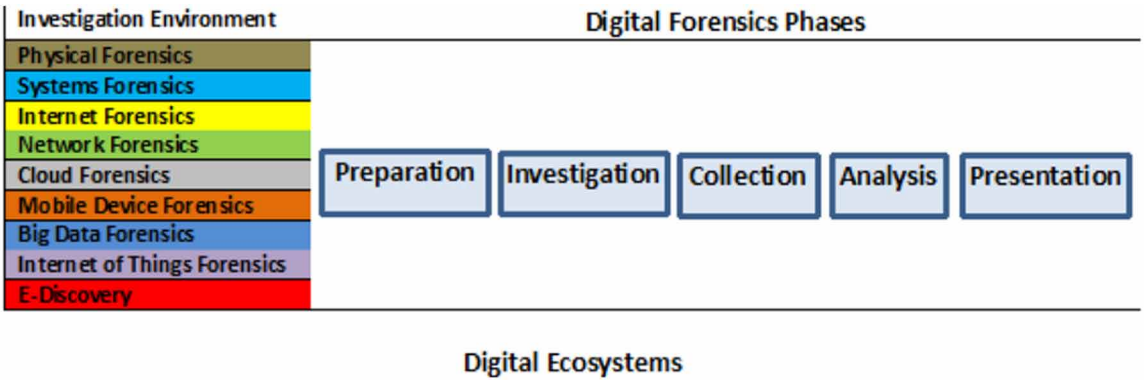
7. CYBER FORENSICS MODEL IN DIGITAL ECOSYSTEMS (CFMDE)

We propose a cybercrime digital forensics model called "Cyber Forensics Model in Digital Ecosystems", we wanted to introduce a model that combines the traditional cyber forensics phases with all the diverse digital environments that create digital ecosystems. The main phases of the model (Figure 2) are preparation, investigation, collection, analysis and presentation that can run on a specific investigation or combined with several forensic environments.

The model comprises the following phases that are applicable to any or multiple investigation environments:

- **Preparation:** This initial phase involves all the required planning for a specific environment or in multiple environments;
- **Investigation:** This phase deploys the response plan to the incident;
- **Collection:** Relevant data is collected based on the approved methods and techniques;
- **Analysis:** Significant digital evidence is selected and the drawing of conclusions;
- **Presentation:** The findings of the digital investigation are presented.

Figure 2. Cyber Forensics Model in Digital Ecosystems (CFMDE)



The investigation environments are suitable for physical forensics, systems forensics, Internet forensics, network forensics, cloud forensics, mobile device forensics, big data forensics. IoT forensics and e-discovery.

This model in comparison with the studied DF methodologies focuses on:

- Defining emergent environments for digital investigations;
- Identifying all data sources and digital evidence acquisition;
- Determining the digital evidence requirements and chain of custody management;
- Integrating DF practices in digital ecosystem environments.

The main objectives of this proposed model are to consider emergent technological trends in cybercrime investigations and to align digital forensic investigations within digital ecosystems.

8. CONCLUSION AND FUTURE WORK

Cybercrime is global problem that creates many financial losses and jurisdictional and political issues as well. Cyberattacks and further consequences can affect people's privacy, corporate's image and in many cases are never ever reported for a follow up action or investigation.

In this paper, we highlighted the importance of aiming digital investigations towards criminal digital ecosystems. Somehow, the DF methodologies in the last three decades are not being effective in dealing with the international expansion of cybercriminality.

The Digital Forensics community is in need of new approaches to investigate and prosecute cybercriminals. Traditional digital forensics phases need to be redesigned to keep up with vast amount of new technologies and to counterattack new and diverse Techniques, Tactics and Procedures (TTP) of cybercrime.

Digital forensics methodologies, phases, tools, techniques, digital investigations, digital evidence collection and cyber investigators must constantly adapt to new technologies, environments, scenarios, best practices and regulations. The functionalities of DF tools need global frameworks and standards in order to conduct better cyber investigations and above all, international cooperation and collaboration ought to improve to start fighting cybercrime more aggressively.

DFRWS (2016) has identified future digital forensics challenges like forensic analysis for the Invisible Internet (I2P), evidence in the cloud, Windows 10, Internet of Things (IoT), unmanned aerial vehicles (drones), abstraction of digital evidence, malware, pattern searching, graph queries of digital evidence, visual analytics techniques and automation of forensic artifacts. Future research of these new DF challenges must aim at creating new tools, methodologies and technologies to improve early detection, investigation, containment and eradication of cyberattacks.

The proliferation of new digital devices will continue to grow at accelerated rates, likewise more advanced and sophisticated technologies will emerge in the years to come. Digital Forensics must evolve with new holistic approaches and paradigms to face these coming challenges.

Tools and Technologies

Chapter 30
Making It for the Screen:
Creating Digital Media Literacy

Paul Chilsen
Carthage College, USA

ABSTRACT

We are immersed in a culture of spoken media, written media, and now irrevocably, digital screen media. Just as writing and speaking skills are keys to functioning in society, we must consider that the world increasingly demands proficiency in "mediating" as well. Doing anything less leaves this powerful medium in the hands of a relative few. By offering instruction in what digital screen media is, how it is effectively created, how the Internet continues to alter communication, and how this all informs everyday teaching and learning, digital media literacy can become more broadly understood and accessible. This chapter follows a program developed by the Rosebud Institute and looks at how—using simple, accessible technology—people can become more digital media literate by creating screen products themselves. The creation process also enables deeper, more authentic learning, allowing us all to communicate more effectively, to self-assess more reflectively, and to thrive in a screen-based world.

DIGITAL MEDIA: LITERACY ON SCREEN

You may well be reading this text on paper, but it remains increasingly likely that you are reading some or all of it on a screen right now. In many cases, as you read this chapter, it seems not that big of an issue. After all, it is simply words on a page and the medium of delivery may not be all that crucial. Inverting the classic phrase of communication scholar Marshall McLuhan for a moment, the medium does not really seem to alter or affect the message all that much in this particular case.

However, with the tectonic media shift in which we find ourselves, the lines we think we know, and think we can count on, seem to be blurring. The myriad machinations and goings on in our convergent media world, while a fascinating and rich topic, understandably extend beyond the scope of this chapter. Rather the focus here is to look more at what we are doing now. Now that the explosive growth and pervasive penetration of new media is upon us, are we doing the best that we can to get a firmer grip on the reins? The wave of buying and handing out expensive devices designed to merely access the con-

DOI: 10.4018/978-1-5225-3822-6.ch030

versation continues to grow and swell, threatening to eat up shrinking resources. In light of that, what are steps that can be taken to move beyond the latest techno wizardry and instead convey real skills that allow more people to effectively join in, to make clear meaning, and to affect the change they seek?

One way is to take a step back – get back to basics a bit and begin to give people some simple tools that they can use to more effectively be a part of the burgeoning world of what is happening on screens around the world. Yet another related approach is to seek out existing resources and systems that are already in place, but are ripe for innovation, change and a refreshed perspective. As mentioned, you may be looking at a screen right now but if not, you have probably looked at one if not several already today and most certainly – unless you make a concerted effort to the contrary – you will be bombarded with screen images all day, telling you what to do, what to think, what to like – even what to say.

And that trend continues to grow with abandon. As Eva and John Waterworth state in their discussions on mediated presence "Our everyday lives are more and more pervasively experienced through media… There are very few places where one is out of reach of [these] devices…" (Waterworth & Waterworth, 2010)

This ever-expanding world of screen-based electronic media encompasses such an understandably and incredibly broad array of media types, paradigms, and histories that even finding a name or term to refer to it all can prove difficult. Under the auspices of the

Rosebud Institute, introduced in the next section, we have used the term broader term 'digital media' as well as the more specific 'screen media'. These terms work somewhat interchangeably to describe media specifically produced, created for, and unfolding on the screen yet are general enough to encompass a broad array of different media, both moving (film, video, television, and gaming) as well as those which are generally more static (websites, social media, blogs). As mentioned, this chapter has a necessarily refined scope. It looks at a very practical and doable approach that is giving people a baseline way to become more active and informed members of a screen media world. Interestingly, it is in this more simple approach that the potential becomes highly expansive, giving people the tools to literally go wherever they want, much like the effect of teaching a person to write or to read.

But what *people* or *persons* are we talking about? In attempting to define who really needs to be digital media literate, to say *everyone* may well elicit a raised eyebrow or two but literally, digital media literacy is so crucial that virtually everyone will need some baseline understanding of what it is and how it works. This is not a new concept of course. The term media literacy has been around since the 1970's and in 1988, one of the most relevant and enduring quotes comes from a former president of the Carnegie Foundation for the Advancement of Teaching, Ernest Boyer: "It is no longer enough to simply read and write. Students must also become literate in the understanding of visual images" (Boyer, 1988). What is new however, is how far-reaching and therefore undeniable the screen has become. If screen media is virtually everywhere, then its literacy is in demand virtually everywhere if we are to have an informed and literate public. "The ability to both read and write visual information; the ability to learn visually; to think and solve problems in the visual domain—will, as the information revolution evolves, become a requirement for success in business and in life." (Gray, 2008) That said, keeping the sites of this chapter on achievable goals and not biting off more than is manageable, the immediate audience addressed mostly herein are students and educators – both in a K-12 environment and in post-secondary education as well.

Without delving too deeply into program specifics, we will outline a broadly prescriptive approach that we have pursued and continue to develop – a program that takes achievable steps towards reducing and addressing what has been referred to as our rampant media *illiteracy* (Baker, 2012). While the

method is simple enough, there have been some speed bumps and even roadblocks along the way but the promise of a more informed, empowered, and literate digital citizenry seems a worthy enough cause to overcome the obstacles.

Toward the end of the chapter, there is a look at ongoing program efficacy and the exploration of ideas for growth, refinement, and expansion, giving attention to where things can go and furthering the mission of creating digital media literacy for all.

THE NEW DIGITAL DIVIDE

It has been said that those who control the media, control the future. Setting aside a more manipulative connotation of "control," and focusing rather on an interpretation more aligned with understanding and effective use, it seems a natural, logical extension that in order to more positively affect our future we must not only increase the *number* of future media makers, but we must also increase the number who are truly and more fundamentally literate (Chilsen & Wells, 2012).

If you accept this "proliferating mediation of our everyday lives" (Waterworth & Waterworth, 2010) as perpetual and expanding, and embrace the intrinsic notion that we are therefore irreversibly immersed in a screen media culture, then one could argue that just as we are taught and know how to write and speak in a text-based society, now, in order to function competently in a screen-based society, we all would do well to start becoming more proficient at "mediating" as well.

Given the massive realignment that continues to unfold in the broad world of digital media, it seems both right and pressing that we realign the thinking and approach taken towards defining what screen media is, who ought to know how it works and how we can democratize the understanding and use of these powerful and exploding media.

Unlike fashionable pedagogical trends, the need for screen media literacy and ability is here to stay. Embracing and expanding what Elizabeth Daley, of USC's School of Cinema-Television once called "the greatest digital divide," the approach outlined herein seeks to close the chasm between those who can read and write in screen media, and those who cannot (Van Ness, 2005). Put simply, because so many now have access to and can therefore create media for the screen, everyone ought to be learning the basics of how to read and write in its unique language. To do anything less leaves this awesome and expanding power in the hands of a relative few and by virtue of its relevance and importance, a *new* digital divide has opened before us.

The term 'digital divide' has been around since the 1990s and originally defined technology's haves and have-nots (Richtel, 2012). According to the World Economic Forum in a 2014 report on global information technology, the original divide is still a problem and progress is slow (Cann, 2014). However, not unlike the way phone service or even electrical service eventually found its way to wherever it could reasonably go, this seems more an economic question rather than an ideological concern. As with phone and electricity, it may seem callous to say but there's simply too much money to be made for high speed internet to not also eventually reach everywhere it can logically go. Eventually screens will literally be everywhere and like the current internet joke about Afghan rebels being able to send a video from a mountain cave when we can't get cell service in our living rooms, everyone will be using its power. Since the mid 1990s, many have expropriated the digital divide term, refining it as the issues continue to morph. But one of the earliest realignments of the term has followed the logic that since eventually most all will have the access, what do we *do* with it now? This is truly a new divide.

It is from this wellspring of possibilities that the Rosebud Institute was formed. Given the somewhat prescriptive nature of this chapter, it seems prudent to at least briefly discuss this umbrella organization, in the interest of giving a point of reference for the approach taken. To that end, it is important to point out the Rosebud Institute is at least partly inspired in name and independent spirit by the enigmatic and prodigious filmmaker Orson Welles, (*Citizen Kane, The Magnificent Ambersons, Touch of Evil*). The institute seeks to embody both Welles' revolutionary approach to motion pictures as well as a sort of can-do, hands-on approach to addressing a growing need – a need to better equip future media makers in a world virtually drowning in images on the screen.

ROSEBUD INSTITUTE: MISSION

Even five or six years ago, things looked quite different in the increasingly intersecting worlds of media and education. At the time, most were grappling with how and whether to effectively put the expanding technologies to work in the classroom. The Rosebud Institute was formed around this time, at least in part as a response to the call for more technology in schools. Schools were doing a decent job of "infusing technology in schools" but the general notion could be summed up with a "now what?" mentality – now that it's here, how can we make better, more comprehensive use of the technology to enhance teaching and learning (NEA, 2008). The Rosebud Institute found an appropriate and constructive association at Carthage College in Kenosha, Wisconsin, a private, liberal arts institution, nestled between the twin metro areas of Chicago and Milwaukee. The newest department at Carthage is Communication and Digital Media (CDM). Tangentially affiliated with CDM, the Rosebud Institute found obvious alignment with a substantial portion of the department's stated mission in that CDM is devoted to the advancement and development of a student's knowledge and ability with media on the screen. Grounded in the liberal arts, and taking a modest, non-film-school approach – just far enough away from the trappings of the entertainment industry – the Rosebud Institute seeks an appropriate combination of exploring where and how education may change in the area of digital media literacy. It is neither an easy nor insular task, and challenges, encouragement, input and even inspiration are sought from every corner. Even the very name Rosebud Institute – as mentioned, inspired by a Wellesian sensibility – has a geographic alignment; Orson Welles was born in Kenosha and lived there for the first formative years of his life.

Irrespective of any ethereal inspiration Welles may provide, it is the broader notion that all students need at least a basic, core knowledge of creating media, wherein exists a powerful motivator – for Carthage, for the Communication and Digital Media department, and for the Rosebud Institute. This motivation lead to action and the Rosebud Institute was formed. Since then, the institute has developed and expanded a program that is finding better ways to teach and utilize digital media literacy. Building on this, and collaborating with a large and robust Education department as well as Office of Graduate and Professional Studies, the Rosebud Institute's larger, more universal mission – defining and exploring screen media literacy for all in order to better equip individuals to communicate and thrive – seems connected at Carthage College, both in ideal and setting.

Rosebud continues to seek and find new associations and connections, both at Carthage and beyond. Later in the chapter we will look at new curricular programs being explored that are highly interdisciplinary, leveraging the almost inborn tendency of students to want to blend sources, texts and technologies in order to more fully explore their world and more deftly direct their own learning. New affiliations will be looked at with Library and Information Services at Carthage, (LIS) where the development of a

Center For Digital Literacy is being imagined that begins to grapple with the changing role of libraries in a technology-centric and media-centric society. Additionally, there are new initiatives in the surrounding communities – outreach programs to organizations, workshops for professionals, and effective K-12 programs being instituted. All of these enterprises function to more fully bring digital media literacy literally out of the dark and into the mainstream where technological advancement has already placed its many and varied tools.

A MEDIAFESTO: PLEASE "LIKE" THIS…

When one currently teaches writing or speaking, it is not necessarily to create great novelists or orators. That may happen, but the main driver is literacy and all that comes with it – especially cultural, social and political literacy and along with that cultural, social and political efficacy. As Carl Casinghino (2011) asserts in the preface of his text *Moving Images*, we do not teach math to young students in order to prepare them all to become professional mathematicians. Similarly, we are not teaching motion picture studies to crank out a new generation of Spielbergs. Instead we are "helping learners to develop cooperative skills, to enhance their problem-solving abilities, and to participate in cultural and social processes as capable, engaged interpreters" (Casinghino, 2011). Rosebud is interested in pushing the idea of skills development further, insisting that both reading and *writing* in screen media are important, and intrinsically interconnected.

In short, we need both. It seems increasingly a given that education needs to improve student understanding of how screen media work, how they make meaning, and how they construct (or reconstruct) reality. But more and more are coming to understand that true screen media literacy must also provide students with the ability to *create* media products. (Baker, 2012). With the written word, we know that people are better readers if they have at least a working understanding of how to write, and the same seems to hold true for media.

The notion of cultural context pushes the importance further still. David Buckingham (2007) in his piece on Digital Media Literacies, extracts this notion from the discourse on "multiliteracies": that literacy education cannot simply be confined to the acquisition of skills but rather must include a framing by cultural and social contexts. In media for the screen, there is always a maker and there is always an audience. Without an understanding of who made what, for whom, and for what reason, there will always exist a danger of painting media with too broad a brush. With due respect to the late Roger Ebert, especially with matters of the screen, we live in a "thumbs up-thumbs down" world where it seems everyone has an opinion and the conversation quickly gets judgemental, political, even vituperative. In a world where we are merely asked to "like" something, and aren't really all that well trained or even asked to look at the who or why behind what we see, media products get passed off as temporary, mundane and far too easily dismissible. When discussing media, tangential arguments surface on all sides, a good portion of which come under the "media is too…" lead in: media is too violent, it's too much about entertainment, it's too difficult, it's too expensive, it's too liberal, it's too sexy and perhaps the biggest one in education circles: it's just too much more for teachers to teach. However, one could easily make the argument that media is simply too important – too important now to just let it go.

If you take a moment to look around the American mediated landscape, you may quickly come to the conclusion that the average teenager seems to do precious little thinking outside of the four walls of the screen. Given the chance, they will let the addictions of Facebook, YouTube and Twitter usurp their

time (along with any number of current online trends, e.g., Instagram, Pintrest, StumbleUpon) But we currently give them no formal training to navigate these byways even in the most basic of ways, to say nothing of inculcating them with any sense of how best to spend their time there. An increasing number end up simply "wasting time," and the reality is only increasing that a computer's "use for education or meaningful content creation is minuscule compared to its use for pure entertainment" (Richtel, 2012)

It's not surprising given that we are unrealistically expecting young people to develop an enlightened sensibility on their own, basically giving them the keys to drive without requiring they obtain any kind of license. By comparison, if we took an average child, but one who had been given no formal training in any of the disciplines of reading, writing and speaking, and set them down anywhere in a modern culture, leaving them to their own devices, expecting them to develop a culturally recognized proficiency solely from the multiple channels of stimuli around them, would they be able to function in society? Some of them certainly would, eventually, but intrinsically, we recognize that many of them would not function all that well, and that overall, their proficiencies would remain at the lower end of that functionality. Just as a rising tide lifts all boats, in this case, the opposite is also true. Our reasons for teaching any basic literacy may seem to be a given to many, but in this case it requires a retrospective, even deconstructed look. We teach these basic literacies for many reasons, not the least of which is to elevate our society and level the playing field, as it were. The more who know the language of the land, the more who are able to come to, and participate at, the tables of meaningful discourse. If we accept the fact that digital screen media is here to stay, in perpetuity, and recognize that its literacy is important and unique, then it stands to reason that we must take a more formal approach to its pedagogy (Chilsen & Wells, 2012). Media on the screen has become, in effect, how we communicate…now.

And yet, in at least the broadest sense, in this culture of *like*, we are generally taking the opposite approach. "Most uses of computers in schools signally fail to engage with the complex technological and media-saturated environment in which children are now growing up. For the most part, they are narrowly defined, mechanical and unimaginative" (Buckingham, 2007). If that is still the case – and it appears that little has changed in that arena – then what we are doing is leaving it up to the surrounding stimuli to teach our children how to read and write in this pervasive, growing medium. In that way, students – and the general public – are developing a skewed and undiscerning way of relating to screen media in general. A University of Wisconsin and Northwestern University colleague, Laura Kipnis, has referred to this phenomenon as a "marginally-trained sensibility" – one based almost entirely on the unregulated consumption of commercial television, film and internet programming in a comparatively indiscriminate fashion. If the educational system produces students with little or no formal training in digital media literacy, we are passing on that legacy and sending them out into the world as comparative babes in the wood, rather ill-equipped to function at the level the rapidly-converging world demands. Filmmaker, George Lucas has been quoted as saying "If people aren't taught the language of sounds and image, shouldn't they be considered as illiterate as if they left college without being able to read and write?" (Lucas, 2004). This may seem a strong and biased opinion but it raises a valid point. If we can begin to address the often-vast differences in a student's understanding of how screen media is made, how its language works, and how it affects change in ourselves and the culture around us, we will start students on a path of developing and refining the tools they need to function as capable, engaged individuals in a digitally mediated world.

As the downward trend in cost and the concurrent upward trend in quality in consumer electronics continue to expand both the reach and cultural power of screen media technology, the core knowledge of making media is even further democratized. And as accessibility continues to spread, so do the

expectations of a modern culture. The whole idea of "media making" becomes a lingua franca of the future. In order to keep up, people – students and their teachers – need a basic tool kit of these specific skills as they venture out into the real and professional world, regardless of their eventual vocation. It is a new literacy – a language that continues to be accessible and used by greater numbers of people. It is a natural step then to guide, educate, and form the possible ways students can use this language across virtually all professions, in a more engaged, enlightened and effective manner (Chilsen & Wells, 2012).

Creating Those Who Can

The challenge for the Rosebud Institute has been to translate its mission and ideals into action and come up with an approach that can address a need in current and future pedagogy. A pilot program launched in June 2010 lead the way to develop a curricular series called *Media and the Moving Image.* Building off these beginnings, a number of offshoot programs, explorations and successes have grown, and reviewing them here is at least one way to look at both the importance and the possibilities of what can be done about digital media literacy and even fluency.

Originally offered under Rosebud's program header *Summer Series for Teachers*, Media and the Moving Image (MMI) is now a regular offering at Carthage College both in the summer and during the regular academic year. Using current resources at Carthage College and remaining affiliated programmatically with the Education Department as well as the Office of Graduate and Professional Studies, the courses can still target elementary, middle and high school teachers who are interested in learning to better understand digital media themselves and want to be able to teach it in their classrooms.

The core instruction takes place in a highly regulated and rigorous classroom component. Available also to graduate students, the course is designed to address new approaches for teaching media literacy by exploring the basics of reading and writing in the language of screen media. Outside of the education ties, the course has also become a sought after offering for many across the disciplines. It offers students not only an opportunity to re-explore their creativity, but the ePortfolio segment gives them a much needed baseline in setting up a professional representation of their work and what kind of employee they can be.

Following a dynamic yet simple hands-on approach, participants learn a two-pronged approach to screen media. They each create two somewhat modest media pieces designed to help them begin to find their own voice in the often-cacophonous world of digital media. Participants conceive of a simple, relevant motion picture project, which they write, film and edit, trying their own hand at using basic narrative, cinematic language to tell a simple, visual story. Alongside the film project, they each build an eFolio website of their own design, creating a timely, accessible and expandable way to display, manage, and share their projects, their ideas and even themselves. The film is not simply a slideshow movie and the eFolio is not simply another website repository, but rather both projects carry the weight of audience and are a true expression of what one can call the maker's 'digital self'. While the projects may seem modest in scope, they are rife with importance and significance. The gratification of getting a solid grip on using technology more effectively, coupled with the thrill of truly creating something from nothing, lends a palpable air of accomplishment to the work. All of the projects are done in a guided, supportive learning environment where collective work, feedback, interaction, and sharing are all fostered and encouraged.

Creating a short first film of this nature seems to give most people a heightened sense of ownership along with the empowering feeling of "I can do this." They get to see how it is done, and – contrary to their assertions at the beginning of the course – they learn to become *better* watchers of film and television, not "ruined" as they often fear. An additional benefit of both projects is a deeper, richer and

more authentic learning experience. We have found this to be even more significant in younger students but literally, one cannot help but learn something more deeply by going through the process of having to create a piece about it for the screen. The very creation process itself, seems to imbue the creator with knowledge and insight that reportedly surpasses any number of pedagogical activities. As inverted classrooms and project-centered learning continue to grow in importance and efficacy, this is one of the areas we are most excited about exploring further.

As mentioned, both projects have a strong sense of audience – the idea of *who is watching*. In an attempt to address this issue even further, we give some focus to eFolios as a form of self-distribution. Again, these are not simply a way to show work, but rather ePortfolios can also give the maker a sense of the potential power and reach of their creations. This is not art or expression created in a vacuum. This is work that potentially the world can see, and that is a lot of power and responsibility to consider.

The motion media component, while relying on basic precepts of moviemaking, is decidedly removed from a Hollywood mode and instead approaches film grammar as new language of expression and making meaning. To lay the groundwork for effective communication, the coursework introduces a process encompassing fundamental aspects of

1. **Preproduction:** Treatments, scripting, storyboarding and planning,
2. **Production:** Basic camera use, angles and filming, and
3. **Postproduction:** Importing and editing clips, exporting, and delivery, as well as addressing issues of aesthetics, ethics and cultural impact.

The eFolio component extends communication beyond creation and into the arenas of audience and distribution via internet presentation. Participants build a base of knowledge with which to create their own purposeful, comprehensive collection of work and information. Through the process of building their own site throughout the course, they learn about the collaborative potential of online portfolios as well as the means by which they are able to create, upload and share their own original media in the form of video and audio podcasts.

With the pervasive spread of social networking, and its ever-younger-skewing clientele, a concurrent and integrated approach to creating, managing and distributing digital assets seems a viable, connected and crucial initiative to pursue. The additional benefit is to stimulate teachers to think about instructing their students on some of the how and why – and need – of managing their digital personae…their digital selves. As stories continue to hit the news about school-age sexting and other inappropriate interactions on the web, and as employers, schools and organizations increasingly support their personnel decisions by what they find on someone's Facebook site (Hechinger, 2008), the time seems perhaps even a bit overripe for educating students in the art of representing themselves appropriately in virtual reality, at a young enough age to begin building essential and culturally suitable lifelong skills. Of course the hope is that eventually there will come a day when most everyone is able to instantly capture, identifiably own, intelligently store, and instinctively know what to do with their digital assets (Chilsen & Wells, 2012), but until that time, we need to guide, to prod, even to insist.

As the discussion of mediating continues to unfold, a natural progression continues to build towards presentation; the dovetailing of eFolios or other Web 2.0 interfaces with motion media is a natural occurrence and a means of distributing originally created digital media via the use of a well-designed, well-placed, and well-managed websites. As designed, anyone can simply take the course for their degree, their

enrichment or their professional development, but teachers taking the class have the additional option of coming away with interrelated curriculum modules which they may want to use in their own classrooms.

As the MMI program continues to modestly expand its reach, building from the baseline notion of how best to communicate on the screen, several other related affiliations and connections continue to present themselves. The courses are finding connections with a much broader array of constituencies beyond education, such as professional development and undergraduate distribution coursework.

One way this has been successfully explored, at least in its initial stages is with a Rosebud program launched as a pilot with a local high school in spring 2011. Dubbed the Intensive Onsite Training Approach (IOTA), the program gives individuals working within their organizations the chance to work closely with Rosebud Institute instructors to implement their own version of teaching the MMI series directly in their schools. Five highly successful IOTA programs have been completed to date including an Illinois College professional development program working under a 2011 Mellon grant.

Another exciting measure of the program's success is an ongoing program by one of the IOTA graduate students, Cindy Renaud. As a teacher, Ms. Renaud implemented a modified version of the Rosebud screen media approach at her high school, launching new coursework in the fall of 2012 at Harborside Academy, an Experiential Learning (EL) school in Wisconsin. The program continues to this day and has been successfully implemented throughout the school. Ms. Renaud may not seem the rule, in that she is a very driven teacher who is drawn specifically to more intentional use of technology in the classroom, but highly effective classroom teachers are out there in great numbers and it is up to the educational structures to give them the training and support to more fully utilize the tools they – and their students – are being handed. A growing number of teachers recognize that "technology is a tool, not a solution. [and] what really matters in the classroom is teacher quality" (Day, 2014). As a quality classroom teacher, Renaud's words are convincing and cut to the core of a broader necessity for more integrated screen media instruction:

Today's students will live their lives in a competitive, technology-driven global society. The ability to create relevant, content-specific, professional quality products using screen media will give students a foundation for being proficient digital citizens…. The aim of today's educator, then, is to engage the media-centric population of youth and prepare them for the competiveness of a global society and economy. (Renaud, 2012)

Another approach and angle that Rosebud programming has pursued is going directly to younger students by launching a summer camp for students ages 13-17. Originally called *Screen Media Boot Camp*, and now being reworked under a more structured summer program at Carthage College as the *Summer Media Experience*, this weeklong overnight camp essentially takes the same type of program offered to the adults, tweaks the coursework and activities for a younger audience, and takes kids through the steps to make their own movies and eFolios with intentionality and purpose.

The Department of Communication and Digital Media at Carthage College (CDM) continues to grapple with these emerging issues. Under new leadership at many levels, the college and the department are working to find a balance between what students seem to want, what employers seem to need and what the future of education seems to demand. As educators, programmer and administrators, it seems increasingly important to get the balance right. Education has never really relied on what's trending well with students in the hope of figuring out what they need, and we really only can depend on employers to know what they need today. Therefore, it must be up to educators to look to the near and upcoming

futures and try to educate and prepare students for those futures. We need to be aware of the trends and try to stay ahead of them as much as we can, but ideally, we are building not only their practical skills, but we are giving students essential understandings and protocols so they can re-tool and modify their abilities as the world inevitably shifts under their feet.

As core curricular choices, clarifications and enhancements are contemplated, some startup interdisciplinary initiatives show great promise at Carthage. Working with Modern Languages Professor Matt Borden, two different courses have been implemented that effectively draw on the notion of communicating and learning by creating with media. One course is called *Filming Don Quixote*, where students read the full text of Quixote and also extract and create a couple short films throughout the term as adaptations of inspiring or interesting aspects of what they have read. The results of the initial offering garnered some attention in tangential academic circles and have given the program some needed feedback and insight from international colleagues (Borden & Chilsen, 2012).

The other is a course called *Filming Cultures: Explorations Beyond Tourism*, which is originally designed as a month-long course that has a two-week study tour component where students travel to a foreign country and are then required to interact with the culture, cuisine and commerce of the target destination. The student participants film all the interactions –interviews, personal digital essays, student travel, etc – and the results are edited together and shown upon returning to campus. The success of the course has lead to the development of a semester-long version that will hopefully be launched in the near future.

Another of the more promising and new explorations has come in the form of working with Dr. Todd Kelley of Library and Information Services at Carthage (LIS). Originally invited as part of a Rosebud panel at the popular Charleston Conference, a gathering of all things library, Dr. Kelley has been a strong supporter of creating learning environments that allow students to become not only literate, but *proficient* with digital media. In a follow-up series of articles called *Digital Conversations*, in the industry trade bimonthly *Against The Grain*, Kelley is sharing his department's exploration of how to manage the necessary change that libraries must go through to remain current and viable. As libraries buckle under the strain of new and varied uses by a screen-driven society (Crawford, 2011), Kelley sees the need to shift our understanding of what a library is and what it can be. Far from eschewing the strong traditions of a library, Kelley sees a necessary blending of mission. He is strongly aligned with the idea that media spaces need to literally and figuratively come out of the basement – out of the small dark rooms that are typically associated with media creation – and up into the bright and common areas where everyone can see their existence and understand that these newly imagined "maker spaces" are for their use and for their creating. The ultimate hope is for the eventual establishment of something preliminarily called the *Center for Digital Literacy*, a new and visionary part of the academic library, further asserting that these are not ideals housed in a single department or discipline, but are foundational components of how we teach and learn (Chilsen & Kelley, 2014).

All of these interdisciplinary and cross-curricular initiatives – the programming, the outreach, the camp, the library – are highly intentional and are attempting to address what is seen by more and more as a core necessity. As screen time increases for students, up to one quarter of their day and rising (Herring & Notar, 2011), the need to educate to, through and with screen media is becoming crucial. With this in mind, the current Rosebud approach, albeit developing, offers recurring rotation of courses, enabling participants to expand both their own skills in making media, as well as guide and assess the work of their peers, graduates and students. When applicable, course credit has been configured for the necessary flexibility in today's transfer-laden and professional development landscape. Additionally, other options

offer more choices for virtually anyone seeking general professional development, giving individuals and teachers more – and more media-savvy – options that can apply toward advancement, and licensure renewal, extending their abilities, their strengths and their own digital media literacy.

With the IOTA onsite exceptions mentioned above, most classes and initiatives are currently somehow related to or physically located on the campus of Carthage College. But as the IOTA and other programs demonstrate, the courses and ideals are a movable feast of sorts, able to go virtually anywhere and effectively instruct at almost any level. Altered as appropriate for various constituencies, programs attempt to offer realistic and useful options for participants, giving them differing viewpoints and ideas through a number of atypical sessions including film screenings, story circles, panel discussions, emerging technology lectures, and relevant supplemental coursework. What has been witnessed in programs thus far is that the close-knit structure of the course and the necessity to collaborate offers ample opportunity for participants to work and learn together while networking and sharing with their peers.

In a tangential fashion, the veritable explosion of social networking, self-promotion, and digital media distribution via the internet creates another opportunity for learning. As mentioned above, the sheer accessibility of virtually anything, anywhere at anytime necessitates that students learn to build, discern, shape, maintain, organize, and share their own *original* selves through the creation and management of their online presence. Additionally, it is increasingly in the nature of younger students to want to pull together all the elements they can get their hands on, in an effort to better understand and communicate in the world as they see it. They don't really have any formal training or guidance, hardly even in the basic issues of ethics and the law that quickly arise in these endeavors, but they are venturing forth, with or without our help. Especially for young people, it is important to "think twice about the online personae they are presenting to the world" (Coutu, 2007). What they post or even expropriate today, will be available for years, and they may not understand this until they are sitting in a job interview years from now, and the potential employer opens a file that includes their résumé as well as their latest online rantings and party photos (Coutu, 2007). In short, students must manage and contextualize their digital selves, and if they do not, someone will begin to do it for them.

By offering instruction in these areas, focusing on what screen media is, how its language is constructed, what it looks like, how to make it, how it impacts the culture around us, and how it informs everyday teaching, learning, discourse and commerce, Rosebud Institute programs and initiatives are seeking to make screen media literacy more broadly understood and accessible, allowing us all to communicate and thrive in an increasingly media-saturated world (Chilsen & Wells, 2012).

FASTFORWARDING

How do we keep moving forward? Just as the tendrils of digital media pervade all channels and insistently drive and necessitate a literacy entirely its own, how do we approach the need for a more global paradigm shift? This is not a disciplinary expansionist view nor is it intended to simply add to the increasingly overwhelming cacophony and unrelenting focus on technology tools, interface, and software. Rather, it is an assertion and potential solution towards a refocus – a shift towards communicating rather than simply responding, embracing a baseline process that is inherently multi-platform and upgrade-proof rather than chasing the newest toys, a step that puts technology's tools to work for our learning and efficacy and sets aside the notion of like.

Recognizably, this is almost as challenging and exciting as arriving at this point in the first place. The interconnected nature of this kind of literacy exploration – a pioneering attempt to define, codify and teach a basic screen language and the subsequent digital and screen media literacy it will hopefully engender – is most certainly not an isolated undertaking, nor should it be. Instead, it demands input, guidance and molding not only from the ongoing development of learning technologies and teaching, but from the many other pursuits – academic, social, and professional – which will continue to shape its content as well as its analysis.

Therefore a look forward involves not only assessing the results of the ongoing and expanding programs of the Rosebud Institute – their overall acceptance, efficacy and usefulness according to the participants – but also seeking and considering a veritable multitude of other viewpoints and approaches. As mentioned earlier, just as screen media is not created in a vacuum, so too, the analysis, definition and program development toward broader digital media literacy – even the most basic grammar, syntax and structure of the language as well as how best to teach this literacy – is an ongoing and multi-dimensional subject which, like most areas of study across the academy, will thrive best as it becomes part of the rich discourse on how we now communicate, interact and get along.

A growing number of academics, theorists, educators and pundits from varied walks of life are seeing the need. MIT Computer Scientist Mitch Resnick embodies many of the same baseline ideals with his assertion that it is crucial to teach kids to code, so they can do more than just "read" new technologies (Resnick, 2013). Popular Kansas State anthropologist and self-proclaimed digital ethnographer Michael Wesch touts similar ideals, asserting that critical thinking is having to share its importance with the need for educators to create learning environments where students can harness and leverage this screen-driven world, allowing them to learn to not only examine and question it, but be able to re-create it as well (Wesch, 2012). The innovative education portal Edutopia often espouses similar views and seems based on a notion of access *and* ability, recognizing that students need to see these new devices as more than merely toys, but as useful learning tools that their teachers and parents also know how to use and can help guide them (Day, 2014).

These are critical issues; would that they were a sitting target. They are not, and complicating the discourse is the fact that it's all changing, often before we can grasp what happened yesterday. Kathryn Montgomery, noted theorist and pundit on children and youth interactions with media, pointed out over a decade ago that "the explosion of the new digital media culture is occurring so rapidly that its growth is surpassing the ability of scholars…and educators to grasp fully its nature, its direction and its impact…" (Montgomery, 2000). And it's only getting worse.

All the more reason it seems, to work to get a better understanding of it now. In the interest of not chasing the elusive dragon of expanding media portals and their pervasive, seemingly unruly effects on our culture, the Rosebud Institute programs are attempting to take a more stripped-down, basic approach. How can educators arm themselves in what many see as a battle for attention in an ever-dizzying cacophony?

One way is by realizing that there is a *me* in media. As the personal increasingly becomes public, it will be the clearer voices that rise above the din. As with any form of communication, if you want to be heard you must strive to be the more effective communicator. More and more, what the world seems to want and even demand are unique and personal views. Witness how the phenomenon of "mommy blogging" continues as an important resource for those in search of the best consumer goods. As with the voyeuristic attraction of cinema, the more personal someone is on the screen, the more drawn in the viewers seem to become. Why else would the seeming mundanity of Twitter be so engaging for so many?

The aproach outlined herein is designed to give individuals the tools they need to find their voice and become more effective "mediators." The approach is simple. The equipment is accessible. The results are measurable (Chilsen & Wells, 2012).

Initial, pre-course feedback from Rosebud Institute program participants thus far reveals that a general and pervasive fear of technology poses a significant initial hurdle, especially among established professionals who are looking for fewer challenges in their busy days, not more. *Digital Natives* – kids who grew up with technology, and "spent their entire lives surrounded by and using computers…phones, and all the other toys and tools of the digital age" (Prensky, 2001) – seem to have a great deal less of this anxiety. In many cases they are naturals, but it still does come up. In view of this fear, it is important to continue to assess the effectiveness of the coursework's attempt at demystifying and deemphasizing the technical interface, in favor of a more basic exploration of reading and writing in the language of the screen. Is the program ultimately encouraging participants to first embrace and then look beyond the technical, towards a future that will eventually equate camera and screen technology with pencil-to-paper technology? Can cloud computing, where digital assets and computing resources are delivered over the web, be accepted by educators as a natural extension of teaching, learning and self-assessment? Will we be willing to start down the road of affirming that "writing" with a camera in a basic cinematic language or communicating with images on a website, are no more or less "natural" than depositing ink on the page or even painting on the walls of a cave?

Ongoing analysis of post-coursework comments and survey results indicate that many aspects of the offerings are finding an effective and relevant niche. Comments such as the following are representative:

- "I'm getting a lot of ideas that I can take back to the classroom."
- "The ePortfolio portion of the course was also inspiring."
- "I learned more technology here than I've learned in my whole life. It's been an amazing class."
- "I think it's interesting that every single person in this class is going to do something different with what they've learned once they leave."
- "I was afraid of this stuff at first. But when my work heard I took this course, they asked me to make a film for our company website; I did, and they loved it!"
- "I was not getting any response from job applications until I included a link from my new ePortfolio. I got three calls the next week and have now landed a job!"

These comments seem to indicate that the general structure of the program is headed in the right direction and is garnering the kind of ownership, engagement and buy-in initially hoped for.

Further assessment, refinement and development of the coursework and its results will also include investigation of participants' responses to and incorporation of the ongoing application of what they learn. How the participating teachers deploy program elements in their classrooms, how professionals use their new skills to communicate more effectively with their constituencies, even how graduating seniors use these skills to land a job – all of these are important and measurable indicators of people's capacity and willingness to inject digital media literacy and fluency into the ebb and flow of their lives.

The creation of more streamlined and organizationally specific approaches that can be remapped onto different circumstances according to need also seems a critical component of expansion. Potential school in-service visits to directly introduce, assess, and promote further program application and efficacy should be further explored. The hope is that such follow-up activities will nurture a more complete, ongoing acceptance and integration of the foundational principles that the programs espouse and embody.

Continuing the look forward, program outcomes are extrapolated across visions for further coursework modification, integration and expansion in order to continue to effectively meet the needs of professionals, both within education and outside of it, as well as the mediated learning abilities of their constituencies.

TEACHING CONVERGENCE

A few final thoughts revolve around perhaps somewhat overrun notion of convergence – that we indeed find ourselves nearing what feels to many like an apex in mediating, a veritable disolution of old ways and a tumultuous, aggressive and often calamitous scramble for finding a new modus operandi. While access to technology remains an issue, it seems to be turning more into a matter of effectively accessing one's own voice. "When people talk to me about the digital divide, I think of it not being so much about who has access to what technology as who knows how to create and express themselves in this new language of the screen" (Lucas, 2004). Even more so today, with phones becoming cameras and cameras becoming mobile devices and iPods becoming iPads and tablets and movie screens and televisions, and everyone scrambling to reach the almighty consumer where they live, eat, breath and sleep, the time does indeed seem to be now. While not everyone agrees how this will unfold, most are clear that as the crescendo ensues, the best way to use this new power and reach cannot be left to its own devices:

Learning depends crucially on the exact character of the activities that learners engage in with a program, the kinds of tasks they try to accomplish, and the kinds of intellectual and social activity they become involved in…technology may provide interesting and powerful learning opportunities, but these are not taken automatically; teachers and learners need to learn how to take advantage of them. (Salomon & Perkins, 1996)

Since simply having technology in the classroom "does not automatically inspire teachers to rethink their teaching or students to adopt new modes of learning" (Hiltzik, 2012), handing out $2000 pencils is not enough. Technology is here to stay and digitally native students relate to it differently. We therefore need a different approach (Chilsen & Wells, 2012). We can't simply add screen media literacy "to the curriculum menu, hiving off 'information and communication technology' into a separate subject" (Buckingham, 2007). Rather, in a world that is increasingly dominated by media and even basic communication on the screen, we need to reconceptualize our definition of *literacy*. We have both the ability and the duty to educate young and old alike in the language of the screen; to do anything less would be to leave them unprepared in an often hostile world – a world where the immediacy, manipulation and message of today's media have the potential to dramatically alter the classic modes of teaching, learning and communicating.

KEY TERMS AND DEFINITIONS

Digital Asset: An originally created piece of work that has been imported or converted into digital format and therefore can be deployed in any number of digital media. Digital assets can include but are not limited to: photos, videos, music, blog entries, podcasts, files, résumés, and/or any other work created in an academic setting.

Digital Divide: Originally a term to define the gap between those who have access to internet and related computer technologies and those who do not.

Digital Immigrant: A person born before the existence or current pervasive nature of digital technologies who is not naturally familiar or instinctively comfortable and therefore must adapt to using digital technology, interfaces, and software.

Digital Media Literacy: The acquired ability to understand, access, evaluate, and analyze types and avenues of information created online or with available software and hardware to communicate and participate in civic life as competent media consumer, contributor, and creator of media in the online community.

Digital Native: A person who is indigenous to the digital world, has grown up with and uses a wide variety of available and continually evolving technology with an inborn, instinctive sense of how to communicate, record, understand and share in society.

eFolio (Also ePortfolio): A website created for or by an individual, that manages their digital assets and online presence, communicating learning or professional progress, which continues to change as long as its creator continues to develop and refine the content to reflect current experience, skill, and/or career focus.

Media Convergence: The natural, continual, accelerating evolution of technology resulting in a more integrated, inescapable coming together of multiple avenues of information, entertainment and online communication.

Mediate: To create original work for and effectively communicate through the technology, tools, and language of the screen.

Screen Media: Any media that is produced for or distributed via the screen, including the entire spectrum of what constitutes 'the screen': the cinematic screen, the television screen, the computer screen, and the small screens accessed on a smartphones and other handheld devices.

Chapter 31
Digital Media, Civic Literacy, and Civic Engagement:
The "Promise and Peril" of Internet Politics in Canada

J. R. Lacharite
University of Northern British Columbia, Canada

ABSTRACT

It has been asserted that digital media can improve literacy, engagement, and activism so long as it is promoted and judiciously encouraged by state, political, and societal actors committed to expanding the scope of policy-making to those that otherwise feel 'left-out'. More specifically, it has been averred that social media, 'clicktivism,' and electronic referendums have the potential to educate and energize voters on the day-to-day challenges that confront government, and give them a direct say into how certain issues ought to be addressed. However, this chapter argues that while there are still good reasons to be optimistic, looking forward, we also need to critically appraise the false promise(s) of digital media, and do so in a more nuanced fashion. It will be suggested that Canada's comparably low civic literacy rates provide us with some insight into the underlying perils of plebiscitarianism should a more sincere form digital empowerment prevail. It will also be argued that political institutions, culture, Internet usage, populism should also be accounted for.

INTRODUCTION

It has been almost 15 years since Henry Milner (2002) published his wonderfully crafted book on the indispensable link between civic literacy and political participation. In it, he argued that well-informed citizens are perhaps the most critical component to genuine political discourse and engagement. Indeed, voters that possess high levels of moral and instrumental competence can reasonably contribute to governmental decision-making and hold their legislative representatives to account. Conversely, those lacking in adequate knowledge of local, provincial, and/or federal affairs typically become complacent and unwilling to appraise the performance of those elected to preserve and uphold broadly shared com-

DOI: 10.4018/978-1-5225-3822-6.ch031

munity (and/or national) values and visions. They become little more than subjects to be managed and ruled over, and their silence or disinterest tends to reinforce a form of creeping elitism that is patently out of step with meaningful participatory politics. 'Democracy,' in all of its uses, devolves into a kitschy slogan rather than a system of government and governance designed to empower the myriad stake-holders that compete for power in liberally oriented societies.

It has, however, been asserted that digital media can improve literacy, engagement, and activism so long as it is promoted and judiciously encouraged by state, political, and societal actors committed to expanding the scope of policy-making to those that otherwise feel 'left-out' (Peters and Abud, 2009; Perimutter, 2008; Kim, 2008; Behrouzi 2006a). More specifically, it has been averred that social media, 'clicktivism,' and electronic referendums—to name a few of the possibilities—have the potential to educate and energize voters on the day-to-day challenges that confront government, and importantly, give them a direct say into how certain issues ought to be addressed (Kempo, 2013). Furthermore, we are told that e-governance and e-voting are the future and that governments will have no choice but to submit to the demands of 'emerging digital citizens' (Tapscott, Williams, & Herman, 2008)! In all, information and communications technologies (ICTs)—that is, the Internet and Web-based services—are liberating, and embody a logical, necessary, and irresistible revolution in democratic politics. They innervate, cultivate new and promising forms of expressiveness, and in significant ways, make it easier for people to get involved in the fine art of politicking at multiple levels.

Yet, much of this positive zeitgeist seems to be taken as an article of faith. There is an obvious disconnect between how ICTs are being used to improve government services and efficiency and how they are being used to improve the overall quality of democratic intercourse. Put differently, the Internet's 'potential' and government e-services are often conflated with how Internet based applications can be deployed—and are being deployed—to enhance public trust, government transparency, and genuine political activism.

As well, there is considerable variation in how democratic states apply and utilize 'digital media.' The Canadian case, in particular, provides us with some intriguing insights into the limitations of Internet politics on real and/or purposeful political participation. In general, Canada stands out because it has been designated by the Organization for Economic Cooperation and Development (OECD) as a knowledge based society that ranks relatively high when it comes to adult 'problem solving in technology-rich environments,' but that also possesses rather mediocre—and in some instances disturbingly low—numeracy and literacy rates (OECD, 2016; Statistics Canada, 2013). Moreover, as Milner (2007, 2002) and Llewellyn et al (2007) have convincingly shown, the country's general competency level in the specific area of public affairs—that is, how legislatures function, how government is financed, how and where tax revenues are collected from and distributed to, and so on—is dangerously thin. Hence, it is useful to examine—and comment on—the extent to which Canada's federal and provincial government efforts to facilitate a higher degree of political engagement via digital media (the supply), and voter interest (the demand), have made any positively measurable or eventful progress in the realm of citizen empowerment.

Canada's experience is instructive because despite government initiated investments in electronic or digital media—i.e., to promote more transparency and trust in public institutions—it has been unable to reverse stagnating or declining voter participation rates. Curiously, more 'access and opportunity' have failed to renew the citizenry's lingering lack of faith or confidence in governing institutions and officials. In addition, evidence from Statistics Canada (2011) reveals that the 'political uses' of the Internet are consistently incidental to other more hedonistic or personally gratifying tasks—the data actually show that the Internet has now basically evolved into a tool for consumption purposes and inter-personal

communications. What is more, the OECD's 'Programme for the International Assessment of Adult Competencies' test results seem to confirm that a significant number of Canada's ballot casters lack the necessary skill(s) set needed to make well-informed choices (Statistics Canada, 2013a). This has not gone unnoticed, and many of the country's most important political offices—municipal councils, provincial premiers, and the federal executive—ostensibly remain unconvinced of the ultimate value of enabling voters via various digital channels—as can be evidenced by the near universal appeal of 'executive predominance.'

The findings in this chapter derive from comparing and evaluating the claims made by cyber-optimists and cyber-pessimists against the available evidence on Internet use in Canada and how Canadian governments have typically used 'Web-based' applications to improve public services and engagement. Civic literacy represents a critical component to this discussion, but no attempt is made to uncover the extent to which civic literacy influences 'digital political participation' more than traditional forms of political participation—an interesting line of inquiry, to be sure, but one that remains outside the scope of this chapter. Instead, it is argued that while there are still good reasons to be hopeful, looking forward, we also need to critically appraise the so-called benefits or false promise(s) of digital media, and do so in a more nuanced fashion. For example, Canada's comparably average to low civic literacy rates—which have contributed to substandard collective outcomes such as counter-active referendum results on taxation and/or infrastructural improvement proposals—underscore the underlying perils of plebiscitarianism should a more sincere form digital empowerment take root.

Policy-making and political decisions are complex by their very nature, and while consulting 'the people' (i.e., populism) has become a well-entrenched feature of many democratic regimes, it does have drawbacks. What makes 'the people' the ultimate arbiter of crucial matters of public policy anyway? Before we even consider increasing the consultative and decision making capacity of voters, should we not first expect a reasonable level of competence to prevail? The Canadian case provides us with a better sense of what the Internet is actually being used for, and some other institutional and cultural 'realities' that tend to impede the country's complete conversion to a more robust and e-inspired 'citizen-centered' governing system.

Predictably, this subject has become an intensely polarizing one with contesting parties generally falling into one of two intellectual camps. On one side of the spectrum we have the cyber–optimists who envisage a central and prominent place for ICTs in the worlds of democratic politics and social activism. This chapter begins by surveying the claims made by these writers because it would be naïve to deny that digital media can be used to enlarge the depth and breadth of political participation. Some discussion, then, on how digital media are transforming the public sector and democratic governance is warranted—much of the focus, however, will be on the Canadian case only. Following this, the second part of this chapter highlights some of the more salient concerns, criticisms, and reservations expressed by the cyber-skeptics—located on the other side of the spectrum—in relation to what can truly be achieved by applying digital media to the various operations of government and governance. It is here where we begin to see a conflict emerge between the most appropriate and ill-advised uses of ICTs in a democratic context. Again, emphasis will be placed on the Canadian case. The final part of this chapter considers and weighs up the merits and deficiencies of both perspectives and then attempts to provide a clearer picture of what has actually happened in Canada. The news is not all bad, but there is very little indication that government initiated Web-services and programs have done much to improve civic literacy or political participation. Rather, one of the more predictable developments has been to use

digital media to facilitate a more sophisticated form of image building among Canada's major federal and provincial party leaders.

The Promise of Digital Media and Internet Politics?

Extolling the virtues of Internet government, governance, and democracy was all the rage in the mid-1990s, but it began to gain considerably more traction at the turn of the 21st century. The OECD, for example, produced several comprehensive reports on the merits and shortcomings of using ICTs to improve administrative efficiencies and citizen engagement (2003a, 2003b, 2005). Not to be outdone, several prominent scholars and techno-luminaries such as Mark Zuckerburg (Facebook) and Eric Schmidt (Google) have chimed in and commented on the transformative impact that digital media can have on public sector reform and modern democratic politics (see, Zuckerburg, 2016; Aladalah, Cheung, & Lee, 2015; McNutt 2014, 2008, 2004; Peters & Abud, 2009; Eaglesham, 2006; Roy 2013, 2008, 2006; Behrouzi, 2006a; Scott, 2006; Coleman & Norris, 2005; Chadwick, 2003). Today, it is now widely accepted that we have moved into an era of 'Government 2.0,' largely characterized by efforts to implement 'social collaborative' technologies to increase access to government information, services, and public engagement opportunities (McNutt, 2014; Dixon 2010).

Over the past two decades, e-government has been used as a catch-all phrase to accentuate the technological changes that have been adopted in many advanced liberal-democratic states—though, authoritarian regimes have also experimented with selected e-government related initiatives. However, it is actually a phenomenon that "consists of two mutually supportive developments:" e-governance and e-participation (Lacharite, 2011, p.3). Moreover, up to this point, e-government programs appear to have evolved along a specific time-line and in two distinct stages. Stage one centered predominantly on employing ICTs to improve administrative practices and lean-up government bureaucracy; that is, apply Web 1.0 processes to government agencies in an attempt to emulate the purported success and efficiencies enjoyed by private sector entities. More specifically, it aligned wonderfully well with the desire to contain the accumulating public debt costs harassing redistributive governments in the 1980s and early 1990s. For all intents and purposes, 'corporatizing' government and reconfiguring so-called industrial age bureaucratic structures with sophisticated communications systems would accelerate the mutually compatible goal(s) of using ICTs to: 1) supplant or replace superfluous public sector employees; and 2) (towards this end) automate certain services and provide more information to citizens to make government more accessible, transparent, and responsive (McNutt & Carey 2008; Borins 2004; Danzinger & Anderson, 2002).

By any objective measure, the use of Web 1.0 technologies to reshape the contours of late late 20th century government and governance was an impressive undertaking. Most high income regimes took up the challenge of public sector reform with a fair degree of ebullience and converted many of their outmoded services to ones that were far more streamlined and consistent with the consumer-friendly and customer feedback schemes employed by multinational corporations. Indeed, filing a tax return, paying for a speeding ticket, applying for a passport, retrieving a transcript from a recent parliamentary debate, filling out a complaints form, or receiving a pension cheque are now all done online and have become both normalized and standardized features of government and governance in the new millennium. The Government of Canada's principle web-portal (www.canada.ca) is a superlative illustration of how access to important 'public services' is being encouraged, centralized, and enabled through various digital mediums. Whether users are looking to apply for employment insurance benefits, explore the

government's national jobs data bank, check up on the status of their work visa, prepare for a citizenship test, or look to take advantage of a small business grant or tax credit, they are directed to a single site that asks them to navigate through the appropriate content, set-up a service account, and then 'follow the instructions.' Simply put, many of the country's federally oriented services are supplied online, and as a matter of course, citizens are expected to make these electronic service options their first point of contact. Of course, some 'bricks and mortar' service outlets remain intact, but when and where these options are available, they are supplemented by a host of personal computers and users/visitors/citizens are urged to resolve their queries via the hardware and software provided.

Again, by any objective measure, the uses of ICTs to better systematize archaic administrative practices and improve critical services such as benefits disbursements and application reviews—refugee status claims, licensing, and so on—remains relatively unproblematic and eventful. Most democratic governments have clearly embraced the notion of digitization and have committed considerable resources to revolutionizing their Keynesian based (and other related) service delivery operations. Yet, this is where the promise of Web based technologies to enhance real political participation, government transparency, and civic literacy generally begins and ends. This discrepancy will be discussed in more detail below, but first it is important to point out that some experimentation, particularly in the areas of e-consultation, e-activism, and e-voting, has been conducted with varying degrees of success, and it is to this second dimension or stage in government use of technology that we now turn.

Using ICTs to incrementally recalibrate government administrative activities, with the benefit of hindsight, was probably initiated by design. Information and communications revolutions can have a strikingly disruptive impact on conservative institutions and actors. Conventional operators typically resist rapid change and therefore make a concerted effort to only gradually introduce devices and processes—should they be perceived as inevitable—that can lead to significant organizational disorder and/or a lateral diffusion of power (Kovarik, 2016). Yet, shortly after high income governments began testing the efficacy of ICTs on the administrative structures of the state, a new set of communications technologies started to materialize.

Known as 'social collaborative' technologies (or just social media), applications such as Twitter, Facebook, MySpace, Flickr, and the like reflect recent improvements in both fiber optic and satellites based networked systems and represent a fundamental evolution and revolution in personal communications. Governments everywhere are now using these types of communications platforms to reverse the scourge of political disengagement, stimulate myriad forms of collective action, and buttress public information campaigns on vital social, economic, and health and safety programs (McNutt 2014; Dixon, 2010; Wooley et al., 2010; Osimo, 2008). The literature abounds with dozens of reflective pieces on how digital media are being deployed by elected officials to reinforce some of the more essential qualities of public/democratic engagement (Landsbergen, 2010; Hill, 2008; Scott 2006; Culver & Howe, 2004; Kersten, 2004). And, while many of these offerings are circumstantial, sporadic, and highly specific, they nevertheless provide us with some insight into how second generation communications technologies can be positioned to animate democracy at the local, sub-state, and state levels of government.

For the most part, 'social collaborative' tools are used in one of five ways. First, techno-savvy politicians routinely attempt to establish a personal bond or connection between themselves and their constituents via social media. Here, Web 2.0 technologies like Twitter or Facebook are used to keep professed 'followers' abreast of what is happening during an election campaign, at the local riding office, or on Capitol Hill (Cogburn & Espinoza-Vasquez, 2011). Naturally, 'supporters'—and detractors—can

subscribe to an elected officials Twitter feed and/or befriend him/her on Facebook, and then repost or 'retweet' an update or news item that they find intriguing and/or informative.

A second mode of e-inspired participation relates to both public and private efforts to get citizens to collectively resolve an immediate or persistent domestic or global crisis. In these instances, Canadians, Americans, or Australians are asked to engage in a form of direct, formal, and shared engagement and to draw on the expertise and resources of already well established online entities. This phenomenon has been popularly referred to 'crowdsourcing' or 'crowdfunding.' The idea is to get Internet users to lend their time, money, and voice to a political cause or relief effort, and many high income states have now regularized a national appeals strategy to foment collective action where it is needed. The Canadian government's desire to assist the fire ravaged residents of Fort McMurry by encouraging Canadians to support the city's recovery through a Red Cross matching donation(s) scheme is just one of the ways that people can contribute via digital means. The Red Cross itself actually uses a crowdsourcing framework to maintain a virtual community of volunteers to monitor social media and to provide victims of all sorts with valuable information on where to find food, medical supplies, and so on.

A third method of empowerment relates to the rather new idea of social voting; that is, "a process that allows citizens to vote for their preferred policy outcomes" or political candidate on the basis of other popularly held attitudes, beliefs, and preferences (McNutt, 2014, pp. 61). This has developed into a fascinatingly exciting way to encourage citizens to participate in a more direct and personally responsible manner. For example, a news report carried on *Science*'s webpage in 2012 highlighted the results of a survey of 61 million Facebook users that found that online social network usage influenced voting behavior more 'than spamming users with information via television ads or phone calls' (Bohannon, 2012). An interesting development, to be sure, but the report also questioned the extent to which online behavior translated into 'real-world activism.' Morozov (2013) has pursued a similar line of inquiry in his book '*To Save Everything Click*' and has concluded—based on substantial evidence—that there is a tendency to use technology as a substitute for more sincere and conspicuous engagement—an alarming trend that is also discussed in the next section.

A forth area that deserves some mention is what McNutt (2014) describes as 'social networking' and how public administrators can use digital media to connect to user groups that frequently observe the day-to-day travails of governments and other political actors. In these instances, we are assured that government administrators can seek out, and are seeking out—through multiple social media channels—opportunities to 'communicate messages and to listen to what people are saying about issues that are important to them and important to an agency's or department's mandate' (McNutt, 2014, pp.62).

Finally, several governments have used digital mediums to test the practicality of electronic voting and e-consultation. There has been extraordinary interest in using various electronic devices and systems to make voting more convenient and accessible, and to 'reach-out' to citizens, stakeholders, and other governments (Mishra, 2012; Peters & Abud, 2009; Coleman & Norris, 2005). However, security and privacy concerns remain the most obvious obstacle to more widespread adoption, and as we will see below, e-democracy and e-consultations are not likely to relieve low civic literacy rates or voter apathy in places like Canada.

The Web 1.0 and 2.0 variants of political and administrative engagement differ in a number of meaningful ways, but they can probably be best understood as communications systems that are either generally passive in nature or generally active in nature (Calista & Melitski, 2007). One requires deeply held convictions about a particular issue and some sort of purposeful or consequential initiative. The other also requires a degree of initiative, but prohibits deliberate user input and is more about conditioned responses—insofar

as it functions as a reward(s) based mechanism. Passive technologically driven government programs and services can be controlled and generate very little controversy or exposure. Active technologies, on the other hand, have the potential to undermine government authority and complicate decision-making on highly sensitive political matters—mostly because they are participatory and self-directed. Moreover, they can be manipulated to serve powerful interests and can be utilized to weaken the pillars of liberal democracy, and this why many cyber-skeptics have continued to express serious reservations in relation to how, when, and where 'active' and social collaborative technologies should be used.

Unfulfilled Promise(s) and the Perils of Digital Media and Internet Politics?

Cyber-skeptics tend to view investments in digital infrastructure through a vastly different lens. That said, a careful survey of the scholarship seems to confirm the belief that using ICTs to transform government was probably inevitable. Yet, it is also cynically pointed out that this conversion, initially at least, had less to do with improving public services and more to do with cutting costs (Lacharite 2011; McNutt & Carey, 2008; Borins, 2004; Danzinger & Andersen, 2002). In essence, the image and act of eliminating good jobs and 'corporatizing' services was softened significantly by the promise that technology would make government more cost-effective. Nowadays, there is very little debate that governments have achieved this objective—though, it remains unclear how important ICTs have truly been in this regard. Hence, installing Web 1.0 technologies to disentangle oppressive bureaucratic practices and programs has now largely been granted a universal 'seal of approval.' Still, cyber-skeptics remain ever vigilant and cautious when it comes to the newer issues of government and social collaborative technologies, e-consultation, and e-democracy.

In response to the social media and e-democracy developments presented above, critics usually consider a number of intriguing counter-points to take, what some believe to be, the artificial 'sheen' off the potential of digital media to transform modern democratic politics. Beginning with e-democracy, Lacharite (2015, 2011), Van Dijk (2012), Chevallier (2009), Liptrott (2007), Kampen & Snijkers (2003), and Lenihan (2002) make a number of compelling arguments and remind us that embarking on a course of hyper-egalitarianism—that is, one expedited by digital media—needs to be examined within the political, cultural, institutional, and 'user' contexts in which it is trying to take root—if only to avoid falling victim to a form of 'Internet-centrism' (Morozov, 2011). For example, Lacharite (2011) asks us to pay more attention to roles of elitism and executive predominance in parliamentary and republican regimes and to acknowledge the factors that underline voter apathy. The notion that (eligible) voters "should have [a] direct and substantive role in making legislative and policy decisions" is sacrosanct to some extent, and "constitutes the main ideal (and a primary moral component of the idea) of democracy" (Behrouzi, 2006b, pp. 2). However, this particular viewpoint, cherished though it may be, does not embody an empirical reality that is consistent with the politics of places like Canada and the United States. Indeed, as Laswell and Kaplan (1950) so eloquently put it several decades ago: 'elites, not masses, govern all societies.' Alas, 'elitism' as a feasible and rival theoretical and conceptual model for understanding modern democratic politics, has been systematically undone and overshadowed by intellectual frameworks that promote pluralism (Dahl, 2006, 1989). But we would do well to remember that policy and decision-making are a decidedly top-down affair and process, and are influenced by well-organized, well-financed, and well-resourced interests (i.e., single issue and pressure groups and other stakeholders) at all levels of government. Voters continue to merely legitimize competing policy agendas and little else (Wolin, 2008; Rothkopf 2008; Domhoff 2002; Dye 2002, 2001, 1978; Bottomore 1993). Perhaps

nothing exemplifies this reality better than the institutionalization of executive power. Prime Ministers, Presidents, Premiers, and Governors are typically reluctant to cede power to constituents because they see political decision-making and policy initiation and reform as the exclusive preserve of governing officials. This is not to say that they do not, on occasion, consult 'the people' for the purpose of maintaining positive public relations, but for all intents and purposes, the instances of authentic and effective citizen involvement remain patchy and subject to considerable oversight (Margo 2012; Lacharite, 2011) Put simply, the 'leaders and lemmings' relationship that exists in many democratic states is not likely to be significantly altered by digital media.

With regards to the factors that contribute to voter apathy, Docherty & White (2004) and Pammet & Leduc (2003) demonstrate that in the case of Canada political disengagement is normally linked to a lack of interest in politics, an inability to discern between policy alternatives and quality candidates, and a lack of awareness and/or motivation. These types of eligible voters are unlikely to be persuaded by the prospect of greater access to e-consultation or e-participation opportunities—or even benefit from them. Even so, it is not immediately clear why more citizens need to participate in policy-making or why their opinions really matter? Certainly, soliciting expert commentary and advice on a proposed piece of legislation can be constructive, by why then do 'the people' need to get involved and do they, in a collective sense, possess the intellectual capacity to vote on issues related to tax reform, national unity, or individual rights? This question will be examined in more detail in a Canadian context in the next section. For now, it is sufficient to point out that there is a downside to many of the positive characteristics of social media. For example Lacharite (2015), the United Kingdom's House of Lords' Select Committee on the Constitution (2010), Lenihan (2002), and Marquis (1993) warn us of the dangers of embracing plebiscitarianism. In sum, xenophobia, religious fanaticism, demagoguery, and populism have had a pernicious and corruptive influence on well-reasoned debate and otherwise useful policy proposals—see, for example, 'Brexit 2016,' California's 2008 proposition 8 on eliminating rights for same sax couples, and British Columbia's 'Harmonized Sales Tax' proposal and campaign (Lacharite, 2015; Bell, 2011). The question that follows then is: why would facilitating and exploiting peoples' emotions via digital networks, e-referendums, and so on be undeserving of serious refection? There are several contemporary examples of populist decision-making gone awry. Yet, putative political instruments such as recall, popular initiatives, and referendums remain the clarion call for anti-elitists looking to dismantle what they consider to be unrepresentative political systems and processes. In the 'heat of battle,' voters can often find themselves susceptible to an agent's 'cult of personality' or misleading rhetorical salvos that simply confirm already, but entirely inaccurate or unsupported, biases (see Lacharite 2015; Shermer, 2012). Representative democracy, for all its faults, provides an indispensable check against the unbridled enthusiasm and energy of voters motivated by special interests in privilege positions. Hence, utilizing digital media to enhance political participation is not without costs.

A raft of other reservations has been expressed in relation to e-voting, e-consultation, and social media as well. One of the more prominent concerns revolves around the issues of privacy and security. In February 2014, an 'Independent Panel on Internet Voting' in British Columbia (a province in Canada) advised Elections BC and the provincial government against experimenting with a system of e-voting because of persistent security challenges—such as preserving ballot anonymity and voting-system integrity (IPIVBC, 2014). In addition, accessibility issues and the digital divide, have yet to be fully resolved in many democratic states. In Canada, approximately 20 percent of residents remain disconnected or insufficiently connected to participate equitably in digital politics—especially those confined to non-metropolitan regions (Statistics Canada, 2013b). Furthermore, while McNutt (2014) and Colledge (2013)

regard the 54 percent of Canadians visiting social media sites—and an additional 26 percent '[seeking] information and joining conversations on political, social, or policy related issues'—as a victory or sorts, it still strongly indicates that a significant minority and majority of users remain indifferent to the alleged opportunities available to them.

Unsurprisingly, this brings us to one final observation that bears a great deal more scrutiny, and that is: Internet usage. More than anything, Canadians use the Internet to communicate with friends and family, bank online, obtain information on weather conditions, book vacations, and shop (Statistics Canada, 2011). Statistics Canada also reports that 65 percent of Canadian Internet users visit or interact with government web-sites. On the surface, this is an impress number, but other evidence from Statistics Canada illustrates that much of this activity is of the non-consultative or 'direct-input based' variety (Underhill & Ladd, 2007). 'Government online' users mainly connected to Ottawa's principal web-portal to search for ministry-related information, access a program or service, download a form, submit a completed form, or file a completed income tax return. Alternatively, very few used government web-sites to vote, provide an opinion, or communicate with an elected official (Underhill & Ladds, 2007). Disturbingly, the authors identified a considerable number of users who did not care to connect with government at all—incidentally, the majority claimed that they had 'no need' or 'interest' in using the government's online platforms.

Above all, the counter-arguments supplied by cyber-skeptics provide more 'food-for-thought' and uncover some real deficiencies in the desire to enhance political participation and democracy through Web 2.0 technologies and applications. The last section in this chapter attempts to illuminate some of these limitations and weaknesses even further by focusing on the state of civic literacy and political participation in Canada.

HAVE DIGITAL MEDIA AND INTERNET POLITICS MADE A DIFFERENCE IN CANADA? CIVIC LITERACY AND POLITICAL PARTICIPATION

Canada provides additional substance and evidence to support the broader claim that in some instances the benefits of digital media have been wildly overstated. Put differently, the instrumentalist view of the Internet as a tool for 'enhanced democracy,' in the Canadian case, has yet to materialize, and is unlikely to materialize when the factors of civic literacy, trust in government, and current citizen interest in politics are taken into account. One of the critical problems with reports and analyses that assert that modern democratic governance—both the parliamentary and republican varieties—remain conspicuously out of step with 'today's digitally and socially networked world,' are the assumptions that: 1) citizens are now more learned than ever because of more access to relevant information; 2) that they necessarily want to be engaged in state and sub-state politics; 3) that they possess the requisite levels of moral and instrumental competence to make well-informed decisions and/or contributions when called upon; and 4) that a modern digitally enhanced citizenry necessarily translates into more genuine and legitimate political power. In the Canadian case, however, none of these assumptions are supported by the available evidence. Still, one would have to concede, that liberal democratic states differ considerably in terms of their eagerness to promote civic literacy and political participation, which means that low civic literacy societies can address this condition by investing more generously into the non-technological components of education that actually facilitate interest in politics and governance.

Proponents of e-government, governance, and democracy generally fail to clarify what they mean by participation and engagement in a conceptual sense. Of course, there are exceptions, but by and large we are left wondering what qualifies as real, meaningful, or authentic participation or engagement. This omission is critical and while it would have to be conceded that digital media can resolve the 'engagement gap' in certain instances, it will not suffice to draw on a collection of mere anecdotes and then present them as proof of the efficacy of social collaborative applications. Instead, we need to rely on, and consult, a broader range of interdisciplinary source material(s) to cultivate a better understanding of why digital media is not the panacea that it is made out to be. To this end, investigating this issue on a case by case basis is critical, and Canada represents an excellent place to start because of its low levels of political participation and high levels of technological adoption.

Canadian governments (federally, provincially, and municipally) have been trying to restore trust in the country's institutions, political parties, leadership structures, and electoral system for several years now (Conference Board of Canada, 2013). Voter turnout in the last federal election (2015) reversed a two decade long decline in overall participation, but it is probably too early to tell how significant this change in fortunes will be. Moreover, only 68 percent bothered to cast a ballot—hardly a cause for sustained celebration—and profoundly low voter turnout rates in many provinces and municipalities continue to be the norm (Siaroff & Wesley, 2015; Uppal, S., & LaRochelle-Cote, S., 2012; Nakhaie, 2006). Of course, much of this reflects a lack of trust in government institutions and political representatives, but it is also important to note that Canada still possesses fragments of a highly deferential political culture—which implies that while some distrust might exist, there is also confidence in the ability of elected officials to govern in a more or less satisfactory fashion. This is important insofar as political 'participation' has been said to exist on a 'ladder' that reflects multiple forms. There are citizens in certain democratic countries that are happy to take on the role of subject and are perfectly content with the tokenism offered up by their elected representatives. Others want more delegated power. Arnstein (1969), articulated this distinction exceptionally well by breaking down and describing the various levels of accepted engagement in his Maslow-inspired hierarchy of citizen participation and power. The point here is that 'citizen control' of policy agendas, processes, and outcomes is not the end-game for most voters, and there is not a lot that ICTs can do to change this. In Canada, the general lack of input and participation is suggestive of a voting population largely situated at the bottom and middle rungs of Arnstein's participation model.

One reason why this may persist is the relatively low levels of civic literacy that characterize Canadian voters. The OECD, Statistics Canada, and others have noted that Canada is currently experiencing an unusually acute literacy and numeracy crisis—unusual because Canada produces exceptionally high numbers of well-credentialed post-secondary graduates. As Milner (2007) and Llewellyn et al. (2007) have demonstrated this appears to be especially true of young Canadians in the area that concerns cyber skeptics the most: political knowledge. Still, it is not isolated to this cohort alone. The Canadian Council on Learning (2006) and the OECD's Programme for the International Assessment of Adult Competencies (2013) clearly indicate that a good number of Canadians have serious problems in the areas of prose literacy, document literacy, and quantitative literacy. Reflecting these deficiencies, Lacharite (2015) quipped that 'if a high percentage of potential voters have difficulty calculating a tip or discerning basic points in a 750 word article, how can they be expected to pass reasonable judgement over a provincial tax initiative or an infrastructural project intended to lower greenhouse gas emissions? The argument here is that many Canadian voters are not equipped with the appropriate educational training or qualifications to participate in highly complex matters of public policy. But to sufficiently redress this situation, Canadian governments will need to commit more financial resources to curriculum redevelop-

ment and information campaigns. Investing in more online networks is unlikely to improve the literacy and numeracy skills of Canadians.

CONCLUSION

Attempting to button-up a complex issue that rests, in part, on 'potential' is notoriously difficult. However, a number of conclusions—some obvious, some not so obvious—can be drawn from the preceding analysis. First, in most cases using ICTs to tighten-up the administrative operations of government, improve service delivery, and eliminate excessive staff was probably to be expected, but remains largely uncontroversial. Digital media continue to have a prominent and beneficial role to play is this specific area of governance. But some of the evidence presented in the Canadian case also confirms that universal accessibility continues to undercut Ottawa's best intentions and that investments in more digital infrastructure will need to be undertaken to mitigate the gaps that tend to disenfranchise rural and remote residents and citizens—the Liberal Governments' 2016 budget actually commits $500 million to this endeavor, but whether it will be enough remains to be seen (Digital Canada 150).

A second conclusion that can be made is that for all their 'potential' ICTs cannot, at the moment, undo well-established political conventions and practices in parliamentary regimes like Canada and are unlikely to eliminate deeply embedded preferences for executive governance. Consulting a close-knit collection of cabinet officials and policy advisor will almost certainly continue unabated, which will also continue to limit the scope and potency of e-governance.

Third, any discussion on the efficacy of ICTs has to include some commentary on the nature and scope of political participation—i.e., why it is necessarily a good thing—and the ways that digital media can be used by governments and other powerful societal agents or actors to overthrow proactive, well thought-out, and constructive policy plans and proposals. As Morozov (2013, 2011) and others have argued, there is a 'darker side' to Internet politics that needs to be more thoroughly examined and considered.

Finally, we need to accept that civic literacy—and more generally literacy and numeracy—is an indispensable component to a well-functioning and enlightened democracy. In the absence of a robust and critically oriented educational curriculum that places considerable emphasis on civics and the value of participating in politics, we will continue to see a good number of citizens simply 'check-out' from all things formally political—as Canada illustrates.

Of course, a real commitment to 'civics' could take on multiple forms, including more time and energy being devoted to a study of contemporary political history, political economy, political culture, foreign relations, or perhaps even designating any 'voting day' as a public holiday—to better celebrate the importance of political participation and what it really means. In any event, in Canada's case, this will require the country's provincial governments to review and improve the scope of civics instruction at the elementary and secondary levels of education. For example, in British Columbia, Kindergarten to Grade 7 Social Studies curriculum covers such a wide range of subject materials—'identity, culture and society, governance, economy and technology, and human and physical environment'—that it makes it difficult to discern how effectively the province's recommended instructional hours are being use, whether they are indeed being committed to reinforcing the lessons of 'responsible, active, and thoughtful citizenship,' and given the new and rather cryptic methods of evaluation, whether students are actually retaining any of the crucial lessons being delivered by their teachers (Ministry of Education, 2016). At B.C. high schools, while some importance has been placed on an integrated Civics/Social

Studies course package, it is restricted, for the most part, to students in Grades 10 and 11. Moreover, other critical areas of inquiry such as 'Social Justice' are only offered on an elective basis—empowering students, to be sure, but doing little to develop a passion for meaningful political engagement (Ministry of Education, 2016). If the goal is to produce truly active and critically reflective citizens, then it might be time to make 'civics' a permanent, more specialized, and clearly defined part of the curriculum from Kindergarten to Grade 12; that is, make it a mandatory course of study that is not merely dispersed over two semesters and lumped into other broad areas of instruction that, though important, would tend to attenuate a genuine understanding and appreciation for statecraft and citizenship.

In the end, we need to concede that simply being labelled a knowledge based society does not guarantee participation or improvements in moral or instrumental competence. No amount of technology is likely to change this. Ultimately, modern democratic societies currently confronting a democratic deficit or widespread voter disengagement will have to go back to the basics, and this will mean investing in people—e.g., educational professionals—and the physical bedrocks—e.g., educational institutions—that make civic education work for citizens.

ABSTRACT

In this paper the authors define a novel data model for Multimedia Social Networks (MSNs), i.e. networks that combine information on users belonging to one or more social communities together with the multimedia content that is generated and used within the related environments. The proposed model relies on the hypergraph data structure to capture and to represent in a simple way all the different kinds of relationships that are typical of social networks and multimedia sharing systems, and in particular between multimedia contents, among users and multimedia content and among users themselves. Different applications (e.g. influence analysis, multimedia recommendation) can be then built on the top of the introduce data model thanks to the introduction of proper user and multimedia ranking functions. In addition, the authors provide a strategy for hypergraph learning from social data. Some preliminary experiments concerning efficiency and effectiveness of the proposed approach for analysis of Last.fm network are reported and discussed.

INTRODUCTION

Nowadays, *Multimedia Sharing Systems* (MSSs) and some *On-line Social Networks* (OSNs) provide users an interactive platform to create and share multimedia content (e.g. text, image, video, audio, etc.) of interest. As an example, each minute thousands of tweets are sent on Twitter, several hundreds

DOI: 10.4018/978-1-5225-3822-6.ch032

of hours of videos are uploaded to YouTube, and a huge quantity of photos are shared on Instagram or uploaded to Flickr. In such "interest-based" social networks, each user interacts with the others through the multimedia content of interest and such interactions forming social links that well characterize the behaviors of involved users in the networks.

Social Network Analysis (SNA) methodologies have been recently introduced to study the properties of such kind of information networks with the aim of supporting a wide range of applications: information retrieval, influence analysis, recommendation, marketing, event recognition, user profiling, and so on.

In our vision, an additional challenge in the management of social networks derives from the presence of multimedia information and several questions arise, if we consider the important role that multimedia data can assume in a social network:

- Is it possible to exploit multimedia features and notion of *similarity* to discover more links? Are such links effectively useful for analytics purposes?
- Can the different types of user annotations (e.g. tag, comment, review, etc.) and interactions with multimedia objects provide a further support for an advanced network analysis?
- How is it possible to integrate and efficiently manage the information coming from OSNs and multimedia sharing systems (for example, a Facebook user has usually an account also on Instagram or Flickr) in a unique social network? How can we deal with very large volumes of data?
- In this context how is it possible to model all the various relationships among users and multimedia objects? Are the "graph-based" strategies still the most suitable solutions?

The preliminary step to provide an effective answer for the above questions lies in the introduction of a model for *Multimedia Social Networks* (MSNs): integrated networks that combine the information on users belonging to one or more social communities, with all the multimedia contents that can be generated and used within the related environments.

In the literature, the term MSN have been used over the last years together with *Social Multimedia Network* or *Social Media Network* to indicate information networks that leverage multimedia data in a social environment for different purposes: distributed resource allocation for multimedia content sharing in cloud-based systems (Nan, Zang, Dou, & Li, 2015), generation of personalized multimedia information recommendations in response to specific targets of interests (Liu, Ye, Chen, Yan, & Chang, 2012), evaluation of the trust relationship among users (Z. Zhang & Wang, 2013), high dimensional video data distribution in social multimedia applications (Ji et al., 2014), characterization of user behavior and information propagation on the base of multimedia sharing (O'Donovan et al., 2013), representation of a social collaboration network of archeologists for cultural heritage applications (Moscato, Picariello, & Subrahmanian, 2015), just to cite some of the most recent proposals. As we can notice such proposals face only in part the discussed problems, rather focusing their efforts on specific applications.

In this paper we define and implement a novel and general data model for MSNs. Such work represents an extension of a previous one that the authors have presented in a recent conference (Amato, Moscato, Picariello, & Sperlì, 2016). The model allows us to represent in a simple way all the different kinds of relationships that are typical of such environments (among multimedia contents, among users and multimedia content and among users themselves) and to support several kinds of analytics and applications by means of the introduction of some *ranking* functions. In addition, we provide a strategy for hypergraph learning from data coming from different OSNs (e.g. Facebook, Twitter) and MSSs (e.g Flickr, Last.fm, Youtube). Finally, some preliminary experiments concerning efficiency and effective-

ness of the proposed approach for analysis of Last.fm (a popular internet radio and social network) data are reported and discussed.

The paper is organized as the following. Section 2 presents the related work on different models that can be used for representing and managing a social information network, also detailing the supported applications. Section 3 describes the proposed model with its properties and foundations also showing several examples. Section 4 shows some experimental results using Last.fm, while Section 5 reports conclusions and the future work.

RELATED WORK

The huge amount of heterogeneous information produced by information networks makes the effort of their characterization a really challenging problem in the literature. The first proposals for OSNs modeling take into account only *user* as basic entity and her/his interactions. Exploiting this model, different approaches has been proposed for different applications, such as lurkers identification (Tagarelli & Interdonato, 2013), experts finding (J. Zhang, Tang, & Li, 2007), influence analysis (Kempe, Kleinberg, & Tardos, 2003). However, such approaches do not consider multimedia contents. Successively, more complex models for social information networks, embedding multimedia data, have been introduced and it is possible to classify them on the base of four main categories.

In the first one, a social network is defined as a *graph* composed by heterogeneous vertices, such as users, tags, multimedia objects. In (Qi, Aggarwal, Tian, Ji, & Huang, 2012), the authors propose an algorithm that combines both context and content network information for multimedia annotation purposes. In turn, Jin et al. (Jin et al., 2013) use network and content-based information to propose a new image similarity concept. The second type of approaches is in turn based on *bipartite graphs*. Zhu et al. (Zhu, Su, & Kong, 2015) propose a user-content bipartite graph model to compute the influence diffusion in a social network. Gao et al. (Gao, Liang, Fan, Sun, & Han, 2013) exploit a bipartite graph - composed by users' group and objects - in order to address a consensus maximization problem. The third category of approaches uses *tripartite graphs*. In (Lu, Hu, & Park, 2011), a strategy that exploits users, tags and resources for clustering goals is proposed. A similar approach is then proposed by Qui et al. (Qi, Aggarwal, & Huang, 2012), they leverage a tripartite graph in order to cluster multimedia objects. In (Chen, Wang, Huang, & Mei, 2012), the authors propose a different approach that allows to model the interaction existing between user, query and videos in order to define a personalized video recommendation. Eventually, the last group contains the approaches based on *hypergraph* theory. In (Bu et al., 2010) the authors propose an approach based on hypergraph network in order to develop a music recommendation exploiting both social and acoustic based information. In (Anandkumar & Sedghi, 2015), authors propose a tensor decomposition approach for guaranteed learning of communities in 3-uniform hypergraph. Finally, a news recommender system via hypergraph learning is described in (Li & Li, 2013), while (Fang, Sang, Xu, & Rui, 2014) propose a novel Topic-Sensitive Influencer Mining (TSIM) framework in interest-based social media networks.

Table 1 summarizes the described approaches.

The graph based approaches permit to model only binary relationships existing among two entities of a MSN, but they can be easily implemented by the most diffused graph database technologies. On the other hand, hypergraph based models allow to represent all the different types of relationships of

Table 1. Social networks modeling

Type	Ref	Entities	Application
Graph	(Qi, Aggarwal, Tian, et al., 2012)	Multimedia Objects, concepts	Multimedia annotation
	(Jin et al., 2013)	Images, users, tags	Link based Similarity
Bipartite	(Zhu et al., 2015)	Users and contents	Influence Diffusion
	(Gao et al., 2013)	Objects, users, groups	Consensus maximization
Tripartite	(Lu et al., 2011)	Users, resources, tags	Clustering
	(Qi, Aggarwal, & Huang, 2012)	Multimedia Objects, users, tags	Recommendation
	(Chen et al., 2012)	Users, videos, queries	Recommendation
Hypergraph	(Bu et al., 2010)	Users, tracks artists, tags, albums	Recommendation
	(Anandkumar & Sedghi, 2015)	Tags, users	Consensus maximization
	(Li & Li, 2013)	Users, topics, articles, named entities	Recommendation
	(Fang et al., 2014)	Users, topics, images	Influence mining

MSN, but they require a hypergraph based store engines or techniques to "map" hypergraph structures in an equivalent graph.

Inspirited by hypergraph based approaches, our model proposes a solution for representing MSNs sufficiently general with respect to: i) a particular social information network, ii) the different kinds of entities, iii) the different types of relationships, iv) the different applications.

THE MSN DATA MODEL

Preliminaries

In this section, we present our model for managing information within a *Multimedia Social Network* (MSN). In our vision, a MSN is basically composed by three different kinds of entities:

- **Users:** The set of persons and organizations constituting the particular social community: several information concerning their profile, interests, preferences, etc. can eventually be considered and exploited by our model;
- **Multimedia Objects:** The set of multimedia resources (i.e. images, video, audio, posts, documents, etc.) that can be shared within a MSN community: high level (*metadata*) and low level information (*features*) can be properly used in our model;
- **Annotation Assets:** Each set of symbols (e.g., keyword, label, tag, textual comment etc.) exploited by users to annotate multimedia resources within a MSN; we explicitly note that it is possible to relate a given asset with a specific *topic* (the most significant terms or named entities of a given domain) which definition can be found into dictionaries, ontologies and so on, thus formally providing the related semantics.

Several types of relationships can be established among the described entities: for example, a user can annotate an image or a song with a particular tag, two friends can comment the same post, a user can tag another user in a photo, a user can share some videos within a group and so on. Due to the variety and complexity of these relationships, we leverage the *hypergraph* formalism to model a MSN. Our model is quite general and allows modeling not only the main social networks for multimedia sharing (such as Panoramio, Flickr, YouTube, Instagram, Last.fm, etc.), but also the most diffused OSNs (such as Facebook, Twitter, etc.) and other kinds of networks used for specific purposes (e.g., LinkedIn, ResearchGate). In the following, we describe in details our proposal.

The Hypergraph-Based Modeling

Definition 1 (Multimedia Social Network): A Multimedia Social Network MSN is a triple $(V; E = \{e_i : i \in I\}; \omega)$, being V a finite set of vertices, E a set of hyperarcs (or hypredges) with a finite set of indexes I and $\omega : E \rightarrow [0,1]$ a weight function. The set of vertices is defined as $V = U \cup M \cup A$, U being the set of MSN users, M the set of multimedia objects and A the set of annotation assets. Each hyperarc $e_i \in E$ is in turn defined by a ordered pair $e_i = \left(e_i^+ = \left(V_{e_i}^+, i\right); e_i^- = \left(i, V_{e_i}^-\right)\right)$. The element e_i^+ is called the head of the hyperarc e_i whereas e_i^- is its tail, $V_{e_i}^+ \subseteq V$ being the set of vertices of e_i^+, $V_{e_i}^- \subseteq V$ the set of vertices of e_i^- and $V_{e_i} = V_{e_i}^+ \cup V_{e_i}^-$ the subset of vertices constituting the whole hyperarc. The degree of a hyperarc e is defined by the related number of vertices, while the degree of a vertex v is $\sum_{v \in e} \omega(e)$, $\omega(e)$ being the weight of the hyperarc e.

A MSN can be thus represented by a weighted and directed hypergraph, where vertices are the basic entities of our model and hyperarcs constitute the related relationships.

Actually, vertices and hyperarcs are particular *abstract data types* with a set of properties (attributes and methods) that permit to support several applications. In particular, in our model each hyperarc has to be characterized at least by the following attributes (common to all kinds of relationships):

- **Id:** A unique identifier for the hyperarc that is automatically assigned;
- **Name:** A generic name that can be assigned to the hyperarc to describe it;
- **Timestamp:** The given time in which the relationship has been instantiated;
- **Type:** The identifier of particular class which hyperarc belongs to.

We use the dot notation to identify the attributes of a given hyperarc: $e_k.\text{id}$, $e_k.\text{name}$, $e_i.\text{time}$ and $e_i.\text{type}$ represent the id, name, timestamp and type of the hyperarc e_k, respectively. In addition, the weight function can be used to define the confidence or uncertainty of a given relationship in terms of probability, fuzzy membership and so on.

In a similar manner, each vertex is an abstract data type that can be characterized by several attributes. As an example, a vertex of user type can be described through the related username, information about her/his profile, preferences, list of interests, etc. and identified by a system identifier. For multimedia

objects, we can exploit their high level and low level description, and eventually, for annotations assets we use the symbolic representation together with the possible URI of related concepts.

Analyzing the different types of relationships that can be established in the main multimedia social networks, we have identified three categories of relationships:

- *User to User* relationships, describing user actions towards other users;
- *Similarity* relationships, describing a relatedness between two multimedia objects, users or annotation assets;
- *User to Multimedia* relationships, describing user actions on multimedia objects, eventually involving some annotation assets or other users.

Another basic concept of our model is *social path*, which definition is reported in the following.

Definition 2 (Social path): A social path between vertices v_1 and v_k of a MSN is an alternative sequence of distinct vertices and hyperedges (hyperpath) $v_1, e_1, v_2, e_2, \ldots, e_{k-1}, v_k$ such that $\{v_i, v_{i+1}\} \subseteq V_{e_i}$ for $1 \leq i \leq k-1$. The length of the path is $\alpha * \sum_{i=1}^{k-1} \cdot \frac{1}{\omega(e_i)}$, where α is a normalizing factor. We say that a social path contains a vertex v_h if $\exists e_i : v_h \in e_i$. In turn, we define a constrained social path as an hyperpath containing a specific set of hyperedges.

In our model, social paths (hyperpaths) between two nodes leverage the different kinds of relationships. As an example, a given path can "directly" connect two user because they are friends or members of the same group, or "indirectly", as they have shared the same photo or commented the same song.

User to User Relationships

Definition 3 (User to User relationship): Let $\mathrm{U}' \subseteq U \subseteq V$ a set of users in a MSN, we define user to user relationship a hyperarc $e_k = (e_k^+ = (V_{e_k}^+, k); e_k^- = (k, V_{e_k}^-))$ with the following properties:

$V_{e_k}^+ = \{u_i\}$ such that $u_i \in \mathrm{U}'$

and:

$V_{e_k}^- = \mathrm{U}' - \{u_i\}$

The weight function for such relationship returns as value $\frac{H'_{ij}}{H_i}$, H'_{ij} being the average number of distinct social paths related to relationships between u_i and u_j for each $u_j \in \mathrm{U}' - \{u_i\}$, and H_i the number of user to user paths having as initial vertex u_i.

In the following, we report several examples of "user to user" relationships that characterize our model.

Example 1 (Friendship relationship): Let $u_i, u_j \in U \subseteq V (i \neq j)$ be two different users in a MSN, a friendship relationship is any hyperarc e_k characterized by: i) $V_{e_k}^{+} = \{u_i\}$, ii) $V_{e_k}^{-} = \{u_j\}$, iii) e_k. type equal to "Friendship".

In this case, u_i is the user sending the friendship request and u_j is the user accepting the request; e_k.time represents the given time in which user u_j accepted the friendship request.

We explicitly note that it is possible to introduce in our model other attributes that are specific for friendship relationships, such as the given time in which user u_i sent the friendship request.

Figure 1 shows as a friendship relationship (typical of the Facebook OSN) can be easily represented in our model.

Example 2 (Following relationship): Let $u_i, u_j \in U \subseteq V (i \neq j)$ be two different users in a MSN, a following relationship is any hyperarc e_k characterized by: i) $V_{e_k}^{+} = \{u_i\}$, ii) $V_{e_k}^{-} = \{u_j\}$, iii) e_k. type equal to "Following."

In this case, u_i is the follower user (a user who desires to follow activities of another user), u_j is the following user and e_k.time represents the given time in which the following relationship was created.

Figure 2 shows as a following relationship (typical of the Twitter OSN) can be easily represented in our model.

Example 3 (Membership relationship): Let $\mathrm{U}' = \{u_1, u_2, \ldots, u_n\} \subseteq U \subseteq V$ be a set of users in a MSN, a membership relationship is any hyperarc e_k characterized by: i) $V_{e_k}^{+} = \{u_i\}$ such that $u_i \in \mathrm{U}'$, ii) $V_{e_k}^{-} = \mathrm{U}' - \{u_i\}$, iii) e_k.type is equal to "Membership".

Figure 1. Friendship relationship

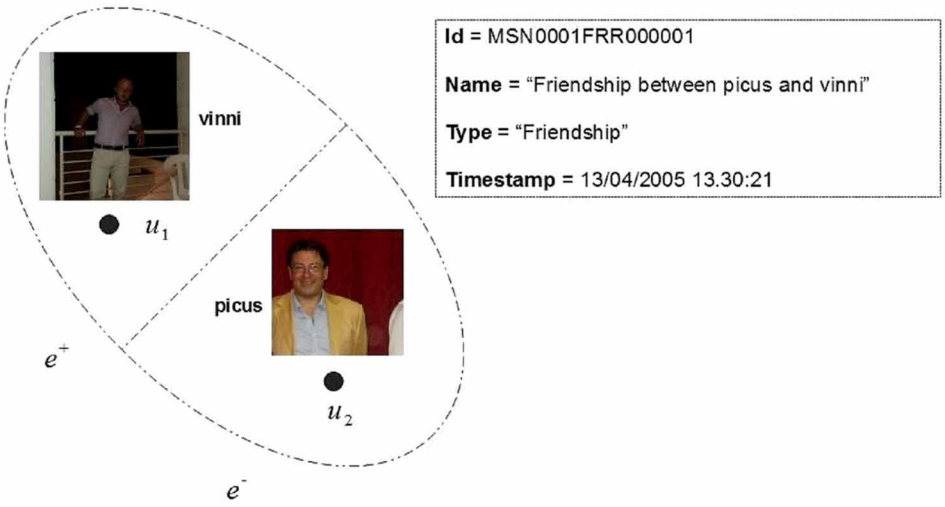

Figure 2. Following relationship

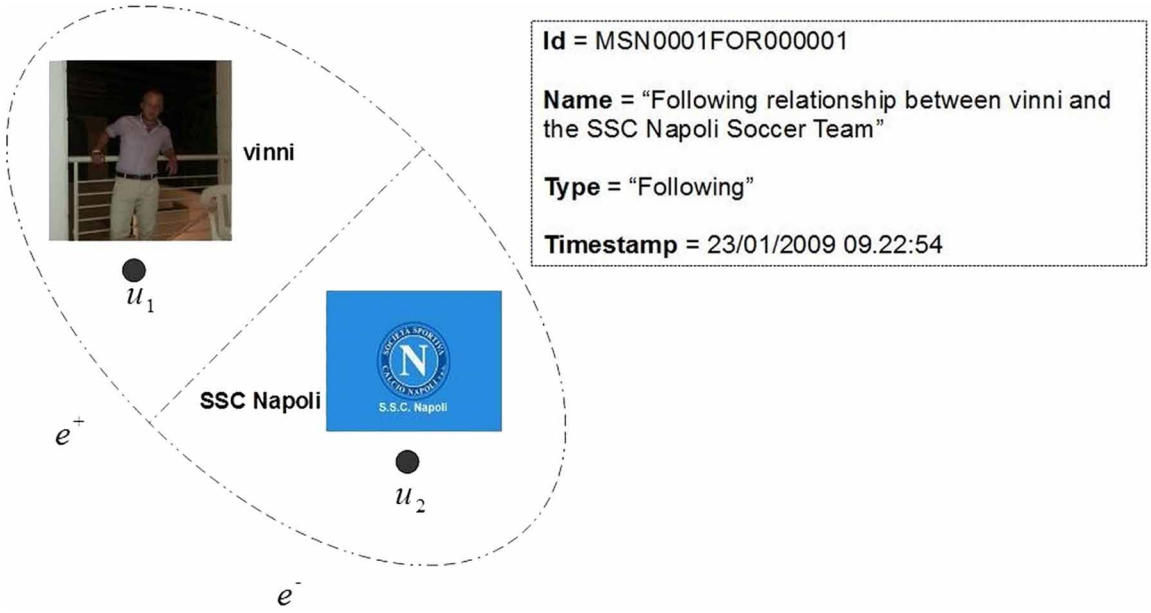

This kind of relationship allow users to "connect" themselves with one or more users belonging to the same organization, having similar interests, etc. within a given *group*.

In this case, u_i is the group creator, the remaining elements of U' are the participants to the group, e_k.time is the given time in which the group was created by the user u_i.

Facebook and Twitter allow to define users aggregation to share multimedia contents between group members, whereas Instagram does not have this kind of relationship.

Figure 3 shows as a membership relationship can be easily represented in our model.

Similarity Relationships

Definition 4 (Similarity relationship): Let $v_i, v_j \in V \ \left(i \neq j\right)$ two vertices of the same type of a MSN, we define similarity relationship a hyperarc e_k with the following properties:

$$V_{e_k}^{+} = \{v_i\}$$

$$V_{e_k}^{-} = \{v_j\}$$

The weight function for this relationship returns similarity value between two vertices of hypergraph.

In our model, the similarity relationships are defined on the top of a *similarity function* $f_{sim} : V \times V \rightarrow R$.

This function can be applied to a pair of vertices of the same type, and in particular it is possible to compute a similarity value:

Figure 3. Membership relationship
