
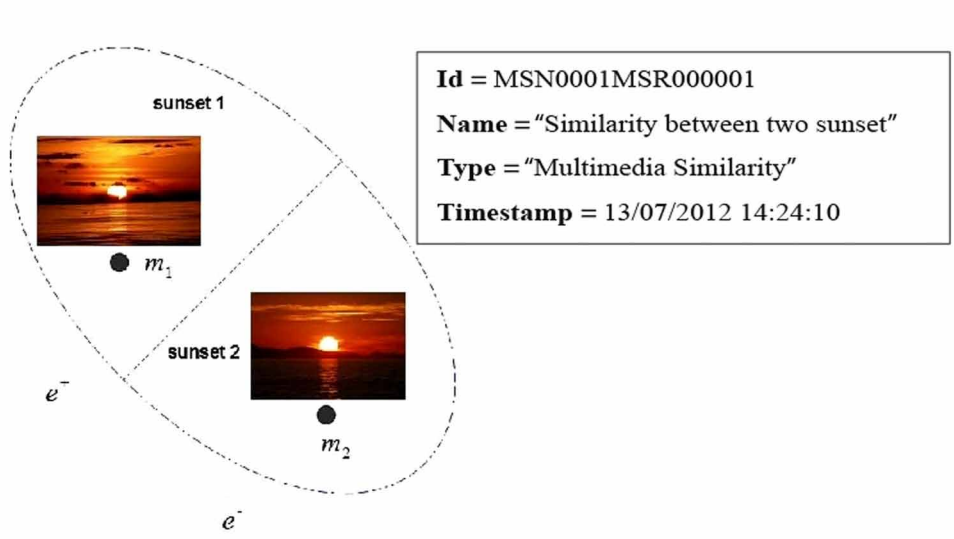
- Between two users by considering different types of features (interests, profile information, preferences, etc.);
- Between two multimedia objects using the well-known (high and low level) features and metrics proposed in the literature;
- Between two annotation assets exploiting the related concepts and the well-known metrics on vocabularies or ontologies.

In the following, we report some examples related to the similarity between two users, multimedia objects and concepts.

Example 4 (User Similarity relationship): Let $u_i, u_j \subseteq U \subseteq V \ \left(i \neq j\right)$ two users of a MSN, a user similarity relationship is any hyperarc e_k characterized by: i) $V_{e_k}^+ = \{u_i\}$, ii) $V_{e_k}^- = \{u_j\}$, iii) $\omega(e_k) \geq \gamma$, iii) e_k.type is equal to "User Similarity".

In this case u_i and u_j are two users, γ is a given threshold and e_k.time represents the given time in which the relationship was instantiated (e.g., through the application of user similarity metrics). In order to compute the similarity between two users, we define a feature-space based on information extracted from user profile and can exploit the well-known similarity metrics to compute the related relatedness. In Figure 4 it is shown an example of how *User Similarity* relationship existing between two users, called *vinni* and *giank*, can be modelled in easily way through our model.

Figure 4. User similarity relationship



Example 5 (Multimedia Similarity relationship): Let $m_i, m_j \subseteq M \subseteq V \ \ (i \neq j)$ two multimedia objects of a MSN, a multimedia similarity relationship is any hyperarc e_k characterized by: i) $V^+_{e_k} = \{m_i\}$, ii) $V^-_{e_k} = \{m_j\}$, iii) $\omega(e_k) \geq \gamma$, iv) e_k.type is equal to "Multimedia Similarity."

In this case m_i and m_j are two different multimedia objects, γ is a given threshold and e_k.time represents the given time in which the relationship was instantiated (e.g., through the application of particular computer vision algorithms).

As an example in the multimedia realm, two images can be considered "similar" if they have similar features (e.g., color, texture, shape, etc.) and/or metadata (e.g., title, keywords, description, etc.).

Figure 5 shows as the similarity between two images can be easily represented in our model.

Example 6 (Concept Similarity relationship): Let $a_i, a_j \subseteq M \subseteq V \ \ (i \neq j)$ two annotation assets of a MSN, a concept similarity relationship is any hyperarc e_k characterized by: i) $V^+_{e_k} = \{a_i\}$, ii) $V^-_{e_k} = \{a_j\}$, $\omega(e_k) \geq \gamma$, iv) e_k.type is equal to "Concept Similarity".

In this case, a_i and a_j are two different annotation assets (provided with the related concepts), γ is a given threshold and e_k.time represents the given time in which the relationship was instantiated (e.g., through the application of particular algorithms). As an example, shown in Figure 6, two tags can be considered "similar" if they have attached a similar semantics: similarity can be computed using a semantic distance (e.g., Wu & Palmer) between concepts on a given taxonomy.

Figure 5. Multimedia similarity relationship

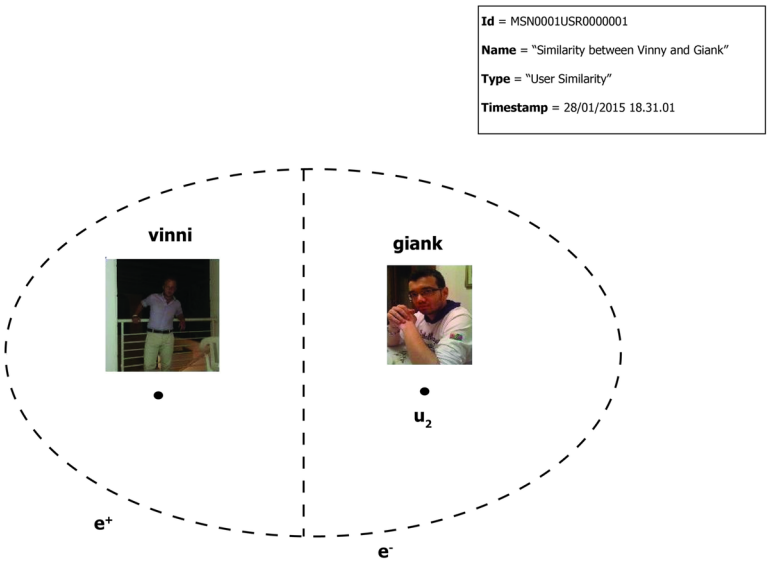


Figure 6. Concept similarity relationship

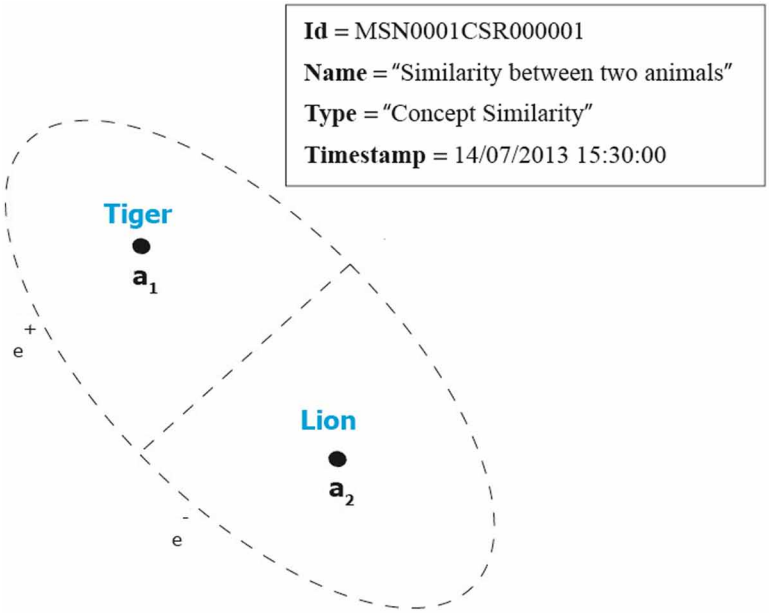


User to Multimedia Relationships

Definition 5 (User to Multimedia relationship): Let $U' \subseteq U \subseteq V$ a set of users in a MSN and $M' \subseteq M \subseteq V$ a set of multimedia objects, we define user to multimedia relationship an hyperarc $e_k = (e_k^+ = (V_{e_k}^+, k); e_k^- = (k, V_{e_k}^-))$ with the following properties:

$V_{e_k}^{+} = \{u_i\}$ such that $u_i \in \mathrm{U}'$

$V_{e_k}^{-} \supseteq M'$

The weight function for such relationship reurns as value $\frac{H'_{ij}}{H_i}$, H'_{ij} being the average number of distinct social paths related to relationships between u_i and m_j for each $m_j \in \mathrm{M}'$, and H_i the number of user to multimedia paths having as initial vertex u_i.

In the following, we report several examples of "user to multimedia" relationships that characterize our model.

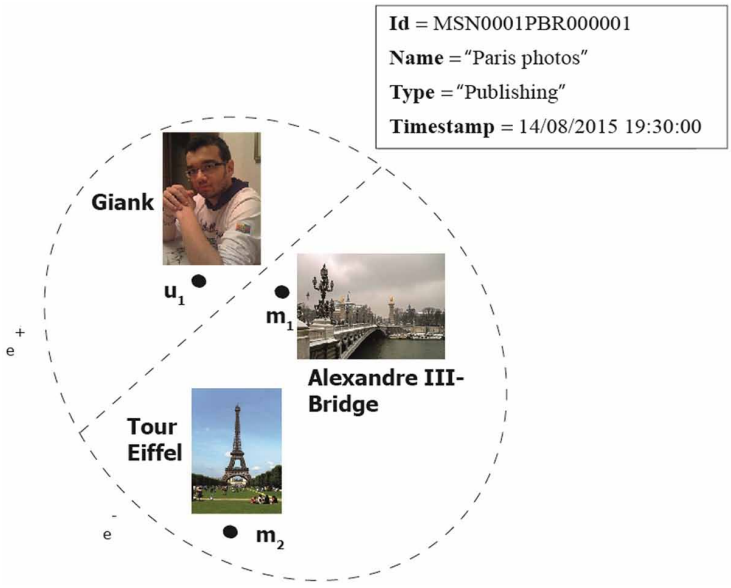
Example 7 (Publishing relationship): Let $u_i \in U \subseteq V$ be an user of a MSN and $M' = \{m_1, m_2, \ldots, m_n\} \subseteq M \subseteq V$ a set of multimedia objects, a publishing relationship is any hyperarc e_k characterized by: i) $V_{e_k}^{+} = \{u_i\}$, ii) $V_{e_k}^{-} = M'$, iii) e_k.type is equal to "Publishing."

In this case, u_i is the user who desires to publish a set of multimedia objects, whereas $m_1, \ldots, m_n$ are the published multimedia objects; e_k.time represents the given time in which user u_i performed the publishing operation.

As an example, this relationship takes place in a MSN when a user publishes several multimedia objects (e.g., those related to an album and the name of relationship could be the album title) in order to share them with other users or to remind a particular event.

Figure 7 shows how our model easily allows to represent the relationship established between a user and her/his shared photos.

Figure 7. Publishing relationship



Example 8 (Annotation relationship): Let $u_i \in U \subseteq V$ be a user of a MSN, $m_j \in M \subseteq V$ a multimedia object and $\mathrm{A}' = \{a_1, a_2, \ldots, a_m\} \subseteq A \subseteq V$ a set of annotation assets, an annotation relationship is any hyperarc e_k characterized by: i) $V_{e_k}^{+} = \{u_i\}$, ii) $V_{e_k}^{-} - = \{m_j\} \cup \mathrm{A}'$, iii) e_k.type is equal to "Annotation".

In this case, u_i is the user who describes a multimedia object m_j with a set of annotation assets (A'); e_k.time represents the given time in which this relationship occurs.

Figure 8 shows how our model easily allows to represent the relationship established when user annotates an image using some tags that is typical action supported by of the majority of MSNs.

Example 9 (User Tagging relationship): Let $m_i \in M \subseteq V$ be a multimedia object and $\mathrm{U}' = \{u_1, u_2, \ldots, u_m\} \subseteq U \subseteq V$ a set of users, a user tagging relationship is any hyperarc e_k characterized by: i) $V_{e_k}^{+} = \{u_j\}$ such that $u_j \in \mathrm{U}'$, ii) $V_{e_k}^{-} = \{m_i\} \cup \mathrm{U}' - \{u_j\}$, iii) e_k.type is equal to "User Tagging."

In this case, u_i is the user who "tags" other users (the remaining elements of U') within a multimedia object (m_j); e_k.time represents the given time in which this relationship occurs.

Figure 9 shows how our model easily allows to represent the relationship established when user tags another one in a given photo that is typical action supported by of the Facebook OSN.

Figure 8. Annotation relationship

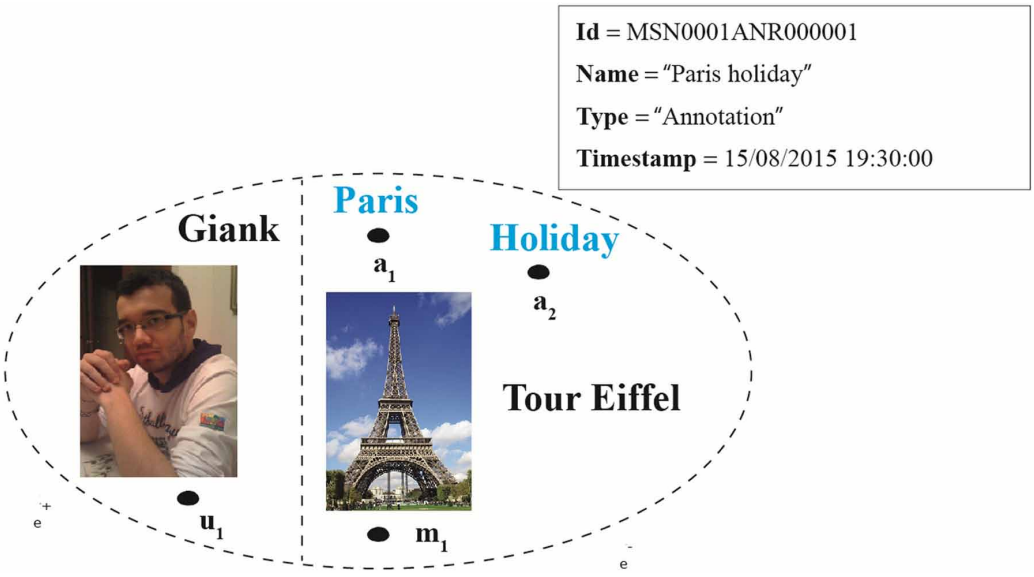


Figure 9. User tagging relationship

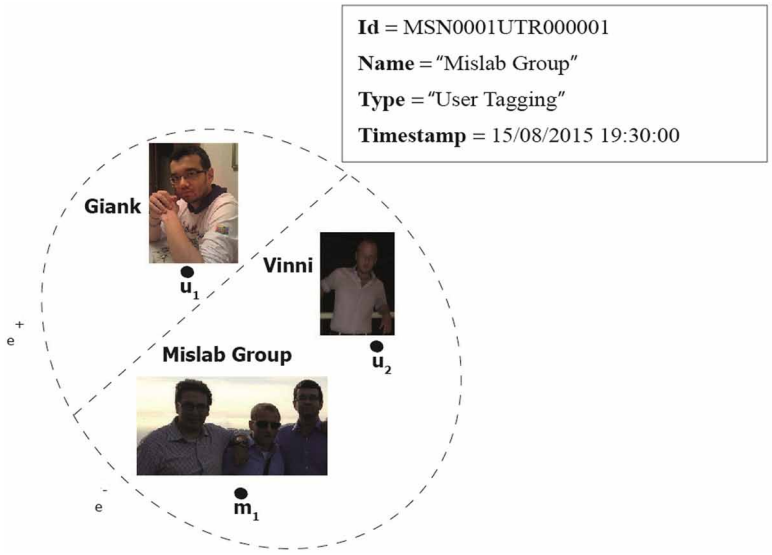

Example 10 (Endorsement Relationship): Let $u_i, u_j (i \neq j) \in U \subseteq V$ be two users in a MSN and a_k an annotation asset, an endorsement relationship is any hyperarc e_k characterized by: i) $V_{e_k}^{+} = \{u_i\}$, ii) $V_{e_k}^{-} = \{u_j, a_k\}$, iii) e_k.type is equal to "Endorsement".

In this case, u_i is the user who wants to make an endorsement related to a_k asset for u_j user in the e_k.time instant.

This kind of relationship is typical of several social networks as ResearchGate or LinkedIn.

Figure 10 shows how our model easily allows to represent the relationship established when user endorses another one for a particular job skill.

Example 11 (Reaction relationship): Let $u_i \in U \subseteq V$ be a user of a MSN and $m_j \in M$ a multimedia object, a Reaction relationship is any hyperarc e_k characterized by: i) $V_{e_k}^{+} = \{u_i\}$, ii) $V_{e_k}^{-} = \{m_i\}$, iii) e_k.type is equal to "Reaction" together with the related kind (like, sad, angry, etc.).

In this case, as shown in Figure 11, u_i is the user who likes the m_j multimedia object in the e_k.time instant. This kind of relationship is typical of Facebook OSN.

Ranking Functions

In this subsection, we introduce some functions can be profitably used to "rank" users or multimedia objects in a MSN.

First, we introduce some preliminary definitions.

Figure 10. Endorsement relationship

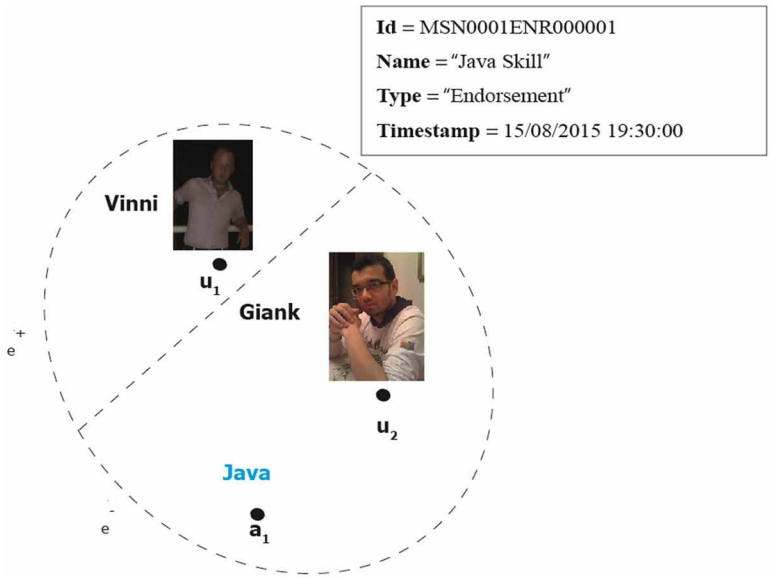

Figure 11. Reaction-like relationship

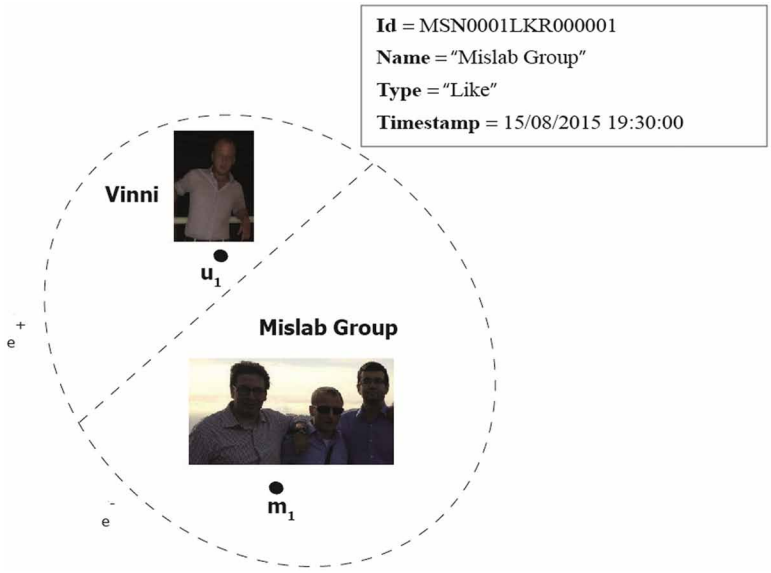

Definition 6 (Distances): We define minimum $v_j \in U$ distance $\left(d_{min}(v_i, v_j)\right)$, maximum distance $\left(d_{max}(v_i, v_j)\right)$ and average distance $\left(d_{avg}(v_i, v_j)\right)$ between two vertices of a MSN the length of the shortest hyperpath, the lenght of the longest hyperpath and the average length of the hyperpaths between v_i and v_j, respectively. In a similar manner, we define the minimum distance

$\left(d_{min}(v_i, v_j \mid v_k)\right)$, maximum distance $\left(d_{max}(v_i, v_j \mid v_k)\right)$ and average distance $\left(d_{avg}(v_i, v_j \mid v_k)\right)$ between two vertices v_i and v_j, for which there exists a hyperpath containing v_k.

Definition 7 (λ-Nearest Neighbors Set): Given a vertex $v_i \in V$ of a MSN, we define the λ-Nearest Neighbors Set of v_i the subset of vertices NN_i^{λ} such that $\forall v_j \in NN_i^{\lambda}$ we have $d_{min}(v_i, v_j) \leq \lambda$ with . Considering only the constrained hyperpaths containing a vertex v_k, we denote with NN_{ik}^{λ} the set of nearest neighbors of v_i such that $\forall v_j \in NN_{ik}^{\lambda}$ we have $d_{min}(v_i, v_j \mid v_k) \leq \lambda$

If as neighbors we consider only vertices of user type, the NN^{λ} set is called λ*-Nearest Users Set* and denoted as NNU^{λ}, similarly in case of multimedia objects we define the λ*-Nearest Objects Set* as NNO^{λ}.

On the top of such definitions, now we are able to introduce the *ranking* functions for our model. They allow to rank users or multimedia objects in a MSN in absolute way or with respect to a given topic of interest.

Definition 8 (User Ranking function): Given a user $u_i \in U \subseteq V$ and a subset of users $\mathrm{U}' \subseteq U \subseteq V (u_i \notin \mathrm{U}')$ of a MSN, a user ranking function is a particular function $\rho : U \rightarrow [0,1]$ able to associate a specific rank to the user u_i with respect to the community U' that is computed as in the following:

$$\rho_{u_i}(\mathrm{U}') = \frac{\left|NNU_i^{\lambda} \cap \mathrm{U}'\right|}{\left|\mathrm{U}'\right|} \tag{1}$$

NNU_i^{λ} being the λ-Nearest Users Set of u_i.

Definition 9 (Topic-User Ranking function): Let $u_i \in U \subseteq V$ a user, $\mathrm{U}' \subseteq U \subseteq V (u_i \notin \mathrm{U}')$ a subset of users and $a_j \in A \subseteq V$ an annotation asset of a MSN, a topic-user ranking function is a particular function $\rho : U \times A \rightarrow [0,1]$ able to associate a specific rank to the user u_i with respect to the community U' given the topic a_j that is computed as in the following:

$$\rho_{u_i}^{a_j}(\mathrm{U}') = \frac{\left|NNU_{ij}^{\lambda} \cap \mathrm{U}'\right|}{\left|\mathrm{U}'\right|} \tag{2}$$

NNU_{ij}^{λ} being the λ-Nearest Users Set of u_i with respect to the topic a_j.

Definition 10 (Multimedia Ranking function): Given a multimedia object $m_i \in M \subseteq V$ and a subset of users $\mathrm{U}' \subseteq U \subseteq V$ of a MSN, a multimedia ranking function is a particular function $\rho : M \rightarrow [0,1]$ able to associate a specific rank to the object m_i with respect to the community U' that is computed as in the following:

$$\rho_{m_i}\left(\mathrm{U}'\right)=\frac{\left|NNU_i^{\lambda}\cap \mathrm{U}'\right|}{\left|\mathrm{U}'\right|} \tag{3}$$

NNU_i^{λ} being the λ-Nearest Users Set of u_i.

Definition 11 (Topic-Multimedia Ranking function): Let $m_i \in M \subseteq V$ a multimedia object, $\mathrm{U}' \subseteq U \subseteq V$ a subset of users and $a_j \in A \subseteq V$ an annotation asset of a MSN, a topic-multimedia ranking function is a particular function $\rho : M \times A \rightarrow [0,1]$ able to associate a specific rank to the object m_i with respect to the community U' given the topic a_j that is computed as in the following:

$$\rho_{m_i}^{a_j}\left(\mathrm{U}'\right)=\frac{\left|NNU_{ij}^{\lambda}\cap \mathrm{U}'\right|}{\left|\mathrm{U}'\right|} \tag{4}$$

NNU_{ij}^{λ} being the λ-Nearest Users Set of u_i with respect to the topic a_j.

In our model the concept of *rank* of a given node is related to the concept of *influence*, and in our vision it can be measured by the number of user nodes that are "reachable" within a certain number of steps using any hyperpath, with respect to a social community of users, and eventually to a given topic of interest. By exploiting similarity relationships several paths can be "implicitly" instantiated: two users (that are not friend, do not belong to any group and do not share any multimedia object) have annotated two images that are very similar (e.g. two sunsets) on the base of their high and low level multimedia features, or they have commented two different posts which concern similar topics (e.g. sport or politics).

In a similar manner to most diffused influence diffusion models, the influence of a node decays with the path distance necessary to reach the other ones.

Thus, our ranking functions can be easily exploited to solve influence analysis problems or to support multimedia recommendation strategies.

Hypergrpah Learning

The proposed hypergraph learning approach is inspired by the methodology proposed in (Fang et al., 2014). It consists of three learning stages: hypergraph construction, topic distribution and similarity learning, and topic-based ranking.

First, extracted data related to relationships between multimedia contents, users and multimedia content and users themselves are initially used to construct the hypergraph structure in terms of nodes and hyperedges. For the annotation relationships, textual annotations are then analyzed by the LDA approach - proposed by some of the authors in (Colace et al., 2014) - to learn the most important topics and to infer relations between topics and annotation assets. From the other hand, similarity values between users, multimedia objects and topics are eventually determined using proper strategies (Boccignone, Chianese, Moscato, & Picariello, 2008). Eventually, the hypergraph global and topic sensitive ranking is performed with respect to the discovered topics.

EXPERIMENTAL RESULTS

In this section, we show some experimental results obtained through the implementation of the proposed model using different types of *graph databases*. As well-known, many of them do not natively support the hypergraph data structure, thus proper mapping techniques are necessary to transform the hypergraph into an equivalent graph, such as *clique expansion* (Zien, Schlag, & Chan, 1996) or *clique average* (Agrawal, Gehrke, Gunopulos, & Raghavan, 2005).

For our experiments, we decided to adopt two different graph databases: *HypergraphDB*[1] (supporting the hypergraph data structure) and *Neo4J*[2] (together with the clique expansion technique).

We performed two kinds of evaluation: firstly we analyze the scalability of the two databases for hypergraph management with respect to the graph size, and successively we show an application of our ranking functions on music domain using Last.fm data[3] to identify the related more "important" objects.

Scalability

In the first stage of our experimental evaluation, we compared the hypergraph construction and shortest hyperpath computation times varying the related topology and size. To this goal, we automatically generated three different types of connected graphs (see Table 2):

- **Low-degree connection:** The graph is connected and each node has a number of incident edges varying from 5 to 8;
- **Medium-degree connection:** The graph is connected and each node has a number of incident edges varying from 9 to 12;
- **High-degree connection:** The graph is connected and each node has a number of incident edges varying from 13 to 16.

Figures 12, 13, and 14 show the comparison between HypergraphDB and Neo4J concerning the average construction times with respect to the three different types of dataset. It is possible to note that the use of a graph database technology based on the hypergraph data structure has comparable perfor-

Table 2. Artificial datasets

Type	Nodes	Hyperedges	Edges
Low-degree connection	20000	120,875	582,284
	50000	302150	1,447,267
	100000	603.263	2,900,547
Medium-degree connection	20000	200,756	741,125
	50000	502201	1,849,976
	100000	1,004,047	3,680,928
High-degree connection	20000	280,831	894,389
	50000	702100	2243848
	100000	1,404,247	4,508,468

Figure 12. MSN construction times: Low-degree connection

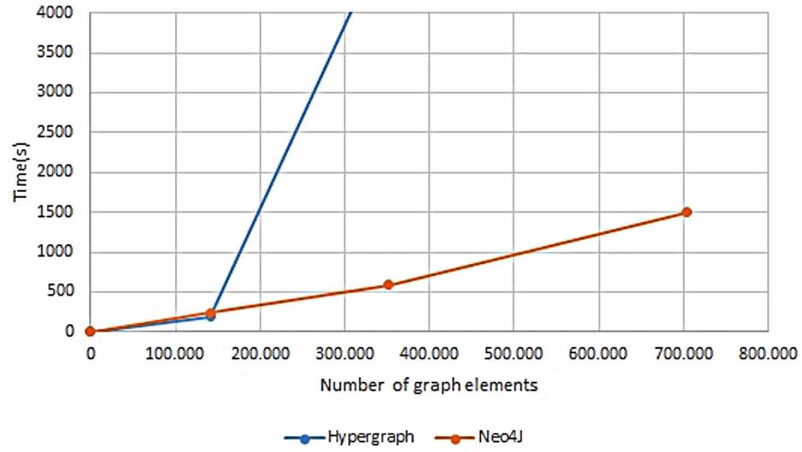

Figure 13. MSN construction times: Medium-degree connection

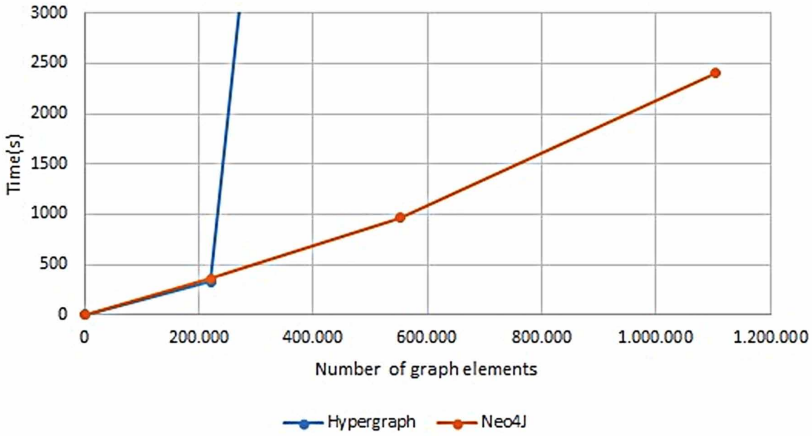

Figure 14. MSN construction times: High-degree connection

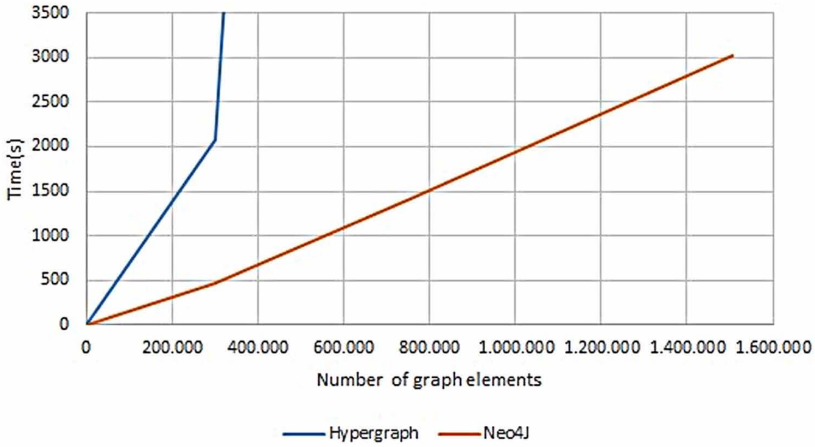

mances with a classical graphdb only for small graphs. From the other hand, Figure 15 reports the comparison in terms of shortest hyperpath computation times for a graph with a medium degree of connection of about 400000 elements, varying the λ (The hypergraph-based modeling) value. Also in this case, HypergraphDB exhibit worse performances than Neo4j database.

Last.fm

In the second stage of our experiments, we want to show a possible application of our model and of the related ranking functions in the music domain.

In particular, we used as dataset a music collection[4] containing a set of data extracted from the Last.fm multimedia social network in the first half of 2009. Table 3 reports all the information related to

Figure 15. Shortest hyperpath computation times

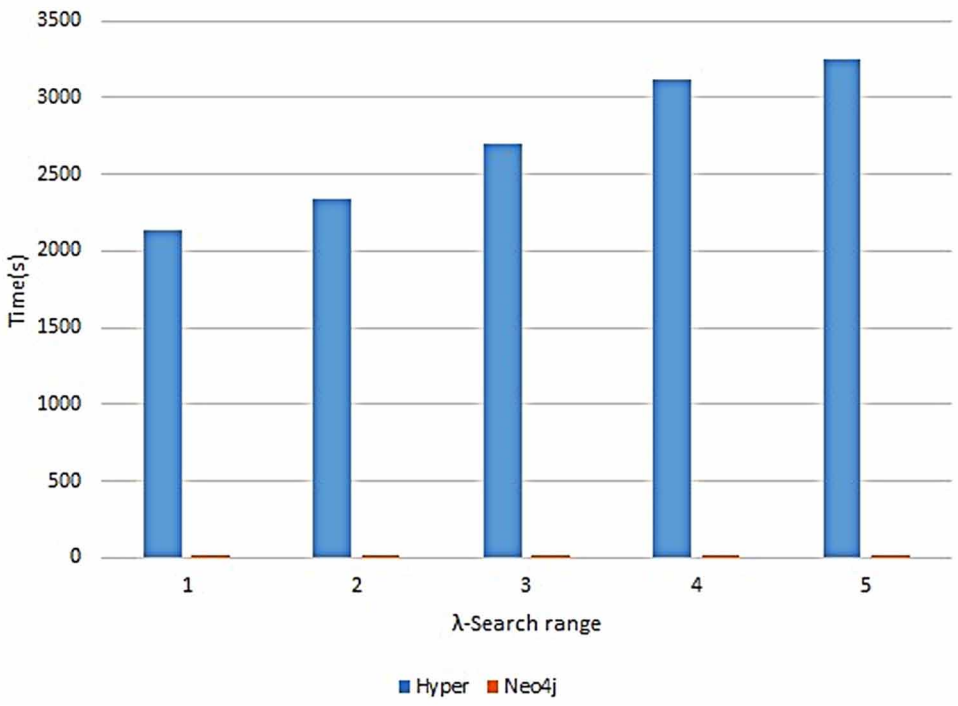

Table 3. Last.fm dataset

Element	Number
Crawled users	99,405
Annotations	10,936,545
Items	1,393,559
Tags	281,818
Groups	66,429

adopted dataset. In addition, through the help of some domain experts, we preliminary classified the songs belonging to the dataset with respect to the related musical genre (e.g. rap, pop, rock, etc.).

We selected as nodes of our hypergraph *users*, *topics* discovered by the analysis of tags used in the annotation, and *items* (songs eventually with the related raw data and multimedia description). In addition, we considered the following relationships: friendship, membership, annotation, user and multimedia similarities. We computed the similarity between two users leveraging the *neighborhood* values provided by the Last.fm API and between two songs using Spotalike [5] facilities (based on the low-level features) together with Last.fm *similarity score*.

Then, we computed the ranking functions for two specific users' communities: *rap* and *pop*.

Figure 16 shows the average values of users' ranking for each community varying λ. We can note that these communities have a strong degree of interconnection among users: using low values of λ, we rapidly obtain that each node assumes the highest ranking value.

From the other hand, we report in Figure 17 the average values of multimedia ranking. In this second case, we can observe that for smaller communities as rap the multimedia ranking values rapidly grow up to the maximum value with λ (each user have in some way interacted with all the musical items), in the opposite for larger communities as pop ranking values exhibit a more slow trend.

Finally, we show in Table 4 the Top-5 songs with respect to the computed ranking values for each examined community. In addition, Table 5 reports the most important users (id) for the considered communities. We can notice that the most important songs for our ranking are effectively those with the higher number of global "scrobbles".

Figure 16. User ranking

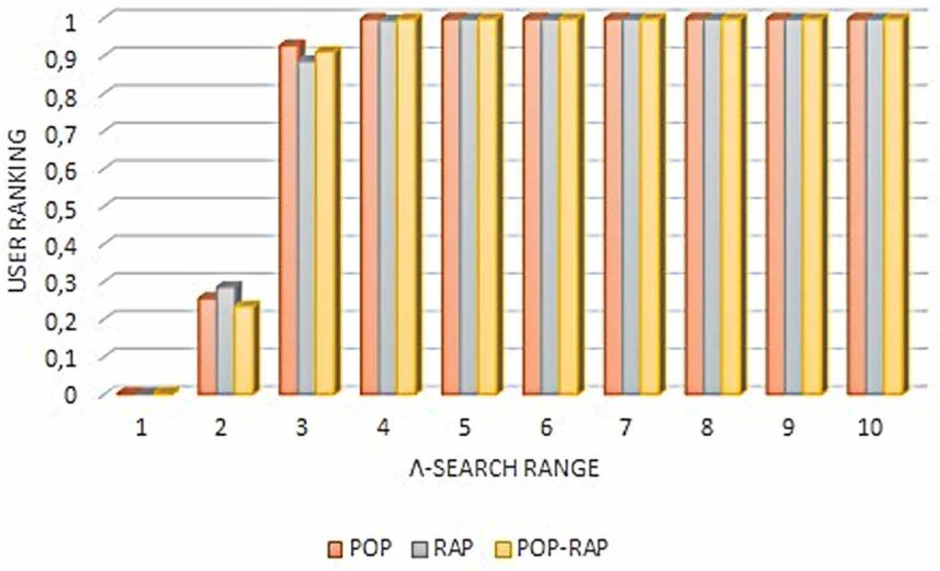

Figure 17. Multimedia ranking

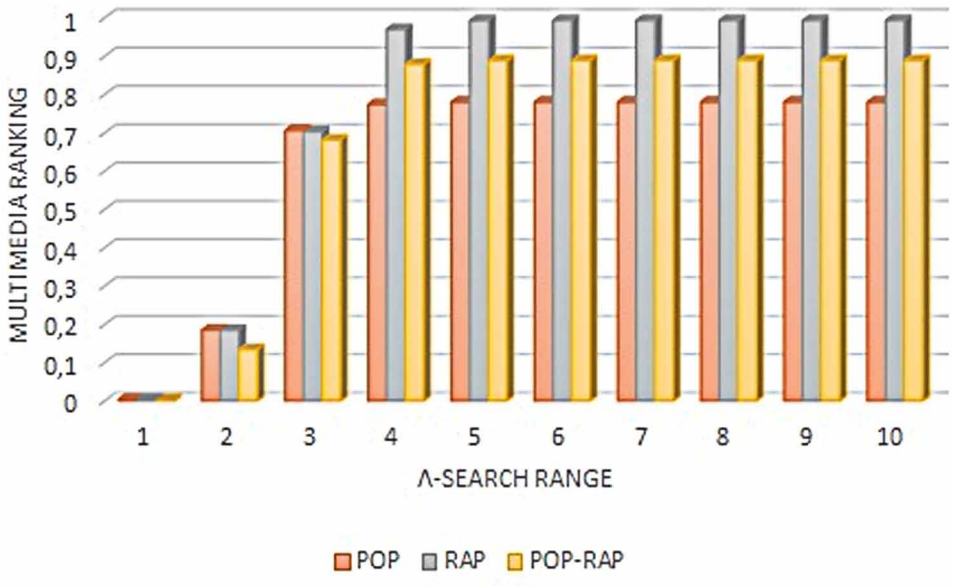

Table 4. Multimedia Top-5 for pop, rap and pop-rap communities

Pop	Rap	Pop-Rap
Lady Gaga – I like it rough	Eminem – We made you	Madonna – Hung up
Klimt 1918 - Snow of ’85	Jay-z – U dont know	Britney spears - Piece of me
Rihanna – Umbrella [feat. jay-z]	Dr. dre - Big,ego’s	Mariah carey - Reflections
Estelle feat. Kanye West - American boy	Eminem – Forgot about dre	Eminem - Mockingbird
Michael Jackson - Don’t stop ’til you get enough	Snoop dogg - Pass it pass it	Eminem - My fault

CONCLUSION AND FUTURE WORKS

In this paper we described a novel data model for *Multimedia Social Networks*, combining information on users together with the multimedia content, with several applications.

Using hypergraphs, the model allows us to represent in a simple way all the different kinds of relationships that are typical of a MSN (among multimedia contents, among users and multimedia content

and among users themselves) and to enable several kinds of analytics and applications by means of the introduction of some ranking functions.

In addition, we provided a strategy for hypergraph learning from data coming from different OSNs (e.g. Facebook, Twitter) and MSSs (e.g Flickr, Instagram, Last.fm, Youtube) and presented some preliminary experimental results using Last.fm data.

Future work will be devoted to extend experimentation of our system prototype (in the current version it allows the hypergraph browsing and the computation of rankings) to other multimedia social networks. Successively, we are planning to exploit the introduced ranking functions to support multimedia recommendation and influence analysis applications, in order to perform an experimental evaluation of the proposed model for the cited problems.

Chapter 33
The Use of Eye-Gaze to Understand Multimedia Learning

Malinda Desjarlais
Mount Royal University, Canada

ABSTRACT

There is great interest in how learners construct knowledge when presented with multimedia. Although information has been gained from evaluating recall performance across multimedia conditions, the use of eye-gaze indices for understanding multimedia learning is becoming increasingly popular. Within the multimedia learning literature, researchers have used duration, frequency and sequence of fixations as well as shifts in eye-gaze to identify differences regarding the selection, organization, and integration of information among learners. The current chapter provides a discussion of eye-gaze measures that have been employed in multimedia research and their related interpretations for the attentional process that takes place during the learning phase. In addition, considerations for using eye-gaze measures to understand multimedia learning are presented.

INTRODUCTION

Educators and researchers have long been interested in how learners construct knowledge. Relatively recently, attention has been devoted to information processing when learners are presented with multimedia. Multimedia presents learners with information consisting of verbal (spoken and/or written text) and pictorial (static and/or dynamic visualizations including drawings, photos, animations, graphics, and videos) representations which may or may not be relevant to the individual's learning goals. Multimedia presentations are increasingly being used to present information in both formal and informal learning contexts. These contexts, include but are not limited to the traditional classroom, online during distance learning courses, slideshows, Internet websites, educational-focused apps on smartphones and tablets, and during work presentations. Much empirical research supports that people learn better from multimedia, when the presentation is designed effectively, than from words alone (Fletcher & Tobias, 2005).

DOI: 10.4018/978-1-5225-3822-6.ch033

In effect, there has been a call for investigations of information processing during multimedia learning and the variables that influence knowledge acquisition.

Although information has been gained from evaluating recall performance across multimedia conditions (see Mayer, 2005 for a review), the use of eye-movement indices for understanding multimedia learning is becoming increasingly popular. Indeed, area journals have devoted special issues to eye-gaze research regarding multimedia learning (e.g., ACM Transactions on Multimedia Computing, Communication & Applications, 2007, vol. 3; Learning & Instruction, 2010, vol. 20). To highlight the unique knowledge eye-gaze recordings have contributed to the understanding of learning from multimedia, the current chapter is structured as follows: background to eye-gaze research is provided for readers not familiar with the methodology, followed by a discussion of information processing during multimedia learning based on eye-gaze measures. The objective of the current chapter is not to provide a comprehensive review of the multimedia literature, but rather to provide a discussion of the eye-gaze measures that have been employed in multimedia research and their related interpretations for cognitive processing during the learning phase.

BACKGROUND ON EYE-GAZE RESEARCH

According to the eye-mind hypothesis (Just & Carpenter, 1980) and the assumption of the eye-mind link (Reichle, Pollatsek, & Rayner, 2006), there is a close association between the element of the visual field a person is fixating on (aka overt attention) and his/her cognitive attention (aka covert attention). It is assumed that individuals are attending to the element of the visual field which their eyes are fixated (Anderson, 2000; Wang, 2011). When people attend to information they make a sequence of fixations separated by fast eye movements known as saccades. Fixations capture the motionless gaze or pauses that typically last about 200-500ms when visual information enters the information processing system; on the other hand, vision is suppressed during saccades (Rayner, 1998; Viviani, 1990). Therefore, information abstracted from learners' fixations - including duration, frequency, location, or sequence - has been considered the most meaningful for understanding attentional processes during multimedia learning.

According to Lai et al. (2013), popular eye-gaze measures can be categorized into the following three different scales of measurement: temporal, count, and spatial. Temporal eye-gaze measures involve the length of time a person is fixated on a particular element of the visual field, either on average, in entirety, or relative to other fixation locations; whereas, count measures involve frequency counts of fixations in particular areas of the visual field. While the most popular method for assessing differences in frequency and duration of fixations has been quantitative, some researchers have compared heat maps to assess temporal differences among learners. Heat maps show the overall visual distribution using color codes to differentiate the time spent fixating on each location of the visual field. This visual display enables researchers to identify at a quick glance which elements were attended to most and least often for either individuals or on average when collapsed across participants in a particular group/condition. Often the number and length of fixations have been used to answer questions related to how learners process information and which elements in the visual field receive greater attention.

Generally, it is agreed upon that fixation frequency and duration indicate attention (Wang, 2011) and the amount of cognitive processing engaged with fixated information (Anderson, Bothell, & Douglass, 2004; Graesser, Lu, Olde, Cooper-Pye, & Whitten, 2005; Just & Carpenter, 1980; Rayner, 1998). However, it is ambiguous as to whether extensive processing of a particular element is due to perceived impor-

tance or to difficulty (Rayner, 1998). In his review, Rayner (1998) describes that increased processing difficulty is related to longer fixations, suggesting that learners would need to attend to more difficult information for longer periods of time in order for cognitive processing to be successful. Given that attention to relevant information is often positively related to performance on learning tests in multimedia literature (Desjarlais, 2013; Hannus & Hyönä, 1999; O'Keefe, Letourneau, Homer, Schwartz, & Plass, 2014; She & Chen, 2009), researchers typically conclude that more and longer fixations are indicators of successful information processing even if fixations are a product of increased cognitive load. It should be noted, however, that some multimedia researchers have reported negative correlations between mean fixation duration for relevant information and test performance (e.g., Ozcelik, Arslan-Ari, & Cagiltay, 2010). Ozcelik and colleagues (2010) suggested that higher average fixation durations occurred when information was harder to understand.

Since learners can exhibit the same fixations for similar lengths of time but in a different sequence, spatial measures of eye-gaze have been used in attempt to account for individual differences in learning. Researchers record fixations in a space dimension such as location, sequence, and transitions. Transitions refer to shifts between one element of the visual field to another, with a greater number of shifts implying greater interplay or integration between elements (Schmidt-Weigand, Kohnert, & Glowalla, 2010). The sequence of eye-gaze, also referred to as saccades or scan paths, show the location of the learner's fixations and their connections in order. Scan paths provide a visual representation of the distribution of fixations using circles in which the size of the circle is directly related to the fixation time for that position in the visual field before eye gaze shifted. The fixation circles are connected by a line and are identified according to their sequence in the learning session. Thus, scan paths provide information regarding both the selection of information and sequencing of attention. Another method to assess differences in locations attended to along with their sequences include the Levenshteins' distance measure. When using the Levenshteins' distance measure, the sequence of fixations are determined for each participant and considered as the input data. Similarity scores for each possible pair of participants in a group/condition are calculated, and the mean similarity scores for the groups of learners are then typically compared. Similarity scores are based on the number of insertions or deletions needed to transform the sequence for one learner into that of another learner, where a smaller value represents a greater similarity between the scan paths (Jarodzka, Scheiter, Gerjets, & van Gog, 2010).

Similar to temporal and count measures, the interpretation of spatial measures are not straightforward. Although differences in fixation sequences and transitions reveal differences in the learning process, multiple sequences may be associated with similar levels of learning gains and thus it is questionable what differences in eye-gaze patterns actually mean. More attempts to integrate information may represent either success of readers' construction of referential connections between sources or problems when integrating information (Holsanova, Holmberg, & Holmqvist, 2009; Johnson & Mayer, 2012). Given that an increase in recall performance is typically associated with a greater number shifts between conceptually related information (Mason, Trornatora, & Pluchino, 2013; O'Keefe et al., 2014), multimedia researchers often consider the presence of transitions as an indicator of successful information processing. However, some studies have shown that while the number of transitions changed due to certain features within the multimedia, such as the inclusion of signals, an increase in transitions was not related to learning outcomes (Scheiter & Eitel, 2015). Therefore, the interpretation of changes in eye-gaze behavior is still debatable.

It should be noted that analyzing fixations during multimedia learning, whether the measures are based on duration, frequency, or sequence, typically require researchers to first separate the elements

of multimedia into what is referred to as areas of interest (AOIs). AOIs are precise researcher-specified areas in the visual display, such as introductory text, glossary items, relevant components of text or images, or interesting but irrelevant segments. Researchers can then determine the total or mean frequency, the amount of time, or the order in which learners attended to a particular AOI or groups of AOIs (e.g., all relevant information).

EYE-GAZE MEASURES IN MULTIMEDIA RESEARCH

Based on the dual-coding theory (Paivio, 1986) and theories of working memory (Baddeley, 1986; Chandler & Sweller, 1991), the cognitive theory of multimedia learning postulates that meaningful learning occurs when learners engage in the following three kinds of cognitive processes: selecting, organizing, and integrating (Mayer, 2005; Mayer & Moreno, 1998; Mautone & Mayer, 2001). Sensory information in the form of verbal (spoken/written text) and pictorial (static/dynamic visualizations) representations enter the information processing system through separate visual (eyes) and auditory (ears) channels. Learners then actively attend to or *select* the elements of the multimedia presentation for further processing. Information that is selected from sensory memory is moved into working memory where learners *organize* words into a coherent verbal representation and pictures into a pictorial representation. Next, learners *integrate* or merge the verbal and pictorial models with relevant prior knowledge to construct a coherent mental model. Selecting, organizing and integrating are active mental processes that are constrained by the limited cognitive capacity of the information processing system. That is, only a limited amount of cognitive processing can take place in either the visual or auditory channels at any one time (Baddeley, 1986; Chandler & Sweller, 1991).

There has been great attention devoted to guiding learning from multimedia, including identifying design features of multimedia and learner characteristics that impact instructional efficacy (Crooks, Cheon, Inan, Ari, & Flores, 2012; Kalyuga, Ayres, Chandler, & Sweller, 2003; Leslie, Low, Jin, & Sweller, 2012; Mayer, Heiser, & Lonn, 2001; Tabbers & van der Spoel, 2015). Although there currently is an understanding of how to design effective multimedia and the individual differences that need to be considered, the reasons driving the relations with performance have been largely speculative; that is, until the recent popularity of eye-gaze research in multimedia learning. Eye-tracking methodology has provided valuable insights into the encoding and attentional processes carried out during the learning phase (Hyönä, 2010). The general questions that have been addressed by examining eye-gaze in multimedia learning research include: Where is attention distributed during the learning phase? Why does a particular instructional design feature work to promote learning? And, how do learner characteristics facilitate learning? The following sections in this chapter provide an overview of the contributions of eye-gaze research for addressing the aforementioned three questions, while highlighting the three categories of eye-gaze indices and their relation to the three cognitive processes. Table 1 (Appendix) presents a summary of findings from multimedia learning research involving eye-gaze recordings organized by the cognitive process (i.e., selection, organization, and integration) that was assessed as well as whether the findings address visual distribution in general or as a function of contextual or learner characteristics.

How Do Learners Distribute Their Attention During Multimedia Learning?

Researchers have used eye-gaze measures to understand the way in which learners distribute their attention during a multimedia presentation that facilitates learning. First, the length of fixations has been commonly used to assess differences in learners' attention to multimedia elements. Using AOIs researchers differentiate relevant from irrelevant (or less relevant) information as well text from picture content. Overall and average fixation duration is greater for task-relevant over irrelevant segments (Hannus & Hyönä, 1999; Kaakinen, Hyönä, & Keenan, 2003; Slykhuis, Wiebe, & Annetta, 2005) and for text compared to pictures (Ho, Tsai, Wang, & Tsai, 2014; Johnson & Mayer, 2012; Liu & Chuang, 2011; Schmidt-Weigand et al., 2010; Stone & Glock, 1981). Based on the above findings, researchers have suggested that learners are able to adequately identify and select relevant information and that the processing of pictorial material was mainly driven by the text. Moreover, Desjarlais (2013) examined differences in study behaviours between learners with high levels of attention to relevant information (which was computed as a total proportion of time fixated on relevant information) compared to low levels of attention when learning from Internet websites containing text and pictures. Learners with high levels of sustained attention more frequently deployed context-effective navigational patterns and reading strategies and explored information in a more linear fashion, suggesting that sustained attention may be impacted by the monitoring of one's progress towards the learning goal.

Sequences and transitions of eye-gaze have been used to understand the order of elements attended to and the interplay between text and illustrations. Order of attention has been explored by examining the location of learners' initial fixations (Ozcelik, Karakus, Kursun, & Cagiltay, 2009; Schmidt-Weigand et al., 2010; Stone & Glock, 1981), and the location of the AOI when a switch in visual attention to another modality occurred (Hegarty & Just, 1993; Liu & Chuang, 2011). Schmidt-Weigand and colleagues (2010) found that 91% of the first five fixations were associated with the text among all scene changes during the dynamic multimedia. They suggested that learners construct an initial understanding of the material based on the text before elaborating on their mental models with information from the picture. Similarly, Hegarty and Just (1993) presented learners with text and a static image and found that an average of 55.6% of the diagram inspections occurred following the completion of reading a clause or sentence. The researchers argued that the content of the text guides attention to the parts of the picture that are necessary/complementary for understanding the material. In either case, learners often selected and started reading text before shifting attention to accompanying pictures in order to supplement the mental model formulated from the text. In contrast, others have reported an alternative learning process. For example, Stone and Glock (1981) examined participants' initial fixations and found that within the first 1 to 2 seconds of viewing a multimedia consisting of text paired with an illustration, participants tended to inspect the picture first and then shifted gaze to the text. The researchers presumed that by using this strategy learners were able to obtain a first impression or gist of overall theme which they then could use as a base for formulating the mental model from the text-based content.

The integration of text and corresponding illustration elements during multimedia learning has been examined using spatial eye-gaze measures. For example, Hegarty and Just (1993) examined the number of shifts in overt attention from text to pictures. There was an average of 6.07 shifts, which given the

short nature of the multimedia presentation indicates relatively high interplay between the modalities. Hegarty (1992) made similar observations when examining the scan paths of participants. Hannus and Hyönä (1999) also examined the interplay between text and illustrations during the learning phase of their fourth-grade participants. In lieu of using the number of transitions, the researchers coded the amount of time children looked back and forth between the relevant illustration and the target text segment using a 5-point scale. A score of 5 represented extensive interplay and was obtained when a participant made at least 3 relatively long fixations on the relevant illustration following the text segment. A score of 3 was assigned for one to two short fixations on the relevant illustration following the text segment and finally a score of 1, which represented no interplay, was assigned when a participant did not make any fixations on the relevant illustration. The overall average was 2.3 indicating limited interplay for the younger learners.

Researchers have also used eye-gaze measures to explore the learning process as it evolves over time. For instance, Hegarty and Just (1993) reported that the total number and duration of fixations corresponding to a diagram increased over time. They attributed the increase in the inspection of the diagram to an increase in complexity of the text-based content, and thus learners progressively relied on the diagram to aid in their understanding of the text. In addition, Ozcelik et al. (2009) compared fixations for the technical terms presented in the text with those for illustration materials corresponding to each 10 sec interval that occurred during the initial 40 sec of the multimedia presentation. A duration of 40 sec was chosen given that 49 sec was the minimum length of the learning phase for the self-guided presentation. During the first two 10-sec intervals the total fixation time was longer for the technical terms within the illustration than the text; however, this difference disappeared during the subsequent two 10 second intervals. Supporting Stone and Glock (1981), Ozcelik et al. (2009) suggested that learners initiate their studying of the material by looking at the illustration and then shift their attention to the text.

Overall, eye-gaze measures have contributed to an understanding of multimedia learning. Learners exhibit little difficulty identifying and sustaining attention on relevant information and often select text-based information over illustrations to form their mental models. There are differences across the research in terms of what learners typically attended to during the initial stage of the learning phase, which may be attributed to differences in multimedia formats; however, within studies there was consistency regarding where learners looked first when considering attention to text and illustrations. Therefore, differences in learning may not be attributable to the selection of information but rather result from differences that occur during the organization and/or integration processes when building a mental model. Regardless of the modality learners attend to first or for the longest, learners seem to move back and forth between verbal and pictorial information, even slightly, in attempt to integrate information into a single mental model. Moreover, attentional patterns change throughout the learning phase, possibly as learners monitor their own learning to ensure that the mental model is meeting their learning goals.

Why Does a Particular Design Feature Work to Promote Multimedia Learning?

Knowing that multimedia can aid learning compared to text alone, attention has been devoted to identifying design features for multimedia that further promote learning. Research based on performance measures has led to the establishment of multiple principles regarding instructional efficiency (see Mayer, 2005 for an overview). The principles of multimedia design that are pertinent to the current chapter include:

1. The spatial contiguity principle, which states that placing corresponding text and pictures physically close to one another on the screen rather than at a distance facilitates learning (Ayres & Sweller, 2005);
2. The signaling principle, which states that the inclusion of signals/cues promote learning by identifying for the learner the relevant information (Mautone & Mayer, 2001);
3. The coherence principle, which postulates that eliminating unnecessary verbal or pictorial information from the presentation facilitates learning (Ayres & Sweller, 2005; Kalyuga, Chandler, & Sweller, 1999); and,
4. The modality principle, which indicates that learning is facilitated when animation is paired with narration rather than text (Moreno & Mayer, 2002).

By understanding how individuals process information from multimedia under various conditions, design of these materials can be optimized to further enhance learning (Mayer & Moreno, 2002). Eye-gaze research has shed light on why the aforementioned multimedia designs guide learning, and a discussion of this research is provided below.

First, according to the spatial contiguity principle, when multimedia presents integrative information physically distant on screen learners must split their attention between the conceptually related sources of information that are essential for understanding the material (Ayres & Sweller, 2005). It is presumed that having to scan back and forth to mentally integrate the multiple sources of information places extraneous cognitive load on the learner, hindering learning compared to multimedia that presents conceptually related information in close proximity. In order to investigate the mediating factors involved in the contiguity effect, three studies included temporal and spatial eye-gaze measures. Holsanova and colleagues (2009) presented learners with newspaper articles consisting of words and graphics either within close or far proximity from one another and assessed the proportion of integrative transitions between conceptually related text and picture segments made by participants. In addition to comparing integrative transitions, Johnson and Mayer (2012) examined the proportion and total fixation duration for text between groups presented with multimedia where text was either separated or integrated with a conceptually related illustration. Bayram and Bayraktar (2012) assessed the number and duration of fixations along with comparing heat maps among learners studying from integrated versus separated dynamic multimedia.

Johnson and Mayer (2012) reported no difference in the number or total duration of fixations with text between the integrated and separated multimedia designs. They concluded that the selection of information within the cognitive learning process is not impacted by proximity. In contrast, Bayram and Bayraktar (2012) did find that learners fixated on target areas more and for longer overall when studying from an integrated compared to separated multimedia design. As such, they concluded that learners in the integrated group were more focused on the instructional material. Regarding the shifts between sources, Johnson and Mayer (2012) as well as Holsanova et al. (2009) reported that readers did make more integrative transitions overall and more transitions between text and corresponding elements in a picture when learning from the integrated format as compared to the separated format. A greater number of integrative transitions may result because the corresponding information is easier to find between sources when material is integrated, whereas learners treat the text and picture as two separate units when separated. Therefore, Johnson and Mayer (2012) claim that integrated presentations encourage learners to make successful connections between words and pictures. Overall, while the integration of information may not improve attention to relevant content, integrated multimedia does seem to guide

learners to successfully organize verbal and pictorial representations and integrate these into a successful mental model.

Chuang and Liu (2012) also compared integrated and separated multimedia presentations, but did so using a different format. Instead of manipulating the physical distance between pictures and text on a single screen, Chuang and Liu (2012) asked learners to study information from a multimedia presentation consisting of either five successive pages or a single page detailing the formation of lightning. They assessed the total number and duration of fixations as well as the scan paths. Therefore, the conceptually related text and images were presented physically close together on screen throughout the presentation, but all information was available at once during the integrated presentation whereas the separated presentation required learners to hold information from previous steps in the process in their working memory while attending to successive material. The number and duration of fixations for pictures was greater for the segmented design than the single page multimedia, suggesting that segregated sources heightened interest for the learner (based on frequency data) but decreased learning efficiency for the images (based on duration data). This is one study in which longer fixations were regarded negatively in terms of information processing. On the other hand, the number of fixations on text was the same between the conditions indicating that information processing efficiency was the same for text areas regardless of the design. Chuang and Liu (2012) used a qualitative approach to examine the scan paths. Specifically, they described individual differences observed in sample students' scan paths between the two conditions. For example, in the single page condition, one participant fixated predominantly on the text with only one fixation appearing on the image. Another participant's eye fixations were distributed across the text and image, with the movements within the image primarily occurring as shifts to and from the text. In contrast, one participant in the multiple page condition fixated predominately on text for the first page but then showed more integration between text and image for the second page. Based on the examples provided, the researchers concluded that students appear to be more cognitively engaged with the pictorial information when the material was presented in segments rather than in a single page.

Second, signaling or cueing learners involves visually highlighting specific passages or image segments in the multimedia to guide learners' attention to relevant information in a particular order. A variety of signals have been compared for their effectiveness, such as spotlights, highlighting, arrows, and changing colors (Boucheix & Lowe, 2010; Harp & Mayer, 1998; Jamet, 2014; Sung & Mayer, 2012). Although performance is enhanced with the presence of cues, it is less clear whether signals actually result in increased attention to relevant sources and consequently decreased attention to irrelevant information. The purpose of the present discussion is not to compare cues, but rather to explore what information eye-gaze measures have provided when researchers have compared cued to non-cued designs.

Not surprisingly, differences in learner attention patterns between experimental conditions have been found. The total as well as mean number of fixations and the total fixation time for relevant (signaled) information were greater for groups who received cues versus no cues (Boucheix & Lowe, 2010; Jamet, 2014; Ozcelik et al., 2009; Ozcelik et al., 2010; Scheiter & Eitel, 2015). Signaled areas were also fixated on longer (when considering fixation duration overall, Lowe & Boucheix, 2011; Ozcelik et al., 2010; mean fixation duration, de Koning, Tabbers, Rikers, & Paas, 2010; proportion of time fixating, Kriz & Hegarty, 2007) as well as more frequently (i.e., greater mean number of eye fixations; Scheiter & Eitel, 2015) compared to non-signaled elements. Students who were not presented with cues took longer to fixate on target elements compared to students for whom those elements were signaled (Scheiter & Eitel, 2015). Researchers claim that the increased fixation data supports the idea that the comprehension improvement associated with the cued format was a result of the cue redirecting attention to relevant elements of the

multimedia for essential processing (e.g., Boucheix & Lowe, 2010; Jamet, 2014; Ozcelik et al., 2009). Indeed, Scheiter and Eitel (2015) show that even when the signals within a diagram do not correspond to the text, attention is still guided to the signaled information. Specifically, during the initial pages of a multimedia presentation the mean fixation count was higher on signaled (but non-corresponding) elements for those who were presented with signals versus students without signals. The effect of signaling vanishes, however, as students learn that the signals are not helpful for learning. Approximately half way through the presentation, there was an evident shift in mean fixations (and attention) away from signaled information and toward relevant (non-signaled) information.

Jamet (2014) expanded on such analyses above by examining when the shift in gaze to cued information occurred. The percentage of time in which the gaze shifted to the cued information prior to, as well as 2 sec following, the conceptually related information being shared in the narration were calculated. While no differences in attention were observed between the groups following the evocation in the narration, gaze shifted to the target element of the image just prior to being discussed in the narration more often when the cue was present. The cue, therefore, seemed to be helpful for directing gaze more quickly but not necessarily in entirety. Furthermore, to consider how the learning process evolved over time, de Koning et al. (2010) separated the learning phase of their participants into five segments of 22 sec each. They then examined the proportion of time fixated on target information for participants who received a cued versus non-cued multimedia. Cueing resulted in more visual attention initially, but differences in attention between cued and non-cued multimedia disappeared over time, suggesting that cueing may be helpful to guide attention only initially. Overall, eye-gaze data supports the presumption that cues/signals guide attention, at least during the initial stages of the learning phase. Taking into account the facilitative effect of cues for learning, learners exposed to multimedia with cues may start off with a more successful mental model to build on during the latter stages of the learning phase.

Third, seductive details include emotionally interesting verbal statements and attention-grabbing images added to a presentation in order to increase reader interest and capture learner attention, and thus are presumed to promote learning (Chang & Choi, 2014). However, according to the coherence principle, learning is facilitated by the elimination of such unnecessary information. Indeed, the relative amount of gaze duration on (or attention to) seductive text segments is negatively related to test performance (Chang & Choi, 2014). The inclusion of seductive details may hinder learning because of distraction, disruption or diversion (Harp & Mayer, 1998; Rey, 2012). According to the distraction hypothesis, seductive details may seduce selective attention away from relevant information. Then, because seductive details require little attentional effort and are easily understood, learners may remember seductive details in lieu of the target information. According to the disruption hypothesis, learning of a causal chain of events requires steps to be integrated and when seductive details are presented they interrupt the connections being made between main ideas. Each step in the causal chain is then cognitively processed as an independent event making it difficult to organize information into a single coherent mental model. However, in Rey's (2012) meta-analysis, support for all the hypotheses were provided, as well as contradictory support for whether or not there is an effect on learning when seductive details are included. Rey (2012), therefore, made a call for more eye-tracking studies to understand the seductive details effect.

In one eye-gaze study of the seductive details effect, Rey (2014) compared overt attention among learners who studied from one of the following four multimedia: consisting of only relevant text and images, added seductive images, added seductive text, or added seductive text plus images. Although those who did not receive any seductive text passages or illustrations performed better on learning tests than those who received one or both types of seductive details, Rey (2014) reported a significantly shorter

total fixation time on relevant material when seductive details were excluded as compared to students who received seductive images only. There were no differences in fixation duration for the relevant material between the group with no seductive information and either those with seductive text or both seductive text and images. Students with seductive text passages fixated longer in total on relevant information (marginally significant) compared to those with seductive text and images. Rey (2014) regarded the fixation duration as a measure of positive performance and thus suggested that the inclusion of seductive details, to a certain extent, served to increase arousal to an optimal level which then sustained attention on relevant information. Although the presence of seductive details appeared to hinder learning, Rey's (2014) findings support the assumption that seductive details increase interest in the material, leading to higher persistence during learning (Park, Kim, Lee, Son & Lee, 2005; Schnotz, Fries, & Horz, 2009).

Last, according to the modality effect, pictorial information presented with spoken rather than written text leads to better learning outcomes. The underlying principle of this relates to the dual-channel assumption of information processing. When information is presented simultaneously in the same sensory channel (visual or auditory), it is presumed that learners need to split their attention in order to incorporate the information from the sources into their mental model. Alternatively, attention does not need to be spilt when one source is visual and the other is auditory, and thus the representations enter the information processing system through two different sensory channels (Mayer & Moreno, 2002). To test this principle, Schmidt-Weigand et al. (2010) presented learners with an animation accompanied by written text or a narration. The total viewing time of the animation was greater among learners who received the narration than the written text, although there was no difference in learning outcomes. She and Chen (2009) found similar findings with 7th graders learning science regarding the number of fixations and mean fixation duration. Therefore, attention is diverted away from the picture when learners need to read text, supporting the underlying principle of the modality effect.

In summary, performance measures have shown that different instructional designs optimize multimedia learning. A comparison of attention between particular AOIs (e.g., integrated vs. separated sources, signaled vs. non-signaled information, relevant information with vs. without seductive details included) and exploration of transitions in attention between designs (e.g., integrated compared to segmented text and illustrations) has confirmed presumptions regarding mediating factors associated with different multimedia principles. It should be noted that only a selection of the multimedia features investigated have been presented in this chapter. Eye-gaze measures have also been used to explore changes in information processing depending on the pace of presentation (Meyer, Rasch, & Schnotz, 2010; Schmidt-Weigand et al., 2010), the inclusion of narration in general (Slykhuis et al., 2005; Wiebe & Annetta, 2008), as well as the presence of redundant information (Liu, Lai, & Chuang, 2011). Eye-gaze measures have provided insight into what is attended to and when; however, they still fall short in identifying specifically what cognitive processes (selection, organization or integration) are facilitated or hindered by the different design features.

How Do Learner Characteristics Facilitate Learning?

Multiple individual differences account for variation in information processing. Three of the popular learner characteristics considered in multimedia learning that have been explored using eye-gaze measures include expertise, intellectual ability, and working memory capacity. First, differences in the learning phase as a function of expertise have been examined using temporal and spatial measures. For example, there is evidence that learners with higher domain knowledge fixate faster (Gegenfurtner, Lehtinen, &

Säljö, 2011; Liu et al., 2007) as well as fixate longer and more (Canham & Hegarty, 2010; Ho et al., 2014; Jarodzka et al., 2010; van Gog et al., 2005) on relevant/target areas as compared to when learners have low domain knowledge. In terms of spatial measures, a variety of methods have been used to examine transitions. Based on frequency counts, a greater number of transitions between elements were reported for participants with greater levels of prior knowledge (Yang, Chang, Chien, Chien, & Tseng, 2013). Similarly, although differences in prior knowledge were not observed between three patterns of visual behaviors based on a fixation times with a variety of elements, prior knowledge was positively associated with specific behaviors including total number of integrative transitions and total duration of fixations on text that occurred after a shift from the illustration (Mason et al., 2013). Ho and colleagues (2014), on the other hand, examined differences in experts' and novices' attention using heat maps. Learners with high domain knowledge typically read both the text and picture, whereas learners with low domain knowledge focused on the text and rarely inspected the picture. In addition, Jarodzka and colleagues (2010) used the Levenshteins' distance measure to compare the scan paths between experts and novices. They found that scan paths were more heterogeneous between experts than novices, concluding that either experts employed more individualized strategies or novices did not use any strategies to guide their learning. Across the research, expertise appears to facilitate the selection of relevant information while easily ignoring irrelevant material, and also encourages successful integration. However, since expertise has been investigated as a between-groups variable (Liu, Gale, & Song, 2007; van Gog, Paas, & Van Merriënboer, 2005) more often than involving manipulation of prior knowledge as a within-groups variable in pre-posttest designs (e.g., Canham & Hegarty, 2010), one cannot conclude with certainty that the differences between groups is specifically due to an increase in knowledge. Other individual differences associated with prior knowledge, such as experience with similar multimedia environments when acquiring their knowledge and intrinsic motivation, may be responsible for variation in cognitive processing.

Regarding intellectual ability, Hannus and Hyönä (1999) examined differences in the learning process between fourth-grade students with high and low intellectual ability. Accompanying the traditional measures of fixation frequency and duration, the researchers also coded participants' attentional processes on two 5-point scales for attention to relevant segments and interplay between text and illustrations. Regarding attention to relevant information, high and low ability students fixated on target information the same amount of time and just as often. However, low ability students fixated more often on irrelevant blank spaces between and around the text and illustrations than high ability students, indicating that low ability students were more likely to become momentarily distracted during the learning phase. For the coding, a score of 5 was assigned when a participant spent at least 80% of his/her inspection time with the illustration or text on pertinent segments. A score of 3 represented an equal distribution of time with pertinent and less pertinent segments, and a score of 1 was assigned if a participant spent at least 80% of his/her time with less pertinent segments. Based on their coding, high ability students showed greater attention to relevant information than low ability learners. The researchers also coded the transitions between text and corresponding segments of the illustrations on a 5-point scale, with a 5 denoting extensive interplay and a 1 denoting no interplay. A score of 5 was assigned when a participant made at least 3 relatively long fixations on the relevant illustration following the text segment, and a score of 1 was assigned when a participant did not make any fixations on the relevant illustration. Although there was relatively little interplay overall, high ability students did exhibit greater integration of text and illustration information than low ability students. Overall, Hannus and Hyönä (1999) suggested that high-ability students use more effective learning strategies, including concentration on pertinent information and integrative processing.

Third, Sanchez and Wiley (2006) evaluated the learning process of individuals with varying levels of working memory capacity when multimedia included seductive illustrations. Learners with low working memory capacity spent more time in total viewing irrelevant illustrations, viewed significantly more of the irrelevant diagrams, and exhibited less backward fixations (fixations that move from the current text position backward to text segments that were beyond text included in the same line) than learners with high working memory capacity. There was no difference between learner groups for the time spent reading the text. They concluded that learners with higher working memory capacity were better able to control their attention and integrate information from the various sources and modalities.

Overall, heightened levels of prior knowledge, intellectual ability and working memory capacity were each associated with more efficient interactions with multimedia. These learner characteristics were positively related to the selection of and attention to important information as well as longer attempts at integrating sources.

CONSIDERATIONS FOR USING EYE-GAZE MEASURES TO UNDERSTAND MULTIMEDIA LEARNING

In general, eye-gaze data has the potential to provide insight into cognitive processing that is not available through assessing learning outcome data alone. However, as evidenced in this chapter, interpretations of specific visual behaviours vary across learning contexts and researchers. For example, more fixations or longer fixation duration in one context may represent heightened interest for the material whereas in another context this may represent greater difficulty with the information (Rayner, 1998). As such, differences in the number of fixations for certain elements may not be observed between learners, such as novices and experts, not because they are mentally processing the information in a similar fashion, but rather because their visual attention is driven by different factors that ultimately do have implications for how information is organized and integrated. The use of eye-gaze data to understand cognitive processing is further complicated in that the relation between eye-gaze measures and learning outcomes has not been consistent.

In addition, although there is evidence of a strong link between overt and covert attention, it is possible that gaze is not reflective of the mind's activity. A reader could be staring at the words in this chapter right now but thinking about something else. The fixations that would be recorded then are not representative of the individual's momentary cognitive processing. When learners experience high levels of cognitive difficulty or memory load over time, the ability to sustain attention deteriorates (Parasuraman, 1979). Similarly, instances of task-unrelated mind wandering may be associated with boredom (Eastwood, Frischen, Fenske, & Smilek, 2012). This may be a concern when the multimedia content is relatively uninteresting or too challenging. Moreover, eye-gaze measures are unable to capture attention that occurs in the peripheral field of vision. Learners may attend to elements in the periphery without specifically directing their gaze (i.e., overt attention); thus, claims that learners did not attend to elements that were not fixed on may be erroneous. Although eye movement measures provide researchers with knowledge regarding what learners are looking at on screen, they still have to make presumptions about learners' mental activities.

Eye-gaze measures do not explain *why* a learner was looking at selected representations for a particular amount of time and in a certain order (Mayer, 2010). The conclusions made about the learning process based on the selection of information and the sequence of that selection discussed in the current

chapter involve assumptions about the learners' strategies when studying from multimedia. For example, researchers have assumed that learners purposely read text before inspecting a picture (Schmidt-Weigand et al., 2010) and that learners with high domain knowledge employed a variety of learning strategies in comparison to less knowledgeable peers (Jarodzka et al., 2010). However, in addition to being guided by task-related goals, eyes are also guided by perceptually salient stimuli such as the abrupt onset of a stimulus, stimulus brightness, and stimulus movement (Schreij, Los, Theeuwes, Enns, & Olivers, 2014). When learning from multimedia, movement during animations, sudden onset of cues, brighter colours in the illustration and so on, could draw the eye automatically. Since both stimulus-driven and goal-driven attention can be automatic and learners can exhibit involuntary shifts in attention due to features of the visual field (Folk & Remington, 1998), it makes it difficult to distinguish these eye-movements. Furthermore, even if the learner is actively attending to the information on screen, the learner can spend time attending to the information without adequately comprehending its relevance (de Koning et al., 2010).

Taking into account the challenges associated with interpreting eye-gaze data, some researchers have included complementary measures beyond learning outcomes, such as retrospective reporting (de Koning et al., 2010; Jarodzka et al., 2010; van Gog et al., 2005). During retrospective cued reporting, participants are shown their eye-movement patterns to serve as an aid when verbally reporting their thoughts at the time of the recording. Verbalizations are then assessed for consistencies between overt and covert attention. For example, de Koning and colleagues (2010) counted the number of idea units expressed in the verbalizations that corresponded to the idea units contained in the multimedia presentation. Similarly, Jarodzka et al. (2010) assessed the content of utterances for reference to relevant and irrelevant features. In both studies the verbalizations supported the findings from the eye-gaze measures, confirming that learners' gaze corresponded to what they were attending to during the learning phase. However, it would also be valuable to ask learners to recall the strategies they employed. Azevedo and Cromley (2004), for instance, asked participants to detail their thoughts while completing the learning phase specific to how they were regulating their own learning. They obtained information then on the learners' momentary motivation, learning strategies, effort, and the reasons behind their behaviours. Such verbal protocols would be extremely valuable to pair with eye-gaze data for understanding and confirming attentional processes.

With advancements in technology, eye-gaze recording is becoming easier and more accessible to conduct, and thus attracting many new users to this methodology. However, background knowledge is essential for such research for the selection and understanding of eye-movement indices. Familiarity with the limitations of eye-gaze research pertaining to the mental processes that eye-gaze data can in fact capture will evade misinterpretation of eye-gaze measures and facilitate the selection of measures based on theory.

CONCLUSION

Among the studies presented in the current chapter, researchers predominantly analyzed eye-gaze data, including duration and number of fixations, and number of transitions, for the learning phase overall. Eye-gaze research of multimedia learning has provided an understanding of the global differences between learners' attention as well as supported various multimedia design principles, including the spatial contiguity, signaling, modality, and redundancy principles. Nonetheless, the variability in specific eye-gaze measures incorporated into multimedia research has made it challenging to compare results across

studies. In addition, the commonly used total, average, or proportion measures do not provide insight into momentary information processing and how processing evolves over time. A handful of studies were presented in the current chapter that attempted to capture the learning process as it unfolded by examining changes in fixations across intervals of time. Overall, eye-gaze data has contributed much to the understanding of multimedia learning and the impact of various design features for information processing. However, the conclusions obtained from eye-gaze measures still require assumptions about learners' cognitive activities on the part of the researcher. Therefore, not only is there a call for more investigations of momentary attentional processes, but also the pairing of eye-gaze measures with verbal protocols focusing on learners' self-regulatory processes.

KEY TERMS AND DEFINITIONS

Areas of Interest (AOIs): The researcher-specified areas or regions in the visual display.

Covert Attention: What the mind is attending to at a particular moment.

Eye Fixations: The motionless gaze or pause of the eye to attend to information in the visual display. Fixations typically last 200-500 ms.

Multimedia: The presentation of information using a variety of verbal and/or pictorial representations.

Overt Attention: The area of the visual field one's eyes are fixating on at a particular moment.

Pictorial Information: Static and dynamic visualizations, such as illustrations, diagrams, graphics, images, animations and videos.

Scan Path: The sequence of eye fixations and saccades.

Transitions: The shift in eye fixations between areas of interest in the visual display.

Verbal Information: Spoken (aka narration) and written text.

This research was previously published in Eye-Tracking Technology Applications in Educational Research edited by Christopher Was, Frank Sansosti, and Bradley Morris, pages 122-142, copyright year 2017 by Information Science Reference (an imprint of IGI Global).

APPENDIX

Table 1. Sample studies using eye-gaze measures to examine cognitive processing during multimedia learning

Cognitive Process	Findings
1. Selection and Organization: How Long Are Elements Inspected and What Elements Are First Detected?	
a. General observations	• Attention was greater for relevant than irrelevant content (fixation duration: Kaakinen et al., 2002). • Attention was greater for text than pictures (fixation duration & count: Johnson & Mayer, 2012; Liu, 2010). The element receiving attention at the outset of the presentation varied: • Initial fixations focused on the picture (Stone & Glock, 1981). • 91% of the first five fixations focused on the text (Schmidt-Weigand et al., 2010).
b. Multimedia design considerations	Support for the spatial contiguity principle: • Attention was greater for target areas during integrated versus separated multimedia (fixation duration & count: Bayram & Bayraktar, 2012; heat maps: Bayram & Bayraktar, 2012). Support for the signaling principle: • Attention was greater for relevant than irrelevant information for cued versus non-cued multimedia (fixation duration & count: Boucheix & Lowe, 2010; Chuang & Lui, 2012; Jamet, 2014; Ozcelik et al., 2010). • Attention was directed more quickly to target information for cued versus non-cued multimedia (Jamet, 2004; Scheiter & Eitel, 2015). • Attention was greater for signaled versus non-signaled elements (fixation duration & count: de Koning et al., 2010). Opposing observations for the coherence principle: • Attention was greater for relevant than irrelevant content when multimedia contained rather than omitted seductive images (fixation duration: Rey, 2014). Support for the modality principle: • Attention was greater for an animation when verbal information was presented as narration rather than as text (fixation duration & count: Schmidt-Weigand et al., 2010; She & Chen, 2009).
c. Learner characteristics	More effective cognitive processes were exhibited by learners with high prior knowledge, intellectual ability, and working memory capacity: • Attention was greater and faster for target information among experts (fixation duration & count: Canham & Hegarty, 2010; van Gog et al., 2005; latency to fixations: Gegenfurtner et al., 2011; Liu et al., 2007). • Experts attended to the picture and text, whereas novices focused on the text with seldom inspection of the picture (heat map: Ho et al., 2014). • Experts exhibited more heterogeneous eye-gaze sequences (Levenshteins' distance measure: Jarosdzka et al., 2010). • Learners with low intellectual ability attended to blank spaces longer (fixation duration: Hannus & Hyönä, 1999). • Learners with high working memory capacity attended less to seductive details (fixation duration: Sanchez & Wiley, 2006).
2. Integration: What and When Do Transitions Occur?	
a. General observations	Occurrence of transitions: • 55.6% of picture inspections occurred at the end of sentences (Hegarty & Just, 1993). Amount of interplay: • Extensive: Learners exhibited an average of 6.07 shifts from text to an illustration (Hegarty & Just, 1993). • Limited: Learners scored an average of 2.3 (on a rating scale of 1-5) regarding the amount of interplay (Hannus & Hyönä, 1999).
b. Multimedia design considerations	Support for the spatial contiguity principle: • The number of shifts between text and conceptually-related pictorial information was greater when the modalities were integrated rather than separate (Holsanova et al., 2009; Johnson & Mayer, 2012).
c. Learner characteristics	More effective cognitive processes were exhibited by learners with high prior knowledge, intellectual ability, and working memory capacity: • Experts exhibited a greater number of transitions between elements (Yang et al., 2013). • Learners with high working memory capacity exhibited more backward fixations (Sanchez & Wiley, 2006). • Learners with high intellectual ability showed greater interplay between text and illustrations (Hannus & Hyönä, 1999).
3. Time Course of Processing: Does Information Processing Change over Time?	
a. General observations	• Attention to illustrations decreased over time (fixation duration & count: Hegarty & Just, 1993). • Attention to technical terms presented within the picture was greater than the text during the first two 10 sec intervals, but differences disappeared during the remaining two 10 sec intervals (fixation duration: Ozcelik et al., 2009).
b. Multimedia design considerations	Attention was greater for target information during the initial 22 sec for cued over non-cued multimedia, whereas no differences were observed for the remaining four 22 sec intervals (fixation duration: de Koning et al, 2010).
c. Learner characteristics	High ability students exhibited greater integration of information than low ability students, although there was relatively little interplay overall (Hannus & Hyönä, 1999).

Note. Studies presented in the table represent a sample of the eye-gaze measures used. Only statistically significant findings are presented.

Chapter 34
Agent-Based Modelling of Emotional Goals in Digital Media Design Projects

James Marshall
Swinburne University of Technology, Australia

ABSTRACT

The authors promote agent-oriented models to identify, represent and evaluate high-level abstractions of digital media design projects. A major aspect is the introduction of emotional goals, in addition to functional goals and quality goals to describe feelings such as having fun, being engaged and feeling cared for. To establish emotional goals, digital media design methods and processes were employed including the development of emotional scripts, user profiles, mood boards and following an iterative participatory design process. This approach proved to be highly successful, not only to represent emotional goals such as fun, tension and empathy, but also to facilitate the ideation, creation and progressive evaluation of projects. The process supports communication between designers, developers and other stakeholders in large multidisciplinary development teams by providing a shared language and common artefact. The process is demonstrated in the development of a Multiplayer Online Role Play Game (MORPG) called Aspergion that promotes respect for people with Asperger's Syndrome.

1. INTRODUCTION

Human interaction with technology is ubiquitous and the objectives of software are widening from the utilitarian, to the facilitation of rich and engaging human interactions. *"Interaction with technology is now as much about what people feel as it is about what people do."* (McCarthy & Wright, 2004). Computing and software is increasingly pervasive and integrated throughout our lives making the consideration of human factors fundamental to the development of successful products and systems. "We do not just admire technology; we live with it. Whether we are charmed by it or indifferent, technology is deeply embedded in our ordinary everyday experience." (Pacey, 1999).

DOI: 10.4018/978-1-5225-3822-6.ch034

Computing and software has moved from the workplace, into our personal lives rendering socio-cultural aspects increasingly influential (Iacucci & Kuutti, 2003). Meta-issues outside of the technical system, such as lifestyle and social structures, have become more important and need to be considered in design (Dourish, 2001b; Randall Harper & Rouncefield, 2004; Rheingold, 2003).

Realising emotional factors is fundamental to design disciplines, from industrial and communication design to architecture and fashion design. In each case, collaboration with manufacturing, science and engineering experts is required. The current challenge for the emerging field of digital media design is to develop mutually beneficial partnerships with software engineering, as architecture has with civil engineering and industrial design has with materials science.

As digital technologies increase in complexity and collaboration with other disciplines is necessary, a trans-disciplinary approach for developing sociotechnical systems is required, where digital media design practices may be incorporated into software engineering. Agent-oriented models show potential, not only to identify and realise emotional goals, but also to provide an overall progressive evaluation of these goals as we will demonstrate in this paper.

The overall objective of this research is to facilitate the creation of digital media design outcomes including sociotechnical systems that positively affect people's emotional state or wellbeing. We claim that this can be achieved by incorporating creative design processes that explicitly identify emotions as high-level goals into existing agent-oriented models (AOM) to provide a shared language between stakeholders and support project design, development and evaluation. We also propose a colour-coded evaluation system to easily communicate the progress of projects to all stakeholders and serve as a form of acceptance testing.

2. EMOTIONAL GOALS IN DESIGN

Sociotechnical systems are complex interactions between people and technology. They can be defined as a system that includes hardware and software, has defined operational processes and offers an interface, implemented in software, to humans.

Sociotechnical systems exist to support human activities, such as guarding of a building, trading, planning a route, and flirting. (Sterling & Taveter, 2009)

The consideration of emotions is important in the development of many sociotechnical systems. If a computer game does not feel fun, we will not play it; if an ecommerce website does not feel trustworthy (irrespective of the actual security) we will not purchase from it; and if a social networking application does not feel engaging we will not use it. We describe these as the *emotional goals* of the system, which we define as goals that aim to affect people's emotional state or wellbeing. These include basic emotions such as happiness, sadness, fear, anger, surprise and disgust, human factors like engagement and more abstract descriptions of feelings such as fresh, cool, wicked and fun.

Emotional goals, often described by designers as the *look and feel* or *values* of a product, have always played an important role in design considerations (Desmet & Hekkert, 2009). The industrial designer Hartmut Esslinger who worked on Apple product lines from 1984 to 90 expresses the importance of

considering emotions, saying that; "even if a design is elegant and functional, it will not have a place in our lives unless it can appeal at a deeper level, to our emotions […] form follows emotion" (Esslinger quoted in Demirbilek & Sener, 2003).

Apple's commitment to achieving emotional goals is expressed in its recent advertising campaign, launched in June 2013. The Apple campaign presents a manifesto that reflects Esslinger's design philosophy "form follows emotion" in the television commercial "Our Signature" and in the motion graphic "Our Intention" quoted here:

The first thing we ask is what do we want people to feel? Delight, surprise, love, connection? Then we begin to craft around our intention. It takes time. There are a thousand no's for every yes. We simplify, we perfect, we start over, until everything we touch enhances each life it touches. Only then do we sign our work. Designed by Apple in California. (Apple Inc, 2013)

Apple exemplifies a design-led approach to developing products and services, including software, where the "feel" precedes the functional and quality goals. By identifying, valuing and satisfying the emotional goals of its customers, Apple's products and services have revolutionised the Personal Computer, Desktop Publishing, Mobile Phone, Tablet PC, Retail Space and Music Industries. For some part of 2012 it was the world's most valuable company. We cite Apple to demonstrate how the consideration of emotional goals may facilitate the creation of successful products and services.

As a system requirement it is admittedly difficult, perhaps impossible, to quantify whether an emotional goal has been fully satisfied. Emotional goals depend on context, individual experiences and attitudes and are constantly changing, so even if we could quantify an emotional response at one moment in time, we could not apply it at all times. However whilst emotional goals are qualitative and temporal they are none the less important and in sociotechnical systems are often the primary system requirement. For example, a computer game must be engaging enough that people will play it. Making a game that is fun trumps other system requirements, irrespective of whether the goal of fun is clearly definable or measurable. If no one wants to play the game, no matter how robust the code is, it has not met the primary system requirement.

Digital media design methodologies have a tradition in realising emotional goals (often referred to by designers as the look, feel, values or brand values) by using tools and processes such as: emotional colour scripts, flowcharts, rich pictures and mood boards, where "the mood board takes all structure and explicit message out […] leaving only colour type and innuendo […] to capture a feeling." (Daniel & Brown; 2007). Designers model emotion and communicate the feel to clients and to each other using this visual and in some cases audio and textural language.

However, digital media design lacks the modelling techniques, ontology and domain expertise required to represent and build large sociotechnical systems. A trans-disciplinary approach that encourages digital media designers and software engineers to co-create sociotechnical systems is needed. Current software engineering modelling techniques are inadequate to provide for such integration. This is recognised by Baxter and Sommerville (2011): "The abstractions currently used in technical system modelling (e.g., use-cases, objects, etc.) do not seem to us to be sufficient to represent sociotechnical considerations." Our main thinking was that if emotional goals could be incorporated into agent-oriented models complemented with digital media design process then we could realise emotional goals in sociotechnical system design.

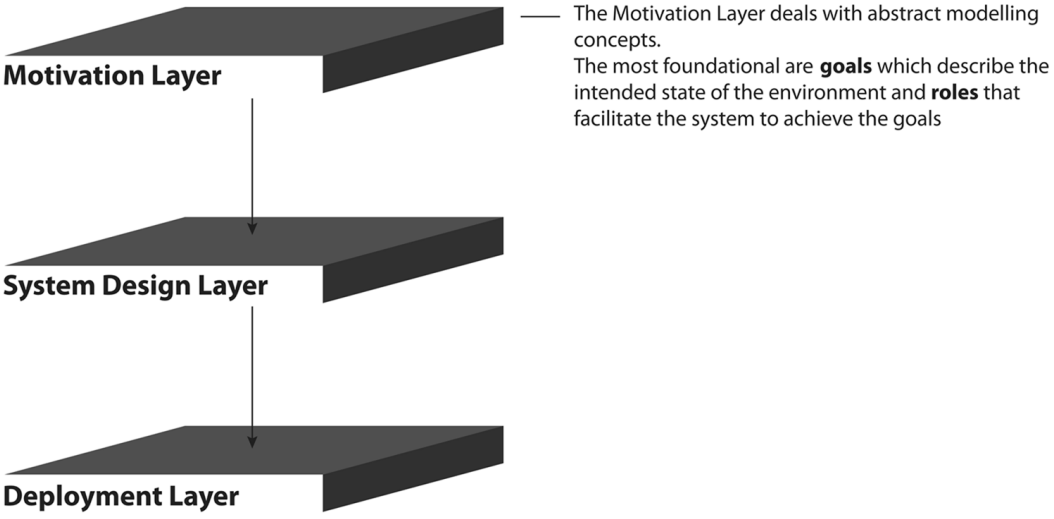
3. EMOTIONAL GOALS IN AGENT-ORIENTED MODELS

Agent-oriented models provide a promising direction forward as the characteristics of agents can be equated to human actors. They are highly suitable for understanding complex topics because the concepts used in these models are suitable for expressing the behavioural aspects of individuals and their interactions (Pavon, 2008). Agents may exhibit human-like behaviours such as autonomy, flexibility, intelligence, learning, and dynamic adaptability to the surrounding environment, increasing their suitability for socially oriented software facilitating people's social interactions. Figure 1 illustrates the agent-oriented modelling conceptual space according to Sterling and Taveter (2009), where on the motivation layer, goal models describe high-level abstractions. Current software engineering practices specify two types of goals. Functional goals, which describe a specific function such as performing a calculation and quality goals that describe the systems attributes, such as the system being stable, scalable or safe.

Focusing on quality is well established within software and systems engineering. Software engineers are aware of the need to express quality attributes of software as well as functional capabilities of software. These quality attributes are referred to using a variety of terms including: non-functional requirements, constraints, quality attributes, quality goals, or quality of service requirements (Gross, 2005; Kirikova et al., 2002; Reekie & McAdam, 2006; Sommerville, 2007; van Lamsweerde & Letier, 2003). However, goal models are often perceived as useful only at the early stages of requirements analysis to arrive at a shared understanding between stakeholders (Guizzardi & Perini, 2005; Jureta & Faulkner, 2007). Following this they are usually discarded and the quality goals deprioritised. Furthermore quality goals do not generally have a direct relationship with functional goals (Chung et al., 2000). This makes it more difficult to carry them through the whole development process and often quality considerations get lost during development. Consequently quality goals have been neglected, as they are difficult to specify, implement, and measure during development (Paay et al., 2009).

However, Sterling and Taveter (2009) use the construct of quality goals attached to functional goals to represent quality attributes of social interactions. Quality goals are formulated to encapsulate social

Figure 1. Agent-oriented modelling conceptual space (Sterling and Taveter, 2009)



aspects of the context into the software requirement model, thus providing a mechanism to carry subtle nuances of those social aspects through to the implementation phase. The direct pairing between system goals and quality goals opens up a variety of possible interpretations both in the design and use of the system.

In agent-oriented models, real people may be included in goal models and emotional factors may be expressed as quality goals. "We believe that agent-oriented concepts enhance the handling of quality requirements in open, distributed sociotechnical systems." (Sterling & Taveter, 2009).

Importantly, the agent-oriented models do not require that the implemented system be agent-based, instead, the agent paradigm is used to understand a domain and the activities of its people. This approach is again well described by Sommerville:

Agent-oriented technology is an effective way to construct sociotechnical systems, which take into account organisational and human issues as well as technical issues. Agents are a useful abstraction that helps us think about how sociotechnical systems deliver the services required by their users. We should think about this without regard to whether the agents that deliver these services are people or automated systems… (Ian Sommerville 2008 foreword page xii, in Sterling and Taveter)

Sterling and Taveter (2009) focus on how to make high-level agent-oriented models palatable to design discussions. This is achieved using goal models with a straightforward and easy syntax and semantics. Functional goals are represented as parallelograms, quality goals are clouds and roles are stick figures. These constructs can be connected using arcs, which indicate relationships between them (See Figure 5). They use the construct of quality goals attached to functional goals to represent quality attributes of social interaction as abstract, ambiguous and unresolved concepts in the models.

3.1. Proposed Method for Considering Emotional Goals

To promote the consideration of human factors we propose a new category of goal, called an *emotional goal*, to be modelled with equal hierarchy to functional and quality goals. By incorporating emotional goals into agent-oriented models the aim is to signal that the goal may be best realised by a trans-disciplinary approach. When these goals are encountered by software engineers they should seek a domain knowledge expert to apply digital media design methodologies and processes.

An icon set was developed for these goals as illustrated in Figure 2. This includes the conventional parallelogram and cloud to signify functional and quality goals with the introduction of a heart symbol to signify emotional goals.

Figure 2. Icon set for functional, quality and emotional goals

To help categorise system requirements, they can be thought of as 'doing', 'being', and 'feeling' goals. For example we can consider a university as a sociotechnical system and model its high-level goals as shown in Table 1.

For most universities the functional and quality goals will be similar, however the emotional goals will differ depending on the university's market position. We have described the type of emotional goals that a small, mid ranking university may aspire to. An Ivy League university may have emotional goals such as feeling elite, traditional, influential, distinguished and preeminent. Emotional goals are central to design and are treated with the highest consideration. The emotional goals (brand values) of sociotechnical systems like universities should permeate though every aspect of the system, from the physical and virtual spaces to the smallest interactions such as answering the phone. This includes systems like the university's website and student management system and is therefore highly relevant to software engineers.

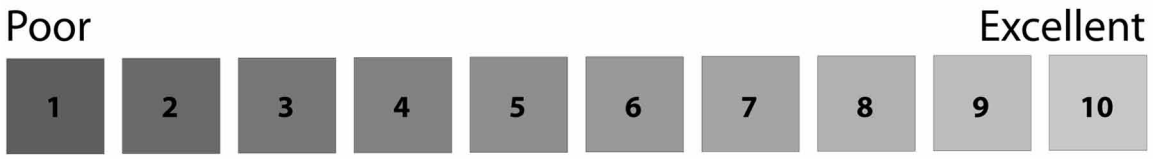
We further adapted agent-oriented models to include a colour-based rating scale. The aim was to provide a method of communicating project progress to each of the stakeholders in a quick and easily understood way. A ten steps colour chart, from red to green was developed to indicate whether the project goals were being met, where 1 (red) indicated no progress and 10 (green) indicated excellent progress (See Figure 3). The colour brightness and saturation of the red and green colours used in the scale are similar to ensure that text can remain single colour (black). Alternatively if the colour brightness varied for example from white to black, the text colour would also have to change inversely to remain readable. A consequence of this is that the colour scale must be viewed in colour. For viewing in black and white a numbering scale may be added to each goal.

To explore the feasibly of incorporating emotional goals into agent-oriented models and rate project progress using a colour-based scale, we applied them in the development of a sociotechnical system called Aspergion.

Table 1. Example of the goals of a university

Functional goals (do)	Quality goal (be)	Emotional goal (feel)
Teach students	Equitable	Dynamic
Promote wisdom	Credible	Cool
Conduct research	Accessible	Inspiring
Engage with society	Accountable	Cutting edge
Archive knowledge	Financially Sustainable	Flexible

Figure 3. Colour rating scale for project goals



4. CASE STUDY: THE ASPERGION PROJECT

Aspergion is a learning resource for secondary school students, which promotes 'respect' for people with Asperger's Syndrome. Asperger's Syndrome is an autism spectrum disorder at the least severe, or high-functioning end of the autism spectrum. To generalise, people diagnosed with an autism spectrum disorder have behavioural, social and communication impairments. Typically, people with Asperger's Syndrome will have a special interest that they focus on in detail. These are often rule-based such as mathematics, music, computer programing and science. Some famous people diagnosed with high-functioning autism / Asperger's Syndrome include abattoir designer Temple Grandin and actress Daryl Hannah. Albert Einstein, Wolfgang Amadeus Mozart, Thomas Edison and others that have hyper-focus in specific interests display traits of Asperger's Syndrome. However this alone is not sufficient to be diagnosed with an autism spectrum disorder.

Ten people with Asperger's Syndrome (further referred to as Asperger participants) were heavily involved in the development of the Aspergion project to give creative direction, provide domain knowledge, act as representative users, give user feedback and set the project goals. In setting the high-level project goals it was clearly stated that they did not want to create a project that provided therapy for people with Asperger's Syndrome, rather they wanted to create awareness and change of attitude in Neurotypicals (non-autistic or 'normal' people). They collectively set the primary project goal, which was to promote "respect" for people.

Approximately 160 students developed the Aspergion project in the 3rd year of the Digital Media Design Program at Swinburne University of Technology. Aspergion was delivered as a capstone (finishing) project in the Group Research Project and Advanced Technology units, each of which had three contact and nine non-contact hours per week over a 12-week semester. There were two separate cohorts of students (approximately equal in size) that created the project over two semesters with each student working approximately 250 hours. In addition university lecturers and domain specialists contributed to the Aspergion bringing the total project development time to 42,550 hours as detailed in Table 2. As a digital media design university project, this is extremely large, both in the time commitment and complexity.

4.1. Incorporating Emotional Goals into Agent-Oriented Models

The Aspergion project provided a unique opportunity to explore the feasibility of incorporating emotional goals into agent-oriented models, because the high-level system requirement was to affect a real world

Table 2. Participants in the Aspergion project (approximate numbers)

Participants	Quantity	Semester Delivery	Hours
Student Developers	160	1&2	40,000
Lecturing Team	12	1&2	1,800
Aspergers Participants	10	1	300
Psychologists	4	1&2	200
Documentary Maker	1	2	200
Script writer	1	2	50

behavioural change of respect by evoking feelings of empathy and responsibility in the player. Additionally the system was a Multiplayer Online Role Play Game (MORPG), requiring a range of emotions to be realised throughout the gameplay. The game was developed in two phases by separate development teams providing an opportunity to collect systematic data on whether or not agent-oriented models affected the quality of the outcome.

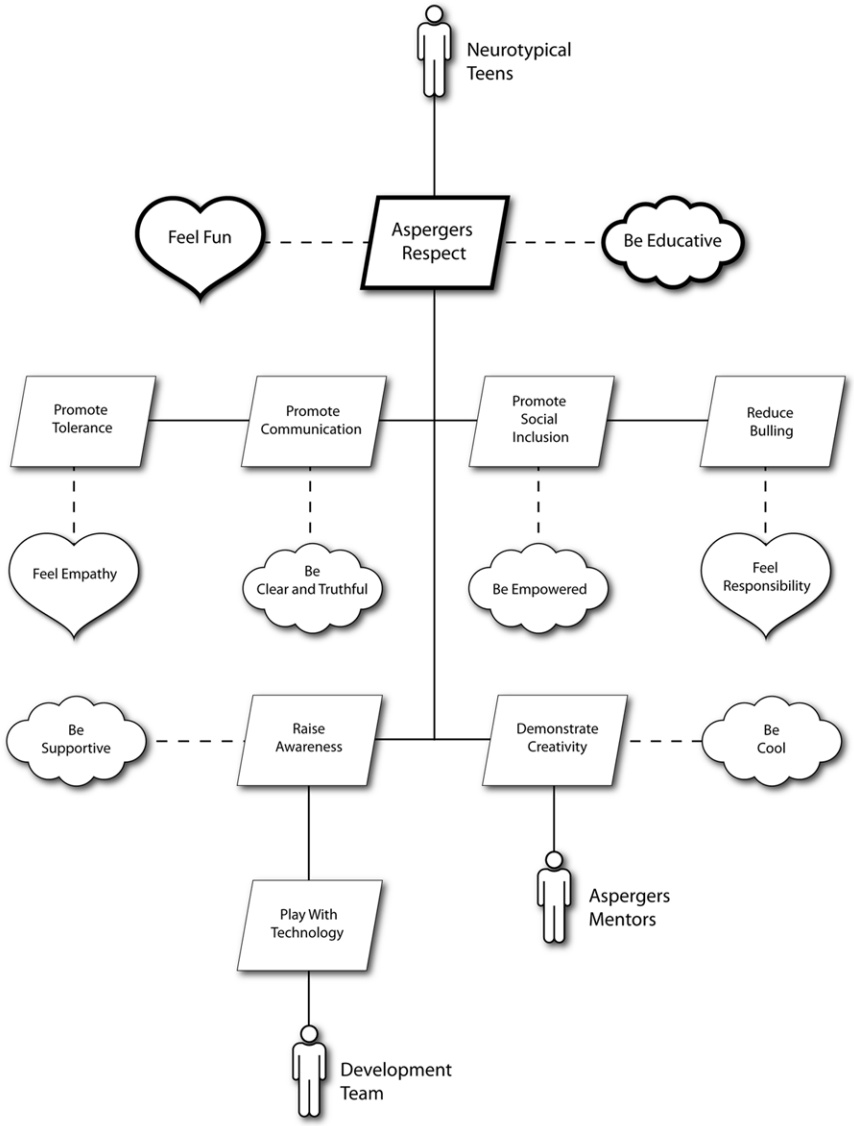
The primary target market for Aspergion was Neurotypical secondary school students. To achieve the functional goal of respect, we aimed to demonstrate that people with Aspergers could be cool and creative, through the creation of a MORPG. The game was developed in Unity 3D and has similar functions to the popular MORPG, World of Warcraft. All of the code, characters, animations, environments, attacks, spells and interface design, were develop by the digital media design students, rather than modifying an existing game. Playing the game takes approximately 40 hours to complete and the game is currently in Beta stage. A screenshot of the game can be seen in Figure 4.

Aspergion is a space adventure containing ten planets that may be explored. Each of these planets was designed and developed by a team of six students and specified by one of the ten Aspergers participants. The specification included the planets name, inhabitants, flag, environment, laws, manifesto, activities, friends and enemies, obstacles, objects, currency etc. The majority of Aspergers participants used their special interest as a foundation for the planet specification. For example the planet "Scientifica" reflects the participants interest in science, planet "AncesTree" in genealogy, planet "Cadenza" in music and planet "Dilemmacon" reflects the participant's interest in moral dilemmas. Backstories were developed for each planet such as the following:

Dilemmacon is a planet of mystery and contradiction. Once having unrivalled biodiversity, the planets energy source, known as Mana, has now been plundered. In the past, this opulent planet thrived with dramatic mountain vistas, magical flowering fields and valleys of treasure. However greed and overconsumption has resulted in a dystopia. With a lack of resources for daily survival, distrust festers on Dilemmacon and caution is advised.

Figure 4. Aspergion game play

Figure 5. Aspergion game project level agent-oriented model



Students met with the Aspergers participants and communicated via email. Each week the students would send an updated design document detailing the progress of the planet development and receive feedback from the Aspergers participants. At the conclusion of the first semester delivery of Aspergion a design document approximately 40 pages in length specified each planet.

4.2. How Agent-Oriented Models Were Used

Aspergion was developed by two separate groups of students over two semesters, each covering a different phase. In the first delivery an agent-oriented model was developed that was derived from interviews with the ten Aspergers participants to set the high-level project goals (See Figure 5). This was an early

exploration of using agent-oriented models to support digital media projects and the intention was to investigate the feasibility of incorporating emotional goals into agent-oriented models.

The agent-oriented model shown in Figure 5 was posted in the main development lab and the lecturers reinforced the goals to the student developers on a weekly basis. The model proved useful as a communication tool to ensure that all 80 students were aligned and working to achieve the primary functional, quality and emotional goals. In post interviews with the Aspergers participants it was clear that these goals had been addressed in the development process. This was also evident in self and peer assessment conducted by the students and in the context of a capstone university project it was successful. However in the first semester delivery the Aspergion game was not successful. Whilst an interesting concept the game lacked an overall narrative and purpose and was not fun to play.

The Aspergion project was delivered again the following semester and to make the game fun to play a professional games scriptwriter was employed to provide expert advice. An overarching plot was developed that included the necessary conflict and character arcs that make games engaging. The plot is to save the Aspergion galaxy from being pulled into a black hole, by bringing balance to the 'VIBE'. The planets of Aspergion are out of harmony due to their inhabitants displaying intolerance, exclusion and poor communication resulting in conflicts. The character arc enacted by solving these conflicts is to grow your avatar from being a rogue space traveller, to "Aspinaut Admiral, Grand Master in the VIBE." The game introduction script provides the backstory:

In a parallel universe much like our own the Aspergion Space Architects developed the universe's ultimate energy source. By focusing their positive emotions they harnessed the virtually infinite potential of black holes. They used this power to create new and utopian worlds. As the planets grew, three space stations were constructed to focus the collective emotions of the galaxy's inhabitants. Known as VIBE, this Virtually Infinite Behavioural Energy keeps the delicate system in balance. It requires Behavioural Tolerance, Social Inclusion and Clear Communication. The VIBE is the life force on which everything depends.

On entering the game the player finds that the 'VIBE' is critically low and the Aspergion Galaxy is on the brink of annihilation. To complete the game the player must visit all ten planets and resolve a societal conflict by demonstrating tolerance, inclusion and clear communication. As previously mentioned Asperger's Syndrome is characterised by behavioural, social and communication impairments and the goals of the game encourage the user to recognise, accommodate and tolerate these.

In the first semester delivery an agent-oriented model described the entire Aspergion sociotechnical system, including the game, documentary, social network and website. The model proved useful in focusing the student developers on the project goals. In the second semester delivery of Aspergion the use of agent-oriented models was greatly extended to facilitate a coherent narrative for the game and to model the emotional goals that we were aiming for the player to feel. Three levels of agent-oriented models were developed, a high-level project model (See Figure 5) a game level model and a planet level model (See Figure 6), with a breakdown of goals being detailed in Table 3.

The high-level project model remained similar to the first delivery model, but was updated to focus more on achieving goals related to the Aspergion game. The game level model described the overall game goals and detailed which planets had the role of achieving these goals. Thirdly, a planet level goal model (See Figure 6) described the overall conflict, the quest chains required to resolve the conflict, the

Figure 6. Planet level agent-oriented model (Planet Dilemmacon)

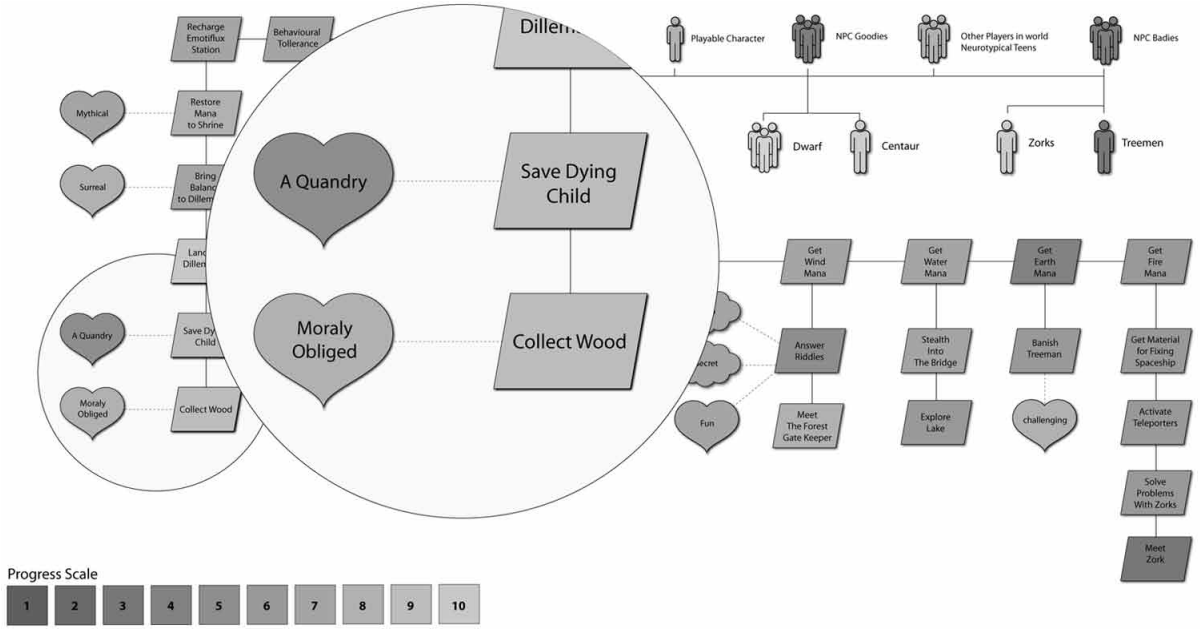


Table 3. The granularity of goals and roles across three levels of goal model

Level	Model	Roles	Functional goals	Quality goals	Emotional Goals
Level 1	Project	3	8	5	3
Level 2	Game	3	18	3	2
Level 3	Planet	219	363	115	97

characters (roles) involved and the associated emotional story and character arcs. Each level of agent-oriented model increased in complexity as illustrated in Table 3.

Emotional goals were derived from the story elements. For example, on planet Dilemmacon the overarching conflict is between the native inhabitants and an alien race that are stealing the planet's precious minerals. In working to resolve this conflict the player is exposed to a series of quest chains to complete. As the name suggests Dilemmacon is a world of moral dilemmas. When playing the game, in the first task you encounter on Dilemmacon is a mother who is nursing her sick child and requires wood for the fire to keep him warm. She cannot leave the child and fears that he will surely die that night of exposure if the fire goes out. You are asked to collect wood from the neighbouring houses, but the neighbours aren't home to grant you permission to take it. The moral dilemma is that to take the wood without permission is stealing. What should you do, is it morally correct to steal sometimes and if so when? The functional goal of this task is to "save dying child" by doing "collect wood". These functional goals are linked to the emotional goals of feeling "a quandary" and of feeling "morally obliged". The narrative elements and tasks, known as quests, were developed in collaboration with a professional game scriptwriter to create emotional arcs that supported the higher-level project goal of feeling "respect" and "responsibility".

Quests are game interactions that the player undertakes to complete a larger game objective, or mission called a quest chain. For example to complete the quest chain "Save Dying Child" the player must complete a conversation quest with the child's mother, a multi-choice question quest to resolve a moral dilemma, a search quest to collect wood and a return quest to take the wood to the child. To build emotional goals into quest chains, in addition to the environmental and character design, game patterns are used, for example battling an enemy will make the player feel *tension* and *accomplishment.*

In order to incorporate digital media design processes into the agent-oriented models, each time an emotional goal was specified it was supported with a mood board and game pattern. The emotional goals for the Dying Child quest chain were for the player to feel both "a quandary" but ultimately "morally obliged". The mood boards provided art direction for the designers by translating the emotion into a visual from. From this, the dialogue, character design, objects, environment, ambience and colour palette could be derived. By sequencing the mood boards the emotional flow was developed and refined. A similar process is used in the animation industry by companies such as Pixar, where a movie will be broken down into type of storyboard called a colour script from which the emotional arc of the movie is visible. The happy, scary, exciting and dramatic sections of the movie are evident in colour palette.

The three levels of agent-oriented models provided a common language and shared artefact between the lecturing staff and student developers and the granularity of the models allowed for sufficient detail to be expressed at different levels. For example the planet level model directly described the storyline as a series of quest chains allowing for the story and character arcs to be identified and realised.

4.4. How AOM Supported Progressive Appraisal and Evaluation

Rotating teams of approximately 20 student testers would evaluate the project goals on each project build, which occurred weekly in the last six weeks of both semester one and semester 2 project deliveries. The students would assess aspects of the game that they hadn't worked on, which usually meant playing an Aspergion planet other than the one that they were developing. Lectures also provided an expert evaluation. The evaluation involved giving each of the 614 project goals a ranking from 1 to 100, which was then translated to an absolute score out of ten and given a colour coding on the agent–oriented model. Figure 7 shows the assessment of the high-level project goals, as modelled in Figure 5, by student developers at the completion of the Aspergion project, where the rows are individual student evaluations of each goal. An average of these provides an empirical project evaluation by the students of 76.7%. It is important to note that Figure 7 only details the data for the 16 high-level goals and this process was repeated across all 614 goals on a weekly basis and updated and displayed (See Figure 8).

The majority of the testing occurred at the planet level, where the agent-oriented models described the quest chains that the player would be required to complete such as the Save Dying Child quest. The project lecturers provided a rubric of the criteria for assessing functional goals. Firstly, did the quest chain break the game? If so it received a rating from 1-10 indicating that it required critical attention. Secondly, if the functional goal (quest chain) broke but was non-critical to the game progression, it would score 11-20. Thirdly were there major errors in continuity (21-30), fourthly spelling mistakes (31-40) etc. The majority of user testing and evaluation of functional goals was bug fixing, primarily ensuring that the game didn't break. It was relatively easy to develop the rubric criteria and to rate the progress of achieving the goals from 1 - 100.

The evaluation of emotional goals was more subjective than that of functional goals. Firstly this was due to the fact that emotional goals are subjective by nature and it is difficult do develop a rubric

to empirically measure goals such as fun, respect and moral obligation in a consistent way. Secondly, within the scope of the project, the vast majority of the 12-week production time was spent in development and to assess the emotional goals requires a minimum level of development for example the game must be playable, should not crash and ideally should be conducted with the target market. Thirdly the scale of the project was prohibitive. It was possible to measure whether sections of the game achieved the specified emotional goal. For example did the Save Dying Child quest chain make you feel morally obliged and how this could be improved? The higher-level emotional goals such as, was the game "fun" and did it "promote respect" for people with Asperger's Syndrome required that the game be played to

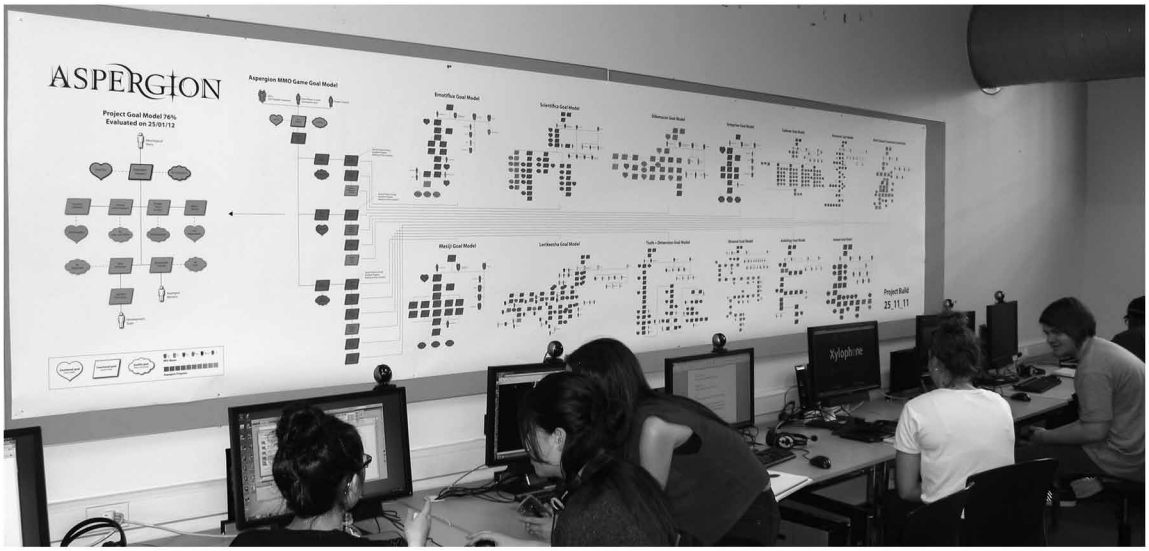
completion. This takes approximately 40 hours and requires at least 2 people, a player and a facilitator to record the player's feedback on the 614 goals being assessed.

To evaluate emotional goals student testers provided a numerical rating based on their own feeling as they played sections of the game and from this assessment valuable data was gained. Where numerous tests consistently ranked an emotional goal like "moral obligation" poorly, this provided an indication that the game section required investigation and usually further work. In addition by declaring and modelling high-level emotional goals such as "fun" "cool" and "respect" with the same hierarchy as functional and quality goals, ensured that they were continuously being considered throughout the development process.

The data collected from student and lecturer evaluation was averaged and transferred into colours on the project agent-oriented model. In this way the student developers, lecturers and other stakeholders such as financial backers could get a fast overview of the project progress. A large print of the model (See Figure 8) containing the 614 goals of the project was displayed in the main production lab and was updated after each testing phase. This also encouraged peer feedback and support where team members from successful production teams would voluntarily help the teams who were falling behind. The agent-oriented model shown describes the state of the goals at approximately three quarters of the way through the project build.

The assessment conducted gave a good overview of the overall state of the project. Whilst in the first delivery we had specified fun as a high-level emotional goal, insufficient tools, processes and focus were employed to realise the goal of fun sufficiently. Rather we relied on the tacit knowledge of students and lecturers, which is often the case in digital media design projects and can be successful in projects of a smaller scale. By expanding the use of agent-oriented models to include the planet level goals (the game play) the user interaction was evaluated at regular intervals, between 30 seconds and 5 minutes, depending on the length of the quest chain. This granularity ensured that the users didn't get bored and that the developers gave appropriate attention to the emotional goals, rather than focusing solely on the programming. Importantly the process of defining, modelling and evaluating goals and was repeatable, both in the two development phases of the project and throughout the project, game and planet level goals.

Figure 8. Agent-oriented model of the 2011 Aspergion project



The assessment detailed in Figure 7 demonstrates that from the student developer's perspective all high-level project goals were addressed, ranging from 74% to 84% completion. The consistency of results for each goal indicates that an appropriate level of attention was given to realising the functional, quality and emotional goals and shows the value of modelling them with the same hierarchy. By using a colour-coded system any of the stakeholders could rapidly see the state of the project.

5. BENEFITS FOR THE DESIGN AND AGENT COMMUNITES

Agent-oriented models used in the development of Aspergion demonstrated that emotional goals could be effectively incorporated into agent-oriented models to support the development of digital media design projects and sociotechnical systems. By providing high-level abstractions that were easily interpretable, the agent-oriented models served as a common language between student developers, lecturing staff and other stakeholders. Modelling emotional goals in addition to and with the same hierarchy as functional and quality goals provided an appropriate focus and acted as a signalling point for digital media design processes to be employed. In this way the process supports a trans-disciplinary approach to the development of sociotechnical systems that engage people by appealing to their emotional goals. By explicitly identifying emotions using creative design processes, and incorporating them into agent-oriented models that were available throughout the design, development and evaluation phases of the large cross-discipline team project, we went a long way to achieving our objectives.

An important development step of Aspergion was that the game was conceptualised by people with Asperger's Syndrome, each designing a planet to be included in the game. Having asked the participants to specify planet designs, agent-oriented models were created to clearly communicate the planet goals, inhabitants, character arcs and overall narrative. In the second delivery of the project three levels of agent-oriented models were developed to communicate goals at the project level, the MORPG game level and the planet level. This significantly contributed to the development and evaluation of the project, which in past digital media projects had been tacit.

The colour-coded evaluation system that was developed ensured that all stakeholders could get an instant snapshot of the projects progress and served as a form of acceptance testing. Over 600 project goals were defined, modelled and progressive evaluated. The process was repeated to support the realisation of high-level project goals, game level goals and more granular planet level (narrative) goals. This approach of using emotional goals to model narrative introduces a new method for incorporating emotional goals into agent-oriented models. 614 project goals, 102 of which were emotional goals, were being evaluated on a weekly basis by teams of student user testers. Explicitly modelling emotional goals ensured a coherent narrative and also signalled when design processes should be employed to support the development.

The process described in this paper of incorporating emotional goals into agent-oriented models and using a colour scale to evaluate project progress, has become a standard in the design process taught in the Digital Media Design Program at Swinburne University of Technology. The process has been repeated in over 120 projects, each representing approximately 150 hours of development time. In these projects agent-oriented models that include emotional goals have been applied to the development of software, computer games, websites and animations, with projects ranging in scale from 1 to over 160 developers and at academic levels including 3rd year, Honours, Masters, Doctoral and Post Doctoral.

Further research in this area would involve developing a rigorous method of categorising and evaluating emotional goals and using the process detailed in this paper to investigate whether agent-oriented models may be used to describe how game patterns elicit emotional goals.

ACKNOWLEDGMENT

I would like to thank the students and lecturers from the Swinburne University of Technology Digital Media Design program and the people with Asperger's Syndrome who participated in this project.

Chapter 35
The Use of Eye Tracking as a Research and Instructional Tool in Multimedia Learning

Katharina Scheiter
Leibniz-Institut für Wissensmedien, Germany

Alexander Eitel
Leibniz-Institut für Wissensmedien, Germany

ABSTRACT

The present chapter summarizes the state of the art of using eye tracking in research on multimedia learning. It first provides an overview the various eye tracking parameters that have been used in this field before describing its various functions as a research tool. As a research tool eye tracking serves to test and refine assumptions regarding the process of learning with multimedia, explain the origin of individual differences in learning outcomes, gives insight into the effects of instructional interventions at a process level, and enriches other forms of assessment. In addition, more recently eye tracking has also been used to develop materials aimed at supporting multimedia learning. Thus, it also serves as an instructional tool when it used to design adaptive instruction or to model cognitive processes relevant to multimedia learning. The chapter concludes with a description of some of the challenges in using eye tracking in multimedia research.

INTRODUCTION

Learning from multimedia has become one of the major areas of research in learning and instruction especially since digital technology is increasingly used in education, thereby allowing not only static instructional materials, but also dynamic formats. Despite the fact that many people think of multimedia involving the use of advanced digital technology, its definition in research is far more traditional. Here the term multimedia refers to any combination of words (spoken or written) and pictures (e.g., photographs, diagrams, videos, animation). More generally speaking, multimedia environments are multirepresen-

DOI: 10.4018/978-1-5225-3822-6.ch035

tational systems (Ainsworth, 1999) where different representational formats are combined in a way to best convey an instructional message.

The case for multimedia is made by comparing it to monomedia formats, mostly to text-only instruction. There is abundant empirical evidence showing that multimedia yields better learning than text (Mayer, 2014a). This multimedia effect is dependent on a variety of conditions: In particular, pictures that serve to augment the text should be relevant to the learning objective and not only serve decorative purposes. Moreover, the materials should be designed in a way that they enable and facilitate certain cognitive processes that have been determined as essential for effective multimedia learning by respective theories in this research area. Accordingly, the majority of current multimedia research is focused on identifying possible boundary conditions for the multimedia effect and the cognitive processes underlying multimedia learning. This is where eye tracking comes into play (cf. Scheiter & Van Gog, 2009; Van Gog & Scheiter, 2010). For instance, as will be discussed later in more detail, eye tracking research has shown that successful learning from multimedia requires that learners will pay sufficient attention to pictures rather than predominantly reading the text and that they will make connections between both representations (e.g., Hannus & Hyönä, 1999; Hegarty & Just, 1993; cf. Renkl & Scheiter, in press, for a review on further boundary conditions).

According to cognitive theories of multimedia learning such as the Cognitive Theory of Multimedia Learning by Mayer (CTML; Mayer, 2014b) or the Integrated Model of Text and Picture Processing by Schnotz (ITPC; Schnotz, 2014), a set of distinct cognitive processes contributes to the construction of a mental model and thus learning from multimedia. Both theories agree upon the fact that learners first need to identify and attend to relevant information contained in both the text and the picture and select it for further processing. Once the relevant information is selected, it needs to be organized in memory into coherent, mode-specific mental representations. Finally, information from both representational formats are then related to each other with the help of prior knowledge and integrated into one mental coherent mental model. This mental model composed of verbal and pictorial information is seen as the major reason for why learning from text and pictures is more effective than learning from text only.

The objective of the present chapter is to illustrate how eye tracking can serve as a valuable tool to study and potentially also to support the aforementioned cognitive processes of selection, organization, and integration while learning from multimedia. In the following, we will first discuss which eye tracking parameters are typically used in multimedia studies and how they relate to the theoretical assumptions outlined above. Second, we will review studies in which eye tracking was used as a research tool to study cognitive processes underlying learning with multimedia, before turning our attention to more advanced uses of eye tracking for designing instruction in the third section. The fourth section deals with the various methodological challenges of using eye tracking in multimedia research before concluding with some suggestions for future research.

EYE TRACKING PARAMETERS USED IN MULTIMEDIA LEARNING STUDIES

When describing a person's gaze behavior, two major event categories can be distinguished, namely, fixations and saccades. During a fixation, the eyes remain relatively still, thereby allowing intake of information from the part of the stimulus that is being attended. On average, fixations last between 200 and 300 milliseconds. Their duration is affected by a number of factors such as the type of activity performed

(e.g., silent reading: 225 ms vs. scene perception: 330 ms), a person's interest, or the complexity of the materials, with longer fixations signaling higher interest and complexity, respectively (e.g., Rayner, 2009). In order to comprehensively process a stimulus, multiple fixations are required. This is the case because the area in which we see with high acuity is very limited; acuity degrades rather quickly the further away from this foveal region a visual element is placed (i.e., the more it is placed in the periphery). The high-velocity movements between multiple fixations are called saccades. During saccades information intake is suppressed. Together, fixations and saccades make up a scanpath, which provides a trace of how a person processes a text or a picture on a moment-to-moment basis (cf. Holmqvist et al., 2011 for a more detailed description of the basic characteristics of eye movements).

The use of eye tracking in multimedia research is to a large extent inspired by its use in reading research (cf. for an overview Rayner, 2009), which is likely due to the fact that multimedia is often conceptualized as an augmentation of (written) text with pictures. In reading and likewise in multimedia research, eye tracking is seen as providing insights into the moment-to-moment processes that occur during comprehending an external stimulus such as expository text or text-picture combinations (Rayner, Chace, Slattery, & Ashby, 2006). This interpretation is nourished by the eye-mind assumption (Just & Carpenter, 1980). That is, eye tracking parameters are not only used to make statements about students' distribution of visual attention or their perceptual processing (Mayer, 2010); rather, they are seen as evidence for when, how long, and in which order externally presented information is processed at the cognitive level, that is, in the person's mind. This link between visual attention and cognitive processing occurs without delay, so that once information is perceived it is also immediately processed at the cognitive level (immediacy assumption).

There are a variety of measures that can be derived from eye tracking and linked to cognitive processes. In reading research, it is typical to distinguish between first-pass and second-pass indicators since these are linked to different cognitive processes (Hyönä, Lorch, & Rinck, 2003; Hyönä & Nurminen, 2006). First-pass indicators describe processes that occur when first encountering a target area (i.e., area of interest, AOI) until leaving it. They are often linked to basic attentional phenomena such as differences in salience in visual stimuli or reflect basic reading processes. On the other hand, second-pass indicators refer to revisits of AOIs. They are linked to more intentional processes such as attempts to resolve comprehension problems and to integrate information across target areas. Only very few studies in the field of multimedia learning distinguish between first-pass and second-pass indicators; rather, they use aggregated values irrespective of when they occurred. The studies by Lucia Mason reviewed later in this chapter build a notable exception in this regard.

From a theoretical perspective, it is useful to subdivide eye tracking applications in multimedia learning studies into two major categories, which are also associated with different eye movement indicators: First, eye tracking is used to study selection and organization processes during learning, and second it serves to investigate the integration of text and pictures. To this end, those parts of a multimedia message that are seen as relevant to answer a research question are defined as AOIs for which parameters such as the fixation time or the number of fixations are determined. AOIs may range from a very coarse level (i.e., the text or picture as a whole) to a very-fine grained level (e.g., a word that corresponds to a visual detail shown in the picture).

In studies with a focus on selection and organization processes, eye tracking serves to determine when parts of the multimedia message are first detected and for how long they are attended during the course of learning. To determine how long it takes a person to attend to some part of the multimedia

message, the time it takes for the first fixation to land on that region (time to first fixation) or the number of fixations that occurred before the AOI was attended can be used as indicators. They may tell researchers something about the amount of visual search that was required to identify the AOI (e.g., De Koning, Tabbers, Rikers, & Paas, 2010; Ozcelik, Arslan-Ari & Cagiltay, 2009; Scheiter & Eitel, 2015), the salience of the element in question, or its relevance from the perspective of the learner – with earlier attention being an indicator of less visual search as well as higher salience and relevance, respectively.

To determine the amount of attention devoted to a certain AOI, both, the overall number of fixations and total fixation time can be used as indicators. Higher values are seen as indicating more intense processing with the reasons underlying this being manifold. That is, learners may decide to process a certain part of the stimuli for longer, because it appears more interesting or relevant to them in the context of the learning task, or because they find this part more difficult to understand than others. In order to disambiguate the first two reasons from the last one it may be worthwhile to further relate the number of fixations and total fixation time to each other. Mean fixation duration (i.e., total fixation time divided by the number of fixations) is often seen as an indicator for students' processing difficulties at least when reading text (e.g., Rayner, 2009).

In addition, eye tracking is frequently used in multimedia research to study the process of integrating text and pictures. To this end, look-froms and the number of saccades between text and pictures (i.e., text-picture transitions) have been used. Look-froms are indicators related to second-pass processing (Mason, Pluchino, & Tornatora, 2013; 2015). They describe the duration (fixation times) for re-reading text while re-inspecting the picture (i.e., look-froms picture to text) and vice versa (i.e., look-froms text to picture: re-inspection of the picture while re-reading the text). Text-picture transitions can be obtained at a global level by counting the number of times a person moved his/her eyes between any location within the text to any location within the picture. Moreover, researchers have investigated whether these transitions reflect an accurate understanding of the relations between text and pictures by counting only the number of transitions between corresponding (i.e., semantically related) text-picture elements (e.g., Johnson & Mayer, 2012).

So far, multimedia research has mostly used aggregate measures such as total fixation times or overall number of saccades. These measures can be assessed and analyzed relatively easy; however, they provide rather little insight into the temporal dynamics of processing illustrated text (Hyönä, 2010). There have been only very few studies that have deployed measures reflecting the time course of processing such as scanpath analysis. For instance, Jarodzka, Scheiter, Gerjets, and Van Gog (2010) determined Levinshtein's distance to determine the similarity among scanpaths both within and across different expertise levels of participants. To do so, each individual scanpath is represented as a string of events (i.e., fixations on different AOIs); typically, individuals will differ in whether certain events occur (e.g., whether an AOI has been attended at all), in the order of events, and in the number of events making up a scanpath. Levinshtein's distance reflects how many transformations, that is, deletions and insertions of events, are needed to convert one scanpath into another. Skuballa, Fortunski, and Renkl (2015) used Levinsthein's distance to test whether a pre-training that was assumed to direct students' attention while learning from a visual display would lead to a more homogenous gaze behavior compared with a no-training control group, but they found no such effects.

Similarly, time-locked analyses are rarely used. In time-locked analyses, eye tracking data are studied relative to the onset of some event such as the appearance of an object in an animation or the highlighting of information when using signals or cues in multimedia presentations (Hyönä, 2010).

EYE TRACKING AS A RESEARCH TOOL

As a research tool in multimedia learning, eye tracking can serve various functions with respect to studying the attentional and cognitive processes taking place. In particular, it may serve to test and refine certain assumptions regarding the processing of multimedia materials, explain why there is individual variability in learning outcomes, explain how instructional interventions work, and enrich other forms of assessments.

Testing and Refining Processing Assumptions

Cognitive theories of multimedia learning suggest that students conduct multiple steps when learning with illustrated text that range from constructing locally coherent mental representations involving the processing of a limited number of text and picture elements to establishing a globally coherent mental model of all relevant elements. Hegarty and Just (1993) provided first evidence favoring this assumption in their seminal study on how learners comprehend the functioning of a pulley system. Their students received a text describing how a pulley system works together with a corresponding picture of a pulley system and their eye movements were recorded. The results showed that learners proceeded in an incremental fashion and alternated between text and pictures when constructing a mental model in a highly interleaved fashion. That is, they read the text, upon reaching the end of a semantic unit (typically composed of 1-2 sentences) moved their eyes to the picture to investigate the part of the picture corresponding to that unit, and then continued reading the text. The fact that learners interrupted their reading to inspect the picture was interpreted as first evidence that learners mentally integrate information from both external representations rather than constructing two separate mental representations. This process appears to be largely guided by the text in that learners search the diagram for information corresponding to the text that they just read.

Since then, a number of eye tracking studies have confirmed that integrative processing of text and pictures is highly predictive for learning (e.g., Hannus & Hyönä, 1999; Mason, Pluchino, & Tornatora, 2013, 2015; O'Keefe, Letourneau, Homer, Schwartz, & Plass, 2014), thereby confirming one of the major assumptions of theories of multimedia learning, namely, that integration is pivotal to mental model construction. For instance, O'Keefe et al. (2014) studied learners' eye movements while they learnt about the Ideal Gas Laws with a multimedia simulation composed of multiple representations (i.e., a container filled with gas particles, sliders to control temperature, pressure, and the container's volume, a graph showing the relationship between two variables). Students who made more transitions between the control sliders and the graph and between the gas container and the graph scored better in a comprehension and transfer test, respectively (after controlling for pre-test scores). On the other hand, neither the number of fixations nor overall fixation time on any of the representations was related to learning outcomes. Thus, it is not the mere intensity of selecting and organizing information from each representation, but their integration that is related to better understanding during multimedia learning.

Not only does eye tracking confirm already existing theoretical assumptions, it also allows refining these assumptions. For instance, cognitive theories of multimedia learning assume that at least to some extent text and pictures are first processed independently from each other before being integrated. However, recent research has shown that integration of pictorial information with text occurs already very early during learning with multimedia, that is, after pictorial information has been studied for a short time only. Eitel and colleagues (Eitel, Scheiter, & Schüler, 2013; Eitel, Scheiter, Schüler, Nyström, &

Holmqvist, 2013) have suggested that a quick glance towards a picture will already allow extracting its global spatial structure, which in turn serves as a mental scaffold for further processing. This mental scaffold is reactivated during text processing and facilitates mental model construction from the text, thereby yielding a coherent mental model from both information sources. This assumption was tested regarding learning outcomes as well as via eye tracking data from students who saw a blank screen while listening to spoken text explaining the structure and functioning of a pulley system. Some students just received a blank screen while listening to the spoken text whereas others were exposed to a picture of the pulley system for a short time (600ms, 2s) before this. The spoken text described the spatial structure of the pulley system; however, it did not mention that the three pulleys were oriented diagonally from bottom-left to top-right (i.e., global spatial structure). This information could be extracted only from the picture. Students in the conditions with brief initial picture presentation (for 600ms, 2s) had better comprehension scores and made more eye movements in line with the pulley system's diagonal orientation of the pulleys than students in the condition without the picture. This indicates that students reactivated the global spatial structure constructed from briefly processing the picture while subsequently processing text about the system, hence suggesting early integration. The (early) integration of pictorial information with text facilitated the construction of a mental model as reflected in better comprehension.

Finally, eye tracking can reveal aspects of learning from multimedia that so far have not yet been addressed by the respective theories. For instance, cognitive theories of multimedia learning leave open the question whether text and pictures are given equal attention or whether one representation is favored over the other. However, eye tracking studies suggest that learners will often attend predominantly to the text at the expense of sufficient processing of the picture (Hegarty & Just, 1993; Rayner, Rotello, Stewart, Keir, & Duffy, 2001; Schmidt-Weigand, Kohnert, & Glowalla, 2010), which can explain why in some cases no multimedia effect occurs.

Explaining Individual Differences in Learning Outcomes

Eye tracking can provide explanations for why students differ in their learning outcomes. There are at least two types of studies addressing this question: One group of studies looks at the relationship between learner characteristics that can be considered relevant for multimedia learning and gaze parameters recorded during learning. The idea underlying these studies is that variability in learner characteristics will be associated with variability in gaze parameters, with the causal direction, however, being unclear. For instance, a low level of prior knowledge may cause inadequate online processing of text and pictures; however, it may also be the case that students' inadequate processing during past learning episodes may have caused them to acquire little prior knowledge. Another group of studies takes the interindividual variability of students' eye movement behavior as a starting point and seeks to identify groups of learners showing similar behavior (e.g., by applying multivariate statistical methods such as cluster analysis). Then it is tested whether the group membership, which reflects a certain pattern of eye movement behavior, can predict learning outcomes. What is interesting about this approach is that multiple eye tracking parameters are analyzed simultaneously rather than looking at the relationship between single eye tracking parameters and learning outcomes in isolation. It might well be that when analyzed in isolation, single parameters are unrelated to learning outcomes suggesting that these parameters are irrelevant for better learning. However, in the multivariate approach patterns composed of a specific configuration of multiple parameters (e.g., long fixation *and* early attention towards pictures) can be identified as being relevant for learning.

Prior knowledge and cognitive abilities have been shown to be linked to eye movements in a number of studies: Mason, Pluchino, and Tornatora (2013) found that prior knowledge was positively related to both, the number of integrative transitions and the look-from text-to-picture fixation time, which in turn were indicative for better learning outcomes. Hannus and Hyönä (1999) studied how 10-year old elementary school children processed illustrated passages from a biology textbook. Prior to learning, students were tested for their cognitive ability and divided into high and low ability groups. High ability students had better learning outcomes than low ability students; moreover, the prior paid more attention processing pertinent information in text and pictures and showed more transitions between the two. Ozcelik et al. (2010) showed that longer mean fixation durations on highlighted information elements in a multimedia message were related to lower prior knowledge and lower transfer performance. Moreover, there a number of studies on expertise differences suggesting that more expert persons are more likely to attend to relevant information (Canham & Hegarty, 2010; Haider & Frensch, 2001; Jarodzka et al., 2010). On the other hand, visual attention of persons with less expertise is often drawn towards salient, but irrelevant information (Lowe, 2003). Madsen, Larson, Loschky, and Rebello (2012) showed that students who were able to correctly solve a number of physics problems consisting of text and graphics attended longer to areas of the problem display that were thematically relevant to its solution than did those students who did not solve the problems. What is particularly interesting about the study by Madsen et al. (2012) is that they showed that at least in the case of solving physics problems it is not so much saliency that guides unsuccessful problem solvers' attention; rather, they attend to information that aligns with novicelike misconceptions, which explains their failure in solving the problems.

Nevertheless, there are also studies showing no relationship between prior knowledge and students' gaze behavior: For instance, O'Keefe et al. (2014) found no correlation between prior knowledge and the frequency of transitions between multiple representations in a chemistry simulation, with the latter, however, being related to better comprehension and transfer performance. Moreover, the results by Schwonke, Berthold, and Renkl (2009) suggest that the relationship between prior knowledge, gaze behavior, and learning outcomes may be more complicated than suggested by the previous studies. In their study on learning probability calculations in a multirepresentational environment, attention to diagrams was positively correlated to learning outcomes for high prior knowledge students, whereas there was a negative relationship for low prior knowledge students. Thus, the interpretation of a certain eye movement behavior as helpful or harmful for learning may change when prior knowledge increases or decreases.

Mason, Tornatora, and Pluchino (2015) studied the eye movements of 7th graders in a multimedia lesson on the food chain. They ran cluster analyses using first-pass and second-pass parameters, respectively, as input variables. Two clusters emerged: With respect to first-pass processing, one group of students showed longer text fixation times than the other; there were no further differences among the two groups. With regard to second-pass processing, the groups differed in their integrative processing of text and pictures. That is, one group showed more transitions between corresponding text and picture elements and vice versa as well as longer look-froms from text to pictures and vice versa than the other group. These differences in integrative processing predicted better verbal and pictorial recall, as well as transfer performance, whereas differences in first-pass processing were unrelated to learning outcomes. Students' integrative processing was predictive for learning outcomes beyond individual differences such as their reading comprehension, prior knowledge, and academic self-concept in science. This study replicates findings from an earlier study of the same research group (Mason, Pluchino, & Tornatora, 2013). In this study 4th graders were presented with a single slide explaining the concept of air using text and a picture. A cluster analysis was run using first- and second-pass processing indicators. It revealed

three clusters of learners different in the intensity of their integrative processing: low, intermediate, and high integrators. High integrators outperformed low integrators with regard to answering factual knowledge and transfer questions, suggesting that individual variation in eye movement behavior can explain individual variation in learning outcomes.

Explaining How Instructional Interventions Work

Eye tracking allows testing assumptions on how instructional design manipulations cause better learning by altering the way students will process the materials. Various instructional design measures have been investigated using eye tracking.

One way to improve the design of multimedia material is to highlight correspondences between text and pictures by means of signals or cues to facilitate text-picture integration. Signaling has been shown to yield better learning rather consistently and is associated with a small to medium effect for measures of deeper learning (see Richter, Scheiter, & Eitel, 2016 for a meta-analysis). The signaling effect is typically traced back by referring to two, non-exclusive explanations: First, signals reduce visual search for corresponding text-picture elements, thereby rendering the processing of multimedia materials more efficient by speeding up the selection of relevant information. Second, signals provide visual guidance towards relevant information so that learners will spend more time processing this information, possibly allowing for improved organization of information. As a consequence of both explanations, learners should be better able to integrate information from text and pictures. There are several eye tracking studies that have investigated the effects of signaling in closer detail by testing one or both of these explanations.

Ozcelik, Karakus, Kursun, and Cagiltay (2009) compared an unsignaled multimedia lesson on the nervous system composed of written text and a labeled picture to a version, in which terminology from the text and the corresponding labels in the picture were shown in the same color. As expected, color coding led to better transfer performance. Moreover, students in the color coding condition took less time fixating the corresponding label in the picture after having read about it in the text, suggesting that visual search demands were reduced due to color coding. Also, color coding yielded longer mean fixation durations for text and pictures, which were positively related to transfer performance. However, color coding did not cause an increase in total fixation times for highlighted terms. The latter finding may, however, be explained by the fact that spending additional time on a single word after it has served to identify a text-picture correspondence does have little functional relevance as compared with, for instance, processing the corresponding pictorial element. The latter interpretation is corroborated by the fact that visual search was negatively correlated with transfer performance, while there was no correlation between total fixation time and transfer performance. Thus, identifying correspondences between text and pictures quickly apparently facilitates integration and, as a consequence, supports comprehension, but further processing of corresponding labels does not yield better learning.

Ozcelik et al. (2010) compared an unsignaled multimedia lesson explaining the functioning of a turbofan jet engine using narration and a labeled static picture with a signaled variant, in which labels changed their color upon being mentioned in the narration. Students in a signaled group performed better in a transfer test than those learning without signals. Moreover, signals led to more frequent fixations and longer fixation times on relevant labels and picture elements as well as to a more efficient visual search. The latter was measured as the proportion of labels attended while listening to the corresponding narration as well as the time between mentioning a relevant item and attending it. Results furthermore showed

that longer search times were related to worse retention of the multimedia content, while longer mean fixation durations were associated with lower transfer performance (cf. Jamet, 2014, for a similar study).

Similarly, Mason, Pluchino, and Tornatora (2013) studied the effects of improving multimedia instruction by means of introducing labels into a diagram accompanying a science text. Labels improved transfer performance; moreover, students in the labeling condition spent more time refixating the text while reinspecting the illustration. These look-forms can be interpreted as an indication of integrative processing and were correlated with better transfer performance.

Taken together, these studies consistently show that signaling improves learning and changes visual attention processes, with the two aspects being correlated with each other. However, even though these two effects co-occur, it is still not clear from these studies whether changes in visual attention can explain the positive effect that signaling has on learning outcomes. To address this limitation, Scheiter and Eitel (2015) deployed mediation analyses to test whether the relationship among signaling, visual attention, and learning outcomes can be interpreted this way. In their study, students learnt either with unsignaled multimedia materials explaining how the heart works or with a signaled version using a variety of signals (e.g., deixis, labels, color coding) to highlight text-picture correspondences. Across two experiments, mediation analyses revealed that attending earlier towards relevant (highlighted) pictorial information and more frequently fully explained the positive effects that signals had on comprehension.

Johnson and Mayer (2012) studied the effects of another way of supporting integration of text and pictures, namely, the physical integration of text into the picture. According to the spatial contiguity principle, physical integration of text into the picture reduces the need to search for corresponding text-picture elements; moreover, the fact the text is segmented into smaller, meaningful units highlights its semantic structure. Accordingly, it has been shown to yield better learning rather consistently (for a meta-analysis see Ginns, 2006). Johnson and Mayer (2012) used eye tracking to test three alternative explanations for the spatial contiguity effect: First, when text is physically integrated into the picture, learners might be more inclined to attempt to integrate both representations, which should be visible in a higher number of transitions from text to diagram (integrative transitions). Second, physical integration might provide guidance for successfully identifying text-picture correspondences as reflected in a higher number of transitions between corresponding text and picture elements (corresponding transitions). Finally, it might guide learners' attention towards the graphic more generally, thereby increasing the proportion of time spent processing the diagram. In two out of three experiments students showed better transfer after having learnt with an integrated illustrated text; moreover, across all three experiments students had more integrative and/or more corresponding transitions, but did not show increased attention towards the diagram. It was concluded from the occurrence of differences in transfer performance and in integrative processing that the latter must be the reason for the former, but no mediation analyses were conducted.

Both, signaling and spatial contiguity, are based on simultaneously manipulating the layout of text and pictures. Thus, they improve text-picture integration by communicating meta-information to learners regarding the correspondences between the two representations. Mason, Pluchino, Tornatora, and Ariasi (2014) showed that also changes regarding the concreteness of the pictorial representation affect text-picture integration. In their study, they varied the instructional format by giving learners text only or text augmented with either an abstract or concrete visualization. The eye tracking data showed that students learning from text and abstract visualization processed the text more efficiently and made more frequent attempts to integrate the text with the picture.

Finally, also verbal instructions that commit students to the use of specific multimedia learning strategies during studying text and pictures can improve learning outcomes via supporting integrative processing. Stalbovs, Scheiter, and Gerjets (2015) used implementation intentions to improve students' processing of text and pictures. Implementation intentions are if-then plans that link an action aimed at reaching a specific goal to a favorable opportunity to perform this action; they have been shown to be a highly effective means to support goal accomplishment (Gollwitzer & Sheeran, 2006). Stalbovs et al. (2015) applied implementations intentions to foster different multimedia learning strategies (e.g., "If I have finished reading a paragraph, then I will search for corresponding information in the picture"). Multiple implementation intentions that addressed text processing, picture processing, and the integration of text and pictures led to a higher number of transitions between text and pictures, which in turn was linked to improved learning outcomes.

Enriching Other Forms of Assessment

Eye tracking can serve to enrich and improve other types of assessments regarding learning processes. For instance, eye tracking can be used to complement verbal reports and triangulated with students' introspections in order to arrive at a more meaningful interpretation of the data than what can be achieved by using only one process assessment in isolation. In particular, eye tracking provides objective information on whether a certain piece of information was attended or not, whereas verbal reports leave it open whether some information was not processed or whether the person simply forgot to mention this information in her/his report. On the other hand, eye tracking does not allow for any conclusions regarding why a person attended to a piece of information, which is, however, an insight that may be derived from a verbal report. What has to be kept in mind though is that there may be technical barriers when assessing eye tracking and verbal reports concurrently. In particular, letting people talk while recording their eye movements will inevitably lead to head movements that will reduce the accuracy of the eye tracking data. To circumvent this problem, eye tracking can be combined with retrospective verbal reports, which are assessed once a person has finished learning. Unfortunately, retrospective reports are more error-prone than concurrent reports (Brinkman, 1993) in that learners may be unable to retrieve memories regarding their learning behavior from long-term memory, fabricate reasons for their behavior, or make statements to comply with the experimental situation (e.g., by taking into account alleged expectations of the experimenter; cf. Van Gog, Paas, van Merriënboer, & Witte, 2005).

To improve the validity of retrospective verbal reports, Van Gog et al. (2005) have suggested using cued retrospective reporting as a technique. In cued retrospective reporting, gaze replays of students recorded during learning or problem solving are shown to students afterwards and they are asked to comment on their gaze behavior. Thus, the gaze replays act as cues that remind the students of the learning task and the behavior that they actually displayed during learning, making it more likely that the verbal reports are a true reflection of what students did. Jarodzka et al. (2010) used cued retrospective reporting to investigate expertise differences. The data from the eye tracking and the cued retrospective reporting provided converging evidence for expertise-dependent differences regarding the way the participants approached the task: Experts mentioned task-relevant information more often during their initial utterances than did novices; similar, their visual attention was more often focused on this information. In addition, the cued retrospective reports for the entire task duration showed that the experts remained focused on processing and interpreting task-relevant information, even though their visual attention was also drawn to less relevant aspects of the visual display.

To summarize, the use of eye tracking as a research tool has become quite popular in the field of learning and instruction and more and more researchers use it to complement their research in one (or more) of the aforementioned functions. In addition, there is a growing interest in using eye tracking to not just study, but to design instruction that aims at improving multimedia learning. Importantly, research that is based on the idea of using eye tracking as an instructional tool is still in its infancy; nevertheless, there have been first promising results that justify its review in the present chapter.

EYE TRACKING AS AN INSTRUCTIONAL TOOL

Research in which eye tracking is used to design interventions whose goal it is to improve multimedia learning is also conducted against the backdrop of the cognitive theories of multimedia learning introduced earlier. These theories serve to state which cognitive processes, namely, selection, organization, and integration of information from text and pictures, should be addressed in an intervention. Furthermore, self-regulated learning theories are used to reason why learners will often fail to learn if not guided, namely, because they will not adequately monitor and regulate their learning process, which in turn will lead to an insufficient use of effective cognitive (multimedia learning) processes (cf. Nelson & Narens, 1990). Finally, intervention studies that model effective processing of multimedia materials using eye tracking often refer to socio-cognitive learning theory (Bandura, 1977) to argue why observing another learner's processing behavior (i.e., his or her eye movements) should improve one's own learning. In the following, we will refer to two types of innovative interventions, both of which have only recently been introduced in the literature.

Designing Adaptive Instruction

Eye tracking can serve to assess and evaluate students' learning processes online and provide instruction that is adapted to their behavior. In a recent study by Leber and others (Leber, Skuballa, & Renkl, 2014) eye tracking was used to identify a potentially dysfunctional processing of text and pictures (e.g., insufficient reading of text), in which case the system provided rapid assessments of the knowledge that could have been acquired had the information in question been processed adequately. If the assessment item was answered incorrectly, prompts asked the student to restudy the information in question. Findings showed that an adaptive assessment was better able to identify students' knowledge gaps compared with a non-adaptive assessment and that prompts that had been generated based on the assessment improved learning.

In our own lab, we currently evaluate an adaptive multimedia system that analyzes learners' gaze behavior in real time and offers individual instructional support tailored towards students' processing (i.e., contingent to the learners' gaze behavior; Wassermann, Hardt, & Zimmermann, 2012). In a first experiment, it was determined how successful and less successful learners differed in their viewing behavior in a non-adaptive multimedia learning session on mitosis. Based on these findings, it was decided when and how the adaptive system should support learners when learning with this material. To this end, specific threshold values were defined for several eye-tracking parameters (e.g., minimum picture processing times) that were linked to different forms of adaptation of the material (e.g., enforced restudy of the pictures). For instance, if the system noted that the learner performed too few transitions when studying text and pictures, a color-coded version of the same material was presented to foster more

integrative processing. Unfortunately, a first evaluation of the adaptive system revealed no improvements in learning outcomes when compared with a non-adaptive system, suggesting that the adaptation rules implemented so far require further optimization.

Modeling Cognitive Processes

If a certain eye movement behavior is related to better learning, it might actually be helpful for learners to be able to observe this behavior prior to studying instructional materials in order to internalize it and then apply it during learning. This is the basic idea underlying eye-movement pre-trainings and Eye Movement Modeling Examples (EMME) described in the following.

Skuballa et al. (2015) used eye movements as a pre-training to improve subsequent learning from narration combined with a static visual display explaining how a solar plant works. Students in the pre-training condition watched an animated circle moving on a blank screen before learning from the multimedia instruction. The movement of the circle reflected the order by which students were expected to later attend to the different components of the solar plant. Students were instructed to follow the moving circle with their eyes. The control group started learning with the multimedia instruction without receiving pre-training. The results showed that students in the pre-training group better understood the processes and functions underlying the way a solar plant works. Interestingly, the pre-training had no effect on students' gaze behavior during studying the multimedia instruction.

EMME consist of videos showing the gaze behavior of a skilled learner, who carefully studies text and pictures. These EMME are used as processing instruction for learners to illustrate how they should study multimedia materials to learn more effectively from them, thereby serving as strategy models (Jarodzka et al., 2012; Jarodzka, van Gog, Dorr, Scheiter, & Gerjets, 2013; Mason, Pluchino, & Tornatora, 2015). In EMME aimed at supporting multimedia learning, the eye movements of a skilled (instructed) learner, that is, his/her fixations occurring from reading text, inspecting the picture, and saccades illustrating how s/he moves back and forth between these two activities, are superimposed onto a multimedia training stimulus, resulting in a video of the model's learning behavior. Against the backdrop of the socio-cognitive theory of learning (Bandura, 1977), learners watching this video are assumed to internalize the model's behavior. To test this assumption in studies evaluating the effects of EMME, learners - after observing this video – are given a second set of multimedia materials to learn from, for which they do not receive any guidance. Recent research has shown that EMME yield a more effective processing of these subsequently presented text-picture combinations (as evidenced by eye tracking) and improve learning outcomes in both, children (Mason, Pluchino, & Tornatora, 2015, in press) and adults (Schubert, Schüler, & Scheiter, 2015).

Mason, Pluchino, and Tornatora (2015) studied the effects of EMME compared with a no-EMME control group in 7th graders. In the experimental condition, learners saw a gaze replay of a model, who first read the whole text, and then shifted his/her attention to the picture multiple times to connect corresponding elements from the picture with the text. The control condition received no strategy modeling. Students' eye movements and learning outcomes were assessed for a second illustrated text that was unrelated to the first. Results showed that learners in the EMME condition showed more integrative processing as measured by the duration of their look-froms compared with the control condition; moreover, they had better verbal and graphical recall and transfer performance. Finally, the duration of look-froms predicted better transfer performance in the EMME, but not in the control condition. These findings were replicated in a second study (Mason, Pluchino, & Tornatora, in press); this study moreover revealed that

especially students with poorer reading comprehension skills benefitted from EMME, whereas there was no effect for students with stronger comprehension skills.

Schubert, Schüler, and Scheiter (2015) investigated how EMME that illustrated a variety of different multimedia learning strategies supported learning for university students. Different prior knowledge aspects were assessed as control variables to test whether these cognitive prerequisites would moderate the effects of EMME. Learners in the EMME group showed more adequate visual processing of the materials as became evident through more intense processing of pictures and more frequent transitions between text and pictures. Regarding open recall, learners with weaker cognitive prerequisites showed poorer performance after having studied EMME, whereas EMME did not impact performance of students with stronger cognitive prerequisites. In a forced-choice verification task, this pattern changed in that students with stronger prerequisites benefitted from EMME, whereas there was no effect for students with poorer prerequisites. The time spent on processing of the pictures was suited to explain the positive effects of EMME regarding the latter outcome measure. The results indicate that more complex EMME illustrating multiple multimedia learning strategies can also support learning of adult learners, at least if these learners possess good cognitive prerequisites.

CHALLENGES OF USING EYE TRACKING IN MULTIMEDIA RESEARCH

To conclude, eye tracking can move the field of multimedia learning forward by serving as a research and instructional tool. However, there are also a number of challenges associated with its use.

Conceptual Background Knowledge

Eye tracking systems have become very user-friendly in the last years; however, what is neglected is that eye tracking requires more than just technical knowledge on how to operate the recording device; rather, conceptual background knowledge is required to avoid misinterpretations of results. For instance, there exist gaze tendencies in humans that are independent of materials and not considering them in the design of the materials may yield artifacts in the data. According to Tatler (2007) there is a marked tendency in subjects to fixate the center of the screen when viewing visual images on a computer monitor. There exist yet unexplored alternative explanations for this central fixation bias such as that the center may be the most informative point to look at while making best use of peripheral vision. Regardless of the reasons for central fixation bias, not knowing about it when designing materials may yield artifacts in the data, for instance, when comparing visual attention for material variants, where in one case relevant information is incidentally presented in the center of the screen whereas in the other case it is not. Analogously, in general horizontal and vertical saccades are more frequent than oblique saccades (Tatler & Vincent, 2008); attributing such a difference in frequencies as being caused by one's material would yield a wrong interpretation.

Moreover, the fact that a person has not fixated an AOI does not exclude the possibility that the person has perceived the information contained in it nevertheless. In some cases, peripheral vision which is not accounted for when limiting one's analyses on fixations may be sufficient to notice visual information (e.g., coarse colorless shapes or rapid changes in the display, which do not require high acuity vision to be noticed). In other cases, albeit being quite accurate the eye tracking system can only estimate where the "real" point of gaze is located at any given moment. Hence, there is always minor imprecision as-

sociated with it, which needs to be accounted for when defining AOIs – the smaller the AOI the more spatial imprecision is a problem, because there is a higher chance that fixations will be erroneously (not) counted as being on the AOI.

Also one needs to be aware of the assumptions one buys into when running eye tracking studies, which is particularly problematic when studying text-picture combinations. Many of these assumptions derive from reading research and it is yet unclear whether they can be reasonably applied to multimedia instruction in a one-to-one fashion. For instance, standard definitions have been established in reading research for fixations. According to these standards, an average fixation that allows for information intake needs to be about at least 100 ms long while reading text; however, much shorter fixations (e.g., as short as 19 ms; Greene & Oliva, 2009) have been shown to already allow for extraction of pictorial information from scenes (e.g., landscapes). Similarly, mean fixation durations typically differ between reading (for skilled readers: 200-250 msec; Rayner, 2009; Rayner et al., 2006) and scene perception (330 milliseconds; Henderson & Hollingworth, 1999). Finally, mean fixation duration is interpreted differently in these two areas of research: Whereas longer mean fixation durations in reading research reflect students' processing difficulties (e.g., Rayner et al., 2006), they are seen as indicators of increased interest in information elements in scene perception research (Henderson & Hollingworth, 1999). Whether or not these differences are relevant for multimedia research, we do not know yet. There is tentative evidence that in multimedia learning, reading and picture processing may be more similar to each other than suggested by the previously discussed findings. Ozcelik et al. (2009) compared mean fixation durations for text and pictures and found no differences between them; moreover, both values were well within the range that is considered typical for skilled readers. Thus, it might be that 'reading' instructional pictures is actually more similar to text reading than it is to scene perception, but further research is required to explore these issues.

Selection and Interpretation of Eye Tracking Parameters

The multitude of measures to choose from and the fact that their interpretation often is ambiguous are the major challenges in using the eye tracking technology as a research tool. First of all, the fact that eye tracking software automatically generates a list of potential dependent variables makes it very tempting to simply pick those that promise the 'best' (significant) results – irrespective of theoretical considerations regarding whether they are suited to answer a research question formulated a *priori.* This will inevitably lead to an increase in type I errors. Second, having so many measures to choose from makes it very difficult to compare findings across studies. For instance, whereas some studies use overall fixation count as a measure of attention, others use total fixation times.

More importantly, there exist hardly any standard interpretations for the various eye tracking parameters and the question whether these can in fact exist. This is certainly less of a problem as long as eye tracking parameters are interpreted as indicators for a person's distribution of visual attention; however, once a researcher wants to use them to make statements regarding a person's cognitive processing, the situation becomes more difficult. In this case, an interpretation of these parameters will likely depend upon the context (i.e., the task, materials, sample) in which it was measured. For instance, attending towards some information for a long time may mean that it was interesting, relevant, or complex; often, decisions among these alternatives will be possible only by relating eye tracking parameters to other measures such as learning outcomes. But even this will not resolve all interpretation problems, since the relationships with learning outcomes may be moderated by prior knowledge (Schwonke et al., 2009) or

unknown contextual factors. For instance, Ozcelik et al. (2010) found that longer mean fixation durations were associated with lower transfer performance, whereas the opposite was the case in the study by Ozcelik et al. (2009). The authors do not refer to this contradiction between their studies. It shows that interpretations of eye tracking parameters are bound to the local context in which they occur, which is rather unsatisfactory from a measurement perspective.

Similar contradictions have been observed for the use of text-picture transitions as a measure of integrative processing. In some studies, the number of transitions was affected by experimental manipulations aimed at facilitating integration (e.g., O'Keefe et al., 2014; Johnson & Mayer, 2012; Stalbovs et al., 2015) sometimes it was not (Scheiter & Eitel, 2015); moreover, it is inconsistently linked to learning outcomes. For instance, Hegarty and Just (1993) showed that students with less prior knowledge in the domain of mechanics performed less well in a comprehension test, but more frequently switched between single text expressions and picture elements, whereas in other studies the number of transitions was linked to higher learning success (O'Keefe et al., 2014; Stalbovs et al., 2015).

One reason for this inconsistency may be differences in the cognitive demands resulting from integrating verbal and pictorial information in memory rather than by physically switching the attentional focus between text and picture processing. These memory demands may vary both as a function of the age of learners and the complexity of the materials. That is, younger learners may have to move their eyes back and forth between text and pictures, because their cognitive processing resources are yet too constrained to manage integration of verbal and pictorial information in the mind (i.e., without being supported by an external representation). Moreover, some materials are so complex that integration from memory becomes too taxing; rather, in this case learners will need to go back and forth between text and pictures multiple times to arrive at a coherent understanding of the instructional message. Finally, the design of the materials and the costs that arise from switching attentional focus may cause differences in whether learners show integrative saccades or not. Accordingly, Bauhoff, Huff, and Schwan (2012) showed in an eye tracking study using a comparative visual search task (Hardiess, Gillner, & Mallot, 2008) that whether students moved their eyes between different representations to integrate them or whether they integrated based on memory depended on the physical distance between the representations. Closer proximity afforded a higher number of saccades between representations, whereas for more distant representations people were more likely to apply memory-based strategies. These findings correspond nicely with those of Johnson and Mayer (2012) revealing that text-picture transitions were more frequent in the case of physically integrated multimedia materials.

Moreover, the inconsistency regarding the role of text-picture transitions for learning may be also be due to the fact that its relationship with learning outcomes is more complex than what can be detected by the statistical methods used to analyze it. Most studies assume a linear positive relationship between the number of transitions and learning outcomes; however, it might well be that this relationship in fact follows an inverted u-shape. That is, up to a certain point more transitions will be linked to better learning outcomes, whereas beyond that point conducting even more transitions may be an expression of students' difficulties in relating information from text and pictures (e.g., Hegarty & Just, 1993). When analyzing such u-shaped relationships using linear statistical models, contradictory patterns of results can be obtained depending on which range of the distribution of number of transitions is analyzed (i.e., below or above the turning point).

The previous discussion suggests that even relatively simple, aggregate eye tracking measures may be difficult to interpret; however, the case becomes even more challenging with more complex measures sich as Levinsthein's distance. For the calculation of Levinsthein's distance certain decisions are made:

First, if the same events follow upon each other repeatedly (e.g., multiple, consecutive fixations within the same AOI) these are typically treated as only one occurrence. This means that a scanpath in which the person refixated the same AOI multiple times, thereby showing intense processing of that AOI, is treated as identical to a scanpath, in which the person fixated the AOI only once. Moreover, when looking at an event occurring later in the sequence, in the first case there were many events occurring before that particular event (meaning that this event occurred relatively late in time), whereas in the second case it occurred rather early in the sequence. In general, in scanpath analyses any information regarding the duration of events is lost. Moreover, the actions that are required to transform one string into another (deletions, insertions) are typically treated as being equally meaningful for determining the similarity among strings (although in principle one could assign different weights to them). However, whether or not deleting a fixation in a scanpath (suggesting that a person never attended an AOI although s/he did) and insertions (suggesting that a person attended an AOI even though s/he did not) is identical in meaning from a cognitive processing perspective is unclear. Thus, using Levinsthein's distance as a measure requires that one carefully reflects upon the assumptions underlying this measure before applying it to learning with multimedia.

Designing Eye-Tracking Interventions

The design of eye-tracking based interventions is still in its infancy. Regarding the design of adaptive learning environments, it is yet an open question which eye-tracking parameters should be chosen for an adaptation and how to best determine the threshold values that control when an adaptive response is elicited. Moreover, an online computation of eye-tracking parameters required in order to allow for immediate responses of the learning environment is still challenging in particular if one aims at using more fine-grained measures or combinations of multiple measures, which both require sufficient computational power to due the necessary computations without any delay. To effectively model multimedia learning processes via pre-trainings and EMME, it is important that we learn more about the exact nature of these processes from studies deploying eye tracking as a research tool. That is, once we have detailed insights into the most effective processes, we can design modeling interventions based upon them. Importantly, this does not yet address the question whether the most effective learning processes should be the ones that are shown to learners. Alternatively, learners might benefit more from a model showing an advanced processing behavior, which can potentially be more easily incorporated into their repertoire of learning than that of an expert learner. A discussion of these and related issues pertaining to characteristics of effective models can be found in van Gog and Rummel's (2010) review.

Data Analyses

Most often, the data derived from eye tracking is more difficult to analyze because they often violate assumptions of standard statistical procedures based on the General Linear Model (e.g., ANOVA, regression). In particular, there may be many missing values where one needs to be aware that calculating person or group means will be based on different numbers of raw values.

Thus, the variance associated with these means will differ as well, which may lead to variance heterogeneity. Moreover, time data are often skewed, thereby violating assumptions of normal distribution. One means to respond to these issues is to analyze eye-tracking data by using mixed models (e.g., generalized linear mixed models) because of their advantages in dealing with missing values. Another

challenge is that eye tracking provides high-frequent data with many parameters and data points. Hence, conducting multiple univariate analyses is likely to yield at least one significant effect, even if, in reality, there is none (type I error). Conducting multivariate analyses can become quite complex so that one good strategy would be to approach the analysis in a top-down manner, with clear hypotheses for specific eye tracking parameters for each given point in time.

CONCLUSION AND FUTURE DIRECTIONS

Eye tracking has provided us with important insights in how students learn from multimedia and may even serve to design novel forms of instruction as recent research suggests. However, it is important to keep in mind that is not the Holy Grail that will answer all questions whenever deployed. Rather, its use needs to be motivated by and grounded in theories on how people learn that allow formulating *a priori* hypotheses that can then be tested using eye tracking. Also it needs to be kept in mind that learning is more than just attending to information; rather, it requires additional cognitive processes such as elaboration to arrive at a deeper understanding. Thus, attending towards relevant information is a necessary, but not a sufficient condition for learning, which may explain why some studies have also failed to establish any link between measures of visual attention distribution and learning outcomes (e.g., Kriz & Hegarty, 2007).

There are a multiple avenues for future research. First, the field is still lacking models of learning with multimedia that describe the time course of text-picture processing in more details and how it is modulated by linguistic and pictorial features. For instance, regarding integration of text and pictures, Hegarty and Just (1993) showed that subjects interrupted their reading of the text multiple times to inspect the picture, thus, suggesting that the learning from illustrated text proceeds in a highly interleaved fashion. On the other hand, Mason, Pluchino, and Tornatora (2015) showed that EMME, which suggested to learners to first read all the text before inspecting the picture were effective in promoting later learning. It is yet unclear whether these different approaches to integrated processing are equally successful, whether their relative success is bound to individual learning characteristics, etc.

Moreover, the lack of models describing the time course of text-picture processing in more detail is paralleled by the shortage of studies analyzing and reporting the time-course of eye movements on a fine-grained level (for an exception see Lindner et al., 2014). In order to better exploit the high temporal resolution of eye tracking data, future studies should focus more on deriving and testing hypotheses about how eye movements develop across the time-course of learning with (complex) instructions.

KEY TERMS AND DEFINITIONS

Eye-Mind Assumption: The assumption that what is attended with one's eyes is an indication of what is processed at the cognitive level. The eye-mind assumption is fundamental to a cognitive interpretation of eye tracking data.

Fixations: A state of the eyes when the eyes remain relatively still and focused onto one location of the stimulus, thereby allowing intake of information from this part of the stimulus.

Integration: The cognitive process of relating corresponding information from a text to that of a picture and building a coherent mental representation of information from both sources. Integration is seen as the pivotal process for learning from multimedia.

Look-Froms: An eye-tracking indicator related to second-pass processing. It describes the duration (fixation times) for re-reading text while re-inspecting the picture (i.e., look-froms picture to text) and vice versa (i.e., look-froms text to picture: re-inspection of the picture while re-reading the text).

Multimedia Learning: Learning from combinations of (written or spoken) text and pictorial representations (e.g., diagrams, animations).

Scanpath: The sequence of fixations and saccades that can be used to describe the time course of attending to a stimulus.

Signaling: Changing the visual appearance of elements of the multimedia message to highlight relevant information without altering its instructional message. Signaling is often deployed to highlight correspondences between text and pictures that are pivotal to integration.

Transitions: Move the eyes from one area of interest to another. Transitions between text and picture processing are often studied as an indicator of integrating information from both sources (integrative saccades or text-picture transitions).

Chapter 36
Requirements to a Search Engine for Semantic Multimedia Content

Lydia Weiland

Leibniz Information Center for Economics, Germany

ABSTRACT

The authors investigate user requirements regarding the interface design for semantic multimedia search and retrieval based on a prototypical implementation of a search engine for multimedia content on the web. Thus, unlike existing image or video search engines, they are interested in true multimedia content combining different media assets into multimedia documents like PowerPoint presentations and Flash files. In a user study with 20 participants, the authors conducted a formative evaluation based on the think-aloud method and semi-structured interviews in order to obtain requirements to a future web search engine for multimedia content. The interviews are complemented by a paper-and-pencil questionnaire to obtain quantitative information. As a result, the authors elicit requirements to a web search engine for multimedia content. Among them, scalability and personalization of the presented information are identified as the main goals. Based on the requirements, they present mockups demonstrating the user interface of a future multimedia search and retrieval engine.

1. INTRODUCTION

Multimedia content, which is provided by PowerPoint presentations or Flash documents, is widely adopted and can be found in any domain. Despite the growing interest in multimedia web search, most major web search engines currently offer only limited multimedia search functionality. Unlike existing

DOI: 10.4018/978-1-5225-3822-6.ch036

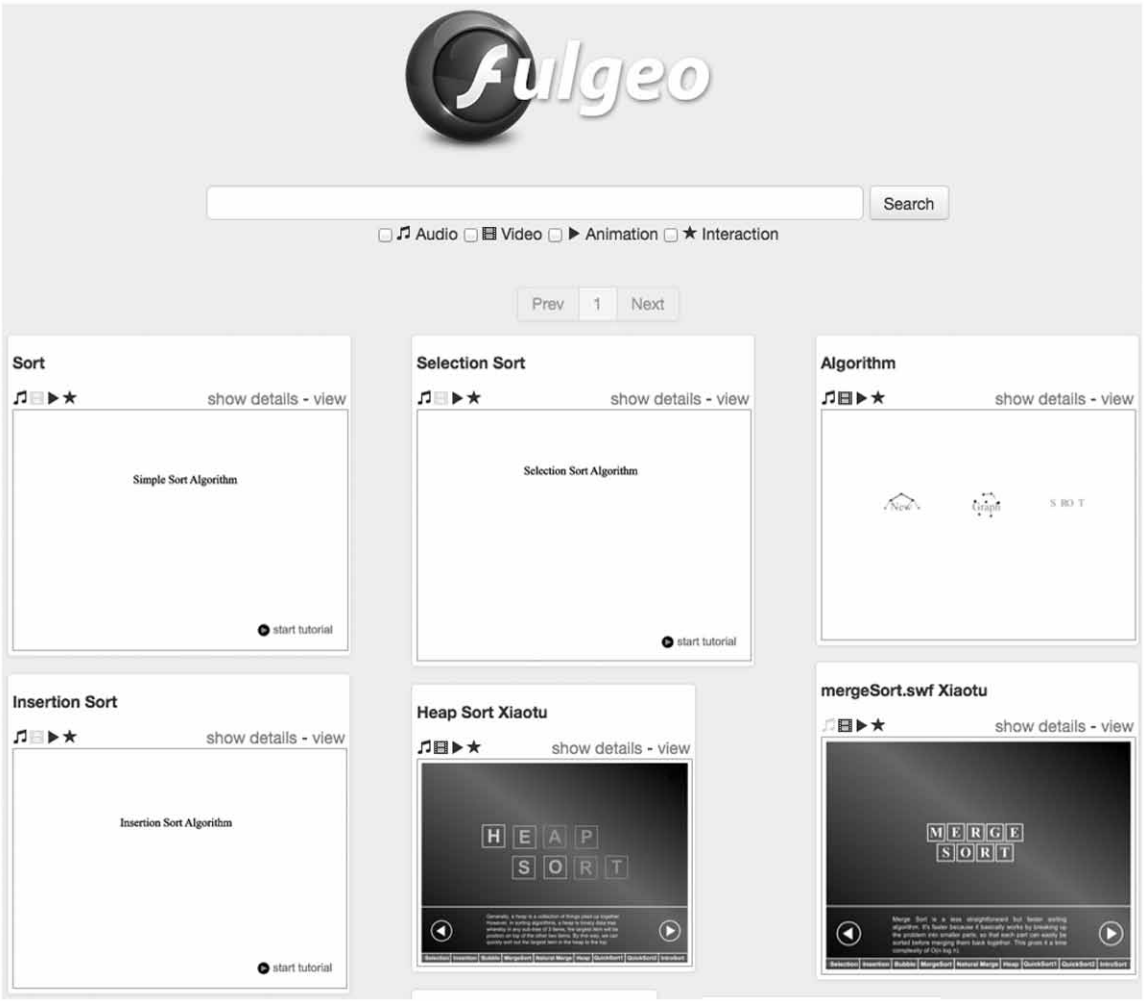
image or video search engines, the content a multimedia search engine has to deal with is the coherent combination of different types of media assets such as images, videos, audios, and text. Those media assets can be animated or rearranged by interactions (Candan & Sapino, 2010). The semantic within multimedia documents is given through relations dealing with time and space of media assets (Boll, Sandhaus, Scherp, & Westermann, 2007), e.g., duration of a video, width, height, and position of an image, but these are just partially taken into account by previous systems. Research on search engines dealing with a single media type like images and videos is well established and there exist studies that investigate how users apply media search engines (Maniu, O'Hare, Aiello, Chiarandini, & Jaimes, 2013; Kofler & Lux, 2009). However, regarding search and retrieval of *true* multimedia there is a gap in the research. Thus, we have developed an early prototype of a search engine for multimedia content on the web (Tingvold, Stohr, Schneider, & Amundsen, 2013)[1] (cf. Figure 1). The prototype offers users to search and explore for multimedia content. The goal of this early search engine was to provide users an initial idea of what a retrieval system for true multimedia could look like and to use this system to bootstrap requirement elicitation and detailed understanding of users' needs for semantic multimedia search. On the basis of this prototype, we conducted a user study evaluating the features for a future multimedia search engine. The current prototype is developed for keyword-based queries only. There are filters for audio, video, animation and interaction. These filters are applied by logical OR operators. The preview of the multimedia documents in the result list indicates if the document contains media assets fulfilling the filter. The thumbnails, which show the first frame or the first slide of the multimedia document, are of different sizes, starting with larger ones in the upper position to smaller ones in the lower position of the results page. Hovering over a thumbnail shows an animated preview of the document. Clicking on a document opens a detail view in the lower part of the search engine's window.

In the subsequent sections, we present the related work in multimedia search and studies on media search engines. In Sections 3 and 4, we describe the conducted user study and its results. Based on these results, we derive requirements to a future multimedia search engine in Section 5. We designed mockups combining good features of the existing prototype, with new requirements collected from the survey, and further ideas derived by the interview section (Section 6). Finally, we discuss the overall results and the limitations of our study (Sections 7 and 8).

2. RELATED WORK

Various media retrieval systems have been developed in the past like the MEMORAe project (Merzougui, Djoudi, & Behaz, 2012), where ontological knowledge is used for indexing and searching educational videos. Breaking the barrier of a single media modality, there are approaches for semantic cross-media search and retrieval like the semantic search engine Squiggle (Celino, Valle, Cerizza, & Turati, 2006) for images and audio. The FLAME framework (Flash Access and Management Environment) (Yang, Li, Wenyin, & Zhuang, 2007) is considered to be the so-far most comprehensive work on multimedia search. It supports retrieval based on some spatial and simple interaction constraints. Regarding the use of media retrieval systems, there have been some empirical investigations conducted in the past. Hearst (Hearst, 2009) states that there are three main search behaviors in web search: fact finding (looking for specific facts or pieces of information), information gathering (the collection of information from multiple sources), and browsing (visiting web pages without particular goal). Kofler and Lux (Kofler & Lux, 2009) conducted an evaluation of user intentions within image search. They conclude that existing

Figure 1. Fulgeo search interface and result view pagination is used and limits the result list to 20 documents per page. Overall, the prototype has about 4000 multimedia documents in the database.



taxonomies and models do not represent the users' intent while searching for multimedia content sufficiently. Maniu et al. (Maniu, O'Hare, Aiello, Chiarandini, & Jaimes, 2013) analyzed web server logs and all user actions during search sessions. They identified differences in search behavior caused by the different categories of search. Those categories are derived from the analysis of the server logs. They also conclude that current models and thus, interfaces, do not exactly represent the user's intent while searching for multimedia content.

3. USER STUDY

In July and August 2013 we conducted a user study with 20 subjects (eight female). The average age was 26-year-old (standard deviation (SD) = 2.87), ranging from 22- and 34-year-old. A pretest checked

minimum command of English (required to use the prototype) and computer skills. This is important to obtain feedback from users which are familiar with existing search engines. The majority (16 subjects) said to have "worked a lot with search engines" (rating 6 and 7 on a 7-point Likert-scale), while the others rated themselves as intermediate users (rating 3 to 5). The experience distribution about multimedia search was nearly similar (13 experienced users and one novice user). Special consideration was given to the subjects' diversity regarding educational background and profession in order to avoid bias by a specific population group (Miles & Huberman, 1994). The sample consisted of bankers, cooks, doctors, machinists, computer science students, media and communication science students, and students of teaching.

3.1. Apparatus and Data Set

At the time of the user study, the prototypical multimedia search engine was filled with about 4000 multimedia documents crawled from the web. These multimedia documents cover terms related to the topic climate change and global warming. The experiment was conducted at a normal workplace using the same laptop with a 19-inch screen.

3.2. Tasks

Every subject had to solve four tasks. The main aim was to find specific multimedia documents. For solving the tasks, the subjects had to use the different features offered by the engine. The tasks were of different levels of complexity. The first task was to find a document and to open it in a new window or tab. This document had to fit to the query "Climate conference in Kyoto".

In the second task, the subjects had to apply the filter for animations to find a multimedia document in the context of the "Greenhouse effect".

In the third task, they had to use the detail view and the highlighted keywords to find a document, which contains most occurrences of the keywords "Climate change, sea level, glacier, Kyoto, and climate protection".

In the last task, a subject had to start an animation or activate an interaction within the context of "Climate change and glacier". The tasks were motivated by a task scenario, wherein the subject is supposed to explain climate change to pupils using multimedia. No specific introduction was given to the subjects on how to use the search engine. Thus, the subjects had to solve the tasks based on their prior knowledge from existing search engines.

3.3. Procedure

At the beginning, we informed the subjects about the goals of the study and asked them to sign an informed consent form. We asked the subjects to write down their first impressions of the prototypical multimedia search engine. Then we asked the subjects to conduct the different search tasks. While conducting the tasks, the subjects were encouraged to think aloud. Subsequently, the subjects were asked to fill in a paper-and-pencil questionnaire. Here, a set of 19 closed-questions taken from the IsoMetrics (Gediga & Hamborg, 1999) questionnaire (version 2.01) were chosen and adapted to assess the prototype. The IsoMetrics questionnaire is a catalogue of questions aiming at summative and formative evaluations of

software. Questions in IsoMetrics address part 10 of the DIN EN ISO 9241, which defines principles of ergonomic user interfaces. Thus, IsoMetrics focuses at an evaluation of usability and user-centered design.

We focused on questions about the suitability for executing the task, for learning the application and individualization of the application, the conformity with user expectations, self-descriptiveness, controllability, and error tolerance. In addition, we asked specific questions regarding search and exploration of multimedia content: The features of the current prototype are about filtering by medium type, thumbnail preview of multimedia documents, the detailed view of a selected document, and the ranking by size to support the prediction of relevance. The subjects answered the questions on a 7-point Likert scale.

In addition, open-questions were asked to the subjects, e.g., "what do you like about the search engine", "what do you not like about the search engine", "what do you think is missing (any kind of design or functionality)?", and "what do you believe might improve the usability of the search engine?". These open questions were investigated in a semi-structured interview in order to explore emergent meanings and intentions of the subjects in context (Myers, 2009).

4. RESULTS

4.1. Task Execution

The mean duration for all sessions was 39 minutes (SD = 9min.), mean processing time for task 1 is three minutes (SD = 1 min.), task 2 also three minutes (SD = 2 min.), task 3 four minutes (SD = 2 min.), and task 4 three minutes (SD = 1 min.). All subjects were able to successfully accomplish their tasks. Considering the feedback from the subjects that they assess the tasks to be gradually more challenging but never unsolvable and considering the measured execution times, suggests that task demand was adequate. This fits the intention of an accessible test design.

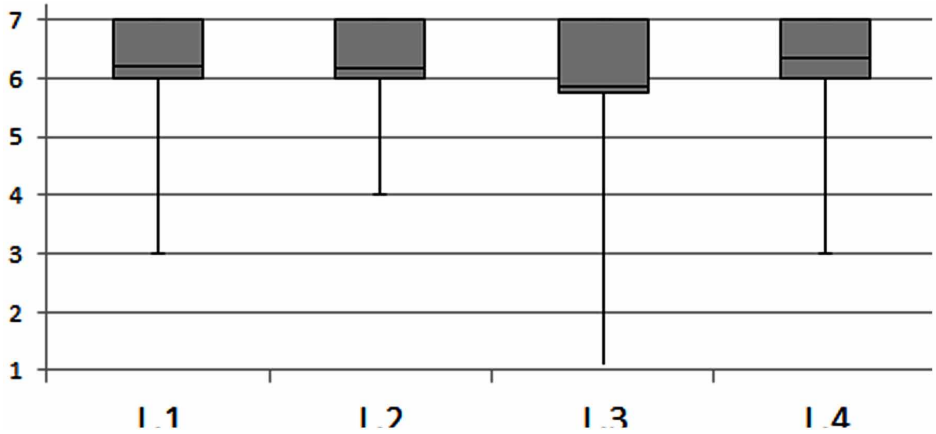
4.2. User Satisfaction

In detail we asked the following amount of questions from the categories. Abbreviations in brackets will be used in the latter and on the visualizations for the evaluations: S*uitability for learning the application* (4 items, L.1-L.4), c*ontrollability* (2 items, C.1-C.2), *suitability for executing the tasks* (2 items, T.1-T.2), and questions about the specific *features for multimedia search* (4 items, F.1-F.4).

4.2.1. Suitability for Learning the Application

Most subjects predominantly agreed to the statement L.1: "The interface of the search engine is understandable at first glance." (mean (M) = 6.2; SD = 1.12)(cf. Figure 3). Also most of the subjects predominantly agreed to L.2: "The search engine is designed in such a way, that functionality not yet known could be learned by trying out." (M = 6.15), with lower SD = 0.91. A higher deviation and lower agreement was received for L.3: "It did not take long time before I learned to operate the search engine." (M = 5.75; SD = 1.68). L.4: "I don't have to remember a lot of details to operate the search engine", reached a higher agreement and a lower deviation again (M = 6.35; SD = 0.96). Overall, the interface was easy to understand, but there were some features which require learning or explanation (See Figure 2).

Figure 2. User ratings about learnability shown as box plots



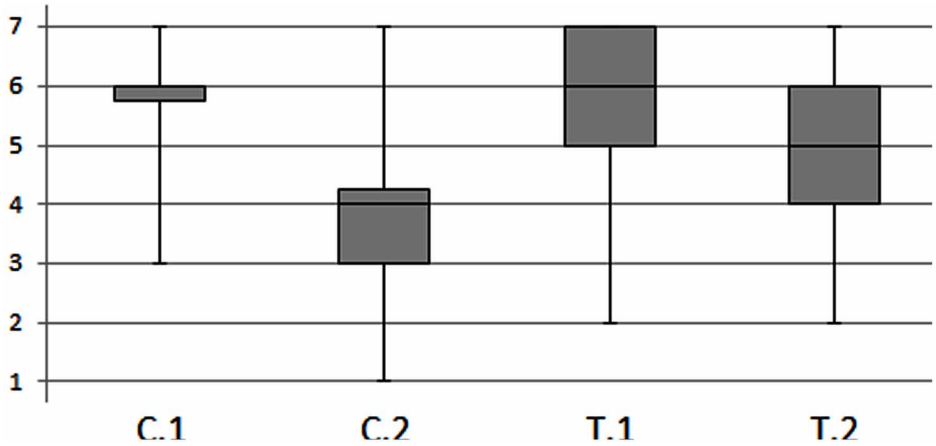
4.2.2. Controllability

The results for the L-items were supported by C.1: “Handling the multimedia search engine is easy.” (M = 5.8; SD = 0.98) and C.2: ”The engine can only be used in a rigid way.” (M = 4.05; SD = 1.66).

4.2.3. Suitability for Executing the Task

Suitability for task was represented by the following questions T.1: “The search engine permits to enter queries just the way it is necessary for searching multimedia content.” (M = 5.7; SD = 1.35) confirmed the initial keyword as approach for searching multimedia content. Nevertheless, generating and representing results need some rework, as T.2: “The results found by the search engine match my queries.”, only got an “agree” (M = 4.85; SD = 1.46).

Figure 3. Ratings of controllability and suitability for executing the task shown as box plots



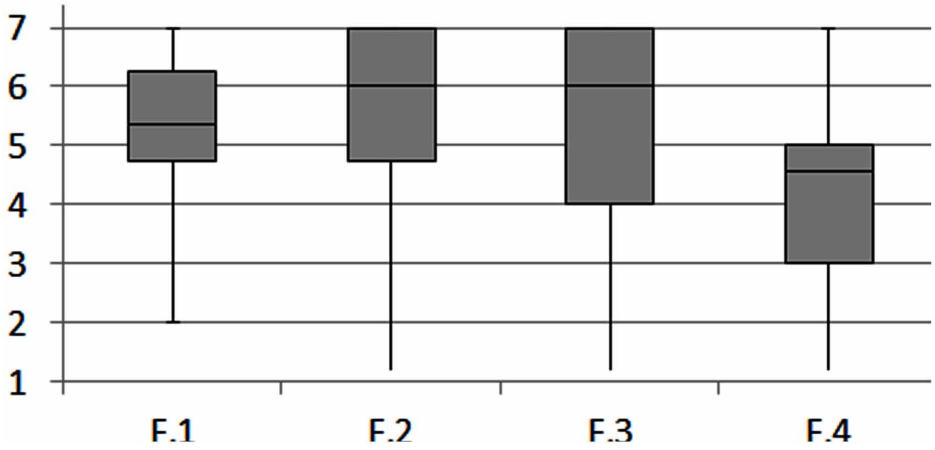
4.2.4. Features for Multimedia Search

The questions which were used to evaluate the specific features of multimedia search are about filtering by medium type (F.1), thumbnail preview of multimedia documents (F.2), the detailed view of a selected document (F.3), and the ranking by size to support the prediction of relevance (F.4). The median values of the ratings regarding the specific features of our prototype range between 4 and 6 (cf. Figure 4). As can be seen from Figure 4, all results were in median higher than 5.5. But the detail view needs improvement.

4.3. Semi-Structured Interviews

We conducted semi-structured interviews and applied a bottom-up process to analyze the results and obtain concepts from the detailed analysis of the collected data (codification) (Young, Kuo, & Myers, 2012). Overall, we can state that the subjects enjoyed using the multimedia search engine. Eleven subjects enjoyed the detail-view of the multimedia documents and found it, e.g., "very helpful" and "good for a preview so you do not have to open several pages". Eight subjects mentioned the four filter categories (audio, video, animation, interaction) positively, assuming these filters facilitate their research, especially because they can use multiple filters simultaneously. Six subjects liked the preview-animation as a concept, despite some technical issues (which were due to encoding problems). Other positively attributed comments by at least three subjects are: pleasant look, clarity, simple to use, simple to understand or conformity with user habits (see Google). Also, positively mentioned were automatic opening of the documents in a new tab, a good overall impression, automatic text highlighting of the query in the detailed view, a logo to restart a search, and the simultaneous presentation of the result page and the document details. Regarding aspects that could be improved, seven subjects mentioned that they found the results page unstructured, irritating, or chaotic, as they rather prefer representation of relevance by either size of thumbnails or a grid layout with descending order, but not both combined in one layout. Six subjects mentioned missing meta-data such as the authors, date, and URL. Four subjects mentioned to be confused by the imprecise use of filters. Three subjects did not understand the meaning or concept

Figure 4. Box plots showing the ratings of multimedia search features



of the animation, which starts playing when the user hovers over a thumbnail of a document shown in the result list. These three also mentioned that the icons and names for the filters are not self-explanatory enough. They proposed to add tool tips, which are shown when hovering over the icons.

5. REQUIREMENTS ELICITATION

Based on the results of the questionnaire, the user feedback in the semi-structured interviews, and existing literature we derive requirements for a future multimedia search engine. We organize the requirement along the different existing as well as new functional aspects of the prototype. For all requirements, we also provide further details on the user feedback.

5.1. Search Bar

The search interface of a multimedia search engine should offer an error tolerant autocompletion. According to Morville (Morville & Callender, 2010) queries should be easy to formulate, adapt and change according to the user's needs and preferences and direct the user to results, even if the user does not know exactly what he or she is looking for. More filters, which cover metadata, like author or date of creation, should be offered. To avoid an overload of the interface these additional filters can be hidden in an advanced search interface. These requirements to the search bar are suggested by analyzing the user comments, where eleven users stated that they would feel more supported by an autocompletion feature and less restricted by the implementation of further filter options. Six users suggested outsourcing more options, like further filters, into an advanced search interface.

5.2. Result Page

A multimedia search engine should offer several options or styles to view the result page. Two possibilities were suggested:

1. Arrange results strict from top to bottom. Representation of relevance is given from top to bottom in ascending order, without the representation of relevance by thumbnail size;
2. Results are presented in a grid layout with the same thumbnail sizes, but users can arrange their appearance on basis of adjustable relevance options or rearrange via drag-and-drop. The users are allowed to choose the appearance of relevance manually, so that a user can choose the relevance by size within the grid layout, like it is provided by the current prototype. This manually chosen relevance appearance prevents the user from being confused by a chaotic layout.

Overall, the subjects prefer consistency and clarity over style. As rationale for this requirement, we consider that some subjects rather want a simple list or at least the option to show the results as a list of names or headlines.

5.3. Thumbnail View

The aim of snippets is to support the user in predicting the relevance of result items. Therefore, the representation should be clear, self-explanatory, and provide enough information. The thumbnail view should provide icons for filters, which are more visible and, where the function, if a certain media type is included or not, is clear. As known from other search engines, the headlines should provide a link to the URL of the original document. Besides providing a link, a download button might also be useful. These requirements are supported by half of the subjects: they nearly ignored the icons for the different filters. Furthermore, four users thought that these icons are for interaction. They tried to click on the headers of the thumbnail in order to obtain the entire multimedia document. As there is a difference in "show-details" and "view", five users suggested to state the difference between those more apparently. Nevertheless, five users did not want or do not need snippets in the "detail view".

5.4. Detail View

The suggestion for the detail view is to enable the user to scroll through the whole text, search for further keywords within that document and to use the highlighted keywords as markers for navigating between them. When a user clicks on the highlighted keyword and then jumps to the next highlighted keyword, the preview image of the document will also change according to the text. Customization by resizing or moving the detail view window should be supported. Also adding buttons for navigating between detail views of several multimedia documents is recommended. The requirements are stressed by the statements and behavior of the subjects. Twelve of them suggested having the ability of customization, like resizing. The next and previous buttons to switch between detail views of the complete list of results are suggested by seven users. The requirement for scrolling through the multimedia document was directly expressed by two users; also two suggested adding the search inside feature within the detail view. One explained the jump navigation between highlighted keywords within the texts of a multimedia document. Thereby a user can jump back and forth between highlighted keywords which fit to the initial query. Thus, a user is able to find relevant passages quicker, without engaging the search feature first.

5.5. Request for New Features

Common browser-based features like a top menu bar, e.g., to save search sessions, a back-button, a right-click menu, should be added. One participant suggested a function to store the last search queries, settings, and result sets. Another user suggested including gesture interactions either by mouse movement and keyboard shortcuts for browsing the interface, or with regard to the rising mobile device usage and their ability of multi-touch gestures. Suggestion made by three other users were about being able to customize the order of result items, probably moving them by drag and drop. Two users suggested to stack collect multiple detail views in order to search within these presentations separately. Besides the already mentioned requirements for additional features, a play-button for videos was suggested. Finally, it was quite interesting to observe that none of the subjects requested a query-by-example or query-by-sketch feature. In fact, all subjects said they disliked the idea of query-by-example techniques.

6. MULTIMEDIA SEARCH ENGINE MOCKUP

Based on the user study and the derived requirements (cf. Section 3, 4, and 5), we created mockups for a future search engine for multimedia content, which will then also consider the semantic integration of time, space and, interaction. Overall we can state, that there are no requirements for totally new functions, but known and proven functions will be combined to allow a user centered design of a multimodal interface. The mockup provides an overview of the result list and presents additional information for each single result such as an advanced search, more filters, customization with choosing amount of shown data and thumbnails sizes and menu options like storing the current status (cf. Figure 5). The search by media type supports image, audio, and video. Additional filters for animation and interaction are added and explained when hovering over. The option for an advanced search is included in a dropdown list next to the textbox for entering the query. The advanced search enables to search for media in context, e. g. music, science, maps, or file type. The interface enables the users to customize the presentation of the result items, such as: changing scalability of the preview thumbnail and the amount of metadata by a slide control in line with the textbox. Another feature of customization is the button for activating or deactivating animations.

The results page enables users to view the result list by several aspects such as the overall relevance represented by the ranking position of the items, explicit headlines with a short and contextualizing subline (approx. snippets), a preview animation by mouse-over, metadata based on media type specifications, e. g., file size and duration, and metadata of common web content specifications, e. g., publisher, URL and release date (cf. Figure 6). The result list can be scrolled down to (in principle) infinity. Thus, no pagination is needed for users. The result view is divided into two parts: A vertical bar splits the list with the thumbnails of all relevant results from the detail view (cf. Figure 7). Using drag and drop one can move a document from the overview side to the detail view side. Alternatively, a user can also use

Figure 5. Mockup for the multimedia search bar: with filters, customization settings for previews, and options. Described with quick tips on mouse hover.

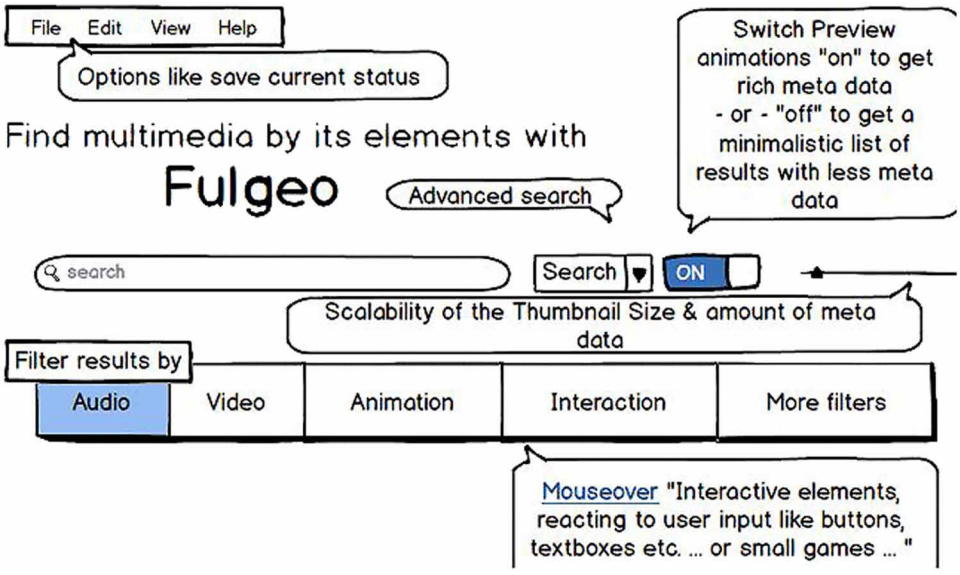


Figure 6. Mockup showing the result list view with thumbnails presented in grid-layout, more metadata, and bigger symbols for different filters. The three items in the upper row illustrate a template for the result list view. The bottom row shows three concrete examples of multimedia presentations appearing in the result list.

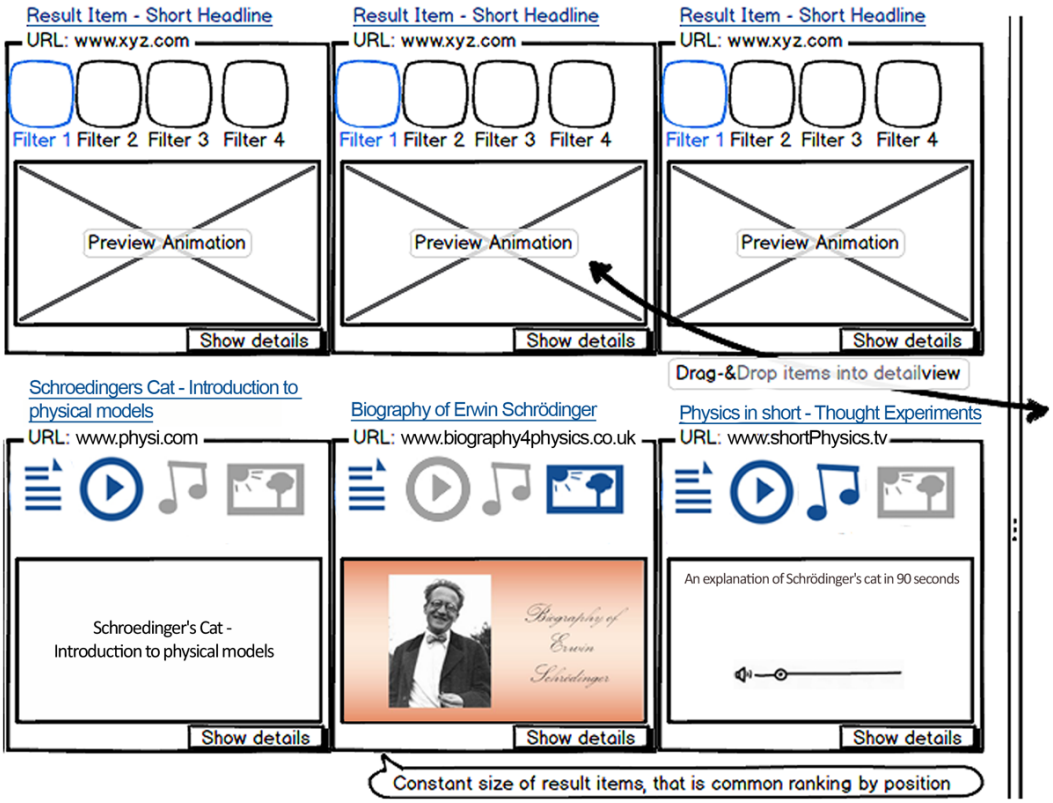


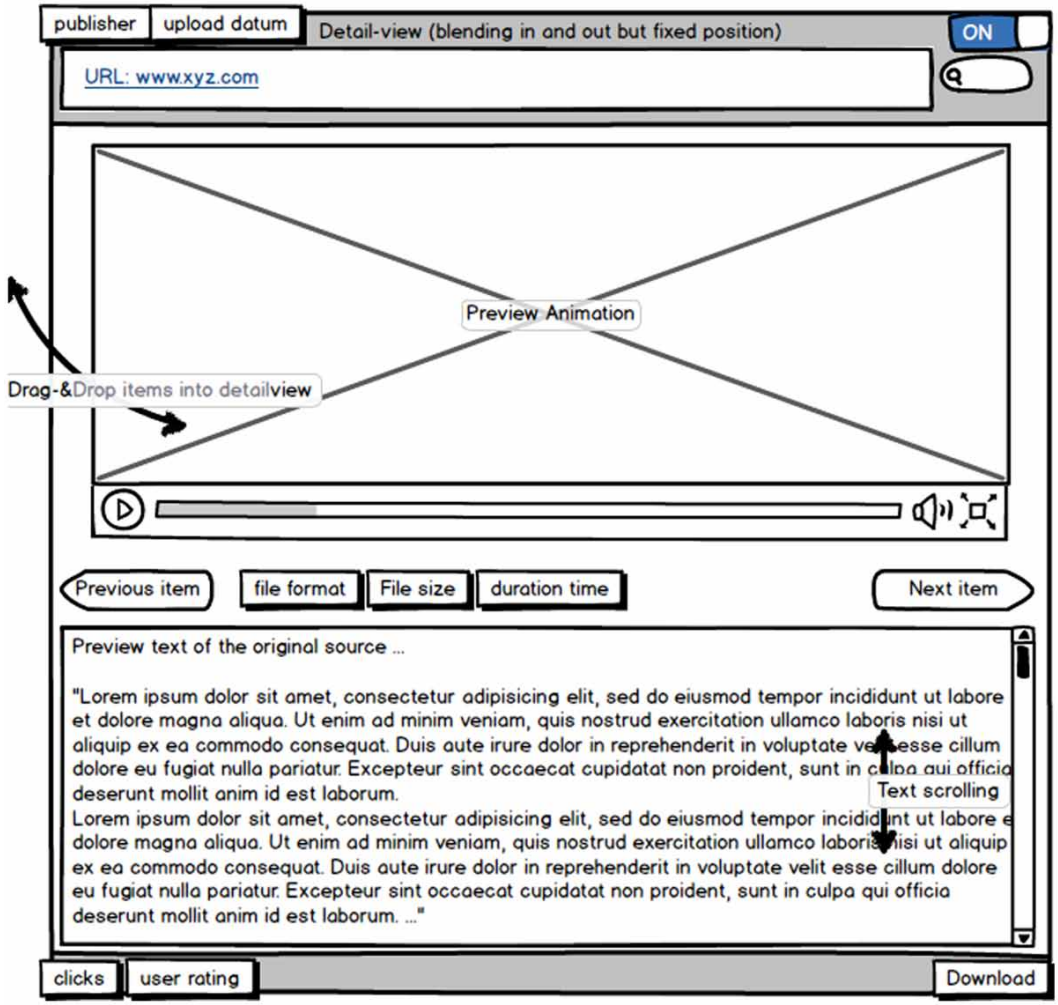
the "Show details"-button below a thumbnail. The preview text is scrollable as most users expected it to be rich in quality. When the users scroll through the preview text, the animation of the presentation changes, too.

Likewise, when the play-button is pressed to render the presentation also the text below changes. This allows to search in the whole multimedia document and has a strong focus on the visual media types. The affiliated text, which changes accordingly, supports the search for visual media types and represents the relation of visual media types and text. A user is able to navigate through the result list via the detail view by clicking on the previous or next item buttons (cf. Figure 7).

7. DISCUSSION AND LIMITATIONS

The purpose of this research was to gain insights into the requirements to a search engine or multimedia content. Based on these, we generated ideas for further research and development in the area of multimedia search and retrieval. Below, we reflect on the main insights gained from this study. In addition, we acknowledge aspects that are beyond the scope of this article and may be addressed in future work.

Figure 7. Mockup of a more advanced detail view, showing the whole text, more metadata and allows for interaction like navigating through the multimedia content



7.1. Discussion

Even though, the ergonomic quality of the prototype as assessed by users can be considered quite high, most users prefer a straight structure like a simple grid-layout of the result page in order to better orient themselves in the result list.

This is in particular important as naturally for a multimedia search engine the result set will be full of colorful animations. This insight is in line with findings of Lohmann, Ziegler and Tetzlaff (Lohmann, Ziegler, & Tetzlaff, 2009) who found out that fun and aesthetic aspects largely affect the user's interaction with, e. g., tag clouds or meaning. Tag clouds for example draw the user's intention to the center of the cloud or to colorful large tags, so that the user focuses less on content. A layout that is simpler might less influence the user's intention and encourage him in concentrating on the actual content. The subjects made clear that they did not want to have advanced features like query-by-example. This find-

ing is in line with the research by (Jaimes, Christel, Gilles, Sarukkai, & Ma, 2005) who states that in many real world applications it is hard to find an example to describe the user's information need. Many subjects asked for more individual filtering options which often referred to metadata like author, date of creation or the keywords given by the author, rather than technical differentiators such as the offered format filters for image, audio, video, and animation. Using filters supports the user in finding more relevant results to the initial query. If tags are shown next to the documents, which describe categories, e. g., persons or events, the user's assessment about the relevance of a document can be supported. This approach is inspired by Voxalead[2]. Altogether, the use of user generated annotations, comments, ratings, colorized tags etc. should be encouraged to enrich the metadata and include relevance feedback for the multimedia search (Jaimes, Christel, Gilles, Sarukkai, & Ma, 2005; Tjondronegoro, Chen, & Joly, 2008; Wang, Shih, Wu, Wang, & Jeng, 2011). Finally, it was interesting to observe that people do not have specific expectations to a multimedia search engine. However, they like to be able to customize in which modality, context, and detail of the preview or thumbnail they are looking for multimedia content.

7.2. Limitations

The fact, that models in search engines often do not fit to the intentions of users (Kofler & Lux, 2009; Maniu, O'Hare, Aiello, Chiarandini, & Jaimes, 2013), implicates a need for more psychological research to build models of human activity during multimedia information search and retrieval, e. g., connected to common dual channel theories (Kahneman, 2011) or concrete versus abstract thinking (Trope & Liberman, 2010). The tendency to request customization of the search engine suggests that there is a higher level of perceptual gap between content and current representation of content in contrast to personal requirements of users regarding the representation of search results to estimate relevance of results (Jaimes, Christel, Gilles, Sarukkai, & Ma, 2005). Despite the results obtained from the study, the evaluation also needs to be seen in context of the methodological limitations based on self-report using a standardized questionnaire. Thus, after having implemented the mockups we plan to conduct a longitudinal study.

8. CONCLUSION

We evaluated the user interface of a search engine prototype for multimedia content with the goal to generate grounded ideas for further development in the area of multimedia search and retrieval. We found that users prefer straight layouts of multimedia result sets, but would like to switch between different modes of result set presentation with different amount of information. Also they would like to be able to customize the search engine by filters and search by context or domain. Based on the user study, we derived requirements and created mockups of a future multimedia search engine. In the next step, we will implement the requirements elicited in the study and conduct more extensive evaluations using subjects from different background and different knowledge levels.

ACKNOWLEDGMENT

We thank our students D. Schneider, D. Stohr, J. Tingvold, and A. B. Amundsen for implementing the search engine prototype used in this study (Tingvold, Stohr, Schneider, & Amundsen, 2013).

Chapter 37
A Model for Mind–Device Dialectic and the Future of Advertising in the Social Media Age

Recep Yilmaz
Ondokuz Mayis University, Turkey

Nurdan Oncel Taskiran
Ondokuz Mayis University, Turkey

ABSTRACT

Every advertisement text has a specific impact on the mind of receivers. Just like a water-mill or wind mill, human mind develops a specific systematic interaction against different advertisement texts. This section focuses on how information presented and carried by different texts are built on human mind. The basic aim is to reveal how advertisement texts operate human mind. In this sense, the authors try to understand the impact of analogue media on our minds through discussing the nature of science, the way human mind operates, and the structure of mass communication means. On top of that, the authors visualize this interaction on a model. This model would not only make it possible for us to understand our interaction with analogue media but also would give clues about digital media. With these clues, it would be possible to make predictions about changing advertising environment, and accordingly the way of making more effective strategies and future of advertising sector.

INTRODUCTION

Advertising is quite a dynamic sector. This field which has no problem about creative manpower and financial support is developing every day. This development also includes advertising media. Such that due to their radical transformations, media is candidate to transform the structure of human reality. transformation of human mind and indirect cultural structure can change advertisements, as well. By understanding advertising instruments and the way they present information and interaction with

DOI: 10.4018/978-1-5225-3822-6.ch037

humand mind, it is possible to make some predictions for the future. Therefore, this section focuses on how information presented and carried by different texts are built on human mind. Our basic aim is to reveal how advertisement texts operate on human mind. In this sense, we try to understand the impact of analogue media on our minds through discussing the nature of science, the way human mind operates and structure of mass communication means. We formed a model from the connections we made. This model would make it possible for us to understand our interactions with analogue media; Such a perception would also give clues about impacts of digital media on human mind. With these clues, it would be possible to make predictions about changing advertising environment, and accordingly the future of advertisement and the way of making more effective strategies for advertisers.

Our study is organized as follows: the first chapter of the study focuses on the structure and mechanism of human mind. Within the chapter, current theories on the issue are to be discussed. Theories presented will be formed and guided by insights from philosophy and psychology. This and the following chapters will provide a base for the discussion part of the study, which is in the third section. The second chapter of the study divides and establishes some characteristics of mass communication devices. We share an explanation which has been previously used in other publications and accepted by the academic community. The third chapter will pave the way to explain how this device makes the mind work in other chapters. In the fourth chapter of the study, a model is introduced. The model is created and presented on the basis of theoretical background claimed in the previous chapters. The fifth chapter examines the issue, how discourse is shaped by the structure of human- device interaction in the process of knowledge building. The connection among the impact of digital media, augmented reality and digital rhetoric is established in this chapter. In conclusion, some suggestions relating to external factors to be refrained for the sake of exactness of learning, how to create effective advertising strategies, and the future of advertising, are made.

KNOWLEDGE AND THE DIALECTICS OF THE HUMAN MIND

Πάντα ῥεῖ; (Panta rhei); [Everything flows] (Heraclitus)

Motion is at the core of dialectical thinking (Hilav, 2012). In the case of the human mind, the concept of knowledge is defined in different ways in philosophy, sociology and psychology. Philosophers agree in distinguishing between knowledge in the first of these senses, and belief (Vesey & Foulkes, 1990, pp. 163-165). Sociology of knowledge is explained as "the study of how styles of expression and the character of ideas or systems of thought are related to different social contexts" (Bullock, Stallybrass & Trombley, 1988, pp. 457-458). In psychology, the most prevalent definition of knowledge is "the verified belief; dogmas and doctrines about the physical and social system (of human, society and culture); thoughts, hierarchy of principles; common things; whether it is innate or the experience gained, for the mental plane. In this sense, knowledge is close to what is meant by memory because the memory is the place for storing information" (Budak, 2005, pp. 129-130). However, all these definitions fail to provide us a full description within the circular frame of our study. To deal with a subject like mental construction of knowledge also requires the structure of its mechanism which provides us mental embodiment, as well as its nature.

The first thing we should determine is to reveal the difference between the mind and the external world. According to the British philosopher Bertrand Russell, human being is just a thinking agent

trying to interpret external reality in the light of his mental capability (Problems of Philosophy, 2008, pp. 11- 18). He claims that reality is unknown to human mind and man could detect only some parts of reality with his limited perception. Thus, it infers that the knowledge acquired could be fallacious. Consequently, man's reality is nothing more than a pure image, in other words, image is the reality itself. In his work, the relation manipulated between the external world and mind also exhibits the situation of reality and the direction of knowledge flow at the same time. However, it would be likely an incorrect behaviour to reduce this information phenomenon into a simple relationship with the external world, which is unique to man only. Accordingly, it seems inevitable to clarify the structure of information. First of all, we should perceive the materials human mind interacted while producing information and the ways materials interact, as well. The key concept here is the ability that is called 'symbolization'.

Symbolization forms man in two ways: firstly, socialization of man as an individual; secondly ontological development of man. Becoming a man as an individual stage initiates with the progression of an infant from the world of images to the world of symbols. Jacques Lacan calls it 'mirror stage' and explains that "the mirror stage is a phenomenon to which I assign a twofold value. In the first place, it has historical value as it marks a decisive turning-point in the mental development of the child. In the second place, it typifies an essential libidinal relationship with the body-image" (2007). For the very first time an infant recognizes his /her image on the mirror as a whole, the synthesis of this image produces a sense of contrast with the lack of co-ordination of the body, which is perceived as a fragmented body. The child experiences this contrast initially as a rivalry with his or her own image, because the wholeness of the image threatens the child with fragmentation—thus the mirror stage gives rise to an aggressive tension between the subject and the image. Successively follows the language, which is the most authoritative form of symbolization. As a kind of organizer, language provides mental construction and positioning of the icons provided; consequently individual acquires the characteristic unique to man and is situated in the society.

Ontological progression of man is the major of philosophical antropology and Jean Bruller Vercors provides a good example of it in his essay İnsan ve İnsanlar [Mankind and People] (1988). In his opinion, human alone signifies nothing unless the partipication of others. This could only be possible in case we accumulate our knowledge away from ourselves and employ symbols. By doing so it would be possible to transfer a mental activity produced by a man to the next generation safely. It is the fact that underlines the basis of civilization and our ability for symbolization. Likewise, philosopher Ernst Cassirer, who is accepted as the founder of Neo-Kantian tradition, describes man as an 'animal symbolicum' in his work An Essay on Man (1962). To Cassirer, what makes man is not his capacity for thinking, but his ability for symbolizing basically.

Thanks to this ability, man gradually isolated himself away from all other creatures and has entered a completely different world of his own. Thus, his talent is the unique key to his evolution; therefore, man, who creates a reality in his mind with limited perceptions, could be able to destine himself new horizons.

Man's ablity to symbolize is the basic component of being a human. Correspondingly, fundamantals of information also underlies this ability. Symbols have various functions in human mind; they enable external world to be permanent in mind, because man acquires knowledge through senses and decodes into images then transfers them to the mind. Among these inconstant images, mind can select the stable ones, which we call symbols. Symbols constitute the representations of external world in mind, barely consisting of morphemes and their compositions. We will name this kind of knowledge as 'perceptible'.

American Philosopher Charles Sanders Peirce cites about that kind of knowledge in his work On a New List of Categories (1868) and clarifies man's ability to 'conceptualize' instead of what we propose as 'symbolize'.

These conceptional configurations could only be provided through a relationship among object, representment and interpretant, which can be assumed as a sort of mechanism. Each concept may survive by the mediation of interpretants, being decoded into a sign. Let's take a duck in real life; it will be transformed into a representment of a duck depending on the willpower of interpretant. This representment exists as a concrete concept in human mind. Interpretant could correlate a representment to another object so that s/he could get another sign. Such a process will provide mind more abstract knowledge and gradually it will construct itself a world of its own. On a plain basis, from a white duck image, a wide range of knowledge could be deductible: from environmental conditions ducks have to encounter after the civil war, to the increase in death rates, all mental activities should be considered within this structure. Peirce proposed a list of triadic relations which he made the most fundamental categories of all 'things' of any sort whatsoever the categories of 'Firstness', 'Secondness', and 'Thirdness' and he often described things as being 'firsts', or 'thirds'.His triadism constitues the base of abstraction mechanism in general.

Hereby what we define about knowledge, implements us the facility of redefinition of knowledge. At present, we can redefine it as 'the act of rationalization of things'. New definition is now much more comprehensive and functional with respect to the ones in previous chapters. We deal with 'things' as obscurities which are already familiar to us and name other obscurities unknown to us as 'things', We envisage the abstract but obscure ones in our minds similarly. On this point, we encounter 'corollarium'[1] by virtue of hightlighting all sort of knowledge as a constituent of mind. The information acquired from mass media should be investigated on that platform.

THE CHARACTERISTICS OF MASS COMMUNICATION DEVICES

The primary characteristic of mass communication is that it takes place during a process. Understanding the process alone does not mean grasping its quality. Communication is at the same time an exchange of meaning. This exchange can be ensured by understanding the semantics rather than the approach constituting the process. The fact that mass communication is an exchange of meaning is the second feature. This is the realm of semiotics which is a branch of science analyzing the production and reproduction of meaning (Fiske, 1990; Isik, 2000, pp. 37-53; Mutlu, 2004, p. 114).

Another element required comprehending the essence or nature of mass communication is making a differentiation between its instrumental and implemental (device) aspects. When the codes loaded to devices are received by a certain person, the meaning is realized. Coding and encoding constitute the semantics of communication. One of the approaches that best clarifies this process –although on interpersonal level- is the theory of speech-act. According to a theory introduced by John L. Austin in his book How to Do Things with Word (1975) and developed by his student John R. Searle (1999), there is a connection between words and actions which cannot be explained through rules of physics. This connection functions by transforming the physical one into semantic one. Throughout his process, words turn into actions in external world. The theorists who underline the existence of three different speech-acts refer to meaning only as speech-act acquisition, its reception and transformation it creates on earth as impact speech-act concepts. If we are to transform this concept into communication technology, you perform only an act through coding but the change it shall create on earth will form its impact. The thing

that transforms mass communication into a device is that process of impact. What should be underlined at this point is that reception takes place between a device and mind. We shall refer to it with dialectic of mind-device and explain its structure in the next section. At this point we shall simply underline that this dialectic constitutes the essence of instrumentalism.

As a consequence of its definition, mass communication implies interaction with not one person only but a mass of individuals which points to the fact that a single mind-device interaction does not count. It is the interaction between identical devices and different minds (Taskiran & Yilmaz, 2007).

MIND-DEVICE DIALECTIC AND FORMS OF MASS COMMUNICATIONAL INTERACTION

As indicated in the previous part, we employ dialectic of mind-device to imply the interaction taking place between communicational devices and human mind (Yilmaz, 2008). As clearly indicated through its definition, such an interaction basically includes two parameters which are mass communicational devices and human mind. In that way the structure of dialectic shall find a meaning among variables since each of these devices has a specific character and unique interaction forms that come with this character. However, once the mind is handled as a meaning production unit, it offers just one mechanical structure –this topic has been analyzed in the second part. Throughout the process, each device operates a specific mechanism in a different dimension. Therefore, the attempted interaction gains a new quality each time. For that reason, in the present study, it seems plausible to continue on analyzing these forms.

Interaction Through Reading

Interaction through seeing takes place between devices such as paper and ink and the mind. The visuals and linguistic indicators presented in a certain form determine the functioning of mind, too. Another determinant is the element of temporality. Indeed, between concepts of present time and images formed with these concepts, temporality emerges as an element determining the nature of reception.

In the interaction through seeing the images uncovering iconic and symbolic indicators are perceived in a process which is totally dependent on the subject interacting. This form of reception provides various means to the mind in forming fantastic connections. In that way, the mind can find an exit to exhibit its upper abstraction capacity. Let us discuss an advertisement text where there is a bunch with one flower, a bunch with a few flowers and a bunch with a dozen flowers. On top of the text suppose that such a statement is written: "How angry?" Under such condition, the mind shall at first receive the elements. The mind shall identify the pictures on the paper with real world counterparts and imagine them as one and the same. Next, the mind shall make sense of the text by establishing the context between words. Then, it will form syntax between the elements. Since there is not an ordinary meaning in such a narrative form, the mind will be forced to establish some kind of a context. Whether such a context can be formed or time of its formation is something completely related to personal competency. Still something is constant; the paper is there itself and unless the subject turns or closes the page it shall remain that way. Sooner or later, a person with normal temporal competencies shall make sense of it.

Since what is mentioned here is an implication, the mind shall be forced to consult mind linguistics pragmatics. Other meanings embedded within social reality shall be the determiner of meaning which is phenomenon commonly present in idioms. For instance, while "Şekerleme yapmak" idiom in Turkish

is the equivalent of producing sugar, for an English person the same idiom means "taking a nap".In the advertisement text described above the person cannot solve the semantic structure between images of flower and linguistic message without knowing the element of discussion in man-woman relations and the role of flower in an apology ritual. Beyond that, once a subject that goes to upper abstractions is considered, this condition shall be carried to a far different level. For instance, a person contemplating on the relation between flower sales and advertisement shall not only think about the analysis explained above but, s/he also consider other parameters on a more abstract level. If s/he has an anti-system critical mind, based on this paradigm, this person can read the theorem on advertisement "buying flower in line with the level of anger" as "in capitalist system even love relations are materialized". A more competent mind can make sense of the same message as "reification". That is the way the mind functions on and on and what makes this possible is nothing but the stability feature of the device. Interaction which is actualized through reception that is based on the stability of device, enables the functioning of mental mechanism in deeper dimensions.

Interaction Through Listening

In the interaction through listening the device provides a verbal motion. This motion not only keeps the mind away from deep thoughts but it also operates the imagination intensely. A soccer match broadcast on radio is a good example. A subject listening to the match receives the story of speaker through verbal means. During this process the sound vibrating through air shall resonate in the ears of listener and turn into audio images in mind. Yet, unlike visual elements, these images are not presented in ready forms. The listener shall be obliged to imagine the narrated things in his/her mind. This condition pushes the imagination to operate intensely. The unique capacity of radio in creating a phantasm world is the determiner of its singularity as well. A mental world created through pure hearing is subjective to the same extent.

Mental interaction through hearing strengthens the emergence of subjective judgments as well. To illustrate, a verbal theorem "With the introduction of Post-Fordist production structure, surplus emerged" shall find a meaning within all mental designs that took place until the time theorem was presented. This meaning is a formation actualizing in an imaginary background. This formation does not take place in a form that is based on a personal graphics or gestures and mimics of a presenter. It is totally shaped within subjective semantic auras that are attributed to the historical transformation of the person's own production structure which adds a unique dimension to act of making sense. Among free associative semantic phrases any radio listener makes sense of the issue from a different aspect. This condition is a unique feature determining the quality of learning.

As a device, another feature the radio provides us is mobility. With the discovery of transistor technology in Bell Laboratories, this feature has forced us to take a new parameter into account about sense making. Indeed, while the presented images are made sense in a phantasm world, the space we are in can also emerge as a determiner. The mental condition of a person travelling in his car and the person drinking tea in his yard and listening to the radio at the same time are not identical at all. The mind shall meet a different imaginary environment depending on the place radio is used. This stands before us as an element determining the success of reception so much as the level of reception.

The disadvantage of radio as a device is that it offers a singular image. Ferdinand de Saussure in his work Courses in General Linguistics (2006) presents an indicator as a combination of one concept and audial image but, an indicator is a combination of one concept and a good number of audial images. For instance, a piece of cube sugar is the expression of the unity of'sweet, hard and white'images. In society

one or more than one of these images take prominence on pragmatic level and becomes the main image explaining the concept. For cube sugar, the dominant image here is the sense of tasting. Accordingly, this definition presents us a fact: A thing can assume its real meaning through various images. Pure audial images are at the same a conceptualization that is deficient. This shows us the hardship that surfaces on the free associative level of conceptualization of radio.

Interaction Through Seeing-Listening

The main components of devices that function according to the operating principles of television and radio are not only determined by visual and audial unity but element of motion as well. Arthur Asa Berger in his article Television as a Device of Terrorism (1991) reports that television as a device attacks to us with a beam of light. During this process the mind is forced to continuously monitor light beams and the motion. Television captivates the mind involuntarily. Such kind of a mental captivity impacts its reactance as well. In an interaction through television, the share of phantasm is rather limited. Due to the device characteristics, it minimizes its imaging competencies. It is no doubt that this is a feature that comes with a pure concentration.

Another characteristic of television is its capability to present visual and audial elements together as a device. That means while on one side semantic codes arriving through linguistics messages construct a discursive meaning, on the other side the semantic supplements that come with mobile audio indicators complete this discursive structure. Let us analyze the news narrating the operation of armed forces against illegal protestors. The images of the news shall be surrounded with chaos and combats. Simultaneously, a speaker shall read a text that constructs a discursive structure on these images. In the presentation stage the viewer shall focus on the news text guided by the news transmitted from news reporter. Generally, such type of information introduces question marks. While watching the news, a viewer finds answers to the questions in his/her mind at the same time. This reactionary model determines the act of making sense, too. Here, the images assume a secondary quality. They go beyond observation and function as evidence. However, in addition to this function, they also constitute the main component of making sense of the text. A person focusing on images gets away from imaginative competency and throughout act of watching, s/he moves away from abstract meaning auras which dwell on the upper dimensions of the mind. The main reason accounting for this fact is that verbal and visual motion operates quite fast. Similar to the example, we have shown two parts earlier, the mind cannot read the text within a conceptual formation like "reification". This constitutes the weakest point of the mental interaction through seeing and listening.

The strong aspect of such interaction is that when a visual indicator is required, it can provide it on the spot. Some things are, regardless of their strong literary competency, hard to explain through linguistic means. Television and similar devices present such an image and they can also mobilize this image. The integrity of audial component is another element strengthening the competency of description. Hence, such devices rise to a competent position not through imagination but the available capacity of presentation. Regarding unmediated description, there is nothing above television. This competency is present in narration as well. Narrative forms function as a primary element in assisting the individual to comprehend the world. Ludwig Wittgenstein in his work Philosophical Investigations (1953) explains it through metaphor of language games. According to him, our relationship with the world is totally determined within the metaphor of game. From this point of view, we can reasonably assume that television is quite a competent device for us in internalizing the world.

Another point to consider in television broadcasts is meta-communication. On radio this element is possible only via sound tones but on television the dubbing and attitudes of portrayed characters shall be determiners. Referring to the previous example, if the news reporter made a face while narrating the news, we would perceive this act as a sign of discontent towards the protestors and their ideology as well. Unquestionably, this would be an element that would affect us while reading the text. Again, the intonation of the speaker would be equally effective. That would be an element forming both its disadvantage and advantage. Pragmatic dimension of meta-communication is totally associated with its application.

Interaction

Interactivity stands before us as a communication form where mutual interaction is sustained. The difference of interactive communication devices from others is that they enable a reciprocal interaction. Teleconferences, live television links and internet use can primarily be given as examples. Interactivity is used mostly for situations where audio visual elements are reciprocally shared. Simultaneity is the main principle. Therefore, mediated feedbacks cannot be included within this context.

Regarding their device aspects, the devices that make interactivity possible are no different than the ones presented in the previous section. For instance, in an interaction via internet the elements valid for television shall be the same. Additionally, the windows enabling reciprocal chat shall be also included. This element shall be influential on communication course but, it shall also act as a process determining the direction. Indeed, a speaker shall form the direction of a speech according to the reactions and instead of a flat narration s/he will prefer a circular interaction.

One of the most critical aspects of interactivity is that the share of package forms is reduced. Communicational structures which are mostly based on reciprocal chat, limit the existence of production elements. Consequently, in an interactive communication environment, the devices are not as determinative as they are on television. However, during the process, the share of the domination of meta-communicational structures on meaning rises.

In interactive applications, the low quality of the conditions enabling the interactive communication is another striking point. Since vision, sound and transmitting elements are actualized in relatively low quality, there is a definite decrease in their effectivity rates. In addition to all, interactive environments lack the level of interaction provided via face to face interaction. For instance, in a course presented on electronic environment, the instructor is no more than a small image window for the viewers. For the instructor the viewers are simply a chat window on computer. That condition is determinant in the success of reciprocal interaction as well.

A suggestion made by Scandamalia argues the classroom conditions as a knowledge building environment. In her article (1994) Scandamalia focuses on the educational ideas for knowledge-building discourse - with some discussion, and she argues that the classroom needs to foster transformational thought, on the part of both students and teachers, and that the best way to do this is to replace classroom-bred discourse patterns with those having more immediate and natural extensions to the real world, patterns whereby ideas are conceived, responded to, reframed, and set in historical context. Her goal is to create communication systems in which the relations between what is said and what is written, between immediate and broader audiences, and between what is created in here and now and archived are intimately related and natural extensions of school-based activities.

MODEL

The subject matter is illustrated in Figure 1.

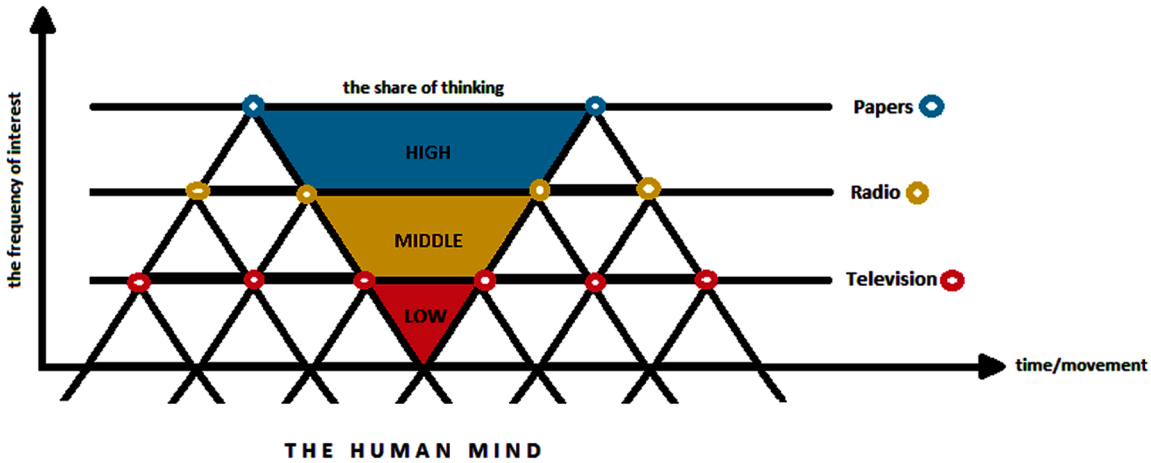
American Philosopher Charles Sanders Peirce cites about that kind of knowledge in his work On a New List of Categories (1868) and clarifies man's ability to 'conceptualize' instead of what we propose as 'symbolize'. He also claims that:

… universal conception which is nearest to sense is that of the present, in general. This is a conception, because it is universal. But as the act of attention has no connotation at all, but is the pure denotative power of the mind, that is to say, the power which directs the mind to an object, in contradistinction to the power of thinking any predicate of that object, -- so the conception of what is present in general, which is nothing but the general recognition of what is contained in attention, has no connotation, and therefore no proper unity. This conception of the present in general, of IT in general, is rendered in philosophical language by the word "substance" in one of its meanings. Before any comparison or discrimination can be made between what is present, what is present must have been recognized as such, as it, and subsequently the metaphysical parts which are recognized by abstraction are attributed to this it, but the it cannot itself be made a predicate. This it is thus neither predicated of a subject, nor in a subject, and accordingly is identical with the conception of substance.

If the concept of knowledge is defined as 'the act of rationalization of things', we define the concept of time as 'a mental sequence'. We think on the basis of the mental mechanism which is formed by Peirce, we can better understand Figure 1.

As shown in Figure 1, we see the mass media devices and the human mind which is directed towards them. The horizontal axis of the model is presented movement/time curve. This curve is linear. The vertical axis is presented us with the frequency of mental attention. Each point on figure represents the human mind's interaction with the mass media devices. When we follow-up contacts, we see the mental contact time increased gradually, which is necessary for thought. Clearly, decrease in hiatus which the thinking prevents, causes an increase in the share of thinking. Difference in level are shown as low,

Figure 1. A model for mind-device dialectics (analog media)



medium and high in figure. As described in the previous part of this study, television is in continuous motion, for this reason, requires a focus on high to get in touch with it. This situation leads to a lower consciousness. Therefore, the lowest share of thinking attributed to the mental contact with television. Due to the same reasons, consciousness is at medium level for the radio, high level for papers. Internet has a mixed content, so it is not mentioned and not inserted into the model.

THE IMPACT OF DIGITAL MEDIA, AUGMENTED REALITY AND DIGITAL RHETORIC IN THE PROCESS OF KNOWLEDGE BUILDING

It is possible to mention five basic characteristics of mass communication within the context of mental interaction. The first one is spatial independence. Unlike other communication forms, within their present communicational structures, mass communicational devices perform their interactivity by extending beyond contextuality in spatial meaning. They can perform the communication simultaneously in an area of thousands of kilometers. As a secondary feature, this simultaneity, which can be designed, determines the strength of devices together with spatial independence.

The third characteristics of mass communication are that it can be directed from a center. The existence of a central area and simultaneous interaction that is independent of space gains them a capability of public control. As explained in previous sections, this is an instrumental capacity originating from their implemental (device) aspect. Through mass communication, public opinion can be guided in a variety of ways. This guidance can be actualized on ideological dimension as well as learning dimension. Such public control constitutes the fourth dimension of mass communication within interaction.

The fifth feature is the cost efficiency. Installing a mass communication can be a real challenge. The installed communication may appear to be costly but, once analyzed within the scope of mass context, it becomes clear that in the long run the cost of communication decreases significantly. For instance, the cost of an advertisement reaching the consumers through television is around 3 Dollars per thousand people. Indeed, media planners calculate the costs per thousand instead of per one person for the ease of calculation (Basal, 1998).

Those five elements also construct the structure of communicational information. All these elements emerge as an indirect element determining order for orientation. People are likely to imagine mass communication as a device. Mass communication is indeed a device for its beneficiaries rather than users. The pragmatism of interaction operates through logic of coverage. This logic has spread to all media systems.

Learning is defined as the continual change occurring in behavior as a result of repetition and experience. People spend a great deal of their lives with learning hence a huge part of psychology is dedicated to learning as life goes on through learning. Learning mostly takes place in three forms which are classical conditioning, contingency conditioning and cognitive learning. People can learn through conditioning but they mostly learn through cognitive ways. Learning through cognition is usually an outcome of actual practices and element of cognizance is at the center. During this process, the individual transfers the data of external world to his mind and this mental accumulation grows continually (Morgan, 1956, Ch. 4-5).

Principally the first element determining human learning is language aptitude. Thanks to language aptitude, a person can abstract the words and concepts and construct the interaction between them. Personal success is on the other hand determined by intelligence level, age, anxiety and stimulation and previous learning. The longevity of something learnt is set according to the positioning level in memory. The structure of learning material, way of learning, level of affinity and repetitions are determiners here

(Morgan, 1956). It is obvious that after all, learning is a construction of information. If we handle information as raw information, processed information and reprocessed information, we can put learning through education to the third category. Information constructed through mass communication is also within this category.

Information constructed through mass communication is, above all else, a pragmatic information. People who consult to a mass communication device for information, perform a pragmatic act. The organizational structure conveying them the information becomes part of another type of pragmatism due to the relations outside its own realm. Hence, the act of informing is also pragmaticized in a different dimension. The association among ad-giver, media channel and viewer sets a good example to this dimension. The orientation of viewer to media channel will be different from the orientation of media channel towards viewer. Media channel will be forced to discover the viewer while viewer shall be oriented to the channel hoping to have fun or catch the news. State of stimulated condition and affinity that emerge as a result of such anxiety become a personal external element determining the success of learning. A trainee, since s/he will be consciously oriented to learning, shall have high affinity level and the level of forming mental effectivity through mass communication will be higher.

The functionality of mass communicational information is conditioned by the materials used. As indicated previously, each device operates the mind in different dimensions. For that reason, one of the points to focus on in act of learning is the outcomes of mind-device dialectic. For instance, while information on a newspaper allows the reader to make a comparison with previous learning, this is not the case on television. On the other hand, the power of visual imagination of television cannot possibly be compared to newspapers. Therefore, each device shall be effective in different levels and competencies. As regards systematic learning however, it is necessary to apply a design that goes beyond daily information. New technologies which have developed in our daily life have also changed learning. In addition to this, it depends on mechanic structure presented here above. Digital media devices present a kind of mixture of analogue media, in some cases exceed reality presented by analogue media. Augmented reality can be shown as an example for this case.

The term Augmented Reality (AR) expresses military technology. The mentioned technology which has been used for more than ten years can be regarded as candidate for the most popular advertisement applications of future. Augmented reality was developed as an extent of more general study field which is known as Mixed Reality (MR). Application field of Mixed Reality includes virtual reality (VR), augmented reality (AR), Telepresence and other related technologies. While virtual reality expresses reality which was created in non-physical environment, telepresence includes illusions created in concrete field. Augmented reality refers to semi-virtual, semi physical reality. Whole of practices which were developed from a technology called Head Up Display (HUD) is integrated into the field of advertisement today. Head up display was used on the cockpit monitor of war craft pilots and at glasses adapted to helmet used by infantry. Due to these glasses or monitors, it was possible to convey specific informative data such as speed, heat, height, coordinate, radar. Adaptation of technology to advertisement was possible with smart phones. Due to some application loaded on smart phones, it was possible to form interaction through ordinary billboards. This interaction makes it possible to make connection between virtual and real world. Technology is currently available in applications synthesis of billboard-smart phones. When you show smart phone on billboard, stable objects on billboard move within telephone. Let's consider a jeep advertisement. If you have a smart phone and applications are loaded on your phone, the vehicle which seems immobile to the naked eye would move when you show your phone, maybe tour around or tumble or even pierce the billboard and wander on the street. When it is imagined, it would be understood

how enjoying the advertisement is. The element of entertainment included within the core of application forms the ground of possible popularity. Augmented Reality technologies whose actualization is possible through combination of real and visual worlds, real-time interaction and existence of 3D recording elements seems to ease the job of advertisers in today's world, where the interest towards marketing messages is obtained quite difficultly (Taskiran & Yilmaz, 2013; Bimber & Raskar, 2005; Kuru, 2009; Silva, Oliveira & Giraldi, 2003; Yücel, 2005).

Another element which differs digital media and analogue media is digital rhetoric and its meta-communicative impacts. The concept of meta-communication refers to the whole of external elements in the communication process. These elements are decisive on the meaning. For example, we think, two people are talking to each other, each sentence will express a proposition in the process of speaking, however, the real meaning will emerge along with such factors as gestures, facial expressions, tone of voice, as well as verbal messages. This phenomenon that communication configuring in this way is called meta-communication (Demiray, 1994; Klinger & Coffman, 2011; Firat & Yurdakul, 2011).

The emergence of digital rhetoric as a concept is related to the transformation of lifeworld (lebenswelt). Digital rhetoric and traditional rhetoric are different concepts. The biggest difference between the two concepts is perceptions of meaning. In contrast to the traditional rhetoric, digital rhetoric is not considered to be a sign of linguistic messages alone. According to this new understanding of the meaning, complex images and sounds as well as the syntactical subtleties of words, and digital world has a shifting mix of words, images and sounds. "How the resources of different semiotic systems have been and can be combined?", answer the question of the search effort resulted in the emergence of the concept of digital rhetoric. Thus, the concept of digital rhetoric is the scope of visual rhetoric largely (Handa, 2001; Lanham, 1992; Lanham, 1994; Lanham, 1995; Lemke, 1998; Porter, 2009).

James Berlin claims that:

Our business must be to instruct students in signifying practices broadly conceived- to see not only the rhetoric of the college essay, but also the rhetoric of the institution of schooling, of politics, and of the media.…We must take as our province the production and reception of semiotic codes, providing students with the heuristics to penetrate these codes and their ideological designs on our formation as subjects. Students must come to see that the languages they are expected to speak, write, and embrace as ways of thinking and acting are never disinterested, always bringing with them structures on the existent, the good, the possible, and the resulting regimes of power (1996, p. 83).

In this context, we can consider digital rhetoric as a meta-communicational form. The concept is of great importance, especially in learning and interaction. Way of structure of digital media in knowledge-building, augmented reality and digital rhetoric give various clues transformation of our daily life and future of advertising. Let's discuss in the conclusion section how we can make use of these in order to form the impact of analogue and digital media and effective advertisement strategies.

CONCLUSION

From the models and issues we have discussed so far, it is possible to make specific inferences about effectiveness of advertisement texts of media means. The first point to pay attention is that while preparing a learning strategy, an inter-instrumental structure should be used as a base. As analyzed in detail earlier,

each device has different capacity regarding mind operation. While preparing learning materials, this should be taken into account and concept construction, different characteristics of different devices in language and visualization should be employed coordinately. To that end, first of all the deficiencies of devices should be clarified. The gaps which are likely to emerge in the act of learning should be filled by making use of other devices. These deficiencies can be given as: 1- For the interaction through listening, lack of visual image. 2- For the interaction through reading, the stability or mechanical immobility of visual image. 3- For the interaction through seeing-listening, shift of attention to visual images or lack of abstraction. 4- For interactivity, motivational lacks caused by spatial distance and meta-communicational deficiencies. However, it should also be remembered that while preparing the strategy the strong sides of devices should also be taken into account. These strong sides have been explained in detail in the fourth chapter.

The second point deserving attention is that learning is an activity that mostly takes place on conceptual level. In this level, the dialectic relation between language and thought should be paid heeds. Particularly in concept construction, printed materials (billboard, newspaper ads etc.) should be focused on more audio-visual and audial devices should act as a pre-information provider and reinforcer. The level of applied language also emerges as a significant element at this point. In all acts, except act of reading, it should be ensured that the abstraction of the employed language and familiarity of the words are not beyond the comprehension of receiver. It should be kept in mind that the success of communicational transfer is usually determined by the success of reception.

The speed of contact in the attempted interaction is the third point we must note. This is directly proportional to the mechanism of employed device. There is a connection between implemental (device) mechanism and the way this mechanism operates mental mechanism. In particular, the mechanical structure of printed materials draws a favorable picture for concept construction. On the other hand, audio-visual devices can be more effective in context formation and reinforcement. Purely audial devices can be useful in reinforcing through repetitions.

To sum up, the final point to pay heeds is the role of individuality in the success of learning. Each receiver has a different mental structure which eventually determines the final success of learning. For instance, for a person with high visual intelligence television or internet would be an effective channel while for a receiver with high verbal intelligence the opposite holds true. Also with respect to implemental (device) interaction forms, different reactions are likely to emerge.

Digital media has a different appearance. First of all instruments are different from analogue media and include characteristics of analogue media. For example on a smart phone one can both read a stable text and catch an audible mobile image. This enables opportunity to gather knowledge-building process based on analogue media operating human mind in advertisement texts.

The second important factor is that digital media means are more functional compared to analogue media means. Mobility is the foremost one among these functional characteristics. People not only fulfill their need of talking with their telephone but phones also enable people to have non-stop communication with the world on global scale. While applications created at high technology enable opportunity of interactivity on one hand, it also makes possible to carry out viral studies more powerfully.

The final issue to be mentioned is the position of digital media against reality. The issue that traditional media build human reality has been an important discussion issue of academicians until recently. Here is the difference of digital media. Beyond managing our reality perceptions, it would open path for shifting towards a new reality dimension in a near future. The term digital culture will be mentioned more explicitly apart from terms of verbal culture, written culture and visual culture. Even if we do not

improve as far as technological determinists assert, it is impossible to deny the impact of technology on human mind. Our minds which are shaped within augmented reality, effectiveness of advertisement texts and rules for advertisers to make more effective strategies will be formed with original structure of this status of humankind.

KEY TERMS AND DEFINITIONS

Advertisement: An action for marketing communication which is carried out by place and time from advertisement media by emphasizing on its being advertisement.

Advertising: As the expression of the ad business area.

Analogue Media: Mass traditional massive devices which display activity on unidimension such as newspapers, radio, television.

Augmented Reality: The term which defines combined reality which is possible with applications in devices such as specially produced glasses, or smart phones, tablet and formed with intertwinement of reality and visual reality.

Digital Media: General name for communication means which has emerged with the development of communication technologies, includes characteristics of analogue media and combines them with digital methods.

Mind-Device Dialectic: The structure of interaction which explains media devices and how these devices operate human mind.

Semiotics: A field which was developed simultaneously within the same historical period by two philosophers who lived in two different parts of the world. Semiotics deals with the production and reproduction of meaning.

Social Media: A form of interpersonal communication, how is without limitation of time and space, and based on the sharing and discussion, such as Facebook, Twitter, etc.

Chapter 38
Interactive Multimedia and Listening

Yen (Ingrid) Vo
Nhon Hai Middle School, Vietnam

ABSTRACT

The topic of this chapter is concerned with the use of interactive multimedia in teaching listening skills to English language learners. The chapter starts with the difference between listening and hearing, the definition of interactive multimedia, and interactive multimedia listening environments. Explanation is then given to why listening is so important. The chapter also addresses main types of listening, active listening process, and obstacles to listening. This chapter additionally shows the benefits of and rationales for listening using interactive multimedia resources in comparison with audio-only listening materials regarding visual support, authentic content, comprehensible input, vocabulary acquisition, and student motivation. The chapter concludes by suggesting some Internet sources and materials for listening practice as a part of learning English as a foreign or second language.

INTRODUCTION

With the development of information and communication technology (ICT), teaching with multimedia resources is becoming a trend in foreign language teaching environments. Recent researchers (e.g., Warshauer, Shetzer, & Meloni, 2000; Lombardi, 2007) tends to agree that interactive multimedia learning environments offer language learners a source for authentic materials, specialized materials, a place for authentic communication, a collection of tools which allow learners to share their ideas, knowledge, and student-or teacher-created materials. Especially, listening practice with multimedia materials offers learners appropriate support, guidance, training, and scaffolding. Language learners can choose the materials so that interactive multimedia materials enables them to become more autonomous, which is one of the skills learners need to develop today, as well as the materials allow them to monitor their learning and take on responsibility for their learning. Language learners can also use the Internet for self-study purposes without the need for a teacher. Moreover, interactive multimedia materials give learners the opportunity to acquire and practice essential 21st century professional skills such as critical thinking skills, problem-solving skills, cooperatively working skills, etc.

DOI: 10.4018/978-1-5225-3822-6.ch038

In this chapter, I shall first give the definitions of key terms such as listening, listening comprehension, and interactive multimedia listening environments. I then review some studies on the importance of developing listening skills of language learners as a part of learning English as a foreign/second language. I additionally discuss the types of listening, the stages of listening, and the factors that influence listening comprehension. I also review some research on the benefits of the use of interactive multimedia resources in listening practice. I finally suggest some Internet sources and materials (see Table 1, 2, 3, 4, 5 and 6) for listening as a part of learning English as a foreign/second language.

MAIN FOCUS OF THE CHAPTER

What Listening Is

Listening is the vital skill that provides the basis for the successful communication and successful professional career. According to Purdy and Borisoff (1997), listening is a primary skill among the basic skills that bring success in our everyday life. "There is no meaningful communication without listening," (p. 4). It is said that people learn to listen first, then speak, read, or write, (p. 4). Research has indicated that among the four communication skills: listening, speaking, reading, and writing; people spend more time listening than the other three skills, (Cotton, 1986). Regarding foreign language learning, Nunan (1989) states that that foreign language learners spend over 50 percent of their time on listening. Brown (1987) also notes that "of foremost importance is the role of listening in language acquisition," (p. 5). There have been several definitions of listening, and it appears some confusion between listening and hearing. So, what are the differences between listening and hearing? And what is listening comprehension?

Listening vs. Hearing

There has been a variety of the definitions of listening comprehension process. One of the earlier definitions given by Lado (1961) emphasises that listening comprehension is "recognition control of the signalling elements of the language in communication situation," (p. 206). Another definition of listening indicates that listening is a complex communication behavior, involving a process of receiving, attending to, and assigning meaning to verbal and/or non-verbal stimuli," (Coakley & Wolvin, 1986, p. 20).

Chung (1994) defines listening as a communication activity in which listeners receive messages and understand the messages through the three types of information including oral messages (i.e. words and sentences), paralinguistic messages (i.e. extra-speech sounds) and non-verbal messages (i.e. facial expressions, gestures, eye contacts, etc.), while Nation (2009) claims that listening occurrs in two ways: the process of transmission of information (one-way listening) and the process of social interaction (two-way listening).

Therefore, listening is an active process in which listeners make their concentration and conscious effort to understand and respond to spoken and non-verbal messages. In other words, listening requires focus on and attention to what is said, how it is told with the use of language and voice, and how the speakers use his or her body language (i.e. gestures, facial expressions, and eye-movements, eye contact, body movements, etc.), (Brownell, 2010). For example, when we listen to a good song, a weather broadcast, an education report, etc. we give our full attention, which is different from hearing traffic noise or a child's shouting on the playground.

Hearing

Hearing refers to the act of perceiving sounds by the ear. Hearing is a physiological process, while listening is a cognitive process. For example, we hear someone's words or a noise outside such as the sound of traffic or music. Thus, hearing is an automatic and passive process which occurs when our ears pick up sound waves which are then transported to our brain. It uses one sense – hearing. However, listening requires more than one sense including the sense of hearing, observing, or even touching.

Both hearing and listening require the use of our ears, but hearing occurs all the time whether we like or do not like what we hear, while listening occurs only when we consciously choose what we want to listen to with a purpose. It may be to achieve information, solve problems, share interest, show support, or understand others. Therefore, we concentrate on the spoken message in order to comprehend it and perhaps react or respond to what the speaker is talking about.

Listening Comprehension

The term 'listening comprehension' is defined in the Longman Dictionary of Language and Applied Linguistics (1992) as follows. Listening comprehension is the process of understanding speech in a second or foreign language. The study of listening comprehension processes in second language learning focusses on the role of individual linguistic units (e.g. phonemes, words, grammatical structures) as well as the role of the listener's expectations, the situation and context, background knowledge and the topic. It therefore includes both top-down processing and bottom-up processing. While traditional approaches to language teaching tended to underemphasize the importance of teaching listening comprehension, more recent approaches emphasize the role of listening in building up language competence and suggest that more attention should be paid to teaching listening in the initial stages of second or foreign language teaching (p. 313).

Thus, it can be concluded that listening comprehension is not a passive process but a complex, active process of interpretation in which listeners match what they hear with what they already know. This process requires active involvement from the listeners to try to understand the message from both linguistic and non-linguistic sources. With the development of ICT, enhancing listening skills with interactive multimedia listening materials is becoming a trend in foreign and second language teaching and learning environments.

Multimedia

Multimedia is defined as the integration of several different types of media: text, audio, graphics, animation, and video into a program or a learning course (Cybermedia Creations, 2006; Turel, 2014a). According to the Longman Dictionary of Language Teaching and Applied Linguistics (1992), the term "multimedia" refers to "a collection of computer controlled or computer mediated technologies that enable people to access and use data in a variety of forms: text, sound, and still moving images," (p. 345). Multimedia is also defined as an optimum combination and instant delivery of a wide range of digital elements on the same digital platform which "provides a multidimensional, multi-sensory environment in which rich, efficient, instant, comprehensible, optimum and meaningful input and feedback can be presented" in effective ways (Turel 2014a, p. 167; Turel, 2015).

Today, the advancement of technology has made significant impact on the evolvement of English language teaching and learning methods from traditional face-to-face teaching to Computer Assisted Language Learning (CALL) or e-learning systems in all levels of education. Modern education and communication environments can offer alternative ways in the learning process. Multimedia has been widely used in educational technologies. It is believed that multimedia learning tools can be used as a supplement to traditional classes since it can assist language learning processes. Many researchers, including Lopuck (1996), Jones (2003), and Gaskins, (2010) tend to agree that multimedia helps enhance and enable language learners to acquire the target language and, consequently, it offers them more effective language learning. Therefore, using interactive multimedia in language teaching and learning attracts more attentions of researchers, institutes, educators, language teachers, and learners. More efforts are needed to design and create interactive multimedia language learning tools and software to fulfill a content-rich learning environments to provide to different language learners (Turel & McKenna, 2013). Because multimedia allows integration of text, graphics, audio, and motion video in a range of combinations, learners can now interact with textual, aural, and visual media in a wide range of format.

Interactive

Interactive is used in computer assisted instruction to describe the ability of a user to communicate with a computer, for example, the involvement of a question on the computer, a response from the user, and feedback from the computer (The Longman Dictionary of Language Teaching and Applied Linguistics, 1992).

Interactive Multimedia

The term "Interactive Multimedia" is used to describe a physical or digital system where multiple media or people have an effect on each other through their interactive behavior. When "Interactive Multimedia" is used in fields such as art or education it implies the use of multiple media for expression or communication and the existence of a dynamic user-state or content-altering capability. Cybermedia Creations (2006) defines interactive multimedia as a "two-way interaction with multimedia course material, another computer, or another user with direct response to the input, as opposed to one-way communication from T.V, video, and other non-responsive media," (p. 2). Moreover, Turel (2015) defines interactive multimedia as "the combination and delivery of digital elements on the same computer platform which have links between elements in the form of buttons, hotspots or hyperlinks to create an interactive application in which users can navigate" (p. 2505). Interactive multimedia also involves using mouse input, touch screens, voice commands, video capture and real-time interaction that allows users to actively participate in the learning process. England and Finney (2011) stated interactive multimedia was the combinations of different types of media including texts, graphics, images, animation, video, and audio into resources and materials that offered users in general and language learners in particular the ability to interact with these materials such as browsing, navigating, analyzing, annotating or personalizing the materials for various purposes emerge in various fields including entertainment, marketing, education, engineering, scientific research, medicine, business, art and communication. These resources and materials could include the Internet, telecoms, interactive digital television, and other information technologies.

Interactive Multimedia Listening Environments

Interactive multimedia listening environments are used to describe multiple-media systems, software applications, materials, products, or courses that are designed to allow language learners to process combined media (text, sound, and video) simultaneously through physical interaction (e.g. pressing a button, choosing a link) in order to navigate through the data enabling listening skills acquisition. As multimedia technology becomes more accessible to language teachers and learners, its potential as a tool to support listening skills development becomes a practical option. Building interactive multimedia listening environments needs much more attention from researchers, educator, and language teachers so as to help learners improve their listening skills as listening is the primary skill among the four language learning skills.

The Importance of Developing Listening Skills

Wilson (2008) discussed the importance of developing listening skills in learners of English. He indicates that there are many good reasons why learners should listen to English, including access to the world, pleasure, travel and tourism, work purposes, and academic requirements. Similarly, Tramel (2011) also agrees that it is very important to develop listening skills in children because through listening and attention activities, children can explore the world by themselves, build relationships around them, develop their own behavioral patterns, and have a higher chance of good grades and outstanding comprehension of lessons. Kurita (2012) claims that, "listening comprehension is at the heart of language learning. Learners want to understand second language (L2) speakers and want to comprehend a variety of L2 multimedia such as DVDs and the Internet," (p. 30).

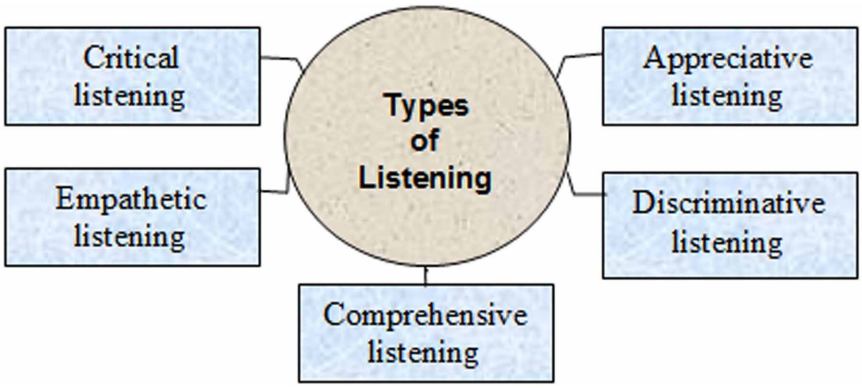
Besides the importance of listening skills, it should be said that listening competence is a complex skill that needs to be developed by practice. Wilson (2008) asserts that listening is a difficult skill in terms of the characteristics of the message, the delivery, the listener, and the environment (p. 12). Having the same opinion as Wilson (2008), Kurita (2012) states that, "in spite of its importance, second language (L2) learners often regard listening as the most difficult language skill to learn," (p. 30). Thus, the teacher plays a very important role in providing their learners with opportunities to reflect on their listening processes and practices. The teacher can help language learners with listening lessons not only to guide them through the process of listening, but also to motivate them to hear as much English as possible (Liubinienė, 2009, p. 92). For all these reasons, it is vital to develop listening skills, especially in English as foreign language (EFL) learners, and using interactive multimedia resources can develop learners' extensive listening.

Types of Listening

Coakley and Wolvin (1995) identified five types of listening which do not always exist singly. During the listening process, the listener sometimes requires to use more than one type of listening. These types of listening are clearly displayed in Figure 1.

- Appreciative Listening: The term 'appreciative listening' refers listening for enjoyment to the information that the listener is highly interested in. This type of listening is often made used of when listening to many forms of entertainment, music, television programs, and shows. For ex-

Figure 1. Types of listening according to Coakley and Wolvin's categorisation (1995)



ample, listening to a piece of good music, sports broadcasts, funny stories, or poetry is considered 'appreciative listening'. Also, we often use 'appreciative listening' in casual daily conversations to enjoy others' thoughts and experiences. Our appreciation of what we listen to will vary relying on our personal preferences and may have been shaped through our experiences and expectations.

- Discriminative Listening: 'Discriminative listening' is the most basic form of listening where the listener is able to identify the speaker's inferences or emotions. This type of listening also involves the ability to distinguish different sounds. With 'discriminative listening', listeners can recognise the gender of the speaker or the number of the speakers in the message. For example, they can probably distinguish the voice produced by a male, a female, a young person, or an old one. Listeners also probably know how many speakers are involved in the message. In addition, they may recognise differences in the way that sounds are made. These differences include distinguishing between regional accents, recognising foreign languages, emotional variation in speaker's voice (whether the speaker is happy, excited, upset, sad, angry, or stressed, etc.). 'Discriminative listening' does not involve understanding what the speaker is speaking.
- Comprehensive Listening: In 'comprehensive listening', the listener's goal is not only to understand the speaker's message, but also to be able to recall what has been said. The listener pays attention to all the information - the speaker's words, the tone of his voice, his body language, and the physical setting in which the conversation is taking place. Thus, 'comprehension listening' is also known as 'content listening', 'informative listening' and 'full listening'. To understand the meaning of the message, listeners need to have their linguistic knowledge and ability of the language such as knowledge of phonology, morphology, and syntax. An example of 'comprehensive listening' is that you are listening to a weather broadcast to get helpful information of weather conditions of the place you are going to travel to, or you are listening to a lecture presented by your professor to reach understanding of a particular subject in your course.
- Empathetic Listening: The emphasis of 'empathetic' listening is on understanding how the speaker is feeling and being truly empathetic and supportive. This requires an ability to listen to others and to feel empathetic for their feelings and needs. It additionally requires excellent discrimination and close attention to the nuances of emotional signals to be able to listen empathetically. For example, let us say that your close friend tells you that he has failed to get into college; you will probably listen to his story empathetically and feel sorry about that.

- Critical Listening: Unlike 'empathetic listening' which is non-judgmental, 'critical listening' involves judgment where listeners critically respond to the message and give their opinions. With 'critical listening' or 'evaluative listening', the listener listens in order to evaluate, judge, and give opinions about what is being said. Judgment includes assessing strengths and weaknesses, agreement and disagreement. This form of listening requires cognitive effort, as the listener analyses what is being said, relating it to existing knowledge as well as keeping listening to the incoming message to understand in order to make evaluations and judgments about the content of the message.

The Process of Listening

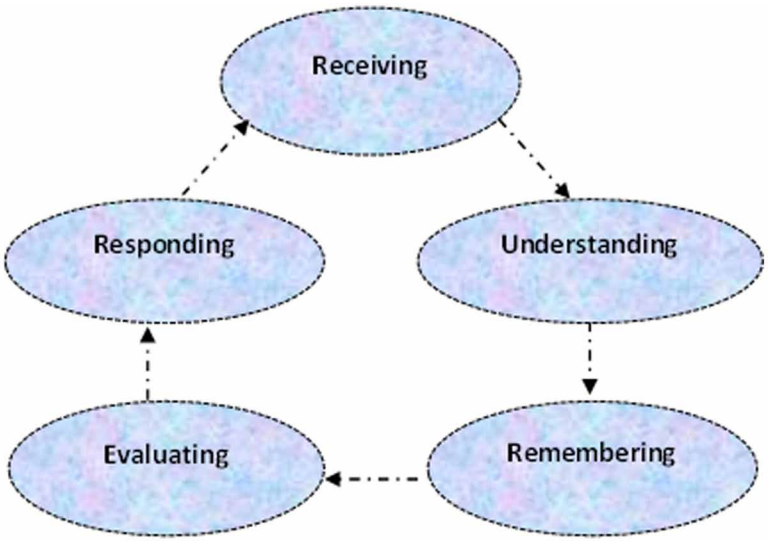
Listening is the psychological process of receiving, attending to, constructing meaning from, and responding to spoken or nonverbal messages. Listening process involves five stages which occur in sequence, showed in Figure 2.

The first stage in the process of listening is 'receiving' the message. In this stage, a listener perceives sound waves stimulating the sensory receptors of the ear; thus it is a physical process.

Understanding is also called interpreting or decoding. It refers the process of accurately decoding messages which are expressed through both verbal and nonverbal cues and finding the meaning of what is being said. During this process, listeners connect the information they have received from the message to their prior knowledge to make sense of it.

The third part of the listening process is remembering, which is also called recalling. It is believed to be an important part of the listening process because it is often used to indicate how well the listener understands information presented in the message. Remembering is well-known as the process of transferring the information from short-term memory which is a mental storage capacity that can hold a small amount of information in mind for a short period of time) into long-term memory which is relatively permanent memory and in which information can be stored for long periods of time (Hargie,

Figure 2. The process of listening



2011). What listeners might do at this stage is focusing attention on the central ideas of the message, organizing what they hear, summarizing the content of the message, relating new information to what they already know, etc.

Evaluating is the fourth part of the listening process in which listeners determine how the information they receive from messages is truthful, authentic, or believable, based on what listeners know about the topic of the message. In this stage, listeners are required to use critical thinking skills to make a worth judgment about what is being said.

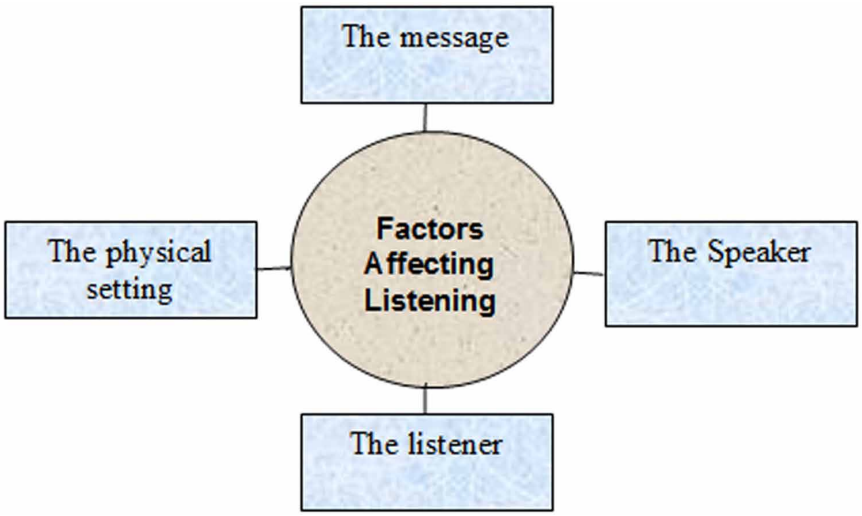
Responding is the process of reacting to what is being said. In the responding stage, a listener provides verbal or nonverbal responses (facial expressions, eye contact, nods) about the message or speaker. For example, the listener shows focused attention, asks questions to get additional details about the topic, shows support, agreement, or disagreement indicating whether the listener has understood the message and what the listener thinks of the message delivered by the speaker.

Factors Making Listening Comprehension More Difficult

Listening is a demanding process, not only because of the complexity of the process itself, but also due to factors that characterize the listening process. These factors are (a) the speaker, (b) the message, (c) the speaker, and (d) the physical setting (Brown & Yule, 1983), as shown in Figure 3.

- The Message: Studies have indicated some characteristics of the delivered message including length, content, organization, language forms, information density, delivery rate, and visual support that can affect second language listening comprehension. In terms of the message length which is measured as duration or word count, a longer message is associated with more difficult comprehension items. However, this effect is inconsistent across studies. The second characteristic is the content of the message which can interfere with listening comprehension. If content is fa-

Figure 3. The factors making listening comprehension more difficult



miliar, it is easier to comprehend than content with unfamiliar vocabulary or for which the listener has insufficient background knowledge. Regarding message construction, the third characteristic, poorly structured messages or messages that are too vague, too jargon filled causes listeners find it difficult to follow the message, whereas a message with well-organized structure, coherence, and discourse markers or transitions used improve listening comprehension. The fourth factor, language forms which refer syntactic and morphological features used in a message also affect listeners' understanding of the message. Krashen (1981) in his study about second language acquisition and second language learning indicated that language learners needs "comprehensible input" to learn a language. Thus, syntactic and morphological modifications have an important role in making input more comprehensible. For example, simple sentence structure and simple vocabulary used in a speech decreases the difficulty of listening material. Another characteristic of message is information density which refers how closely packed information is in the message. If the message is filled with more ideas, it makes the message more difficult to comprehend. There are many reasons for why a great amount of information in a message may increase comprehension difficulty. The primary reason is that with a message filled with a great deal of information, listeners often need additional effort to understand information that they have failed to comprehend. As a result, they may miss information that follows or are unable to understand later information because it depends on how much they understand earlier information (Goh, 2000). The fifth characteristic is the rate of delivery of the message which refers how fast or slow the message is delivered. A message delivered at varying rates of speed influences the listener's comprehension. Brown (2007) showed the difference between reading and listening is that in reading, the reader can stop and reread what he may concern, whereas in listening, the listener cannot stop or control the stream of speech which keeps flowing. Having the same opinion with Brown, Underwood said that "many English language learners believe that the greatest difficulty with listening comprehension, as opposed to reading comprehension, is that the listener cannot control how quickly a speaker speaks" (Underwood, 1989). For example, a listener cannot reach the speech because it has been delivered too fast, and this results in missing some information in the speech or not fully understanding its content, while a message delivered with few pauses will benefit the listeners because they are given extra time to listen. Finally, visual support accompanying the message such as video, pictures, diagrams, gestures, facial expressions, and body language help to improve comprehension (Turel, 2014b).

- The Speaker: The speaker's accent can make the message more difficult. People come from different parts around the world will have different accents. Thus, if learners are familiar with a particular accent, they might find it difficult to understand messages in unfamiliar accents. It would be a great idea that listeners should deal with a variety of British, American and Australian accents, and other accents. In addition, the language which the speaker uses impacts the listening process. For instance, if the speaker uses too many reduced forms, idioms, slang, or reduced forms in his speech, these will hurt second language listening comprehension. By contrast, if the speaker uses a lot of redundancy which includes hesitations, corrections, rephrasing forms, repetition, insertions, and pauses during his message, the listener may be beneficial from these because they can get more time and more information to comprehend the delivered message with ease, (Brown, 2007).

- The Listener: Listener characteristics appear to affect listening comprehension. These characteristics include listeners' background knowledge about the listening topic, their language proficiency level, their working memory ability or willingness to concentrate during listening. When a listener knows well about the topic, it may increase the listener's listening comprehension because his prior knowledge helps to facilitate understanding of the message as well as predict what is going to be said. Otherwise, a listener listens to a message about which he has insufficient background knowledge; the message becomes more difficult to comprehend. For example, the listener may use some of extra cognitive processing abilities to repeat, rephrase, or reorganize messages in a way that reinforces the primary message. Moreover, English is a "stress-timed language as well as the language with rhythm and intonation patterns. If listeners become aware of these characteristics of the English language, it helps process listening, (Brown, 2007). Language proficiency level is an additional factor that has a profound impact on effective listening. For example, a listener who has greater phonology, morphology, syntax and vocabulary size of the target language are able to make sense of the message easily. In addition to the characteristics above, personal factors such as interest and motivation also aid comprehension. If the listener is very interested in what is being said, this makes the listening process take place more easily than a listener without interest in the message. Motivation is an additional factor that influences listening comprehension. When a listener is motivated to listen or has a specific listening purpose, he tends to pay attention to information that benefits him in some ways and may ignore other information that he does not find personally relevant. Physiological and psychological variables such as weakness, sleepiness, and tiredness, mental anxiety, boredom, and frustration also impact listeners' ability to understand the spoken message. Aside from cognitive capacities and personal factors above, listening practices and listening strategies can interfere with listening. For example, listeners with limited prior exposure to the language, a bad listening practice, or poor listening strategies during the listening process finds failure to understand what is being delivered, compared with those who has frequently listening practices and use effective listening strategies such as listening for the main idea or specific details, summarizing, predicting a speaker's purpose, seeking clarification, drawing inferences, etc.

Though we are in full agreement that message, speaker, and listener characteristics are all responsible for successful or unsuccessful listening comprehension, there are additional factors which may cause comprehension prevention. One of these factors is the physical setting.

- The Physical Setting: The physical setting includes environmental and physical factors which present barriers to effective listening. One of these factors is the classroom environment itself such as lighting, temperature, furniture, and the presence of environmental noise that can affect our ability to listen. For example, the uncomfortable feeling resulting from an exam room that is too dark, too hot, or too cold can affect the students' concentration and ability for listening comprehension.

In addition, the quality of sound in the recordings, technical problems with the audio equipment, background sounds and noise inside or outside the room such as sounds of traffic or people talking or distortion in the audio signal are barriers to comprehension.

Reasons for Using Interactive Multimedia in the Language Classroom and for Listening Comprehension

Lopuck (1996) claims that language learning in interactive multimedia environments can provide better ways of presenting information than single media (e.g. only audio or video). Especially, listening practice with interactive multimedia materials offers better understanding, easier learning, more engagement, and more empowerment, and more enjoyment than with single media. Consequently, learners become responsible for their own learning and gain control over the listening process.

According to Gaskins (2010), there are many advantages of using multimedia in the classroom. One of the advantages is student motivation. In multimedia environments, students become motivated to participate in classroom activities since various learning styles are addressed simultaneously (e.g. seeing, hearing, imaging, etc.) to meet the needs of many students, to attract students' attention, and to make learning fun. Another advantage is that both learners and teachers can access to endless materials or resources for their learning and teaching. Multimedia additionally offers student-centered learning in which learners can control their own learning and are responsible for their learning through collaborative learning activities, project-based learning activities, or even self-study. Life-long learning and critical thinking skills are also believed to be built for learners in interactive multimedia learning conditions. Multimedia helps learners to retain their learning, enjoy the learning, and study much more with the provision of enjoyable learning styles, scaffolding, visuals, etc. Lastly, through a multimedia learning environment, learners may build many life-long skills, e.g. critical-thinking skills which will also be required for their daily activities beyond school as well as for their future work.

According to Warshauer, Shetzer, and Meloni (2000), there are five main reasons to use the Internet for English teaching: authenticity, literacy, interaction, vitality, and empowerment. In terms of authenticity, the authors states, "language learning is most successful when it takes place in authentic, meaningful contexts" (p. 7). Another reason for using the Internet for language teaching is literacy. Language teachers offer students an opportunity to develop their abilities of listening, speaking, reading, writing, communicating, researching, and publishing. Interaction is additionally an important reason why English teachers should use the Internet in their teaching. It provides students with opportunities to interact with native speakers and non-native speakers around the world. For vitality, the fourth reason for using the Internet, "the Internet can inject an element of vitality into teaching and motivate students as they communicate in a medium that is flexible, multimodal, constantly changing, and connected to their real-life needs" (p. 7) Lastly, regarding empowerment, the Internet allows teachers and students to empower their teaching and learning. The Internet offers them chances to become "autonomous lifelong learners," (pp. 7-8).

Besides the reasons for using Internet-based resources for general language teaching and learning, research has shown that adopting Internet-based resources to listening skill teaching brings many benefits for students compared with using materials on CDs or tapes (Brett, 1997) In fact, listening to materials on the Internet supplies students with multimedia input including visual support, such as texts, captions, illustrations, photographs, etc., while CDs and tapes provide only audio input (Turel, 2014c).

There are five specific multimedia benefits. First, listening with visual support helps to promote students' listening comprehension and is more useful for less proficient language learners (Mueller, 1980; Rubin, 1975, as cited in Suvorov, 2008, p. 16). Second, studies tend to conclude that the advantages of video over audio-only format is providing learners with more authentic content, context, discourse, paralinguistic feature, and cultural aspects, (Coniam, 2001, as cited in Suvorov, 2008, p. 15). Obviously, these benefits support learners in their listening comprehension. Third, Jones (2003) indicated that using

visual and verbal annotation assists learners in their listening comprehension and vocabulary acquisition (p. 41). Fourth, according to Peterson (2010), the effectiveness of Internet-based resources improves listening comprehension. He believed that "while listening to digital audio or watching a video clip, learners have the opportunity to pause at will, and listen and read a transcript. Moreover, learners can get instant feedback on what they have done (e.g., you watch a video clip/listen to audio and check answers immediately after watching/listening)," (p. 140). Finally, in terms of motivation, Nobar and Ahangari (2012) states that with the introduction of computers and the Internet into language classrooms, it helps improve language learners' attitudes and motivation since language lessons become practical and enjoyable for learners, (p. 39).

Chapelle (1999) also indicates that teaching listening skills with Internet-based resources contributes to enhancing EFL students' listening comprehension both in and beyond the classroom. For example, CALL software, online discussion boards, and online conference tools such as text chat, whiteboard, audio and video, offer opportunities for comprehensible input and output, and negotiation of meaning. Luu (2011) also suggest that "computer use in listening instruction should be given much more consideration so as to improve the listening skills of EFL learners, and to motivate both teachers and learners" (p. 5).

Some Internet Resources and Materials for Listening Practice

There are many varieties of Internet sources for EFL learners to extend language learners listening skills as a part of learning English as a second/foreign language (see Table 1, 2, 3, 4, 5 and 6). Some of suggested sites, categorized according to themes, are presented in Appendix 1- Websites for Listening Practice.

FUTURE RESEARCH DIRECTIONS

Many researchers have appreciated the benefits of interactive multimedia technology in teaching and learning listening skills, including fostering learners' listening skills and their motivation in listening classes. However, many aspects relating to the development of the listening skill in second language (L2) and EFL learners with multimedia resources have not been paid much attention from researchers. For example, they should have recommended appropriate sources or tools of multimedia which can be used to enhance EFL learners' listening skills as well as the most effective uses of multimedia tools for developing listening proficiency in EFL learners. Therefore, this is a need to explore these issues to contribute to recent studies.

CONCLUSION

The introduction of interactive multimedia into language teaching and learning gives language teachers and learners opportunities to facilitate their teaching and learning. Especially, interactive multimedia listening environments provide visual support, authentic content, and comprehensible input for learners. Moreover, listening practice with interactive multimedia resources allows learners to monitor their learning, thus they are motivated to learn. Thus, multimedia resources and materials have been viewed as wonderful and rich sources for improving listening skills. In other words, interactive multimedia helps both language teachers and learners facilitate the process of English listening skills teaching and learning.

KEY TERMS AND DEFINITIONS

Hearing: The physiological process of perceiving sound produced by any source in the environment.

Interactive Multimedia Listening Environment: Including multiple-media systems, software applications, materials, products, or courses that are designed to offer language learners opportunities to process or interact with different types of media to enhance their listening skills.

Interactive Multimedia: Interactive multimedia allows the user to interact with textual, aural, and visual media in a wide range of formats.

Listening: The physiological and cognitive processes in which listeners pay particular attention to and understand what is being spoken.

Listening Comprehension: The process where listeners use both background knowledge and linguistic knowledge in understanding the meaning of spoken and/or nonverbal messages.

Listening Skills: The ways to help a person listen something more effectively. So, listening skills can be trained and developed.

Multimedia: The combination of text, graphics, audio, motion video, or interactivity content forms.

This research was previously published in Intelligent Design of Interactive Multimedia Listening Software edited by Vehbi Turel, pages 225-244, copyright year 2015 by Information Science Reference (an imprint of IGI Global).

APPENDIX

Websites for Practice Listening

Table 1. Websites for songs

	Site Names and URL	Brief Descriptions
1	Alpozo's Phonetic Blog http://allphonetics.blogspot.com/search/label/videos	This is a great blog for songs. The blog is mainly based on the field of phonetics addressed to teachers and students of English at all levels. You can listen to songs you like and do the tasks following the songs if you wish. The activities are interactive and can be used as lessons in class, a language lab, on-line or off-line.
2	Elllo http://www.Elllo.org/english/1001.htm	This website supplies teachers and students with free online listening activities. Many of them have quizzes and a transcript. There are many kinds of authentic materials such as songs, interviews, and casual lectures on this website. It is suitable for intermediate and advanced students.
3	ESL Videos: Category: 'Songs' http://www.manythings.org/b/e/category/songs/	This site features folk songs, campfire songs, and group-singing songs that native English speakers sing. These podcasts are short and designed to be listened to more than once, so learners can listen and sing along as many times as they need to in order to learn the song.
4	MusicTube 101 http://www.youtube.com/watch?v=anxqSb3XrGE	This video is about a famous song, including its transcript. You can listen to the song and practice singing the song. It is recommended for all levels.
5	Songs for Teaching http://www.songsforteaching.com/phonemicawareness.htm	This website is a great idea for using music to promote language learning. It has audio and video songs categorized into a broad range of topics. It also includes transcripts, so you can listen to the song and read its transcript at the same time. You not only listen to your favorite songs, but also practice phonetic features. It is appropriate for elementary and intermediate young learners.
6	VOALearningEnglish http://www.youtube.com/watch?v=33qbMCuJ5XI&feature=player_embedded#	This is the video about a VOA Special English Education Report about songs. Through this report, you may find your favorite songs.

Table 2. Websites for news reports

	Site Names and URL	Brief Descriptions
1	6 Minute English http://www.bbc.co.uk/worldservice/learningenglish/general/sixminute/	Learners can listen to current news from Europe in a way that is easy to understand and download the files to listen to many times. Another great thing is having a copy of the text available for reading at the same time or after listening. This site is suggested for advanced English learners or native-like speakers.
2	CNN Streaming Video News http://www.cnn.com/videoselect/	Learners can listen to clips of individual news items or to whole programs. The CNN site is predominantly American English.
3	ESL Videos http://www.manythings.org/b/e/	In this site, learners can choose from a variety of videos to help them learn English, which can be accessed by date or subject. It is appropriate for adult learners.
4	Euronews http://www.euronews.net	The website has Euronews TV, radio, and video about news, European affairs, business, special reports, sports, and culture. It is suggested for advanced level.
5	Listen and Watch http://learnenglish.britishcouncil.org/en/listen-and-watch	The site has five-minute audio reports and transcripts on subjects such as famous people, pop music, and entertainment. Learners can listen to or watch news on the computer, or download audio and video files to their mp3 players. Audio and video materials are accompanied by language practice activities that learners can do on their computers while they listen or watch, or print out and do them when they want to.
6	VOA Learning English http://www.voanews.com/specialenglish/	This website is recommended for adult learners and learners who are interested in politics, current news as well as special features on life in the U.S. including: science, education, health, famous Americans, and American history. They can read and listen to them on their computer or download them to their iPod or mp3 player.

Table 3. Websites for conversations

	Site Names and URL	Brief Descriptions
1	Elllo http://www.Elllo.org/english/1001.htm	This website supplies teachers and students with free online listening activities. Many of them have quizzes and a transcript. There are many kinds of authentic materials such as songs, interviews, and casual lectures on this website. It is suitable for intermediate and advanced learners.
2	ELT Podcast http://www.eltpodcast.com/	ELT Podcast provides basic conversations for EFL and ESL students and classes. ELT Podcast presents a common conversation theme in each episode. The first presentation is spoken at a normal speed, and then at a slower, less natural speed to help with comprehension. The site also provides a transcript of the conversation.
3	Focus English: http://www.focusenglish.com/	This resource is suggested for intermediate to advanced EFL learners. Through this site, learners can hear real English, including idioms, vocabulary, and other commons words and phrases.
4	Learning English Online http://esl.wikidot.com/listening	This site provides teachers and students listening exercises from intermediate to advance levels. It also gives learners many links to practice listening from many different sources. Most listening exercises focus on real speeches, or real life conversations. It is recommended for beginning, intermediate, and advance levels.
5	Learning Oral English Online http://www.rong-chang.com/book/	Learners have an opportunity to practice their listening and speaking through daily conversations on a wide range of topics. The website is recommended for all levels.
6	OM Personal English Conversation http://www.ompersonal.com.ar/omaudio/contenidotematico.htm	This site includes daily conversations on a variety of topics. The conversations are categorized according to elementary, intermediate, and advanced levels.
7	Real English http://www.real-english.com/	There are thousands of topics from easy to difficult levels on this website. Learners can watch and listen at the same time. One special thing is that they can watch a short video with or without subtitles. It is useful for pre-intermediate to advanced levels.

Table 4. Websites for stories

	Site Names and URL	Brief Descriptions
1	Annenberg Learners http://www.learner.org/resources/series71.html	The website has video stories about people and their lives in slow English. It includes 50 fifteen-minute video programs and coordinated books. It is suggested for college and high school classrooms and adult learners.
2	Beeoais.com Beeoasis.com	The website has stories with audio about people and their lives, spoken slowly. Learners can listen to and read along with the stories. It is recommended for three levels: beginning, intermediate, and advanced.
3	ESL Videos: Category: 'Stories' http://www.manythings.org/b/e/category/stories/	This site provides language learners with stories, videos with subtitles, and videos with transcripts, spoken at slow speed. Thus, they can listen to and read along with the stories. It is appropriate for beginning, intermediate, and advanced levels.
4	Npr http://www.npr.org/	The website is recommended for advanced language learners who are interested in listening to stories. These short stories are deep and touching.
5	Spotlight http://www.spotlightradio.net	The site is about podcasts, stories, and news. The English is at almost normal level. Language learners can listen to and read at the same time. It uses a specially modified form of English to make listening to the radio easier. It is suggested for beginning and intermediate levels.
6	StoryCorps http://storycorps.org/	The website has a collection of stories told by ordinary people in the United States. Visiting the website, you will have the opportunity to listen to over 80,000 people who have shared life stories with family and friends through StoryCorps. The site is recommended to advanced learners.
7	StorylineOnline http://www.storylineonline.net/	StorylineOnline is a collection of video recordings of children's stories being read by notable actors and famous people. The videos are short and easy to follow. Each video has a short introduction by the actor before transitioning to the reading of the story. Learners can follow along with the pictures and words of each story. It could be a nice resource for three levels: beginning, intermediate, and advanced.
8	Takako's Great Adventure http://international.ouc.bc.ca/takako/index.html	This is a full novel told in parts that learners can listen to. They can also download PDF files of it to read. The site is good for advanced learners.

Table 5. Websites for film clips/drama

	Site Names and URL	Brief Descriptions
1	Annenberg Learners http://www.learner.org/resources/series71.html	The website has video stories about people and their lives in slow English. It includes 50 fifteen-minute video programs and coordinated books. It is suggested for college and high school classrooms and adult learners.
2	Learning English through movies http://cinema.clubefl.gr/	There are a series of videos and cartoon videos that provide learners with listening skills. Most of the videos have subtitles and they are quite easy to understand. Therefore, they are relevant to young learners at lower levels.
3	Living English (Australianetwork) http://australianetwork.com/livingenglish/	People speak at a slow speed. A drama is divided into forty-two parts, which look at the English language used in real life situations such as making an appointment or asking and giving directions. There are full transcripts to follow along with the audio files. It is good for beginner or near beginner level learners.
4	Movie trailers http://www.movies.com/movie-trailers/	You can download free movie trailers. Since it is to promote the movie, a trailer usually shows the high points and low points of a movie, which makes it exciting. The trailers are not very long which means learners can see a variety of them in a short time. This also leaves a lot of time to reflect on what students saw in the trailers and focus on the language. It is appropriate for upper beginners to advanced levels.
5	Top Documentary Films http://topdocumentaryfilms.com/	This site is very helpful because it provides non-fiction movies. There are 25 documentary categories with 847 movies. You can choose many videos related to your topic. The language is appropriate and quite slow, so it is easy for students to understand. All the videos are free. The summary of each movie is also provided before you watch it. This site is recommended for high intermediate to advanced levels.
6	YouTube http://www.youtube.com/	There are endless possibilities for watching video clips from movies or TV shows, as well as videos created and contributed by regular people. The site is suggested for high school and adult learners who are interested in current events, or have niche interest areas.

Table 6. Websites for lectures

	Site Names and URL	Brief Descriptions
1	FreeVideoLectures http://freevideolectures.com/	You can watch more than 18400 video lectures from top 30 universities on 35 categories. You can even download the lectures in MP4, FLV, 3GP, and MP3 for easy access later. The site is recommended for advanced learners.
2	Nobelprize.org http://www.nobelprize.org	The Nobel Prize web site has an archive of video lectures from winners dating back to 1999. You can watch winners in every subject talk about their lives and their research. This website is suggested for advanced learners.
3	Prezi http://prezi.com	On this website, you could listen to and watch great Prezi presentations with videos, images, texts and other presentation media. This site is recommended for advanced adult learners.
4	reddit http://www.reddit.com/r/lectures/	The website provides advanced learners with video lectures on mathematics, physics, computer science, programming, engineering, biology, medicine, economics, politics, social sciences, and many other subjects. This website is suitable for advanced learners.
5	TED Ed Lessons Worth Sharing http://ed.ted.com/	On this site, you will find carefully curated educational videos, many of which represent collaborations between talented educators and animators nominated through the TED-Ed platform. The website is suggested for intermediate to advanced learners.
6	TED Ideas Worth Spreading http://www.ted.com/	On TED.com, you will watch the best talks and performances about Technology, Entertainment, and Design. More than 1500 TED Talks are now available, with more added each week. All of the talks are subtitled in English, and many in other languages, too. The website is suitable for advanced learners.
7	videolectures.net http://videolectures.net/	VideoLectures.NET is an award-winning free and open access educational video lectures repository. The lectures are given by distinguished scholars and scientists at the most important and prominent events like conferences, summer schools, workshops and science promotional events from many fields of Science. It might be best for students in college who are pursuing Computer Engineering since the site puts a special emphasis on that particular topic, but they also cover several general topics such as biology and mathematics.

Chapter 39
Design Patterns for Integrating Digitally Augmented Pop-Ups With Community Engagement

Joel Fredericks
The University of Sydney, Australia

Martin Tomitsch
The University of Sydney, Australia

Laura Stewart
Aurecon Australia, Australia

ABSTRACT

This article explores the opportunities of translating existing community engagement techniques into digitally augmented pop-up interventions, for on-the-spot feedback around infrastructure within the built environment. Pop-up interventions allow for more inclusive forms of community engagement through the combination of digital and physical media. The paper draws on Alexander et al.'s idea of pattern languages to put forward a set of design patterns for integrating digitally augmented pop-ups into community engagement activities. The patterns are based on a review and analysis of existing community engagement techniques, digital technologies used in urban environments, data from our own field studies and a focus group with engagement professionals. The aim of the patterns is to: (1) capture collective wisdom; (2) reuse and extend ideas; and (3) converge on designs that work for communities.

INTRODUCTION

Citizens of the 21st century live in a world where they are more connected than ever before, more exposed to an unprecedented amount of information and have a greater awareness of social, political and environmental complexities. As a result, engaging citizens in the urban planning process is not only a complex and divisive issue due to busy lifestyles and competing priorities, but also a result of top-down government approaches and current engagement tools and techniques used. Governments around the

DOI: 10.4018/978-1-5225-3822-6.ch039

world undertake formal community engagement either as a legislative requirement or for the political interests and agendas of elected representatives (Cuthill, 2003). However, current practices, such as town halls, workshops, drop-in sessions and online platforms do not necessarily capture the opinions of the wider community and pose a number of other challenges. It has been shown that some of these traditional community engagement techniques are outdated, resource intensive, lack public interest and exclude certain demographics within local communities (Falco, 2016; Hosio, Goncalves, Kostakos, & Riekki, 2014; Sarkissian, Hofer, Shore, Vajda, & Wilkinson, 2009; Schroeter, 2012). As a result of this, time poor citizens, younger demographics and culturally and linguistically diverse people are either disengaged or excluded. Legally required community engagement and top-down decision making therefore rarely achieves genuine engagement outcomes, but rather fragments communities and creates dissatisfaction amongst citizens, who feel they have not been heard (Innes & Booher, 2004). Head (2007) argues that a greater dialogue between governments and citizens encourages deliberation between stakeholders in the decision making process.

Within the last decade communities around the world have taken it upon themselves to drive bottom-up initiatives through temporary installations in the form of pop-ups. This contemporary approach is commonly referred to as pop-up urbanism (Fredericks, Tomitsch, Hespanhol, & McArthur, 2015), tactical urbanism (Lydon et al., 2014), guerrilla urbanism (Caldwell, Osborne, Mewburn, & Crowther, 2015) and DIY Urbanism (Caldwell & Foth, 2014). Pop-Up interventions 'hack' public space by appropriating new and temporary purposes within communities. They have the ability to attract passers-by, create awareness amongst citizens and stimulate the imagination of participants (Fredericks, Caldwell, Foth, & Tomitsch, 2015; Fredericks, Tomitsch, et al., 2015). Examples such as PARK(ing) Day ('http://parkingday.org', 2016), Build a Better Block project ('Better Block', 2016), Pop-up town halls (Lydon et al., 2014), and InstaBooth (Caldwell, Guaralda, Donovan, & Rittenbruch, 2016) demonstrate the successful application of pop-ups within public space. The design patterns proposed in this article build on these previous interventions and provide new insights into the use of pop-ups in conjunction with new digital technologies for community engagement.

Existing digital technologies used within the built environment also offer opportunities to devise novel participation strategies that can engage previously difficult to reach, as well as new, segments of society in urban planning. Foth et al. (2009, p. 97) pose that "Information and Communications Technology has contributed to the globalisation of cities and facilitated increased contacts between places and people at both global and local levels." Tomitsch (2014) discusses the evolution of information and communication technology (ICT) and its transition from the workplace into all aspects of daily life within the last decade, including the urban built environment. New digital technologies are providing numerous opportunities for the efficient use of existing infrastructure within the built environment. In this article, we contribute to these emerging fields through the development of eight design patterns that integrate digital technologies, pop-ups and urban planning.

The concept of pattern languages and design patterns, originally developed by Alexander et al. (1977), is an established practice within the field of architecture. This original concept has inspired many disciplines, such as software engineering, ICT and human–computer interaction (HCI) to create their own pattern languages. Based on three field studies we conducted in Sydney, Australia, which used a combination of digital and physical media, supported by a review of existing work and an expert focus group, we propose an initial set of design patterns for integrating digitally augmented pop-ups into community engagement. Although, there have been a number of projects and studies that integrate situated digital technologies with community engagement initiatives (Fredericks, Tomitsch, et al., 2015;

Hespanhol et al., 2015; Koeman, Kalnikaité, & Rogers, 2015; Vlachokyriakos et al., 2014) there is no generalised framework available that can guide the implementation of such hybrid initiatives. We aim to fill this gap by proposing our design patterns as a first step towards forming a foundation for creating a future pattern language for creative and interactive community engagement facilitated through pop-up interventions. The design patterns are intended to be dynamic as we encourage other researchers to test and improve the patterns and to contribute new patterns.

The rest of this article is structured as follows: We first provide an overview of digital technologies in the urban environment. We then introduce the concept of pattern languages, discuss examples of design patterns used in other disciplines and introduce existing community engagement assessment frameworks. This is followed by an overview of our three field studies and an expert focus group, which led to the development of our patterns. We then present eight design patterns, which follow the format of Schuler (2008) and Lyle et al. (2015). Each pattern is introduced through a problem statement, its context, a discussion and a description of the solution proposed by the pattern, illustrated through examples from our own field studies and previous work.

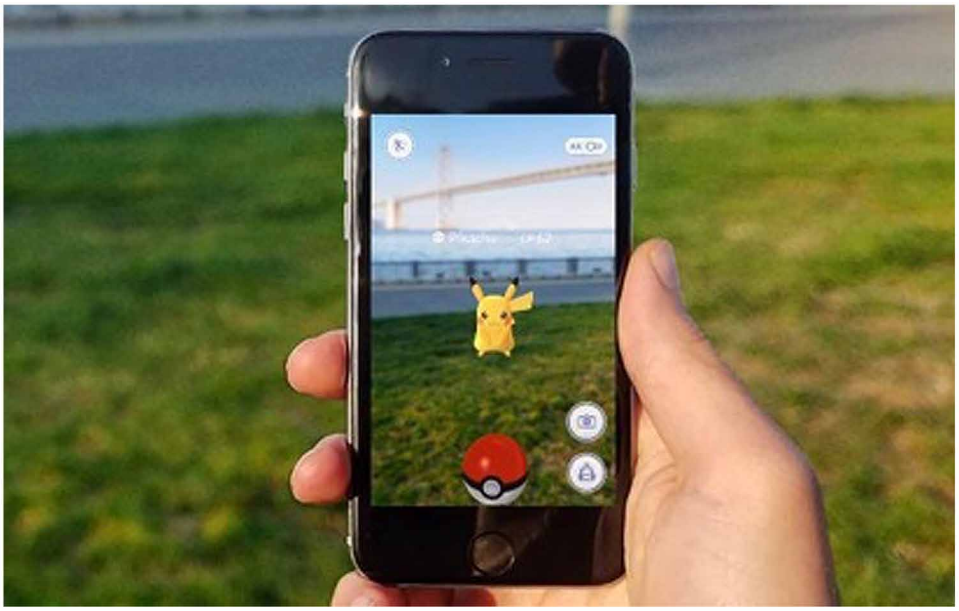
DIGITAL TECHNOLOGIES IN THE URBAN ENVIRONMENT

Digital technologies within urban environments are becoming increasingly pervasive. Over the past few decades they have evolved from being located and used in official locations, such as workplaces and government agencies, to being integrated into all aspects of daily life (Tomitsch, 2014). Digital technologies provide a significant opportunity to level the social playing field. It no longer matters who you are, how much money you have or who you know. It has become a mediocracy by providing opportunities for citizens to be involved in society and recognised for their abilities and accomplishments (O'Connor, 2016). Technologies are increasingly being used in urban environments, such as, the internet of things (IoT) (Gubbi, Buyya, Marusic, & Palaniswami, 2013), smartphones (Fredericks & Foth, 2013), tablet devices (Takano et al., 2012) and Web 2.0 applications (O'Reilly & Battelle, 2009).

An example of a recent social phenomenon is Pokémon Go, a smartphone gaming application using augmented reality (Hern, 2016). The game is interactive both digitally and physically, by taking people out onto the streets to compete with other people using digital characters within a physical space (Figure 1). This is not a new idea – augmented reality has been previously proposed for enriching urban experiences, for example by Human Pacman (Cheok et al., 2004), a project based on the 1980s arcade game Pacman. Like Pokémon Go, the game encourages collaboration and competition between players in both a digital and physical setting. However, the enormous popularity and uptake of Pokémon Go by people around the world demonstrates that technology is reaching a maturity, which demonstrates the potential of integrating digital technologies into the urban environment. The success of Pokémon Go further highlights that people want to engage and be engaged within the urban environment.

Technological advancements have led HCI researchers to investigate the use of digital technologies in city making, postulating the need to shift from thinking about people as 'users' of technologies to 'citizens' (Foth, Tomitsch, Satchell, & Haeusler, 2015). A number of fields and approaches have emerged that each use particular lenses to investigate new opportunities for urban communities enabled through digital technologies, including ubiquitous computing (ubicomp) (Weiser, 1993), urban informatics (Foth, Choi, & Satchell, 2011), urban computing (Kindberg, Chalmers, & Paulos, 2007), digital placemaking (Fredericks, Hespanhol, & Tomitsch, 2016; Latorre, 2011), and urban interaction design (urban IxD)

Figure 1. Pokémon Go used in a public space
(Credit: Gamespot)



(Brynskov et al., 2014). What all these concepts have in common is the application of digital technologies for improving the use and experience of existing urban infrastructure and providing new opportunities for connecting citizens with their city. We will describe some of these concepts and their relevance in the context of this article below.

The concept of ubicomp dates back to the early 1990s. It was first introduced by Weiser (1991) to describe the vision of moving computing from the desktop and integrating it in the 'fabric of everyday life' (Weiser, 1993). Mobile phone communication, wireless internet, location-based mobile services, situated interactive public screens and electronic information signs are examples of ubicomp infrastructure being actively used by citizens. Urban informatics research investigates the relationship between people, place and technology with a focus on urban environments, location-based services and mobile technology. Foth et al. (2011) describe urban informatics as the collection, classification, storage, retrieval, and dissemination of recorded knowledge in a city. Essentially it is the integration of technologies into cultural practices within the context of specific communities, cities and spaces (Foth et al., 2011).

The notion of urban computing focuses around the integration of computing, sensing and mobile technologies into everyday urban environments, cultures and lifestyles (Kindberg et al., 2007). Urban computing has the ability to provide a broad range of opportunities through the extensive use of everyday technologies, such as public WiFi networks, mobile data networks and features provided in smart phones, tablets and computers. It has the ability to encourage citizens to use existing technologies in a creative and spontaneous way to appropriate spaces that create significance and meaning to them (Greenfield & Shepard, 2007). Urban informatics and urban computing share similar core ideas, such as the use of data and networks. Urban informatics however emphasises the role of people, and their relationships with places and technologies, whereas urban computing is more focused on the underlying technologies for deploying digital applications in urban environments. Both concepts provide a technological foundation

for the design patterns presented in this article. Urban informatics further contributes case studies of digital technologies, such as urban screens (Schroeter, 2009) and mobile devices (Anastasiu, 2012), and their use for engaging local communities around civic issues.

Both, urban informatics and urban computing focus on site-specific localised interventions, whereas urban planning is more concerned about the city as a system. To address this limitation, Foth (2009) proposed the notion of 'urban anatomy' (Francey Jr, 1995) which suggests that cities, like living organisms, are more than the sum of its parts. This notion shares aspects with other urban planning methodologies, such as placemaking, which focuses on the holistic planning, design and management of public spaces (Schneekloth & Shibley, 1995). With the increasing availability of and access to digital technologies, a number of scholars have suggested to augment placemaking strategies through digital technologies. This hybrid approach, referred to as 'digital placemaking', offers two distinctive perspectives. The first perspective suggests the use of situated digital technologies as a means of revitalising activity in public space. This can take the form of a purpose-built structures, digital urban screens ordinarily used for advertising, or temporary urban festivals using light and media projections (Tomitsch, 2016). The second perspective sees digital technologies as a means of informing placemaking strategies. Latorre (2011) describes this perspective as being a community-centred and transparent process, which leverages digital technologies to encourage collaboration between stakeholders. Fredericks et al. (2016) further extend this perspective by suggesting the use of situated digital technologies as part of community engagement initiatives, therefore informing placemaking strategies by engaging local communities within public space. This view aligns with the position taken in this article, as such a form of digital placemaking provides opportunities to facilitate interactive discussion within a localised context.

Urban IxD shares some of the core principles of digital placemaking. Similar to digital placemaking, it puts an emphasis on involving all stakeholders in the design of urban environments and experiences. More specifically, it focuses on the interaction of humans within their urban surroundings, and provides citizens with options to enhance everyday urban experiences to be more pleasurable, interesting, productive and efficient. Building on the tradition and philosophies of the interaction design discipline, urban IxD can be used as a platform to bring various professional disciplines together to address urban development within the built environment (Brynskov et al., 2014). It provides a framework for building relationships with and engaging urban planners, urban designers, academics, bureaucrats and members of the community. The concepts discussed above provide a foundation for the existing research and examples we draw on for the development of our design patterns.

PATTERN LANGUAGES AND ENGAGEMENT FRAMEWORKS

The concept of design patterns and pattern languages used in this paper follows the definition outlined by Alexander et al. (1977). Alexander and his colleagues observed that most architectural design projects involved solving similar types of problems. To assist designers in developing solutions to these common problems, they created a 'language' composed of a collection of 'patterns' based on practical experiences. Each pattern was represented through a description of the context in which it can be applied, a problem statement and a proposed solution along with practical example implementations. According to Alexander et al. (1977) "[e]ach pattern describes a problem which occurs over and over again in our environment, and then describes the core of the solution to that problem, in such a way that you can use this solution a million times over, without ever doing it the same way twice". The language is divided

into three categories, 'towns', 'buildings', and 'construction', which start broad and then narrows down to more specific and localised problems. An example for a pattern that relates to community engagement is 'Small Public Squares', which describes the need for public spaces situated along the intersection of paths most commonly used to create an activity node. Another example is the pattern 'Necklace of Community Projects', which encourages community driven grassroots movements situated around or in close proximity to a local town hall. These two examples highlight that grassroots initiatives, whether that be government-organised community engagement, political activism or community driven DIY tactics, require activated and accessible public space in order to succeed.

The use of pattern languages in architecture is well established, however, other disciplines, such as software engineering, ICT, and HCI, have developed their own sets of pattern languages and design patterns. Hafiz (2013) created a pattern language for developing privacy enhancing technologies (PET). Twelve patterns were created to address three key themes: PET software design; drawing on previous experiences to customise patterns; and, allowing practitioners to explore the big picture. The patterns have an architectural structure, provide a high-level solution and demonstrate how it can be applied in a variety of PET contexts (Hafiz, 2013). *Liberating Voices* (Schuler, 2008) is a pattern language focusing on social change in information and communication media outlets. The 136 patterns promote bottom-up grassroots activism and citizen empowerment in order to shift the decision making from top-down government and corporate organisations. Schuler (2008) applies a different approach to pattern language by providing detailed explanations of each pattern's problem, context and solution.

Lyle et al. (2015) developed design patterns for urban gardening consisting of a set of eight design patterns to bring communities together across digital and physical spaces for urban gardening practice. The patterns were grouped by aligning them along two axes – the first covering the themes highlighted through their research, and the second identifying whether the pattern applies to physical or digital space. We draw on both approaches employed by Schuler (2008) and Lyle et al. (2015), as our patterns are community-centred and involve the use of both digital and physical interactions. Pop-up community engagement studies (Caldwell et al., 2016; Fredericks, Tomitsch, et al., 2015) have identified a variety of themes relating to the types of information available, participant interactions – both digital and physical, the civic space and public feedback. By employing design patterns for digitally augmented pop-ups, we aim to support a variety of actors, including built environment professionals, interaction designers, university students, researchers and members of the community.

Our patterns complement other engagement frameworks that have been developed for the evaluation of the types of tools and techniques used for community engagement. Arnstein (1969) developed the ladder of participation to identify levels of community engagement in urban planning decision making. The framework describes a continuum of engagement, from 'nonparticipation' to 'citizen empowerment'. Similarly, the wheel of participation (Davidson, 1998) developed by the Shire of South Lanarkshire, Scotland is a further adaptation of the ladder of participation. This concept identified the extreme of no community input, from top-down government 'informing', through to bottom-up citizen 'empowerment', where the community makes all the urban planning decisions (Sarkissian et al., 2009). The International Association for Public Participation (IAP2) developed the public participation spectrum ('IAP2', 2006) to assess the level of engagement undertaken. Similar to the wheel of participation, the IAP2 spectrum is seen as a further adaptation of the ladder of participation. The spectrum's stages include: inform, consult, involve, collaborate, and empower. These stages show the differing levels of engagement, the goals, timeframes, resources and the levels of concern in the decision making process. These engagement frameworks have been developed with the intention to identify and assess the levels of community engage-

ment undertaken. The proposed design patterns can be used in parallel with these existing engagement frameworks to evaluate the deployment of digitally augmented pop-ups for community engagement.

DISCOVERING POP-UP ENGAGEMENT PATTERNS

The design patterns presented in this article have emerged through a review of previous work and concepts, and reflecting on three pop-up interventions we implemented for community engagement. This was followed by an expert focus group with professional representatives who have been involved in the strategic planning and facilitation of community engagement. The purpose of the focus group was to evaluate the proposed design patterns and their applicability in community engagement initiatives, and to seek feedback from participants for revising the patterns. We drew on the themes and experiences from these investigations in order to develop our design patterns, which are presented in the following section. In this section we describe the three pop-up interventions and associated field studies as well as the findings from the expert focus group.

Encouraging Community Discussion through Pop-Ups

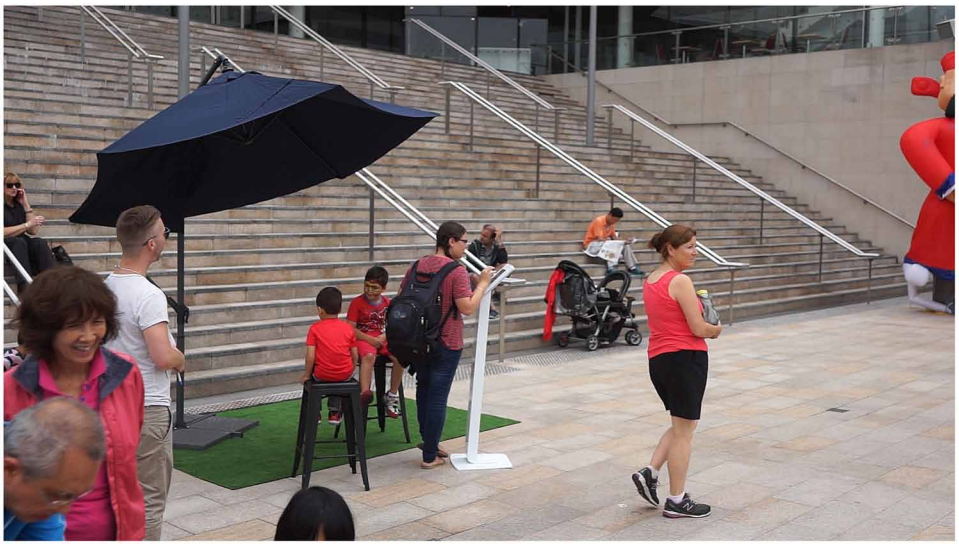
The pop-up interventions were carried out between 2014 and 2016 across a variety of locations in Sydney, Australia. During the field studies we interacted with people from a range of demographics, including, cultural and linguistically diverse communities, people who live in social housing areas, and residents from affluent suburbs. Each pop-up intervention used a combination of digital and traditional physical media for the purpose of community engagement. Each intervention built on the findings from the previous intervention(s), which led to an iteration of the physical structure and form of the pop-up as well as the media channels used within the pop-up to engage passers-by around topics of local relevance. The topics also varied from field study to field study, as each intervention was aligned with an on-going community engagement initiative. We will now describe the specific setup for each intervention and the key findings that relate to the design patterns proposed in the following section. The field studies were part of a larger research program, and we therefore collected a variety of data from interviews, surveys and observations for each of the interventions. The field study-specific findings and more detailed evaluations of the design process leading to the interventions are described in previous publications (Fredericks, Caldwell, & Tomitsch, 2016; Fredericks, Hespanhol, et al., 2016; Fredericks, Tomitsch, et al., 2015).

Digital Pop-Up

The first pop-up intervention comprised a series of community engagement activities in collaboration with a Local Government Authority (LGA) (Figure 2). The LGA's aim of the activities was to obtain public feedback around council services and the implementation of healthy infrastructure. We designed three variations of the pop-up intervention, which we deployed over three separate days consisting of:

1. A tablet device on a stand with a customised yes/no voting web interface used in conjunction with an existing urban screen
2. An unstaffed pop-up using a tablet device – with an adapted web interface that allowed participants to type text responses, the urban screen, market umbrella, synthetic turf and barstools

Figure 2. Digital Pop-Up study



3. A staffed pop-up using the same tablet device with web interface, the urban screen, gazebo structure, synthetic grass, seating, plants, and 'call to action' signage, which was displayed on the urban screen and on physical posters at the pop-up (Fredericks, Tomitsch, et al., 2015).

We observed and took notes about the behaviour of people moving around the space, such as people walking near the tablet, people noticing the tablet but not engaging with it, and people interacting with the tablet. We also held a focus group with three professional representatives from the local council to obtain feedback on the study outcomes and how this approach could be further improved. The findings of this study gave insights into the following themes:

- Interactive digital pop-up interventions have the potential to facilitate effective community engagement, e.g. attracting varied demographics, local discourse and decision making
- By deploying the pop-up within a civic space citizens were able to participate on the spot, with little effort in comparison to attending traditional community engagement events (e.g. focus groups)
- Digital methods of engagement provide effective means of complementing existing engagement techniques
- Pop-up interventions can help address community wide topics, and how citizens would like their responses to be addressed

Digitally Augmented Pop-Up

The second pop-up intervention was carried out as a community engagement study in collaboration with an electricity supplier using a combination of traditional physical media and digital technologies within a pop-up installation (Figure 3). The study was held in four locations across the Sydney metropolitan area to obtain community feedback around tree trimming and powerlines. Reflecting on the outcomes of the first intervention, Digital Pop-Up, we decided to involve a variety of stakeholders in the design

process of the second pop-up intervention. More specifically, we collected early feedback on potential engagement activities, engagement questions, pop-up setup, and locations to deploy through informal meetings with representatives from a variety of LGAs and local community organisations. The information obtained from these participants highlighted the types of issues people wanted to discuss, and therefore informed the initial design of the engagement activities. Following this process, we held a focus group in which we presented mock-ups of the pop-up engagement activities to practitioners with backgrounds in graphic design, public relations and communication and stakeholder engagement. We invited focus group participants to interact with the proposed engagement activities and to provide feedback around the design of the pop-up and how the activities could be adapted to be more relevant to the overall topic.

By undertaking this collaborative and iterative process we were able to develop three effective engagement activities consisting of

1. A selfie voting app, where participants could answer yes/no questions by taking a selfie in front of a fabricated tree
2. The same yes/no questions printed as physical media in the form of a paper leaf, which were then placed on a second fabricated tree
3. A tree game, using augmented reality where users could see virtual powerlines and trees by looking through Google Cardboard augmented reality goggles and using customised tracking markers to move the virtual objects around the physical space

Similar to Digital Pop-Up we took observations and notes about the types of behaviours of people moving past the pop-up. The findings of this study gave insights into the following themes:

- Involving a variety of stakeholders in the design of engagement questions and activities highlights topics that communities want to discuss and how they would like to provide their feedback;
- Passers-by generally avoid standalone formal looking pop-ups in public space (e.g. charity organisations, corporate organisations). However, informal looking pop-ups surrounded by other activities (e.g. local markets) encourage people to stop and inquire; and
- Fun and creative activities attract people to pop-ups, therefore creating a honeypot effect (Wouters et al., 2016).

Pop-Spot

The third intervention, Pop-Spot, was architecturally designed as a booth structure, made up of a series of modules (Figure 4). The study was held at The University of Sydney to obtain feedback from staff and students around transport infrastructure on and around the campus. Reflecting on the design process and the engagement outcomes of the previous pop-up interventions, we developed this study to incorporate five thematically themed engagement activities consisting of digital, physical and mechanical media channels. We held several workshops over a 12-month period to design, develop and test the engagement activities, and to execute the architectural design of the booth structure. Similar to the second intervention, Digitally Augmented Pop-Up, we presented mock-ups of the pop-up structure and engagement activities at a focus group with industry professionals from urban planning, computer science, public relations and communication and stakeholder engagement backgrounds. This allowed us to collect early feedback on the booth structure and the proposed engagement activities.

Figure 3. Digitally augmented study

The engagement activities deployed as part of the pop-up included five media channels:

1. An analogue display with a large transparent screen, facing the direction from which the majority of passers-by approached the pop-up and thus enticing them into interacting with the pop-up. This analogue display used a robotic writing mechanism to visualise the responses submitted to an engagement question. The answers to the question were drawn as emoticons representing yes (happy face) and no (sad face). People were able to submit answers by either using a Twitter hashtag on their personal mobile device or through a tablet device affixed to one of the module structures.
2. A tablet installed on one of the modules displaying a selfie voting app – similar to Digitally Augmented Pop-Up – allowed participants to answer an engagement question by picking up a picture representing a mode of transport (car, public transport, walking, cycling) and taking a selfie.
3. An interactive 40-inch multi-touch screen, which provided a visual representation of selfies taken on the selfie voting app. The screen also allowed participants to view local public transport options and points of interest (e.g. entertainment and restaurants).
4. Chalk stencils, representing modes of transport, drawn on the ground adjacent to the booth, to display the cumulative results of responses submitted via the selfie voting app.
5. A static chalkboard, installed on the opposite side of the booth, on which participants were able to provide feedback through freehand drawing and writing.

The findings of this study gave insights into the following themes:

- A collaborative and iterative design process helps refine the engagement activities and ensures they are relevant for data collection;
- Bright pop-ups (in our case taking a red colour), background music and a range of digital and physical activities surrounding the pop-up creates curiosity and thus entices passers-by; and

Figure 4. Pop-Spot study

- Presenting real-time data (chalk stencils, selfie pictures and static chalkboard results) adds meaning and encourages reflection by showing participants accumulative results from the engagement activities.

Categorising Community Engagement Techniques

Having discussed the themes of digital engagement and the findings from our three field studies, we now discuss the outcomes of an expert focus group held with professional representatives from urban planning, communication and stakeholder engagement, public relations, marketing and computer science (Figure 5). The recruitment of participants was based on their experience in the strategic planning of engagement programs and facilitation of community engagement. The objective of the focus group was to create a dialogue about three key engagement themes: Notification – the process of notifying communities about upcoming community engagement; Interaction – the types of forums people participate in for community engagement; and Engagement Results – the types of data collected and how it will be reported back to communities. Specifically, we wanted to understand the current industry practice for these three themes and how digitally augmented pop-ups can be integrated into them. The aim of the focus group was to gather input from experts for the synthesis of our findings into the set of proposed design patterns.

The focus group was conducted over two and half hours and consisted of the following format:

1. A presentation of the challenges of traditional community engagement, highlighting the limitations of current engagement activities and online forums;
2. An open discussion about current community engagement tools and techniques and how they are categorised into – Notification, Interaction and Engagement Results;

Figure 5. Expert focus group

3. A presentation on current pop-up engagement projects around the world, and the three field studies discussed above; and
4. Categorising the types of digital and physical media used in community engagement activities into Notification, Interaction and Engagement Results.

The focus group was held in an environment (a lounge area in our faculty building) that encouraged open discussion, inviting participants to draw on their professional experiences in the planning and facilitation of community engagement. We first identified the current techniques used by practitioners, which then prompted discussion around what does and doesn't work in current practice. This then enabled us to create a second list of techniques using both digital and physical media that can be integrated into pop-up engagement.

DESIGN PATTERNS FOR DIGITALLY AUGMENTED POP-UPS

We now present eight design patterns, which synthesise our research in the form of directly applicable strategies for community engagement activities. The final set of patterns that is presented here draws on our review of digital technologies used in urban environments, existing community engagement techniques, our three field studies and the expert focus group. For each design pattern we present a problem description, the context in which it is placed and the solution, adopting the format used by Schuler (2008) and Lyle et al. (2015). Each pattern uses the following structure:

1. Name and number.
2. **Problem:** Statement of the reoccurring engagement challenge.
3. **Context:** An overview of the engagement issues it applies to.

4. **Discussion:** Examples of where and how the problem occurs, and ways in which the problem has been approached in engagement activities.
5. **Solution:** Approaches to address the problem.

We grouped the patterns around the three engagement themes of notification, interaction and engagement results as shown in Table 1.

Pattern 1: Raising Awareness

Problem

Undertaking successful pop-up engagement depends on the ability to draw the attention of passers-by and converting them into active participants. This can be problematic as people are either in transit between locations or reluctant to stop due to the unknown. What types of measures can be put in place to raise the awareness of the pop-up engagement?

Context

This problem applies to government organisations, community groups and individuals where the intent is to undertake pop-up engagement in a public space. This pattern focuses on the ability to raise awareness of the pop-up engagement through situated advertising materials, community networks and online platforms.

Table 1. Design patterns for digitally augmented pop-ups

	Design Pattern	Description
Notification	1. Raising Awareness	Raising awareness through situated advertising materials, community networks and online platforms.
	2. Creating Activity	Embedding pop-ups into existing events, and providing staffing, music, signage and bright colours.
Interaction	3. Local Information	Understanding the demographics of the local area and tailoring the pop-up accordingly to encourage localised discussion.
	4. Community Discussion	Providing on-the-spot discussion between participants and staff and providing assistance with engagement activities.
	5. Submitting Responses on the Spot	Designing engagement activities that have a clear direction, are quick to interact with and don't require staff assistance.
Engagement Results	6. Balancing Digital & Physical	Providing a range of media channels that are both digital and physical to address the needs and abilities of various demographics.
	7. Contextual Representation	Displaying engagement results in a form that is appropriate and adopted for the context of the local community.
	8. Immediate Feedback	Showing accumulative results on the spot either inside or around the pop-up.

Discussion

Pedestrian traffic flows through public space are similar to the types of experiences people have on motorways and public transport. During high volume periods there are many activities and obstacles to manoeuvre, including street performers, which often draw large crowds, charity organisations seeking donations, homeless people asking for money, companies giving away free merchandise, and local markets and pop-up shops. As a result of these everyday urban activities, passers-by have either become immune to what is going on around them or deliberately avoid interacting. This also applies to formal looking pop-up interventions that appear to be stand-alone, lacking in character and posing an uninviting appearance.

We deployed our first pop-up field study Digital Pop-Up during a cultural festival in a busy public space surrounded by other market stalls. A majority of passers-by ignored the pop-up due to lack of situated advertising and call-to-action for people to interact. The limitation with this approach was the assumption that passers-by would stop and interact with the pop-up without needing too much information, or gathering this information through the digital media channel (the tablet) itself. Reflecting on this limitation we designed large signage for the second iteration of Digital Pop-Up and our subsequent field studies Digitally Augmented Pop-Up and Pop-Spot. The studies used large call-to-action signs in three languages (English, Chinese and Korean), and information signs explaining how to interact with the engagement activities. This helped to communicate the purpose of the pop-up, clearly linking it to topics of local relevance, and therefore enticing passers-by stopping to enquire about the pop-up engagement.

While situated signage material can be effective, there is an opportunity to collaborate with local community organisations to promote the pop-up engagement within their member networks. This can further be complimented by promoting pop-up engagement through online platforms that provide information about the engagement, its objectives and results. An example of this is the Visualising Mill Road (Koeman et al., 2015) project that undertook community engagement with a local community around a redevelopment. In addition to advertising their engagement in the physical space they also provided the project information and aggregated results online via a dedicated website.

Solution

Appropriate advertising of pop-up community engagement raises awareness around the engagement objectives and activities. This should include collaboration between a variety of government and community stakeholders and advertising within the physical location and online platforms.

Pattern 2: Creating Activity

Problem

Pop-up engagement needs to create curiosity and draw people in. The risk is passers-by might not be aware of the pop-up or deliberately avoid interacting as a result of the set-up looking too formal and uninviting. How can activity around pop-ups be created that encourages people to interact?

Context

Locating pop-up engagement in conjunction with other urban activities, such as local markets, cultural events and community fairs creates a more informal environment and has a greater opportunity to attract participants. Additionally, standalone pop-ups that stand out from the surrounding environment (e.g. through bright colour or their architectural design) and have activity (e.g. music, interactive and playful activities) can create curiosity and attract passers-by.

Discussion

Pop-up engagement that is embedded into an existing event or surrounded by activity has the ability to attract passers-by to stop and enquire and therefore participate. We deployed our Digitally Augmented Pop-up study in four locations over a two-week period. The first three locations formed part of a local community event with the last one as a standalone within a local community plaza. Based on the observations we took during the course of these studies we identified that the awareness rate and therefore the participation rate was significantly lower on the last day deployment. The set-up of the pop-up was the same as the previous three deployments but the location and surrounding activity did not attract passers-by to interact. This finding highlights that a pop-up design that was successful in one location does not necessarily work in another. However, there are other types of techniques that can be used to make a standalone pop-up look and feel less formal.

Reflecting on Digitally Augmented Pop-Up we designed our Pop-Spot study to be used as a standalone pop-up located in a high pedestrian area on a university campus. Taking into consideration that our study would not form part of an existing event we experimented with the overall pop-up design and engagement activities. This included the structural design and colour (bright red), and linking the activities to the engagement topic. To make the pop-up feel less static we played music, had call-to-action signage and made sure it was staffed at all times. Passers-by were intrigued by the look of the pop-up and the activity surrounding it, leading them to enquire and consequently interact with the pop-up's engagement channels.

While pattern #1 Raising Awareness above is concerned with the advertising component of pop-up engagement, this pattern focuses on the social interactions in public space and how curiosity can create its own natural advertising and lead to a honeypot effect (Wouters et al., 2016), which in turn attracts other by-standers to engage.

Solution

Locating pop-up engagement in a busy location and making it part of an existing event leverages on opportunities to engage with members of the public. It is also important, in particular in situations where the pop-up is not integrated with another event, to create activity. This can be achieved by incorporating music, using bright colours, having staff dressed up according to the theme and clear and instructive 'call to action' signage.

Pattern 3: Local Context

Problem

Traditional community engagement has been shown to exclude certain demographics in engagement process, such as time-poor citizens, younger demographics and people who are culturally and linguistically diverse.

Context

Understanding the demographics of a pop-up engagement location is crucial. This can assist in tailoring the engagement activities, the deployment timing and how the pop-up can be aligned with other events.

Discussion

In order to engage with the wider community in one location, pop-up engagement should be conducted over several days and times, and be tailored according to the demographics of that location. Our Digital Pop-Up study was deployed in a public square over three separate days. The location had a high volume of traffic from office workers, local businesses and a large Chinese and Korean speaking community. Working in collaboration with the LGA our intention was to capture the opinions of local residents and people who worked in the area but not necessarily lived there. We deployed our pop-up during a Chinese New Year event with the intention of engaging with people who are culturally and linguistically diverse, and over two working days to engage with office workers and local businesses. The study had its own limitations in regards to some of the pop-up design elements, highlighting that pop-up engagement cannot be generic. It needs to take into consideration the local context, the demographics who live and work there, and the best times to interact with people (e.g. weekends for local residents versus lunch time for office workers).

This pattern compliments pattern #1 Raising Awareness and #2 Creating Activity by considering the local impacts to pop-up engagement. It cannot be assumed what works in one location will work in another. These patterns have the ability to be tailored to the local context.

Solution

It is critical to choose activities that are appropriate for the local context and to take into consideration the place, its demographics and time of deployment. For the pop-up engagement to be successful it needs to be designed and deployed to reach the right people at the right time.

Pattern 4: Community Discussion

Problem

Pop-up interventions located in public space are not always attended by staff to assist with any questions from members of the public. The intention is to provide an information kiosk where people can freely interact. However, this approach has the ability to cause communication breakdown. The design

of pop-up engagement should take into consideration what types of human interactions will take place, juxtaposed with the engagement activities.

Context

This pattern applies to all pop-up interventions used for the purpose of community engagement. Stand-alone and unstaffed pop-ups can be static and appear unengaging to passers-by. Members of the community who stop to interact with the pop-up may prefer face-to-face discussions with staff about the engagement objectives before engaging in the process. Members may also require assistance with the activities, including the use of digital technologies.

Discussion

During our Digital Pop-Up study, we investigated the difference between having a stand-alone unstaffed pop-up and a staffed pop-up with information signage. The unstaffed pop-up failed to communicate its objective as a majority of passers-by did not notice it. Instead people used it as a shelter to sit and rest, talk amongst each other or make mobile phone calls. Interviewed participants highlighted that the pop-up appeared to have no purpose as there was no information around it, they didn't know what it was for and it was uninviting. The design and deployment of this pop-up is an example of a communications breakdown, due to lack of information surrounding it and staff attendance. The staffed pop-up coupled with information signage was more effective in making passers-by aware of the pop-up. Interviewed participants expressed that the activity and energy at the pop-up attracted them to the space and that they enjoyed interacting with the staff. Similarly, our Digitally Augmented Pop-Up study was successful in attracting the attention of passers-by as a result of signage, the design of the engagement activities and the playful character of the engagement activities. This was complimented by a multi-disciplinary team who were available to answers a variety of questions and to assist with the engagement activities. The culmination of those activities resulted in a honeypot effect (Wouters et al., 2016), making people curious about what was going on and therefore drawing them in to enquire and interact.

This pattern has some aspects in common to Lyle et al.'s (2015) pattern #7 'Community Communication', which suggests that designers should consider what means of communication is appropriate within a local setting in order to avoid a communications breakdown. Similarly, the design of pop-up engagement should take into consideration the engagement objectives, what information needs to be provided and collected, and how this will be communicated to participants. The pattern also draws on Schuler's (2008) pattern #122 'Community Enquiry', which states that people should come together and collaboratively work on problems in an experimental and critical manner. Similarly, collaboration between participants and staff and the types of data collected through their interactions at pop-ups can be experimental, however, they may need to be adjusted according to location and demographics. This pattern compliments pattern #1 Raising Awareness by allowing open dialogue between participants and staff.

Solution

Not all passers-by will be able to understand the immediate purpose of the pop-up, therefore it is critical to provide information through signage and staff presence. The design should be flexible and allow for adjustments during deployment, including information channels and the set-up of engagement activities.

Pattern 5: Submitting Responses on the Spot

Problem

Community engagement demands an investment of time with engagement sessions generally held on specific dates and times. Participants would need to learn about the engagement topic and how it could potentially benefit or directly impact them before being able to submit their responses. Like many variables in urban living, this investment of time competes with other priorities.

Context

This pattern can be used with any type of pop-up engagement where competing interests, priorities, and time constraints might come into play. The pattern is also specifically useful for engagement initiatives that require input from time-poor people who aren't able to come to dedicated sessions or spend a long time engaging with the topic. Members of the public may have limited time due to work, social or family commitments, which might conflict with the designated timeframes allocated for the proposed engagement. Community engagement is resource intensive and involves a significant amount of research and preparation, which therefore dictates its duration and timeframes.

Discussion

This pattern indicates a need to design engagement activities that have a clear direction, are quick to interact with, and don't require staff to assist. One of the constraints with traditional community engagement is time poor citizens are unable to attend due to other commitments. Traditional engagement methods, such as workshops, focus groups and town halls can run up to several hours. The objective of this pattern is to encourage passers-by who don't ordinarily attend community engagement sessions to quickly submit a response on the spot. With pop-up engagement people can stop for a few minutes on their way to work, lunch or home to engage and submit their response. Participants would not be required to undergo a lengthy registration process or provide any personal information. The project Vote As You Go is an example of deploying a digital intervention for the purpose of situated community engagement in a public space (Hespanhol et al., 2015). This study investigated the use of two voting systems that allowed passers-by to interact with the activities on the spot. The digital interfaces used for this study provided an effective strategy for attracting the attention of members of the public and converting them into active participants. Similarly, Koeman et al. (2015) deployed small scale voting devices in local shops to obtain feedback about a local community development. This enabled people to quickly vote on the spot about the topic without having to spend a significant period of time filling out forms or surveys.

Solution

As outlined in Digitally Augmented Pop-Up involving a variety of stakeholders in the development of engagement activities provides a greater understanding of the types of issues people want to raise and topics they would like to discuss. The location of the pop-up also plays a crucial role, making sure that any barriers between the flow of pedestrian traffic and the engagement activities are removed. Similarly,

the instructions to using the engagement activity should also be clear. For digital engagement channels, it is critical to design them as walk-up-and-use interfaces (Hespanhol et al., 2015) that don't require people to spend time learning how to use the interface and submitting their responses.

Pattern 6: Balancing Digital and Physical

Problem

Pop-up engagement needs to cater for the wider community. Not all participants are able or willing to use digital technologies due to language, literacy or ability barriers. At the same time, certain demographics may be more interested and willing to engage with digital media channels. Providing participants options to participate either through physical or digital media can therefore enhance the community engagement process by attractive a wider demographic to participate.

Context

This pattern can be used to create opportunities for a more inclusive pop-up engagement experience by providing a number of media input channels that are both digital and physical. This pattern particularly applies in situations where communities consist of a mixed demographic (older people, culturally and linguistically diverse). Balancing digital and physical also applies to situations where multiple responses are required to answer the engagement question – some of which are better collected via physical and some via digital media.

Discussion

Providing a balance of digital and physical media for pop-up engagement is an effective means of attracting and enabling a greater cross section of the local demographic to participate. During our *Pop-Spot* study we designed five engagement activities; three with digital inputs and two as physical media that were thematically themed. Each of these media channels had a connection to the other, ensuring coherence between the channels and their alignment with the overall engagement topic. The study was designed to allow participants to interact with the engagement activities that they felt most comfortable with, which provided an enhanced engagement experience. Similarly, Caldwell et al. (2016), deployed the *InstaBooth* as a pop-up engagement booth using both digital and physical media for engagement activities. Participants were encouraged to respond to engagement questions through SMS and Twitter, or storytelling through drawing pictures and writing responses on paper. The digital media responses were displayed on digital screens located inside the booth, and the physical media was displayed on pin boards both inside and outside of the booth.

These two examples demonstrate that a combination of digital and physical media can provide a different material experience, which can lead to richer forms of engagement. For example, writing on chalkboards or paper evokes different emotional connections compared to typing answers into a smartphone or tabled device. More playful engagement activities, such as voting by taking a selfie, can help to attract younger demographics. Therefore, depending on the engagement topic and the intended target demographic it is important to shift the balance between digital and physical media.

Solution

Pop-up engagement should employ a combination of digital and physical media, which needs to be balanced according to the local context, demographics and the intended engagement questions.

Pattern 7: Contextual Representation

Problem

One of the limitations of traditional community engagement is that people feel disconnected from the engagement results, as they are either too high level or presented in a way that is difficult to understand or not accessible.

Context

This pattern can be used to display or present pop-up engagement results that are in the context of the local community. For example, feedback on strategic planning proposals, local area plans and proposed developments.

Discussion

Traditional community engagement results are generally presented in planning reports or as high level statistics. As a consequence, local communities often feel that their contribution was not considered in the decision making process (Innes & Booher, 2004). Pop-up engagement presents an opportunity to provide a localised representation of engagement results that is relevant and directly addresses the local context. This pattern works in conjunction with pattern #3 'Local Context' – tailoring engagement activities to local communities. This pattern takes this further by adapting the engagement results to the local community in which it was collected. Our expert focus group participants highlighted that such an approach would have the potential to alleviate the feeling of disconnection amongst communities. This can be achieved through using digital (urban screens, digital displays, online platforms), analogue (chalkboards, chalk stencils on the ground), or physical (expert staff on the ground) output channels. Our *Digital Pop-Up* study displayed the engagement responses of local participants on the urban screen. This is an example of providing localised engagement responses for all people to see. Similarly, the *Visualising Mill Road* project, which spanned across two communities, used two different types of chalk stencils displayed in different locations to distinguish the results of each community.

Solution

Presenting engagement data that is relevant to the local area provides an opportunity to connect citizens with a localised dialogue around community topics. This approach also provides further opportunities to alleviate disconnection between what is happening in a local community and how it might connect into a greater city wide project or initiative.

Pattern 8: Immediate Feedback

Problem

Traditional community engagement techniques fail to provide feedback collected from participant interactions and input immediately after the engagement. Participants therefore experience a very isolated view as they don't know what responses others have submitted.

Context

This pattern can be applied during pop-up deployments to display the immediate and accumulative engagement results. These can be displayed in a digital or physical form either inside or surrounding the pop-up.

Discussion

Enabling participants to visualise the local engagement results in real-time has the ability to enhance the overall engagement experience for local communities. Participants can see what others had to say in regards to the engagement questions. Our Digital Pop-Up study is an example of displaying immediate feedback through digital media. Using an existing large urban screen, we displayed the yes/no voting results and text based responses as participants interacted. Schroeter et al. (2009) undertook a similar study, which enabled participants to SMS and tweet responses to engagement questions that were displayed on a large urban screen in a busy public square. Both of these studies showed the immediate and accumulative results of the engagement topic.

Digitally Augmented Pop-Up used both digital and physical inputs for people to answers questions, which displayed the results of the physical media (pining the paper votes to a fabricated tree) and displaying previous participants' selfie responses - through thumbnail pictures displayed on the home screen of the web interface tablet device. Pop-Spot displayed engagement results through digital and physical media. Participants that used the selfie voting app could see their picture on an adjacent digital display along with other participants' pictures. In addition to that we used physical media (chalk spray and stencils) to keep an accumulative tally of participants' responses grouped by type of response (in this case mode of transport). These results were displayed on the ground directly next to the selfie voting app. Through interviews with participants, our studies have shown that people prefer to see the results of other people on the spot. This approach validates the overall engagement objective and has the ability to inspire other people to further contribute to what others have said.

Solution

Displaying immediate feedback at pop-ups has the potential to further enhance community engagement in local communities. This can be achieved by employing a combination of digital and physical media in and surrounding the pop-up, taking into consideration the local context, demographics and use of space.

DISCUSSION

The design patterns presented in this article have been created as guide for the deployment of digitally augmented pop-ups for community engagement. The eight patterns were designed within the three engagement themes of Notification, Interaction, and Engagement Results. The review of existing community engagement frameworks, our own field studies and the expert focus group informed the structure of the three engagement themes and therefore the design of each pattern. People wishing to deploy digitally augmented pop-ups may choose to follow the format outlined, however, we have deliberately avoided suggesting specific relationships between patterns to allow pop-up interventions to be appropriated according to the proposed community engagement objectives and activities. We have however, suggested connections between the patterns, for example in the discussion of pattern #3 Local Context, we highlight that this pattern compliments pattern #1 Raising Awareness and #2 Creating Activity. Similarly, in the discussion of pattern #4 Community Discussion we draw on the pattern examples of Lyle et al. (2015) and Schuler (2008) and how that relates back to our pattern #1 Raising Awareness. As these design patterns evolve we feel that distinct relationships will emerge once they have been tested and refined in real world practice.

We acknowledge that there are a number of limitations with the data collected through our three field studies Digital Pop-Up, Digitally Augmented Pop-Up, and Pop-Spot. Conducting field studies in public space with the intention to interact with passers-by are notoriously difficult to run. Throughout each of these studies we collated and analysed the engagement results, took observations and undertook interviews with willing participants. However, there are data inconsistencies between the studies, for example, in Digital Pop-Up and Digitally Augmented Pop-up we interacted with a variety of demographics within local communities. This included office workers, culturally and linguistically diverse people and residents who lived in public housing areas. Whereas Pop-Spot was conducted within a university campus where participants were predominately from younger demographics and have been exposed to higher levels of education. Our studies also highlighted clear points for improvement regarding the usability of pop-up engagement. For example, we learned from interviewed participants that some people were unfamiliar with the novel context of our pop-ups, and were confused about its purpose and how to navigate around the activities effectively. Digitally augmented pop-ups are not intended to replace existing community engagement but rather used as an additional channel to engage with local communities. This approach does not propose that existing methods of community engagement are redundant, but rather suggests that these patterns can be used to complement existing tools, techniques and frameworks already established and widely used for community engagement.

CONCLUSION

In this article, we outlined eight initial design patterns that can be applied to the context of digitally augmented pop-ups that incorporate a combination of digital and physical media. The patterns were designed to address limitations of traditional community engagement techniques used in local communities, and to be able to reach and include a wider demographic. The focus of this work is to provide an alternative to the ‘one size fits all’ approach generally employed for community engagement in urban planning by providing an initial set of design patterns to be tested and challenged by built environment students, researchers and practitioners. The development of these design patterns contribute to the field

of urban planning practise and research in three ways. Firstly, we have advanced the field by proposing a novel and interactive approach for community engagement mediated through digital and physical media. Secondly, we further expanded on the work undertaken by Alexander et al. (1977), Schuler (2008) and Lyle et.al (2015), by presenting real world examples that have been tested within the built environment. And finally, these patterns set a foundation for creating a future pattern language that encourages creative and interactive community engagement facilitated through pop-up interventions, which can be applied to urban planning practice. These patterns are intended to be dynamic as we strongly encourage students, researchers, practitioners and members of the community to test, refine and improve the current patterns.

Chapter 40
Applying Digital Storytelling to Business Planning

Yoko Takeda
Yokohama National University, Japan

ABSTRACT

Digital storytelling for business planning has two different modes of perception, thinking, and communication: the narrative and the logical scientific. This chapter pointed out how the structure and the contents of the digital storytelling work influence its effectiveness through examination of works and the audience's evaluation of the works. Critical points regarding the structure of work were the consistency and the balance. The most important link was from a contrast between the initial situation and obstruction in the narrative part, to key success factors deriving in the analytical part. The link represents what is the problem that the storyteller found. Regarding the contents of work, familiarity to the audience—a story of "something like you"—is effective in understanding, persuasiveness and empathy of the story's message.

INTRODUCTION

Digital Storytelling

In this chapter, digital storytelling means a short digital work that combines narration and visual-auditory material, such as photographs, music, and movies, produced by an individual as his or her own story[1]. The origin of digital storytelling was a kind of democratization movement of visual art on the West Coast of the United States in the 1970s–1980s. In the 1990s, the movement developed through the appearance of low-cost and easy-to-use equipment, such as personal computers, digital cameras, and the Internet. In 1994, the San Francisco Center for Digital Media was founded and developed into the Center for Digital Storytelling (CDS) in 1998 (Lambert, 2013). Although a virtual reality game in which players develop their own stories with a character is also called digital storytelling (Murray, 1998), this chapter addresses digital storytelling following the CDS's movement.

DOI: 10.4018/978-1-5225-3822-6.ch040

Lambert, one of the founders of the CDS, pointed out that digital storytelling has seven components: self-revelatory, personal or first person voice, scenes of a lived experiences of the storyteller, photos more than moving images, soundtracks, short-length (under five minutes) and simple designs, and the storyteller's ownership of the entire process and distribution (Lambert, 2013). As Lambert (2013) noted, the storyteller's private life need not always be revealed, but telling a storyteller's non-fiction expressed in the first person is recommended because it is the easiest way to deeply reflect himself or herself.

Regardless of whether or not a story is the storyteller's nonfiction, digital storytelling is oriented to be subjective, personal experience-based, emotional, sensory, and self-reflective in general. Through these aspects, digital storytelling contrasts with the ideal of logical scientific presentation in academic society.

Hartley and McWilliam (2009) added the definition of an element: that digital storytelling is a workshop-based practice called a story circle, although the workshop basis is an implicit premise from the beginning of the digital storytelling movement. In a story circle, participants not only learn how to create works but also communicate with each other during the process of developing stories. A story must be told to someone; thus, members of a story circle function as both author of their stories and hearers of other members' stories. In addition, if the workshop has a specific social theme, such as an environmental problem, digital storytelling can assist the social movement by sharing members' consciousness.

Digital storytelling has been applied to a variety of fields, not only visual arts but also a new style of media, education, therapy, and various social movements in public health care, social services, and others. Digital storytelling has spread not only in the United States but also in countries in Europe, Oceania, North America, Asia, Africa, and South America (Hartley & McWilliam, 2009). In Japan, where the workshop for this research was held, workshop-based practices by educational institutes and non-profit organizations have been observed since the 2000 (Nishioka, 2014).

Digital Storytelling in Business Situation

From the earliest time of the CDS, business use of digital storytelling has been positively attempted. For example, Coca-Cola adopted digital storytelling early in its brand marketing process. The company's brand story appeared on its website and recently has become more interactive with customers on social networking services (SNSs), such as Facebook. Because brand is an identity, a story can be told even for an agent who is not a human being.

The narrative approach did not result directly from the influence of the CDS but has expanded in social sciences from the 1980s and has broadly influenced businesses. A number of narrative approach practices have appeared, such as narrative planning, narrative marketing, storytelling for career development and storytelling in system development. Denning (2007) focused on leadership language; leaders must tell true stories about themselves, think through narratives, and understand the audience's story. Kusunoki (2010) advocated that an excellent corporate competitive strategy is a story. Future scenario planning (Schwartz, 1991; Van der Heijden, 1996; Wade, 2012) is also an example of narrative approach in business. In the early stage of the scenario planning process, one tends to place importance on logical analysis by identifying a focal issue, listing and classifying key factors and driving forces, and selecting scenario logic. In the latter process, the narrative approach becomes more pertinent as it fleshes out, interprets the scenarios and finds indications of the future (Schwartz, 1991). Scenario planning could be regarded as a hybrid version of the narrative approach and logical analysis.

Although a narrative approach in business is not always accompanied by the use of information technology, the usage of digital media is becoming increasingly prevalent these days. The narrative approaches in business have naturally changed to "digital" storytelling.

The focus of this paper is to understand application of digital storytelling to business planning. The differences in digital storytelling for business and non-business, such as art and therapy, are assumed as follows:

- There is a clearer aim of storytelling (i.e., business goal).
- Concrete business methods should be mentioned as conclusions at the end of the storytelling work.
- Evidences for business success are expected.

These traits develop a scientific attitude in storytellers. Thus, we expect that a hybrid style of the narrative and logical analysis would be observed in the digital storytelling for business planning.

Digital Storytelling as a Narrative

Clearly, digital storytelling is a form of a narrative. A narrative is an organized interpretation of a sequence of events. The function of a narrative is to bring order to disorder and to reflexively provide structure to our very sense of selfhood. The character of the story told depends on to whom the story is being told, the relationship between the narrator and the audience, and the broader social and cultural context (Murray, 2015). The narrative has the power to arouse the imagination, understand circumstances, facilitate communication with other entities, and rebuild the storyteller's own reality.

As compared to a simple narration or text, digital storytelling supposedly strengthens and expands the traits of a narrative. To summarize, the difference between "digital" storytelling and other types of "analogue" narratives, such as a simple narration or text, is assumed as follows:

- Digital storytelling strengthens the sensuous and emotional effect of a narrative in terms of visual images and auditory effects when compared to an analog narrative. The power of making sense of a confused real world might be enhanced using multi-sensory expressions.
- A digital format allows the storyteller to exhibit his reflection to other participants in the workshop. In the editorial process, the authors also tend to become reflective by hearing their own voices.
- Digital storytelling helps broaden social communication in digital form. The storyteller can reach out to a global audience and new narrative possibilities, which go beyond the constraints of time and location, may appear.

Objectives of This Chapter

The application of digital storytelling to business planning is assumed to be a hybrid version of the narrative approach and logical analysis, which strengthens the sensuous, emotional, reflective and communicative traits compared to an "analog" narrative. It becomes a curious case when one observes how the interaction of narrative and analytical approaches impacts the digital forms in business. This chapter aims to explore the potential of the narrative to create new value and synergy with the traditional analyti-

cal approach. This can be achieved by demonstrating a case study of applying digital storytelling to the early stage of business planning. The findings of this research will contribute to business administration because management literature has rarely been exposed to the synergistic effect of the narrative and analytical approaches.

BACKGROUND

Narrative Mode and Logical Scientific Mode

Bruner (1996) advocated that human beings have two modes of thinking: the logical scientific mode and the narrative mode. The logical scientific mode is used to explain something causally through a theory that elucidates necessary and/or sufficient conditions. It does not depend on the specific contextual setting. In contrast, the narrative mode is used to understand something through an interpretation process and depends on the specific context and history. A sequence of events is interpreted as having various meanings, and different people can interpret such a sequence in different ways (Bruner, 1996, 2003).

The criteria for the two modes of thinking are different. Logical scientific thinking should verify propositions using context-free logic and evidence. For narrative thinking, the interpretation should not only be rooted in factuality but also be better contextualized and rhetorically fair-minded, and there should be an awareness of the requirements of the narrative, such as a mutual understanding with the audience on how stories are developed and become realistic (Bruner, 1996, 2003). The narrative has a kind of logic regarding consistency and plausibility, but its criteria have very different qualities from that of the logical scientific mode.

In the 1980s, hermeneutics in the literature developed in a variety of social science fields, such as psychology (Murray, 2015). Although the "narrative turn" has appeared in academia in recent years, people in practice have perceived, thought, and communicated with others in the narrative mode from ancient times; the logical scientific mode is rather extraordinary.

However, the logical scientific mode broadly influences ordinary individuals through schools and academic society, whose formal mode is logical scientific. In business administration, although a very punctual logical scientific mode is rarely seen, as it is in academic society, semi-logical scientific thinking is broadly observed. Business administration presentations and reports have a form that is similar to that of academic presentations and papers, although the thoroughness of the literature review and the verification method is weaker than in academia. At least the business planning and assessment process typically require clear logic and some evidence.

On the one hand, a business plan must rigorously solve problems because of the variety of types of stakeholders and required resources, such as money, talent, and facilities. Typically, a business planner puzzles over a number of complicated problems, and the problem solving matches the logical scientific mode that develops propositions logically and verifies them systematically.

On the other hand, a business plan must point out problems that have not yet been solved. Essentially, the purpose of the narrative mode is to find problems (Bruner, 2003). Thus, it could be considered effective, particularly in the early business planning stage. The sensuous and emotional function of the narrative mode is also important to refine thoughts and communicate it to other people (Bower, 1981; Forgas, Bower, & Krantz, 1984). "… emotion powerfully influenced such cognitive processes as free associations, imaginative fantasies, social perceptions, and snap judgments about others' personalities

... when the feeling-tone of a narrative agreed with the reader's emotion, the salience and memorability of events in that narrative were increased (Bower, 1981, p.129).

Although the narrative mode and the logical scientific mode are fundamentally different, explaining and interpreting are linked (Bruner, 1996). Actually, even in a scientific style presentation, presenters frequently insert impressive episodes. The possibility is strong that digital storytelling for business planning includes both narrative and logical scientific modes.

Exploring a form of a link between the narrative and the logical scientific modes is a curious endeavor. When both narrative and logical scientific modes exist in a presentation, what is the structure of the work and how effective is it?

Structure of Narrative

The narrative in digital storytelling for business planning might have commonalities with folklore, the novel, and other stories. Bruner (1996) defined a (fictional or actual) story of an agent who acts to achieve a goal in a recognizable setting by the use of certain means. Although a number of variations exist, the sequence of events of a story always has a single pattern that begins with an explicit or implicit prorogue representing the ordinariness or legitimacy of its initial circumstances and the hinted evaluation of the end of the story. Next is the most important part: trouble. Trouble means a misfit among agents, acts, goals, settings, and means, and a violation of the initial legitimate expectancy. Then, the agent struggles to recover legitimacy. Finally, restitution of initial legitimacy or a revolutionary change in affairs with a new order of legitimacy is achieved.

Bruner (1996) referred the original concepts of the narratology literature such as Propp (1928). Comparing to the framework of Propp (1928), a prorogue that represents ordinariness corresponds to the initial situation before the functions of a story start. After symptoms of trouble occur, such as absence and interdiction, the main character encounters significant problems. In Propp (1928), the center of trouble is described as villainy or lack. Then, the main character attempts to solve the problem by, for example, departure and struggle. The solution sometimes comes from the power of donors' magical agents (tools). At the end of the story, legitimacy is recovered through, for example, victory, liquidation, or rescue, and revolutionary change comes through, for example, transfiguration, or wedding.

Propp's theory has elaborated on other refined theories such as Greimas (1970). The focus on the forms of narrative as well as its contents have led to the appearance of narrative discourse theories such as Genette (1972). This paper, however, adapts Brunner's theory in the psychology literature concerning the narrative approach based on the simplified framework of the narratology literature such as Propp (1928), and does not aim to conduct a deep analysis of the narrative's contents and structure.

Basically based on Bruner (1996), we suppose that the narrative side of digital storytelling for a business plan has the previously described four units, similar to other types of narratives. We call the four units an old situation (prorogue), obstruction (trouble), the solution (struggle), and a new situation (recovery or change). In our study, the core of the narrative may be considered a unit of obstruction because the workshop in this research was held during an early stage of business planning. Finding a problem is more important in the early stage of business planning than detailed problem solving, and an obstruction is a strong suggestion of where a problem occurs, in contrast to an old situation that represents ordinariness.

This research explores the influences of the structure and contents of digital storytelling on the audience's evaluation of business plans. In particular, we observed a qualitative link between the narrative and the logical scientific modes.

METHOD

Digital Storytelling Workshop

During April–July 2014, we held a workshop on business planning using digital storytelling that were instructed by an academic researcher and a business consultant at a Japanese university. Six graduate students participated. Two of them had experience in working with companies and had started a new business in their 40s and 50s. Four of the participants had no work experience and were in their 20s.

Ten sessions on digital storytelling lasting one and one-half hours were conducted. The workshop schedule was as follows:

Session 1: Three-minute speech on business plans with an image: What do I want to do and why do I do it?
Session 2: My personal history: How is my personal history related to my business plan?
Session 3: Presentation of storyboard and discussion.
Session 4: Digital storytelling technique and engaging in digital storytelling.
Session 5: Presentation of digital storytelling prototype and discussion.
Sessions 6–8: Engaging in digital storytelling.
Sessions 9–10: Presentation of final digital storytelling work and discussion in front of the audience.

All six participants completed the storytelling work up to session 8. Sessions 9 and 10 were held as an open meeting and six works were presented. Graduate students, staff, and outsiders interested in business planning using digital storytelling participated.

Data Collected

In the last session held on July 18, 2014, the completed six works were shown to 35 members of the audience and their positive and questionable responses were recorded during the presentation of each work by an audience response system. [2] At the end of each presentation, the audience filled out a questionnaire.

During July–October 2014, the same survey was conducted online. Through the Internet, respondents observed presentations of the digital storytelling works, and during the presentation of each work, their positive and questionable responses were recorded using the online audience response system. At the end of each presentation, they filled out the same questionnaire as the offline one. 39 responses were collected.

A total of 74 members of the offline and online audiences responded to the questionnaire. The audience was 53% male and 47% female, the average score of age was 30.5 years old, and 74% were graduate students and 26% were working. All the participants of the workshop have a basic knowledge of management through university education or through their experience of running a business. A few participants actually have the experience of starting a new business.

The composition of the questionnaire was as follows:

Questions regarding the work after each presentation:

1. Open-ended questions:
   a. Good or interesting points.
   b. Questionable points.
   c. Other points noticed.

2. Prefixed questions:
    a. Overall evaluation of the work (0–10 point scale).
    b. Attribute evaluation of the work.
    c. (1: Unlikely, 2: Rather unlikely, 3: Cannot say, 3: Rather likely, 5: Likely):
        i. I can well understand the contents of the business plan.
        ii. I can understand the business planner's vision and motivation.
        iii. I am interested in the business plan.
        iv. The business plan is persuasive.
        v. I have empathy with the business plan.
        vi. Visual expression is good.
        vii. Narration is good.
        viii. The description of the storyteller's personal experience is good.
        ix. I had a similar experience.
        x. The story is realistic.
        xi. The overall structure is well considered.
        xii. The business plan has a good point of view.
        xiii. The business plan is well considered.
        xiv. I would help if I could.
        xv. I would fund the plan if I were a venture capitalist.

Overall questions at the end of all presentations:

1. The difference between digital storytelling and the traditional presentation style.
2. Compared with the traditional presentation style, digital storytelling is…
3. (5: Effective, 4: Rather effective, 3: Cannot say, 2: Rather ineffective, 1: Ineffective):
    a. Understanding the contents of the business plan.
    b. Understanding the business planner's vision and motivation.
    c. Interest in the business plan.
    d. Persuasiveness of the business plan.
    e. Empathy with the business plan.
4. Open-end questions on overall comments.

The questions pertaining to the evaluation of attributes (1.b.ii.) were selected keeping in mind the types of cognition and behavior. The first type is reasonable, and the objective cognition is mainly affected by the logical scientific mode (No. 1, 11-13). The second type is sensuous, emotional, and its episode memory-related cognition is mainly affected by the narrative mode (No.5-10). The third type is affected by the mixture of both the modes and intention of the final behavior (No. 2-4, 14-15).

Method of Analysis

Participants of the workshop were instructed to tell a story about what they want to do and why they want do it that reflects their personal history. Instructions were given to keep the total time length to approximately 5 minutes. However, participants were not told the details of the contents and structure of the work. Thus, the contents and structure naturally appeared in the process of developing the work.

Although participants were not told, the work could be divided into two main parts: the narrative part and the analytical part. The researchers identified the parts and units of the works by focusing on the owners of the viewpoint of the story. The part of the story told from the viewpoint of a personal character, including that of the storyteller, was regarded as a narrative. The part of the story viewed and told objectively and scientifically, i.e., from a point of view of God, was regarded as analytical. All storytellers started from the narrative part and ended with the analytical part, except for the beginning of the work (see Figure 3).

The methodology of the analysis, first, is to identify the structure of the parts and units of the works by examining length of time, order, and position throughout the entire work. In addition, we observed qualitative aspects regarding the interaction of each unit.

Second, we observed the audience's response and evaluations that were collected in the workshop and online. The audience's evaluation was measured using data from the audience response system and the questionnaire described in the previous section.

Finally, we qualitatively estimated the influence of the structure and contents of each unit on the audience's evaluation. The first point of view was from the impact of the proportion of the time length of each unit on the evaluation. Second, we observed the contents of the narrative part and focused in particular on the influence of personal experiences in this part. The third point of view was the influence of other factors, such as the quality of the concept, the existence of objective evidence, visual expression, and narration.

STRUCTURE OF DIGITAL STORYTELLING WORKS

A summary of the digital storytelling works of the workshop participants is provided in Figure 1 and Figure 2. [3]

The structure of the digital storytelling works that the participants developed are indicated in Figure 3. In total, the storytellers' narrative part consumed 53% (average 185 seconds) of the total time and the analytical part consumed 47% (average 167 seconds) of the total time.

The narrative part consisted of four functional units: old situation, obstruction, solution, and new situation. The old situation unit took 51% of the time, the obstruction part took 30%, the solution unit took 14%, and the new situation unit took 4%. Four of the six works had no solution and no new situation unit.

The analytical part consisted of six functional units: factor, resource, evidence, element explanation, method, and expected result. The time length of the analytical part was 29% for the factor, 3% for resources, 11% for evidence, 11% for the element explanation, 43% for the method, and 3% for the expected result.

The participants were not provided instructions regarding the structure of their work during the workshop. Thus, the structure of the work, which is indicated in this section, could be considered as the outcome of the unconscious and spontaneous activities of the participants.

Structure of the Narrative Part

Two patterns to the composition of the narrative part appeared in the works. The first pattern (Works B, C, E, and F) was that the narrative part includes only the old situation and the obstruction units. In this pattern, the factor unit of the analytical part immediately follows the final obstruction unit of the episode and the solution is never indicated.

Figure 1. Summary of the digital storytelling works for business planning (Work A, B, C)

Work A	**Title: Japanese-style home delivery system in China** **Time Length:** 417 sec, **# of Screens:** 24, **Music:** yes, **Main Character:** Storyteller **Author:** 20s, student with no working experience
Narrative part	**Episode 1:** When I was a child in China, I was lonely because my parents lived overseas **(Ob).** One day, my parents gave me a Japanese manga **(So)** and my personality became cheerful, encouraged by Japanese animation **(New).** **Episode 2:** I came to Japan and encountered thoughtful Japanese services **(Old)**. I started a small business to export animation character models, but it failed because of the immaturity of the Chinese delivery service **(Ob)**. I found a solution for exports to China using the Japanese home delivery service **(So)**.
Analytical part	**F1:** New style of home delivery service in China **F2:** Customer-oriented service for special needs **E1:** Cases of service for golfers and refrigerated transportation service by Japanese home delivery company **F3:** Marketability of the delivery of fragile goods in Shanghai **E2:** Specific demands for animation character models and level of existing delivery service **M:** Standardization of packet, fee system according to size, human- oriented services, value-added services, staff education, expanding category of fragile goods **ER:** Delivery service that connects human relationships
	
Work B	**Title: Recycling system for university insiders** **Time Length:** 307 sec, **# of Screens:** 20, **Music:** yes, **Main Character:** Storyteller **Author:** 20s, student with no working experience
Narrative part	**Episode 1:** I moved recently. I wanted to exchange unnecessary and newly required goods and sought people with which to exchange them through SNS **(Old)**. I found an appropriate person, but we failed to exchange goods because of a change in the counterpart's situation **(Ob)**.
Analytical part	**F:** Trusted and easy-to-use recycling system **E:** Problems of existing services **M1:** Use of internal network and system of the university, closed membership only for students and staff of the university, expanding services to other universities **R:** Existing system of my university **M2:** Testing in my university and expanding to other universities **ER:** Service placing value on things and people
	
Work C	**Title: New style Japanese school for factory workers in China** **Time Length:** 396 sec, **# of Screens:** 14, **Music:** no, **Main Character:** Storyteller **Author:** 20s, student with no working experience
Narrative part	**Episode 1:** When I was a college student in China, I was depressed because I failed to enter the expected university **(Ob)**. However, I met an excellent and enthusiastic teacher who is handicapped, and I made up my mind to become a teacher **(So)**. **Episode 2:** I went to teach Japanese to Chinese factory workers as an intern **(Old)**, and I knew the factory workers faced difficulties learning **(Ob)**.
Analytical part	**M1:** Japanese school for factory workers of Japanese company in China **F:** Time-saving for busy workers, interactive and practical learning **M2:** Targeting specific industrial area in China where Japanese companies accumulate, small classes at night, practical teaching methods, motivation management, a close relationship with Japanese companies and universities
	

Narrative Part: Old situation = **Old**, Obstruction = **Ob,** Solution = **So**, New situation = **New**
Analytical Part: Factor = **F**, Resource = **R**, Evidence = **E**, Element Explanation =**EE**, Method = **M**, Expected Result =**ER**

Figure 2. Summary of the digital storytelling works for business planning (Work D, E, F)

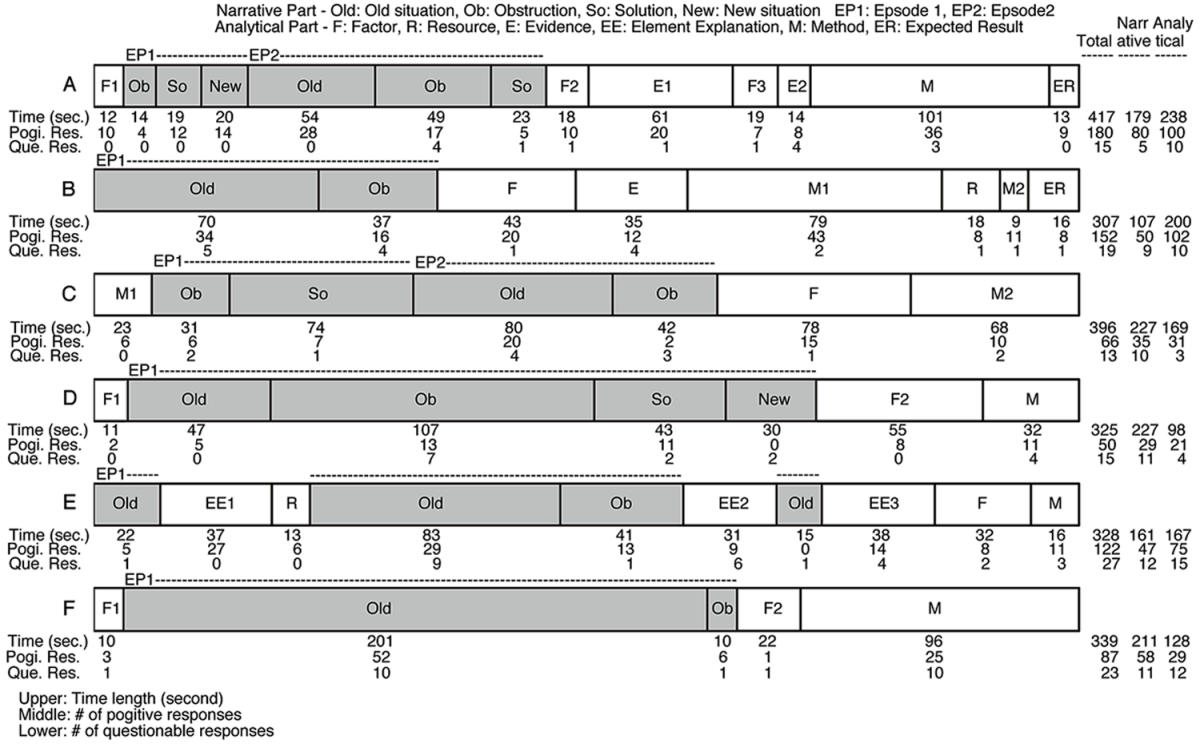
Work D	**Title: Consulting service supporting the service staff** **Time Length:** 325 sec, **# of Screens:** 9, **Music:** no, **Main Character:** Fictitious character **Author:** 50s, working
Narrative part	**Episode 1:** Tama (fictitious character) started a part-time job at a grocery store and loved the job **(Old)**. One day, a customer complained about the quality of the product. Tama apologized, but the customer said that she did not understand the problem. Tama was depressed and quit the job **(Ob)**. Later, Tama went to the store and knew that the customer wanted the store to investigate the cause of the accident **(So)**. Tama made up her mind to work at the store again **(New)**.
Analytical part	**F1 :** Support plan for service staff **F2:** Organizational support for staff, improvement of customer service skill **M:** Visualization and analysis of complaint, consulting to improve customer service skills and motivation of the staff
	
Work E	**Title: Promotion of chenpi, the specialty of a hometown** **Time Length:** 328 sec, **# of Screens:** 18, **Music:** no, **Main Character:** Storyteller **Author:** 20s, student with no working experience
Narrative part	**Episode 1:** I did not know the goodness of my hometown **(Old1)**. **Episode 1 (continue):** When I was a child, I did not love chenpi (a kind of herb), but I have good memories of eating chenpi with my family **(Old2)**. When I came to Japan to study, I was shocked that dishes tasted strange and noticed that chenpi was good for my health **(Ob)**. **Episode 1 (continue):** I also long for a memory of people in my hometown making chenpi **(Old3).**
Analytical part	**EE1:** Introduction and effects of chenpi **R:** The hometown is one of the largest producing districts for chenpi **EE2:** Production process of chenpi **EE3:** Application of chenpi **F:** Publicity for Japanese individuals to know about chenpi **M:** Exhibition of chenpi at the school festival
	
Work F	**Title: Networking between an illustrator and customers** **Time Length:** 339 sec, **# of Screens:** 12, **Music:** no, **Main Character:** Storyteller **Author:** 40s, working
Narrative part	**Episode 1:** I love to collaborate with and support my friends in business. I have a friend, an amateur illustrator who has been engaged in a number of volunteer activities **(Old)**. She is now thinking about working as a professional. I would like to support her **(Ob)**.
Analytical part	**F1:** Networking between an illustrator and customers **F2:** Networking of existing fans **M:** Communicating with fans on SNS, customer-made illustration service

Narrative Part: Old situation = **Old**, Obstruction = **Ob,** Solution = **So**, New situation = **New**
Analytical Part: Factor = **F**, Resource = **R**, Evidence = **E**, Element Explanation =**EE**, Method = **M**, Expected Result =**ER**

Work B starts from the old situation unit, "I moved recently, and wanted to exchange unnecessary goods," and then the character meets the obstruction, "I failed to exchange the goods because of the change in the counterpart's situation." The potential needs of a trusted and easy-to-use recycling system of the analytical part are indicated.

In episode 1 of Work C, the obstruction unit appears first, "I am depressed because I failed to enter the expected university," followed by the solution, "I met a handicapped teacher, and inspired by her, I made up my mind to become a teacher." As a consequence of episode 1, episode 2 starts from, "I went to teach Japanese to Chinese factory workers when I was an intern," as the old situation, and then the character encounters the obstruction, "I know that the workers faced learning difficulties," is indicated. Following the conclusion of the episodes, the success factors are indicated as analysis, that saves time for busy works, is interactive and facilitates practical learning.

Figure 3. Time length and number of responses of each work



Work E begins with the character's memory as the old situation, "I did not love the specialty of my hometown, chenpi (a kind of herb) when I was a child." Here the obstruction is, "I was shocked that the dishes tasted strange and noticed that chenpi was good for my health after leaving my hometown." The story is linked to the promotion of chenpi in the Japanese market in the analytical part.

Work F starts from the old situation, "I love to collaborate with my friends, and I have a friend, an amateur illustrator," implicitly indicates the obstruction by saying, "My friend is now thinking about working as a professional. I would like to support her." This episode has developed into an idea of networking between an illustrator and customers in the analytical part.

The second pattern of episode composition (Works A and D) was that the episode has a solution and, in one case, also indicates a new situation.

In Work A, the narrative part starts from the obstruction, "As a child, I was lonely in China," and a solution is presented, "My parents gave me a Japanese manga," and a new situation appears, "My personality became cheerful encouraged by Japanese animation." The new situation in episode 1 was connected to the old situation, "I came to Japan and encountered thoughtful Japanese services." In episode 2, the character again encounters an obstruction, "A small business of exporting animation character models, which I had started, failed because of the immaturity of the Chinese delivery service." This is followed by the solution, "I found a solution from Japanese home delivery service." This finding was linked to the key success factors for a new style of home delivery service in China in the analytical part.

Work D had one episode that starts from the old situation, "Tama (a fictitious character[4]) took up a part-time job at a grocery store and loved the job," followed by the obstruction, "One day, a customer

complained about the quality of the product. Tama apologized, but the customer said that she did not understand the problem. Tama was depressed and quit the job." The solution follows, "Later, Tama went to the store and came to know that the customer wanted the store to investigate the cause of the accident," and ends up in the new situation, "Tama made up her mind to work at the store again." (Figure 1 and 2)

Structure of the Analytical Part

The analytical part represented a very similar style of scientific presentation. The assumption of the key success factors for a business (the factor unit), the concrete methods to satisfy the key success factors (the method unit), the objective evidence for the supporting hypotheses (the evidence unit), the business planner's existing resources (the resource unit), the explanation of business element in detail (the element explanation unit), and the expected result from fulfilling the method (the expected result unit) were observed.

Only the factor and method units that commonly existed in all six works are considered essential for a business plan. In the factor unit, key success factors for a business derived include concepts related to the overall strategy and objective of a business, specialization, targeting of customers, important functions of the business, and important characteristics of a service. Examples of a concept related to the overall strategy and objective of a business include customer orientation, support for the service staff, and support for a friend.

Embodying the concepts of the factor unit drew concrete methods in detail, such as standardization of packet size, usage of closed networks, location of industrial accumulation in a Japanese company, visualization of complaints, exhibition in a school festival, and fans' SNS.

Element explanation units appear only in Work E because the storyteller had to explain the product, chenpi, that is not well known in the Japanese market. The resources that the storyteller (= business planner) already owns appear only in Works B and E. In Work B, the resource is the storyteller belonging to a university and having access to the university's internal network. In Work E, the resource is the storyteller's hometown being one of the largest producing districts of chenpi. In other works, clarification of business elements and resources tends to be weak.

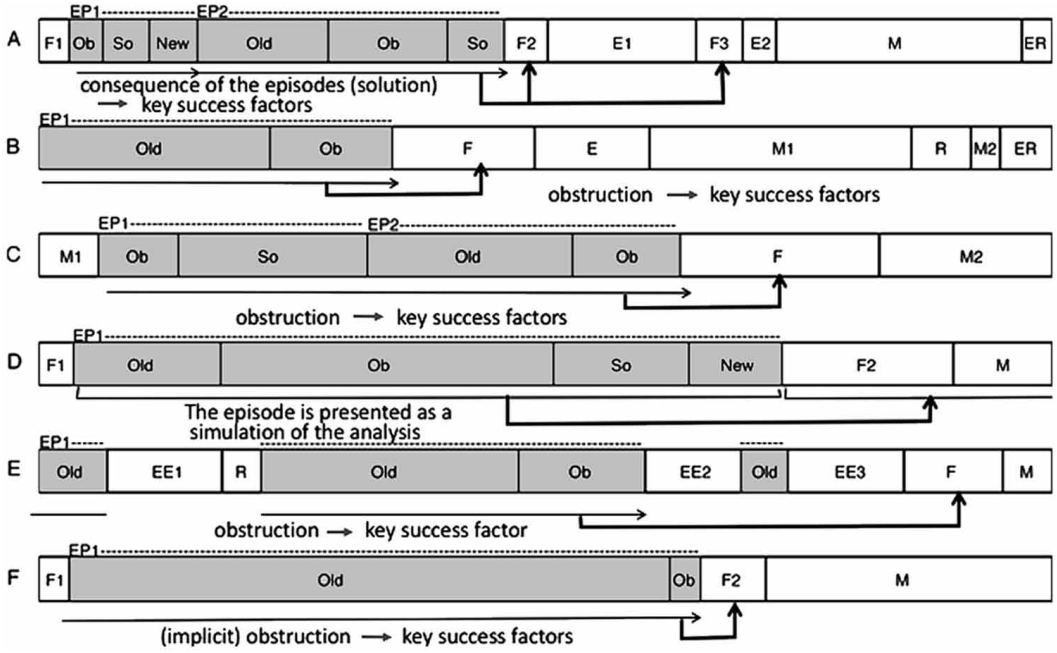
Notably, the evidence and the expected result appear only in Works A and B. The analytical part of Works A and B are said to be, relatively, a scientific presentation style, including theory (= clarifying factor), evidence, and forecast (= expected result). Objective evidence could be considered to reinforce the theory and the consistency with the narrative part in these works. (Figure 3)

Linkage between the Narrative and the Analytical Part

As mentioned in the section of the structure of the narrative part, we observed that the narrative parts of all works are connected to the logic of the analysis. The narrative part is not isolated from the analytical part in digital storytelling for business planning.

As seen in Figure 4, a typical pattern as observed in Work B, C, E, and F is that the storyteller starts the story to explain the old situation, and then the main character encounters the obstructive situation. The change from the old situation to the obstruction is a clue to derive the key success factors. In the pattern, which contains the solution or a new situation in the narrative part, the consequence of episodes

Figure 4. Linkage of the narrative part to the analytical part



of Work A suggests key success factors. In Work D, the narrative part was presented as if it were a simulation of the analytical part – the proposal of a consulting service, which will support the service staff.

Interestingly, these elements are viewed as similar to the narrative model of leaders' speech in Denning (2007): capture attention with a negative story (Obstruction) >> elicit desire with a positive story to achieve action (Solution) >> reinforce with reason as a neutral story to explain what, how, and why (Analytical part).

Both the logical and emotional linkages were observed between the narrative and the analytical parts. The narratives of all of the works contain an emotional expression. For example, Work A expresses loneliness in childhood and empathy with Japanese cultures, Work B expresses the emotion of avoiding wastefulness, Work C expresses respect for one's teacher and sympathy with learning enthusiasm of factory workers, Work D expresses the service staff's depression, Work E expresses the emotion of longing for one's hometown, and Work F expresses the love of supporting friends in business. These emotional expressions represent the motivations of the storyteller or promote the audience's empathy—although not always successful, as subsequently described.

EVALUATION OF EACH WORK

The audience provided an overall evaluation of each work, an attribute evaluation, and open-end comments using a questionnaire and real-time responses from the audience response system, as previously described.

Overall and Attribute Evaluation

As Figure 5 indicates, the overall evaluation rank is Works A, B, C, D, E, and F. Works A and B are in the top group and are significantly different from the other works. Work F was evaluated as the lowest among all works, followed by Work E. Works C and D were in the middle. Thus, we consider Works A and B to be in the top group, Works C and D to be in the middle group, and Work E and F to be in the lowest group.

In general, evaluation of the attributes was highly correlated with the overall evaluation (Figure 6).

Seeing the exceptional ranking of attribute evaluation compared to the ranking of overall evaluation, Work E in the lowest group received a relatively high evaluation for understanding the contents of a business plan, vision and motivation, description of personal experience, and point of view, but received a low rating in persuasiveness, similar experience with the audience, and overall structure. Although Work E has a good episode that communicates the storyteller's motivation, it is problematic to the entire structure, as subsequently described.

Work D received a relatively high evaluation in narration, but a low evaluation in the description of personal experience because the storyteller has narration experiences on the job and the main character in the narrative part is fictitious only in Work D.

Figure 3 indicates the number of real-time responses during each work presenting. The top group—Works A and B—received the most frequent positive responses. The lowest group, Works E and F, received the most frequent questionable responses. Real-time responses showed the same tendency as those of the overall rating from the questionnaire after the presentation.

Figure 5. Overall evaluation (N=74, 0-10 point)

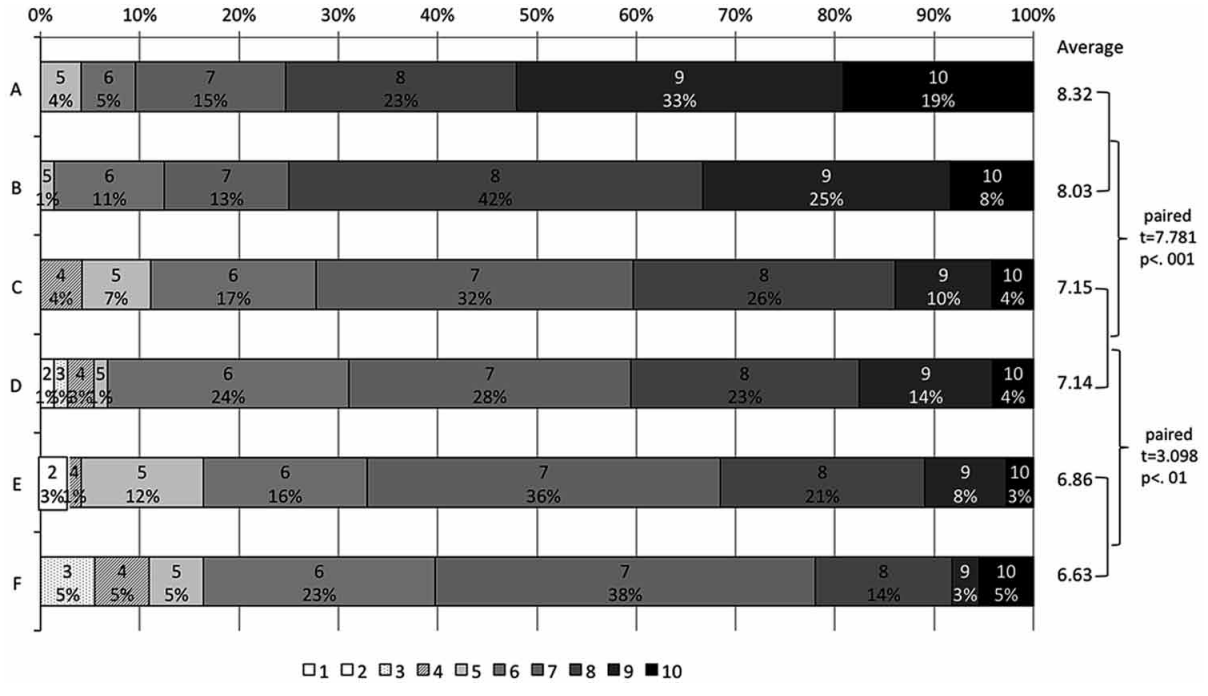


Figure 6. Average scores of attribute evaluation (N=74, 1-5 point) Real-Time Responses to Each Part of the Story

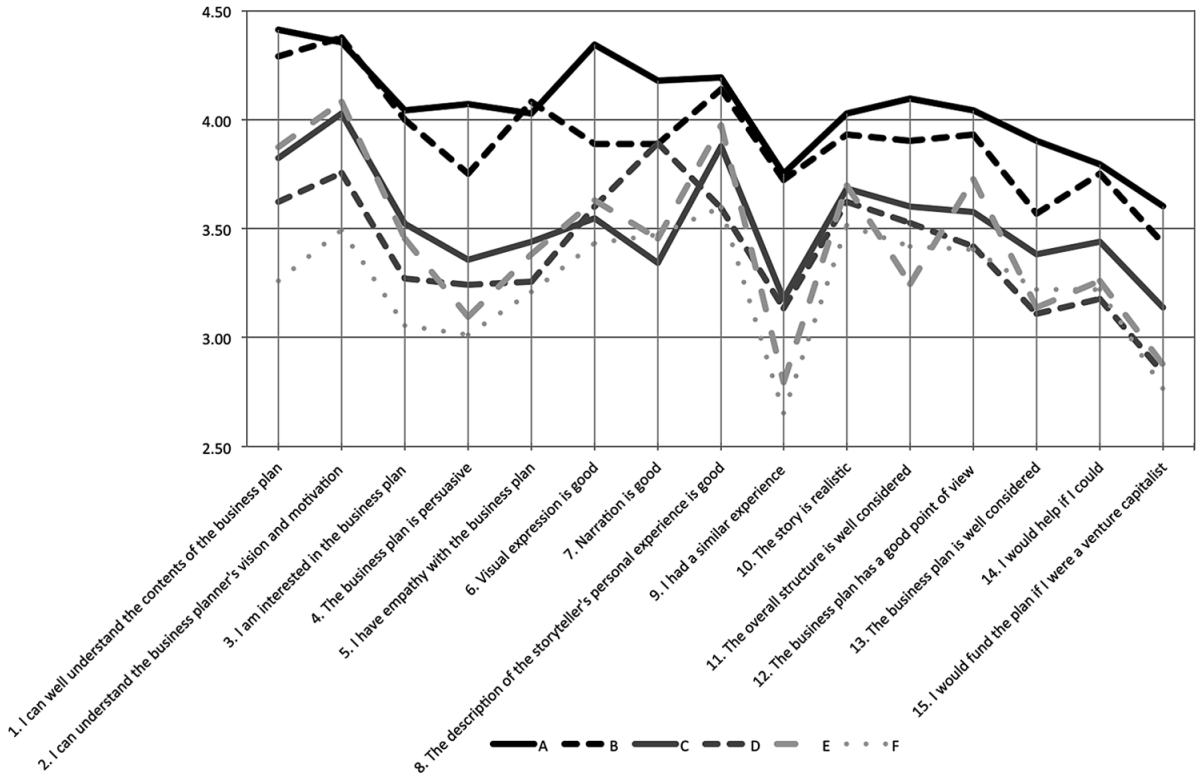

Open-Ended Comments

A total of 691 comments were gathered from the audience. The composition of categories is indicated in Table 1.

The comments tended to emphasize the rational side of the presentation, including the concepts of the key success factors for businesses, linkages with the episodes and evidence, explanation of business elements, the business method, and new points of view, over the emotional side, including sensory expression, simple empathy, and motivation. A total of 69% of all comments were on the rational side of the presentation. The strength of the rational side of the audiences' evaluation of the digital storytelling work is presumed to be a characteristic of the reaction to the business plan work compared with the work for other application fields, such as artistic expression and therapy.

Considering the characteristics of digital storytelling for a business plan compared with a scientific presentation for a business plan indicates that comments on linkage between episodes and key success factor concepts (12% of all comments) were very important. Interestingly, the positive comments (53 comments) on the linkage between episode and concept were very homogeneous; that is, 98% of the comments were similar to, "It is good because the business plan is drawn from the storyteller's personal experience/realistic story." (Most comments noted the "storyteller's personal experience"; however, for Work D, comments stated "realistic story" because the main character was not a storyteller but a fictitious character.)

Table 1. Open-ended comments

		Total
Positive/Negative	Base	691
	Positive comment	56%
	Negative comment	44%
Category	Concept of business plan	31%
	Business method	16%
	Linkage between episode and concept	12%
	Shortage of evidence and comparison	6%
	Explanation of element	2%
	New point of view	2%
	Sensory expression	18%
	Motivation	3%
	Sympathy	3%
	Overall impression	6%
	Others	1%
Composition of Large Categories		
Concept of Business Plan (Positive)	Base	**144**
	Mentioning about specific concepts	62%
	Concept is overall good	38%
Concept of Business Plan (Negative)	Base	**72**
	Concept is unclear/insufficient	100%
Business Method (Positive)	Base	**23**
	Mentioning about specific methods	83%
	Detailed/concrete description of method is good	17%
Business Method (Negative)	Base	**86**
	Mentioning about specific methods	41%
	Business method is unclear	37%
	Financial plan is not clear	20%
	Others	2%
Linkage between Episode and Concept (Positive)	Base	**53**
	Business plan is drawn from the storyteller's personal experience/realistic story	98%
	--> I also had a same/similar experience	(35%)
	Others	2%
Linkage between Episode and Concept (Negative)	Base	**30**
	Shortage/obscurity of linkage between episode and concept	100%

continued on following page

Table 1. Continued

		Total
Sensory Expression (Positive)	Base	**75**
	Photo, drawing	49%
	Narration	28%
	Music	12%
	Others	11%
Sensory Expression (Negative)	Base	**48**
	Photo, drawing	38%
	Narration	58%
	Music	4%

Furthermore, among the comments on drawing concepts from personal/realistic experience, 35% stated, "I also had a same/similar experience." The audience found such experiences not only plausible but also familiar. The plausibility and familiarity of the narrative part could become the foundation for the key success factors of business plans, although relatively more subjective than scientific evidence. This finding is critical in considering the function of a story when applied to businesses in general.

Negative comments about the linkage between episode and concept (30 comments) complained about the shortage or obscurity of the linkage (Table 1).

FACTORS THAT INFLUENCE THE EVALUATION

Influences of Structure on the Evaluation

The structure of the work is considered to influence the overall evaluation. An attribute evaluation of "Overall structure is well considered" of the top group is superior to that of the middle group (paired $t=4.727$, $p<0.001$, $df=70$), and the rating of the middle group was higher than that of the lowest group (paired $t=3.243$, $p<0.01$, $df=69$) (Figure 6).

As we have already seen in the section on the structure of digital storytelling works and a qualitative analysis of the audience's comments, the narrative part could become the foundation of deriving the key success factors. Typically, the contrast between the old situation and the obstruction units provides a clue to the reasoning for the factor unit in the analytical part.

A comparison among the proportion of the time length of the old situation unit, the obstruction units, and the factor unit of the top group for Work A is 33:38:30 (where the total time of these three parts is 100) and for Work B is 47:25:29. For the middle group, it is 35:32:34 for Work C and 21:49:30 for Work D. In the lowest group, it is 62:21:17 for Work D and is 86:4:9 for Work F (see also Figure 3.)

The proportion of the three units is almost equal in the top and middle groups, although the proportion between the old situation and the obstruction in the narrative part differs slightly for Works B and D. At least the proportion of the factor of the analytical part is typically at approximately 30% in these groups.

Apparently, the balance of these units is incorrect in the lowest group. Work E has a long old situation unit, obstruction is relatively short, and the factor unit is only 17%. Work F has a very long old situation unit that occupies 86%, the obstruction takes a very short time of 4%, and the factor is only 9%. Although identifying exactly the appropriate proportion of units is difficult, if only a long personal story and poor analysis exist, the audience may not find a connection between the story and the business plan.

Influences of Personal Episodes and the Feeling of "Something Like Me" on Evaluation

As was observed in the section on open-ended comments, 98% of the positive mentions on the linkage between episode and concept were "It is good because the business plan is drawn from the storyteller's personal experience/realistic story." Of these comments, 35% stated, "I also had a same/similar experience."

In the pre-fixed attribute evaluation, "The description of a storyteller's personal experience is good" was rated significantly higher in the top group than in other groups (paired $t=4.606$, $P<0.001$, $df=70$ between top and middle; paired $t=4.538$, $P<0.001$, $df=68$ between top and lowest). "The story has reality" had the same tendency (paired $t=3.692$, $P<0.001$, $df=70$ between top and middle; paired $t=4.393$, $P<0.001$, $df=68$ between top and lowest) (Figure 6). The number of comments that had the same meaning was larger in Work B (21 comments) and Work A (10 comments) than in other groups (average of five comments).

Regarding the attribute evaluation of "I have a similar experience," significant differences existed among the top, middle, and lowest groups (paired $t=5.253$, $P<0.001$, $df=70$ between top and middle; paired $t=4.666$, $P<0.001$, $df=69$ between middle and lowest). The ranking using the average score of this attribute was exactly the same as that of the overall evaluation: Works A, B, C, D, E, and F (Figure 5 and 6).

A relationship exists in which a higher evaluation of personal experience/reality results in a higher overall evaluation. The relationship is much stronger if the experience or realistic story is familiar to the audience. In another words, the feeling of "something like me" positively impacts on the audience.

The top group—Works A and B—well represents the storyteller's personal experience and reality of the story, and the audience perceived that they had a similar experience at the same time. Work C follows the top group in these aspects of evaluation. Regarding Work F, which had the lowest overall evaluation, the audience did not admire the representation of the storyteller's personal experience. Moreover, the reality and familiarity of the story also received a low evaluation, even though Work F presented a long emotional story. Work F's representation of the story was problematic (Figure 6).

Regarding Work D, although the attribute evaluation of personal experience was low because of a fictitious main character, the reality and familiarity of the story were the same as that of Work C, which followed the top group (Figure 6).

In contrast, Work E was rated at the same level as Work C for personal experience and reality, and received the lowest rating—similar to Work F—for familiarity to the audience (Figure 6). Although the storyteller's memory of his or her hometown is well described, the story was about a Chinese student. Therefore, a cultural gap may exist with a Japanese audience, which may have difficulty being empathetic.

These facts might imply that familiarity is more important to the audience than plausibility or reality. Thus, the episode need not necessarily be based on the storyteller's personal experience, but the degree to which the audience has a similar experience to the story is essential. For this reason, Denning (2007)

pointed out the story of the audience's problems, the story of who we are, and the common memory story as devices for effective leadership communication.

On the emotional side, plausibility might affect an audience's perception of storyteller motivation but it does not always improve the audience's empathy. Regarding attribute evaluation, in Work E, the storyteller's motivation and vision effectively describes the personal experience and was understood relatively well; however, familiarity, empathy and overall evaluation were low (Figure 5 and 6).

Influences of Concepts and Evidence on Evaluation

Regardless of the linkage with the narrative part, the quality of the concepts of a business plan is, naturally, essential. The largest share of open-ended comments was on the concept in general. The top group in the overall evaluation—Works A and B—received a larger number of positive comments on the quality of the concept. Moreover, the attribute evaluation of "The business plan has a good point of view" and "The business plan is well considered" was higher in the top group than in the other groups (Figure 6).

The excellence of the concept was considered the basis for the evaluation of the business plan; therefore, if the concept is of very poor quality, the overall evaluation will be low regardless of the quality of the narrative. However, in this research, the average attribute evaluation of the concept rated using these two questions ("a good point view" and "well considered") was higher than at the middle point of the measurement (3.0). The concepts of all of the works are good or average, enabling the narrative part to play the role of enhancing the foundation of the concept.

Regarding the foundation of the concept, only the top group also provided objective evidence in the analytical part. The evidence unit appears twice just after the factor unit in Work A and once in Work B (Figure 3). Objective evidence enhances the accompanying logic deriving factors, in addition to the linkage of the narrative part.

Influences of Visual and Auditory Expression on Evaluation

Visual and auditory expression techniques are also important for overall evaluations. The number of comments about the techniques of expression was the second largest, following comments on the concept (Table 1). The top group—Works A and B—tended to receive more positive comments than negative comments. The attribute evaluations of "Visual expression is good" and "Narration is good" of the top group were also rated higher than that of the other groups (Figure 6).

The top group used a larger number of screens of pictures compared with the lower group (Figure 1 and 2). As was noted in the section on open-ended comments, in general, the amount of visual expression was positively perceived.

The volume of the narration is important. The recording level of Works C, E, and F was problematic and numerous complaints were received for these works on the level of narration.

Regarding the quality of the narration, the narration of Work D was eminently frequent and some audiences said, "It is professional-like." Actually, the storyteller of Work D has experience with making public announcements for her job. The fluency of the narration tended to be evaluated in a positive manner; however, interestingly, some audiences perceived the narration as somewhat negative, with comments such as "The frequency is too high" The fact that too much frequency of the narration was negative at some point is related to the fact that a familiar experience for the audience affected the overall evaluation. A story told by a professional narrator may be perceived as less familiar than a story told by an amateur.

The impact of music is relatively less compared to the visuals and narration (Table 1). Overall, preference was given to the kind of music that provides a good atmosphere but does not disturb the narration.

DISCUSSION

Consistency and Balance of a Story

In the context of application to business planning, digital storytelling has two faces: the narrative and scientific logical analysis. The two faces are not separate, but have a mutual relationship. The works we researched started telling stories from an episode and ended at analysis. The function of the narrative part reinforces the analysis part both rationally and emotionally.

The rational side of the link between the narrative and analysis is that, first, a narrative points to the start of the business. In other words, the narrative represents the problem to solve. The inspiration for the initial concept of a business cannot be deducted from a theory or inducted from objective data. Finding problems is the most appropriate function of the narrative. It means that the business planners not only find problems, but also make other stakeholders understand where the problem lies – in consumer needs or unrevealed market potentials. In particular, obstruction plays a most critical role in finding problems. An incidence of trouble or the lack of something represents problems, and a number of entrepreneurs frequently start a business from an obstruction experience.

Second, a narrative provides rich explicit or implicit hints to derive key success factors, resources, business methods, and expected results. People can guess at the factors from a contrast between the old situation and obstruction, and by following the progress of the episode. Hints of resources are often implicitly indicated in the episode's background. In some cases, the main character gets new devices in an episode, which become hints of the business methods. The scenario is similar to folklore in which magical agents are given by a donor. The end of an episode(s) implies the expected result.

Problem solving and forecasts can be done through analysis; however, new alternatives from new points of view are difficult to find through strict analysis. The narrative is also good at finding new alternatives, similar to finding problems.

The narrative is also good at emotional representation. Although rationality tends to be more important than emotion in the context of business planning, the emotional side functions to enhance the entire consistency of the story.

The emotional side of the link is that, first, a narrative conveys a business planner's motivation and commitment to the business. The motivation and commitment of the entrepreneur are quite important for other people who may cooperate with him or her. A high possibility exists that the business will fail if the entrepreneur is not well motivated and committed.

Second, a part of the audience's empathy for the business plan can be brought from the empathy for the narrative. An audience's empathy is different from the storyteller's motivation. Even the audience sensing the business planner's motivation from the narrative does not always spur their empathy if the narrative is not empathetic enough, such as Work F.

Mixed links exist on both the rational and the emotional sides to form a bridge from the narrative to the analysis: problem finding, alternative finding, conveying the business planner's motivation, and spurring the audience's empathy. Regardless of the quality of the links, every unit should always be linked with other units to make the work effective for the audience. At least one path from one unit to another

unit is necessary. The comments show that audiences are very sensitive to how every unit is connected to other units. People do not like inconsistencies in the story (Bruner, 1996).

In addition, the entire structure of a work should be balanced. Too short length of important units, such as obstruction, factor, and method, and too large length of complimentary units, such as element explanation cause an imbalance in the logic of the story, and make the work ineffective.

Consistency[5] and balance of the narrative and analysis represent a kind of logic of digital storytelling for business planning. An audience mentioned the feeling of the logic as follows:

There is logic in the way of telling a story. When I listen to the story, I felt that my questions were answered one by one (comment for Work C).

Power of the Story of "Something Like You"

Another key point in making a narrative effective is familiarity of the episodes to the audience. If the audiences sense, "This story is something like me," the narrative makes the storyteller's message understandable and improves its persuasiveness and empathy. The story need not be exactly same as the audience's experience, and it is adequate if audiences find some essential commonality between episodes and their experience. Although episodes of the personal experiences of the storyteller are generally effective, it is a fact that "Me story" (Lambert, 2013) often has some essential commonality with other people. If the story is heterogeneous to the audience, even a storyteller's experience will not convey the message well.

Conveying the message is more difficult if audiences have divergent experiences. If the characteristics and background of the audience are homogeneous, the storyteller can prepare the story relatively easily. However, in reality, individuals' backgrounds are typically divergent, even if they belong to the same organization or environment.

An excellent presenter is skilled at telling a story that is "something like you," regardless of the audience. Such a presenter might understand the general and essential commonalities among human beings. If a person is skilled at telling a story that is "something like you," telling personal experiences and using the first person is not necessary. Creators such as novelists and filmmakers have made a number of works that enables readers or audiences to sense a commonality with themselves, even when using fictitious characters in a fictitious situation.

Digital storytelling is compatible with broad worldwide social networks. The broadening of the network increases the diversity of the audience and the corroborative team members. Finding commonality among individuals has increased in importance. An education system that teaches the development of a story that is "something like you" is needed, although teaching balance and a mix of links between the narrative and analysis is more difficult. These more general issues face digital storytelling in the era of worldwide networking.

FUTURE RESEARCH DIRECTIONS

This research is an explorative and qualitative study to find problems rather than to solve problems. A larger amount of data that is objectively measured, and a controlled research design, are necessary to verify the findings of this research.

Furthermore, this chapter does not address certain important points of view, such as the influences of digital storytelling on the storyteller and its influence on the concept of a business plan.

Digital storytelling is broadly known to change the storyteller (Hartley & McWilliam, 2009; Lambert, 2013). Rather, an important objective of digital storytelling is recognition of selfhood and a self-revolution, particularly in the application areas of therapy and education.

Reflection is the critical process of recognition and change of selfhood. Generally, a narrative reflexively provides structure to our very sense of selfhood (Murray, 2015). Seeing personal photographs and listening to the narrations of storytellers through digital storytelling may arouse richer images of selfhood and may induce reflection. Moreover, the workshop system of digital storytelling explicitly enhances the reflection process by enabling discussion with other participants. Observing the reflection process on how stories are developed by participants in the workshop provides clues to the influences of digital storytelling on the storyteller.

In addition, the narrative has the character to bring new points of view to people. Finding problems and alternatives, which was pointed out in this chapter, is the result of the function of expanding viewpoints, and some members of the audience mentioned new ideas for a business plan in the open-ended comments. The business plan itself may have changed because storytellers found new points of view during the process of developing stories. Changing an idea and its factors could be also clarified by observing the process of the workshop.

CONCLUSION

Digital storytelling for business planning has the unique trait of two different modes of perception, thinking, and communication at the different locations of the work: the narrative and the logical scientific. This chapter pointed out how the structure and contents of the work influence its effectiveness through examination of the works and the audience's evaluation of real-time responses, and prefixed and open-ended questions at the end of each presentation of work.

The consistency and the balance of the narrative and analytical parts were considered to relate to the audience's evaluation. The obstruction unit in the narrative part and the factor and the method units in the analytical part were critical for digital storytelling of business planning. The most important link was from a contrast between the initial situation and obstruction in the narrative part, to key success factors deriving in the analytical part, although all units need at least one connection with other units. Isolated units create a sense of inconsistency for audiences.

Regarding the contents of the narrative, if a narrative is familiar to the audience, and helps them relate to the narrative, i.e., "something like you," it is effective in understanding, persuading and creating an emotional effect on the audience.

The findings of this research show that a narrative creates new value in helping audiences relate to it, "something like you," and has a synergistic effect by creating logical and emotional links between a narrative and traditional analysis.

KEY TERMS AND DEFINITIONS

Analytical Part: A part of the digital storytelling that was told in the logical scientific mode. In this chapter, the researchers identified the analytical part on whether it was told objectively and scientifically, i.e., from a point of view of God.

Digital Storytelling: A short digital work that combines narration and visual-auditory material, such as photographs, music, and movies, produced by an individual as his or her own story.

Element Explanation Unit: A unit of the analytical part, in which an unfamiliar or a peculiar business element such as a product, a method, an environmental factor is explained in detail.

Evidence Unit: A unit of the analytical part, in which objective evidences for examining the hypotheses in the factor unit are indicated.

Expected Result Unit: A unit of the analytical part, in which the expected result from fulfilling the business method in the method unit is forecasted casually.

Factor Unit: A unit of the analytical part, in which the key success factors of the business are derived as the hypotheses objectively and analytically.

Logical Scientific Mode: A cognition style of human being to explain something causally advocated by Bruner (1996). Interpretation does not depend upon the specific contextual setting.

Method Unit: A unit of the analytical part, in which the business methods to satisfy the key success factors are proposed concretely.

Narrative Mode: A cognition style of human being to understand something through an interpretation process advocated by Bruner (1996). Interpretation depends upon the specific context and personal and/or communal history.

Narrative Part: A part of the digital storytelling that was told in the narrative mode. In this chapter, the researchers identified the narrative part on whether it was told from the viewpoint of a personal character (including the storyteller).

Narrative: A sequence of events told by people with oral communication, text, movie, comic, digital presentation, and other devices. A narrative is open to interpretation for the storyteller and the audience.

New Situation Unit: A scene(s) of the narrative part, in which a character finds a newly appeared situation after the problems were solved in the solution unit.

Obstruction Unit: A scene(s) of the narrative part, in which a character encounters a trouble or shortage of a critical thing.

Old Situation Unit: A scene(s) of the narrative part, which represents the initial or the ordinary situation before a character encounters an obstruction.

Resource Unit: A unit of the analytical part, in which the business planner's internal resources such as human network, existing facilities, and financial situation are presented.

Solution Unit: A scene(s) of the narrative part, in which a character struggles and solves problems that were found in the obstruction unit.

Story of "Something Like You": A story making audiences sense some essential commonality with their experience.

ENDNOTES

1 In this chapter, a "story" denotes a causal sequence of events directly related to a character who is seeking to solve a problem or to achieve a goal. This refers to the fourth definition of "story" of Prince (2003). Then, an "episode" is a series of mutually related events that have distinctive characteristic(s) (Prince, 2003). A story contains one or more episodes.

2 The audience response system used in the offline study was a "clicker" system, which is widely used for teaching assistance. The main function of the clicker is to aggregate the number of clicks by participants, in real time. The audience response system used in the online study was developed as part of the study, and is original. The system adds up the number of clicks in real time while the movie is shown online.

3 The narrative and analysis were determined by whether the point of view is that of the main character (subjective) or God's eye (objective). Events are divided by the appearance of a solution (and result) of an event. The analysis of the structure of a work is based on a discussion by researchers. Thus, a weakness of this study is that the analysis methodology is subjective. An objective methodology should be developed in future research. (The texts shown in Figures 1 and 2 were summarized by the researcher, owing to space restriction in this paper. However, the analyses was conducted on the original movies.)

4 In an interview with the author of Work D, she confirmed that the narrative part of the work is fictitious, based on her experience. In all other works, the authors stated that they were the main characters, and that the contents of the narratives were real-life accounts.

5 The effectiveness of a story does not always improve when the consistency of the story is high. Defamiliarization—a representation that causes feelings of strangeness or a lack of familiarity in the audience—is sometimes used in movies, plays, and novels (Kanai, 2005). Although there is no work that uses defamiliarization in this study, its existence and the mechanism of its effect in the context of business planning should be examined in future research.

Chapter 41
Reasoning Qualitatively about Handheld Multimedia Framework Quality Attributes

Daniel Hein
Garmin International, USA

Hossein Saiedian
The University of Kansas, USA

ABSTRACT

Today's mobile handheld devices, such as smartphones and action cameras, are well equipped for a wide range of multimedia and context-aware tasks. Such tasks can leverage traditional services like streaming audio and video as well as newer services like sensor fusion. Ubiquitous network access, coupled with an increasingly sophisticated mixture of device-based hardware and software, is enabling context-aware applications at an unprecedented rate. The objective of this chapter is to discuss specific quality attributes with respect to device-side software architectures providing these multimedia and sensor capabilities. This chapter focuses specifically on device-side client architectures rather than network or server architectures. Specific domain requirements and quality attributes are first derived through a synthesis of current research and industry trends, and subsequently analyzed. The analysis reveals some qualitative results that seem unintuitive at first glance but that become more understandable when provided with rationale relative to the handheld domain context.

INTRODUCTION

Today's non-tablet, mobile handheld devices (i.e., smartphones) are well equipped for a wide range of multimedia and context-aware tasks (e.g., augmented reality). Already, current wireless and cellular technologies like Wi-Fi (802.11), 4G LTE, and HSPA+ enable streaming audio and video content to a wide range of mobile devices (Choi, Choi, and Bahk, 2007). Applications such as audio or video streaming, video conferencing, video surveillance, and web browser applications are migrating from PC/notebook computers to their handheld counterparts (Kim and Nieh, 2006). In addition, the complex mesh of sen-

DOI: 10.4018/978-1-5225-3822-6.ch041

sors on many of today's smart phones, combined with mobile data, enable completely new applications such as augmented reality (Wagner, 2012). The wide availability of sensors such as barometric altitude, gyroscopic rotation, and GPS sensors also enable new context-aware applications and usage modes. With handheld computing devices outnumbering conventional desktop systems in much of the developed world (GSMA Intelligence, 2014), both manufacturers and developers would do well to consider the special limitations inherent in the handheld domain. By giving careful consideration to quality attributes and their corresponding impact within this domain, manufacturers and developers are more likely to develop applications that work intelligently to mitigate shortcomings imposed by small-screened devices with limited battery life. The objective of this chapter is to discuss architectural attributes of multimedia frameworks on client-side mobile devices such as mobile phones and other handheld computers.

Our goal is to consolidate handheld factors such as power and screen size limitations in order to stimulate deeper consideration during software specification and design, particularly with respect to multimedia and contextual computing frameworks. The following sections further explain the motivation behind this objective and provide an overview of the chapter's organization.

Currently, there is a lack of a standard approach to architectural evaluation for device side multimedia architectures in the handheld domain. This implies that handheld multimedia frameworks must be assessed more through trial and error than through a fitness assessment of some kind. Ultimately, this may lead to inflexible architectures that are difficult to modify later in the software's lifetime. Not only that, but these architectures and the software built on top of them may not adequately address the availability, testability, and performance needs of software operating in the handheld domain. This problem, and its more specific incarnations are addressed in the research and observations section.

Motivation

The motivation for addressing architectural issues on the device-side, or client side, is in reaction to steadily growing body of literature and research in server-side middleware, wireless network protocols, and network infrastructures. Many challenges must be overcome with regard to these network and server-side aspects of ubiquitous computing, but at the same time, the impact of these evolving technologies on client devices must not be overlooked. The motivation for discussing software quality attributes stems from the need for greater awareness of the impact of the multimedia software architecture on the device itself, and its development as a whole

Software architecture is of course essential to the success of the developing organization as it largely determines the success of the organization's software on many levels. Bass, Clements, and Kazman (2012, p. 25) enumerate more thirteen reasons why software architecture is important. Of those, we find the following reasons especially key:

1. An architecture will inhibit or enable a system's driving quality attributes,
2. The analysis of an architecture enables early prediction of a system's qualities,
3. A documented architecture enhances communication among stakeholders,
4. An architecture can be created as a transferrable, reusable model that forms the heart of a product line

We believe the architectural considerations discussed in this work will benefit developing organizations by providing a basis for reasoning about candidate multimedia architectures (i.e. facilitating com-

munication). Similarly, early design decisions can be made on a more informed basis if developers are better informed about the ways that early design decisions impact quality attributes of the final product. Additionally, we hope that this work may be a step towards a consensus about what factors need to be considered in this domain in order to derive standards on top of which future work may build (i.e. the transferable, reusable abstraction). For additional discussion, we encourage a reader to consult (Taylor, Medvidovic, and Dashofy, 2010).

Scope and Organization

The objective of this chapter is to provide a synthesis of the mobile handheld domain with respect to current and future mobile applications, and through this understanding, discuss quality attributes for architectural evaluation. To this end, the chapter is organized by first providing background on handheld computing, the role of multimedia, and handheld capability evolution. Note that by "handheld", we intend to report on devices easily held in one hand, and explicitly exclude notebook and tablet computers. Following the background section, the research and observations section identifies both essential runtime and non-runtime quality attributes to address needs identified in the background discussion. The research and observations section also discusses the interdependencies among quality attributes and their impact within this domain. Finally, the future research section provides suggestions for future work.

BACKGROUND

This section is provided to gain an understanding of the handheld domain. An understanding of the domain and its characteristics is essential to calling out architecturally significant requirements (Laine, 2001). Such requirements are needed to begin evaluation of a software architecture, or as in this work, to better understand quality attributes in the handheld context.

The following sections provide a synthesis of the mobile domain, multimedia capabilities in this domain, and speculation regarding future advances in this area. These sections are provided to show the forces that influence the architectural business cycle (Bass, et al., 2012). A key theme permeating this section is a practical look at the types of applications best suited to handheld mobile devices given their inherent constraints. Finally, some background information on quality attributes is presented.

Handheld Computing Trends

Handheld computing has evolved greatly in the last decade. A large shift in handheld capabilities has been enabled largely by lower hardware costs, and to a lesser degree, better power conservation techniques. In the late 90's, handheld Personal Digital Assistants, or PDAs, were growing in popularity in consumer markets but their sound and display capabilities were still quite limited. Typical displays were either a 4 shade grayscale or limited to 256 colors. Sound capabilities consisted of simple frequency/duration tones for making simple "beeps". Users of such devices used PDA functions primarily for personal information management, such as calendaring, contacts, memos, and task lists.

Over the last decade, PDA functions have been integrated almost entirely into mobile phones as personal information management (PIM) applications. Today, handheld computing capabilities in mobile phones approach their desktop counterparts, largely due to advances in hardware in terms of reduced

size and power consumption. Larger video memory capacities and LCD technologies have resulted in hand-held displays with high resolution, photo quality display capabilities. Today's displays are a mix of 16 and 24-bit per pixel, capable of simultaneously displaying between 64 thousand and 16 million colors. Display resolutions vary widely, but the upper end are well represented by iPhone and Android devices which are often increasingly full high definition, at 1920x1080 pixels, with pixel densities approaching 500 PPI. Sound capabilities have increased in parallel with these display advances. Handheld computers and mobile phones increasingly incorporate software and DSP hardware for playing CD-quality, stereo sound (44 KHz, 16 bit left and right channel samples).

We argue that while such advances now enable audio and video playback, the power and size constraints on handheld devices will continue to limit multimedia use on these devices. Notice that hardware technology will continue to advance making previous concerns like memory size and processor speed less of a limitation (in terms of multimedia capability) than in the past. However, power limits on the rate and duration that new processors can be clocked with respect to limited handheld power supplies will be less likely to change as rapidly. Likewise, the relatively standard and small size of handheld computer displays limits the types of applications users will desire to use in this environment.

Power Constraints

Conventional wireless phones are powered by a rechargeable battery that is recharged by periodically plugging the device into a "brick" or charger. Because these devices are mobile, battery life provided while away from the recharging brick is a key concern.

Although actual numbers vary from product to product, we'd like to see the battery life hold up for several days under typical use (Nemits, 2003). The idea of typical use is a bit vague, but most batteries cannot handle continuous drain for much longer than 4 hours (Nuccio Michaud and Gentile, 1997). Power consumption and battery life is therefore a major concern for overall handheld design and is also one area where intelligent software and efficient algorithms can make a big impact. For example, (Lin, et al., 2007) demonstrated that XviD codecs used less power than MPEG-4 and that it was more power efficient to increase bit rate than to increase resolution. Additional advances in near-threshold computing seek to dynamically reduce the power supply voltage near the threshold voltage of a device's transistors to extend battery life anywhere from 5 to 10 times that of current lifetimes (Dreslinski, et al., 2010). As we'll see later, this implies that our architecture must be flexible enough to leverage such power conservation discoveries.

While many handheld devices feature a fairly stout 2000-3200 mAh internal battery, increasing processor clock speeds and the addition of ASICs in the support of peripheral functions increase power demands. In fact, Weiser, in his 1993 paper on the challenges of ubiquitous computing gave the fundamental equation relating power consumption to processor clock speed as follows (Weiser, 1993, p. 78):

$$\text{Power} = C_L * Vdd^2 * f$$

where

- C_L is the gate capacitance;
- V_{dd} is the supply voltage; and
- f is the clock frequency.

Although as phone users, we may now have the capability to run multimedia applications on the device side, we may not actually want to do so for a very long period of time in order to conserve power. This might especially ring true if we are away from our recharging station for an extended period of time. Of course, this also depends on the multimedia applications themselves. For example, decoding an MPEG-4 video stream over a wireless network connection is likely to drain battery power very quickly. Not only do we have to run the processor (or dedicated decoding chip) for MPEG-4, but we also have to run our LCD, its backlight, audio amplification/filtering circuitry, and the RF circuitry for our wireless connection. On the other hand, listening to streaming audio on its own might be less taxing on the battery because our wireless connection could 1) run slower, and 2) we could turn the backlight off while still playing sound.

Size Constraints

The form factor for handheld computers is fairly fixed and is not likely to get much smaller. There is a point in size (about 10 cm x 18 cm) above which the device becomes too large to be conveniently portable and can no longer be considered a handheld; devices above this size are usually classified as tablet or notebook computers (Kärkkäinen and Laarni, 2002). Conversely, human usability factors for handheld devices limit how small such a device can get.

The last several years have witnessed the creation of tailored web experiences through dedicated "Mobile" sites where the Web browsing experience has been tailored to the display area limitations of smaller handheld devices. However, there is a point beneath which we cannot feasibly shrink the display area and still provide a good user experience (Polta, et al., 2012). In particular, form factors below 6 x 9 cm are not common for touch-screen based handheld computers. Smart phones and handheld computers typically become unusable below this point. Displays beneath this size threshold severely limit touch screen input ability; to compensate, such devices are commonly augmented with buttons. Additionally, when going below this size, traditional PIM applications, along with Web content become cumbersome to use because extensive scrolling is required to view all of the relevant information (Borodin, Mahmud, and Ramakrishnan, 2007).

Role of Multimedia on Handheld Computers

Different types of multimedia content meet different user needs. Until now, the term multimedia has been used rather loosely to mean audio, video, and web content. These different forms of multimedia can achieve different levels of usability on a handheld device (Kärkkäinen and Laarni, 2002). The following lists enumerate the role of audio, video, and web content (hypermedia) in a handheld environment.

Audio capabilities serve the following roles in a handheld environment:

1. Appointment notification through audible alarms and ringtones.
2. System sounds to augment the user interface.
3. Digital dictation, or voice recording capability for personal information management.
4. Streaming audio (locally or over a network) as a viable entertainment appliance.

Video capabilities serve the following roles in a handheld environment:

1. Still video capture or camera/snapshot functionality.
2. Dynamic video capture or digital video recording of short segments.
3. Video streaming for entertainment and information retrieval.
4. Sensor fusion for augmented reality.

Web content/connectivity in a handheld environment:

1. Retrieval/composition of email.
2. Limited information lookup (e.g. reading news, checking stocks, price comparison, etc).
3. Position indexed information retrieval for navigation and augmented reality.

Capability Evolution

Mobile phones are convergent devices, combining phone, PIM, camera, and myriad sensor functionality in a single unit. Combinations of these capabilities on a single platform have enabled a whole new breed of applications. For example, intelligence built on top of sensor fusion can enable new modes of operation, such as adapting power modes when sensing motion contexts: standing still, jogging, riding a chair lift, or sking downhill. Additionally, sensors combined with live camera feed enable augmented reality composites where virtual data are superimposed on real-world objects. For example, a motorist could locate engine components under the hood of their car by viewing a virtually annotated view of their engine compartment by looking at it with their phone.

Although online video and music streaming is commonplace on modern wireless networks, and many of the server side protocols already account for the wide variability in mobile device capabilities, performance is not always ideal. Presentation languages like HTML5 exist to automatically tailor information presentation ``on the fly'', but require the CSS handling and rendering capability equivalent to browsers on a desktop machine. It is the authors' opinion and experience that HTML5 seems impractical for applications such as 3D gaming where quick redraw and low latency responsiveness is required. Nevertheless, specialized silicon such as multi-core processors, DSP chips, and vector processors (e.g., NEON™ SIMD coprocessor) will continue to drive the need for new driver support.

Additional driver support will be required on the communications and compression front. The evolution of wireless communication technologies have resulted in increasing adoption of 4G LTE and HSPA+ in addition to a multitude of compression/decompression (CODEC) formats like MPEG-4 and H.264. All of these technologies must now be supported by handheld devices wishing to access streaming content over a wireless connection (Choi, Choi, and Bahk, 2007). The future will no doubt hold even more formats to be supported.

Quality Attributes

Quality attributes do not offer a hard and fast method for evaluating architectures, but provide a set of high-level objectives for the software as a whole. Quality attributes maybe used in conjunction with qualitative review techniques like the Software Architecture Analysis Method (SAAM), where stakeholders and system designers meet to discuss various software evolution scenarios and assess how the architecture would accommodate these scenarios. The quality goals drive the development of the various scenarios. Such techniques rate the architecture fitness against scenarios, and consequently, their underlying quality

attributes on a high, medium, low type of scale often indicated with a (+, 0, -). Note that SAAM does not constrain software evaluation to functionality or product requirements alone. Evaluation against quality attributes extends above and beyond functionality to encompass fitness for modifiability, availability, portability, etc. As stated by Bass et al. (2012), many "systems are frequently redesigned not because they are functionally deficient—the replacements are often functionally identical—but because they are difficult to maintain, port, or scale, or are too slow, or have been compromised by network hackers." Determining how these various quality attributes should be established is a delicate balancing act. No quality can be maximized without sacrificing some other quality or qualities'' (p. 63).

When considering quality attributes, we can focus on runtime quality attributes or non-runtime quality attributes. Runtime quality attributes represent those qualities observable at runtime operation of the software. Example qualities include, but are not limited to availability, performance, security, and usability. These attributes are likely to matter most to users of the software when actually using their mobile phone because these run time attributes largely dictate externally observable attributes (e.g. fast/slow, stable/unstable, easy to use/complicated). Conversely, we can choose to focus only on those attributes of the software mattering more to the development organization. The development organization is likely to be more concerned about the cost of developing and maintaining its software and is therefore more interested in non-runtime attributes such as reusability, portability, modifiability, integrability, and testability. Typically, it takes longer to recover value from the efforts spent on designing the architecture to achieve non-runtime quality attributes, but over time and through several product releases, the returns are often well worth the effort (Bosch, 2000).

RESEARCH AND OBSERVATIONS

This section builds on the preceding sections to callout architecturally significant requirements for a handheld multimedia architecture (Laine, 2001). Next, the general problem outlined in the introduction is probed in greater detail. Following the problem definition, the quality attributes role in the handheld domain is discussed. Finally we discuss considerations among run time and non-runtime attributes.

High Level Requirements

Change is inevitable and potential handheld applications for multimedia and sensor fusion differ significantly from desktop use. Software architectures in support of multimedia on the device side need to address these very important points. In order to begin evaluating the fitness of software architectures towards these ends, it is important to summarize high level software requirements that may be derived from the earlier discussion and that are likely to apply to a wide range of handheld devices. A few key, but very broad requirements are listed below:

- The multimedia and sensor fusion functions must be able to coordinate with power control functions on the device so that power consuming hardware resources and software services can be disabled when not needed. Architectural mechanisms must be in place to facilitate this communication.
- The architecture should have a well-defined plug-in interface for extending the device's repertoire of media formats. Encoding formats will change. New, more power efficient compression techniques will be developed (Lin, et. al., 2007). A maintainer of the multimedia software should be

able to `easily' add a new CODEC to the platform. Based on our development experience, `easily' would translate to 1-3 days, assuming the core algorithms are already proven on the target processor.

- There should be some type of abstraction for sources and sinks of data such that data access interfaces look universal to client player and recorder applications. Such interfaces would be capable of reading from/writing to a micro SD card, internal nand, RAM, or from/to a network connection albeit UDP, TCP, or other protocol. This implies an architectural portability layer. To what degree the OS already provides these services may change the emphasis given to both portability and security within the multimedia framework itself.
- There should be some type of priority negotiation scheme for making the best use of limited handheld resources for concurrently running multimedia applications. For example, a digital voice recorder application might require use of the same hardware currently being used for audio playback. The digital voice recorder should be able to issue requests to the multimedia framework such that the audio playback is suspended while the recording is created. After recording creation, the multimedia framework could restart the audio playback.
- The software must be reliable with high availability such that the user can access information on demand. Mobile phones are heavily used items. Users depend on these devices to function when needed. Designers must strive for both high availability and reliability. This final requirement, along with the previous one regarding priority negotiation, necessitate that the architecture must have well defined control over component interaction.
- The software must provide security. One element of security for a multimedia framework could be the secure online purchase of digital media (e.g. downloading a song or movie). Another element to consider is providing digital rights management DRM. Recording labels and content providers are increasingly demanding that devices provide protective controls enforcing distribution and copying policies established for digital media. Supporting DRM would be advantageous for maintaining interoperability and compatibility with content vendors.

With these high level requirements and their architectural implications in hand, we could start developing various solution architectures. However, there will be solutions that are more optimal than others, especially when consideration is given to the desired architectural attributes outlined above and the constraints outlined previously. There's no one-size-fits-all approach. In fact, the adoption of a, or constraints imposed by a turn-key solution could keep a vendor from providing benefits tailored to its specific market segment or niche area.

Specific Problems and Quality Attributes

As stated earlier, there is currently a lack of a standard approach to architectural evaluation for device side multimedia architectures. These architectures and the software built on top of them may not adequately address the availability, testability, and performance needs of software operating in the handheld domain. As implied through our earlier background discussion, failure to adequately address these needs could result in effects ranging from unnecessary power consumption to poor user experiences.

There are currently a number of more specific problems that result from the absence of some standard method of architectural comparison for multimedia frameworks in the handheld domain. The following constitutes a short list of key problems in this industry and their related architectural issues:

1. Currently, multimedia architectures used on handheld computers are increasingly ported from PC platforms. These often do not address the high availability concerns of the handheld environment; PC users are used to rebooting, but are likely to be less forgiving of unstable PDA or phone software.
2. The mobile industry as a whole is highly competitive and is characterized by very short development cycles. Handheld multimedia architectures should provide a highly testable, easily modifiable, and integrable base; a base on top of which further development may take place as needed to meet changing requirements driven by competition and technology advances.
3. Software memory footprint, software memory access patterns, and software structure has been shown to be important to power consumption on electronic computers in general. With the number of handheld computers growing, the energy consumption of these devices and their environmental impacts are becoming an increasing concern (Ravi, J., and Wullert, 2002). Proper architectural integrability would allow software components to be swapped in and out of a system as needed to tailor its memory footprint.
4. Current handheld device platforms are currently fragmented in their degree of multimedia support and services provided. Our discussion provides a step towards qualitatively evaluating ubiquitous device-side multimedia frameworks such as the Helix DNA, GStreamer, and OpenMAX (OMX).

Quality Attribute Analysis for Handhelds

This section compares and contrasts quality attributes considering their interrelationships. The discussion in this section builds on our previous characterization of the handheld domain. In particular, we first suggest that portability and usability are not key attributes weighing on a handheld multimedia *architecture*. Next, we cover security discussing its relevance. Finally, we end by discussing testability, integrability, modifiability, and reusability. Keep in mind that all of these attributes are important at some level, but this chapter is focusing on explicitly showing why some attributes are more important in the handheld domain as they relate specifically to multimedia frameworks:

- **Runtime:** Availability, Performance, Security, Usability.
- **Non-Runtime:** Testability, Integrability, Reusability, Modifiability, Portability
- **Runtime + Non-Runtime:** Availability, Testability, Integrability, Modifiability, Reusability, Security, Performance, Portability, and Usability.

We begin our analysis by focusing on items we don't feel are as relevant in an architectural sense, given the domain and pre-existing elements. The first of these is portability and usability.

Portability

It might be argued that portability should be a primary consideration due to the need to adapt to changing hardware. While this concern is valid, especially for organizations wishing to adopt a product line approach, not as much emphasis and attention is required in a multimedia architecture as the other attributes. There are two reasons for this. First, portability is one of the more mainstream aspects already addressed by handheld operating systems and newer operating systems in general. Android, for example, supports OpenMAX Development Layer which provides a common API for processor abstraction. Most modern operating systems, handheld or otherwise, have a hardware abstraction layer (HAL), kernel, or board

support package (BSP). This means that the multimedia architect is freed from many portability concerns and can instead build on available operating system hardware abstractions. Secondly, due to rapidly advancing hardware technologies, considerable work will have to be performed for each different display or audio controller. In other words, we don't spend effort designing portable device drivers when we'll be likely to design them from scratch as the silicon changes. Depending on the operating system's level of support for multimedia, satisfying portability becomes more about the cross-compilation portability of the implementation language than an architectural consideration. Likewise, usability is not a key focus because the usability of the device is less impacted by the architecture than are other quality attributes.

Usability

Although a successful handheld must be very usable, as a device lending itself to quick entry and retrieval of information on the go, this quality is less of an architectural concern than it is a design and implementation concern. Making a system's user interface simple, efficient, and easy to use requires the correct application of interaction and communication protocols. With regard to architecture, communication paths must exist such that user-level applications can retrieve and display information for the user and so that user commands get to the correct destination. As an example, a multimedia architecture evaluated against usability would give a higher usability mark if the architecture provided communication paths affording user-level applications control over low-level hardware settings for audio/video playback. However, using this same example, the device vendor may pre-establish such hardware settings for ``optimum'' quality, obviating the need for direct user control.

Security

Increasingly, the market is considering security as an extremely important quality attribute, especially for enterprise-wide mobile applications. The attention given to security (in an architectural context) may move up or down depending on stakeholder objectives and business motivation. As mentioned earlier, a key motivation for security may be to protect the customer and content vendor during an online transaction (such as a song download). Another objective may be to provide an interface for applying security patches and updates. Providing customer protection in online transactions is simply standard practice in the industry. Providing an interface, or ``auto-update'' for applying security patches is also widespread. When boiled down to their driving motivations, both customer protection and auto-update functionality are most likely motivated by competitive pressure (we do it because our competitor does it). If the developing organization does not provide these security features, they are likely to lose customers to their competitor.

Architecturally speaking, security for multimedia purposes should allow us to integrate new "security-conscious" protocols and data encoding/decoding schemes into our platform. Additionally, we should consider applying classic security policies/notions such as least-privilege and defense-in-depth into our software design. Security considerations are likely to impact internal communication pathways in that those pathways need to be capable of passing around user credentials and/or handling privileges and permissions. Additionally, appropriate communication mechanisms must be in place to coordinate with security services in the OS, especially as they relate to encrypting sources and sinks of streaming multimedia data. Finally, we must design our error handling architecture such that we don't go into an unsecure state when handling errors.

Security is often in direct conflict with usability and performance in non-architectural areas of design and implementation. For example, security typically conflicts with usability because it requires extra steps for the user, often entailing password entry. Password entry can be quite difficult on a handheld computer given the limited input methods. Passwords can be cached, but overall security is reduced because the password is kept around. These concerns are not architectural in nature since usability and security can often be balanced through intelligent UI design and compromises in the level of security required. However, security and performance may be architectural in nature.

Security considerations in the architecture are likely to lead to additional layering and compartmentalization to reduce internal exposure to external threats. Additional layering and added security-based operations are likely to add overhead to when compared to a less-secure, more efficient design.

Hopefully, the reader now understands the rationale behind the lower weight given to the portability and usability, as well as some key security considerations. We now turn our attention to performance.

Performance

Performance, as classified here, is concerned with runtime efficiency. Performance can be thought of as responsiveness of the system to some stimuli, or as the number of transactions processed over some time quantum. Performance is directly and significantly impacted by the architecture since communication in computing systems often takes longer than computation. Since the choice of architecture dictates the number and type of communication interfaces among components it is clear that a poorly designed architecture with extraneous communication mechanisms could easily lead to a very inefficient system (Bass et al., 2012).

Although the performance attribute is critical to the operation of a handheld device, especially one with limited resources, it is less of a concern than the other quality attributes with which it is in direct conflict which is pretty much every other quality attribute listed. Attributes like security, integrability, modifiability, and reusability for example, all require extra communication paths to allow components to be broken away from the framework as their own independent entities. In the handheld multimedia domain, performance is a mid-level priority because it costs less in terms of the hardware than the software needed to drive that hardware (Boehm, 1987). Qualities like security, availability, and testability become more important, especially when one considers delivering reliable software with support for convergent features, in the very short time-to-market that spurs on the mobile industry (Bosch, 2000). Meeting non-runtime attributes like integrability and testability help to ensure that an adequately tested and highly available product is delivered to the market within the allotted time. Greater emphasis on modifiability and reusability means that less development effort is likely to be required for future products.

Note however, that we don't just throw consideration for performance out the window altogether. As stated, much of the rationale for its priority placement comes from development cost and time to market pressures. However, at the end of the day, a handheld vendor still needs to produce a working device and within a multimedia framework, this means meeting real-time deadlines for performing audio or video frame decodes while conserving as much power as possible, or at least degrading gracefully when these deadlines cannot be met. The power concerns are largely implementation related and concern algorithms used along with overall processor use (Issarny, et al., 2000). On the other hand, meeting real-time deadlines means that hot-spots for performance optimization have been identified and isolated within the architecture and that communication to and from these hot-spots are optimized

Integrability, Modifiability, and Reusability

Integrability, modifiability, and reusability all reinforce each other in similar ways since they all require a clear separation of concerns, well-defined interfaces for communication, as well as identification and isolation of points of change and variability. Therefore, since we've already established the validity for choosing these attributes over performance, we lump them all together. As mentioned before, because hardware is less expensive than the cost of developing software, we would like to capitalize on efforts already put toward developing a multimedia framework by making sure it is reusable in other devices. In addition, due to the rapid development cycles and competitive pressures facing PDA vendors, it is advantageous to make sure that the software is easily modifiable, allowing features to be added or removed in order to tailor various products to different target markets and development budgets (Bosh, 2000). Again, due to the rapid development cycles and large changes likely to take place during product development, the software must be highly integrable, such that the entire system is not disrupted by the addition of a new component (perhaps offering a product differentiating feature).

A multimedia framework maximizing integrability, modifiability, and testability attributes would allow agile software development processes like extreme programming to be used. Using such software development practices could greatly aid the speed of development. For example, clearly specified extension and integration points would help with extreme programming regression testing and refactoring practices.

Testability

Testability also aids with the ultimate attribute of availability. Testability helps ensure that the product is able to be adequately tested at its various levels through execution based testing. In addition, testability greatly aids incremental development as mentioned above. Testability is often complementary, either reinforcing, or being reinforced by, integrability, modularity, and reusability.

Availability

Finally, we are ready to describe the importance of availability. This quality attribute is based on the type of device that we are working with. It is not acceptable for a PDA to suffer from the same availability problems that have plagued PC users for years. A PDA is first and foremost a personal information device. In the case of a mobile phone, the device is first and foremost a communication device. These devices need to be accessed when needed and provide requested information or record information without fail. The added multimedia capabilities must not adversely affect the availability and reliability of the handheld device with respect to its primary purpose. Furthermore, given the inherent expectation for these devices, the multimedia framework must be robust and cleanly isolate control paths so that availability can be reasoned about at design time in order to "prove" and reason about system availability. Furthermore, extending computing ubiquity requires highly available components in order to provide a solid basis for experimentation and adaptability.

Due to the physical and power limitations of typical handheld computers, it is not feasible to provide redundant components, either hardware or software to assure availability. However, availability can be achieved through careful attention to error reporting and handling. Such attention requires that the interaction patterns among components be clearly defined and appropriately constrained. Constraining interaction patterns in this way, while tending to help security, may conflict with most directly with

modifiability, preventing the degrees of freedom in which the software can be extended. Interestingly, this implies that object-oriented development and deployment of multimedia frameworks will probably require special attention since object interaction/communication patterns are often very unconstrained and free-form (Laine, 2001).

FUTURE RESEARCH DIRECTIONS

This work has presented general ideas for architectural multimedia analysis in the handheld domain, but it is still largely qualitative. More work remains to be done in this area, as in the area of software architecture as a whole, in order to establish more quantifiable measures between specific architectural unit operations, design patterns, and quality attributes being emphasized (Shaw, 2001). This work has hopefully brought this specific domain closer to this goal by providing a more detailed context for quality attribute consideration within the handheld domain. Two more specific and interesting avenues for further research include the following:

1. Establishing a ubiquitous, platform independent, device side multimedia framework. OpenMAX currently seems like an ideal candidate. Our analysis could be used to guide modifications to the core framework such that it could be ideally tailored to the handheld environment. Appropriate modularization concerns would be important in providing various levels of multimedia capabilities commensurate with host device hardware.
2. Quantifying architectural impact on the ability to configure multimedia systems to reduce power consumption. The key work here would be to experimentally derive power savings and/or tradeoffs against architectural patterns at runtime. For example, does the communication overhead, or spatial memory accesses inherent in various patterns add significantly to the power consumed by the device over time? What abilities do these patterns allow us in terms of reducing the size of our software and our corresponding memory footprint? How does the runtime power savings of different patterns compare with power savings realized by reduced memory footprints? Again, our analysis can be used here to initially narrow the field of study to patterns only applicable to handheld devices.

CONCLUSION

This chapter has discussed an architecture centered quality attribute analysis for device-side software Qualitative arguments used in our analysis included intended use, domain constraints, and the needs of developing organizations operating within a market environment characterized by rapid change. Through our analysis, we highlighted several quality attributes that are often at odds with each other as the architect attempts to balance them in the overall software architecture. It is therefore important to have a qualitative understanding of the domain and the needs of the developing organization. For example, performance was discussed in contrast to many other architectural attributes such as integrability, modifiability, and reusability. As discussed earlier, it might seem counterintuitive to give performance second-hand consideration to testability, integrability, modifiability, and reusability. Only when one understands the factors affecting the bottom line, can one begin to understand the rationale. In the

mobile domain, such factors include time-to market pressures and the drive for added features. Such factors motivate an architecture that is more easily testable, integrable, reusable, and modifiable than it is efficient. Performance can often be improved via faster hardware. The other attributes cannot be improved in a similar manner, purchased after the fact. Finally, such hardware improvements can often be purchased more economically than incurring costs associated with maintaining software based on a poorly testable, reusable, modifiable architecture.

KEY TERMS AND DEFINITIONS

Domain Engineering: Engineering systems intelligently based on intended use, incorporating considerations and constraints from the deployment environment.

Handheld Computing: Computation domain concerned with small portable devices, encompassing both mobile phones and personal digital assistants.

Middleware: Software often containing control and business logic residing below the user interface, but above the interfaces provided by the operating system in a layered architecture.

PIM: Personal information management; a class of handheld computing applications used for managing personal information such as calendar/datebook, memo, and contacts.

Requirements Engineering: Process of collecting and analyzing (often conflicting) requirements in order to define a product and to facilitate its evaluation.

Software Architecture: Organization of components and component inter-connections in a larger software product.

Software Quality Attributes: Various attributes of a software product that may refer to qualities observable by an end user (e.g., reliability) as well as developers (e.g. maintainability).

Chapter 42
QoS Routing for Multimedia Communication over Wireless Mobile Ad Hoc Networks: A Survey

Dimitris N. Kanellopoulos
University of Patras, Greece

ABSTRACT

A lot of intensive research has been carried out in the direction of providing multimedia communication over wireless mobile ad hoc network (MANET). In MANET, various QoS problems exist such as inefficient routing, handling node mobility, power conservation, limited processing capabilities of network devices, high error rates. Wireless routing introduces new challenges as applying basic routing algorithms directly on MANET could lead to large power consumption, interference, and load-balancing problems. Many routing algorithms have been proposed as extensions to the basic routing algorithms to enhance their performance in MANETs. This paper summarizes existing solutions on QoS routing and resource reservation mechanisms in order to provide multimedia communication over MANET. It also considers the limitations of existing QoS models with regard to satisfying QoS in serving multimedia over MANET. The newest QoS architectures give much better results in providing QoS support. However, more refinements must be proposed in order to enhance further their performance in MANETs.

INTRODUCTION

Delivering multimedia data over wireless MANETs has its own application domain, and also has its own challenges (Loo et al., 2012). Wireless MANET is a prominent solution in diverse emergency situations that require rescue operations, when disasters have destroyed the network infrastructure. There is no need to deploy any infrastructure to make MANET nodes to communicate with each other. The IEEE 802.11 wireless LAN can be implemented without any infrastructure or central controller (Crow et al., 1997). In ad hoc mode, all nodes participate in both data processing and routing task. The network also

DOI: 10.4018/978-1-5225-3822-6.ch042

relies on the multi-hop type of routing for their data transmission. The concept of wireless MANET can give a new bloom to the multimedia industry because in MANETs we can provide the same without deploying any additional infrastructure. So, such networks can work in collaboration rendering services either without paying anything or paying a tiny share of revenue charged. In addition, we can define Quality of Service (QoS) models that will be used to provide the desired QoS efficiently (Nyambo et al., 2014). Existing high-speed networking and effective compression techniques utilize available bandwidth to serve a large number of connections, resulting in various multimedia applications. Basically, three types of multimedia services have been developed: accessing stored data, accessing live data, and accessing interactive data.

The diverse nature of networked multimedia applications causes various problems because each application has its own requirements (Rao et al., 2002). An application might demand better quality data and can tolerate some acceptable amount of delay, while another application may be more sensitive to delay by compromising the quality of data. Every data flow of packets from a source to a destination in the network needs certain and prerequisite resources in order desired QoS to each individual flow to be provided. Obviously, the transfer of continuous media data (e.g. video and audio) need much more bandwidth than the transfer of discrete media (i.e. text or images–i.e. lightweight data). Also, a decision must be made in order to allocate proper bandwidth to each flow available in the network. For example, Vaidya et al. (2005) have proposed a distributed fair scheduling scheme that ensures that all packets will get a proper bandwidth of the wireless channel.

Multimedia applications can be categorized as per their delay requirements (Rao et al., 2002). Non real-time applications (e.g. image transfer) have no delay requirements, while real-time applications have delay requirements, and can be classified into hard real-time and soft real-time applications. Hard real-time application has very strict delay requirements and failure in satisfying them might result in hazardous side effect. It includes various applications like nuclear-reactor control system, missile control system etc. Soft real-time application has some delay requirements, but that are somewhat less strict than hard real-time application, where failure in satisfying the delay requirements would not result in any hazardous side effects. Examples of soft real-time applications are video-conferencing and video on demand. There is also an extra categorization. Non-interactive applications (e.g. video-on-demand) do not need any type of feedback from the receiver in order to continue application function. There is only the requirement of handling one-way traffic. On the contrary, interactive applications (e.g. gaming and video streaming) require some kind of feedback or commands from the receiver, so that application can proceed further. An interactive application requires two-way traffic, each of which is very much delay sensitive. In interactive applications, one single path may lead to network congestion ultimately affecting the overall network throughput and especially QoS (Rao et al., 2002).

In audio/video transfer, user may either download it or may allow for streaming. Audio/video streaming is preferable as it eliminates the end-to-end delay for user. However, streaming is more difficult to handle than simply downloading the contents, and the QoS may differ with the change of application raising to more difficult challenges. Different types of standards and techniques to successfully transmit multimedia over networks constitute the basic issues related to multimedia transmission. These research issues cannot be ignored, as they can also occur in wireless multi-hop networks. In addition, the wireless medium is very often influenced by the physical obstacles like noise, shadowing, interference and multipath fading. During the transmission of text/images, these problems are insignificant, but for the audio/video transfer, these should be addressed properly. Actually, audio/video transfer demand better control over the end-to-end delay and minimum jitter (i.e. variation in delay). Moreover, if video or audio is

live, these requirements are much more delay sensitive and should be handled strictly. Depending upon the type of access i.e. whether it is a point-to-point or multicast or even broadcast, the issues vary. For point-to-point communication, the network can provide better bandwidth to both end-points. However, in multicasting mode multiple nodes compete for the same wireless channel, resulting in interference. Broadcasting makes it worst, where every node is trying to get access to medium, which finally increases the interference levels of signal. The IEEE 802.11 uses distributed coordination function (DCF) as the basic medium access control (MAC) protocol or optionally it uses point coordination function (PCF). DCF makes use of the carrier sense multiple access with collision avoidance (CSMA/CA) scheme as a mechanism to deal with collision, and it increases the medium access delay in proportion to the load on the network (Wu et al., 2002). PCF uses a polling technique that aims towards providing the contention-free services.

Providing multimedia services over wireless MANET has many challenges:

- Wireless MANET devices have small size for supporting mobility. This imposes them to work with limited CPU processing capabilities, limited battery life, limited bandwidth support, limited storage etc.;
- It is not an easy task to handle multimedia. New difficulties arise, as we have diverse set of coding and decoding techniques for audio and video, different resolutions of images, and higher data rate demands for video transmission. Also, we have the stringent delay requirement of real-time audio/video transmission or even more reliable and secure transmission demands of security applications (Lian et al., 2009);
- The wireless links make it more complex due to higher error rate, fading, interference of signals etc.;
- Last but not least, the dynamic nature of wireless MANETs makes routing more difficult because of the frequent route change/route break leading to loss of connectivity. New challenges for multimedia transmission are imposed as the mobility of nodes (making frequent route breaks) adds an extra overhead. The routes have to be updated frequently. This situation even becomes worst in live streaming. If a node moves suddenly, then a few packets might take route having 'dead ends' and as the transmission is real-time, the time till which it will be detected and corrected using retransmission, the deadline would have been crossed already. This ultimately affecting the overall performance. Once more, after getting new route, the receiver might get out of order packets. In live streaming, it is just useless to retransmit the packets once the time has passed. Also, it becomes difficult to resynchronize the video or audio. Audio/video transfer suffer from the higher error rates occurred in wireless links. In real-time audio/video, there is no concept of retransmission as real-time media can't even tolerate loss of few frames. Thus, the loss of few frames would result in degradation of quality. As the nodes, which are part of the path, should be capable of processing the data it is going to transfer along with the routing, the paths should be chosen intelligently. Finding node capability in advance is vital in order to transfer data efficiently. As this might happen, that node suddenly moves out of order and less capable or even non-capable node becomes part of the network, finally resulting in degradation of quality. Again, it must reroute, and then start transmitting again. This is rather acceptable in stored video, but in live streaming this won't be entertained. Consequently, we must develop dynamic routing algorithms, those are able to change their behavior according to the network characteristics and are able to predict the node capabilities and node mobility.

In source routing algorithms, each node maintains global state allowing computation of the end-to-end path at the source. The Dynamic Source Routing (DSR) route discovery and route maintenance protocol is effective for the transfer of text and images (Johnson et al., 2001). But, let us examine what happens in real-time audio/video streaming. The route breaks, a number of retransmissions has to be attempted over the broken link, and the new route must be established resulting in delay. Rerouting is a spendthrift process because it must be well-confirmed before initiating it. It causes additional delay, and thus it is unsuitable for real-time streaming. We must check when the route is likely to break, and as we will get to know that route is possible to break soon, we can take decisions on rerouting or finding of any alternative root available (Hu & Johnson, 2002). A possible solution it to measure the Signal-to-Noise Ratio (SNR) parameter for received packets, as SNR indicates if the route is likely to break.

To achieve QoS provision in MANETs, the traffic-engineering approach is applied where available resources are used efficiently to meet the QoS requirements. This approach includes implementing different QoS models, QoS routing and resource reservation protocols, channel access mechanisms etc. And all these protocols associated with different sub-layers such as MAC, routing, resource reservation must work in synchronization in order a QoS model to guarantee the desired multimedia services.

This survey considers existing problems and issues that are currently present in providing multimedia communication over wireless MANET. It focuses on two modules of a QoS model: QoS-based Routing and Resource Reservation for providing multimedia communication over wireless MANET. These different modules work together to meet QoS. QoS-based Routing protocol tells on which particular paths, nodes can provide resources sufficiently to meet QoS (Crawley et al., 1998). Resource reservation protocol ensures how these paths or resources could be made available, when required. The survey gives an overview of the different techniques and solutions proposed in QoS routing and resource reservation in order to make efficient the multimedia communication over wireless MANET.

The paper is organized as follows: The next section highlights the wireless MANET characteristics. It also elaborates QoS models and frameworks, as well as routing and resource reservation schemes for wireless MANET. The third section presents advanced QoS routing protocols that can guarantee various QoS parameters. The fourth section presents recent advancements in QoS routing protocols, while the fifth section discusses novel approaches and techniques that resolve important problems of multimedia over wireless MANET. Finally, the last section concludes the paper.

MULTIMEDIA COMMUNICATION OVER WIRELESS MANETS

Wireless MANET is an IP-based network that works on the best-effort delivery concept. Although network components will try their best, this network won't guarantee that required QoS will be achieved. However, real-time applications need a guarantee that all the QoS requirements should be achieved irrespective of the network conditions.

QoS in Wireless MANETs

QoS is a set of service requirements to be met by the network, while transferring a flow (Kanellopoulos, 2011). Certain metrics such as bandwidth, delay, jitter and packet loss rate (PLR) can be used to measure and achieve the required QoS by any particular application. In wireless MANET, hop count and

path reliability may also be considered. To provide better QoS services, we must consider the following characteristics of a wireless MANET:

- **Lack of Central Authority:** In wireless MANET, there is no central controller available. Also, there is not an analyzer which makes a decision, whether or not, the link and protocols currently being used are capable of providing desired QoS;
- **Limited Resource Availability:** There is a limited amount of memory, limited processing capability and limited battery power etc. So, the resource availability in wireless MANET is very much limited. All these limitations cause problems in providing the required QoS, as we cannot easily increase the node capacity. Therefore, we have to manage the available resources efficiently so that maximum throughput can be achieved;
- **Error Prone Shared Radio Channel:** The availability of bandwidth becomes very scarce to every node because the network uses the shared radio channel in broadcast mode. Again, the wireless medium gets badly affected by the channel properties like interference, attenuation etc.;
- **Variable Network Topology:** Without any notification, the nodes make moves very frequently. These moves may result into the different topologies causing frequent path breaks and establishment of new paths. It also requires some delay and still after investing the time it is not guaranteed that the required path will become available;
- **Insecure Medium:** The network shares one common radio channel in a broadcast mode. Consequently, everyone can get an easy access to the data being transferred among the devices. This issue is not bearable by the applications, which have privacy as their main concerned issue. For example, military applications, private video conferencing and some kind of banking transaction cannot bear this issue. Also, simple attacks such as denial-of-service, message tampering, impersonation etc. can be performed very easily (Lian et al., 2009);
- **Deficient State Information:** Most of the protocols and mechanisms in wireless MANET force nodes to maintain some kind of state information, which may be related to link or related to flow. However, the network devices have limited memory capacity. This limitation makes this task more challenging of maintaining a relevant information, and old information has to be vanished to make space for new information. Even, if we succeeded in maintaining all this state information, this information might become irrelevant just after an interval, as the dynamic nature of MANET might cause the network topology to change and all the information maintained so far will become irrelevant.

Video transmission requires higher bandwidth, and this requirement imposes some nodes to stop their transmission so that desired QoS can be achieved. In interactive communication, traffic also becomes two ways and might follow the same path both ways. And this might need external synchronization to avoid interference. Existing protocols and standards for audio/video transmission in wired environments have been evolved from years and have undergone many refinements. However, we cannot apply these protocols and standards to wireless MANET because:

- In the case of wireless medium, signal is transmitted through air in all directions, which ultimately requires higher transmission power to cover more distance;
- The transmission range or interference range is not visible and more efforts are required, while dealing with congestion, collision, packet colliding etc.;

- In the wireless medium, the problems of reflection, diffraction and scattering are present;
- Finally, the wireless medium is more error prone and problematic. Still, it becomes worst, when it comes to multi-hop networks. The packet drop ratio (PDR) drastically goes up, while delay increases in proportion to these, and ultimately it affects the QoS.

Conclusively, existing protocols and standards for audio/video transmission need extra refinements for wireless MANETs.

QoS Models and Frameworks

In MANET, QoS is characterized by the node resource constraints while the QoS provisioning needs the consideration of various issues (Bheemarjuna Reddy et al., 2006). So, some QoS models and frameworks have been proposed and work along with different protocols and mechanisms to fulfill the application QoS requirements. Such protocols and mechanisms address: QoS PHY (i.e QoS at the Physical layer), QoS MAC, QoS Signaling, Admission Control, Scheduling, QoS Routing, QoS at the Transport and Application layers. Its beyond the scope of this survey to present all these protocols and mechanisms. The survey aims only to analyze QoS routing issues that involve routing protocols and resource reservation mechanisms. Hereafter, we present the most important QoS models and frameworks.

IntServ

Integrated Service (IntServ) (Braden et al., 1994) is the earliest model used for providing QoS on the Internet. In IntServ, QoS is guaranteed on per flow basis. For each flow, proper amount of resources is reserved to meet QoS requirements. IntServ is an architecture that specifies the following modules for achieving QoS guarantees in each flow:

- A QoS specification mechanism in order each flow to specify its requirements;
- Admission control to determine if a new flow should be admitted without affecting the QoS of other ongoing flows;
- A QoS negotiation process so that as many flows as possible can be served. During the QoS negotiation phase, each peer computer/node must determine, if it can support the desired QoS. If so, certain resources are reserved for this session. If the user is satisfied with the suggested QoS, the session is established. Otherwise, the session is rejected;
- Resource allocation and Scheduling to meet the QoS requirement of accepted flows;
- Traffic policing to make sure that flows generate the correct amount of data within the agreed QoS specification;
- A QoS re-negotiation mechanism is required so that flows can request changes in their initial QoS specifications. The actual QoS provided to the ongoing sessions should be controlled, so that suitable actions can be taken in case of any problem in providing specified QoS guarantees. Media scalability and graceful quality degradation techniques should be used together with the above mechanisms to provide efficient services to flows;
- Traffic-shaping schemes. Traffic shaping refers to the act of delaying the packets in the flow so that packets conform to certain defined rules. Traffic shaping schemes are used, when the traffic pat-

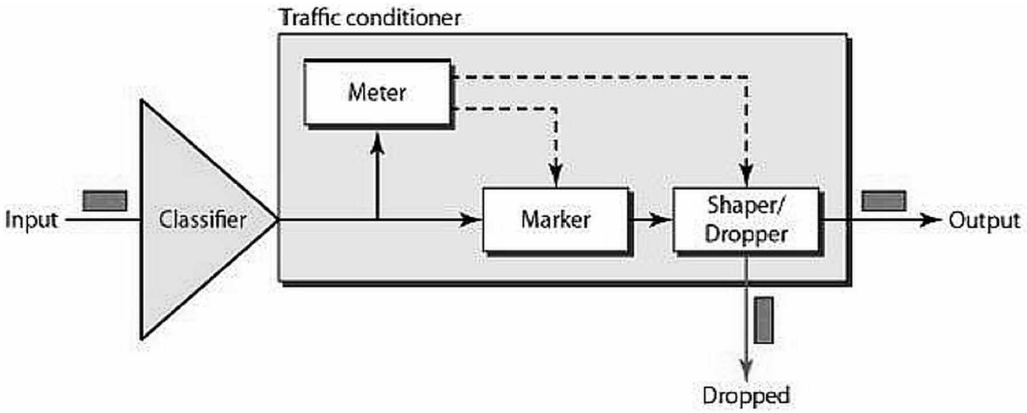
tern is too complicated to describe or the traffic is unsuitable for networks to support directly. For example, when video is variable bit rate coded, it may be hard to characterize the coded bit stream;

- Resource reservation protocols. IntServ uses RSVP (Braden et al., 1997) to make per-flow reservations at routers along a network path. While this allows the network to provide service guarantees at the flow level, it suffers from scalability issues. In IntServ, there is a potentially infinite number of different types of traffic, so each router has to store heavy information about each flow in order to provide QoS guarantees to each type of traffic. RSVP is a soft-state protocol, which implies that the router's state has to be refreshed at regular time intervals, and this adds to traffic overhead. The limited CPU processing capability and the limited storage capacity of wireless MANET devices enable IntServ unsuitable to maintain heavy information related to each flow.

DiffServ

Differentiated Services (DiffServ) model (Blake et al., 1998) takes a middle ground between the best-effort service and IntServ. It defines a fixed number of packet classes (Figure 1). All traffic types/packets are aggregated into these classes, and the network/routers provide different services to different packet classes. But how service classification works? The IPv6 protocol has a header byte called traffic class. In DiffServ the type-of-service (traffic class) byte is re-defined as a Differentiated Services (DS) field. The first six bits of the DS field is called DiffServ Code Point (DSCP) field, which indicates the behavior each router is required to apply to the individual packet. Packets with the DSCP set to 0 receive the same service as they get in the best-effort service. Values between 1 and 7 are defined to be backward compatible with the original IP precedence mechanism, to ensure that DiffServ technology can be deployed in the operational Internet progressively. The DS filed can be assigned by the end-user to indicate the desired service. Alternatively, the ingress (source) router marks the DS field based on the MultiField (MF) classification. MF classification classifies packets based on the contents of multiple fields e.g. source address, destination address, type-of-service byte, protocols ID, source port number and destination port number. As a packet moves from one Internet service provider to another, it may be re-classified. Many service classes can be defined. However, DiffSev is designed for fixed networks, and it cannot be adopted in wireless MANETs (Xiao et al., 2000).

Figure 1. DiffServ model



FQMM

Xiao et al. (2000) have proposed the Flexible QoS Model for Mobile ad hoc networks (FQMM). It is a hybrid model that provides both fine-grained behavior of IntServ and coarse-grained behavior of DiffServ. This hybrid model is shown in Figure 2, as it was depicted by Bheemarjuna Reddy et al. (2006). The traffic of highest priority will be given per-flow provisioning, while other priority classes will be given class-based provisioning. The FQMM model defines three different types of nodes: ingress, interior and egress nodes:

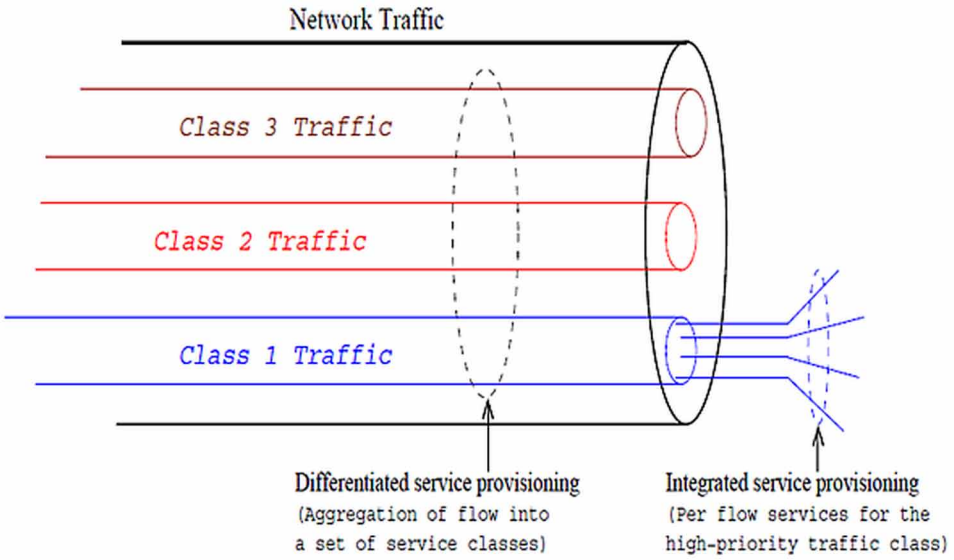
- An ingress node (i.e. source node) generates the traffic and performs also traffic shaping;
- An interior node is responsible for routing the packets towards desired location. It just forwards the packets towards desired locations, as directed by the traffic profile;
- An egreess node receives the traffic generated by the ingress nodes.

In MANET, the roles of mobile nodes change frequently as nodes move. For example, the node which is currently idle may in the next movement get the responsibility of forwarding packets. Similarly, the node which is currently acting as a packet forwarding node may become idle at very next movement. FQMM is unsuitable for wireless MANET, where nodes change their role continuously. This is why FQMM was originally defined for small to medium size wireless MANETs with less than 50 nodes (Xiao et al., 2000). Anyway, the FQMM model seems to be better approach than using IntServ or DiffServ alone.

INORA

Dharmaraju et al. (2002) have proposed the INORA QoS framework for wireless MANETs. INORA is based on the interaction of two subsystems: (i) the INSIGNIA in-band signaling system (Lee et al., 2000);

Figure 2. The FQMM model



and (ii) the Temporally-Ordered Routing Algorithm (TORA) (Park & Corson, 1997). The interaction of these subsystems aims to deliver the finer QoS. INSIGNIA supports fast reservation, restoration, and adaptation schemes to deliver the adaptive services. These services support applications that require only a minimum quantitative QoS guarantee (e.g. minimum bandwidth).

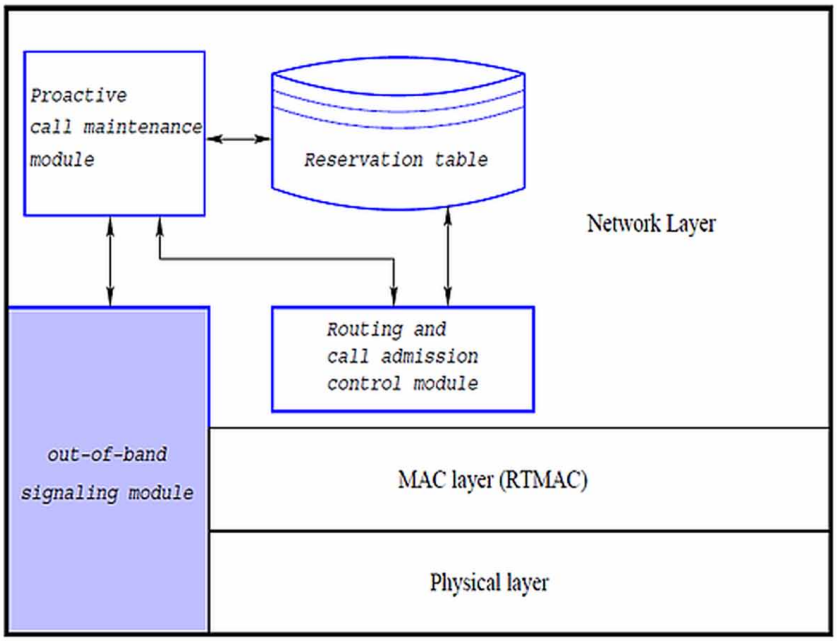
INSIGNIA is light-weight and responds rapidly to changes in the network topology and end-to-end QoS conditions. However, the drawbacks of INSIGNIA are: (1) its scalability problem due to the flow state information (which is kept within the nodes of a certain path) and (2) the inefficient bandwidth usage. Both drawbacks are inherited in the INORA architecture. TORA routing protocol is used because of the data structure it uses (i.e. Directed Acyclic Graph) and also because of the TORA's property that provides multiple paths between source and destination. TORA also limits its control packets for route reconfiguration to small regions. So, TORA does not cause unnecessary network traffic. INORA basically operates into two different schemes: coarse feedback scheme and class-based fine feedback scheme. The main benefit of INORA is that it can search for multiple paths. However, INORA cannot be used for hard real-time applications, since no resources are reserved before actual data transmission starts. This enables INORA inappropriate for providing QoS in hard real-time applications over wireless MANET.

PRTMAC

Vishnumurthy et al. (2004) have proposed the Proactive RTMAC (PRTMAC) QoS architecture (Figure 3) that supports differentiated service classes. Three types of classes provide service differentiation:

- **Class 1:** This class has the highest priority. PRTMAC ensures that the calls for this class do not get disturbed, because of the calls belonging to other lower priority classes. If the situation arises

Figure 3. PRTMAC architecture (Bheemarjuna Reddy et al., 2006)



that call could not be carried out further, then any on-going call from low priority class can be dropped in order to keep this call awake;

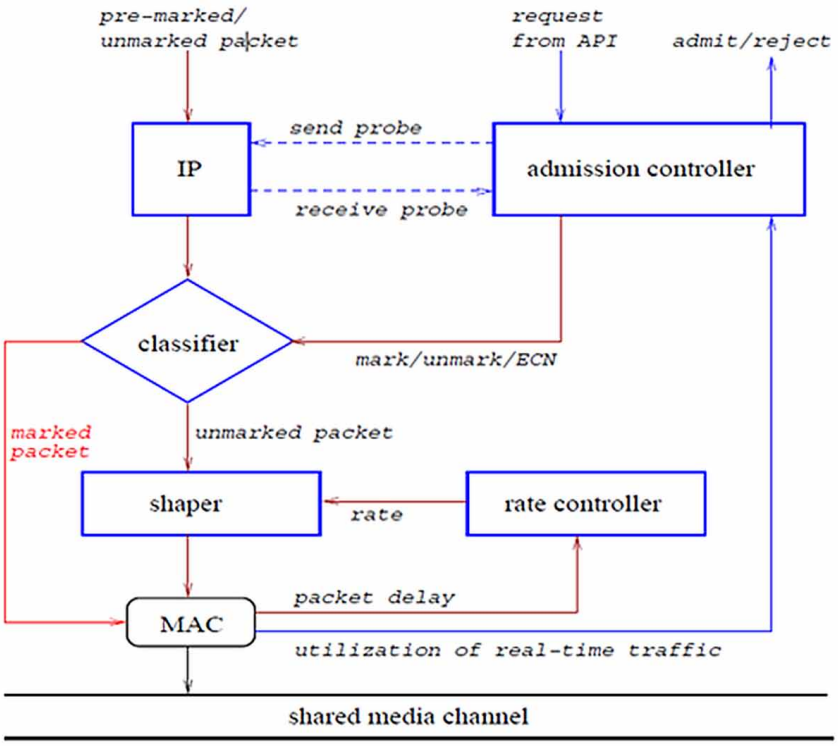
- **Class 2:** This class has somewhat low priority than class 1, but not the least one. The calls belonging to this class can only be dropped, if the network needs to serve the call belonging to class 1. The calls belong to class 2 are also real-time calls. However, class 2 accepts calls only, if end-to-end bandwidth is reserved for the call it is trying to accept. Otherwise, the call won't be accepted;
- **Best-Effort Class:** This class has the least priority. Under the best-effort class, non-real-time traffic falls. This type of traffic does not need any type of service guarantee and calls belonging to this class can be dropped without any notification, if the need arises to serve the higher priority classes.

PRTMAC includes an enhanced real-time support scheme that uses an out-of-band signaling mechanism to predict future mobility patterns and take corrective action when needed. This helps mobility affected nodes to take proactive measures so as to offer better real-time services to bandwidth critical applications. PRTMAC adopts a cross-layer designing approach. In such approach, optimization is achieved by permitting one layer to access the data of another layer; to exchange information and enable interaction (Bin-Salem & Wan, 2012). In PRTMAC, some significant parameters are shared among the Network and MAC layers. At MAC layer, PRTMAC framework uses Real-Time MAC (RTMAC) protocol (Manoj & Murthy, 2002), while at Network layer, it uses a DSR routing protocol. PRTMAC demands the bandwidth reservation and bandwidth availability estimation from the RTMAC protocol. By using the out-of-band signaling channel, RTMAC collects the information about current real-time traffic. RTMAC can handle the link breaks and node failures, which makes it more robust. The PRTMAC is a better option than FQMM and INORA for providing the real-time support and service differentiation in high mobility MANETs (e.g. military networks formed by high speed combat vehicles). However, PRTMAC is not a reasonable solution because it makes use of narrow-band control channel as the out-of-band signaling channel. But having another channel in MANET (which is already struggling to make better use of available bandwidth) may not be an economically viable solution.

SWAN

Ahn et al. (2002) have proposed a Stateless Wireless Ad hoc Network (SWAN) model that is a QoS model for wireless MANET. SWAN supports both real-time UDP and best-effort UDP and TCP type of traffic. User Datagram Protocol (UDP) uses a simple connectionless transmission model with a minimum of protocol mechanism. UDP is often used by multimedia applications (e.g. voice over MANET) because dropping packets is preferable to waiting for delayed packets. SWAN supports real-time applications by using distributed control algorithms and also service differentiation. In distributed routing algorithms, the path computation is conducted in a distributed manner by intermediate nodes comprising an end-to-end path. As shown in Figure 4, the Classifier classifies real-time and best-effort traffic. Then, the Shaper (leaky bucket) gets best-effort traffic, which is processed at calculated rate by the Rate controller. The local Rate controller algorithm is used to control the traffic entering into the network. The real-time packets (marked) directly travel towards MAC protocol. So, these packets are getting channel fast, and thus improving QoS. The Rate controller decrements the rate of Shaper, when excessive delays are

Figure 4. SWAN model adapted from (Bheemarjuna Reddy et al., 2006)

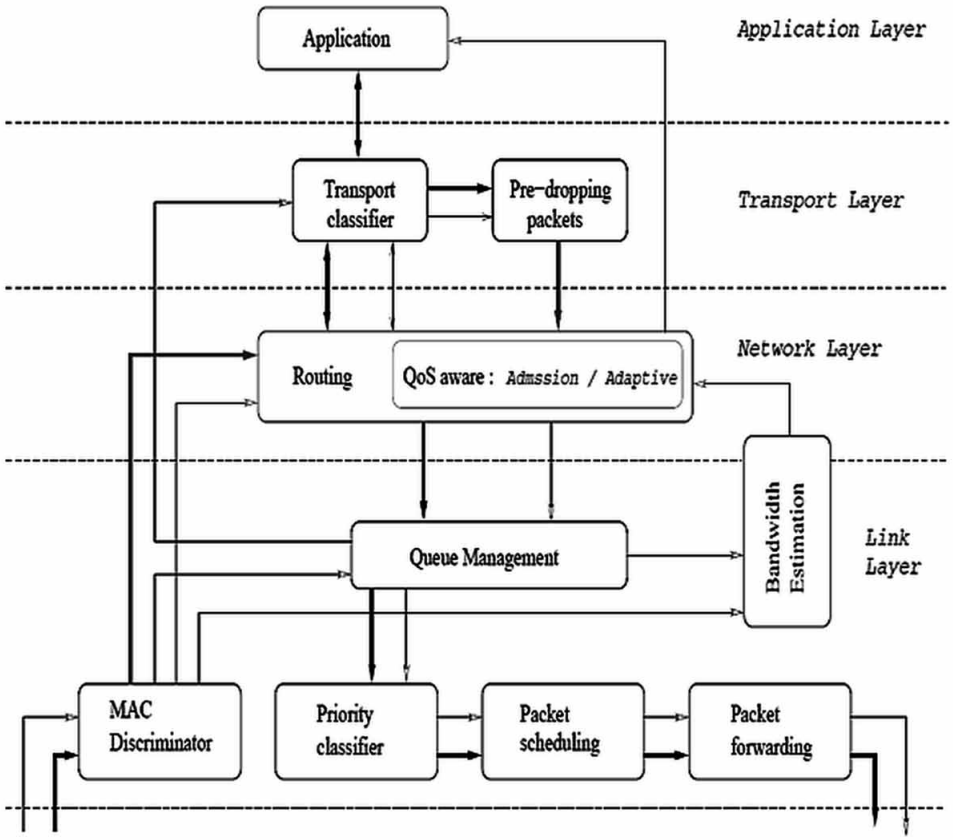


observed. SWAN does not get affected by the dynamic behavior of topology, as intermediate nodes do not maintain the per-flow or aggregate state information. However, SWAN fails to entirely utilize the DiffServ field that is used only for two classes of traffic. It would be more realistic if full advantage had been taken of differentiating the traffic into a variety of classes that exist in practice.

Network Architecture

Chen and Heinzelman (2004) have proposed a Network Architecture that is based on a cross-layer approach. The Network Architecture (Figure 5) supports QoS in wireless MANETs considering real-time traffic. This architecture considers QoS Transport layer protocol, QoS routing protocol, queue management, and priority MAC protocol. Narrow lines indicate the control flow while bold lines depict the data flow. Application layer manages two types of traffic: real-time and non real-time. Transport layer demands for information from the Packet queue and from the Network layer for achieving desired QoS. Network layer forwards the current network status to the Application layer. While MAC layer and Link layer provide appropriate information to the Network layer, so that performance can be improved. Link layer does the task of bandwidth estimation, which can be passed to Network layer to take appropriate routing decisions. The Queue Management unit does the task of scheduling different priority packets. The MAC Discriminator unit does the task of differentiating data packets and control packets that it has received from the wireless channel. The Priority Classifier classifies different data packets (real-

Figure 5. The Network Architecture (Chen & Heinzelman, 2004)



time or non real-time) which it has received from the Queue Management unit. The Packet Scheduling unit handles the task of scheduling packets according to appropriate priority of packets. The Network Architecture can be efficiently used for achieving better video quality and to obtain lesser packet delay.

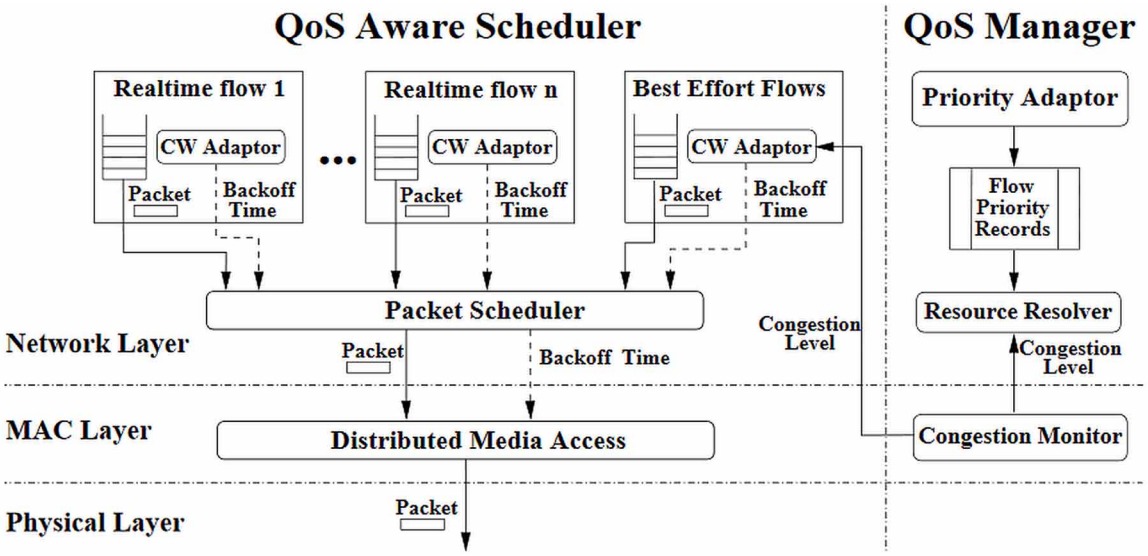
QPART

Yang and Kravets (2004) have presented a QoS Protocol for Ad hoc Real-time Traffic (QPART) that is a cross-layer solution used for providing QoS to real-time applications. In QPART, three different tasks are performed for ensuring desired QoS:

- Admission control that decides if a new flow can enter into the network;
- QoS-aware Scheduling that assigns resources to the admitted flows;
- Conflict resolution that selects and rejects the victim flow, which is causing problem to the other flows.

The QoS-Aware Scheduler and the QoS Manager are the main parts of the QPART architecture (Figure 6). The QoS-Aware Scheduler does the task of scheduling and operates on the principle of enhanced IEEE 802.11 MAC layer protocol [IEEE 802.11e (Mangold et al. (2002)]. The QoS Manager

Figure 6. QPART model (Yang and Kravets, 2004)

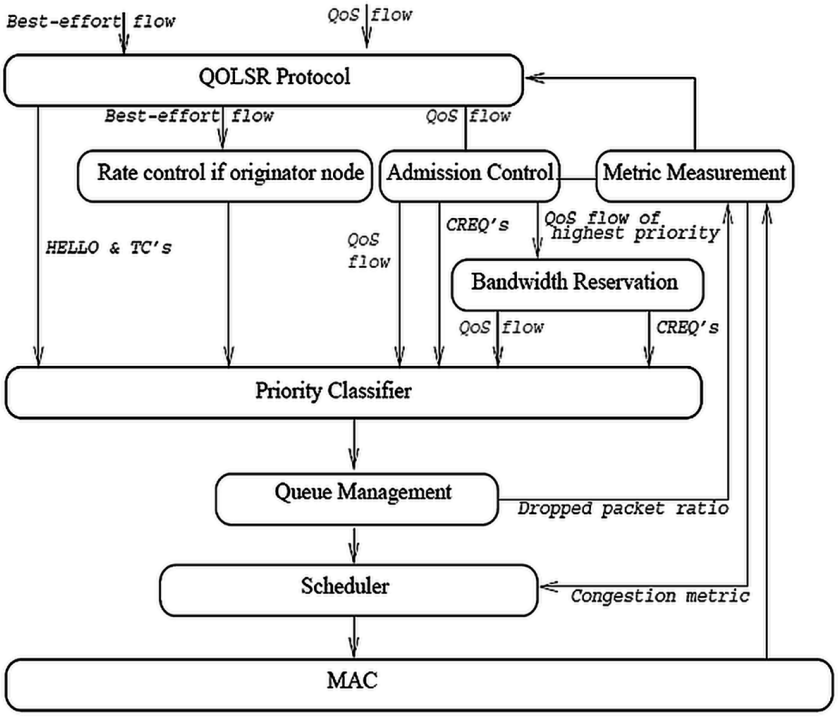


performs admission control and conflict resolution. OoS Manager does the flow prioritization in order to do the conflict resolution and admission control. However, the priorities are assigned dynamically by the Priority Adapter and a low priority flow becomes victim, if congestion occurs in the network. One remarkable advantage of QPART is that for resource allocation, no exchange of any control messages is necessary. In order to do so, it dynamically adapts the contention window size, based on local network congestion level. As it is a cross-layer solution, it also considers the received QoS while adapting the contention window.

CEQMM

Badis and Agha (2006) have introduced the Complete and Efficient QoS Model for MANETs (CEQMM). It is a hybrid model that combines the good features of IntServ and DiffServ. In CEQMM, QoS routing is implemented via the QOLSR protocol to decide the optimal paths available. QOLSR (Badis & Agha, 2005) is an extension of the Optimized Link State Routing (OLSR) protocol. OLSR makes use of MultiPoint Relay (MPR) nodes to forward broadcast messages during the flooding process (Clausen & Jacquet, 2003). The QoS metric is used to calculate the QoS-MPR's, which are then given to every node in the network. Firstly, it will decide whether or not the path is available to fulfill the required QoS provisioning. If no path is available to fulfill the QoS requirements, the traffic is simply rejected. Figure 7 shows the functional model of CEQMM. The Priority Classifier classifies the traffic according to its priority. Then, the Queue Management unit makes queues for this traffic. And the traffic Scheduler schedules each traffic class according to its priority and allows channel access (i.e. can be passed to MAC layer). CEQMM model also confronts the congestion control problem. For congestion control, each node that generates the best-effort traffic, limits the packet flow to available bandwidth. CEQMM also includes a Metric Measurement unit that predicts the QoS metric parameters like jitter, delay, bandwidth, loss probability etc. One limitation of implementing CEQMM for MANETs is that the average delay is

Figure 7. The CEQMM model



very long when node moves continuously. Thus, many packets are dropped, which makes it unfavorable for multimedia traffic (Muhammad et al., 2011). However, CEQMM model is better than FQMM as it confronts the congestion control problem.

Table 1 shows a comparison among all these QoS models and frameworks.

Table 1. A comparison of QoS models and frameworks

QoS Model	Features	Comments
IntServ	It provides a fine-grained and flow-based technique.	QoS is guaranteed on per-flow basis.
DiffServ	It provides a course-grained and class-based mechanism.	It uses a limited number of service classes.
FQMM	It combines IntServ and DiffServ models.	It is scalable.
INORA	It combines INSIGNIA signaling system and TORA routing protocol.	No resource reservation is done. It cannot be used for real-time application.
PRTMAC	It adopts a cross-layer approach.	It is useful for real-time communication.
SWAN	It is based on distributed routing and provides services differentiation.	Does not require QoS support from MAC layer.
Network Architecture	It adopts a cross-layer approach.	It provides better video quality and less average packet delay.
QPART	It adopts a cross-layer approach.	It supports real-time application. There is no need of any control messages for resource reservation.
CEQMM	It is a hybrid model and combines good features of IntServ and DiffServ.	It faces congestion control via an effective mechanism.

Routing in Wireless MANETs

The multi-hop nature in wireless MANET introduces many problems. As the number of hops increases, jitter gets badly affected. In addition, links come into existence and break down more frequently than static network. Because of users mobility, routing becomes more complex. It cannot just simply stop and wait for the link to regenerate every time it fails, it has to find alternate path and eventually this comes at a cost of increase in end-to-end delay. On the other hand, the hard real-time application needs the high bandwidth link to be available continuously, and the delay introduced by the link or node should be as minimum as possible. Also, the processing power of intermediate nodes should be enough to process the heavy amount of data. From all perspective, hard real-time applications demand for best services from all participating units.

To make routing more efficient, many routing protocols' categories have been proposed such as:

- Proactive routing protocols (e.g. Optimized Link State Routing - OLSR): In this category, all nodes periodically exchange routing information to maintain a consistent, updated, and complete network view. Each node uses the exchanged information to calculate the costs towards all possible destinations. In proactive routing schemes, there is no initial delay when a route is required;
- Reactive routing protocols. Examples are DSR, Ad hoc On Demand Routing protocol (AODV) (Perkins et al., 2003), and the dynamic on-demand routing protocol (DYMO) (Chakeres & Perkins, 2008). Reactive routing does not depend on periodic exchange of routing information or route calculation. When a route is required, the node must start a route discovery process.

Royer and Toh (1999) have compared many naive routing protocols. They have concluded that none of these protocols are uniquely sufficient to give best results for particular application. That implies that we must consider the application specific requirements (e.g. minimum power usage, minimum delay tolerance etc.) in order to use specific routing protocol. For example, in video downloading more throughput is desirable, while in live streaming more focus should be on delay and jitter. Thus, we must develop more specific (as per the application's requirements) efficient routing algorithms. Earliest, Chen and Nahrstedt (1999) have presented a ticket-based distributed QoS routing scheme, named as Ticket-Based Probing (TBP) for wireless MANETs. The simulation results prove that TBP has higher success ratio than most of the flooding algorithms. Pearlman et al. (2000) have presented the simulation results for the Alternate Path Routing (APR) protocol. They have concluded that it gives 40% improvement in end-to-end delay. The use of APR is beneficial, if the data being transmitted is more of delay sensitive. Feeney (1999) has explained and categorized the routing protocols as:

- **Topology-Based:** Examples are DSR and the Global State Routing (GSR) protocol (Chen & Gerla, 1998);
- **Destination-Based:** Examples are the Destination-Sequenced Distanced Vector (DSDV) (He, 2002) and AODV protocols;
- **Neighbor Selection-Based:** An example of this category is the Zone Routing Protocol (ZRP) (Hass & Pearlman, 2001);
- **Partitioning-Based:** An example is the Core-Extraction Distributed Ad hoc Routing (CEDAR) protocol (Sivakumar et al., 1999).

Rajaraman (2002) has also classified routing protocols as:

- Flat routing protocols (e.g. DSDV, OLSR, DSR, AODV, TORA);
- Hierarchical routing protocols, e.g. the Hierarchical State Routing (HSR)(Iwata et al., 1999);
- Geographical routing protocols, e.g. the Greedy Perimeter Stateless Routing (GPSR)(Karp & Kung, 2000).

Alotaibi and Mukherjee (2012) have also offered a comprehensive review of routing-algorithm categories, such as Geographical, Geo-casting, Hierarchical, Multi-path, Power-aware, and Hybrid routing algorithms. It is noteworthy that naive routing protocols can be used effectively only for text or images. For audio/video transmission, special routing protocols must be proposed, as special attention must be given towards the live streaming. Igartua and Frias (2010) have presented a self-configured framework for video streaming services over wireless MANET, entitled as Adaptive-Multi-path Multimedia Dynamic Source Routing (A-MMDSR). This framework can self-configure according to the dynamics of the environment. In particular, the routing algorithm in A-MMDSR periodically updates a set of paths, classifies them according to a set of metrics and arranges a multi-path forwarding scheme. Chow and Ishii (2007) have used multi-point-to-point transmission together with Multiple Description Coding (MDC) (Goyal, 2001) results in enhancement of the quality of video streaming. They have also suggested an extension to DSR protocol that eventually results in load balancing and finding of maximally disjoint routes. Munoz et al. (2010) have presented a more attractive extension: Reliable Dynamic Source Routing for Video (RDSR-V) streaming, which is a QoS-aware reputation-based routing protocol for video-streaming applications over wireless MANETs. Hu and Johnson (2002) have presented a more specific demonstration of DSR protocol for live audio and video transfer over wireless MANET. Their work significantly improves the transmission of real-time media over multi-hop wireless MANET.

In wireless MANET, multiple paths for the same source and destination may be present, and thus handling of an interactive application becomes somewhat an easier task. This happens because data from source node A to destination node B will take some path, while reply from node B to node A can take some different path, so the efficiency of the link and ultimate throughput can be increased. As a node selects the type of service (e.g. video-on-demand), it declares specific bandwidth requirements. And depending upon bandwidth requirements, appropriate paths may be set. Using multi-path for video/audio transmission over wireless MANET seems to be a good option as the failure probability of a single path is always more as compared to multipath. It allows packets to take multiple paths as if we are doing loose source routing (Johnson, 1993), and thus overall link utilization can be improved. In addition, probability of packet loss can be minimized. But to implement this scheme successfully, receiver has to struggle in handling jitter for each packet or in handling out of order packets and in some cases some packets in between might get misplaced. As a result, if we are dealing with real-time video/audio streaming, then multi-path might not give the desired output. Obviously, routing in case of multi-path becomes more interesting. Mueller et al. (2004) have demonstrated various issues and challenges related to multi-path routing algorithm in wireless MANETs. However, they have left out with handling out of order packets (introduced at receiver due to different packet arrival rate).

Resource Reservation

Every flow needs certain and prerequisite resources in order desired QoS to be provided. So, resources can be reserved in advance, so that when and as demanded by flow it should be there. Reserving the path in advance also tells us that whether the required resources are available or not to fulfill the desired QoS parameters. This might so happen that resources are currently occupied by some other flows, so the current flow can't be served. In this case, protocol may assign some waiting time to the current request to avail that resources or if the current request is of higher priority, then the protocol will snatch out the resources from current flow and will make it available to the requested flow. The resource can be reserved either in hard state or soft state QoS:

- The hard state QoS reservation forces the resources to keep reserved along the path from source to destination, until the whole communication process gets completed. Hard state QoS reservation releases the resource, if and when the path in between brakes. Obviously, this type of reservation is problematic in wireless MANET, because the link breaks happen most often;
- In case of wireless MANET, soft state QoS reservation is much better choice as the topology changes very frequently, and doing hard state reservation might result in wastage most often.

RSVP

In wired networks, the topology is fixed and the resources required by the nodes can be reserved efficiently by using the RSVP (Braden et al., 1997). However, RSVP cannot be directly applied to the wireless MANET because:

- Wireless MANET nodes are mobile in nature, so we cannot be sure whether or not reserved resource will be available when a need arises;
- The bandwidth of network devices is very much limited. Consequently, handling the heavy amount of control information generated by RSVP becomes an overhead.

Talukdar et al. (2001) have argued that there is no provision of passive reservation in RSVP. Therefore, RSVP cannot use advanced reservation viz. a node cannot reserve resources where it will be in future.

MRSVP

This resource reservation protocol is useful for infrastructure-based cellular networks. It requires some kind of prediction i.e. it is presumed that the mobile node is aware of all the locations to those it is going to visit during the lifetime of the flow. MRSVP can reserve resources using two different ways (Talukdar et al., 2001):

- **Active Path:** In this case, data packets are currently using the path reserved (i.e. path is active);
- **Passive Path:** If the path reserved is not active yet and will only be useful in future.

However, MRSVP is not suitable for wireless MANETs. The uncontrolled mobility of network devices makes it almost impossible to predict the future locations of the node; and this is the key requirement for MRSVP to work. Suppose somehow we obtained all the future locations and we reserved the resource along the path, then it may possible that node holding that resource will move out of the range, when the actual need will arise.

Dynamic RSVP

In DRSVP, the QoS can be guaranteed even in a network whose bandwidths are dynamic in nature (Mirhakkak et al., 2000). The DRSVP protocol automatically divides the available bandwidth among all other applications so that varying link bandwidth can be handled efficiently. DRSVP protocol decides whether to or not to accept the connection. If certain QoS parameters (e.g. maximum packet size, peak rate, token bucket depth, average rate and the minimum polished unit) can be supported by the network, then reservation can be accepted, otherwise it will be rejected (Mirhakkak et al., 2000). The DRSVP gives range of values, which allow it to entertain multiple flows. However, this becomes much more complex to handle than simple RSVP, and nodes having limited processing capability in wireless MANET makes it more difficult to implement.

QOS ROUTING

A routing protocol finds the path that can provide the required resources to the flow, while a resource reservation protocol reserves this path prior to data transmission. In wireless MANETs, the routing protocol must be very adaptive to the route changes that occur. For this purpose, novel QoS routing protocols have been proposed and operate by taking into account different (or maybe multiple) QoS parameters. Throughput is the most extensively considerable QoS parameter.

Hereafter, we present routing protocols that guarantee throughput. Chen et al. (1997) have proposed the Clustering-based Channel Capacity Routing (CBCCR) protocol. This protocol extends the concept of DSDV protocol, specially developed for supporting multimedia over wireless MANETs. Sivakumar et al. (1999) have proposed Core Extraction Distributed Ad hoc Routing (CEDAR) protocol which depends on the "core" which is constructed. The "core" provides efficient and low overhead infrastructure such as to provide routing and broadcasts in wireless MANETs. Chen and Nahrstedt (1999) have proposed Ticket-Based distributed Probing (TBP) protocol that selects multiple paths without using flooding those are capable of satisfying the QoS parameters. Stine and Veciana (2004) have proposed Node State Routing Protocol (NSRP) that is based on location awareness and signal strength. Chen and Heinzelman (2005) have proposed Contention-Aware Ad hoc On-demand Distance Vector (CAAODV) routing protocol that contains admission control with feedback scheme. By disseminating bandwidth information using "Hello" messages, the bandwidth estimation is performed. Yang and Kravets (2005) have proposed Contention-aware Admission Control Protocol (CACP) which also thinks about the effect of the admission of new flows on the neighboring nodes along with local information. Gupta et al. (2005) have proposed Interference aware QoS Routing Protocol (IQRP). IQRP makes use of probe packets to compare different paths that are available. Ivascu et al. (2009) have proposed Quality-of-Service Mobile Routing Backbone over AODV (QMRB-AODV) that struggles to distribute traffic all over the network, so that bandwidth can be utilized efficiently. In addition, it reduces the number of control messages.

Next, we discuss some protocols that guarantee bandwidth. Lin and Liu (1999) have proposed the Channel Capacity-Based Routing (CCBR) protocol. By performing the calculation of bandwidth and slot reservation, the CCBR protocol guarantees bandwidth. Zhu and Corson (2002) have proposed on-demand QoS routing protocol based on AODV for TDMA-based MANETs (QoSR-Z), which is cross layer approach that negotiates information between Network and MAC layers. Liao et al. (2002) have proposed a TDMA-based Bandwidth Reservation Protocol (TBRP) for QoS routing for a MANET. Furthermore, it considers hidden and exposed terminal problem, while taking decision about route discovery. Jia et al. (2005) have proposed Ad-hoc Shortest-Widest Path (ASWP) routing protocol that is based on Bellman-Ford architecture and k-shortest path approach. ASWP attains performance close to the optimal possible. Guimarães et al. (2009) have proposed Bandwidth Reservation on multi-rate Ad-hoc Wireless Network (BRAWN) protocol that performs bandwidth allocation on per flow basis. BRAWN is inclined to select highest possible transmission rate in order to perform data transmission.

Now we present QoS routine protocols that aim to guarantee delay. Zhang and Mouftah (2005) have proposed On-Demand QoS Delay-Constrained Routing (ODCR) protocol, which is on-demand unicast routing protocol. It works towards reducing communication overhead. Liu et al. (2006) have proposed Cross-Layer Scheduling Protocol (CLSP). CLSP considers multiple connections with different QoS requirements and uses a cross-layer approach. Abdrabou and Zhuang (2006) have proposed a position-based Quality-of-Service Greedy Perimeter Stateless Routing (QoS-GPSR) protocol that performs temporary bandwidth reservation. QoS-GPSR makes use of position information in routing and bandwidth reservation and adopts a cross-layer approach. Tang and Zhang (2007) have proposed Amplify-and-Forward (AF) and Decode-and-Forward (DF) QoS routing protocol (AF-DF) that considers throughput along with delay as its QoS parameter. It is a cross-layer approach that works towards maximizing the relay network throughput along with considering delay constraint. Nikaein et al. (2001) have proposed a Hybrid Ad hoc Routing Protocol (HARP) protocol. HARP is hybrid in nature and combines reactive and proactive schemes. It is noteworthy that HARP considers Buffer space as its QoS parameter.

Sheng et al. (2003) have proposed the Delay-Sensitive Adaptive Routing Protocol (DSARP) which considers Delay along with Buffer space as its QoS parameter. DSARP is based on constraint condition: 'The shortest route and the lowest delay'. Wang and Kuo (2005) have proposed Application Aware QoS Routing (AAQR) protocol which is a QoS-aware routing protocol. It also considers jitter along with delay and throughput as its QoS parameters. To estimate the node state, it makes use of Real Time Control Protocol (RTCP). Badis and Agha (2005) have proposed QoS Optimized Link State Routing protocol (QoLSR) which considers MAC delay along with throughput as its QoS parameter. It also proposes refined and a more efficient heuristic for selecting MPR set with minimum size. Fan (2004) has proposed a Cross-Layer Multi-Constraint QoS Routing (CLMCQR) protocol, which also considers Packet Loss Rate (PLR) as its QoS parameter along with throughput and MAC delay. It negotiates information between Network layer and MAC layer in order to select an optimal route. Barolli et al. (2003) have proposed Genetic Algorithm based routing for Mobile Ad-hoc Networks (GAMAN) which considers delay along with PLR as its QoS parameter. It is source initiated Genetic Algorithm (GA) based routing algorithm having good response time. Misra and Banerjee (2002) have proposed Maximum Residual Packet Capacity (MRPC) routing protocol, which considers energy along with PLR as its QoS parameters. It also considers the stuff that different links require different transmission powers instead of relying only on function of battery power for making routing decisions. Kim et al. (2004) have proposed Signal-to-Interference Ratio (SIR) and Channel Capacity-based Routing (SIRCCR) protocol, which considers SIR also along with throughput as its QoS parameters. It claims to reduce the probability of call denials.

Hereafter, we present some QoS routine protocols that consider Link stability as their QoS parameter. Shen et al. (2003) have proposed the Entropy-Based Routing (EBR) protocol, which is based on entropy (i.e. life of path). The QoS is guaranteed in wireless MANET by selecting path having longest-life i.e. calculated with the help of proposed entropy metric. Rubin and Liu (2003) have proposed a similar concept entitled as Link Stability-Based Routing (LSBR). Also, they have presented a number of models those can be used to predict the link stability. Sun et al. (2006) have presented a position-based routing protocol for wireless MANETs, called GvGrid. GvGrid takes into account Packet Arrival Ratio (PAR) as it's QoS parameter. It makes use of GPS in order to access the relative position of nodes, which might cause some delay.

Table 2 shows the comparison among these normal QoS routing protocols, while Table 3 shows the comparison among the discussed cross-layer based routing protocols.

RECENT ADVANCEMENTS IN QoS ROUTING

Many modifications have been made in the routing protocol to improve the performance of the network. Egilmez et al. (2012) have presented a Distributed QoS Routing (DQR) architecture for scalable video streaming. DQR architecture divides the video into different layers. As each layer will have different QoS requirements to be satisfied, DQR architecture forces different layers to take different paths. The DQR architecture works on Open-Flow network, but can be migrated easily to wireless MANET. Dai et al. (2012) have presented Correlation Aware QoS Routing (CAQR) algorithm for wireless sensor network. By using correlation-aware inter-node differential coding scheme, they achieved to reduce the traffic in the network. In particular, they proposed a load balancing scheme to distribute the traffic throughout the network. Finally, by integrating this correlation-aware technique to the routing framework, they accomplished low energy consumption system along with reduced traffic and load balanced system. The Light-Weight Trust-based QoS Routing (LW-TQR) algorithm has been proposed by Wang et al. (2014). This algorithm aims towards providing more secure, better packet delivery ratio and average end-to-end delay in the network. In this framework, malicious nodes are detected and isolated from the network. So, security does not get compromised enabling this mechanism best suited for the military-related application. In the case of stable links, the real-time application would perform better. Moussaoui et al. (2014) have proposed Link-State QoS Routing Protocol (LS-QRP) based on the link stability. LS-QRP protocol is best suited for the point-to-point voice call applications (e.g. Voice over MANET - VoMANET) or video streaming because it makes stable and sustainable links between each pair of nodes in the network. A stable link meets proper QoS requirements. Obaidat et al. (2013) have proposed QoS-aware Multipath Routing Protocol (QMRP). This protocol tries to reduce the delay such as to improve the reliability and QoS of the multimedia communication over wireless MANETs. QMRP passes the packets by using multiple links to the same destination in order to reduce delay. The same result in more reliable transmission as even though one link fails then it will not affect throughput badly. In order to achieve better quality, QMRP is a cross-layer approach that tries to make physical layer and network layer interact. The simulation study depicts that QMRP performs much better in most of the cases like end-to-end delay, packet delivery fraction and route discovery frequency, but fails in reducing the routing overhead in comparison to AODV. Alwan and Agarwal (2013) have proposed Multi-objective QoS Routing (MQoSR) protocol for wireless sensor networks. In order to provide the QoS, two differ-

Table 2. A comparison of QoS routing protocols

Protocol	QoS Parameter	Features	Explanation
CBCCR	Throughput	Can inform source of bandwidth and QoS to any destination	Provides more effective call acceptance control.
CEDARP	Throughput	Depends on "core": self-organizing routing infrastructure.	Core provides an efficient and low overhead infrastructure
NSRP	Throughput	Based on location awareness and signal strength.	NSR protocol provides capability to predict connectivity.
IQRP	Throughput	Uses probe packets to compare different packets.	Uses local knowledge and state information.
CACP	Throughput	Scalable	Considers effect of admission of new flow on neighboring nodes
QMRB-AODV	Throughput	Makes use of mobile routing backbone	Lesser control messages and better utilization of bandwidth by distributing traffic
MRPC	Throughput, Energy	Power-aware routing algorithm.	Routing decisions are based on a function of battery power
SIRCCR	Throughput, SIR	Selects multiple routes.	Reduces the probability of call denials.
QoLSR	Throughput, MAC delay	Considers packet collision probability, nodes MAC queuing and service times	Uses new heuristics for selection of MPR's
AAQR	Throughput, Delay, Jitter	Node state estimated using RTCP	No need of any additional probing messages.
CCBR	Bandwidth	Performs bandwidth calculation and slot reservation.	DSDV + "resource reservation" with/without bandwidth calculation.
ASWP	Bandwidth	Based on adopting Bellman Ford algorithm and k-shortest path protocol	Algorithm is able to achieve performance close to optimum possible.
BRAWN	Bandwidth	Allocates bandwidth on per flow basis.	Selects highest possible transmission rate for transmitting data.
TBP	Delay	Multipath and distributive.	Selects multiple paths without flooding.
ODCR	Delay	On-demand and unicast.	Reduces communication overhead
GAMAN	Delay, PLR	Source based and based on genetic algorithm.	Robustness is primary concern.
DSARP	Delay, Buffer Space	Based on constrained condition: the shortest route and the lowest average delay.	Ensures that minimum packets get lost in the network
HARP	Buffer space	Hybrid: combines reactive and proactive schemes.	Performs two level routing, intra zone and inter zone.
EBR	Link stability	Entropy based: lifetime of path.	Selects path having longest life.
LSBR	Link stability	Based on link survival time.	Proposed different models to estimate link stability.
GvGrid	PAR	On-demand and makes use of GPS	Selects nodes that are likely to move in similar direction with similar speed

ent kinds of metrics (i.e. Link-based-metric and Path-based-metric) are used. MQoSR uses heuristic neighbor selection mechanism with geographic routing algorithm in order to provide a routing solution.

It can be useful to a wide variety of applications as this is a multi-criteria QoS routing algorithm. Rehman et al. (2015) have introduced the Forward-Link-Quality-Estimation Routing (FLQER) protocol that is originally designed for VANET's. FLQER includes an efficient technique to predict the forward link quality. So, that whenever we will get that link won't be useful in future, we can immediately switch

Table 3. A comparison of cross-layer QoS routing protocols

Protocol	QoS Parameter	Features	Information Negotiation
QoSR-Z	Bandwidth	Distributed, based on AODV, can handle some degree of node mobility.	Between network and MAC layers.
TBRP	Bandwidth	TDMA based and solves hidden terminal and exposed terminal problems	Between network and MAC layers
CLSP	Delay	Allows multiple connections with different QoS requirements	Between physical and MAC layers
QoS-GPSR	Delay	Does temporary bandwidth reservation and provides per flow end-to-end guarantee.	Between network and MAC layers
AF-DF	Delay, Throughput	Aims at maximizing relay network throughput.	Between physical and data link layers.
CAAODV	Throughput	Combines admission control and feedback, estimates residual bandwidth available at each node.	Between network and application layers
CLMCQR	PLR, MAC delay, Throughput	Level of interference is calculated by observing MAC delay.	Between network and MAC layers

to some alternate paths. FLQER protocol can be useful in real-time applications, as the link quality estimation algorithm can be migrated to wireless MANET. Cadger et al. (2015) have presented Geographic Predictive Routing (GPR) which can be an efficient protocol for video-streaming applications, especially in the highly mobile network. GPR focuses on location and mobility criteria in order to get improved performance. The advance concept of Artificial-Neural-Network is being used to correctly depict the future locations of neighbor nodes so that link-switching decision can be made. Huang (2015) has presented a special QoS routing algorithm, which does the load-balancing for multi-path video transmission over wireless MANET. The QoS routing algorithm can be used efficiently for video streaming applications. Brak et al. (2014) have introduced a novel and effective modification to existing Optimized Link State Routing (OLSR) protocol entitled as OLSR-VA to make OLSR aware of VoIP applications. Brak et al. based their protocol in the principle that effective adaptation of routing parameters can enhance VoIP quality. OLSR-VA constantly monitors traffic and detects the VoIP activity. After that routing parameters are adapted in order to meet the QoS requirement of VoIP application. This protocol is self-adapting routing protocol, which adapts its parameters to the VoIP load in the network. Sanchez-Iborra et al. (2015) have proposed a new routing protocol entitled as Better Approach To Mobile Ad-Hoc Networking (BATMAN). This protocol exclusively claims to provide QoS in providing VoIP and video traffic. By using both emulator and simulator, the authors evaluated the performance of the BATMAN. They concluded that BATMAN performs much better than OLSR. They have also suggested that performance can be further improved with an appropriate tuning of configuration interval. In addition, BATMAN is capable of adjusting the bit-rate of the video traffic according to the number of streams in the network for managing video traffic.

Table 4 shows a comparison among all these recent advancements in routing protocols.

ACS-Based QoS Routing Protocols

Recent literature has focused on achieving QoS using ACS (ANT-Colony) algorithm. An Ant-based multi-QoS routing metric, named as AntSens-Net, has been introduced by Cobo et al. (2010). AntSens-Net

Table 4. Recent advancements in routing protocols

Protocol	Features	Comments
DQR	Supports video streaming over large-scale multi-domain Open-Flow networks.	Divides the video into different layers and force different layers to take diverse paths.
CAQR	Deliver visual information under QoS constraints.	Also proposed correlation-aware inter-node differential coding scheme and a correlation-aware load balancing mechanism
LW-TQR	Estimate the trust degree between nodes.	Best suited for the military-related application
LS-QRP	Minimizes the recalculation of MPR and routing table	Guarantees packet loss and response time.
QMRP	Introduces new parameter projected-load	Cross-layer approach(negotiates information among physical, MAC and network layers).
MQoSR	Uses heuristic neighbor selection mechanism.	Uses link and path-based metrics for QoS provisioning
FLQER	Improves the selection of next relay node.	Achieves higher reach-ability compared to existing relay selection protocols
GPR	Bottom-up routing process.	Predicts future locations of nodes using Artificial Neural Network
QRVS	Depicts multi constrained QoS routing mechanisms in AOMDV.	Can be used efficiently for video streaming
OLSR-VA	Extension of OLSR protocol	Can be used efficiently for VoIP applications
BATMAN	Capable of adjusting bit-rate of video according to the number of streams in the network.	Supports both VoIP and video traffic

is based on traditional ant-based mechanism and also consider QoS. It builds some type of hierarchical structure on the network and then selects the paths in order to fulfill the QoS requirements for different types of traffic. It uses multi-path video packet scheduling, which results in minimum video distortion transmission. Wang Y. et al. (2014) have presented an Improved Ant-colony based Multi-constrained QoS Energy-saving Routing (IAMQER) algorithm. This algorithm is also capable of energy saving and throughput optimization for wireless MANETs. IAMQER manages the relationship between the network throughput and energy consumption by analyzing the local node parameters, such as node queue length, node residual energy, number of forwarding data packets etc. Simulation studies of IAMQER have proven that it also improves the packet delivery ratio, thus resulting in better quality and better user satisfaction. Rodriguez-Perez et al. (2015) have proposed an Ant Colonization routing algorithm to Minimize network Power Consumption (ACS-MPC). The algorithm works on the principle that in low load network conditions, we can aggregate the whole traffic in a minimal set of links, so that all other nodes (that are not part of link aggregation) can sleep for a moment saving energy. This algorithm minimizes the global energy consumption by designing their routing tables in a decentralized manner. Eiza et al. (2015) have proposed Situation-Aware Multi-constraint QoS (SAMQ) routing algorithm that is based on the ACS routing algorithm. SAMQ focuses on vehicular ad hoc networks (VANETs) and is best suited for the highly wireless MANET where the speed of the mobile node is high. In particular, SAMQ computes the possible routes between the communicating vehicles depending on the multiple QoS constraints those are granted between them. It responds in a proactive manner in order to handle the route failure. In addition, it benefits from the situational awareness (SA) model that provides a framework for improving QoS routing reliability in VANETs.

Table 5 shows a comparison among all these ACS based routing protocols.

Table 5. Recent advancements in ACS based routing protocols

Protocol	Features	Comments
AntSens-Net	It builds hierarchical structure on network.	It uses efficient multi-path video scheduling.
IAMQER	It is based on the analysis of local-node information.	It proposes path evaluation function.
ACS-MPC	It works on power conservation.	It aggregates and/or divides traffic all over network.
SAMQ	It selects best route from multiple computed routes.	It responds locally and proactively to link/route disconnections

NOVEL APPROACHES FOR MULTIMEDIA OVER WIRELESS AD HOC NETWORKS

An interesting cross-layer approach for real-time streaming on wireless MANET has been demonstrated by Kuo et al. (2013). This approach is titled Cross-Layer Overlay for Multimedia Environment on P2P-MANET (COME-P2P). COME-P2P is useful for real-time point-to-point applications (like VoMANET or video communication) as it is specific for peer-to-peer communication. It is a cross-layer approach and thus the lower layers detect the mobility of nodes and convey this information to upper layers, so that the upper layer can maintain the routing table. The main contribution of COME-P2P approach is to maintain the stability of the routing paths for live streaming via IPv6 routing. The simulation results have depicted that it reduces the signaling overhead for live-streaming.

Bellavista et al. (2013) have proposed a light-weighted and self-organizing middleware, named localized relay-based mobile multimedia (LEM). LEM is useful for multimedia delivery in MANET (especially which is dense in nature). However, LEM approach is designed for providing multimedia services in some geographically bounded area of interest. Consequently, LEM middleware can be useful for applications like localized-video-conferencing or localized-rescue-operation.

Diaz et al. (2014a) have proposed the Multimedia Wireless Ad-Hoc Cluster Architecture (MWAHCA) to create and manage the cluster-based wireless MANET to provide multimedia streaming over it. It claims to provide proper QoS for a cluster-based wireless MANET. It evaluates the capacity for each individual node and uses this information to meet different QoS parameters. The main advantage of MWAHCA is that it divides the network into different clusters, where each cluster will be dedicated towards specific traffic types. It makes use of suitable Multimedia Init Profiles (MIPs) to adapt the different physical network configurations. However, MWAHCA does not take into account load balancing and fault tolerance mechanisms. Diaz et al. (2014b) have proposed the fault tolerance mechanism to be used with MWAHCA in order to increase its reliability. For fault tolerance, they have used a temporary fast switching path to improve the QoS recovery transition. They made provision to run algorithm independently for each multimedia flow in the network. They have reduced the convergence time to control the QoS parameters and to keep them as low as possible, which eventually resulting in minimum packet loss.

Ahmad et al. (2015) have demonstrated an efficient approach for delay optimization using the Knapsack algorithm, designed to deal with the multimedia data. First, they have demonstrated that delay is dependent on the packet size and buffer size to a great extent by presenting the mathematical relation of delay, buffer size, and packet size. Afterwards, they have used Knapsack algorithm to maximize the "in-order packets in the buffer", while on the other hand to minimize the "out-of-order packets in the buffer" simultaneously. For doing the same, they have also estimated the proper packet size and buffer size. They have made a buffer to act as a leaky-bucket for packets. With the help of simulation, they

have demonstrated that their approach can be useful for the multimedia transmission over MANET, especially when the size of the buffer is somewhat small, but the size of data is more. This is what will be the situation most of the time in wireless MANET.

Coll-Perales et al. (2015) have presented more interesting empirical models of the communications performance for the Multi-hop Cellular Network (MCN). MCN can be easily inherited to the wireless MANET, as it is dependent on the device-to-device (D2D) model. These models consider the impact of various parameters like: a number of hops, propagation conditions, distance etc. The authors have argued that this model can be very useful in case of design and demonstration, testing or optimization of novel communications and networking protocols designed to work with MCN. The models represent the MCN throughput experienced at the mobile destination node, as the function of multiple parameters like a number of hops, propagation condition, distance etc.

Ghazani (2015) have proposed a new Light Weight distributed QoS Algorithm (LWQA) for wide area ad hoc networks. It dynamically adjusts the Contention Window (CW) related to real-time flows using queue data structure and linear algebra. The algorithm distinguishes between the flows of the same type and can provide the different types of service for these similar flows. The main advantages of LWQA is that it doesn't need any type of resource reservation to ensure QoS. Unlike all other algorithms, flow in LWQA doesn't contend with other flows. Simulation studies have demonstrated that LWQA is capable of achieving the required quality.

Finally, Castellanos et al. (2016) have proposed a new QoS routing protocol based on AODV (AQA-AODV) that creates routes according to application QoS requirements. They have introduced link and path available bandwidth estimation mechanisms and an adaptive scheme that can provide feedback to the source node about the current network state, to allow the application to appropriately adjust the transmission rate. The authors proved that the combined use of AQA-AODV and the scalable video coding provides an efficient platform for supporting rate-adaptive video streaming.

The above mentioned approaches give much better results than earliest models in providing multimedia communication over MANETs. However, further improvements (e.g. support for end-to-end delay during the route discovery phase) must be proposed in order to enhance more their performance in MANETs. More experiments must be also performed using novel routing approaches with network-adaptive protocols for assessing the quality of experience (QoE) of the user.

CONCLUSION

MANET applications can be rapidly developed, if the technical issues concerning the provision of QoS will be resolved. Among these technical issues, the most important is QoS routing that includes the required routing mechanism and protocol as well as the required resource reservation protocol. Many intra-domain routing algorithms have been proposed which satisfy bandwidth, delay, and multiple constraints, while other multicast routing algorithms address the discovery of a tree covering source and multiple destination nodes subject to a set of constraints. Source, distributed and hierarchical routing algorithms have also been demonstrated in the literature.

This survey has provided an overview of some of the existing issues and challenges in providing multimedia communication over wireless MANETs. Especially, it has focused on the issues related with selecting proper QoS-based routing protocol, and it has enlisted some of the existing techniques resolv-

ing these issues. Also, it has discussed various QoS models, routing mechanisms and protocols used in order to provide efficient QoS routing over MANETs.

Most of the existing QoS models and frameworks are designed considering specific QoS routing protocols, which are working at their best to the some kind of applications and scenarios. Scalability and reliability of QoS for multimedia applications over wireless MANET will depend partially on QoS routing mechanisms operating on a full end-to-end basis. Obviously, other protocols and mechanisms, such as QoS PHY, QoS MAC, QoS signaling, and QoS admission control and scheduling will play their significant role to this issue, but studying them was not the goal of this survey.

Several combinations of QoS routing mechanisms are possible toward customized QoS routing solution for current multimedia application. In most cases, the nature of these QoS routing solutions will drive the combination of these mechanisms. We must design a generic QoS routing framework as it would be able to provide QoS routing to multimedia flows with divergent QoS requirements by having the scope for adaptation to various protocols/mechanisms, those can further help in achieving the desired QoS routing in MANETs. Such generic QoS routing framework should:

- Classify the traffic into real-time and non-real-time classes;
- Assign scalable priorities to the real-time traffic flows as they come with different bandwidth, throughput and delay requirements. Real-time flows must be treated differently according to their needs;
- Offer good bandwidth management based on an intelligent adaptation method that recognizes the priorities of the traffic.

Finally, the functionalities of this QoS framework (i.e. resource estimation, admission control, resource reservation and bandwidth adaptation) should be handled in a way that avoids the waste of resources and interference with other on-going flows.

Chapter 43
Digital Storytelling and Digital Literacy:
Advanced Issues and Prospects

Kijpokin Kasemsap
Suan Sunandha Rajabhat University, Thailand

ABSTRACT

This chapter reveals the overview of digital technologies; the overview of digital storytelling in education; and the overview of digital literacy in education. Digital storytelling and digital literacy are very important in modern education. Digital storytelling is used to improve student's learning through multimedia in the modern classrooms. Digital storytelling is the expressive medium that can explain even the most intricate topics in depth, integrating it with the rest of the curriculum. Digital literacy is the ability to use Information and Communication Technology (ICT) to find, evaluate, create, and communicate information, requiring both cognitive and technical skills. Digital literacy leads to the great increases in information that can be conveniently accessed. The chapter argues that developing digital storytelling and digital literacy skills has the potential to improve both teaching and learning performance in modern education.

INTRODUCTION

The impact of technology is one of the most critical issues in education (Sincar, 2013). Digital technologies become the essential parts of students' learning experiences in the classrooms (Kissel, 2014). The advent of digital technologies brings substantial shifts both at the material levels and at the global literacy levels in this digital world (Limbu, 2014). Storytelling on electronic platforms can become powerful if adopted and delivered with appeals known as digital storytelling (Hassan, 2016). With digital storytelling, technologies allow individuals to organize their educational messages through sophisticated multimedia and to participate in the cross-cultural communication (Kozdras, Joseph, & Kozdras, 2015). Digital storytelling brings the time-honored teaching and learning achievements of storytelling with the modern student's affinity for technology (Bhattacharyya, 2012).

DOI: 10.4018/978-1-5225-3822-6.ch043

Digital storytelling represents an interesting method to establish a methodology that takes advantage of multimedia technologies to develop learning mechanisms (Carrozzino, Evangelista, Neri, & Bergamasco, 2012). The inherent interactivity of the Internet and the emotional engagement of digital story can lead to transformative learning experiences in the media-rich environments (Kalogeras, 2013). Educational leaders (e.g., school district managers and administrators who are implementing mobile learning devices) need deeper comprehension of the value of such technology initiatives and the types of technological support needed to bring about the meaningful learning projects toward effective digital programs (Ostashewski & Reid, 2013).

The growing digital experiences have radically transformed the traditional approach, and have traced the route for a new communication paradigm in education (Ganzerla, Colapinto, & Rocco, 2015). The 21st century literacy skills increasingly reflect the ability to use technology (Pilgrim & Bledsoe, 2013). Digital literacy for students and learners has developed into an important dimension of information and communication technology (ICT)-related educational policies worldwide (Karagiorgi & Gravani, 2012). The balanced literacy approach to teaching, reading, and writing derives from the philosophy that students learn best through opportunities for authentic reading and writing experiences (McGinnis, 2013). It becomes imperative for technology to be embedded in the digital literacy methods courses to prepare the future teachers of writing (Werderich & Manderino, 2014).

In the educational process, teaching with technology is as challenging as it is necessary as the 21st century has facilitated learners ever more vigorously into the digital age, offering multimedia for interpreting the world (Chen, 2016). Regarding digital literacy, the utilization of computers and video games, combined with more traditional storytelling, serves as the useful tools for motivating and engaging students as well as promoting learning in education (Jin, DaCosta, & Seok, 2016). Thus, teachers should consider how best to teach and apply their digital literacy skills in their classrooms so as to support the students' digital literacy development toward gaining better educational performance (Wake, 2013).

This chapter aims to bridge the gap in the literature on the thorough literature consolidation of digital storytelling and digital literacy. The extensive literature of digital storytelling and digital literacy provides a contribution to practitioners and researchers by revealing the advanced issues and prospects of digital storytelling and digital literacy in order to maximize the impact of digital storytelling and digital literacy in modern education.

BACKGROUND

Nowadays, many teachers are under pressure to provide the evidence of the impact that coursework has on student learning, and student-generated digital stories provide the valuable artifacts of learning (Matthews-DeNatale, 2013). In recent years, digital stories have been used for both teaching and learning purposes as a result of the advancements of technology and overspread use of technological devices by students and teachers (Soleymani, 2015). A constructive teaching approach is adopted to allow students to create their own digital stories based on an authentic experience and express their thoughts (Tay, Lim, & Lim, 2011). Unlike the traditional stories, digital stories have multimedia format and are made with different types of technological tools (Soleymani, 2015).

The advent of digital storytelling in educational environments is based on theories by which learning is a result of knowledge building (Psomos & Kordaki, 2012). Digital storytelling is a concept that

is growing in popularity and one which offers versatility as an instructional tool (Wright, 2008) and aims at generating the compelling stories based on the user's input (Smed, 2014). Digital storytelling approach provides students with several opportunities that enable them to utilize technology as the active participant designers in the process of putting forward their creativity and that allow them to create their own original and creative languages (Eristi, 2014). The integration of both traditional and new literacy practices is evident throughout the process of creating a digital story (Shelby-Caffey, Úbéda, & Jenkins, 2014).

Digital literacy is the set of skills, knowledge, and attitudes required to effectively access the digital information (Julien, 2015) and is one of the core competencies for the 21st century (Voogt, Erstad, Dede, & Mishra, 2013). In order to adequately characterize literacy, the definition of digital literacy has to capture the relationship between literacy and new technologies (Bodomo, 2010). Davis, Palmer, and Etienne (2016) defined digital literacy as the ability to access, analyze, evaluate, and produce messages and information across a range of ICT in a variety of social settings. Martinovic, Freiman, Lekule, and Yang (2015) viewed digital literacy as the ability to effectively use digital technologies for learning, working, and functioning in a modern society. Digital literacy needs, including general computing skills, computerized communications, distance education, and Web 2.0 tools can make navigating coursework an additional challenge (Hsu, Wang, & Hamilton, 2013).

Technologies used in teaching can be delivered through many mechanisms, such as slide projectors, overhead machines, filmstrip projectors, TV, interactive whiteboards, and computer projectors (Streeter, 2011). The changing nature of online engagement privileges interaction over information (Merchant, 2009a). Many online classes make use of discussion boards, on which students can interact with their peers, the content, and the instructor (Wegmann, 2010). With the rapid development of information technology (IT), the trend in education and learning has changed from traditional in-class teaching to teaching through digital media. In order for technology knowledge to be transferred to the classroom, teachers need to find both knowledge and digital literacy skills being taught relevant to their future classrooms (Ottenbreit-Leftwich, 2012).

The increase in the popularity of mobile and social media practices, from texting and sharing multimedia to social networking and online gaming, has aroused the discussion around the affordances of technologies for the creative learning (Ranieri & Bruni, 2016). While access to technology is rapidly growing, educators need to be aware that students' technological knowledge and skills are diverse (McAdams & Gentry, 2014). Regarding digital literacy enhancement in education, teachers and schools need to predict and prepare students for their future, the scope of which covers teaching students how to effectively apply digital technologies and information, how to think, and how to communicate (Tsai, Shen, & Lin, 2015). Technology education continues to rapidly develop as the basic channel for preparing students and learners concerning digital literacy (Thomas, 2016).

IMPORTANT PERSPECTIVES ON DIGITAL STORYTELLING AND DIGITAL LITERACY

This section emphasizes the overview of digital technologies; the overview of digital storytelling in education; and the overview of digital literacy in education.

Overview of Digital Technologies

The rapid development in digital technologies during the digital era confronts individuals with situations that require the utilization of an ever-growing assortment of technical, cognitive, and sociological skills that are necessary in order to perform and solve problems in the digital environments (Eshet, 2005). Modern digital technologies provide users with opportunities to create visual art and written works by reproducing and manipulating texts, visuals, and audio pieces (Eshet-Alkalai, 2009). Students need to be aware about the growing technologies and media so that they can effectively access, evaluate, and create the media messages of all kinds (Mahajan, Rather, Shafiq, & Qadri, 2016).

As digital technologies and social media have become the integral parts of individual's everyday life, there is a global trend for effectively integrating them in education (Marav & Espinoza, 2015). Technology utilization has been found to have the greatest effect on learning (Gibson, 2006). Universities and colleges are required to incorporate digital technologies into teaching and learning (Haneef, 2015). Using digital technologies to make both learning and teaching educationally productive must be cultivated over time (Arnseth & Hatlevik, 2010). An increasing reliance on digital technology necessitates the development of digital literacy skills to enable individual's continued participation in the digital age (Antonio & Tuffley, 2015).

Digital technologies refer to a subset of electronic technologies that include hardware and software utilized by both children and adolescents for educational, social, and recreational purposes (Ng, 2013a). The digital environment provides the abundance of multimedia and offers the new potential for using resources in the multiple modes of representation for teaching and learning (Matusiak, 2013). For example, learning with mobile devices is the need to develop the associated digital literacy in students (Ng, 2013b). Augmented by recent developments in user interfaces, the use of mobile devices is likely to broaden both user receptiveness and acceptance of video learning content in modern education (Abdous, Facer, & Yen, 2015).

Over the past three decades, new digital technologies have rapidly proliferated and transformed the character of both public and interpersonal communications (Underwood & Parker, 2011). Among the technological developments in educational environments are technology applications that allow individuals to express themselves better, to recognize their own potential, and to develop themselves (Eristi, 2014). The expectation for responsive change to the changing student learning needs significantly comes in the form of educators' attempts to transform K-12 classrooms with digital technology (Leneway, 2014). Digital curation appears to be an approach that helps frame an inquiry-based pedagogy geared toward student engagement and digital literacy comprehension (Mills, 2013).

Digital technologies are mainly used to communicate in social networks or to play music and movies (Cartelli & Di Nuzzo, 2013). Technology mediates the way in which students around the world communicate, consume content, and create meaning (Botha, Vosloo, Kuner, & van den Berg, 2009). The close relationship between modern technology and humanity affects the way of learning and teaching (Incikabi, 2015). Digital reading and writing are affecting not only how K-12 students think about literacy, but also how teachers teach and how educators and researchers define and investigate literacy (Foley, Guzzetti, Agnello, & Lesley, 2014). Beyond developing reading and writing skills, it is necessary to emerge in the digital culture and master the different codes of different languages (Fantin, 2012).

Community-based digital storytelling must take seriously the realities of the digital divide, and must consider the social, political, economic, and cultural contexts of communities and their specific relationship to digital technologies to ensure that educational communities have the effective access to

the digital medium (Tharp & Hills, 2004). Preservice English teachers reflect the positive perceptions toward the use of digital storytelling (Aşık, 2016). Their reflections are significant in terms of the tools to be used for digital storytelling, the viewpoints regarding young learners, and the improvement in their technological pedagogical content knowledge (TPACK) (Aşık, 2016). TPACK is one of the technology integration models that focuses on the effective technology integration regarding the teacher's technology integration competencies (Yurdakul, Odabasi, Sahin, & Coklar, 2013).

Overview of Digital Storytelling in Education

Digital storytelling refers to the use of digital media to produce and disseminate stories (Davis & Foley, 2016). Digital storytelling is an innovative tool and serves as a promising activity facilitating learning and development in the post modern society (Nilsson, 2008). Digital storytelling includes a special emphasis on the group process and the experience of individuals sharing stories with each other. Digital storytelling combines the functions of visualizing and verbalizing, which are essential for language comprehension and thinking from the perspective of cognitive neuroscience (Kimura, 2012). Digital storytelling provides the interactive approach for establishing learner communities, engaging learners in digital literacy, and creating educational opportunities for the global audience interaction (Alameen, 2011).

In recent years, digital storytelling models have helped teachers achieve the improved outcomes (Smeda, Dakich, & Sharda, 2014). Acquiring new literacies and learning how to integrate them into the classroom will take considerable time and resources. School must be prepared to invest both. Rather than focusing primarily on skills in technology and the development of high-quality media products, facilitators take care to build and further community connections through a process of reflecting on the stories in the classroom. Encouraging preservice teachers to reflect on their digital literacy stories provides them with the opportunity to connect their past experiences as literacy students with their present and future goal of becoming the digital literacy teachers (Hughes & Robertson, 2013). Preservice teachers can facilitate both mathematical problem-solving competences and pedagogical competences for applying digital storytelling in solving mathematical problems (Starčič, Cotic, Solomonides, & Volk, 2016).

Digital storytelling has the potential to contribute to the formation of new knowledge, expand dialog, and promote the exchange of ideas. Digital storytelling is the important approach for the transformative learning (Christopher, 2011) and is effective in both early child education and in all areas of higher education (Wang & Zhan, 2012). Digital storytelling projects can be beneficial in the development of student media production skill sets (Spicer & Miller, 2014). To optimize opportunities for this development, teachers are encouraged to consider the required media components with relevant production tasks and skill sets while designing a digital storytelling assignment toward digital programs (Spicer & Miller, 2014).

The process of digital storytelling requires that students explore the relationship between narrative, audio, and visual text, offering both storyteller and audience the multiple layers of meaning-making within each story. Research in online reading comprehension is informed by theoretical work in new literacies (Leu, Kinzer, Coiro, & Cammack, 2004). Additional reading comprehension skills are required to be a successful online reader (Coiro & Dobler, 2007). Little instruction in the new demands of online reading comprehension takes place in schools (Leu, 2006). Teachers will benefit from an understanding of new instructional models that take full advantage of the Internet, such as Internet Workshop (Leu, 2002), Internet Project (Leu, Leu, & Coiro, 2004), and inquiry models (Eagleton, Guinnee, & Langlais, 2003).

In game-based learning (GBL) and in teaching using virtual worlds, educational designers creating the learning products and teachers providing them to students are both faced with a dualism between instruction and construction (Martens & Maciuszek, 2013). Educational computer games can motivate students to develop the basic competencies and encourage challenging themselves to be better and learn the additional knowledge related to the important tasks (Kasemsap, 2017). Most of the literature supports the notion that the experience of creating digital stories can have a positive impact on the students' acquisition of literacy skills and their motivation to engage with the text (Tobin & Blanton, 2014). How-to manuals, project descriptions, and anecdotal comments are available on digital storytelling (Love, Cushing, Sullivan, & Brexa, 2011).

This section is dealing with the overview of digital storytelling in education and the next section is dealing with the overview of digital literacy in education. Digital storytelling is the process of using story and digital media for personal expression. This includes expressive outlets, such as blogs, podcasts, and social media. Performing digital stories encourages youth to move beyond the role of consumer and into the role of producer of media, and thus of culture. This process helps build cultural capital among young people. At its core, digital storytelling invites youth to combine technology, performance, and personal experience to contribute to the educational world.

Effective digital storytelling relies on creative, group facilitation skills, and an ability to structure a safe space for young people to share, listen to, and reflect on educational experiences toward improving digital literacy in education. Digital storytelling is utilized in the K-12 classroom to build community through personal exchange and reflection; support creativity, communication, and collaboration; foster connections between curriculum content (inside the classroom) and students' lived experiences (outside the classroom); engage youth in research, writing, and reflection; support peer-to-peer teaching and learning; and to promote language skills, as well as visual and media literacy.

Overview of Digital Literacy in Education

Literacy is a basic principle of any educational system (Heredero, 2012). Digital literacy refers to the ability to use digital technology to locate, evaluate, and create the information (Manzoor, 2016). Digital literacy represents the changes in the traditional views of literacy due to the impact of the Internet and technology tools (Pilgrim & Bledsoe, 2015). The 21st century literacy perspective can support the inclusive literacy practices that create the community of learners, utilize the digital tools to make the curriculum accessible, and link the academic goals with the real-world platforms (Price-Dennis, Holmes, & Smith, 2015). Blogs are recognized as the media-rich platforms in which learners operate with plural modes of literacy to construct educational meaning (O'Byrne & Murrell, 2014).

Digital literacy has gone from a virtually non-existent entity to an essential skill set (Weisberg, 2016). Introducing digital literacy into classroom settings is an important task and is encouraged by both policymakers and educators (Merchant, 2009b). The digital literacy practices of many educational communities provide the new ways of technological and digital culture (Tan, Abdullah, & Saw, 2012). Regarding cultural transition, global society moves from a literary society to digital one, adopting the widespread use of advanced technologies, such as the Internet and mobile devices (Rivoltella, 2008). Digital literacy education requires each learner to grasp unfamiliar terminology, learn skills for unfamiliar tools, and apply complex ideas to digital interactions (Donohue & Kelly, 2016).

With technology infused throughout the standards, teacher preparation programs are confronted with the challenge of priming preservice teachers to be the technologically literate educators ready to cultivate

the educational curriculum for 21st century learners (Robinson, 2014). As technology becomes more and more accessible outside of the classroom, educators are challenged to reconsider the digital literacy skills required to be successfully literate (Wells & Lyons, 2016). Becoming literate in the 21st century means that one must decode and comprehend multimodal digital texts and be able to purposefully engage with these texts with others (Mills, 2014). A digitally literate person must possess a wide range of abilities necessary to collaborate and present information through multimedia (Pilgrim & Bledsoe, 2013).

Digital literacy incorporates an ability to critically evaluate information, communicate concepts, and express ideas in a wide variety of media, all mediated by computers (Kennedy, 2008). Education institutions need to prepare their students and their own organizational processes to thrive in the age of digital knowledge practices (Littlejohn, Beetham, & McGill, 2012). The lack of knowledge of how to operate and utilize digital tools is a critical barrier to the enhancement of digital literacy (Lee, 2014). Teachers are confronted with not only developing curricula that focus on the important learning components, but also with incorporating curricula that highlight the technological skill sets students need to be the successful learners (Mallon & Gilstrap, 2014).

The development of digital learning skills in school curricula challenges the designers of educational software (Utsi & Lowyck, 2009). Regarding digital literacy, many students gain transformative benefits from knowing how to perform various tasks on the Internet and computers (Lee, 2015). ICT training can motivate students to develop digital literacy, numeracy, and language skills (Jimoyiannis & Gravani, 2012). By using digital literacy skills, students are able to utilize the forms of literacy for non-text based instructional material increasing the options available for them to learn (Brown, 2016). In addition to incidental learning taking place in virtual environments, learning style and digital literacy seem to predict the incidental learning in some instances (Thomas & Boechler, 2016).

The emergence of digital literacy skills to better fit the networked information economy presses higher education institutions (HEIs) to invest in the digitally rich environments that allow learning to be personalized, taking place in multiple locations and at time that suits both students and learners (Coutinho, 2016). In the higher education sector, technological resources have been devoted to the development of the virtual and game-based environments (Kennedy-Clark & Wheeler, 2014). Game technology can be successfully utilized to aid in the development of social skills among those with special needs (Kinsell, DaCosta, & Nasah, 2015).

The digital society is characterized by an extensive utilization of digital technologies (Rodríguez-de-Dios & Igartua, 2016). Facing digital society means to accept the need of a digital literacy (Vasilescu, Epure, & Florea, 2013). It is important to provide the cognitive and emotional support for the risk-taking cycles of experimentation and trial-and-error process that is essential for learning to utilize the digital tools (Hobbs & Coiro, 2016). Teachers and students use many digital tools including computers, iPads, and videos, and demonstrate practices that characterize the 21st century skills, such as collaborative learning, technology literacy, and information literacy (Lawrence, 2016).

Pedagogical decisions associated with the use of digital tools are an important part of the new literacies for 21st century learning. The utilization of digital tools requires educational leaders to consider what digital literacy means in the 21st century (Brown, 2014). Many digital tools offer the innovative approaches for writing instruction in K-12 settings (Brown, 2014). Handheld computers have the potential to have a tremendous impact on teaching and learning in the K-12 classroom (van 't Hooft, 2006). Laptops, personal digital assistants (PDAs), and cellular phones are the major components of digital literacy (Garland, 2006). The iPad-based curriculum can promote the critical digital literacy skills for students (Hilton & Canciello, 2013).

Modern technology continues to revolutionize the teaching and learning landscape establishing the new possibilities to utilize the new digital media to digitally enhance the multiple literacies (Levitt & Piro, 2016). Enhanced user engagement and collaboration are recognized in terms of rich media experience, semantic interaction services, intelligent content processing, and management automation over the interoperable multiplatform environments (Matsiola, Dimoulas, Kalliris, & Veglis, 2015). The pedagogical value of technological video projects creates the opportunities for learners to interact with authentic materials in the real world by searching for relevant information, thus developing their own interpretation and producing the multimedia video (Huang, 2015).

Preservice teachers indicate the transformative practices in two ways: firstly, through designing lessons that indicate that they will teach differently than the way that they were taught; and secondly, through utilizing digital literacy as a method of reflecting on their own social identities and working for the educational changes in both culture and society toward transforming the status quo (Hughes & Robertson, 2013). Concerning technology-rich teacher education programs, teacher educators engage preservice teachers in the world of diversity using technology (Thomas, 2016). Both the use of digital technology and the digital literacy pedagogy can help preservice teachers reflect on personal experiences to digitally develop both literacy teaching and learning practices that have the transformative elements (Robertson & Hughes, 2010).

FUTURE RESEARCH DIRECTIONS

The classification of the extensive literature in the domains of digital storytelling and digital literacy will provide the potential opportunities for future research. A virtual classroom is a teaching and learning environment where participants can interact, communicate, discuss presentations, and engage with the learning resources while working in groups, all in an online setting. A course management system (CMS) is a set of tools that enables the teachers to create the online course content and post it on the Web 2.0 without having to handle hypertext markup language (HTML) or other programming languages. An examination of linkages among digital storytelling, digital literacy, virtual classroom, and CMS in education would seem to be viable for future research efforts.

CONCLUSION

This chapter highlighted the overview of digital technologies; the overview of digital storytelling in education; and the overview of digital literacy in education. Digital storytelling and digital literacy are very important in modern education. With the advancement of digital tools, the practice of digital storytelling has become prevalent. Digital storytelling is used to improve student's learning through multimedia in the modern classrooms. Digital storytelling is the expressive medium that can explain even the most intricate topics in depth, integrating it with the rest of the curriculum. Digital storytelling can be shared on each student's device through the Internet and can make the classroom learning much more practical and easy in the modern learning environments.

Digital literacy is the ability to use ICT to find, evaluate, create, and communicate information, requiring both cognitive and technical skills. Digital literacy leads to the great increases in information that can be conveniently accessed. Teachers must be cognizant of promoting digital literacy, putting the

proper utilization of digital tools and technology right on par with reading and writing. Teachers and students must determine which tools are essential to their digital literacy tool kit. Embedding digital literacy lessons and social media across the curriculum can open up a wide variety of educational tools for teachers and students.

Commitment to providing digital tools must come with a commitment to providing fidelity in instructional practice toward effective digital storytelling and digital literacy for teachers and students. Allowing students to find their own learning resources creates a true personalized learning environment. The developed digital literacy skills through learning and development programs provided by universities and colleges can afford students the ability to seek out and utilize knowledge resources that help them create a personal learning connection in the digital age. Developing digital storytelling and digital literacy has the potential to improve both teaching and learning performance in modern education.

KEY TERMS AND DEFINITIONS

Digital Literacy: The ability to find, evaluate, utilize, share, and create the content using information technology and the Internet.

Digital Storytelling: The practice of using computer-based tools to tell the stories.

Information Technology: The set of tools, processes, and associated equipment employed to collect, process, and present the information.

Knowledge: The state of knowing about or being familiar with something.

Learning: The activity of obtaining knowledge.

Literacy: The knowledge of the particular subject.

Storytelling: The art of telling stories.

Technology: The utilization of scientific knowledge to solve the practical problems, especially in industry and commerce.

Chapter 44
Copyright Protection of Audio Using Biometrics

Muhammad Yaasir Khodabacchus
University of Mauritius, Mauritius

ABSTRACT

In our global community, the Internet, the issue of copyright is increasing. The International Maritime Bureau (IMB) reported over thousands of incidents this year compared to three hundred only ten years ago. Although laws and other ways have been intended to protect the rights of content developers and describe restrictions that can be placed on copying materials, pirate users always find a way to breach the protection. Base on this fact, a new method has been implemented using biometrics as it is described in the following chapters. This paper was developed taking into consideration one of the most widely used biometrics which is the fingerprint. Precisely, the aim of the system includes embedding the fingerprint into an audio file which can only be read using the fingerprint of the registered user.

INTRODUCTION

In today's information technology era, a pirate user is offered a plethora of opportunities to make illegal copyrights with the use of digital techniques in the creation, editing and distribution of multimedia data. Furthermore, the widespread usage of Internet is providing additional channels for a pirate to quickly and easily distribute the copyrighted digital content without the fear of being tracked. As a result, the protection of multimedia content is now receiving a substantial amount of attention. In recent years solutions such as steganography and encryption were found, but due to some problems, pirate users have been able bypass the security provided by these techniques.

Biometrics is an alternative solution to eliminate copyright problem. The field of biometrics has been able to prove effective in various fields such as protection of sensitive data at the Federal Bureau of Investigation and the Central Intelligence Agency and also in biometric passports to authenticate the identity of travellers.

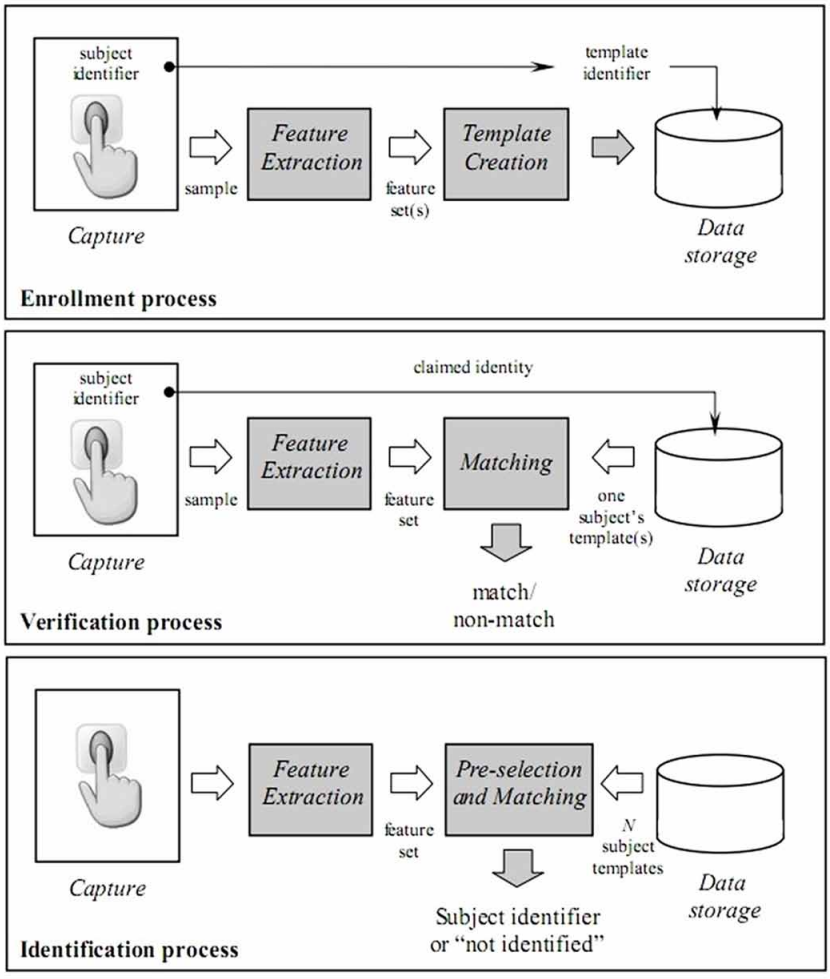
DOI: 10.4018/978-1-5225-3822-6.ch044

The ability to relate biometric to multimedia can enhance the trustworthiness of a system. In this paper, biometrics will be combined with existing protection technique such as steganography to alleviate the problem of copyright.

Biometrics Overview

The word biometrics is derived from the Greek words bios (meaning life) and metron (meaning measurement), so biometrics is in essence, the measure of life (Lim Dong, 2010). As the level of security breaches and fraud increases, the need for highly secure identification and personal verification technologies is becoming apparent

Figure 1. Biometrics Architecture (Jain et al, 2009)
Source: Jain et al. 2009



Biometrics System

For any biometric system the most important aspect for it to work properly is that the individual must first be enrolled. Furthermore in designing a practical biometric system is to determine how an individual is going to be recognised. Depending on the application, a biometric system may be called either a verification system or an identification system:

- **Enrolment:** User enrolment is a process that is responsible for registering individuals in the biometric system storage. During the enrolment process, the biometric characteristic of a subject is first captured by a biometric scanner to produce a sample. A quality check is often performed to ensure that the acquired sample can be reliably processed by successive stages. A feature extraction module is then used to produce a feature set. The feature set is then used to produce an enrolment template. The enrolment template is stored in the system storage together with the demographic information about the user.
- **Verification:** The verification process is responsible for confirming the claim of identity of the subject. During the recognition phase, an identifier of the subject is provided to claim an identity. The biometric scanner captures the characteristic of the subject and converts it to a sample, which is further processed by the feature extraction module to produce a feature set. The resulting feature set is fed to the matcher, where it is compared against the enrolment template of that subject. A match/non-match decision is produced by the verification process.
- **Identification:** In the identification process, the subject does not explicitly claim an identity. The system is set to compare the feature set against the templates of all the subjects in the system storage. The output is a candidate list that may be empty or contain one identifier of matching enrolment templates.

Traits

Any human anatomical or behavioural trait can be used as a biometric identifier to recognise a person as long as the following requirements are satisfied: (Jain et al, 2009)

- **Universality:** Each person should have the characteristic.
- **Uniqueness:** How well the biometric separates individuals from another.
- **Permanence:** Measures how well a biometric resists aging
- **Collectability:** Ease of acquisition for measurement.
- **Performance**: Accuracy, speed, and robustness of technology used.
- **Acceptability:** Degree of approval of a technology.
- **Circumvention:** Ease of use of a substitute.

Examples of biometrics (Table 1).

Table 1. Biometrics traits

Bertillonage	Measuring body lengths
Fingerprint	Analysing fingertip patterns
Facial Recognition	Measuring facial characteristics
Hand Geometry	Measuring the shape of the hand
Iris	Analysing features of coloured ring of eye
Retinal	Analysing blood vessels in eye
Vascular Pattern	Analysing vein pattern
DNA	Analysing genetic makeup

Recent Application

Forensics

Biometric recognition techniques have been used in forensic applications for over 100 years. They have helped criminal investigations, identified disaster victims, and helped to locate missing children. Biometric systems can spare investigators the time-consuming process of sorting through thousands of files by hand.

Government

Forged or stolen identification cards are a common security problem all over the world. According to the United Kingdom's Identity and Passport Service, over 290,000 U.K. passports are lost or stolen each year. Some international airports are adopting iris, fingerprint, or face recognition systems to prevent individuals from entering a country using false credentials.

Commercial

The need to protect personal information has led to the deployment of numerous commercial biometric recognition systems. In the U.S. alone, identity theft and credit card fraud strike millions of consumers every year, with an annual cost of around $50 billion dollars. More and more personal and private data is stored in electronic form: medical history, credit card information, vital statistics, and more. Biometric recognition techniques add an extra layer of security to traditional password-based systems or replace them altogether.

Scope of the Work

The multimedia protection system requires that a biometric sample is verified against a biometric sample stored in a multimedia file. Three components are used for both enrolment and verification stages:

1. A mechanism is used to scan and capture digital images of individuals' biometric characteristic.
2. An agent and database are used to process and store the image as binary files for verification process.

3. An application system is used to interact with individuals for confirming their true identity.

BACKGROUND

Background Study is set to exploit one of the most popular biometrics, the fingerprint. A fingerprint is an impression of the friction ridges of all or any part of the finger. Using the template created concepts for copyright protection can be derived to be used in today's modern era.

Fingerprint Formation

Fingerprints are fully formed at about seven months of fetus development. Finger ridge configurations do not change throughout the life of an individual except due to accidents and cuts on the fingertips (Babler, 1991). This property makes fingerprints a very attractive biometric identifier.

Fingerprint History

A timeline from prehistoric until 1999 of how fingerprint became part of everyday life and an important tool in maintaining security is placed in the Appendix.

Fingerprint Sensing

Historically the acquisition of fingerprint images was performed by using the so-called "ink- technique". While this technique is still in use, new technologies such as sensors are being used to acquire better quality images.

Offline Technique

In the ink-technique the finger skin is first spread with black ink and then pressed against a paper card. The card is then converted into digital form by means of a paper scanner or by using a high-quality camera.

Live Scan

The most important part of a fingerprint scanner is the sensor, which is the component where the fingerprint image is formed. The two most common families of fingerprint scanner that exist are:

- Optical
- Solid-state

- **Optical Sensors:** The finger touches the top side of a glass prism, but while the ridges enter in contact with the prism surface, the valleys remain at a certain distance. The left side of the prism is illuminated through a diffused light. The light entering the prism is reflected at the valleys, and absorbed at the ridges.

Figure 2. Images acquired off-line with the ink technique
Source: Maltoni, 2003

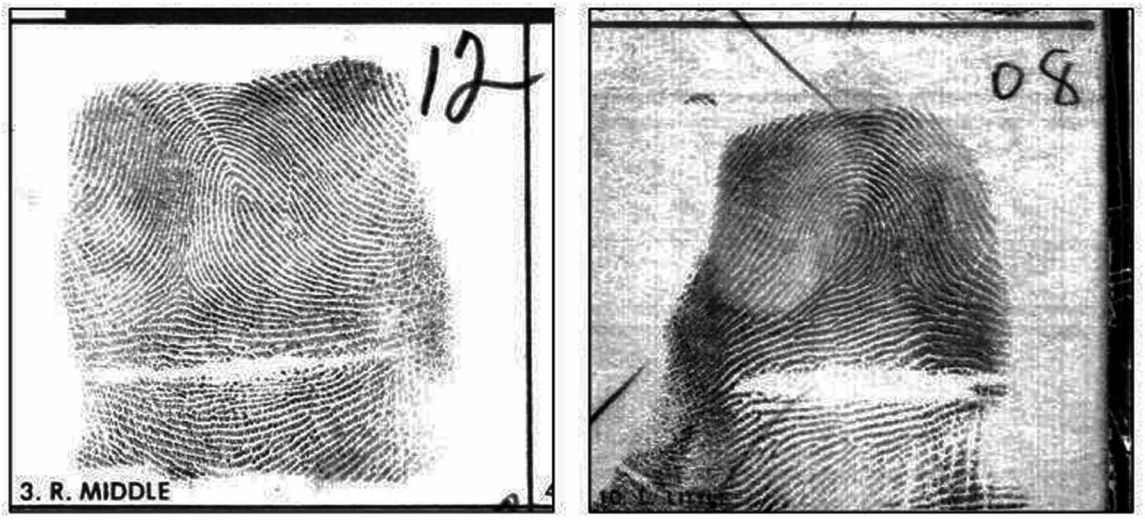


Figure 3. Optical sensor
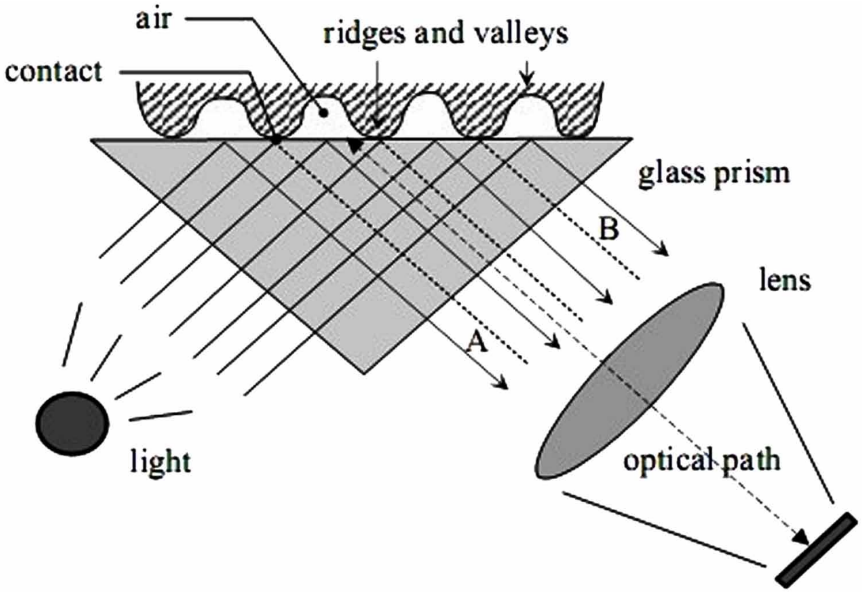
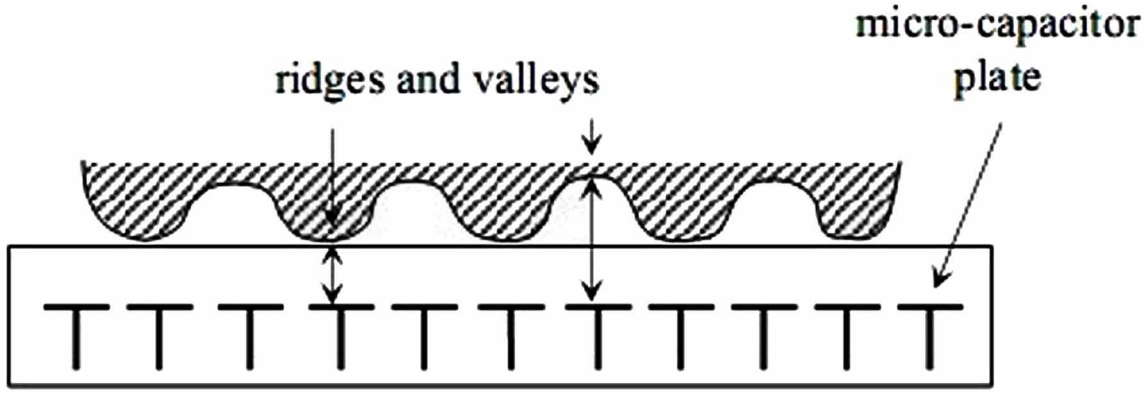
Source: Maltoni, 2003



- **Solid-State:** All solid state-based sensors consist of an array of pixels, each pixel being a tiny sensor itself. The user directly touches the surface of the silicon. A capacitive sensor is a two-dimensional array of micro-capacitor plates embedded in a chip. The other plate of each micro capacitor is the finger skin itself. Small electrical charges are created between the surface of the finger and each of the silicon plates when a finger is placed on the chip. The magnitude of these electrical charges depends on the distance between the fingerprint surface and the capacitance plates.

Figure 4. Solid-state sensor
Source: Maltoni, 2003



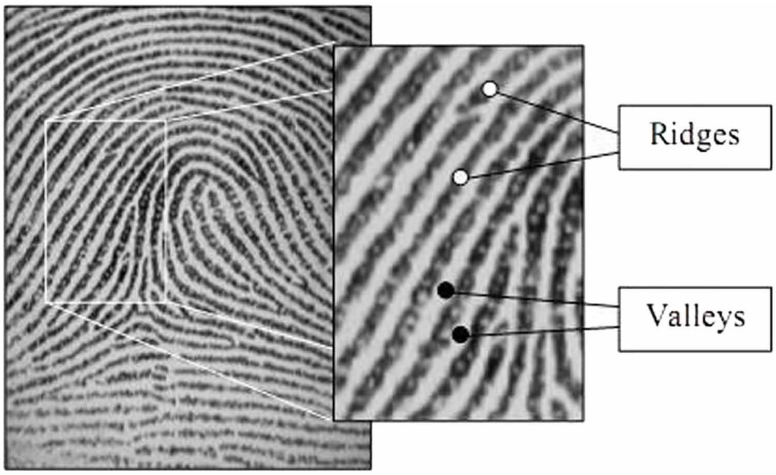
Storage

Storing raw fingerprint images may be problematic for large-scale identification systems. In 1995, the size of the FBI fingerprint card archive contained over 200 million items, and archive size was increasing at the rate of 30,000 to 50,000 new cards per day. Although the digitization of fingerprint cards seemed to be the most obvious choice, the resulting digital archive could become extremely large. In fact, each fingerprint card, when digitized at 500 dpi requires about 10 megabytes of storage. (Jain, 2007)

Representation and Feature Extraction

A fingerprint is the reproduction of a fingertip epidermis, produced when a finger is pressed against a smooth surface. The most evident structural characteristic of a fingerprint is a pattern of interleaved

Figure 5. Ridges and valleys in a fingerprint image (Jain & Prabhakar, 2009)
Source: Jain & Prabhakar, 2009



ridges and valleys. Ridges and valleys often run in parallel; sometimes they bifurcate and sometimes they terminate. Generally, the period of a ridge/valley cycle is about 500 μm. (Jain et al, 2003)

Level 1

When analyzed at the global level, the fingerprint pattern exhibits one or more regions where the ridge lines assume distinctive shapes. These regions may be classified into three typologies: loop, delta, and whorl. Singular regions belonging to loop, delta, and whorl types are typically characterized by ∩, Δ, and O shape, respectively. (Maio et al, 2003)

Singular regions are commonly used for fingerprint classifications, that is, assigning a fingerprint to a class among a set of distinct classes, with the aim of simplifying search and retrieval.

Level 2

At the local level, other important features, called minutiae can be found in the fingerprint patterns. Minutia refers to various ways that the ridges can be discontinuous. Although several types of minutiae can be considered, usually only a coarse classification is adopted to deal with the practical difficulty in automatically discerning the different types with high accuracy.

Extraction

There has been proposed many methods for the minutia extraction, the traditional method consist of the following steps: (Griaule, 2008)

Figure 6. Singular regions (white boxes) and core points (small circles) in fingerprint image (Maio et al, 2003)
Source: Maio et al, 2003

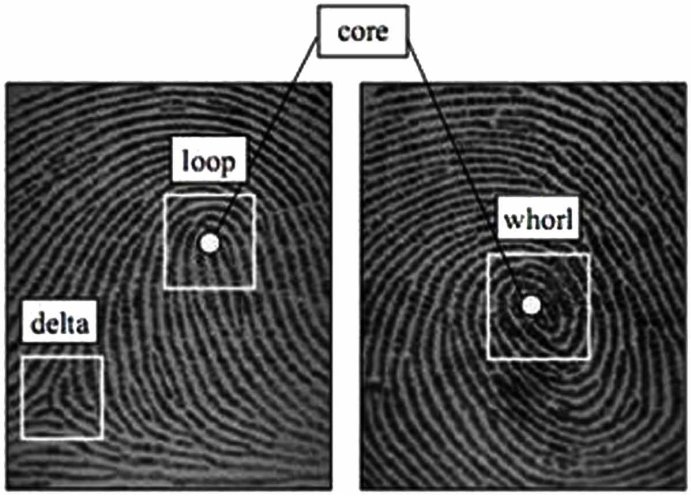


Figure 7. Classification of Fingerprint (Maio et al, 2003)
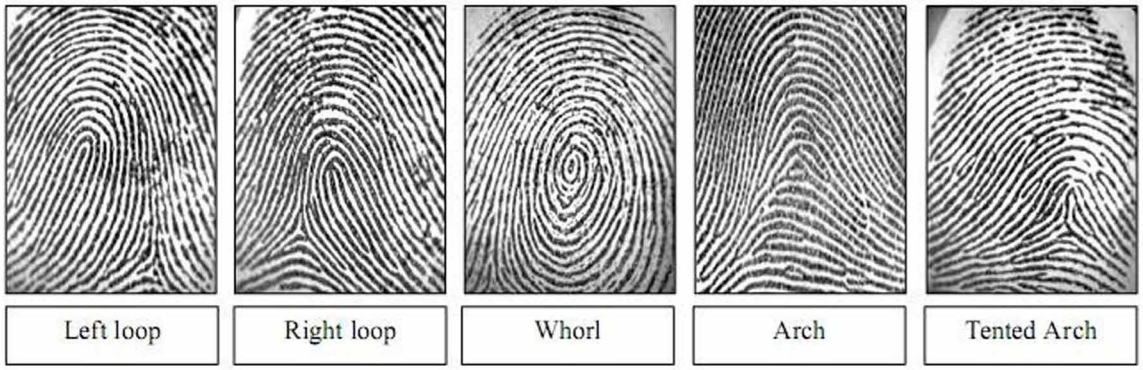
Source: Maio et al, 2003



- Binarization,
- Thinning
- Minutiae detection.

- **Binarization:** The global threshold value is used in converting the gray scale image in binary image. The intensity of the image has only two values: black, representing the ridges, and white, representing the valleys and the background.
- **Thinning:** The objective of thinning is to find the ridges of one pixel width. The process consists in performing successive erosions until a set of connected lines of unit-width is reached. This line is also called skeleton.
- **Minutiae Detection:** From the binary thinned image, the minutiae are detected by using 3x3 pattern masks. Although the process seems to be simple, it is necessary to consider the elimination of false detected minutiae.

The results of each step for minutiae extraction are shown in Figure 9.

Figure 8. Seven most common minutiae types (Jain & Ross, 2007)
Source: Jain & Ross, 2007

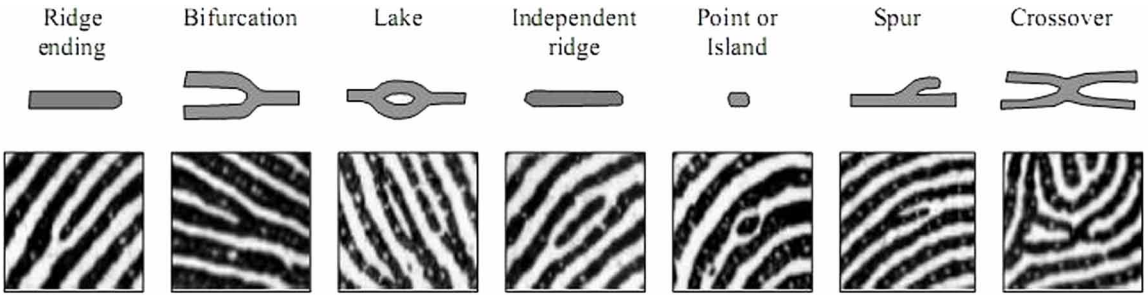


Figure 9. Minutia Extraction (Griaule, 2008)
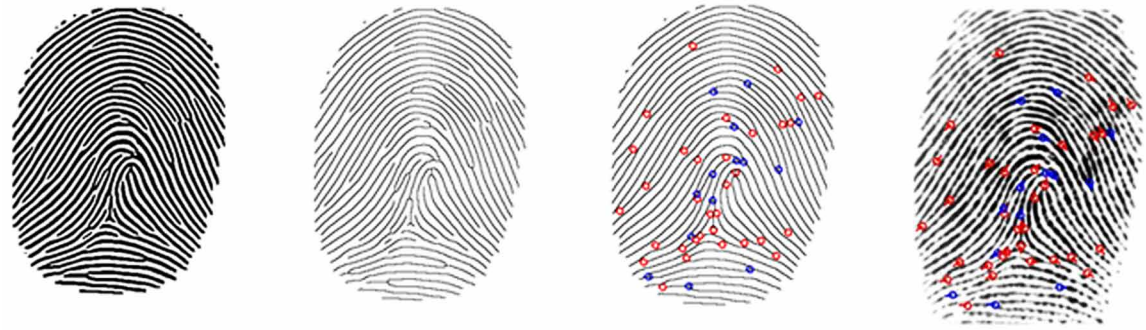
Source: Griaule, 2008

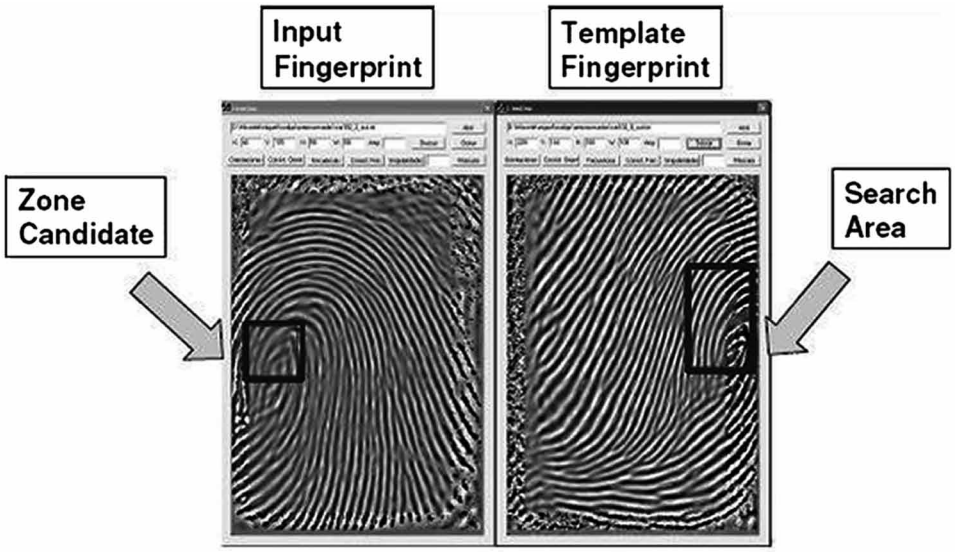


Matching

Correlation-Based Matching

In order to match two fingerprint using correlation based technique, the fingerprint are aligned and computed the correlation for each corresponding pixel, however as the displacement and rotation are unknown it is necessary to apply the correlation for all possible alignments. The singularity information may be useful in order to find an approximated alignment.

Figure 10. Correlation based Matching (Systems Lab, 2010)
Source: Systems Lab, 2010



Minutiae-Based Matching

This method tries to align the minutiae of the input image and stored templates and finds the number of matched minutiae. After alignment, two minutiae are considered in matching if the spacial distance and direction difference between them are smaller than a given tolerance. The query template (q) and reference template (r) are compared using their segments. Two segments (r,q) are considered in matching if their length (l) and angles (α,β) difference are below some threshold.

Where *tl* is the tolerance of the segments length difference and *ta* is the tolerance of the angles difference.

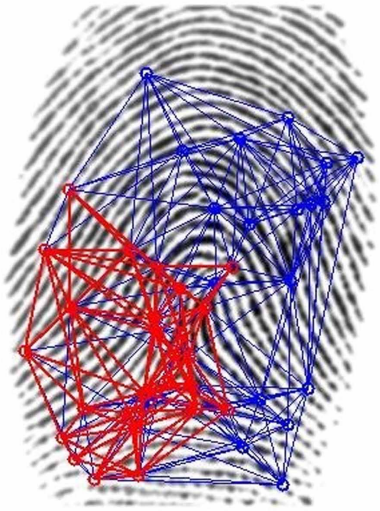
DIGITAL RIGHTS AND PROTECTION TECHNIQUES

The growth of the Internet has allowed images, audio, video and so on to become available in digital form. Though Internet is used as an additional way to distribute material to consumers it has also made it far easier for copies of copyrighted material to be made and distributed. In the past, pirating music

Figure 11. Matching Equation (Griaule, 2008)
Source: Griaule, 2008

$$\left|l_r - l_q\right| < tl$$
$$\left|\alpha_r - \alpha_q\right| < ta$$
$$\left|\beta_r - \beta_q\right| < ta$$

Figure 12. Matching Minutia (Griaule, 2008)
Source: Griaule, 2008



used to require some form of physical exchange. Using the Internet a copy stored on a computer can be shared easily with anybody regardless of distance often via a peer- to-peer network. Therefore it is harder for the copyright owner to locate and prosecute offending parties.

Today multimedia security can be achieved by a method or a set of methods used to protect the multimedia content against unauthorized access or against unauthorized distribution.

The methods are:

1. Encryption
2. Steganography and Digital Watermarking

Encryption

Encryption is the process of transforming plaintext using cipher to make it unreadable to anyone except those possessing the key. Encryption has long been used by militaries and governments to facilitate secret communication. Encryption is now used in protecting information within many kinds of civilian systems such as copyright protection. Multimedia encryption technology is used to provide end-to-end security when distributing digital content over a variety of distributions systems. (NewEncyclopedia, 2010)

Application in Multimedia Security

Digital images and textual digital media can be accomplished by means of standard symmetric key cryptography. Such media can be treated as binary sequence and the whole data can be encrypted using a cryptosystem such as Data Encryption Standard (DES). Encrypting the entire multimedia stream using standard encryption methods is often referred to as the naive approach. It involves careful analysis to determine and identify the optimal encryption method when dealing with audio and video data. It is also oriented towards exploiting the format specific properties of many standard video and audio formats in order to achieve the desired speed and enable real -time streaming. (Sharma et al, 2010)

Limitations

Even though encryption is the accepted standard, it is not foolproof. For this reason, it has not completely solved copyright infringement. Here are some of the main problems:

1. Encryption is susceptible to impersonation attacks.
2. Difficult to implement correctly and prone to weaknesses based on usage
3. Cryptanalytic attacks such as ciphertext-only attack and brute force attack can be used to eliminate the protection

Steganography

Steganography is derived from the Greek for covered writing and essentially means “to hide in plain sight”. As defined by Cachin (Cachin, 1998) steganography is the art and science of communicating in such a way that the presence of a message cannot be detected. Simple steganographic techniques have

been in use for hundreds of years, but with the increasing use of files in an electronic format new techniques for information hiding have become possible.

Types of Steganography

Steganography can be split into two types; these are Fragile and Robust (Cummins et al, 2004). The following section describes the definition of these two different types of steganography.

- **Fragile:** Fragile steganography involves embedding information into a file which is destroyed if the file is modified. This method is unsuitable for recording the copyright holder of the file since it can be so easily removed, but is useful in situations where it is important to prove that the file has not been tampered with. Fragile steganography techniques tend to be easier to implement than robust methods.
- **Robust:** Robust marking aims to embed information into a file which cannot easily be destroyed. Although no mark is truly indestructible, a system can be considered robust if the amount of changes required to remove the mark would render the file useless. Therefore the mark should be hidden in a part of the file where its removal would be easily perceived.

One of the most popular types of robust marking is Digital Watermarking.

Digital Watermarking

Digital watermarking is the process of embedding information into a digital signal in a way that is difficult to remove (Cummins et al, 2004). The signal may be audio, pictures or video. If the signal is copied, then the information is also carried in the copy. A signal may carry several different watermarks at the same time.

Limitations

Information hiding techniques still suffer from several limitations leaving them open to attack and robustness criteria vary between different techniques. Attacks can be broadly categorized although some attacks will fit into multiple categories (Cummins et al, 2004).

1. **Robustness**: Attempt to diminish or remove the presence of a unique identity
2. **Presentation**: Modify the content of the file in order to prevent the detection of the unique identity
3. **Implementation**: If the mark detection software is vulnerable it may be possible for attackers to deceive it.

MAIN FOCUS OF THE CHAPTER

In this section we shall look at recent research on Encryption, Steganography and Watermarking that could have help in mitigating the risk of copyright.

Encryption

Securing information is obviously a challenge for research worker as they are building creative and new approach to get it more safe. Over several decades, several encryption schemes are executed, each with different characteristics, pros and cons. There is a need to perform security evaluation of the schemes to analyse the research gap.

All methods may be generally classified into two types: symmetric- key cryptography and asymmetric - cryptography. The primary difference between both of these techniques is in relation to the kind of crucial decryption and encryption procedure used by them. In symmetric- cryptography, just one key is used for both decryption and encryption approach. This one crucial component is called the secret key or private key. When just one key is be used to do decryption and encryption procedure, the odds are quite high that the message may be decrypted by an unauthorised user. But this demerit will not necessitate the prevention of its usage due to the concealed efficacy inside.

In asymmetric - cryptography, two keys- private-key and still another public-key can be used for decryption and encryption procedure. This offers more safety and feasibility over symmetric - cryptography. In cases like this, public key can be used for encryption of data and private-key can be used for decryption of data. Asymmetric- cryptography is founded on sophisticated mathematical theories, where it is infeasible to locate the right private key of the receiver to decrypt the right information, even though, public-key may be available to everyone. These attacks are cost-effective when it comes to revealing the cipher text, although there are several kinds of attacks still potential with this cryptography.

RSA cryptosystem is among the asymmetric- cryptography, which centered its approach on some theories. It is strong in terms making data infeasible, inflexible, and cheap. The XOR method that is according to symmetric-key cryptographic supplies flexibility to pick distinct sequence of keys for every single round of encryption that allow to create option that is more robustness. But this does not in any way reduce its usability and profitability although, some attacks are possible with this cryptosystem.

A paper by Kulkalni (2015) proposes an efficient image encryption scheme according to a Peter De Jong disorderly map as well as an RC4 stream cipher. A Peter De Jong map is used to find out the original stream keys as well as during permutation phase. The stream generator is used to create the random figures for the diffusion procedures and the value spinning. Each encryption round is made up of three phases; permutation, pixel value rotation and diffusion. The permutation is based on scrambling the rows and columns, in addition, circular rotations of the rows and columns in alternate. By using M * N pseudo random numbers every single value circularly rotates. By scanning the picture in two manners, the final phase is carried out. In a different work proposed by Li (2015) a new picture encryption scheme is proposed base on two even-symmetric chaotic maps as well as a skew tent disorderly map. In the permutation procedure, a P-box is generated by sorting a straight-symmetric disorderly sequence is used to shuffle the locations of image pixels. In the diffusion method, equally symmetric map and skew map are employed to create the key stream. The pixels in the picture that is permuted discover which of two symmetric maps is iterated for byte in the key stream each time, therefore the key stream is carefully associated with the basic picture. Kwon, Lama, Pyun and Park (2015) suggest a sophisticated encryption of MP3 and MPEG4 coder using an excellent degradation-centered safety design. For the MP3 sound, the magnitude and phase details of changed discrete cosine transform (MDCT) coefficients is encrypted. DCT coefficients and motion vectors (MVs) are useful for the scrambling of the MPEG4 movie. This encryption scheme procures in understanding, has a degree of security, keeps format conformity, and gets better time performance by decreasing the volumes of multimedia contents. These qualities allow it

to be practical to integrate encryption and decryption procedure into de-compression and compression procedure, and therefore ideal for risk-free sharing or A/V transmission.

Kwon, Wang, Lian and Hwang (2011) suggest an enhanced partial encryption of watermarking and scrambling utilizing the magnitude advice of Modifed Discrete Cosine Transform (MDCT). In MPEG1/ Audio Layer III (MP3), the magnitude and phase details of changed discrete cosine transform (MDCT) coefficients is encrypted. The approach is aimed at safeguarding the contents after descrambled against eavesdropping and also against prohibited mass distribution, and uses both scrambling and watermarking.

Guesmi, Farah, Kaouchiri and Samet (2015) suggest a colour picture encryption scheme utilizing onetime keys according to crossover operator, chaos as well as the Secure Hash Algorithm(SHA2). The (SHA2) is used to create a 256-bit hash value from the clear-picture as well as the solution hash keys to help make the vital stream shift in every encryption procedure. The SHA2 worth is used to create three first values of the program that is chaotic. The permutation-diffusion method is dependent on cross over operator and XOR operator . Mosavi, Norouzi, Seyedzadeh and Mirzakuchaki (2015) suggest a new algorithm for image encryption on the basis of the hyper-chaotic system. To be able to create the first states of the -chaotic method, 256- bit outside secret key can be used. The algorithm contains three major sections. In the initial section, as an alternative to encrypting each pixel, columns and the rows of the picture are encrypted utilizing a row-column algorithm. To be able to achieve higher sensitivity, higher sophistication and higher-security, the next segment applies masking procedure that will be applied to every quarter of the picture which is to be encrypted, utilizing that sub-picture information itself and among the other sub-pictures as well as the typical information of other quarters of picture.

In the research dated 2015 by Verma, Singh and Kumar, a fresh encryption algorithm for protected video transmission is proposed utilizing permutation and doping perform, thus protection of the initial cipher was improved by inclusion of impurities to misguide the cryptanalyst. The synthetic neural networks are suitable for this particular goal in decryption algorithm, considering that the encryption procedure is one way perform. The ANNs have several features including learning, generalization information condition, precision, easy execution, and computer software and components availability, which can make it quite appealing for a lot of programs. Additionally demand of exchange before information exchange was removed.

A new method was proposed by Singh and Singh (2015) where the traditional means of mapping the figures to affine factors in the elliptic curve was removed. The ASCII values of the plaintext are matched up. The matched values function are used as input for the curve cryptography. This method prevents expensive operation of mapping as well as the need to talk about the typical look-up table involving the receiver and also the transmitter. The algorithm was created in this fashion that it may be used to encrypt or decrypt almost any script with defined ASCII values

Steganography and Digital Watermarking

Digital watermarking technologies is among the primary methods to recognize the protection and authentication of electronic functions in the info age, and lots of outstanding watermarking algorithms are proposed to reach distinct operations in various use. But, attackers can also use the plan fault of the algorithms to recognize their prohibited intent, including embedding authority, access without authority or removing without authority, and the security issue of watermarking system has become increasingly more serious.

Thus in the paper by Wang et al. (2015), an electronic watermarking centered copyright protection system is proposed with regard to information security in wireless sensor networks. In accordance with the special features of gathering data, the capability may be enlarged applying this approach to controlling both MSRB and LSB components of as the electronic watermarking to the info to be forwarded. The authors make use of the speed of information parsing to increase when the base station receives the information. So that one can reach and check the copyright defense on WSNs, both theoretical analysis and experimental results have shown the technique can efficiently find the data dependability.

Gopal and Powal (2015) newspaper comprises of various techniques of embedding and extracting watermarks, used in time-domain/spatial-domain and transform domain of transmission signal. Genetic Algorithm strategies can be used as the principal issue so as to ameliorate robustness of multimedia information and each the fidelity. Hallur (2015) paper describes the strong digital watermarking for grayscale picture according to algorithms discrete wavelet transform (DWT), discrete cosine transform (DCT) and singular value decomposition (SVD). The purpose of the paper will be to improve imperceptibility and robustness of the picture for approaches like cropping, rotation and compression.

Gosh, Chatterjee, Maity and Rahaman (2015) paper provides a brand new algorithm on wavelet established robust and imperceptible digital picture watermarking for multimedia protection. The algorithm was designed, executed and checked using MATLAB R2014a simulation for extraction and embedding of the watermark and the outcomes of which reveals major progress in efficiency metrics like PSNR Suggest Correlation, MSE than another algorithms in the literature that was current. The protect picture contemplated within our algorithm is of the size (256*256) as well as the binary watermark picture size is taken as (16*16).

Li, Zhang, Zhao and Wu (2015) present a strong algorithm of digital image watermarking based on discrete wavelet transform. Binary picture watermark is added by it in to grey picture as well as the host picture is needed for detecting. The algorithm have two features:

1. It is adapted to different grey pictures owing to utilizing the mean value of chosen coefficients.
2. Arnold change pre-treatment removes spatial correlation coefficient and disperses the malfunction bits among all picture elements to create watermarking more powerfully strong against cropping procedure.

Results demonstrate the algorithm that is proposed is strong and undetectable against typical image-processing and cropping procedure.

Nilchi and Taheri (2008) provides a new powerful digital image watermarking approach depending on discrete cosine transform (DCT) and neural net. The neural net is complete full counter propagation neural-network (FCNN). FCNN continues to be utilized to model the visible and perceptual features of the first picture. The characteristics of the first picture have already been utilized to find out the very best changeable threshold values of DCT coefficients. The maximum changeable threshold values are utilized to embed the watermark in DCT coefficients of the first picture. The watermark is a binary picture. The values of the picture are added as zero and one values. The execution results show this algorithm comes with an okay robustness versus different types of assaults.

Xie and Qin (2010) proposed an algorithm-based on wavelet transform of electronic image watermark. By embedding and extraction, the algorithm is developed and executed using an intuitive importance

of the image and extraction of the concealed watermark. The filtering, sound, geometry as well as other assaults on experiments is also taken into account by the algorithm. To validate the robustness of the algorithm, the writers used Normalized Cross- Correlation Coefficient to check the watermark with all the watermark likeness and utilizing Peak Signal-to-Sound Ratio to measure the variation between the watermarked picture as well as the first image. The results demonstrate the algorithm research-paper is possible, straightforward, an easy task to execute.

Massachusetts, Zang a Li (2010) present a fresh wavelet domain watermarking system, the carrier wave picture using wavelet decomposition. Following the Walsh transform low-frequency wavelet coefficients, computed by block adaptive embedding power, change the wavelet coefficients of every block, and then do singular value decomposition (SVD), duplicate on embedded watermark in the singular worth. Fractional portion of the anti-changed picture is saved, correction of the image may be correctly extracted watermark. The results show the algorithm can efficiently resist cutting, scaling, transformation and also other geometric assaults, assaults generally are also strong.

Chaudhari and Venkatachalam (2014) paper depicts a scheme to safeguard copyright of raster images using wavelet change. Third degree wavelet coefficients (LL and HH) are employed to embed and extract the watermark in the raster image. Results demonstrate the algorithm that is proposed hasn't only great foil, strongness, substantial information hiding right and ability extraction of watermark, but has powerful robustness against JPEG compression and sound. The categorization of first and watermarked information is performed and it's found the proposed watermarking scheme results in less categorization. The planned scheme satisfies each of the conditions for copyright protection of raster pictures essentially.

Zie, Hong, Zhu and Tao (2015) paper studies anti-counterfeiting techniques for printed QR barcode. The primary performance parameter, decoding rate of QR barcode as well as detection rate of digital watermark, is defined and discussed. A multi-channel robust watermarking scheme based on discrete wavelet transform (DWT) is proposed. In the watermarking scheme, the DWT domain is divided into non-overlapping rectangular areas as called watermarking channels. Channel watermark as well as anti-counterfeiting watermark is embedded into each watermarking channel. At the stage of anti-counterfeiting watermark extracting, the distortion rates of the watermarking channels are estimated by channel watermark. Based on the distortion rates, anti-counterfeiting watermark is computed by a well-designed linear estimation algorithm, whose validity is theoretically proved by analyzing anti-counterfeiting watermark bit error.

A no reference strategy according to digital watermarking is proposed by Som, Mahapatra and Senator (2015) for the authentication goal of pictures getting some malicious or non-malicious assaults. It's no reference in the meaning that it needs a reference picture nor an outside watermark. This characteristic makes the scheme desirable for scenarios where authentication of a picture should be achieved without having an entry to first picture or the reference watermark. The watermark built in the picture and is embedded as a strong signature The Discrete Wavelet Transform (DWT) can be used to split the approximation and detail areas of the picture. The watermark is built in the low frequency area and embedded to the spatial domain by changing the Least Significant Bits (LSBs) of each pixel. Upon comparing, centered on metrices like Peak Signal-to-Noise Ratio (PSNR) and Structural Similarity Index (SSIM), authentication is ensured. Simulations on the pictures from a well known picture database happen to be performed to present the efficiency of the planned strategy that is planned}.

Rajab, Al Khatib and Al Haj (2015) paper provides a blind digital-video watermarking approach according to a mix scheme involving the Discrete Wavelet transform in (DWT) as well as the actual Schur Decomposition. The scheme begins with using 2-degree DWT to the movie scene accompanied by by Schur decomposition where the watermark bits are embedded in the block upper triangular matrix The method reveals high efficiency as a result of usage of Schur decomposition which needs fewer computations in comparison with other transforms. The imperceptibility of the scheme can also be quite high as a result of utilization of DWT change; so, no visible distortion is seen in the movie after embedding, so, no visible distortion is seen in the movie. Moreover, the technique turns out to be sturdy against established of common strikes like: salt, Gaussian and pepper and turning and a few video assaults including: body averaging, cropping and dropping. Both ability and blindness characteristics will also be considered in this this system.

Naik, Prasad and Pal (2015) proposed to compressed picture as a protect media for embedding the key message along with the altered compressed picture elements will maintain the visual message when it is going to be re-built. Singular worth decomposition was used in cover picture for compression. Where the coefficients are not chosen in sequence arrangement so that you can improve the protection, the key concept was embedded in to compressed picture elements. So in the planned work, a clear-cut message extraction procedure won't be appropriate.

A new image steganography algorithm proposed by Li, Pan, Yan and Yang (2015) combine compressive sensing with subsampling, which can hide secret message into an innovative embedding domain. Considering that natural image tends to be compressible in a transform domain, the characteristics of compressive sensing (CS), dimensional reduction and random projection, are utilized to insert secret message into the compressive sensing transform domain of the sparse image and the measurement matrix which is generated by using a secret key is shared between sender and receiver. Then, stego-image is reconstructed approximately via Total Variation (TV) minimization algorithm. Through adopting different transform coefficients in sub-images gained by subsampling, high perceived quality of the stego-image can be guaranteed. Bit Correction Rate (BCR) between original secret message and extracted message are used to calculate the accuracy of this method.

SOLUTIONS AND RECOMMENDATIONS

Copyrighted works of authors have been receiving considerable attention in recent years. Unfortunately, techniques such as digital watermarking and encryption have not been able to provide an efficient and reliable protection against pirate users. As an alternative solution, biometrics was suggested to be used with multimedia. After going through the background study, among all the biometrics that is available, fingerprint will be used as the key to protect multimedia.

Multimedia Selection

Multimedia is a combination of different types of media. With the current tools available for implementation only one type can be considered for protection for now. In this section the three most common types are analysed: (NSBHS,2010)

1. Image
2. Audio
3. Video

- **Image:** Images are pictures, such as drawings, paintings or photographs. Images are used to provide interest and provide information. It is stored as bit maps or vector objects which may be compressed. Common formats include JPEG, GIF, PNG and BMP.
- **Audio:** Audio is sound that has been digitised. It is used to explain concepts, reinforce selections and provide special effects. It is represented by the sampling size and rate, and common file types include .wav, .mp3, MIDI and .wma.
- **Video:** Video combines pictures and sounds displayed over time. It is stored as a series of images combined with audio and often compressed. Formats include MPEG, Quicktime, avi and .wmv.

The easiest way to proceed with the implementation would have been to use images. However, a more challenging approach would be to choose audio or video. It was noted during some experiments that the video type will take an eternal long time to process. In conclusion only the audio type of file will be used in the implementation.

Designing the Solution

The design phase is set to illustrate what is going to be carried out in the implementation phase. All the functionalities identified in previous chapters are represented graphically. All the requirements are transformed into a workable solution through the use of Unified Modelling Language (UML).

Architecture

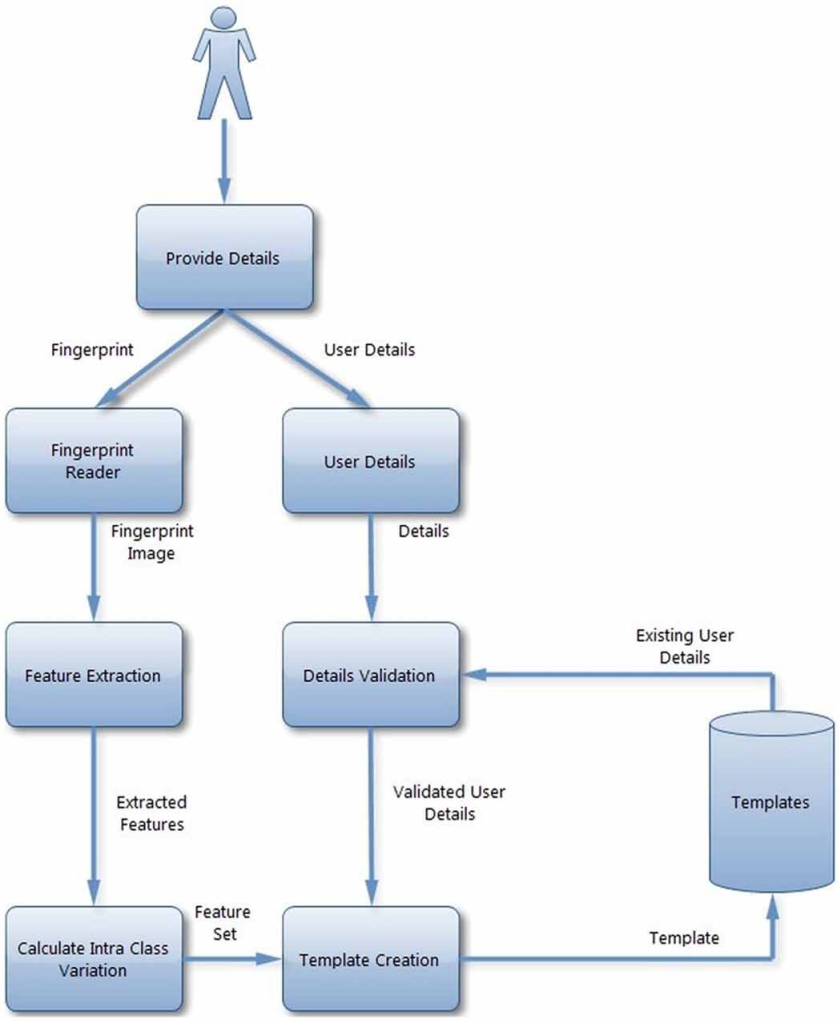
The system consists of two main sections; the enrolment section and the access section. During the enrolment process, the user is prompted to enter his username and password and the fingerprint is captured by a scanner to produce a sample. After extraction of features a template is created. To alleviate the problem of intra variation, the user is asked to re-enter the fingerprint. After validation and computation of a standard template, the template is stored in the system storage together with the demographic information about the user.

During the recognition phase, the characteristic of the subject is captured by a fingerprint reader and is converted into a sample. It is then compared against the enrolment template of that subject a match/non-match decision is produced by the verification process. Using the matching values on the fingerprint, a steganography algorithm is applied on the audio file requested by the user. The audio file is sent towards the media player.

The Workflow

The system workflow is shown in Figure 15.

Figure 13. System architecture



Implementation

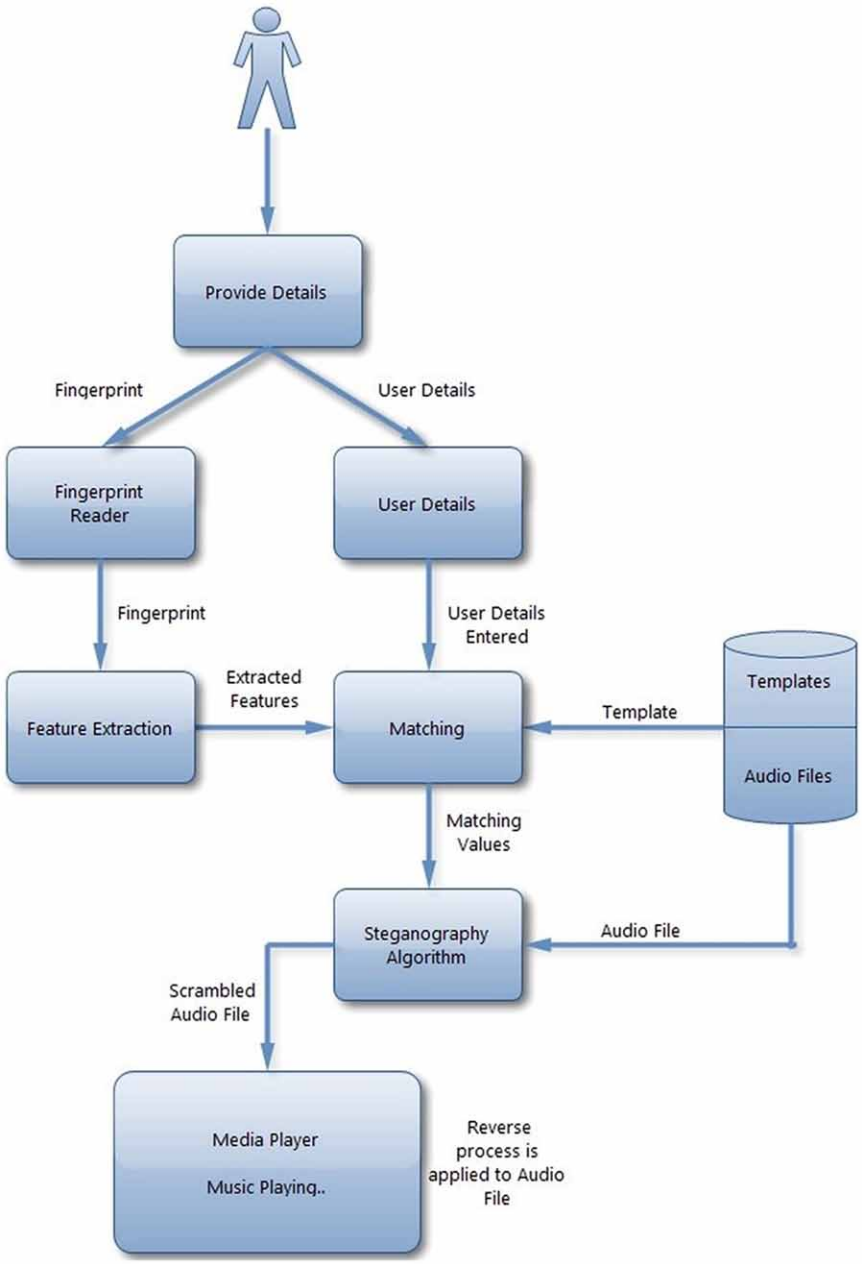
Requirement Specification

A requirement specification is a comprehensive description of the intended purpose and environment for software under development. It fully describes what the software will do and how it will be expected to perform.

It will consist of:

1. System Requirements
2. Functional Requirements
3. Non Functional Requirements
4. Domain Requirements

Figure 14. Recognition phase

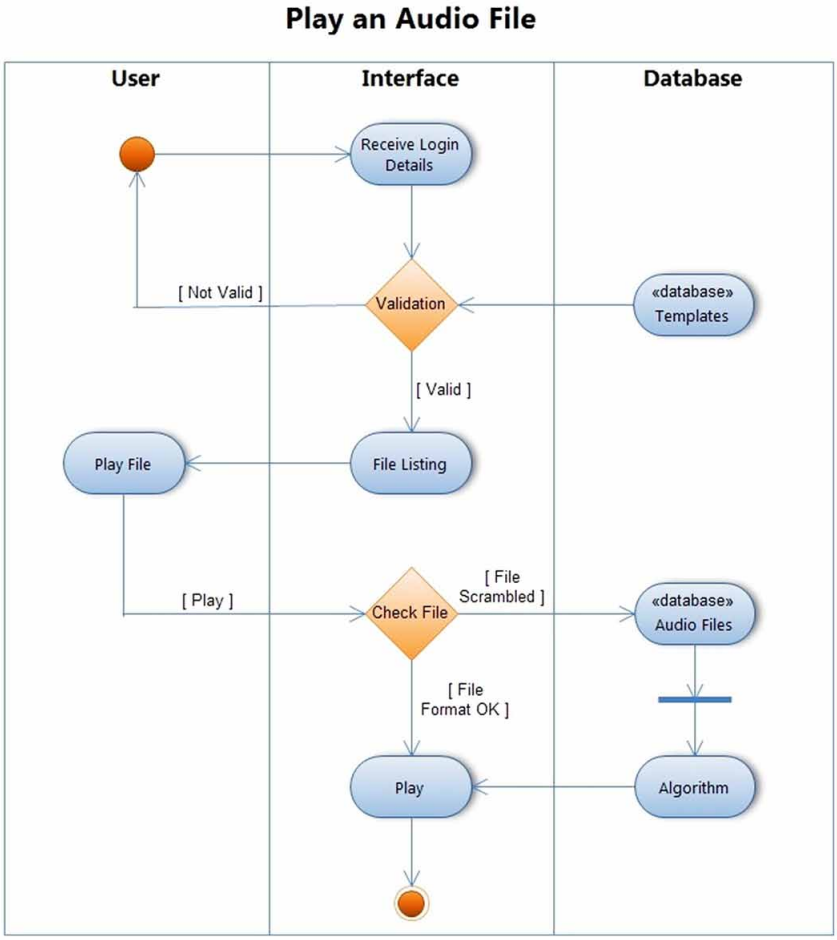


The following section each of the requirements above in details.

System Requirements

To use software efficiently, certain hardware components or other software resources need to be present on a computer. These pre-requisites are known as system requirements and are often used as a guideline as opposed to an absolute rule.

Figure 15. System workflow



Recommended Software Requirements

- Windows 7 Professional
- SUN Java with JavaFx
- MySQL
- GrFinger SDK
- Driver for Fingerprint Reader

Recommended Hardware Requirements

- 2 Gigahertz 32-bit processor
- 2 Gigabytes RAM
- 32 GB available hard disk space
- DirectX 9 graphics device
- Fingerprint Reader

Functional Requirements

A function is described as a set of inputs, the behaviour, and outputs of a system. Functional requirements define what a system is supposed to accomplish.

The Functional Requirements are:

1. The system should allow for fingerprint enrolment of new users
2. The system should be able to store the fingerprint templates of each user
3. The system should perform verification and identification of a registered user
4. The system should be able to store all the details about each user
5. The system should perform the steganography algorithm on the audio files
6. The system should store audio files for each user

Non-Functional Requirements

A non-functional requirement is a requirement that specifies criteria that can be used to judge the operation of a system.

The Non-Functional Requirements are:

- The system should have a graphical user interface
- A fingerprint reader should be available to the system
- The system should provide database management facilities
- The system should provide appropriate response on different actions

Domain Requirements

Domain Requirements are derived from the application domain of the system rather than from the specific needs of the system needs.

The Domain Requirements are:

- The system shall use fingerprint biometric traits when enrolling a user
- The system shall use fingerprint biometric traits when identifying a user
- The template shall be optimised for a proper recognition process
- The audio file shall be scrambled before any transmission

The types of the requirement mentioned above are an official statement of what is required of the system developers. Therefore, it should be taken into consideration when implementing the system, otherwise the developer might go astray.

The implementation consists of many functions, but some which are regarded as most important will be used in the following sections to show how it was done.

The functions are:

1. Database Connection
2. Fingerprint Enrolment

3. Fingerprint Verification
4. Intra Class Variability
5. Fingerprint Steganography

Database Connection

The database connection allows the client software to communicate with the database. A data access object (DAO) is an object that provides an abstract interface to some type of database, providing some specific operations without exposing details of the database.

Using a data access object, the communication was established with the database. Each form on the system was assigned a data access object. Finally the following codes were used to enable permanent connection.

private static String dbURL= jdbc: mysql://localhost:3306/FingerStego"; private static Connection dbConnection; Class.forName("com.mysql.jdbc.Driver").newInstance();
dbConnection = DriverManager.getConnection(dbURL,"root","root");

Fingerprint Enrollment

This function will allow a user to enrol his/her fingerprint upon signing up in the system (media player). The fingerprint enrolment works as follows:

1. Image Acquisition
   a. Stores the captured Fingerprint Image
   b. Call for Fingerprint Extraction
   c. Display Fingerprint Image
      onImageAcquired(String idSensor, FingerprintImage fingerprint)
      this.fingerprint=fingerprint;
      showImage(fingerprint)
2. Extract Minutia
   a. Extracts a template from the current fingerprint image.
   b. Identify Quality
   c. Display Fingerprint Image with Minutia
      template = fingerprintSDK.extract(fingerprint);
      switch (template.getQuality()){
      case Template.HIGH_QUALITY: break;
      case Template.MEDIUM_QUALITY: break;
      case Template.LOW_QUALITY: break; }
      showImage(GrFingerJava.getBiometricImage(template,fingerprint));
3. Template Identification
   a. Starts identification process by supplying query template.
   b. Gets enrolled templates from database.
   c. Iterate over all templates in database
   d. Reads the current template data on a buffer

e. Creates a new Template
f. Compares current template.
fingerprintSDK.prepareForIdentification(this.template); ResultSet rs = identifyStmt.execute-Query();
byte[] templateBuffer = rs.getBytes("template");
Template referenceTemplate = new Template(templateBuffer);
boolean matched = fingerprintSDK.identify(referenceTemplate);

4. Template Enrolment
   a. Get array of data from template
   b. Convert data to bytes if input stream
   c. Insert into database
   enrollStmt.setBinaryStream(1,new ByteArrayInputStream(template.getData()), template.getData().length);
   enrollStmt.executeUpdate();

Fingerprint Verification

This function will allow a user to verify his/her fingerprint upon signing in the system (media player). The fingerprint enrolment works as follows:

The Image Acquisition and Extract Minutiae process is the same procedure as shown in the Fingerprint Enrolment section. As these two processes, the template verification is triggered up.

Template Verification

- Gets the template with entered id from database.
- Reads the template data from the database
- Creates a new Template
- Compares the templates.
- Show Image if Matched

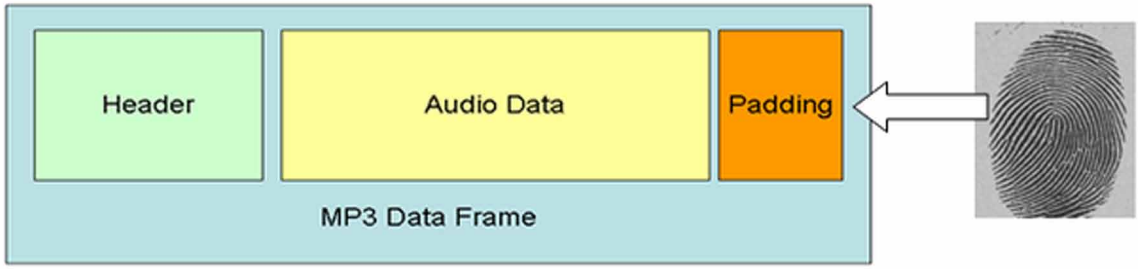
```
ResultSet rs = verifyStmt.executeQuery();
byte templateBuffer[] = rs.getBytes("template");
Template referenceTemplate = new Template(templateBuffer);
boolean matched = fingerprintSDK.verify(template,referenceTemplate);
showImage(GrFingerJava.getBiometricImage(template, fingerprint, fingerprintSDK));
```

Fingerprint Steganography

Some mp3 audio frames are padded with an "empty" byte to even out the frame rate. On average mp3 files tend to have hundreds of frames which need to be padded. Since the padding bytes do not carry any audio information they are a good target for data stuffing.

Padding byte stuffing is an attractive method because it is relatively straightforward to implement and has good average storage capacity. It is possible to encode information at 1 byte per frame as long as padding bytes are available. There be should enough padding bytes to contain a template.

Figure 16. Padding byte stuffing

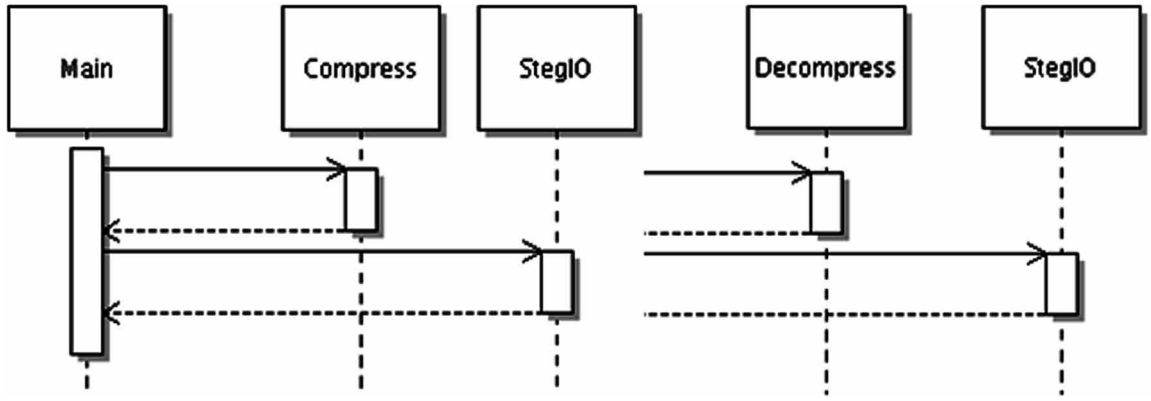


StegIO has a dual role of reading and writing data into the file. The Main class calls either the Compress or Decompress to do the lzw compression, and then calls the StegIO class to do actual embedding. This is a very simple, and yet powerful design.

The StegIO class uses a fairly straightforward algorithm to find padding bytes. The procedure used to accomplish this can be expressed in the pseudo code below:

```
calculate the length of the message in bytes prepend the length to the message
put the message on a byte queue while(there are still bytes to be written) {
Header = read 4 bytes from the file
if(Header is_valid && contains padding byte) {
seek to the end of frame
pop the byte from the queue
write the popped byte into file } }
To read back the data, and reverse the process see the pseudo code below:
length = integer > 4 counter = 0
while (counter < length)
{ Header = read 4 bytes from the file
if(Header is_valid && contains padding byte)
```

Figure 17. StegIO process flow



```
{ if(counter == 4)
{ length = to_integer (pop 4 bytes from queue) }
seek to the end of frame read a byte from the file
push the read byte onto queue }
}
}
```

Results

When a user will first run the media player, he/she will have to register in order to make full use of the player. At first the user will be prompted to enter his/her details and will then proceed to the fingerprint enrolment.

The clear option will erase all content of the fields and the cancel will close and abort the signing up process. Any error message will be displayed in red on the top just below the title.

The error controls are the same as discussed in the previous sections.

Once the user filled in the required fields and click on Submit, he/she will be prompted to enter her fingerprint twice.

Steganography

When the user will add an audio file to his/her playlist, the current file will be scrambled and placed in the music folder of the user. The only way to play the file is to login into the media player and select the file to play.

Figure 18. Signup form

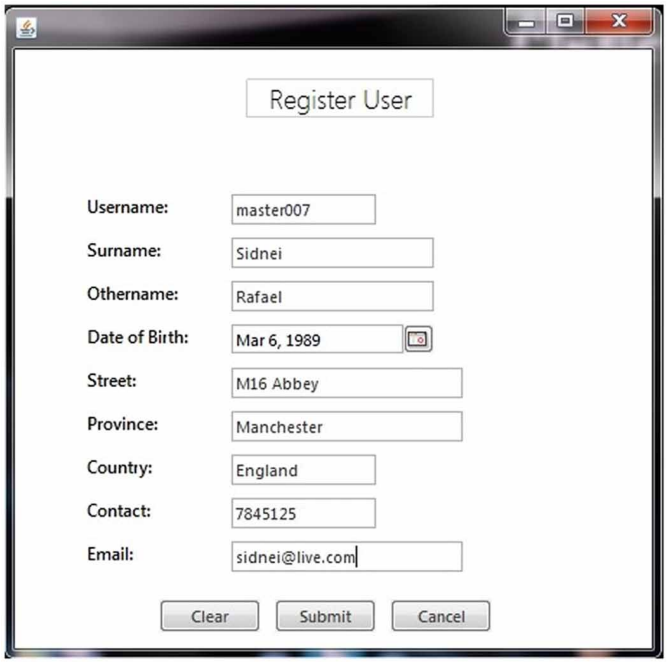


Figure 19. Fingerprint registration

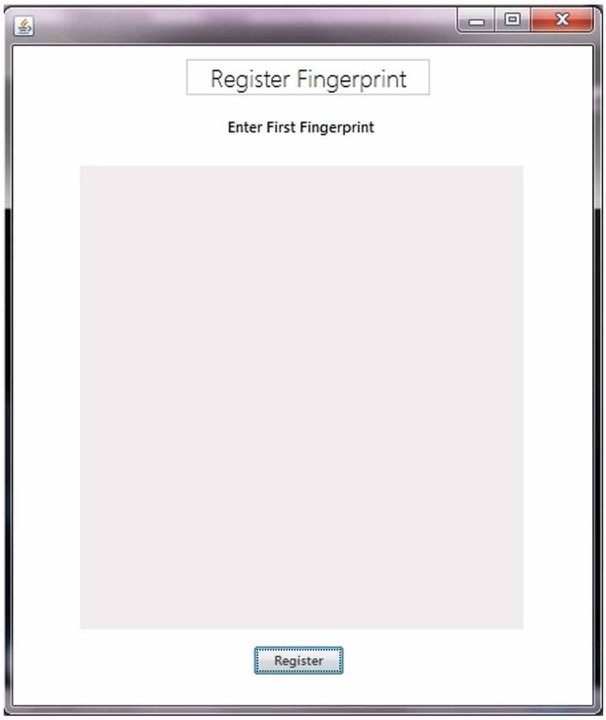

Figure 20. Fingerprint enrollment

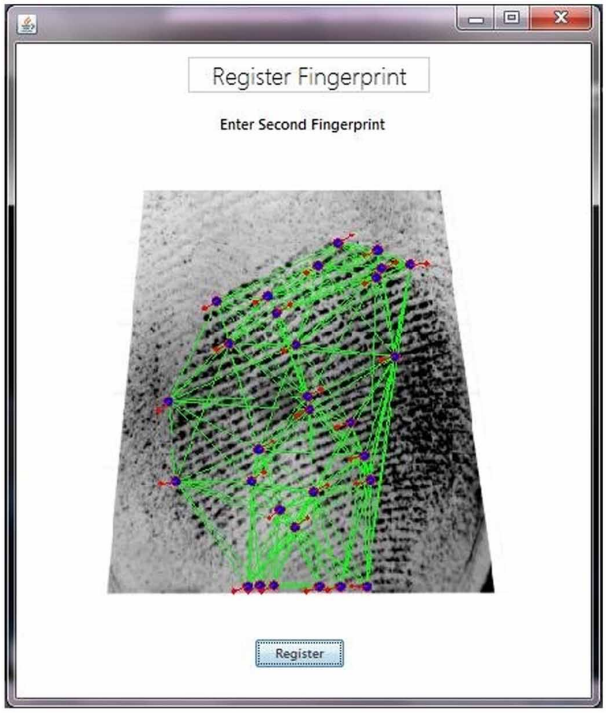

If a user tries to open the file with other players around, an error message will pop out indicating a file error.

FUTURE RESEARCH DIRECTIONS

In this section some suggestions are made of how the system would have been developed without current time and resource constraints.

- The steganography algorithm can be extended to work for any type of audio files
- The steganography can be used to apply to any type of media.
- Visualization and graphic equalizer can be used to enhance the media player.
- The media player can be built with features like reshuffling, repeat and multiple playlist creation.
- Using a very powerful server, the system can be deployed online. No change in coding will be needed since JavaFx can be compiled to run on web.
- Together with online system, the issue of distributed system and networking can be catered
- Security measures for protecting the templates on the server can be addressed.

CONCLUSION

Digital watermarking is among the crucial technologies that may be found in Electronic Rights management techniques for avoiding prohibited replication, tracking use, ensuring approved entry, creating possession rights, and easing content authentication. There are two kinds

Of electronic watermarking methods they can be invisible and visible watermarking identified Steganogtaphy techniques that are identified. It gives authentication for possessors. By using this methods that were watermaking the information might be protected and saved users that were unauthorized.

Figure 21. Error reading file directly

In this paper we supply essence of utilizing finger print and Steganography for security. Identification according to biometric fingerprint scan removes the requirement to recall a password or carry a token which additionally eliminates theft of fobs or cards and so continuous replacements. As people are easily taken out of the machine at no additional price biometric choices can also be more affordable. The organisation must issue a card that is new to all beginners whereas in card-based methods.

Everybody has a special, finger-print that is unchanging. A finger print consists of some ridges and furrows on the area of the finger and all these are utilized to look for the singularity of the finger print. After enrolled on the finger-print scanner, the picture of the designs is converted by way of a sequence called an algorithm which efficiently becomes a kind of you right into a code. That is saved on a data base for comparing which allows accessibility and authentication during the guaranteed door.

Using fingerprints for recognition and identification is the earliest usage of biometrics. Now, notebook computers and USB pen-drives are available with finger-print visitors. However, you will find lots of reasons why the employment of finger prints is the most frequent type of biometric protection. Primarily, fingerprinting will stay an honest kind of protection whilst you get older. facial-recognition in certain can-not beat attribute changes, whereas through employing a biometric finger-print scanner, the finger print will endure the test of time facial-recognition in certain can-not and Iris beat attribute changes. Additionally, you will not have to alter anything in regards to the looks of your finger prints. In case you have hair obstructing specific points of the encounter for instance you'll need to get rid of the eyeglasses or wear eyeglasses or pull-back your hair whenever you present that person for scan.

In large government organizations and corporations, biometrics plays a huge role in employee identification and security. Additionally some data centers have jumped on the bandwagon and have implemented biometric scanners to enhances remote access and management by adding another layer of network security for system administrators. Unfortunately the cost of implementing fingerprint and other biometric security scanning in data centers is still quite expensive, and many centers still rely on ID badges while waiting until biometric technology becomes a little more pocket-book friendly.

Today companies have realized that fingerprint scanning is an effective means of security. While the cost of implementing biometric scanners in larger organizations and data centers is still quite costly, we did find several fingerprint scanning devices which would fit into the budget of many small offices and home users. These home and small office products are designed to protect your hard drive, notebook or even to remove the need for users to remember multiple passwords.

Table 2. Security analysis

	Replay-attack	Input Tampering	Session Error	Sensitive Data Exposure
Password	1%	0%	0%	0%
Cryptosystems Based System	89%	93%	71%	99%
Multi-factor authentication	92%	91%	88%	99%
Secure Biometric Fuzzy Vault Using Personal Image Identification	90%	89%	85%	99%
Blind Authentication	82%	89%	78%	99%
Sparse Watermarking Techniques for Multibiometric System	91%	92%	88%	97%
Biometrics and Steganography	92%	91%	92%	99%

We tested the implementation with certain scripts and open source software for the implementation vulnerability. The result below shows at which rate the threats are secured. The figures have been obtained by a global average of the number of attacks at application and network level.

Accordingly we found that the proposed arrangement fulfills the security and copyright issue of multimedia. However no matter how good the new system can be, it does suffers in terms of usability.

APPENDIX

Table 3. History of fingerprint

Year	Description
~1000-2000 B.C.	Fingerprints were used on clay tablets for business transactions in ancient Babylon.
3rd Century B.C.	Thumbprints begin to be used on clay seals in China to "sign" documents.
610-907 A.D.	During the T'ang Dynast, fingerprints are reportedly used on official documents.
1st Century A.D.	A petroglyph located on a cliff face in Nova Scotia depicts a hand with exaggerated ridges and finger whorls, presumably left by the Mi'kmaq people.
14th Century A.D.	Many official government documents in Persia have fingerprint impressions. One government physician makes the observation that no two fingerprints were an exact match.
1686	Marcello Malpighi notes the common characteristics of spirals, loops and ridges in fingerprints
1858	The Chief Magistrate of the Hooghly district in Jungipoor, India, Sir William Herschel, first used fingerprints to "sign" contracts with native Indians.
1880	Dr. Henry Faulds was credited with the first fingerprint identification
1888	Sir Francis Galton became the first to provide scientific evidence that no two fingerprints are exactly the same, and that prints remain the same throughout a person's lifetime

Chapter 45
Video Authentication: An Intelligent Approach

ABSTRACT

With the growing innovations and emerging developments in sophisticated video editing technology, it is becoming highly desirable to assure the credibility and integrity of video information. Today digital videos are also increasingly transmitted over non-secure channels such as the Internet. Therefore, in surveillance, medical, and various other fields, video contents must be protected against attempts to manipulate them. Video authentication has gained much attention in recent years. However, many existing authentication techniques have their own advantages and obvious drawbacks. The authors propose a novel authentication technique that uses an intelligent approach for video authentication. This chapter presents an intelligent video authentication algorithm for raw videos using a support vector machine, which is a non-linear classifier, and its applications. It covers both kinds of tampering attacks, spatial and temporal. It uses a database of more than 2000 tampered and non-tampered videos and gives excellent results with 98.38% classification accuracy. The authors also discuss a vast diversity of tampering attacks, which can be possible for video sequences. Their algorithm gives good results for almost all kinds of tampering attacks.

INTRODUCTION

With the rapid development and innovation in digital information technologies, video applications are infiltrating into our daily lives at breakneck speed, from traditional television broadcasting to Internet/Intranet, wireless communication and consumer products such as VCD/DVDs and smart phones. Though this immense development in digital information technology has brought us in the new era of powerful

DOI: 10.4018/978-1-5225-3822-6.ch045

information, we are having some severe challenging issues related with the information. One of them is credibility of the information. Today, editing or modifying the content of a digital video can be done efficiently and seamlessly, and the credibility of the digital data decreases significantly (Friedman, 1993). To ensure the trustworthiness, authentication techniques (Lin & Chang, 2001; Naor & Pinkas, 1997; Perrig, Canetti, Tygar, & Song, 2000) are needed for verifying the originality of video content and preventing the forgery. Building a mechanism that enables media authenticity verification, is basically needed in court of law where digital media might be used as evidence against potential criminals. A possible scenario that justifies the need of such a mechanism is a case where a defendant claims that an incriminated media was fabricated.

So the video authentication is a process which ascertains that the content in a given video is authentic and exactly same as when captured. For verifying the originality of received video content, and to detect malicious tampering and preventing various types of forgeries, performed on video data, video authentication techniques are used.

These techniques also detect the types and locations of malicious tampering. In fact a wide range of powerful digital video processing tools are available in the market that allow extensive access, manipulations and reuse of visual materials (Hauzia & Noumeir, 2007). Since different video recording devices and close circuit television camera system become more convenient and affordable option in the private and public sectors, there is a corresponding increase in the frequency in which they are encountered in criminal investigations[1]. The video evidences have significant role in criminal investigations due to their ability to obtain detailed information from their own. And they have tremendous potential to assist in investigations. Therefore, it would be necessary to take utmost care to make sure that the given video evidence, presented in the court, is authentic.

MOTIVATION BEHIND VIDEO AUTHENTICATION

In some applications the authenticity of the video data is of paramount interest such as in video surveillance, forensic investigations, law enforcement and content ownership (Upadhyay, Singh, Vatsa, & Singh, 2007). For example, in court of law, it is important to establish the trustworthiness of any video that is used as evidence. As in another scenario, for example, suppose a stationary video recorder for surveillance purpose, is positioned on the pillar of a railway platform to survey every activity on that platform along a side. It would be fairly simple to remove a certain activity, people or even an event by simply removing a handful of frames from this type of video sequences. On the other hand it would also be feasible to insert, into this video, certain objects and people, taken from different cameras and in different time. A video clip can be doctored in a specific way to defame an individual. In the recent years, several cases have been reported where the eminent personalities of the society were caught in illegal activities in the video recordings made by so called journalists. However in the absence of foolproof techniques to authenticate the video it is difficult to trust on such reports. On the other hand criminals get free from being punished because the video (used as evidence), showing their crime cannot be proved conclusively in the court of law. In the case of surveillance systems, it is difficult to assure that the digital video produced as evidence, is the same as it was actually shot by camera. In another scenario, a news maker cannot prove that the video played by a news channel is trustworthy; while a video viewer who receives the video through a communication channel cannot ensure that video being viewed is really

the one that was transmitted (Pradeep, et. al., n.d.). In the scenario of sensitive cases where a video is produced as a witness in the court of law, even a small modification may not be acceptable. However there are some scenarios where editing also may be allowed while keeping intact the authenticity of the video. For example after shooting the video, a journalist may need to perform some editing before broadcasting it on a news channel. In such a case a video authentication system should be able to allow editing on the video up to a certain level ensuring the authenticity of the video (Pradeep, Atrey, El Saddik, & Kankanhalli, 2009). Now a day an ordinary person can easily make unauthorized copies of digital video data and manipulate them in such a way that may lead to severe financial and social losses. These are the instances where malicious modifications cannot be tolerated. Therefore, there is a compelling need for video authentication. Although traditional data authentication technology for message integrity was mature, video authentication is still in its early development stage and many fundamental questions remain open (Han & Chu, 2010). For example, for a number of different authentication algorithm developed over the past few years, it is difficult to affirm which approach seems most suitable for ensuring the integrity adapted to videos (Han & Chu, 2010). For verifying the credibility of received video content, and to detect malicious tampering attacks and preventing various types of forgeries, performed on video data, video authentication techniques are used.

CHALLENGING SCENARIOS FOR VIDEO AUTHENTICATION

In some of the surveillance systems storage and transmission costs are the important issues. In order to reduce the storage and transmission cost only those video clips, containing objects of interest, are required to be sent and stored. Moreover in most of the surveillance applications background object changes very slowly in comparison to foreground objects. A possible efficient solution in these scenarios is that only the objects of interest (mostly foreground objects) are sent out frame by frame in real time while the background object is sent once in a long time interval. In such surveillance applications, it becomes very important to protect the authenticity of the video: the authenticity against malicious alterations and the authenticity for the identity of the transmission source (i.e. identify the video source).

In event based surveillance systems, the video sequences are captured when there is any kind of change in the scene (existence of an event) which would be captured by the camera. If there is uniformity in the scene in such a way that there is not any change in the scene then the surveillance camera does not capture any video sequence. This kind of surveillance system is used in military system for border security purpose. Authenticity for this kind of video sequences is a challenging issue because there is no proper time sequence in video sequences which are captured by surveillance camera.

In another scenario where a surveillance camera is recording the postmortem activity of a human body in postmortem house, any kind of disturbance in recording (due to electricity problem or some other hardware problem) would be resulted in frame dropping. This would be a severe issue since some important activities may have happened during frame dropping and these activities may be missed to be recorded by surveillance camera. Authentication of this kind of video sequence is also a very challenging task because we are not in the condition of detecting all the positions where and how many frames have been dropped.

In addition of these scenarios, there are some challenging conditions for video authentication. To assure the authenticity of the videos, captured in the following situations, would be fairly difficult.

- The videos recorded in the foggy and rainy weather condition
- The videos recorded in the hazardous condition.
- The videos recorded in a condition where the camera or the objects (recorded by the camera) or both are moving very rapidly.
- The videos recorded in the night vision mode.

These all are the different scenarios which poses considerable challenges for the authentication purpose.

VIDEO TAMPERING

A continuous video data $V_c(x, y, t)$ is a scalar real valued function of two spatial dimensions x and y and time t, usually observed in a rectangular spatial window W over some time interval T. If $M(x, y, t)$ is modification vector then the tampered video $B_c(x, y, t)$ would also be a scalar real valued function of spatial dimensions x and y and time t as follows:

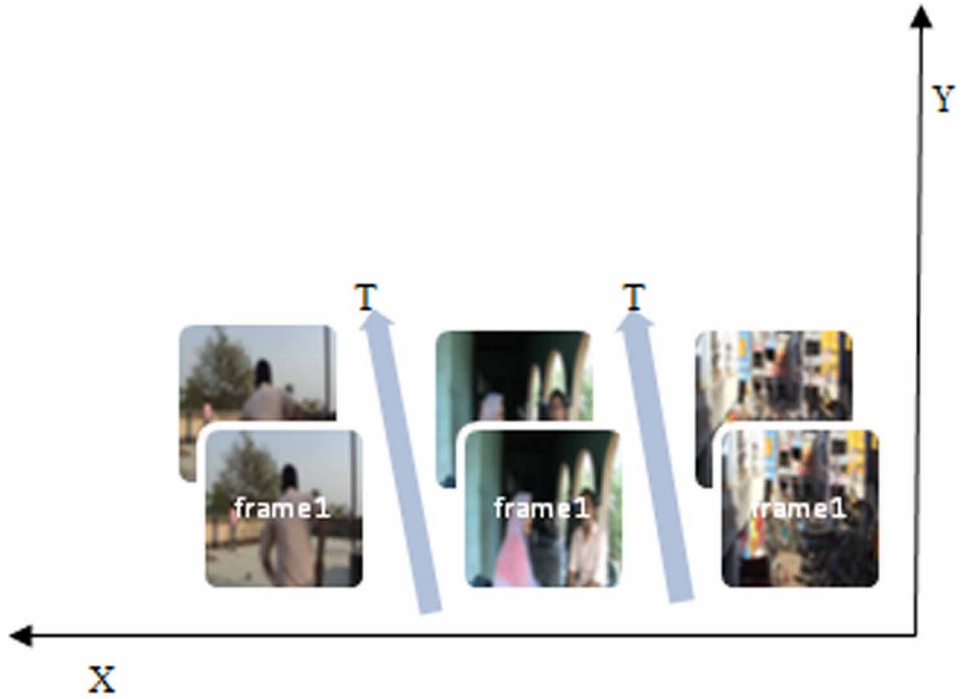
$$B_c(x, y, t) = M(x, y, t) + V_c(x, y, t)$$

When the content of information, being produced by a given video data is maliciously altered, then it is called tampering of video data. It can be done for several purposes, for instance to manipulate the integrity of an individual or to deceive any one by producing fake information through tampered video. Since a wide range of sophisticated and low cost video editing software are available in the market that makes it easy and less expensive to manipulate the video content information maliciously, it poses serious challenges to researchers to be solved.

VIDEO TAMPERING ATTACKS

There are several possible attacks that can be applied to modify the contents of a video data. Formally a wide range of authentication techniques have been proposed in the literature but most of them have been primarily focused on still images. However the basic task of video authentication system is to prove whether the given video is tampered or not but in several applications, due to large availability of information in video data, it may be more significant if the authentication system can tell where the modifications happened (It indicates the locality property of authentication) and how the video is tampered (Yin et al., n.d.). On considering these where and how, the video tampering attacks can have different classifications. A lot of works have been done that briefly address the classification based on where (Upadhyay, Singh, Vatsa, & Singh, 2007; Yin et al., n.d.). And some papers address the classification based on how (Dittman et al., 2000). In general finding where the video data is altered is more efficient than to find out how the how data is tampered. When a video is being recorded by a video recording device, it captures the scene which is in front of the camera lens, frame by frame, with respect to time. Number of frames being captured by video recording device in a second, depends on the hardware specification of the device. Thus a video can be viewed as a collection of consecutive frames with temporal dependency, in a three-dimensional plane, as shown in Figure 1.

Figure 1. Three-dimensional view of video information



It refers to the regional property of the video sequences. When a malicious modification is performed on a video, it either attacks on the contents of the video (i.e. visual information presented by the frames of the video), or attacks on the temporal dependency between the frames of the video. Therefore based on the regional property of the video sequences, we can broadly classify the video tampering attacks into three categories: spatial tampering attacks, temporal tampering attacks and the combination of these two, spatio-temporal tampering attacks (Yin et al., n.d.). They can be further classified into their subcategories.

Spatial Tampering

In spatial tampering malicious alterations are performed on the content of the frames (X-Y axis). The operations which are performed as a tampering attack in spatial tampering are cropping and replacement, morphing, content (object) adding and removing, in the frames of the video, etc. (Yin et al., n.d.). These attacks can be efficiently performed with the help of any professional video editing software for example Photoshop, etc.

Temporal Tampering

In temporal tampering malicious manipulation is performed on the sequence of the video frames. The focus is on the temporal dependency of the video. Temporal tampering attacks are mainly affecting the time sequence of visual information, captured by video recording devices. The common attacks in temporal tampering are frame addition, frame removal and frame reordering or shuffling in the video.

Spatio-Temporal Tampering

Spatio-temporal tampering attacks are the combination of the both kinds of tampering attacks: spatial and temporal tampering attacks. Frame sequences are altered and also visual contents of the frames are modified in the same video. The authentication system should be able to identify both kinds of tampering attacks.

All these tampering are further classified into their subcategories. Spatial tampering can be in effect either at block level or at pixel level. In both the cases the objects of the frames of the video are altered.

Further the objects of the frames are classified into two categories: Foreground objects and Background objects. The foreground objects are those which are captured as individual elements, excluding the background, in a frame. And the background object is the background part of the frame excluding all of the foreground objects. The different pieces of visual information shown in the frames of the video are altered in spatial tampering. Basically the contents of the video frames are treated as objects. Based on these objects and their classification the spatial tampering can be further classified as shown in Figure 2.

OBJECT REMOVAL ATTACK

In object removal attack of the spatial tampering, the objects of the frames of the video are eliminated. This kind of tampering attack is commonly performed where a particular person wants to hide his/her presence in a certain sequence of frames. With this kind of attack he /she may disappear in a specific time domain, recorded in the video, and with the help of this, he/she can easily prove his/her absence in any event which has been recorded by video recording device, as shown in Figure 3.

OBJECT ADDITION ATTACK

An object or set of object is inserted in a frame or in a set of frames of the video in object addition attack of spatial tampering. In any video, which can be treated as evidence, an additional object can be

Figure 2. An explicit classification of spatial tampering attacks in reference of objects of the frames

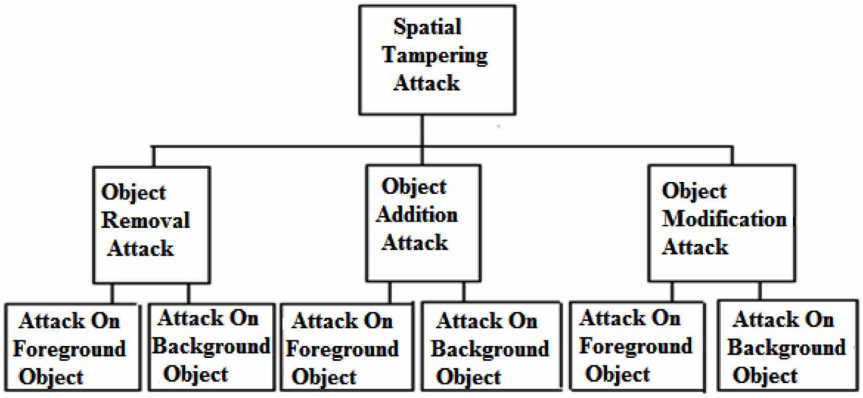


Figure 3. Example of object removal attack: (a) shows object removal attack with foreground object, where a small device is removed from the original frame in tampered frame, whereas (b) shows the object removal attack with background object

Original Frame

Tampered Frame

Figure 3 (a)

Original Frame

Tampered Frame

Figure 3 (b)

pasted in a frame or set of frames, with the help of sophisticated video editing software to mislead the investigation agencies as well as court of law. With the help of this kind of attack, one can prove his/her presence in any event of the pre-recorded video, as shown in Figure 4.

OBJECT MODIFICATION ATTACK

In Object modification attack of the spatial tampering, an existing object of the frame(s) can be modified in such a way that the original identity of that object is lost, and a new object may be in appearance which is completely different from the original object. The object modification attacks can be existed in many prospects of the given video. For instance, the size and shape of any existing object may be changed, the color of the object may be changed or it may be discolored, and with the help of additional effect the nature of the object and it's relation with other objects also may be changed. It depends upon the intention. In fact it is very hard to detect and locate this kind of attack of spatial tampering for authentication systems, since these attacks are performed at pixel level. The authentication systems should also be robust enough to differentiate this kind of attack with the normal video processing operations. Figure 5 shows a typical example of object modification attack where the face of a person has been changed in such a way that the person's face, which is introduced in the altered frame, is completely different from the face of the person in original frame.

Besides spatial tampering, temporal tampering attacks have also sub classifications. Temporal tampering attacks are specific to video applications and can be performed at scene level, shot level and frame level, but the primary focus is on attacking the temporal dependency of the frames of the video. This kind of tampering attack basically affects the sequencing of video frames. We call it 'Third dimensional

Figure 4. Example of object addition attack: in original frame (a) two persons are there as major foreground objects, while in tampered frame (a) an additional person as a foreground object is added. In tampered frame (b), not only a foreground object is added but also an additional wall as a background object in the middle of the frame is added

Original Frame

Tampered Frame

Figure 4 (a)

Original Frame

Tampered Frame

Figure 4(b)

Figure 5. Example of object modification attack: the face of the person in original frame is modified in tampered frame in such a way that the new face of the person cannot be identified as the same as in original frame

Original Frame

Tampered Frame

(dimension with respect to time) attack' on the video sequences. Therefore based on this third dimensional attack we can classify the temporal tampering attacks into following subcategories.

FRAME ADDITION ATTACK

In frame addition attack of temporal tampering, additional frames from another video, which has the same statistical (height and width of frames) and dimensional (number of frames per second) properties, are

intentionally inserted at some random locations in a given video. This attack is intended to camouflage the actual content and provide incorrect information (Upadhyay, Singh, Vatsa, & Singh, 2007). A typical example of the frame addition attack is shown in Figure 6.

FRAME REMOVAL ATTACK

In frame removal attack of temporal tampering, the frames of the given video are intentionally eliminated. In this kind of tampering attack frames or set of frames can be removed from a specific location to a fixed location or can be removed from different locations. It depends upon the intention. Commonly this kind of tampering attack is performed on surveillance video where an intruder wants to remove his/her presence at all. Figure 7 shows a typical example of frame removal attack.

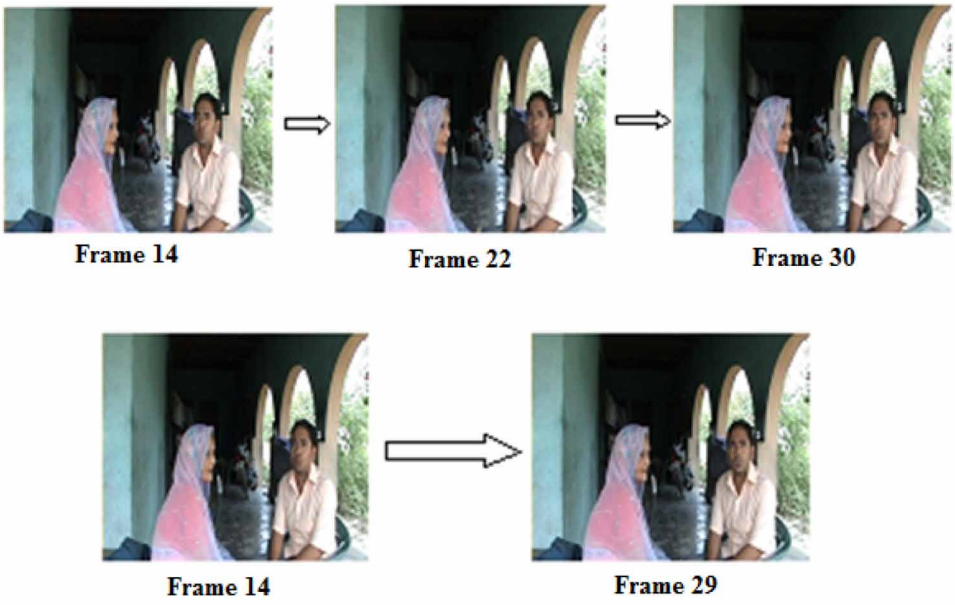
FRAME SHUFFLING ATTACK

In frame shuffling attack of temporal tampering, frames of a given video are shuffled or reordered in such a way that the correct frame sequence is intermingled and wrong information is produced by the video as compared to original recorded video. Figure 8 shows a typical example of frame shuffling attack where two frames are shuffled.

In addition to these types of tampering attacks, tampering can be done at different levels in video sequences.

Figure 6. Example of frame addition attack: in first row the original frame sequence from frame 6 to frame 16 has been shown. After attack, the second row of the frames shows the altered frame sequence in which a new frame is inserted between frame 6 and frame 16.

Figure 7. Example of frame removal attack: the first row of this figure shows the original frame sequence with frame 14, frame 22, and frame 30. In second row of the frame sequence, which shows the tampered frame sequence with frame removal attack, frame 22 is eliminated from the video and hence frame 30 becomes frame 29.



Scene Level

When the tampering attacks are performed at scene level then a whole scene of the video sequence is manipulated in such a way that, not even the scene itself is modified but also in reference to the given video the scene of that video is modified. It means spatial and temporal both kinds of tampering can be done at scene level.

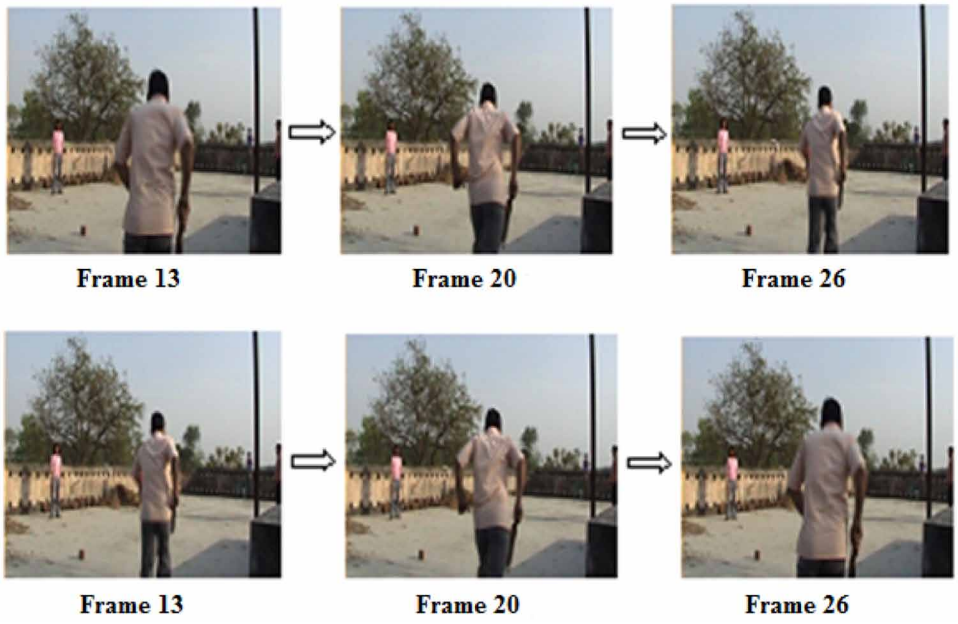
Shot Level

In shot level tampering a particular shot of the given video is modified in reference to the given video. In shot level tampering a shot can be added or removed from the video. It can also be performed with all kinds of tampering attacks.

Frame Level

When frames of the given video are maliciously modified, then it is called tampering at frame level. Frame removal, frame inserting and frame shuffling are the common tampering attacks that can be performed at frame level. In other words, temporal tampering attacks are commonly performed at frame level.

Figure 8. Example of frame shuffling attack: the first row of this figure shows the original frame sequence with frame 13, frame 20, and frame 26. After the frame shuffling attack, the original frame sequence is tampered as shown in second row of the figure where the positions of frame 13 and frame 26 have been changed.



Block Level

In block level tampering, tampering attacks are performed on the blocks of the video frames. The content of the video frames are treated as blocks on which the tampering attacks are applied. Blocks (a specified area on the frame of the video) can be cropped and replaced, morphed or modified in any way in block level tampering. Spatial tampering attacks are commonly performed at block level.

Pixel Level

In pixel level tampering contents of the video frames are modified at pixel level. This is the smallest level in video sequences at which tampering attacks can be performed. The video authentication system should be robust enough to differentiate the normal video processing operation and pixel level tampering, since many normal video processing operations are performed at pixel level. Spatial tampering attacks are commonly performed at pixel level.

All these levels of tampering show the different aspects of tampering.

AUTHENTICATION TECHNIQUES

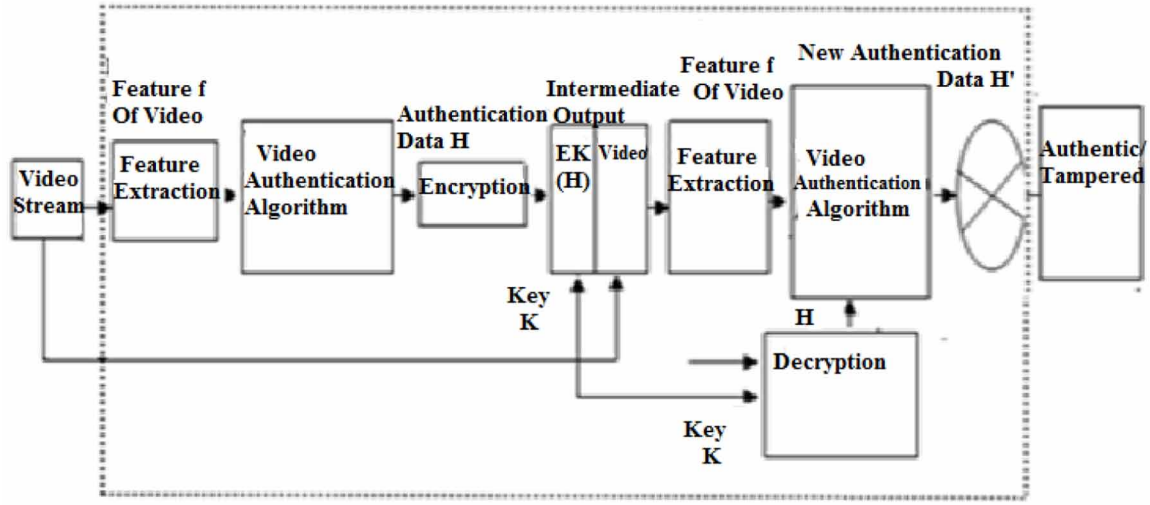
By definition, authenticity means sometimes "as being in accordance with fact, as being true in substance," or "as being what it professes in origin or authorship, as being genuine" (Authenticity, 1989).

Another definition of authentication is to prove that something is "actually coming from the alleged source or origin" (Authenticity, n.d.). A video authentication system ensures the integrity of digital video and verifies that whether the given video has been tampered or not. But in most of the cases, especially in the court of law, it may be more beneficial if the authentication system can tell where the tampering happens and how the video is tampered. A typical video authentication system is shown in Figure 9. For a given video, authentication process starts with feature extraction. After that, with a specific video authentication algorithm, the authentication data H is generated using the features f of the video. This authentication data H is encrypted and packaged with the video as a signature or alternatively it can be embedded into the video content as a watermark. The video integrity is verified by computing new authentication data H` for the given video. The new authentication data H` is compared with decrypted original authentication data H. If both are matched, the video is treated as authentic else it is considered as tampered video.

An ideal video authentication system, to be effective, must support to the properties such as sensitivity to malicious alteration, localization and self-recovery of altered regions, robustness to normal video processing operations, tolerance against some loss of information, compactness of signature, sensitivity against false intimation and computational feasibility. In fact in addition to having robustness against benign operations, an ideal video authentication system must make a given video resistant against all possible attacks and must verify whether a given video is tampered or not. Benign operations are those video processing operations that do not modify its content semantically such as geometric transformations, image enhancements and compression. Once the verification is done for the given video, it would be useful to find where and how the tampering has been done.

However, based on the objectives of authentication, an authentication system can be categorized as complete verification and content verification. Techniques that are proposed for complete verification consider that the multimedia data, which have to be authenticated, have to be exactly the same as the original one. Content verification is a characteristic of multimedia data authentication.

Figure 9. A typical video authentication system



CLASSIFICATION OF AUTHENTICATION TECHNIQUES

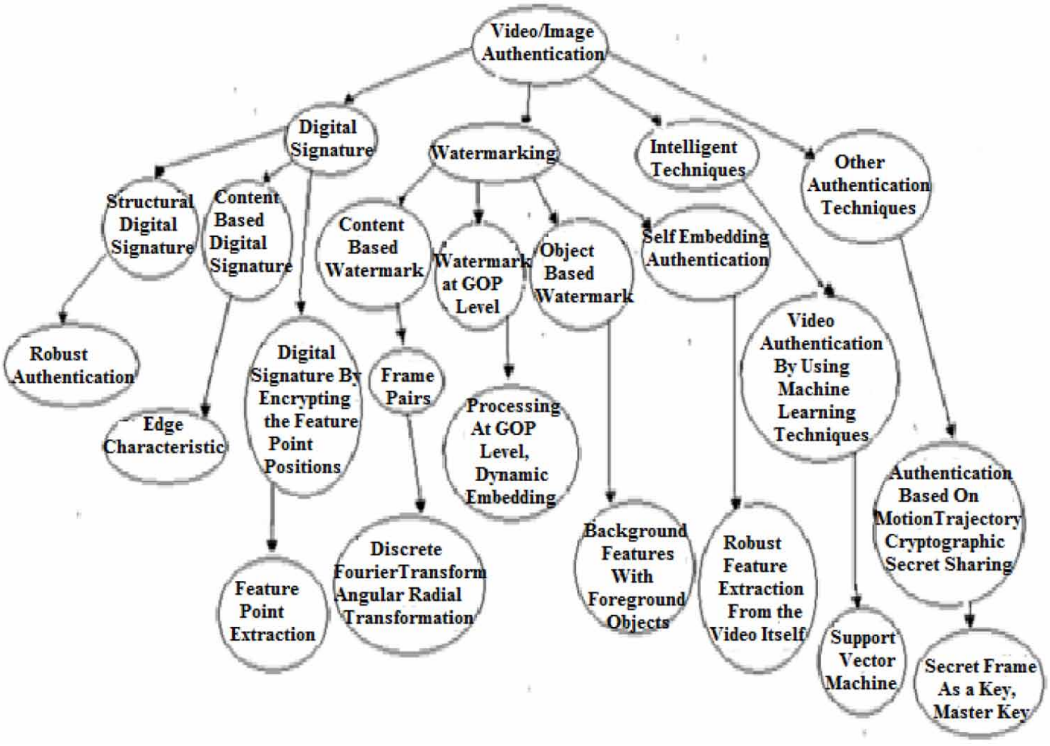
In past few years, watermarking and digital signatures have been widely used for the purpose of video authentication. Different techniques have their own advantages and shortcomings. In fact fragile watermarking and digital signatures are the two commonly used schemes for authentication.

Fragile watermarking embeds the authentication data into the primary multimedia sources, while digital signature stores the authentication data separately, either in user defined field, as like, in the header of MPEG sequence, or in a separate file (Yin et al., n.d.). Moreover there has also been worked on intelligent techniques for video authentication (Upadhyay, Singh, Vatsa, & Singh, 2007; Singh, Vatsa, Singh, & Upadhyay, 2008). Intelligent authentication techniques use learning based techniques for authentication purpose. Apart from these digital signature, fragile watermarking and intelligent techniques, some other authentication techniques are also introduced by researchers, which are specifically designed for various cases of malicious attacks. Basically video authentication techniques are broadly classified into four categories: Digital signature based techniques, watermark based techniques, intelligent techniques, and other authentication techniques. Figure 10 represents a tree structure of authentication techniques which have been commonly proposed for the purpose of video/image authentication.

Digital Signature

Integrity of multimedia data can be greatly verified by digital signature. For the authentication of multimedia data, it was first introduced by Diffie and Hellman in 1976 (Diffie & Hellman, 1976). For

Figure 10. Tree structure of authentication techniques



the purpose of authentication, digital signatures can be saved in two different ways. Either they can be saved in the header of the compressed source data, or it can be saved as an independent file. Further they can be produced for verification. In the prospective of robustness, since the digital signature remains unchanged when the pixel values of the images/videos are changed, they provide better results. In the digital signature authentication, the digital signature of the signer to the data depends on the content of data on some secret information which is only known to signer (Wohlmacher, 1998). Hence, the digital signature cannot be forged, and the end user can verify a received multimedia data by examining whether the contents of data match the information conveyed in the digital signature. In fact digital signature can be used to verify the integrity of multimedia data which is endorsed by the signer.

In Lin and Chang (1999), two types of robust digital signatures are used for video authentication in different kinds of situations. The first type of authentication signature is used in situation where the GOP (Group of Pictures) structure of the video is not modified, after transcoding or editing processes. The situation, where the GOP structure is modified and only the pixel values of picture will be preserved, a second type of digital signature is used.

In another work, video authentication is done by generating digital signatures for image blocks and using them as watermarks (Celik et al., 2002). In this approach localization packet, watermark insertion is done via LSB modification of pixel values. As compared to (Mobasseri & Evans, 2001) where video tampering is identified through an analysis of watermark sequencing, here (explicit) block ID's are used for this purpose.

The Johns Hopkins University Applied Physics Laboratory (APL) has developed a system for authentication of digital video (Johns Hopkins). The authentication system computes secure computer generated digital signatures for information recorded by a standard digital video camcorder. While recording, compressed digital video is simultaneously written to digital tape in the camcorder and broadcast from the camera into the Digital video authenticator. In this authentication system, video is separated into individual frames and three unique digital signatures are generated per frame—one each for video, audio, and (camcorder) control data—at the camcorder frame rate.

Here the key cryptography is used. One key, called a "private" key is used to generate the signatures and is destroyed when the recording is complete. The second a "public" key is used for verification. The signatures that are generated make it easy to recognize tampering. If a frame has been added it would not have a signature and will be instantly detected and if an original frame is tampered the signature would not match the new data and it will be detected in verification process.

In digital signature based video authentication schemes, different features are used for different applications. Dittman (Ditmann, Steinmetz, & Steinmetz, 1999) and Queluz (Queluz, 1998) used the edge /corner of the image as the feature to generate the digital signature. They claimed this feature is robust against high quality compression and scaling but the problem is that the signature generated based on the edge is too long, and the consistency of the edge itself is also a problem. Formally digital signature based authentication techniques are able to detect regions that have been tampered, but often they are too fragile to resist incidental manipulations. For this type of incidental manipulations structural digital signature (Lu & Liao, 2003) can be used for image authentication. This approach makes use of an image's content to construct a Structural Digital Signature (SDS) for image authentication. The characteristic of the SDS is that it can tolerate content preserving modifications while detecting content changing modifications. In this approach (Lu & Liao, 2003), many incidental manipulations which can be detected as malicious modifications in other digital signature verifications or fragile watermarking schemes, can be ignored.

In the scenario of a station streaming video over network, it is significant for the audiences to have guarantees that the video stream they are watching is indeed from the station. Schemes that are used for this purpose can prevent the malicious parties from injecting commercials or offensive materials into the video streams. Actually, this problem has been covered in information security called streaming signing (Gennaro & Rohatgi, 1997; Park, Chong, & Siegel, 2002), which is an extension from message signing by digital signature schemes which are able to both protect the integrity of the message and prevent the signer's repudiation.

In another technique, a separate authentication code is written in (Su, Chen, & Chang, 2009) from the blocks of the video frames. Here the authors Po-Chyi Su, Chun Chieh Chen and Hong Min Chang use the approach of scalar/vector quantization on the reliable features. Once the authentication code is written, it is transmitted along with the video. Thus, the authenticity of the given video content can be checked by matching the extracted feature with the transmitted authentication code. The authentication code chosen by authors is sensitive to malicious modifications of video data. The proposed work also considers two classical false detection tests. These are false alarms and misses. In the situation of former false detection test the authentication scheme wrongly signals a happening of tampering while the normal video processing operations are there. In the later situation, false detections are related to misses of detection after an actual tampering on video content has been performed. This work is resilient to lossy compression procedures, while the tampered regions on the video frames can be located if malicious attacks were applied (Su, Chen, & Chang, 2009).

Navjit Saikia and Prabin K. Bora present a scheme for video authentication in (Saikia & Bora, 2007) that generates the Message Authentication Code (MAC) for a Group Of Frames (GOF) using coefficients from the last but one high pass band at full level of temporal wavelet decomposition. This digital signature based scheme uses temporal wavelet transform for the generation of message authentication code. After the extraction of GOFs from the video, these GOFs are recursively decomposed into high pass band up to a certain level using temporal wavelet transform (Chuk, Jayant, & Farrardin, 1995). At this level the high pass band consists of two frames. In the signature generation process, these frames are divided into some blocks of fixed sizes. These blocks are randomly mapped on to a set of groups, using a mapping key in such a way that each group contains equal number of blocks. With the transform coefficients and these groups of blocks, a set of linear combination values is evaluated for each frame in the high pass band. And with these sets of linear combination values, message authentication code (MAC) is obtained for the GOF. In the signature verification process, the distances d ($MAC_{i,1}$, $MAC`_{i,1}$) and d($MAC_{i,2}$, $MAC`_{I,2}$) are calculated where d is any distance measure and { $MAC_{i,1}$, $MAC_{i,2}$ } is the MAC of i^{th} GOF of the original video and {$MAC`_{i,1}$, $MAC`_{i,2}$} is the MAC of corresponding GOF calculated at receiver site. Here the GOF of the video would be authentic if these two distances are below some predefined threshold values, otherwise tampered. When all GOFs in it are found authentic then the given video is declared as authentic video. This authentication scheme would be advantageous for spatio-temporal manipulations, since it is effective for spatial tampering as well as for temporal tampering.

Watermarking

Watermarking always remains a significant issue for solving authentication problems regarding digital multimedia data, in past few years. A wide variety of watermark based authentication techniques have

been proposed by various researchers in literature. However watermarking techniques can be used for authenticating various multimedia data, but most of the work has been done for image and video authentication. Based on the application areas, watermarking can be classified in different categories (Dittman et al., 2000). Beside to ensure the integrity of the digital data and recognizing the malicious manipulations, watermarking can be used for the authentication of the author or producer of the content. Watermarks can be embedded with the multimedia data, without changing the meaning of the content of the data. The advantageous feature with the watermarks is that, they can be embedded without degrading the quality of multimedia data too much. Since the watermarks are embedded in the content of video data, once the data is manipulated, these watermarks will also be modified such that the authentication system can examine them to verify the integrity of data. In (Guerrini, Leonardi, & Migliorati, 2004), authors describe the use of video authentication template, which uses a bubble random sampling approach applied for synchronization and content verification in the context of video watermarking. The authentication template is introduced in order to ensure temporal synchronization and to prevent content tampering in video sequences (Guerrini, Leonardi, & Migliorati, 2004).

Basically in past few years, an increasing use of digital information in our society and availability of very sophisticated and low cost video editing software creates problems associated with copyright protection and authentication. One of the main advantage of digital world is that here perfect copying is performed easily. That causes severe security related issues. The owners or producers of information resources are being worried of releasing proprietary information to an environment that appears to be lacking in security (Queluz, 2001). On the other hand with the help of powerful video editing software one can challenge the trustworthiness of digital information.

In (Queluz, 2001), M. P. Queluz presents the generic models with labeling and watermarking approaches for content authentication, in which existing techniques for content authentication are described and compared. In labeling based approach authentication data are written in separate file (Queluz, 2001), while in watermarking based approach the authentication information is embedded in the frames. In this labeling-based authentication system, features C and C` are extracted from the original and modified pictures respectively as according:

$$C = f_c\left(\ I \ \right),$$

$$C' = f_c(\ \hat{\mathrm{I}})$$

In order to assure the authenticity of the label content, it is signed in a trustworthy way, that is, the label is encrypted with a private key (K_{pr}). The label content is produced as:

$$L = EKpr(C,\ C_I)$$

where C_I is optional information, say Complementary Information, about the frame and its author, assigned by an author society. Besides image-dependent features, the label can also convey this information. In the authentication system the corresponding public key Kpu is used to decrypt the label, producing:

$$C,\ C_I = EKpu(L)$$

Moreover in (Queluz, 2001), M. P. Queluz presents two classical image features for image/video content authentication. The first image feature is concerned with second order image moments. It has a less computational requirement with small memory which makes it more advantageous computational feature. The second feature relies on image edges and it takes the problem of image/video authentication from a semantic, higher level point of view (Queluz, 2001). In image moments feature, for a two dimensional continuous function f(x, y), the moments of order $(p+q)$ is defined as

$$m_{pq} = \int_{-\infty-\infty}^{+\infty+\infty} x^p y^q \; f\left(x,y\right) dxdyfor \;\; p, \;\; q = 0,1,2,\ldots\ldots\ldots\ldots$$

For a digital image the above equation would be as follows:

$$m_{pq} = \sum_i \sum_j i^p j^q \;\; f(i, \;\; j)$$

where $f(i, \;\; j)$ represents image color values at pixel site (i, j). Moments are usually normalized dividing it by the image total mass, defined as $\sum_i \sum_j f(i,j)$. He also presents a brief comparison of labeling approach with watermarking for tamper detection, which is independent of applications where they can specifically be implemented. The video authentication techniques using the watermarking approach have wide dimension in the literature.

In (Liang, Li, & Niu, 2007), Chang-yin Liang, Ang Li and Xia-mu Nin proposed a video authentication system which is robust enough to separate the malicious attack from natural video processing operations with the cloud watermark. The authentication system in (Liang, Li, & Niu, 2007) first of all splits the video sequence into shots and extracts the feature vector from each shot. Then the extracted feature is used to generate watermark cloud drops with a cloud generator (Liang, Li, & Niu, 2007). Here, for robustness, a con tent based and semi fragile watermark is used for authentication. In this authentication technique DCT coefficients are evaluated firstly by partially decoding the given video. After watermarking the video is encoded again (Liang, Li, & Niu, 2007). Invariable features of the video are selected for content based watermarking. The watermarks are then embedded back into DCT coefficients of the video. The extracted watermarks are compared with the features derived from the received video, to check the authenticity of the given video.

However attacks on watermarks may not necessarily remove the watermark (Johnson, n.d.), but can disable its readability. Image/video processing operations and transforms are commonly employed to create and apply watermarks on the multimedia data. These techniques can also be used to disable or overwrite watermarks. Multiple watermarks can be placed in an image and one cannot determine which one is valid (Craver, Memon, Yeo, & Yeung, 1998).

In (Mobasseri & Evans, 2001), the proposed algorithm explains the frame-pair concept where one video frame would watermark another frame downstream based on a specific sequencing and a key. Basically in this approach three points are there: First the watermark is derived from the video itself, therefore cannot be pirated. Second if video frames are taken out, it is possible to identify their locations by simply monitoring the breaks in authentication key sequence. And third, video frames that are removed could

actually be recovered because frame pairs contain copies of other frames disguised as watermarks. In this approach unless both frames are removed, frame restoration is possible. Watermarking can also be used for the authentication of compressed video (Cross & Mobasseri, 2002). Here the watermarking of compressed video (Cross & Mobasseri, 2002) is done by identifying label carrying VLCs in MPEG-2 bit stream. In this approach every bit in the watermark payload is compared with the LSB of the current label carrying VLC. If they are the same, the VLC remains unchanged, if they are not, the LSB is replaced by the watermark bit. The embedded watermark may be used for the authentication of video and protection against tampering.

For the authentication of MPEG video, authentication data can be embedded at the Group Of Pictures (GOP) level (Yin et al., n.d.). Since it is almost infeasible to embed information in all pictures of a video clip or embed all the information for each picture in a video clip, Dynamic Embedding for each picture in a digital video can be adopted (Yin et al., n.d.). In this approach current GOP's authentication data (bits) are embedded into next GOP. Basically this approach has three advantageous features. First, by making each watermarked GOP dependent upon other GOP, the problem of watermark counterfeiting becomes computationally impossible and thus reduces the chances of success for the attackers. Second, for MPEG video, if watermark is added in I picture in a GOP, it results in drift errors for the following P or B pictures in the same GOP. If the video quality requirement is in demand, the drift errors should be corrected, the correction could cause the changes of the authentication bits and thus need to re-add the watermark in I picture. This will cause dead loop. Therefore it would be advantageous to embed the authentication data at the GOP level. Third this operation is causal and saves much memory to store a GOP's data.

For the investigation of the authenticity of uncompressed video signal, the quality of digitization process is considered significantly (Geradts & Bijhold, n.d.). The way the A/D conversion is done is important for the result. For this purpose the histogram of gray values can be checked. Previously Lin et al (Lin & Chang, 1999) and Peng et al (Peng, 2002) have worked on compressed domain schemes that are robust against transcoding and editing operations. For computing the signature Lin (Lin & Chang, 1999) used the difference in DCT coefficients of frame pairs. Since the value of DCT coefficients can be modified keeping their relationship preserved, it is vulnerable to counterfeiting attacks. Peng (Peng, 2002) used DC-DCT coefficients as features to build watermark.

An object based watermarking scheme for video authentication is proposed by Dajun et al (He, Sun, & Tian, 2003). They use background features to embed the watermark into foreground objects to establish a relation between background and the foreground of a video. Here the raw video is segmented into foreground objects and background video the watermark is generated by using the features extracted from both the foreground and background. The watermark is then embedded into foreground objects, so that a secure link between foreground objects and the back ground is created. At the receiving end integrity between the foreground objects and the background can be verified by comparing two sets of codes: one is the watermark extracted from the objects and the other is regenerated from both the received object and the background. If these two sets of codes are the same, then the video is claimed as authentic.

A more robust authentication scheme for scalable video streaming by employing Error Correction Coding (ECC) in different ways (Sun, He, Zhang, & Tian, 2003) has also been produced. This scheme achieves an end - to-end authentication independent of specific streaming infrastructure. Actually this scheme is an extension from (Sun, Chang, & Maeno, 2002) where a semi fragile authentication framework, for images in terms of ECC and public key infrastructure, is used.

In another work, a semi fragile object based authentication solution is produced for MPEG 4 video (He, Sun, & Tian, 2003). To protect the integrity of the video objects /sequences, a content based watermark is embedded into each frame in the Discrete Fourier Transform domain before the MPEG 4 encoding. A set of Angular Radial Transformation (ART) coefficients are selected as the robust features of the video objects. Error Correction Coding (ECC) is used for watermark generation and embedding. The main difference between the frame based video application and the object based video application lies in the utilization of the shape information.

In a self-embedding authentication system (Martinian, Wornell, & Chen, n.d.), a robust and important feature of the video is extracted and embedded in to the video at the sending site; the detector retrieves this original feature from the watermark and compares it with the feature extracted from the received video to determine the authenticity of the video. If the difference exceeds a threshold, the received video will be claimed as un-authentic video.

INTELLIGENT TECHNIQUES

Intelligent techniques for video authentication use database of video sequences. The database comprises authentic video clips as well as tampered video clips. As in (Upadhyay, Singh, Vatsa, & Singh, 2007), the authors proposed an intelligent technique for video authentication which uses inherent video information for authentication, thus making it useful for real world applications. The proposed algorithm in (Upadhyay, Singh, Vatsa, & Singh, 2007) is validated using a database of 795 tampered and non-tampered videos and the results of algorithm show a classification accuracy of 99.92%. The main advantage of intelligent techniques is that they do not require the computation and storage of secret key or embedding of watermark. The algorithm in (Upadhyay, Singh, Vatsa, & Singh, 2007) computes the local relative correlation information and classifies the video as tampered or non-tampered. Performance of this algorithm is not affected by acceptable video processing operations such as compression and scaling. Here the algorithm uses Support Vector Machine (SVM) for the classification of the tampered and authentic videos. SVM (Vapnik, 1995) is a powerful methodology for solving problems in nonlinear classification, function estimation and density estimation (Singh, Vatsa, & Noore, 2006). In fact SVM is a nonlinear classifier that performs classification tasks by constructing hyper planes in a multi-dimensional space and separates the data points in different classes. This algorithm (Upadhyay, Singh, Vatsa, & Singh, 2007) is performed in two stages: (1) SVM training and (2) Tamper detection and classification, using SVM. In SVM training, the algorithm trains the SVM by using a manually labeled training video database, if the video in the training data is tampered, then it is assigned the label -1 otherwise the label is +1 (for the authentic video). From the training videos, relative correlation information between two adjacent frames of the video is computed, with the help of corner detection algorithm (Kovesi, 1999). Then relative correlation information RC is computed for all adjacent frames of the video with the help of

$$RC = \frac{1}{m}\sum_{i=1}^{m} L_i$$

where Li is local correlation between two frames for i=1,2,…m. and m is the number of corresponding corner points in the two frames. The local correlation information RC is computed for each video and

the RC with the label information of all the training video data are provided as input to the SVM. With this information of all the video in video database the SVM (Vapnik, 1995) is trained to classify the tampered and non-tampered video data. Output of SVM training is a trained hyper plane with classified tampered and non-tampered video data. In (Singh, Vatsa, Singh, & Upadhyay, 2008), authors integrate the learning based support vector machine classification (for tampered and non-tampered video) with singular value decomposition watermarking. This algorithm is independent of the choice of watermark and does not require any key to store. This intelligent authentication technique embeds the inherent video information in frames using SVD watermarking and uses it for classification by projecting them into a nonlinear SVM hyper plane. This technique can detect multiple tampering attacks.

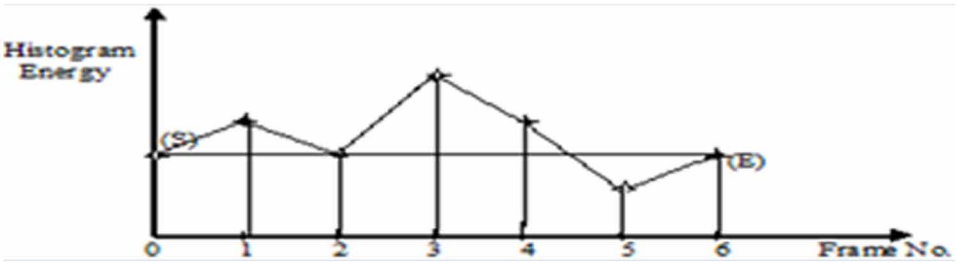
OTHER AUTHENTICATION TECHNIQUES

Apart from digital signature, watermarking and intelligent techniques, various other techniques are there for authentication purpose of digital video in the literature. In (Yan & Kankanhalli, 2003), an authentication scheme for digital video is introduced which is based on motion trajectory and cryptographic secret sharing (Yan & Kankanhalli, 2003). In this scheme, the given video is firstly segmented into shots then all the frames of the video shots are mapped to a trajectory in the feature space by which the key frames of the video shot are computed. Once the key frames are evaluated, a secret frame is computed from the key frames information of the video shot. These secret frames are used to construct a hierarchical structure and after that final master key is obtained. This master key is used to identify the authenticity of the video. Any modification in a shot or in the important content of a shot will be reflected as changes in the computed master key. Here trajectory is constructed, using the histogram energy of the frames of the video shot. For a particular video shot, in Figure 11, vertical axis indicates the histogram energy of each frame of the shot and the horizontal axis marks the frame number in the shot. A polyline belonging to the video shot is drawn which is a motion trajectory. This figure also shows the process of key frames extraction from the video shot. The starting frame S and the last frame E of the trajectory are connected to each other. Then a distance d between each frame point and this line is computed by using:

$$d = \frac{\left|Ax + By + C\right|}{\sqrt{A^2 + B^2}}$$

where d is the distance from a point $(x,\ y)$ to the straight line $Ax + By + C = 0$.

Figure 11. Frames with their histogram energy for a video shot



After that the point at the maximum distance from the line is chosen and the corresponding frame is declared as one of the key frames in this shot. Once the key frames are computed these are utilized to compute the secret frame by extrapolation. Now an interpolating polynomial $f(x)$ is computed by using key frames as follows.

$$f(x) = \sum_{j=1}^{n+1} \prod_{i=1}^{n+1} \frac{x - x_i}{x_j - x_i} I_j$$

This is Lagrange interpolation formulation where the x_i position refers to each key frame and I_i is the pixel value of the key frames. By using this equation and extrapolation a frame at $x = 0$ is computed, which is regarded as the secret key. Considering the set of secret keys as another set of shares, the master key frame is computed for that particular video. With this scheme any video can be authenticated by comparing its computed master key with the original master key. This comparison can be performed by using the general cosine correlation measure given by:

$$sim = \frac{I_O \cdot I_N}{\left| I_O \cdot I_N \right|}$$

where I_O and I_N are the original master key and the new master key considered as vectors. The similarity value would be in the range [0, 1] and if sim = 1, the two master keys would be the same, however if sim = 0, the two master keys would be different. Here the authors also claim that if the similarity value is high then the video has undergone benign transformations. But if the similarity value is low, then the video must have undergone some significant tampering. In (Latechi, Wildt, & Hu, n.d.), the key frames are selected by deleting the most predictable frame. In the approach of reference (Zhao, Qi, Li, Yang, & Zhang, 2000), the key frames are extracted from a video shot based on the nearest feature line. The work in (Quisquater, 1997) authenticates a video by guaranteeing the edited video to be the subsequence of the original video using a special hash function. The MPEG video standard is one of the most popular video standards in today's digital era. In (Wang & Farid, 2007) Weihong Wang and Hany Farid have been worked on MPEG video standard (MPEG-1 and MPEG-2) in this paper they specifically show how a doubly compressed MPEG video sequence introduces specific static and temporal statistical perturbations whose presence can be used as evidence of tampering. In a MPEG video sequence, there are three types of frames: I-frame, P-frame and B-frame. Each with different level of compression occurs in a periodic sequence in the MPEG video. Amidst all the frames I-frames are the highest quality frames of the video sequence, which are usually encoded by standard JPEG compression scheme. In the I-frame, compression is achieved at spatial level by reducing spatial redundancies within a single frame (Wang & Farid, 2007). Temporal redundancies are concerned with P-frames arcos the frames of video sequence. For achieving double MPEG compression, I-frames of the MPEG video sequence are compressed twice. For this purpose when the frames are double quantized with different step size, there is a significant difference in their histogram. When the step size decreases in image quantization, some bins in the histogram are empty while in greater step size some bins of the histogram contain more samples than their neighboring bins (Wang & Farid, 2007). In both cases of double quantization, periodicity of the artifacts is introduced in to histograms. This artifact would be used as evidence of double compression

and hence tampering. In temporal analysis, addition or deletion of frames from a video sequence and re-encoding the resulting sequence, results in a large motion error between consecutive P-frames of the video, since they originated from different GOPs. Moreover this increased motion error would be periodic, occurring throughout each of the group of pictures following the frame deletion or addition. Periodic spikes in the motion error indicate tampering (Wang & Farid, 2007).

In (Farid, 2006), Hany Farid describes three techniques to expose digital forgeries in which the approach is to first understand how a specific form of tampering disturbs certain statistical properties of an image and then to develop a mathematical algorithm to detect this perturbation. These are Cloning, Lighting and Retouching. In Cloning, a digital image is first partitioned into small blocks of the regions. The blocks are then reordered so that they are placed a distance to each other that is proportional to the differences in their pixel colors (Farid, 2006). Since it is statistically unlikely to find identical and spatially coherent regions in an image, therefore their presence can be used as evidence of tampering. In lighting approach the direction of an illuminating light source for each object or person in an image is automatically evaluated by some mathematical techniques. The retouching technique exploits the technology by which a digital camera sensor records an image, for detecting a specific form of tampering.

A robust video authentication system should tolerate the incidental distortion, which may be introduced by normal video processing such as compression, resolution conversion and geometric transformation, while being capable of detecting the intentional distortion, which may be introduced by malicious attack. There has also been some work for scene change detection of video sequences in the literature.

LIMITATIONS OF EXISTING VIDEO AUTHENTICATION TECHNIQUES

There are different challenges with the existing watermark and digital signature based video authentication approaches. However there is no issue related with the size of authentication code in digital signature based video authentication techniques, but if the location where digital signature is stored is compromised then it is easy to deceive the authentication system. On the other hand fragile watermarking algorithms perform better than algorithm based on conventional cryptography (Hauzia & Noumeir, 2007). Fragile and semi fragile algorithms show good results for detecting and locating any malicious manipulations but often they are too fragile to resist incidental manipulations. Moreover embedding the watermark may change the content of video which is not permissible in court of law (Upadhyay, Singh, Vatsa, & Singh, 2007).In other techniques, most of the authentication techniques are established for specific attacks. Moreover existing algorithms are also affected by compression and scaling operations.

PROPOSED METHODOLOGY

Keeping in mind all those limitations, we are going to propose an intelligent video authentication technique, which does not require computation and storage of any key or embedding of any secret information in the video data. We have designed our algorithm especially for raw videos (videos captured and given in any situation or condition), which suited best for surveillance videos. Our proposed video authentication algorithm computes the statistical local features information in digital video frames and establishes

a relationship among the frames. A Support Vector Machine (SVM) (Vapnik, 1995) based learning algorithm is then used to classify the video as tampered or non-tampered. The proposed algorithm uses inherent video information for authentication, thus making it useful for real world applications.

SUPPORT VECTOR MACHINE

Support Vector Machine, pioneered by Vapnik (Vapnik, 1995), is a powerful methodology for solving problems in nonlinear classification, function estimation and density estimation (Singh, Vatsa, & Noore, 2006). The main idea of a support vector machine is to construct a hyper plane as the decision surface in such a way that the margin of separation between two classes of examples is maximized. It performs the classification task by constructing hyper planes in a multidimensional space and separates the data points into different classes. SVM uses an iterative training algorithm to maximize the margin between two classes (Upadhyay, Singh, Vatsa, & Singh, 2007; Singh, Vatsa, & Noore, 2006). The mathematical formulation of SVM is as follows:

Let $\left\{(x_i, d_i)\right\}_{i=1}^{N}$ be the training sample of N data vectors, where x_i is the input pattern for the i^{th} example and d_i is the corresponding desired response. It is assumed that the pattern (class) represented by the subset $d_i = +1$ and the pattern represented by the subset $d_i = -1,$ are linearly separable. The equation of generalized decision function can be written as:

$$f\left(x\right) = \sum_{i=1}^{N} w_i \varphi_i\left(x\right) + b = \quad W\overline{\varphi}\left(x\right) + b$$

where $\varphi_i\left(x\right)$ is a nonlinear function representing hidden nodes and $\overline{\varphi}\left(x\right) = \left[\varphi_1\left(x\right), \quad \varphi_2\left(x\right), \ldots . \varphi_N(x)\right]^T$, and b is a bias. To obtain a non linear decision boundary which enhances the discrimination power, the above equation can be rewritten as:

$$f\left(x\right) = \sum_{i=1}^{N} d_i \propto_i K\left(x, x_i\right) + b$$

Here $K\left(x, x_i\right)$ is the nonlinear kernel that enhances the discrimination power and $\propto_i$ is the Lagrangian multiplier (Upadhyay, Singh, Vatsa, & Singh, 2007). Basically a nonlinear SVM uses a kernel function $K\left(x, x_i\right)$ to map the input space to the feature space so that the mapped data becomes linearly separable. One example of such kernel is the RBF kernel

$$K\left(x, x_i\right) = exp\left(-\gamma x - x_i^{\,2}\right), \quad \gamma > 0$$

where x and x_i represent the input vectors and γ is the RBF parameter (Upadhyay, Singh, Vatsa, & Singh, 2007). Additional details of SVM can be found in (Vapnik, 1995).

PROPOSED VIDEO AUTHENTICATION ALGORITHM

As mentioned above the common tampering attacks on a video data are spatial and temporal tampering attacks which include object addition, object removal, object modification, frame removal, frame addition, and frame shuffling. Our proposed algorithm gives excellent results for temporal and spatial, both types of tampering attacks. In this chapter, we have focused on the three kinds of tampering attacks, frame addition attacks, frame removal attacks and spatial tampering attacks. However the proposed algorithm can handle all kinds of malicious attacks. Since we are using SVM based learning and classification technique, it can also differentiate between attack and acceptable operations.

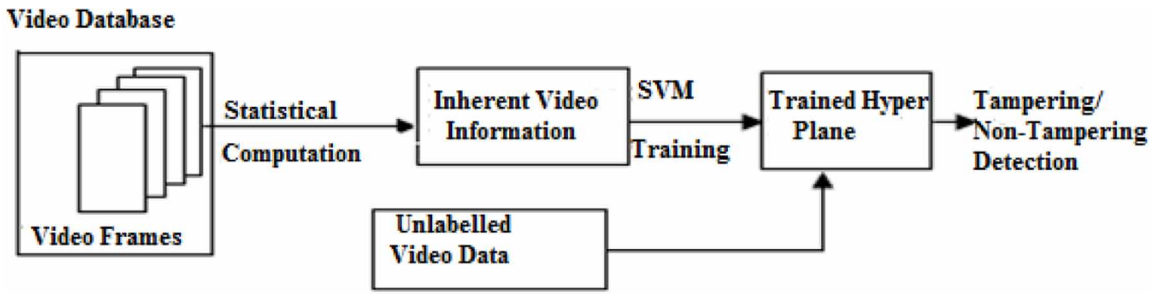
The concept of the proposed algorithm is shown in Figure 12. The proposed video authentication algorithm computes the statistical local features information between two consecutive video frames.

Here we take the absolute difference of every two consecutive video frames. The average object area and entropy of difference frames are used as statistical local features information. They are worked here as the basis for SVM learning. This information is computed locally using statistical tools and then classification is performed using support vector machine (Vapnik, 1995). Based on the functionality, the proposed algorithm is divided into two stages: (1) SVM Learning and (2) tamper detection and classification using SVM.

SVM LEARNING

SVM learning is the first step of the proposed algorithm. For this purpose a database of 50 tampered and non-tampered video clips is used, and the hyper planes are trained for frame addition, frame removal and spatial tampering attacks, separately. Training is performed using manually labeled training videos of the video database. For each of the video of the video database, if the video in the training data is tampered then it is assigned the label 0 otherwise (if it is not tampered) the label is 1. From the training videos, statistical local information (average object area and entropy) are extracted. This labeled information, together with the statistical local information (SL), is then used as input to the SVM which performs learning and generates a non-linear hyper plane that can classify the video as tampered and non-tampered. All these steps involved in the training of the kernel are performed for the video database and are explained in the learning algorithm.

Figure 12. Block diagram of the proposed video authentication algorithm



Learning Algorithm

- **Input:** Labeled training video frames.
- **Output:** Trained SVM with a non-linear hyper plane to classify tampered and non-tampered video data.
- **Algorithm:**
  - Individual frames are obtained from the different tampered and non tampered video data.
  - The difference frames of all the video data are obtained by taking absolute difference between every two consecutive frames. In absolute difference, we subtract each pixel value in second frame from the corresponding pixel value in the first frame.
  - All these difference frames are converted into binary frames.
  - The total number of objects in first binary difference frame and their area are calculated. Then the average object area and the entropy of the first binary difference frame are computed statistically.

If the area of an object in a binary frame is a_i then the average object area of the binary frame A would be

$$A = \frac{1}{N}\sum_{i=1}^{N} a_i$$

where N is the total number of objects.

If the average object area and entropy of a binary frame are A_i and E_i then the statistical local information of a video of the video database would be defined as

$$SL = \sum_{i=1}^{m}\left[A_i, E_i\right]$$

This statistical local information is a column vector of size $\left[\left(m-1\right)\times 2\right]$ where m is the total number of binary difference frames extracted from all the tampered and non tampered video of the video database.

Steps 1-6 are performed on all the labelled training videos and the statistical local information SL is computed for each video of the video database.

- Statistical local information and labels of all the training videos are given as input to the Support Vector Machine.
- In the learning process the SVM kernel (Vapnik, 1995) is trained to classify the tampered and non tampered video data. Output of this training is a trained hyper plain with classified tampered and non tampered video data.

TAMPER DETECTION AND CLASSIFICATION

We now explain the proposed tamper detection and classification algorithm. Input to this classification algorithm is a video data of which authenticity needs to be established. As performed in SVM learning algorithm, statistical local information of all the binary frames of the given video is computed and the trained SVM is used to classify the video. The proposed algorithm uses the dynamically adoptive threshold value to decide whether the given video frame is tampered or not. It automatically selects a threshold value with the help of learning database, for declaring any binary difference frame as a tampered frame. If the SVM classifies the input video as tampered then the location of tampering is computed. The tamper detection and classification algorithm is described below.

Tamper Detection and Classification

- **Input:** Unlabelled video frames.
- **Output:** Classification result as tampered and non-tampered video data.
- **Algorithm:**

Using steps 1-7 of the SVM learning algorithm, the statistical local information SL for the input video is computed.

1. This statistical local information of the input video data is projected into the SVM hyper plane to classify the video as tampered or non-tampered. If the output of SVM is one for all of the difference frames of the input video then the given video is authentic otherwise it is tampered.
2. If any of the frame of given video is classified as tampered then we determine the particular frames of the video that have been tampered.

Plot the statistical local information SL (average object area and entropy) of difference frames of all the adjacent frames of the video.

3. Local values showing the maximum deviation in the plot are the values corresponding to the tampered frames.
4. Plot the trained SVM classifier which shows the support vectors for the training video data

EXPERIMENTAL RESULTS AND DISCUSSION

The proposed algorithm shows very good results for all the three kinds of attacks, frame addition attacks, frame removal attacks and spatial tampering attacks. We have shown the results for all kinds of tampering attacks of temporal tampering and also for spatial tampering.

RESULTS FOR FRAME REMOVAL ATTACK

Figure 13 shows the plot of average object area values as statistical local information (SL) for 120 tampered videos, 120 non-tampered videos and 100 videos for validation process in the database, subjected to frame removal attack. Here 120 tampered and 120 non-tampered videos of the database are used for the learning process of SVM. The average object area (SL) values of all the non-tampered videos are below than almost all the SL values of tampered videos. However some of the SL values of tampered videos are below than some of the SL values of non-tampered videos. This is because; some of the videos in database have normally greater difference in consecutive frames than the difference due to malicious modifications, in consecutive frames.

Here we are using 100 testing videos for the validation of our algorithm. The testing video, which has the SL value lower than the highest SL value of non-tampered videos and also lower than or equal to lowest SL value of tampered videos, would definitely be a non-tampered video. In the same way the testing video, which has the SL value higher than the highest SL value of non-tampered videos and the lowest SL value of tampered videos, would be detected as tampered video. For the SL values which are below than the highest SL value of non-tampered videos but are above than the lowest SL value of

Figure 13. Plot of average object area as statistical local information of 120 tampered, 120 non-tampered, and 100 testing videos of the database, in which our algorithm correctly classifies 99 videos and misclassifies one video subjected to frame removal attack

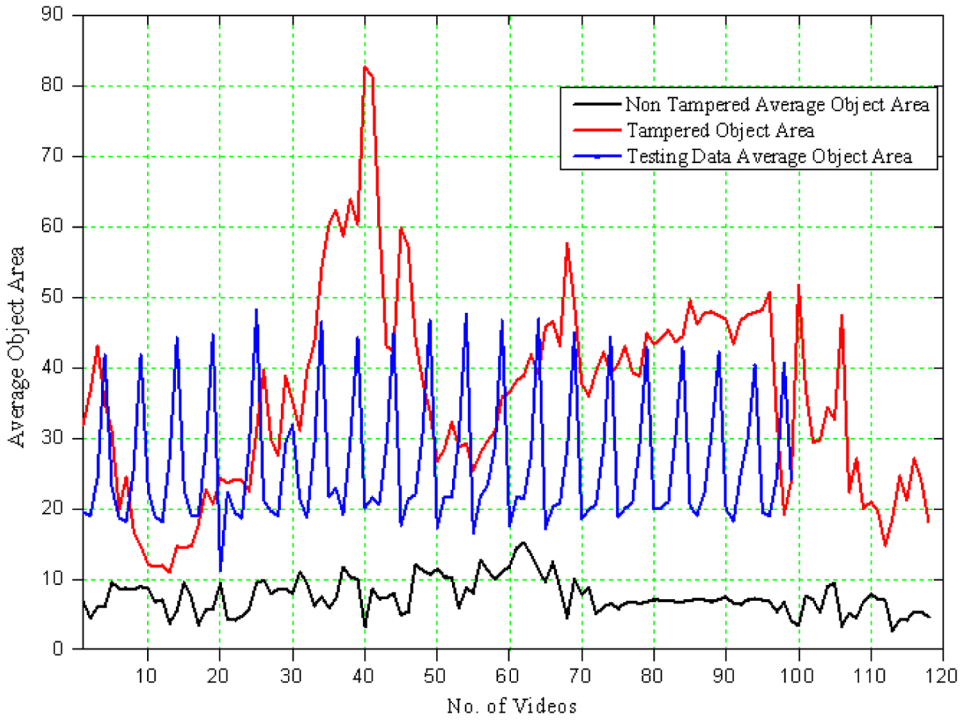


Figure 14. Plot of average object area as statistical local information of 96 tampered, 96 non-tampered, and 100 testing videos of the database in which the algorithm correctly classifies all the tampered videos subjected to frame addition attack

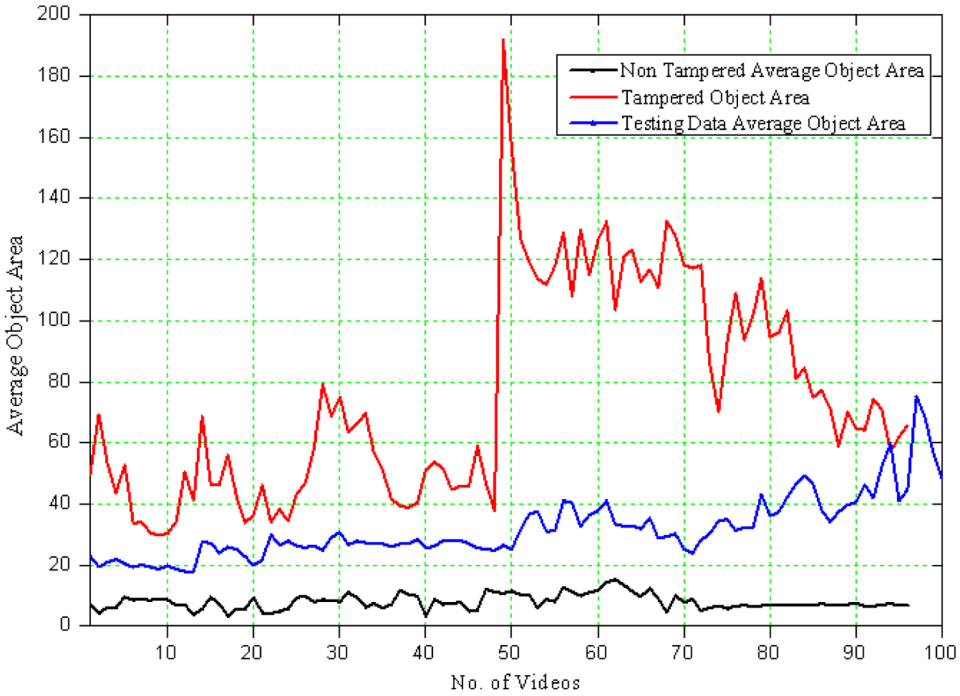
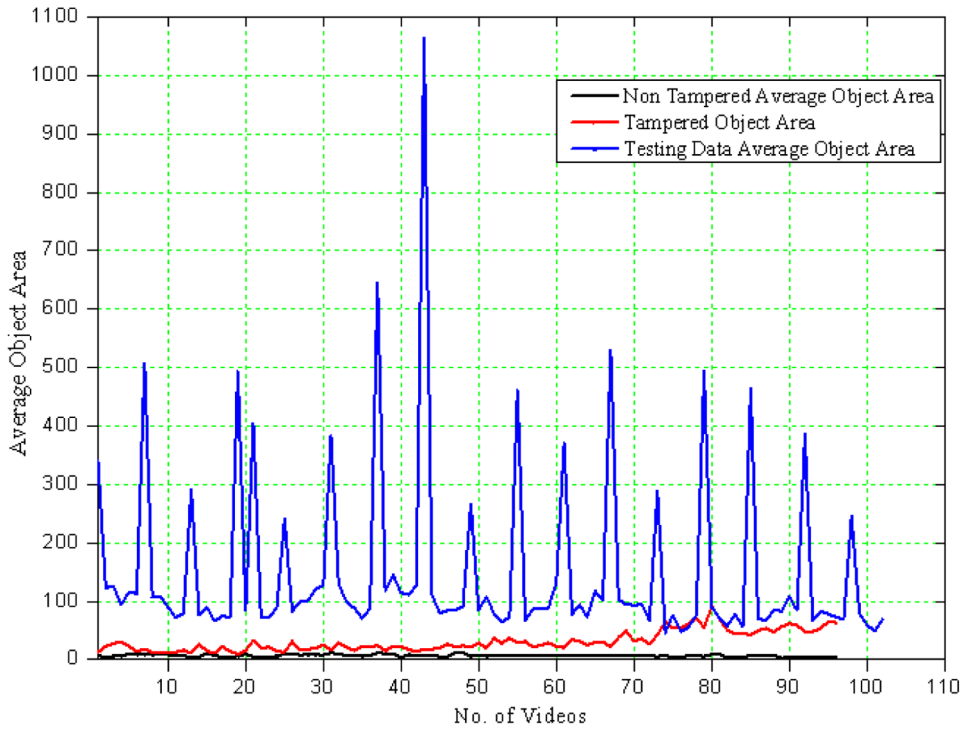


tampered videos, the testing videos may be detected as either tampered or non-tampered videos. In that case videos with the lower SL values would be treated as non-tampered videos and the videos with the higher SL values would be detected as tampered videos. These boundaries for tampered and non-tampered videos are automatically defined by our algorithm once the learning process completes and highest and lowest SL values of learning videos work as a threshold for testing videos. As shown in the graph of Figure 13, the SL values of almost all the testing videos are higher than the highest SL value (which is the threshold value) of non-tampered videos except one. It means that here our algorithm misclassifies only one tampered video as a non-tampered video, and correctly classifies 99 videos as tampered video.

RESULTS FOR FRAME ADDITION ATTACK

In frame addition attack, since the consecutive frames at the tampered positions in the videos have much difference (compared to each other), our algorithm gives better results for frame addition attack. Figure 14 shows the plot for average object area values as SL values for 96 tampered videos, 96 non-tampered videos and 100 testing videos of the database, subjected to frame addition attack. Here in this figure, the SL values of all the tampered videos are much higher than the SL values of all the non-tampered videos. So the learning is performed well. Our algorithm dynamically adopts the highest SL value of non-tampered videos as a threshold value. For the validation process we have taken 100 tampered videos.

Figure 15. Plot of average object area as statistical local information of 96 tampered, 96 non-tampered, and 103 testing videos of the database in which our algorithm misclassifies 12 videos subjected to spatial tampering attack



Our algorithm successfully classifies all the 100 videos as tampered videos, as not a single testing video has a SL value lower than or equal to the SL values of any non-tampered video.

RESULTS FOR SPATIAL TAMPERING ATTACKS

For spatial tampering, we have modified the spatial content of the frames of the video with the help of professional software and created the tampered videos for our video database. These tampered videos include almost all kinds of spatial tampering attack. In spatial tampering attacks, we basically consider the object addition and object removal attacks. In spatial tampering, sometimes changes, due to tampered objects, in consecutive frames are small enough to be ignored as compared to normal changes in consecutive frames. It depends upon the size and movement of the tampered objects in the frames. It also depends upon the size and movement of other non-tampered objects in the frames of the video. Here the tampered object is referred to as an object which is either removed from some frames or pasted to some frames additionally. If the tampered object is small in size and less in movement as compared to other non-tampered objects of the frames, then it creates small enough changes in consecutive frames, to be ignored and it cannot be detected as a malicious attack. While on the other hand if a non-tampered object, big in size (total area of all the pixels covered by it), moves very rapidly then it creates big enough changes in consecutive frames to be detected as a malicious attack. Therefore the proposed algorithm,

sometimes, does not give very good results for spatial tampering attacks. However, since our algorithm is a learning based algorithm, it gives overall good results for spatial tampering attacks. In Figure 15, the SL values of testing videos are much higher than the SL values of learning videos. We have taken 96 non-tampered and 96 tampered videos for learning purpose. Here the SL value line of tampered videos touches the SL value line of non-tampered videos at several points in x-axis. It means some of the tampered and non-tampered videos have same SL values. Therefore, the adoptive threshold value would be changed for the points, in x-axis, where the SL value lines of tampered and non-tampered videos touch each other. For these points, the highest SL value of tampered videos would be adoptive threshold value for testing videos.

Thus here two adoptive threshold value works, one for the points, in x-axis, where the SL value lines of tampered and non-tampered videos touch each other and another for the points, in x-axis, where the SL values of tampered videos are greater than the SL values of non-tampered videos. The highest SL value of non-tampered videos would be the adoptive threshold value for the later one. For the validation process we took 103 tampered videos. In the Figure 15, it can be seen that our algorithm misclassifies 12 videos out of 103 videos with a false acceptance rate of 11. 65% and correctly classifies 91 videos.

VALIDATION OF PROPOSED ALGORITHM

The proposed tamper detection algorithm is validated by using a video database which contains fifty videos. Our video database contains 50 originally recorded non-tampered videos with 2000 frames, each captured at 24 fps. The frame size of each video clip is 720×576 . This video data is used as the ground truth. Each video of the database is further split into 10 equal sized video of 200 frames. For each of the 50 ground truth videos of the video database, different tampered copies are created by subjecting them to different video tampering attacks Experimental protocols for validation process are as follows:

1. For each video, 10 copies are created with frame removal attack in which 1to 20frames have been dropped at random positions. For the frame addition attack, an additional video other than the 50 videos in the database is chosen. Frames of this additional video are inserted at random positions in the database videos to generate 10 tampered copies of each ground truth videos. For spatial tampering attacks we used professional software. With the help of this software we altered the contents of the frames of each ground truth video. This alteration is performed in various aspects, such as, object addition and object removal from the frames. Ten copies of each video of the video database are created, subjected to spatial tampering attacks. We, thus have total 50 ground truth videos with 500 non-tampered videos, 500 videos with frame addition attack, 500 videos with frame removal attack and 500 videos with spatial tampering attacks.
2. 624 videos from the video database are used to train the support vector machine, for frame removal, frame addition and spatial tampering attacks. This SVM training is performed for each kinds of attack separately with different tampered and non-tampered videos.
3. The remaining videos of the video database are used as the probe database to determine the performance of the proposed algorithm.

The performance of the proposed video authentication algorithm is evaluated with this experimental protocol.

All of the computations are performed using the hardware configuration of Pentium ® Dual-Core CPU 2.20 GHz computer with 2 GB RAM under MATLAB programming environment. The RBF parameter used in the proposed algorithm is computed empirically using the training video frames. The best suited value of RBF parameter (γ) among 1 to 5 is 3. The value of $\gamma = 3$, gives the maximum classification accuracy. We therefore used $\gamma = 3$ for classification on the probe data.

The results given in Table 1 summarize the performance of the proposed video authentication algorithm. For authentic videos and videos subjected to the frame addition attack of temporal tampering, our algorithm gives the result with maximum accuracy and yields 100% correct classification. For frame removal attack, a classification accuracy of 99% is obtained. For frame removal attack our algorithm misclassified one tampered video out of 100 tampered videos, because the object movements in the binary difference frames were very small. For spatial tampering attacks, the proposed algorithm gives the result with 88.35% accuracy and misclassifies twelve tampered videos out of 103 tampered videos. Thus the overall classification accuracy of the proposed algorithm is 98.38%.

According to steps 3-5 of our tamper detection algorithm, the SL values, obtained from video frames, are analyzed. This analysis gives the specific frames that have been altered. These results show the efficacy of our proposed video authentication algorithm for all kinds of tampering attack of temporal tampering and spatial tampering.

We also compared the performance of the proposed video authentication algorithm with the motion trajectory based video authentication algorithm (Yan & Kankanhalli, 2003), proposed by Wei-Qi Yan et al. Table 2 depicts a theoretical comparison of both algorithms. Motion trajectory based algorithm (Yan

Table 1. Classification results of the proposed video authentication algorithm for tampered and non tampered video frames

Tampering Attacks	Total Number of Videos	Number of Correctly Classified Videos	Classification Accuracy (%)
Non-tampered	500	500	100
Frame Addition	100	100	100
Frame Removal	100	99	99
Spatial Tampering	103	91	88.35
Total	803	790	98.38

Table 2. Theoretical comparison of the proposed video authentication algorithm with the motion trajectory-based video authentication algorithm (Yan & Kankanhalli, 2003)

Category	Motion Trajectory based Video Authentication (Yan & Kankanhalli, 2003)	Proposed Video Authentication Algorithm
Basic Concept	Master Key computation based on motion trajectory	Statistical Local Information is computed from video frames.
Classification	Using empirical threshold values and cosine correlation measure	Using Non-linear Support Vector Machine for classification
Advantage	Simple algorithm, It handles frame addition and frame removal attack	In addition of frame addition and frame removal attack, it handles frame alteration attack (Spatial Tampering).
Disadvantage	It cannot handle frame alteration and other attacks	Computationally expensive and a little bit slow algorithm due to the use of SVM and a video database.

& Kankanhalli, 2003) is fast and simple but unable to detect spatial tampering attacks (object addition, removal and modification in a frame). It also gives poor results in frame removal attacks of temporal tampering, when only three or four frames are dropped (in case of twenty-frame removal). It also gives unsatisfactory results in frame removal attack of temporal tampering, when object movements within consecutive frames of the video, are very less.

On the other hand, our proposed algorithm uses an intelligent technique, namely SVM classification which is able to detect both kinds of attack, spatial as well as temporal. Thus our proposed algorithm covers a wide range of tampering attacks with good classification accuracy and a minor increase in computational time.

CONCLUSION AND FUTURE RESEARCH DIRECTIONS

From entertainment to court decision, from broadcasting to surveillance, and from investigation agencies to smart classes, video applications have already infiltrated into many aspects of our lives. In the past decade, video based industry has flourished at an unparalleled speed. However, as a spin-off of this exciting development, many security issues have inevitably emerged. In video industry, in contrast to the copyright issue, which only concerns the video content providers, the issue of video content integrity or authenticity concerns not only the content provider, but also the content receiver. Thus, the issue of video content authenticity, sooner or later, will bottleneck video industry if it is not solved properly. Most of the existing video authentication algorithms use watermarking or digital signature based algorithms. Digital signature based algorithm can be deceived, if the location where digital signature is stored is compromised and watermarking based algorithms are not acceptable in court of law because they may alter the content of video during watermark embedding and extraction. To address these issues we have proposed an efficient intelligent video authentication algorithm which can detect multiple video tampering attacks. Our proposed algorithm computes the statistical local information of all of the binary difference frames of the given video and projects them into a non-linear SVM hyper plane to determine if the video is tampered or not. Our algorithm dynamically adopts the threshold values for the statistical local information of tampered video frames. It automatically opts the best suited threshold value for declaring the binary difference frames as tampered frames. The algorithm is validated on an extensive video database containing 1500 tampered and 500 non-tampered videos. The results show that the proposed algorithm yields a classification accuracy of 98.38%. In future we would like to expand our video database, which would cover some more critical conditions for video recording, like the videos captured in different light conditions such as in day light and night vision systems, and in a situation where the camera and objects are moving very fast, videos in critical weather conditions and the videos captured in hazardous condition, and apply the intelligent authentication algorithms for obtaining the results regarding all kinds of tampering attacks.

KEY TERMS AND DEFINITIONS

Digital Signature: Digital signatures can be used for the purpose of authentication.

Fragile Watermarking: Fragile watermarking can be used for the authentication of the author or producer of the content.

Intelligent Techniques: Intelligent techniques use machine learning approach to solve the problems.

Support Vector Machine: Support Vector Machine, is a powerful methodology for solving problems in nonlinear classification, function estimation and density estimation.

Video Authentication: Video authentication is a process, which ascertains that the content in a given video is authentic and exactly same as when captured.

Video Database: A database which contains the videos is called video database.

Video Tampering Attacks: Video tampering attacks can be applied to modify the contents of a video data.

Chapter 46
Young Children and Digital Media in the Home:
Parents as Role Models, Gatekeepers, and Companions

Patricia Dias
Catholic University of Portugal, Portugal

Rita Brito
Universidade de Lisboa, Portugal

ABSTRACT

This chapter presents an overview of the digital practices of young children (under 8 years old) in the home. At such an early age, parents are the main mediators of the contact with digital media, thus paying a preponderant role in shaping young children's practices, perceptions and attitudes. In this chapter, we present partial results of a European-scale qualitative project that followed a methodology based on grounded theory, using interviews to families as method. Our findings reveal different roles played by the parents – role models, gatekeepers, companions, and supervisors. We also found that these different roles are related to the parenting style and also to the parents' own digital practices, and most importantly to perceptions and attitudes towards digital media.

INTRODUCTION

Our society is profoundly shaped by the integration of digital technologies in our daily routines. Children are being born in homes filled with computers, smartphones and tablets, and they are increasingly being exposed earlier to digital media in the home, and consequently engaging with such devices. They are "digitods," they were born after the launch of smartphones in the market (2007) and their parents are usually experienced digital users themselves (Leathers *et al.*, 2013; Holloway *et al.*, 2015). Digital media are fully integrated in the family's daily routines (Kucirnova, 2011).

DOI: 10.4018/978-1-5225-3822-6.ch046

However, most research on children and digital practices has focused on older children, mostly adolescents, who soon stood out as pioneers and trendsetters in the use of the Internet and mobile phones. Our research fills this gap by exploring the way young children (under 8 years old) engage with digital technologies in the home, looking particularly at family dynamics (Vatavu *et al.*, 2014; Plowman, 2015). Both the academic literature and industry reports show that young children have facilitated access to digital technologies at home, and parents are the main mediators of digital experiences at such a young age, as children learn directly from their help and support or by observation and imitation (Plowman *et al.*, 2008; Findahl, 2013; Genc, 2014).

BACKGROUND

There is a broad body of academic literature on parental mediation of media consumption, focusing particularly on young children and television (e.g. Dorr *et al.*, 1989; Sang *et al.*, 1993). This concept refers to the role played by parents as mediators of young children's engagement with communication media, thus shaping their practices and perceptions. Different facets of parental mediation have been explored, namely mediation styles, factors that may influence mediation styles, and the consequences of mediation styles for children's practices and perceptions.

There are different models of parental mediation styles, that Valkenburg *et al.* (2009) sum up in three categories: a) restrictive, corresponding to highly controlling parents in the sense of monitoring and limiting media use; b) instructive, referring to parents who are still controlling but more in the sense of teaching and advising; and c) coviewing, a concept used to describe negotiations, dialogue and search for consensus between parents and children regarding media engagement.

Recent research on parental mediation has addressed this phenomenon when it occurs with digital media. Livingstone (2007) was a pioneer, suggesting the concept of "parent regulation" to describe that parents often draw on family roles, particularly their dimension of authority, to negotiate rules and practices concerning media. Usually, there was an adaption of the rules already set regarding television for digital media. Proposals by other authors (e.g. Barkin *et al.*, 2006; Eastin *et al.*, 2006; Rosen, 2008) can be synthesized in two categories: whether parents tend to 'support' the children's digital practices, thus teaching and helping them overcome difficulties; whether parents tend to "control" their digital practices (at this age, control is more exerted over time of use than over content). Later on, previous mediation styles identified for television watching were applied to digital media: restrictive, active and co-use. Moreover, new mediation styles specific for digital technologies were added: monitoring and "helpdesk" (Nikken & Jansz, 2013).

DIGITAL PRACTICES OF YOUNG CHILDREN

Although most research on digital practices has focused on older children, in the past few years, as children are coming into contact with digital media at increasingly younger ages, a considerable body of academic literature and industry reports have been produced. Despite the different contexts – some international, some national – and methodologies – qualitative and quantitative – they all point to the same conclusions: young children have access to digital media very early and they are spending increasingly more time interacting with such media, to the detriment of others.

Quantitative research stresses penetration rates and time of use. For instance, in the US, 83% of families with children under 5 years of age own a tablet, 77% a smartphone, 58% a computer, 56% a console and 59% have Internet access (Kabali *et al.*, 2015). In the UK, 86% of children under 8 years old have access to a computer in the home, 69% to a smartphone and 40% to a tablet (Lauricella *et al.,* 2015). In the UK, children spend an average of 75 minutes a day watching TV, and their second favorite media is the tablet, when they use about 29 minutes a day; while in the US, 45 minutes a day was dedicated to watching TV, and 27 minutes to watching videos on mobile devices and more than 22 minutes using other apps.

Industry reports highlight a considerable growth in the use of the tablets. Among 5 to 7 years old children, tablet use grew from 11% in 2012 to 39% in 2013. In addition, 68% of 5 to 7 years old children own mobile devices, and 46% of 3 to 4 years old (OFCOM, 2013). Another report corroborates that 3 out of 4 children have access to a smartphone or tablet in the home, and the number of children under 8 years old that have their own tablet rose from 8% in 2011 to 40% in 2013 (CommonSense, 2013). The growth in penetration and use of mobile devices is mirrored by a decrease in other devices such as computers, consoles, and even the TV. In the UK, young children spend an average of six and a half hours a day in front of screens, but tablet-time is increasing and TV-time is decreasing (ChildWise, 2016). The report adds that the tablet is also replacing the computer and reports that 67% of children have their own tablet.

Another common finding is that the tablet is the absolute favorite of young children. Only 3% of children under 8 years of age have never used a tablet, and 25% of them have their own personal devices (Kabali *et al.*, 2015). The tablet is young children's favorite device. Other trends spotted are that as age increases, children have access to more digital devices, spend more time using them, and are capable of more complex and diversified uses (ChildWise, 2016).

Having established that young children are keen on using mobile digital devices, the literature also identifies their favorite practices. Children play games and go online to watch videos and listen to music (OFCOM, 2013; CommonSense, 2013). The favorite online destination of young children is YouTube, with 72% of the surveyed children visiting it everyday (Luscombe, 2015). The choices of devices and activities are strongly gendered among young children. Boys own more consoles and girls own more smartphones; boys enjoy games related to races, sports, adventure and fighting, while girls like fantasy, storymaking, dressing up and taking care of pets (OFCOM, 2014). On the academic side, the conclusions are similar: although the tablet is the favorite device of all children, the choice of apps tends to reflect boys and girls fictional universes of superheroes and princesses, respectively (Chaudron *et al.*, 2015).

PARENTAL MEDIATION

Parents tend to be generally permissive with the use of mobile devices in the home (Plowman *et al.*, 2008). The main reason for this is that this generation of parents are "digital natives" (Prensky, 2001) themselves, and most of them as the competent digital users and enjoy engaging with digital media. Thus, the primary source of parental mediation is imitation. The parents' digital media are available in the home, and young children observe how their parents engage with them, later mimicking their practices. There is a "mirror'" effect between the digital practices of parents and the ones adopted by children, highlighting the fact that the younger the children are, the more they tend to reproduce their parents' practices with digital devices (Lauricella *et al.*, 2015).

Another important reason for such permissiveness is that tablets are effective "babysitters" that keep the children entertained while the parents are busy with house chores or work (Dias & Brito, 2016). For

instance, 28% of the parents of children ages six months to four years, use the tablet as a replacement of direct interaction during bedtime, that is, they use the tablet to "tell" bedtime stories to children until they fall asleep (Kabali *et al.*, 2015). Thus, parents tend to be comfortable with allowing occasional use of their devices such as smartphones, laptops and tablets, and children have even freer access to their own personal devices, usually tablets and consoles (Plowman *et al.*, 2008; Findahl, 2013; Genc, 2014). This means that children are often left alone to explore digital devices independently (Livingstone, 2007; Plowman *et al.*, 2008; Bittman *et al.*, 2011; Kucirnova & Sakr, 2015). Children under five years of age tend to use tablets and smartphones for long periods everyday, and usually without any help from parents, or supervision (Kabali *et al.*, 2015).

However, at such an early age, although children are able to explore digital media independently, they frequently need guidance and help. When they encounter difficulties, young children first attempt to overcome it on their own, usually adopting a trial-and-error strategy; if they are unable to solve the problem independently, they resort to older siblings if they have them, and later to parents (Chaudron *et al.*, 2015; Dias & Brito, 2016). Parents play a crucial role in their adoption of digital media, as it is with them that children first experience digital media (Warren, 2003; Livingstone, 2007; Plowman *et al.*, 2008; Bittman *et al.*, 2011; Craft, 2013; Kucirnova & Sakr, 2015).

Despite this general permissiveness, there are some rules that are common in many homes, such as only being allowed to play after finishing homework and not being allowed to play for long periods of time or just before bedtime. In fact, parents control the devices that children are allowed to use and time of use, instead of monitoring the content to which children are exposed. Parents believe that such young children are not often exposed to online risks, because their skills and consequently use are rather limited: they do not go online frequently, and they do not interact with others on social networks. However, it is precisely on YouTube that children under eight years of age are more vulnerable to risks, mostly exposure to inappropriate content (Dias & Brito, 2016). Because of the touch-screen nature of mobile devices and the tailored functioning of YouTube, children can easily follow the platform's suggestions for content to watch, and most often children use their parents or older siblings' accounts, thus becoming exposed to content intended for adults or teenagers. In addition, children develop complex strategies for conducting searches, memorizing letters and shapes, and they are keen on finding the content they want (Hourcade *et al.*, 2015). If children are more competent than parents are aware of, parents are often oblivious to measures they could take to protect the children, such as YouTube "child mode" of filters, and most of them believe that blocking access and forbidding is ineffective, and that dialogue is the best way to protect children from online dangers (Dias & Brito, 2016).

There is also recent research on the variables that shape the parental mediation of digital media. Gender plays an important role as parents tend to be more permissive with boys and restrictive with girls. Also, mothers are generally more permissive and fathers more authoritarian (Goh *et al.*, 2015). Other socio-demographic features of the parents, such as age, educational background, level of internet usage, online experiences and perceptions and attitudes towards the Internet, are also important (Valke *et al.*, 2010). In general, parents with more digital skills, who use more digital media, and have more positive perceptions and attitudes towards these technologies, are more permissive. Negative experiences with older siblings also have an important weight on parental mediation (Nikken & Jansz, 2015). Family dynamics and factors such as proximity and intimacy between parents and children must also be mentioned (Rudy *et al.*, 2014). Valke *et al.* (2010) draw on previous work on television to propose a model that relates parental mediation of digital technologies to overall parenting style. They define two axes of parental mediation regarding Internet use at home – parental control and parental warmth

– leading to a matrix of four mediation styles: authoritative, authoritarian, permissive and *laissez-faire*. The authoritative style is the most frequent, combining high parental control with high parental warmth.

Researchers are also worried about how parental mediation styles affect children's digital practices and also overall perceptions and attitudes towards digital media. Children of permissive parents are more tech-savvy and more active online while children of authoritarian parents show lower levels of digital literacy (Valke *et al.,* 2010). The mediation style is a determinant for harvesting (or not) the potential of digital media for learning (Bittman *et al.*, 2011). Surprisingly, higher education of parents is not a predictor of co-use of digital media. It is the less educated parents that spend more time playing console or watching YouTube videos with their children (Connell *et al.*, 2015). Although the literature already reveals important information about parental mediation of digital media and the way it affects children, researchers seek further research on such a complex phenomenon (e.g. Tiller *et al*., 2003; Wang *et al.,* 2005; Barkin *et al*., 2006).

Despite the important role played by parents in the adoption of and engagement with digital devices, it must be considered that children are an active part in this mediation process. They may or not engage frequently with their parents – asking for help, for instance; or they may or not choose to explore digital media by themselves (Plowman *et al.*, 2015). The parenting style is, thus, dynamically negotiated between parents and children, and in permanent flux.

EMPIRICAL WORK

Methodology

Our approach is qualitative and follows the procedures for developing grounded theory suggested by Strauss & Corbin (1998). The engagement with digital media is explored along two dynamics: a) between the child and the family; and b) between uses and practices and self-reported. Thus, our study considers four research questions that result from the crossing of these axes: 1) How do children under the age of 8 engage with new (online) technologies? (individual use); 2) How are new (online) technologies perceived by the different family members? (family dynamics); 3) How do parents manage their younger children's use of (online) technologies? (parental mediation); and 4) What role do these new (online) technologies play in the children's and parents' lives? (awareness of benefits and risks).

This proposal presents national results from Portugal about the relationship between the parent's use and perceptions about digital media and their parental mediation style (Valcke *et al.*, 2010; Nikken & Jansz, 2015) that are a part of the wider project "Young Children (0-8) and Digital Technologies." This project included 180 qualitative interviews of families with children aged 6 or 7 years old in 2015. Our national sample is constituted by only 10 families with children aged 6 to 7 years old, which were selected according to theoretical models for obtaining a stratified sample, aiming at getting diversity in family composition, gender of the children, income, education and digital skills of the parents. Table 1 presents additional information about the families. The families were recruited using personal contacts of the researchers and social care institutions and they all live in the metropolitan area of Lisbon.

The methods used are a set of interviews with three moments - an icebreaker activity with the whole family and simultaneous but separate interviews with the parents and children – and observations collected with multiple activities – a schedule with stickers about daily routines, a card game about favorite activities, a grid for identifying apps, a digital tour given by the children, a chart of digital media use

Table 1. Socio-demographic information about the participating families

Family Code	Child Code	Other Members Code	Income	Ethnicity	Parents' Education	Parents' Profession
PT1	PT1b6 (boy)	PT1m36 (mother)	Low	Portuguese	PhD	Early childhood educator

Notes: Our coding system refers to the country (PT, Portugal), the role in the family (b, boy; g, girl; f, father; m, mother) and the age. The family members signaled with * are fathers who do not live permanently with the interviewed children or because they are divorced or because they are working abroad at the time. However, we decided to include information about them as they are present in the lives of the children and participate in the engagement with digital technologies.

built by the parents and several photos. All of this information was coded in a database according to a system of thematic categories and keywords, following the method of QCA - Qualitative Comparative Analysis (Boyatzis, 1998; Braun & Clarke, 2006), and ultimately analysed and discussed.

Although we are aware of the limitations inherent in studying such a small sample, our in-depth and holistic approaches to families and the selection of a stratified sample reinforce the relevance of the results. These are not generalizable, but provide enlightening insights about how digital technologies are being used in the intimacy of the home and the implications of such practices for family dynamics.

Findings and Discussion

In Table 2, we present an overview of the issues that this section addresses, namely the experience and skills with digital media both of the child and the parents, and the parental mediation style.

Table 2. Technology use by the children and parents and parental mediation style

	Technology Use by Child	Technology Use by Parents	Parenting Style	Quotes
PT1	PT1b6, High	PT1m36, Medium	*Laissez-faire* (low demands, low involvement)	*PT1m: Sometimes he asks questions and I say we have to search it on Google... the other day he asked how bridges were built underneath the water and I said we could look it up when we got home. But then we got home and forgot, because he only remembers these questions in the moment and then forgets. We do searches very rarely... In theory, I try to use the tablet as an information source, but in practice when we get home we don't actually do it...* *PT1m: If he is on the computer, he plays alone in the living room. I only go there when he has some difficulty, or when it blocks, or if the Internet fails.*
PT2	PT2b7, High	PT2m39, High PT2f, 39, High PT2b3, High	Permissive (low demands, high involvement)	*PT2b3: I want the tablet!* *PT2f: Look, it's not the weekend. You know that. When are you allowed to play with the tablet?* *PT2b3: At the weekend. But today is the weekend!* [It was Thursday] *PT2f: Almost... Maybe tomorrow I'll let you play a little bit...*
PT3	PT3g7, High	PT3m39, Medium PT3f35, High *divorced	Authoritative (high demands, high involvement)	*PT3m: I don't have the laptop at home, I keep it at work and I rarely bring it home. And she doesn't ask to use it. But when I do bring it, she watches videos on YouTube for hours. If I let her, I think that any child would, she would be there for hours. That is why I rarely bring it... I want her to have other experiences.*
PT4	PT4b6, High	PT4sf38, Medium PT4m26, Medium PT4g9, High PT4b7, High PT4b2, Low	Authoritarian (high demands, low involvement)	*PT4m: During school time, during the week, they are forbidden to touch the tablet, I don't allow it. They can only play on Friday and Saturday, if they don't have homework.*
PT5	PT5b6, Medium	PT5f42, Low PT5b11, Medium PT5b7, Medium	*Laissez-faire* (low demands, low involvement)	*PT5f: I don't even know what they do* [on the smartphone]... *Listening to music, I don't know... Sometimes they watch videos on YouTube and some are music videos.*
PT6	PT6b7, High	T6m41, Medium PT6f XX, High *divorced	*Laissez-faire* (low demands, low involvement)	*PT6m: I haven't quite adapted* [to digital technologies]*… I don't really like them. And that is an addiction; it becomes addictive.* *PT6m: There are no strict rules* [regarding device use] *because he…. He follows the rules.*
PT7	PT7b6, High	PT7f42, High PT7m38, Medium PT7b1, Low	Authoritative (high demands, high involvement)	*PT7m: During the weekend* [he is allowed to use the tablet]. *If he behaves very well I also allow him on Wednesdays, because that is the day of the week when he doesn't have homework. But it is rare. And during the weekend I try to control the time he plays. I don't let him play for hours.* *PT7m: We don't make the same mistake again* [allowing their youngest child to use the tablet without setting rules]... [laughter] *We don't allow him to do it.*
PT8	PT8b6, Medium	PT8m40, Low PT8f42, Medium PT8g15, High *Father emigrant	Authoritarian (high demands, low involvement)	*Interviewer: What kind of games does he enjoy?* *PT8m: Hum...* [PT8b6], *Which games do you like, son? Don't ask me because I don't know... Sometimes I watch him play, but...* *Interviewer: If he doesn't behave well, do you take the tablet away for a day?* *PT8m: Yes. I don't let him play.* *Interviewer: Does it happen frequently? Does that punishment work?* *PT8m: Look, this kid is impressive, he has a very strange temper. It doesn't really work because he says "I don't play today, I will play tomorrow"* [laughter]. PT8g15*: Sometimes my mother says that he has to turn it off, but there are no specific rules.*
PT9	PT9g7, Medium	PT9m35, Medium	Authoritative (high demands, high involvement)	*PT9m: I try to have her play, or chooses games, with which she ends up learning something.* *PT9m: She is aware there are videos* [online]... [laughter] *But I don't give her much autonomy with the videos because I want to be with her, so she doesn't watch anything that just comes on, I don't let her watch videos alone.*
PT10	PT10g6, High	PT1042, High PT10f59, High * father emigrant	Authoritative (high demands, high involvement)	*PT10m: She uses them more during the weekend* [digital devices]. *During the week, she doesn't really use them... But we don't have rules.* *PT10m: Most of the times, she ends up using the tablet when I am unavailable, so we don't really keep each other company.*

Chaudron et al., (forthcoming).

Notes: The family members signaled with * are fathers who do not live permanently with the interviewed children or because they are divorced or because they are working abroad at the time. The assessment of the levels of digital media use by parents and children was adapted from what Livingstone *et al.* (2015) used in the EU Kids online project for older children, considering high users those that use at least one digital device more than twice a day, medium users those who use at least one digital device once or twice a day, and low digital users those who use at least a digital device less than once a day. The classification of the parental mediation style follows the model from Valcke *et al.* (2010).

General Use of Digital Media

Young children enjoy using digital media, and their absolute favorite is the tablet, which is replacing the TV and the console to some extent. The main activities are playing games and watching videos on YouTube, and the choices extend to offline preferences, as children tend to choose games related to their favorite activities/sports and fictional characters/toys. Children's choices are strongly gendered: boys like adventure and fighting games with superheroes while girls like dressing, nails and make-up, princesses and taking care of virtual pets. Children know more about digital media than parents think, since they observe the parents and mimic their behavior. Parents emerge, therefore, as role models for children. For instance, in the homes where parents (usually fathers) were digital gamers, children often played with the console, and that activity was often performed together (e.g. PT2, PT4, PT7). Also, parents described intimate moments with children co-viewing YouTube, usually mothers watching tutorials and video-clips with their daughters (e.g. PT3, PT9, PT10).

However, co-use of digital media is not very frequent in the studied families. For parents, the tablet is often a "babysitter" or an "SOS," a strategy to keep children entertained when they are busy. This means that children experiment and explore alone, and only ask the parents for help when everything else has failed, thus becoming resourceful and savvy with digital technologies. They learn mostly by observing and mimicking the parents, and also by individual trial-and-error approaches. When questioned about how they learned certain skills, they answer "I did it alone!" or "I already knew how to do it!" Even younger children, who are not able to read and write yet, have their own strategies for finding content in the App Store, on Google Play and also on YouTube, based on icon memorization and following suggestions. Parents also report that they only have to show or teach once; children learn very easily and become increasingly autonomous. Older siblings play an important role, as they often teach the younger ones, but the roles of teacher and apprentice can be interchangeable (e.g. PT4, PT6). They also introduce the youngest to new apps and activities.

Parental Mediation Style

Our overview of the parental mediation styles follows the model by Valcke *et al.* (2010), a matrix of four styles according to the degree of control (demand) and involvement. Most families report low involvement of the parents in their children's digital activities, as children engage with digital devices alone. Parents justify their low involvement with the need to keep the children entertained while they do house chores or work from home, claiming that the tablet is the most effective way of keeping the children entertained and happy. Thus, it is by the end of the afternoon, between finishing homework and having dinner, that children have their "play time" with the tablet.

Interviewer: *When he plays with the tablet, is he alone or you are next to him?*
PT1m: *He is usually alone.*
PT10m: *Most of the time, she uses the tablet when I am unavailable, so we do not keep each other company.*

The parents also use this "babysitting" strategy outside the home. They bring the tablet for situations when they know children will be bored, such as long car trips. Also, mothers refer to their smartphone

as an "SOS," as they allow children to play with it when they get restless, misbehave or cause embarrassing situations.

Interviewer: *During waiting time, does he play? For instance, at the doctor...*
PT1m: *Yes.*
Interviewer: *He asks for the tablet or do you give it to him?*
PT1m: *It depends (laughter), usually I give it to him...*
Interviewer: *You do that to keep him quiet...*
PT1m: *Exactly, to keep him from destroying the doctor's office.*

One of the most common joint activities is gaming. Mothers often play dance and karaoke games on consoles, and watch YouTube videos about cake-making and make-up with their daughters, while fathers are their sons' companions in action and adventure games. Most parents enjoy these shared intimate moments and complain about not having more free time to dedicate to them.

Interviewer: *Do you like playing games with him?*
PT2f: *I do, the problem is that I don't have a lot of time.*

Another joint activity is Google searches, but this only happens in less than half of the families. Parents explain that school does not stimulate the use of digital devices for searching or doing homework yet, and they do not have time to explore it further. A few parents report situations where they feel that a search would be helpful and intend to do it later with their children, but end up forgetting or not having time. In fact, the potential of digital devices - especially the tablet - for learning is largely under-explored or even ignored. Children know a few pedagogical games but prefer others. We only found pedagogical apps installed in two families, and they were not used frequently (e.g. PT9, PT10).

PT9m: *I try to have her choose games that will lead her to learn something. I also let her play the ones for dressing princesses, I allow, but they are not the ones I find more interesting or important. I prefer that she plays games related to learning, such as puzzles and memory games… and even games where she needs a strategy to overcome obstacles and go to the next level, so that the games stimulate her in some way.*

In most cases, parents have a rather limited perception of the tablet or the smartphone, regarding them as toys or sources of entertainment, overlooking their pedagogical potential. However, some parents report higher involvement and benefit from the pedagogical potential of the tablet. For instance, PT9m told us she likes to be around when her daughter plays with the tablet, so that she can help her and influence her in choosing more pedagogical apps. Thus, parents can act as gatekeepers, selecting content and activities that they consider appropriate or beneficial for their children, and preventing access to what they find inappropriate or dangerous. PT9m is particularly concerned about YouTube, so the daughter is not allowed to use this particular platform alone.

PT9m: *I prefer if she plays with me.*
Interviewer: *For instance, she watches videos on YouTube, or she doesn't do that yet?*

PT9m: *She knows there are videos... [laughter] But I don't allow her to be very autonomous with the videos because I want to be with her, so that she doesn't just watch anything that comes on... But she knows we can go online and search for movies or short videos. However, she knows she must always do it with me, she is not allowed to do it alone.*

Actually, YouTube is a source of concern for parents, but most of them choose an occasional monitoring instead of a high demand/control. Parents monitor what the children are watching from time to time, and listen while they are busy with their chores, thus having some notion of the content their children are watching.

Interviewer: *And the videos, do you watch with her or do you let her watch alone?*
PT3m: *She almost always has the sound on. I let her have the sound on. If I don't like what I am hearing, and it has happened, I ask her "What are you watching?" Generally, it is always make-up and music, but once there was a make-up video to turn people into monsters or creatures and I was afraid it might scare her.*
Interviewer: *Do you pay attention to the videos she watches on YouTube?*
PT10m: *Look, when she plays with the tablet is when I am less available for her, but I end up keeping an eye on what is going on... So, between the living room and the kitchen, I ask her about what she is doing... I peek, I listen, I end up controlling but in a subtle way, without much pressure... but with a regular periodicity.*

Parents dislike playing the role of gatekeepers or rulemakers, they prefer being companions to their children. However, there are some rules regarding digital practices in most of the homes. The parents tell us they are negotiated with the children, and often are a consequence of some problem that occurred. However, the children perceive the rules as imposed by the parents. Most rules limit the time that children are allowed to spend using digital devices, as parents are more concerned with the consequences of excessive use – stress, frustration, hyperactivity, tiredness, lack of social contact, lack of outdoors activities – than with risks associated to content – violence, advertising, sexual content. Thus, children feel that these time restrictions are imposed by the parents, and most of them would like to play for much longer periods. Most children play between half an hour during the week, usually only after finishing their homework (as technologies are perceived as a distraction from schoolwork). Sometimes they also play after their hygiene, and before going to bed. During the weekend, the rules are less rigid and children can play for longer periods.

Some of the children are only allowed to use digital devices during the weekend. Usually, this strictness follows negative experiences. Some parents report that their children were too excited and nervous after playing for long periods, and they felt the need to set some rules. In family PT7, their son PT7b6 is only allowed to play with the tablet during the weekend, and the parents are careful not to expose their younger son to digital technologies too soon.

Interviewer: *How old was he [PT7b6] when he started using the tablet?*
PT7f: *Very early. (...) We were in Angola and he started to play with it very early.*
Interviewer: *And now his younger brother wants to play too, right?*
PT7f: *Hum...*
PT7m: *We're not going to make the same mistake... [laughter] We don't allow him to do it.*

The parents of PT7b6 also told us about another danger of leaving their son playing alone: he spent 50€ on paid apps.

PT7f: *Once, she [the mother] had her account set to make purchases, by default... If I buy something, it asks for my code, but if I shop more during the next half an hour, I can keep shopping and it won't ask for the code again. And we had an episode of three or four purchases in a row... And 50€ to pay for in apps... [laughter]*
Interviewer: *But did he do that?*
PT7f: *He did it! He bought one, and another, and another... He didn't need the code because the mother had just bought one app. And he kept browsing the app store and had a lot of fun buying games.*

Actually, not being allowed to buy paid apps was a common rule in all the families. Parents believe that there is such a big offer of free games that they don't have to pay for this kind of content. Besides, some of the children must ask permission before installing apps, or the parents use a password that they must insert in order to install apps, and in this way they are always up to date with the content their children come into contact with.

Although there are not strictly established rules, another form of high control is to deprive children of digital technologies as a punishment. Parents are aware of how much their children enjoy their tablets, so they use it for disciplining them, both as reward and punishment.

Interviewer: *Do you use digital media as punishment?*
PT2f: *If he doesn't behave properly, we take away his tablet. (...) There was a weekend when he misbehaved and I took away his tablet, that was it.*
Interviewer: *But it is the punishment that most affects him, or is it one among the others?*
PT2f: *It affects him a lot [laughter]. Yes, because he loves it, he loves to play.*

Despite these rules, there were two families where the parental mediation style was based on low control. Both mothers reported that they didn't need to set rules because their children didn't play excessively. Rules and control are related to the parents' perceptions of the dangers their children are exposed to. Parents believe that, at such a young age, the children are not very exposed to dangers because they rarely go online and they do not communicate with strangers. In addition, parents are not fully aware of the children's skills and practices. Nevertheless, children are exposed to dangers, particularly inappropriate content on YouTube.

Interviewer: *Have they ever watched something on YouTube that shocked them or scared them?*
PT7f: *Sometimes they are watching Spider-Man videos and the other one appears...*
PT7m: *The one with a skull.*
PT7f: *We must pay attention.*
PT7m: *Because when he sees him he doesn't even want to go upstairs alone if it is dark.*
PT7f: *Yes, when he watches that stuff we know we are going to have problems with him at night.*

Most parents believe that, in the face of online dangers, dialogue and monitoring are more effective than prohibitions, as they fear that forbidding might make children even more curious. For example, when PT10m noticed that her daughter had installed a violent game, she explained to her that those

games were not appropriate for her age, and the child stopped playing those kind of games. However, most parents did not feel the need to have this kind of conversation yet. Some mothers with daughters are more careful about social networks and have approached the subject with the children.

PT8m: *About friendships on Facebook, I talk to her. I explain the dangers. And she watches the news on TV. And I tell her "Do you see how dangerous Facebook is?" It has a lot of good things, you can make friends, ok. But she must be aware that a lot of people in there can take her on bad paths."*

PT4g9 has already asked her mother to create a Facebook profile, but the mother did not allow it, and explained to her that we never know who is behind each profile "asking for friendship." PT4m reports that if she catches her daughter on Facebook, she will forbid the use of all digital media: "internet, tablet, everything."

In the case of divorced parents, there were more visible differences in the parental mediation style and in the resulting practices. There were two cases of the fathers being high digital users and the mothers being low and medium digital users. As a result, the children used the devices for longer periods and for more diversified activities when they were with the fathers. Also, the fathers taught them how to perform certain tasks - for instance how to call the father via tablet - and often played with them.

Interviewer: *PT3g7 didn't mention digital technologies in her routine with her mother. She doesn't use them?*

PT3m: *It depends on which house she is in. When she is with her father, the first thing she does is go to the living room and grab the tablet. I have even talked to her stepmother and said "It is so weird watching her with you, she is a completely different child. She doesn't do this with me." She has very different behaviours and habits from one house to another. Including the tablet. I have witnessed it several times, the first thing she does when she gets to her father's home is ask, "Where is my tablet?. She goes to the living room, turns on the TV and plays with the tablet at the same time.*

Parents' Perceptions about Digital Technologies

In the previous sections, we have already presented some perceptions about digital technologies that are common to most parents: they undervalue their children's digital skills and believe that their digital practices are more limited than what they actually are; a consequence they believe that the children are not exposed to dangers at such an early age, when they in fact are. These perceptions (or misperceptions) are reflected in the control dimension of the parental mediation style (Valcke et al., 2010), as parents focus their monitoring and rule setting on time spent playing and only occasionally monitor the game selection and online content being watched. In addition, parents perceive digital media, particularly the tablet, as a "toy," and its main function as "entertainment," thus overlooking its pedagogical potential. This is reflected in the involvement dimension of parental mediation (Nikken & Jansz, 2015), as parents do not regularly engage in joint digital activities, and when they do the most common is playing games.

In our research we were able to spot other general perceptions about digital media that shape their parental mediation style. For instance, most parents acknowledge digital media is important – and even indispensable – for their children's future.

PT3m: *If I let her play with the tablet, I am helping her because she understands more easily how the future is going to be. She will live in a world where everybody is "cyber."*

According to the parents, digital media facilitates work and improves life in general. Parents stress quick and easy access to information and keeping in touch with distant family and friends as advantages that are afforded by digital technologies. Others mention their utility for schoolwork, for searches, and the fact that digital tools can promote the development of children, namely memory, hand-eye coordination, motivation for reading and writing, and mostly autonomy in exploring and problem-solving.

PT8m: *Today, children, I don't know why, they grow up very fast. They do things, they search for things that I cannot do. But my son is 6 years old and he does. I don't know why or how. For me, it is not normal. He does such things! There are things I don't need to teach him because he learns everything alone. On the tablet, on the smartphone. I don't even need to open my mouth because he says "I know because I have seen it on your smartphone!"*

Mothers PT3m, PT6m and PT8m discuss having trouble keeping up with their children's digital practices. In spite of these positive perceptions, parents are concerned about the changes in what their children understand as "play," when compared to what they regards as "play." Some mothers, as PT1m, PT3m and PT6m report that they would prefer if their children played more outdoors and used more of their imagination and creativity, but they also believe they could compromise their future skills and school/work performance if they prevented them from using digital media. Many of the parents - fathers and mothers - referred nostalgically to their childhood, spent playing outdoors with friends, living in rural areas, playing traditional games, building and inventing their own toys.

A big concern is the replacement of social contact by technologies, and the loss of social skills. Parents dislike that children prefer engaging with technologies to playing with other children, and fear for their socialization and ability to make friends. Some even mention that their child spends too much time playing and doesn't interact much with the rest of the family.

PT3m: *The negative side [of technologies] is the lack of social contact. I am afraid for those children, I know that there are a few, even the children of friends of mine, that spend the whole day on their PC, and they have difficulties in connecting with other people, have low social skills, and I think it is the technology that takes that away from them. (...) To the extent that I am able to, I will keep her in contact with less technology and more nature.*

Some parents also mention fearing that the children will become addicted to technologies. They also point out that the children become nervous, frustrated and too excited when they are playing games on the tablet for too long. Others observe that children are becoming less resilient, as technologies make everything easy and immediate for them. They do not try to overcome problems, or make an effort, or wait for something. They always look for the easiest and fastest way of getting the satisfaction they want.

These perceptions, which are often misperceptions, have a strong impact on the children's digital practices, influencing their perceptions of the parents' behavior as a model, the rules that parents set as gatekeepers, and the activities that they choose to share with the children as companions.

CONCLUSION

Regarding the relationship between the parents' digital practices – Valcke *et al.* (2010) mention the level of Internet usage and online experiences – and their parental mediation style, our results show that low users tend to have more extreme styles, ranging from *laissez-faire* to authoritarian (although the *laissez-faire* is the most frequent). This is mostly a result of their low involvement in the digital practices of the children, while regarding control they can be permissive or restrictive. On the contrary, parents with high digital skills and frequent and diversified digital practices are more likely to mediate the children's online practices, although their perspective on control may be more permissive or restrictive (it is usually more restrictive). Thus, the parents' digital practices have a stronger weight in their degree of involvement, while their degree of control/demand is shaped by their perceptions.

Nikken & Jansz's (2015) claim that perceptions and attitudes of the parents regarding digital technologies influence their parental mediation style is also corroborated by our findings, as parents who have more positive perceptions and attitudes tend to be more permissive, and parents with more negative views tend to be more restrictive. Whichever the case, their degree of involvement may vary, but it is high in most cases. When there is high involvement from parents, digital media are triggers of intimate shared moments and strengthen the relationship between parents and children. However, in the case of low involvement, digital media become individual spaces of intimacy for the children, who are free to explore, learn and play.

In spite of these findings, our qualitative approach also revealed that parental mediation is a dynamic process that not only depends on a wider set of variables and interdependencies, but is also in permanent flux. Parents and children learn from one another, explore new technologies and possibilities, and negotiate rules, in a process that develops more or less at the same pace than children's growth.

SOLUTIONS AND RECOMMENDATIONS

Our research identified some important gaps between the parents' perceptions and the children's digital practices, mostly resulting from parental styles based on a low involvement. These gaps are a discrepancy between the parents' perceptions about their children's digital skills and practices and the children's effective skills and practices, which go far beyond what the parents think; the lack of awareness of parents about the children's exposure to online risks and also different views about rules regarding digital media in the home and the way these rules are set (parents describe the process as a negotiation and children regard it as an imposition). On the contrary, parents and children do share one perception that is discrepant from reality: they regard digital media, particularly the tablet, as a toy, what leads them to overlook its pedagogical potential.

The phenomenon studied happens in the home, but we recommend the engagement of external stakeholders in order to overcome the discrepancies in perceptions and misperceptions identified. We consider that schools have a privileged position, deriving from their proximity to the families, to foster awareness, digital literacy, and digital engagement. However, schools need a wider favorable political and societal setting that is up to policy-makers to build. We recommend that schools work in articulation with families to promote awareness about dangers and risks, to promote informed, diversified and safe digital practices, and to fully integrate the learning of children in a holistic approach that includes both formal and informal settings and agents.

FUTURE RESEARCH DIRECTIONS

One of the main difficulties of researching young children is the need to adapt traditional research methods and techniques to their age, maturity and competencies. This chapter reports on a qualitative exploratory study that aimed to draw a snapshot of the role played by the parents in the children's engagement with digital media in the home. However, further research is needed, particularly longitudinal approaches. Also, innovative methods based on the affordances of digital media themselves may be developed and applied to collect non-self-reported data which can be contrasted with the self-reported data collected through traditional qualitative methods.

KEY TERMS AND DEFINITIONS

Children 0-8: Children under eight years old. This age group, although very diverse, is characterized by not being proficient in reading and writing, which shapes their appropriation and use of digital devices. Also, they have less autonomy at this stage, and strongly depend on parents as role models and helpers for their digital practices.

Children's Digital Practices: The way in which children have access to digital media and appropriate them, integrating them in their daily routines. The specific uses and activities performed by young children with digital devices, and their cognitive and social implications.

Digital Native: Term coined by Prensky (2001) to describe the gap between those who had grown up in contact with ICT (Information and Communication Technologies, mainly personal computers, mobile phones and the internet), and who were completely at ease and proficient with these media, and those who had come into contact with it later in life, and who despite being able to learn and adapt, always felt like "immigrants" in this digital context.

Digitods: Term coined by Holloway *et al.* (2015) to refer to children born after the launch of smartphones in the market (in 2007), and who have therefore come into contact with touch technology at a very early age or since birth. Touch interfaces make a big difference in the access of young children to digital media and content, as they enable an easier way of interacting with devices.

Home Environment: When it comes to young children, their main locus of socialization and learning are the home and the school. The literature usually distinguishes these two settings considering the home an informal setting, as rules tend to be specific to each family's dynamics and often negotiated, and the school a formal setting, as rules and social conventions tend to be less negotiated and generally applied. Thus, we talk about the home environment as an informal setting for the appropriation of digital devices and for the development of digital skills.

Information and Communication Technologies (ICT): Term early used (around early 90s of the 20th century) to describe a set of technological innovations that enabled information processing and storage and also communication at a global scale. It refers mainly to personal computers, mobile phones and the internet. It can be broadly considered a synonym of digital media or digital technologies.

Information Society: Term early used (around early 90s of the 20th century) to describe a new social model that was being shaped by the widespread and frequent use of ICT (Information and Communication Technologies). Information Society highlights a significant difference regarding the previous social (and also economic and politic) model, the Industrial Society. Similar terms are networked society (Castells, 1996) and digital age (Levinson, 1999).

Parental Mediation: As young children are not very autonomous, the concept of parental mediation highlights the pivotal role played by the parents as mediators of the contact of young children with media. The concept was initially developed regarding the TV, and later applied to digital media. Parents decide on access, and also on practices. There are different parental mediation styles, ranging from permissive to restrictive, and with different degrees of support.

Utilization and Applications

Chapter 47
Abuse of the Social Media Brain: Implications for Media Producers and Educators

Fritz Kohle
University of Edinburgh, UK

Sony Jalarajan Raj
MacEwan University, Canada

ABSTRACT

Despite the criticism in the mainstream press regarding the use and abuse of digital and social media, its use has been increasingly encouraged and supported in schools and universities. This chapter examines the social media behaviour of techy-savvy undergraduate students at NHTV, University of Applied Sciences, Breda, The Netherlands, from the perspective of an independent documentary producer and educator, to determine whether any correlation between the amount of time spent online and the use of cognitive functions exists. Media producers require an audience capable of critical thought, and teachers educate future audiences to acquire the necessary cognitive skills. Hence, the chapter analyses how the viewer's cognitive functions impaired by the use of social and digital media affects the reception of media products. This further leads to a more critical concern about the educators' response to the challenges provided by social and digital media.

INTRODUCTION

In some recent research articles, Kohle and Cuevas (Kohle, 2012; Kohle & Cuevas, 2012; 2010) demonstrated that digital natives have and continue to adapt their viewing habits to social and digital media, challenging traditional content development, production and distribution methods. Social media marketing has become a buzz word—users, companies, charities and governments, all are exploring the use of social media. As happened during previous 'information revolutions', social media users and content creators are still in the process of developing the social media narrative. They are not only learning how to access social media networks (SNS), they are increasingly developing the capability to critically process

DOI: 10.4018/978-1-5225-3822-6.ch047

online information, becoming social media literate. For example, social media has become and remains instrumental in movements such as the Occupy movement and the Arab Spring. The digital and social media revolution has become a game-changer on a global scale and is the most recent in the evolution of previous 'information explosions', such as the invention of broadcasting and print technologies, the invention of the alphabet, and language itself.

Recently, the negative aspects of social media moved into the focus of the mainstream press. Surveillance of social and digital media was highlighted once more by Edward Snowden (Branigan, 2013). Agencies such as SS8 (2011) and Glimmerglass (2011) are well described regarding their data collection activities on behalf of government and private clients. Intelligence Support Systems for Lawful Interception (ISS, 2013) offer a platform for companies such as SS8 and Glimmerglass to present their latest social media tools in intelligence gathering. Conferences take place across the globe and services offered include, but are not limited to: cyber security and lawful interception of data, as well as submarine cable landing stations, offering access to submarine optical cables that support millions of voice calls and internet traffic. SS8 specializes in 'accurate reconstruction of intercepted voice, text and internet activity' and the 'correlation of intelligence from Internet Protocol Data and Call Detail Records to full communications content' (SS8, 2013). How this can be done without violating the 1st amendment of the US constitution is debatable, not to mention international and national law for the rest of the world.

The topic of social media surveillance abuse on its own requires further investigation, but this would go beyond the scope of this paper, which does not focuses on social media surveillance and security issues, but on the impact of social media on the development of cognitive skills of digital natives and place it into a historical as well as social theory context.

BACKGROUND

This paper is relevant to media producers who continue to work in their profession and who have an interest in teaching. Familiarity with Marshall Mcluhan's (1995) media theory and Briggs & Burke's (2009) history of media is recommended. Macluhan argues that the "medium is the message". It is the media system itself which transforms society. Evidence suggests that the use and abuse of social media also has a detrimental impact on the development of cognitive skills among digital natives and immigrants alike. (Spitzer, 2012) At the same time digital natives are challenged to acquire new skills to navigate social and digital media; skills needed to become literate in the use of a new media technology, which in itself is influencing user behavior and the way content is produced. Data suggests that not only behavior is affected; the brain itself also undergoes significant changes.

Social media is not only the latest 'information explosion' in a series of evolutionary steps, since the invention of language (Kohle, 2013); it differs considerably from previous information explosion events, such as print and broadcast technologies in speed of information dissemination. This was discussed by Mcluhan, though the speed with which this new technology evolves and the extent to which it encompasses previous media technologies is beyond the scope envisaged by Mcluhan. Social and digital media are a paradigm shift when compared to previous information explosions, such as the invention of writing and the alphabet.

History teaches us that the introduction of new technology also brings with it undesirable side effects. Social media is no exception to this: it not only challenges the way media productions are developed, produced and distributed – evidence suggests social media is also playing a role in the way audiences

develop their cognitive skills. With regards to content for social and digital media, we take into account Mcluhan's idea on how content for new media originates from yesterday's technology. For example: content for TV is print; content for print is writing. We take a closer look at Mcluhan and examine his ideas within the context of social media. We then conclude this paper exploring uses and abuses of social media among digital natives from the perspective of a media producer and educator.

Research Methods

We critically examined the impact social and digital media has on cognitive functions among a group of digital natives and undergraduate students aged 18-22 at NHTV, University of Applied Sciences, Breda, Netherlands. A group of 77 undergraduate students was surveyed using a multiple-choice questionnaire to investigate their social media behaviour. The survey was designed to provide insight into the use of cognitive functions such as memory and orientation. All 77 students completed the survey.

We conducted a literature review of the arguments provided by critics, such as neuro-surgeon Prof. Dr. Manfred Spitzer (2012), as well as claims by South Korean researchers who have found evidence suggesting a correlation between the early onset of dementia among South Korean digital natives and the use of digital and social media. We further investigate phenomena such as cyber bullying and Facebook depression by reviewing relevant papers in the field. We then compare the outcome of our survey to arguments presented by critics, discuss the implications for documentary filmmakers within the context of Mcluhan's ideas on media theory, and summarize our findings accordingly.

Survey Results

The author of this study observed viewing habits of digital natives since 2009, following the Occupy movement, Arab Spring, describing the impact social media have had on digital natives and immigrants alike, as the ultimate information explosion. Abuse of social and digital media did not escape the authors' attention, i.e. use of social and digital media by agencies such as the NSA. In this chapter, we discuss the outcome of our survey, research into the impact of social media on cognitive functions and media theory. The classical definition of dementia is based on the loss of cognitive functions, memory and orientation (WHO ICD-10 Classification of Mental and Behavioral Disorders, 1992). Survey questions were designed to explore memory relating to literature read, news headlines noted, documentaries seen, and the ability to relate the campus location of NHTV to the Breda city centre. Our survey focused on the claims students made without judging the validity of the content of their claims. For example, it was not important for the survey outcome if students claimed they remembered the news headline: "Obama stops clandestine NSA internet surveillance", even if this news headline at the time of writing this paper was factually incorrect. The survey only captured the student's claim that they remembered something. We also added a control question, such as "What did you have for lunch yesterday?". If students were dement at the time of taking the survey, the answer to that question would more likely than not elude survey participants.

Only 4 out of 77 students participating in the survey stated that they spent less than 2 hours per day online. This small group claimed that they had the least difficulty staying focused during class and staying off-line during lectures. In stark contrast, 7 students claimed to spend 10 hours or more online per day: 6 students from this group stated that they had difficulties staying off-line during class and tutorials. 3 of the 4 of students claimed to spend less than 2 hours online and remembered the last documentary

they saw. Only 4 of the 7 students claiming to spend 10 or more hours a day online remembered the last documentary they saw. Data suggests that more online time using social media does not correlate with improved memory.

However, not all results were this clear. 6 of the 7 students from the group that spent 10 hours online, stated that they remembered news headlines, compared to 3 out of 4 students who claimed to spend 2 hours or less online per day. In this case the 10-hour online group's results were similar to that of the 2-hour online group. This could be due to a number of reasons, such as size of the sample group and cultural differences within an international setting. Another reason could be that students 'skim' news headlines using various sources, meaning that they are aware of newsworthy events but without do not have deeper knowledge of them. It would be desirable to repeat this survey on a larger scale to investigate these two groups in more detail. We did not observe a statistically significant difference between sexes.

45 out of the 77 students stated that they spend between 3-5 hours online every day. 47% claim that they experience difficulties staying offline during lectures and tutorials. 35% do not remember the last documentary they saw, 88% do not remember the last day they spent without internet access, 71% do not remember the title of the last book they read, and 40% could not place the location of the university in relation to the city center of Breda. Based on the above, nearly half of the students in this group could be diagnosed with a mild form of dementia: a degree of memory loss interfering with every day activities, the main function affected being the learning of new material (WHO ICD-10 Classification of Mental and Behavioral Disorders, 1992).

Having said all that, 97% of students remembered their lunch the day before, an indication that dementia is not yet an issue for digital natives between the ages of 18-22. But it is debatable whether students are exercising and further developing their cognitive skills considering the survey outcomes. Data suggests that retention of literature recently read, daily news and events or documentaries seen, is not improving among this group of students by means of social and digital media. A small group of students who spent less than 2 hours online a day read more, are better informed, more focused and less distracted by social media in the classroom when compared to students who are online longer. Control questions indicate that students are not dement, but distraction from social media poses a real problem: the majority of students who are online between 3-5 hours a day find it difficult to remain offline during lectures, remain focused, remember news events, literature and documentaries seen, or even when they were last offline.

MAIN FOCUS OF THE CHAPTER

Cognitive Functions: Effects of Social and Digital Media on the Brain

Manufacturers of tablets and mobile devices are keen to expand their market reach, increasingly targeting children and teenagers for their products as existing markets reach saturation. Sandvik, Smordal and Osterud (2012) argue that the use of tablets improved language learning in a kindergarten setting. Their data suggests that digital tools such as iPads provide an opportunity for 'children to engage in useful language interaction', though it remains unclear how the use of tablets at such an early age influences brain development. Similar studies claim that children aged 3-5 developed considerable vocabulary and phonological awareness (Chiong & Shuler, 2010). Still, even proponents of digital tools claiming ben-

efits in the development of language among 3-5 year olds are cautious and recommend further studies regarding this topic (Sandvik, Smordal & Osterud 2012).

Critics such as Manfred Spitzer (2012) and Psychiatrist Dr. Kim Dae-jin (Some teens are exhibiting signs of 'digital dementia', 2013) have described the early onset of dementia among social media users. They claim that digital and social media are hindering the normal development of cognitive functions in teenagers and adolescents. Similar articles have appeared in other mainstream papers, highlighting concerns over the use of social and digital media (Digital Dementia on the rise, 2013; Ryall, 2012). Social and digital media may not only hinder the physical development of the brain, if used inappropriately; researchers in the field of education examined online social aggression and abusive behavior in Australia (Burgess & Mcloughlin, 2011). They claim that the consequences of cyber-bullying can be more severe than face-to-face bullying because the physical separation of victim and aggressor does not lead to an end of bullying. The recent increase in cyber-bullying and the consequent suicide of a number of teenagers brings this issue once again into the public domain (Gadkari, 2013; Arkin, 2013; Ensor, 2013; Warren & Quigley, 2013). The psychological aspects of online social aggression warrant further investigation.

If true, a growing number of digital natives are at risk of not being able to fully develop their cognitive skills, exposing them to the onset of dementia at an early age. Society as a whole will need to bear the moral and financial costs associated with an increase of dement citizens in the future. Media producers rely on audiences equipped with well-developed cognitive skills in order to encourage and stimulate critical thought on the topic presented.

Spitzer (2012) argues that the indiscriminate introduction of mobile devices and digital media into the classroom at an early age and during adolescence has a detrimental impact on the development of cognitive functions. As a neuro-scientist and brain surgeon, he found a spot in the German public highlight as one of the more vocal critics of social and digital media. His writing style can be construed as polarizing; nevertheless, he provides a well-constructed argument, not entirely against social and digital media per se.

Instead, he advocates a more thoughtful and responsible use of social media. We know too little about the impact of social media use in the class room and in kindergarten. Media use combined (TV, music, games, computer, books and cinema) averaged at 7:38 hours per day in the US in 2009 (Rideout, 2010). Consequences of this amount of media consumption are not frequently examined by industry-funded researchers for obvious reasons. The London School of Economics surveyed 25000 9-16 year olds from 25 European countries (Livingstone, Olafsson, & Staksrund, 2013). They concluded that digital natives frequently visit sites inappropriate for their age, lacking the skills to navigate SNS's safely.

In response to these considerable threats to the safety of young people and teenagers, the industry has responded with self-imposed strategies that aim to minimize these risks, though little is known about the effectiveness of these strategies. Strasburger, Jordan and Donnerstein (2010) published similar results, making concrete recommendations to schools, the entertainment and advertising industries, as well as researchers and government bodies, on how to deal with the consequences of social and digital media 'abuse'.

The importance of well-developed cognitive functions is also highlighted by Woollett and Macguire (2006, 2011) in their investigation into the role of the hippocampus, a part of the brain associated with memory. Taxi drivers who regularly studied to memorize London street maps to pass the London taxi driver exam showed a measurable increase in the size of the hippocampus. Critics such as Spitzer claim that social and digital media makes it too easy to not practice and develop cognitive functions. Spitzer explains that the descent into dementia at a later age is very much determined by how well an individual's

brain developed during early, formative years: a person with well developed cognitive functions at his or her disposal is more likely to descend into dementia later in his or her life. Data suggests that lesser developed cognitive functions result in the early onset of dementia, though clearly more research is needed in this area.

His arguments are supported by reports from South Korean psychiatrists such as Kim Dae-Jin at Seoul's St. Mary's hospital (Baek Il-Hyun & Park Eun-Jee, 2012). South Korea's mobile device penetration is among the highest in the Western world (Media Trend Watch, 2012). Practitioners such as Kim Dae-Jin have noticed an increase in cases described as 'digital dementia': the deterioration of cognitive abilities not normally associated with the age group of digital natives. According to Baek Il-Hyun and Park Eun-Jee (2012), the South Korean Health Insurance Review & Assessment service also reported a significant increase in people suffering from cognitive problems since 2008. This increase correlates with the rise of the sale and use of mobile digital devices in South Korea.

Further evidence is provided by Zhou et al (2011), who measured the effects of internet addiction on the brain. Individuals addicted to being online are shown to have a different brain structure. After 50 hours of internet gaming, Lee Seung Seop collapsed and died of heart failure. Christakis (2010) concludes that parents and teachers are too complacent in dealing with this issue, and terms the separation of digital immigrants and natives the 'digital divide'. Those who need most guidance, namely digital natives, are cared for by digital immigrants who are unaware of the negative aspects of social and digital media.

Critics argue that social media discourages digital natives from developing their cognitive skills. The impact of learning on the brain and the consequent development of the hippocampus were already described by Wollett and Mcguire (2006, 2011). Digital natives are prone to 'outsource' information into the 'cloud' (Mell & Grance, 2011), their computer, laptop or mobile device, and it is reasonable to argue that they are not training their brain. For example, London taxi drivers could use a GPS based navigation system guiding them via the most suitable route to their destination. In turn, however, their hippocampus would be less developed, which, as critics claim, increases the likelihood of developing dementia earlier rather than later.

Data from our survey suggests that social and digital media do not improve cognitive functions, memory and orientation, especially when essential information is kept in a cloud instead of the brain. Social and digital media are part of a transformation process in society, and are physically measurable: South Korean and German researchers find that abuse of social and digital media have detrimental effects on the development of the brain (Spitzer, 2012).

The Medium is the Message: Or is It?

Social media can be compared to Mcluhan's famous light bulb analogy: the light bulb in itself does not have any content, but at night it illuminates an otherwise dark space for social activity. The internet, social, and digital media function very much in the same way: on their own, they have no content, but they have enabled users on an unprecedented, global scale to access and participate in a virtual space. It is reasonable to argue that this new online world is evolving into a global online collective consciousness.

Society is being transformed from a non-virtual world to encompass a virtual state, providing post-modern content via the social and digital media domain, which in itself is constantly changing: a key characteristic of post-modernity. Users no longer need to study and memorize a roadmap. This is

accomplished by the mobile device instead. Perhaps this is the next evolutionary step. Dunbar (2003) describes the human brain's limitation in dealing with more than 200 social contacts, when compared to the brain of other hominids. Watkins (2010) submits that it became necessary for early man to overcome this limitation by cultural means; for example, monumentalism and storytelling. The development of language also had a major impact on the brain's structure (Corbalis, 2009)—it increased in size and led to the development of episodic memory as humans developed the ability for 'mental time travel' (Tulving, 2002). Language allowed us to tell stories that required an understanding of time: past, present and future. Or in narrative terms: a beginning, middle and end.

Briggs, Burke and Mcluhan teach us that previous media technologies played a significant role in the transformation of society and culture. We also learn that with the introduction of each new technology the human brain underwent significant changes. For example learning the London roadmap results in an increased hippocampus for London taxi drivers, a significant and measurable outcome attributed to practicing memory as a cognitive skill. Critics are also quick to highlight negative aspects regarding cyber bullying, Facebook suicides, internet addiction and their observations on the development of cognitive functions and the brain. But what if that is all part of a natural evolutionary cycle? What if we are supposed to 'outsource' information onto a cloud and share it with the world? What if the next evolutionary step for Homo Sapiens Sapiens is to develop a global collective consciousness located in the cloud? On the other hand, if dementia occurs as a result of under-developed cognitive skills as Spitzer claims, what kind of society are we looking forward to? How will outsourcing crucial information to the virtual cloud world prevent the onset of early dementia?

Mcluhan (1995) argues that the 'medium is the message'. He submits that it is the medium that transforms society rather than the message it carries. It is debatable whether or not media is causing transformation, or if it correlates regarding change. His ideas describe the transformative effect of media on cultural and social aspects of society. Evidence suggests that a correlation exists between the development of the brain and the way users engage with media. Jung's (1981) ideas on synchronicity could provide another perspective on media and 'Zeitgeist'. It is therefore reasonable to argue that the "medium being the message" not only plays a role in the transformation of society, but also a causal or correlative function in the development of the brain, a topic that warrants further investigation.

Mcluhan understood very well the nature of the beast. For example, he advised his son Eric not to expose his granddaughter Emily to "hours and hours of TV", as he considered TV to be a "vile drug which permeates the nervous system, especially the young" (Morrison, 2013). Spitzer and his South Korean counterparts present evidence that suggests that not only TV but social and digital media in particular have a detrimental effect on audiences. Jacobs (2011) points out that Mcluhan was prone to make popular statements such as this, using a variety of media platforms such as print and TV – the medium he despised so much. Jacobs rightly questions Mcluhan's credibility if on the one hand he claims that media as 'the extensions of man's consciousness …. [hold] the potential for realizing the anti-christ", yet in the same discussion proposes that "we're standing on the threshold of a liberating and exhilarating new world". How could anyone take Mcluhan seriously after such a 180 degree turnabout?

Nevertheless, many of Mcluhan's assertions are visible within the social and digital media domain. There is a case to support his claim that 'yesterday's technology' provides content in the social and digital media domain. For example, Mcluhan describes the message of the moving image as a transition from lineal connections to configurations. Previous information explosions such as print transformed

a feudal society into a linear and conform society, which in turn paved the way for the French Revolution. He argues that content distributed by each new technology has its origins in the previous medium, for example the content of writing is speech that of print is writing, and so on. The key difference with social and digital media though is that it encompasses all previous forms of media in a virtual space: language, writing, print, film and interactivity.

For example, Jencks (2009) concludes that 'branded terrorism' could be considered a post-modern pre-announcement of murder, after discussing Lyotard (1992). Lyotard describes the characteristics of modernity vs. postmodernity in graphic detail. Auschwitz as a death camp was a highly structured mass-production place of murder, well organized, a well-kept secret, the epiphany of a modern, totalitarian society. G. W. Bush's pre-announced attack on Iraq, on the other hand, could be described as branded terrorism, the post-modern equivalent. Current events in Syria and the Obama administration's justification to intervene also fit this category. Mcluhan also observed that the introduction of each new technology speeds up cultural and social processes in society. The speed with which social and digital media has invaded real and virtual spaces confirm this. In fact, the speed with which social media evolves is such that by the time this paper is published, it may already be outdated. It is not surprising to observe an increase of 'old' messages being distributed via digital and social media, such as social aggression in the form of bullying, aptly named cyber-bullying as it takes place online.

Mcluhan provides a reasonable theory explaining how previous media technologies provide content for new ones. With the arrival of electronic media he foresaw the 'global village'. Social and digital media move beyond the scope of his vision; all pervasive content is reaching a global audience at an ever increasing speed, yet messages have remained the same. Previously, teenagers and adolescents were bullied at school and at home, either in person or by means of an anonymous note or letter.

Cyber-Bullying and Facebook Depression

The latest fashion among bullies today is to bully peers online. 'Facebook depression' and 'Cyber bullying' are known online phenomena. Moreno at al (2011) observe that out of some 200 students surveyed, 25% displayed depressive symptoms. 2.5% met the criteria for a major depressive episode (MDE).

Hannah Krasnova of the Institute of Information Systems, Berlin, surveyed 600 individuals to find that one in three felt worse after visiting a social networking site (SNS) (Krasnova et al, 2013; Sifferlin, 2013). Krasnova describes how Facebook users experience envy when visiting sites of peers and comparing their own lives accordingly. Krasnova demonstrates that users frequently perceive Facebook as a stressful environment. The post-modern online world is constantly changing and thus challenging users and content creators to continuously update and apply their social media skills.

Moreno's group provides further insight regarding Facebook users who decide to go public with their depression, which may not be rooted in the use of a SNS alone, but other circumstances. His group comes to a positive conclusion in their evaluation of Facebook as a platform for users to express depression: social networking sites could become a tool in dealing with depression, though this would require more regulation of SNS's. Pediatricians too have noticed the negative impact of SNS's in the lives of children. Schergin and Clarke-Pearson (2011) investigated this problem and have made specific recommendations to pediatricians dealing with the negative effects of social and digital media. Still, cases of Facebook suicide are on the increase and make headlines, with calls from concerned parents and consumer watchdogs to review and improve existing legislation regarding social media abuse and cyber bullying.

FUTURE RESEARCH DIRECTIONS

Social media and internet use has been a major issue as social space has been taken over by the virtual world. This research not only opens further consideration into the cognitive process of social media use, but the role of social media in the educational spectrum. The new learning curriculum incorporating digital technologies and virtual learning, pose challenges both to the students as well as the teachers. For a viable and effective teaching and learning module, understanding the (adverse) effect of social media use and student's concentration level is important. Hence this research initiates a humble step towards it. The date can be further used and explored in a wider scale for further indulgence into the social media research.

CONCLUSION

Why is this important to media producers and educators? Media producers need to be aware of the social media narrative developing among digital natives in order to develop, produce and distribute content to the appropriate target audience, using ethically justifiable methods. Social and digital media as a new medium implies that content of previous technologies provides content for it, according to Mcluhan. This is essential knowledge producers need in order to develop, produce and distribute content via social and digital media.

Educators, though working in a different environment, need to understand social and media technology equally well to meet their educational mandate. They develop a different kind of narrative for an audience consisting of students. Most of them are digital natives in the process of becoming versed in social media. Producers, educators nor society as a whole can afford to only note and apply the advantages of social and digital media, such as crowd-funding, social media marketing and self-distribution. Motivation to investigate the negative side of digital and social media is not coming from industry and remains neglected. Society as a whole will have to bear the costs of the negative effects of social and digital media regarding the development of an individual's cognitive function.

Though tempting, not all content should be marketed via social media and apps to younger audiences. The guidelines are not yet available to all stakeholders, though the calls to review and regulate social media practices are increasing. Industry funded research is not likely to accomplish this on its own. A media market based on generating revenues alone is not likely to implement anything else but voluntary guidelines regarding the use, implementation and marketing of social and digital media tools aimed at digital natives at home and in the classroom. Educators are advised to critically evaluate the benefits of social and digital media, and put in place guidelines that protect users and require them to practice their cognitive skills until more research in this field shows otherwise.

Our survey shows that social and digital media has become an integral part in the lives of digital natives; increasingly, digital immigrants find it difficult to escape this new technology as well. Students are using social and digital media to deal with the information tsunami they are faced with on a daily basis. For many, including digital immigrants, it has become impossible to process the amount of information presented online and via traditional media in any other way. As a consequence, information is no longer processed at a deeper level, but absorbed superficially instead. Critics argue that using social and digital media in this way does not improve the development of cognitive skills, making it even more difficult for students to acquire new knowledge and retain it in the long-term.

Producers need to carefully consider the means that should be used to develop, produce and distribute their programme to avoid unwitting support regarding the use of technology unsuitable for the intended target audience. There is a need to better understand the new emerging digital native culture. Understanding and critically examining Mcluhan's ideas in this area helps obtain the big picture. Reaching an audience is a challenge for the best of producers, but even more so without an understanding of the narrative unfolding among digital natives and digital immigrants alike.

Teachers are equally challenged when communicating with their students via SNS's, while producers are constantly searching for new ways to engage with their audience online. Expectations of online content and viewing behavior have changed significantly. In 2010, the average YouTube video, selected from among 2.5 million video clips, analysed was 4 minutes and 12 seconds in length (Inside YouTube Videos, 2010). Understanding this emerging narrative among digital natives provides numerous challenges to producers, such as length of programme, gamification, interaction and participation, format, i.e. short-form webisodes, and/or traditional long-form formats. The Scottish Film Institute is exploring new ways to meta-tag content, provide audience interaction and distribute their catalogue using technologies such as Popcorn and Distrify (Wistreich, 2012; Kempas, 2012).

New job descriptions are emerging, such as the Producer of Marketing and Distribution, social and digital media being one of the tools to develop, distribute, market their product and engage with audiences. Teachers are frequently challenged in the classroom, populated by students who are texting, skyping and facebooking. Almost half of the students in our survey stated that they found it difficult to stay offline during class. The negative effects of multi-tasking have been described in the literature, and educators are struggling to deal with the consequences of social and digital media in the classroom. Producers are dealing with this new reality by exploring new ways to reach audiences in the multi-screen-verse.

The unfolding social media narrative is increasingly making headlines because of tragic events, such as the death of a 17-year-old teenager in the UK (Teenager's death sparks cyber-blackmailing probe, 2013). According to Barbara Brams (2013), 75% of adolescents have a social network profile, which is accessed by more than half of them every day. They increasingly share private information online, disregarding privacy and safety concerns (Madden et al, 2013). Even though they still prefer face-to-face contact over social media, digital natives are increasingly exposed to cyber-bullying, resulting in depression, social isolation and suicidal thoughts (Hinduja & Patchin, 2010). Educators are challenged to pay more attention to social media; though for many, this technology is scary and unknown territory. Nevertheless, if parents fail to spot suicidal thoughts, the teacher may be the next in line to deal with the problem, but not if she or he disengaged from the social media narrative.

Bullying and suicide are not new to mankind; the social media phenomena has developed into a global platform, with its own culture, language, narrative and interaction that is not well understood by digital immigrants, such as parents, teachers, social workers, government bodies and media professionals themselves. While digital natives are exposed to the good and bad of social media, digital immigrants are trying to figure out how to deal with this new technology, leaving digital natives to deal with the consequences of social media with little or no guidance.

Social media has taken on its own dynamic pace and the rest of the world is lagging behind trying to work out how to react to his new global challenge. Viewing social and digital media from Mcluhan's perspective, we recognize the post-modern content in a post-post-modern technology. Constant change has become the norm, one might even argue that we are observing the death of post-modernity—whereas the pre-announced attack on Iraq based on branded terrorism was still effective, taking into account the weapons of mass destruction lie presented by the Bush administration, the current US administration is

facing a great deal more resistance when applying the same kind of post-modern strategy to deal with Syria. Social media offers greater transparency to all stakeholders, though it will only have any benefits if users are still in control of their cognitive skills.

The Occupy and Wall Street movements demonstrate all too well how digital natives and immigrants alike have understood social media and its post-modern content. It shows how users of social and digital media have developed a new form of media literacy for this new medium, accelerating the transformation from a post-modern into a post-post-modern society. Mcluhan's ideas on media encompass this process; though social and digital media are not only encompassing the post-modern 'Zeitgeist', they contain all previous media technologies at an ever increasing speed.

Producers need to understand Mcluhan's ideas better to fully appreciate the transformation, social and digital media is facilitating for society and at an individual level. The world is in the midst of this process, audiences, users and producers are becoming media literate in this new technology. Institutions, organizations and governments are adapting swiftly to this new challenge and they are learning their lessons, reacting in typical post-modern fashion to the challenges online. Producers are more likely to adapt quickly in order to reach their target audience during this transformation. Small and medium-sized businesses are better suited to act and react to these challenges. Due to their size, they are able to act and react faster when compared to their large, modern and post-modern counterparts.

Educators, on the other hand, are required to work within hierarchies that managed to survive centuries of transformation, i.e. the introduction of print and broadcast technologies. This paper itself is a testament to the positive aspects of social media in such an environment: i.e. access to libraries and online sources, as well as the potential to collaborate at the research level with scholars across the globe made it possible to discuss and exchange new knowledge via this new virtual space. Educators are advised to actively become part of the social media narrative and provide clear guidelines on the use of social media in the classroom.

Note: Conflict of interests; the authors of this paper declare that their research has been entirely self-funded.

KEY TERMS AND DEFINITIONS

Cognitive Skill: It refers to the human capacity of processing the thoughts like memorizing, differentiating, learning, speaking and understanding information/data.

Cyber-Bullying: It's synonymous to digital abuse whereby anyone with the aid of digital technologies harass and threaten other users.

Dementia: Impaired intellectual faculty like lack of memory, concentration and judging power.

Digital Abuse: The use of digital technologies like social networking sites and digital gadgets (through SMSs, photographs or online messages) to bully and harass anyone.

Digital Natives: It represents a generation who are born or bought up in a digital era who are well-versed in the technological aspect and whose daily endeavor revolves around these technologies.

Social Media: It is a virtual medium through which the users can communicate, interact and share information with the fellow-users and indulge in a social networking. Facebook, YouTube, Second Life, Twitter etc. are some examples.

Virtual Space: It is a computer simulated environment where people interact.

ABSTRACT

This chapter introduces the overall concept of multimedia Quality of Experience (QoE) over the Internet. It presents all the elements of multimedia QoE ecosystem and emphasizes their roles in determining the user satisfaction. The chapter also presents different multimedia transmission components and how these components contribute to successful transmission of the media content. In addition, some key performance indicators relevant to the multimedia QoE are presented with more emphasis on network and application level indicators. Furthermore, different QoE estimation methods and techniques along with QoS/QoE learning algorithms are presented. Finally, the chapter includes some of the future challenges and issues related to multimedia QoE.

INTRODUCTION

The multimedia era started in the middle of the last century, when the television appeared and people got used to watch TV shows and movies at home. Moreover, with the VCR, DVD and Blue-ray disks and players, viewers could use the TV set to watch recorded material. In parallel, in the late 90s internet video service started. This was a time when video Internet technologies were merely innovation and

DOI: 10.4018/978-1-5225-3822-6.ch048

novelty. Due to the technological limitations with dial-up connections and slow modems, it was hard to achieve good transfer rate and superior quality. In addition, the limited graphics processing power at that time prevented wide adoption of high quality videos. However, with the proliferation of broadband Internet and the tremendous increase in processing power, multimedia technologies boomed (Motorola, 2012). The combination of high speed Internet and sophisticated powerful devices introduced a completely new way for multimedia consumption through Internet. It was the boom of "Over the top" and "Video on Demand" services.

Moreover, the advancement in different concurrent digital multimedia technologies and the proliferation of smart mobile terminals with their application ecosystem have exponentially increased the popularity of Internet multimedia services. Multimedia services are a key player in current ICT business. It is expected that video traffic will reach 66% of the global mobile traffic by the year 2015 with one million minutes of video content crossing the Internet every second (Cisco, 2011). At the same time, video consumers are getting more demanding about the quality of multimedia content. Therefore, in order to satisfy users' demands with acceptable viewing quality, it is utmost necessary to monitor their satisfaction.

Traditional approach of measuring the user satisfaction relies on Quality of Service (QoS) parameters collected from the network. In this case, the QoS parameters are monitored and controlled in order to provide a satisfactory level of service quality. Different QoS parameters like bandwidth, delay, packet loss etc. are essential metrics for determining the service quality from technical point of view. However, QoS parameters do not necessarily reflect the user's satisfaction and feelings towards a particular service. In order to accurately address the human perception of the service quality, a new concept of measuring the *Quality of experience* (QoE) is involved.

The QoE refers to "*the degree of delight or annoyance of the user of an application or service. It results from the fulfillment of his or her expectations with respect to the utility and/or enjoyment of the application or service in the light of the user's personality and current state*" (Brunnström et al., 2013). Accordingly, the QoE is a subjective metric and can vary due to the user expectation and context. Moreover, the QoE is a reliable indicator for service providers and telecommunication operators to convey overall end-to-end system functioning (client, terminal, network, services infrastructure, media encoding, etc.). Furthermore, it is a multi-disciplinary approach when determining QoE, which involves user psychology, engineering science, economics etc. The QoE depends on different elements (i.e. content, network, application etc.) that directly or indirectly affect the user's perception towards the multimedia service. These elements should perform at their best to provide high user experience. However, the diversity in these elements makes the QoE estimation rather complex and unpredictable.

It has been shown that multimedia customers are willing to pay for better quality of experience with multimedia services (Accenture, 2012). The success of paid VoD services (not to mention that of Netflix) is just a simple proof. However, customers get intolerant if a multimedia service is not satisfactory and they easily shift to other options, if their needs are not fulfilled. Therefore, the user satisfaction is utmost important for retaining customers and has become the main differentiator for the success of network operators and service providers. Correspondingly, network operators and service providers should accurately estimate and monitor the multimedia QoE in order to track the performance and quality of a particular service.

In the following sections, we consider different components of the multimedia QoE ecosystem and their roles in the multimedia QoE. We present different multimedia transmission components and highlight some key performance indicators relevant to the multimedia QoE. We also explain different multimedia

QoE estimation methods and techniques along with the QoS/QoE learning algorithms. Finally, we discuss some of the future challenges and issues related to the multimedia QoE.

MULTIMEDIA QoE ECOSYSTEM

Quality of Experience (QoE) is an important indicator for network operators and service providers to help them assessing the user acceptability towards a particular service or a particular application. As the paradigm is shifting towards user-centric evaluation of service or application performance, the real time estimation of QoE is becoming a necessity for network operators and service providers in order to attract and bind users to their service.

Generally, QoS parameters are used for evaluating the quality of multimedia transmission that does not necessarily reflect the user satisfaction with an overall service. The QoS parameters reflect network and service level performance; however, they do not address the user's reaction to the service or to the application. On the other hand, QoE is a multi-disciplinary metric, which is evaluated subjectively and can vary according to the user expectation and context. Moreover, it is an overall end-to-end system effect (client, terminal, network, service infrastructure, media encoding, etc.) that depends on a number of factors and cannot be simply measured.

Multimedia QoE ecosystem incorporates all the possible components that directly or indirectly affect the user's perception towards the multimedia service. Figure 1 shows different components that play an important role in determining the user's perceived QoE. The diversity in these components makes the QoE estimation rather complex and unpredictable.

Role of Each Component in Multimedia QoE Ecosystem

Each component of a multimedia QoE ecosystem determines the effectiveness of the service. A component's behavior depends on the performance of other components and their behavior can affect the overall multimedia QoE. The multimedia service provider should monitor, evaluate and adapt these components according to different service requirements in order to offer a better experience. The success of a multimedia service depends on how well all these components are behaving in the ecosystem. Hereafter, the role of different components of the multimedia QoE ecosystem is described.

Content

If the original multimedia quality is unsatisfactory, then the QoE at the destination is also unsatisfactory. In order to have a better multimedia QoE, the multimedia content should be of high quality. Some of the characteristics of multimedia content and their descriptions are listed in Table 1.

Different content characteristics represent the diversity of multimedia content and their properties influence the multimedia QoE. However, content characteristics like higher bit rate, frame rate and resolution increase the complexity of video encoding and require higher network bandwidth for getting better QoE. Moreover, different multimedia devices and applications should support different content characteristics for a smooth playback.

Figure 1. Multimedia quality of experience ecosystem

Table 1. Multimedia content characteristics and their descriptions

Content Characteristic	Description
Bit rate	*Bit rate in terms of video transmission refers to minimum rate at which video bits are transferred from a source to a destination. The higher is the multimedia bit rate, the better is the multimedia quality.*
Frame rate	*Multimedia frame rate refers to a number of multimedia frames presented per second. The higher is the frame rate, the smoother the video appears and hence, the better is the video QoE.*
Resolution	*Video resolution refers to the number of pixels in both directions (width and height) of a video frame. A higher frame resolution yields to a better video quality.*
2D/3D	*Video types i.e. 2D/3D, refers to visual dimension of a video content. These content types have different service and network requirements.*

Network

Network represents the segments from the content servers, the core and distribution segments and the access network with a combination of copper, fiber and wireless links. In order to experience better multimedia QoE, transmission conditions at the network end should be reliable. The network condition is represented by the QoS parameters. Each multimedia service has its own QoS requirements. Some of the network QoS parameters and their descriptions are presented in Table 2.

Table 2. Network QoS parameters and their descriptions

QoS Parameter	Description
Packet loss rate	*Packet loss rate is the ratio of the total number of packets lost in transmission compared to the total number of packets sent. The higher is the packet loss rate, the lower is the multimedia QoE.*
Burst loss	*If a group of consecutive packets are lost then the burst loss is defined as a burst packet loss. A higher burst loss results in a lower multimedia QoE.*
Jitter	*Jitter is the variation in the packet inter-arrival delay. Higher jitter results in a lower multimedia QoE.*
Bandwidth	*Bandwidth is the amount of information that can flow in a network during a specific period of time. To some extent, the higher is the network bandwidth, the higher is the multimedia QoE.*
Packet error rate	*Packet error rate is the ratio of the total packets received with errors to the total number of transmitted packets. The higher is the packet error rate, the lower is the multimedia QoE.*

The variation in time of the network conditions will directly impact the network QoS parameters, and thus, the multimedia QoE.

Users

Each individual user has his/her own perception towards the multimedia quality. User attitude and expectation towards multimedia services play a vital role in determining the quality of service. Multimedia QoE can depend on different user profiles such as age, sex, interest, skills, frame of mind, experience, etc. For example, if a person is young and sportive, he/she might be inclined to sport content and his/her perception towards the QoE of sport content can be different than for a movie content. Thus, it is necessary to categorize users and to analyze their needs.

Environment

Different environmental conditions can impact how users perceive the multimedia service content. Multimedia QoE can vary according to when, where and with whom the service is used. For example, multimedia QoE will be different when the multimedia service is used while commuting, in a cafe, at home or in a bar. These places offer different levels of external noise that can directly or indirectly impact how a user perceives the service. Moreover, time of a day (morning, afternoon, evening, etc.) also has an impact on the user multimedia experience. It was observed that for the same multimedia content, a higher level of user experience was obtained in the afternoon and in the mid-day (Msakni & Youssef, 2013). Also, the results obtained from lab tests (having controlled environment) and crowdsourcing experiment for multimedia QoE differ (Shahid et al., 2014).

Device

Multimedia content can be consumed through different devices such as television, personal computers, laptops, tablets, mobile phones, etc. These devices offer different level of screen size resolution as well as different sound quality to the users. Therefore, the user experience can vary when different devices are utilized. For example, the user experience of watching a video content on a personal computer (PC)

at a fixed distance differs a lot from that when watching it on a handheld mobile device, where one has a possibility to move (Khan et al., 2011). Subjective tests for multimedia QoE conducted by (Khan et al., 2011) on PC and mobile handset revealed that, for the same content, almost all users preferred the PC over the mobile handset.

Application

Multimedia content can be consumed as a video-on-demand (VOD) service, over the top (OTT) service, broadcast service, etc. These services provide different multimedia applications for usability and interactivity. Multimedia applications should be self-intuitive and easy to use for getting the higher QoE. In the study performed by Bernhaupt et al. (2007), it was discovered that the usability rating is higher when the service is easier to use. Moreover, every application has its own video buffering scheme, encoding and decoding, which can affect the playback of multimedia content and the overall multimedia QoE.

Each component of the ecosystem plays an important role in determining how users perceive the multimedia quality. If any element of the ecosystem is imbalance, the overall multimedia ecosystem is disturbed with lower QoE. This implies that concerned parties involved in the multimedia content distribution should be very careful in monitoring, evaluating and adapting these corresponding components for getting the higher QoE.

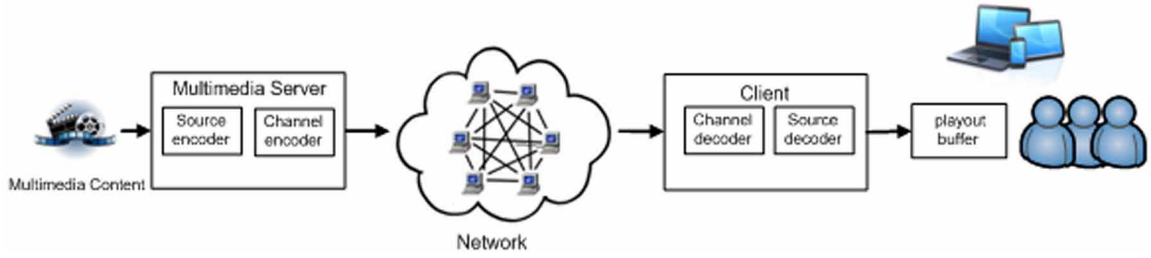
MULTIMEDIA TRANSMISSION AND KEY PERFORMANCE INDICATORS

Nowadays, multimedia traffic is the major source of traffic over the Internet. It is used for different purposes such as entertainment, education, advertisement, etc. Internet technology boosted the growth of multimedia by providing a transmission platform from where each individual can stream the content to their devices. However, Internet is the best-effort service and is shared by various data greedy applications, which means that multimedia traffic is vulnerable to various network perturbations. To overcome this time varying nature of Internet's network quality, different operators provide dedicated service (in the form of SLA agreement) to the managed multimedia services such as IPTV and VOD. However, most of the multimedia services are Over-the-Top (OTT) and need to share the same bandwidth with competing applications. Below, we study different aspects of multimedia transmission over the Internet.

Multimedia Transmission over the Internet

Figure 2 illustrates different components of multimedia transmission system over the Internet. The raw analog multimedia contents are huge in size and can consume large amount of network resources. To compensate this, analog multimedia contents are digitized and compressed by video compression and audio compression algorithms in the source encoder and stored in the multimedia server. Upon the client's request, the multimedia content is retrieved from the server and the channel encoder adapts the multimedia stream to network QoS requirements by adding redundant information for error recognition and correction. After that, the multimedia stream is transmitted (streamed) to the client terminal over the Internet. Multimedia stream can suffer from different types of perturbation like packet loss and delay due to congestion. At the client terminal, a channel decoder performs the error detection and correction and transmits the digital data to the source decoder. The digital data received from the channel decoder

Figure 2. Multimedia transmission



are transformed into continuous waveform in the source decoder, which can be viewed or listened when using different players at the application layer. To compensate the network jitter, different multimedia players implement a playout buffer. The playout buffer stores some multimedia content in order to have a smooth playback.

Different streaming protocols for data transmission are used over the Internet. Streaming protocols control the data transfer between the multimedia server and clients. The most popular streaming protocols, used for multimedia Internet transmission, are HTTP over TCP and RTP over UDP. We further explain the characteristics of these protocols.

RTP/UDP Based Streaming

The Real Time Transport Protocol (RTP) (Schulzrinne et al., 2003) is one of the popular and most used streaming protocols for multimedia transmission. Most of the IPTV and VOD services use RTP/UDP based multimedia steaming. RTP is transmitted over UDP and is basically used for real-time transfers. As Avermedia (2013) remarks, TCP is unsuitable for real-time transfers due to high delay. RTP works in conjunction with the Real Time Control Protocol (RTCP), which operates at the session layer. The main function of RTCP is to provide a feedback on the quality of the data distribution (McGath, 2009). However, when using UDP, data packets often have difficulties when getting through firewalls and network address translators (Biernacki et al., 2012). UDP is an unreliable protocol and the multimedia streams can suffer from packet loss, which might cause distortion of the multimedia content.

HTTP/TCP Based Streaming

Nowadays, most of the OTT video streaming applications use HTTP/TCP as a transport mechanism for multimedia streaming. This happens because HTTP/TCP can easily pass through firewalls and routers. In addition, it does not require special proxies or caches. HTTP media streaming is easier and cheaper to deploy, since web streaming can use generic HTTP solutions and does not require specialized servers at each network node (Biernacki et al., 2012). However, the use of TCP for streaming has some shortcomings. Due to the TCP congestion avoidance mechanism, it produces transmission rate which is saw-tooth shaped and has high variation. Also, due to TCP reliability, retransmission of lost packets occurs, which introduces additional transmission delays. To cope up with this short term bandwidth variation of TCP, streaming services deploy playout buffer (Seyedebrahimi et al., 2013). The use of TCP guarantees the reception of all packets to ensure no video impairment. However, due to severe network conditions,

multimedia transmission can freeze for a long time. Also to cope up with different network conditions, various adaptive HTTP-based video deliver schemes have been developed (RGB Networks, 2011). In adaptive HTTP based video delivery, video contents are encoded in different data rates and are stored as small fragments (a few seconds each) on the server. It has an ability to switch between different data rates based upon network conditions and other variables (RGB Networks, 2011). This will eliminate undesired freezing events at the client terminal however, reducing the multimedia quality, namely, the resolution. Different implementations of adaptive HTTP based video delivery are *Apple's HTTP Live Streaming* (HLS), *Microsoft's Silverlight Smooth Streaming* (MSS), *Adobe's HTTP Dynamic Streaming* (HDS) and *Dynamic Adaptive Streaming over HTTP* (MPEG-DASH) (RGB Networks, 2011).

Impacts of Different Transmission Components on Multimedia QoE

Different components are involved, when a multimedia content is being transmitted from the server to a client. Each of these components has its own effect on the multimedia QoE. Out of these different components source encoding, network and playout buffer have a significant effect on the multimedia QoE. In the following section, we explain some of these components and their effects on the multimedia QoE.

Source Coding

A source encoder converts the uncompressed raw media signals into bit streams. However, the size and the bitrate of this bit stream are huge. Therefore, different compression techniques are used in source coding to make the source data light weighted with the lowest possible bit rate in order not to exceed the available network bandwidth. The compression is performed in such a way that the same data can be easily reproduced at the decoder. However, data compression adds visible distortion and artifacts to the multimedia quality, since a lot of redundant information is lost. Moreover, the highly compressed multimedia streams are easily susceptible to network impairments. Examples of video compression standards are MP3, MPEG-2, H.264, H.265, VC-2, etc.

Network

Today's Internet services rely on unreliable and best-effort network. The network bandwidth available between the source and the destination is unknown in advance and can change over the time. Therefore, there is no guarantee for the bandwidth, the packet loss, the burst loss and the jitter for having a good multimedia quality. Moreover, multimedia streams are the most sensitive to the network perturbations and the effect of network perturbations can range from distortion-less to intolerable distortion. The impact of network perturbation on multimedia content streaming can result in a frame loss, freezing, pixelization, etc.

Playout Buffer

A multimedia service requires a multimedia player at the client terminal. Most of the players employ a playout buffer to compensate the jitter in the network. If the playout buffer gets empty, the playback of the multimedia stream gets interrupted. The size or the length of the playout buffer can determine start-up time or freeze events of the multimedia stream. If the length of the playout buffer is high, then the

start-up time will be high; that means users need to wait longer time before playback. On the other hand, if the length of the playout buffer is small, the buffer gets empty fast and there will be a risk of freezing events. Therefore, it is required to design the playout buffer smartly. Till now, there is no systematic guideline for buffering strategy and dimensioning of player buffer size. However, hereafter we outline video buffering strategies as discussed in (Sonnati, 2011).

- **Standard Buffering:** In the standard buffering strategy, the player maintains one buffer threshold level (buffer size). To start playback, the player continuously downloads the content up to this threshold and when the threshold is achieved the playback starts immediately. In parallel, the player downloads the video content in order to maintain this threshold. However, if the download bandwidth drops below the video data rate, data available in the buffer decrease continuously. This will empty the buffer and playback stalls until the buffer fills up again to the particular threshold. The main limitation of the standard buffering scheme is that the player needs to have larger buffer threshold level to compensate longer bandwidth drops. This leads to a longer prebuffering time, which can affect the user QoE.
- **Dual-Threshold Buffering Strategy:** To avoid the limitations of the standard buffering scheme, the dual-threshold buffering strategy maintains two buffer threshold levels. The lower threshold level is chosen to start the playback fast, while the higher threshold level is chosen to compensate longer bandwidth drops. In this scheme, when the buffer level reaches the lower threshold it starts playback and increases its buffer threshold to the higher threshold level. Therefore, in the good network conditions, the buffer grows continuously to achieve the higher buffer threshold level, which can be used in the future to compensate sudden bandwidth drops. However, if the buffer is empty due to adverse network conditions, then the lower value of buffer threshold is triggered for fast start.

Indicators (KPIs) for Multimedia Quality

Key performance indicators (KPIs) are parameters that indicate the overall success or the quality of a particular service. In case of multimedia services, KPIs indicate the overall quality of the multimedia service. The measurement of KPI parameters at different transmission points can help to identify and to locate the problem. In general, multimedia KPIs are classified into two groups namely: *Network level and Application level KPIs.*

Network Level KPIs

Network level KPIs are the QoS parameters associated with the network layer that indicate the quality of a multimedia service. Different packet level information (i.e. IP level information) is used to measure network level KPIs. Some of the important network level KPIs are described below.

Packet Loss Ratio (PLR): It is the ratio of the total number of packets lost in transmission, compared to the total number of packets sent. The higher packet loss ratio allows concluding that the network has problems. Multimedia traffic is highly susceptible to the packet loss ratio.

PLR is defined as follows:

$$PLR = \frac{N_{loss}}{N_{send}}$$

where N_{loss} is the total number of packets lost and N_{send} is the total number of packet sent.

Block Error Rate (BLER): BLER is the ratio of the number of erroneous blocks (transport blocks) received to the total number of blocks sent. Transmission errors significantly influence the BLER. When the BLER in the system increases, the multimedia quality decreases.

$$BLER = \frac{\sum Transport\_blocks\_with\_error}{\sum Transport\_blocks\_send}$$

Bit Error Rate (BER): BER is the ratio of the number of bit errors to the total number of bits sent. It is mainly caused due to noise and interference in the system. If BER in the system increases, multimedia quality decreases.

$$BER = \frac{Number\_of\_bit\_errors}{Total\_number\_of\_bits\_sent}$$

Average Delay: It refers to an average time needed for a packet to reach from a source to a destination. It can be measured in *ms* (milliseconds) or *μs* (microseconds). Larger delay results in the increase of a start-up time in the multimedia playback.

$$End\_to\_End\_Delay = Packet\_receive\_time - Packet\_send\_time$$

$$Average\_delay = \frac{\sum \left(Packet\_receive\_time - Packet\_send\_time \right)}{Total\_packet\_received}$$

Burst Loss: If a group of consecutive packets is lost, then this fact is defined as burst packet loss. The larger is the burst loss, the greater is the multimedia quality degradation. A single burst loss can impact a single video frame or can propagate to a number of video frames.

Jitter: It is the change in the packet inter-arrival delay. Jitter shows how much the latency changes from packet to packet. A low jitter indicates good and uninterruptable connection. A high jitter is a sign that there is congestion in the network. If we consider RTP protocol specified in RFC3550 (Schulzrinne et al., 2003) *Jitter* is calculated as follows:

If S_i is the RTP timestamp from packet *i*, and R_i is the time of arrival in RTP timestamp units for packet *i*, then for two successive packets *i* and *i*-1, inter-arrival delay *D* can be expressed as:

$$D_i = \left(R_i - R_{i-1} \right) - \left(S_i - S_{i-1} \right) = \left(R_i - S_i \right) - \left(R_{i-1} - S_{i-1} \right)$$

The inter arrival jitter is calculated continuously according to the formula:

$$J_i = \frac{\left(15 * J_{i-1} + \left|D_i\right|\right)}{16}$$

Throughput: A throughput refers to the number of bits received during a time unit and is measured in bits per second (bps). The higher is the multimedia content steaming throughput, the better is the multimedia service quality. If the throughput is less than the required multimedia bit rate, the multimedia quality degrades. For example, if throughput is less than desired multimedia bit rate, then the congestion occurs and packets are lost.

Number of Duplicate Packets: If the same packet is received more than once, it is considered as a duplicate packet. When duplicated packets appear, this means that there are some configuration errors in the network or some devices are defective. If the number of duplicate packets increases, the multimedia quality decreases.

Number of Reordered Packets: A packet is considered as reordered, if the sequence number is smaller than the sequence number of the packet previously received. If the number of reordered packets increases, the multimedia quality decreases.

Application Level KPIs

Application level KPIs are the performance parameters that are directly associated to the application layer and the presentation of a multimedia content. Some of the important application level KPIs are described below.

Resolution: Resolution is taken into account when a video multimedia content is considered. Video resolution refers to the number of pixels in both directions (width and height) of a video frame. It is represented in width × height format. Different video formats such as HD (1280× 720), SD (720× 480), QCIF (176× 144), etc. have their own video resolutions. The higher is the video resolution; the better is the video quality. It is noteworthy that the low resolution videos are preferred for handheld devices and the higher resolution videos are preferred for bigger display screens.

Frame Rate/Sample Rate: Multimedia frame rate refers to a number of video frames presented per second. The higher is the frame rate, the smoother the video appears i.e., the better is the video QoE. Video frame rate is measured in frame per second (fps). In case of audio, a sample rate is used, which is measured as the number of audio samples carried per second (Hz).

Encoding Rate: Multimedia encoding rate refers to the data rate at which the multimedia files are encoded. Multimedia files are generally encoded in Constant Bit rate (CBR) or in Variable Bit rate (VBR). The higher is the bit rate, the higher is the image quality. However, the higher bit rate adds more complexity to the system and requires a larger network bandwidth. This parameter is measured in bits per second.

Freezing Time: The duration of time, when the multimedia playback stops, is called a *freezing time*. This phenomenon occurs, when the application's playout buffer is empty. For smooth playback, application's playout buffer should be always full so that video frames/ audio samples can be always available for the playback. The higher is the freezing time, the lower is the multimedia QoE. This parameter is measured in seconds.

Freezing Frequency: The number of times that the multimedia playback stops or freezes is referred as a freezing frequency. If the freezing frequency increases during the multimedia playback, then the multimedia QoE decreases.

Blurriness and Blockiness: These are applicable for a video content. If there are insufficient bits available to represent details of image, blurriness and blockiness occur. This phenomenon is basically caused due to the compression techniques.

ESTIMATION OF MULTIMEDIA QUALITY OF EXPERIENCE

Multimedia services and applications have grown exponentially in the last years. Different multimedia services like IPTV, VOD, OTT video, video conferencing, etc. are very common in a massive Internet market. To gain a prominent market share, different vendors are competing with each other. Such competition includes cable television, Internet service providers, traditional and emerging telephony carriers, etc. On the other hand, multimedia costumers are expecting to access a high quality service on any device they are using (PC, smartphone, tablet). A user gets intolerant if the multimedia service is not satisfactory and he/she easily shifts to other options if his/her needs are not fulfilled. This requires the service provider to deliver the best multimedia quality to the customers under heterogeneous network conditions as well as for different terminals' capabilities. In these challenging scenarios, it is critical to guarantee an appropriate QoE for end-users. This requires efficient QoE estimation and monitoring techniques to track the performance of the multimedia service in terms of user's perception.

The QoE estimation methods can be implicitly categorised into *subjective* and *objective* methods. Subjective methods consist of many participants viewing sample multimedia and rating its quality according to a predefined quality scale depending on their personal perception. On the other hand, objective methods are used to measure the QoE, based on objectively measured network/media parameters. Different limitations of subjective and objective methods are listed below.

Limitations of subjective methods:

- Testing environment requires strict attention.
- Real-time implementation is difficult.
- Process is hard for automation.
- Subjective estimation is costly and time consuming.

Limitations of objective methods:

- These methods are hard to correlate with human perception.
- Objective methods may require high calculation power and time.
- When using objective methods, it is hard to integrate all quality affecting parameters in the model.

As listed above, both methodologies have their own shortcoming; to overcome these shortcomings, various hybrid approaches that combine both subjective and objective methodologies are proposed. For example, in different approaches such as those presented in (Rubino et al., 2006; Kushik et al., 2014; Pokhrel et al., 2014; Pokhrel et al., 2013) the authors use a dataset, which represents the relationship between objective QoS parameter values and the subjective QoE. Following this, different intelligent

systems (Rubino et al., 2006; Kushik et al., 2014; Pokhrel et al., 2014; Pokhrel et al., 2013) are trained with this subjective dataset to objectively evaluate/predict the QoE. Several researchers have shown that such hybrid approaches can objectively reflect the subjective mean opinion score of users with the reasonable accuracy.

Below, we describe some QoE estimation techniques that can be used when estimating the QoE for a speech or for a video content.

Speech QoE Estimation

Speech QoE estimation refers to the quality estimation of an audio/speech signal originated from different sources like TV or movie while talking, interacting, singing, etc. Speech QoE estimation can be classified into two groups which are subjective and objective QoE estimation methods.

Subjective QoE Estimation

The subjective speech estimation requires controlled environment. The test environment should be soundproof so that no external noise affects the experiment (ITU-T Recommendation P.800, 1996) and the participants involved in the experiment should not have any hearing problems. Different methodologies for subjective speech QoE estimation are described below.

Mean Opinion Score (MOS): One of the most common subjective speech QoE estimation methods is the Mean Opinion Score (MOS) method. In this method, participants are asked to rate the overall quality of a multimedia speech/audio being tested, without being able to see the original reference. Absolute Category Rating (ACR) is used for rating the quality. The MOS score of a multimedia sample is simply the average of the scores collected from subjects/users (ITU-T Recommendation P.800.1, 2006). Table 3 shows the MOS scores and categories.

Degraded Mean Opinion Score (DMOS): The Degraded Mean Opinion Score provides the numerical score to the annoyance or to the degradation of a speech quality based on human subjects. In the subjective test, the panel of listeners is fed with the reference speech and listeners evaluate a sample speech based on the reference one. The Degraded Category Rating (DCR) is used for rating the speech quality (ITU-T Recommendation P.800.1, 2006). Table 4 shows the DMOS scores and their corresponding categories.

Comparison Mean Opinion Score (CMOS): In the comparison mean opinion score method, the participants are provided with both reference speech and sample speech to be assessed in a random order. They are unaware about the order of the reference speech and the sample speech to be assessed. This

Table 3. MOS scores and its categories

MOS	Category	Category
5	Excellent	Imperceptible
4	Good	Perceptible but not annoying
3	Fair	Slightly annoying
2	Poor	Annoying
1	Bad	Very annoying

Table 4. DMOS scores and categories

DMOS	Category
5	Degradation level is inaudible
4	Degradation level is audible but not annoying
3	Degradation level is slightly annoying
2	Degradation level is annoying
1	Degradation level is very annoying

method uses seven scales ranging from -3 to +3 to compare the speech quality (ITU-T Recommendation P.800.1, 2006). Table 5 below shows the CMOS scores and their categories.

Pairwise Comparison (PC): In the pairwise comparison method, participants are provided with all possible combinations of the speech samples to evaluate. Participants listen to two consecutive speech pairs one after another and they are asked to decide which sample has the better quality. Participants provide the score in terms of their preferences. Preference values are converted to regular quality values (MOS scale) using different algorithms (Li et al., 2013). Table 6 provides the comparison between different speech QoE estimation methods.

Table 5. CMOS scores and categories

CMOS	Category
3	Much better
2	Better
1	Slightly better
0	About the same
-1	Slightly worst
-2	Worst
-3	Much worst

Table 6. Comparison between different speech QoE estimation methods

	MOS	DMOS	CMOS	PC
Explicit reference	No	Yes	No	No
Hidden reference	No	No	Yes	No
Scale	ACR	DCR	CCR	Preference
Listening session (minutes)	20 (ideal) 40 (max)	20 (ideal) 40 (max)	20 (ideal) 40 (max)	20 (ideal) 40 (max)

Objective QoE Estimation

The objective speech QoE estimation methods evaluate the speech quality based on media, network and terminal physical parameters. According to the availability of original speech quality metrics, the objective speech QoE estimation can be classified into intrusive and non-intrusive (Falk et al., 2005) techniques.

Intrusive Method: The intrusive measurement depends on some distance metric between the input (clean) and output (degraded) speech signals to predict the subjective MOS (Falk et al., 2005). This methodology requires input parameters from original speech signals for the quality estimation.

Non-Intrusive Method: The non-intrusive methods are passive in nature and do not require reference signal for the quality estimation. This technique is based on estimating the speech quality based on the metrics from the degraded speech only (Falk et al., 2005). Table 7 lists various implementations of intrusive and non-intrusive methodologies for the speech QoE estimation (Côté, 2011).

Video QoE Estimation

Video QoE estimation refers to the quality estimation of a video signal originated from different sources (movies, sports, cartoons, etc.). Similar to the speech QoE estimation, the video QoE estimation can be classified into two categories, which are subjective and objective estimation techniques. Different methodologies for subjective QoE estimation of video signals are described below.

Subjective QoE Estimation

Subjective video quality estimation methods require an appropriate test environment. General environment conditions for a subjective laboratory test and a test at home are defined in (ITU-R Recommendation BT.500-13, 2012). Moreover, each user should be screened for (corrected-to-) normal visual acuity on the Snellen or Landolt chart, and for normal colour vision using specially selected charts (Ishihara, for instance) (ITU-R Recommendation BT.500-13, 2012). The participation of at least 15 participants is considered as statistically reasonable for this kind of subjective tests (ITU-R Recommendation BT.500-13, 2012).

Double Stimulus Continuous Quality Scale (DSCQS): In the DSCQS method, participants are required to give scores to multiple video sequence pairs. These pairs consist of original and test sequences of duration of around 10 seconds each. The pairs are shown in alternating fashion. These sequences are shown twice and in a random order. Participants are unaware which sequence is an original and which one is a test sequence. They rate the quality on a scale from bad to excellent. This scale has an equivalent scale from 0 to 100. The difference between these two scales is used to remove the uncertainties caused by the material content and/or viewer's experience (ITU-R Recommendation BT.500-13, 2012).

Table 7. Objective speech quality estimation methodologies and implementations (Côté, 2011)

Methodologies	Implementations
Intrusive	IS, Seg.SNR, CD, BSD, TOSQA, P.AAM, PSQM, PAMS, WB-PESQ, PESQ, DIAL
Non-intrusive	INMD, CCI, P.563, ANIQUE

Double Stimulus Impairment Scale (DSIS): The DSIS method (ITU-R Recommendation BT.500-13, 2012) differs from DSCQS by showing multiple video sequence pairs only once and the original sequence is always shown before the test sequence. If longer test sequences (for example, over 10 seconds) are shown when using the DSIS or DSCQS method, the time between the original sequence and the test sequence can be increased. Furthermore, it can be hard to rate the sequences accurately and a psychological "recency" effect can be noticed (Alpert & Evain, 1997).

Single Stimulus Continuous Quality Scale (SSCQE): In the SSCQE method, a video sequence of around 5 minutes is shown to the participants. Each participant needs to evaluate the video quality instantaneously by continuously adjusting the slider in each 1-2 seconds. The DSCQS scale (from Excellent to bad) is used in this case (ITU-R Recommendation BT.500-13, 2012). The reference video sequence is not provided to participants. One may notice that in this case it is difficult to compare scores for different test sequences as well as to provide the overall quality rating for a particular test sequence. Moreover, the scores provided by end-users can be also affected by a "recency or memory" effect (Alpert & Evain, 1997).

Simultaneous Double Stimulus Continuous Evaluation (SDSCE): In the SDSCE method, two video sequences, the original and the test, are simultaneously shown to participants. Participants will check the difference between these two sequences and rate the quality by moving the slider of a handset-voting device using a 0-100 scale. If the difference between the two sequences is null, then the slider should be at the top i.e. 100, while when the quality difference is maximum, the slider should be at the bottom, i.e. 0. Participants are unaware which sequence is the original and which one is the test sequence (ITU-R Recommendation BT.500-13, 2012).

Subjective Assessment Methodology for Video Quality (SAMVIQ): Most of the methodologies discussed above were developed to perform the subjective test in a TV or similar environment. However, the SAMVIQ method can be used for PC and for mobile environments. Participants are shown different versions of the same video sequence and when all the sequences are rated, the following sequence content can be then accessed (ITU-R Recommendation BT.1788, 2007). In this case, the participants can access any version of the sequence and they can replay, start or stop, change or keep the current score if they prefer. Participants are allowed to view one version at a time, and they use the DSCQS method for rating the sequence. Figure 3 illustrates the test organization in the SAMVIQ.

Pairwise Comparison (PC): This methodology is preferred when participants are not always capable to express their view by means of exact rating score. The PC method tries to evaluate all possible combinations of two samples. In the pairwise comparison methodology, participants are shown video sequence pairs one after another. The duration of each video sequence is around 10 seconds. Participants observe the quality of these two video sequences one after another and based on their perception they select the video sequence with higher quality, i.e. provide the preference (ITU-R Recommendation P.910, 1999). Preference values are converted to regular quality values (MOS scale) using various algorithms (Li et al., 2013). Results can be stored in a so called comparison matrix (C).

Table 8 illustrates the comparison between various video subjective test methodologies.

Objective QoE Estimation

Objective video quality estimation methods are based on media, service, and transmission parameters. These methods mostly rely on mathematical models that can be used when estimating the multimedia QoE based on some objective parameters. The lack of human presence increases error margins for the

Figure 3. Test organization in SAMVIQ (ITU-R Recommendation BT.1788, 2007)

where, "$C_{ij} = n$" means that condition C_j was preferred over C_i, n times.

corresponding estimation. However, the estimation process can be automatic, and thus can be performed fast enough. Therefore, service providers and network operators are mostly interested in a tool that can objectively reflect the subjective mean opinion score (MOS) of users with reasonable accuracy.

Objective methods can be classified in three groups (ITU-T Recommendation J.143, 2000) according to the availability of original video sequence for estimation; those are full reference method, reduce reference method, and no reference method.

Full Reference (FR): In the full reference method, the distorted sample is compared with the original sample including per-pixel processing and temporal/spatial alignment. The comparison between the

original and distorted samples is then used by measuring device (algorithms) for QoE estimation. Figure 4 below illustrates the full reference method.

Reduce Reference (RF): The reduce reference method is somehow between the full reference and no reference methods. It is developed to predict the multimedia quality based on only partial information about the original sample. In this case, partial information indicates the features extracted from the original sample. Figure 5 below illustrates the reduce reference model.

No Reference (NR): The no reference method uses a degraded signal for the quality estimation and does not rely on any information about the original reference sequence. Due to the lack of an original

Figure 4. Full reference model

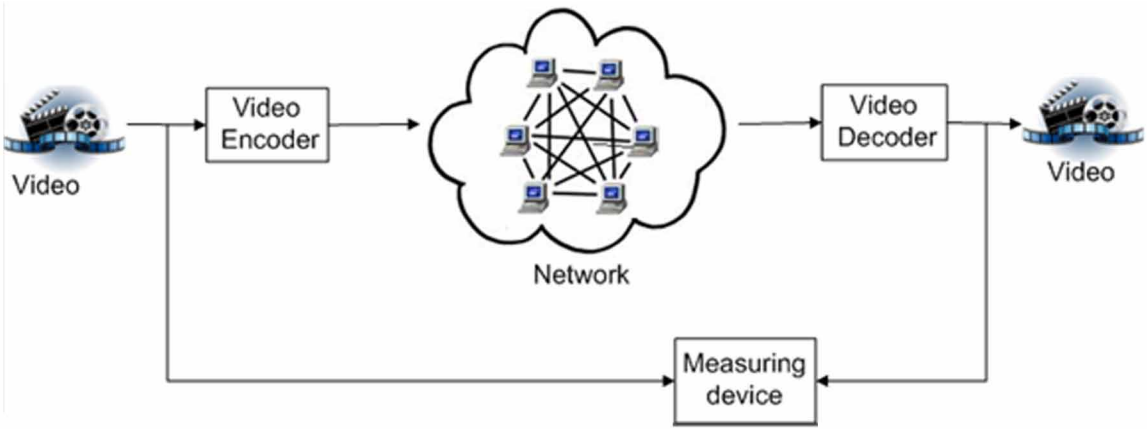

Figure 5. Reduce reference model

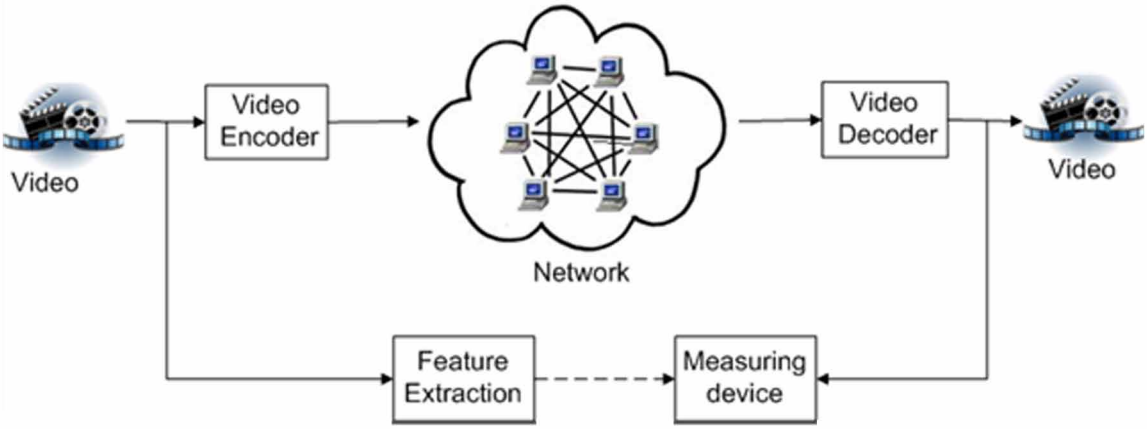


sample for the comparison, the accuracy of NR methodology is less than that of the FR or RR methods. Figure 6 below shows the no reference model.

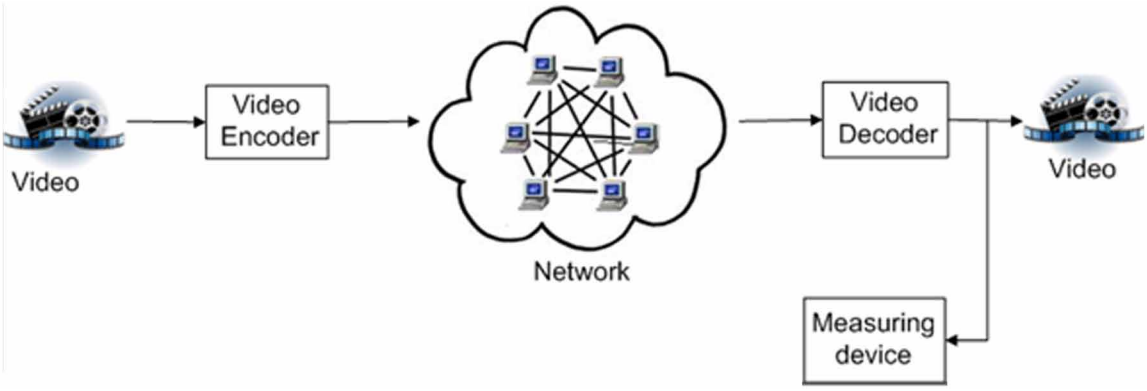
Common Objective Techniques Used for the Multimedia (Video/Audio) QoE Estimation

There exist various models for objective quality estimation of a multimedia traffic. These models are classified in five different groups based on the application scenario, as well as on the objective input metrics. Different models available for the objective quality estimation assessment are listed below (NTT, 2014).

Media Layer Model: The media layer model utilizes media signals as inputs for the multimedia QoE estimation. This model uses content-dependent features (noise level, interruptions, etc.) for the QoE evaluation. Intrusive speech quality estimation methodology along with FR and RR video quality methodologies falls into the media layer model.

Parametric Packet Layer Model: The packet layer model relies on the information gathered from IP and RTP headers (IP/RTP packet loss, IP/RTP jitter, etc.) for the multimedia QoE estimation. This model

Figure 6. No reference model



is efficient for estimating the "in-service quality". The reason is that the computational complexity for this technique is not very high, as it does not require media signal to be decoded for the estimation purpose.

Bit Stream Layer Model: The bit layer model exploits the information gathered from the payload bit stream before decoding and the packet header information for estimating the multimedia QoE. This model often needs to decrypt the encrypted multimedia payload. Therefore, it can have high computation complexity.

Hybrid Model: The hybrid model utilizes several or all of the above methodologies for estimating the multimedia QoE. It exploits as much information as possible to estimate the multimedia quality; therefore, it is considered as one of the most effective models for the multimedia QoE estimation.

Parametric Planning Model: The parametric model relies on network and terminal quality design and management parameters (e.g., coding bit rate, packet loss rate, etc.). These models typically use a mathematical formula, representing the quality estimation as a function of different parameters (Joskowicz et al., 2010).

Figure 7 illustrates the scope of various objective quality estimation models, while Table 9 presents the comparison of different objective quality estimation models with existing standards.

SUBJECTIVE TEST ENVIRONMENT

Subjective tests involve human participants and requires appropriate environment to perform such testing. Test environment should be unbiased, should not be affected by external noise, and should be close to real world scenario. Most of the research works use lab environment for subjective tests. However, crowdsourcing environment is getting popular as well (Shahid et al., 2014). Below, we discuss laboratory and crowdsourcing environments in detail.

Laboratory Environment: The laboratory experiment provides a controlled environment for performing subjective tests for evaluating the multimedia quality. Different parameters associated with the test such as noise-level, distance between screen and users, screen size, etc. can be easily controlled according to the requirements. However, lab based experiments have limitations, such as 1) high cost in terms of time and labor 2) limited participants diversity (Yen et al., 2013). A laboratory experiment takes weeks for preparing tests, recruiting users, scheduling time slots for supervising the experiments. Also users

Figure 7. Scope of different objective quality estimation models

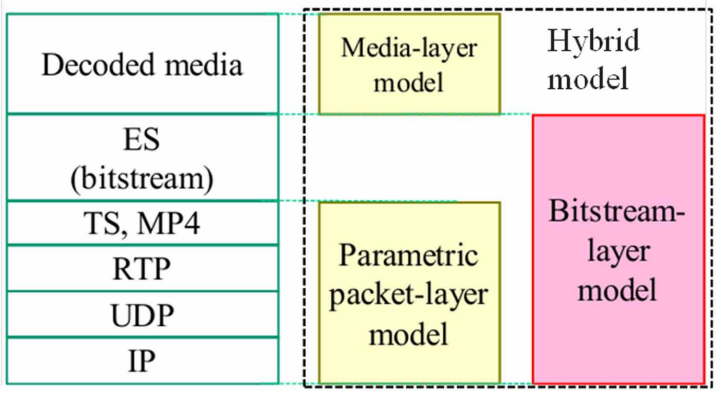


Table 9. Comparison of objective quality estimation models with existing standards (Takahashi et al., 2008)

	Media-layer Model	Parametric Packet-Layer Model	Parametric Planning Model	Bitstream Layer Model	Hybrid Model
Input information	Media signal	Packet header	Quality design parameters	Packet header and payload	Combination of any
Primary application	Quality benchmarking	In-service nonintrusive monitoring (e.g. network probe)	Network planning, terminal/application designing	In-service nonintrusive monitoring (e.g. terminal-embedded operation)	In-service nonintrusive monitoring
Speech/Audio (Standards)	ITU-T P.862, ITU-R BS1387	ITU-T P.564	ITU-T G.107	-	ITU-T P.CQO

Multimedia (Standards)	ITU-T J.148				

need to be physically present in the laboratory to perform the test (Yen et al., 2013). Generally lab tests are performed at the university or research laboratory, so the participants for the test are either students or researchers. This can limit the diversity of participants: most of them are boys who are young, well-educated, etc.

Crowdsourcing Environment: In the crowdsourcing environment, subjective experiments can be performed from a distance and there is little control over the participant's environment. It is computer software assisted method that is generally performed on a web platform. This methodology mainly involves collecting subjective assessment of quality through ubiquitous streaming via the Internet. Different screen test and cheat detection mechanisms are employed in a crowdsourcing experiment (Gardlo et al., 2014; Hossfeld et al., 2014) to make the test reliable and resilient. Crowdsourcing based subjective experiments have gained attention to replace needs of lab-based tests and these experiments offer promising correlation with the former (Li et al., 2013). This allows an investigator to get opinions from a vast variety of subjects, in a time-flexible, test-data size scalable, and swift manner (Shahid et al., 2014). Different crowdsourcing software available for multimedia subjective test are *QualityCrowd* (Keimel et al., 2012), *PC-Video-Test-Interface* (PC-Video-Test-Interface 2014; Shahid et al., 2014), etc.

QoS/QoE LEARNING ALGORITHMS AND SELF-ADAPTIVE MODELS

In this section, we briefly discuss four self-adaptive models that can be used for the automatic QoE evaluation when the values of QoS and/or QoE attributes are known. The QoS parameters reflect the objective network and service level performance and they do not directly address the user satisfaction of the delivered service or application. On the other hand, QoE has become an important indicator, useful for network operators and service providers to help them understand the user acceptability towards a

particular service or an application. The paradigm is shifting towards user-centric evaluation of a service or an application performance. To attract or bind users to a service, real time estimation of QoE is a must for network operators and service providers. Therefore, it is necessary to derive a correlation between the QoS parameters and the QoE, so that it can be used to identify the impact of different QoS parameters on the QoE of the users and moreover, to estimate the QoE objectively. However, the relationship between QoS and QoE is hard to estimate, since this relationship is not linear. Moreover, the higher QoS level does not always yield the higher QoE value.

Various QoS/QoE correlation algorithms can be found, for example, in (Rubino et al., 2006; Mushtaq et al., 2012; Wang et al., 2010). The relationship between the QoS and QoE metrics has a number of applications, including multimedia, web, etc., when assessing an end-user satisfaction with a given service (Wijnants et al., 2009; Mushtaq et al., 2012; Pokhrel et al., 2014).

A number of continuous and discrete models are developed for the automatic evaluation of user satisfaction but nevertheless, no one can prove the accuracy of these models. However, nowadays, people study human cognitive processes very carefully and try to elaborate a model that behaves similar to brain neurons. Since a human mind is known to be nondeterministic, just now it is not possible to get a formal algorithm of the human behavior. That is the reason why researchers turn their attention to self-adaptive models and learning algorithms. The advantage of such models is the learning or training possibility. In this section, we briefly discuss four self-adaptive models that are based on machine learning algorithms and can be used to automatically evaluate the user satisfaction with a given multimedia service based on the known values of quality of service parameters. All of the self-adaptive models rely on pre/post conditions that can be expressed in terms of IF-THEN operator such as:

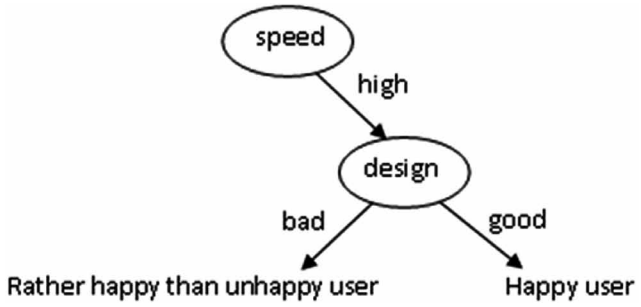
- If the service works fast then I am rather happy with this service;
- If the design of the service is bad then I am unhappy with this service;
- If the speed of the service is high AND the design of the service is good then I am happy with this service;
- If the speed of the service is high AND the design of the service is bad then I am rather happy than unhappy with this service.

We further discuss how such pre/post conditions can be used in order to derive a self-adaptive model and a corresponding learning algorithm.

Decision Tree Based QoE Estimation

One of the machine learning algorithms is based on a *Decision Tree* (Mitchell, 1997). The decision tree for a multimedia service is a tree, which nodes correspond to service parameters (attributes) while edges are marked with different parameter values (scores) (Mitchell, 1997). Each tree level corresponds to a single service parameter which can be evaluated by scores. The leaves of the tree correspond to different values of the user satisfaction. The decision tree can be derived based on IF-THEN conditions where a path labeling each branch of the tree to a node with a given QoE value corresponds to the conjunction of conditions under IF operator. For example, the condition "*If the service speed is high AND its design is good then I am happy with this service*" corresponds to the path from the root of the tree to a leaf that traverses nodes labeled by speed and design with outgoing edges labeled by high and good, correspondingly (Figure 8).

Figure 8. An example of decision tree for a multimedia service



The decision tree can be learnt based on deriving IF-THEN conditions by adding additional paths. As usual, such pre/post conditions are derived based on experimental results or following some expert opinions. The decision tree provides an algorithm for evaluating the user satisfaction if and only if it is completely specified. Those paths in the tree that are not specified by the conditions have to be somehow defined in order to predict the user satisfaction in this undefined situation. Thus, the purpose of specifying undefined paths is to "guess" what a user would like or dislike under appropriate conditions. Binary decision tree can be represented as a disjunctive normal form (DNF) or sum of products (McCluskey, 1965) where each conjunction corresponds to a path from the root to a leaf. For example, a conjunction that corresponds to the path that leads to the leaf "Happy" can be fast $\wedge$ popular. The complexity of such a tree is exponential w.r.t. the number of quality parameters, and grows fast when each service parameter is evaluated not by two but by more values. That is the reason why one looks forward to a scalable representation and manipulation of such Boolean formula (normally, DNF). One of possible ways to effectively represent such formula is to use a logic circuit. Similar to a decision tree, the initial logic network is derived based on statistics that are gathered from experts, developers and end-users who agreed to provide a feedback about the service quality. The circuit accepts the service parameter values encoded as Boolean vectors and outputs the Boolean vector that corresponds to the encoded QoE value. We describe the logic circuit-based approach in detail in the following section.

QoE Prediction Based on Logic Networks

In this subsection, the approach based on Boolean formula that is represented by a corresponding logic circuit is briefly described (Kushik et al., 2014a; Kushik et al., 2014b). The translation from the Boolean formula to a logic circuit is made by the use of a look-up-table/truth table (LUT). The QoE prediction approach relies on logic circuit learning and we first discuss how the initial circuit can be derived and then turn to a learning procedure itself. Consider a multimedia service W and a collection of service parameters $p_1, p_2, \ldots, p_k$ that are used for the QoE evaluation. For the sake of scalability, we consider each parameter p_i value as a nonnegative (unsigned) integer, bounded by the maximal value M_{p_i}, p_i–*value* $\in \{0, \ldots, M_{p_i} - 1\}$. In order to evaluate the QoE of the service W, written $QoE(W)$, a logic circuit S is derived. Inputs of the circuit S correspond to service parameters $p_1, p_2, \ldots, p_k$ which values are encoded as Boolean vectors of length $]\log_2 M_{p_i}[$, where $]t[$ denotes the minimal integer that is not less than t; thus, the number of primary inputs of S equals $\sum_{i=1}^{k}]\log_2 M_{p_i}[$. The circuit calculates the $QoE(W)$

value for given integers p_1_value, p_2_value, …, p_k_value and $QoE(W)$ that is bounded by the maximal value M_{QoE}, $QoE(W) \in \{0, \ldots, M_{QoE} - 1\}$ also represented as a Boolean vector. The length of a corresponding Boolean vector is $]\log_2 M_{QoE}[$, as $]log_2 t[$ bits are needed to represent an unsigned integer t. Therefore, the circuit S has $\sum_{i=1}^{k}]\log_2 M_{p_i}[$ primary inputs and $]\log_2 M_{QoE}[$ primary outputs.

In order to derive the initial circuit S, we use statistical data gathered from multimedia service experts as well as by the automatic evaluation of service parameters and/or from end-users, who have an experience of using the service W. The logic circuit S that is derived based on the provided statistics, evaluates and predicts the QoE value of the multimedia service W for any values of input parameters. In order to derive an LUT for the statistics, each user score is converted into Boolean vectors and the corresponding line is added to the LUT. Then circuit S is synthesized from a partial system of Boolean functions.

Once a circuit S is derived, the circuit can be used for evaluating the QoE of the multimedia service. The circuit accepts Boolean vectors as inputs representing current values of considered parameters and the output is a Boolean vector corresponding to an integer that evaluates the QoE value. As we are interested in self-adaptive models, we discuss how such circuit can be modified if the circuit behavior does not match new statistical data that can appear when a new end-user agrees to leave his/her feedback about the service quality. Therefore, the circuit behavior has to be modeled under a corresponding input **i** and if the result produced by the circuit differs significantly from the expected one then the circuit has to be resynthesized. Such difference can be specified as a confidence interval that can be derived for a multimedia service with the use of various heuristics as well as the knowledge of experts and/or service provider.

If the output **o** produced by the circuit S does not belong to the corresponding confidence interval then the circuit is resynthesized. Two options are possible: a) the line specified in the LUT of the circuit S has the wrong output $\mathbf{o}'$, in this case the output is changed to **o**; b) the corresponding line is not present in the current LUT, in this case, the new line is added. In both case, the circuit is resynthesized w.r.t. the modified LUT.

Additional experimental research is also needed to evaluate the optimal length of confidence interval for different services, since the length of confidence interval significantly influences both, the accuracy of predictions and the computational complexity contradicting each other. The bigger is the length the less resynthesis steps are needed, along with reducing the accuracy of circuit predictions. Studying optimal values of such length intervals remains one of challenging issues for further authors' investigation.

Neural Network for the QoE Prediction

Neural networks are widely used for solving various problems in the artificial intelligent area. Such networks are used in the "machine learning sense" and all the neurons of the network are assumed to be artificial and can be modified by a "teacher" in a given way. Neurons are connected to each other and these connections also can be learned. Usually neural networks without feedbacks are considered and in this case, the network can be divided into levels. Each network level can be treated as a collection of states and a network accepts inputs and produces the output. Usually, for each neuron there exists a formula that calculates its output according to weighted inputs that is used when coming to the next level via weighted edges. Two-level neural networks are often considered which have very simple neurons that calculate the output according to some threshold of weighted inputs; the input weight corresponds to a

link weight this input comes through. Weights usually are integers or rational (for example, for Hopfield network, Kohonen network, etc.).

A neural network accepts values of input (QoS/QoE) parameters and depending on the neuron definition and on the weights of distributed connections the network produces the output (the QoE value) (Al-Masri & Qusay, 2009) by changing states from level to level. At the initial step, the network connections are set based on the initial statistics, i.e., on the set of given input/output pairs. A network learning process consists of modifying weighted connections (or a set of nodes) of the network based on new knowledge (more statistics, for example). In other words, when new statistical data appears the network can learn how to modify its connections and possibly, nodes in order to have the correct behavior. Thus, a problem of gathering statistics appears again, since the size and diversity of the learning data set impacts the accuracy of the QoE estimation in the prediction phase. The goal of a modeling process is to derive a network that can predict output with high confidence, when an input is applied.

One of a good alternative to artificial neural networks is a fuzzy logic that is also good for modeling human behavior. Similar to neural networks different self-adaptive models can be derived based on fuzzy logic calculus. In this following subsection, we briefly discuss how fuzzy logic formula can be learnt in order to correctly calculate a degree of the user satisfaction for a given set of QoS/QoE parameters.

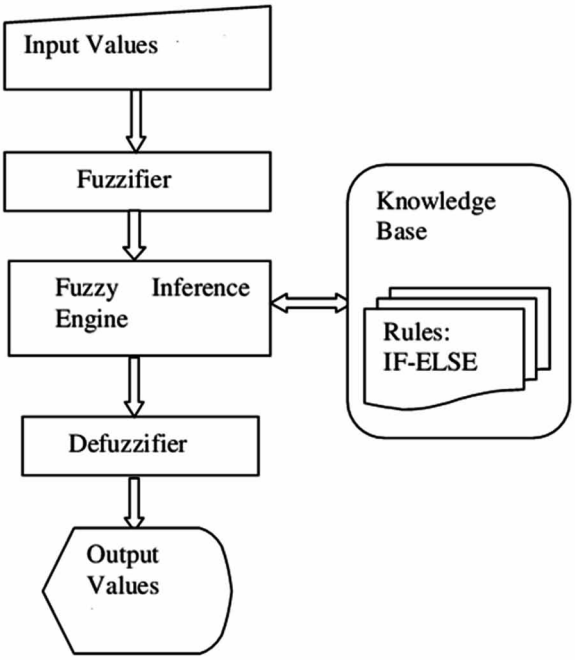
Fuzzy Logic for the QoE Prediction

Fuzzy logic has been introduced by Lotfi A. Zadeh (Zadeh, 1965) in 1956 and it extends the classical set theory to so called *fuzzy set* theory. In the general set theory, a set A can be specified by its *characteristic function* χ, and the set A contains an element a, i.e., $a \in A$ if $\chi(a) = 1$, otherwise $\chi(a) = 0$ and $a \notin A$. If A is a *fuzzy* set then the χ function is not a classical predicate but its value belongs to an interval between 0 and 1, i.e. $\forall\ a\ \chi(a) \in [0, 1]$. In this case, the χ function shows the degree *how likely that the statement* 'a belongs to A' *holds*. In other words, differently from classical Boolean algebra, a partial truth is introduced in the fuzzy logic where the truth degree may range between *completely true* and *completely false* (Novák et al., 1999).

Fuzzy logic expert system is one of the well-known estimation/prediction techniques that is used for making decisions with imprecise information in various fields (Baghel & Sharma, 2013). The aim of the fuzzy logic expert system is to draw a concise result based on ambiguous information. Fuzzy logic expert system has three main components, namely *fuzzifier*, *fuzzy interference engine* and *defuzzifier* as shown in Figure 9 (Attaullah et al., 2008).

The *fuzzifier* contains the membership functions (fuzzy sets). In the *fuzzifier*, input parameters (service parameter values) are mapped into membership functions to determine the membership of these parameters to appropriate fuzzy sets. The *fuzzy inference engine* contains a collection of IF-THEN rules, which are obtained from experts or learnt using other intelligent techniques. The justified inputs taken from the fuzzifier (i.e. membership values) are applied to the antecedents of the fuzzy rules. The obtained value is then applied to the consequent membership function (i.e., the output QoE membership function). In other words, the consequent membership function is clipped or scaled to the level of the truth value of the rule antecedent. If more than one rule is triggered from one set of input parameters, the outputs of all the rules are aggregated into the *aggregated output fuzzy set*. The *defuzzifier* is used to perform a *defuzzification*, namely a single output value is obtained from the defuzzifier with the use of the *aggregated output fuzzy set*. There exist various defuzzification techniques (Ross, 1995) such as the centroid method, the weighted average method, the maximum method, etc.

Figure 9. A fuzzy expert system



The fuzzy expert system significantly depends on the membership functions and the inference rules. The more accurately the membership functions and inference rules are specified the higher is the prediction ability of the expert system. Therefore, in order to effectively apply the fuzzy logic expert system for the QoE estimation, one has to carefully specify the membership functions as well as the inference rules. These membership functions and inference rules can be derived based on subjective data set; namely statistical data gathered from end-users and/or based on experts' knowledge and recommendations.

Once the initial machine (fuzzy expert system or a logic circuit) is derived, one may use it to predict the QoE value. However, the new statistical data can also play a role in 'upgrading' the system by increasing its prediction ability. To improve the fuzzy logic expert system, fuzzy membership functions and inference rules are updated based on the new subjective data set. One may notice that such improvement requires a 'teacher' to be involved in the machine learning process. That is the reason why it is hard to implement a 'real' self-adaptive algorithm or a 'real' self-adaptive fuzzy expert system. In other words, usually, the fuzzy expert system is not adapted automatically when the new statistical data appear; nevertheless, preliminary experimental results (Kushik et al, 2014) prove the high prediction ability of the fuzzy expert system, when estimating the QoE for multimedia services.

Evaluation Metrics for QoE Prediction Techniques

In this section, we shortly discuss how QoE prediction techniques can be evaluated with respect to two main criteria: prediction accuracy and self-adaptability. The prediction accuracy refers to the ability of the model's estimated score to match that of the subjective QoE. Therefore, for a model to have high prediction accuracy, the score difference should be minimal. On the other hand, self-adaptability refers to the ability of the model to adapt to new dataset. An efficient model should automatically adapt

(re-organize) to the new dataset without much complexity and time. However, both accuracy and self-adaptability depend highly on the size and coverage of the learning dataset and the number of considered input parameters. Furthermore, in spite of the fact that machine learning algorithms and self-adaptive models are widely used for evaluating user satisfaction, almost all these models rely on statistical data provided by high quality experts and/or collected from ordinary users. Collecting these statistics is the most critical task since it requires time and cost. Moreover, when training a self-adaptive model there are a number of additional points specific to the learning algorithms that need to be considered such as, defining the number of branches of a decision tree or designing membership functions and inference rules of a fuzzy expert system. As the QoE prediction techniques differ significantly for various multimedia applications and services, we further present some particular cases.

QoE IN 3D VIDEOS

The popularity of three dimensional (3D) videos is increasing from cinema to home entertainment. There is a huge industrial push in order to bring 3D video into a home (Wang et al., 2012). Moreover, 3D broadcasting and 3D video services have already been introduced around the world. One of the major concerns for the wide adoption of such technology is the ability to provide sufficient visual quality, especially if 3D video is to be transmitted over a limited bandwidth for home viewing (i.e. 3DTV) (Huynh-Thu et al., 2010). Therefore, there is a huge amount of research interest on improving the QoE of 3D videos. While considering the quality of 3D videos, image quality as well as user safety are considered as a important factors. 3D video QoE is mainly affected by three factors (NTT, 2014):

- Content production factors: camera performance, video shooting conditions, effect of picture frames, etc.
- Video compression and deliver factors: video format, coding schemes, transmission line errors, etc.
- Viewing environment factors: display schemes, viewing angle, ambient light, etc.

It is also necessary to consider biological effects of 3D videos such as eyestrain, visually induced motion, sickness, etc.

Methodologies for 3D Video QoE Assessment

3D video QoE assessment methodologies can be classified into four groups:

1. *Subjective assessment method* that is based on assessing the quality by viewing a questionnaire. As an example, one can consider DSCQS (Double Stimulus Continuous Quality Scale), ACR (Absolute Category Ratio), Factor analysis, SSQ (Simulator Sickness Questionnaire), VAS (Visual Analogue Scale) and other methods.
2. *Physiological assessment method* that is based on assessing the response by measuring various physiological data. Examples are: Measure brain activity, Measure bio signal (heart rate, breathing, dilation of pupils, accommodation, eye-blinks, skin potential activity), etc.

3. *Performance assessment method* that is based of assessing performance on specific tasks, i.e. response time, fatigue etc. As an example one can consider ATMT (Advanced Trail Making Test) measurements.
4. *Objective assessment method* that is based on objective measurable metrics. Examples of these methods can be found in (Ozbek & Tekalp, 2008; Yasakethu et al., 2008; Mittal et al., 2011; López et al., 2013; Han et al., 2014; Sohn & Ryu, 2014).

QoE in Dynamic Adaptive Streaming over HTTP (DASH)

In the bandwidth variant network environment, the basic HTTP download/streaming seems to be inappropriate since the video streaming suffers from considerable amount of freezing events. Therefore, in order to provide smooth video streaming, video stream needs to adapt according to the network environment to avoid freezing at the best possible video quality, which is achieved by dynamic adaptive streaming over HTTP (Stockhammer, 2011; Sodagar, 2011). This technology is used by different video streaming application such as You Tube, Netflix, etc.

DASH technology was developed under MPEG and is also known as MPEG-DASH. The MPEG-DASH standard was published as ISO/IEC 23009-1. It specifies XML and binary formats that enable delivery of media content from standard HTTP servers to HTTP clients and enable caching of content by standard HTTP caches (ISO/IEC 23009-1.2, 2012). In this technology, video is stored in different versions, i.e. at different bitrates at the multimedia server. These video versions are segmented in chunks such that the segment boundaries are aligned in time. Each terminal (DASH client) decides to download a particular version based on the device capabilities and network conditions. This decision can be made at frequent dispersed time instant during the streaming of the video (Sánchez et al., 2011). Hence user experiences quality variation (bit rate switching) during the video playback instead of freezing. However, if the video streaming is at the lowest bit rate and the network degrades further, then freezing occurs.

The QoE estimation in DASH is complicated. Traditional subjective and objective methods based on UDP for video quality estimation might not work well with DASH based video streaming. Recently there has been some work done with respect to QoE estimation of DASH, however, finding a reliable metric for QoE estimation remains a challenging issue.

Some of the works on the QoE estimation of DASH can be found in (Thang et al., 2012), (Robinson et al., 2012), (Mok et al., 2012), (Oyman & Sing, 2012), (Yitong et al., 2013), (Alberti et al., 2013), (Eckert et al., 2013), (Shahid et al., 2014), etc.

MULTIMEDIA QoE STANDARDIZATION BODIES

There are different multimedia QoE standardization bodies, industry forums and others that work on different aspects of multimedia QoE. These include definitions and terms of reference, requirements, recommended practices, test plans, and many more (Winkler, 2009). Some of the most active ones are discussed below.

Video Quality Experts Group (VQEG): This Group (VQEG, 2014) works in the field of multimedia QoE assessment (particularly video). It was founded by ITU-T and ITU-R group members in 1997. The group works in the field of video quality assessment and investigates different new and advanced subjective and objectives methods and measurement techniques (VQEG). Moreover, they plan, test and

validate objective quality estimation. VQEG is an open group and does not require fees, membership applications and invitation to join. Some of the past projects of VQEG groups are FRTV Phase I, FRTV Phase II, multimedia phase I, RRNR-TV, etc. Some of the active projects of VQEG groups are 3DTV, Audiovisual HD (AVHD), HDR (High Dynamic Range Video), Hybrid Perceptual/Bitstream JEG-Hybrid, MOAVI (Monitoring of Audio Visual Quality by Key Indicators), Quality Recognition Tasks (QART), RICE (Real-Time Interactive Communications Evaluation) and Ultra HD (VQEG).

ITU-T: The ITU-T (for Telecommunication Standardization Sector of the International Telecommunications Union) is the primary international body working in the field of standardization of telecommunications equipment and systems. ITU-T is a part of ITU (International Telegraph Unit) (ITU, 2014). This organization is based on public-private partnership and requires membership to be involved in. There are different study groups inside ITU-T that works for multimedia quality standardization. ITU-T Study Group 9 is focused in studies of cable television and quality assessment methods for video and multimedia services. ITU-T, Study Group 12 (SG12) is mainly studying QoE requirements and assessment methods for multimedia services including IPTV (Takahashi et al., 2008). A joint group has been established, i.e. Joint Rapporteur's Group on Multimedia Quality Assessment (JRG-MMQA) to harmonize the work of these two study groups. IUT-T works in all the area of multimedia QoE assessment, i.e. speech, audio, video and multimedia (combined) and has developed different standards for a quality assessment of multimedia for example ITU-T J.148, ITU-T P. NBAMS, ITU-T P.862, etc.

ATIS IIF: The ASTIF-IIF is working with Industry segments to define necessary standards and specifications for IPTV network architecture, QoS and QoE, Security, and Interoperability (ATIS-IIF, 2014). It requires membership for involvement. Different partners working together in ATIS IIF include service providers and manufacturers, content and entertainment providers, manufacturers, and the entire IPTV industry ecosystem. The Quality of Service Metrics Committee (QOSM) inside ATIS IIF works in different issues related to QoS and QoE in IPTV services. It has issued different documents related to QoS and QoE in IPTV services such as ATIS-0800008, ATIS-0800004, etc.

CONCLUSION

Multimedia QoE assessment and monitoring is essential to deliver an optimized end-to-end high QoE service. This requires a deep understanding and efficient identification of different objective and subjective parameters that impact the user experience. Multimedia content delivery is a large and continuously evolving field that involves various actors from content service providers to Internet service providers and to content consumers (users) themselves. Therefore, a comprehensive QoE assessment requires the understanding, the role and impact of these actors on multimedia content from delivery till consumption (Barakovic & Skorin-Kapov, 2013). A multi-disciplinary approach involving different measures at the server, network, application or user levels for a wide range of objective (QoS) and subjective (user perception) metrics is necessary for building QoE assessment models. A typical process for building such model includes:

- Conducting subjective lab or crowdsourcing tests to evaluate user perception in different scenarios. As the number of impacting parameters is relatively high, the objective of subjective tests is used to measure user acceptability with respect to a limited number of parameters such as screen size change, player buffering strategy, or network conditions change, etc.

- Building correlation model to map between parameters (for example, QoS parameters) measured during the subjective tests with the QoE scores given by subjects. This phase is considered as the learning phase.
- Evaluating the QoE based on the model against user scores to measure its accuracy.

FUTURE RESEARCH DIRECTIONS

The QoE assessment model requires extraction of QoS parameters from different points of the network. For this perspective, the measurement of potential QoS parameters plays a crucial role in providing the required input data for the quality estimation model. Such measurements can be achieved by installing network monitoring probes on key points of the network. These tools deploy *Deep Packet Inspection* (DPI) techniques to extract relevant parameters from the network traffic. When the traffic is encrypted, DPI needs to decrypt the content in order to extract relevant parameters. In most of the cases, this operation is simply impossible. Therefore, new models using statistical properties of the network traffic need to be designed.

Furthermore, with the push for personalized and user centric services, there is a pressing need for QoE estimation probes capable of processing high speed network links in real time to extract the QoS parameters and to correlate them with the user perceived QoE. However, the relationship between QoS and QoE is fuzzy and non-linear. To address this issue, there are large numbers of intelligent algorithms proposed in the literature. However, there is still room for innovative mechanisms to efficiently correlate QoE from QoS, in real-time. Finally, efficient QoE management systems aim at reacting before the user even notices the quality degradation (Hossfeld et al., 2012). This requires an efficient feedback loop that can detect, locate and react in real-time to degraded network conditions by controlling or reconfiguring different components of the QoE estimation system. Big advances have been made in this direction, however, open questions such as when, where and how to react still need to be addressed.

KEY TERMS AND DEFINITIONS

Crowdsourcing Video QoE Estimation Method: In crowdsourcing video QoE estimation methods internet crowd is asked to perform video QoE experiments using web platform.

Dynamic Adaptive Streaming over HTTP (DASH): DASH is a standard developed by ISO (International Organization for Standardization) for adaptive streaming using convectional HTTP web servers.

Key Performance Indicators (KPIs): KPIs are the parameters that indicate the behavior or performance of any service.

Mean Opinion Score (MOS): MOS represents the average score of all the participants in a subjective assessment.

Objective Video QoE Estimation Method: Objective video QoE estimation methods use objectively measured network/media parameters for estimating video quality.

QoE Learning Algorithms: QoE learning algorithms are intelligent learning algorithms that learn the relationship between multimedia QoS and QoE to predict the QoE objectively.

Quality of Experience (QoE): QoE is the degree of satisfaction of users of a service.

Quality of Service (QoS): QoS is the measure of service quality from the network perspective.

Subjective Video QoE Estimation Method: Subjective video QoE estimation methods use human participants to rate the video quality. Human participants rate the video quality based on their viewing perception.

Three Dimensional (3D) Video: The advancement to 2D videos by adding the illusion of depth perception.

Chapter 49
Concept Maps, VoiceThread, and Visual Images:
Helping Educators Spawn Divergent Thinking and Dialogic Learning

Kristen M. Snyder
Mid Sweden University, Sweden

ABSTRACT

The context of this chapter has its roots in an educational movement that recognizes the importance of preparing youth for living and working in a global community. Central to this is a belief in 1) engaging students in collaborative learning, 2) developing cultural sensitivity, 3) using digital media for communication and creativity, and 4) transforming pedagogical practice to foster reflection, divergent thinking, and creativity. The question addressed in this chapter is how teachers can use digital media and visual images to spawn divergent thinking and dialogue in a global learning context. This chapter presents a case analysis to examine evidence of inquiry-based collaborative learning and three-dimensional thinking among students when using digital images and collaborative software in a global partnership project.

INTRODUCTION

Story!, Design!, Creativity!, Divergent Thinking!, Complexity!, Exploration!, Curiosity!, Empathy! These are just some of the 21st century skills that business and international educational policy leaders suggest are essential for learning and working in a globally connected society. Already many of us, in particular children and youth, have experienced this transition from left-brain dominated communication (text-based) to right-brain communication (visual and spatial) through the Internet and other social media. The growing use of images and video on the Net, for example, is shaping a new way of thinking and communicating that is more divergent and creative. Through social media we are learning to collaborate, expanding our perspectives and stimulating new questions about life, society, and each other. Researchers have found exciting benefits from this networked, visual communication culture that supports the development of 21st century skills and creativity (Nilson & Nocon, 2005; Offir et al., 2008;

DOI: 10.4018/978-1-5225-3822-6.ch049

Schlais & Davis, 2001). Despite this, other international studies (Jerald, 2009) have found little evidence of pedagogical innovation taking place at the classroom level that reflects the above skills and attributes. In general, the majority of schools remain on the outside of this media equation (Snyder, 2007). The dominant learning model is most suited to left-brain analytical thought, while the workforce calls for greater right-brain activity (Pink, 2005; Silverman, 2004). Many now recognize the need to explore pedagogical opportunities that today's media affords innovation in learning.

One of the questions worth asking then is "what can educators do differently to develop learning environments that support holistic learning stemming from inquiry, exploration, creation, and collaboration through the use of digital media? While technology has been used in many classrooms around the world for the past decade or more, many teachers still report that they lack the skills and knowledge to think differently about the use of digital media to support pedagogical innovation (Snyder, 2010). We need to provide teachers with examples of how digital media can be applied pedagogically to stimulate, among other things creativity, diversity of thought, exploration and collaboration. Visual literacy and divergent thinking tools, such as concept maps, can be a helpful step in that direction (Wegerif, 2007). Studies are now reporting the dynamic changes that occur in learning when social software and images are used as part of the curriculum and tools for learning (Beaudry & Wilson, 2010; Stokes, 2001).

In 2010, The Gulf Oil Spill Crisis pilot (GOSP) was developed to support cross-cultural collaboration and pedagogical innovation in 14 schools in Nanshen China and Florida USA. The pilot emerged in response to research findings from the Global Partnership Project (Snyder, 2010). Little evidence was found in student online exchanges that reflected exploration, collaborative learning, and divergent thinking when communication took place predominantly through a text-based learning platform. To support pedagogical innovation, the GOSP pilot introduced the use of digital storytelling (Lambert, 2006) with concept maps (Beaudry & Wilson, 2010; Niesyto et al., 2003) and VoiceThread in an online learning community (Harasim, 1989; Sorensen, 2002). This model was guided by a transformative pedagogical approach that shifted the focus from teacher-driven to student-driven learning (Mezirow, 1997). The intent was to help teachers and students explore the use of collaborative learning media to promote reflective and dialogic learning (Abbey, 2008), as well as divergent thinking through visual literacy. This chapter presents a comparative analysis between the two projects periods examining differences in student exchange and the nature of inquiry when using concept maps and visual images as compared to text-based communication. The purpose is to contribute perspectives on how teachers can use digital media in their classrooms to support 21st century learning skills and help promote critical thinking, creativity and collaboration.

BACKGROUND

In 2007, The EU Commission on education identified eight key competencies that support program development within education, of which digital competence, global awareness, and social skills are included (European Commission on Education, 2007). The call stretches the focus from technology as a mere tool, to technology as a context for interacting and learning. The Commission (2007) states that, "ICT skills comprise the use of multi-media technology to retrieve, assess, store, produce, present and exchange information, and communicate and participate in networks via the Internet" (p. 22). Similarly, U.S. educational programming is guided at the present by an umbrella initiative called Framework for 21st Century Learning (2009), which promotes an integrated model of core subjects, digital media and

technology skills, life and career skills, and with learning skills such as communication, creativity, collaboration and critical thinking. These two educational agendas and others alike around the world recognize the importance for schools to redesign their educational programming in ways that integrate pedagogy, technology, and workforce preparation. They suggest it no longer is sufficient to focus solely on core subjects, for social skills, digital literacy and visual literacy are essential for preparing youth for the kind of divergent, inter-connected, networking, and creative work that is demanded of business for the future workforce.

Messages from the business community echo these educational agendas as well, and at the same time caution us about the gap between need and reality. Jerald (2009) reported in a study examining 21st century business skills that creativity, communication, divergent thinking, and collaboration are essential and need to be more fully developed in school curricula. Unfortunately, they report, the dominant educational model is overloaded with a focus on well-structured problems; students are not prepared to meet the real world of complex problems that require new ways of seeing and thinking. Moreover, reports Jerald (ibid), students are exhibiting difficulty presenting their thoughts and ideas, and lack a sense of passion and focus in their thinking. This would suggest that it is time for educators to take stock in the research on learning styles, brain based learning, and arts and education to understand more fully what teachers can do to integrate right-brain learning activities in the classroom and spawn divergent thinking, curiosity, creativity, and dialogic learning among students. And further, learn how visual images can be used to facilitate communication and learning across cultures where spoken and written language are often barriers.

The time has come, according to Pink (2005), to take advantage of the arts, and in particular visual thinking, to inform pedagogical development and programming in schools to open space for imagination and divergent thought. He claims that society is engaged in a paradigm shift from a left-brain dominated focus to a focus on the whole new mind, in which the left and right brain work in partnership with each other. The heavy emphasis on productivity and effectiveness in the industrial age, he suggests, is being replaced by a need among humans to have greater social connections, spirituality and creativity. He, and others (Snyder, et al., 2008) propose that the jobs of the future will be more focused on artistry, empathy, emotion, design, invention, counseling, ethnography, networking, and global. These jobs incorporate right brain activities, including, design, story, symphony, empathy, play and meaning (Pink, 2005). According to Silverman (2004),

Visual-spatial learners are individuals who think in pictures rather than in words… They are non-sequential, which means that they do not learn in the step-by-step manner in which most teachers teach. They arrive at correct solutions without taking steps, so "show your work" may be impossible for them. They may have difficulty with easy tasks, but show amazing ability with difficult, complex tasks. They are systems thinkers who can orchestrate large amounts of information from different domains, but they often miss the details. They tend to be organizationally impaired and unconscious about time. They are often gifted creatively, artistically, technologically, mathematically or emotionally. (p. 2)

Unfortunately, as research shows, schools have difficulty addressing the needs of right-brain visual learners because they are designed from a left-brain dominant model (Cochrane, 1999; Silverman, 2004). According to Silverman (ibid), "the school curriculum is sequential, the textbooks are sequential, the workbooks are sequential, the teaching methods are sequential, and most teachers learn sequentially" (p. *XXX*). What is important is for educators to seek ways to build learning environments that embrace

both the left and right brain and also encourage dialog and collaboration. Building brain-friendly learning environments engages both brains and is stimulated by challenge and feedback, as well as artistic expression (Galyean, 1983; Pink, 2005; Respress & Lufti, 2006*).*

Advances in Web 2.0 technology create possibilities for educators to develop classroom practices that promote 21st century skills including creativity, critical thinking, collaboration, empathy, and reflection. Needed is a pedagogical framework that helps teachers utilize the technology in ways that stimulate creativity and divergent thinking through discovery and inquiry. Traditional classrooms that reflect the left-brain dominated learning environment are guided by a pedagogical approach that assumes the teacher as knowledge bearer (ISTE, 2000); Knowledge is expert driven and in order to obtain knowledge one needs to learn from those who have it. Transformative learning (Mezirow, 1997) environments are guided by the pedagogical principles of among others, Dewey (1938, 1998), Vygotsky (1978), and Kolb (1984) who suggest learning occurs best when it is social, interactive, reflective, multisensory, collaborative and designed around a student's own questions. Such learning environments promote a balance between left-brain and right-brain activities as learners utilize a variety of media and art forms to explore phenomena as well as learn the basics in the core subjects.

A missing link for educators in the age of technology and social networking, I would suggest, is the use of visual images and representation that naturally invite open and creative thinking, as well as collaborative media that calls for students to work together on shared questions. Studies suggest (Snyder, 2010) that it is not enough to put students in learning groups and ask them to find information about problems or issues. This approach is limited in its linear orientation and is not sufficient to help students master the kinds of right-brain skills and competencies that are being called for by business today (Pink, 2005; Silverman, 2004). Whole brain learning requires a stimulus that invites thinking, exploration and curiosity (Dewey, 1998) and a forum for representing ideas as they grow. Visual thinking is a key ingredient in opening new doors for such learning to occur. It creates possibilities to incorporate both left-brain linear, logical thinking, and right-brain spatial and divergent thinking, while representing complex relationships in a variety of mediums.

The Arts, Visual Literacy and Creativity

Proponents of arts education have for years been seeking to help educators and politicians understand the significant role of the arts for holistic learning (Eisner, 2002; Greene, 1995; Rabkin & Redmond, 2004). According to Respress and Lufti (2006) "the arts pay off most expansively in basic reading skills, language development, and writing skills. Increases in general academic skills also show up and appear to reinforce these specific literacy-related developments. These skills emphasize focus and concentration, skills in expression, persistence, imagination, creativity and inclinations to tackle problems" (p. 26). Dickinson (2002) demonstrated interesting relationships between different art forms and thinking and reasoning. For example, music has a strong correlation to spatial reasoning, which is used in mathematics, while drama helps stimulate problem solving, concentration and analytical reasoning. And dance increases self-confidence, tolerance and appreciation for others.

Eisner (2002) and Greene (1988, 1995) focus on the use of the arts to stimulate imagination. Eisner (ibid) contends the arts "provide not only permission but also encouragement to use one's imagination as a source of content. Unlike in the sciences, where imagination is also of fundamental importance, in the arts there is a tradition that does not hold the artist responsible for 'telling it like it is'" (p. 82). Working with imagery can help foster a kind of divergent thinking that is essential for creativity and

imagination. It is in this role that visual literacy becomes significant for helping bridge the gap between business needs and student preparation for 21st century work. While the arts have remained external to the core curriculum and pedagogical practice in most educational systems, the growing use of images for communication on the Internet is causing us to take a second look and rethink the importance of visual literacy for 21st century living and work.

"A picture is worth a thousand words" is an old saying that can be heard around the world in a variety of languages. It reminds us that there is power in images that cannot be captured in words. Visual communication is a language of its own, and it is universal, like music. Moreover, and more significantly, interpreting images allows for divergent thought for there is no single right answer to the meaning of an image (Eisner, 2002). Images are everywhere, in our landscape, in museums, on TV, books, and on the Internet, and it is now becoming clearer that visual literacy needs to be developed in order to participate in knowledge sharing and development in the 21st century (Stokes, 2001). Visual literacy is the ability to read and interpret messages conveyed through visual images, as well as producing images for an audience (Bamford, 2003; Yenawine, 1997). It provides for a deep and reflective understanding of a topic or concept in a way that text-based representation does not invite in particular because reading and communicating with images involves critical thinking and multi-modal learning that stimulate deep learning.

Housen (2002) states that aesthetic thought strongly correlates with critical thinking and creativity and new cognitive growth as students observe, speculate and reason on the basis of evidence. Her work has led to the development of Visual Thinking Strategies (VUE, 2001), which she describes as a discovery process in which questions about images serves as the basis for dialogue. She states, "Discussions are initiated by questions phrased to provoke many thoughtful responses to what is seen in the images. Responding leads to active and extended involvement. The questions students ask become reflective —the basis for thinking critically" (VUE, 2001, p. 2). Starting with visual images, students begin to explore by asking, "what's going on in this picture," which serves as the basis for opening dialog for learning. Further exploration leads to the next level of questioning, "what do you see that makes you say that" and then finally, "what more can we find." These open, exploratory questions lead students into a reflective dialogue that stimulates divergent thought and creativity.

Within the context of cross-cultural sharing and learning, the arts, and in particular visual communication, can play a significant role in both communication and development of cultural sensitivity as youth explore common questions from different perspectives using a shared language of visual representation. Bamford (2009) suggests that the arts can serve as a cultural agent, helping students to develop an understanding of human experience and cultural identity and explore issues in a dialogic space that stimulate creative solutions. Working with imagery provides students a focal point for generating questions that are more divergent in nature, and foster exploration rather than argumentation and proof. Such questions invite dialogic learning (Shor & Freire, 1987) in which youth explore questions and perspectives in collaboration with one another, rather than arguing a particular point of view. It is through reflection, critical thinking and dialogue that creativity and knowledge transfer are supported (Frijters et al., 2008).

Collaborative Learning Software

Collaborating and working with diverse perspectives in an exploratory manner is not easy and automatic for all students. Often students need help finding ways to represent their ideas, communicate their thoughts, or organize information to see relationship between concepts or perspectives. Moreover, students need tools to help them develop collaborative inquiry. Two useful tools that are analyzed in this

chapter are VoiceThread and Concept mapping. VoiceThread is a collaborative multimedia tool in the form of a slideshow that allows users to interact with the context via text, voice, audio and video. As a pedagogical tool, VoiceThread creates conditions for student introduction, reviews of literature, reflection, brainstorming and digital storytelling. Its use in education is growing, and in particular it offers a multi-modal option for youth to explore, communication and collaborate around ideas. Brunvand and Byrd (2011) suggest that, "interface and feature set are well-suited for promoting student engagement and motivation, as well as helping students develop as independent learners" (p. 30). They promote the tool based on its flexibility to offer both synchronous and asynchronous learning, as well as a storage facility of ideas that can be accessed at a later date. Its intended use makes VoiceThread a useful tool for both collaboration and peer learning. Gillis et al. (2012) applied VoiceThread with young children to support language development, and found that it supported expressive language through storytelling, receptive language through listening to stories, comprehension through story retelling, and inferencing. They conclude VoiceThread to be a significant technology for its multimodal interactive ability including, voice, photo, and text, that engage students in active learning and expression.

Burden and Atkinson (2008) state that while VoiceThread was not originally designed for education, its application for learning is significant in relation to 21st century skill building. In particular they highlight strengths of VoiceThread as a social software for supporting 1) "connectivity and social rapport," 2) "collaborative information discovery and sharing," 3) "content creation," and 4) knowledge and information aggregation and content modification" (p.122). They point out, however, that it is not the software itself that stimulates a collaborative inquiry based learning, but rather it affords teachers the opportunity to support students in engagement. Benefiting from VoiceThread, among other social software, requires careful planning and stimulation on the part of the teacher to facilitate students' use of the software´.

Concept mapping is a higher-order thinking tool that has been used as a graphic organizer to help reflect and represent relationships between concepts (Novak & Canas, 2008). Nesbit and Adesope (2006) report that they were initially used as "advanced organizers, priming students for learning by activating prior knowledge and illustrating relationships with new concepts" (p. 413). Since then, the application of concept maps in education has developed in a variety of directions and is often used to support both collaboration (Gaines et. al., 1995) and divergent thinking. For students who have difficulty communicating their ideas in text-form, concept maps function as a spatial learning tool and offer visual learners possibilities to both explore the relationship between thoughts and represent them on paper, albeit in another form than pure text.

Research on concepts maps and learning demonstrate significant gains in retention and transfer. Nesbit and Adesope (2006) state that

In comparisons with activities such as reading text passages, attending lectures, and participating in class discussions, concept mapping activities are more effective for attaining knowledge retention and transfer. Concept mapping was found to benefit learners across a broad range of educational levels, subject areas, and settings. Much of this benefit was due to greater learner engagement, occasioned by concept mapping in comparison with reading and listening, rather than the properties of the concept map as an information medium. (p. 434)

Clearly stated here is the possibility that concept maps afford student engagement that is different from typical student involvement in class discussions. In part, the key lies in the construction of information

and ideas students generate through the concept maps, unlike when they engage in a verbal dialogue. Beaudry and Wilson (2010) provide further evidence of the use of concept maps for student engagement. In their study of the use of concept maps and formative assessment, they reported that students experienced a progressive mapping model, including collaborative learning phases, to be a strong factor in their learning. They claim that concept maps "are products that facilitate interactions of multiple forms of literacy, bringing thinking, writing, visualizing together with listening and speaking" (p. 7). Their argument supports the use of concept mapping and visual representation to stimulate a dialogic learning model that can promote critical thinking skills, questioning skills and deep reflective learning.

Findings from those who have worked with and studied the use of concept mapping, voice thread and visual images paint a picture for educators that demonstrates possibilities for creating learner-centered environments that spawn divergent thinking and creativity through the use of arts and technology. The next section of this chapter presents an analysis of data on the Gulf Oil Spill Project (GOSP) to explore the evidence of changes in student engagement, thinking and learning comparing the use of concept maps and voice threads with text-based exchange in Moodle.

THE GLOBAL PARTNERSHIP PROJECT

In 2009 the Global Partnership Project (GPP) formed to support international school partnership in China, USA, and Sweden. The GPP's mission was to help advance education through cross-cultural learning and collaboration for the development of global citizenship and pedagogical innovation (Snyder et al., 2010). Twenty-two school teams participated during the first two years (N=36 schools) from China, Sweden and the U.S. engaged during which educators were encouraged to build cross-cultural learning groups with their students through the support of communication technology (Moodle, ooVoo and Skype) to address global issues. The GPP was designed around an entire academic year with the fall term focused on helping students get acquainted using both Moodle and Skype. The curriculum was designed by the teachers in the three countries to support learning about global issues within the context of the curriculum focus in the partnering schools. The general framework began with a unit on "getting acquainted" in which students were asked to present themselves to each other in Moodle. The next unit focused on a community presentation by each school sharing something unique about their school or community and everyday life. The third unit was designed to stimulate global collaborative learning around a selected global theme, including water, the environment, or recycling. Research on this project (Snyder, 2010) showed that while student awareness for global issues increased and curiosity for different cultures expanded, little collaboration took place between students, in large part due to the text-based, linear nature of Moodle in which teachers were the main communicators.

In response to these findings, The Gulf Oil Spill Project was designed to advance pedagogical development in the GPP introducing visual images and collaborative tools including concept maps and voice threads (Beaudry et al., 2011). The pilot project title was conceived from the content, context and process of the intended learning model: *Gulf Oil Spill Project: Cross-cultural Digital Story-telling (GOSP)* and eight project goals that were identified. The project was designed to support collaborative learning in cross-cultural learning communities. The pedagogical framework that underpinned the project was drawn from transformative learning theory (Mezirow, 1997), visual thinking (Niesyto et al., 2003), intercultural competence development (Deardorff, 2004) and online collaborative learning (Sorensen, 2002). Three primary tools were introduced including a visual image data repository, VoiceThread and Webspiration,

which is a collaborative concept mapping tool. The tools were designed for use in a discovery model designed (Beaudry et al., 2011) that reflected four stages of learning for transformation: investigate through photos and information, create (digital stories), share (on concept maps and voice thread), and evaluate the information collaborative for knowledge transfer. The model is illustrated in Figure 1.

METHODOLOGY

This chapter examines how communication exhibited by students in a global learning context differs when using concept maps and visual images as compared to text-based responses, and explores any differences that are visible in the dialogic nature of the inquiry that ensued. Articulating a specific method that was used in this analysis is not a clear-cut process, for the focus of this chapter lies in between two worlds. On the one hand the study is a phenomenological exploration of changes in classroom-based learning that takes place in a cross-cultural learning context with different uses of digital media and concept mapping. At the same, it is not a pure phenomenological (Lancy, 1993) study in the classic sense, given that the focus is on patterns of change in the kinds of questions and communication that students engage in using digital technology, rather than on their experience with the technology. At best it can be described as a comparative collective instrumental case study (Stake, 1995), borrowing from Stake (ibid) and from Denzin and Lincoln (1994). Stake (ibid) defines an instrumental case study as a method to examine a particular question by studying a particular case. The case itself is not the object of study, but rather the vehicle through which a researcher can understand a situation, phenomenon, etc. to answer a question. When several cases are used as study objects to examine a question, the case becomes collective. I have chosen to include the use of the term "comparative" since this particular study examined differences in the types of questions and cross-cultural communication that occurred between students who participated in a global partnership project over a three-year period.

Data for purposes of this analysis were selected from student communication during the two project periods. In total 12 school partnerships were represented in the first project phase (GPP) with a total of 3 schools in each partnership team from China, USA, and Sweden (N=36 schools). Seven school partnerships participated in the pilot project (GOSP) with a total of 14 schools arranged in seven teams. Due to several logistical factors related to language and technology, the cross-cultural exchange dimension was

Figure 1. Digital work flow model (copyright Beaudry, Burden, Keuchel, Snyder, 2011)

not developed. Data were not available from the schools in China, and of the participating American schools, data were available from four schools out of seven. Data were then selected from the remaining schools that had demonstrated student work relevant to the purpose of this chapter, which included three middle partnerships from the first project phase, represented by schools in both the USA and China, and three schools in the USA from the pilot phase: one middle school and two elementary schools.

Selected data used in this analysis included: Seventeen concept maps from one seventh grade class in the USA (GOSP 7), seven VoiceThreads from two middle school classes in the USA, and text-based dialogue exchange in Moodle from a three middle school partnership in both USA and China. Individual interviews with 7 teachers in the U.S. were conducted via Skype and one focus group with all participating teachers in Florida (N=12) was conducted via Flashmeeting. Due to language barriers, communication with the teachers in China was limited and did not permit for a focus group or online survey.

Data were analyzed using a semantic approach to examine the content of communication as well as the form and structure, and social interaction of images, ideas and text. Erikson's (2007) Thinking Classroom model was applied to identify questions as either two-dimensional, reflecting fact-based knowledge, or three-dimensional questions that are conceptual and provocative. Two-dimensional questions relate to convergent, non-dialogic learning, and three-dimensional questions relate to divergent and critical thinking. The Digital Work Flow model was applied to explore the ways in which student communication showed evidence of inquiry-based dialogic learning using digital media.

FINDINGS

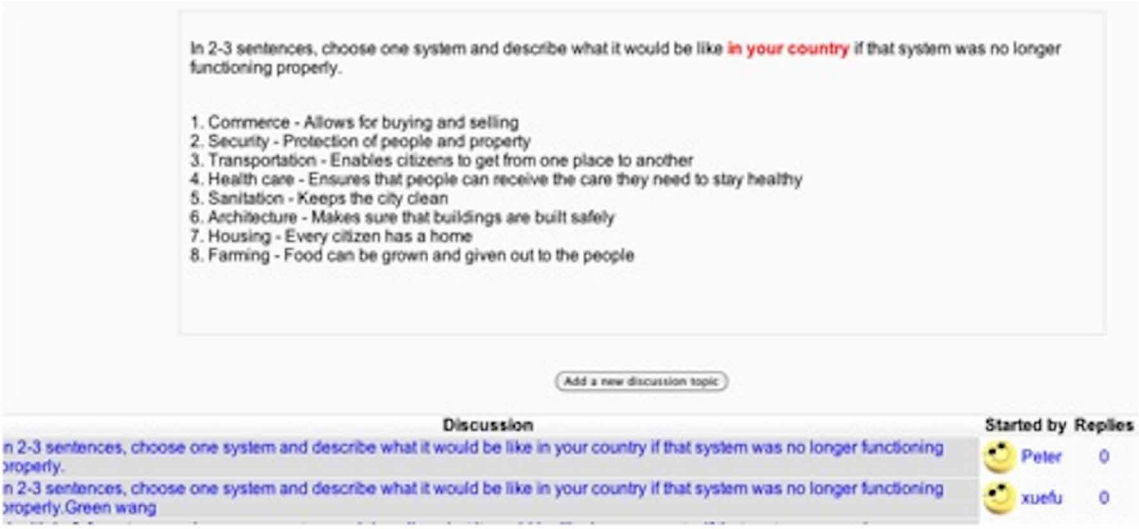
Findings are presented with respect to the two project phases of GPP and GOSP. The first analysis explores student inquiry and collaboration within the context of a teacher-driven curriculum that was carried out in a predominantly text-based communication platform (Moodle). The second analysis explored student inquiry and exchange in a student-driven model in which visual literacy tools (concept maps and voice thread) dominated the form and structure for communication. Following these findings, an analysis is provided that compares differences in student learning and explores potential reasons for the differences that can help to answer the question posed in this chapter: "what can educators do differently to develop learning environments that support holistic learning stemming from inquiry, exploration, creation, and collaboration through the use of digital media?

Moodle Discussion Forums and Text-Based Exchange

Examining text-based data from the first phase of the project, it is clear that when students engaged in learning by responding to teacher questions in a discussion forum, the communication was limited to fact-based responses for personal beliefs. Little to no dialogue occurred between students, and when it did, it was limited to one or two sentences. Rarely did students ask any questions of each other more than, "what do you think"? and, "tell me what it is like in your country."

The first example, found in Figure 2, depicts the type of questions that teachers asked as organizers for learning. Here we see that the question asks for facts and does not invite any particular kind of inquiry. The phrasing, "describe what it would be like if that system was no longer functioning properly" does not necessarily elicit inquiry from students. Moreover, the Moodle discussion forum was organized so that each student had a separate discussion forum in which to post. This required each student to open

Figure 2. Screenshot of Moodle online discussion forum



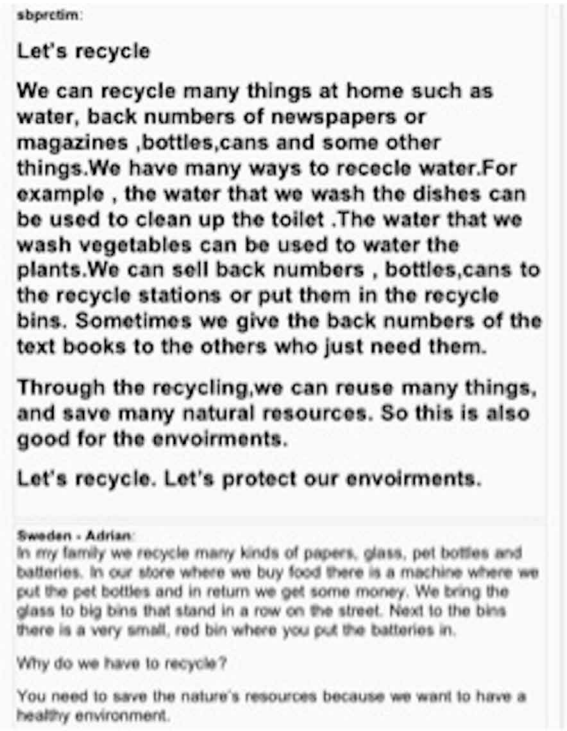
the individual discussions and post to each one, as opposed to seeing the entire discussion thread as a dialogic space. This one-to-one communication structure appeared to affect the type of exchange between students, as evidenced by the little to no commenting on the different threads.

In another example, teachers identified two project themes: Earth and Carbon Emission, and asked students to generate questions that they could then work on together. The Moodle environment was identical to that depicted in Figure 2 above. One student responded to the question about Earth with a simple comment, "I think more people should recycle and maybe we would have less earth related issues!" Another group prepared a power point slide that focused on "how to reduce your footstep" using data from different Internet sources that point to the need to use energy saving features in your home, for example, use cleaner transport or choose sustainable building materials. No exchange or dialogue followed the posting of this power point in Moodle.

Following this activity, teachers then chose to post a new question on Moodle: "What do you recycle at home"? and "how do you recycle at home"? The stated objectives from the teachers were for "learners to give examples of renewable and non-renewable resources and explain the differences between the two categories of resources, 2) generate a list of non-traditional uses for a given object or material, and 3) address problems that come with a nations prosperity and growth." Students began to post in a common discussion forum their responses to the questions. What is evident from the postings, as highlighted in Figure 3, is that students merely answered the question, rather than engaging in an exploratory dialogue together. Furthermore, the content of their postings does not reflect deep learning. Rather it was descriptive of what they already do at home to recycle.

In another school partnership, students used word documents to communicate their thoughts and ideas about an environmental issue in response to a teacher-initiated question posted in Moodle: "What kind of global issues can we explore together? Post a question or comments about an issue and let's talk about it." Following this question, teachers had identified two thematic areas in which they intended for students to respond to the initial question. The themes included the environment and water resource

Figure 3. Online text-communication in Moodle between two students



sbprctim:

Let's recycle

We can recycle many things at home such as water, back numbers of newspapers or magazines ,bottles,cans and some other things.We have many ways to rececle water.For example , the water that we wash the dishes can be used to clean up the toilet .The water that we wash vegetables can be used to water the plants.We can sell back numbers , bottles,cans to the recycle stations or put them in the recycle bins. Sometimes we give the back numbers of the text books to the others who just need them.

Through the recycling,we can reuse many things, and save many natural resources. So this is also good for the envoirments.

Let's recycle. Let's protect our envoirments.

Sweden - Adrian:
In my family we recycle many kinds of papers, glass, pet bottles and batteries. In our store where we buy food there is a machine where we put the pet bottles and in return we get some money. We bring the glass to big bins that stand in a row on the street. Next to the bins there is a very small, red bin where you put the batteries in.

Why do we have to recycle?

You need to save the nature's resources because we want to have a healthy environment.

management. The theme of environment generated dialogue between six students representing the schools in Sweden and the U.S. In one of the postings, a student asked questions of their partners:

What do you think we should do about the environmental problems of the world?

How do you think the world will look like in 20-30 years?

Do you think there will be new and dangerous diseases that may lead to thousands of people dying due to the rise in temperatures?

Some people think that they do not care about the environment and that everyone takes it too seriously. What should we do to change that kind of person and get them to understand the importance of global warming?

Responses by other students to these questions included, 1) "I think you are right. We need to help out the earth. I do not think we residents have a choice about fossil fuels, but we can walk and other things that will help"; 2) "what I think we should do about the environment crisis is we should pay attention to the small things like riding your bike to the store instead of driving a car. We could trade our old light bulbs for environmental friendly ones. I think that if we start paying attention to the small things now,

later on our world will start to mend itself back together, but the Earth cannot mend itself on its own, so let's start going green!"

In this online exchange, the initial questions asked by one student indicated three-dimensional thinking in that they suggested an awareness of implications for the future based on the current environmental issues, for example: "do you think there will be new and dangerous diseases that may lead to thousands of people dying due to rising temperatures?" The relationship identified the connection between rising temperatures, disease and death. It appears from the responses that the format for communication did not invite exploration or dialogue, as none of the responses were in direct relation to the questions. They reflected a collegial perspective, but no collaboration, dialogue, or reflection that was stimulated by the posting.

Another student in the same partnership posted their comments individually in a word document, asking questions of their school partners at the end of the letter. They wrote the following:

The environmental problems are something that I think we should start thinking more about. Before when I was younger I didn't care so much about it so much but now I can't avoid it. Something that our country can do is to stop produce so much environment pollutions things. I don't think that I as a private person can do so much to change the environment problems and not my parents either. Now some questions to you.

Do you care much about the environment problems?

Do you try to do something to change the problems?

How much does your country care about the problems?

How much do your parents care about the problems?

Have you noticed some different about the climate now and for some years ago?

The types of questions raised in this posting reflect mostly convergent thought and two-dimensional thinking focusing on facts and skills for how to care for the environment. The affective nature of the questions suggests potentially divergent thinking, but this is not evident since there is no dialogue to follow or follow-up. It is conceivable that if these students had another forum for connecting, and were encouraged to dialogue, their questions could support creative inquiry. However, in the text-based forum the questions became mostly rhetorical.

These examples suggest that while students may possess skills in inquiry, using them to facilitate deep learning requires more than just posting thoughts. It requires a forum, process or method that invites exchange and exploration, as well as testing concepts. In relation to the first set of questions posed by the teachers on Earth and Carbon Emission, only one student responded in the U.S. to the question about Earth, and one class in China to the question about Carbon emissions. In a separate question to the same schools about recycling, only seven students responded representing two different schools. This would suggest that the discussion forum model in combination with a teacher driven curriculum framework, was not enough to evoke dialogic learning, curiosity and divergent thinking among students.

Concept Maps and Visual Images

In contrast to the first phase of the project, the second phase (GOSP) employed a transformative pedagogical approach grounded in student-inquiry in which teachers served as facilitators. The concept maps, VoiceThreads and visual images were used as stimuli and platforms for communication for student inquiry and collaboration. To begin, students were asked by their teachers to choose between one and 3 photos from a photo bank of 12 photos, each from the Gulf Oil Spill and the Yushu Earthquake. Using a Visual Thinking Strategy model they then asked students the question, "What do you think is happening in this photo?" followed by a series of questions that began with "Why?" The purpose according to the teachers was to help students engage in a deeper learning process using the photos as a stimulus. According to one teacher, the photos, helped students "to generate emotion, talk about personal experience, including such questions as how the gulf oil spill affected our sea life and seafood prices." The teacher further shared that 'The pictures brought emotion. We asked students to look at the photo without saying anything and then asked, 'what are you feeling'. This helped them to generate questions that then became a part of their investigation.

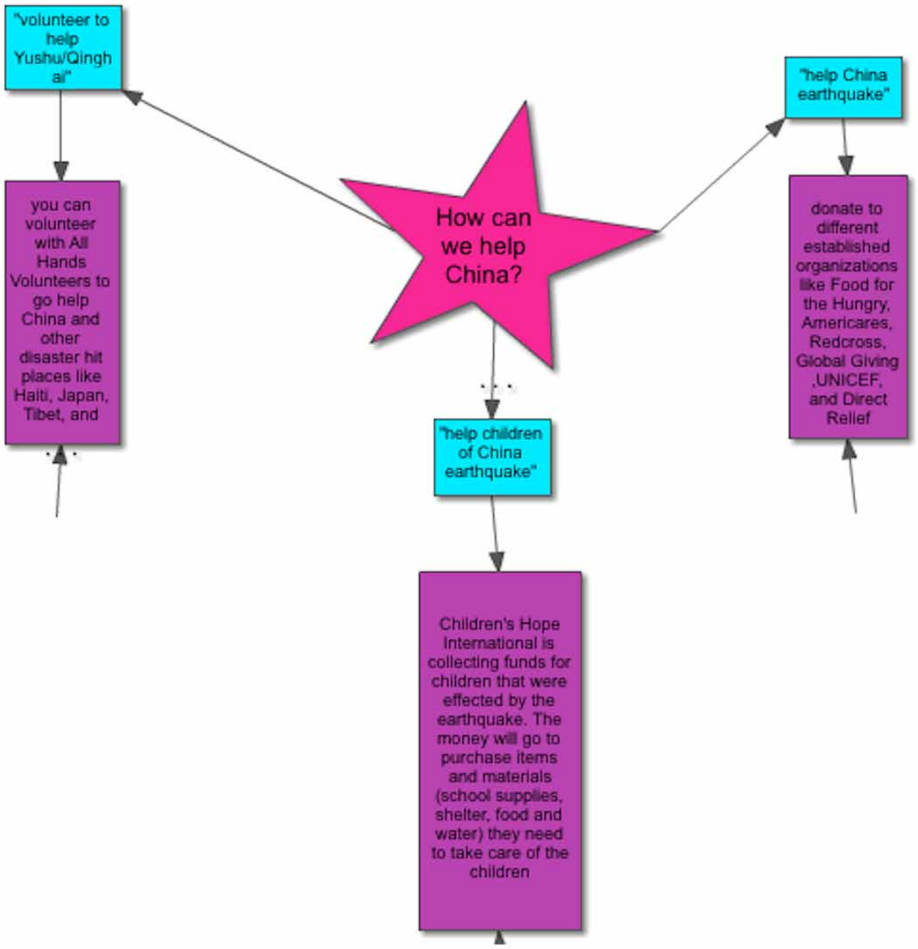
Following exploration of the photos, students collaborated in groups of three from each school working with concept maps to explore further the initial questions that had emerged from the photos. They received help from the teachers to generate a question that could help them start their inquiry. In the concept maps that were generated, there was evidence of three-dimensional thinking represented by the different types of questions asked that illustrate an understanding of the relationship between concepts. In the first concept map, the collaborating students asked the main question, "What happened to the sea animals during the oil spill?" Their inquiry included sub questions, such as "did the animals get cleaned after the oil spill? In which they explored information about the cleaning process. As well they learned that the particular timing of the oil spill had an impact on sea life in a larger sense, as many of them had begun the spawning and nesting period. According to the teacher, the photos helped the students to make different kinds of connections to additional questions so that their inquiry was not just fact based; it also included affect, which is linked to divergent thinking. They guided:, "as you type in the concept map, you enter data in different boxes. As the boxes develop, you see how questions become sub-sets of questions, and how concepts relate."

In one concept map in Figure 4, elements of affect are displayed in the questions, as well as deeper exploration of what can be done to help China in the cleanup. Rather than asking only fact-based questions, students were curious about how to engage in the issue, which is considered an important characteristic of critical thinking and creative learning.

In another concept map, presented in Figure 5, we see again evidence of the kinds of sub-questions that emerged in the student's inquiry that were generated from one major question: what happed to China's major cities. This question is reflective of an "essential question" which fosters divergent thinking. The question itself can be answered from a variety of points of view both fact-based and affect-based. The sub-questions that were generated during the inquiry indicate an awareness of the complexity of the event and its impact on china.

In the concept maps there is also evidence of collaboration. Students who worked in groups of three began with a common question and then generated a series of sub-questions, which they explored individually to begin with. Students collaborated on the concept map, filling in their information and then dialoging about its implications. During the interview with the technology teacher in one of the schools, they shared that the concept map was significant in stimulating collaboration: "When students researched

Figure 4. Concept map from a seventh grade team

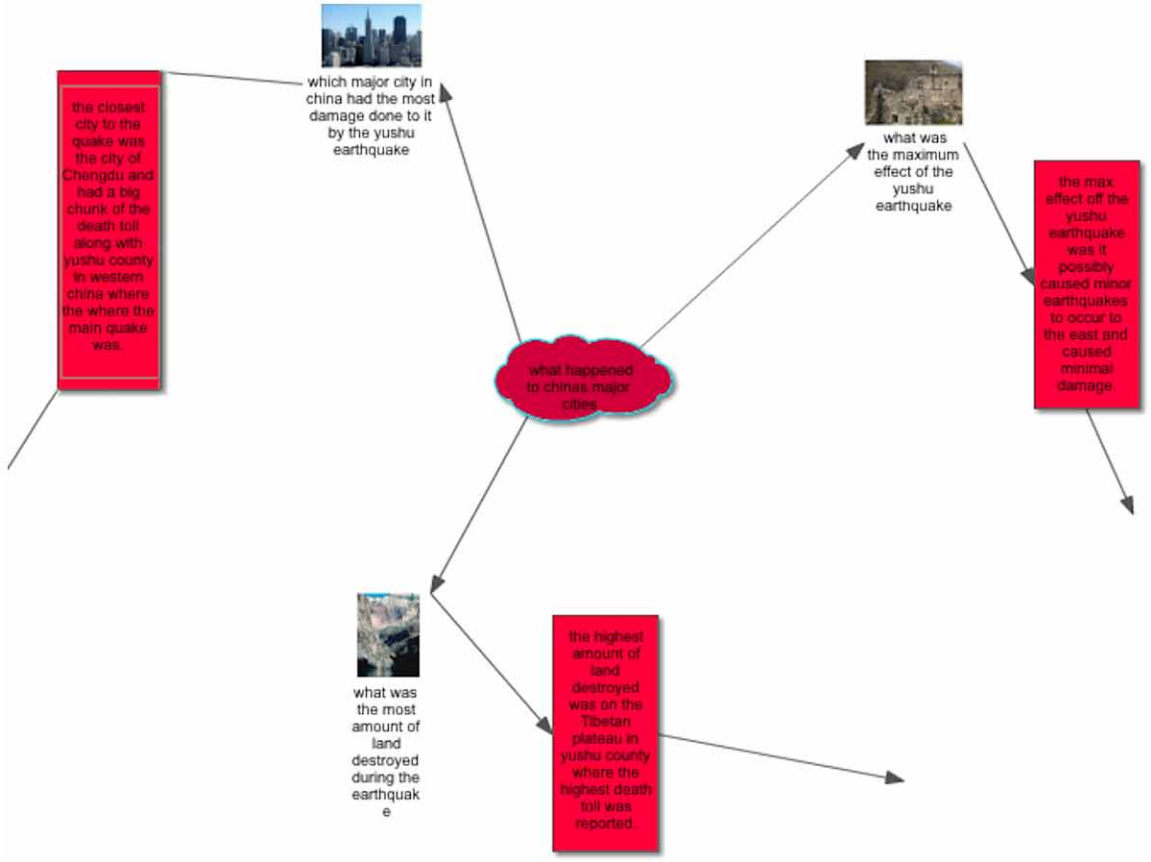


their questions, they could collaborate on one document in Webspiration (a concept mapping software). Students were asked to find a different photo to support their question. Then they uploaded them to the concept map. Then they had to research and enter their info. Ask questions about the picture and then research. They then saw that student A's question could relate to student B and C based on their pictures. We found that this stimulated students' curiosity and interest." What was not evident in second phases on the GPP project was cross-cultural collaboration. According to the teachers, the project was implemented too late during the spring term and did not allow time for cross-cultural sharing. However, according to teachers, the photos helped students develop a sense of curiosity about the respective countries and sense of empathy for the experience of both natural disasters for its citizens.

VoiceThread

In another class, students began to study the photos as a stimulus for dialogue. Instead of concept mapping, they used VoiceThread as the medium for communication, both to present their knowledge of the Gulf Oil Spill and Yushu Earthquake, as well as to present their experiment with how to clean up an

Figure 5. Concept map from a seventh grade team



oil spill using a simulated project model. In the first VoiceThread as depicted in Figure 6, two students presented information about the Gulf Oil Spill. A transcription of their postings showed that students incorporated facts they presented in narrative form. They used imagery in their words to paint a picture of the human element, rather than just reporting facts. For example, one student shared, "When the gulf oil spill happened they were a mile underground and there were eleven workers onboard who died because of the explosion and that's because there were a few glitches with the machine." Another student shared the following, "The gulf oil spill was terrible. It killed a lot of marine life. Mostly sea turtles, but it spread for a 100 miles and it also killed a lot of people." Together, these two different storylines embedded within the same VoiceThread represented collaboration around information about the event. One student focused on the explosion, its cause and impact on workers, while another focused on the impact on marine life. The two different questions, in collaboration with one another illustrate three-dimensional learning that connects facts with emotion and skills for working with visual imagery and digital media.

In the second voice thread, depicted in Figure 7, students shared the simulation they made to learn how to clean oil. They simulated an actual ocean using a variety of materials that functioned similarly to elements found in an ocean. Embedded in the VoiceThread are the voices of two different presenters.

In an interview with teachers, they shared their observations of students working with VoiceThread and compared this to text-based exchange on Moodle. Students were more engaged with each other

Figure 6. VoiceThread from an elementary school team

when working with the voice thread, and were more creative in their thinking: "when the students see photos they spur ideas, and the VT also stimulated new ideas listening to one another talk about the global events." The teachers also perceived other benefits to voice thread and working with visual images. According to them, "some students are more comfortable talking and have difficulty writing. For them, the options in VoiceThread help them to present their thoughts. Working with images they can also illustrate their ideas differently. In Moodle, it requires that students read everything in order to participate in a dialogue. That takes more time and another kind of skill that not all students are comfortable with."

Analysis

What can we learn from the above findings to help teachers think differently about the use of digital media to engage students in discovery, collaboration and 21st century skill development? Analysis of the findings show that students appeared to be more engaged, inquiry-driven and collaborative when working visually with concept maps and VoiceThread as compared to text-based dominated exchange. Understanding potential reasons for this can be found in other studies about the power of image for stimulating creativity (Bamford, 2009; Eisner 2002), and the interactive nature of learning that takes place with a transformative pedagogical practice (Mezirow, 1997; Sorensen, 2002; Snyder, 2007). In the text-based Moodle environment, which was teacher-driven, students displayed an interest in sharing their thoughts and ideas, however, they did not appear to engage in collaborative or shared learning. Their exchanges were based predominantly on sharing what they do or think and asking of their global partners what they thought. Salmon (2000) would suggest, in this text-based dominated platform the need to build a culture of learning that engages students in higher order thinking over time. She suggests that the text-based model requires a facilitator to help students move from engagement to involvement.

Figure 7. VoiceThread from an elementary school team demonstrating the oil clean up simulation

In contrast, the content of the VoiceThreads reflected dialogic inquiry that was evidence of what Pink (2005) refers to as storytelling and empathy, and an understanding of the parts in relation to the whole. In the GOSP project, students worked in groups to select photos from the photo data bank that were then used to spawn questions for collaborative discovery. What was interesting in listening to the postings and reading their text was the narrative nature of their communication. There were elements of story, including scenic description and emotion as well as facts about the oil spill. Unlike the text-based communication in Moodle, the messages in the VoiceThread had a more dynamic dimension as well as storytelling model that are akin to critical thinking, reflective learning, and divergent thinking. The work with VoiceThread also highlighted how students worked following the digital workflow model as they first used the photos to investigate answers to questions that they identified. With the information they began to create a collaborative story that was built by the variety of postings, told often in narrative form. In so doing, they developed a dialogic dimension in their learning through which student's individual knowledge, curiosity and understanding about the Gulf Oil Spill and Yushu earthquake was deepened and contribute to a collaborative knowledge transformation.

There was also evidence from the analysis that the role of the teacher and the pedagogical approach were significant for fostering divergent thinking and collaborative learning. In the GOSP project, in which concept maps and voice thread was used, teachers worked with questions to help probe students

to explore and reflect on ideas and information. The use of photos transformed the concept map into a dynamic collaborative exploratory. By taking time to select photos and explore the potential significance of them, students arrived at deeper questions for their collaborative inquiry. This process reflected transformative learning (Burden & Atkinson, 2008; Mezirow, 1997) depicted in the digital workflow model: investigate, create, share, and evaluate (Snyder et al., 2010).

Solutions and Recommendations

Asking questions stimulates curiosity and the desire to discover. The types of questions we ask have profound implications for the type of learning that can ensue (Erikson 2007; Wilson, 1997). Children in their early years reflect a natural, innate behavior, for divergent thinking and curiosity that somehow reduces with the years. It is often suggested that the left-brain dominated, prove it to me, model of schooling and educational politics has killed this wonder (Eisner, 2002; Silverman, 2004). Educators like Dewey and Vygotsky remind us of the need to keep the wonder alive by creating learning environments for youth that invite and stimulate curiosity and secure the notion that the process and experience of learning is just as important, if not more important than the outcome.

The standardized testing movement has challenged teachers to find ways to embrace discovery learning amidst the demands to prepare students for selected aptitudes that are tested on national and international tests. This paradoxical condition between proof of educational success and natural learning through discovery and social interaction has created a condition in which teachers themselves often do not take the risks to be creative. Their visions, albeit worthy, are often limited to the confines of the testing culture (Snyder et. al., 2008). This was evident in the Global Partnership Project in which carefully articulated lesson plans reflected the traditions of testing, in the form of stated objectives that sought proof of student knowledge acquisition. Despite the group context for learning, there was little to no evidence of teachers facilitating a dialogic, discovery based learning in Moodle that encouraged students to develop their sense of curiosity and investigation.

Dewey (1938; 1998) speaks of the importance of experience for learning and the need for teachers to create learning environments that invite curiosity, investigation and sharing. He states,

In a word, we live from birth to death in a world of persons and things, which in large measure is what it is because of what had been done and transmitted from previous human activity. When this fact is ignored, experience is treated as it if were something which goes on exclusively inside an individual's body and mind. It ought not be necessary to say that experience does not occur in a vacuum. There are sources outside an individual which give rise to experience. It is constantly fed from these springs. A primary responsibility of educators is that they not only be aware of the general principle of the shaping of actual experience by environing conditions, but that they also recognize in the concrete what surroundings are conducive to having experiences that lead to growth. (pp.34-35)

The context of the Global Partnership Project (GPP), one could argue, was well thought through from the start, with a base in contemporary research on learning and school development (Snyder, et al, 2010). The approach was holistic from a whole school perspective rather than classroom-based. The leadership and teaching staff planned together what was needed to foster learning in a cross-cultural context. Technology specialists were on hand to assist teachers with the development of Moodle and connections

in Skype and ooVoo. These measures are certainly commendable as research from this project phases indicated many positive outcomes for students and teachers regarding global awareness and the use of technology (Snyder, 2010). What was missing, I would contend, was an understanding of the need to create an environment that supported discovery and dialogue in order to fulfill the dream. The limitations could be understood from a variety of perspectives that emerged during the initial research, including language barrier, technological challenges, and schedule conflicts between countries which created a dynamic in which students did not have access to work together on a regular basis using face-to-face technologies. However, the analysis presented in this chapter suggests that perhaps something more fundamental was at play: the type of technology and the pedagogical model needed to invite student-driven participation and inquiry in order to stimulate creativity and divergent thinking

The GOSP pilot project, regardless of its introduction of concept mapping, visual images, and VoiceThreads, suffered from similar technological challenges as participating schools had difficulty accessing some of the software (despite prior testing of the tools). This limited the cross-cultural dimension of the learning space. Despite this, there is still evidence of a different kind of learning between and among students in local groups working with concept maps and VoiceThread, which is represented in the storytelling nature of their communication, as well as the reflective nature of their presentations.

There are two aspects, I suggest, that are important to consider from this analysis to understand what teachers can do differently to spawn divergent thinking with the use of digital media. The first is to consider the digital media that is chosen and the degree to which the interface invites discovery and sharing. The second is to understand the implications for teachers to create a learning environment that invites experience. The interface in Moodle was more linear and it was designed around individual postings, rather than group discussion threads. The dominant form of sharing was text-based, and didn't invite collaboration. Compare this with concept mapping and VoiceThreads in which the interface was both multi-modal, and the documents were shared among the students in each group inviting collaboration and dialogue around the content.

Another important factor is for teachers to understand how they can incorporate digital media to support discovery and experience. In the first project the curriculum framework was strict and evidence-based with an emphasis on sharing findings across cultures. In the second pilot project, the focus was on helping students explore two major events by reflecting on a set of photos from the Gulf Oil Spill and the Yushu Earthquake. The set-up of the learning activity from the teachers was experience-based both in exploring meaning behind photos, as well as experimenting with how to clean up an oil spill. In many of the dialogues students explored the meaning of the natural disasters for themselves, trying to understand, for example, what the students in the Yushu Earthquake must have experienced and what that would have been like for them, or the availability of seafood after so many marine life died in the Gulf Oil Spill. The more students explored their own questions together, the less they were interested in the teachers input. For the teachers, watching their students engage with eagerness stimulated new responses in their own teaching as facilitators of discovery and creativity.

FUTURE RESEARCH DIRECTIONS

This chapter has been developed in relation to a broader question spawned by the editors: "Can students improve their critical thinking, their understanding and production of arguments by being given practice

in mapping? ” The analysis was based on a comparison of the same schools over a two-year period that applied two different models and digital technology to support learning in a global context. The findings help to provide insights to answer the editors' question, suggesting there is strength in the use of concept mapping to stimulate divergent thinking, exploration and inquiry, as well as collaboration, which are linked to critical thinking and deep learning.

The chapter also pointed to gaps in the knowledge among educators about how to connect pedagogical models that support inquiry and social learning with digital media. One significant element that is supported by both brain-based learning and arts education is the need for teachers to work with multi-sensory learning and allow these tools and approaches to support a new kind of learning environment. Considering future directions of both research and practice, it seems necessary to begin connecting knowledge from different fields into a holistic understanding for teaching and learning. For example, the research on arts education tends to remain on the periphery of pedagogical practice, yet there is strong evidence to suggest the arts should be central to informing pedagogy. In research on technology and learning, there is a strong knowledge base developed about the strengths of media to support collaborative learning. And the theories of Dewey and Vygotsky related to social and experience-based learning have found a home in the practice of creation that is afforded by social collaborative technology such as concept mapping. Educational policies such as Framework for 21st century learning (2009) provide a natural context in which schools can begin to embrace the diversity of research to inform practice. Yet, the standardized test model of education seems to dominate. Perhaps this is the area that we need to be focusing on: how to rethink testing and accountability so that educators are supported by an environment in which they can offer students possibilities for developing 21st century skills that integrate knowledge and experience from a variety of disciplines including technology, the arts, communication, and social learning theory.

CONCLUSION

Helping teachers understand what they can do in their classrooms to spawn divergent thinking with the use of digital media has been the focus of this chapter. A review of research on future workforce skills for the 21st century presented in the beginning of this chapter suggests the need for continued exploration as too many schools continue to develop in an arena fixated on productivity and outcomes at the expense of preparing youth for a future workforce. Dewey's theory of learning is not new, but it is fundamental and paramount for today's educational agenda to help schools prepare youth with 21st century skills. The focus on experience and discovery is more than just social learning in which students work in groups. It is about creating possibilities for students to actively engage in a process of reflection, inquiry, investigation, sharing, and discovery to be prepared with skills to engage in storytelling, divergent thinking, empathy, and networking that are sought after by businesses. With the continued development of technology and digital media since Web 2.0, teachers have at their disposals a myriad of tools with which they can help spawn a stimulating and transformative learning environment for students. It requires, however, that teachers not only select software that supports such learning, but that they also match a learning model that opens doors for investigation, exploration, discovery and creation.

KEY TERMS AND DEFINITIONS

Collaborative Learning: A concept that suggests learning occurs best when the participants themselves determine the focus of learning, the question to explore and the ways in which they will explore the focus of interest. Compared to cooperative learning in which a framework or structure is externally determined, collaborative learning engages participants in the creation of their own structures and determinants of learning.

Concept Mapping: A higher-order thinking tool that has been used as a graphic organizer to help reflect and represent relationships between concepts.

Creativity: Seeing relationships between unrelated ideas, objects, or concepts and combining them to make something new.

Digital Media: Used to indicate a variety of software programs that are used to communicate and represent information. The media can be visual and or auditory.

Transformative Pedagogy: A philosophical orientation to learning in which students engage in shaping the curriculum through their own questions and curiosity. The role of the teacher is to facilitate conditions for students to arrive at their own answers, rather than to provide the students with answers. One of the main intentions is to transfer the learning from the classroom to the real world.

Visual Literacy: The ability to represent and interpret ideas using graphical models and pictures. In the context of learning it is related to right-brain higher order thinking skills and it leads to cognitive growth in observing, speculating and reasoning based on evidence.

Whole-Brain Learning: Pedagogical praxis that engages both left-brain logical, analytic reasoning with right-brain creativity and higher order thinking.

Chapter 50
Digital Media in Uganda: Where Regulation and Freedom of Expression Contradictions Are Sharpest

Brian Semujju
Uganda Christian University, Uganda & Makerere University, Uganda

ABSTRACT

This chapter is an analysis of the law in the face of the growing digital media in Uganda. It begins with a summary of Uganda's digital media terrain which helps the chapter to raise an argument of numbers in relation to relevance and external pressure, as forces behind digital media regulation. The background introduces the gist of the chapter, which is the regulation of Uganda's media in the digital age. A recent court case in Uganda, in which a local singer was sentenced to one year in jail along with her video producer, who was convicted for producing a pornographic music video that was distributed online, inspires this chapter. Didi Mugisha pleaded guilty and became the first victim of the Anti-Pornography Act, which was signed into law in 2014. Beyond that court drama and the international fame it garnered are some serious concerns. First is the relationship between the bulk of Uganda's media laws and the existing producer/consumer digital platforms, and secondly are the broad implications the current state of affairs of that and similar laws has on the freedom of expression.

INTRODUCTION

The chapter therefore reviews the above landmark case in Uganda's digital content production and the Anti-Pornography Act (2014), which was used to charge the two artistes, to present the contradictions that are apparent between the application of the digital technology, which is premised on the freedom of expression argument, and the protection of other freedoms and rights. The Neo-liberal understanding of globalization technology and the Neo-Marxist counter-views are used to ground the analysis into global scholarship. Furthermore, international and regional instruments which protect free expression and their stand on both the limitations and the regulation of the same freedom are used to strengthen the argument.

Indecent and pornographic clauses are not new in Uganda's media law history. In fact government takes a pragmatic view on the issue, arguing that media should exercise their freedom with responsibility.

DOI: 10.4018/978-1-5225-3822-6.ch050

In 2004 for example, an FM radio station, Radio Simba, was fined $1,000 by the Broadcasting Council and ordered to make a public apology (BBC, 2004) for hosting homosexuals on a show, contrary to the Penal Code Act. Debates about freedom of expression and laws among traditional media have been around for quite some time. But the way media laws are designed in the face of digital media, how they relate with freedom of expression and the implications of that regulation for new media, has received little attention.

The other crucial issue that the chapter addresses, apart from attempting to cover the above gap, is whether or not media literacy extends to digital content producers. Article 19 of the Universal Declaration of Human Rights, assumes 'equal access to channels of communication' (Nassanga, 2009). After getting access, people should actively utilise the resource of information. Media literacy, or the "ability of individuals to analyze and evaluate media critically and to express themselves, producing social communication in a variety of forms"(Nassanga, 2009), has been advanced as an idea for media consumers mostly. What about the producers, especially the digital content producers, who may also act as the distributers? Using that background, issues of digital media literacy for local entertainment content producers, who are mesmerized by the free digital distribution channels, are highlighted in this chapter as well.

THE DIGITAL MEDIA FORM

The "digital revolution" is made important by the fact that it uses the web as a centre stage for voice, picture and text media that previously were mutually exclusive (Verweij, 2009, p. 75). That kind of convergence has been hailed for its production capacity that is massive, for its interactivity, for defying distance over time, and for its individualization of producers and consumers (McQuail, 2010). In the pre-digital era, the video described above would have to be through a major state/private TV/film company regulated by government. The new dawn of digital media has ushered in the "convergence of citizenship and journalism" (Berger, 2011, p. 708) and created possibilities for alternative content production such as the ones used to produce the music video that this chapter analyses.The advances in mobile phones are pushing the internet possibilities further by introducing a smartphone (Weiss, 2013) which has lessened the regular visits to internet cafes. Nevertheless, issues of the digital divide cannot be neglected when discussing the digital revolution especially in Africa, a region that remains the world's under-penetrated with subscriber growth standing at 12% (GSMA, 2015).

Regardless, "mobiles have been the platform for a uniquely massive and multidimensional enhancement of capabilities in developing countries" (Smith, Spence, & Rashid, 2011, p. 77) and "people turn to their mobile phones to get news and information and to be entertained" (Wei, 2008, p. 37). In Uganda specifically, there are 17 million people now having access to mobile phones (UCC, 2015). The number of people using smart phones in Uganda is not yet recorded but studies done on ICT and media in rural areas indicate that 1.6 percent use the phone to access the internet for various purposes (Semujju, 2013; 2016). The African internet picture is picking up too with one in five people using the internet (ITU, 2015). In Uganda, there are 6 million people with access to the internet (UCC, 2015) of the total population of 35 million people (UBOS, 2015). Mobile phones have been instrumental in promoting Uganda's digital revolution. In relation to this chapter, whether or not the current laws provide for content that is produced (and consumed) online using gadgets like the mobile phone, computer, and others, is crucial.

LOCATING THE PROBLEM IN THEORY: GLOBALISATION THEORIES

The internet is a global technology, one that is responsible for speeding up the process of globalisation in the area of media content, regulation and form. This creates necessity for this chapter to apply theories of globalisation to explain various understandings of digital media regulation. Regulation in the digital age can be theoretically explained using the globalisation theories of neo-liberalism, neo-Marxism and traditionalists theories (Servaes and Lie, 2003; Banda, 2006).

The neo-liberals include the content producers and consumers who see the internet as an invention that will help them to circumnavigate the authoritarian rule that puts undemocratic inscriptions on the enjoyment of fundamental rights. Due to the creation of "consumer-citizens" (Lemmens, 2015) or "prosumers" meaning producers who are also consumers (Rennie, 2007), the internet is a liberation tool against despotism or any despotic form of rule or, in this case, countries' communication commissions that go from regulation to control, draconian laws that criminalise the enjoyment of fundamental freedom (like the Anti-Pornography Act) and other government mechanisms. The technical aspects of digitalization and multimedia help to promote the pervasive and ubiquitous nature of the neoliberal interests (Kaul, 2011). However, despite the promise of globalisation to bypass the local political will, media policy-making is still influenced by national and political factors (Ndlela, 2007). In more progressive economies, content platforms like YouTube can be blocked as the 2009 case in China was (Antony and Thomas, 2010). As for the video that is discussed in Uganda's case, since the conviction of Mugisha and the imprisonment of Kansiime, the song that got them into trouble, is still on line. In the traditional media sense, if there was someone convicted, the radio or TV would be ordered to remove the content or risk being switched off. This happened to four radio stations in 2009 which were switched off-air for, as the government noted, 'hosting opposition' (Lumu, 2010).

On the other hand, the argument by the neo-Marxists is an argument of access at its least but inherent in it are the various economic, political and other interests (Banda, 2006). Issues like the digital divide come into play here. Out of the 35 million people in the country, although it is not known how many watched the video within the boundaries of Uganda, the video has 18,819 views. Even if one assumes that all these were Ugandans, it is not enough to say that the internet facilitates information access to Ugandans. The neo-Marxists therefore see no reason to be excited since the new media are just continuing to facilitate information access to people who can already afford to have information. On top of that, only those who understand computer knowledge and those who have a stable internet connection (or those who can pay for one) will be the only people to upload (or to comment on) information. In the end, they control both production and consumption processes and rather than liberating people, they enslave them (Verbeek, 2015; Lemmens, 2015). The digital revolution in addition, either introduces a new set of owners like the search engine giants or consolidates power to the previous owners like Rupert Murdoch who owns MySpace (Beckett, 2010). The majority are held hostage by those few people who happen to be those who have financial and literacy power. It is their information that millions and millions of people are consuming, which reinforces their domination.

The Traditionalists worry about the potential of "the new" or of globalisation to alter the status quo and disrupt the power of established order (Servaes and Lie, 2003; Banda, 2006). We would theoretically put the ideas behind the Anti-Pornography Act under the arguments raised by the traditionalists. The law could have been raised by people who thought it was necessary to preserve the cultural heritage or norms that relate to some music genre. Traditionally for example, among the Baganda, one of the 52 tribes in Uganda, when a couple bears twins, there should be a function thereafter where attendees hull

obscenities to the couple while the couple fires back. In fact, the couple is expected to shout the most explicit of all the words. Normally, the function takes place in the absence of children and at night. Between random shouting of obscenities, there are pornographic songs that have even more vulgar lyrics, passed on from generation to another. It is the way things are done traditionally. The digital media, like the internet, gets this tradition out in the open without regard for children or the rules of engagement. Additionally, the traditionalists worry about the globalisation of culture (Kraidy, 2002), especially at their own cultures' expense. While the traditionalists may enjoy trans-border data flow, they worry about other influences of globalisation like cultural imperialism (Jan, 2009). However, instead of undermining cultures, globalisation technology and economics create ways for new media setting to emerge, although weak cultures might be eroded in the process (Wang, 2008).

UGANDA

To be able to contextualise the arguments presented in the coming part, the background of the country talked about in the chapter is important. Uganda is located in East Africa. It is the twenty-first poorest country globally (Global Finance, 2013), a factor that is crucial in understanding the realities talked about in this chapter. The World Bank (2014) notes that Uganda is a low-income country (LIC) with a gross domestic product (GDP) per capita of US$506 and an economy growing at the rate of 5.2 percent. While agriculture employs 66 percent of the working population, jobs advertised in the public service decreased from 80 percent in 2010 to 49 percent in 2011(UBOS, 2015). That put employment in civil service to 275,149 jobs in 2011.The country's population stands at 35.4 million people (UBOS, 2015). Forty nine percent of that population is below 14 years of age. Although life expectancy is 53 years, the infant mortality rate is 76 per 1,000 live births. The maternal mortality ratio stands at 438 deaths per 100,000 births (Ministry of Health Maternal and Perinatal Death Review Uganda, 2013). The literacy levels on the other hand stand at 79 percent for men and 66 percent for women (UBOS, 2015).

THE MEDIA LEGAL REGIME

Uganda has a constitution that was made in 1995. It provides for freedom of expression and freedom of the press in article 29 which states that

Every person shall have the right to-

1. Freedom of speech and expression, which shall include freedom of the press and other media.

The constitutional guarantee above is supported by two international agreements on freedom of expression: the Universal Declaration of Human Rights (UDHR) article 19, and the International Covenant on Civil and Political Rights (ICCPR) article 10. On top of these, several regional covenants like the Johannesburg Principles, the African Commission on Human and People's Rights, and others, reemphasise the need for free expression.

Regardless of such a group of guarantees, freedom of expression is not absolute and so there is a legitimate (constitutional) limitation to the freedom. Article 43 (1) states that:

… no person shall prejudice the fundamental or other human rights and freedoms of others or the public interest.

The limitation cannot block free expression unless under 'demonstrably justifiable' circumstances. This has been a challenge to the Ugandan government in relation to freedom of association where the police's blocking of demonstrations sparks off violence.

But to safeguard freedom of expression, the constitution, article 43(c) has a limitation on the above limitation which regulates how article 43 should work. The other article that is important in the constitution is article 2 which states that "the constitution is the supreme law of Uganda and shall have binding force on all authorities and persons throughout Uganda." Since there are laws outside the constitution that affect freedom of expression, article 2 helps to regulate their impact on freedom of expression. Some of the limitations are found in the two principle laws that govern the press and broadcasting sectors. For example, the Press and Journalist Act (1995), limits people from practicing journalism (Section 15) by demanding a university degree from reporters and editors. This section violates Article 29 above which grants free expression for all, if you consider the fact that media are just a conduit of expression. The Press and Journalist Act, which regulates print, was condemned right before it was signed into law, in 1992, when journalists met in a conference in Kampala and declared it (then bill) "ill conceived, superfluous, dictatorial, draconian, obnoxious, and that it curtailed freedom of expression" (Okello, 2009). There is also the Uganda Communications Commission Act (2013) designed for broadcasting and new media. However, the criminal provisions for media are found in several laws some of which include: the Penal Code Act (1950), the Anti-Terrorism Act (2002) and the Anti-Pornography Act (2014), which concerns this paper.

The Penal Code Act for example still maintains Section 37 (Publication of Information Prejudicial to National Security), Section 51 (Inciting Violence) and Section 100 (Contempt of Court). The Anti-Terrorism Act (2002) on the other hand was intended to spy on people the Government suspects of terrorism by tapping into their phone calls. Journalists have sometimes been accused of collaboration in that regard like former *Monitor* news editor Wanyama Wangah, and Andrew Mwenda, a journalist, who survived a jail sentence or death penalty under that law. While it blocks coverage of conflict and conflict resolutions, it also hampers media from covering stories of the opposition (Okello, 2009). The current digital revolution makes it necessary for the regulators to create laws for the digital life. Among such laws that were made with online content in mind is the Anti-Pornography Act (2014).

THE ANTI-PORNOGRAPHY ACT

The Anti-Pornography Act defines pornography as "*any representation, through publication, exhibition, cinematography, indecent show, information technology or by whatever means, of a person engaged in real or stimulated explicit sexual activities or any representation of the sexual parts of a person for primarily sexual excitement*". Additionally, the Act mentions the internet as a possible distribution channel of pornographic material. Among the ideas noted in this chapter will be whether by publishing pornographic material online, the content producers fit within the realm of freedom of expression or they are just ignorant of the current legal and policy trends relating to the platforms that they use.The gist of this law is the section that prohibits and another that states the consequences of the prohibited action. Section13 (1)states: *"A person shall not produce, traffic in, publish, broadcast, procure, import, export,*

sell or abet any form of pornography." Section 13 (2)notes: *"A person who produces or participates in the production of, or traffics in, publishes, broadcasts, procures, imports, exports or in any way abets pornography*, *contrary to subsection (1) commits an offence and is liable, on conviction, to a fine not exceeding five hundred currency points or imprisonment not exceeding ten years or both."*

The first part of the Act interprets the terms used. The Act states that *"Internet-content-developer" means a person, individual or corporate, who produces and uploads or causes to be uploaded on the internet, any matter.* The Act also notes that "traffic" means to deal in or cause or permit or aid the provision or circulation of pornographic matter by way of trade or publishing or entertainment or programming or unrestricted internet access or any access or any other means or purpose. Section 17 too mentions "internet service providers".

THE LANDMARK CASE

On October 30, 2014, Jemimah Kansiime aka Panadol W'abasajja (stage name literally translating into Men's painkiller) and her manager Didi March Muchwa Mugisha, were arrested in Kampala and taken to court. The first defendant, Kansiime is a local singer while the second defendant, Mugisha, is an audio and video producer. The prosecution alleged that the two defendants trafficked and abetted pornography by making a pornographic music video called *Nkulinze* (Am waiting for you) and posting it on the internet, contrary to the anti-pornography law (Wesaka, 2014). If convicted, Kansiime faced 10 years in jail while Mugisha would go for four years. Mugisha pleaded guilty and apologised for his involvement, noting that he did not know that he was committing a crime. He was fined 10 currency points ($75) and released that day. Kansiime did not plead guilty and was remanded to prison pending another trial the following month. By entering a guilty plea, Mugisha was the first person to be convicted under the law that had been signed the same year.

There are two major implications of the above case on Uganda's media law scene: It implicitly exposes the relationship between the country's media laws and content producers while at the same time, it has implications on freedom of expression as guaranteed by the constitution. This chapter is concerned with whether or not the limitation on freedom of expression found in the above law (especially section 13) is consistent with article 43, which is the legitimate (constitutional) limitation on freedom of expression. The conditions set by the legitimate limitation on freedom of expression (article 43) are that "*…no person shall prejudice the fundamental or other human rights and freedoms of others or the public interest.*"

Posting a pornographic video does not prejudice the fundamental or other human rights. If anything, the act contributes to ways in which citizens can "seek, receive and impart" information, as protected by article 29 of the Ugandan constitution. However, it is in public interest to make sure that morals of different cultures are protected, alongside the protection of minors from accessing illicit sexual content (Edick, 1998), as the intention has been for countries that make laws to regulate indecent content (Saul, 2015). But inherent in the above good intentions is the freedom to enjoy or to produce content as a constitutional right. The above law protects children and family values at the expense of that constitutional right and this is done by banning the production and distribution of content which is the same as banning content itself.

The constitution (article 43c) still guides that public interest should not be used to allow *"Any limitation of the enjoyment of the rights and freedoms prescribed by this chapter beyond what is acceptable and demonstrably justifiable in a free and democratic society"*. There are two other problems created by

article 43 (c) that the Anti-Pornography Act does not answer. One is of what is acceptable and what is not. The other is of whether or not the limitation in the act is not beyond what is "demonstrably justifiable". Putting a ban on content is to go "beyond what is acceptable" in relation to the principles of "free and democratic" life. It limits both the freedoms of personal and public expression (Sturges, 2006) and gives credence to the fact that most of the nation-states that created bills of rights after the end of the cold war with influence from liberalism have laws that are "mere window dressing" instead of protecting the rights they claim to protect (Keith, 2002, p. 112).

When the constitution was made, TVs, radios and newspapers dominated the media arena and any information through them would reach to millions. There was pornographic content then with measures to make sure that it did not make it on TV or radio at a time when children were supposed to be awake. Apart from culture and beliefs helping to create self-censorship in media where content with nudity lost support among certain age groups, such content was broadcast at a certain time of the night when children were in bed, for example after 10pm (Baliboola, 2015). Additionally, warnings were given before that content, which was mostly in western movies, was aired. Regardless, the TV station still chose a movie with less explicit sexual content or blacked out some scenes that were deemed to be excessively sexual as the conditions for licensing were (Otto, 2013). This is how the balance was reached between the fundamental right of expression and the protection of minors and morals.

For a law to be truly helpful, the conditions set in article 43 and 43c have to be met. But, we must also consider the view that the constitution was created to regulate freedom of expression as it was understood in 1995. More than 25 years later, a lot has changed, especially with the emergence of the internet. These new changes and challenges have to be met without foregoing the fundamental freedoms. The internet is a multimedia (Lehman-Wilzig and Cohen-Avigdor, 2004) global network of computers (Dominick, 1996). In such a complex global system that promotes global lifestyles, only a network as complex as the internet can help us claim our global positions (Qvortrup, 2006). Undemocratic interference in content distribution means denying Ugandans freedom of expression in the global village.

In other jurisdictions, for example in Europe and America, restrictions tend to allow a certain level of enjoyment based on an understanding that opportunities and risks go hand in hand (Livingstone, 2011). In the United States, pornography or obscenity as the court held in *Roth v. UnitedStates* (1957) is not a right protected by the law. However, the enjoyment is still provided for. In relation to pornography online, the 1996 Communications Decency Act stipulates that content distributers online should protect minors by " requiring use of a verified credit card, debit account, adult access code, or adult personal identification number" (Edick, 1998, p. 447). Under those restrictions, children who access the internet should never have access to indecent material. In the UK, the 2014 amendment of the Communications Act specifies certain actions within pornographic material that should never be acceptable for children's consumption like "strangulation, facesitting and fisting" (Saul, 2014), on top of including a rating sign on content that should not be watched by persons under 18 years.

OTHER CRITICAL ISSUES ARISING FROM THE CASE

The landmark case above also raises issues of media literacy on the side of the audience and the producers of media content in Uganda. Mugisha told the court that he did not know he was breaking the law, and yet the Penal Code Act (section 166), which was repealed by the coming of the new law, prohibited trafficking obscene publications. The Penal Code Act had been active way before Mugisha started his

music journey. Being a music producer, he ought to know the law that regulates what he does. In an interview done for this chapter, Mugisha actually admitted that he advised the singer to make the video. He did not think even for a second that he would end up having trouble with the law. He also argued that "in a country that is still bound by cultural norms, the acceptability of certain things nude is still low compared to the West and this influences our ways of life, including laws" (D.M. Mugisha, personal communication, February 2, 2016).

The singer too was oblivious of the fact that she would be taken to court and even remanded for a video of herself dancing nude. According to Mugisha, the singer, Kansiime, is a sex worker and a friend, who too did not know about the legal implications of the video. Mugisha tended to mean by that statement that most sex workers in Uganda are girls who did not get a lot of education and even if some of them did get an education, without a special attention to the law, they would never know such details. What the court did not know (perhaps) is that Kansiime had not been singing for a long time. In fact Mugisha noted in the interview that Kansiime was not known in Uganda before the video. She was not a fulltime singer before the song in question. Mugisha, on the other hand, was a household name in Uganda's music production for having started off artists who are now superstars in the country, including one Eddy Kenzo, who recently won an American BET award.

Most importantly, the law criminalises speech and expression to an extent that artistes' creativity can be limited, which is a form of self-censorship. This is in addition to losing one's licence as Mugisha lost his. He survived going to jail, paid a fine but has no work because of the revocation of his licence. The law should have been designed in a way that someone pays a fine instead of both a fine and a prison as it states currently. Most importantly, speech and expression transgressions should be treated as a civil matter.

The media are known for their educational, informational and entertainment functions. The law provides for educational and informational purposes but does not do the same for entertainment. What about the adults who may want to watch pornography for entertainment? Should there be a special curved-off virtual space where such explicit content is enjoyed? What qualities should such a place have? Or most importantly, how could the law provide for such space? These questions are answered by the examples from the UK and US above where specific extremes are banned but not content in its entirety and provisions are made to limit children from accessing such content since the internet is a global medium. Internet service providers should make sure that they put the above procedures in place to comply with the law. Currently, by not providing for all those options, the law implies that watching a music video that is pornographic for entertainment is completely illegal.

CONCLUSION

This chapter made an analysis of Uganda's media laws in the digital era and revisited the Anti-Pornography Act that was enacted in 2014. The Chapter questioned the law's ability to respect freedom of expression, a right that is guaranteed by the Ugandan constitution, using some clauses that prohibit the distribution of pornography. In addition, the landmark case, in which the law was first applied where a music video producer and a singer were charged, is cited. The chapter concluded that by protecting both morality and the minors, the law takes away the right to free expression and this makes the law inconsistent with the legitimate limitation of freedom of expression. The chapter used examples of regulation of indecent material in other jurisdictions like the UK and the US to suggest that the best law could focus on prohibiting the excesses of adult content and also specify exactly the circumstances under which an

adult person seeking such adult content for entertainment can access or make the same content. Some of the major challenges pointed at include lack of digital media literacy by the relevant stakeholders in Uganda, especially the content producers, and the fact that the current law against pornography creates self-censorship, something that stifles creativity.

Chapter 51
The Benefits of New Online (Digital) Technologies on Business:
Understanding the Impact of Digital on Different Aspects of the Business

Farhan Shaikh
IIT Bombay, India

ABSTRACT

This chapter explores how digital technologies are impacting the businesses – challenging the industry leaders while enabling entrepreneurs to do so. The overall findings have been bucketed under three broad sections – Customer Experience, Process Optimization, and Business Innovation. The Customer Experience section captures the way companies are using the data from digital technologies to enhance the way they interact with the customers. The section on Process Optimization highlights the significant improvements achieved by using digital technologies for existing business processes. Business Innovation captures the transformation power of digital, through new business models, business areas, and data monetization.

INTRODUCTION

Digital technologies have deeply impacted the way we live, deal, shop, travel, socialize, interact, choose, purchase and make other important decisions. They have enabled a large number of entrepreneurs to solve real world problems and in most of the cases – in real time. A majority of startups today have a digital gene giving them the flexibility of having an agile business model, which can be tweaked as per the requirements and needs of the market. For example, Uber operates as an aggregator in some regions but provides ride sharing facilities in others, to avoid legal hassles. It also provides services such as cargo delivery along with pick up and drop facility in some cities. In parallel, existing and established companies are investing in digital, either to optimize the existing business models or to create new ones

DOI: 10.4018/978-1-5225-3822-6.ch051

by lapping up the opportunities provided by the digital citizens of the world. To give an example from the travel industry, established car manufacturers like Ford are trying to establish themselves in peer to peer car sharing service industry, in some regions to battle stiff competition from purely digital startups like Uber and Lyft. Other than the new business models, digital also impacts the way companies reach out to their customers, understand what their customers are saying and what their needs are. Using digital platforms, companies can empower their employees to collaborate in real time, reach out to colleagues in different parts of the world and break the silos, which prevent innovation. Digitalized processes also mean increased efficiency, new data points for optimized calibration and most importantly – increased profitability. As Gartner predicts, by 2018, digital business will require 50% fewer business process workers and 500% more key digital business jobs, compared with traditional models.

Also, once thriving industry leaders such as Blockbuster, Kodak and Borders that couldn't adapt to the digital shift by providing any alternatives to the market, no longer exist.

Every business speaks about being digital or going digital; however, very few convey what they actually mean by it. Is it about the digital marketing and online presence, is it just the use of social media to reach out to customers or is it about using cloud or about applying the science of analytics to understand their customers better – the definition is wide open. That exactly explains how it positively impacts multiple aspects of business, internally as well as externally.

Digital is less of a 'thing' and more 'a way of doing things'. It is the strategy that drives digital, not the technology. Digital is orchestrated through technologies like social media, analytics, cloud and big data. It is demonstrated in the ease of usage, connectedness of customer and business resources, multi-channel experience, end-to-end integration, facilitation of storage for dissemination of data and information; and policies such as BYOD (Bring Your Own Device) which have led to consumerization of IT. Gartner defines consumerization as, "the specific impact that consumer-originated technologies can have on enterprises. It reflects how enterprises will be affected by, and can take advantage of, new technologies and models that originate and develop in the consumer space, rather than in the enterprise IT sector." Digital technologies are reaching the maturity stage with introduction of wearables, virtual reality, drones, video analytics and connected devices.

Digital helps companies understand their customer in ways not known earlier, in proper context of information and location, to provide a delightful experience, at different touch-points on every single occasion. It enables companies to engage their employees and empower them with the right tools to connect on a platform where they can provide quicker solutions by going breaking the silos. Digital also allows the company to keep their business models agile, have a faster go to market strategy, reach out to larger customer base and at the same time, have real time feedback. It helps companies hear what their customers are saying across multiple platforms about their existing brands, react and take measures to keep a check on their sentiments, or to nurture a new brand with which customers can relate to. It helps companies to generate revenues from new streams, supported by digital technologies

Need for Digital

An average employee uses much more advanced digital tools and applications at home than in office. Population in technologically mature markets like UK and US have lead the digital adoption with mobile penetration as high as 138% and 112% respectively, while Germany leads globally with 141% share. Similarly, mobile penetration in emerging markets has grown 321% compared to 46% in developed

countries in 2002. Globally, the number of smartphones is expected to increase from 2 billion in 2014 to almost 5 billion in 2019. In today's time, a smartphone has more computational power than what a computer had just a few years back. This has increased the consumption on mobile devices. Out of 890 million daily active users, 745 million access Facebook from mobile. Similarly, Twitter just crossed 302 million Average Monthly Active Users (MAUs) for the first quarter of 2015, up 18% year-over-year and compared to 288 million in the previous quarter and approximately 80% of total users logged in through mobile. Google searches on mobile devices now outnumber those on personal computers in 10 countries, including America and Japan.

The need for digital is further expected to increase as Millennials have started joining the work force. Millennials, as demography are those who were born between 1980 and 2000. They are also known as digital natives, given their ease at leveraging digital technologies for personal as well as professional use. Millennials represent the largest demographic group in history and by 2025; they are expected to comprise almost 75% of the workforce that is expected to have a tremendous impact on the entire business landscape. Their affinity for technology means they prefer to interact and work for those companies, which offer maximum convenience through the use of digital technologies. They want the information to be available to them with complete ease, as and when required by them.

This has made companies change the way they function and they have started adopting digital technologies such as cloud, social media and internet of things. According to forecasts by Forrester, cloud computing will increase from approximately $41 billion this year to more than $240 billion in 2020. Gartner reports that there would be 25 billion things connected over internet, by 2020, clocking in close to $2 trillion of economic benefit globally. All of these will have a great impact on the economy by transforming many enterprises into digital businesses and facilitating new business models, improving efficiency and new sources of revenue.

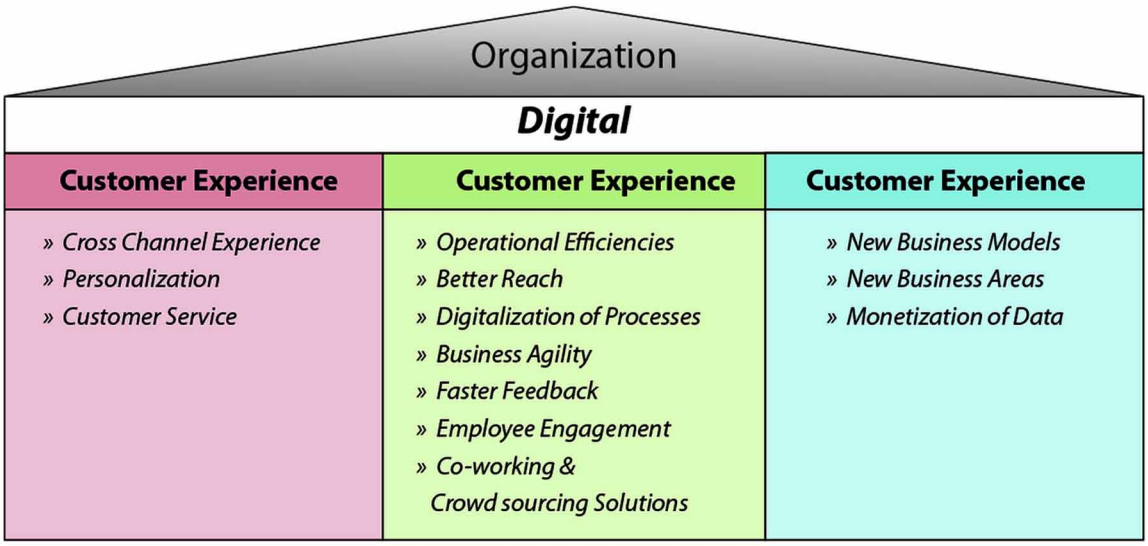
And digital also means profit. An in depth research undertaken by Capgemini Consulting along with MIT Center for Digital Business in 2012, surveying over 400 major global companies worldwide, reveals that digital leaders outperform industry competitors on multiple financial metrics. They generate, on average, 9% more revenues through their existing assets; outperform their peers by 26% in terms of profitability; and achieve significantly higher (12%) market valuations.

Impact of Digital

By and large, majority of practitioners equate social with digital. While social is an important subset of digital, digital goes much beyond that. Most of the large scale companies were already working with standard technologies as per their business requirements such as ERP, CRM, PLM and CAD systems. However, with the introduction of digital tools, the way companies were working has changed drastically as it has connected machines, employees and customers together through big data, analytics, social media, mobility and cloud. While initially these technologies were being used to support the existing systems within the company, the digital tools are now driving business forward, creating new opportunities and revenue models. Briefly, there are three aspects to how digital impacts businesses – Customer Experience, Process Optimization and Business Innovation.

Companies which are digitally mature are focused on integrating their different digital initiatives to transform their business, while the less mature ones are focusing on solving discrete business problems using individual technologies.

Figure 1. Impact of digital on business



Customer Experience

Digital has changed the way companies deal with customers. From the demand side, the customer expectations have witnessed a sea change. Customers now expect personalized experience at all the touch points – offline as well as online. They expect companies to be aware of their likes, dislikes and preferences. With rise in emerging technologies customers now expect services to be available on demand, at the pull of the customer, while being more relevant and responsive. Similarly, customers are now active users of social media and mobile penetration has been huge. Buying decisions are made on the move and the customer journey has evolved to become complex as customers keep use a mix of mobile, social media and store before completing a purchase. There has been a 'mobile mind shift' in customers and they now expect to get what they want in their immediate context and moments of need.

In most of the industries, the competition has been so intense, that it has reduced the scope for traditional product and service advantages. With rapid technological evolution and innovation, the products across segments have moved towards commoditization, making customer experience the new battlefield. In the digital age, innovation in customer experience thus becomes the most strategically important aspect for value creation and is proving to be the only truly durable competitive advantage. According to Gartner, by 2016, 89% of companies expect to compete mostly on the basis of customer experience and by 2017, 50% of consumer product investments will be redirected to customer experience innovations.

Cross Channel Experience

Digital has lead to complex customer journeys with customers using multiple channels to connect with the companies. Engagement on digital channels like social media, web and mobile means companies need to be forever listening and be available for the customers. Digital technologies have empowered customers to compare prices, specifications and features on the go, before making the purchase decision. This has resulted into customers using mobile devices within the store to make the final decision and

often moving out of the funnel before reaching the purchase stage. Initially when there were store-only retailers and pure ecommerce players, many retailers suffered from the concept of 'showrooming' – where customers would research about the product online, walk in to the stores for checking it out physically and then end the purchase journey by ordering it online at a discounted price. As ecommerce players adopted the mobile first strategy, the 'showrooming' actually increased significantly as customers would check the product in the store and directly order it online from ecommerce players, even while being at the store itself.

Burberry uses multiple digital channels to ensure a perfectly orchestrated cross channel experience for all its customers. Using digital channels, Burberry brings its brands to life within the store premises. Sales personnel within the stores are equipped with iPads, which provides customers access to the entire global collection, irrespective of their availability in the store. On the other hand, 60% of its customers complete the purchase journey online but prefer collecting their products offline, from the stores.

Burberry also uses digital technologies to enhance the multimedia experience within the stores. Whenever a customer approaches a clothing item, the RFID system gets activated which shows the details about the clothing item on the display. Customers can also place their products on RFID platforms which project the same products on the large display. Mirrors double as audio-visual displays that show footage from run-way shows while the fitting rooms have screens which show specific product information such as a bag's stitching detail or how a skirt was worn on the catwalk. Thus the overall experience, across offline and online channels, remains seamless, creating a memorable experience for customers while increasing satisfaction and minimizing annoyances.

Similarly, pure ecommerce players are looking at ways to provide a platform where customers can physically experience the products to counter the growing phenomenon of 'reverse showrooming'. 'Reverse showrooming', also known as 'webrooming' is when customers browse, compare and finally choose the product online, but complete the purchase offline, in a store. The reasons for completing the purchase journey offline can be varied – from better customer service, to immediate ownership of the product, assurance of receiving a genuine product or even the level of trust in the local shopkeeper. Also, for most of the customers, there's no substitute for being able to see, touch and test a product in person before buying it.

However, many companies, especially retailers, have invested in uniform cross channel experience. As customers have started using multiple channels for shopping, the more channels they find a particular brand, the more they develop a familiarity with the product or service associated with the company and, ultimately, a loyalty towards the brand. It has positively contributed towards the revenues by ensuring brand loyalty and has helped companies to leverage 'showrooming' and 'webrooming' in their favor. Companies use data from customer's web presence and online behavior to personalize the experience offline, in the store. Similarly, companies are leveraging customer preferences disclosed and mapped in the stores to send relevant mailers, offers and newsletters to the customers – online, on social platforms as well on the mobile.

Digitalization is also enabling manufacturers to establish a more direct link with the consumers and manufacturers have already started leveraging it. They have also started using online marketing and advertising, in compared to their earlier traditional ways of reaching the customers. Significant numbers of manufacturers have started selling online, especially higher-margin products in high-growth markets. This has helped them with increased profitability (by recovering some of the margin given up to retailers) and has also empowered them to get valuable new insights as they engage in more direct relationships with their customers than they have ever had before.

Personalization

Personalization is a process that creates a relevant, individualized interaction between two parties designed to enhance the experience of the recipient. It uses insight based on the recipient's personal data, as well as behavioral data about the actions of similar individuals, to deliver an experience that meets specific needs and preferences. – Gartner (n. d.)

Industrialization enabled companies to manufacture at scale, thereby reducing costs, while allowing them to maintain high standards in quality. Henry Ford took the industry by storm using mass production for his Fords Motor Company using assembly line method for producing just one car – in one single color, black. Over a period of time, they got displaced in the market by General Motors which understood and celebrated the existence of different customer segments which had different expectations from the same product – car. More number of companies started realizing the importance of segmentation and they tried categorizing customers using different parameters. With evolution of computers and databases, companies were able to reach out to customers directly and store structured information about them. Similarly, more processing power empowered companies to generate better insights using data mining, artificial intelligence and clustering analysis.

With the advent of digital technologies, the customer touch points increased significantly, giving companies an opportunity to have a more holistic view of the customer. Mobile and digital channels not only provide details such as real time location, in app behavior, on site preferences, but also empower companies to understand the relevance, context and customer sentiment at given point in time along with their purchase intention and aspirations. The segmentation has thus evolved from the simple geographic segmentation to the more advanced and technology dependent behavior-based segmentation (Oliviera-Brochado & Martins, 2008). Integration of structured data from enterprise systems and CRM along with the unstructured data from digital channels is helping companies create better personas of their potential customers.

Caesars Entertainment, one of the world's largest gaming and entertainment companies, has personalized the entire experience – right from booking till the actual stay in the hotel. Company starts with collating customer details from the vast amounts of transactional, demographic and gameplay data through its loyalty program for creating a detailed profile for each of the customers. It also provides the customers with mobile check in facilities and uses their mobile data for sending location based offers. The mobile app of the company helps customers to track their loyalty points and to check where they can use those points. The app is also the first point of contact for any concierge and room services, which helps the company in understanding individual behavior to personalize the experience accordingly. Even the wait staff uses mobile app for ordering drinks to reduce the time for reaching the counter. As company uses multiple data points, it is well aware about customer's experience even at the table and it tries to personalize the experience accordingly – so a player with big losses gets freebies such as food and extra night accommodation—that can ease the pain of the losing, without affecting the gaming for anyone else.

All these can lead to more sales per customer, higher retention and greater profitability. It has also helped companies to identify where the next marketing investment should be made and while ensuring higher return on investment by implementing behavior-based segmentation and personalization (Tsai & Chiu, 2004). According to Gartner (n. d.), by 2018, organizations that have fully invested in all types

of personalization will outsell companies that have not by more than 30%. Companies are leveraging this data to envision new products and services, and ways to bundle and price them in different markets and categories. Almost 20% of durable goods "e-tailers" are expected to use 3D printing for creating personalized product offerings by the year 2017.

Large organizations which value the growth of their employees are exploring data generated from digital training channels to personalize the learning through programs which are paced according to individual's capabilities to grasp and use the knowledge imparted through such programs. With digital technology being available for instructional data and tools for analyzing, such data points that help understand immediate and larger context are increasing the adoption of personalized and adaptive learning.

Customer Service

Customer service involves engaging with customers for a variety of reasons – it could be before purchase to answer any queries and concerns, it can also be for handling post purchase issues and eventually for up sell based on the existing purchase. For any of which reasons, customer service is generally expected to be pain-free, proactive at minimum and preemptive at best. Company needs to value the customer's time spent during the engagement and needs to ensure maximum productivity. For customer focused companies, customer service has been one of the key pillars on which the brand has been built over a period of time through exceptional service record.

BMW launched ConnectedDrive technology that serves as an in-car navigation system with mobile components. It also offers a wide range of intelligent services and apps that provide customers with all the relevant information and entertainment during their journey. BMW car come with SIM card and basic telematic features along with facilities such as BMW Teleservices, BMW Breakdown Call, TeleService Battery Guard and Intelligent Emergency Call (Motoring, 2014)

BMW Teleservices keeps the driver and the preferred dealer informed of the car's condition – and notifies them if there's any need for a service. Driver can use BMW Breakdown Call using the iDrive menu and relay the vehicle's functional state and location to a technician for roadside assistance. The system will also provide vehicle's driver with further information to connect with technician. TeleService Battery Guard automatically updates the vehicle's owner of unexpected deterioration of the battery, sending the information by text or email, according to the preference selected in the iDrive menu. Intelligent Emergency Call contacts a call centre in the event of a crash and provides details of the severity and circumstances of the crash. Customers can also book other optional services and applications such as Concierge Services, Internet or Real Time Traffic Information. The car is connected to Google and can be used to locate best restaurants in town along with recommendations from BMW Online (Motoring, 2014).

The digital technologies have redefined the times to be called the age of the customer. With everything expected to be at the pull of the customer, companies don't decide how customer centric they are, but the customers do. The social, mobile and big data have changed the customer expectations from companies they have to deal with. Also, providing good customer service is a win-win situation for both - the customers as well as the company. Great customer service makes customer more loyal and loyal customers are less likely to switch companies as they will prefer considering purchase from the same company. As the company's efforts to establish loyalty increases, customers are also more likely to recommend the company to friends and colleagues, thus establishing advocacy for the brand. In digital age, customers expect their questions to be answered in real time, with painless and minimum service interactions, ir-

respective of their position in the purchase journey and across different channels. They get frustrated if they have to struggle for accessing customer services and they even drop off the purchase journey if the experience is unsatisfactory at any stage.

By 2020, the number of connected devices is expected to cross 50 billion. The kind of customer information companies will have will be unmatched and so will be the expectations of the customers. Companies will be in a position to be in forever listening mode of the connected devices. This will help them notify customers in advance, preemptively diagnose and fix small issues with minimal human intervention. The emerging digital technologies will thus change the face of customer service resulting into faster resolution at lower costs and extremely personalized engagements. It will also help companies to plan accordingly and anticipate future service requirements of their customers.

Process Optimization

While digital is largely associated with digital transformation and disruption, digital technologies are also being used to optimize the existing business processes. By leveraging digital technologies, companies are able to benchmark the repetitive processes against the standards or industry leaders and map the deviation, if any. It has even empowered companies to rectify the processes on the go with real time feedback. This has increased the overall operation efficiencies of the long established processes.

Some companies entirely transforming their existing business process to rethink it in terms of final output. This allows companies to break away from the business strategies that have been deemed redundant in the digital age. However, not all companies have the necessary mandate or will to change from the scratch. A lot many companies are using digital to enhance and optimize the prevailing business models by replacing some modules with digital technologies. Breaking larger processes in to small independent ones, which can be digitized without disrupting the overall system, is helping companies to increase efficiency. It has enabled companies to have faster access to information, which on processing in correct context, helps them to access accurate insights, almost in real time. It the companies are leveraging digital technologies like cloud; it also empowers them to have agile business models in place.

Operational Efficiencies

The kind of data provided by digital technologies is humungous and depending on the capabilities companies can use it to improve operational efficiencies of different business units. While some companies would like to focus on the supply chain aspect, others would be more interesting in looking how their marketing campaign is being received by different segments of the customers. For example, the financial organizations use data to reduce risk, improve fraud detection and to ensure complete compliance. Companies working with employees operating out of different locations, in different time zones are successfully leveraging digital technologies to run the processes in a more efficient manner, with a direct impact on the business outcomes – making it more profitable and customer friendly.

ABB Process Automation Service (USA) used different spreadsheets to manage approximately 300 field service engineers (FEs) managed through regional coordinators. The spreadsheets were used to aggregate data to streamline and improve processes which led to inefficient resource utilization. Therefore, the company invested in a new cloud based technology platform to run the service application. A service dispatch board was created to provide a consolidated view of all regional service requests. The

software allows the company to assign FEs based on skill set, availability, and geographic proximity. It also allows the customers choose FEs from a more distant region by paying an additional fee, depending on urgency. As a result of this, these services have become more responsive and have delivered improved uptime. The productivity applied by field engineers increased from 70-80% to a whopping 120%, post the deployment of cloud based application. The digital upgrade has also resulted in an improvement of customer satisfaction ratings from 79% to 84%. (Capgemini Consulting, 2014)

Better Reach

As digital captures every single interaction with customers, it helps companies to understand their customers better. Given the rate of adoption of digital technologies, customers are present at different channels, round the clock and are engaging with other customers and companies. As the number of digital technologies being used by customer increases, it gives companies new avenues to reach out to customers. The data generated from these touch points also helps companies to understand their target customers and tailor the communication accordingly, which helps in creating engaging conversation instead of blink-and-you-miss traditional channels.

Nike introduced Nike+ product range in 2006, consisting of a sports watch, a wrist band and a mobile phone running app. The products track wearer's location and their activity level throughout the day. The data is collected on a central platform that the athletes use to make training schedules, track sports achievements and share them with friends across multiple digital platforms. This service enables Nike to achieve strong customer engagement with all its existing customers. Over and above this, the digital platform also helps Nike to reach the customers in a direct manner for advertising its products while gathering valuable data about how customers use their products.

Companies are also using the digital reach for different business reasons. Industrial companies use the digital channels to convey the technological advancements and innovation to the end customers as well to inspire potential employees. Hotels and restaurants use different digital mediums such as Instagram and Vine to share pictures of new décor and dishes. Those employed in entertainment industry leverage these channels to share behind the stage scenes to create a special bonding with the users and these days it is also used to interact in real time through platforms like Google Hangout, Twitter and Facebook. Digital also makes it faster. Cloud enables companies to have a faster time-to-market at a pace, which could not be achieved using traditional data center, empowering companies to deliver results in a short span of time.

Digitalization of Processes

Digitalization of processes is one of the initial steps when companies set out for digital transformation. In such initiatives, companies start with introducing digital technologies to their existing business processes and workflows to replace manual and physical efforts, such as introducing mobile application instead of paper-pen entry work to capture data in digital form. This tremendously increases the velocity of business process and enables quicker decision making. While digitalization being about huge benefits to the organization, it is not transformational in nature as it simply improves the existing process, by and large following the same structure of implementation and governance.

The aviation industry commonly uses milling process to manufacture complex aviation parts. But milling produces large amounts of waste in the form of swarf. This makes prototyping complex, consuming more time for retailing and produces large amount of waste. Leveraging the new digital technologies GE adopted rapid prototyping approach using 3D printing for these parts. Instead of machining parts from solid billets of metal, only the material needed to shape that specific part is used. (Capgemini Consulting, 2014)

Digitalizing processes not only replaced paper and manual processes with software and digital technologies, but also allows businesses to automatically collect accurate data that can be analyzed to better understand process performance, cost drivers and causes of risk, if any. Further, it also enables companies to deliver real-time reports and dashboards on digital-process performance, empowering managers to address problems before they become critical in nature. According to a report released by McKinsey & Company in 2014, digitalizing information-intensive processes can help save costs by up to 90% and improve turnaround times by several orders of magnitude. It also helps companies in improving their bottom lines while delighting customers with faster, accurate and predictive processes.

Business Agility

Legacy systems, which earlier helped the companies to evolve as they became huge enterprises, have often posed a challenge to agile business strategy. Established process often followed top down approach with decisions taking forever to percolate to the ground where the real action takes place. With the expansion of businesses, companies got department oriented which created organizations working in multiple silos, further slowing down the strategic decision making process. While such a setup ensures cost benefits and business efficiency, demands of the customers have changed and they now expect agility and real time capabilities from companies they deal with.

Uber being a purely digital company is one of the most agile companies in the market. Its ecosystem consists of the back end system, which leverages big data and analytics, a driver willing to work as a partner using mobile application and the end customer that pays for these services. The technology helps Uber to modify its business model on the go – so in some countries it uses the ride sharing model while in others it offers carpooling services. This model helps Uber to provide other services such as UberCARGO for moving cargo in the city and UberRUSH, a document delivery service. Uber also uses analytics to understand the demand in a particular region and increases the price through its surge pricing program, where it offers higher fees to drivers to attract them in these particular areas, all in real time.

Digital technologies when integrated with the existing enterprise systems provide companies with a much needed agility to handle the new age connected customers. Deep social listening with advanced analytics and cloud-based infrastructure enable fast paced deployment of new products and services. They also offer the ability to quickly learn from and fix mistakes. The explosion in smartphones, tablets, wearable devices with internet-connected objects and mobile apps means that a company should have the ability to interact personally, directly and in real time with consumers and business partners. Companies need to move with great speed to meet evolving customer needs, adapt to market and deal with dynamic regulatory changes. Companies are investing in processes which are unstable in nature and can be adapted dynamically with changing customer demands. They are moving away from stable processes which are based on typical legacy systems having limited information about the customer to unstable and ever evolving ones which capture customer information on the go and adapt.

Faster Feedback

Before the advent of internet, companies would launch product and services, which would have a long curve of adoption. The cycle to gain some ground level feedback about the offering would therefore be much longer. In case of factory based production, companies would have to complete one cycle of quality check before flagging off mass production. With digital technologies, companies have redefined their feedback processes – in terms of manufacturing as well as customer feedback.

The digital processes create continuous cycle of improvement fed by continuous feedback during the manufacturing process. The entire process cycle fetches data from multitudes of sensors that monitor every move and feed those observations directly into predefined and tested models. As the feedback is in real time, the model itself can rectify the glitch or there is scope for manual intervention to make real time adjustments in the manufacturing process. Such digital processes also enable mass personalization of products as the interventions can be made in real time to customize products on the go.

BMW's prototype cars produce an average of 15,000 data points from the engine and transmission down to the suspension and brakes. Using big data analytics, BMW Group can detect and even fix vulnerabilities that show up during the manufacturing process. In absence of digital technologies, it would have taken months to analyze reach the actual root cause of the defect, if any. However, with digital, the entire process of error detection to correction can now happen in just days. Based on the data collected during the test drives and other processes, BMW can find faults and fix them before new cars go into full production. BMW Group is thus able to enhance customer satisfaction by producing higher quality cars through digital technologies as the feedback is quick and data can be mapped to the source easily (Motoring, 2014).

Digital process can also be leveraged to sense the feedback from the customers and make adjustments in the current manufacturing cycle without much effort. If the products are enabled with internet or if the customers are speaking about the product on digital channels, companies can leverage such data to do real time listening, analyze the cause and try to fix up in the next production batch itself. This helps companies to fail fast and reiterate at much faster rate. Some retailers have actually replaced the price marking with digital boards as it helps them fluctuate the pricing of the products in real time – based on the insights from the sales generated in the store at that very point of time. In a traditional ERP or CRM based system it would be difficult to leverage such real time feedback unless the systems are able to speak with the new digital technologies (Motoring, 2014).

Employee Engagement

Digital technologies have changed the way employees work in office. The concept of on duty hours and off duty hours has been impacted as digital allows employees do some of their personal work online during office hours and vice versa. Employees end up carrying doing thing – work or entertainment while being in office and often complete the task assigned to them from home. Depending on the maturity level of bring your own device (BYOD) policy in the office, employees have been provided with enough flexibilities to choose a device as per their own liking and consideration. While some companies limit this option to phones, some even allow employees to choose their work stations (computer and laptop). Social media has also helped to establish an employee-to-employee relationship, which often goes beyond the work.

Companies are now leveraging all these aspects to engage employees, which studies have proved, have a direct impact on productivity, efficiency and attrition rate of the company. The digital technologies have now empowered companies with data to design, asses and redesign their engagement activities in continuum. Some companies are using off the shelf digital tools such as Yammer and Chatter for providing a platform for employees to connect and share knowledge with each other, while some companies are investing in bespoke mobile applications which are hardwired according to the needs and functioning of the company.

The Cheesecake Factory, a well-known national chain of restaurants, gamified its operational training, to change training from a typical "operational training" process to a Disney-like gaming portal. Instead of notes and presentations, employees had to post videos of their experiences in solving common restaurant problems in dedicated digital platform called as Video Café. Other employees accessing this content had options to comment and rate it along with sharing their videos or blogs. The contributors with highest ratings are celebrated on a "leaderboard" and are presented with "slices" (for example, of cheesecake) for their contributions to the team (Engaming, 2012).

It also uses a mobile application to ensure that the employees know all the ingredients of their burgers. The Cheesecake factory launched a mobile app where employees actually "build the burger" on their iPhones, instead of practicing it offline. They have to increase the speed as they play further and after that a new burger recipe is introduced. Playing the game for quite a few times ensures that the employees remember all the important aspect about creating a perfect burger for their customers (Engaming, 2012).

Using gamification and analytics, companies are mapping the performance of individual employees against fixed parameters, while benchmarking them against colleagues to choose the leading players. These players are then awarded with points or rewards based on the company policy, which inspires other colleagues to join in as the engagement continues further. Companies are even using engagement activities to improve the health of their employees by tracking their calories and activity details using fitness bands which keep sending the data to the company. Such companies are utilizing the data to make informed decisions which help them save on insurance.

Co-Working, Collaboration, and Crowdsourcing Solutions

Digital tools have not only enabled companies to connect with their customers better, they also strengthened the intra company networks of employees like never before. Large of companies have invested in such digital tools which enables employees to connect with each other beyond the email. Cloud based collaboration tools have provided the connectivity on the go. They have eased communication and thus given a huge impetus to collaboration. This has helped companies to increase resource efficiency even for widely distributed teams.

Citi launched Citi Mobile Challenge to foster digital and mobile innovation in banking. Citi Mobile Challenge is a next-generation accelerator that combines a virtual hackathon with an incubator, a worldwide network of FinTech experts and Citi's unparalleled global sponsors and clients to discover solutions across more than 100 markets. It invites developers from around the world to help build innovative solutions based on the Citi digital platform. Citi opens up a variety of APIs from the bank and other leading financial and technology companies to help developers create real-world innovations that could function with existing Citi technology. This helps Citi to reach beyond its own employees, crowd sourcing innovation from the global community of developers on its digital platforms. (PwC, 2015)

In 2014, Citi brought 60 finalists to Silicon Valley, New York City and Miami to present their ideas to a panel of judges who could decide whether these were innovations that could benefit its clients. The finalists competed for an opportunity to take their idea to production, a share of $100,000 and other services to help get some of their ideas off the ground. Citi is currently working on several top innovations from this competition to launch pilot solutions for consumer and business clients in various markets. (PwC, 2015)

Companywide collaboration has sped up innovation and development processes as the digital tools are being used to support idea generation. Bringing multiple stake holders from different geographies on one single platform, virtually together, has further reduced the turnaround time of an idea to get implemented in the organization.

Business Innovation

As more number of companies are embracing digital technologies and deepening the engagement with the customers, they are generating piles of data which is often left unused. However, few companies understand the importance of this data and are investing in technologies which will help them innovate and to create new sources of revenues. While some companies are using data to create new business models, which are premium because of the nature of information they carry, others are trying to monetize this trove of data by either selling it in the raw format or by processing it to deliver in on demand – as a service. Entrepreneurs are leveraging digital technological advancements to create platforms where users can share and offer underutilized resources in creative ways. Most of such companies are growing rapidly across the globe, entering new markets, without having to invest in any resources other than technology. Being asset-light makes these companies agile and they are able to transform the business strategy as per the needs and demands of the market.

New Business Models

Digital technologies have helped connect people in ways which were not thought of earlier. Companies have created dedicated platforms where users having a common need, can directly get in touch with other users and can share, barter, buy or loan products and services, without having to deal with any middlemen in the entire process. Such platforms have paved the way for the new sharing economy, also known as peer to peer economy, which encourages collaborative consumption. The sharing economy is an emerging economic-technological phenomenon that is fueled by developments in digital technology, growing consumer awareness, proliferation of collaborative web communities as well as social commerce/sharing (Botsman & Rogers, 2010; Kaplan & Haenlein, 2010; Wang & Zhang, 2012). The potential sustainability benefits associated with such sharing economies are thus interesting from an organizational and environmental perspective, particularly in the context of the increasing urbanization many countries experience today.

According to MetroMile, 70% of American car owners overpay for insurance because they drive much less than rest who actually drive more. The insurance is then designed in a manner that those who drive less often end up paying the same amount as those who drive much more, creating a steady balance for the insurance companies. With digital, companies can now access data directly from the vehicles – be it the distance covered in the car or the way it was driven, using details about the fuel consumed. Me-

troMile has thus started distributing a Metronome device that plugs onto the dashboard of the car and capture such detailed information in real time. These details are also available to the customers on their mobile through a dedicated app which information such as miles per gallon, time spent behind the wheel and other weekly statistics. MetroMile uses this data to provide a personalized deductible and liability options along with the pay by mile alternative (Constantine, 2014).

The kind of data being available to companies is helping them to define new business models as well. With internet of things, companies are able to analyze the performance of anything and everything, which has internet enabled on it. From cars to patients, from tennis racket to sports car, all objects which transmit data on regular basis can be optimized to perform better or prevented from failure by timely intervention. These scenarios have encouraged existing companies and entrepreneurs alike, to establish business models which would have not been possible without digital technologies. As per the predictions from Gartner, by 2017, a significant and disruptive digital business will be launched that was conceived by a computer algorithm.

New Business Areas

Companies which adopted digital technologies early on, started accumulating data in large quantities, which when processed right, provides insights about costs, profits, operations, supply chain and even the end customer behavior. The early adopters are leveraging data to disrupt the markets and are threatening the traditional value propositions of their respective industries. Similarly, such companies are challenging the competitors in adjacent industries as well, while they are being themselves getting threatened by the digitally agile startups.

GE resolved to expand its business into the software and analytics domain in 2011 and since then it has developed and introduced nearly 40 software products under its "Predictivity" brand. It started embedding sensors to all the machines for capturing their performance data. The data is then analyzed for providing real time information which helps in improving machine efficiency. It also helps clients to prevent downtime and enables them to effectively schedule preventive maintenance. The company has also introduced a wide range of big data products which predictive software products, a Hadoop-based big data software for ingesting and managing industrial data. GE has partnered with Amazon Web Services to share industrial data in public cloud.

GE expects the revenues from 'Predictivity' solutions to reach $5 billion by 2017.

Companies are redefining their value propositions and unique selling points, based on the new data. For example, an automobile company which records detailed data of the connected car for providing efficient customer service will know the driving habit and risk attached with the driver more than anyone else. Such an automobile company is thus, in a much better position to offer personalized and robust insurance offerings than traditional insurance companies. Similarly, social media companies, with magnitude of data about the customers, is much better equipped to provide feedback about the newly launched product or service than a dedicated market research company. Digital companies which not only capture such diversified data, but also have the processing power, are challenging the traditional players in horizontal industries.

Monetization of Data

For data rich digital companies, data is the new product, which they either directly sell to other organizations or process it and sell it as a service. As data reflects the customer preferences, patterns and behaviors, a company from one industry can benefit from using data of another company from a different industry altogether. This kind of data actually allows companies to understand customers from a more holistic point of view. For example, data from telecom companies is helpful for retailers to deliver real time location based marketing. Similarly, data collected from automobile companies can help insurance companies bundle their packages in a more personalized manner where every customer pays according to his driving habits.

Vodafone Netherland wanted to monetize the mobile data it had of its customers. However, Dutch Telecom law restricts telecom companies from using customer-generated personal data for non-revenue assurance purposes, since the personal data is also stored in non-anonymized form within the same company. So Vodafone partnered with Mezuro and started supplying crowd analytics to the public sector. Mobile phone data is sold by Vodafone in anonymized and aggregated form to Mezuro. Mezuro further accesses data from companies specializing in camera-based person counting systems (ViNotion) in order to provide high-level estimates of crowd density, mobility and footfall. With the combined network and video-count data, Mezuro is able answer questions related to city marketing, event safety and traffic density. Because Vodafone provides network data around the clock, Mezuro can offer its customers trend analyses, such as the effects of weather or changing shopping hours on footfall in a city district. Thus, mobile network data is used for crowd analytics without endangering the privacy of Vodafone's own customers, while it earns a share of Mezuro's revenues billed by processing the data further for the end clients.

FUTURE TRENDS

Digital technologies have the capability to revolutionize the way industries have been operating, but companies are finding it challenging to leverage it completely. While some companies have successfully implemented digital for driving down costs, improve efficiency, very few have used it to create new revenue streams and business models. Companies will need a deep shift, more than technological; it has to be strategically and culturally driven for being digital in truest sense. Since 2000, 52% of the companies in the Fortune 500 have either gone bankrupt, been acquired, ceased to exist, or dropped out of the Fortune 500. With data being the new oil, or gold, as some thought leaders call it to be, companies with such data will be the new leaders across different industries. Companies which are aware and accept the new data based economy will adapt and continue to flourish.

According to Forbes, by 2018, 35% of IT resources will be spent to support the creation of new digital revenue streams and by 2020 almost 50% of IT budgets will be tied to digital transformation initiatives. Digital will also transform the way companies chose their IT partners to implement strategies in action. Bank of America, for example, is working to leverage Facebook's Open Compute project, which applies the principles of open source software to hardware, and is expected to have a major tech overhaul by 2018. Standard IT organizations are expected to spend 30% of its budget on risk, security and compliance by 2017 while allocating 10% of IT staff to these functions.

Companies are working on innovation centres where they can attempt and fail faster to in order to understand the impact of emerging technologies on different aspects of the business. These centres, working as startups within the organization, are working closely with entrepreneurs and venture capitalists to bank upon the next wave of digital technologies. Another example can be of Bitcoin, a type of digital currency in which encryption techniques are used to regulate the generation of units of currency and verify the transfer of funds, operating independently of a central bank, which is now being accepted for transactions by larger corporations such as Target and Amazon. Companies, such as Tesla, are also a sneak view of how digital transformation could be manifested in hardware, on the roads. Not only the cars from Tesla have been truly digital in nature, they have also upped the customer experience expectations, and with its frequent software upgrades, it has revolutionized the way cars would be treated in the future.

Artificial intelligence is also expected to drive the wave of digital transformation. After Apple's Siri and Microsoft's Cortana, even Facebook is leveraging artificial intelligence and has launched virtual assistant, M. This wave of digital transformation initiatives will shift focus from gathering and mining data to creating new models and algorithms that augment existing work activities and support consumers when they shop, trade, and make decisions in real time. Similarly, government agencies will also be more open to leverage such technologies either by adoption or through strategic partnerships with startups to improve the efficiency of governance. Altamonte Springs, just outside of Orlando, has adopted Uber as its public transport and partially subsidized fares, paying 20% of the total fare, starting or ending within the city. It also provides a twenty 25% waiver for rides to and from the local railway station.

However, according to research by Arthur D. Little, eight out of ten companies are lagging behind when it comes to digitalization. Most of the leading companies are being reactive, rather than proactive, with lack of knowledge and sense of urgency, being the biggest obstacles. While every industry is trying to respond to the digital disruption, automotive industry seems to be leading the pack followed by telecom and media industry. The energy and utilities industry comes a close third, but the travel & transport along with EPC & manufacturing industry appear to be the slowest in chasing up with digitalization. Overall, Accenture estimates that digital technologies in the world's top 10 economies can add a combined $1.36 trillion to their GDP in 2020 – more and more companies are digitalizing their operations.

As more companies embrace digital transformation, across different industries, the future looks exciting!

Chapter 52
Impact of Interactive Multimedia in E-Learning Technologies:
Role of Multimedia in E-Learning

Aditya Khamparia
Lovely Professional University, India

Babita Pandey
Lovely Professional University, India

ABSTRACT

Multimedia-based technologies have significant impact on our daily life learning activities as they have shifted the education from teacher centered to learner centered. E-learning provides opportunities to people to take course online and provide a virtual classroom environment on the web through teacher learner interactions, course material distribution based on interactive multimedia. Interactive multimedia offers learners different forms of media to match their learning style, provides personalization of adaptive content delivery which enhanced learners learning effectiveness. In this chapter, we have discussed how information quality can be improved by multimedia based authoring tools and approaches, also identified the negative and positive effects of using interactive multimedia for learners in E-learning. Finally, focus was given on current E-learning multimedia technologies, their research challenges and future trends on social networking based technologies.

INTRODUCTION

E-learning is one of the important fields of research in education. The purpose of E-learning is to automate education. Various authors agreed on different definition for E-learning. (Ghaleb, 2006) defined an E-learning as a means of education that incorporate self-motivation, communication, efficiency, and technology. (Rosenberg, 2000) defined an E-learning as use of internet technologies to deliver a broad array of solutions that enhance knowledge and performance. It is concerned with use of computer and advance technology to support learning and transfer knowledge to learners by guiding them from basic to advanced concepts in particular domain, as it allows learner to learn anytime, anywhere through

DOI: 10.4018/978-1-5225-3822-6.ch052

various process including web based learning, computer based learning, virtual classrooms and digital collaboration. E-learning is suited to distance based and flexible learning, but also suited in conventional based learning where blended learning plays a major role. In higher educational institutes there is a need to create Virtual Learning Environment (VLE) which combined strategic and tactical planning with management information system to create a managed learning environment with help of consistent user interface as a standard throughout the organization. With the rapid deployment of growing number of universities, as well as newer online-only colleges, have begun to offer a select set of academic degree and certificate programs via the Internet at a wide range of levels and in a wide range of disciplines. Most of the orientation sessions require student to attend classroom sessions or many are delivered completely online. Most of the educational institutes offer online student portal services such as online counseling, advising, online purchasing of text books, e-distance learning, e-newspaper for student through various multimedia modes such as telephonic system, caller Id, video conferencing etc.

E-learning technologies are designed to support learning by encompassing a range of media, tools and environments. With an invention of web based and E-learning technologies the education methodology has been shifted from traditional classroom teaching to virtual or blended learning. Multimedia technologies facilitate the presentation of adaptive learning materials in different forms. These enrichments are effective in delivering personalized learning material, effective learning content to learners based on their preferences, skills and learning characteristics. An important characteristic of E-learning is to provide interactivity with help of interactive multimedia. Interactive multimedia facilitates collaborative creation through project-based learning that provides opportunities for authentic collaboration (Mishra & Ramesh, 2005). Lot of media types like collaborative networking technologies, game-based learning has been developed to enhance learner learning effectiveness and experience.

Knowledge management (KM) and E-learning are recognized as self-contained disciplines as they deals with knowledge capture, sharing, application and generation; contribute to building a continuous E-learning culture and can be decomposed into various learning objects. The major goal of E-learning and knowledge management is to promote learning and knowledge transfer. There are several theoretical approaches for connecting both disciplines. They are described in literature as KM and E-learning integration models (Maier 2016; Schmidt 2005; Islam and Kunifiji 2011; Woelk and Agrawal 2002; Sivakumar 2006; Mason 2013; Ungaretti and Webb 2011). To develop practically applicable integration solution for specific organization it is necessary to understand these integration approaches.

PROBLEM STATEMENT

How to promote learning and transfer of knowledge to different e-learning systems with interactive usage of different multimedia based applications.

OBJECTIVES OF STUDY

The objectives or aims of this chapter is

- To analyze current practices and latest trends in E-learning industry regarding the use of interactive &emerging multimedia technologies as a learning tool.

- To establish relationship between knowledge management and E-learning with respect to various integration models.
- To analyses how the quality of E-learning can be improved by effective multimedia learning tools.
- To identify the positive and negative effects of using interactive multimedia in E-learning as they relate to both learners and developers.

LITERATURE REVIEW

Semantic web is used in E-learning systems for different purposes such as: to control the acquired knowledge of learner, to generate learning path sequence, to developing course material on basis of e-resource content available on web and storing and retrieving the learning material. Various types of interactive e-learning system have been developed on basis of interactive multimedia. The effectiveness of Intelligent Tutoring System (ITS) and Adaptive Hypermedia System (AHS) for multimedia content delivery analyzed by adaptive learning.

Learners ability can be characterized on basis of learners Visual, Auditory or Kinesthetic ability to absorb and process the information. Visual learning is based on gathering information from visual media i.e. charts, diagrams, maps, slides etc. Auditory learning comprise of listening lectures, discussions etc. and kinesthetic is based on practical experience. Activity theory is applicable to E-learning and interactive multimedia which states that learners use interactive multimedia as tool to interact with the world to achieve their goals in work place (Benson & Whitworth, 2007).

Interactive multimedia promotes motivation, which accelerates learning and provides manipulative experiences which are unavailable in regular classroom environment (Aldrich, 2005; Jackson, 2007).

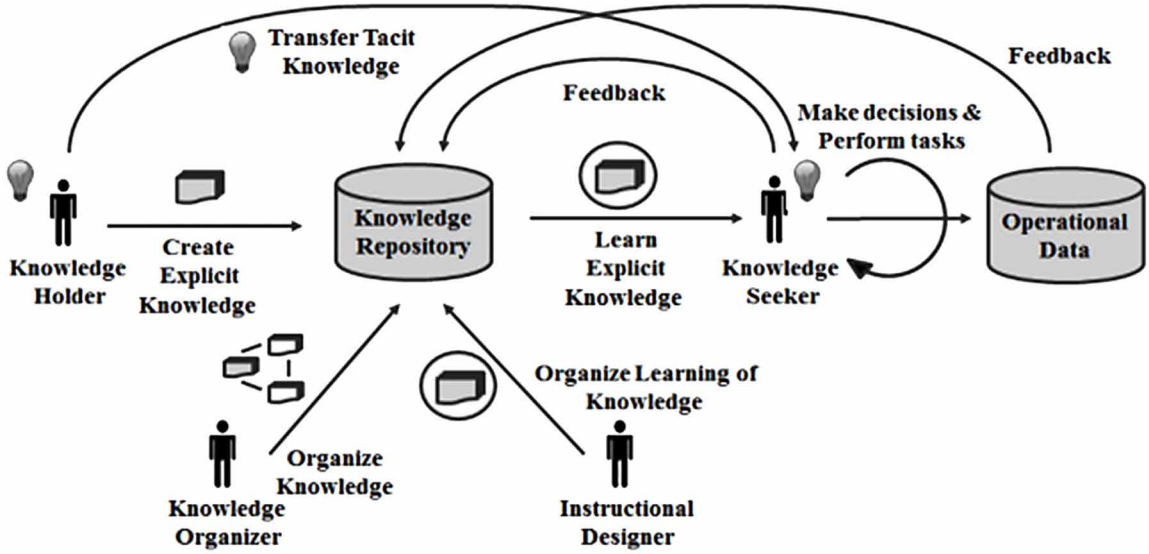
A platform called eMUSE has been developed based on social media and integrated learning environment for collaborative learning which integrates learner tracking functionality, visualization feature and evaluation system support (Popescu, 2012).

There are various approaches to train learners like game based, digital-modeling based learning. Some researchers investigates how lower level students get trained and learned by modeling skills in mathematics through a multiplayer based online game (Araya et al., 2013). A system called DigiMina developed for self and peer assessment of instructors digital competencies based on performance indicators (Poldeja et al., 2012). Interactive multimedia identified path sequences for different activities of learners based on GUI and supports a hybrid recommendation system to recommend learning items based on discovery or filtering and identification of common learning sequence approach during the learning process.

In order to establish the relationship between knowledge management and E-learning some integration models has been suggested by various researchers.

Woelk's and Agarwal's (2013) model helps to understand the E-learning and KM technology integration capabilities with the aim to capture, organize, and deliver traditional courses and large bodies of knowledge. Knowledge management can be analyzed for understanding the role of knowledge management life cycle and the knowledge flow in the organization. Model is based on Nonaka and Takenuchi SECI model (1995) of knowledge conversion with four phases - socialization, externalization, combination and internalization 16. Two more phases are added to SECI model - cognition and feedback. For each of the knowledge management phase e-learning technologies are providing their own improvements. Knowledge management phases with e-Learning enhancements are shown in Figure 1. Knowledge Holder can create explicit knowledge and store it in a knowledge repository or transfer his tacit knowledge to

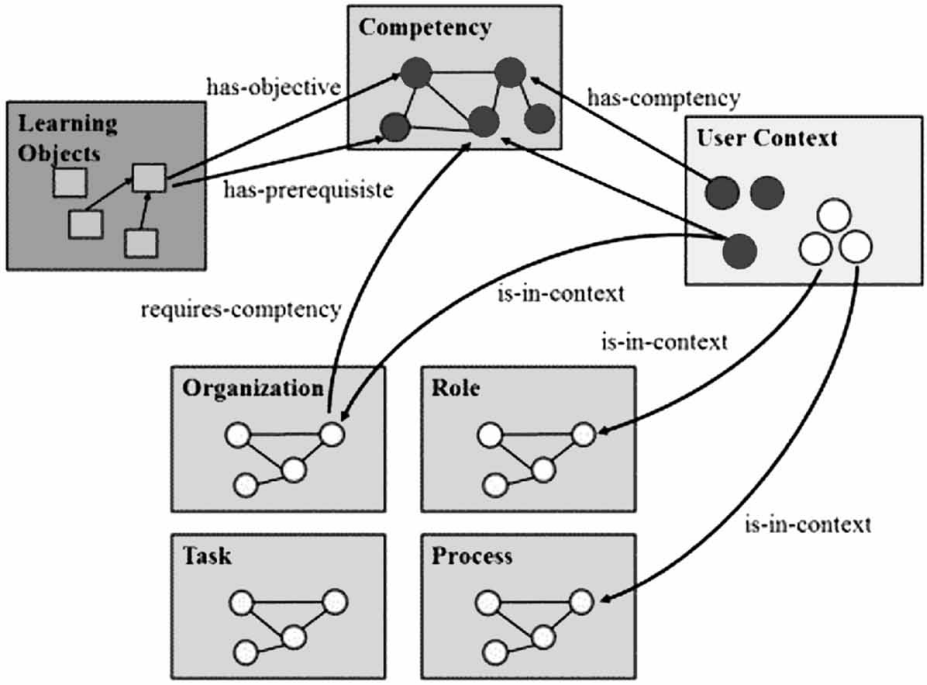
Figure 1. Knowledge management with E-learning enhancements



Knowledge Seeker through socialization. The Knowledge Organizer and Instructional Designer are persons or software programs. The Knowledge Organizer is responsible for linking knowledge bodies or other improvements. The Instructional Designer is responsible for preparing knowledge for learning needs by adding assessments and assignments. The Knowledge Seeker gains the explicit knowledge by selecting them from knowledge repository. The Knowledge Seeker uses his knowledge to make decisions and perform tasks. Work performance of knowledge seeker can be measured and returned to knowledge repository as feedback.

Schmidt (2005) believes that both knowledge management and e-learning solves a fundamental problem – encourages learning in organization. However, for the solution of the problem two different paradigms are used that lead to two different types of system use. Reason of the isolation is explained by the lack of attention to the context of employees involved in learning. For practical usage, the employee's context can be described by the personal (current competencies, objectives, desired interactivity), organization (department, role, business processes) and technical specifications (operating system, applications, bandwidth). Learning objects are bind with the user's context using competences from competency catalog (see Figure 2). Competences and individual context are linked directly (as the existing competences and future planned) and indirectly (by linking the organization contextual elements with the competency requirements). Learning objects are described by their objectives (which are described as competencies that are acquired as a result of successful training) and prerequisites (which describe the competencies needed for successful learning). This model demonstrates KM and E-learning integration by using user/learner context as connecting platform. Both KM and E-learning are seen as equally important disciplines. Model has been implemented in some prototype environments and shows relatively high user acceptance. Evaluation of this model shows that this blend of e-learning and knowledge management functionality can help to improve workplace learning. For practical implementation, organization must support general user context management services to deal with user context acquisition and management tasks.

Figure 2. Relationship between Context and Learning resources



The main interest of Sivakumar (2006) research is the dissemination of knowledge in the organization and how this may be improved with specially adapted e-learning system. For different types of knowledge (tacit and explicit) dissemination it is necessary to choose the appropriate technology, the pedagogical method, the type of communication, interaction and learning styles. E-learning environment development in organization must comply with the three aspects of the design - a technical solution, communication and interaction between the organization and design of training. For each of these aspects certain pedagogical approaches and learning styles need to be selected in accordance with organization's needs and knowledge types. In order to effectively meet the needs of geographically distributed employees, e-learning system providers should provide support for all four Nonaka and Takenuchi SECI model knowledge conversion phases. They also need to adjust the e-course content, teaching methods, architecture and training delivery methods used in their systems. In accordance of this model, integrated e-learning system design framework for knowledge dissemination in the organization must: Promote close interaction between staff, using synchronous and asynchronous communication; Incorporate pedagogical approaches that encourage active, collaborative, self-paced e-learning for explicit-tacit (explicit) knowledge conversion; Implement effective online mentoring forms for tacit-tacit (explicit) knowledge conversion; Integrate existing employee communication channels to organize practitioners, experts and mentors communications.

Maier un Schmidt (2013) propose integration of E-learning and KM on the basis of a process that explicitly aims at designing the transitions of knowledge along varying degrees of maturity. The authors indicated the following barriers to the successful integration of E-learning and KM: Different fundamental approaches. E-learning is rooted in psychology, didactic and pedagogy, emphasizing importance of structured and personal guidance. In turn, knowledge management focuses on the organization's memory

or knowledge base, where individual's knowledge must be transferred and made explicit; Fragmented ICT environment. Organizations use a wide range of systems to improve the knowledge and learning processes. Employees are working in fragmented environment and each system provides only a certain part of the learning and knowledge processes; Fragmented organizational structure. Knowledge and learning processes are distributed among the organization's departments, such as human resources, e-learning, knowledge, innovation, and quality control departments. However, disciplines are using knowledge bodies with different levels of maturity. Maier and Schmidt offered the use of knowledge maturation process as a conceptual framework for organizations to undertake necessary integration processes. Knowledge maturation process is presented as a conceptual model to analyze and explain the disruptions in the organization-individual knowledge flow.

Mason (2013) proposed InterCog sense-making model (ISMM) for analysis and understanding common areas of e-learning and knowledge management. The model can be used to create a strategic approach for planning, development, implementation and use of e-learning standards. This may be achieved by describing e-learning and knowledge management common "problem area" with very general and simple concepts. The main emphasis is placed on interrelationship of learning, knowledge and thinking.

In accordance with personalized learning model proposed by Irfan & Shaikh (2008) e-learning can take place via either explicit or tacit knowledge. Islam & Kunifuji (2011) offers to increase efficiency of e-learning systems by supplementing personalized learning model with knowledge management knowledge conversion methods to convert tacit knowledge to explicit. This approach is described as a theoretical model for knowledge management adoption for e-learning system. Term "adoption" here is understood as the application of certain techniques, i.e. conversion tacit knowledge into explicit knowledge. In the KM an E-learning adoption model knowledge creation, acquisition, evaluation and feedback are displayed as tacit knowledge with corresponding conversion to explicit knowledge. On the other part, knowledge organization, storage, dissemination and retrieval is shown as explicit knowledge, which can be converted to tacit knowledge.

Ungaretti and Tillberg-Webb (2011) suppose that knowledge management and e-learning are important components of learning allowing integration of both disciplines. Learning may be common ground where KM and EL distinct theoretical approaches can be combined and complement each other. For this goal Dynamic learning system (DLS) model is proposed by combining three components – knowledge management, e-learning and assurance of learning

(AoL). Assurance of learning is described as systemic, intentional process that identifies desired learning and provides a process to measure its achievement and the improvement of both the learning and the process to attain it. AoL is also known as learning outcomes assessment, assessment, the outcomes assessment movement, assessing student learning, assurance of learning. Assurance relates to systemic and multidimensional nature of process – it is not limited to assessment of learning results. Dynamic learning system model is composed from common elements of knowledge management, e-learning and assurance of learning value chains, divided into four groups/ phases: Institutional-level analysis and goal setting; Individual/ group-level needs analysis; Knowledge/ learning design and distribution and Knowledge/ learning increase measurements and analysis.

Each of these three disciplines has their primary goals. KM is focused on organization-level knowledge formed by individuals. EL main aspect is individual learners while considering impact on whole organization. Assurance of learning is focused on achieving certain business goals aligning this with data management, externalization of tacit knowledge, individual learning with explicit knowledge, etc. Together they allow the organization to develop a systemic approach to knowledge and learning. Important

part of DLS is evaluation that measures impact to organization produced by KM and EL. In this phase, learning outcomes are analyzed in the level of learning program or organization. Results may suggest improvements for learning system. In that way closed organization's development circle is formed. Main targets of KM systems are on what tacit and explicit knowledge is and how it will be managed: created, organized, shared, preserved, gathered, captured, etc.

Various researchers have identified different models for KM and E-learning integration in the analysed literature as shown in Figure 3.

Analysis of these models showed usage of both approaches – integration (both disciplines are seen as equal) and adoption (approaches and techniques when one discipline is used to enhance other). Adoption approach was used in both directions – EL techniques may be applied in KM and KM approaches may be used to enhance e-learning. Integration approach is looking for common ground of knowledge management and e-learning. Several authors identified learning as a common ground, however they proposed to use additional component (like context, knowledge maturity level and assurance of learning) for integration of KM and EL. Dynamic learning system model is best example to base integration on learning as common ground. However, assurance of learning is approach specific to academic environment and it may be problematic to implement it in business environment.

ANALYSIS OF SEMANTIC WEB AND ITS KNOWLEDGE BASED SERVICES

The semantic web is the future generation of web comprises of set of language and standards. It is the extension of the current web, in which information is given well-defined meaning, better enabling computer and people to work in cooperation. The basic aim of semantic web is to create a layer on web that enables automatic processing of dynamic web content so that data can be shared and processed by

Figure 3. Comparison of KM and E-learning integrated models

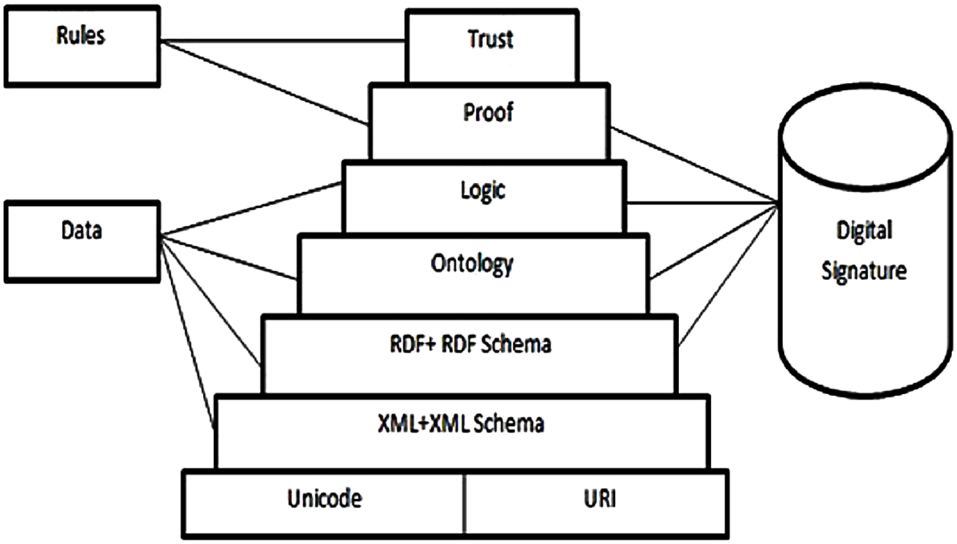
Nr.	Author	Integration model	Practically applied	Description
1.	Woelk, Agarwal	KM and EL technology integration model	Partly	Theoretical model; KM enhanced with EL technologies; Applied to some real world scenarios; Lack applicability support.
2.	Schmidt	KM and EL integration using context-aware corporate learning	Yes	Practical model; KM and EL integration based on user context; Implemented in prototype environment; Need applicability support for generic user context management functionality.
3.	Sivakumar	An integrated EL system-design framework for knowledge dissemination	No	Theoretical model; EL system development based on knowledge type conversion; Lack importance and criticality assessments for system design factors. Need further elaboration and validation.
4.	Maier, Schmidt	Knowledge maturing conceptual process model for integrating EL and KM	No	Theoretical model; KM and EL integration based on knowledge maturity process; Need further applicability support, elaboration and validation.
5.	Mason	InterCog sense-making model	No	Theoretical model; KM and EL integration by adding dimension of knowing; Need applicability support.
6.	Islam, Kunifuji	KM and EL adoption model	No	Theoretical model; Adopt KM approaches to EL to enhance EL performance; Need applicability support, verification and testing.
7.	Ungaretti, Tillberg-Webb	Dynamic learnings system model	No	Theoretical model; KM and EL integration by adding assurance of learning; Need applicability support, elaboration and validation.

both humans and software. Semantic web technology will facilitate the intelligent search, structural and semantic definition of documents, query answering instead of information retrieval and provide customize view to documents via ontology mappings with help of its customized architecture.

Architecture of Semantic Web

The semantic web architecture comprised of seven layers. It has been developed step by step with each step building a layer on top of others. A layer in layered semantic web architecture as shown in Figure 4 follows the principle of downward compatibility and upward partial understanding. The first layer is URI (Uniform Resource Identifier) and Unicode, the URI is uniquely identifier used to identify the resources. Unicode is standard of encoding international character set and allows all human centric languages to be used on the web. The second layer includes XML (Extensible Mark-up Language) that can be used to write structured web documents with user defined vocabulary. An XML document contains element that can be nested and may have attribute and content. The next layer is composed of RDF (Resource Description Framework) to describe the resource and RDF Schema (RDF-S). The next layer is Ontology vocabulary representing more powerful ontology languages for domain knowledge representation and relationship between web objects. The logic layer represents the further enhancement of ontology languages to allow the writing of application specific declarative languages. The actual deductive process as well as representation of proofs in web language from lower layer and proof validation is involved in next layer. From use of digital signatures and other kind of recommended knowledge or rating of trusted agent and certification agencies, the trust layer is emerged. SWRL (Semantic Web Rule Language) is an extension of OWL that supports Horn rules. It is combination of both OWL-DL and OWL-Lite in which OWL-DL descriptions are used in both head and body of rule.

Figure 4. Description about Semantic web Architecture



Functions of Web Services for Knowledge Management

Web services are a kind of framework for creating services for users over the World Wide Web. Web Services consists of three functions: publishing, finding and binding. The service provider describes all the details necessary to interact with service, provide message format that based on standards and formal XML notations with help of Web Service Description Language (WSDL). Then provider publishes the web service with a service registry using a standard called Universal Description Discovery and Integration (UDDI). The semantic web adds annotations to web service description to facilitate operations like service discovery, publishing, selection, composition, invocation, monitoring and ontology management (Cabral, Domingue, 2004). Different types of operations utilize different functionalities of web services.

Semantic web services are self-sufficient, reliable, supports software reusability which can be used to fulfill a particular task.

Service discovery locates appropriate web services needed to fulfill a given request. Service features include inputs and outputs of the service and also the precondition for running the service and effects of running the service on world. Precondition and input features should be satisfied before service invocation and effect and output features will be satisfied after service invocation. Semantic service discovery can be performed in different ways depending on the service description language, means of service selection and coordination between separate entities. UDDI is a mechanism for recording and discovering web services. It permits how services interact with each other. A web service discovery process can be carried out in three ways; first step is the advertisement on the web, Services by developers, in second step web service is requested by user through some repository, the final step is to select and invocation of retrieved web services. Discovery of Web service mainly depends on how user requirements can be interpreted and how they are matched with available services. Discovery enables flexible matchmaking between service descriptor and requests by using descriptor logics which preferred DAML and OIL languages. Peer to Peer systems support decentralized discovery in which web services are indexed based on the keywords being described. Discovery framework covers the entire task from service mediation, selection and considered as best matchmaker to service invocation.

Service publishing will allow agents or application to discover services based on its goals and capabilities. Service selection is required if there is more than one service matching the request. Non-functional attributes like cost or quality can be used for choosing a service. In agent type of interaction a negotiation process can be started between a requester and provider but for them the service must themselves be knowledge based. Selection of services is based on quality of services, adaptation of context, matchmaking, ontology prediction and agent system. Various types of filtering and different models with specific languages like XSLT, DAML-S and SOAP preferred by several authors to achieve QoS and related parameters. Client requests for service which is selected by service selectors from a repository of services where different web services are stored. After getting feedback from client, repository of non-functional parameters analyzed with desired web services and stored them back in Service repository for better and efficient selection of services. A response arrived to the service requester to invoke client if desired query feedback is solved on the basis of QoS.

Service composition is required when a single service is not able to produce the desired result for user, so this operation composes atomic services to create a new composite service to fulfill the desired needs. Service composition life cycle involves following phases to improve end to end service composition. It includes specification, planning, validation, discovery, execution and monitoring. Service provider proposes web services to use; service requester consumes information or service offered by a service

provider. The translator converts or translates the outward language used by participants, and internal languages used by service generator. If more than one plan found validated validates and evaluates all plans and proposes the best plan for execution. The execution engine executes the plan and returns the result of the service provider. The necessity of composition is to provide validated web service to use on the basis of service specifications mentioned by them. Different web engines are required to execute user requests. Only the translator predicts the internal service specifications and provides to the user as the result in xml or rdf formats.

The purpose of service invocation is to validate the input against the ontology type and invoke the service on basis of required parameters. Service matchmaking takes the form of matching appropriate web services based on syntax and semantic matching. In syntactic matching textual comparison or presence of keyword in the text is matched with known information, whereas in semantic matching relationship between the elements is matched with structured data. Use scenarios like prototyping and composition matchmaking allow searching for services on demand. Various matchmaking approaches like SHADE and FIPA operate over logic based structured text language like open-math and XML. Various matching algorithms are adopted in the context of semantic web services like syntax and ontological match, an algebraic equivalence match, value substitution match and decomposition.

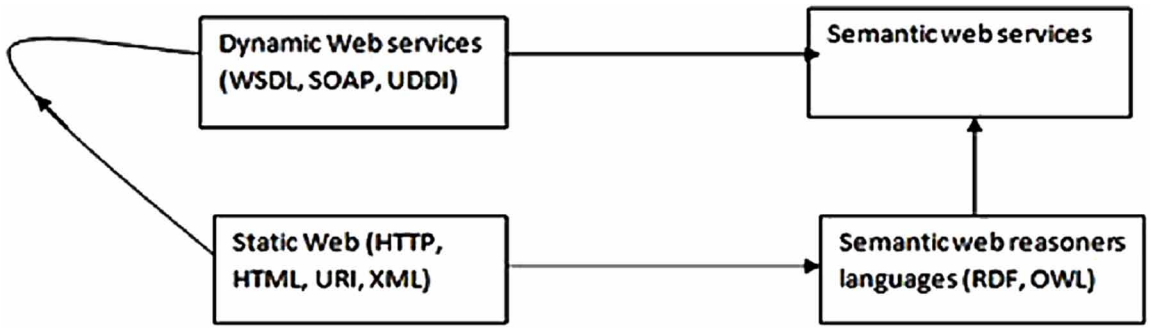
Service monitoring assists during the execution of composite task and give feedback in form of alert to composition agents so that they will adapt to new situation if changes are required The advantage of such monitoring is it can give feedback to the execution or composition agents and they will be able to adapt to the new situation if changes are required.

Ontology management guarantee that semantic web descriptions are created accessed and reused within the semantic web. Ontology describes in the knowledge representation about a specific domain. Relationship among classes and objects is used for semantic composition of services inOntology domain.

MULTIMEDIA AND ITS KNOWLEDGE MANAGEMENT FOR E-LEARNING SYSTEMS

Multimedia is powerful tool for making presentations, slides, charts, maps etc. in the field of E-learning. To enhance the educational experience, and deliver the learning material to learners based on sequence of learner's response and request, multimedia applications are used. Multimedia can provide an enhanced or augmented learning experience at low cost per unit through exploration, discovery and experience.

Figure 5. Realization of semantic web services with web



With multimedia the communication between instructor and learner can be done in more effective manner and enable the instructor to represent the information in various media like sound, videos, animations, text and images. Multimedia learning tools enable learners to represent information using several different media. Hypermedia based adaptive systems allows learners to organize information in meaningful ways which involves theme based activities, open book assignments, etc. With an invention of multimedia based learning authoring tools learners are motivated to create quality product by taking strong decisions and execution skills.

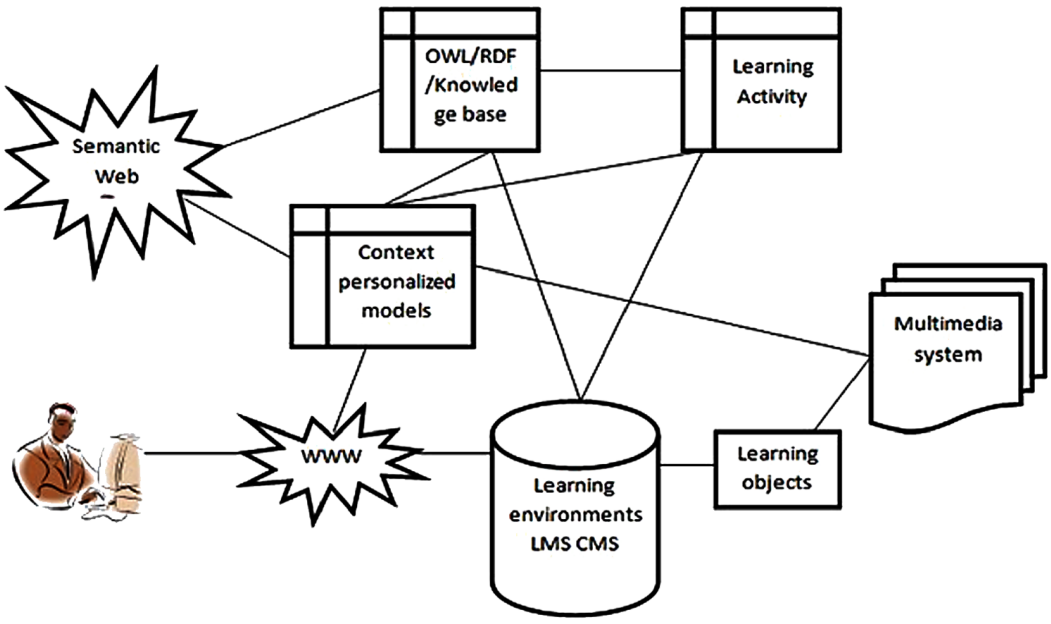
As shown in Figure 6 Multimedia based e-learning system where users interact with semantic web with help of personalized models which correlated with knowledge base and ontology structures. Different types of learning activities are associated with management systems like LMS, CMS etc. which relates individual learning objects to multimedia systems. These systems engaged learning activities according to context of individual needs and preferences.

Advantages and Disadvantages of E-learning

E-learning has various distinct advantages over other learning or conventional approaches like Personality, Flexibility, Interoperability, Collaboration, Source sharing, Reusability, Cost and time effectiveness and performance evaluation.

- **Personality:** The most important feature of E-learning is personalization as it allows selection of learning material according to knowledge level of learner, preferences, skills and according to their needs provide intended learning material to them.
- **Flexibility:** Variety of learning materials which can be shared and provide add on to developer as ability to add, remove and update the learning material content at any time.

Figure 6. Multimedia based e-learning system



- **Interoperability:** Variety of learning standards allows building new contents with different learning style and can be used as platform independent by various users.
- **Collaboration:** Learner's collaborate together in a group or individual according to their convenience through e-mail, chats, and forums to discuss learning standards and intractability.
- **Source Sharing:** Learning resource or material content available on the web has to share knowledge with peers. Various learners are engaged to demonstrate their concept understanding with peers to reflect their thinking processes.
- **Reusability:** The learning content based on different learning styles can be used without redesign, reconstruction in multiple applications and platforms. Similar concepts can be restructured and reused with adaptive methodology.
- **Cost and Time Effectiveness:** The E-learning tools, methods are much time effective and less costlier than traditional learning. It allows learner to learn anytime, anywhere with any modes.
- **Performance Evaluation:** E-learning has measurable assessments which can be used to evaluate learner's acquired knowledge and performance upon completion of course.

The feeling of isolation experienced by distance learning students is also often cited, although discussion forums and other computer-based communication can in fact help ameliorate this and in particular can often encourage students to meet face-to-face, although meeting face-to-face is often not possible due to the disarray of student's physical locality. Discussion groups can also be formed on-line. Human interaction, faculty-to-student as well as student-to-student, should be encouraged in any form.

E-learning tends to work better for the student when the topic matter consists of self-learned items. When much group collaboration is required, E-learning can cause lag times in collaborative feedback if the students are not disciplined. For example, some student's may only check their online agenda once a week, or even less, making it impossible to achieve goals. Web and software development can be expensive as can systems specifically geared for E-learning. The development of adaptive materials is also much more time-consuming than that of non-adaptive ones.

Multimedia and Knowledge Based E-learning Tools

Now a day, many commercialized and personalized multimedia based E-learning tools available in education sector. These tools can provide training and educating a large number of learners with diverse cultural background and provide sufficient amount of learning content to them based on their knowledge level, preferences, skills and their desired needs. There are varieties of E-learning tools like MOODLE, Blackboard, CMS, WebCT, Udutu and Dokeos etc. available in market for delivering and managing online learning content.

A Course Management System (CMS) is a web based system with back end support feature of database. It assists instructors in obtaining resources on web for learners and to facilitate the management of course activities and tasks. There are mainly three strengths of web based course management system i.e. accessibility of course resources to students, proper time to time communication between instructor and learner and reduction of paper usage by enabling online learning systems. The strength of CMS is a security and privacy. CMS system enabled student access controlled to activities and tasks. It protects the instructor intellectual properties. Student privacy and copyright material has been protected from hackers and crackers. The intended course content is released and updated on timely basis with help of CMS.

Moodle is a web based learning management system used in education, training and knowledge management. It helps instructor and learners as a tool to provide in creation of quality teaching and learning. Moodle stands for modular object oriented dynamic learning environment. It is easy to install, configure and reuse. It can be installed on many servers and work in different execution platforms without any requires modifications. Moodle supports user authentication in which instructors and students are allowed to log into system with help of username and password to provide security protection mechanism. It has facility to conduct surveys and supports built in template format for questionnaire. Different type of questions has been asked by system to assess the knowledge level of learners at different level of interest. Apart from all these, there are varieties of advantages of the communication in Moodle.

Moodle avoids regularly reminding and repeating learners during lectures. It has been used to provide immediate response to learner queries and issues and solve them with help of messages. It encourages learners to give sufficient time to courses outside the classroom. Very helpful in saving time spent on writing questions which are of long length. The most advantageous thing about Moodle is Just in time delivery of lectures and downloading of course content has been on demand as required by learners. Open house discussion on course topic has been facilitated easily with help of Moodle.

Blackboard is a hybrid kind of instructor tool. It can be used by instructors throughout the lecture sessions to discuss important ideas and brief on main points. It can be useful tool to help learners to visualize their key aspects and learning features of chapters but if like conventional learning in a classroom teaching, if instructor attempt to teach large group them it will be failure to do so. Blackboard comprised of lot of tools like tests, surveys, assignments, software considerations as technical usage, control over quiz and assessment pattern, grading, reporting and alternative form of assessments. There are numerous advantages of blackboard learning system like integrating assessments with teaching material, the learning content has been available on demand basis, it is mainly used to select randomized questions from list of allotted questions. There are several disadvantages of blackboard like it is not desired for testing of all skills and activities of learner regarding the course topic which they studied. Some IT skills need to be incorporated to support fundamental mechanism of blackboard. The biggest hurdle is time require to design questions which is more costly and input requirement is large compared to other learning systems. As per security aspects, it is more vulnerable to security attacks compared to Moodle and other systems. In comparison to functionality, blackboard is far better than Moodle as it permits greater flexibility in designing the course curriculum for regular terms and maintain the study schedule as per learner requirement to continue the education course in successive manner.

Dokeos 2.0 is a web learning based application which is used to manage online courses. It is mainly SCORM compliant, reliable, light weighted and secured application. It supports different kinds of learning and collaboration activities. Instructors can easily create, manage and publish their course content over the web.

ROLE OF ITS AND KNOWLEDGE MANAGEMENT IN E-LEARNING

An Intelligent Tutoring System (ITS) is a computer system which provides personalized learning content to students based on their performance, needs and background knowledge. ITS may be defined as computer based instructional system with models of instruction content that specify learning strategies i.e. what to teach and how to teach. ITS is web based learning system which are used to teach wide range of topics based on personalized learning.

Knowledge management and training are integral and closely associated parts within a single framework. Knowledge management allows effective control and management of the corporate memory – the knowledge that is within the organization. As a result of corporate knowledge, a virtual classroom evolves, which in addition to the classic "live training program" makes a dialog / interaction possible despite "distance learning." For example the interaction of virtual teams and how they can process information together. Especially the exchange of experience and interaction in form of chats, discussion forums is one of the most efficient ways

of informal training. On the other hand corporate memory that has been collected, managed, organized and has been made accessible to everyone within the company through a KM program, could work proactively pushing knowledge and new information to interested parties (alerting) so that they could better accomplish their job. The training is provided through 4 different media: User Guides (available on knowledge management community of practice), FAQ documents, CBTs and Digital Library.

Computer Based Learning

Computer based learning is commonly abbreviated as CBL, which refers to the use of computer as a key component of the educational course systems. While this can refer to the use of computers in a classroom, the term more broadly refers to a structured environment in which computers are used for teaching purposes. The concept is generally seen as being distinct from the use of computers in ways where learning is at least a peripheral element of the experience (e.g. computer games and web browsing). Common types of Computer Based Learning include CBTs, asynchronous online discussions, or synchronous interactions.

Computer Based Training

Computer-based training (CBT) services are where a student learns by executing special training programs on a computer relating to their occupation. CBT is especially effective for training people to use computer applications because the CBT program can be integrated with the applications so that students can practice using the application as they learn.

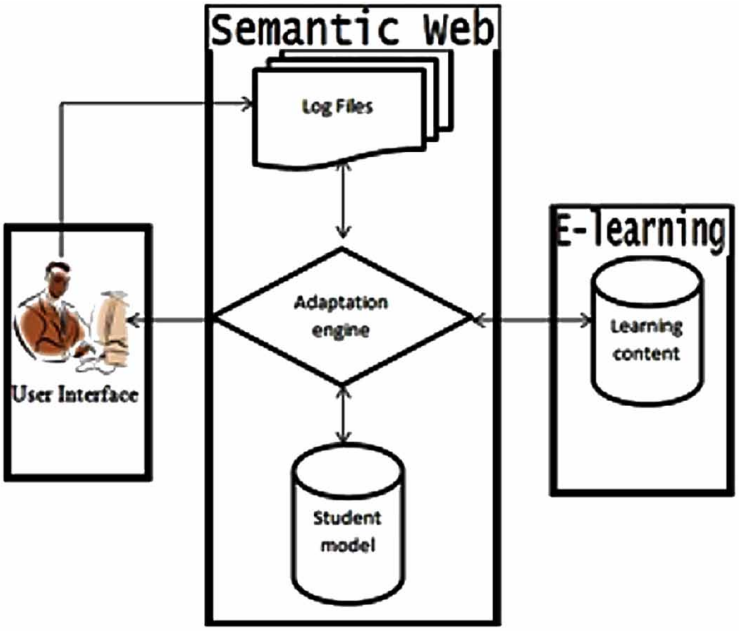
Variety of modules has been integrated into ITS to enable the flexible and efficient delivery of learning materials. They have evaluated the learner on the basis of their skills and requirement of knowledge needs and preferences. Variety of applications has been integrated with ITS to provide flexible, interoperable, secure, plagiarism free environment to support more number of learning web based solutions.

The ITS consist of user interface, the learning content, student model and adaptation engine.

The functionality of ITS can be expressed as:

The user interface delivers the learning content to the student and accepts the students' responses to the questions posed by the ITS. Based on the nature of the ITS, the learning content can be delivered as text, voice, simulation or interactive games. The user interface can be a mobile device (PDA, Mobile, and Laptop) or a desktop. The students' interaction with the ITS, such as response to questions, number of attempts and time taken for various activities (responding, reading and others) is captured in the log file. The log file used to create student model. The learning content of the ITS is stored in a database as topics. The topics are divided into learning units to enable the teaching of a specific concept or a fact. Misconceptions and common wrong answers of each learning unit are stored in the database.

Figure 7. ITS architecture



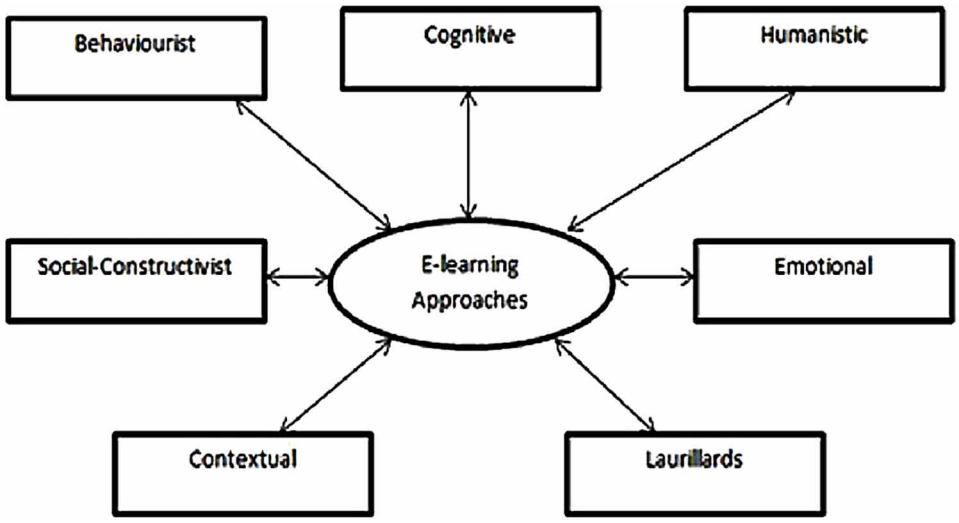
The learning units can be explanations, examples, hints, quizzes, questions and they can be used to teach, demonstrate or test the students. The student model contains general information about student their skills, goals, background knowledge, plans, learning styles and characteristics.

The adaptation engine is an algorithm to select (adapt) the learning content based on the student's input from the user interface (response to the question) and the information from the student model. In ITS, if a student registers for the first time, general information like age, gender and background are collected and stored in the student model. Based on the student's request, the learning content that matches the student's profile is provided in the user interface. The student then interacts with the ITS by solving problems, or playing games or by other ways of interaction. The student's interaction with the ITS is stored in the log file, which is analyzed to identify the student's performance and preferences and is stored in the student model. The adaption engine in ITS tailors the learning content based on the student's request and the data from his/her profile. For example, if the ITS detects that the student has a misconception on a learning unit, the ITS can suggest that the student redo the current learning unit, or redo the previous learning unit or resolve the misconception using remedial content.

Pedagogical Approaches for E-Learning

Learning theory or methodology based upon accepted theories as to how people learn (Aimeur & Frasson, 1996). Not every person learns the material in same way according to given situation, so lot of variants of theories are required to cover specific types of individuals and learning situations. To create such type of E-learning content various pedagogical approaches are need to be evaluated. Simple pedagogical approach can create content easily but lacks flexibility, productivity and purpose behind creation. Complex approaches provide better learning experiences for learners but they require extra

Figure 8. Shows E-learning approaches



effort and time to build system. To incorporate these features there is a need to use various pedagogical approaches for E-learning which includes behaviourist perspective, cognitivist perspective, emotional perspective, contextual perspective, laurillards conversational approach, humanistic approach and social-constructivist approach.

E-Learning Problems

Most of the author focused on various e-learning problems classified as learning path generation (LPG), object recommendation (OR), personalization of content (POC), Context learning problem (CLP), Information retrieval (IR), Domain Ontology construction (DOC), Classification of learning styles (CLS).

LPG focused on providing sequence of learning object materials to learners (Helic et al., 2005). OR system advised learner to choose most desired learning object (Wang et al., 2007). POC specifies what learning objects are needed for course established for specific learner requiring a specific subject. CLS is performed on the basis of learner's interest, background knowledge, mental level, skills and preferences (Li and Park, 2007). CLP describes the availability of learning materials from difference courses for different learner at the same time. IR is activity of obtaining intended course from collection of different courses as per need of learner (Chang, 2002). DOC provides best possible information to learner on basis of hypertext structure.

EMERGING MULTIMEDIA TECHNOLOGIES FOR E-LEARNING

Multimedia technologies are used to enhance content visualization, collaborative network technologies and user interaction with help of digital media. The integration of multimedia is key role in present E-learning technologies. Multimedia based technologies induces dynamic course content delivery anytime

anywhere, improves learner learning effectiveness and experience based on learning content. Variety of media in form of audio, videos, animation etc. supports E-learning whose purpose is to provide channels for delivery of various forms of learning content.

Now a day communication technologies, social networking, Gaming and virtual learning act as a medium for E-learning. In case of communication technologies electronic gadgets like mobile devices, PDA, laptop etc. provides more convenient way for instructor and learner to interact and collaborate with each other.

Communication technology based media facilitates accessibility, interactivity, adaptive, permanent and situation based learning. The hybridization of communication devices with help of ubiquitous and pervasive computing enrich E-learning environment where learner can use his gadget anywhere for their personalized learning environments. Based on collaborative tools, assessment of learner has been done and if learner can correctly answer the questions they receive further information about course.

Social networking plays a major role in E-learning. It uses internet and mobile networks as communication medium for maintaining social groups and communities like Facebook, Twitter, and Instagram where information sharing and interaction among learner takes place. With growth of such online communities learners are engaged to discuss, formulate and share information based on their experiences. Use of social media strengthens the collaboration and interaction among learner easily with help of multimedia learning tools.

Third important medium called game based learning motivates students to learn new skills with help of gaming and visual effects. This kind of learning is supported by different computing technologies like Human Computer Interaction (HCI), Ubiquitous and Pervasive computing etc. The intent is to turn learning process into visual oriented, entertainment driven, and interacted one which facilitate students to gain insights of learning. There are various criteria's for evaluating the quality in E-learning like explicit pedagogical design principles appropriate to learner types, need and context must be clear and high level of interactivity.

Multimedia Content

Student learning performance and effectiveness can be improved by providing appropriate learning content to them. Multimedia content available in different forms like audio, video, images and animations. Various web based E-learning systems like Moodle, Blackboard, Dokeos conduct online quizzes, test assessment, distribution of learning content to students. Based on pre and post-test analysis, it was observed that learners self-efficacy, personalized learning ability, interactivity and multimodal instructions are dominating factor to learning effectiveness. To enable interactivity video based learning has been formalized which generate learning content in multimodal forms helping students to visualize concept easily. Virtual learning provides graphical simulation environments with dynamic learning content to students. Multimedia instruction requires communication standards to formulate and produce learning content. Different types of authoring tools are available to construct multimedia information based learning content. SCORM and IMS is popular standard for content authorization, student assessment and schedule learning content delivery to students. Various kind of learning path sequences has been provided to students based on their skills and background experience which motivates them to enhance their learning effectiveness.

Positive Significance of Multimedia on Learners

Interactive multimedia provides several benefits for learners enable them to use multimedia based information content in form of audio, video, images and animations. Interactive multimedia enhance motivation, which accelerates learning power of learners; enables knowledge transfer through retention and provides manipulative experiences unavailable in normal classroom environment (Aldrich, 2005; Jackson, 2007). Effective learning occurs when learner interacts with multimedia content and on basis of activity feedback which they performed to improve their skills. E-learning needs to encourage learner motivation by providing depth learning experience to them and enable knowledge transfer among efficient learners. E-learning is blind to racial, cultural and sexual differences as it offers no more or less learning support to any individual. It promotes disinhibition which enables learners to express themselves openly. It promotes the interaction of shy people because they are more comfort when they have space and time. The accessibility of E-learning content has biggest impact on learners so they can access learning at their own convenience.

Negative Significance of Multimedia on Learners

Interactive multimedia has negative implications on the learners which include the problems resulting from self-guidance, diminished media richness and issues regarding technology compatibility. Variations on learner preferences like lack of self-directed learning, unclear objectives may result in a hesitancy and reluctance to learn among them. Due to instructional systems, E-learning may be time consuming for learners and sometimes due to lack of experience beginners take poor decision to proceed with given information. Media richness associated with face to face communication diminishes when communication goes electronically. It can be resolved by using multimedia content as adding visual to text. If learner gets distracted due to information available on the web or in online environment then desired animated software enhance their interactive skills and provide fun learning environment for others. Lots of technical issues are involved in interactive multimedia as lots of software are required to play multimedia files and computer capabilities affect online speed in web that prevent learners from accessing multimedia efficiently.

Multimedia Based Educational Programs

In education sector, variety of educational programs have been developed and implemented to identify the problems or trouble those are faced by learner and provide better and optimal solutions for them. The combination of multimedia content and distinguished methodologies are used to solve out such issues which academic society is facing now a days. There are various multimedia based educational programs run by several nations to spread awareness among learners and their guardians to improve the literacy rate which can be achieved only when we deliver or impart right education at right time. Here, we have discussed various educational programs like HEADS UP, WIT, ACALPA, KAD and TiM.

HEADS UP stands for Health education and discovering science while unlocking potential. The main purpose of this program is to aware Non-Asian minority students of schools and the goal is to develop their interest in health sciences and motivate them to choose medical science as their career goal options. Various multimedia based technology used in such programs like various lectures and history of

scientist from medical health sector, different graphical and animated activities to increase awareness among learners, implant and usage of customized web resources, feedback taken from instructor on the resources available for students.

WIT stands for William Instructional Technology. This program spread awareness among summer interns working on government funded project. The goal of this program is to develop high quality multimedia application based project, which helps instructor to teach course contents to learners according to their needs. The multimedia technology used in this program will be to print publications for advertising WIT as per need, different types of standalone presentations and share individuals experiences with each other, organize digital workshops for the learners to customize their work during training.

ACALPA stands for Affective Computer Aided Learning Platform for Children with Autism. This program is applicable for students who suffered from Autism. The main goal is to examine the educational procedure for students who have autism and can motivate other students of same level. Various multimedia technologies used in program like different usage of sensing techniques with help of color, words helps user interest during game playing. Specific synthesized speech will be delivered in native language of person who suffered from autism. Varieties of animated visual motion are being expressed for identification of student reaction. To achieve personalization, individual instructions are being delivered to different students at different levels.

KAD represents Kino-Ani-Drama and animation therapy. The intention of this program is to provide better improvised learning for blind children or those having several visual impairments. The major purpose is to design, develop and to adapt simulated computer based games for visually and physically challenged children. Variety of multimedia technologies like boom sound interface for playing through several narrated stories which children feels interactive and interesting, usage of virtual keyboard need to be enhanced and different game playing instruments like maker, joy stick, cards have been used to control the sound interface for small children.

CONCLUSION

In this chapter we have made discussion of relationship between Knowledge management and E-learning with respect to various integration and adoption models, semantic web technologies and E-learning approaches pertaining to different multimedia systems. It contains information on understanding the fundamental concepts of E-learning. The development of knowledge management (KM) and E-learning (EL) naturally brings both disciplines closer and encourages integration. There are several models that offer possible ways of such integration. Model analysis shows several integration ways and approaches, however, these models are not implemented in production environment and lack necessary technical specification and application support. As result of specific organizational goals and needs models employ different adaption and integration approaches. The more general approach is to base integration on common ground, which was identified as learning.

Similarly, availability of multimedia based technologies on web enable distance-independent learning, low cost video telephone service, improved customer relationships through e-commerce and allows new gaming entertainment. We have analyzed current practices and latest trends in E-learning industry regarding the use of interactive & emerging multimedia technologies as a learning tool in form of social learning, emphasize on instruction authoring, game based learning, to integrate multimedia type with

database system and its query language and to incorporate reality as learning content. Finally, we have discussed different E-learning approaches and their positive and negative effects of using interactive multimedia in E-learning as they relate to both learners and developers.

FUTURE RESEARCH DIRECTIONS

Based on numerous studies, we visualize a lot of research directions in developing and incorporating multimedia technologies for E-learning. Interactive multimedia has impact towards social learning, emphasize on instruction authoring, game based learning, to integrate multimedia type with database system and its query language and to incorporate reality as learning content.

Conventional E-learning systems delivers learning content material i.e. static or based on predefined knowledge set but not on basis of dynamic and adaptive content. Social learning changes learning paradigm from traditional to online community based system where learners can interact with people with similar common interest. It facilitates learning processes by sharing opinions in discussion forums, writing blogs, and article conversion from text to speech or audio with help of predefined converters. Various social networking platforms like Dokeos, Udutu, Moodle, Elgg, blackboard etc. have been designed for online education. Social networking allows experts of different domain to interact with each other with help of multimedia aids.

A major research area in social learning is to improve interaction among learners. There is a need to identify desired methods which fulfill learner request on basis of learning activities like sharing ideas, comments, content sharing, and post videos in social learning environments. As learning content comprise of various multimedia forms like text, audio, videos etc. there is a need to develop automatic methods for content searching, discovery and delivery of learning content in social networking based learning environment. Student characteristics and their behavior also played a major role in E-learning. By identifying learner characteristics E-learning system can better address their individual needs to improve learning effectiveness and classifies on basis of their knowledge level.

Learning facilitates learners to gain deeper insights in certain knowledge and acquire different skills on basis of learning approaches. Conventional multimedia E-learning systems allow learners to represent knowledge based information through various senses like cognitive, humanistic, emotional but these systems unable to integrate physical context of learners. To achieve the same context or situation and reality based learning come into role. Context aware learning uses sensors which can sense and react based on personalized context or environment. It enables community based learning by wearing wrist gadget and captures personal thoughts, locations, body temperature and feelings of learners. Reality based learning enable vision of augmented reality where learners able to visualize information from both real and virtual world. There is a need to improve accuracy and performance of real world object recognition and design interaction techniques to manipulate real and virtual world objects. Another research challenge in E-learning system is to collect interactive response from learner which includes multimodal information and determines way to analyze and interpret the response which is collected.

Game based learning is another research focus which facilitates game designers and educational professionals to work together. Variety of gaming tools is available to develop such systems. An important research issue is the constructional learning design which carried out easily in game based learning environment. This issue requires collaborative and team based learning. It provides learner a way to use

such gaming based environment based on training information they receive. Game playing has improved learner way of learning and helps them out to be restrained.

Constructing multimedia instruction imposes extra burden on instructors as instructions are complex and takes time to produce. Despite of all such facts, challenge is to produce multimedia learning content as an important research objective. The implementation of producing learning material for learners based on their learning style makes adaptive multimedia instruction authoring difficult. Learner has to choose best possible learning path using path sequencing techniques. Instructors can monitor student learning details based on multimedia based content. Based on learner feedback it allows instructors to review instructions and improve the quality of authoring process. There must be production of unified form of abstractions to learning content constructed by different kind of media and ensure that abstraction produced are pedagogically meaningful.

KEY TERMS AND DEFINITIONS

ITS: It is computer software designed to simulate a instructor behaviour and learning guidance. It provides customized instruction or feedback to learners without intervention of instructor.

RDF: RDF stands for resource description format. It is a standardized model for data interchange on web. It mainly provides interoperability between applications that exchange machine understandable information on web.

SCORM: It stands for sharable content object reference model. It is designed to meet technical standards like durability, interoperability, accessibility and content validity of systems.

Semantic Web: It is an idea of World Wide Web community to make web more intelligent and adaptive to human needs based on their intuitions.

Web Services: These are client and server based an application which provides a standard means of interoperating between software applications running on variety of platforms and applications.

Chapter 53
Interactive Media Steer in Educational Television Programs

Burçin Ispir
Anadolu University, Turkey

ABSTRACT

Most distance education institutions still use traditional media such radio, television, printed materials to provide and support education. The educational materials are designed according to the students' individual necessities. So, students can maintain their own learning. The most important property of digital media is interactivity. Traditional media provide interactivity with the support of digital media. To provide a transparent learning and teaching activity in cyber space can be accomplish with interactive opportunities to all learners. In this case the most effective environment should have open access to everyone, easy to follow, unlimited information access. These specialties can be seen in web-based environments. In these days we can eliminate the noninteractive structure of traditional media with the support of web based environments. With the development of Web 2.0 technology, social media applications have gained great popularity in recent years. This chapter will explain, the contribution of Web 2.0 on television in distance education systems.

INTRODUCTION

In spite of developments in information and communication technologies, the instructional television is used in distance education already. Because the television is common traditional media environment which appeals to wide audience and which has in every household as mass medium.

Television takes part in the media environments by the reason of existing the communication which doesn't hold the interaction and which is unilateral. Even if there are interactive television applications developing with technological convergence, utilization in order to provide the training doesn't grow up completely yet.

DOI: 10.4018/978-1-5225-3822-6.ch053

Distance education activities contain education and support services in which tutorial and student don't exist together and in which take part the different time and place applications. So the point arrived at distance education in the world, it prefered interactive media in which has been placed individualization to forefront. Despite this disposition, the instructional television situated in traditional media category is subsisted.

To being in use of television already while there are applications of interactive technologies which are popular between users shows that it maintains it's importance for audience. Even if it was prefered by audience, joining digital collaborations to maintain the presence as teaching environment prefered by students in training events confronted as inevitable reality.

It becomes popular quite between users the social media with expanding of the web 2.0 technologies in recent years. Social media guidances given during the television broadcasts also beget interactive chat environments in which audience can share opinions about watched program, can take part in discussions. Hereby it was prompted the guidances for environments in that audience can compare notes about program by breaking the structure of television which enables to simplex communication. The result of this digital collaboration can be seen as an interactive opportunity presented for watchers of television.

Presentation of digital collaboration opportunities that we can describe as interactive environment guidances with the intent of instruction presentation or support in instructional television applications to distance learners are quite important service. With digital collaboration to be provided, students with guidances given at the time of lesson's presentation can access to detailed support about content through social media environment. It will be stated in this study for what purpose and how to use this model of distance education institutions which uses the television as dominant educational environment. However it should be emphasised on the television training programs, web 2.0 technology and interactive media guidances before configuring the model.

DISTANCE EDUCATION AND COMMUNICATION TECHNOLOGIES

In fact the Distance education concept is not a new concept. Concept was used primarily in 1892 catalogue of Wisconsin University (Verduin & Clark, 1994: 7). First use of concept in the form of "Maintain the teaching-learning relationship of student and teacher separately from each other" was heard while had a conversation between Moore and Börje who is Swedish pedagogue. First beginning of the distance education was performed with letter. Later on it was used different communication and information technologies in teaching presentation parallelly to emerging technologies.

Definition of the concept was changed by the time as well as technologies used in teaching presentation. Because it has been formed the distance education perception in which placed the teaching methods and techniques, student expectations and requirements, individual needs in changing conditions to forefront. In this regard, the distance education concept has been possessed wider definition. Distance education is defined as system in which the communication provided with technology and student gets education independently from time and place.

As it is understood through its definition, distance education defines the activity in which continued the teaching activities with communication technolgies' support. Therefore distance education institutions carry on the activities as institutions providing the ideal education opportunity for students by following the developments in communication technologies. Diffusion of individual-centered instruc-

tional approach, understanding of interaction's importance in education caused to arising the wider use perception of communication technologies in teaching domain.

In recent years the use of digital technologies become widespread rather quickly in the community. Distance education institutions also don't ignore the contributions of digital technologies for teaching activities. However television and printed material based instructional media located in traditional media category subsists already. Especially distance education based on book and television has great advantages in terms of teaching presentation for audience. For this reason these technologies located in traditional media category can be prefered already in teaching activities. It can be provided more ideal learning environments in accordance with education requirements of the age for distance learners by crossing the several lines of television and printed materials with coalescence between traditional media and digital media in recent years.

INSTRUCTIONAL TELEVISION

Television is between mass communication most commonly used. Television which located in traditional media category and defined as household technology takes part in media category consumed at most by audience. As per Mohanty (1986:85) Instructional Television (ITV) is mass media which has interest and motivation arouse power for children and adults (Akhter, 2011:189). If television is used for community education, then it is instructional television. ITV programs also define programs prepared for training courses. The television is convincing and influential tool for enormous mass of humanity (Akhter, 2011:189).

It should define the limitations and possibilities clearly in mass communication of television media. It should be configured the ITV activities in the direction of facilities defined in this way. We can put television features located in traditional media category in order as shown in Table 1.

The possibilites and limitations of television features given in Table 1 by classifying. The limitations can be thought as an obstacle for consumption of television when considered the features of digital media environments nowadays. However in spite of it has very much disadvantages in the face of digital media, it subsists presently as popular media environment in many parts of the world. It prefered as communication media which persuades person at most with presented program and channel varieties

Table 1. Television features

Possibilities	Limitations
Television provides relayed messages for wide audience which are spread and froma distance physically from eachother	Television is traditional media which allows one-way communication.
Television is electronic media which can relay mobile video and audio messages at once by its structure	The interaction on TV as traditional media is limited with only channel variety. Accordingly it is low as minute amount.
Transmitted messages on televison can receive at the same time a great number of audience which positioned dispersedly	Because of interaction absence the audience is defined as passive audience.
It's information distribution is faster than other traditional media	Because of there is one-way communication and there isn't interaction on TV, the feedback is so low.
User-friendly technology	Television is situated as household technology by its structure.
It is easy to access to the content	

inspite of mentioning about passive audience, which motivates and has display and sound quality at high level. Because of these features it stays popular as educational media used at present by distance education institutions and their students. It can be exceeded the features determined in limitation category as the result of collaboration between traditional media with digital media at the present time. Because instructional television applications possessed more individual, interactive and immediate feedback opportunity with digital media collaboration. Thus it has been paved the way for turning into active audience by breaking the passive position of audience and it has been provided dual communication medium for distance learners.

Instructional television programs show similarity with production and coverage of television program. It has been mentioned small differences in process before production of programs to be prepared for instructional television. Because the television also has taken place among main components of training activities in addition to printed or written course materials in distance education institutions. It performed pre-production process by considering the training material prepared as written and printed in training program which will be prepared accordingly.

The first thing to be done in program which will be prepared for instructional television is determination of important issue, conception and sections required to be presented, clarified, visualized or animated on television within the course involved in printed materials. Producer, editor and scenarist determine this process together. Following it will be designated instructor or presenters who will host training programs. Afterwards it will be completed necessary preparations for pre-shooting. (Demiray and others, 2002:5)

After shooting performed in accordance with determined points, it will be set post production stage. In this stage the program will be made ready for broadcast by editing the program and adding the visual and audio effects. The program prepared for instructional television can be produced in two different ways. They are: Live Broadcast and Prec.(Pre-recorded) Broadcast.

Live Broadcast defines producing the television program in an instant production (John, 1967, 517). There is simultaneity in programs to be broadcasted live. In studio or in setting intended as studio performed shootings made. In these shootings where discussed the use of camera more than one, the visual transitions and program integrity will be provided with vision mixer's support. After completion of pre-production process in programs to be broadcasted live like in all other productions, the shootings will be performed in extent of determined projection and it is given to broadcast instantly. The biggest advantage of such kind of broadcasts is giving feed back with getting through, e-mail possibilities provided for audience. Live broadcasts are used too much in instructional television applications in order to give lecture. Live broadcasts are set up in the manner rendering the support service for students mostly. For instance as well as exam preparation programs, programs which can kept informed about system operation. Students can connect to performed live broadcasts by using the support communication technology as telephone, e-mail and can ask the questions which they wonder. The importance of live broadcasts is pretty great in instructional television applications. Because it made possible receiving feedback of student with interaction opportunity provided, even if it is limited. However despite this opportunity the number of students is limited who will interact in limited period of the program. And this is doesn't seen as sufficient opportunity for distance education institutions which has enormous student audience.

Prec. defines realization of television programs' production process with broadcast process at different times. In programs broadcasted from prec, the shootings are performed in accordance with criteria determined at pre-production stage of program id est. at pre-development stage. It will be gone to post production stage with obtained video and audio as the result of shootings performed either in studio or

outdoor with use of one or more than one cameras. Obtained video and audio informations will be edited in the manner that visual and semantic wholeness will be provided. It will be added required effects with with animations and program will be made. Completed program will be given to broadcast in order to communicate for target audience in appropriate day and time. Because of there is different timeliness in production and broadcast of prec program, the audience is in more passive position. It is not possible to mention about interaction. Feedback is received from only ratings or reactions after broadcast. Therefore it can't be mentioned the direct feedback. Indirect feedback can be seen in the form of reflections within society. Training programs devoted to lectures by distance education institutions are broadcasted from pre-recorded broadcasts mostly. Accordingly it hasn't been satisfied the need of interaction and feedback which are important factors for distance education. Nevertheless it has not given up a prec because of visual-auditory power of television and communication prevalence for target audience.

Programs to be produced on instructional television remain incapable in two-way communication and interaction dimension regardless whichever broadcast technology is used. At the present time when becomes widespread the use of digital media and applications, it can be exceeded the limitations with instructional television applications located in traditional media category. The digital collaboration with one-way non interactive structure of traditional media training can be broken with digital media's support. Especially with mobile devices it can be gained access to contents of digital media without time and place limit, can be shared information and thought and received the feedback. In this regard the use of mobile devices is prefered further. Mobile devices contain main features as portability, functionality, multimedia convergence, accessibility, personal ownership, social interactivity, context sensitivity, spatial awareness, connectivity and personalization (Cook, 2010,1-2). Teaching process' promotion of distance learners can be possible with digital collaboration between mobile devices and television.

WEB 2.0 TECHNOLOGY AND SOCIAL MEDIA

Under widespread of social media concept underlies the development of web 2.0 technology. Web 2.0 concept states coming together of methodologies, technologies and platforms which represent the new progresses in the development of web (Akar, 2010:11) There has been a rapid change in the understanding of technological advancements which provides emergence of web 2.0 technology with user's information retrieval. For this reason it can be said that web 2.0 technology is not only technological change, therewithal it is web environment which is open for participation, interaction and implementation. In consequence there are many possibilities provided for user with features whihc possessed by web 2.0 applications. With this new technology, the web users have been transfered to more active position by eluding from passive position. The users are not in case of let off with a reading the content located in web environment anymore. Because the users with web 2.0 technology can spread their contents by creating them over the web which has a great number of users to whole world. In this way user can use web services with this new application for information sharing as well, not only for information access. All of these services are presented for user with different applications which presented by technology. We can put these applications in order as shown in Table 2 (Constantinides & Fountain, 2008:233).

Five main applications of web 2.0 technology give wealthy opportunities for users. Kaldoudi, Konstantinidis and Bamidis (2010) state that web 2.0 applications have 7 main component. (Yuzer, 2014:88). They are displayed in Figure 1.

Table 2. Web2.0 applications

Blogs
Social Network
Media networking site
Forum/bulletin boards
Content Aggregators

Figure 1. Web 2.0 components

- **Participation:** Defines participating of social media users to internet environment as much as they like, receiving feedback from everyone and sharing thoughts with everyone freely.
- **Collaboration and Sharing:** Defines propagating and distributing of users located in a social media platform obtained content with other users.
- **Clarity:** Defines the gaining access of social media users to content which they want without time and place limitation. Shared and propagated information is mass, not individual. Shared information open for rating and comments.
- **Reuse:** States ability to use shared content in social media by other users exactly or re-usability of them by commenting and handling.
- **Personalization:** Can determine contents which followed by social media users in accordance with individual requests, necessity and expectations. Hereby they can perform information access and sharing upon their requests in social media monitoring. Social media users can provide information access and sharing by tagging the content which they want to follow.

- **Promptness:** Means digital speed of the age. It performs information access and sharing within very short periods. Users can access to an information within seconds freely from time and place and can spread to other users.
- **Apomediation:** Defines the use of social media's some environments as a promotive tool. For sectors as educational, professional life the social media environment can be converted into structure which will support the activities. In this respect it can be configured as support medium for advertising, marketing, educational and even for other media.

Web 2.0 technology is used easily as support for instructional television broadcasts in support structure when taken into account the main components of technology, especially the apomediation. Accordingly the most appropriate environment between social media environments in which will be performed apomediation can be facebook and twitter. Because there are two-way communication flow where can be performed the instant audiovisual information sharing and access, where is possible direct and instant access with tagging.

Social Networking Sites: Facebook/Twitter

In words of Castells (2005) today's human being lives in the community where they will be in connection with each other in global or local dimensions. One of the formative of individual existence in this network society is social networking site (Toprak and others, 2009:25)

Social networking sites are interactive communication media in which users create one completely or partially public profile, in which they can exhibit people list with whom in relationship and they are can be in relationship with other users by observing, and which can be defined as the invention of the age adopted by millions of people in a short time (Varnalı, 2012:105). Between social networking sites Facebook and Twitter also are in demand mostly.

- **Twitter:** Is free of charge social networking site in which users can share messages based over 140 characters with each other and communicate mutually in this way (Akar, 2010:58) Twitter users determine the users whom they want to follow by identifying them in their accounts. Hereby, twitter user either individual or organizational structure can see instant information sharing of other users in own page. Also it is possible to answer to up-to-date information and sharing this information with another user for twitter user. There are three main components of Twitter: followings of User, followers of User and Tweets. Also there are e-mail service with ability to send a private message to other user as well as they can share openly to all followers of Twitter. We can put the main features which provide the popularity of Twitter between users in order as shown in Table 3.

Table 3. Twitter's features

It is easy to write a message and read it
It is easy to become acquainted with other people
They can receive automatically the message of following people with User selectable messages
The messages can be received in any internest-enabled device

- **Facebook:** Is virtual communication environment in which users create the profile by registering to social networking and by sharing the personal characteristic, photos, videos. In Facebook environment also it can be shared public messages for everyone as well as thee can be sent private messages to one user or user group directly. Facebook is virtual communication environment in which can be added only persons as friend and corporate pages can be followed. Individuals can give feedbacks and share own thoughts as can be received the up-to-date information sharings of following person and pages. In this respect the facebook is interactive virtual communication environment. They can have simultaneous conversation with persons as individually or in group listed with on line chatting property. There are so many features which support user interactions of Facebook. They are; (Toprak and others,2009:38); "Wall" where located sent messages, "Pokes" which enables for virtual pokings, "Photos" which allows to load the album and photos, "Status" where provides information access to place and actions of users.

Digital Collaboration between Television and Social Media

New Technologies renovate the traditional media and improve them on the contrary to destroy. For instance TV viewers can share opinions comments about content as real-time during the broadcast. This event can be defined as "viewertrait" (Anstead ve O'louglin, 2014:441). Viewertrait states digital collaboration in which applications belonging to traditional and digital media tools work together.

In recent days one example of this collaboration is experienced between television which is traditional media and social media. Almost in all programs broadcasted on television used often interactive environment guidances intended for social media. In this regard especially facebook and twitter guidances are one of the interactive environment guidances which prefered commonly. Interactive environment guidance on television covers applications in which audience situates in interaction as the result of collaboration between traditional media and digital media. For instance audience can connect to page about watched program with one hashtag defined in facebook/twitter guidance given on television program broadcats through constant or portable internet-enabled device. It can be accessed directly to up-to-date information, comments, and opinions of other audience with given hashtag.

Hashtag; is easy and effective way to access to wide range of people. In Twitter writing of one word after # sign shows the hashtag. Users can tweet between themselves with Hashtag. (Abanoz, 2012:77) Real-time social media conversations of users seen in the characteristic of reform for wide range of audiences.

In television programs it is used facebook guidances except twitter hashtags. Facebook platform as its structure is not active as twitter in real-tşme instant messaging. However it is possible to share instant comments by accessing to guided pages of audience. With synchronization between Facebook and twitter, twitter users has a chance to send messages to facebook which was shared. In this regard there can be seen advantages provided by both technological convergence and digital collaboration between different digital platforms and traditional media.

Support Provision of Social Media for ITV

We stated before that instructional television is used already in many countries prevalently. It is obvious that instructional television remains incapable in some points against the developing technology despite

it's plenty advantages. Structures in which students can interact and communicate on Itv broadcasts can be possible with support of interactive media guidances' use and digital technology.

It can be provided communication of both other students and curators of explained lesson with distance learners during the broadcast with social media hashtags to be given in training progams which were telecasted. In this regard, Facebook and Twitter which are social media platforms can be configured rendering the service for students differently.

Twitter is the platform that can render the service better to real-time messaging necessity. Therefore even if training program is live broadcast or prec, it is situated as a platform where students can communicate simultaneously with other srudents and instructors. On live broadcast itv programs, replying the sent messages from social media on television during the broadcats can be seen as an important service. Herewith program broadcast will be produced in accordance with requests and reviews from social media. Accordingly there is no need to subject matter expert to be there during live broadcast which manages the social media platform. Subject matter expert/ instructor involved in presentation of live broadcast will make statements simultaneously toward received messages. It is not possible to provide this service in the prec programs intrinsically. Student has abilities to comment and getting answer by asking questions about subject directly with twitter hashtag given about explained lessons on instructional television. Hereby one-way communcation structure of the traditional media with learning activity can be broken with a support media. At airing time of progrmas in interactive itv support program to be given with twitter, the subject matter expert which will reply the questions should be active and support the students during the broadcast. According to result of the study made intended for Tweeter use, it was proved that 50% of the sent tweets with # sent during the program broadcast. (Anstead and Loughlin, 2014:454) As for study made intended for influence of tweeter on learning reveals that tweets sent by users ease the learning and carry out better comprehension (Aydın, 2014:2).

The use of Facebook guidance on Itv as social media platform can be projected as student supportive service. Student can get answers by asking the questions to page administrator by adding the facebook guidance given for a lesson in own profile outside itv program broadcast and can benefit from the service by communicating with other members. In this way it can be provided interaction of distance learners with both subject matter expert and other students. Sharing of the video lesson telecasted will be benefit for the student from supportive service by listening them again independently from the certain place in a time of need later. In Facebook guidance it can be sustained simultaneous or different time conversation under the discussion headings about the subject. Hereby it can be positioned the facebook as important supportive service which will be given to student except the moment of teaching presentation. We can put the main criteria intended to use supportively of the facebook and twitter's traditional itv broadcasts in order as in Table 4.

Provided services in both of social media platforms even if it is facebook or twitter are quite important student supportive service for distance education activities presented with traditional media. In this respect the opportunities of social media platforms for students shouldn't be ignored.

FUTURE RESEARCH DIRECTIONS

When distance education is called, it has been reminded that an education activities, which are supported and carried on with technology. Also recent development on the era of digital media gives opportunities to take place in education environment everyday for a new application and innovations. In this study,

Table 4. ITV features of social media collaboration

Twitter		Facebook
Live Broadcast	**Prec.**	**Non-Teaching Moment**
No need to Twitter administrator	Required Twitter administrator. The subject matter expert is twitter administrator.	Required Facebook administrator. The subject matter expert will be designated as administrator
Program presenter/ subject matter expert involved in program follow the messages	Twitter administrator follow the messages	The subject matter expert follows messages
Program presenter/ subject matter expert reply the messages during broadcast	Replying of the messages will be carried out during broadcast on twitter	Replying of the messages will be carried out on non-broadcast
The interaction of learners with each other will be carried out on twitter	The interaction of learners with each other will be carried out on twitter	The interaction of learners with each other will be carried out on facebook
The interaction of student and instructor/ subject matter expert will be carried out through television	The interaction of student and instructor/ subject matter expert will be carried out through twitter	The interaction of student and instructor/ subject matter expert will be carried out through facebook
It will be provided supportive service during broadcast. Time is limited.	It will be provided supportive service during broadcast. Time is limited.	The supportive service will be configured as at the moment of broadcast and out it.
Shortcut of the interactive media guidance will be given during the broadcast.	Shortcut of the interactive media guidance will be given during the broadcast.	Shortcut of the interactive media guidance will be given during the broadcast.

an interactive content design, which can be served to students, was developed with using Web 2.0 technology. The developments of TV program production and broadcasting technology brings with its new opportunities and these opportunities mean that new applications for distance learners. IPTV application can developed for education environments with to become widespread of Internet based broadcasting practice. Interactivity is one of the most important concepts in the distance education activities. Because of this, it's required that students can manage their own needs and requirements on education activities with supporting of technology. All technologies in the category of digital media include interactivity components. In the context of the ITV activities era, the studies are requiring such as IP based broadcasting, the development of NVOD and VOD systems, the supporting of education contents with augmented reality. The adaptation of Web 2.0 philosophy on interactive digital TV (IDTV) also can brings great interactivity opportunities to distance learners in nowadays which widespread smart TV ownership. Because, Web 2.0 philosophy is gradually turning the current web into a cooperative space where knowledge sharing collaboration take a leading role in the new social networking sites (Redondo an others, 2011, 151-152)

Further research, which are suggested about distance learners supporting with digital media environments on ITV application are not limited those mentioned above. Distance learners' satisfaction levels and attitudes towards on new digital media environments are other subjects that need to be understood. Because, it can be supposed that the environments where convergence of technology are preferred preliminary when individuals' digital media usage are considered. Within this context, it is predicted that the environment, which have faster information access, suitable for mobile life and usage of more than one application within a digital media technology, will be preferred principally. It's undeniable reality that making design which gives freedom learner and access the interactive content any time and space. Learners' attitudes towards ITV applications and interactive environment redirection are included the

subjects which needed to be researched. The investigation of learners' ides about television capacity directed towards solutions of individual learning as being household technology.

The investigation aspects of digital media supports directed towards ITV applications and in this context, the researchers understanding about students' perceptions and attitudes will contribute to academic literature.

CONCLUSION

It is fact that digital media products don't destroy the traditional media, on the contrary it helps maintain the popularity by supporting it. Above all of these supports is seen possibly in educational field. Even if use of digital media in distance education applications is widespread, the dominant teaching tool is traditional media in our age already. Television and books don't lose thier popularity in this context. However in any case this traditional media used prevalently should get support from digital technology.

There aren't too much studies yet intended to use of social media as direct and supportive training environment in literature. Made studies concentrate on social media users, interactive media guidances from television programs and advertising. There can't be finded research results intended to use of social media in television training programs in this respect.

In recommendations given devoted to effective use of social media in television with training activities, it was demonstrated the small difference for live and prec broadcast progrmas. Apart from that the process is handled identically. Supportive service given on Facebook defines supportive services about non-teaching moment lessons not about direct training presentation. While Twitter service occurs actively during itv broadcast, facebook service covers also the time of non-teaching moment.

Chapter 54
Lean and Digital:
A Case Study on Procurement and Supply Chain Professionals' Online Social Network

Oya Zincir
Istanbul University, Turkey

Adil Ünal
Istanbul University, Turkey

Murat Erdal
Istanbul University, Turkey

ABSTRACT

This study focuses on "BuyerNetwork.net," an online social networking website which brings procurement and supply chain professionals together on a digital-sphere for the purposes of interacting on work related communications and gathering information about supply chain products, operations and industry specific updates. It is aimed to explain the concepts of digital entrepreneurship and lean startup concepts with a literature background and on a case study. In the proposed case study, BuyerNetwork.net's establishment process is examined.

INTRODUCTION

Entrepreneurship is the topic that occupies a prominent position on the research agendas of scholars from a variety of disciplines including anthropology, history, management, psychology, sociology and economics. It has been introduced by Jacques des Bruslons in 1723 on the French dictionary, *Dictionairre Universel de Commerce* (Navale, 2013) and the 'entrepreneurship' word derives from the French word 'entrprendre' (Kuratko, 2009). In about 1800, Jean-Baptiste Say, a French economist who was one of the first mentioned 'entrepreneur' word, has explained it as "a person who shifts economic resources out of an area of lower, into an area of higher productivity and greater yield" (Butler-Bowdon, 2010, p. 82). Over the years, many research studies have been conducted to understand the personality characteristics, abilities, capabilities of the entrepreneurs. One can see many studies which examine the relationship

DOI: 10.4018/978-1-5225-3822-6.ch054

between entrepreneurship and many more related concepts such as culture, innovation, economy. Moreover, 'entrepreneurship literature' shows that it has many new categories such as eco-entrepreneurship, social entrepreneurship, woman entrepreneurship, digital entrepreneurship, lean entrepreneurship etc.

Weightless economy, digital transformation and many other new concepts emerged in the 21st century. Social media and social networking are two of these concepts which take place in the digitalization movement. Mainstream social networks such as Facebook, Instagram, LinkedIn are widely in use. Also, there is an emerging attention to vertical social networks which are specialized online communities built on shared interests, needs, events etc. BuyerNetwork.net is one of them which has been established in 2014 at Istanbul University Teknokent (Turkey) for innovative university practices by two scholars. There are procurement and supply chain professionals, entrepreneurs, scholars, researchers, students and NGOs in the BuyerNetwork.net ecosystem. It provides professional communications and connections; B2B opportunities and campaigns; and professional tools. It has more than 3300 members, 6 modules (performance measurement, commercial campaigns, goods and services, quality documents, references, marketplace, blogs and events modules), 3 user groups and 16 special functions.

The emerging digital economy has attracted much interest in recent years. Since internet and digitalization have changed almost everything including entrepreneurship, it brought new concepts such as digital entrepreneurship. Davidson and Vaast (2010, p. 2) explains that "digital entrepreneurs rely upon the characteristics of digital media and IT to pursue opportunities. In doing so, they exacerbate changes in the competitive landscape, as they attempt to seize the opportunities and thereby potentially further the creative destruction process of the digital economy". According to Hull (2007) digital entrepreneurship basically has three types which are mild, moderate and extreme digital entrepreneurship. In this study, BuyerNetwork.net is emphasized as 'extreme digital entrepreneurship' which the entire company is digital, going from production to customers. This explanation points a 'type of entrepreneurship' based on the digital-sphere.

The other concept which is explained in this study is lean startup. It offers innovative and profitable products and/or services while minimizing unnecessary over-costs to customers, suppliers and the environment. In this study, BuyerNetwork.net establishment process has been explained with this concept. While lean start-up method focus on how new entrepreneurial companies can develop new products and services for a large number of customers in a shorter period of time by minimizing costs (Tanev et al., 2015), digital entrepreneurship states the platform which entrepreneur(s) do business in. Lean startup concept deals with "how" by explaining the process of producing MVP(s) in an early stage company based on waste reduction thinking. Digital entrepreneurship defines "what" by putting a framework and stating the tools can be used such as social networking platforms, digital apps. Both concept stress the challenges, the risks and uncertainties the companies have to deal with. In many cases, the solution for the companies is to build relations and networks to minimize both complexity and uncertainty, as well as to optimize the use of external resources. The link between the two approaches can be found in their focus on entrepreneurship, since in both cases the entrepreneurs have to learn to operate in a complex and uncertain business ecosystem including customers (which is very important for lean startup concept), suppliers, R&D partners, competitors, etc. (Tanev et al., 2015).

Some previous studies examined the concepts both conceptually and empirically (Sambamurthy et al., 2003; Hull, 2007; Turban et al., 2008, Davidson &Vaast, 2010; Ashgari & Gedeon, 2010; Hafezieh et al., 2011, Esmaeeli, 2011, Tanev et al., 2015, Grohn et al., 2015). This chapter aims to bring these two concepts together with a single case study on BuyerNetwork.net. In doing so, lean start-up method can deeply be understood for establishing a digital company on a vertical social networking site.

LITERATURE REVIEW

Entrepreneurial activities had begun with the first age and still continues. It has varied in many different concepts with the new necessities such as being green, digital and lean etc. Thus, in this direction, for this study, digitalization, digital entrepreneurship and lean concepts are explained below.

Digitalization and Digital Entrepreneurship

In today's world, one word is so popular: Digitalization. But what exactly is digitalization? According to Business Dictionary, it is "the integration of digital technologies into everyday life by the digitization of everything that can be digitized" (online). The communication has been digitalized by social media, the design of production prototypes have been digitalized by digital tools etc. Weightless economy, dematerialization, digital transformation are the emergent subjects related to the topic recently. The Internet and digitalization have changed almost everything including entrepreneurship.

From traditional entrepreneurship models at the Industrial Age, to new entrepreneurship models at the Information Age; capability, learning and flexibility became the essential facets. According to Naisbitt (1994), technological revolution is the deriving power of the new economy. The global dynamic and ever-changing environment, with technological resources, brings continuous change, transformation and development. Rather than material goods, bits of information are processed (Negroponte, 1996), accelerating the shift away from the production of material goods and toward an economy based on the production and circulation of information and knowledge-based services (Davidson & Vaast, 2010).

Technological developments and innovations empowers individuals by challenging them to go further, harnessing new innovative ways of thinking, working and being creative. Thus, it can be said that entrepreneurial activities on digital-sphere increase among individuals who intend to engage in entrepreneurial activities day by day. More and more businesses are 'born digital'.

Sambamurthy et al. (2003, p. 242) define four factors which explain why one would start entrepreneurship in the digital-sphere:

1. Entrepreneurial action that refers to behaviours through which companies recognize and exploit market opportunities through novelty in resources, customers, markets, or combinations of resources, customers, and markets;
2. Agility which refers to the fit that could exist between the company's strategy, its structures and capabilities;
3. Digital options which refers to a set of IT-enabled capabilities in the form of digitized enterprise work processes and knowledge systems; and,
4. Capability of a company which refers to exploring marketplace and determining opportunities for action which is called as the entrepreneurial alertness.

According the Schumpeterian perspective on entrepreneurship, entrepreneurs render certain industries obsolete while creating new ones (Davidson & Vaast, 2010). Entrepreneurship activities on webs (in other words, web entrepreneurship companies) are ventures that do not only use IT to support their business processes, moreover, they use internet and associated technologies such as 'Web 2.0' to create and implement new business ideas (Spiegel et al., 2013). Since digital media (e.g. Web 2.0) and information technologies have generated new conditions for communication as well as new opportunities for

business models while also damaging long-standing, established industries; the concept is especially useful to understand digital entrepreneurship. Esmaeeli (2011) describes digital entrepreneurship as a subcategory of entrepreneurship. According to him, some or all of what would be physical in a traditional organization has been digitized. Thus, digital entrepreneurship implies entrepreneurship activities associated with some degree of digital goods or services, or with other forms of digital activities. Entrepreneurs competing in the digital environment face unique challenges and opportunities; ease of entry, production, and distribution, instantaneous responses from competitors and 'virtual commitment' from employees (Tanev et al., 2015). Thus, there is a growing need to understand deeply this type of entrepreneurship with related concepts.

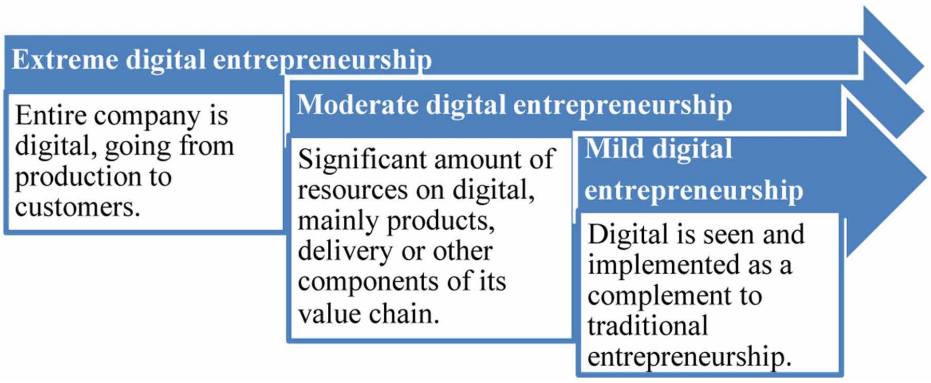
When explaining digital entrepreneurship, it is essential to develop a typology of digitalization of a company. According to some authors, digital entrepreneurship implies entrepreneurship, or new value creation, involving a new business model based on digital goods or services, digital distribution, digital workplace, digital market place, or some combination of these (Turban et al., 2008; Esmaeeli, 2011; Hafezieh et al., 2011). According to Esmaeeli (2011), the degree of business digitalization may be derived from; (1) the digital nature of a company's goods or services, (2) the digital distribution of goods or services, (3) the digital interactions with key external stakeholders within the value chain, and (4) the digital internal activities associated with a company's operations. Hull et al. (2007) also explain the degree of business digitalization by enhancing Esmaeli's framework to six items which are; (1) the degree of digital marketing undertaken by a firm, (2) a firm's digital selling, (3) the digital nature of a firm's goods or services, (4) the digital distribution of goods or services, (5) the digital interactions with key external stakeholders within the value chain, and (6) the digital internal activities associated with a firm's operation.

First one refers to digital goods or services such as videos, search engines, websites, portals, online advertising, digital media services etc. For example, Yandex Search Engine is the digital good of the Yandex Company. It is one of the largest internet companies in Europe, operating as Russia's most popular search engine and its most visited website (Mission, 1997-2017). Second one refers to the distribution of digital goods and services. The potential of digital distribution impacts a company's activities, markets and competitive abilities. For example, Rakuten Kobo Inc. sells digital goods and distributes them on a digital platform. Third one refers to activities of potential digital interactions with key external stakeholders within the value chain such as customer relationships, gathering feedback and information from customers and suppliers etc. It is very important for the companies, especially for marketing activities and strategy practices. Fourth one refers to a digital workplace that employees can work despite geographic distances. Such new ways of work are possible via video conferencing, intranets and other virtual tools. Fifth one refers to the use of digital resources to communicate and interact with stakeholders, including suppliers, industry associations, NGOs, and governmental agencies. Finally, sixth (the last) one refers to the digital operations which are based on digital modes of interactions within a company.

In recent years, more and more theoretical and empirical studies have been conducted on digital entrepreneurship and related topics, especially which have tried to examine the underlying mechanisms. In one of those studies, Hull et al. (2007) categorizes digital entrepreneurship into three types (see Figure 1):

1. Mild digital entrepreneurship which refers to a company's business model that is similar to "click and mortar"; both online and offline operations, which typically include a website and a physical store. In this category of digital entrepreneurship, digital is seen and implemented as a complement to traditional entrepreneurship.

Figure 1. Digital entrepreneurship categories

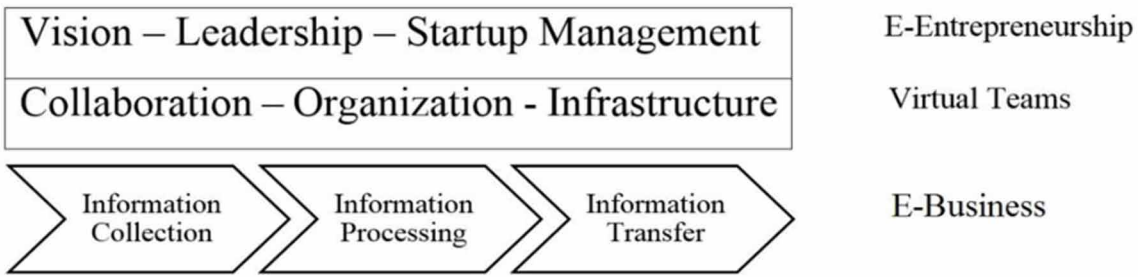


2. Moderate digital entrepreneurship which refers to a company that invests a significant amount of resources on digital, mainly products, delivery or other components of its value chain.
3. Extreme digital entrepreneurship which refers to an entire company that is digital, going from production to customers.

This study tries to explain 'extreme digital entrepreneurship'. On this concept, a modified version of the conceptual framework for *Completely Digital Entrepreneurship* (CDE) based on Kollmann's "E-Business Value Chain in the Net Economy" by Ashgari and Gedeon (2010) is presented (Figure 2).

Completely Digital Entrepreneurship (in this case "extreme digital entrepreneurship") means developing digital products and/or services and selling them over a digital channel. In the framework, there are three key factors which include some sub-factors: e-entrepreneurship, virtual teams and e-business. E-entrepreneurship includes vision, leadership and startup management. A startup company is an organization formed to search for a repeatable and scalable business model and startups are not smaller versions of larger companies; it is a temporary organization designed to search for a product/market fit and a business model (Blank & Dorf, 2012). In line with this definition, one can understand that startup management is highly different than a regular company management. In any organization, vision and leadership are the basics. These concepts provide founder(s)'s way of doing business, plans, desires, leading style etc., and they effect the whole company's both soft and hard elements. Collaboration, organization

Figure 2. The conceptual framework for Completely Digital Entrepreneurship (CDE)
Source: (Ashgari and Gedeon, 2010).



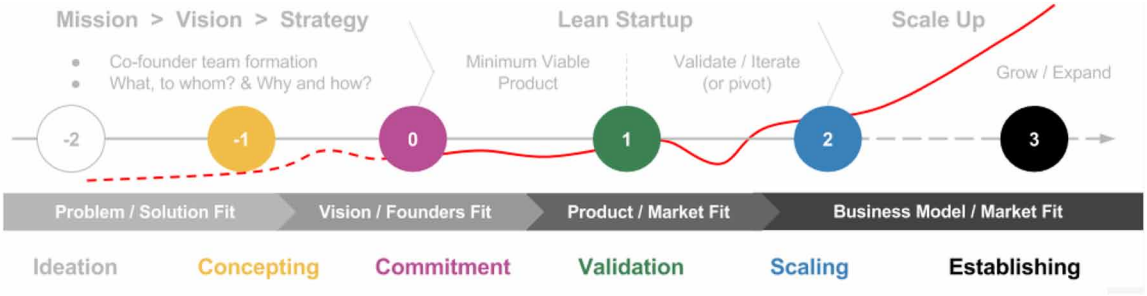
and infrastructure are the factors of virtual teams that refers to all aspects of managing human resources which allow team members to connect independent from physical existence in the same place. They can do business online and collaborate effectively. In the framework, information collecting, processing and transferring it refers to e-business. It includes internet based activities inside and outside of the company to maintain the process of services and product creation, procurement activities, external collaboration, marketing and financial management (Ashgari & Gedeon, 2010). By explaining this framework, the necessary components are defined and examined. For example, below mentioned examplary case company has followed these complete/extreme digital entrepreneurship internal processes. The vision and leadership of the founders of the company is a part of e-entrepreneurship thinking. Also, startup management is the key concept since it hasn't started as a regular traditional company which started with a 'preparation phase' before the establishment by grounding on the lean thinking. Collaboration, organization and infrastructure are stated in virtual teams which lies upon a "team understanding".

The 'Lean' and the 'Lean Startup' Concepts

Startups do not unfold in accordance with master plans. They are not smaller versions of large companies, instead, they are the ones that ultimately succeed, go quickly from failure to failure while adapting, iterating on, and improving their initial ideas as they continually learn from customers (Blank, 2013). Eric Ries, in his popular book *The Lean Start-Up*, explained 'the lean startup' term as a method for developing businesses and products. A lean startup is "a temporary organization designed to search for a repeatable and scalable business model" (Blank, 2013, p. 5). The lean method has three key principles: (1) instead of writing an intricate business plan, founders summarize their hypotheses in a framework called a business model; (2) lean startups ask potential users, purchasers, and partners for feedback on all elements of the business model, including product features, pricing, distribution channels, and affordable customer acquisition. They test to redesign offerings and make further small adjustments (iterations) or more substantive ones (pivots) to ideas that aren't working; (3) lean startups practice agile development, which eliminates wasted time and resources by developing the product iteratively and incrementally. It is, on the basis, a process by which startups create the minimum viable products (MVPs) they test (Blank, 2013). Basicly, a 'lean enterprise' will sustain with growth by aligning customer and employee satisfaction. The Lean Enterprise concept offers innovative and profitable products and/or services while minimizing unnecessary over-costs to customers, suppliers and environment.

In Figure 3, startup development phases can be seen. For the establishment of the project company, founder team should follow these phases. First phase, ideation refers to the entrepreneurial ambition and/or potential scalable product or service idea for a big enough target market. In other words, initial business idea on why and how it would create value is the ideation. As can be seen, 'the before foundation' process start with problem-solution fit and it should be certain and determined. Mission, vision and strategy will be shaped with co-founder team (or one person) that has been formed in this phase. Questions such as "what product(s)/service(s) will be produced? To whom? Why and how will it be produced?" are essential to be answered for this process. Also, vision-founders fit is important for the process to continue well. Second phase is the concepting which refers to define mission and vision with initial strategy and key milestones. Two or three entrepreneurial core co-founders with complementary skills and balanced ownership plan are needed. Third phase is commitment. Committed and balanced co-founding team with shared vision and attitude is the key factor in this step. They should be able to develop the product (minimum viable product-MVP) or service without dependency of uncommitted

Figure 3. Startup development phases
Source: (Startup Development Phases, 2017)



external resources or already have initial product or service in place. After commitment, validation comes as the forth phase. In this phase, iterating and validating assumptions until validated solution to demonstrate initial user growth and/or revenue Key Performance Indicators (KPIs) are identified. KPIs include attracting additional investment-based resources (money or sweat equity) for equity, revenue share or future revenue though. Product-market fit is really important in this phase. Fifth phase is scaling. In this phase, focus on growth showing KPIs based measurable growth in user, customer revenue growth and/or market traction in a big or fast growing target market are the key factors. The sixth (the final) phase, is establishing which the business model-market fit is important for the process. In this phase, the company achieves great growth that can be expected to continue. It easily attracts financial and human resources. Depending on vision, mission and commitment, it is expected that company will continue to grow. It often tries to continue 'like a startup'. Founders and/or investors make exit(s) or continue with the company in this phase (StartupCommons, 2015, online).

There are some differences between lean and traditional organizations (see Table 1). In the lean start-up organization establishment, the process begins with the search for a business model rather than execution a business model. As stated above, it is hypothesis-driven, not implementation driven. The new product process is not a typical step-by-step product management plan. It is a customer development process which includes testing hypotheses. It requires deep researching and testing practices because of the need of problem-solution fit. It requires agile development which means building up the product iteratively and incrementally. The organization members should be hired for their learning capacity, nimbleness, and speed rather than their experience and ability to execute. For the reporting system, metrics are important. In this manner, accounting-style reports should not be adopted. When facing a failure, expected actions will be fixing the failure by iterating on ideas and pivoting away from ones that don't work, rather than fixing the failure by firing executives. In data management, lean start-ups operate on good-enough data, not complete data which is essential for the speed when doing business.

METHODOLOGY

Research Background

Widely used online social networks (e.g. Facebook) can be called as mainstream social networking sites (SNSs). These platforms allow people to create a personal profile (Boyd & Ellison, 2007). A research

Table 1. The differences between lean and traditional organizations

	Lean	Traditional
Strategy	"Business Model" Hypothesis-driven	"Business Plan" Implementation-driven
New-Product Process	"Customer Development" Get out of the office and test hypotheses.	"Product Management" Prepare offering for market following a linear, step-by-step plan.
Engineering	"Agile Development" Build the product iteratively and incrementally.	"Agile or Waterfall Development" Build the product iteratively, or fully specify the product before building it.
Organization	"Customer and Agile Development Teams" Hire for learning, nimbleness, and speed.	"Departments by Function" Hire for experience and ability to execute.
Financial Reporting	"Metrics That Matter" Customer acquisition cost, lifetime customer value, churn, viralness.	"Accounting" Income statement, balance sheet, cash flow statement.
Failure	"Expected" Fix by iterating on ideas and pivoting away from ones that don't work.	"Exception" Fix by firing executives.
Speed	"Rapid" Operates on good-enough data.	"Measured" Operates on complete data.

Source: (Blank, 2013).

indicates that there are 3.42 billion internet users and 2.31 online social network users. According to the recent data, internet usage has been increased as %10 (332 million users) and social networking usage has been increased as same percent (%10 which is about 219 million users). Mobile usage for online social networking is about 1.97 billion users, which correspond to %27 (Kemp, 2016). In this manner, it can be said that about 46% of internet users are using online SNSs and connecting to other users via these platforms. Mobile devices allow internet and social media usage to be easier and faster then ever, thus, people are increasingly use these platforms almost every hour in a day by being on-line all day. Individuals and organizations which are doing business via internet can have many advantages such as gathering information, staying connected and doing business easier.

Platforms such as Facebook, Twitter, LinkedIn, Pinterest, Google+, YouTube, Tumblr, Instagram are mainstream social media platforms which are used widely. Besides these sites, there are vertical/niche SNSs which are used by a group of people. These SNSs aim that group of people for the specialization that they have. They are some kind of specialized online SNSs which serve basic features plus some other special features (see some examples of this platforms at Table 2).

It is possible to predict that vertical SNSs will increase by number in the near future. In this manner, entrepreneurs who work/want to work in the digital-sphere are aware of this opportunity and this kind of online clusters, especially for the groups which share same interests and have common background, special knowledge etc.

Purpose of the Study

Purpose of this study is to explain BuyerNetwork.net as a vertical online SNS which provides a platform for procurement and supply chain professionals and other participants by mentioning lean and digitalized

Table 2. Some examples of vertical social network sites

Vertical Social Networking Sites	Target Group	Explanation	Year of Establishment
Petsbook.com	Pet owners	This SNS is an online platform where pet owners can create a profile for their pets and connect to other pet owners.	2015
BuyerNetwork.net	Supply chain and procurement professionals and other participants such as academics	This Turkey based SNS is a platform which supply chain and procurement professionals and other participants such as academics can create a profile, connect each other, and share their professional knowledge.	2014
Gromsocial.com	Children	This SNS is an online platform where children can use only by having an allowence document of their parents.	2011
Doximity.com	Medical doctors	This USA based SNS is a platform which doctors can create a profile and connect each other.	2011
Edmodo.com	Teachers, Students and Parents	This SNS fill the gap between teachers, students and parents by providing a platform for school and home learning.	2008
Github.com	Software developers	This platform is used by software developers for exchange information about their professionalism.	2008
Rocketlawyer.com	Lawyers	This SNS is an online platform where lawyers come together and share their knowledge in online-sphere.	2008
Researchgate.net	Scientists	This platform is used by scientists for scientific research such as articles by providing membership and a personal profile.	2008
Spiceworks.com	IT professionals	This SNS is a platform where IT professionals come together and share their knowledge in online-sphere.	2006
Patientslikeme.com	Patients	This SNS provides a online networking platform for patients to exchange information about their illness.	2004

establishing processes. In this regard, it is aimed to contribute to the field by making it clear how can lean startup method be put into practice in digital startup companies.

Research Questions

In accordance of the purpose of this study, some research questions are mentioned below:

- What is BuyerNetwork.net and for what purposes and by whom it has been established?
- How has the establishment plan been made? How did the project idea come forward?
- How has lean entrepreneurship methodology been used for this project?
- Accepting BuyerNetwork.net as an examplary company, what are the advantages and disadvantages of lean entrepreneurship methodology for vertical social network sites?

Case study research method has been used for this study. This method is "an empirical inquiry about a contemporary phenomenon (e.g., a "case"), set within its real-world context, especially when the boundaries between phenomenon and context are not clearly evident" (Yin, 2014:43). It gives the researcher(s) the opportunity to harness in-depth knowledge and to examine the subject deeply. Yin (2014) mentions three different case study types for different usage purposes: exploratory, explanatory and descriptive case studies. While "exploratory designs seek to define research questions of a subsequent study or to

determine the feasibility of research procedures; explanatory designs seek to establish cause-and-effect relationships. Descriptive designs attempt to present a complete description of a phenomenon within its context" (Hancock & Algozzine, 2006:33). This study bases on descriptive case study method.

Research Design

All public and business-special documents and informations have been gathered directly from Buyer-Network.net establishment documents since it has been established by two of the authors of this study. Thus, all the information about the processes, decisions, strategies and how the entrepreneurship thought represent the lean method have been collected from primary resources. For the case study research, in regard to the questions have been mentioned above, analysis type(s), method(s) and source(s) can be seen at the Table 3.

Participant Observation, Interview Review and Document Review techniques are widely in use when doing a case study research. These useful techniques provide the researcher(s) to participate in the process of the research by direct observations. In this manner, findings of this study are build upon the data results of these techniques.

Findings

BuyerNetwork.net is a procurement professional-oriented online vertical social network site (also supply chain managers can be members of this platform) which has been established by two scholars at Istanbul University Teknokent (Turkey) for innovative university practices. It provides an online platform for;

- Procurement and supply chain managers to connect for professional communications with peers.
- Connections between professionals.
- Procurement and supply chain professionals to create a synergy by gathering them together and give them the opportunity to share their knowledge.
- Possible employees and procurement and supply chain professionals to find a job/offer a job.

Table 3. Research design plan

Questions	Source(s)	Method(s)	Analysis Type
What is BuyerNetwork.net and for what purposes and by whom it has been established?	Founders and Company Documents	Participant Observation Interview Document Review	Content Analysis
How has the establishment plan been made? How did the project idea come forward?	Founders and Company Documents	Participant Observation Interview Document Review	Content Analysis
How has lean entrepreneurship methodology been used for this project?	Founders and Company Documents	Participant Observation Interview Document Review	Content Analysis
Accepting BuyerNetwork.net as an example company, what are the advantages and disadvantages of lean entrepreneurship methodology for vertical social network sites?	Founders and Company Documents	Participant Observation Interview Document Review	Content Analysis

- Procurement and supply chain professionals to get education with/without simulations about career specific knowledge.
- Procurement and supply chain professionals to determine problems of supply chain and procurement practices via discussion topics/forums and question-answer module.
- Procurement and supply chain professionals to harness knowledge about supply chain productions and services.
- Procurement and supply chain professionals to monitor sectoral informations easily

Ideation, Concepting, and Commitment: The Emergence of the Project Idea and Project Planning

Supply Chain Management and similar courses have been integrated in "Business Administration" field of study in the universities recently. But there is a lack of knowledge in theoretical and practical bases. As the nature of this field, procurement and supply chain professionals mostly get knowledge and specialization from sectoral practices. Additionally, the job itself forces one to get specialization and knowledge in some sub-fields such as construction supply chain management, mining supply chain management, hospitality supply chain management. Thus, these kind of specialization and knowledge are very important for those who want to have/has a career in this field, especially in the ever-changing global competition area.

In this manner, there has been an emergence to create a platform for procurement and supply chain managers to connect each other and, share and harness knowledge. Some qualitative researchs (in-depth interviews and focus group discussions) have been conducted with the professionals. By doing so, it has been aimed to understand their needs and wants. Firstly, "Does vertical social network sites motivate users to be a member?" question has been asked and responses have been gathered. Other questions are stated below:

- Who are the target users/stakeholders? Which web sites, social networking sites, blogs and forums they follow? How and how often do they use these platforms?
- What are the needs of target users? And how much of it have been met?
- Which contents are "trend topics" on the internet about this field? And how much of it have been met for target users?
- Which factors stand out for target users to choose specific social networking sites?

As can be seen on Table 4, there are some examples of participant comments for the ideation process which categorized with the functions of the SNS. They are expressed as networking, personal development, career development, sharing information and knowledge, training (conference and seminars), taking special opportunities offered by professionals and socializing. Participants have used more or less similar comments that haven't fully cited in this study. With these comments, some features occurred which can be seen below in a matrix.

Table 5 briefly states the features of social networking sites by comparing mainstream SNSs and BuyerNetwork.net. Since it is a vertical SNS, it allows users to read job-related publishments such as non-academic e-journals (e.g. 'Satınalma Dergisi' ['Purchasing Magazine']). In addition to above mentioned features, some additional features added in accordance with the findings of the research results. For example, there is Satınalma Uzmanları (i.e. Purchasing Professionals) Group[2] on LinkedIn but it

Table 4. Some examples of participant comments for the ideation process

Participant No	Function of SNS	Participant Comments for the Ideation Process
1	Networking	"Members can connect to each other, being in-touch, communicate online, can reach all the new sectoral updates and can share their experiences about their work."
2	Personal Development	"Members can enhance their personal development by reaching experts, and getting information about a subject that they do not fully have information about but need for it."
3	Career Development	"Members can reach information about the companies that they want to work for, can get in-touch with the people who already work for that companies and in doing so, they can have the opportunity to make their presence known."
4	Sharing Information and Knowledge	"Website can have a databank that can support members to develop their careers. The members can share their presentations, work-related experiences and projects that do not violate the rights of privacy of the companies."
5	Training (Conference and Seminars)	"Member-specific training programs, conferences and seminars can be organized. This can increase members' knowledge on some topics and also it can strengthen the communications and networking among members."
6	Taking Special Opportunities Offered By Professionals	"Website can allow members to take special opportunities offered by procurement and supply chain professionals."[1]
7	Socializing	"Since it is defined as a social networking website, the members can socialize; can share photos, videos or other contents to socialize. LinkedIn have this function. So this platform can provide this too."

is lack of job-related communication tools and, despite 5057 members in the group, there isn't effective discussion environment. This is mostly because the platform should follow LinkedIn's community management approach. BuyerNetwork.net fill this gap with its job-related events such as discussion groups and face-to-face events.

After the main research studies and their results have been finalized by the founders, other researches have been conducted to;

- Identify of the need for software development,
- Identify of the need for qualified human resources,
- Account of the project cost for establishing the social networking site,
- Identify of the project calendar.

Other then the founders of the company which are both project coordinators, there are 4 people who are working for the company; 2 of them are software development experts, one of them is business development expert and one is a graphic designer. They provide necessary software developments working as a virtual team by collaborating.

Validation, Scaling and Establishing: The Implementation of Lean Startup Methodology on BuyerNetwork.net

Eliminating the waste operations is in the core of lean thinking and it has widely been popularized with Toyota's operations in this field since 1970s. First, it has been used by industrial operations, then, service and many other types of operations. Agile and lean software developments have been implied by lean

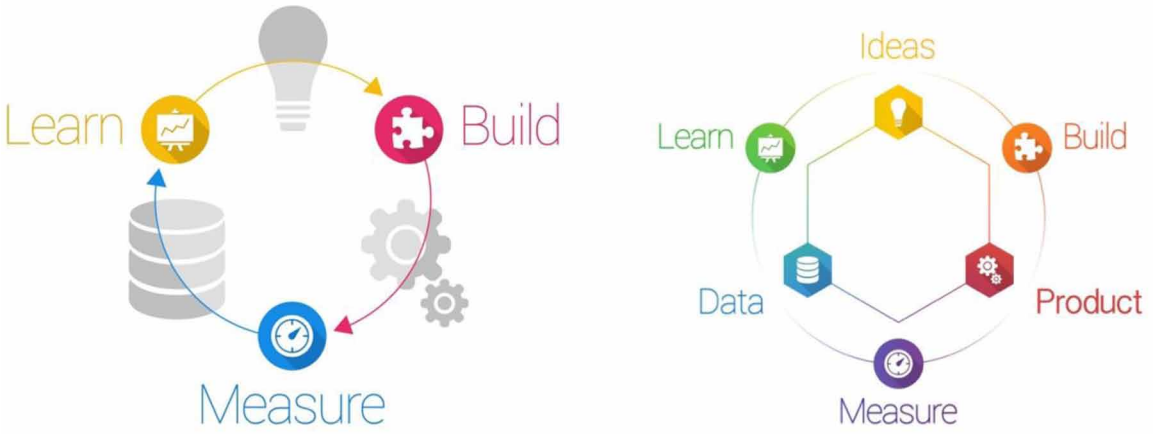
thinking method in the software development practices since they can be adaptable with the changing conditions.

Lean Thinking has been integrated to startup literature with the popular book of Eric Ries. In the *Lean Startup* (2011) book, he explains the lean entrepreneurship method. While reducing all the unnecessary processes through product and/or service development, the aim is to spend all the sources and time only for the development process. Ries (2011) offers a methodology that explains how to practice lean thinking in startup companies. He mentions that new ventures should focus on product and/or service development and offer "minimum viable products" (MVPs = lean products that can be produced for customers' need and wants at the base level) at the first stage. Ries also explains that while some researches have been conducted to understand what customers need and want, it is clear that they don't exactly express their deep thoughts and needs. Thus, he predicts a feedback circle about MVPs that put on market while gauging and developing the success of this products and/or services (see Figure 4a and 4b).

Figure 4. a & b. Build – Measure – Learn (BML)9 Feedback Loop
Source: Ries, 2011 p. 111.



Ries (2011) emphasize the concept of "validated learning" by mentioning the importance and value of learning process for startup companies. According to him, product and/or service development failures can be a way of experiencing and adopting it to the new processes. In this regard, failures can be prevented. These understanding grounds on BML Loop.

When establishing BuyerNetwork.net, this concept has been adopted. First, product features have been determined by examining user needs and wants deeply by in-depth interviews and focus groups with the target user groups. In the technical analysis, a pilot copy of the networking site has been established and asked for target customers (users) to use it with open access on BuyerNetwork.net website. Harnessing instant and continuous feedback and analysing these feedbacks are very important for lean entrepreneurship method. Thus, it has been adopted for the BuyerNetwork.net case.

Rapid-launching system in the lean thinking is essential for the establishment process. Almost %25 of the websites in the internet provide their online infrastructure from Wordpress content management system which is a market leader and dominate the content management market by having %60 of it (Gelbmann, 2015). Its infrastructure has provided the necessary add-ons and other technical background for the short-term purposes of BuyerNetwork.net. In this regard, after the software technology research, Wordpress content management system has been chosen for compensating the short-term needs.

This system has been planned by the project team according to the feedbacks of the users while covering all the purposes of the establishment authentically. Firstly, continuous developments and improvements have been made. Then, the stabilization of the software has been done by the project team to make infrastructure and databases to operate problem-free on the server-side.

The first version of the networking site (MVP version) brought into use on the Wordpress system and, in a short time, over 1000 users became a member of the website. Meanwhile, many features have been tested and confirmed for further usage. At this stage, the language was Turkish to prevent the foreign language problems for users. Then, browser adaptability has been worked through since it is a very important factor for web applications. In this regard, reliable datas have been gathered for the possible future big-scale researches/projects. Updates have been made for the project and business plan according to the experiences that has been gained through this project. For example, database platform has been changed to provide active users a better service and maximize their benefits while using this platform.

BML circle has been adopted in the process of the product as a MVP. Real experiences of the users have been gathered through this circle method and it has provided to improve the service continuously (see Figure 5).

Figure 5 summarizes BML feedback loop for BuyerNetwork.net. User statistics, users' real wants and needs have been considered for usage specific developments. Backend and frontend software problems, user experience/user interface (UX/UI) problems have been solved within the system. The current version of BuyerNetwork.net is authentic by its very nature. Lean thinking, harnessing validated learning method by learning from user experiences of MVPs and focusing on product and/or service development have given the opportunity to gather target users' real needs and wants. In this regard, project has been developed and succeeded.

Advantages and Disadvantages of Lean Startup Methodology on Vertical Social Networks

It is essential to mention the advantages and disadvantages of lean startup methodology on vertical social networks. In this study, they are emphasized on BuyerNetwork.net as an examplary company. The most important advantage of lean startup methodology is that it gives a roadmap to 'focus on value' and 'eliminate other practices which do not create value'. In this regard, it is important to determine that which activity creates a value and which does not. In the industrial sectors, these activities are mostly clear to determine; but in a startup company it is mostly not. Customers decide which activities are valuable. Thus, to focus on value, Build-Measure-Learn should be adopted to determine the valuable activities and customer feedbacks should be learned by validated learning method for the product and/or service

Figure 5. Build-Measure-Learn (BML) Feedback Loop for BuyerNetwork.net
Source:(© Eric Ries, THE LEAN STARTUP (2011). Reprinted by permission of the author.)

development processes. If there is a decision failure of which is valuable and which is not, that would be a disadvantage of the company. So, the decision must be properly made.

In the BuyerNetwork.net case, this method has provided a supportive role for entering to market fast and gaining competitive advantage among potential rivals. Thus, the company has focused on value created for the customers, which are procurement and supply chain professionals in this case. It provides a platform which they can share knowledge, get sectoral informations, connect to peers etc. Most of its tools are free to use, but there are some company specific solutions. Since the company establishment process has been based upon lean thinking, practices that do not create value have been eliminated. For this process, customer development is an important concept. It has been accepted as one of the basic elements of the establishment process to get rid of any decision failure.

CONCLUSION

This study examines BuyerNetwork.net through a case study method by explaining establishment process from start to finish with the lean startup methodology. Digital entrepreneurship is also mentioned since the networking site is a digital platform (above mentioned complete/extreme digital entrepreneurship) and the company runs on that platform. It provides related theoretical background by linking them on digitalization and lean thinking.

In this study, "BuyerNetwork.net", which has been established on a digital platform, has been examined with lean startup methodology. The research part has provided the answers to "why" and "how" questions about the overall process for lean startup establishment on a digital platform. In regard to the results, it has been deduced that lean startup methodology can be practiced and brought to a successful outcome for vertical social network establishment processes. In addition, it has been seen on BuyerNetwork.net that with qualitative researches, customers' needs and wants can be determined deeply before offering MVP(s) to the market and the research results (mostly customer feedbacks) can be used for MVP producing processes.

In the lean thinking, "focusing on value" and "eliminating non-valuable practices / activities / products / services" are been overemphasized; differently, customers are the core factors since they determine what is valuable and what is not. In this manner, MVPs should be confirmed by real experiments to determine real wants and needs of the customers. In the BuyerNetwork.net case study, it has been seen that this process is really important and should be well-evaluated and practiced for entrepreneurs who want to adopt lean startup methodology in their business plan. BuyerNetwork.net case provides a guidance for a lean startup methodology for a business which do business on a digital platform. These kind of platforms are on the rise. Since digitalization is an important concept of todays, more and more startup companies -some of them are unicorns such as Uber, AirBnB etc-. are doing business in the digital-sphere.

This study stresses the importance of getting customer feedback by using BML loop. It points the importance of form an MVP to see whether it meets the customer needs and wants. The aforementioned case show that digital products/services are different from physical ones. Since they need software experts (some kind of skilled human resources) to be developed, they should be tested and retested again and again. Moreover, they can contain many features that customers seek to use for their needs and wants.

In conclusion, this study gives an opportunity to show the establishment process of a digital-born company by emphasizing the importance of developing successful business plan, adopting lean thinking

and providing new products and/or services in the online-sphere. Since the Single Case Study method has been adopted, more than one case studies might provide a broader perspective, comparison and generalization. For different sectors and businesses, same methodology can be adopted by scanning practices and processes in enhanced research studies.

KEY TERMS AND DEFINITIONS

Case Study: A qualitative research method about a contemporary phenomenon which is set within its real-world context when the boundaries between phenomenon and context are not clearly evident.

Digital Entrepreneurship: Entrepreneurship activities which are associated with some degree of digital goods or services, or with other forms of digital activity.

Lean Start-Up: A temporary organization which is designed to search for a repeatable and scalable business model while minimizing unnecessary over-costs to customers, suppliers and environment.

Minimum Viable Product: Lean products that can be produced for customers' need and wants at the base level.

Start-Up Company: A temporary organization which is designed to search for a product/market fit and a business model.

Vertical Social Network: Some kind of specialized online SNSs which serve basic features plus some other special features for some target group of people.

Chapter 55
Digital Marketing Strategy for Affinity Marketing:
Utilising the New Marketing Arena

Aster Mekonnen
GSM London, UK

ABSTRACT

Integration of digital marketing into overall business strategy is no longer an option, it is imperative for success. Yet, not all have tapped into this. Another opportunity that could leverage an organisation in today's competitive environment is affinity marketing. Successful implementation of affinity marketing has the potential to enhance participation, raise revenue, increase retention and provide a mutually beneficial arrangement for the partners involved. Yet, despite its appeal and the popularity it achieved in the late 1980s and early 1990s, uptake of the scheme has slowed down. Whilst some affinity partners have embraced digital marketing to an extent, most are not using it effectively to drive and sustain their affinity marketing scheme. Cognisant that affinity marketing is still a lucrative area, this chapter sets forth a digital marketing strategy for affinity marketing, e-affinity marketing, as this is where the added value for the 21st century customer is envisioned.

INTRODUCTION

Businesses in the 21st century are hugely reliant on the internet to support the growth of their organisations. Whether one should integrate internet technology as part of their business plan is no longer questionable, but rather a matter of how it may be most effectively deployed (Michael Porter, 2001). The growth of and investment in digital marketing is astounding. For instance, an industry survey conducted by Pricewater house and Cooper (PwC) and sponsored by the Interactive Advertising Bureau (IAB) has shown that in US alone the revenue generated for half-year 2014 totalled $23.billion, 15% higher than the previous year (IAB, 2014). Coupled with the digital era, affinity marketing presents a unique opportunity for organisations to strengthen their competitiveness as well as build on their customer's loyalty. The internet presents the ultimate interactive and integrative communications system (Schultz, 1996).

DOI: 10.4018/978-1-5225-3822-6.ch055

Given that affinity marketing (i.e. the triadic relationship between the affinity group, the customer and the service provider) is said to be built on the affinity that customers already have with their affinity group, integrating and implementing digital marketing effectively has the potential to further enhance the customer-affinity group as well as the customer-service provider relationship.

Given the minimal integration of digital marketing in driving affinity marketing, the challenge is to determine the extent to which marketers are using it and to propose ways of enhancing usage. As noted above, unlike most media the internet is interactive and provides marketers with a wide variety of potential uses that range from marketing research to advertising and selling. One of the most significant contributions of the internet is that of value-added marketing – adding value to visitors' experience by allowing marketers to give them additional information as well as services. "The concept of value-added marketing creates loyalty to one or more homepage sites and consequently to the homepage sponsor. Such loyalty is the corner-stone of building lasting relationships with customers" (Husted & Whitehouse, Jr., 2002, p.4).

In the face of today's rapidly changing environment, with the advent of a technology revolution and associated trends such as social media, customers' needs and demands (and even decision making processes) are changing. Recent studies have elicited that companies which master the process of digital integration are 2.5 times more likely to convert their customers (Bughin, 2013). Unfortunately, affinity marketers have not risen to the challenge. The investigation by the author has shown that most affinity marketing schemes are not adequately visible on the internet, therefore failing to capitalise on the opportunity that the digital platform presents.

This chapter intends to provide a strategy that enables affinity partners to integrate their business plan with digital marketing as a key component to drive success. The rest of the chapter is organised under three main areas: the new marketing arena; affinity marketing and digital marketing; and strategic integration. The new marketing arena gives an overview of the 'technology behind digital marketing', looking at the impact of technology and the internet. It also introduces such concepts as e-business, e-commerce and e-marketing with a view to clarifying terminologies, as well as to help put digital marketing into context. The first section will also outline some of the popular 'digital marketing strategies' adopted by marketers to date. Part two on affinity marketing and digital marketing reviews the origins and core values of affinity marketing under the section 'affinity marketing – the big opportunity', highlighting some of the challenges faced by affinity marketers. It then explores how this could be utilised to formulate objectives for e-affinity marketing. Part three – 'strategic integration' – begins with an investigation into 'affinity marketing on the web', a key step in planning the process for e-affinity marketing strategy. This is followed by a discussion on 'knowing the customers', as understanding visitors' needs is an important step in determining what they are offered. Then the 'strategy to activity' proposes steps to help set appropriate strategy and related activities based on knowledge of the target group. The last step in the process – 'performance analysis' – is designed to review the effectiveness of the new initiatives.

1. THE NEW MARKETING ARENA

Aghaei et al. (2012) describes the four generations of the web as follows: Web 1.0 as a web of information connections, Web 2.0 as a web of people connections, Web 3.0 as a web of knowledge connections and Web 4.0 as a web of intelligence connections (the future). The internet has grown from strength to strength since its innovation phase 1964 - 1974 (creation of the fundamental building blocks), through

the institutionalisation phase 1975 - 1995 (when large intuitions were provided funding and legitimisation), up to today's commercialisation phase 1995 – present (private corporations take over, expand the backbone of the internet and local services) (Laudon & Travis, 2013). By the end of 2014, the number of internet users in the world is predicted to reach almost 3 billion, with two-thirds of them coming from the developing world (ICT Publication, 2014). Today, the web provides a tremendous opportunity to reach customers directly. A recent survey of digital marketing spending indicated that up to 2.5% of a company's revenue is used in this area (Gartner, 2013). This report suggests that the three top digital activities key to marketing success are the operation of a corporate website, social marketing and digital advertising. Social media is undoubtedly gaining in prominence, with over 72% of internet users now active on social media. The likes of Facebook and Google+ now have over 1 billion users and the potential to attract more (Laudon & Travis, 2013).

Advances in technology and the evolution of marketing are inseparable. The printing press, radio, television and now the internet are all examples of major breakthroughs in technology that also advanced the field of marketing. Technology has the ability to open up new markets and to radically change existing ones. The rapidness of changes in technology makes it necessary to continuously study consumer behaviour. As soon as one thinks that they may have a grasp on what their archetypal consumer wants, those wants will have changed. In the developed world, the digital revolution is changing the way we choose and buy our products and services. People are now going online on a daily basis to fulfil needs such as banking, shopping, recreation and communication.

Some marketing principles never change. Companies must meet the needs of their customers, the need now is digital integration, which is further fuelled by digitally enabled social networking (more commonly known as social media).

The Technology Behind Digital Marketing

The terms internet marketing, e-marketing and digital marketing are often used interchangeably. However, e-marketing is sometimes considered to have a broader scope than internet marketing since it refers to digital media such as web, e-mail and wireless media, but also includes management of digital customer data and electronic customer relationship management systems (E-CRM systems). The term 'digital marketing' was first used in the 1990s and was then described as 'the marketing of products or services using digital channels to reach consumers (Dorie 2012). The key objective is to promote brands through various forms of digital media. To help clarify these alternative terminologies and definitions, in collaboration with the Institute of Digital Marketing, Chaffey (2005) proposed an all-encompassing explanation of digital marketing, describing it as an activity that involves the application of technologies which form online channels to market; that's web, e-mail, databases, plus mobile/wireless and digital TV.

The internet began in the late 1950s in the military and was gradually advanced by computer scientists. The digital revolution, also called the third industrial revolution, is the change from analogue, mechanical, and electronic technology to digital technology (Ryan & Jones, 2012). The digital age as we know it now began with the internet and the Web 1.0 platforms of the early 1990s. This was a rather static world in which users could get the information they desired but it could not be shared on the web. There was no such thing as interaction, as the only activity was reading of content. In 1993, we saw the entrance of the first clickable banner ad and by the next year online magazine Hotwired had begun to purchase huge numbers of banner ads. This was the first step towards shifting the market into a new digital age.

Web 1.0 then slowly progressed into Web 2.0. This is not a new version of Web 1.0; it is about enhancing how people use technology. People were no longer passively taking in information, but instead the internet became a sort of super-highway where users could directly interact with both other users and businesses, the collaborative potential enabling users to share, interact and communicate via rich media content such as Facebook, Instagram, YouTube, FaceTime, Skype and many more. In the early 2000s, supported by the capabilities of broadband and fibre optics, numerous networks and social platforms were developed. This finally enabled Web 2.0 to become truly social. Social media has now become a thriving entity.

In the 2000s and the 2010s, as digital marketing continued to get more sophisticated, it became recognised as an effective technology to enable and foster a relationship with more concisely targeted consumers. With this came the need to formulate a strategy specifically tailored to meet the demands of the internet audience. Digital marketing has changed drastically since its conception in the early 1990s and will continue to change.

Which Digital Marketing Strategy?

Although the term 'strategy' has been used in many different contexts, they are all synonymous in being described as the means to achieve a goal. One simple definition is that it is "a plan of action designed to achieve a long-term or overall aim" (Strauss & Frost, 2014, p. 72). In comparison to traditional strategy, e-business strategy is described as "the deployment of enterprise resources to capitalise on technologies for reaching specified objectives that ultimately improve performance and create sustainable competitive advantage" (Strauss & Frost, 2014). This is inclusive of information technology components such as the internet, digital data, databases, etc.

There are several tools that have been developed or adapted by marketers in their effort to integrate digital marketing strategy into their overall business strategy. Chaffey and Chadwick's generic digital marketing strategy development process (2006, 2012); Chaffey and Smith's 'SOSTAC© Planning Framework for e-Marketing' (2012); and Strauss and Frost's 'E-Marketing Plan' (2014) being amongst such theories. The foundation of these strategies is traditional marketing with common elements, such as; assessing the marketplace; defining objectives; selecting a strategic approach; implementing actions or activities; measuring results or performance (being comparable).

When considering the formulation of a strategic plan suitable for e-affinity marketing, first and foremost one has to examine the unique features inherent to affinity marketing. The review of generic and specific digital marketing strategies, as well as current best practice, can also aid the building of an e-affinity marketing strategy as it will undoubtedly unveil some of the most essential elements required in order to develop a robust digital marketing strategy. Therefore, highlights from some of the notable literature mentioned in the subject area are discussed below.

In a comprehensive study on internet marketing, Chaffey and Chadwick (2006) suggest that the internet marketing strategy should follow a similar form to the traditional strategic marketing planning process and should include: goal setting, situation review, strategy formulation and resource allocation and monitoring. The authors highlight that this plan should also take into consideration external and internal factors that could affect the organisation. In their discussion of digital marketing, the authors further outline three key steps that need to be followed: defining the online opportunity, selecting the strategic approach and delivering results online.

A similar concept was proposed in in the late 1990s by PR Smith, who developed a marketing planning system represented by SOSTAC©, which stands for situation, objectives, strategy, tactics, actions and control. This model was voted as the third most popular marketing model by the Chartered Institute of Marketing (CIM). This could be attributed to its simple, all-encompassing features. At a later date, in 2008, Chaffey and Smith proposed an overall strategy process model for strategic internet marketing - the SOSTAC© planning framework for digital marketing strategy development, which incorporated unique features and capabilities of the internet.

The environment, strategy and performance (ESP) model created by Strauss and Frost (2014) is an alternative approach to e-marketing strategy, which builds on the idea that businesses need a well formulated process on which to determine the success of their strategy. ESP is supported by key marketing tools such as the SWOT (strength, weakness, opportunity and threat), and e-marketing mix to create a comprehensive strategy.

Deviating from the process or plan orientated approaches described above, Ryan and Jones (2012) identified five key components that generally form the foundation of a digital marketing strategy as follows; knowing your business; knowing your competition; knowing the customer; knowing what you want to achieve and knowing how you are going to do it. The authors argue that this process "forces you to sit down and analyse the market in which you are operating in with a critical eye, and to really think about the different components of your business and how digital marketing can help you to achieve your business goal" (Ryan & Jones, 2012, p.23).

Another recent work with an alternative focus is Scott's (2013) investigation of the use of social media, in which he discusses the importance of setting a clear goal when building a digital marketing and PR plan. Here, the author places emphasis on a buyer orientated focus in the context of the organisational goals. Scott suggests that organisations should learn as much as they can about their buyers and segment them into groups identified by 'buyers' persona'. This, he notes, should be the first and single most important step that an organisation needs to take in creating a digital marketing plan. Scott also explained other components that need to be included in the overall planning, such as tactics for the implementation and measurement of the marketing effort and success.

What is clear from the review is that the digital marketing strategy must support and be integrated with the overall business and marketing plans. The review has also shown that there is no single common approach to building a digital marketing strategy, nor should there be one. But, there are essential elements that every marketing strategy must have. This should include (but not be exclusive to); setting digital goals or objectives; analysing the situation; knowing one's customer; setting the strategy and tactics by which to execute it and having a control mechanism for evaluating performance. To the same effect, one must design a strategy or plan that is well structured and comprehensive in the context of the specified sector. With an informative overview of the key components required to build a digital marketing strategy, let us now turn to the context in which we want to develop it for – affinity marketing.

2. AFFINITY MARKETING AND DIGITAL MARKETING

Affinity marketing is widely recognised as a scheme that:

Involves customers who already have sympathy to one brand (be it commercial, not-for-profit or another membership organisation) being sold another service, by another organisation, with the endorsement of the affinity organisation and using its channels of communication. (Mintel, 2000)

Considering how affinity marketing fits within the broader field of services marketing, while most of the studies to date placed it within the context of relationship marketing, associations of the topic have also been made with cause-related marketing. The first time affinity marketing appeared in association with cause-related marketing was in Varadarajan and Menon's (1988) work on the concepts of cause-related marketing. In this work, the authors described affinity marketing as an extreme type of highly targeted cause-related marketing. Varadarajan and Menon (1988) defined cause-related marketing as:

The process of formulating and implementing marketing activities that are characterised by an offer from the firm to contribute a specified amount to a designated cause when customers engage in revenue-providing exchanges that satisfy organisational and individual objectives. (Varadarajan & Menon, 1988, p. 123)

Similarly, Macchiette and Roy (1992) suggested in their study of affinity marketing that the revenue generated by affinity could be seen as cause-related marketing. Soon after, in Schlegelmilch and Woodruffe's (1995) comparative analysis of the affinity card markets (the most popular affinity marketing scheme in the USA and the UK) it was suggested that affinity credit cards fit with cause-related marketing because a firm (the card issuing service provider) uses an association with a designated cause (for example a charity) to market its product or service. Another view that follows the same line of discussion is Worthington and Horne's (1992) proposal that affinity marketing is a sub-set of cause-related marketing, representing a step-change in the nature and intensity of the triadic relationship between the commercial and non-profit partners and consumers. Both cause-related marketing and affinity marketing are premised on the idea that linking specific products to a credible and respected cause or non-profit organisation (in return for a contribution to that cause or organisation) will make the product offering more attractive to consumers (Ross et al, 1992).

Currently, there is growing interest in the use of cause-related marketing as a corporate communication strategy in encouraging sales and as a tool for competitive differentiation (Bigné et al., 2012). Therefore, due to their similarity, equal interest could be expected for affinity marketing. Moreover, one should also note that the role of information communication technology in philanthropy is growing. There is a new culture of generosity, for instance in the UK, between 2007 and 2008 online donations almost doubled, rising from 4% to 7% of UK wide giving (Honoré, 2011). In light of the role of technology and the 'big opportunity' presented through affinity marketing, this section starts with an in-depth review of affinity marketing, highlighting the key principles underpinning its foundation. It then explores how this could be utilised to formulate 'objectives for e-affinity marketing'.

Affinity Marketing: The 'BIG' Opportunity

The first significant academic perspective of affinity marketing was offered by Macchiette and Roy (1992), who described it as a blending of affinity and existing marketing concepts. Affinity, they suggest, is "an individual level of cohesiveness, social bonding, identification and conformity to the norms and standards of a particular reference group" (p.48), while the marketing concept focuses on the "expectation of benefit for the individual, satisfying consumer wants and needs" (p.48). Therefore, the main component in

affinity marketing is the customer/affinity group relationship, upon which the affinity marketing scheme is leveraged. Affinity marketing is therefore based upon a strategic partnership between complementary brands, in which a mutually beneficial triadic relationship is formed between the group, the members of the group and the service provider of the product being used for marketing purposes.

There were several organisations linked to affinity marketing schemes. For example, work related organisations, charities, educational institutes and leisure clubs could all be linked to such a scheme. It is worth noting that different types of affinity groups are likely to exhibit differing types of relationships (Worthington, 2001; Laing et al., 2004). This is suggestive that each type of group is influenced by different sets of values that could potentially affect an individual's decision making process with regards to an affinity product. Popular industries that utilise affinity schemes include financial services (often related to the issuance of credit cards), insurance, communications, travel and tourism.

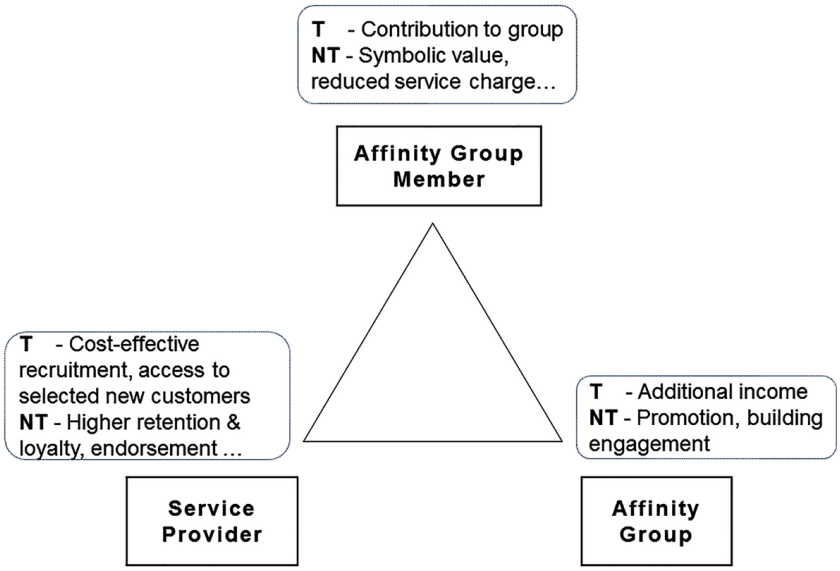
In examining affinity relationships and related schemes, one also needs to be aware that strength of these relationships may vary. Consequently the strength may influence customers' decision making processes and levels of engagement with the affinity group and associated partners, be it offline or online. In addition, the nature of the customer - service provider relationship needs to be taken in to consideration in order to get a full picture of the triadic relationship. This will enable us to gauge why and how the relationship developed, the extent to which the affinity group affects the relationship and how this could aid in the development of a digital strategy.

As previously noted, the affinity marketing partnership (described as a triadic relationship) is based on Macchiette and Roy's (1992) 'affinity interaction model'. The model depicts the triadic relationship formed between the consumer, the affinity group and the commercial organisation. Varied adaptations of the triadic relationship have since been proposed (Mekonnen, 2012, Worthington. 1997). In a triadic relationship it is assumed that a long-term ongoing relationship is formed. Moreover, it is believed that value is created to all partners involved in the triad, provided the relationships are managed well (Worthington, 2001). The triadic relationship provides tangible and non-tangible benefits to all the partners involved (i.e. the customer, the affinity group and the service provider). A summary of these benefits are illustrated in Figure 1.

Utilising the concept of affinity marketing, affinity credit cards provided the main focal point for affinity schemes, especially in the early days of the development and growth of affinity marketing. Consequently, most of the literature on the subject is based on affinity credit cards. Affinity cards were also the earliest adopted and have been perhaps one of the most successful affinity products. Therefore some of the examples in this chapter may draw on affinity credit cards to demonstrate key concepts in relation to digital marketing

Affinity credit cards are like conventional credit cards for the most part, except that they are affiliated to particular affinity groups and it is therefore presumed that they are taken out by people with common interests. Usually, an affinity credit card will display the logo of the particular affinity group, along with the name of the service provider and the card scheme mark (Visa or MasterCard). The key difference between the affinity credit card and the generic bank card is that when a member or supporter of the affinity group signs up for the card, a payment is made by the affinity credit card service provider to the affinity group. Most affinity credit card agreements include both an initial donation from the service provider to the affinity partner (ranging from £5 to £10 per card issued) and an ongoing turnover related payment (usually around 20p to 25p per £100 spent on the card). The USA is the leader of affinity marketing and can often serve as a useful indicator for the UK market. A recent report on credit cards conducted by the USA's Government of Accountability Office (GAO, 2014) indicated that the University

Figure 1. Triadic relationship and associated benefits: The case of affinity credit cards
Key: T- Tangible benefit NT- Non-tangible benefit



of California received about $1.5 million through its agreement with FIA card services, the largest payment to an institute of higher education in 2012. The University of Cambridge, whose alumni affinity credit card launched in 1993, had 10,000 card holders by 1999 and had generated over £250,000 for the university by that date (Mintel, 2000). Thus, there is undoubtedly a 'big opportunity' to raise funds and promote the standing of an organisation or a cause through affinity marketing.

Affinity Marketing Challenges

Looking at the affinity card industry in particular, despite sounding like the ideal partnership, the decline in the number of charity credit cards available is a sure sign that these partnerships have encountered some problems. Horne et al. (2000) have shown that there was a gap in how the affinity partners understood the benefits each gained (i.e. there was a knowledge gap between the customer, the affinity group and the service provider). Such a gap in knowledge could potentially lead to mismanagement of the scheme, particularly mismanagement of the customers and possibly even lead to the dissolution of the customer-service provider relationship (Mekonnen, 2012). Such problems could hamper the growth of the affinity marketing industry.

Mintel (2004) has reported that the number of affinity credit cards in issue, as a proportion of all credit cards, has fallen from a peak of 8.6% in 1998 to 3.4% in 2003. More recently, a market research report on affinity credit cards has indicated that payment card affinity schemes fell in number by over 25% between 2008 and 2010 (Finaccord, 2010). This report also notes that many credit card schemes have been discontinued either through lack of demand or lack of profitability. Supporting this, in a study relating to all types of credit cards in the UK, Euromonitor (2011) reported that the total number of personal credit cards that use affinity has fallen from 69,927.4 million in 2005 to 55,894.3 million in

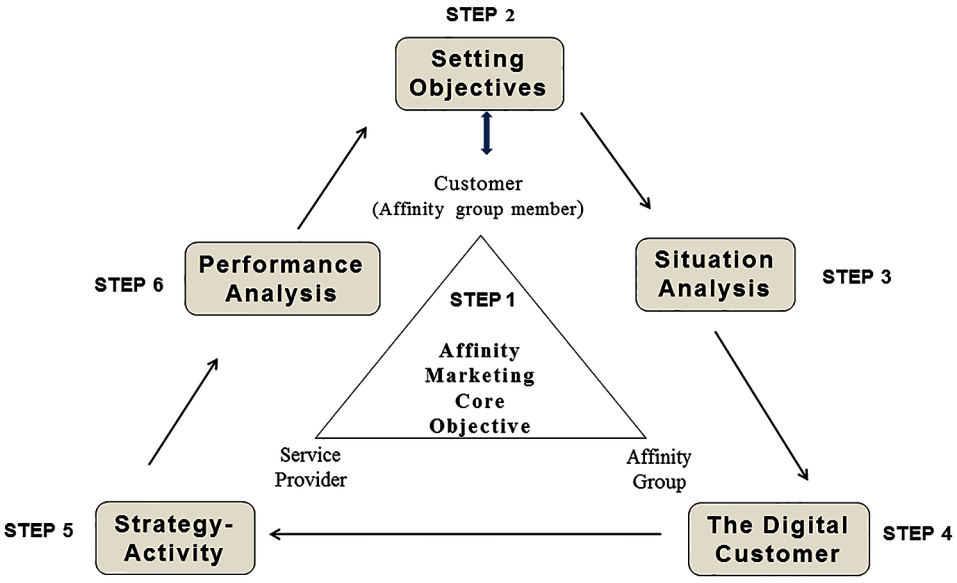
2010. However, the reason behind the fall was not explored. Furthermore, due to the difficulty in obtaining access to customers holding affinity products, there is a gap in understanding customers' attitudes towards this product and the nature of the relationship customers have with their affinity groups. More often than not, affinity partnerships end due to one member of the party failing to receive comparable benefits to the other (Bumell, 2013). A recent example of this can be seen in the demise of the Lloyds Banking Group's partnerships with charities such as Cancer Research UK, the NSPCC and the Scottish SPCA. In the case of Cancer Research UK, Lloyds ceased offering their charity credit card in 2012 after a 23-year partnership which raised a total of £14.5 million for the charity (Howard, 2012).

There is no known study to date that explains why the growth of affinity marketing schemes has stagnated, or any that have considered why there is limited integration of affinity marketing in the digital landscape. Yet the coupling of these two areas has huge potential in capturing a unique market. Having reviewed alternative digital strategies for business and the core concepts of affinity marketing, let's now turn to the setting of a plan for e-affinity marketing in the 21st Century.

3. STRATEGIC INTEGRATION

This strategic integration identifies the key steps required for planning a digital marketing strategy for affinity marketing. The 'E-Affinity Marketing Planning Process' presented in Figure 2 illustrates the step-by-step process for creating an e-affinity marketing plan. Each step is not necessarily conducted in isolation and there is likely to be an iterative process of back and forth to fine-tune essential elements that need to be reviewed within each step.

Figure 2. E-affinity marketing planning process



Setting E-Affinity Marketing Objective

One main area highlighted in relation to planning a digital marketing strategy is the need to clearly identify the goal or objective desired from the digital channel. It is important that organisations build on their overarching objectives in the advent of digital integration. Likewise, affinity marketing schemes should follow the same ethos, as it is an extension of the channel or means by which the organisation reaches customers. Therefore, to help create objectives for e-affinity marketing, the recommendation is to initially evaluate the core values related to the scheme and then consider how this can be enhanced or achieved via digital channels. Informed by knowledge of the core objective, the next step in the process is setting e-affinity marketing objectives (Step 2).

A review of digital marketing strategies to date indicates that most of the e-marketing planning tools proposed begin with an evaluation of the environment before commencing with the designated steps. However, given the nature of affinity relationships and the overarching aims and principles underpinning affinity marketing, this paper opted to diverge from this approach as it was felt necessary that the digital objectives for e-affinity marketing should be defined from the outset.

In the SOSTAC© model for digital planning, the objective is denoted by the statement "Where do we want to be?" It is further noted that the model can be used to identify what a business wants to achieve through online channels, as well as to question what the benefits might be (Chaffey & Smith, 2008). This model is encompassed by five broad benefits of, reasons for or objectives of e-marketing: 1) to grow sales 2) to add value 3) to get closer to customers 4) to save costs and 5) to extend the brand online. What is striking about these objectives is that most of it is already aligned with the principles and aims underpinning affinity marketing.

In digital marketing, there are a number of different objectives that can be set; for example, lead generation, acquisition, engagement or retention. In previous studies it has been proposed that an *explorer* could be converted to a *supporter* – thereby strengthening the customer-affinity group relationship as well as the customer-service provider relationship (Mekonnen, 2012). Therefore, if one was to consider a charity group seeking to raise more donations through long-term commitment, one objective could be to convert x% of its episodic donors or members on the newsletter mailing list to the affinity credit card scheme by July 2016. As shown by Mintel's 2000 report, customer acquisition through affinity-based direct mail communication to a 'warm' audience may yield a 6% to 7% response, whereas direct mail into the mass 'cold' market may only yield at best a 1% response. Therefore, it could be said that such a strategy has a high potential of succeeding, given that the target audience are already said to have sympathy for the affinity group. Ultimately, the objectives should relate to what an affinity group and partner aspires to achieve in their overall business objective. Once the objectives for e-affinity marketing have been clearly defined, the next step is to analyse the digital marketspace in the context of affinity marketing.

The remainder of the discussion in this section logically follows the rest of the e-affinity marketing process demonstrated in Figure 2 and is organised accordingly from Step 3 through to Step 6. Step 3 reviews the current practice of 'Affinity marketing on the web' (situation analysis on Figure 2). The next logical step would be to ensure the needs of affinity marketing customers are understood, in both an online and offline sense (Step 4, the digital customer on Figure 2). This is a fundamental requirement for any business striving to succeed in today's competitive environment. *'Knowing the customer'* is crucial for affinity marketing given the unique affinity relationship that the scheme is leveraged upon. Based on the analysis of the situation and the customers' persona, strategies for e-affinity marketing

need to be identified (Step 5, strategic-activity on Figure 2). The last step in the process is to formulate a control mechanism with key performance indicators (KPIs) to measure and analyse performance (Step 6, performance analysis on Figure 2).

Affinity Marketing on the Web

The situation analysis (Step 3 of the process in Figure 2) should provide an overview of your organisation (who you are, what you do and how you interact and trade online) by addressing internal and external factors impacting on the business. For e-marketing, it is suggested that this analysis should include growth in users, changes in the market place as well as examples of good and bad e-marketing practices (Chaffey & Smith, 2013 and Strauss & Frost, 2014). Extending this, in the context of e-affinity marketing analysis an assessment of members or supporters' engagement with the group via the web should also be included.

It is important to have an honest and realistic baseline of your current capabilities and activities in order to define a meaningful digital marketing plan for the future. In order to analyse the situation in the first instance, affinity partners (in particular the affinity groups) should consider encompassing the following areas and answering related questions:

1. **Identification of the Digital Customer:** The affinity group needs to know who the digital customers are (with a demographics breakdown), how they interact with the brand, and what platform(s) they use.
2. **SWOT Analysis:** What are the strengths, weaknesses, opportunities and threats of digital integration in relation to the affinity scheme to the organisation as a whole. This should be inclusive of the affinity groups internal capabilities, skills and knowledge with respect to digital marketing.
3. **Competitor Analysis:** The affinity group should identify its competitors and assess how they compete. In terms of added value, to what extent have competitors incorporated an affinity scheme? Competitors overall product offering (i.e. inclusive of price, customer service, and their key differentiators). Furthermore, affinity groups should take this opportunity to assess their competitive position with respect to digital marketing in the industry they operate in and in relation to their close competitors.
4. **Digital Channels Analysis:** The affinity group should list the various digital channels used and success of each in different areas of the organisation. In other words the affinity groups should be able to assess the scope, depth and effectiveness of their current digital marketing activities across the range of digital channels.

Currently it is apparent that the main presence of affinity marketing on the web is on the affinity groups website. This could be attributed to the complicated nature of the triadic relationship and due to the fact that the initial contact with the affinity group members or supporters is often made via the affinity group. However, once the customer sign up to the affinity scheme, the affinity product provider is primarily in charge of the relationship, and subsequently the one that has regular contact with the member with regards to the scheme.

Taking the above into consideration, following on the affinity credit card theme, the author investigated the presence of the affinity marketing scheme on the websites of affinity groups. Past studies have shown charity, sports, and university affinity groups to be amongst the most popular ones from the

array of affinity groups at present (Mintel, 2000 and Mekonnen et al., 2008). Therefore, the websites of 10-15 affinity groups within each of the above category were investigated to evaluate the current situation. Visibility and activity of each group in relation to the prominence of the scheme in the homepage as well as related sub-pages were examined.

An e-commerce presence map is one way of identifying presence in the context of the website, email, social media and offline media, with presence identified on different platforms including the traditional desktop, tablet, and mobile (Laudon & Traver, 2013). Activities one should look for when evaluating presence should include search, display, newsletter, conversation, engagement and sharing. Ideally an extensive investigation of all of the above would be recommended, but in this case the author had already uncovered that current digital integration of affinity marketing to be minimal. Therefore, the information the researcher was able to unearth was limited.

The key findings from the investigation into affinity scheme presence on the web include the following:

1. In extreme cases there were affinity groups with a robust website dedicated to the main function, but they did not have a page on their website for the affinity schemes which they are participating in offline. Therefore, in these cases no further investigation could be conducted.
2. With the affinity groups who had their affinity scheme represented on the website, at the time the investigation was conducted, with the exception of a few the affinity schemes were not visible at all on the homepage. In a few of the cases where it appeared on the homepage, it was only visible as a side banner ad.
3. Where the affinity groups had incorporated the affinity scheme in their website, it was noted that there was no link associated to the scheme on the homepage. This suggests that affinity schemes may not be ranked highly in terms of the organisation's priority for digital integration.
4. In most cases it is evident that unless a potential digital customer actively searches for the affinity scheme, with existing knowledge the scheme, there was not much chance of the customer finding out about the scheme whilst navigating through the homepage. For the most part, there does not appear to be any consistency as to how the affinity groups are leading potential customers to the site dedicated to the affinity scheme. Out of the three categories investigated, universities appear to have adopted a relatively similar step for customers to reach the site dedicated to the affinity scheme. They all appear to lead their members or supporter to the page hosting the affinity scheme via the alumni page, for which the link is often visible on the homepage.
5. Once customers reach the page related to the affinity scheme, if they wish to proceed with signing up for the scheme, they will then be directed to the partner's (affinity product provider) website to complete the registration.

On the whole, all the affinity groups investigated appear to have the technological capability to fully integrate the affinity scheme as part of their digital activities, as can be evidenced by the depth of the activities they have integrated for some of the functions relating to the organisation's main offerings. For example, the University of Cambridge's magazine page gives visitors several opportunities to interact, e.g. play crosswords, download the magazine, link to the CAM reader app, etc. In comparison, the page related to the affinity scheme only has general information and a link to the service provider. Generally speaking, there is no indication to show that the same level of effort is exerted for affinity schemes.

For many of the affinity groups, although the affinity scheme may not be their main priority in relation to their overarching business objective, if harnessed it has the potential to add value to the customers experience and consequently build a long-term relationship for all parties involved.

Knowing Your Customer

Once the overarching e-affinity marketing objective has been derived from the core values underpinning affinity marketing (Step 1 and 2) and the situation analysed (Step 3), the affinity groups needs to focus on their customer (Step 4) and work towards an appropriate digital strategy that meets customer's demands.

Identification of digital customers in situation analysis looked at a more generic set of information exploring their demographic breakdown, how they interact with the brand, and what platform(s) they use However, here the emphasis is to extend this knowledge and get a deeper understanding of customers' value in relation to their affinity relationship and the affinity scheme, with a view towards building a persona for the digital customer. A better understanding of how affinity group members or supporters perceive their group's unique qualities, social status and size may provide a way of assessing the strength of their 'affinity', therefore analysing their receptivity to affinity marketing. When an organisation considers the design of their site, they need to understand the differing mind sets of the visitors in order to reach them by building an effective content strategy (Scott, 2013). Scott demonstrates this point by explaining how a college website could have multiple goals such as: 1) Keeping alumni happy so that they donate money to their Alma matter (differentiating between the young and the older alumni), 2) Recruiting students (with sites that need to be tailored for both high school students who may be considering the college as well as the parents reviewing the college, with different information needs), 3) keeping current students happy. In total, five groups are identified here. By understanding the persona of these five groups, the college can create appropriate content to cater for each set of visitors. Similarly, when considering creating of an effective e-affinity marketing site, affinity groups needs to first understand the behaviour of each group of customers that are likely to visit the site.

With e-affinity marketing the affinity group can start by segmenting potential customers based on existing knowledge of the characteristics exhibited by members of the affinity group. For instance, three types of affinity marketing customers - *communicators, supporters* and *explorers* were identified in a recent study related to understanding their relationship with affinity marketing (Mekonnen, 2012). Explorers were primarily driven by opportunities in the marketplace (benefit sought: individual-functional). For communicators, conveying their profession as part of their identity was a strong influencing factor when considering an affinity scheme such as an affinity credit card. For supporters, the functional benefits (donations) were the main reason for acquiring the affinity product. With this knowledge in mind, for example, a professional group's website could place emphasis on the symbolic value of the affinity product on the page dedicated to the affinity scheme. Furthermore, the group could also promote the symbolic value of the scheme on its homepage as one of its online value propositions.

It is also important to recognise that the strength of relationships varies and customers with different strength of relationships (for instance high, medium or low) will require different levels of engagement. Once the organisation has a clear picture of its potential e-affinity marketing customers, it then needs to plan its digital strategy with these groups in mind. Subsequently, the marketing channels used, message, content, layout and structure, as well as wording and language intended to describe what the affinity group provides, should be guided by the defined persona (Scott, 2013).

Strategy to Activity

Having recognised the 'big opportunity', defined digital objectives in line with the organisation's core values and objectives (Step 1 and 2), conducted a situation analysis to assess the affinity scheme's presence on the web (Step 3) and defined the digital audience in relation to the affinity scheme (Step 4), the next step in the process is to set out a strategy and set of related activities (Step 5). This should be formulated to enable the affinity marketing partners to fulfil the objectives set.

Affinity partners should consider the following three steps in setting and implementing the strategy:

1. Initially, affinity partners need to clearly specify what they want to achieve. Strategy is the long-term vision and should be set for a defined period. There should also be an approved budget allocation. For example (continuing on the theme of the affinity credit card), if we revisit the example used in Step 2, if the objective is 'to convert x% of the members on the mailing list for newsletter to the affinity credit card scheme by July 2016', the strategy could be to send periodic communication to the target audience, from the mailing list. In this strategy the affinity group should strive to understand the existing customer database and learn how it interacts with the website. In addition the strategy should also question how the affinity group is currently communicating with its existing customer database?
2. The next step is the tactic. Tactics are the detailed plans to implement the strategy and tend to be short-term and flexible (Chaffey & Smith, 2012 and Strauss & Frost, 2013). Continuing on the theme of the affinity card example from Point 1 above, at this stage the affinity group can determine the exact online activities or communication channels suitable for each target identified. Furthermore, decision regarding the content and frequency of the communication can also be taken.
3. In the final stage the partners need to specify how each activity will be managed. Given the complexity of the scheme, partners may have different objectives and levels of responsibility at different stages in the relationship. This includes everything from the promotion, to the sales and on to the maintenance of the scheme. This is evident if we look at the nature of the triadic relationship demonstrated by the infographic diagram (Figure 1), which indicates the variety of benefits to be gained by each partner. The process of building the affinity scheme also demonstrates different levels of responsibility. For instance, whilst the introductory and initiation of customers often falls upon the affinity group, the signing up of customers is the affinity product provider's responsibility.

Earlier studies have already indicated that there has been a gap in how the affinity partners understood the benefits each gained by each (Horne et al., 2000). Mintel (2004) has also reported how the complex nature of triadic relationship might lead to a problem in relation to how the customers are managed. Technically, the affinity groups might feel that they should have a say in the relationship, since it is assumed that the customer will be a member or supporter of their organisation. Besides, it is assumed that the affinity group would obviously have been the host group that provided the service provider with details of the customers' names and addresses in the first instance. However, in reality it generally tends to be the service provider that takes control of the customer relationship in affinity marketing schemes. For example, with affinity credit cards, the service providers know who the card holders are, they speak or communicate with them regularly via email and the monthly statement; ultimately, they provide the customer service to their card holders. Moreover, due to data protection requirements, the affinity groups were not even always told which of their members have actually arranged a financial product via the

scheme (Mintel, 2004). Therefore, when devising and implementing the e-affinity marketing strategy it is critical that both partners are involved in the design, management and maintenance of each tactical e-tool, as both will benefit if the site is fully optimised.

Performance and Analysis

The final step in the process of strategic integration is 'performance and analysis' (Step 6, Figure 2). This is designed to measure and analyse the performance of the website in order to determine the success of the strategies and the plans. As the result is intended help future developments of the site, this is indicated as an iterative process with the final arrow pointing back to e-affinity marketing objectives.

Performance analysis is primarily led by the objectives set at the outset, with the help of web analytics. Web analytics is the measurement, collection, analysis and reporting of the internet data for purposes of understanding and optimising web usage (Web Analytics Association WWW, 2008, p.3). Analytics is not just a tool for measuring web traffic, but can be used as a tool for business and market research, and to assess and improve the effectiveness of a website. The partners involved in the triadic relationship should be able to measure, monitor and review their e-affinity marketing campaign, updating and modifying elements as required.

Often the objectives set at the beginning should guide the identification of KPI at the start of the process. Other areas that need to be considered are the frequency of reporting and the analysis of performance, questioning why it is happening. Furthermore given the complex nature of the triadic relationship partners should also determine who measures what and reports to whom and finally who takes appropriate actions arising (what should be done about it). As with the previous step (strategies – activities) this is another area where the responsibilities and terms performance and analysis need to be clearly defined and agreed between the affinity scheme partners.

CONCLUSION

This paper was inspired by the dearth of literature and lack of practical guide on optimising affinity marketing schemes through digital integration. There is no known study to data that explains why the growth of affinity marketing scheme has stagnated or one that looks at why there is limited integration of the scheme in the digital landscape. Yet the coupling of these two areas has huge potential in capturing a unique market. The Internet is an ideal platform to target and engage customers, consequently encouraging a long term relationship. Moreover it has been shown that the role of information communication technology in philanthropy is growing, with donation via the internet nearly doubling between 2007 and 2008 (Honoré, 2011).

This paper proposes a strategic integration plan which identifies six key steps required for planning a digital marketing strategy for affinity marketing, 'E-Affinity Marketing Planning Process'. Initially, the core values related to the scheme needs to be evaluated (Step 1) as this will enable clear and concise e-affinity marketing objectives to be set (Step 2). Then the current situation or current practice of affinity marketing on the web needs to be reviewed (**S**tep 3). The next step is to understand affinity marketing customers' persona (Step 4). Knowing the customer is fundamental for any business striving to succeed in today's competitive environment. Following this based on the situation analysis and the customers' persona, strategies and activities for e-affinity marketing need to be identified (Step 5). Finally the last

step in the process is to formulate a control mechanism with KPIs to measure and analyse the performance of the scheme (Step 6).

On the whole all the affinity groups investigated appear to have the technology capability to successfully integrate affinity scheme as part of their digital activities, as evident by the depth of the activities they have integrated for some of the functions relating to the organisations main offerings. But the activities supporting the affinity scheme appears to be limited. Thus it is apparent that affinity groups are not exerting the same level of effort on their affinity schemes digitally as they are doing so in other areas of their website. There may be a number of factors contributing to the lack of the schemes presence on the web. For instance lack of digital collaboration between the affinity partners and not having a clearly defined responsibility with regards to the management of the scheme online could be possible reasons worth exploring.

Knowledge and understanding of customer is an asset for any organisation for better segmenting and management. As Scott (2013) has suggested, if organisations can segment their customers into distinct groups then it makes it easier to create content targeted to each group identified. As it stands the affinity scheme sites investigated did not exhibit segmentation or targeting. Yet there are some known characteristics associated with affinity marketing customers (Laing et al., 2004, Mekonnen, 2012; Worhington, 2001). For instance the typologies identified as 'explorer', 'communicator' and 'supporter' can give good insight as to what affinity marketing customers associated with a professional or a charity group would expect from an affinity scheme such as an affinity credit card. Such knowledge could be used as a starting point when formulating personas for e-affinity marketing customers in different sectors.

It is undeniable that all partners involved in the triadic relationship could benefit given that the digital integration is implemented and managed correctly. Specifying clear strategies guided by the digital objectives aligned with the core values underpinning affinity marketing is crucial to the success of the scheme. The strategy then needs to be implemented and executed properly with tactics formulated that takes into consideration partners responsibility. In the past affinity marketing schemes had faced some challenges with regards to customer ownership and responsibility. This needs to be clarified as failure to do so could impair successful digital integration. Whilst the initial engagement of the customers may primarily fall under the affinity group, management of the scheme is often undertaken by the affinity scheme service provider. With regards to converging and conflicting interests relating to customer ownership the affinity group and the affinity service provider should have an agreement in place as to how to manage the customers in the event where the terms of the partnership have to be altered or if the partnership has to end. This is strongly tied with good communication, sharing information, and collaborative working without compromising customers' confidentiality. Affinity partners' efforts in promoting the scheme to customers need to be aligned. Without breaching confidentiality, a possible plan of action for the service provider could be to collaborate with the affinity group in providing periodic updates to the customers. From the customers' perspective, lack of informative continuous communication could lead to relationship weakening (Mekonnen, 2012). This relates to communication during the periods when the customer-service provider relationship was stable as well as during the process of dissolution (Mekonnen, 2012). To avoid such pitfall the digital integration of affinity scheme, needs to ensure that there is a schedule or plan in place to harness communication online. Furthermore affinity partners need to understand the nature of communication desired by different segments.

Through performance analysis continuous improvement and sustainable growth could be achieved. Web analytics will bring this to life. The right KPI need to be set for this to be effective. Affinity marketing on the web has been explored to a degree but for the most part an untapped area.

KEY TERMS AND DEFINITIONS

Affinity Relationship: A relationship built on the notion of cohesiveness, bonding, liking, identification and related concepts.

Affinity Scheme: A way of adding value through differentiation by designing a product that is of interest to members, employees and supporters of the said affinity group.

Cause-Related Marketing: A marketing activity where by a product is linked to a cause or non-profit organisation in return for a contribution to that cause or organisation and to make the product offering more attractive to consumers.

Digital Integration: In the context of marketing, this refers to integrating online efforts and aligning it with overall business objective.

E-Affinity Marketing: Refers to the promotion and sales of products endorsed by affinity groups through the internet.

Chapter 56
Digital Media Affecting Society: Instruction and Learning

Terry Cottrell
University of St. Francis, USA

ABSTRACT

The proliferation of the use of digital media for learning and instruction continues to be investigated and pondered as the advance of a broad range of technologies eclipses currently available traditional text and face-to-face learning modalities for K-12 and higher education instruction. Digital media's affect on educational processes and delivery, an analysis of existing research reviewing whether digital media is benefitting educational outcomes in instruction and learning, and recommendations for the future are the primary goals of this chapter. Investigation into each of the aforementioned topics separately reveals an intersection that is far from being maturely assessed. The topic of digital media affecting how people learn will elicit further research as education continues to call for an increased focus on high outcomes while also increasing the adoption of digital media resources for the transmission and acquisition of knowledge.

INTRODUCTION

The proliferation of the use of digital media resources in the field of education continues to be investigated and pondered as the advance of a broad range of technologies eclipses currently available traditional text and face-to-face learning modalities for K-12 and higher education instruction in the public and private spheres. Digital media's effect on educational processes and delivery, an analysis of existing research reviewing whether digital media is benefitting educational outcomes in instruction and learning, and recommendations for the future are the primary goals of this chapter. Investigation into each of the aforementioned topics separately reveals an intersection that is far from being maturely assessed. Adoption of digital media for instruction is rising, and is predicted to grow indefinitely. The topic of digital media affecting how people learn will elicit further research as education continues to call for an increased focus on high outcomes while also increasing the adoption of multimedia resources for the

DOI: 10.4018/978-1-5225-3822-6.ch056

transmission and acquisition of knowledge. Implications for the future are mixed with hope for positive progress, and suspicion that digital media will make all areas of education less of an engaging enterprise and more of a commodity to be consumed.

The creation of instructional digital media by learners, not just its consumption, is another aspect of sweeping change throughout society that deserves investigation. Learners of all types continually create evidence of their learning outcomes in the form of media—papers, projects, presentations, and group reports. Written, text-based, forms of communication no longer hold the appeal they once had in a world filled with digital media. Students can (and often do) create digital video at the push of a button on a daily basis. They learn visual literacy techniques that increase their abilities to create info graphics and web pages that combine multiple elements of digital media together in the hopes of generating more engagement by audiences of all types. Teachers and professors alike are beginning to understand that communication through the written word is no longer the only essential skill to instill in their learners. The ability to work well with digital media software and hardware is increasingly becoming undebatable as an essential learning outcome.

Finally, some researchers make the assertion that digital media does not affect essential outcomes like reading, writing, mathematics, critical thinking (CT), problem-solving abilities (PSA) and other types of learning goals set in schools at any level. It can be argued that if digital media produce similar learning results in comparison to other forms of media, then the best choice for instructors is the cheapest and most-easily-acquired form of media available. Professor Anthony Grafton of Princeton University explains that all aspects of any medium's elements, including art and binding (as with plain text sources), create an environment that affects knowledge consumption and cognitive processing abilities (Prpick, Redel, & Grafton, 2011). For some, it is not safe to assume that digital media bears any different affect on users than a non-digital form of the same material. For others, there is certainly an effect to be observed throughout society by the wide spread use of digital media. Mayer and Moreno (2003) propose that individuals process pictorial and verbal information differently in their minds, thereby establishing digital media's affect on the mind as something separate from text-based materials. The problem of cognitive overload can stifle learning, the researchers explain, as more information can be presented through digital media than can be presented through text-based materials. In the context of instruction and learning, is access and consumption of digital media (with its ability to present many different types of information to a consumer all at once) ultimately a negative or positive effect of the influence of technology throughout the greater society? Strategic planning and focused utilization may be the best way to integrate digital media in the educational arena in order to maximize positive effects.

BACKGROUND

Digital Media, Cognitive Load, and Cognitive Learning Theory

Cognitive theories related to the effects of digital and multimedia on learning and instruction include research into the visual and verbal channels for information processing and knowledge acquisition combined with the argument that these two channels are not unlimited in their abilities to gauge phenomena and cause heavy loads to weigh on cognition (Mayer & Moreno, 1998b). These cognitive load theories include three types of memory stores: (a) sensory memory, (b) working (sometimes called short-term) memory, and (c) long-term memory. Sensory memory captures the text and visuals in their most exact

form, as well as auditory sounds, for a very limited amount of time. Working memory takes the sensory memory and allows for manipulation where the raw material from the sensory memory can be made into a model that includes spatial representations. For example, if a person hears the word "cat" they tend to immediately imagine a picture of one instead of an image of a bird. Long-term memory is deep storage where retrieval into working memory is problematic and unreliable at times for a variety of reasons (Mayer, 2005a).

Digital multimedia learning theory is consistent with learning design theories like cognitive load theory (Alasraj, Freeman & Chandler, 2013; Plass, Moreno & Brunken, 2010; Sweller, 1999; 2011), and the integrated model of text and picture comprehension presented by Schnotz and Bannert (2003). Schnotz and Bannert's (2003) model includes a structure mapping hypothesis which states that in order for visual materials like digital media to aid in learning they must be integrated well with corresponding textual information where it has been found that "interactions of . . . graphics, and text seem to be the key determinant of comprehension and performance in learning from [digital media]" (Rinck, 2008, p. 186). Each of the aforementioned theories lead to the sense that multiple channels (e.g., visual, verbal) working in concert together play a key role affecting memory and information processing in the minds of any type of learner at any age range (Mayer, 2005a). After starting with their initial proposition, the researchers develop their theory by explaining that there are limits to what people can mentally process when learning. The problem of cognitive overload brought on by digital media can stifle learning as more information can be presented through digital media materials than can be presented through text-based materials. Herein lies the need for their exploratory study eventually leading to nine suggestions for reducing the load that media can place on learners' minds. Mayer and Moreno (2003) provide definitions for their core concepts. They explain that they define media-based learning as "learning from words and pictures, and . . . 'multimedia instruction' as presenting words and pictures that are intended to foster learning" (p. 43). After providing these definitions, the researchers begin to link them directly to common education outcomes like science, technology, engineering and mathematics (STEM), CT and PSA.

Since digital media is generally developed to facilitate increased learning in a more efficient manner, Mayer and Moreno (2003) provide ways to mediate the damage that can be done by overload of information through digital media consumption. An example of digital media damage is found by Wolf (2007) reporting that screen reading quickens the brain's senses and lessens the cognitive ability to "deep read." Calls for a "slow-reading" movement juxtaposed against the fast-paced nature of digital media use this type of research to support claims that digital media is detrimental to learning (Rosenwald, 2014). Mayer and Moreno (2003) use familiar terms when they argue that they define "meaningful learning" as deep "understanding of . . . material, which includes attending to important aspects . ., mentally organizing . . . into a coherent cognitive structure, and integrating . . .with relevant existing knowledge" (p. 43). This is where the clear connection to the investigators' research into digital media and learning outcomes can be found. They expand their connection between the mind and media processing by explaining that there are three channels for processing in the mind when it encounters images, text, and sound together as an information resource. Mayer and Moreno (2003) identify a

[1)] Dual channel [where] humans possess separate information processing channels for verbal and visual material, [2)] Limited capacity [where] there is only a limited amount of processing capacity available in the verbal and visual channels, [and 3)] Active processing [where] learning requires substantial cognitive processing in the verbal and visual channels. (p. 44)

These aforementioned channels provide a framework for the identification of five major ways in which overload can block learning and instructional outcomes. The scenarios include periods when only the visual or audio channel are taxed individually, times when both are overloaded, times when one or both channels are overloaded by essential and non-essential information, periods when one or both channels are overloaded by information that is presented in a poor manner, and finally times when the learner holds the wrong information in one channel and not the other.

Schema Theory and Mental Models

Concepts on schema became influential in the fields of cognitive psychology and education in the 1970s, and inspired learning and instruction research with picture and text processing, and in the world of television viewing (Krauskopf, Zahn & Hesse, 2012; Hayles, 2012; Seel, 2008). Schemas encompass organized collections of information with how pieces of information relate to one another. Schema Theory works under the understanding that human knowledge is collected in the human mind under such schema. Schemas can be modified, reassembled, and then integrated with other schema containing new and different pieces of knowledge (Hansen, 2012; Alessi & Trollip, 2001). Mental models are dynamic and active representations of knowledge that serve to make what is invisible visible, help to create analogies between what is known and not known, or integrate pieces of coherence with unexplained phenomena (Seel, 2008). Mental models can be created in the minds of learners by the use of schema and other elements. These models can be helped by text, pictures, and video—combinations of which are what is now known as digital media (Block, 2014; Buckingham & Willet, 2013; Clark & Feldon, 2005; Hegarty & Just, 1993; Sharp, Bransford, Goldman, Risko, Kinzer & Vye, 1995; Shrock, 1994). Images alone have the vast ability to help students make sense of things they have not witnessed first-hand. Combine images with text and audio for simulation, or other forms of digital media, and instructors find the job of transmitting knowledge much more enhanced and learners are enticed to explore educational or entertainment content more deeply (Bull & Kozak, 2014; Dunleavy & Dede, 2014; Flew, 2014; Gold, 2012; Goldman, Pea, Barron & Derry, 2014; Schwartz & Heiser, 2006; Hayles, 2012; Tyner, 2014; Van Dusen, 2014).

The application of schema and their accompanying schemata allows the brain to map what the senses perceive in a mental model. Images in the schema and spatial relations that structure the images are mapped to semantic understanding through digital media in ways different from traditional text or audio of the past. This means that mapping is a process that aids in mental model development from images, text, and other media sources, and also helps an individual evaluate the model that was in his or her mind before interacting with the media itself (Rouet, Lowe, & Schnotz, 2008). Mapping is part of the process of critically segregating information for better understanding and eventual decision making desired with the development of learning outcomes. When learners are asked to take a test, or make decisions, they are essentially being asked to map schema in their minds to form mental models that allow for the finding of the "right" answer to a particular question. Digital media creates fundamentally different mental models in the minds of learners in educational environments leading to potentially worse or better outcomes depending on the subject matter combined with media delivery type (viz., audio, video, multimedia, etc.)

Clark and Kozma on Digital Media's Impact on Learning and Instruction

Richard Clark (1994) makes the assertion that media does not affect critical thinking (CT) skills, problem- solving abilities or other types of learning goals set in schools. Clark states that the true essence of

all "media research question[s] is [that they are part of many] similarly confounded questions in educational research" (p. 27). In Clark's mind, media research is subordinate to instructional design research, because it is the design of instruction that influences learning regardless of media used. Digital media, therefore according to Clark, has no affect on society in terms of instruction and learning. The media does not matter, and if replicable media produce similar learning results, then the best choice for instructors is the cheapest and most-easily-acquired form of media available at any given point in time. Robert Kozma (1994a) responds by reframing the concern of media influencing learning from a design science (R. Glaser, 1976; Simon, 1996) perspective rather than from a natural science point of view that seeks to explain human cognitive interaction with the world not created by humans. Kozma explains that educational technology using elements like digital media is a design science deserving critique and analysis observed from relationships between human-created tools and other humans completely separate from the natural world. He offers a response to Clark that asserts that both instructional methods and elements like digital media "influence learning and they frequently do it by influencing each other . . . methods take advantage of a medium's capabilities in well-designed instruction . . . One cannot simply replace one medium with another in a design and hold everything else constant, as Clark . . . suggests" (1994b, p. 11). Both Clark and Kozma provide a review of the literature to support their claims about the effects of digital and multimedia on education. Kozma, however, provides a quantitative data analysis from a study using his 4M:Chem software that allows students to see the results of their chemistry-related course activities. Kozma's research shows that both the instructional methods used and the digital elements affected overall student learning outcomes. He then asks how this phenomenon is possible.

Kozma claims that learning is assessed not so much by the instructor or through the methods used, but by looking at learning "as it happens and [collecting] data on the ways students interact with the system as they learn" (1994b, p. 12). This view is similar to Mitra's (2007) idea that learning occurs through the theory that education is a self-organizing process. In order to find answers, Kozma conducts a separate study and describes how five students from his first experiment participate in a second experiment where they demonstrate how they learned from 4M:Chem. The students show significant abilities to form inferences about particular chemical events through viewing video sequences in the software. This is the combination of media/medium and instructional method affecting learning outcomes consistent with the hypotheses Kozma desires to see. He concludes, refuting Clark's 'replaceability challenge' by stating, "If two [media] treatments yield a similar outcome it does not mean that they resulted from the same cause . . . [and the outcome] does not identify what that cause is . . . if you want to know what causes learning, you have to look at it as it occurs" (1994b, p. 13).

CURRENT ISSUES

Much debate on digital media replacing traditional media information resources in the field of education, along with the resulting effect on learning outcomes, is found in the literature. Comparisons of digital media's affects on learning outcomes can be generalizable only to a certain degree due the fundamental differences between outcomes like science, technology, engineering and math (STEM), language comprehension, CT, problem-solving ability (PSA), and more obtuse outcomes like moral judgment, and psychological/physiological behaviors. Of the extant studies available to-date, most carry mixed results of the basic learning effects of digital over traditional physical resources.

Digital Media Content vs. Traditional Instruction Content: "Mindtools" and Digital Media Affecting Learning Outcomes

Jonassen, Carr, and Yueh (1998) identified early forms of web-based digital media under a term they call "mindtools" describing how digital media computer applications challenge outcome skills by requiring students to think deeply about what they are seeing and hearing on a screen instead of merely accepting the premise that rote absorption is the primary educational goal. In their descriptive meta-analysis of different digital media tools, the researchers connect these various forms of media to educational outcomes such as: (a) interpretation, (b) inferences, (c) manipulation, (d) semantic organization, (e) linguistic evaluation, (f) visualization, (g) prediction, (h) elimination, and (i) inference. They ask, "Why do Mindtools work, that is, why do they engage learners in critical, higher-order thinking about content?" (Jonassen et al., 1998, p. 12). What the researchers assert here is that, in fact, individuals who are challenged in their learning environments (classroom location, materials, access to information/date, etc.) through any sort of combinations of input other than one (e.g., visual alone or audio alone or print text alone) are the individuals who wind up thinking the most about the content contained therein. If this maxim is true, digital media where individuals can both see and hear, or read and hear, or even see, hear, read, speak, and manipulate will engage outcomes more than their counterparts using traditional learning tools (like text alone) and techniques (e.g., lecture). Jonassen et al. (1998) also determine that individuals using "mindtools" as early forms of digital media are capable of more critical thought through ideas that would not be present without the actual use of the tool first. This coincides with the basic idea of learning-tool scaffolding as the genesis for all human innovation: The development of electricity, for example, leads humans toward critical inquiry into the powering of all sorts of tools, like radios, which leads humans to the idea of mass communication over long distances which eventually begins the CT behind the creation of the idea of the internet.

Jonassen et al. (1998) contend that ultimately digital media-type tools are direct descendants of constructivist thinking about learning and education derived from earlier education pioneers like John Dewey (1897; 1909; 1916; 1933). The researchers note that digital media extends the capability of computers to move beyond simple presentation by "engaging learners in reflective, critical thinking about the ideas they are studying" (Jonassen et al., 1998, p. 15). Under this model, computer digital media information is another powerful partner in the learning process. It is not a merely upgraded and advanced way of storing information for reading and memorization, or for reference.

Mills and Exley (2014) studied a similar outcomes in K-12 students aged 8 to 10 years. A digital writing classroom was used as the environment where the research question centered on the time used by students to create text in a digital media environment. The study was conducted over 40 school weeks. Dialogue about writing in the digital classroom was the main method of analysis. The dialogue was recorded digitally and then coded. The results showed that digital media used as a format for writing gave a more explicit time frame for the K-12 students. Writing with physical paper and pen did not carry the same structure in the minds of the learners. More thoughts and content generation occurred in the digital environment. An overall assessment of the quality of the writing, however, was not assessed.

Liao (1999) conducted a comprehensive meta-analysis of over 45 studies conducted between 1986 and 1998 investigating the role of hypermedia on student achievement in many areas. The vast majority of this media research is heavily focused on subject-specific areas (e.g., historical facts, practical mathematics, language assimilation) instead of more over-arching concerns like ethics, intelligence, emotional response, or CT. What was found was the extant research on digital media's influence into

student achievement shows mixed results. If no instructor intervenes (via live instruction, video, chat, etc.), digital media provides a larger effect on student outcomes. With the introduction of instructor interaction, however, text and other forms of traditional information sources become more effective at positively impacting outcomes (Okutsu, DeLaurentis, Brophy & Lambert 2013).

Stoney and Oliver (1999) found that learning outcomes can be enhanced, and more strategically focused upon, by adding digital media to learning environments. The researchers tested their hypothesis by means of one instructional unit inserted into one collegiate finance course focused on accounting. The design of the study called for the replacement of one of the traditional face-to-face instruction days with an equivalent digital media unit accessed by students during a time of their own choosing. The subject of the intervening treatment was a simple stock price valuation simulation where students had to decide how to pick stocks to increase the profits of a simulated portfolio. Eight students were separated into four groups for analysis of their discussions produced during and after engagement with the digital media treatment. The researchers analyzed and coded student activity looking for evidence of time spent utilizing the digital media content juxtaposed against time spent engaged in discussion rooted in the outcomes for the course. The cognitive activities of the students were grouped into two sub-groups: low-order activity and high-order activity. Low-order activity was defined by the researchers as discussion requiring little to no decision-making, cognitive engagement, or problem-solving effort (Stoney & Oliver, 1998; Stoney & Oliver, 1999). High-order activities were described as being any combination of discussion related to: prediction, strategy, contemplation of new and pre-existing knowledge, consideration of belief and evidence, eliminating falsities, and deducing uncertainties.

The findings of the study showed marked learning outcomes increases due to interaction with the digital media unit. All students were required to discuss and make decisions based on the content of the digital media content regardless of how much time was actually spent with the treatment. The evidence related to outcomes advancement was shown through analysis revealing that the more time students spent with the digital media, the more students exhibited higher-order skills. The particular media used in this study was not created by the course instructor or by anyone at the same university. The treatment materials were created by an outside firm specializing in the particular subject fields of business finance and accounting.

Alexander (2014) investigated increases in student engagement through the use of digital historical images to be integrated into presentations for K-12 students. The research cites disengagement research calling for more teacher effort as a primary reason for the attempts at using digital media to bridge the gap between what K-12 want to pay attention to during their leisure time and what they are challenged to focus on in school. Using the Technological Pedagogical Content Knowledge Framework (TPACK) framework, the students were analyzed on the interplay between their teacher's content, technology knowledge and instructional methods (Mishra & Koehler, 2006). Using two sixth-grade history classes, Alexander found that time devoted to the assignment at-hand increased dramatically using digital media. The students reported enjoying the assignment task much more than the teachers enjoyed designing it. The use of digital media was more burdensome to the teachers due to unfamiliarity with the technology and perceived learning curve. The outcomes received from the students, however, justified the integration of digital media within the class.

Thomas, Coppola, and Thomas (2001) questioned whether elements found in online classrooms (including digital media) had a demonstrable effect on learning outcomes. Their study was wide-ranging, mostly including the effect of learning management system (LMS) integration on outcomes. Included in their study was a measure for digital media's affect by way of on-demand video of course content.

The study used a standardized assessment for CT in a pre and posttest design method on three different sections (three different instructors) of the same master's degree-level information systems course. The ages of the participants were between 20 and 29. The instructor was not the creator of all of the content for any of the courses. One class was conducted in a traditional face-to-face class format, one was conducted totally online via an LMS (Blackboard©), and one was conducted face-to-face with electronic treatments including on-demand video. The researchers define the third type of treatment of electronic classroom as "an interactive multimedia electronic classroom networked to the Internet and housing a video/ audio/ keyboard/ mouse broadcast-on-demand system" (Coppola & Thomas, 2000, para. 45). 20 to 40 students per course served as participants for the study.

This investigation found that the third digital media treatment section of the MBA course did show increased mean scores improving (11.00 pretest to 14.28 posttest) on the CT test over the Blackboard course. Posttest CT scores from the Blackboard course were actually lower (11.28 to 10.32) pretest to posttest. Final grades, however, were highest for the traditional face-to-face course. No analysis of teaching style was conducted during this study. A perceptions questionnaire was given at the end of the study asking participants to rate how they felt their method of instruction helped with their acquisition of CT skills. As with the final grade reports, the students in the face-to-face class were the most likely to report that they perceived their learning skills had improved most without technological assistance of any kind. At the end of the study, the researchers mention the need to extend their research to cover the same course taught by the same instructor to better control for pedagogical methods concerns.

Cavalier and Weber (2002) explored the effect of digital media on the learning outcome of moral decision-making through the use of a one-factor three-level experiment where students were surveyed after one group studied the case of burn victim Dax Cowart with only text materials, one group with only a 1-hour VHS documentary, and a third group only with an interactive digital media program created by a third-party vendor. The study was replicated the following year with three different sets of students as participants and using new graders different from the first study. The groups in both years ranged in sample sizes of 21 up to 38 undergraduate philosophy students. The students enrolled in the courses as a requirement for their major. The results of the experiment showed that performance in (a) understanding the complex perspectives and positions of the case, and (b) analyzing the case with respect to its morally relevant details was higher in the groups who were affected only by the interactive digital media program during the first year of testing. Statistically significant differences were not observed, however, in the study's second year. Aside from mixed results in both study periods, other problems with this study arise when considering the quality of the learning materials given to participants, and the fact that the materials were produced by three distinct creators.

Redsell, Collier, Garrud, Evans, and Cawood (2003) conducted a stratified cluster randomized controlled trial of bedwetting children (n=270) undergoing psychological treatment at 15 different nurse-led clinics for their condition. The students viewed and compared bedwetting mediation information in digital multimedia format with text that was mirrored word-for-word in content. The digital media learning materials contained an interactive assessment component not present in the text. The researchers' study showed no significant difference between the two information sources' ability to impact the learning outcomes (e.g., time to dry and remaining dry) of medical information for a specific condition post completion of the study and six months after completion.

Kumta, Tsang, and Hung (2003) used 163 final-year medical students in a study aimed at directly gauging the effects of digital media instructional materials on learning outcomes in an orthopedic surgery context. The study was randomized using a control and experimental group. The researchers begin their

narrative with a fundamental problem of education and outcomes where the observable world is filled with so many information sources. This fact makes it difficult to distinguish between what sources will help solve problems and which will not. The researchers say lecture-based curricula are too commonplace, antiquated, and conventional, and therefore "not well-designed to develop . . . analytical thinking and problem-solving skills" (para. 1), because of inundation of information. Digital media sources, the researchers attest, can mediate this problem. The stakes are higher with medical students, because lack of proper cognitive skills can mean patient harm. The researchers find that their small study with web-based tutorial sources "led students through a thinking pathway that facilitated the development of higher cognitive skills such as analysis, application, and evaluation" (para. 18).

The researchers split their participants into 11 groups of 15 students who all attended a 3-week module on orthopedics throughout the span of their final year in medical school. Next, the researchers randomly assigned each group to a Study or Control group. A multiple-choice pretest was given to all participants before the experiment began. The Study group was exposed to a web-based clinical case simulation (CCS) program designed by the researchers, but tested by existing orthopedic surgeons, to foster logical thinking abilities in the students. They were not given any other lecture-based or digital teaching materials. The Control group was given a standard lecture-based curriculum supported by text materials and optional tutoring. At the end of 3-week module, both sets of students were tested on their knowledge and CT abilities in the arena of orthopedics. The researchers note there was no significant difference between the results of the Control and Study group on the pretest. There was a statistically significant difference on the final test at the end of the 3-week module with the Study group scoring higher than the Control. The researchers note that their study was small and limited. But they give commentary to their findings by suggesting their research demonstrates that "well-designed web-based tutorials stimulate students to think and . . . complement . . . teaching resources . . .foster[ing] better clinical and critical thinking skills in medical students, without subjecting them to an information overload" (para. 23).

Barlett and Strough (2003) conducted a 3-semester-long study where samples (25 min/61 max) of undergraduates in seven different Social Psychology courses taught by six different instructors each term were given one of three different methods of instruction: (a) traditional lecture, (b) traditional lecture with course guide, and (c) digital media with course guide. While the digital media in this study was, in fact, created by the same instructor in some of the courses, the products were not the same due to the inclusion of so many different instructors used in the study. Final grades in the course were the primary measure used to gauge the impact and effectiveness of the instructional method and information source used in each case. The final results showed that it was the course guide, not the delivery of traditional lecture or digital media, which improved final grades. The researchers note that redesigning their study so that "a comparison of traditional and multimedia formats when neither is accompanied by a course guide would be useful in understanding the unique contribution of multimedia formats" (p. 337).

Sheldon and DeNardo (2005) sought further explanation on the difference between how digital media video affected educational outcomes in prospective freshman and upper-level pre-service music education majors. The researchers' study design included two groups (n = 116 prospective freshmen) and (n =130 upper-level) music education majors. Each participant was shown a digital video of a particular musical interaction from two earlier studies (Sheldon & DeNardo, 2004). The researchers describe the 20-minute media treatment as,

The . . . examples consisted of music in special education interactions . . . with mainstreamed groups and people who were mentally retarded, had cerebral palsy, were hearing-impaired, learning disabled,

geriatric, abandoned, or were juvenile delinquents; music education interactions . . . with general, instrumental, or choral groups at the elementary, middle school, and high school levels; and professional, formal music performances . . . that included a piano concerto with both full orchestra and soloist shown and a violin solo accompanied by piano with only the violinist shown. (p. 7)

Each of the aforementioned segments in the treatment was displayed for one minute followed by two seconds of blank screen. The participants were required to watch the presentation, not speak to one another, and simply write down as many observations as they could describing each segment. Assessment by the researchers was made according to two criteria: factual and inferential content of the participants' written observations.

The final results were, like other studies, somewhat mixed. It was hypothesized that the upper-level student would score higher as their experience level would correlate more to what they saw through the digital media treatment. While this was most often the case, it was not always the case. In some instances, the prospective freshmen demonstrated more understanding about the segments they saw on screen. One-way ANOVA was used to compare scores. Post hoc analysis on certain demographic data connected to each participant (viz., GPA, class rank and ACT score) did show consistent correlations. Higher values in these measures equated to higher levels of learning regardless of student status.

Montgomery (2014) used K-12 students in a third-grade classroom as subjects for a study on critical democracy engagement through the production of digital media. Educational outcomes for students of all types mostly commonly come in the form of written text (digital or physical). This study explored the use of digital audio (viz., podcasting) as an outcome demonstrating students willingness to criticize aspects of government. The research found that the third-grade students in the study were much more willing to research governmental issues related to democracy, because of the need to create their podcast assignments. Consistent with Jonassen's (2014) assertion of digital media as mindtools for learning and productivity, the students output and engagement was positively impacted by digital media being incorporated into their learning and instructional environment. The students were using the digital media as mindtool "technology [that represents] what they know versus learning from technology as in traditional tutorial or drill and practice sessions" (Marra, 2013, p. 266). Students were not only more willing to share their views, because of the digital media, but they were also more willing to read and study their given topics because of the introduction of digital media requirements into their classroom experience.

Gerjets, Scheiter, and Schuh (2008) worked with 80 (48 female, 32 male) undergraduate students at a traditional German university. These students were presented with three complex word problems to be solved in an online digital media environment. A navigation bar was always present with the problems to be solved. The navigation bar contained links with information related to solving the problem at hand. Students had the ability to self-select how many links, and which links, they wanted to use to help solve the problem. They could not look at the information contained in the links while attempting to solve the problem. Students could only use this aspect of the digital media environment before attempting a solution. An added value question was included with each "tip" given via the links that asked the students if they felt the information they received was helpful. The researchers say the dependent variables for their study were "problem-solving performance for the three . . . problems, time spent on studying example pages, and mean time spent per example retrieved [from the hyperlinks]" (p. 82). The results of this experiment found a significant difference in solution performance between genders, but not between how many tips were used via the media links. The only other significant factor found was with students

who reported low prior knowledge of the problem material before interacting with the media links. As hypothesized by the researchers, the experiment suggests that digital media link prompting for "cognitive processing might result in a better problem-solving performance, particularly for learners with low prior knowledge" (p. 83).

In a second experiment, the researchers used 31 German high school students (14 female, 17 male) in the ninth grade. The students worked in a computer mediated course (CMC) environment where they worked on algebra problems. Each student was given an 11-item pretest that gauged their prior understanding of algebra concepts before beginning work on the main problems. The concept of "pre-knowledge" in the work of Gerjets et al. (2008) is an essential component for the overall understanding of deep-thinking toward problem solving using digital media. The ninth grade students in this study were first given examples of algebraic concepts in scenarios typically not emphasizing mathematics, viz., biology, chemistry, and politics. They were required to simply read and study the concepts in this first phase of the experiment. They were allowed use their web browser's forward and backward buttons to help guide their cognitive processing of the material during this phase. It was the second phase of the experiment that required the students to solve 21 algebraic problems. The researchers note they were interested in differential effectiveness and therefore "a second independent variable was manipulated within the transfer distance of the 21 test problems that learners had to solve subsequent to the learning phase" (p. 86). The actual learner's solution performance on the 21 questions in the test phase was the dependent measure for the study. Ultimately, the researchers find that the ability to use digital media to view and interact with seemingly unrelated content in the same context of an intended problem (viz., algebraic equation problem solving) will positively affect a learner's ability to solve targeted related problems. The researchers find interactive media comparison tools "help learners to abstract . . . [and] compare examples that share the same cover stories across problem categories facilitat[ing] later problem-solving performance" (p. 87).

Kingsley and Boone (2008) conducted a quasi-experimental, pretest/posttest design study on the effects of digital media as an augmentation to the existing text and lecture content of a middle school American history class. The researchers compared pre and posttest scores for the students in control and experimental groups using a two-tailed *t*-test (unequal variance), because single-tailed *t*-tests are not as sensitive to unknown changes in the direction of mean test scores. Like the Barlett and Strough (2003) study, Kingsley and Boone (2008) used multiple sections of classes taught by multiple instructors (four, all female in total) for a total of 184 participants (93 aggregate in the experimental treatment group, 91 aggregate for control groups). The researchers in this case, however, conducted their research by pulling participants from three different schools. They also used digital media created by a different vendor from the text material used in the subject course sections. Gender, age, and experience level of the instructors studied were noted in descriptions of this experiment, but not studied in-depth. The results of the study showed a significant difference between the control and experimental groups with the experimental displaying 12.2% higher scores on the posttest assessment of their knowledge of American history subjects. In this particular study, the addition of digital media improved students' ability to meet the requirements of a standardized assessment based on NCLB guidelines for middle school student knowledge about American history. Whether or not the digital media provided more, better or clearer information as compared to the traditional instruction experienced by the control group was not discussed or studied by the researchers. The digital media was added to traditional instruction, in this case, not set up as a substitution for traditional instruction or instructional course materials like texts or print articles.

Following Kingsley and Boone's study, Smith (2012) investigated a similar aspect of digital media used for instruction and learning on K-12 students in an Algebra class. The media was used as a complete replacement for the instructor in the case of this study. Seeking to answer the question of whether or not digital media can make a physical instructor irrelevant to K-12 students, the researcher found interesting results. Students in the study had higher levels of self-regulation and lowers levels of intimidation through the use of digital media. A very large number of the students (ninety-three percent) preferred the teacher's "digital media presence" over their physical presence. The researcher indicates that, in the very least, digital media takes some of the pressure off the learning experience by depersonalizing aspects of instructional interchanges between teachers and learners.

Xu, Oh, and Teo (2009) conducted a one-factorial experiment with randomly assigned participants in two groups at a 1:1 gender ratio. The study tested the differential effects of text and digital media advertising on mobile consumers' perception and behavior. Forty-one males and 41 females were recruited from a large university to received simulated advertisements on their mobile devices in text or digital media format depending on their vicinity to a particular vendor in a simulated mall. The researchers found that digital media advertising information improved a viewer's attitude toward a product and significantly increased the intention to buy vs. text-based advertising. Their study also showed that digital media was more of an irritation, but provided more information and entertainment value over text.

Serra and Dunlosky (2010) conducted a digital media study on undergraduate students at Kent State University. Two groups (n=40 for each) were initially studied with a third later added at the end of the research. The study participants either read 500 words (digitally displayed) on how storms develop, or they viewed similar, decreased amounts of text with images added to explicate the same content. The third group in the study examined showed no significant change in learning using text only versus digital media, while the original two groups did. All three groups also believed they would learn more through the use of digital media. The researchers provide commentary cautioning the overuse of digital media, as this heuristic did not always show improved learning, even if learners come to believe it is always a superior learning information source over text. They cite this as a reason for future research linking learning belief with learning format and outcomes performance.

Starbek, Erjavec, and Peklaj (2010) conducted a quasi-experimental pretest/posttest study on 3rd and 4th grade students to gauge overall content acquisition in a course module centered on genetics. The researchers used four comparable groups where the first group (n=112) received instruction only via lecture, the second (n=124) only by reading a text, the third group (n=115) only through two short computer animations, and the fourth (n=117) only through images combined with text on a screen. Their study showed evidence that digital media was a better instructional tool over text for the specific material to be acquired—the understanding of a single dynamic process. The researchers call for additional research to be performed due to the type of understanding the students were required to learn. The researchers say their study is ultimately not indicative of digital media's learning effects toward learning facts, data or other types of knowledge. This study's finding is a consistent precursor to what Hwang, Chu, Lin & Tsai (2011) found in their K-12 study involving fifth-graders in another science course centered on instruction involving the differentiating different species of butterfields. Their study used digital media as a mindtool which also successfully increased students' abilities to understand and learn the required material.

Chuang and Ku (2011) conducted a study comparing Chinese-language learning materials in combined text and image form against the same material presented only in images combined with digital audio narration. Their study resulted in mixed findings where the control group of undergraduate students (text with images, n=33) did not significantly differ from the experimental group (n=33) of undergraduate students in terms of posttest and delayed posttest performance on language learning assessment. There was a significant difference, however, found between the two individual test occasions. The overall results directly contradict Mayer's (2001) modality principle which suggests that text combined with images on the screen is a superior form of information acquisition over images combined with narration, because the mind working on both the visual and nonvisual channel (in tandem) devotes less time to each, thereby reducing learning potential.

Serin (2011) studied the effects of digital media on student ability to use information to make inferences and solve particular problems. The researcher's method included 26 fifth-grade students in a control group and 26 in an experimental group from a single school. In the study, the participants learned about general information on the Earth, the Sun and the Moon. Serin (2011) used a mixed design (pre and posttest) study to assess the impact of digital media created by the researcher and presented to the experimental group students three hours per week for three weeks. The control group did not have the media treatment added to their lessons for the three weeks during the study. The results of the study showed a statistically significant increase in problem-solving outcomes for learners receiving digital media treatment.

Serin, Bulut Serin, and Sayg (2010) used a self-created tool for their assessment of learning outcomes, and a general content-based assessment on the subject matter of the "Earth, Sun and Moon" to collect data from the participants in the study. Cronbach's (1951) Alpha for the self-created tool was reported at .85 with a KR-20 reliability level at .72. The contents of the digital media were also created by the researcher, and included some level of interactivity beyond simply watching, listening or reading in combination on a screen. The results of this study showed mean scores on the self-created tool to be significantly higher for the experimental group. Equivalencies of the groups were assessed by way of initial *t*-tests. Kolmogorov-Simirnov Z was used to determine normal distribution of the scores. The efficacy of the process of the experiment was assessed using ANCOVA. The researcher concludes with a general call for similar studies in different disciplines (and at different education levels) to be carried out using the same pre/posttest design with digital media content used as an experimental treatment.

Recently, Kayaoglu, Dag Akbas, and Ozturk (2011) used an achievement test to assess the impact of digital animation versus print text in two undergraduate English-language learning courses. Pretests were given to the control (n=22) and experimental (n=17) groups showing equivalent abilities before the introduction of the two different forms of learning materials. The researchers created both material types. The results of the study showed increased assessment scores on the posttest for the experimental group given only digital media animation as a means for learning English. Anecdotal opinion on learning via animation versus text was also collected from the participants and teachers, indicating that they were more excited to learn language via animations. The researchers caution, however, that excitement and statistically significantly higher posttest scores are not a justification to replace print text with digital media completely in all cases, because there was ultimately no difference between the groups in terms of overall increase in achievement. The students in both groups increased their performance on English language assessment at the end of the testing phase. In the end, both text and digital media each work to increase overall language performance.

IMPLICATIONS, POLICY AND PRACTICE

Universal Design, Self-Organizing Education, and Digital Media

Universal Design for Learning (UDL) is potentially the most provocative process design change for instruction and learning born in the 21st century. UDL attempts to account for educational theories that support there is no one-size-fits-all approach to learning appropriate for students in any setting (NYC Department of Education, 2014). Before the advent of digital media, education was delivered solely in either face-to-face environments supplemented by drawn visual aids, static images and print books, or remotely through printed material. In some cases, radio and television signals were used for instruction as well, but this market was relatively small and insignificant in comparison to massive commercial market for broadcasting radio wave signals (Saettler, 2004). Due to the advent of digital media for learning, UDL is unleashed allowing for more modalities of learning a single subject which, in theory, will benefit more students in terms of learning outcomes and efficiency.

Digital media development, deployment and adoption has started a trend where once there were only a few modalities supported and endorsed for learning to now all options, permutations and learning scenarios being supplanted by a great many ways to learn. The "many" modalities are almost entirely digital in nature today due to the introduction of the World Wide Web in 1995 (Segal, 1995). The World Wide Web allowed the mass distribution of digitized text via HTML, and from that point forward, learning and instruction have never been the same. Once it was considered wonderful and democratizing for the masses to be able to read because of the Gutenberg's Printing Press (Gray, 1999). The Printing Press spread human knowledge quicker and more efficiently than any other technology prior. The masses, in this case, were required to find and purchase printed text once they were taught and encouraged to read. Still, this was a much slower process for knowledge acquisition and understanding than what occurred through the proliferation of digital print.

Textbooks used for education, and even the revered *Encyclopaedia Britannica*, have now succumbed to digital text (Sollisch, 2012). More and more students each day are finding digital text content they can use for educational purposes at the touch of a keystroke. Students, parents, educators and even some librarians ask, "Why purchase, read, and especially, be burdened with carrying print books when you can get the same content online through a digital device?" Due to physical sizes and weight, and the assumption that digital text content will always be cheaper than traditional print content, formers supporters of physical text content are running away from this format in favor of e-text. Even some librarians themselves are endorsing the elimination of print books from libraries. In the K-12 environment, boards and administrators take this scenario one step farther by eliminating print materials and school libraries entirely. Double-digit year-over-year decreases in school library funding are now common. Connecting the notion of literacy to libraries has also been dropped from the strategy of the U.S. Department of Education through its voluntary elimination of the $20 million Literacy Through School Libraries grant (Siu-Runyan, 2011).

The textbook in digital format is still in jeopardy due to the "many" digital audio, video and multimedia content options. Students in today's digital media environment have numerous choices for entertainment to occupy their minds throughout a day's time. These "many" choices compete with educational resources for the consciousness of learners. Digital media, as an influencer of the process of education, comes from the inherent form of the technology. Educational content, as well as un-related entertainment content, all are now delivered in the same form. These media are simple files sitting on interconnected

servers in cyberspace only distinguishable by file extensions (e.g., .mp3, .mp4, .m4a, .png, .jpg, .js., .flv., etc.) and file size. Before the internet, digital content sat resident on digital media—memory cards/sticks, CDs/DVDs, disk drives. The digital media still needed a physical form in order to be consumed by a learner in the similar fashion that books used to be the media needed for the printed word. Instruction today is guided toward the discovery and the linking of digital media content directly to learners' media devices (tablets, computers, and smartphones). The form of the digital media is no longer a going concern influencing the process of instruction and learning (Gikas & Grant, 2013; Keskin & Metcalf, 2011; Wu, Wu, Chen, Kao, Lin & Huang, 2012).

Digital Media and the "Self-Organizing" Educational Process

In 1999, Sugata Mitra facilitated the installation of a computer terminal in an open area of a slum in New Delhi, India. This experiment, eventually known as the Hole-In-The-Wall experiment, resulted in a number of surprising educational outcomes (Orvis, 2006). Children in the New Delhi slum were encouraged to interact with the computer terminal in their neighborhood. Through their uninterrupted and unfacilitated interaction, the children were able to show the ability to learn through interactive digital media delivered via the internet through the terminal. Calling this development, Minimally Invasive Education (MIE), Mitra (2009) and his colleagues show more evidence of interactive digital media's ability to massively affect education without the need for human intervention. Through the installation of 21 additional internet computer stations, MIE allowed the children in the New Dehli slum to accomplish the following:

- Learn English to communicate—with no prior knowledge of the language,
- Not need to be "taught" how to use a computer and digital media; the media "taught" and self-empowered the children to learn on their own,
- Create their own media through drawing images on the computer screen,
- Increase STEM-based scores at their home schools,
- Modify their own social interaction skills because of the ability to remotely see and hear (digital media) about other people and places (Mitra, 2007; Mitra, 2009).

The Hole-In-The-Wall project was expanded to Cambodia in 2004 after the results of the 1999 efforts worked against the original hypotheses that learning without a teacher through the internet, combined with large language barriers, was nearly impossible. Through MIE, Dr. Mitra seeks to explain that the internet delivering interactive digital media has the power to change the landscape of education as it is has been known since the educational methods were first inspired by Horace Mann (1848) and John Dewey (1897) in America in the 19th Century preceded by British Education developed in the 12th Century. Interactive digital media's ability to enable students is unprecedented, understudied and still in early development. Mitra (2007) also conducted another experiment where 32 children in groups of four working with the internet and digital media together on one station, and not on their own with their own computer, showed equal learning outcomes compared to children with a physical teacher over longer term breaks (two months between pre and post tests) with the non-teacher connected children interacting together with digital media above working alone with digital media.

Mitra and his team's research lead to an argument that education in itself is a self-organizing system where instruction is the vehicle (executed in his experiments entirely via interactive digital media) that can be experienced in a solo or group setting like traveling in a bus can be experienced as a rider or as

a passenger with many participants resulting in differing outcomes depending on their role as driver or rider. Learning in this case, therefore, is a phenomenon that emerges from the self-organizing system enabled entirely by interactive digital media. There are limitations, however, to replacing physical teachers and physical media with digital equivalents. Perhaps these limitations are only found in the amount of access learners have to content online. Regardless, in settings where access to quality physical teachers and classroom mediators is limited, interactive digital media can be an acceptable (and perhaps preferred) replacement vehicle in the Self-Organizing Learning Environment (SOLE) that education is argued to be in the 21st Century (Mitra & Dangwal, 2010).

Learning environments that were previously only face-to-face for both K-12 learners and higher education students are seeing interactive digital media as an information source threatening to completely replace all three of the following learning methods: (a) asynchronous chat, (b) printed textual readings, and (c) face-to-face lectures (Kurzweil, 2005; Masten & Plowman, 2003; Thompson, 2011; Talbert, 2013; Vinge, 1993). Beyond the advantages given to learners via MIE, interactive digital media provides many advantages, including "the liberty to proceed or recede allow[ing] self-pacing [and] an immeasurable interconnectivity to information in a variety of possible combinations, sequences, and mixture of resources which shape . . . higher-order thinking" (Teoh & Neo, 2007, p. 28). Interactive digital media is also a very attractive information paradigm when compared to asynchronous chat via text, printed textual readings, and lecture, because it provides a combination of movement and sound that many find as a superior source of entertainment. Entertainment methods and educational methods, however, are not always in parallel in their ability to demonstrate high outputs of happiness on par with learning outcomes. The problem is that there is not enough good data on the impact of digital on outcomes in K-12 and higher education to warrant replacing these older information formats entirely. Furthermore, while educators everywhere are becoming more unified in their calls for more consistency in outcome skill development, there debates on assessment that may never end.

It is understood that higher education, for example, desires an overall increase in the areas of STEM and CT. No generally agreed upon assessments for STEM and CT outcomes exist, however, and this situation combined with the fact that there is not enough data on the impact of replacing older information formats (viz., text, imagery, chat) with digital media shows a potentially dangerous convergence implying interactions yet to be maturely assessed when targeting a variety of educational outcomes (Cottrell, 2014). While Mitra's experiments may show equivalent outcomes for some STEM learning objectives in K-12 learners via the use of digital media, assessing something like English grammar skills of his New Dehli learners may very well show little improvement over a traditional one-term, face-to-face English as a Second Language (ESL) course.

FUTURE RESEARCH DIRECTIONS

David Wiley (2013) explains that digital media tools like Open Educational Resources (OERs) have been found to be better at increasing educational outcomes versus traditional texts. Wiley also cites an extensive research project from Nature comparing the quality of content from Wikipedia to peer-reviewed, for-purchase traditional text materials, viz., Encyclopaedia Britannica (Giles, 2005). The parity in the number of errors in like-minded content sections of the various information sources tested demonstrates the power to be found in digital media educational resources, some of which allow free access to material commonly used by students toward their learning outcomes. Britannica responded to Nature's research

with a comprehensive negation of all results (Encyclopaedia Britannica, 2006). Similar to the Clark (1994) and Kozma (1994a: 1994b) debate 20 years ago, Nature has returned with another response, providing access to its research data and methodology and leaving room for future debate. What is undeniable is that learners want open digital content, and will use it as proliferation increases. It is also important for teachers, parents, school administrators and educational researchers to accept that students will augment instructor-created (or approved) digital content with random content they find on their own. This may skew research efforts in the future as researchers lose less and less of a sense of which digital media (approved or unapproved) is helping/hurting students' learning outcomes. If educational digital media content from anywhere (and hosted everywhere) is increasingly becoming impactful toward learning objectives, further research is warranted before wholesale adoption begins.

Google's Potential Edge in Transforming Instruction and Learning

Perhaps the single greatest concern in regards to digital media's potential affects on education throughout society is Google, Inc.—specifically in the form of one of its most popular subsidiaries, YouTube. While scientists and researchers debate the form, function and impact on outcomes of digital media in the learning ecosphere, Google has been slowly allowing for the creation of the worlds largest and most free educational institution (albeit devoid of an organized curriculum). Combining Google search and Google Scholar with YouTube gives an individual the power to learn more from digital media than ever before. The convenience of educational and instructional content to be found on YouTube, for many users, trumps that of any traditional school or training center. If an individual wants to learn how to change the brake pads on their vehicle, YouTube will potentially be able to store digital media content related to a users' exact year, make and model of vehicle teaching him or her how to perform a specific action over and over again. If users want to know which version of a particular mobile device is most durable, YouTube can contain hundreds of digital media recording durability tests for one particular mobile device adding to potentially thousands of hours of video on every mobile device every made.

Siva Vaidhyanathan's (2012) book, *The Googlization of Everything*, offers a clear warning about the disruption Google and its subsidiaries can enact onto society at large. In addition to Google Search dominating individuals' ideas of what search engines are, and YouTube providing a dominant instructional digital video platform, Google has entered the educational hardware ecosphere with its very low cost and low-priced Chrome books for student access to its web browsing software and open productivity suite, Google Docs. In an educational environment where "dollars-per-student-spent" on technology equates to quality education at the same time that taxation for funding education is viewed by some as an abuse of civil rights (Rodriguez, 2014), Google can circumvent the notion that more money technology is better not through empirical research on learning outcomes, by providing completely integrated content, hardware, software, operating systems, mobile connectivity and remote broadcasting (through Chromecast) a very low price point. Essentially, Google is building the structure for the world's largest database of instructional information, digital text, video and audio media, and delivery hardware and software at a fraction of the cost to a user versus any traditional learning environment. And, many of their digital media offerings connect students to information for free.

The bulk of the future of educational digital media may already be in the hands of one corporation that does not declare itself to be a school of any type. Large-scale efforts to offer MOOCs (massively open online classes), whose basis for existence is the presentation of digital media to learners in a free (or nearly-free format), are already supported by long-standing, well-capitalized traditional brick-and-mortar

institutions. Coursera is partnered with over 75 American traditional institutions of higher-education including Ivy League universities and large state institutions like the University of Virginia. They also are partnered with some of the largest universities from over 25 other countries (Coursera, 2014). A rival, EdX, offers courses from traditional higher education powerhouses MIT, Harvard, the University of Texas and others. They boast 200+ individual courses, 400+ faculty and 100,000+ online certificates granted so far (EdX, 2014). What, however, about the total amount of digital media needed to deliver this educational experience? The amount of raw educational content from these leading MOOC institutions, which comes solely in the form of digital media, pales in comparison to what can be found on Google servers today. All Google needs to do is begin charging for their services, and the ease of acquisition of their educational content can yield a sizable profit, or none at all; they are at their leisure to begin operations as an educational institution with a varied and diffuse instruction base. Essentially, Google may already be the largest educational institution on earth—all due to the advent of digital media throughout society. The company already has the search tool needed to aggregate their content into instructional, and even curricular, modules of their own.

Regardless of the source of the content, future work should explore what digital media is doing inside the minds of learners as it is presented to students in conjunction with text and other material types as the future of routine adoption of digital media-capable, cheap, lightweight, and mobile devices continues to supplant the traditional physically printed word (Hu, 2011; Hurdle, 2011; Schaffhauser, 2011). Studies that seek to indicate that a mixture of material types yields the best educational outcomes may become more necessary as ADA requirements, the long-standing impact and debate of Multiple Intelligences Theory (Gardner, 1985), and the newest addition of Universal Design for Learning (Orkwis & McLane, 1998; Gargiulo & Metcalf, 2012) impact all levels of education. The presentation of the same material in a variety of different formats (involving different or the same authors) could be found to hinder certain outcomes and improve others. Determinations on which outcomes are preferred in certain educational environments are a perplexing problem necessitating future research.

CONCLUSION

Throughout this chapter, a review of literature and concerns related to digital media's effects on society within the context of learning and instruction has been presented. The prevailing finding is that digital media is being created and consumed at ever-increasing rates, yet the outcomes in the minds of learners affected by digital media are not easy to predict or always moving in the desired direction. It is known that people are using digital media each day to gain knowledge, understand concepts and learn new ways of seeing the world around them. Digital media provides an unprecedented opportunity for the whole of society to instantly access instructional content to learn more concepts than any set of humans in recorded history.

Instructional and learning outcomes and digital media continue to be pressing issues for educators seeking strategies to improve the educational experiences of students. The need for increased accountability within the formal educational atmosphere also shows no sign of abating. As digital media takes over as the dominant form of classroom information source, assessment of its impact deserves attention. Challenges persist in linking learning outcomes and objectives to the influence of digital media in the classroom as K-12 and higher education advances through the remainder of the century. Historically, literacy—a goal achieved through engagement with the reading and creation of physical text—has been

one of the chief concerns of education. As literacy has become more of a virtual guarantee (Central Intelligence Agency, 2012) for students in developed nations like the United States and Western Europe, more focused learning outcomes like STEM, CT and PSA take center stage. Learners can read and write text, but what can they do with what they have learned and how do they explain what they deduce, feel, believe, and know? Digital media will impact these outcomes as it presents information to and interacts with the cognitive ability of all learners. Finding how well the interaction is accomplishing educational outcome targets is now the necessary research goal.

Discussion between researches like Clark (1994) and Kozma (1994a), rooted in foundational assertions like Marshall McLuhan's (1964) "the medium is the message", provides some of the main catalysts for the need for future research. Kozma's refutation of Clark's replaceability challenge ultimately wins the going forward, because all digital media are truly not equal, and therefore, reaction and observed learning outcomes will never be equal across seemingly replaceable digital media types. Digital media types contain their own distinctive educational traits and will produce unique learning outcomes, if students under their influence can demonstrate what they assimilate as they learn. Mayer's (2001; 2005a, 2005) research into media and cognitive load give caution to instructors to assess effectiveness of media instead of adopting a "more is best" approach to the inundation of student minds with as many types of digital media as possible.

All digital media objects are increasing rapidly in development and deployment in all types of educational environments, because of their perceived benefits and efforts to conserve time. Importantly for research considerations, however, is that digital media research shows many mixed results on the impact of this popular and popularly easy-to-use and create medium on learning outcomes. Foundational research like Azevedo, Moos, Greene, Winters, and Cromley (2008), Mayer and Moreno (2003), Stoney and Oliver (1999), Thomas et al. (2001), Starbek et al. (2010), and Sullivan-Mann, Perron, and Fellner (2009), followed more recently by Kayaoglu et al. (2011), Serin (2011), Smith (2012), Marra (2013), Rodriguez (2014), Alexander (2014), and others described in this chapter and found in additional readings, give direction on how to conduct digital media versus traditional learning resource impact assessment studies in a variety of educational settings targeting many different instructional outcome goals. The limited amount of comprehensive research focused on the impact of digital media on learning and instruction is ironic considering (a) the sheer number of students using digital materials today, (b) the large number of digital media objects being created each hour, (c) the assumptions about their benefits to knowledge acquisition, and (d) the high degree of self-efficacy students feel about their engagement with digital media in learning environments despite mixed results on actual outcomes performance. Overall, finding solutions to the problems of cognitive overload combined with access to digital media material and determining what these media do to learners' brains in terms of outcomes serve as major influences for future research needs, as well as future strategic planning about digital media object distribution to students.

Teachers and instructional designers aspiring to design and use digital media that includes educational content that is convenient for a mass audience, entertaining to multiple senses, and potentially absorbed very quickly (versus traditional text-driven content) will find insight from exploring the research found in this chapter, and from any future replicating research going forward. As popular as digital media may be, educators today are potentially faced with many difficult choices regarding the use and popularity of digital media over older information formats (Broussard, 2014; Flood, 2012; Kurzweil, 2005; Vinge, 1993). While this chapter has reviewed the historically substantiating literature, the importance of text-based materials to learning is evident over hundreds of years of tradition since the time of the invention

of the printing press. It cannot be ignored, however, that digital media changes the educational landscape in a way that is often initially perceived as a universal benefit containing few, if any, potentially negative learning consequences. Why would students not want to learn via a method that combines text with audio, video, and/or images? Why would this medium not be the best option in all cases for learning? Students do, in fact, a) believe that they are learning more through content-equivalent digital media, b) enjoy not being required to purchase a non-digital materials, and c) look forward higher outcomes for themselves after taking courses using digital media. The literature shows that perceived higher outcomes through digital media, however, are not always realized. Individual learners are viewing their educational experiences with digital media as a benefit before actually knowing how well or poorly they perform on examinations within courses or on their final grades.

Pursuing the questions found in this chapter will impact various types of educational leaders and policy makers as they struggle to meet the challenge of the mass adoption of digital media content for learning. Institutions can use questions like these as strategic markers for conversations regarding directions for the advancement of their own student learning goals and objectives. Regardless, the need for further research on the topic of digital media affecting society through learning and instruction is clear. Better understanding of how to either decrease the damage done to educational outcomes by digital media, or how to better integrate the positive cognitive benefits of traditional learning information materials into digital media, is a goal that will benefit students in the future.

KEY TERMS AND DEFINITIONS

Digital Media: Any single item or set of items combining text with audio, video, or images for the purpose of conveying information leading to meaning in the mind of a user.

Education: The transfer of understanding, skills and/or knowledge from one source to another.

Instruction: The process of delivering education from one source to another.

Learning: The demonstration of understanding acquired through various aspects of educational experience.

Mental Model: Active and dynamic representations of knowledge that visualize the invisible by creating analogies between what is known and not known.

P-20: Pre-school through traditional undergraduate education in the United States.

Schema: Organized collections of information containing understanding of how each individual piece in the collection relates to one another.

Traditional Media: Any single item or set of items only relying upon physical form for the conveyance of information leading to meaning in the mind of a user.

ABSTRACT

The purpose of this integrative review of theory and research is to assess the economic impact of digital media in ways that are unreached by instrumental means of measuring economic activity. Specifically, we use three overarching arguments identified from a review of the literature that broadly defines the economic force of digital media content in contemporary society. We contextualize those arguments in terms of current issues in the field and gaps in the research base before concluding with a discussion of the implications of what we learned for education, civic engagement, social practice, and policy.

INTRODUCTION

The purpose of this chapter is to interpret the economic significance of digital media through three general arguments about digital communication in contemporary society. Understanding linkages between digital media and social networks enables a view of economic significance driven by digital media's potential to shape human life. In the rapidly shifting digital world, moving beyond explicitly financial or monetary measures of economic activity shifts emphasis away from reactive analysis of completed sales toward proactive understanding of change and exchange as a core feature of human culture. Such a view helps

DOI: 10.4018/978-1-5225-3822-6.ch057

interpret tensions in education surrounding literacy. It affords analysis of changes in human communication readily, but not yet fully, commodified economically. Such a perspective, we argue, is necessary for productive thinking about literacy as a social practice, literacy education, civic engagement, and policy.

SUCCINCT OVERVIEW OF THE RESEARCH

We begin with an integrative review of theory and research on the role of digital media in contemporary society's global economy. Definitions of *digital media*, *contemporary society*, and *global economy* are best formulated as systems within systems. For example, in Nick Couldry's (2012) *Media, Society, World: Social Theory and Digital Practice*, he lays the foundation for a new sociology of digital media as a means of dealing with the complexities of living in a 21st century media-saturated world that extends beyond the social to include the economics of production and consumption. Amid unceasing calls for education, policy, social practice, and civic engagement to "keep up" with digital media, Couldry asks a moral question that holds a key, we argue, to understanding the nested economic impact of systems within systems. What does digital media allow us to "do" to one another?

The term *digital media* defies attempts to reach consensus on its meaning. We review literature on the construction of digital media as content (print and nonprint) that has been digitized and thus potentially ready for dissemination on the Internet. We echo the insistence from various fields of research on digital media that digital media content is a kind of tip of the iceberg for the ways digital media is reorganizing and managing our actual and metaphorical households and villages. Starting with content serves as a starting point for discussing digital media's broader impact on our lives in the broad sense that Couldry intends.

Below, we pursue three arguments we identified from a review of the literature that broadly define the economic force of digital media content in contemporary society. We then contextualize the arguments about digital media content in terms of relevant social, political, and economic factors that mediate the production of digital content. This approach makes it possible to assess economic impact of digital media in ways that are unreached by instrumental means of measuring economic activity (e.g., Boggs, this volume; Chambers, 2013). We seek to capture the essence of how digital media affects the "management of the household or village" (Author C's interpretation of etymology of *Greek oikonomia*).

Argument #1

Digital media in a contemporary society—one that requires a global marketplace to satisfy daily needs—is multimodal (i.e., composed of images, sounds, and bodily performances, as well as oral and written language).

One result of the breakdown between formal and informal learning (Dabbagh & Kitsantas, 2012; Hull, Stornaiuolo, & Sterpont, 2013) is the opening up of spaces in which users explore new online ways of participating and communicating specifically in multimodal ways—ways that require collaboration, production, and dissemination of one's own digital texts as opposed to mere consumption of such. Media production has always been multimodal, but digital media makes multimodality a core feature of interactions with economic potential.

However, digital media *content* and digital media *space* suggest quite different economic possibilities. On the Internet, digital content generated by users, such as a Facebook post, could change nothing or everything, and it seems impossible to predict. However, the social *space* created via Facebook has far more stable, predictable, *tradable* economic value. The newsworthy buying and selling of social media pillars and startups is only one part of the picture. Innumerable businesses make calculated investments about the potential for their enterprises to succeed through merger into digital spaces produced by other vendors.

These developments are not insignificant. They represent a major disruptive innovation in the production of social space. Lefebvre (1992), in Geography, proposed that a place like a city or a rural area at a particular time was a social construction, a kind of script guiding behavior in service of a set of controlling interests. The rapid production and valuation of distinctive online spaces underline digital media's role as a socially produced economic space.

How many downloads per dollar investment? How much traffic is generated by a slicker website? How do customers relate to new products through online video, live chat, and so forth versus traditional print and telephone support? How many purchases per ten new followers? How many additional reservations per dollar spent for online services? These questions resemble those of the shopkeeper or farmer, yet they are following, according to Lefebvre (1992), an overarching ideological and economic script. The distinction between content and space points up the economic importance of digital spaces as socially constructed tools that alter day-to-day activities, job creation, and balance sheets.

Moreover, the situations elicited above largely rely on existing spaces that attract investment. Online *learning* spaces represent a different but equally important multimodal digital media environment where, again, digital content by no means indicates economic impact. In the case of Wikipedia, for instance, donations purchase server space and employ editors, but the economic impact of readily available information cannot be quantified. Yet it is unquestionably greater than the economic footprint of the web encyclopedia organization. Online learning spaces marshalling experts' knowledge resources daily shape economically significant choices worldwide, from when to plant corn and beans to projected trading values of those commodities. Networks of various kinds have formed to define formal and informal research agendas for their particular areas of expertise. However, these networks that connect digital media content and digital media spaces participate in complex economies beyond the traditional buying, selling, and distribution of goods and services. The economic impact, then, is a matter of potentiating connection.

Online learning communities spanning the early grades through higher education (Ito, Gutierrez, Livingstone, Penuel, Rhodes, Salen et al., 2013) have used "connected learning" to evoke this sense of potentiality. A report of the work (http://dmlhub.net/sites/default/files/ConnectedLearning_report.pdf) presents the concept:

It advocates for broadened access to learning that is socially embedded, interest-driven, and oriented toward educational, economic, or political opportunity. Connected learning is realized when a young person is able to pursue a personal interest or passion with the support of friends and caring adults, and is in turn able to link this learning and interest to academic achievement, career success or civic engagement. This model is based on evidence that the most resilient, adaptive, and effective learning involves individual interest as well as social support to overcome adversity and provide recognition. (p. 2)

The nine case studies detailed in the report demonstrate how the connected learning framework addresses our interest in knitting together education, civic engagement (both local and global), social practice, and policy.

Numerous research projects confirm Ito et al.'s orientation toward choice and cultural relevance in the expansion of digital media as an economically meaningful part of life (e.g., Kleine, 2010; Mansell, 2001; Selwyn, 2004). In sum, then, digital media is crucially multimodal, both in terms of digitized content as well as in the social interactions it mediates: the production of new social spaces and the facilitation of learning for economically significant action.

Argument #2

Given all the frenetic activity associated with online broadly-defined text productions, virtual collaborations, and novice dissemination efforts, a savvy consumer will make decisions about what digital content is worthy of attention and what is not.

Nearly two decades ago, an economist named Michael Goldhaber (1997) predicted that the *economics of attention* increasingly important in the global age, as a glut of information, news, and entertainment flooded communication pathways. He rested his economics of attention on the commonly accepted notion that a resource that is in short supply will be in high demand. The scarce resource, for Goldhaber, was human attention.

Attention economy is not a *laissez faire* theory of digital media that gives market dynamics responsibility for producing quality. Instead, scarcity of attention guides the designs of digital spaces, efforts to regulate access to certain kinds of information deemed "spam" or antisocial, policies that protect intellectual property, and campaigns to grant or increase access to digital media. Each of the above areas assumes the economic importance of interwoven online and less-connected aspects of our lives. Garnering and controlling attention via digital media is an important part of altering economic behavior, especially, but also political and personal as well.

The attention economy helps explain why digital media is an unstable constellation of ever-changing platforms. The quest for high ranks in search engine results illustrates how attention economy drives the continual refinement of information delivery on the web. Again, the economic impact of attaining high rank on Google has obvious yet hardly quantifiable impact. More importantly, the development of new opportunities for interacting digitally results in fundamental changes in human interactions, driven indirectly by quests to stay on top of search engine rankings, earn privileged status in a mobile app store, or otherwise justify investors' risk.

Argument #3

The role of digital media in contemporary society's global economy is reflected in the speed with which memes—e.g., phrases, images, videos, sound effects, songs and the like are copied and spread rapidly by Internet users—typically without regard for whether the message or intended meaning is clear or not.

With few exceptions, digital media content readily accommodates strategic re-use. Internet memes express digital media's affordance for sharing and re-combination. However, they expose a serious vulnerability of discussing digital media as content only, since the importance of memes rests in their strategic use

and popularity (i.e., social elements), and their power (i.e., political and ideological elements). Online strategic sharing of excerpted information for new users' purposes underscores the weakness of a content-oriented assessment of digital media's work upon us. Economically, the meme stands for digital media's capacity to blend the human and nonhuman elements of geographically, politically, and even temporally disparate groups or divided people otherwise enjoying fellowship. The production of new households or villages manifested in massively or locally popular memes displays the economic muscle of digital media as it works upon us.

A common critique of digital media's apparent disregard for accuracy in communicating messages online is harbored in memes that go viral. For example, in a 2002 TED talk, Dan Dennett, a philosopher and cognitive scientist, unleashed a barrage of ideas that led to 1,266,365 views as of October 26, 2014 about why memes are dangerous and in need of monitoring (www.ted.com/talks/dan_dennett_on_dangerous_memes?language=en). Briefly, Dennett argued that a meme is often misused, even abused, with each repetition of an idea that a meme comes to represents. To prevent a meme from being caricatured by people intent on turning a benign idea into a variant idea that is dangerous when spread by individuals bent on serving their own needs or causes, Dennett claims we must be ever vigilant. He likens a meme to a virus, giving Richard Dawkins (1976) credit for that term, which spreads and becomes toxic to those who have no immunity to it. Here, Dennett is speaking of cultural memes—ideas tolerated in one community but viewed as abhorrent in another community.

For example, the well-known meme featuring Don Draper from the television show *Mad Men* has gone viral with the saying, "They say a woman's work is never done. Maybe that's why they get paid less" (Gallagher, 2014). Here, we see a message being spread online that depicts the reality that women are paid less than men in the work force today. Yet, the premise behind *Mad Men* is to actually bring those issues of injustice to light (Gallagher, 2014).

For purposes of illustrating Argument #3, we used Dennett's TED talk on dangerous memes as the impetus for mining a substantive body of critical media research (Meehan, 2002; Smythe, 2006). Key to interpreting that literature is a knowledge of how the feminist political economist Eileen Meehan's (2002) research shifted an earlier focus on large-scale, impersonal media corporations and their shaping of cultural commodities and media markets to a focus on women who worked in the media industries. Meehan argued that despite what pleasures a viewer outside the commodity market, which at that time equated to white, 18-34 year-old heterosexual males, television was an agent of oppression. Expanding on Meehan's earlier claim, we see a parallel in some video games' digitized content that results in online harassment of women http://www.democracynow.org/2014/10/20/women_are_being_driven_offline_feminist). The market potential of such misogynist online video games demonstrates the economic muscle of digital media as it works to transform women into mere commodities.

CURRENT ISSUES IN THE FIELD

The purpose of this section is to describe the linkages between the three more general arguments already identified and the specific relationships of power that embed themselves in those arguments. We begin with an observation that occurred to us as we read broadly in the literature on digital media: that is, technology today creates an exciting terrain for society to create in ways it has been unable to do before now. People with access to the Internet are able to navigate the digital mediasphere with relative ease despite an abundance of information that comes at them from every angle and at all times. It is an

incessant display of affordances that individuals before the 21st century could not have imagined, except perhaps in a science fiction film that provided viewers with a glimpse into all that could be connected in a world of touch screens and other digital devices.

Yet, the freedom such affordances provide in terms of communication channels, especially those with nontraditional ways of communicating, makes digital media content and digital media spaces compete for the user's attention. For example, what "app" on a phone will help us create that perfect touch to our photo? Which "hashtag" on a social media site, such as Twitter, will most quickly reach a group of like-minded folks to let them know a new song has just been released? What can we add to our online profile to draw people to our page? These questions point to an overall bigger issue, namely, how, and more importantly, *why* does one have time to interact with most, or even some, of the digital media available today? Furthermore, if digital media is multimodal, readily available, and participatory how do the consumers and producers impact the spaces in which they are connected through the digital media? While there are no easy or simple answers to these questions, slicing it into smaller bits, such as the three sub-issues examined next, is as good a starting point as any.

Digital Media's Challenge to Traditional Print Literacy Practices

Multimodality refers to forms of communication that extend beyond print only. Briefly, multimodality views "representation, communication, and interaction as something more than language" (Jewitt, 2011, p. 1). As noted previously in this chapter, boundaries between formal and informal learning are being broken down (Dabbagh & Kitsantas, 2012; Hull, Stornaiuolo, & Sterpont, 2013), and our society is taking a more connected approach to its interactions (Ito et al., 2013). The problem, however, is that multimodality challenges traditional print-based literacy practices and not all parents, researchers, administrators, teachers, and teacher educators like the changes they see occurring. For example, high-stakes testing remains on the radar and continues to draw heated debates. Standardized tests come in for their share of critique largely because they traditionally privilege print-based reading and writing skills at a time when many young literacy learners with high-speed Internet access are using multiple modes of communication and digital media (e.g., still and moving images, sounds, gestures, and live performances) to interact with others within both local and global spaces. Thus, the disconnects in learning that can develop when traditional literacy practices meet technology-rich, multimodal ways of perceiving are quite stark and create challenges on all fronts (Leu, Kinzer, Coiro, Castek, & Henry, 2013).

Due to "changing relationships to truth and authority—in which knowledge is no longer certain or stable" (Jewitt, 2001, p. 3), we now are experiencing "mediated interactions" in which knowledge is consumed, produced, and disseminated in a variety of complex ways all of which impact the economic capital within the digital sphere. To limit our understanding of these (social) complexities would be to act as if "social, cultural, and historical conditions of societies" were not interconnected at all (Jewitt, 2011, p. 5). In other words, while multimodality has "emerged from linguistic theories" (Jewitt, 2011, p. 6) and pulls from a traditional foundation, it allows us a certain flexibility to engage with and question what constitutes a text. Furthermore, multimodality helps us see why and how people become authors of texts, how texts are read within situations, and how we can analyze these mediated texts, as well as the responses that they produce outside of the traditional definition of print-based language only.

When we look beyond the traditional definition of language, we start to see how a variety of "modes" facilitate varieties of participation in digital media environments. Kress (2011) defines a mode as "a socially shaped and culturally given resource for making meaning" (p. 54). For example, youth use media

that is "converged around multifunctional screens that integrate voice and text communication, image and video, games, photography, music, television, print, and apps" (Ito et al., p. 28). These user-friendly tools train us for a new economy in which digital media allows and requires us to connect to others in ways that extend beyond *meanings* into new forms of formal and informal economic activity.

Thus, as our contemporary society becomes more globally connected through digital interactions, literacy practices shift. In these digital media spaces, it becomes possible to be used by our literacies even as we use them for our own purposes (Brandt & Clinton, 2002). For this reason, efforts to expand literacy practices of students become entangled in economic imperatives of forging connections among local and global communities.

This entanglement works upon literacy education in multiple directions. Teachers may be using digital media to help prepare students to engage with the literacy practices that allow them to participate in the global economy through connected learning opportunities (Ito et al., 2013), but regional or national political and economic interests—represented by departments of education, educational textbook publishers, and curriculum and assessment developers, to name a few—work to standardize outcomes of formal schooling that do not necessarily focus upon those opportunities. Testing demands, financial commitments to curriculum developers, and the politics of education can stifle the difficult work of building authentic classroom connections with local and global communities. As a result, many classrooms still privilege print-based language uses over digital media.

As Ito et al. (2013) suggest, it is not that society should abandon traditional literacy skills, but instead it should focus on "diversifying and multiplying entry points and pathways to opportunity and meaningful participation in society" (p. 34). Students' literacy futures, identities, and opportunities as productive consumers and producers within society today collide with efforts of a strong central government to safeguard existing economic commitments to the teaching profession, manufacturing, publishing industries, higher education, and other economic dynamos of bygone years.

By allowing our definitions of texts and their meanings to encompass multimodality through digital media, we allow students more opportunities to use language in ways that value their experiences, knowledge sets, beliefs, and learning spaces. Furthermore, this expansion of the traditional definitions that privilege print-only texts leaves room for innovative projects such as the Europeana Space Project (http://www.europeana-space.eu). This project focuses on creating "new opportunities for employment and economic growth within the creative industries sector based on Europe's rich digital cultural resources." Thus, its strength lies in its ability to use available digital media in ways that incorporates multimodal "language" to prepare students to be effective members in a global society. At the same time, the development of new literacies among students position them to be exploited by the potentially adverse economic conditions of the new work order (Gee, Hull, & Lankshear, 1996). Under its terms, the buzzwords of the new economy—democratic, horizontal organization and collaboration—mask economic directions that preserve status quo and maintain traditional boundaries of wealth and power.

In order to communicate effectively within the global landscape, we build "language toolboxes" to help us understand how messages are represented in a variety of formats and what they are supposed to mean to others and to ourselves (Ivarsson, Linderoth, & Säljö, 2011, p. 203). Within the economic sphere, advertisers want consumers to use their toolboxes to embed every part of their company's message into their daily lives. Ivarsson, Linderoth, and Säljö (2011) believe that "representations serve as resources for communicating and meaning making, and they are essential to all human practices including perception, remembering, and thinking and other psychological activities" (p. 201). For this reason, the "mediated action," or the process of integrating the producer's message into our daily lives, is always important to

keep in mind (Ivarsson, Linderoth, & Säljö, 2011, p. 211) when we are trying to understand the space in which a text's content develops its economic impact for its audience.

When we consider digital media content here, we see that if the content is taken up by a company's consumers, then this consumption is the driving force behind all of the mediated actions that re-delivers the message in a variety of multimodal formats. Using the Internet as an example, we know that websites are feeding us unique content (through words, images, videos, and the like) that we potentially consider in our own lives. This process of expanding the Internet to become a means of navigating, thinking, speaking, and living is an attempt to foster at once an individual's own representation and a conduit for vast new domains of economic participation. Thus, with the proliferation of potential for asserting meaning comes immeasurable "traffic," or a volume of digital media activity on which its economic power rests. And, if more immeasurable traffic is present, then one must begin to question if consumers are duped, or, in fact, quite savvy with the digital media with which they work.

Media Dupes or Savvy Consumers?

Prior to the 1970s when Stuart Hall's (1973) work in what came to be called "cultural studies" made its mark in intellectual debates, media audiences were viewed as mere dupes of popular culture and mass communication. Though not digitized at the time, media producers' content was thought to represent the way people were positioned in the world and their inability to do little to counteract such representation. Hall, who was then Professor of Sociology in England's Open University, downplayed the role of media content and its influence on viewers' meaning-making abilities. Hall contended that images do not have stable meanings, and that producers' intentions at the time of creation do not guarantee that audiences will take up such meanings. It would be a mistake to characterize Hall as believing that media nearly five decades ago, and especially contemporary digital media, have no real and significant social, political, and economic effects on the world. He realized fully the influence of content and its intersection with powerful forces in society, especially in relation to what gets represented in the media. However, we contend that only with Latour's (2007) work on reassembling the social so that it accounts for nonhuman actants—a term that Latour (2007) used to denote an entity whether human or nonhuman that modifies the actions of another entity (e.g., pouring vinegar on baking soda)—has it become possible to trace associations "between things that are not themselves social" (p. 5). Latour boldly separated his work from postmodernism's attempt to deconstruct grand narratives that have long held people to hegemonic practices, which harm rather than advance their freedoms. In Latour's words, "Dispersion, destruction, and deconstruction are not the goals to be achieved but what needs to be overcome" (p. 11). Proponents of new materialism who have incorporated much of Latour's work continue to redefine the role of nonhuman actants. Most recently, posthumanist philosophers (e.g., Braidotti, 2013) and New Materialist scholars such as political theorist Jane Bennett (2010) use Latour's (2007) and Deleuze and Guattari's (1987) concept of assemblages—ad hoc groupings of human and nonhuman elements—to argue that agency is not strictly a human capacity. In Bennett's (2010) words, the material elements in an assemblage, "while they include humans and their (social, legal, linguistic) constructions, also include some very active and powerful nonhuman actants: electrons, trees, wind, fire, electromagnetic fields" (p. 24). To this list of nonhuman actants, we would add digital media.

Just as Latour and the posthumanist movement have sought to even the playing field that was central to Hall's (1973) concern about representation and the media, so too have education researchers worked to demonstrate the interface between human and nonhuman actants. For example, Bigum, Knobel,

Lankshear, and Rowan's (2003) research illustrates how digital media content and space exacerbate tensions that exist between the highly regulated economics of attention inside schools as contrasted with the relatively deregulated economics of attention outside schools, particularly in situations where mass media and new communication technologies dominate.

Specifically, Bigum and his co-researchers studied a group of Grade 9 boys who attended a rural school with Internet access in northern Australia's eastern coast. Their participants were initially viewed as "disadvantaged" in terms of "the lads' 'inability' to carry out the kinds of literacy based activities regarded as mainstream for Grade 9 English" (p. 103). Inside their school's regulated curriculum, the Grade 9 boys attracted negative, even punitive, attention—the kind that often resulted in instruction that merely re-inscribed the boys' sense of failure. However, when Bigum et al. intervened with a project that involved the boys in constructing a website on motorcycles—an interest that stemmed from a previous project in which they created a motorcycle magazine—the "disadvantaged" lads were positioned as experts in an area that attracted positive attention from their peers and supervising teacher.

This role reversal (going from "disadvantaged" to expert) demonstrates digital media's mediating effects on traditional ways of thinking of defining "failure" and its supposed fixed or permanent place in education discourse. We submit that with digital media as a player, so-called failure is an idea that teachers and students might jointly challenge in their effort to engage with learning on their own terms. In doing so, they might also find reasons to discard previous negative evaluations of student performance.

Digital Media's Disruption of Traditional Meaning Making

Researchers working within contemporary digital media culture, especially in the realm of social media, have reported numerous instances in which the *effect* of people's interactions is more important than the content or meaning derived from those interactions (Varis & Blommaert, 2015). An earlier recognition of this phenomenon is attributed to Vincent Miller (2008), a sociologist and social researcher who noted that in the digital age, "We are seeing how in many ways the Internet has become as much about interaction with others as it has about accessing information" (p. 398). Anyone who participates in Facebook and Twitter is well aware of how memes (or signs that go viral, such as the Don Draper meme discussed earlier) are more characteristic of networks involving human and nonhuman entities than they are of communities in which social interaction is not dependent on the internet.

Particularly in the digital world, relying on the disruption of meaning as a motivating factor in producing and consuming media content is complicated by issues of fair use and the marketplace, especially when transformative remixing is involved. Joyce Valenza (2009), a school library media specialist in a suburban Philadelphia high school, explained *transformativeness* this way:

When a user of copyrighted materials adds value to, or repurposes materials for a use different from that for which it was originally intended, it will likely be considered transformative use; it will also likely be considered fair use. Fair use embraces the modifying of existing media content, placing it in new context.

Examples of transformativeness might include: using campaign video in a lesson exploring media strategies or rhetoric, using music videos to explore such themes as urban violence, using commercial advertisements to explore messages relating to body image or the various different ways beer makers sell beer, remixing a popular song to create a new artistic expression. (Valenza, 2009, para. 6 and 7).

Legal backing for Valenza's interpretation of transformativeness grew out of a study conducted by Aufderheide and Jaszi (2008) at the Center for Social Media in Washington, DC, in which the researchers concluded that a "significant set of creative practices is potentially both legal and at risk of curtailment by currently discussed ways to control online piracy and theft of copyrighted works" (Executive Summary, para. 2).

Using copyrighted material to make something new—what noted media scholar Renee Hobbs (2010) calls *repurposing*—is still a gray area in the field of legal studies due to recurring battles over pirated content. As a result, researchers who want to study the use of digital media for creative purposes have increasingly turned to nonprofit organizations such as Creative Commons (CC) (www.creativecommons.org) for guidance in how to share content legally. A study by Alvermann, Beach, and Johnson (2014) is a case in point. The co-researchers designed a public website, Becoming 3lectric (www.becoming3lectric.com), for the purpose of studying the degree to which remixing digital content would push the boundaries of authorial intent and ownership. They settled on a CC license that met their university's requirements for studying and protecting human subjects. As a result, contributors to Becoming3lectric are legally able to collaborate, repurpose, and share their remixes while retaining their choice of options. For instance, contributors may not want to allow any commercial repurposing of their work, but still allow others to build upon that work if they are credited for it. Or, they may opt to upload their work without granting others any remixing privileges or the right to analyze their work.

With its various licenses for working flexibly and responsibly with digital texts, CC helps people forge new ways of disseminating multimodal content that might otherwise be impossible. Furthermore, as Suthersanen (2007) has pointed out, "Nowadays…do-it-yourself tools, including the CC licensing regime, empower and enable individual authors of literary and musical works to retain more control over their work" (p. 60). Theoretically, CC has flattened the global marketplace in terms of who can participate, as well as what kinds of knowledge count.

GAPS IN THE RESEARCH

Two major topics in the literature on the role of digital media in contemporary society's global economy for which little research has been generated are these: inequality in economic opportunity and the general fallout from untapped digital spaces and connections.

Inequality in Economic Opportunity

Speaking at the American Educational Research Association's tenth annual *Brown v. Board of Education* lecture, Gary Orfield (2014), Distinguished Research Professor of Education, Law, Political Science, and Urban Planning at the University of California, Los Angeles called for a new civil rights agenda. Specifically, Orfield argued that while the United States continues to celebrate Martin Luther King, Jr. and other civil rights leaders, as a nation it currently is failing to focus on the rights that are being lost. He specifically called attention to the fact that close to 60 years after *Brown v. Board of Education*, 40% of Black and Latino/a students are in what he described as "intensely segregated schools . . . with about twice the poverty concentration of the schools of Whites and Asians" (p. 273). To further complicate attitudes of low expectations for children in poverty schools in which advanced intellectual

work is viewed as being beyond their reach, all too often scarce digital technologies are used for basic skill and drill activities.

Echoing Orfield's grim observation, Ito and her colleagues (2013) described what they perceive as a downward trend in equal opportunity for society's least well off students: Over much of our nation's history, expanding educational opportunity has been, in fact and in perception, a key element in the 'rising tide that lifts all boats.' [Currently], after thirty years of steadily rising economic inequality in the United States, that tide is now running out, and our educational system may be doing more to perpetuate and even to increase inequality than to expand economic opportunity" (p. 13).

In their discussion, Ito et al. (2013) point to educational institutions as places that cater to only a certain group of students despite the fact that the economy and work force have become increasingly competitive and limited even for job seekers with a college degree. They draw from their pool of data to argue that educational institutions offer programs with alternative career paths to meet an increasingly diverse applicant pool. And, as previously discussed, they recommend that institutions "expand and diversify meaningful life options and pathways available to young people" or else they will be "reinforcing an educational system that only serves the interests of elites, breeding a culture of competition for scarce opportunities (Ito et al., 2013, p. 14).

In sum, claiming that currently a majority of institutions' responses to the need for equality in economic opportunity is unacceptable, Ito and her colleagues (2013) call for an increased awareness of how "in a world of global interconnections and rapid change, effective learning is lifelong and integrated into the real world of work, civic engagement, and social participation" (p. 14). For this awareness to grow and become second nature to society's way of thinking about inequality, a major shift in how we define *opportunity* must first occur.

A study funded by the William T. Grant Foundation (Carter & Reardon, 2014) is a starting point. This report begins to fill a gap in the research literature on the role of digital media in contemporary society because it lays out a strategic research agenda, which if heeded, could produce more than simply advocating for social justice and access to high-speed internet. Briefly, Carter and Reardon (2014) strategize a research program that would have researchers focus on the following questions: a) how do unequal opportunities occur insidiously over time, b) what social processes preserve inequality, c) which strategies can reduce the consequences of social inequality, and d) what mechanisms are at work that make the distribution of inequality taken for granted?

Fallout From Untapped Digital Spaces and Connections

Digital media content is reorganizing and managing numerous aspects of our lives on a daily basis as Couldry (2012) contends. However, less often studied and reported in the research literature on adolescents' out-of-school uses of digital media is the point that interactions between human and nonhuman actants have valuable economic potential. School-age young people's preferences for producing and learning with multimodal texts that combine moving and still images, sounds, performances, icons, symbols, and the like suggests that their ways of telling, listening, viewing, and thinking in out-of-school digital environments have potential for informing both their in-school identities as learners and hence the trajectories they will follow after graduation (Alvermann, 2010; Ito, Horst, Bittani, boyd, Herr-Stephenson, Lange et al., 2008; McClenaghan & Doecke, 2010; Rennie & Patterson, 2010; Skinner & Hagood, 2008; Thomas, 2007; Walsh, 2008).

Yet it is generally the case that the work of students who self-identify as users and producers of multimodal digital texts on their own terms and time is rarely visible to teachers. Alvermann (2011) linked this phenomenon to other research that suggested four barriers to teachers becoming aware of what their students are producing online in after-school hours. Briefly, she relied on two key tenets to analyze research findings on young people's out-of-school use of digital media. The first is that today's youth interact with each other and the web in ways that rely on collective meaning making, which Jenkins (2006b) describes as a condition in which "none of us can know everything; each of us knows something; and we can put the pieces together if we pool our resources and combine our skills" (p. 4). The second tenet is that literacy is a social practice (Gee, 1990; Street, 1993) and thus implicated in social reasons for getting things done (Barton, Hamilton, & Ivanic, 2000), whether for social, ideological, or economic gain. Experiencing social connectedness while engaging collectively in online literacy practices affords a sense of belonging and an opportunity to identify with others who have similar interests but may vary in their skills and access to material resources.

Among the numerous findings that Alvermann (2011) reported are several that point to barriers, which if overcome, could open spaces for more freely exchanging information, motivations, and accomplishments. The first of these was the prevailing assumption that multimodal digital content distracts. A second barrier consisted of socially constructed artificial dichotomies between in-and-out-of school learning (e.g., schools must be held accountable for covering a set curriculum whereas after-school online learning is just for fun). Third, the results of some studies Alvermann (2011) analyzed suggested that professional development efforts aimed at building teachers' awareness of the role of digital media in their students' lives fall flat when attempts at mediated action result in short-lived interventions that rely more on talking the talk than walking the walk. Finally, a fourth and all-encompassing barrier was the mistaken assumption that age-old tensions between institutional authority and youth identity politics could be easily resolved. When schools and adults are positioned as experts on all topics and students (novices) on few or none, the potential for in-school learning to capitalize on the digital literacy skills, interests, and competencies that youth are free to explore, trade, and expand on in online spaces.

IMPLICATIONS FOR EDUCATION, CIVIC ENGAGEMENT, SOCIAL PRACTICE AND POLICY

Here, our purpose is to highlight the implications of this chapter's integrative review of theory and research on the role of digital media in contemporary society's global economy. Specifically, we address implications for education, civic engagement (global and local), social practice, and policy. In doing this, we draw from each of the three arguments in Section 1 of the chapter that play out in overlapping ways through supporting evidence (Section 2) or lack thereof (Section 3) to inform this last section on implications.

Education

With the increasing focus on new literacy practices and digital media within classrooms today, there is not a question of *why* we should study digital media in contemporary society today, but *how* we should and can study its implications for the global economy. When preparing students with the skills they will need to be productive members of the global economy, we know that we are currently preparing them

for jobs that have yet to be created with skills that may become outdated. Teachers, and by extension educational researchers take on moral responsibility for the ways in which we position children to have their skills exploited economically.

Nonetheless, as previously discussed, "multiple forms of literacy have been named in the literature including information literacy, visual literacy, computer or digital literacy, and media literacy, but there is considerable overlap between these forms" (Considine, Horton, and Moorman, 2009, p. 471-472). The problem is not how these multiple forms of literacy overlap, but instead, how we begin to help today's students navigate these overlaps to better understand their role in contemporary economies.

When we take a "critical" approach to how media and culture are impacting classrooms, we bring an "understanding of ideology, power, and domination" to help students explore "how power, media, and information are linked" (Kellner & Share, 2007, p. 8). For these reasons, there is an increasing need for today's students to actively and critically consume and produce in both the classroom and their lives outside of school, too. With the expectation of their increased engagement comes responsibility to help students ask, as we have in this chapter, what should digital media be able to do to us?

For example, Jocson's (2010) study that noted the need for "critical multiculturalism" (p. 78) is important to consider when we think about the "dialogical relationship between consumption and production and what it means for youth who actively engage various media forms" (p. 79). In fact, as we know, "many young people are not just consuming cultural media but also producing and distributing their own" (Jocson, 2010, p. 80). For Jocson, her qualitative research focus on the process, product, and practice (p. 80) helped her understand the students' poetry through her critical multicultural lens. She notes that "to understand the poem is to understand the actual production" (Jocson, 2010, p. 84) and that "youth are active consumers as well as knowledge producers who with support from others are able to participate in a democratic order and confront social inequities in their lives" (Jocson, 2010, p. 86). The process she describes here and the outcome ties back to the role reversal that demonstrates digital media's mediating effects that allow students be the experts in spaces that extend beyond the classroom walls.

Economically, the technological changes encapsulated by the term digital media signals the possibility for classrooms to move out of a perpetual "research and development" existence. Students can create in a variety of ways that extends beyond classroom walls or the pages of a book. Their posts can go viral, earn money, shape policy, solve meaningful problems, and attract all manner of attention. Instead of focusing on how to keep these mediated intersections of multimodal digital media and print-only language uses from occurring in schools, we should be actively invite them in by "creating school discourse that is not separate and distinct from the blurred discourses of our lives outside of school" (Alvermann & Hagood, 2000, p. 203). When we keep the doors open to the possibilities of digital media and literacy, we create opportunities for all to be valued in and out of school, both now and in the future.

We continue to see that "young people are tirelessly editing and remixing multimodal content they find online to share with others, using new tools to show and tell, and rewriting their social identities in an effort to become who they say they are" (Alvermann, 2008, p. 8). In other words, today's students' literacy practices are both narrative as well as connective especially as these texts become more social.

For this reason, the social nature of literacy practices today gives all of us a new way to think and connect with those around us. In fact, literacy is not just limited to the "local" realm either, such as the classroom. Literacy infiltrates, disjoints, and displaces local life (Brandt and Clinton, 2002, p. 343). It is never just the local impacting literacy practices, but instead the transaction that takes place within that moment: the consumption and production of media with the tools to disseminate "new" informa-

tion in a "new" way created by the consumer, which invites new literacy forms that essentially connect everyone everywhere.

However, what do these new literacy forms mean in regards to today's classrooms? Because we are placed in social situations that "call for critical approaches that make us aware of how [the] media construct meanings, influence and educate audiences, and impose their messages and values" (Kellner & Share, 2007, p. 8), we need to help students move past the obvious meanings and work on a deeper level with the texts in front of them. And, because these mediated, "new" texts are constantly changing in form, it is important for them to understand why and how those changes are being made, including how different formats impact our reading of those texts.

Typically, the "critical component of media literacy must transform literacy education into an exploration of the role of language and communication media in order to define relationships of power and domination that are ultimately deeply embedded in ideological notions" (Kellner & Share, 2000, p. 8). For this reason, students need to see how authors of multimodal messages are consuming (including billboards, music videos, newspaper articles, and novels to name a few) and positioning them as consumers with many mediated messages.

In addition, by helping students to understand how they are already being positioned in the real world by their critical productions (e.g. blog posts, tweets, lyrical raps), we can help many students see connections between their in and out of school literacy practices. "We live in and move in a material world; the things in it—objects, visual representations, machines, and tools—take part in our dramas of meanings as well" (Gee, 2012, p. 185). Thus, students "dramas of meanings" are created in all that they do; yet, the need to help them navigate those many connections and meanings continues to be critical since they are already consuming, producing, and sharing digital media on their own.

Civic Engagement

The production of new social spaces engenders new forms and avenues of civic engagement. Numerous large-scale social movements on every continent underscore the role of social media in landmark social protests. Part of educating students, then, is helping them understand how to manipulate digital media, through which they may be working on a daily basis, to serve civic engagement purposes.

Jones (2011) emphasizes the fact that these communication spaces, or sites of display, become "social occasions in which particular configurations of modes and media coverage in a particular time and space in order to make particular social actions possible" (p. 114). Of course, "the problem with examining sites of display outside of the context of their use by 'watchers' to perform particular social practices is that what people can do with different sites of display alters radically in different contexts" (Jones, 2011, p. 114). Thus, every site of display, or composition space, changes depending on who is viewing it, from what angle it is being viewed, and how it is positioned and embedded within other sites of displays before it may be repurposed within the digital sphere.

In other words, sites of displays are where the reader/viewer actively participates and makes meaning of the constructed text, emphasizing a symbiotic relationship between social practices and itself (Jones, 2011, p. 116). Because sites of display involve social practices, they do become a form of social interaction, where the viewer can become a part of the action by creating her or his own meanings, and social identity/identities as well.

When we think about the attention economy and schools as sites of display, we recognize the restrictive norms for language use that represent the antithesis of the flexible stance needed for civic engagement.

Language use within schools traditionally focuses on what is deemed as a "success" (such as writing a five paragraph persuasive essay) versus what is deemed as a "failure" (such as devaluing that same essay created through a video narrative). If schools devalue students' language by restricting them from creating and sharing information in meaningful ways, then students' attention will be spent on what matters to them and what gives them the most social capital, or power, within society. Thus, it's not about the highest score on a test; it's about how many new followers one gets on Twitter thanks to a strategic tweet at just the right time, for example.

Within contemporary society, we all navigate a text-mediated world in which time, space, identity, and meanings are intricately connected. By using these components as tools, we can create digital texts that accommodate the amount of time we have while moving from one place to another and sharing within a public or private digital space. For this reason, it is increasingly important to understand that "meanings are made across time, across space, in and through matter" (Lemke, 2011, p. 143). However, as educators and researchers, we cannot be afraid of this mediated world and must focus on working towards a common goal of considering how both local and global civic engagements are impacted by these mediated meanings.

"Grassroots social movements, nongovernmental organizations (NGOs), scientists, activists, governments, and some businesses resist IP [intellectual property] with a range of tactics, both inside and outside the policy world, in local, national, and international venues" (Schweidler & Costanza-Chock, in-press, p. 4). Regarding digital media, this point suggests that meanings and knowledge are privileged and guarded closely by those organizations/powers in charge. Yet, if our goal is to unlock the potential of digital media, we must work towards ways of using what we learn from social practices that have the potential to inform policy.

Social Practice

Studies that focus on digitally mediated actions in 21st century learning environments (whether formal or informal) share a common characteristic: "irreducible tension between cultural tools, on the one hand, and agents' active uses of them, on the other" (Wertsch, 1998, pp. 518-525). This is the case even when tools are redefined to reflect Latour's (2007) thinking on human and nonhuman actants. Regardless of whether those actions are socially distributed or directed at individuals, networked digital media technologies ensure that social practices associated with online production, distribution, and consumption are partially dependent on one's audience—whether approving or even disapproving audiences (de Castell & Jenson, 2004).

This factor plus a growing awareness in the field of education that it is the quality rather than the quantity of attention that matters have influenced researchers to focus on young people's penchant for curating online texts that have potential for later remixing. In studying the social practices around remixed texts, for example, Ian O'Byrne and Greg McVerry (in press) found consistent evidence in support of contemporary's youth's movement away from individualistic consumption of commercially prepared texts toward an ethos of collaboration in producing their own socially constructed texts. Yet, as O'Byrne (2014) also reported, there is a general disregard among youthful online curators for applying critical literacy skills as part of their social practices in remixing.

Mellinee Lesley (2012) found a similar disregard for social practices that involve critical thinking. In her study, technically savvy adolescent girl writers did not automatically apply their knowledge and experiences in ways that reflected sophisticated critical thinking skills. For the girls to be able to apply

those skills, Lesley argued, it would require a teacher's investment in instruction on how to frame critical literacy in socially relevant spaces that fostered online text production, distribution, and consumption. Moreover, Lesley contended, without a critical framing of such texts, the girls in her three-year ethnography were likely to find it difficult, if not impossible, to resist the dominant ideologies coming at them on all sides. Succumbing to a loss of voice or personal agency on the part of her participants in *Invisible Girls* was not a finding that Lesley viewed as helpful or even tolerable.

The centrality of pedagogy in mediating people's online social practices was a key finding in Korina Jocson's (2015) design-based action research project. In choosing to theorize through a new media literacies perspective the cultural production of digital texts and use of DIY tools, Jocson learned that the undergraduate and graduate students enrolled in her semester-long teacher education course needed her to intervene at various points in order for them to grasp the importance of developing an ethos of collaboration, participation, and distributed expertise in online text production. This finding has direct implications for working with youth who have not experienced, or at least do not indicate, an awareness of the need to use critical literacy in socially constructed online spaces.

Policy

Privileging language over other modes of communication is common in education as well as in civic and social practices in which digital media plays a role, at least in part because of centuries of print publishers' careful management of intellectual property rights. As technology has made other modes of communication as replicable and able to be distributed as print, concomitant expansion of digital media and its economic significance has major ramifications for policy. Vast national and international economies possess inertia that digital development, education, and intellectual property policy must balance against the need to prepare for uncertain but certainly different economic futures. The decade of economic engines "too big to fail" and educational reform efforts that thwart their own mission (Au, 2011) sound somber notes for U.S. and international policymakers.

Efforts within industry to promote forward thinking in terms of literacy education have gained considerable credibility (e.g., Partnership for 21st century skills), but the underlying economic narratives are lost here and there in patriotic and altruistic abstractions. On the other hand, the real potential for learning and doing through acquisition of literacies in digital media environments has local economic importance beyond preparing a nation's workforce or ending poverty.

Building on Lanham's (2001) work that critiqued the linguistic bias in traditional text production, de Castell and Jenson concluded "... new multimodal technologies of representation…actually consolidate, extend, and improve upon [one's] literate capabilities" (p. 392). Yet who has access to these technologies is a perennial issue for social justice researchers in their attempt to influence policy makers. Digital media's role in influencing how content is distributed via the marketing of social capital through clicks, likes, views, followers, and shares (Terranova, 2012) is not inconsequential.

As discussed earlier, the role of digital media content is reflected in the speed with which memes (images, videos, sound effects, songs and the like) are spread rapidly by Internet users, and typically without regard for whether message is clear or not. This phenomenon, coupled with the breakdown of distinctions between real-world and virtual experiences, which Voithofer (2005) called attention to nearly a decade ago, are associated with the human-computer interface that most of us (including policy makers) take for granted today. However, more mundane observations (mundane, that is, to people outside the field of education) are those that stake out a future for researchers entering the professions 10 or 15 years

hence. What do we mean by this? Here, we're referring to a Pew Internet Report published in 2012 that concluded for most teachers and students alike, "research" means "Googling" or relying on Wikipedia for their information. Reacting to this observation, some teachers we know (as well as those participating in the Pew Report) admit that for their students "doing research" has shifted from a relatively slow process requiring various levels of inquiry to a "hurry-and-get-it-over" one-step process that consists of selecting bare-minimum information to complete an assignment. Whether those in policy-making positions are aware of this development is up for speculation.

Beyond the speed and superficial processing of information today is an ongoing discussion in the academy "about the nature of the participatory democratic utopia and participatory culture and how groups take (or do not take) advantage of the affordances new and emerging media" (Jenkins & Carpentier, 2013, p. 265). In the article cited here, media critic Henry Jenkins concedes that he has contributed to the utopian nature of participatory culture by failing to make distinctions between descriptive and normative language such that all too often we are lured into believing our participation is something more than superficial—something that can lead to our empowerment, when it cannot because the groups who are in control of "that something" are not about to relinquish their power over it.

Ending on a more positive note, we would call attention to Michael Dezuanni's (2014) four-year study in a primary school in Queensland, Australia, and its implications for policy makers worldwide. Dezuanni, a Senior Lecturer of Film and Media Curriculum in the Faculty at Queensland University of Technology, uses Latour's (2007) actor-network theory to focus on young learners' material practices and how those developed over time. Specifically, he uses a building-block metaphor to capture how the children he studies deploy technology and media concepts to participate materially in digital-networked culture not unlike that of older students.

That the children in Dezuanni's research are part of a larger participatory culture should not be lost on those who are responsible for policies governing the ever-changing requirements of copyright law for media literacy education. In point of fact, he and his colleagues (Dezuanni, Kapitzke, & Iyer, 2010) argue that copyright literacy be required for preservice teachers who will be charged with helping young people participate successfully in digital learning networks that have economic significance for both media content and connections.

CONCLUSION

In summary, digital media's economic impact is a bit like winning the lottery. There are many changes that are easily anticipated. One can count how many relations ask for a cut, how much each one expects. However, there's really no way to quantify far more important and economically significant shifts. People relate differently. Everyday actions take on economic significance in ways that may only be recognized in hindsight.

In our chapter, we have steered away from the hundreds of studies commissioned and carried out around the world that counted up the money that changed hands as a result of digital media, the increased tax revenue collected as a result of broadband penetration in a region, and the per capita income comparisons between technological haves and have nots. Instead, we have attempted to listen and understand the economics of digital media in a way that provokes much needed conversation among researchers.

Too often, economic questions are boiled down too far as we question whether some enterprises are worth the risk. The stakes are far too high—and the changes to education, policy, civic engagement, and

social practice too far reaching—merely to rate digital media's gains and losses. Instead, two outcomes are most needed: first, that we think about what we are doing to ourselves by means of digital media; and second, we begin to inquire into the economic meaning of the conveniences we love, the challenges we endure, and the discoveries we make.

KEY TERMS AND DEFINITIONS

Actant: A term used to denote an entity whether human or nonhuman that modifies the actions of another entity (e.g., pouring vinegar on baking soda).

Agency: A human's capacity to make choices; typically contrasted to natural forces or nonhuman elements.

Digital Media: A term given to the tools for communicating that involve conversion into machine-readable formats within human networks.

Economy: Production, distribution, and consumption of goods and services by agents, at times involving intermediaries for exchange known as money.

Global Economy: Combinations of the economies of countries *or* economic interactions that cross geopolitical boundaries overland, by air, by sea, and virtually.

Memes: Phrases, images, videos, sound effects, songs, etc. that are copied and spread rapidly by Internet users—typically without regard for whether the message or intended meaning is clear or not.

Modality: The vehicle/way in which meaning is made through text, speech, or gestures.

Mode: A resource through which people communicate that are socially and culturally determined.

Multimodality: Refers to multiple forms of communication that include language but do not privilege it over other modes such as still and moving images, sounds, gestures, icons, and performances.

New Materialists: 21st century scholars who claim that agency is not strictly a human capacity.

Transformativeness: The state of having been repurposed by a user of copyrighted materials to make them more amenable to fair use criteria.

Chapter 58
Diversification and Nuanced Inequities in Digital Media Use in the United States

Eliane Rubinstein-Avila
University of Arizona, USA

Aurora Sartori
University of Arizona, USA

ABSTRACT

This chapter explores access to, and engagement with, digital media by United States' (U.S.) by non-mainstream populations. Framing the issue from a sociotechnical standpoint, the authors explore how engagement with digital media is shaped by socioeconomic status (taking into account confounding factors, such as race and ethnicity, and social and geographical ecologies). The authors highlight studies that focus on the robust digital practices with which nonmainstream populations already engage, and to which they contribute. One example is how some black Twitter users engage in signifyin'–a culturally specific linguistic practice—as a means of performing racial identity online. The authors also problematize concepts such as the new digital divide and digital exclusion, and finally, reiterate that a universal roll-out of high speed broadband alone will not necessarily lead to further engagement with digital media for ALL populations. In fact, the authors claim that providing more or faster access is likely not enough to prevent the entrenchment of a global digital underclass.

This chapter explores the ways in which nonmainstream populations in the United States (U.S.) access and engage with ICT and digital media. For the purpose of this chapter, the term nonmainstream population refers to racial/ethnic and linguistic minority groups, who are also low-income or poor (i.e., hovering on or below the poverty line), and/or infrequent Internet users. The authors also problematize two related concepts of *digital divide* and *digital exclusion*.

Although the term digital media has been used and described across the literature for over a decade, its definition remains nebulous. Digital media cannot be defined solely as digitized content, but rather must include a discussion its salient features—namely its interactivity and ability to foster collaboration

DOI: 10.4018/978-1-5225-3822-6.ch058

and "group forming" networks (Smith, 2013). Rather than explicitly defining digital media, scholars often refer to it by providing a parenthetical lists of examples, such as "blogging, digital comics, digital photography, digital videos, video game design, information visualization, etc." (Sims, 2014, p. 673). Such lists, however, are ever-changing, as new types of digital media are constantly appearing on the scene. *The John Hopkins Guide to Digital Media* (Ryan et. al, 2014) for example, has over 150 entries, which range from the familiar (social networking sites, wikis) to the more obscure (e.g., digital installation art and machinima). Due to the dynamic nature of digital media, therefore, our definition remains broad and inclusive, encompassing most media that require a broadband connection and, at least for now, hardware such as desktops or laptops, smartphones or tablets to access it.

Currently, the most salient features of digital media include its affordance to access a global audience, providing individuals or groups the opportunity to: (1) create/produce, (2) congregate and share interests and ideas, (3) swap and sell information and goods, and (4) express one's individual/community voice through a social platform. An important and exciting aspect of digital media (viewed as dangerous by some) is that it allows anyone with a fast broadband connection to engage actively in, and even help shape, current political, cultural, social, and economic scenes. Thus, as digital media becomes increasingly influential for all aspects of public life, its equitable access becomes ever more vital. To put it succinctly, our chapter focuses on the intersection between race/ethnicity and social economic status (SES) and with access to and engagement with ICT (Information and Communication Technology) and digital media.

Since the international exploration of this topic is beyond the scope of our chapter, we therefore restricted our search to scholarship conducted in U.S. contexts. To retrieve relevant sources across several growing bodies of literature, we searched various academic databases using keywords such as: *digital media, information and computer technology (ICT), digital divide,* combined with terms such as *access*, *use*, and *engagement*. We then cross-referenced the sources we retrieved with keywords that relate to nonmainstream populations (i.e., *Hispanics, Latinas/Latinos, Blacks, African Americans, Native Americans, American Indians, Indigenous,* and *poor/ low-income* (including whites). This process yielded a range of sources that included academic journal articles, research reports and chapters in academic books.

WHAT IS THE SUCCINCT OVERVIEW OF THE RESEARCH?

Nonmainstream Populations Access to (ICT): An Incidental Predecessor to Digital Media

In the early 2000s the phrase 'digital divide' referred to a binary notion of access, or lack of access, that various demographic groups had to the Internet (Rubinstein-Avila, 2011). However, as access, per se, has become less of an issue, especially compared to the issue of speed, software, and advanced multiliteracies, the term 'digital divide' has become more nuanced. Although scholars from different disciplines have contributed to our understanding of the ways in which digital media is used across race/ethnic groups, and especially socioeconomic lines, ICT access and engagement among the most vulnerable groups (e.g., the poor, elderly, and disabled) have by no means been resolved.

Because the use of digital media is reliant upon ICT, and because such a large portion of the extant research focuses on the digital divide, we find it is essential to explore ICT use among nonmainstream populations as a foreground into a more detailed discussion about the ways in which nonmainstream

populations are using digital media. Therefore, in this section, we explore the digital divide as it is conceptualized both in terms of access to the Internet in general, and to broadband and mobile technology specifically. After presenting the demographic trends, we reflect on the limitations of quantitative results that are not contextualized in social theory, and attempt to frame the issue from a sociotechnical standpoint, exploring how engagement with ICT and digital media is shaped by socioeconomic status in the U.S. (with obvious confounding factors, such as race and ethnicity).

Factors Affecting Access

Predictably, overall ICT use by adults in every racial group and income bracket has increased astronomically since the 1990's. Based on the telephone survey by the Pew Internet & American Life Project conducted by Princeton Survey Research Associates International (PSRAI) of a representative sample of 1,006 adults, a full 87% of adults were online in 2014, versus just 14% in 1995 (Fox & Rainie, 2014). Gaps in access continue to persist, however, given multiple demographic factors (Zickhur & Smith 2012). According to the U.S. Census Bureau (2012), Internet use varies dramatically by race, 82.9% for Asians (25 and older), 80.3% for whites, 68.2% for blacks, 64% for Latinos/as. Native Americans currently have the lowest rate of Internet use, with 49.36% of all households having home access, and 59.69% accessing the Internet at all (NTIA 2013).

Some scholars have found that amongst the Latino/a population, language barriers may impact online rate and use (Livingston, Parker, & Fox 2009; Warschauer & Matuchniak 2010). A report issued by the Pew Internet and American Life Project describes the extent to which English literacy correlates to higher levels of Internet use for Latino/a adults in the U.S. The research for the report relied on three datasets derived from landline surveys conducted by International Communications Research: (1) 2006 National Survey of Latinas/os – 2,000, (2) 2006 Hispanic Religion Survey – 4,016, and (3) 2008 Post-Election Survey – 1,540. According to the report, all three surveys used similar methodologies, targeting Latinas/os ages 18 and older who were given the option of responding in English, Spanish or a combination of the two languages. The report's findings showed that the majority (81%) of adult Latinos/as who could read English very well used the Internet in 2008. Approximately half of those (52%) who reported not being able to read English well went online, compared to 24% of those who reported being unable to read English at all (Livingston et al., 2009). Spanish reading proficiency, however, does not seem to play as important of a role to Internet access; 62% of those who reported being able to read in Spanish very well reported going online, compared to 67% who read it pretty well, 62% who claimed not to read it well, and 66% who claimed did not read Spanish at all. Based on this data, the report noted that literacy levels per se did not appear to impact Internet use for Latinas; however, low English literacy seemed to be a hindrance (Livingston et al., 2009, figure 5, section 2).

Overall, gaps in access seem to be narrowing but still exist (Livingston et al. 2009; Lopez et al. 2013; Zickuhr & Smith 2012). The use of ICT seems to fluctuate depending on variables such as race (Smith 2014), age (Zickhur & Smith 2012), level of educational attainment (Livingston, Parker, & Fox 2009), English language fluency (Fairlie et al., 2006), and income (Warschauer & Matuchniak 2010). Social economic status (SES) seems to be a major factor. When variables such as income and educational levels are controlled for, differences in Internet use between racial groups all but disappear (NTIA 2013). Rates of internet usage amongst Latinas/os, African Americans, and whites with similar income and education levels are virtually the same (Livingston 2010; Smith 2014). The strongest negative predictors for internet

use are not being a member of a certain racial or ethnic group, but rather having a low household income (under $20,000 per year), being over 65 years old, and not having completed high school (Zickhur & Smith 2012). There is little doubt that Internet use is most positively correlated with income: 97% of those earning $75,000 or more use the internet, while only 60% of those living in household earning less than $30,000 annually are internet users (Zickhur & Smith 2012). At the higher income levels, regular Internet access and usage becomes the norm (Livingston, Parker, and Fox 2009).

Types of Access and Connections

Internet access, however, occurs across a broad spectrum, and under widely varying technological and social conditions. Substantial differences exist between connecting through dial-up, high and higher-speed broadband, and using public computers at a library or community centers. As Warschauer and Matuchniak (2010) suggest, the types of connections to which people have access shape their engagement. As an example, the authors cite research reporting that while 62% of adults with broadband went online to look up information about the 2008 election, only 37% of those with a dial-up connection did so (Warschauer & Matuchniak, 2010). Not surprisingly, access to high-speed (broadband) varies considerably along the lines of race/ethnicity, income, location, and level of education (NTIA 2013). Whites generally have higher rates of access (65%), followed by blacks (52%), and Latinas/os (45%) (Livingston, 2010). Since race/ethnicity and SES are highly confounded among households earning less than $25,000 annually, 45% had a broadband connection, compared to 94% of those making $100,000 or more (NTIA 2013). Rural households also have lower rates of broadband access (58%) compared to their urban counterparts (72%). Not surprisingly, research highlighting educational attainment follows a similar pattern (NTIA 2013).

The rise of mobile technology, however, has provided yet another route to connect to and partake in digital media. In fact, the use of cell phones has reached near-parity across all racial groups. As of 2010, 85% of whites owned a cell phone while 79% of blacks and 76% of Latinas/os reported owning a cell phone (Livingston 2010). Basing its findings on a telephone survey of 2,252 adults in 2013, PSRAI found that 91% of all Americans now own a cell phone; in fact, they found that the percentage of cell phone owners that use their phones to access the Internet is around 63%--doubled since 2009 (Duggan & Smith, 2013). With the advent of smartphones and the capacity to connect from almost anywhere, primarily reliance on less expensive phones, rather than computers, to access the Internet has become a noticeable phenomenon—not only in the U.S., but also world-wide. This group of "cell-mostly" Internet users is comprised primarily of younger individuals who are under 30, non-whites, and those with relatively low incomes and lower education levels (Duggan & Smith, 2013). The researchers found that among this group, 60% of respondents were Hispanics, 43% were African Americans, compared with 27% of whites. Level of education seems to be negatively correlated to "cell-mostly" users. In other words, those with higher educational attainments are less likely to connect primarily via their phones; 45% of cell-mostly users had earned a high school diploma or less, and only 21% were college graduates (Duggan & Smith, 2013). On the other hand, the trend in computer ownership provides almost the opposite scenario. According to the 2011 U.S. Census, 76% of all households had a computer; African American and Latino/a households, however, were less likely to have computers (62% and 63%, respectively), as were households with incomes lower than $25,000 (52%) (NTIA 2013).

A Matter of Social Justice

Why is Internet access a matter of social justice? It has been widely acknowledged that access to the Internet is a useful tool in people's lives (Fox & Rainie 2014), but why, *exactly*, is the issue of the digital divide so important? Beyond the fact that so many functions are constantly relocating to the digital realm (e.g., healthcare, taxes, education), we are also in the process of shifting from an industrial to an informational economy, making digital literacy an increasingly invaluable set of skills for employment (Warschauer & Matuchniak 2010, citing Castells, 1996). According to the U.S. Bureau of Labor Statistics, the demand for manual labor is steadily decreasing, as industries such as manufacturing and construction are two of the most rapidly shrinking businesses in terms of net employment (Watson, 2012). Occupations that require the use of information technology, on the other hand, continue to grow; this increase seems impervious even to widespread economic recessions (Csorny, 2013).

In a study conducted as part of the Children and Technology Project, in which ICT use was defined as "computer and internet use, videogame playing, and cell-phone use" (Jackson et al. 2008, p. 438), the authors examined race and gender differences across the nature of use. The authors also explored the extent to which the intensity of engagement in particular activities could predict academic performance. For example, levels of ICT use were found to be significantly lower in general among African American male youth than among other groups. The study was based on a survey of 515 children (172 African Americans and 343 whites) with an average age of 12. The authors found ICT use, in general, to be positively correlated to academic performance (Jackson et al. 2008). With regards to intensity of use, survey results revealed that white students had been engaging with ICT for a longer period of time compared to African American students. Overall, the authors found that males had been using computers longer than females. A race by gender interaction revealed that African American males engaged in fewer activities, with one exception—playing videogames, the only activity that was the linked to lower academic performance in their study (Jackson et al. 2008).

Thus, the new, more nuanced digital divide can be seen as a major obstacle to equal opportunity in future employment. The full benefits afforded by ICT are constantly changing and widespread, and beyond the scope of our chapter. Scholarship on this topic ranges from how engagement with digital media is imperative for social and economic participation in a networked public culture (Ito et al., 2009) to the role of online social media in the cultivation of pro-democratic behaviors (Monforti & Marichal 2014). Based on a cursory glance of occupational patterns and current educational trends, it seems safe to assert that equitable access to ICT is indeed a matter of social justice. Analyzing how such nuanced factors shape the digital divide on a larger scale, however, requires sizable resources. The Digital Youth Project (DYP) is one notable example of such a project. A seminal three-year ethnographic study, the DYP investigated how youth participate in the "new media ecology," a term used to highlight the extent to which digital media is embedded in the lives of youth in a world where technologies, infrastructure, and everyday practices of young people are interrelated (Ito et al, 2009). The project, part of a $50 million initiative funded by the MacArthur Foundation to study learning and digital media, was unique both in terms of its large scale and in terms of its adherence to qualitative methodologies. Drawing upon extensive data collected in 23 different case studies completed by 28 researchers/collaborators, the DYP describes the new media practices of a wide range of diverse populations of youth, spanning from middle-class families in suburban Silicon Valley, to poor teens living in urban LA. The focus of the project, however, was to document practices that were observed broadly, across multiple case studies. The specificities of each research site were largely glazed over in the attempt to provide a more generalizable portrait of

youth engagement with digital media. For this reason, while some of the individual case studies that comprise the Digital Youth Project are highly relevant to the focus of this chapter, the conclusions as a whole are too general to really depict any specific trends regarding how low-income and minority populations interact with digital media.

That being said, there are some underlying points made about the importance of certain *types* of access to digital media that have far-reaching implications when considering how socioeconomic status may shape one's use of technology. Having consistent "lightweight" access to digital tools, for example, was determined by the researchers to be a necessary precondition for participating in networked public spaces (Ito et al. 2009). The researchers concluded that "[w]hen kids lack access to the Internet at home, and public libraries and schools block sites that are central to their social communication, they are doubly handicapped in their efforts to participate in common culture and sociability" (2009, p. 74). The authors assert that engaging in social and recreational activities online, not just accessing "serious" (p. 75) information, is an important aspect of participating in public life in the digital age, in addition to being a crucial starting point for self-expression and digital media creation (Ito et al., 2009).

CURRENT ISSUES IN THE FIELD RAISED BY THESE STUDIES

U.S. Nonmainstream Populations' Engagement With Digital Media

One of the many issues this contemporary scholarship raises is our lack of understanding of the ways in which vulnerable groups *are* accessing ICT and digital media (and for what purposes). While there is quite a substantial body of scholarship about how nonmainstream populations are *not* using digital media (see above discussion on the digital divide), there is a notable dearth of research regarding the many ways in which ethnic/racial minorities and low-income individuals are taking up digital tools actively. For example, there are relatively few studies focusing on how nonmainstream populations in the U.S. use mobile technology. One of the few is a study of Latina immigrant farmworkers by Garcia (2011). Based on the analysis of in-depth interviews with six women in southeastern Ohio, Garcia sought to document how immigrant women use ICT and digital media through their mobile phones. Text messaging was a common form of communication amongst these research participants, specifically for those who were living in the U.S. while attempting to maintain contact with family members in the home country (Garcia, 2011). Additionally, this research revealed that mobile phones connected these farmworkers to information and news relating to their current status as immigrants. Mobile phones also provided the participants a means to locate transportation, which is essential for immigrants who are unable to obtain drivers licenses. Garcia (2011) also found that in many instances, however, the men (husbands, etc.) maintained ownership of the phones and controlled access to the phones—especially when there was only one mobile phone per household. Access to mobile phones, therefore, only appeared to strengthen the hierarchical relations between men and women.

Small scale, qualitative studies such as this one provide an essential dimension to a comprehensive understanding of the state of digital media in the U.S. Rather than simply underscoring the lack of engagement with digital media, studies such as this are needed to illuminate the nuances of *how* vulnerable populations use the technology to which they have access. Information about adult populations is especially scarce, as research on this topic focuses almost entirely on youth.

Social Media: Diversification or Segmentation?

Another issue that contemporary studies have brought to a head is the idealized myth that the incorporeal nature of the web would function as the ultimate democratizing arena, making invisible most, if not all, forms of social differences. However, recent studies illustrate that this is not the case. Social networking sites (SNSs), which have virtually exploded in popularity over the past several years—a phenomenon that was aided in part by the simultaneous proliferation of mobile technology – have been a fertile arena for scholarship on social relations. According to the Pew Research Internet Project, 73% of adults who are online use some kind of social networking site (Duggan & Smith 2013b). Though Facebook remains the favorite overall, marked diversification has taken place. As of recent findings, 42% of online adult users engage in multiple social networking sites such as LinkedIn, Twitter, Pinterest, and Instagram. Which platform people choose, and why, yields surprisingly complex and layered social findings. In fact, an emerging body of scholarship is exploring the ways in which offline social divisions are being reproduced in the digital realm (Duggan & Smith 2013b).

As it stands, it turns out that the SNS people choose are not a matter of random chance, but rather a confluence of multiple demographic and social factors such as race, class, gender, and age (boyd, 2012). Drawing upon four years of ethnographic data collected in diverse communities across the country, boyd (2012) focused on the role of social media in the lives of American teens. Based on her extensive data, which included 2,000 hours of observation of online practices, 103 formal semi-structured interviews, and analyses of 10,000 randomly selected MySpace profiles, boyd offers a qualitative illustration of how the social network site adoption by teens reflects a broader discourse of race and class in the U.S. In fact, boyd's (2012) analysis of teens' perceptions of different SNSs - specifically MySpace and Facebook – focuses specifically on the classed and racialized terminology teens used to describe the sites. For example, boyd (2012) documents that white teens tended to describe MySpace in overtly classed and racialized terms, as being "for the riffraff," folks from "the other side of the tracks," and "ghetto" (boyd, 2012, p. 204 – 220). According to boyd (2012), MySpace, which preceded Facebook by several years, had evolved to embody an "urban late-night culture." Its cachet among teens was mostly derived from the site's association with the freedom and maturity of the 20- to 30-something crowd, its first adopters (p. 206). The origins of Facebook, on the other hand, created in the hallowed halls of an Ivy League college and initially restricted to use by Harvard students, imbued the network with a safer, more elite and exclusive image (boyd, 2012).

By 2006-2007, once Facebook was opened to all users, there was a definitive trend among generally white and more affluent teens to choose Facebook over MySpace. Users from less privileged backgrounds, who identified themselves as belonging to a subculture, preferred MySpace overall (boyd 2012). boyd frames this trend by drawing an intentionally provocative analogy between the movement of mainstream teens from MySpace to Facebook as "white flight," a term that refers to the historical exodus of white city dwellers to the suburbs in the 1960's. boyd (2012) asserts that teens who fled MySpace to join Facebook, were often motivated by many of the same fundamental issues (as the white suburban families fleeing the urban centers)—fear and anxiety, social networks, institutional incentives, and racism (boyd, 2012). Though boyd admits to the limitations of the metaphor, she illuminates several interesting parallels: equating the "American Dream" of the suburbs with the "teen Dream" of collegiate maturity, represented by Facebook. The urban "decay" of cities is likened to the influx of spam into MySpace ("digital graffiti"), in both cases serving as signs of disrepair or feeling unsafe (boyd 2012, p. 219).

Related to the issue of social segmentation raised by contemporary studies is the sociological concept of "homophily," referring to the tendency of individuals to befriend those who are most like themselves. boyd (2012) points out that socializing in the U.S., for both youth and adults, is organized along lines of race and ethnicity (boyd 2012). Thus, the self-segregation of youth into homophilic social groups within school spaces is replicated online, as teens connect virtually with pre-existing networks of friends, following established race and class-based social boundaries (boyd 2012). Using extensive statistical analyses, Hargittai's (2012) work also illuminates the systematic segmentation of youth into distinct social networking sites among first year college students. Harigittai (2012) administered a paper survey to two diverse cohorts of college students, reaching 1,060 students in 2007 and 1,115 in 2009. The data was collected from students at the University of Illinois in Chicago, which she cites as being one of the most ethnically diverse universities in the U.S. (according to U.S. News and World Report 2009). In fact, less than half of each cohort sampled was white, with levels of parental education varying substantially (Hargittai 2012). In addition to obtaining students' demographic information, the survey included questions about the social context of Internet use (e.g. home access, time students spent online, and their knowledge and use of social networking sites). Echoing boyd's (2012) work, Hargittai (2012) found that SNS use varied strikingly along racial and ethnic lines: Latino/a students were significantly more likely to use MySpace and less likely to use Facebook than their white counterparts. However, the opposite was true for Asian and Asian American students. African American students were also much more likely than white students to use MySpace, though most (91% in 2009) also reported having Facebook accounts (Hargittai 2012). MySpace was also significantly more popular among those students whose parents had less than a high school education (56% in 2009, compared to 26% of students whose parents held graduate degrees), a factor used as a proxy for SES (socioeconomic status) or class (Hargittai 2012). Once again, the study shows that offline social divisions are reproduced in the digital realm, the implications of which Hargittai (2012) describes in pragmatic terms: if college professors, employers, or government agencies assume that information is transmitted most effectively by using specific SNS, populations who utilize alternate sites are likely to be systematically excluded from receiving the message.

Assuming Racialized Identities

With 271 million active users, Twitter is widely considered the most popular of the microblogging sites. This genre of digital media is defined by enforcing users to conform their posts to limits of extreme brevity: 140 characters (Twitter.com; Croxall 2014). By electing to follow a given user, that individual's short posts (or "tweets") thereby appear on a continuously updated feed on one's homepage, known as a timeline. Interaction between users consists of "retweeting," (i.e., publicly copying someone's tweets or by replying to another user's tweets by using the @reply feature). The hashtag, created by using the symbol "#," marks phrases and indicates the topic of a tweet, thus allowing users to search for specific topics and follow them.

Given the severe limitations the platform places on the length of the message, one may question whether anything of importance can be communicated. However, Croxall (2014) claims that the medium lends itself to a sharing of day-to-day life that allow users to deepen relationships with each other over time—developing a sense of "ambient intimacy." In fact, Twitter has in large part transcended any indictments of triviality by its role in organizing, disseminating, and publicizing a number of well-known large-scale social acts with very real-world impact (e.g., the revolution in Egypt). The real-time updates of Twitter can function to enable "*social* proprioception" (Croxall, 2014, italics in the original). Literally,

proprioception is a term used to describe an individual's sense of the relative location of her/his body. In this sense, Twitter enables proprioception of a group of people. The platform's real-time, continuously updated feeds enable a collective awareness of a networked public. This renders the coordination of large-scale public actions possible by providing groups of people a sense of self (Croxall, 2014). This specific affordance by Twitter is especially interesting for the purposes of this chapter. It begs us to question *how* a live, continuously updated, and widely used social media platform can function to both reflect, as well as actively shape, cultural identities across an increasingly multicultural, multiracial, and multilingual world.

Of all the social media sites, Twitter has experienced a marked rise in popularity across the U.S., especially amongst African Americans; 34% of black American Internet users report having Twitter accounts, compared to only 18% of the overall population of adult Internet users (Duggan & Smith 2013b). Racialized hashtags are frequently featured in Twitter's list of "trending topics," often showcasing black American culture (Florini 2014; Sharma, 2013). The "Black Twitter" phenomenon has emerged as a much-discussed topic amongst journalists and bloggers (Florini 2014). In her study of "Black Twitter" timelines, Florini (2014) archived and analyzed the timelines of black Twitter users, examining how participants engaged in a specific Black American cultural practice – *signifyin'* – as a means of performing racial identity online. Florini defines *signifyin'* as a "genre of linguistic performance that allows for the communication of multiple levels of meaning simultaneously, most frequently involving wordplay and misdirection" (2014, p. 224). A playful and witty genre, with deep roots in Black American cultural traditions, Florini (2014) underscores signifyin' as a mode of interaction that enables Black Twitter users to "align themselves with Black oral traditions, to index Black cultural practices, to enact Black subjectivities, and to communicate shared knowledge and experiences" (p. 224). Signifyin' often incorporates Black popular culture references, requiring background knowledge and cultural competencies from those engaging in the practice to render the multiple levels of meaning comprehensible. However, Florini (2014) avoids contributing to the idea that "Black Twitter" is homogenous and monolithic, claiming that the use of signifyin' is a choice on the part of many individual users of color to perform a racial identity in a context that does not require the user to disclose race membership explicitly. The choice to invoke Black cultural traditions, therefore, can be interpreted as a means of resisting marginalization and invisibility (Florini 2014).

Florini's (2014) study reveals the ways in which engagement with social media can be used to perform a racial identity, ensuring that race remains visible online. In fact, Florini (2014) interprets the performance of a collective Black identity online as an active rejection of the prevalent "colorblindness" that is so entrenched in contemporary U.S. racial discourses. Employing modes of communication like signifyin', writing tweets in Black Vernacular English (BVE), and indexing Black cultural knowledge are all ways of asserting a racialized identity, and thereby communicating that race, as well as racial inequality, continue to shape Black people's experiences (Florini 2014).

Florini's (2014) study is not only innovative and insightful, but it also approaches research on digital media from a perspective of resource, not deficit. As the author points out, most studies about minorities and digital media tend to portray "people of color as technological outsiders" and to "obscure the many people of color who are online" (Florini, 2014, p. 224). In fact, even a brief foray into recent scholarship certainly conveys this clearly—a trend that is especially apparent in research regarding African American males (Patton, Eschmann & Butler 2013; Smith 2014; Jackson et al. 2008).

An example of academic research that frames African American males' engagement with digital media negatively is Patton, Eschmann, and Butler's study (2013). Patton et al. (2013) explored how

social media (primarily Facebook, MySpace, Twitter, and YouTube), has been repurposed by urban men—mostly African American—to function as a stage for what they call "Internet banging," defined as gang-affiliated communication. The authors claim that the intent of such posts are to promote gang affiliation, boast about or threaten violent acts, or network with other gang members (Patton et al. 2013). The authors also draw parallels between Internet banging and "hip hop identity," which the authors define as a collective urban masculine identity that is "rebellious," "assertive," and "antagonistic toward many other aspects of American culture" (p. A57). In addition, the authors claimed that hip-hop identity, "along with unemployment and poor educational opportunities … fuels the behavior we currently see among African American men on the Internet" (p. A57). The problem with such research is that it fails to contextualize the "Internet banging" phenomenon as only one (uncommon) use out of the *many* ways in which African American men engage with digital media. Because research that focuses on African Americans' digital media use is so scant, it seems particularly troubling that the few extant studies seem to focus on topics already sensationalized in popular media.

GAPS IN THE EXTANT RESEARCH AND DIRECTIONS FOR FUTURE RESEARCH

Engagement of Low-Income Youth With Digital Media (in Classrooms and After-School Contexts)

Much of the research on nonmainstream populations and digital media focuses on youth within educational settings. It is important, however, that such research not be conducted using deficit models, but instead, from a lens that takes into account the robust digital practices with which youth already engage and to which they contribute. For example, descriptive studies (e.g., Tripp & Herr-Stephenson, 2009) seek to document how low-income and minority youth are currently using digital media both in school and out of school, highlighting the unexpected obstacles youth often face at home and at school, as well as the youths' own resourcefulness. Another area of scholarly focus that would add to the gaps in our knowledge are data-driven classroom-based studies, analyzing how instructors of under-funded, urban schools are using digital media production projects to make schooling more relevant for marginalized populations and as a way to engage students as critical, socially aware citizens (e.g., Turner, 2012; and Schmier, 2014). In addition to classroom-based approaches, we need more studies that analyze how extracurricular programs have attempted to cultivate digital literacy skills in low-income and minority populations by supplementing instruction in formal educational settings with academic summer camps (Baker, Staiano, & Calvert, 2011), after-school clubs (Vickery, 2014), and youth development agencies (Soep, 2011).

Despite widely varying degrees of access, many youth seem to be finding ways to interact with digital media in diverse and interesting ways. In their case studies of two low-income Latino middle school students, Tripp and Herr-Stephenson (2009) illustrate the participants' nuanced engagement with digital media (in and out of school) despite economic barriers. The case studies sought to examine how youth who do not have easy access to computers, Internet, and media production software, still manage to interact with digital media in ways that are both creative and personally meaningful. Drawing from ethnographic research from the 2005-2006 academic school year, and informed by *genres of participation* - defined as modes of engagement that shape how technology is framed, understood, and operated within

mediated spaces (Tripp & Herr-Stephenson, 2009, citing Ito et al., forthcoming) - the study highlighted how youth approached technology differently within and across diverse settings. A great distinction lay between youth-driven genres of participation, which were voluntary, self-directed, and motivated by youths' interests, and adult-driven genres of participation, which were organized around adults' goals for young people (e.g., academic educational software) (Tripp & Herr-Stephenson, 2009). How this 'second digital divide' (Tripp & Herr-Stephenson, 2009, citing Buckingham, 2007) is navigated by both young people and parents, teachers, and other figures of authority is an increasingly salient issue and frames much of the research on youth and digital media (e.g., Ito et al, 2009).

Though they would be lumped together demographically, the two participants studied by Tripp and Herr-Stephenson (2009) illustrate the extent to which youths' personal use of digital media is unique, driven by highly individualized interests, experiences, and skills. The subject of the first case study, James, displayed a tendency of disengagement with the adult-driven new media-related school assignments. James utilized his limited access to digital media at school to listen to music, find information on bands, and also maintain a social networking page. While James' home was not equipped with Internet access (his parents citing both economic obstacles and a desire to keep their son out of trouble), he was able to gain access at friends' homes to support his music interests and engage in social networking. The second research participant, Michelle, had a computer and Internet access at home. Unlike James, her time at home—and especially her whereabouts online—were rigorously regulated and monitored by her mother. Also unlike James, Michelle was more engaged with school assignments that utilized new media. Michelle was able to maintain a social networking page to communicate with her friends, despite her mother's concerns.

Interestingly, significant barriers to access experienced by both James and Michelle were sociocultural, rather than physical or economic obstacles. As documented in similar studies of technology and family dynamics (see Tripp, 2011), the parents of both participants attempted to firmly regulate their children's internet use, maintaining that it be restricted to mostly academic pursuits and limiting online activities that were perceived as somehow "risky," such as exploring social media sites (Tripp & Herr-Stephenson, 2009). The school's approach to engagement with digital media also provided limited opportunities for students to connect in-school assignments with out-of-school interests, and primarily involved students in adult-driven genres of participation. The researchers thus conclude that the incorporation digital media into academic settings does not alone make schooling more relevant or interesting to students (Tripp & Herr-Stephenson, 2009). Young peoples' existing knowledge and interests need to be taken into account, as do sociocultural and institutional constraints (Tripp & Herr-Stephenson, 2009).

How student interests and out-of-school literacy practices can be incorporated into classroom pursuits is precisely the focus of Turner's (2012) year-long ethnographic study of an urban middle school's multimodal media production (MMP) class. Focusing on the experiences of 'Gina,' a female African-American student in the MMP class, Turner analyzed the how the class structure encouraged students to reframe their out of school literacy practices as tools for knowledge production and learning in an academic setting. The school that was the site of the MMP class was attended primarily by students whose families lived below the poverty line and had highly variable access to technology at home. Most students were African American and Latino (Turner 2012).

Significantly, Turner notes that the class instructor's ultimate objective was to foster critical thinking – specifically a critical perspective on popular media - through the use of new technologies. The class's principal assignment involved students working together to conduct community research projects. These projects incited students to investigate important issues in their community and then use MMPs – which

included "documentaries, digital stories, Hip Hop music, digital video poetry, music videos, multi-user digital environments (MUVEs), public service announcements, youth radio, Web sites, blogs, wikis, and other emergent technologies used in multimodal designs" – to express and analyze their findings (Turner, 2012, p. 498). Grounded in a theoretical framework that included critical media literacies, Turner's (2012) study draws connections between multimodal literacy learning and issues of social justice, thus directly impacting the lives of youth. As a pedagogical approach framing the MMP class, critical media literacies entailed enabling students to critique media as text, becoming increasingly aware of their own patterns of media consumption, and ultimately having students create their own narratives (Goodman, 2003; Turner, 2012). Turner (2012) identified students' engagement with social justice issues (such as inequality in urban education and racial justice) through the production of their MMPs, which served to indicate the burgeoning critical literacies that the students developed while researching, analyzing, and documenting community issues. This progression is clearly illustrated in the media produced by Gina (the focal participant), whose early work largely consisted of love songs and music videos heavily influenced by commercial Hip Hop and only moderately critical of how the genre portrayed females (Turner 2012). By the semester's end, however, after completing a community research project on homeless youth, Turner (2012) describes Gina's songs "We Strugglin'" and "My Community" as critically addressing heavy issues such as inequality in urban education, racial justice, traumatic life experiences, and popular culture as resistance.

By analyzing the students' MMPs created over the course of a year, Turner was able to track how students engaged with texts differently over time, and observe how the course fostered the development of social consciousness. MMPs allowed students to use the "stylistics of modern youth culture" to cultivate new and traditional literacy skills, providing the students with an avenue for participating in their own "socially, culturally, historically, and politically situated practices that may have been unavailable in previous curricular frameworks" (Turner, 2012, p. 504). As in Tripp and Herr-Stephenson's (2009) study, Turner similarly illustrated that merely incorporating technology and media production into a course does not alone translate to increased student interest and course relevance. In this case, the instructor's own pedagogical stance and incorporation of critical social justice issues were essential factors shaping student experiences in the media production class.

In other words, the research literature would benefit from more studies that value nonmainstream students' media practices outside of school settings. Formal school settings too often marginalize students' interests in favor of focusing on adult-driven genres of participation. This limited focus and enactment of restrictive policies regarding technology use and digital media in school disproportionately impacts low-income students, who may not have consistent, super-fast, and autonomous use of high-speed Internet outside of school.

For example, Schmier's (2014) 18-month ethnography of a single classroom documented how the instructor of a digital media studies class in an urban public middle school incorporated student interests - namely, popular culture - into the curriculum. Building upon studies by Morrell and Duncan-Andrade (2006) and Marsh (2005), Schmier's work contributes to the body of evidence that supports bringing popular culture into the classroom as an effective means of empowering youth as critical media consumers and strengthening students' academic literacy skills (Schmier, 2014). Schmier (2014) also incorporated the concept of "connected learning" (Ito et al., 2013), which proposes fusing student interests and passions with the curriculum as a way to create new educational, economic, and political opportunities for traditionally marginalized populations of learners. Collaboration and networking also play an important role in the connected learning framework as skills necessary to be literate in the 21st century (Schmier,

2104; citing the New London Group, 1996), and making supportive learning communities a central aspect of Schmier's (2014) study.

The class studied by Schmier (2014) was principally engaged in exploring both traditional and new media journalistic practices, such as podcasting. The researcher focused on three students who were immigrants or children of immigrants, with origins in Nigeria, El Salvador, and Honduras. Schmier observed these students' literacy practices in various contexts - online, in the classroom, and in spaces outside of school. Other data collection included focus group discussions, interviews, and the collection of texts produced by the students. Significantly, each of the three focal students maintained highly active online presences outside of school, consistently updating their personal blogs and participating in social media as forms of recreation.

As in Turner's (2012) study, the transformational affordances of digital media emerged when students were permitted to draw upon their interests, skills, and personal experiences in the classroom. Encouraged by their instructor to report on topics that were personally meaningful to them, Schmier describes how the students were able to leverage their out-of-school literacy practices to reposition themselves as "successful author[s], designer[s], and leader[s] in the classroom," and as experts within specific online communities (Schmier, 2014, p. 43). For those youth who were failing their core classes and generally regarded as struggling students, this repositioning as competent and insightful authors and activists was especially significant (Schmier, 2014). Two of the female students in particular became deeply engaged in documenting instances of inequity in their community, and were inspired to produce texts such as an anti-drug public service announcement, a podcast regarding the school's understaffing, and a documentary about a community mural project orchestrated to cover graffiti (Schmier, 2014).

When digital media studies incorporate student interests they serve as an important bridge for students to leverage their community cultural knowledge and out-of-school literacy practices within an academic setting. Digital media production in schools can also function as a creative outlet for expression and a platform for the cultivation of critical social awareness. Through the digital media studies class, the students "honed their ability to publish for multiple audiences," (Schmier, 2014, p. 45), bringing in popular culture artifacts and practices to design multimodal texts that persuasively addressed a wide range of locally relevant topics and positioned the students as community activists. The researcher's concluding suggestions for teachers include allowing for student choice in writing topics and modes of presentation, making peer feedback more rewarding (as in online forums) rather than an "artificial step in linear writing process," and having students work together to create texts that reflect the needs of their communities (Schmier, 2014, p. 46).

Extracurricular Digital Media Programs

There is little doubt that mobile devices, high-speed internet, and personal computers all transform how, why, when, and what students learn, but to what degree schools should support (or restrict) media practices and engagement remains a contentious issue (Vickery 2014). Because of the often limited and heavily monitored nature of technology access in schools, programs offered during the summer, after school, and by youth development agencies play an especially important role in providing marginalized youth with the resources and support necessary to develop digital literacy skills. The academic summer program studied by Baker, Staiano, and Calvert (2011) is one example of how a supplementary program can successfully combine digital media production skills with an environment that reaffirms youths' commitment to and positive perceptions of school.

The study followed 24 low-income, urban African American adolescents who attended the summer program, focusing on how the adolescents expressed themselves through digital media, and analyzing both the form and content of their digital productions (Baker, Staiano, & Calvert 2011). The researchers preface their study with a description of the various challenges confronted by low-income urban African American students, such as high drop-out rates (citing Chapman, Laird, & Kewal Ramani 2010), under-resourced schools that fostered negative academic self-concepts (citing Baker 1998), inadequate programs for high-achieving academic students (citing Ford & Webb, 1994), and exposure to deviant peers due to a lack of supervised settings for peer interaction (citing Brody et al., 2001).

The 24 students, all between the ages of 12 and 18, were randomly selected from a summer camp college-preparatory program that recruited students from a low-income neighborhood in a large metropolitan city. Held at a local university, the summer program provided academic and family mentoring support with the goal of fostering the skills and motivation necessary to graduate high school and pursue further education (Baker, Staiano, & Calvert 2011). The 24 youth who participated in the study were assigned to a digital production course as part of their daily summer camp schedule. The course was led by a professional filmmaker and editor who instructed students to create digital films about their summer experience, encouraging the participants to include whatever content they liked, though filming was restricted to the campus area. The students used digital cameras, mini digital video cameras, and iMovie editing software to create their digital productions (Baker et al., 2011).

The researchers found that the students' digital productions expressed overwhelmingly positive academic views, which was attributed to the supportive academic environment and positive peer relationships fostered by the program (Baker, et al., 2011). The productions also featured montage styles, foregrounded music, and other design features that mimicked much of the media consumed by the students (Baker, et al., 2011). In this sense, the use of digital media here is fundamentally distinct from its position studied by Turner (2012) and Schmier (2014). Without the emphasis on *critical* media literacy described by Turner (2012), the digital media productions of the summer academic program served more as a direct reflection of the media consumed by the youth, as well as an expression of how peer relationships and perceptions of school were correlated in the lives of the participants. While research like Turner's (2012) and Schmier's (2014) demonstrate how digital media production can function as a platform for consideration of social justice issues and inciting students to become more critically aware, the digital productions created in the summer program studied by Baker et al. (2011) functioned more as unmediated modes of communication and expression, surely made more interesting because of their association with forms of popular media consumed by youth recreationally.

The context in which learning takes place has an obvious impact on the modes of participation taken up by students as they interact with digital media. Informal learning environments like after-school clubs, precisely because of their less regulated structure, can serve as vital resources to support students as they develop new digital skills and learn to navigate social networks online and offline (Vickery 2014). Significantly, these affordances can also lead to the expansion of youth's social capital, which plays a vital role in enabling economic upward mobility, particularly for minority youth (Vickery, 2014, citing Hargittai, 2011; Laureau, 2003). In addition to the accumulation of social capital, digital literacies are also cited as enhancing political participation, and in general encompassing a set of skills and ways of interacting with technology that create more equitable futures for young people (Vickery, 2014, citing DiMaggio, Hargittai, Celeste, & Shafer, 2004).

As part of the Digital Edge Project—a large-scale research project designed to analyze teens' media ecologies in both formal and informal learning environments –Vickery (2014) studied Texas City

High School's (TCHS) after-school digital media club for eight months. The researcher observed and interviewed participants from three formal technology courses and two informal after-school clubs at TCHS, which was described as "a large, low-performing, economically challenged, and ethnically diverse, Hispanic-majority, public high school" (Vickery, 2014, p. 82). Vickery's focal participants were a multiracial group of 9 female and 9 male participants, all of whom had unreliable access to computers and the internet in their homes. The after-school digital media club (DMC), therefore, was a particularly vital resource for these students, who otherwise would not have had sufficient access to technology in order to develop digital literacy skills beyond what was available to them in school.

Within the DMC, students were free to engage in low-stakes, interest-driven participation in an environment that facilitated experimentation and a trial-and-error approach to learning (Vickery, 2014). The learning environment of the DMC was distinct from the formal technology classes not only in that the work was ungraded, but also in that it encouraged students to work more collaboratively, teaching each other and cooperatively organizing large-scale projects like scripting, shooting, and editing short films (Vickery, 2014). The club's adult mentor also reached out to nonprofit and community organizations, creating opportunities for youth to work on projects like PSAs for local organizations and thereby expanding students' offline social networks to include professionals in the local community (Vickery, 2014). This networking feature of the club's activities additionally led the adult mentor to provide the students with instruction on how to communicate professionally with the press and potential donors (Vickery, 2014).

RECOMMENDATIONS/IMPLICATIONS FOR EDUCATION, CIVIC ENGAGEMENT (GLOBAL AND LOCAL), SOCIAL PRACTICE, AND POLICY

Overall, the informal learning environment provided by the digital studies club was crucial to the development of students' digital literacies because it allowed for the freedom to collaborate, explore, and creatively experiment with digital media in a way that formal, curriculum-based, teacher-as-expert technology courses did not (Vickery, 2014). The researcher writes that spaces like the DMC "help bridge students' out-of-school and in-school learning by providing a space that students can explore, look up online tutorials, and help each other, but in a space that also offers adult guidance and support." (Vickery, 2014, p. 91).

Beyond underscoring the importance of after-school technology clubs, Vickery's (2014) study touches on the more fundamental issue of how digital media and networked technology are regarded by educational institutions at large, and how to support students' digital skills whilst retaining some control over how those skills are used and to what end. Throughout the study, a noticeable gap became increasingly apparent between how technology was regarded in the informal DMC and the school's official policies, which mandated that social media sites and video sharing sites remained blocked on all school computers (Vickery, 2014). The school's restrictive policies primarily affected those students with no or precarious home Internet access, the consequence of which was that these students were unable to distribute their work online, thereby preventing them from obtaining valuable feedback from the online community. The blocking of social media also inhibited the development of students' network literacies and stymied their opportunities to fully understand how intellectual property functions in the digital realm (Vickery 2014).

Vickery's study demonstrates how the participation gap is constantly evolving as online networks become more complex and new skills are increasingly necessary. After-school clubs can function to

help minimize these gaps by providing the kind of access necessary to cultivate digital literacies. However, students who do not have the time to participate in extracurricular programs, because of financial constraints, jobs, and familial obligations, are still excluded (Rubinstein-Avila, 2006). For this reason, Vickery (2014) asserts that formal education environments need to provide opportunities for youth to engage with digital media in meaningful ways.

Programs that partner with schools and incorporate services for out-of-school youth and recent high school graduates are therefore an important piece of the puzzle. One such program that provides minority and low-income youth with opportunities to study, explore, and create digital media is Youth Radio, a transmedia production company and youth development agency with headquarters in Oakland, California (Soep, 2011). Youth Radio, which has bureaus in L.A., Washington D.C., and Atlanta, involves young people all over the country in producing a weekly live radio show entitled *Youth in Control*. The show features stories written by youth, who also create associated playlists, videos, photos, and online posts on a weekly basis (Soep, 2011). The organization primarily recruits low-income youth and young people of color to participate in the program, seeking to provide a viable and empowering educational alternative to students who attend "economically abandoned schools" in urban areas (Soep, 2011, p. 9). Youth Radio participants progress through specialized courses in digital media and production, taking part in workshops, presentations, and professional development opportunities and eventually becoming eligible for paid positions as peer educators, media makers, and engineers (Soep 2011). As program participants, youth receive individualized education and career counseling, as well as community college credit for some courses. With 1,200 participants and over 30 million weekly listeners, Youth Radio has expanded extensively since its inception in 1992; *Youth in Control* is broadcast via commercial, public, and community-supported radio stations, and is also available on various social media sites, blogs, and iTunes (Soep 2011).

In addition to the radio show and associated media, Youth Radio has several side projects that involve youth in more advanced collaborative technological projects. Perhaps the most impressive of these is the Mobile Action Lab, which pairs students with experts to create locally-relevant apps for mobile devices (Soep, 2011). One app that is currently being created by the Lab, for example, addresses issues of food justice, using crowdsourcing to harvest excess, unused fruit from neighborhood yards and then redistribute the produce to local community members in need (Soep, 2011).

Soep, who is the senior producer and research director at Youth Radio writes that "with the right mix of supportive peers, professional colleagues, and nimble institutions, [young people] can, and do, translate their digital media activities into acts of citizenship and collective work toward public good" (Soep, 2011, p. 11). She argues that digital and mobile tools are increasingly vital for directing the flow of resources and enacting social change. Engaging young people—especially those who would otherwise lack access to digital networked technology—in such types of projects, provides crucial opportunities to take an active part in "democratic life" (Soep, 2011, p. 8). Supportive educational environments that incorporate crucial twenty-first century literacies relevant to youth, and encourage them to engage critically into their lived realities, not only result in relevant learning experiences, but are also likely to render education more equitable for nonmainstream youth.

Beyond Access: Social, Political, Economic, and Cultural Issues

It is clear that as we near the middle of the second decade of the 21st century, the digital divide is more than a simplistic binary issue of access. Providing public infrastructure to improve rates of broadband

adoption is an important measure, but only scratches the surface. The issue of digital disparity is more complex and must consider how technology is taken up and used by individuals and communities, and how different forms of inequity intersect. In an article focusing on digital inequality, Halford and Savage (2010) articulate that: "… the transformational potential of ICT requires capacity building to overcome the effects of other, independent, structural sources of disadvantage" (p. 940). The writers point out that recent research underscores the notion that mere access does not afford the same advantages to all users (Halford & Savage, 2010, citing DiMaggio & Hargittai, 2001; Hargittai, 2008). Thus, the digital divide implies not only differential access to digital technology, but also differential use, affordances, advantages, and outcomes. The authors' recommendations for further research involve deconstructing predetermined ideas of social categories and moving toward a more nuanced understanding of how lines of knowledge/power interact with technology within specific contexts (Halford & Savage, 2010).

Similarly, Gilbert (2010) argued that digital and urban inequalities are mutually constituted, and that research into the "digital divide" needs to take into account social complexities, which include relations of power, scale, and an analysis of place (Gilbert, 2010). Focusing on the daily lives of individuals, Gilbert (2010) proposed that future research ought to examine how social networks and digital capacities do or do not develop, and how the developments of those capacities are either helped or hindered by community resources on a local, regional, national, and global scale (Gilbert, 2010). Recommending that the digital divide needs to be situated within a broader theory of inequality, she is critical of the fact that most research on the digital divide remains merely descriptive, and relies on static notions of racialized/gendered social categories. Gilbert demonstrates that many (quantitative) studies lack the analytic depiction of "the have-nots" as differentiated individuals that possess agency (Gilbert, 2010).

Discerning how to investigate the sociocultural nature of technology, however, is a somewhat ambiguous task. One possible framework for such a task is to use the concept of a *technology identity*, a term proposed by Goode (2010) and defined as a blend of belief systems including (1) beliefs about one's technology skills, (2) beliefs about opportunities and constraints to using technology, (3) beliefs about the importance of technology, and (4) beliefs about one's own motivation to learn more about technology. Using qualitative data from a mixed-methods study conducted at an urban West Coast research university that had a high rate of enrollment of low-income students, Goode (2010) collected data on three students from diverse backgrounds and with varying relationships with technology. Goode (2010) focused specifically on each participants' family practices and experiences, tracing how these impacted the students' technology identities. The findings illustrated that students with positive technology identities tended to thrive, while those with negative technology identities struggled, an imbalance that may impact students' future opportunities (Goode, 2010). Goode also underscored the perpetuation of the digital divide, and the role of universities in reproducing digital inequalities.

Policies to Minimize the Digital Divide and Encourage Digital (Media) Inclusion

The federal government has also acknowledged the digital divide as a troubling issue, and has responded with several large-scale policies intended to counteract disparities in access to broadband internet connections. Around 2008 – 2009, the US government officially recognized that its market-driven approach to broadband service provision, a deregulatory strategy used since 1996, had led to robust investment in the industry, but highly uneven provision of services across the country. To ameliorate this glaring disparity in broadband access nationwide, the American Recovery and Reinvestment Act (ARRA) of 2009 allotted $7.2 billion of stimulus funding to extend broadband Internet access and for broadband projects. These

funds were funneled into two programs, the Broadband Technology Opportunities Program (BTOP), to be administered by NTIA, and the Broadband Initiative Program (BIP), to be administered by the Rural Utilities Service (RUS) of the Department of Agriculture (LaRose et al., 2014). BTOP was to target groups that been empirically shown to disproportionately lack access to broadband connections, such as low-income communities and minorities, as well as those who had gotten less attention in discussions of the digital divide, such as senior citizens, children, and the differentially abled (LaRose et al., 2014). In a federal report published in 2014 analyzing the effectiveness of the programs five years after the BTOP and BIP were initiated, researchers concluded that while the BTOP was successful in expanding access to broadband overall, it did *not* succeed in increasing access to for minority groups. Moreover, the report determined that such programs did not effectively increase broadband adoption in rural areas unless public education efforts about its benefits were simultaneously undertaken (LaRose et al. 2014).

The BTOP-funded programs that were most successful, therefore, not only provided the physical infrastructure and economic subsidies for broadband, but also included initiatives to develop the technological skills of participants. San Francisco's Community Living Campaign (CLC), for example, used a grant from BTOP to provide computers with Internet access at senior and community center and housing sites across the city (Jobling 2014). The CLC found that holding intimate, focused, and nonthreatening trainings in multiple languages (English, Spanish, and Cantonese) and exposing participants to online resources that were relevant to their lives were all important aspects of facilitating digital literacy among the seniors. The three most significant features of the CLC's approach seem to be that (1) the center developed their classes based on the needs and desires of that specific community, building sessions around student goals like learning how to video conference with relatives in another county, or how to see photos of grandchildren on Facebook; (2) the trainings were limited in scope, often focusing on a single skill, and allowing for extensive time to practice that skill; and (3) the CLC integrated technology into other activities, such as healthy aging workshops (Jobling, 2014). Clearly, simply providing the technology would not have been enough to induce seniors to become tech-savvy. Instead, the endeavor required a comprehensive approach, one that was contextually specific, accessible, and tailored to the needs of the target community.

Is a Global Digital Underclass Emerging?

Although our discussion about nonmainstream populations' access to, and engagement with, ICT and digital media was focused on the U.S., we found a U.K.-based site, the LSE Media Policy Project: http://www.lse.ac.uk/media%40lse/documents/MPP/LSEMPPBrief3.pdf that focuses on similar issues to the ones we raise throughout this chapter. For example, a media policy brief, titled "The Emergence of a Digital Underclass" by Ellen Helsper underscored important global issues, not only relevant to the U.K. or the E.U., but also to the U.S., and the rest of the global community. While Helsper and other scholars and researchers point out that infrastructure policies and improved access are necessary, they also raise essential questions, such as: Are these policies sufficient to achieve digital inclusion? Are there particular groups of individuals who are likely to be left behind in this race for ever-increasing broadband speeds?

Currently the healthy, young, well-educated professionals with higher incomes are the ones who are more likely to engage with, and contribute to digital media, through high-speed broadband. Those with health problems, the elderly, low income ethnic/racial minority groups, in manual labor occupations or those with few educational qualifications tend to incorporate the Internet into fewer aspects of their everyday lives (even if their use and engagement has increased). They are becoming relatively more

disadvantaged compared to mainstream Internet users. In other words, the information rich are made richer while the digital poor become, comparatively, poorer. This group's message is extremely relevant to our chapter; they claim that universal roll-out of high speed broadband will not automatically lead to increased Internet use nor encourage digital critical skills or deeper engagement with ICTs and digital media for all. To conclude our discussion and pose a direction for future work, we end with the question: what can, or should, be done to avoid the entrenchment of a global digital underclass?

KEY TERMS AND DEFINITIONS

Cell-Mostly Users: Internet users who connect primarily or only through their cellphones. Cell-mostly users tend to be younger and low-income.

Digital Underclass: Vulnerable populations who are infrequent (or non) Internet users. Despite improvement in infrastructure policy and greater access, digital inclusion is not likely to include all groups, and even create an additional barrier to social mobility.

Homophily: The idea that similarity leads to connectivity. In other words, the tendency of individuals to bond with each other who are similar in regards to social factors such as: age, class, ethnicity, gender, and/or organizational roles.

New Media Ecology: The study of complex communication technologies and systems as cultural environments.

Nonmainstream Populations: Language or ethnic groups that are not a part of the white, abled, middle class population in power.

Racialized (Online) Identities: Are often conveyed actively by members of minoritized groups, from a position of social and political resistance to their marginalization by mainstream society.

'Second' Digital Divide: White the initial (first) digital divide revealed a gap between the "haves and the have nots" (those who had access to Internet connectivity and those who did not, the 'second' reveals a gap between those with more or less ICT skills.

Social Proprioception: Awareness of the spatial positioning of a group in order to organize/coordinate themselves.

Chapter 59
Digital Media and Cosmopolitan Critical Literacy: Research and Practice

Thomas W. Bean
Old Dominion University, USA

ABSTRACT

In this chapter I consider contemporary global conditions pointing to what some scholars term "a global risk society" where digital media and Cosmopolitan Critical Literacy offer a counterpoint to human rights, health, climate, and terrorist threats. By examining current research in global youth communication across nation-state boundaries via the Internet, existing research suggests that tapping into digital media literacy and critical media literacy will be crucial for developing an informed and critical citizenry. At present, studies of transnational youth navigating old and new affiliations across national borders are in their infancy. Nevertheless, the existing research holds promise for developing global world citizens who can realize an ethos of cosmopolitan, critical citizenship through the affordances of digital media.

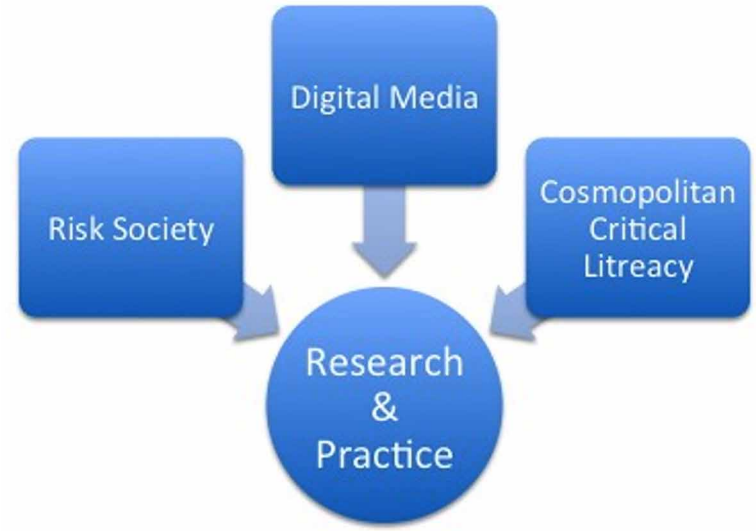
INTRODUCTION

Digital media permeate nearly all aspects of our lives from the connectedness of our families and communities through cell phones, tablets, computers at home, on the road, in the kitchen, and at work. The present chapter considers the impact of digital media and Cosmopolitan Critical Literacy (CCL) (Dunkerly-Bean, Bean, & Alnajjar, 2014) on the development of an astute citizenry capable of critiquing public policies, human rights, and elements of a "risk society" (Beck & Sznaider, 2010; Delanty, 2006). I begin by providing an overview of ongoing scholarly work aimed at defining the interplay of the three elements (risk society, digital media, and CCL) by first considering what it means to live in a global, risk society (see Figure 1).

Following this section, critical literacy is considered along with an expanded notion of cosmopolitan theory and Cosmopolitan Critical Literacy (CCL). Critical literacy is often confused with its older sibling, critical reading, making it imperative that the very different stances underpinning critical reading

DOI: 10.4018/978-1-5225-3822-6.ch059

Figure 1. Risk society, digital media, critical cosmopolitan literacy, research and practice



and critical literacy are clearly defined (Cervetti, Pardales, & Damico, 2001; Stevens & Bean, 2007). Research incorporating these elements and digital media is reviewed with an eye toward how this work might guide our practice in a global context.

In essence, I argue that a global risk society overlaps with a need to develop an astute global citizenry able to collaborate and solve serious problems including war, climate change, racism, sexism, identity theft, and a host of other issues facing the planet. Figure 1 shows the three major elements considered in this chapter.

BACKGROUND

Defining a Global Risk Society

Globalization involves the increasingly fluid and borderless movement of people, ideas, information, and capital that position the global and local as mutually interdependent (Beck & Sznaider, 2010). In this environment the Internet affords an increasingly connected, transnational youth culture (Hull & Stornaiulo, 2010). This increasingly interconnected world society supports positive elements in the form of cultural exchange, as well as negative dimensions including terrorism, disease, and climate change (Trepanier & Habib, 2011) Sociologist Ulrich Beck (2012) argues that our successes and hubris in harnessing nuclear energy, developing advanced weaponry, and producing global warming place us at risk. Beck and other European scholars (Strydom, 2002) note that we now live in a global "risk society" where it will be crucial to develop an informed, critical citizenry. Because of the increasingly powerful Internet, individuals and groups of citizens can examine, deconstruct, and critique geopolitical and local policies.

To get a sense of how profound a change in communication technologies the Internet is, consider that every two years computer power doubles, rendering our cell phones more powerful than all of NASA when it placed two men on the moon in 1969 (Kaku, 2014).

Machio Kaku is a professor of theoretical physics at the City College and City University of New York. He is the co-founder of string theory and conducted interviews with over 166 prominent scientists to explore the future of Artificial Intelligence (AI), the Internet, expert systems, robotics, and new directions in brain research. In the 1900's, the differences in our current lives and those of our ancestors' lives are even more profound. Kaku notes:

To appreciate how technology reduces, rather than accentuates, societal fault lines, consider the lives of our ancestors around 1900. Life expectancy in the United States back then was forty-nine years. Many children died in infancy. Communicating with a neighbor involved yelling out the window. The mail was delivered by horse, if it came at all. Medicine was largely snake oil. The only treatments that actually worked were amputations (without anesthetics) and morphine to deaden the pain. Food rotted within days. Plumbing was nonexistent. Disease was a constant threat. And the economy could support only a handful of the rich and a tiny middle class. (p. 321)

Yet there are places on the planet that look very much like the description in Dr. Kaku's account of life in the United States during the 1900's. South African scholar Hilary Janks (2014) notes that while wealthier countries promote citizens' access to and use of Internet technologies, poorer countries may suffer from high illiteracy rates, and absence of flush toilets, and hunger. Thus, the notion of a risk society applies both on a local, village level in developing countries and on a global level. The essential difference is the degree to which parts of the globe are creating entirely new cities that are avoiding the creaking wired infrastructure of our own urban areas. For example, China and India have embraced wireless technologies and the Internet "to leapfrog past other, more developed nations that have laboriously wired their cities" (Kaku, p. 321).

Despite the escalation of wireless technology around the globe, a digital divide will likely continue to plague isolated and unplugged areas of the planet. Nevertheless, for many youth, digital media are second nature vehicles to keep up with pop culture, gaming, political issues, and families scattered around the globe through voluntary and involuntary diasporas. The point here is that this is complex terrain, a kind of disparate moving target of haves and have-nots.

Defining Digital Media

Digital media scholars struggle to generate a straightforward definition of the field, largely due to its robust and ephemeral nature. For example, Golumbia (2014) noted that: "The field of digital media can be arguably understood to be so wide as to encompass virtually everything" (p. 54). Nevertheless, Golumbia listed the following characteristics in an effort to define, and momentarily "freeze" this dynamic field:

- Digital media are *nonlinear*. That is, the temporal order of texts are largely fluid with authors able to collaborate and easily add to pre-existing texts. In addition, this nonlinearity is a characteristic of e-book readers and bookmarking websites.
- Digital media embrace and capitalize on *multimedia*. Texts can be embellished with elements that go beyond the written word to include hyperlinks and URL's that let the reader branch to multiple sites for additional information on a topic.
- Digital media supports *collaboration* across distant boundaries through the use of applications like Dropbox and others where multiple authors can confer on a project.

In addition to these characteristics, digital media are highly portable, easily archived and preserved electronically. A host of studies exploring multimodal forms in diverse fields including advertising images and angles, green corporate marketing, digital home design and decoration, and computer animation suggest that this is a rich field for research (O'Halloran & Smith, 2011). For example, a German researcher explored the impact of popular social networking sites including Facebook to evaluate the impact of representational qualities (Esenlauer, 2011). Something as seemingly simple as a profile page and adding friends on Facebook may engender a variety of responses in viewers based on the positioning of one's profile. For example, the direct gaze where a potential "friend" is looking directly into the camera is an image that demands an action on the part of the viewer. By contrast, a more neutral profile photo where a person depicted in a grainy image is balancing on a sidewalk curb with his back to the viewer is more innocuous. Esenlauer found that despite the predetermined linguistic profile categories on Facebook, personal images serve to modulate these templates, allowing for personal expression and varying how a viewer is likely to respond. Thus, multimodal images in social network sites, advertisements, and contemporary design methods call for analysis and critique.

The implications these characteristics hold for developing informed citizens able to navigate and critique this unwieldy and vast collection of information are huge. For example, early on, noted new literacies scholar Gunther Kress (2003) observed that the nonlinearity and idiosyncratic nature of reading in digital environments poses new challenges for functioning as literate citizens. For example, paying attention to visual clues to meaning including salience, color, spatial configurations, font changes, and other nonlinear elements constitutes new demands on readers and what it means to be literate.

Multimodal scholars note that studies in this area now cut across a wide array of fields (O'Halloran & Smith, 2011) including personal publishing and design issues (e.g. FaceBook), education, business, advertising, home design, and discipline specific applications (e.g. biology, history, mathematics). O'Halloran and Smith argue that in the 21st Century we are moving away from the age of the disciplines toward technology uses devoted to problem solving applications that are interdisciplinary (e.g. climate change).

In addition, the ability to successfully engage in multimodal composing has already moved well beyond writing the linear print-based texts of the past century (Miller & McVee, 2012). Design issues predominate now and are crucial for active civic, personal, and workplace activities. For example, the creation of visually appealing flyers, signs, social network pages, and videos revolve around design decisions about color, size, font, spacing, white space, movement, music, and other media. Aesthetics become ever more important in creating appealing and attractive digital media (Miller & McVee, 2012).

To gain a sense of what these new digital literacy demands might mean for careers by the year 2025, the *Pew Research Center Report* (2014) charted jobs that could be eliminated in the not too distant future. The list centered on jobs that are repetitive, rote, and easily automated, including:

- Proofreaders,
- Motion-picture projectionists,
- Meter readers,
- Butchers and meat cutters,
- Secretaries and stenographers,
- Payroll and timekeeping clerks,
- Bank tellers
- File clerks,

- Cashiers,
- Typists,
- Bookkeepers and accounting clerks.

In contrast, careers least likely to be eliminated generally involve significant educational preparation and the ability to navigate and use digital media and technology. These positions include:

- Teachers,
- Foresters and conservation scientists,
- Engineers,
- Software designers,
- Artists,
- Archivists and curators,
- Airline pilots and navigators,
- Actors, directors, and producers.

Similarly, the International Society for Technology Education (ITSE) (2007) standards for students proposes that 21st Century professions call for creativity and innovation, communication and collaboration, research and information fluency, critical thinking, problem solving, decision making, and digital citizenship.

In essence, the dispositions and skills needed for today and into tomorrow call for a critical citizenry able to cull through a vast array of digital media material and able to critique both local and global geopolitical risks. To get a sense of the ways in which globalization and cosmopolitanism interact, I turn briefly to recent work in these areas and compare the two views, noting that both conceptions of society are in flux, and, to a great extent, interdependent.

The term, "cosmopolitanism" has a long and contested history. Dating from the Greek kosmopolites, it refers to citizens of the world (Harper, Bean, & Dunkerly, 2010).

Indeed, theorists Beck and Sznaider (2010) argue that:

Cosmpolitanization thus includes the proliferation of multiple cultures (as with cuisines from around the world), the growth of many transnational forms of life, the emergence of various non-state political actors (from Amnesty International to the World Trade Organization), the paradoxical emergence of global protest movements, the hesitant formation of multi-national states (like the European Union) etc. There is simply no way of turning the clock back to a world of sovereign nation states and national societies. (p. 390)

The philosopher, Kwame Anthony Appiah (2006) takes a more critical view of the term "globalization," contending that this moniker has shape shifted from a global marketing strategy to a macroeconomic notion that is largely meaningless. Rather, Appiah sees two major strands of cosmopolitanism:

- The belief that we have obligations to others on the planet beyond our families and members of a shared citizenship, and,
- The belief that we should take seriously the value of human life generally, as well as particular human lives

Acknowledging the pitfalls of cosmopolitanism where cultural imperialists ride into town with their own new order akin to any colonizing entity, Appiah argues for human variety. "A tenable cosmopolitanism tempers a respect for difference with a respect for actual human beings" (p. 113).

The impact of globalization introduces both positive elements for some people (e.g. economic growth) while simultaneously reducing opportunities for others experiencing terrorism, disease, and the effects of climate change. Globalization may reduce geographic isolation from each other through the exchange of ideas, commodities, people, culture, and institutions through a worldwide economy (Trepanier & Habib, 2011). The process of globalization may diminish the sovereignty of the state with a greater interdependence of global citizens across geopolitical landscapes. Thus contemporary postmodern cosmopolitanism offers a philosophical position that invites social difference and values social justice (Appiah, 2006; Trepanier, 2011). Nevertheless, as Trepanier notes, no single school of thought is adequate for defining the various permutations of cosmopolitanism but it offers a way to address some of the complex issues that globalization entails. For example, given the ease with which digital images can be doctored and used as a vehicle for misinformation and propaganda, media scholars argue that the time is ripe for schools and society to embrace critical literacy theories and practices (Lim, Nekmat, & Nahar, 2011).

COSMOPOLITAN CRITICAL LITERACY

In the following section I introduce the notion of Cosmopolitan Critical Literacy (CCL) and situate this concept within critical media literacy. Subsequent sections provide an overview of relevant research and future research directions.

Defining Cosmopolitan Critical Literacy

Critical Literacy

At its most basic level, critical literacy can be defined as an emancipatory endeavor centered on interrogating issues of power, representation, and marginalization (Stevens & Bean, 2007). Its genesis is related to critical social theory and the Frankfurt School (Habermas, 1975) where scholars undertook an interdisciplinary, neo-Marxist critique of society that supported a strong interest in social justice (Borsheim-Black, Macaluso, & Petrone, 2014).

To get a sense of critical literacy as a stance it is helpful to distinguish this position from critical thinking. South African scholar, Hilary Janks (2010) notes that unlike critical thinking or critical reading with its emphasis on textual analysis, critical literacy is centered on deconstructing a message in terms of how it positions the reader or viewer, who benefits from the message, and who is disenfranchised or silenced by the message.

Applying this stance to digital literacies is crucial as the Internet is an open access network where virtually anyone can step on board and publish whatever they want (Leu, Kinzer, Coiro, Castek, & Henry, 2013). The potential for political, economic, and ideological posturing is significant and calls for readers to be critical consumers of virtual texts.

Critical Media Literacy

Critical literacy practices are increasingly applied to digital media under the banner of Critical Media Literacy (Hobbs, 2007; Morrell, Duenas, Garcia, & Lopez, 2013). Growing out of diverse disciplines in the 1990's including literary theory, cultural studies, film studies, semiotics, media studies and other disciplines, critical media literacy centers on the following precepts (Hobbs, 2007):

- All media represent constructions.
- Media messages are shaped by semiotic signs and design conventions.
- Media messages are imbued with particular values and points of view.
- People are likely to interpret the same media message differently.
- Media messages are typically constructed to advance profit and/or power.

Thus, Critical Media Literacy centers on critiquing how diverse people are portrayed and positioned in digital media including films, advertisements, video games, songs, popular culture, Facebook, YouTube, and other social media sites (Stevens & Bean, 2007). Questions aimed at guiding their critique may include:

- What is represented?
- Who is the intended audience?
- Who stands to benefit from the use of this media?
- Who is left out, marginalized, or silenced in this media?
- How are you positioned as a viewer of this media?

For example, one of the activities I do with my graduate students in a New Literacies class involves critiquing the popular Kenny Chesney song, "The Boys of Fall" (Chesney, 2010) chronicling high school football players. In particular, students note who is left out of this picture. Students who are not football players but may do more non-mainstream sports like swimming, tennis, and golf, as well as a host of others including handicapped student athletes, girls, the school band members, and so on.

Thus, digital media including music, YouTube advertisement clips, cartoons, video games, and other Internet content offer available sites where critical media literacy can be used to deconstruct and reconstruct ideological messages. For example, African American ballet dancer Misty Copeland, a ballerina with the prestigious American Ballet Theater is featured in an Under Armour advertisement that juxtaposes her stunning dance performance with the background voice of a teenage girl reading aloud from one of Misty Copeland's actual Ballet school rejection letters (YouTube, 2014). The letter reads: "Thank you for your application to our Ballet Academy. Unfortunately, you have not been accepted. You have the wrong body type for ballet. And, at 13 you are too old to be considered."

This advertisement has garnered over four million viewers worldwide. The ad provides a powerful counterpoint to Under Armour's male football oriented ads and is aimed at empowering women to move past perceived barriers to career choices. Thus, digital critical media literacy can serve to expose discriminatory positions and help reconstruct who has agency, voice, and possible futures.

Cosmopolitan Critical Literacy

While both critical literacy and critical media literacy undoubtedly help create a discerning questioning stance on the part of a reader, these practices remain tied to nation state standards rather than global issues (Bean, & Dunkerly-Bean, in press). Youth are living at the nexus of the local and global. They are the generation that currently studies in educational settings that are striving to become relevant amidst high stakes assessments that often narrow the curriculum to what Australian scholar Allan Luke (2013) calls "first wave" literacy. In contrast, a "second wave" curriculum would address local and global problems impinging on students' lives including water quality, immigration, and other pressing issues.

As I noted earlier, the term, "cosmopolitan" has a long and contested history. Diogenes, a Greek philosopher in the 4th century BCE, used the term to make known his political allegiance to the world (Harper, Bean, & Dunkerly, 2010; Trepanier & Habib, 2011). In the eighteenth century, cosmopolitanism has been associated with Kant's (1795/1972) notions of "Perpetual Peace," and more recently with globalization and mass migrations across various borders that call for intercultural communication (Hansen, 2014).

Although critical literacy and critical media literacy address and critique instances of social inequality and injustice, a cosmopolitan stance focuses on human rights and the reverberations of actions in one part of the world on other areas around the globe (Bean & Dunkerly-Bean, in press). Digital media connect the local and the global in ways that reveal injustices, sometimes in stark ways with respect to war, civil unrest, immigration, and the distant outfall from pollution in one part of the planet on disparate areas thousands of miles away from the original site of the problem. Indeed, critical literacy scholars like Hilary Jenks (2010) argue that critical literacy must be agile enough to address local and global issues. Cosmopolitan Critical Literacy (CCL) moves youth conversations into a larger sphere where they may find common ground centered on basic human rights issues (Dunkerly-Bean, Bean, & Alnajjar, 2014).

The succinct overview of research that follows encompasses the interrelated forms of critical literacy, critical media literacy, and CCL with a focus on refereed studies published in major journals, books, and book chapters. Additional criteria applied to the selection of particular studies centered on research involving digital media and transnational youth at both local, United States settings (e.g. Morrell et al., 2013), as well as globally situated contexts (e.g. Hull & Stornaiulo, 2014) where intercultural communication is considered (Sorrells, 2013).

Overview of Current Research

Social networks can serve to bridge vast distances, as well as ethnic and cultural differences. As cosmopolitan theorist David Hansen (2014) notes:

Education is a transformative experience of becoming aware of one's skills or lack thereof, of grasping their significance or their triviality, of discovering (often with surprise) that knowledge is a many-sided concept, or experience than merely having information. (p. 10)

When youth communicate across national and international boundaries via the Internet, they begin to find common ground around human rights issues and collaborate to generate solutions to problems. For example, in a study using a social media site called Space2Cre8, youth from the United States, South Africa, India, and Norway carried on a three-year collaboration (Hull & Stornaiulo, 2010; 2014).

Embracing cosmopolitan practices, they created and shared digital stories, digital music, stop animation videos, digitized artwork, and critical dialogues about their everyday lives and diverse cultures. Their dialogues discussed human rights issues encompassing discrimination, school stresses, and poverty. For example, when the Norwegian students created a movie on drug and alcohol abuse, one of the students in the United States site resonated with this issue. He lived with parents who regularly got drunk and beat him and his siblings. Although this is a challenging situation, the U. S. student was able to discuss something hidden with a peer thousands of miles away, potentially reducing some of the isolation and despair accompanying their daily lives.

In a follow-up analysis of the Space2Cre8 data, 13 young women from Locknow, India and 12 young men and women from New York City rallied around a video developed by the India students aimed at halting domestic violence against women in their community (Hull & Stornaiulo, 2014). When the video was completed, the India students shared it with the New York City students and this inspired the New York City group to create a 6-minute video showing gang violence and being "jumped into" a street gang. The India students were mystified as to why anyone would elect to join a street gang and urged the New York City students to develop a community action group aimed at resisting gang intimidation.

Thus, the transformative power of digital media afforded these students an opportunity to critique their respective worlds as well as the worlds of others, ultimately proposing and creating solutions to gang violence, drug and alcohol abuse, and other problems. Over the three years, Hull and Stornaiulo (2014) noted: "Participants gradually become more reflexive, achieving enough distance from themselves to move closer to distant others" (p. 25).

Other transnational studies of youth maintaining contact with their homelands and balancing the stresses of being a new student in the United States, suggest that digital media play an important role in quelling some of the anxiety that youth experience in a new social setting. For example, in a case study of a 10th grade girl from Trinidad, Cheryl McClean (2010) investigated how Zeek was able to adopt her digital world as a virtual home while she transitioned into a new high school in the United States. Zeek was able to preserve her Trinidad identity by using her home dialect, "Trini" to communicate with friends back in Trinidad, Tobago. In contrast, in her new high school students mocked her dialect and made her feel self- conscious. The Internet provided a way to maintain her native language while simultaneously taking up the more homogenized, and at times stressful American school setting where students made fun of her.

Clearly, if Zeek were in a school setting that adopted cosmopolitanism with its emphasis on funds of knowledge the Other brings to a new setting, there would at least be potential for what sociologist Elijah Anderson (2011) terms the cosmopolitan "canopy." Although not specifically encompassing digital media, Anderson chronicles urban Philadelphia where people gather across social difference in diners as a counterpoint to views of the Other in a city where de facto segregation is the norm. Similarly, educational philosopher David Hansen (2008) sees a cosmopolitan disposition as "a sustained readiness to learn from the new and different while being heedful of the known and familiar" (p. 289). It is not hard to reconstruct Zeek's experiences that might have been quite different in a high school where her Trinidad-based funds of knowledge were respected and valued. Indeed, the lens of cosmopolitan critical literacy (CCL) suggests that it might well be possible to find ways to reconstitute and reduce educational anxiety and stress for transnational learners trying to bridge homeland and immigration to another country, in this case, the United States.

In another study of two sisters whose family voluntarily immigrated to the United States, McClean's (2013) qualitative case study illustrated the pressure to assimilate in both language and dress. The girls,

Sade age 17 and Kai, 14 attended school in a metropolitan city in the south. Both used digital technology and online social networks to maintain membership in various affinity groups and take up new identities in the U. S. context. They produced content on their blogs, podcasts, and iMovies. Digital media afforded a means to bridge the gap between the social mores of their native and adopted homes.

In McClean's (2013) interviews with Sade, she noted that the girls in her school mocked her style of dress and tried to pick fights with her. In her native Jamaica, Sade wore uniforms to school and now, in the United States, she felt compelled to assimilate and change her style of dress to conform to the normative pressures of her classmates. Indeed, her Facebook profile shifted to indicate that she shopped at fashionable stores like Nordstrom. In essence, Sade's U. S. classmates did little to embrace and appreciate social difference and learn from the Other.

In contrast, Kai elected a different approach to enculturation in the new U. S. setting. She resisted her female classmates' criticism of how she talked (with a Jamaican intonation pattern), by using her digital literacy prowess to create a blog site for diverse youth. This site offered Kai and other diverse bloggers a space to share multiple points of view and world-views, as well as open discussion with local and global audiences regarding racism and other hot button topics for youth.

In addition, Kai resisted dominant ways of naming race (e.g. African American) by proclaiming she was part of the "human race" (p. 70). McClean noted that: "Digital literacies became the multimodal approach through which the girls resisted and re-presented traditional definitions of who they were as girls, racial/ethnic, and immigrants" (p. 71). Although Kai was not invited by her classmates to share her cultural experiences in Jamaica, her blog site provided a forum for these conversations with other youth locally and globally.

In a related study, Skerrett (2012) conducted a case study of Vanessa, a 15-year old Mexican girl who immigrated to the United States but continued to participate in life in Mexico where her father remained to run a business. Vanessa successfully navigated and used Internet social media to traverse online permeable borders. Skerrett completed detailed in and out of school observations, field notes, and artifact analysis. Vanessa kept a diary to chronicle her life in the United States. In addition, she sent regular text messages to her friends in Mexico. Vanessa code shifted from Spanish to English in her communications and she was comfortable enough to take up a transnational, cosmopolitan perspective. She embraced African American vernacular and hip-hop dance. Unlike Zeek who struggled with homesickness and deeply missed her Trinidad friends, Vanessa managed to use her social media savvy to ease the transition to the United States.

Despite the promising trends in these studies, Skerrett (2012) cautioned that studies of transnational youth constitute an underrepresented research area within digital literacies. Nevertheless, the existing body of research suggests that transnational youth have much to teach us about intercultural understanding and the unique skills and dispositions afforded by this nomadic lifestyle. Vanessa, accustomed to very few reading and writing resources in her native Mexico, enthusiastically read books recommended by her teachers. Similar to a cosmopolitan disposition, Skerrett concluded that transnational proficiencies "include multilingual repertoires and consciousness, cultural flexibility, a sense of global citizenship, and nomadic awareness" (p. 388). Thus, in this study the potential for cosmopolitan literacy was realized and exemplified by Venessa's online and school based communication where she took up art and dance, in particular learning about African American dialect and hip hop. In essence Vanessa managed to border cross dimensions of race, ethnicity, culture, and language.

Cosmopolitan Critical Literacy (CCL) was the theoretical foundation for a year-long study exploring middle grade students' multiple identities as global and local citizens creating a short film on the chal-

lenges of immigrants and refugees (Dunkerly-Bean, Bean, & Alnajjar, 2014). Students wrote and acted out scenes following their reading of global young adult literature (Bean, Dunkerly-Bean, & Harper, 2014), multimedia texts, YouTube video clip simulations, and other selections related to immigration, citizenship education, and human rights.

The study was located in a diverse urban international charter school offering afternoon electives by student choice. Nine middle grade students were involved in this global elective entitled: Project *iFLICK*, an acronym for *Integrating Film and Literature for Intercultural Knowledge*. Students had access to a global/international array of young adult literature provided by the researchers. In addition, students also explored Internet sites including Youth for Human Rights as it could be accessed at www.youthforhumanrights.org.

The charter school where this study took place had few material resources. There were no computers, a functioning library, Smart Boards, or other digital media. Thus, the researchers supplied laptops and their smartphones and iPads so that students could create a short iMovie on Article Fourteen of the Universal Declaration of Human Rights. This article states: "Everyone has the right to seek and to enjoy in other countries asylum from persecution." This human right resonated with these students as their personal experiences as Latina/o and the immediate experiences of their families centered on issues related to immigration. The short digital movie entitled: *Asylum: Seeking a Safe Place to Live* may be viewed at: https://www.youthtube.com/watch?v=Qgo7P-f5ba4.

The students' film was set in the year 3033 where war breaks out in a fictional poverty-stricken country called Chinaka. The war was related to a long- standing rivalry between the Jermians and the Evins over a Romeo and Juliette like scenario between two young lovers. The two groups clash violently and a young Jermian named "Ydoc" is killed. A group of refugees decide to flee war-torn Chinaka for the peaceful and prosperous country of Niwaka. They confront government corruption when the ruler of Niwaka bribes their guide for information on the refugees before he decides to close the border to prevent their passing into his country. Only after the intercession of the human rights minded (female) Vice President, does the president give in and grant asylum to the refugees.

It is important to note that the film features a blend of serious, tragic scenes interspersed with comedic elements. Although students drew from their readings of print and multimedia texts where poverty, war, oppression, and deportation where daily events, they gave the film their own creative spin.

Findings from this study revealed that students' understanding of the global and local elements at play became more complex, and at times contradictory to immigrants assimilating into a new culture. The film served as a way to deconstruct and critique the status quo of immigration while questioning exclusionary policies, bribery, and corruption. In the tradition of Cosmopolitan Critical Literacy (CCL), these students learned how to deconstruct a local reality in their lives, along with thinking about how, through a forced diaspora from their native counties, they could reconstruct a better life in their new homeland.

Consistent with the intent of CCL to move from deconstruction to advocacy and reconstruction, scholars in social studies have created a model based on "relational cosmopolitanism" (Baildon & Damico, 2011; Damico & Baildon, 2013). This research points to the interdependence of people across the globe as they attempt to manage pollution and other risk society problems that span national boundaries. These researchers see a profound need for interdisciplinary digital collaboration to address global risk factors including: climate change, pollution, disease, war, terrorism, financial crisis, public health, and poverty.

Toward that end, Baildon and Damico (2011) created the *Critical Web Reader*: http://cwr.indiana.edu/ to help learners engage critically with digital, web-based texts. This work has resulted in a number

of research publications including those in international settings and offers users a powerful template to organize competing texts on various topics, many specific to social studies content.

Other researchers focus on issues of civic engagement and democracy for disenfranchised populations. For example, Ernest Morrell and colleagues engage youth in regularly filming, editing, producing, and distributing high quality digital videos that take up challenging issues including gang violence, immigration, animal cruelty, tagging, budget cuts and other topics (Morrell, Duenas, Garcia, & Lopez, 2013).

These researchers argue that we need to view critical media literacy as a core literacy practice and as a civic tool in the pursuit of democracy. For example, in Ms. Garcia's 9th and 10th grade English class, students created a one minute public service announcement on Arizona's SB1070 which allowed law enforcement to require identification papers proving citizenship for anyone suspected of being an undocumented immigrant. The actors in the video were harassed when they tried to purchase sodas in a convenience store, despite armbands identifying their "legal" status. By writing and producing this counterpoint video these students were able to challenge an untenable position and transform their thoughts into action using digital media. Indeed, this form of communication is rapidly surpassing print based, formal school approaches to civic engagement.

In a study that examined 90 youth civic engagement web sites in terms of the affordances for political action these sites provided, researchers Bennett, Freelon, and Wells, (2010) found that:

Young social media users are increasingly comfortable with replacing old gatekeepers such as journalists, teachers, and officials with crowd-sourced information flows developed through information aggregation technologies, (e.g. Google news) wikis, (e.g. Wikipedia), trusted friends networks, (e.g. Facebook, LinkedIn, Move On) and recommendation engines (e.g. Amazon, iTunes. (p. 397)

In their analysis of the 90 sites they observed, Bennett et al. used a two level taxonomy to name the impact of these sites. At the lowest level of impact, "Dutiful Citizenship" (p. 397) characterized civic engagements as a matter of nation state duty and obligation., with print-based government, newscast, and policy discussions at the center of this model. In contrast, they termed advocacy models as "Actualizing Citizenship" (p. 397) because they were more likely to rely on digital media and social action networks. These participatory cultures are potentially powerful sites for political involvement and organization because of the following five characteristics (Bennett, et al., 2010, p. 401):

1. Low barriers to artistic expression and civic engagement.
2. Support for creating and sharing one's creations with others.
3. Informal mentorship with experienced users helping novices.
4. The feeling that members contributions to the greater good matter.
5. A feeling of belonging and social connection to one another.

Examples of digital media embracing these dispositions include (Bennett, et al., 2010).

- Streaming online video content that is political in nature (e.g. immigration reform videos on YouTube.
- International coalitions that are able to avoid censorship.

- Civic gaming where youth can learn and practice civic engagement.
- Virtual summer camps for discussing issues via *Second Life* (e.g. World Without Oil).

Although these characteristics and examples of the potential digital media holds for youth civic engagement, in the analysis of 90 of North America's most visited civic engagement sites (e.g. TakingIT Global), the researchers found that only 23 percent of online only sites offered participants opportunities to join public and take action projects with only 9 percent providing actual take action possibilities (Bennett, et al., 2010). The researchers noted that the online sites often mirrored the age-old school emphasis on the Dutiful Citizen model of civic engagement (i.e. vote, be a law abiding citizen). Thus, in this study of 90 popular online sites for citizenship, the affordances and potential impact of digital media on social action was quite limited.

Reconceptualizing the extant research on digital media considered through the lens of Cosmopolitan Critical Literacy (CCL), with its potential to disrupt and problematize narrow interpretations of youth, it may be possible to use digital media to improve intercultural communication. For example, in McClean's (2010) study of Zeek, her Trinidad roots were mocked in her new high school but she was able to cope by talking with her friends in Trinidad using her preferred dialect, "Trini."

Similarly, McClean's (2013) study of Sade and Kai from Jamaica found that, although they were mocked by their respective classmates and reacted to this exclusion in different ways, digital literacies offered a space, at least in Kai's approach, to resist and comment on racist attitudes. The unfortunate missing element was a cosmopolitan disposition that invited dialogue around social and cultural difference. Zeek's Trinidad roots and Sade and Kai's Jamaican homeland could offer United States classmates a larger look at the world versus an insular, isolationist stance.

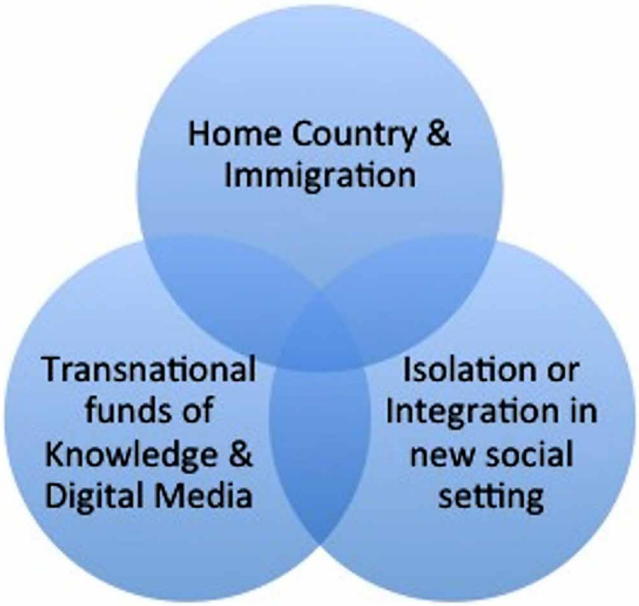
In Skerrett's (2012) study, Vanessa maintained her connection to her homeland, Mexico via the Internet. While Vanessa also assimilated cultural practices taken up in her new school (e.g. dance and hip hop), she would have much to offer in terms of transnational funds of knowledge and intercultural communication. Sorrells (2013) notes that: Intercultural communication is an embodied experience" (p. 51). Social difference is marked by language, dialects, nonverbal gestures, register, eye contact, clothes and other embodied elements in face-to-face contact or via media images.

The use of digital media exemplified by the Asylum research study considered earlier (Dunkerly-Bean, Bean, & Alnajjar, 2014), represents citizen media or participatory media aimed at challenging a political position through "culture jamming" (Sorrells, 2013). Culture jamming is a form of remixing visual and textual elements to challenge taken-for-granted notions advanced in advertising and other media (e.g. fast food ads), by creating counterpoint or alternative versions this material (Knobel & Lankshear, 2014).

Given that one out of every 35 people in the world reside outside their home country; it seems imperative to develop a more cosmopolitan perspective in schools and community settings. Figure 2 offers a useful framework for examining the current issues raised in the studies reviewed.

In the studies considered, youth were engaged in forming new identities and imagined futures, very much in the spirit of cosmopolitan critical literacy (CCL). Delanty (2006) argued that: "Cosmopolitanism concerns processes of self-transformation in which new cultural forms take shape and where new spaces of discourse open up leading to a transformation in the social world" (p. 44). While this is an optimistic view of the effects of globalization, I want to apply the ideas in Figure 2 to an analysis of extant studies of youth in fluid, transnational spaces like those inhabited by Zeek and Venessa.

Figure 2. Creating cosmopolitan critical literacy spaces



SOLUTIONS AND RECOMMENDATIONS

Although focusing on studies that highlight the tensions that exist between a United States nation-state based school curriculum and students' transnational funds of knowledge may seem overly narrow, Williamson (2013) noted that: The curriculum is a microcosm of the wider society outside school" (p. 2).

The reality of living in a risk society (Beck & Sznaider, 2010) suggests that our current school curriculum may be out of alignment with the need to develop a creative, astute citizenry able to address challenging global issues (Williamson, 2013). In a series of case studies located internationally (e.g. New Basics in Australia), Williamson found that:

The visions for the future of society imagined by the various prototypical examples of the curriculum of the future all challenge the idea that a single, central, and official version of the curriculum is possible. Instead, they promote a much more centrifugal and decentralized vision of schooling. Centrifugal schooling, as the collective name given to the prototype curriculum projects, represents an emergent and unofficial vision of the curriculum of the future—a style of thought for the curriculum of the digital age. (p. 121)

Toward that end critical media literacy (Hobbs, 2007) and Cosmopolitan Critical Literacy (Dunkerly-Bean, et al., 2014) take on particular importance in the transnational flows of people and ideas via the Internet. Research reviewed earlier in the chapter reveals the transformative power of digital media. For example, the three-year international collaborative project, Space2cre8 (Hull & Stornaiulo, 2014) engaged youth from the United States, Africa, India, and Norway in media projects on discrimination, poverty, and other topics. Students' intercultural communication barriers were reduced as the project progressed

over time. Thus integration rather than isolation in disparate locales of the globe was a positive outcome for the youth involved in this international project.

In contrast, McClean's (2010) study of Zeek and her difficult transition to a United States high school showed the pain of isolation when U. S. students mocked her Trinidad dialect. Digital media helped preserve her identity by providing a space where she could communicate with her homeland friends using "Trini" and maintaining her home identity even a she attempted to negotiate her new transnational identity. Sade and Kai in McClean's (3013) study of these Jamaican immigrant students revealed their very different ways of coping with having their culture and language mocked by classmates. While Sade assimilated by changing her style of dress to conform to her classmates' norms, Kai resisted peer pressure by using her digital literacies to create a blog site aimed at discussing transnational issues.

Skerrett's (2012) study of Vanessa's navigation of her new home in the United States after moving from Mexico revealed her approach to integrating into the new culture through expressive dance and hip-hop, as well as embracing African-American vernacular. She was able to maintain contact with her family in Mexico via digital media while taking up a new identity in American teen culture. However, it is less clear that Vanessa's culture and language were seen as transnational funds of knowledge. Rather, she seemed to do what many immigrant families have done for ages, assimilate the mainstream cultural mores while trying to maintain her native culture as well.

In the middle school iFLICK asylum study, the researchers found students' understanding of the global and local elements at play became more complex, and at times contradictory to immigrants assimilating into a new culture (Dunkerly-Bean, Bean, & Alnajjar, in press). Writing and acting in the short iMovie film "Asylum" served as a way to deconstruct and critique the status quo of immigration while questioning exclusionary policies, bribery, and corruption. In the tradition of Cosmopolitan Critical Literacy (CCL), the students in this study learned how to deconstruct a local reality in their lives, along with thinking about how, through a forced diaspora from their native counties, they could reconstruct a better life in their new homeland. Thus, their transnational funds of knowledge were respected and invited into the global period where they felt welcomed.

Baildon and Damico's (2011) software aimed at critiquing issues offers a useful tool for critical literacy practices. Similarly, the production of counterpoint high quality videos provided students in various classrooms a vehicle for the critique of immigration policies and a host of other important issues (Morrell, et al., 2013).

Although each of these studies show promise for engaging youth in political critique and potential action projects aimed at transforming social injustices across a range of issues, research by Bennett et al. (2010) shows that the majority of citizenship education is mired in older models of the "Dutiful Citizen."

In their analysis of 90 of North America's most visited civic engagement sites (e.g. TakingIT Global), the researchers found that only 23 percent of online only sites offered participants opportunities to join public advocacy projects with only 9 percent providing actual take action possibilities.

The main issue raised by these studies suggests that intercultural communication and capitalizing on transnational youth's global experiences will be a long-term journey with starts and stops along the way (Hansen, 2014). As Hansen noted in a themed issue on cosmopolitanism in *Curriculum Inquiry*, "People necessarily speak from who or what they have become up to that moment. Their prejudices or presumptions take from through the course of socialization and life experience" (p.9). At times when I have offered a graduate diversity and literacy seminar, this has become readily apparent. That is, the ideals and dispositions of cosmopolitanism go well beyond merely respecting difference. This positioning

means one is able to walk in the Other's shoes and see multiple perspectives expressed in transnational encounters like those of Zeek, Vanessa, and the students in the Asylum production. This is not easy work or easy scholarship and research. As Hull and Stornaiuolo, 2014) concluded:

Yet, we are still a distance away for knowing how to foster a cosmopolitan citizenry, being yet at the beginning of imagining conceptions of imagining conceptions of education, schools, and curricula that produce the globally alert, linguistically versatile, ethically turned, and geographically nimble, or individuals able to converse, understand, identify, and act, not locally but beyond. (p. 40)

With that caveat in mind, I turn to a consideration of the gaps in the extant research and possible directions for future study.

FUTURE RESEARCH DIRECTIONS

It seems to me that the most glaring gap in the existing research on digital media and CCL relates to exemplar settings (e.g. classrooms) where youth from diverse transnational settings have a chance to share their unique funds of knowledge rather than simply assimilate. Although the concept of funds of knowledge is certainly not new (Moll, 1992), we have very few examples of classrooms and other sites where students are, in the best sense of cosmpolitanism, seeing their diverse cultural mores and artifacts acknowledged (Jimenez, Smith, & Teague, 2009).

These researchers noted that: "We believe that the act of embracing and implementing transnational and community literacies is one way for teachers to begin to build productive relationships with students who are English Language Learners" (p. 16). For example, barrio neighborhoods in Nashville where their exploration occurred often feature advertisements for a host of instrumental tasks such as transmitting funds to Mexico, China, and Nigeria. Additional documents explain how to open a banking account in Spanish, as well as informational material on how to apply for a mortgage. These researchers compiled a collection of over 30 digital photos of these "texts" that could be used in the classroom.

In addition, the researchers took photos of foods (e.g. tomatillos) that might not be known outside the local context. Learning the cultural history of these foods would help all students appreciate the diversity in their classrooms and the powerful funds of knowledge students bring from their home countries. Digital media including YouTube clips can be used to further orient students to far flung villages in their home countries, whether in Mexico or elsewhere.

In the Luis Moll (1992) account, Tucson's Latino community possessed a wealth of knowledge about agriculture, mining, economics, household management, science, medicine, folk medicine, ranching, mechanics, carpentry, masonry, electrical wiring, biology and math. Working with teachers to revamp lessons so that students' diverse funds of knowledge were included meant developing units on building and construction where students read, researched, and finally created model buildings. Enroute to this culminating project, students were learning the language of construction as they created streets, parks, and other buildings.

Moll (1992) listed a number of key questions aimed at evaluating the degree to which a school site takes up a multicultural, cosmopolitan curriculum likely to engage transnational students:

1. How well does a school link student learning to families and communities?
2. Have teachers had professional development to learn how they can incorporate their students' unique funds of knowledge?
3. In what way do teachers use students' informal language as a way to bridge to the curriculum (e.g. dialects, hip hop, and so on)?

Given the studies I reviewed in this chapter, there is a pressing need for new studies that explore how these changes might create a cosmopolitan canopy (Anderson, 2011) and a two-way exchange of cultural resources. At present, studies suggest that transnational students assimilate as best they can, or outright resist the hegemonic, conformist pressures to leave their native ways behind. Thus, in this light, even the questions posed by Moll may be too restrictive. A CCL perspective would marshal students' questioning stance to critique policies that limit their voice and agency. Rather, a study aimed at creating the kind of interchange across global boundaries in the fashion of Hull and Stornaiulo's Space2Cre8 (2010/2014) would help the field further understand the potential for moving beyond cultural communication toward intercultural communication.

Other areas within the digital media realm that need further study include how youth might go about critiquing global risk issues (e.g. immigration and human rights). The study where students created a film on Asylum (Dunkerly-Bean, Bean, & Alnajjar, 2014) provides an example of a promising research direction. Additional studies that cut close to home for students (e.g. discrimination, bullying, sexual harassment, cyberbullying, and so on) are hot button topics in many school districts and amenable to CCL practices.

Cross cultural civic engagement studies where youth reach out to tutor younger students in literacy offer yet another venue for intercultural communication and research. For example a study exploring an afterschool program in Los Angeles sought to reduce the digital divide for students of poverty (Felt, Vartabedian, Literat, & Mehta, 2012). Because schools often block social media sites that have the potential for participatory cultures where there are few impediments to creativity, artistic expression, and civic engagement, the researchers sought to change this situation. They noted that participatory cultures are characterized by (p. 214):

- Creative original works;
- Circulating in knowledge exchange by disseminating products across networks;
- Collaborative efforts aimed at problem solving or community engagement;
- Connecting with affinity groups around a common interest.

In this study, set in a high density Pico Union Latino area of Los Angeles where 84 percent of the students were Latino and low income with 50 percent ELL, students had access to a state-of-the art digital media lab, archive, and community center focused on social justice and digital media. Eight participants (6 male and 2 female) age 15 participated. As the 15-week program progressed, these students became more adept at working with digital cameras, video composition, and numerous sites and applications (e.g. YouTube). Their school was located on the site of the former Ambassador Hotel where Robert F. Kennedy was assassinated in 1968. Students developed a video production entitled "This is my L.A." that

was presented to a large audience of family members, administrators, teachers, researchers, and peers. The project reviewed existing schools in their community with an eye toward successful elements and social barriers needing improvement. At the close of the project, students earned Digital Citizenship Certificates.

CONCLUSION

At this relatively early stage of extant research at the intersection of CCL and digital media, this body of work points to needed changes in how curriculum can become responsive to transnational and immigrant youth, as well as how digital media can be instrumental in this transformation. As Ben Williamson argued based on international case studies of curriculum designs (e.g. New Basics in Australia):

A very cosmopolitan vision of curriculum is required. Cosmopolitanism represents the sharing of values on a global scale that transcend local and parochial interests. Such concerns are linked to the diversity of multiculturalism, changes in traditional family structure and everyday life; to the expansion of notions of community and civic participation, powered by digital media, and its effect on the individual's capacity for belonging; as well as to global economic and political forces. (p .90)

Thus, digital media and cosmopolitan critical literacy hold great promise for transforming the lives of youth. As the youth in the studies reviewed for this chapter demonstrate, it is no small accomplishment to immigrate from one's home country and its familiar culture and language to a new land, a new school, a new neighborhood that may, or may not be welcoming. Clearly, one of the ways these youth bridged barriers to active participation as citizens in a new land was through digital media and related practices. Indeed, to be literate now and in the future implies that one can manage a fairly lengthy set of competencies that alter the once lauded basic skills related to reading and understanding print based texts. New Literacies competencies include (Simsek & Simsek, 2013, p. 129):

- *Sharing* via communal bookmarking, photo/video sharing, social networks, writer's workshops, fanfiction
- *Thinkin*g via blogs, podcasts, online discussion forums
- *Co-creating* through wikis, collaborative file creation, mashups, collective media creation, collaborative social change communities

In addition to these competencies, contemporary citizens must be able to navigate multimodal material that includes visual, aural, and media based content while respecting social difference in viewpoints and multiple perspectives (Simsek & Simsek, 2013). While embracing this vision it is important to keep in mind that, as Hansen (2014) noted, we are in the very early stages of fieldwork aimed at placing cosmopolitanism practices, and CCL on the ground. The studies I reviewed in this chapter suggest that alternative and more inclusive curriculum designs that tap local and global funds of knowledge hold the potential to create citizens who respect each other and are able to use digital media successfully to transform theirs and others' life trajectories.

KEY TERMS AND DEFINITIONS

Cosmopolitan Critical Literacy: This framework moves beyond nation-state boundaries and interests to critically address a host of global human rights issues (e.g. immigration) via digital media as a vehicle for discussion and transformation.

Cosmopolitanism: At times a contested term referring to the framing of self and other in relation to the world rather than a nation-state, and a concomitant ethical obligation to others beyond local and national borders and citizenry.

Critical Literacy: An emancipatory endeavor centered on interrogating issues of power, representation, and marginalization. Who is acknowledged and who is silenced in a text becomes crucial, along with the understanding that no text is neutral.

Critical Media Literacy: Critiques how diverse people are portrayed and positioned in digital media including films, advertisements, video games, songs, popular culture, and social media sites.

Digital Media: Digital Media is a highly dynamic category that includes multimodal elements (e.g. visual images and sound). Digital Media are portable, searchable, and able to be digitally preserved.

Globalization: The increasingly fluid and borderless movement of people, ideas, information, and capital that position the global and local as mutually interdependent.

Risk Society: Globalization, while at times treated as an economic element, renders nations interdependent such that events in one part of the globe spill over into other parts, sometimes with dire consequences (e.g. terrorism, climate change, pollution, involuntary diasporas, economic problems).

Transnationalism: The increasing diversity of people immigrating voluntarily and involuntarily to new home countries argues for an appreciation of cosmopolitan cultural funds of knowledge that values social difference in languages and cultural beliefs.

This research was previously published in the Handbook of Research on the Societal Impact of Digital Media edited by Barbara Guzzetti and Mellinee Lesley, pages 46-68, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

APPENDIX: ADDITIONAL READING

Digital Resources

The following web-based digital resources are provided to guide Cosmopolitan Critical Literacy discussion of many of the global risk society issues explored in this chapter. As this is an evolving area of study, the list is not meant to be exhaustive.

Canadian Museum for Human Rights

Established in 2014 in Winnipeg, Manitoba, Canada this resource includes a website offering a virtual exploration of the museum at:

http://museumforhumanrights.ca

Centre for Human Rights and Civic Engagement

Developed by St. Patrick's College in Dublin, Ireland the following two websites include global exemplars of human rights education in the classroom.

http://www.spd.dcu.ie/site/chrce/index.shtml
http://www.hrea.org/pubs/Compendium.pdf

Choices Program

Sponsored by Brown University, this virtual collection engages youth with international issues and discussion.

www.choices.edu

Research by Columbia Teachers College scholar Earnest Morrell in urban settings with African-American youth engaged in multimedia critique of issues can be found at:

http://earnestmorrell.com

Me to We and *Free the Children* features a wealth of examples aimed at interesting students in issues of global civic engagement.

http://www.metowe.com/speakers-bureau/view-all-speakers/craig-kielburger
http://www.freethechildren.com/about-us/our-story/

United Nations Children's Emergency Fund

This well-known resource includes issues lessons on global issues.

Youth for Human Rights

Video clips running 1 to 2 minutes are centered on specific human rights and offer a rich resource for discussion.

www.youthforhumanrights.org

Chapter 60
Economic Impact of Digital Media:
Growing Nuance, Critique, and Direction for Education Research

George L. Boggs
Florida State University, USA

ABSTRACT

Digitization by computers, like steam power and internal combustion, is widely recognized as a pervasive, disruptive engine powering new ways of living and affecting all aspects of economic life. Research on its economic impact cannot be entirely disentangled from powerful cultural stories connecting technological, educational, and economic progress. As cracks appear in the narratives of constant progress through technology, science, civilization, and economic prosperity, research on the economic impact of digital media develops nuance. This review of literature examines a wide range of perspectives on the economic impact of digital media as a basis for suggesting areas of further research and implications for education, civic, engagement, and policy.

INTRODUCTION

The breadth and depth of research on the economics of digital media point to a view shared across academic disciplines and governments that the production of machine-readable information is affecting how humans provide for their needs (Dobson & Willinsky, 2009); in other words, digital media is affecting the economy. "The economy" is often an opaque package of ideology, often exchanged without acknowledgement of which economy, whose economy, what parts matter, and why. The combination of ubiquity and lack of clarity in lay political and educational discourse about the economy complicates efforts to conduct and share research. Equally challenging is researching and discussing the set of materials, texts, and social practices that make up digital media. Assessing the relation between economies and digital media(s) often involves unpacking cultural myths or overarching stories linking the two.

DOI: 10.4018/978-1-5225-3822-6.ch060

Digitization by computers, like steam power and internal combustion, is widely recognized as a pervasive, disruptive engine powering new ways of living (Carlsson, 2004; McQuivey, 2013). Economic growth and, therefore, digital media access are routinely equated with national or global stability (e.g., European Commission, 2014; Yu, 2002). Economic prosperity is often absolutely linked to digital literacy (e.g., Graff, 1979, 2011). These master narratives answer research questions so forcefully that it can be difficult to imagine disconfirmation. However, as cracks appear in the narratives of constant progress through technology, science, civilization, and economic prosperity, research on the economic impact of digital media develops nuance. Under emerging conditions of economic research across numerous academic fields, poverty is less likely to be viewed as a condition of privation to be alleviated by the actions of fiscally and politically powerful groups. Digital media is less likely to be viewed as a static set of tools to be 'rolled out' for others to access. Large-scale formal governing bodies are less likely to be viewed as unproblematic benefactors of struggling villages, regions, and countries.

Powerful stories, old and new, continue to inform research and discussion of the economic impact of digital media. These stories express belief in or suspicion of intrinsic benefits of market economics, global commerce, and privatization. They consequently shape digital media education, policy, and research. As a result, readers approaching the topic of digital media and the economy are likely to encounter a fragmented array of studies verifying and contesting causal links between digital media phenomena and economic life (e.g., Atkinson & McKay, 2007; Brynjolfsson & McAfee, 2012). Projects offer heterogeneous policy recommendations and reports for governments, corporations, and development and educational organizations, whose fragmented missions call for concerted action to steer economic development through digital media education, access, and use.

In order to review the literature comprehensively, digital media is defined broadly to encompass broadband networks, the physically wired infrastructure that supports them, information and communication technologies (henceforth, ICTs) that they support, and the merging of social and economic life into these digital spaces.

WHAT IS A SUCCINCT OVERVIEW OF THE RESEARCH?

Economic Impact of Digital Media in the New Economy

Prior to the Great Recession, research across multiple fields pointed to an emerging "New Economy" explicitly driven by machine-readable information as a "General Purpose Technology" comparable to steam power and the internal combustion engine (Carlsson, 2004). Two studies of the decade prior to the economic downturn found Broadband infrastructure and ICTs to affect national economic growth in Europe (Czernich, Falck, Kretschmer, & Woessmann, 2011; Vu, 2011). The New Economy was shown to depend fundamentally on digital media for increasing productivity, making markets more efficient, improving the quality of goods and services, and creating new or innovative products (Atkinson & McKay, 2007). This influence was "not likely to run out of gas anytime soon and should power robust growth [globally]." These studies before and after the Great Recession provided empirical backing for the "growth" imperative seemingly intrinsic to the Internet and cellular phone technology. In many cases, research explicitly claimed that the "lion's share" of economic growth belonged to digital media (p. 1).

After an initial boom and bust of dot-com industry had passed, yet before the financial crises of the mid-2000s, digital media's true believers trumpeted the narrative linking digital media with economic

growth (Litan & Rivlin, 2001). Research teams carried these growth imperatives into international development settings (Galperin & Rojas, 2013), where technological and market determinism would fix a temporary digital, and therefore economic, divide (Guillen & Suarez, 2005). Skeptics questioned the effect of the Internet on productivity (Gordon, 2000) or connected the dot-com bubble with exaggerated projections regarding the Internet's economic impact (Gadrey 2003). Many more studies, however, strongly correlated changes in Gross Domestic Product with a region or country's degree of access to broadband technology or Internet Communication Tools in order to argue that they drive growth (Chambers, 2013).

The widespread view that digital media was linked fundamentally with economic prosperity spurred attention to the problem of a digital divide reinforcing traditional economic access issues. Digital divides were defined as unequal access to information and communication technologies based on wealth (Mun-Cho & Jong-Kil, 2001). Research on access to digital media in rural North America and Europe, and in numerous regions outside comparatively wealthy cities and countries worldwide was predicated on the assumption that lack of access to digital media was a serious threat to economic and political security, while access to digital media represented an opportunity to "leapfrog" historical developmental obstacles (Dunn, 2013; Faye, 2000). The digital divide has become an important part of research on the economic impact of digital media: It has developed over time, and it demonstrates characteristics of combining factors, zooming in, and critically reflecting found in research not geared toward the digital divide in particular.

Questioning simple causal connections between economic growth and digital media on the basis on historical productivity paradoxes, technology-rich environments have not always demonstrated increased output (Eliasson, Johansson, & Taymaz, 2004; Solow, 1987). Such studies suggest a category of research on the economics of digital media in which scholars have argued that realizing economic opportunities digitally depends upon organization of multiple factors, not just the existence of or access to digital tools. Chambers (2013), for instance, questions the ability to isolate ICTs' impact in the presence of other major factors like recession and war, plus rapid technological changes make longitudinal studies difficult. He notes a shift in research from measuring access to measuring particular economic effects of ICTs in specific developing regions that impede simple comparisons. Among the most important additional factors that may have been overlooked in early projections of the Internet's economic power are social practices and cultural norms that shape how Internet Communication Tools are used.

Another category of research follows in the wake of the global economic downturn beginning in 2007, embracing a mixed picture of economic effects of digital media. Zooming in on particular economic effects allows research to account for economic recession and constriction of markets whose across-the-board growth had previously been used to point up the advantages of digitization before 2007. In this category, the recognition remains that economies are more flexible and adaptable when networked digitally, yet growth claims are more modest (Kim, Park, Kim, & Hwang, 2013). Brynjolfsson and McAfee's report (2012) argued that digital media drives growth despite many signs of economic calamity such as collapse of job sectors and persistent unemployment. Destruction in the New Economy, they argued, makes room for innovative combinations, new products, and new markets, but research increasingly acknowledges that economic benefits may be fragmented:

Technological progress does not automatically benefit everyone in a society. In particular, incomes have become more uneven, as have employment opportunities. . . . The problem is that our skills and institutions have not kept up with the rapid changes in technology (p. 2).

While grand narratives of technology-driven economic growth are still being produced that tout the 'natural' connection between digital media and the economy, a great deal of research has zoomed in to see particular effects.

Research on the economic impact of digital media is *combining* digital media with other factors to understand a more complex economic significance, on one hand. On the other, *zooming in* on smaller scale economic questions, much research seeks a less coherent, but more accurate assessment of digital media's impact. A third major research development involves reflecting critically on the epistemological, political, and social consequences of digital media. Thus, in addition to combining digital media with other factors and zooming in for finer-grained analysis of economic effects, critically reflective research adds further nuance to the economic impact once attributed to digital media by noting the way economic research on literacy, media, and digital access plays into powerful cultural myths. These myths, such research argues, affect global, national, and regional media and educational policies, and they underwrite the massive financial commitments driving universal broadband access and literacy campaigns. Decentering literacy in relation to economics may be essential for making appropriate recommendations for education and digital media policy.

Combining. As early as 1993, studies combined digital media with changing business choices in order to measure an impact (Clemons, Reddi, & Rowe, 1993). But more recent research suggests that oscillations between social and material digital worlds have inadequately characterized the "blurred realities" of life in digital worlds. Moving beyond binaries requires recognition of the complex existence of digital media in the economy (Ettlinger, 2008).

The human and economic networking potential of digital media are closely intertwined, and research on the combined economic and political effects of digitization has shown that authoritarian regimes only withstand the economic and political pressure of digital networks at great cost (Kalathil & Boas, 2003). Related research examined governments' ability to filter available entertainment and found that perceptions of domestic versus foreign entertainment quality played a major role (Cheng, Feng, Koehler, & Marston, 2010). A related study drew similar conclusions by comparatively examining legal and illegal digital content downloading occurring during and after a corporation pulled popular content (Danaher, Danasobhon, Smith, & Telang, 2010). Other studies have examined the intersection of digital media, intellectual property, and government intervention: Chambers (2013) correlated vibrant intellectual property rights policy in European countries with large scale economic growth; MacQueen (2007) sought explicitly to balance the goals of economic growth with copyright protection; Van den Bulck (2014) addressed the pressure on governments to develop new regulatory frameworks to respond to rapidly changing industrial boundaries, such as between media producers and media outlets.

Research on the regulatory responsibilities of government foreshadow new possibilities for "completely digital entrepreneurship" (Asghari & Gedeon, 2010), which takes advantage of protected markets and reduces or eliminates overhead costs. The New Economy thus involves integrating the changing rules of business with responsive government policies (Oh & Larson, 2013).

Digital media spending, on the other hand represents a significant corruption problem. The increase in pork-barrel or preferential government spending on digital media projects prompted research on the messy combination of digital media expansion and undemocratic political processes (Thierer, Crews, & Pearson, 2002). In contrast to the free market goals of the former research project, Bennett and Segerberg (2011) examined how the digital forces enabling globalization also afforded forms of democratic protest and collective action.

Zooming in. Researchers zoom in past grand narratives of economic growth to test digital media's impact more accurately. The degree of mobile phone penetration was correlated with increased Gross Domestic Product (Gruber & Koutroumpis, 2011). Convergence of media devices (Alam & Prasad, 2007), convergence of databases (Janowicz & Hitzler, 2012), and cloud computing (Chambers 2013) have all been evaluated discretely in terms of their economic impact.

Zysman (2010) connected the growth of digital media with service sector expansion in US and global job markets. Much research has clustered around music, film, and entertainment industries as areas susceptible to massive change through digitization. Some have questioned whether digitization and reduced opportunity costs in producing and distributing films will loosen Hollywood's hold on the film industry (De Vinck & Lindmark, 2014; Zhu, 2001). Similar shifts in power were examined in the music industry from large US-based labels to digital community networks (Hughes & Lang, 2003). By contrast, Lee (2009) called into question the liberating possibilities of digital media in view of the complex and still-powerful industrial dynamics too easily overlooked by studies overemphasizing democratizing possibilities of digital media. Other research in this vein has recognized local synergy between university communities and arts and culture clusters (Breznitz & Noonan, 2013), where digital media is argued to play a central role in multiplying the economic impact of local resources. Similarly Morgan (2013) showed that creative media industries could have regionally significant economic impact despite their longstanding marginalization prior to the emergence of a new digital economy.

Possibilities for economic growth through new and reduced-cost outlets for digital cultural content produce economic challenges for existing outlets (Maggiolino, Montagnini, & Nuccio, 2014) in the transition away from brick-and-mortar shops (Waelbroeck, 2013). Booksellers online offer advantages for customers that translate to increased economic activity (Brynolfsson, Hu, & Smith 2003), and consumer-generated content is integrated into their business models (Ghose, 2011). The business developing around the distribution of digital content vary widely, yet the configurations and ownership of digital and non-digital content providers, such as with ebook and print text markets, themselves have measurable economic impact (Jiang & Katsamakas, 2010). At the same time, retailers' internal marketing strategies vary in terms of the way they make use of available digital information about their intended or actual clients (Ziliani & Bellini, 2003).

Critically reflecting. Historians Graff (1979, 2010, 2011) and Trigger (1976) have discussed ahistorical yet culturally important post-Enlightenment liberal social theories that tie literacy and schooling to socioeconomic development. Graff's interrogation of "literacy myths" continues to inform contemporary researchers questioning the autonomous relationship between techno-literacy and sustained economic development. Trigger (1976) used evidence from prehistoric civilizations to argue that literacy is not required to support highly complex economies, even if literacy developed to support complex economies in the Middle East. Katz & Stern (2008) argue that growth promises tied to education in the New Economy ring hollow, providing many medium-low wage jobs requiring no college degree, outsourcing many jobs, and rewarding a tiny percentage of college graduates who reap outsized rewards.

Katz and Stern's (2008) argument about college education touches on the changing value of specialized knowledge and knowledge in general in the "New Economy." Brynjolfsson and McAfee (2012) connect the economic impact of digital media with the educational need to focus on "soft skills" like leadership, team building, and creative thinking. The Partnership for 21st Century Skills (2011) represents core academic knowledge as a "base" for "21st century skills" implementation." The incorporation of educational recommendations manifests the shift in emphasis away from efficiency and cost saving as the main advantages to networked computing and communication. Researchers increasingly recognized the

potential of digital media to affect every aspect of economic life, with a "multiplier effect" (Katz, 2010). Carlsson (2004), Geyer-Schulz, Neumann, Heitmann, and Stroborn (2004), and Maull and Mulligan (2014) locate the salient feature of digital media in its capacity to convert of information to knowledge. The economic and sociopolitical consequences of datafication or "metadata" are only beginning to be realized and studied.

Chambers (2013) claims that entire functions of society (e.g., education, health, security, privacy) are being rethought as they are being translated for exchange through digital media. Accompanying this translation is a shift toward "digital epistemologies" (Lankshear, 2007), where sweeping changes in individual and community life through digital media affects what counts as knowledge. The New Economy represents a structural shift toward "networked information" (Benkler, 2006, p. 3). Because the use of digital infrastructure for networks has been enclosed economically, laws of supply and demand apply to this process of translation. To understand the human consequences of an economic metric for digitizing information electronically, Foray and Lundvall (2009) argued that the economic importance of digitizing information disrupts traditional boundaries between codified and tacit knowledge, with consequences for the social organization of institutions. Zysman, et al (2010) echoed these claims and added that digital media affects how economic value is created: "When activities are formalized and codified, they become computable. Processes with clearly defined rules for their execution can be unbundled, recombined, and automated" (p. 8).

McChesney (1999) argued that, when it comes to the relation between economics and digital media, "the market has assumed mythological status," where "all must pledge allegiance" (p. 137). In an age in which knowledge must have market value to be digitized, Carrette (2007) warned that, despite decades of critical inquiry into the role of media in shaping human thought and behavior, markets for digitized information are increasingly controlling human thought. Gee (2007) agrees, attributing the view of digital media to neo-liberal myths that lasting good is only produced by markets. "Only markets ensure quality," says Gee, to explain a relation among economics, digital media, and human knowledge. Knowledge only counts when it has survived the test of the commodification of knowledge digitally.

Critically reflective research notes the importance of powerful cultural myths at work when people make sense of changes in communication, economy, and knowledge. Selfe (1999) saw the promise of technology as a savior as a uniquely American phenomenon, now being exported globally. Warnick (2001) characterized this view as a form of economic manifest destiny; Berland (2000) found techno-evolutionism at work in the view that technology was a key factor in realizing human potential for freedom, democracy, culture, intelligence, and progress (p. 243). *The new work order* (Gee, Hull, & Lankshear, 1996) argues that changes ascribed to the new economy parrot neoliberal myths of market driven progress, which actually spell increased inequality and oppression for the world's workers despite promises of great work satisfaction, autonomy, and teamwork. Other social criticisms of the rise of digital media (Carrington & Luke, 1997; Luke, 2008) draw on complex concepts of class, lifestyle, and capital found in the work of Bourdieu (1993). Brandt and Clinton (2002) argued that the notion of using literacy to manipulate one's environment overlooks a crucial economic feature of literacy, that using literacy means being used by literacy as well for potentially economic purposes beyond the view of researchers and participants. Similarly, court decisions and other structural factors play a role in the preservation of cultural myths about literacy and media use (Prendergast, 2009).

Critical media literacy has the goal of exposing economic underpinnings of digital media. Cultural messages about economic life and literacy are important (Luke, Iyer, & Doherty, 2011). One study noted the effects of neocolonial literacy education in parts of southeast Asia, where "The dominant character-

ization of the landless peasantry in Bangladesh and elsewhere in Asia is of illiteracy" (Maddox, 2001, p. 137). Another criticized the literacy education agendas sponsored by the World Bank and UNESCO as neocolonial in nature, that is, positioning the less developed regions for a new wave of economic exploitation through digital media.

Such critiques pave the way for new ways of looking at the economic significance of digital media. Ethnographic perspectives of digital media experiences are useful in considering more nuanced economic situations (Coleman, 2010). Case studies undermined the link between economic development and digital media use among low literacy adult workers in Australia (Black & Yasukawa, 2011).

As powerful cultural stories about markets, technology, literacy, and continue to be positioned as reasons to embrace digital media's positive econiomic effects on human life, more and more studies are published questioning the links and the stories that contextualize them. At the same time, the World Bank, United Nations Educational, Scientific and Cultural Organization, and transnational development organizations profit fantastically from "over-promising" (Heeks, 2010) and "overselling" (Kenny, 2001) digital media's or other utility infrastructure potential for economic impact. Still, research on economic impact of digital media continues to draw quite explicitly on problematic myths. The Deputy Secretary-General of the UN made literacy, and even "informatics" prerequisites for "a healthy, just, and prosperous world," (Frechette, 2003 cited in Rutsch, 2003, p. n.p.; Frechette, 1999). The urgency of the "Literacy Decade" represents the intersection of multiple narratives of progress outlined above, but it focuses on the question of a digital divide ostensibly intensifying inequalities between former colonial powers of the Global North, comprising Europe, North America, and parts of Asia, and the formerly colonized regions of the Global South, comprising wealthy regions in Asia, Africa, and South America.

DIGITAL DIVIDE

Research on the Digital Divide flows out of concerns that the ostensibly vast benefits of the New Economy will not be realized apart from access to the Internet. Recent research has therefore either forwarded or confronted the philosophy and policy reinforcing the view that digital media holds a key to development in rural areas of the Global North and both rural and urban regions in the Global South. The World Bank funded research that purported to isolate access as the controlling factor in economic growth in poor countries (Dasgupta, Lall, & Wheeler, 2001), in spite of numerous studies arguing for an approach to increasing access that accounts for social practices shaping use (Warschauer, 2002). Compaine (2000) argued that decreasing cost of use and increasing ease of use would further isolate access alone as the key determiner of economic development through digital media. Bolt & Crawford (2000) neatly equated the economic *have-nots* with information *have-nots*. These research projects bear the marks of a global economy flexing its muscles, yet, even after the economic downturn of 2007, UNESCO-backed research by Katz (2010) still assumed economic growth as the norm despite numerous indicators otherwise. Katz' research supported the view that systematic, that is, top-down, internet access policy was a key global development priority. Global broadband access was recommended as a core step in alleviating the inequalities of the digital divide (Williams, 2013). A study reaching from the end of the dot-com crisis to before the economic downturn correlated broadband access with a broad set of economic growth factors (Lehr, 2005). Similarly, Mainardi (2013) connected Internet Communication Tools, "and specifically digitization," with the assumed need for countries to effectively compete as economic engines: Digital media is a "fundamental driver of economic growth" that holds the key to "the potential development

and maintenance of absolute advantage" (p. vii). Despite the nationalistic zeal inherent in this research funded by Booz & Company, Mainardi's report identifies specific economic impact of digital media despite "continued sluggishness" of "financial crisis" (p. vii). Finally, the report's top down approach to development frames governments as chiefly responsible for building digital infrastructure, since increased digitization beyond basic broadband access produces increasing economic returns on digital infrastructure investment. This top-down view echoes in the pursuit of an inclusive information society (Guerrieri, Bentivegna, & Elgar, 2011).

Digital divide research does not unanimously endorse the top down approach to responding to the digital divide. Projects designed to increase access alone have been critiqued for their inefficiency. Heeks (2010) characterized projects designed to boost economies through networking centers as "heavy over-promising followed by noticeable under-delivery" (p. 629). One review of research (Chambers, 2013) found that economic growth in many regions that had *progressed* along the digitization spectrum had stagnated or even retreated. Recognizing the complexities of economic and cultural life in the Global South and in rural areas of the Global North has resulted, as it did with economic research not geared toward the digital divide, in projects that combine digital media with other factors and zoom in on more discrete economic effects.

Combining. Mansell (2001) found institutional foundations to be important coordinating factors for predicting growth from ICT use through uptake of digital media in business. That study argued that the notion of leapfrogging, by which ICTs enable overcoming developmental obstacles, must move beyond one-dimensional views of access to technology. The same author argued in a later study that ICTs had to be deployed in ways that afforded people making authentic choices about their own lives. Access alone is not enough (Selwyn, 2004). In spite of massive fiscal and political support for global broadband initiatives, a study of a rural broadband access program showed no economic growth (LaRose, Strover, Gregg, & Straubhaar, 2011). Far from denying the economic impact of digital media, research in this vein echoes the view that

ICTs alone cannot improve peoples' lives; the use of ICTs needs to occur within broader strategies that are tailored to make the most use of these tools and techniques in order to reap their potential benefits for human development (Hamel, 2010, p. 59).

Responding to critiques of top-down approaches, much research on the digital divide has oriented on participatory design and implementation of ICTs. When "conceived and accommodated in locally meaningful ways," argued Maive & McGrath (2010), ICTs "can provide a platform for advancing development agendas in ways that are sustainable in the longer term" (p.2). Perhaps the most important combining effort in this vein of research is the recognition that the notion of a digital divide as distinct from issues of poverty is a fallacy. A study by Blake and Quiros (2012) following reviews of digital divide research (van Dijk, 2006; Wersch, 2009) attempted to address numerous reductionist tendencies both in looking at economic impact of digital media and discussing the nature of poverty.

Using a complex view of poverty (Alkire & Foster, 2009) and more grassroots action approach, Blake and Quiros (2012) recommend recasting poverty in terms of capability goals rather than privation, thereby supporting locally relevant strategies for integrated digital media. They argued that community participation was essential to the design of effective responses to the digital divide, and that "efforts aimed at bridging the digital divide therefore need to be refocused as strategies to address the multiple divides within which poverty has been fostered" (p. 8). Research in this vein invests local communities

with agency for digital innovation around their own needs. Contrasting with the agenda of developing universal Internet and broadband policies, von Braun (2010) argues that the perceptions of the target population, rather than the supposed power of the new tools, are of paramount importance if development through digital media is to occur.

Language and gender play a role as well (O'Byrne, 2011; Looker & Thiessen, 2003; Bryson, Petrina, Braundy, & de Castell, 2003), as does race, and class (Mossberger, Tolbert, & Stansbury, 2003).

Combining environmental sustainability and economic issues has resulted in critical comparisons of environmental with economic impact (Cox, May, Kroder, & Franklin (2010). Other studies of environmental economic impact include assessment of "green broadband" (Valley Vision, 2012), energy consumption (Alonso, Hamdoun, Mangeni, & Dwivedi, 2013). At the same time, ICTs are enabling intensive environmental measurement, too, with complicated economic results, where economic growth depends upon public response to environemtnal sustainability imperatives regarding city water quality (Sitzenfrei & Rauch (2011), watersheds (Mishra, 2011), and urban sprawl (Shalaby, Ali, & Gad, 2012). These studies concur on the need for "technology that is suitable for the environmental, cultural and economic conditions in which the technology is intended to be used" (van Reijswoud, 2009, p.3).

Many concerned with a digital divide view education as a natural factor to be combined with economic growth (Borovoy & Cronin, 2011/2014). The combination of economic change and digital media has resulted in numerous recommendations for major educational changes to accommodate new digital literacies (Leu, 2000). Complex changes in the New Economy are said to underwrite a "transdisciplinary" approach to education (Lélé & Norgaard, 2005; Mollinga, 2010) that values academic specializations as it moves among them and to require "transliteracy," or the ability to respect norms of multiple communication environments (Selfe, 1999). At the same time, digital media is also supporting the creation of digital content for schools and digital tools for writing assessment, and educational technology is increasingly recognized as a site of struggle as academic labor is valued through its technological availability, distribution, and marketability (Hall, 2013). An emerging concern merges environmental stability with education. Gomes (2011) made the connection: "If education and development make an irreducible binomial and that development must be sustainable, then we need an education for sustainability" (p. 205).

Zooming in. Challenges to top-down, access-oriented, government-sponsored digital media development projects come from research that zooms in on specific economic effects. One critique rests on the notion that economic projections are made based on what might be possible through digital media when research does not strongly support the idea that economically beneficial activities will form a significant portion of internet use. One study found that digital media available in the home is a vehicle for reaching a region's elite, with poorer consumers' behaviors remaining largely unchanged (Reich, 1992]). Kenny (2011) criticizes the overzealous aims of UNESCO's Broadband Commission for Digital Development and their policy brief *Broadband inclusion for all*. Kenny skeptically cited universalist claims in the report: "international estimates suggest that for every 10 per cent increase in broadband penetration we can expect an average of 1.3 per cent additional growth in national gross domestic product" (cited in Kenny, 2011, p. 1). The critique pointed to numerous areas in which claims linking digital media access to economic growth rested on dubious assumptions, and that the actual margins of growth attributable to digital media rollout are very small.

In the report, partially titled "Overselling broadband," Kenny reveals a suspicion that the large scale of the recommended projects will disproportionately benefit those who will handle the development contracts, rather than a country's taxpayers. The author concludes by zooming in on numerous finer-grained approaches to supporting economic development through broadband rollout:

This is not to say that nothing can or should be done by policymakers to speed broadband rollout in the developing world. McKinsey [& Co. (2009)] estimates that a combination of adding to available spectrum for mobile broadband, encouraging infrastructure- and spectrum-sharing, reducing coverage obligation, reducing competition, and eliminating spectrum fees could reduce wireless broadband costs by as much as 75 percent. If one is less sanguine about the impact of reduced competition and prefer to see spectrum rights auctioned rather than given away, the impact of the remaining measures could still surpass a 50 percent cost reduction. This suggests there are powerful tools that governments could use prior to diverting scarce revenues towards broadband subsidies.

Zooming in on the digital divide led to inquiry into the significance of digital money in Uruguay (Cassoni & Ramada, 2012). Digitized geographies in Europe are consistently presented as domains of economic growth and impact (Mossberger, Tolbert, & Franco, 2012; Misuraca & Broster, 2010). Technological infrastructure is often isolated and its effects studied on particular regions: US states (Lloyd; Hohlfield, 2008), US rural versus urban areas (Whitacre, Gallardo, & Strover (2014), and sub-regions of Africa (Fuchs & Horak, 2006). Research also zooms in on the technological devices themselves. Mobile phones in India (Moz & Tanz) were shown to benefit higher status groups most and marginalized groups least. Varian (2006) saw considerable potential for emerging low cost laptop manufacturing. Brazil's low cost laptop computer program was evaluated (Amiel, 2006, less favorably by Warschauer, 2003).

Critically reflective. The notion that rural regions in the Global North and areas in the Global South can overcome development obstacles through acquisition and use of digital media has been called into question from a range of perspectives for its many assumptions about development, literacy, technology, and globalization (Fuchs & Horak, 2006). Most obvious is the ahistorical assumption that ICT and broadband development funded by outside investors might differ in their economic intent and effect from well-documented exploitive colonial and neocolonial policies. A study conducted in Egypt cautioned against an ahistorical reading of changes in global communication and that digital divide research risked recapitulating the great literacy divide (Warschauer (2002), in which modes of communication were equated with the intelligence and civilization. Providing similar historical context for research in the Global South, others have argued that the digital divide masks exploitive economic imperatives driving outside investment in digital media. The Digital slavery, it is argued, results from bridging the digital divide, where

… the claim that our personal data and electronic interactions are owned by others is tantamount to accepting that we, as digital beings, can be owned by others. . . . With ownership comes the right to use, trade and dispose. Existing legislation such as data protection is concerned with the legitimate use of data items. It does not consider data items to be the organs of a digital being and so is not concerned with the welfare of digital beings protecting them against servitude and slavery" (Rogerson & Rogerson, 2007, p. 1).

Further developing the historical critique, Ogunsola (2005) noted that leapfrogging the industrial stage of development is not a straightforward move for most countries because past economic struggles have resulted in "tighter imperialist control of the continent" by lender countries, the International Monetary Fund, and the World Bank (n.p.).

Alzouma (2005) argued that advocates for development in the Global South assume that help must come from outside, and that ICT and broadband policies magically invest technology with power to solve

entrenched human problems. The digital divide is itself a problem not likely to be eliminated, even if widespread access occurs (Lopez-Sintas, Filimon, & Garcia-Alvarez, 2012), confirming findings in a study of school and home ICT use nearly a decade before (Sunderland-Smith, Snyder, & Angus, 2003). Researchers have also questioned the environmental consequences of e-waste in the Global South, which already receives much of the world's electronic waste (Bjorn, Vanden Eynde, Viaene 2013).

WHAT ARE THE CURRENT ISSUES IN THE FIELD RAISED BY THESE STUDIES?

Educational policy is being affected globally by recognition that digital media and economic growth are entangled, if not always causally linked in an absolute sense. Research intended to inform corporate, industrial, economic, and educational speaks with many voices, without clear consensus. A lack of consensus does not mean a lack of important issues, however. On the contrary, research on economic impact in general and the divide in particular raises an important collage of issues, which provide an increasingly variegated or fragmented backdrop for action. That backdrop was once monochromatic: ICTs and broadband boost GDP, suggest the need to rethink education around watershed changes in human interaction, and demand heavy investment in less-development regions around the world. In the monochrome, social practices mattered less than material technological access, income alone defined poverty, and technology was environmentally clean and politically neutral. The evolution of the digital divide debate, the effects of the economic downturn on attitudes toward global economic progress, increasing attention to global climate change, as well as persistent critical reflections on cultural myths of technology and literacy have given researchers a far more diverse palette. Irreconcilable views among large-scale global anti-poverty groups (Denny, 2011) illustrate how colors may clash.

There is widespread agreement, however, that divisions between digital content, digital infrastructure, and digital practices are not easy to maintain. Digital media are widely regarded as critical elements of 21st century economic growth across scales and stakeholder groups, and the existence of a meaningful digital divide is widely confirmed, but current efforts seek more nuanced approaches that attend to digital media practices—the combination of digital media with cultural, material, and economically oriented practices. Additionally, studies have combined economic growth goals with questions of environmental sustainability in the recognition that limited resources, changing living conditions, and reliance on nonrenewable resources cannot be separated ultimately from digital media, despite the myth of clean technology. Studies have raised similar concerns about the role of digital in globalization, and the need to balance complex national and international interests with equally complex local and regional situations. The balance imperative stems from efforts to place the trendy in context.

The issue of balance and responding to rapid technological change is particularly important for literacy education and research. On one hand, notions of education and economic access as fundamental rights have placed schools on the education technology bandwagon. The technology imperative flows from the seeming urgency of technological and economic change: Schools must act as a stopgap bridge across the digital divide; teachers can hardly integrate enough current technology; and technology is well suited to schooling, because it so efficiently packages and distributes information, because students like learning with new technology, or because its use trains students entering the global workforce. Economic research on digital media potentially offers important balance to the view that schools must bridge the digital divide through digital literacy, as Brandt & Clinton (2002) argued, since the user-friendliness of digital media

is, illusory. Digital media, via literacy, uses us. Other economic research on digital copyright, piracy, and intellectual property raises similar concerns about the elision of technology access with education: Ownership of digital media and the ontological status of digitized personal information does not square well with human rights arguments about digital media access or the school as its conduit.

On the other hand, documentation of specific, varied, and conditional economic impact of digital media is important in literacy research, where monochromatic notions of economic change have limited engagement with the particularities of growth sectors, malleable ICTs, economic meaning-making, and environmental impact such e-waste. These issues present significant opportunities to integrate economic particularities, questions, and problems where only grand narratives existed before. Among the most important issues raised by current research is confirmation of existing concerns about automation, outsourcing, and workforce development. The review of literature reflects a shift from nationally and internationally scaled economic impact studies (even though such studies continue to be produced) to more narrowly defined industrial, local, and personal economic effects of digital media. As the picture of economic impact of digitization comes to life, critical reflection upon techno-evolutionary myths continues to be crucial for literacy research. Educational policies conceived on the basis of the older pre-Recession grand narratives can be revised to support local concerns and practices where they have been ignored or effaced in monochromatic narratives of globalization and national competitiveness.

At the same time, it must be recognized that the issues to which literacy education and research should respond are themselves fragmented. The digital divide, for instance, is hailed as an opportunity for reducing inequality through leapfrogging the glacial process of industrialization in the Global South, yet the too comfortable relationship of development corporations and World Bank or International Monetary Fund confirm fears that the digital divide really refers to neocolonial economic opportunity to expand markets in capitalism's last gasps as human, market, and environmental resources are exhausted. The issue of digital literacy as a set of practices embedded in the cultural life of particular groups (Lankshear, 2007) has been challenged similarly for its naïveté about how global economic forces are exploiting educational imperatives for profit. This issue further raises the questions about 21st century work, knowledge work, and the new work order. Research on digital media's economic impact has not produced a coherent picture of the 21st century worker, but has instead raised questions about "high" and "low" economic roads that preserve familiar class divisions, albeit overlaid with new literacies, new jobs, and new means of building elite social networks. The issue of workforce development in response to digitally mediated changes in the New Economy depends absolutely on economic impact research, and current research in the wake of the Great Recession is suggesting a more varied picture of digitized work.

Research suggests that monochromatic picture of economic growth driven by digital media depend on myths of autonomous or exogenous effects of digital literacy. The gaps in the logic that literacy *has* positive economic consequences are filled in (or papered over) by cultural stories linking high-status technologies with social status, progress, morality, and more. Research on the economic impact of digital media, while diverging in terms of critical and uncritical orientations toward these stories, point together to the importance of underlying literacy myths in shaping local, regional, national, and global policy. Graff (2011) points out that the core issue is not the expulsion of the stories so commonly told about literacy and economic development, but a need to gain some control over them and direct them.

The idea of using cultural myths about literacy strategically raises the important issue that little effort has been given to understanding economic factors affecting literacy outside the work of critical theorists of literacy (e.g., Gee, Hull, & Schultz, 2007; McLaren, 1998; Rose, 2010). Even with these

broad critiques, knowledge of the relation between real schooling practices and local economic history is "pitifully thin" (Rose, 2014, para. 4).

Separating economic from literacy and cognition issues has been an explicit goal of a branch of literacy studies most apt to tackle the problem of linking literacy and economic life beyond the grand myths (see Scribner & Cole, 1981, introduction). Literature published in media studies, by contrast, has maintained a robust critical agenda linking economic goals with digital tools and literacy. So now, the research points up the issue of synchronizing the government, business, and philanthropic economic imperatives with local economic and educational settings, of working across scales, in other words. So far, the synchronization process has been trapped by the politics and economics of scale that produced it: National and transnational governing bodies, in partnership with large national and transnational corporations, have sought to reform educational practices to produce a workforce for the new millennium. But understandings of the nature of literacies constrained by national and transnational scales decreasingly answer to issues raised in the literature. One important feature of this synchronization and scale problem is the failure to reconcile reform goals internally. Indeed, Au (2011) argued that reforms in assessment, driven by digital economies of scale and enabling new forms and levels of teacher, student, and curriculum surveillance, cannot be reconciled with curricular reform goals developed around the notion of disciplinary literacy practices and problem solving. In this study, the economic concept of alienation from work has been realized in the context of the educational reform for the digital age.

Alienation, poverty, and environmental consciousness are issues raised in the literature that demand reconceptualization for designing instruction and educational research. The digital divide debate presses the issue that definitions of poverty have implications for the kinds of economic activity and growth that can be projected upon a research site. Theories of poverty based on capabilities, agency, and freedom rather than "lack" have significant advantages in terms of predicting the way digital technologies may affect lived conditions. Although no consensus exists, digital divide research raises the issue of transdisciplinary approaches to questions of digital media development among underrepresented populations, which may significantly shape kinds of positions on digital literacy and technology integration in schools. A potential explosive conclusion from this research is that teachers, administrators, and educational researchers, as important stakeholders in the digital divide discussion, should or could cultivate transdisciplinary knowledge of digital media. Such knowledge would mean a holistic approach to questions of poverty, technology, literacy, and economics informed and clarified by disciplinary concepts (Mollinga, 2010).

The idea that education professionals should approach the digital divide or other questions of digital media and the economy holistically is an obviously tall order, yet it underlines a persistent problem raised in the literature, that a mythical relationship between economy and digital media has stunted or stood in the way of applied problem-solving about the needs of teaching practitioners, studies, and communities (Brown & Grant, 2010). But this issue applies to educational research as well, where "overly utopian and zealous belief in the role that ICTs play in development" is accompanied by a "lack of linkage" between ICT and poverty alleviation (Blake & Quiros, 2012, p. 3).

Finally, the literature confirms the issue in literacy research and schooling that instrumental and technocentric approaches to digital media should give way to pluralistic and participatory models "determined locally, according to local choices" (Chapman & Slaymaker, 2002, p. 25). In other words, schools, teachers, families, and researchers need pluralistic tools for connecting digital media, literacy, and economic life, for understanding poverty in the digital age, digital participation, possibilities for meaningful change, and possibilities for digital exploitation (Schimmel, 2009). All too familiar in literacy research, this review of literature underscores the problem of deficit models driving acquisition of

digital tools and participation in digital spaces. In a review of digital divide literature, Vaughan (2011) distinguished "ICT programs which demonstrably and explicitly contribute to community well-being aspirations through the contribution they make to capabilities" as "being sustained by communities," while a lack of such meaningful connections result in failed programs and waste (p. 7). Lack of consciousness about the development goals being incorporated in contemporary education are specifically implicated in such indictments of digital media development programs (Maye and McGrath 2010). This tension between top down and bottom up or grassroots digital media acquisition represents a crucial issue present in the literature (Harris, 2004), where functionalist rationales, "What is and what can be achieved" meet moral challenges, "What should be done and how should we do it?" (Unwin, 2009, p.33). Further, participatory development efforts, should they be conceived and deployed in schools may still "hide or widen existing divides," hence a need for balance between meaningful participation and "reinforcement of existing power hierarchies and exclusionary practices" (Grimshaw & Gudza, 2010, p.10; Blake & Quiros, 2012). The question has been raised by combining factors and zooming in on particulars, as well as by critically reflecting upon the stories told about literacy, technology, and growth: Whose economy matters, and why?

WHAT ARE THE GAPS IN THE EXTANT RESEARCH AND DIRECTIONS FOR FUTURE RESEARCH?

Position statements on digital media education pay scant attention to the economic significance of literacy, digital media, and adolescent digital media practices. References to economic impact rarely go deeper than mere mention of economic significance. Educational reform initiatives seeking to restructure schooling in Asia, Europe, and North America treat the New Economy as a form of progress for those who remain competitive (Asia-Pacific Economic Cooperation, 2014; Common Core State Standards Initiative, 2014). The idea of a set of "skills and competencies young people will be required to have in order to be effective workers and citizens" (Ananiadou & Claro, 2009) masks the diversity of use, meaning, and real economic significance of informational capitalism (Castells, 2010). It also reinforces a monochromatic view of the economic and political meaning of digital media. The idea of global skills for global competition (Partnership for 21st century skills, 2013; (US Chamber of Commerce Foundation, n.d.) justifies large scale co-option of education. In the US, many are crying foul, but widespread resistance across stakeholder groups to national and state standards initiatives has challenged almost everything about educational reform except its simplistic economic promises. In Florida, a leader in educational reform, the Career and professional Education Act (2013) is intended, to "lash our education system to the knowledge-based economy" (Florida Senate, President Office, 2013).

The literature does not univocally support the competition imperative. Global competition has resulted in significant job losses and even whole job sectors in the US and elsewhere. Other factors not related to the skill of the workforce shape economic life, and yet a persistent gap exists between research on the economics of digitization and narratives of educational reform, "which subsume educational attainment and social justice inside agendas for commodification, marketisation, employability and enclosure" (Hall, Atkins, & Fraser, 2014, p. 2).

The major gap has consequences for research on teaching and learning, since economics-minded research currently consists of recommendations based on the imaginary 21st century worker: her team spirit, critical thinking ability, ability to communicate, and adapt. Research has not yet connected what is

known about economic impact of digital media with teaching. Instead, teaching is being connected with reductive literacy myths as proxies for knowledge about how digital media is integrated into economic life at multiple levels. Although popular and useful for guiding instruction away from more didactic, fact-based approaches, crosswalks that help teachers, families, and policy makers think between schooling and economics are much needed.

As research begins to responds to this gap, existing literature emphasizes the importance of participatory models of economic impact research that combine material and social dimensions of digital media, carefully evaluate how and why economic impact matters, and critically reflect upon potentially exploitive relationships. While international development fields increasingly embrace these characteristics of economic impact research, as markers of quality inquiry, they delineate a gap in digital media and literacy research attributable to longstanding disciplinary boundaries. The "funds of knowledge" project and approach (Gonzalez, Moll, & Amanti, 2005) illustrate the troubled past of integrating literacy participation, economic considerations, and exploitation. In that landmark study, local economic structures and struggles were centrally important to researchers, who understood the precariousness of immigrant Latino economic participation and recognized the false promises of a literacy myth, in which poor kids could change their economic future by doing well in school. They observed the profound disconnect between vanishing funds of labor knowledge and alienating and evanescent labor opportunities. And yet the implication of their research and the heart of the funds of knowledge approach is to ignore the economic well-being of actual communities in favor of leveraging what funds are left for school success. In the end, the literacy myth won out against less coherent and perhaps less palatable alternatives. Scribner's concern that her predecessor Luria's (1976) interests in literacy, conceptual, and economic development together were too broad has, in a way, come home to roost. Sociocultural and cultural-historical literacy research is theoretically equipped to engage the economic question, to do so locally and beyond, and to do so in a way that attends to human experience.

Critical media literacy has contributed significantly to the discussion of economic impact of digital media, yet economic critique is less robust and distributed less across the field compared with other critical platforms. In some cases, economic critiques may even make it more difficult to interpret the economic impact of digital media for purposes of education, particularly when research implicitly and explicitly positions people as proactive or empowered *consumers*. Framing people as consumers participates in neoliberal systems of social change, in which markets, supported vigorously by strong states, become exclusive arbiters of human experience.

Economic research on the social impact of digital media seeks to refine educational and government policies regarding literacy education and digital media infrastructure. Efforts to link digital media with dramatic changes in the domestic and global economy, along with critiques of those efforts, are warranted in the wake of the most political and economic developments. Among the most relevant phenomena to economics and digital media are the global recession, state collapse in the Middle East, independence movements worldwide, surveillance practices tied to economic activity, and digitally-mediated antisocial behavior. Besides the gaps in research created by ongoing change, even structural change, in economic, political, and technological structures, there is need for focused attention on combined effects of digital media and state control of the Internet. Existing hierarchical structures (e.g., coding language, ownership of wired infrastructure, and data providers) by which digital content are produced are not absolute. Studying the economic impact of different regulatory and commercialization models is needed. In education, the push to digitize instruction has only just begun to be analyzed (Hall, Atkins, & Fraser, 2014). The enclosure of economic labor through educational technology represents a significant area

for future research, given current imperatives to create and distribute digital records of scholarship, instruction, and student work.

These areas for additional research share an emphasis on the production of digital social space and educational responses. It is difficult to overestimate the significance, politically, economically, educationally, and civically, of digital media and digitization in the contemporary production of space. Because that production is regulated politically, economically, socially, and culturally, the politics of space as outlined by Lefebvre (1992) can be a way to interpret the meaning of new arrangements of space (Butler, 2012; Elden, 2004). In sum, the production of new forms of social space represents a crucial area for research relating economic life and digital media. However, issues of scale are everywhere in research on economic impact of digital media, and recognizing scale as a political and ideological construct (Delaney & Leitner, 1997) in defining problems and opportunities with digital media can lead to awareness of whose interests are likely to receive attention. Scale is an important yet unrealized tool for interpreting the significance of digital media development in educational research, too, although arguments drawing on the political and economic significance of scale are rare. Acknowledging scale and the production of social space as political and economic questions can be useful in suggesting alternatives to existing economic imperatives for digital media access and education (McKenzie, 2012).

WHAT ARE THE RECOMMENDATIONS/IMPLICATIONS FOR EDUCATION, CIVIC ENGAGEMENT (GLOBAL AND LOCAL), SOCIAL PRACTICE, AND POLICY?

Research on digital ecologies, digital economies, and their interlocking systems of knowledge and value should continue to demand better articulation of the economic significance of digital media. Despite generations of glib projections of economic growth, a "triple crunch" of financial crisis, climate change, and energy production (Wallis, 2008, para. 1) threatens almost every possible conception of economic life. Far from constructing a crisis narrative to motivate an unmeasured response, the message of the economic triple crunch should tell literacy and civic education that there is real, possible, meaningful work to be done for which existing conceptions of cultural relevance and equality are inadequate.

Education

Better articulation of the economic significance of digital media in education cannot remain, as it is now, "pitifully thin" (Rose, 2014, para. 4), if educational goals of preparing people for personal, civic, and economic life are to ring true. This current situation is especially precarious given drastic economic changes and erosion of myths of permanent economic progress. At the same time the politicization of educational reform threatens to move the discussion out of the realm of academic argument into demagoguery. Still, current pressure on education to respond to economic needs signals a crucial opportunity, to incorporate economics as a feature of culture in culturally responsive pedagogy (Ladson-Billings, 1995). Slavish acceptance of monochrome cartoons of digitally driven economic progress should give way, as has much research outside the field of education, to a kaleidoscope in which multiple economic histories, theories of technology, and literacy pedagogies apply.

A shift away from a mythical, linear, and large-scale view of economic change in the digital economy depends upon dynamic rather than static views of culture. Cultural and economic responsiveness in

pedagogy depend upon participatory research that frames problems of poverty, access, and practice in terms of capabilities and goals rather than privation.

For academic disciplines and teaching in particular, working between economic imperatives and instructional design is crucial. Research has not yet attempted to connect the dots between literacy instruction and economic impact, hence reliance on the literacy myth to fill in the gap (Graff, 2011). Rather than only exposing the myth, Graff recommends using it strategically to foster the development of literacies among researchers, teachers, and students that resist racism, classism, and violence inherent in the hollow promises of literacy for economic gain (Stuckey, 1990).

Civic Engagement

Research on the economic significance of digital media is growing more critical of techno-centric, exogenous solutions to digital divides across multiple scales from the classroom and neighborhood to continents. This shift toward participation and fragmentation coincides with increased recognition that the promises of global, digitally-networked economies require careful consideration, especially regarding the scale of prosperity and the social, civic, and environmental consequences. Global economic change, regional political change, and environmental sustainability issues will continue to decenter literacy and technology from their prominent, yet mythical, role in safeguarding economic success. In civic life, as with education, such decentering sets the stage for exciting new research on the role of digital communication tools in economic development, which plays a dominant role in formal, national and international political arrangements. Changes projected for schools, teachers, students, families, and literacy research place these stakeholders in important positions of civic agency, with the likely outcome of increased accountability of government, philanthropic, and other agencies to this nuanced picture of economic aspects of digital media.

Managing the myths of literacy education and economic life requires critical civic consciousness. The development of critical digital literacies (Author and Colleague, 2014) by teachers and others produce digital media communication and spaces less as domains for consumption and more as boundary spaces in which alternative political and economic agency and arrangements may be explored. Thus the New Economy and its neoliberal underpinnings evoke responses constructed through new literacies (New London Group, 1996), and the new civics (Zuckerman, 2014). The "new" in the economy, literacy, and civics has less to do with time and more to do with space, participation, and multiple possibilities.

Social Practice

Everyday life is being digitized in ways that constantly defy the imagination. Musicians, news outlets, and artists thrive on virtual attention and approval. Digitized smiley faces and thumbs-up stand in for physical gestures. The "on demand" economy brings three dimensional printing, dry cleaners, restaurants, chauffeurs, programmers, and writers to our doors, promising to destabilize and reorganize the above and many other service and industrial sectors. In many ways, these innovations represent significant economic enclosures shaping social practice. Enclosure is an important economic concept of particular relevance as social life merges into digital spaces.

Enclosure refers to conversion of a thing, such as food or a word, from one economic status to another. An individual might enclose land formerly shared freely among neighbors, for instance, in order to convert the resource into personal wealth more efficiently. Digital media works the same way upon

social practices. Social media platforms enclose everyday speech, emoticons enclose human gesture, and so on through music sharing tools, stock market trading aids, online instruction, and so forth.

The idea is that information is only digitized if it has value, if the process of digitization creates a stream of revenue for the parties responsible for the digital programming and infrastructure. Meetings once held in spaces occupied by a single business may allow third party companies to facilitate digital audio and/or videoconferences for which they will be compensated. So one or more brokers of digital media may enclose communication at work that was already monetized through wage labor. For contemporary work, such conveniences may be welcome, but what about indigenous knowledge encoded in unknown languages? Information and practical wisdom specific to particular places, such as highly sensitive ecological zones, is unlikely to be preserved digitally if current investors are not able to envision a timely return on investment. By the same token, the economic factor acts as a mediating influence on the information itself, not only acting as a gatekeeper for information, but inevitably changing it. This reordering knowledge (Author, 2011; Carrette, 2007) obviously shapes social practices as well. Online recipes are a familiar example. Their accessibility and variety change how people cook, think about cooking, interact with elders, and value existing compendia of cultural knowledge. And they exist as economic ventures with very few exceptions.

Digital enclosure is important because, in addition to the economic conversion of hypothetically monetized information and practice, the practices change as they are translated. Cyber-bullying and human sex trafficking are troubling examples of how the translation of social practices into digital spaces brings about new challenges for law enforcement, families, and communities. Further, economic and political fallout from high profile instances of computer hacking and executions point to digital media as a potential catalyst for antisocial behaviors.

Policy

Much research on digital media and economics is explicitly oriented toward shaping Internet and digital media policy at the state, national, and multinational level. As research tends toward finer grained and more cautious analysis of digital media's effect on economic growth, policymakers continue to grapple with contradictory imperatives from established and new economic interests. The thrust of recommendations is to invest in telecommunication expansion, but questions and concerns in the research are proliferating. Intellectual property protection and enforcement have been serious concerns for policymakers for years. Imperatives of growth and copyright protection are seldom in agreement, however.

Contemporary developments in research directed at policy makers stress the importance of nuanced views of digital media access, poverty, and digital media use. Implications for educational policy include adjustment away from cherished literacy goals accompanied by myths of economic attainment to more adaptive views of literacy and economic opportunity.

The "triple crunch" of energy cost, financial instability, and climate change (Wallis, 2008) place educational and other policy makers in a precarious position. Established economic interests who profit from core factors in global insecurity make progressive policy development difficult. A particularly poignant conflict of interest in this context has to do with workforce development as a matter of local, regional, national, and international policy. The idea of developing a workforce for as yet unknown oc-

cupations (Frey & Osborne, 2013) tests the resolve of policymakers who are simultaneously asked to help businesses succeed in increasingly difficult and competitive circumstances. The result is a policy trap, where forward thinking becomes the only solution to decreasing profit margins in existing economic arrangements but established economic interests must be protected by increasingly outdated policy.
