When youth create, not just use digital media, they are engaging in what others have called authentic learning experiences, which can have a transformative role for both the learner and the society that they aim to impact. Creating new media can take the form of questioning mainstream media using animated storytelling (Kafai, Fields, & Burke, 2010) and creating disruptive technologies such as encryption software for text messages (Milberry, 2014). For some, DIY digital media involves taking action without the gaze of those in power (Ratto & Boler, 2014), while others rely on adult guidance and access to resources. In a seminal article, Blikstein (2008) built on the work of Paulo Freire and Seymour Papert to explore the ways that digital media can be used for emancipation, particularly among youth from less privileged communities. He describes how social transformation happens when youth go beyond using technologies to designing personally meaningful devices, using the example of youth in Brazil who created a newspaper and a video documentary to raise awareness about issues of social justice in their community that they believed were important to address.

In this chapter, we shine the spotlight on the transformative power of digital media for addressing issues of social inequity, particularly when put in the hands of young people. While the use of digital media for the social good is thriving in adult populations, the review that follows shows that it is also growing among children and youth, who have increasing access to mobile and child-friendly technologies. In particular, there is a growing interest in the ways in which youth are making digital media for the social good. For the purpose of this chapter, *making* includes youth using digital tools for a range of activities, such as to write stories, make games, create online communities, build apps, create blogs, contribute to crowdsourcing sites, and produce images. Our focus is on pre-college students, so in most cases, the young people are not doing these activities themselves—they are working with peers, teachers, and adults. Thus, we include within the DIY acronym activities that involve making digital media in collaboration with other people. This chapter will both summarize research and provide general and specific examples of how children and youth are working together to make digital media for the social good, how this connects to and departs from a history of social justice movements, and the social conditions that foster engagement.

The following questions will be addressed:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- What are the historical and cultural roots of children and youth making digital media for the social good?
- How are children and youth making digital media and how is it connected to the social good?
- What are the benefits and barriers to digital media production by children and youth?

The chapter includes a definition of what we mean by the "social good." Research on children and youth using digital media for social good is fairly new, and mostly descriptive. Where possible, we highlight variation in age, gender, culture, and socioeconomic status. In addition, we will discuss how to expand the popularity of making digital media in ways that benefit society, and include two case studies that describe efforts to increase access for marginalized youth to create transformative media. The next section describes the additional research that is needed to advance this field. The chapter concludes with recommendations for educators, researchers, and policy makers on how to increase the frequency and diversity of young people making digital media for the social good.

OVERVIEW OF THE RESEARCH

Historical and Cultural Roots

The material presented in this chapter builds on a long history that includes both academic theories and community-driven efforts to create social change. Academic researchers have developed and elaborated on resistance theory as a way to describe how young peoples' actions are often a logical reaction to oppression and inequity. This view, which was given wide attention after the publication of key articles by Willis (1977) and Fine (1991), focuses on youth agency in response to structural inequalities. The significance of this work is that it raised the possibility that youth actions, such as dropping out of school, getting pregnant, or taking low-paying jobs, should not be interpreted simply as an act of self-destruction or a sign of limited cognitive development. An alternative view is that youth were often carefully analyzing their situations and choosing to forge an educational or career path that was based on their values, or their sense of self. In other words, many of these youth were taking action in an effort to reclaim a sense of power and identity, however, given their limited tools, the result often had negative consequences for themselves or those around them.

Fine (2014) has written extensively about the contradictions inherent in resistance, which can result simultaneously in disrupting and becoming part of cycles of inequity. To increase the likelihood that resistance can have positive, transformational results, many have argued for the use of a critical pedagogy, which starts from the lived experiences of marginalized youth and engages them in a critical dialogue (Freire, 1970). The emphasis is on voices that are usually not heard, such as poor and urban youth, and on helping them take action using a medium that is familiar to them (e.g., music or film), in order to resist injustice (Morrell, 2002). Much of this work builds on the writings of Giroux (2003), who long ago argued for the need to engage youth in a dialogue to inform social change and help them recognize what he called the oppression of the mainstream media on today's youth. He argued that youth resistance can be harnessed to address the abuses of power to transform society for all, rather than result in greater marginalization. These works emphasize that by raising critical consciousness and creating spaces of opportunity, youth will be motivated and empowered to play an important role in community action for social change.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Community is at the heart of many social justice movements that look to address issues of inequality or injustice. Successful social change efforts are driven by a collective that is fueled by each individual's awareness of the historical and cultural roots of inequities (Mercado & Reyes, 2010). In contrast to popular descriptions of the individual hero or heroine that makes social change, most efforts take place within a broader social network or context. For example, activism, particularly by youth in poor and urban communities with economic and systematic disparities, comes from collective reflection, action, and healing that takes place when individuals come together to discuss inequalities or violations of social justice (Ginwright, 2010). This coming together shows individuals that they are not alone, and promotes critical reflection about a current situation, and often reveals the roots of social inequality (Ginwight & Cammarota, 2002). It also results in a centralization of skills and knowledge to collectively impact the inequality. These views of youth agency, resistance, and community provide an important context for interpreting more recent examples of youth-driven activities, which are increasingly more likely to incorporate technology. As we show in the rest of this chapter, digital media has not replaced social movements; in many cases it is being used to strengthen these movements.

What Is the "Social Good?"

The focus in this chapter on the social good is part of a growing recognition of the ways in which youth are leading social change, as well as a renewed call for more youth to participate in civic affairs and the political process. It goes beyond examples of youth participation to explore how youth are taking action to address inequity. In an earlier article, we identified a continuum of involvement by youth in social change efforts (Denner & Bean, 2010). On one end of the continuum is *community service*, where youth help others in their community but there is no explicit connection to political systems or social change. A little further along the continuum is *service learning*, where involvement in the community has clearly identified learning objectives and opportunities for reflection that could include political analysis, but the goal is not to promote critical thinking about the roots of social inequality. What these approaches have in common is that they both focus on changing the youth and meeting immediate service needs, rather than on making lasting change in systems or structures. On the other hand, *civic engagement* involves the active participation of youth with others to improve their schools and communities. And *civic activism* typically involves building a critical consciousness, and focuses on social change efforts that are a direct response to an inequity at the local, regional, or global level. Civic activism is also sometimes an effort to address an immediate social injustice or problem and may or may not involve a long-term engagement or critical evaluation of the roots of the injustice (Wheeler, 2003).

In this chapter, we focus on actions that address broader issues, whether they are political, structural, or social. Following the continuum described above, we will include examples of youth involvement that range from civic engagement to civic activism. Although recent research has found that few are civically engaged (Livingstone, 2010; Malin et al., 2014), a wide range of youth-led efforts to make social change have been documented (Cammarota & Fine, 2008; Denner & Bean, 2010; Ginwright & Cammarota, 2007; Sherrod, Torney-Purta, & Flanagan, 2010). Building on this work, Ginwright and Cammarota (2002) created a model that can be used to describe three different stages of action. In their youth development social justice model, youth move from self-awareness to social awareness, and finally global awareness as they develop agency and the skills to negotiate, protest, and challenge institutionalized forms of social inequity. Thus, social change typically begins with awareness, identity exploration, and a critique of existing structures, before it moves to action.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The availability of new media has led to new forms of civic engagement that manifest in online communities and networks (Papaioannou, 2013). Because self-awareness is a critical part of the social change process, this chapter will include examples of digital media creation that may not directly change systems of power and privilege, but are a first step in that process. Weis and Fine (1993) have clearly shown how self expression, particularly by people whose voices are typically silent, is one strategy for initiating both individual and social change. Thus, our definition of the "social good" includes efforts that have the potential to disrupt structural forces of oppression ranging from the local to the global, regardless of whether there is research that shows their impact on society. In addition, building on Fine (2014), we consider an action to be connected to the social good, even if it is not clear that it is driven by the intention to make social change.

What Does DIY Digital Media Look Like for Children and Youth?

Digital media has given youth a global platform to reveal and take action in response to injustice, and this is particularly important for youth with no other political outlet, and those who feel excluded from politics (Buckingham, 2000). One of the most exciting parts of increased accessibility to digital media is that children and youth are using technology in new and unexpected ways, including as a way to make content or products that disrupt or challenge the adult-driven world of digital media, as well as products that help address injustice and a lack of resources or opportunities in their communities.

In this section, we describe how children and youth are making digital media, in ways that range from self-expression to activism. Despite the growth in content creation, it is still being done by a relatively small subset of children and youth. A recent survey of youth in the US found that 1 in 6 are involved in "active expression, such as organizing an online group or discussion, starting a website, or creating original media to share online" (Cohen & Kahne, 2012). That study found that 11% had started a political group in a social media site, 6% wrote an article or sent a video about a political topic to an online news site, 7% wrote an email or blog about a political issue, and 7% expressed their political views in an event like a poetry slam or music event (Cohen & Kahne, 2012). A study in the UK had similar findings. Livingstone (2010) did focus groups and surveyed a large number of 9-19 year olds in the UK and found that very few are interested in civic or political issues. Among those that go online at least once a week, half have visited a website about something like a charity, human rights issue, or the environment, but the outcome was usually just to get information. Only 35% did something as a result of visiting the site, and only 23% created content (sent an email or joined a chat discussion). There is limited data on who are producing media content, but a recent study of Canadian youth showed that although almost all the participants could access the internet outside of school, their activities varied, it was the older and more affluent youth who were more likely to be creating content (Steeves, 2012).

There are a variety of ways in which children and youth are making digital media that have implications for the social good. One popular approach is for youth to engage in participatory action research to collect information that they then use to create change (Whyte, 1991). In one example, young women worked as a collective to do research about gentrification in their neighborhood, and used that data to create websites that "speak back" to different audiences that play a role in these developments (Cahill, Rios-Moore, & Threatts, 2008). Another example is of high school students who conducted research on the inequities at their school that limit access and opportunity, and then created digital media projects (e.g., a documentary) to share the results of their research (Romero et al., 2008). When the students presented their projects to key decision makers, it led to structural changes that improved the safety of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

their school, as well as the learning environment (Romero et al., 2008). And in a third example, middle school students used surveys and interviews to collect information that informed the creation of news media broadcasts that were designed to challenge unfair decisions at their school (e.g., school dress code, recess time) (Jenson, Dayha, & Fisher, 2014a). These examples show how participatory action research can fuel youth-driven digital media production, but the activities are typically initiated by and carefully monitored by adults.

Activities that involve making zines, videos, or blog posts are more likely to be initiated by young people, with less oversight or control by persons in power. Thus, these forms of digital media are often used by youth who want to interrogate dominant discourses that are perceived to limit their access or opportunity. For example, Guzzetti and Gamboa (2004) describe how girls create and distribute zines on the internet (and on paper) to raise awareness and incite others to act on issues that are important to them, but are typically ignored by the mainstream media. Similarly, Edell, Brown, & Tolman (2013) describe how teens and young women challenge media representations of girls' bodies by creating blog posts, online petitions, and presentations that are distributed online. And Banet-Weiser (2011) describes how girls create and post videos online and claims this is a way of "mocking celebrity as well as beauty culture" and "allows girls to both perform gendered identity and to point out its contradictions" (p. 8). Because the videos are not polished by adults, they capture the complexity of the expectations that girls perceive as they simultaneously embrace and challenge societal ideals about beauty.

More readily accessible technologies have been used, particularly by poor and marginalized youth. Mitchell et al. (2010) describe a group of rural girls in South Africa who worked to impact the HIV/AIDS epidemic by writing blog posts that included challenges to media stereotypes about who gets AIDS. Others have described how youth use mobile devices to create visual images and micro-blogging (e.g., Twitter) to capture and share incidents of injustice, in an effort to mobilize millions of voices for social change (Diaz-Ortiz & Stone, 2011; Salazar, 2010). Youth Radio is another example of how young people are creating media that adds to and critiques mainstream news coverage. For example, Youth Radio's Emails from Kosovo series, which told the story of war in Serbia through the eyes of young people, was broadcast on NPR and influenced international politics (Soep & Chávez, 2010). These are all examples of how youth are engaging in disruptive and potentially transformative acts by circumventing the dominant media and producing and distributing their own stories.

Other ways that youth create digital media for social change is in the production of interactive products that others can use, like games and apps. In 1995, a foundational book on computer game programming called Minds in Play (Kafai, 1995) described how children can create games to teach younger children about math or science. Since then, a growing number of freely available, and novice-friendly game authoring tools such as Scratch, GameMaker, and Alice, has led to an increasing number of computer game programming classes, both in and after school; some of the games address social justice issues. For example, a program for First Nations high school students in the US provided the resources for them to create digital games that tell and rework traditional stories from their culture (Lameman, Lewis & Fragnito, 2010). In another US high school class, students created mobile games to advocate for an environmental issue in their community. Mathews (2010) found that when they made a game "…about an issue that was important to them and included their voices, the students felt like they were able to 'push back' against the city" (p. 99). Similarly, girls in an afterschool class were motivated to create games that could be used teach younger students how to navigate the challenges of middle school, including unequal treatment by teachers and administrators (Denner et al., 2005). And in more recent programs,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

youth are creating apps that address structural inequities, such as limited opportunities and access to after school activities (Van Wart, Vakil, & Parikh, 2014).

Like prior social justice movements, a key aspect of youth making digital media is the role of social context, and the ways that it enables and constrains the nature of what is made and the impact it has. Jenkins et al. (2009) have described how children and youth contribute to and shape the content of online digital media as part of a participatory culture. He described participatory cultures as having "relatively low barriers to artistic expression and civic engagement, strong support for creating and sharing one's creations, and some type of informal mentorship whereby what is known by the most experienced is passed along to novices." For example, participatory politics are described as "interactive, peer-based acts through which individuals and groups seek to exert both voice and influence on issues of public concern. Importantly, these acts are not guided by deference to elites or formal institutions" (Cohen & Kahne, 2012). Websites like www.change.org provide a space for youth to rally support for causes that demand a response from or change by corporations, educational institutions, and political groups. Participation in these groups has led youth to create online petitions that directly challenge or protest giant media corporations (Earl & Schussman, 2008).

These movements are taking place primarily online, through actions like blog posts, creating videos, or starting a new political group. For example, Jenkins (2014) describes what he calls "fan activism," and provides an example of a global community of youth who use metaphors from the Harry Potter books to mobilize and raise funds, often rewriting parts of the narrative. And Kafai & Burke (2013) describe the ScratchEd online community as a form of "computational participation," where youth design, create, and remix digital media products in collaboration with others.

As these studies have shown, digital media can provide a tool for self expression, civic engagement, and activism. The examples described here show only some of the many possible ways that children and youth can use digital media to make a difference in the social, cultural, economic, and political issues that affect their daily lives. In the next section, we review some key issues raised by these studies, including the benefits and barriers, and use two case studies to highlight some promising strategies for engaging more children and youth in the production of digital media that can lead to positive societal change.

CURRENT ISSUES RAISED BY THESE STUDIES

What Are the Benefits of Making Digital Media for the Social Good?

The majority of existing research focuses on the benefits of engagement in different kinds of digital media production for the children and youth that are involved. Kafai and Peppler (2011) identified four categories of participatory competencies that are necessary for full participation in DIY media production: technical, critical, creative, and ethical practices. Technical competencies include coding, debugging, and repurposing; critical competencies include reworking and remixing media; creative competencies include applying artistic principles and connecting multimodal sign systems; and ethical practices include crediting ownership and providing inside information. A small body of research shows the range of ways that making digital media, particularly for the social good, can build these competencies. We briefly summarize the results of these studies below.

The different competencies can be found in a range of digital media production activities. For example, studies have shown that when children program games they engage with computer science concepts and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

develop skills such as programming and debugging (Denner, Werner, & Ortiz, 2012; Feng & Chen, 2013). Similarly, writing blogs can increase young peoples' knowledge about how to identify things that they can do in their own communities, and a sense of empowerment that they can make a difference (Mitchell et al., 2010). And making an environmental mobile game (Mathews, 2010) or building an app (Van Wart et al., 2014) can increase students' awareness about and ability to analyze social issues, as well as build their technical understanding. Similarly, creative competencies that include self expression and making artistic choices are fostered through activities like making e-textiles. For example, Kafai and Peppler (2014) describe how youth "redefine their position within established power structures" while creating products that involve sewing, fabric, circuits and codes (p. 180).

Critical practices that directly challenge organizational or political structures involve remixing and deconstructing, and are found in activities such as making Zines (Chidgey, 2014) or do-it-yourself news (Annany, 2014). Although no known formal research has examined the benefits of these activities for the development of critical competencies, records of online viewing suggest they have wide impact. For example, the most popular video by 9-year-old Kid President on Youtube has been viewed over 34,000,000 times and has likely mobilized a generation of young children from racial/ethnic minority groups to become critical and active citizens. These competencies prepare youth, particularly those from poor and underserved communities, with workforce competencies that can have great implications for the economic prosperity of their communities. Other potential benefits of the development of these competencies include increased knowledge and confidence, a more critical or analytic perspective on social justice, and changes in attitudes.

The benefits of youth-led digital media production for the social good are harder to gauge. There are many case studies of how youth are changing conversations and mobilizing adult action (Ginwright et al., 2006; Romero et al., 2008; Soep & Chávez, 2010). However, it is not possible to confirm causation, or whether an external factor caused both of these actions, or whether the result is generalizable beyond that particular situation. While there are several anecdotal examples of how digital media projects have had an impact on social issues, there is not enough research to describe the actual benefits to society.

What Are the Barriers to Making Digital Media for the Social Good?

Research also highlights some of the challenges to productive engagement, which include structural and relational factors that limit access and support. In an analysis of youth activism, Gordon (2008) concludes that mobility plays a major role in who participates. For example, girls and younger students tend to have greater restrictions on where they go (both online and physically) and who they interact with. Thus, in an era of fear about cyberbullying, accessing inappropriate material and sexual predators, efforts to protect children can have the unintended consequence of also limiting their opportunity to engage with transformative social and digital media. Others have also described the ways that adults control youth's access to DIY media production, and the importance of understanding how they both support and constrain opportunity and action (Jenson et al., 2014a; Livingstone & Helsper, 2008). In particular, challenges include school-based power relations that silence youth voices, as well as limited access to technology or adults with expertise in digital media (Jenson, Dayha, & Fisher, 2014b).

Economic factors also determine who has access to computers and unrestricted wifi. Hispanic youth and those with household incomes less than $30,000 a year are the least likely to have internet access, and African American youth are most likely to access the internet on a cell phone (Madden et al., 2013). Not surprisingly, studies show that youth are more likely to be creating digital content when they are

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

older and come from more affluent families (Steeves, 2012). Transparency about the barriers to the productive use of digital media for the social good is rare; probably because the adults writing about these activities are part of the barriers. Building on a legacy of youth-led social justice efforts, adults must maintain a critical perspective on their own role, and the ways that they both constrain and create possibilities for authentic spaces in which children and youth, particularly those from groups whose voices are underrepresented, can create and distribute digital media.

CASE STUDIES

In this section, we highlight two examples of how to meaningfully involve youth in the creation of digital media for the social good. These examples are intended to illustrate contemporary approaches to using a critical pedagogy that motivates marginalized youth to build the skills and become creators of digital products that will benefit their communities and society as a whole. These cases were selected for several reasons. One is that they are designed to overcome many of the barriers to making digital media for the social good described earlier. Second, in contrast to most writings on critical pedagogy that focus primarily on teenagers or young adults, the examples include youth from elementary through high school. Finally, the programs focus on digital media production by Hispanic/Latino youth, whose experiences have been surprisingly absent from critical media studies.

Case #1: CSteach – Computer Science for the Social Good

CSteach is an afterschool class where elementary students from underrepresented groups learn to create digital media to address issues of social justice. It uses a near peer teaching model that includes high school students who are from the community and often know the younger children in the program, either through their extended family or neighborhood. The goal is to foster capacities, identities, and relationships to use the tools of computer science for positive social change, among both the 5th grade and high school students. The class has been implemented 10 times so far in a school district that serves mostly Latino, low income students. To date, participants have included approximately 300 elementary school students (ages 9-11 years), and 30 high school students between the ages 15-17.

The program uses critical pedagogy to help students identify areas of injustice and opportunity in their community, and to create a message using digital media. CSteach draws on research in mathematics that shows how creating learning experiences that are culturally relevant and connect with social justice issues can engage students in learning in a way that is deep, meaningful, and that contributes to the development of a positive identity (Leonard et al., 2010). It also builds on examples of "computing for the social good" in college (Goldweber et al., 2011), and is the first known effort to integrate computer science and social justice in elementary schools. Thus, one of the goals is to help students recognize how computer programming (coding) can be relevant to their lives and that it can be used to make changes or create things that will help their family and community. Specific goals are that students will: a) learn to identify and understand advocacy needs and opportunities in their schools and/or community, b) understand some of the ways that computer science can help address these needs, and c) develop a sense of responsibility and motivation to use the tools of computer science for the social good.

Social justice concepts are introduced in age-appropriate ways to help students understand and generate ideas about how technology can be used for the social good of their school. Because the program targets

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

10-11 year old children, it uses terms that are recognizable to the students. For example, the "definition" of social justice in CSteach is that it is something that a student believes is unfair in their community and needs to be changed or improved. It should be relevant, and ideally personally meaningful to them. To this end, the program teaches four "big ideas" about social justice that are developmentally appropriate for young children:

- **Fairness:** Students learn the difference between having a complaint or a dislike, and situations that are a result of inequality in people's opportunities, due to bias, unequal distribution of power, or other privileges.
- **Community:** Students focus on an issue that is personally meaningful and impacts themselves or people they are connected to. Given their limited mobility outside the school, the 5th grade students are encouraged to think about fairness at their school.
- **Empowerment:** Students learn about other young people who believe that they can make (and are making) real change, which builds their own motivation, including the development of an identity as a leader or change agent.
- **Action:** Students learn that collective action is the most effective way to make social change, and that change can happen by working with others and leveraging both social and computer networks.

The 13-week curriculum guides students through the exploration of social justice both from a local and a global perspective. They are introduced to the topics by watching short videos with examples of how technology is being used by young people to solve problems around the world, as well as children and youth engaged in efforts to improve their community. These short videos highlight the ways in which the power of technology can be leveraged to build community support for a local issue, and how technology can be the vehicle to disseminate information to a community. The activities are framed within a context that the students understand and can relate to--they identify circumstances that they or others consider to be unfair at their school.

A series of activities were designed to scaffold students' developing understanding of social justice, and how they can be involved in social change. The students move from self awareness to social awareness--the first two stages of action in Ginwright and Cammarota's (2002) model of youth development social justice. The activities are delivered by high school students, and are at an appropriate developmental level to help students think about their school as a space where everyone has an equal right to learn and participate. The high school students draw on their own experiences to help the younger students reflect on what is important to them, and then guide them through activities to explore what makes them feel good and helps them learn at school. Then students reflect on things that are unfair, and what prevents them and others from feeling good and having equal opportunities to learn at school. They identify the factors that get in the way of having a safe and fair learning and social environment. Finally, the students work together to identify solutions to those barriers in order to make their school more "awesome."

It is these "awesome" ideas that are incorporated into a digital multimedia project--an animation that students design and then code using the Scratch programming tool. The projects are designed to send a message about something they see as unfair at their school, why, and how it should be changed. The final digital media projects are shared with their peers, teachers, and administrators at school, as well as with their families. The program creates a space for children to contextualize and localize social justice issues in their own language, with support from older students in their community, and gives them the tools and resources to write a message using digital media that can be used as a first step toward social change.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Case #2: The Digital NEST

Digital NEST (Nurturing Entrepreneurial Skills with Technology) creates sustainable and scalable technology centers in low income communities in California, with the goal of engaging, empowering, and preparing youth to create digital media that will fuel local economic development. It is a community-based hub that provides a safe and collaborative learning environment and opportunities for people between the ages of 12-24 to enter a common space where they can work together to build digital media products for the benefit of themselves and their community. The long-term goal is to bring prosperity to underserved communities by teaching technological and entrepreneurial skills to youth and young adults.

The Digital NEST started in an agricultural community where few families can afford to buy their children a computer or get reliable internet, and even fewer can provide expensive software that requires regular updates and maintenance. The community lacks the infrastructure to provide the public with high speed internet, so many motivated high school and college students sit outside businesses or on weekends on the closed campus of the local community college in order to find a connection that will allow them to do their homework. Due to these limitations, the community has few high tech professionals; those who left the community to get an education or pursue work experience have few incentives or opportunities to return to work in their home town.

The Digital NEST is modeled after successful technology companies that inspire creativity and innovation, and provides its members with state-of-the-art technology in a safe space that gets them off the streets. There are four major components. The NEST provides access to: 1) *Technology.* Youth use laptops to access professional, multimedia software, take online computing and digital media courses, visit social networking sites, create original digital media projects, and connect with peers and professionals with similar interests. 2) *Technology education*. Youth meet and take classes from mentors who represent leading digital media and technology companies, such as Google, Netflix, and Smith Micro Software, and they have access to thousands of online courses. The youth can choose among classes on digital film making, digital game design, networking, mobile application development, web site design, and graphic design. 3) *Leadership opportunities*. Youth take on leadership roles both within and outside the NEST. For example, local and regional companies hire youth to work as consultants and gain real-world experience by building digital media products and providing technology support services, which infuse youth voice into local business and fuel community economic development. Youth also learn leadership skills that they apply by directing the activities at the NEST and mentoring younger students. 4) *A safe and creative space outside of school*. The center is centrally located, and run primarily by young adults, providing a safe and productive place where youth can create digital media and reinvent their futures.

As an example of youth leadership, members developed an ideology to guide how the space would be used. Together they wrote the following statement: "As Members of the Digital NEST, we commit to bettering our community by becoming innovators and utilizing technology for the benefit of ourselves and others, providing a safe and collaborative learning environment, maintaining a positive perception about our community, and providing service to our local and global community." While adult participation is a critical part of the Digital NEST, particularly for connecting youth with resources and helping them to establish a process, youth leadership has been essential for creating a place that does not reproduce the structural inequalities that many of these youth experience in formal institutions, like school.

There are some commonalities that run across these two case studies. First, both use an intergenerational model that builds on cultural strengths. This model is based on the work of Bourdieu (1986) that shows there are resources and social capital in poor and marginalized communities, even if they are not

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

valued by the dominant culture. The use of near peers from the local community not only helps to deliver the digital media skills in a language that is familiar to them, it provides youth with more experienced (but still young) people from whom they learn how to navigate challenges and create opportunities that allow them to pursue their goals and still maintain ties to their family and culture (Cooper, 2011). A second commonality across these case studies is that they aim to foster empowerment with digital media among individuals by creating access, building their technical skills, and then scaffolding opportunities for them to use those tools to participate as active citizens in their community. A third similarity is that both CSteach and the Digital NEST recognize the importance of creating a safe space where different kinds of skills and interests are valued. This means that there are opportunities and mentors, regardless of whether a person is interested in the more technical aspects of digital media that involve programming, the more artistic aspects that involve images and music, or the more social aspects that involve leading groups and building networks.

How Can the Popularity of Making Digital Media in Ways That Benefit Society Be Expanded?

Although much of the digital media created for the social good is youth-driven, adults play a crucial role in creating equitable opportunities. Youth with limited access to digital media need adults to set up opportunities and structures that they can realistically use. Although most schools in the US have computers and internet access, firewalls block access to websites that promote social networking and social change. Libraries are another access point, but many have limited hours, or cannot be safely reached by youth from different neighborhoods, and few are accessible to children or youth without parental supervision. As shown in the case studies, effective strategies include providing opportunities to take some introductory courses or workshops, to work with more experienced youth, and to create project-based digital media content that can easily be accomplished even with little technology knowledge. Other organizations like Global Minimum (www.gmin.org) are dedicated to building the capacity of young people to solve problems affecting their communities using innovative methods that often include digital media and technology. In Africa, they foster intergenerational teams that have built a range of solutions including a communication platform through social networks and apps to connect poor high school students with university students, and luminescent boards to create light for emergency service providers to safely navigate through informal settlements. And the TakingITGlobal program combines digital youth engagement with global education and social innovation; a study found that participation led to the creation of digital media online, and the use of the tools to make change in their communities (Raynes-Goldie & Walker, 2008). To increase the number of youth that are making digital media for the social good, we need organizations like these, that leverage the desire of many youth to take action to improve conditions for themselves and their families.

However, not all efforts to engage children and youth in digital media production create the space or the guidance to connect these activities to social change; the results depend in part on the motivation of the adults involved. For example, Fisherkeller (2013) identified multiple reasons that adults have created opportunities for youth to produce their own media. These include: to increase children's civic engagement or political participation, to create opportunities for self-expression and creativity, and to motivate children to engage in and persist in complex digital environments for some other outcomes, such as to learn about computation, to build confidence with computing, or to increase media literacy. Clearly, it is not necessary for every digital media class to focus on how it can be used to address social

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

injustice. However, when adults set up the opportunity and structure for youth to create digital media, they have to be conscious about the ways in which they are controlling it, so that youth can drive the content that is created.

GAPS IN THE RESEARCH AND DIRECTIONS FOR FUTURE RESEARCH

There are several limitations of existing research that prevent us from guiding efforts to effectively engage children and youth in digital media production for the social good. In particular, we know little about why youth participate, what they learn, or the benefits to society. We also have limited knowledge of how the answers to these questions will vary, depending on the kinds of media that youth produce.

Some of the limitations are methodological. For example, most existing studies are small, in-depth descriptions of a group or program, and it is not possible to generalize the findings from most studies due to a lack of diversity in the participants, self-selection of children and youth into the activities, and small sample sizes, which often rely on case studies of one or two children. A range of methodological approaches are needed to provide both in-depth and generalizable findings. We need both large studies to understand who is making digital media for the social good and how, as well as in-depth studies to understand the benefits to both the youth and society as a whole.

In addition, we need more studies of youth designing and developing new technologies for the social good. Soep (2015) makes the important point that "…it's important to disaggregate what we mean by media, that we include technology creation as a kind of media production, and that we pinpoint specific considerations related to telling digital stories versus creating digital tools and platforms" (p. 30). Indeed, creating products like digital games and apps has been linked to various kinds of computational learning and thinking (Grover & Pea, 2013; Werner, Denner, & Campe, 2014). However, the focus of most of these efforts has been on building the capacities of individuals, rather than on the implications of their products for social change—who uses them, how, and what are the resulting changes in people, institutions, or systems?

There are several additional directions for future research. For example, we know little about how and why youth create digital media for the social good—the factors that lead or enable them to design and develop products. We also know little about the kinds of programs, curriculum, or institutional structures that increase the likelihood that youth will create digital media that aims to address injustice or improve lives. Research is also needed on the potential risks or backlash in response to efforts by youth to use digital media for the social good. Few have described who responds to their creations and how the nature of this response varies across communities and power structures. This information is important to understand if we are to increase the number and diversity of youth who engage in these practices.

Despite the emphasis in the research on the importance of social factors, there is very little information about how the family and the school foster the creation of digital media. This is particularly important because Livingstone (2010) found that it was schools and parents that were the greatest influencers on youth's interest in and participation in politics. Thus, we need research on the role that parents, siblings, and other family members play in where, when, and how youth create digital media for the social good. While studies have shown that parents can create barriers, little is known about how they (or other family member) create opportunities, either by being role models through their own digital media creation, or by sending their children to classes where they can get the skills and support. In addition, there is a need for research on whether participation looks different if it is youth-generated compared to when it

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is happening in an adult-led class or program. Part of this research should be an investigation into the role of privilege and adult control in creating digital media for the social good.

Although most of this research has focused on the transformative power of digital media production, there is rarely discussion about the institutional resources or level of adult support that are necessary for young people to successfully complete and share a project. A few have called for more dialogue about this, and have highlighted the ways that institutional structures can limit this work (Jenson et al., 2014a). But additional transparency and documentation of these factors will go a long way toward creating learning environments where young people can create digital media that has a positive influence on themselves and the things they care about.

Similarly, research is needed on effective educational practices and pedagogies. While some teachers are integrating DIY media into their classroom (Guzzetti et al., 2010) little is known about how to support these efforts to be effective for different kinds of students. We also need research on whether students take these experiences outside the school, or the extent to which they involve creating media for the social good. The existing research is also missing a developmental perspective on the most appropriate strategies for introducing concepts of social justice and civic engagement to children at different ages. Additional dialogue with children of all ages is needed to incorporate terminology that is familiar to them.

Fine (2014) recommends taking a long-term view to understand the factors leading up to youth resistance, as well as the consequences of those actions. Thus, the next stage of research should not only analyze the digital media content or products created by youth, but also understand the circumstances (both supports and challenges) that led to the creation of the product, as well as what happened, both to the individual and to society, as a result of those creations. Drawing on these limitations, we will make recommendations for next steps to fill these research gaps.

IMPLICATIONS AND RECOMMENDATIONS FOR EDUCATION, CIVIC ENGAGEMENT, SOCIAL PRACTICE, AND POLICY

There are several implications for educators, parents, policymakers, and companies that make digital media tools. Youth, particularly those from poor communities, need both the support and the resources to use digital media for the social good. Educators and parents can increase the likelihood that their children's digital media use will have a social justice component if they engage youth as leaders in the decision-making about the content and use of their digital media. The best way to promote the use of digital media for the social good involves striking a balance between trying to guide and direct their activities to increase their impact, and supporting youth's critical consciousness, creativity, and self expression. We have described some of those physical and online spaces in this chapter. For policymakers to create and sustain efforts that connect digital media use with the social good, they should break down institutional barriers (e.g., lack of computer centers in underserved communities, high cost of internet) of accessing technology and create financial support for efforts that tie digital media and social justice. And companies can increase the ease with which their tools can be used for the social good by offering free or drastically reducing the cost of software for youth, and providing training and examples of how the software can be used to address social justice issues.

Creating opportunities for the meaningful engagement of youth that are underrepresented in the careers that shape the digital future is an act of social justice itself. Members of underserved communities do

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

not have equal access to the high paying and growing number of technology-related careers. The act of engaging youth from these communities is one way to address the social justice issue but it needs to be done meaningfully and deeply. It must build on existing cultural and social capital, which means having local leaders involved at every stage, and putting youth in authentic decision making roles.

KEY TERMS AND DEFINITIONS

Digital Media: Newscasts, games, blogs, music, films, images, animated stories.
DIY: Do-it-yourself digital media.
Marginalized: A person or group of people whose perspectives are outside the mainstream.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Participatory Culture: A community characterized by creative expression and civic engagement.
Social Justice: Equality in terms of wealth, opportunities and privileges.
Social Media: Internet and mobile-based tools for sharing and discussing ideas.
Youth Agency: Active participation of young people in overcoming injustice.

This research was previously published in the Handbook of Research on the Societal Impact of Digital Media edited by Barbara Guzzetti and Mellinee Lesley, pages 398-416, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

Chapter 32
Is the EU Moving Towards Sustainable Development?
Changes in the Social Exclusion Area in Some European Countries

ABSTRACT

In accordance with its agenda, the EU wants to include actively every European citizen in society taking into consideration some challenges like poverty, gender inequalities, social exclusion or long-term unemployment. The economic crisis has influenced the indicators of social exclusion such as monetary poverty and living conditions, education and the access to labour market. The index "risk of poverty or social exclusion" is influenced by certain characteristics of the population (education level of parents, country of birth, degree of urbanization, activity, household type, age, tenure status, citizenship, sex etc.) being able to identify the most disadvantaged subgroups of it. This paper analyzes the evolution of this index in the European Union, taken in consideration its determinants.

INTRODUCTION

The term of "social exclusion" is used in the literature in various forms: it is often associated with poverty and social capital (Stone, 2001), with the lack of social integration or inadequate social participation (Winter, 2000).

The origin of the concept of "social exclusion" is found in the early twentieth century in German economists and sociologists thinking which have explained it by providing a privileged socially position by a group or by an individual at the expense of others (Hills, Le Grand & Piachaud, 2002).

Social exclusion has always been a constant concern in terms of culture and politics in France. Its origins can be found in the eighteenth century when the idea of the state as the embodiment of the nation has emerged.

Sociologist Emile Durkheim (1895) has focused on this concept and on fragile relationships between society members and between them and the nation state.

Estivill (2003) focuses on the use of political discourse in addressing the concept of social exclusion. In this regard, he said that there is a greater degree of skepticism from politicians regarding remedial measures of poverty. He also argues that social exclusion is more acceptable to public opinion instead of poverty. An exclusive society is much more acceptable for different political views.

The transition from the poverty speech to that linked to social exclusion has occurred with increasing individual culture and neo-liberal thinking.

Byrne (1999) and Levitas (2005) argue that the concept of poverty has been replaced with social exclusion, the latter being understood as a detachment from social life and the labor market.

Amartya (2000) believes that social exclusion provides new explanations on the causes and consequences of poverty and discrimination.

Beall (2002) addresses in her works more conceptual views on social exclusion. Thus, according to neo-liberal thinking, social exclusion is a consequence of global trade liberalization and a unique global market. Another approach considered that social exclusion is a concept which detracts from the inequality created by the malfunction of the economy. The transformationalist approach focuses on social relationships that arise in various formal and informal organizations. The concept is used to analyze international processes in combination with economic and social changes in the global system.

In the modern view, this concept has appeared in France and refers to those who are excluded from the social insurance system (Lenoir, 1974) or are excluded from certain economic or social activities because of lack of opportunities (Saunders, Naidoo & Griffiths, 2007).

Also, at the institutional level it began to be used and adopted this concept where there is a mainstream policy framework within the European Union. The Eurostat Taskforce on Social Exclusion and Poverty Statistics defines the term as follows (Hayes, Gray & Edwards, 2008):

A dynamic process, best described as descending levels: some disadvantages lead to exclusion, which in turn leads to more disadvantage and more social exclusion and ends up with persistent multiple (deprivation) disadvantages. Individuals, households and spatial units can be excluded from access to resources like employment, health, education, social or political life.

The concept of social exclusion has appeared in EU policy discourse during Delors presidency following the recommendations given by the Commission as Directives. Most of them were related to social protection systems and acknowledged that social exclusion has a multidimensional nature becoming more and more diversified. In addition, it emphasized that many individuals can play an appropriate role in economic and social life because of insufficient and uncertain resources.

According to these recommendations Member States are invited to recognize the basic rights of every citizen to live in a decent manner, which means that you must achieve a minimum level of income. In

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

this regard Member States should widen cooperation between them in order to adopt a common political vision of the European Union which has as main objectives the following (Ferrera, Matsaganis & Sacchi, 2002):

- To promote social inclusion;
- To make pension system sustainable;
- To provide secure income;
- To ensure high quality of health care.

In 2013 the European Commission developed a "social investment package for growth and cohesion" to determine inclusion favorable growth in 2020. The package proposes several challenges such as active inclusion of people excluded from the labor market, aging demographic, social services of general interest, homelessness. In addition, the European Platform against Poverty and Social Exclusion was created to establish a structured dialogue between the EU and European stakeholders (NGOs, unions, business organizations, academic structures, national and regional authorities, international organizations and European foundations).

The main purpose of the platform is to implement 64 measures from poverty and social exclusion field at European level. These refer to:

- Reducing early school leaving;
- Fighting child poverty;
- Promoting social entrepreneurship.

The Commission organizes an annual convention in conjunction with the EU Council Presidency that examines the actions at European and national level. The platform and annual convention represent the basic tool for social investments since they force to mobilize key actors at local, regional, national and European level.

There is a connection between global production systems and social exclusion that varies according to international policies on trade and investment. The changes that take place in global production systems are reflected on social exclusion when referring to (Carr & Chen, 2004):

- The situation in which export-led growth has as result the inclusion of workers in the global market in unsafe conditions;
- The situation in which there are barriers that prevent self-employed workers to take advantage from the economic benefits of trade and investment liberalization;
- The situation in which trade liberalization lead to the disappearance of the existing domestic companies by cheap imports and changing technology.

The hierarchy of social exclusion is structured by institutions and key actors that regulate different economic and political environment in which operate social structures. This influences the labor sector by determining each individual's role and place in this structure (see Table 1).

Source: Based on data from Carr, M., Chen, M. (2004), *Globalization, social exclusion and work: with special reference to informal employment and gender*, Working Paper No. 20, Policy Integration Department, World Commission on the Social Dimension of Globalization, International Labour Office, Geneva

DIMENSION OF SOCIAL EXCLUSION

Due to the lack of a precise definition of social exclusion is difficult to measure this phenomenon. Therefore, the literature is using two models that identify several key dimensions of social exclusion.

The first model is given by Burchard et al. (2002) which have identified four dimensions of social exclusion:

- Consumption;
- Production;
- Political engagement;
- Social interaction.

The second model was developed by Millennium Poverty and Social Exclusion Survey of Britain that has identified the follow dimensions (Saunders, Naidoo & Griffiths, 2007):

- Exclusion from adequate resources;
- Service exclusion;
- Labour market exclusion;
- Exclusion from social relations.

In December 2001, the European Council from Laeken (Belgium) has adopted a set of indicators that are designed to monitor the performance of Member States in promoting social inclusion, support the exchange of best practices and to observe the progress at national and European level relative to the key objectives of the European Union. These indicators combine data from national level with transnational objectives agreed by the Member States.

Member States have adopted the "open method of coordination" to fight against poverty and social exclusion addressing the following elements:

- Mutual agreement regarding the objectives on poverty and social exclusion;
- Exchange best practices;

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The development of national action plans;
- The adoption of common indicators.

Given the multi-dimensional aspect of social exclusion, European Union member states have recommended to split these indicators into primary and secondary indicators (see Table 2).

The economic crisis has affected EU countries at both economic and social level and its effects are visible in falling living standards of citizens. In the short term, there was a deterioration in the "risk of poverty or social exclusion" indicator that has manifested in various forms: monetary poverty, severe material deprivation or low work intensity. In contrast, there were positive trends in terms of education indicators, especially for the young population (Atkinson, 2009).

Concerns for the eradication of poverty have been expanded worldwide and were linked with sustainable development. In this regard, there is the decision of the General Assembly adopted in 1997 and the Agenda 21 - Action Plan adopted for more than 178 countries at the Rio de Janeiro conference in June 1992 and reaffirmed at the World Summit on Sustainable Development in Johannesburg September 2002 (Atkinson & Hills, 1998).

Around 17% of the total population in the EU lives below the poverty line. European citizens have different ways of understanding poverty. They believe that people are poor when they (European Commission, 2010):

- Depend on charity or public subsidies (24%);
- Cannot participate to their community because they don't have enough resources (26%);
- Have less than the poverty threshold per month to live on (18%);
- Are not able to afford the basic goods (17%).

These perceptions are different from country to country (see Table 3).

Over 76% of European citizens believe that poverty is widespread in their country. Again, the perceptions are different in each country (see Table 4).

In Table 5 is shown the indicator of *people at risk of poverty or social exclusion* for the more affected countries and less affected countries from European Union (Eurostat, 2014).

Table 2. The main indicators of social exclusion

Primary Indicators	Secondary Indicators
At-risk-of-poverty rate after social transfers	At-risk-of-poverty rate before social transfer
Persistent risk-of-poverty rate	Gini coefficient
Inequality of income distribution	Dispersion around the risk of poverty threshold
Regional cohesion	Very long term unemployment rate
Life expectancy at birth	Persons with low educational attainment
Relative median at-risk-of-poverty gap	
Long term unemployment rate	
Persons living in jobless households

The risk of poverty is linked to a higher risk of social exclusion and the persistent at-risk-of-poverty rate is more relevant for people who live in single-parent households because this group is vulnerable.

People who are more affected by the risk of poverty are young adults, women, low educated people or unemployed people. Table 7 shows that people at risk of poverty or social exclusion indicator was high for young adults (31.6%) and for people between 50 and 64 age (25.6%). For those with low educational level the high percent was again for young adults (35%).

Poverty has several consequences, among them being financial and social exclusion. The poor Europeans have difficulties in accessing the financial services (see Table 8).

Again, because of the high poverty level, European citizens have several difficulties in accessing different services like: decent housing, finding a job, higher education, or maintaining a friends network (Sima and Gheorghe, 2011) (see Figure 1).

These effects have a great impact from psychological point of view and lead to a harder adaptation to labor market demands. The long-term unemployment, the low quality of life and a persistent poverty rate affects the social cohesion (Aceleanu, Serban & Burghelea, 2015).

In order to reduce poverty and social exclusion is necessary to establish several objectives similar to those in the workforce and in the macro-economy. The adoption of a set of indicators was an important step in tackling social exclusion at national and European level. Member States should establish a set of common objectives on common indicators of social exclusion. It is interesting to see what kind of relationship exists between national and EU indicators and different targets set by national economies (Atkinson, Marlier & Nolan, 2003) (see Figure 2).

There is a strong relationship between unemployment, poverty and social exclusion. Some specialists have suggested that poverty and social exclusion are interchangeably, but they are not the same. People may be poor but not socially excluded and vice versa. That's why there are many differences in viewing the role of social security benefits (see Figure 3).

The analysis of social exclusion process complements the literature on poverty. These two processes are different but they interact on dynamically level and they are mutually reinforcing (Devicienti & Poggi, 2011).

CONCLUSION

The concept of social inclusion/exclusion emerged in response to the crisis of the welfare state in Europe, which had an increasing impact on the analysis of social disadvantages in Europe over the last couple of decades.

Lately, EU citizens have become aware of the extent of poverty and social exclusion and they believe that urgent action is needed. Poverty is perceived as a process where resources are so limited that people cannot participate fully in society. Thus, most people depend on public subsidies or charitable activities. Significant increases were observed in this process: thus, over three in four EU citizens believe that poverty is widespread in their country, while over four in five European citizens consider that this phenomenon started in the European Union in recent years. These results must be understood against the background of financial and economic crisis which greatly influenced public opinion.

All over analysis suggest the following:

- Social exclusion is caused by both the way in which institutions and state work and the way of other institutions work as well as civil society, private sector, community or family;
- Social exclusion occurs not only on the labor market or in conjunction with social security; it is also linked with the legal and economic and social policies;
- Social exclusion is affected by the way in which institutions or civil society works at local, national and international level.

Chapter 33
Mobile Learning for Social Change:
Democratizing Education and Civic Engagement

Tseday Alehegn
Columbia University, USA

Dominic Mentor
Columbia University, USA

ABSTRACT

This chapter focuses on how mobile apps and smartphones can be used to enhance democratic education in schools and society at large, why such opportunities need to be more seriously considered as integral to the school learning environment, and how it can empower citizens for civic engagement. Using Dewey's philosophy of democratic education this chapter provides examples of mobile apps designed through classroom, community-based or after school programs that provide youth with coding training opportunities as well as macro-level highlights of civic engagement for social change. Reviewing theories of technology – from determinism to social embeddedness – this chapter reflects on the inherent "democratic" design of mobile technologies, as well as the challenge to embrace the interest that youth and society in general have for mobile app use. It is a call to promote mobile-driven democratic education in an environment encouraging continuous learning as well as cultivating and leveraging mobile technologies to develop an informed public voice and participatory agency.

INTRODUCTION

For the majority of the world's population today the widespread use of mobile phones has become an accepted part of everyday life. In 2014 Quartz publication asserted that globally there were almost as many cell phone subscriptions as there were human beings on the planet, which was more than the total population that ever had access to telephone land-lines (Fernholz, 2014). The advent of smartphones has

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

subsequently launched the mobile app age, which has created more opportunities for connectedness and a globalized social network that can likewise be harnessed for democratic education and social change. This chapter provides an overview of theories of technology and democratic education and highlights both micro and macro-level examples of mobile applications that were designed, developed and used for civic engagement and social change, some of which connected classroom education with real-life experiences.

Currently, the use of new media technologies such as mobile apps in schools has provided the opportunity to not only learn about democratic education, but to also actively participate as citizens in addressing and improving social outcomes. Mobile technologies have in a sense democratized the classroom space by enhancing students' social networks. At the same time, the presence and use of mobile technologies have allowed youth to become civically engaged as they design and develop mobile applications that are – in the spirit of democratic education – relevant to their personal life experiences and pertinent in addressing larger social issues of inequality and access.

BACKGROUND: THEORIES OF TECHNOLOGY AND DEMOCRATIC EDUCATION

What is meant by democratic education? For philosopher and activist John Dewey the concept of democratic education centered on nurturing students' abilities to observe their environment as well as to encourage their development of creativity. Dewey staunchly supported the designing of educational spaces that linked the students' life experiences with the classroom curriculum. School for Dewey was not a place for rote memorization and lecture-based instruction, but rather a place where what is taught is directly relevant to the current social circumstance and experience of the student. Dewey sought to connect the social life of the school with that outside of school walls with the intention that students learn to become aware of how their actions affect their peers and others in the larger society (Dewey, 1916). In his seminal work *Democracy and Education*, Dewey noted that "in the final account, then not only does social life demand teaching and learning for its own permanence, but the very process of living together educates" (Dewey, 1916, p6). In essence one critical purpose of formal schooling is to develop informed citizens who can thrive and contribute to a democratic society.

Building on Dewey's vision of developing informed and active citizens in a democratic society Westheimer & Kahne (2004) describe three ways that individuals can become civically involved. First, there is the personally responsible citizen who volunteers, and takes seriously his/her role as a law-abiding individual. Secondly, the participatory citizen is active at the local, state or national levels. In schools, for example, students are taught how government works and are provided with opportunities to train and take part in community-based initiatives. Finally, the justice-oriented citizen practices democracy by studying the socio-economic and political structure of society and mobilizing solutions to effect systemic change. The justice-oriented citizen inquires about the root causes of social problems and creates opportunities in community to address challenges and find long-term solutions. Both the participatory and the justice-oriented citizen move beyond the responsibilities of the individual to engage with their communities, and both encourage a certain level of discussion and deliberation to solve problems.

Keeping Dewey's democratic education aims in mind, one may reflect on the nature and purpose of mobile technologies currently in popular use. Technology, and in particular communication technologies, have been studied from various viewpoints including determinism, neutralism and social embeddedness. According to Warschauer (2004) the belief that technologies can fix issues or improve conditions

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

irrespective of the social context and thereby create an independent impact on society is a deterministic viewpoint. A neutralist argument, on the other hand, posits that technology is neither bad nor good in and of itself (Warschauer, 2004). Communication theories and media scholar Marshall McLuhan embraced these technological deterministic and neutralist positions while academic and novelist Raymond Williams opted to view technology as inextricably tied to the social fabric of society.

McLuhan's Theory of Technological Determinism: The Medium Is the Message

McLuhan is well known for the notion that technology isn't just man-made material, but rather that it serves as an extension of the human being. Having founded the Centre for Culture &Technology in Toronto McLuhan's work in media studies sought to connect academia and everyday popular culture by studying communication technology as a medium (Witzel, 2003). Through a historical lens McLuhan expounded on how modern societies shifted from a predominantly oral to a written-based system of information with the invention of the printing press and the subsequent mass printing of books. With the advent of the radio everyday culture shifted once again to a new form of oral transmission (Witzel, 2003). Our current utilization of the Internet as well as social media involves a mix of written, visual, and oral records.

McLuhan notes the presence of four principles that apply to the field of communications as follows:

1. A technology functions as an addendum that may extend human faculties;
2. As one kind of experience is increased by technology another is likewise decreased;
3. When moved to its limit the characteristics of the technology itself is altered; and
4. The content of any new technology is derived from a prior type of technology (Witzel, 2003).

In the 1960s McLuhan used the phrase "the global village" to describe how networking through communication technologies was expanding mass media and creating a global culture that made the transmission of messages worldwide faster and easier (Witzel, 2003). Highlighting this influence of communication technologies on society McLuhan coined the phrase 'the medium is the message,' which focuses attention not on the type of information passed on through the use of these technologies, but instead on the medium itself as being inextricably connected to our everyday lives (Witzel, 2003). When technology is perceived, as is the case with McLuhan, to serve as an extension of ourselves it points to our formal embrace of the medium (McLuhan, 1994), and with this embeddedness McLuhan notes that the medium becomes the message itself as it ultimately causes a shift in society as a whole (McLuhan, 1994). As a scholar McLuhan (1992) proposes that technology should be viewed through the context of what produces it as well as what technology itself brings to society. This essence of technology influencing society is the basis of the theory of technological determinism. According to Warschauer (2004) hard technological determinism causes social transformation while soft determinism enables societal shifts but does not cause social change.

Raymond Williams' Critique of Technological Determinism

Raymond Williams' critique of technological determinism is that the theory perceives technology as being independent from society's influence. While technology is considered to cause transformation, it remains untouched by its environment; the impact is unidirectional as the atmosphere in which it operates

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is not included in the equation (Williams, 2003). In contrast, Williams encourages viewing the intention of technology as something central to its nature, as a medium that is developed for a particular purpose and hence is influenced by members of the society who create the tool (Williams, 2003). Furthermore, Williams cites that a technology's development is driven by human values and goals, which becomes an essential characteristic of the technology. Williams contends that human intention drives the nature of technology as much as technology itself transforms society.

The Social Embeddedness of Technology and Durkheim's Social Networks

Warschauer (2004) notes that technology is not positive, negative or neutral. It is also not independent of human and societal influences. Instead, he offers an alternative to determinism and neutralism, which is that technology and society are inextricably linked; they influence one another and therefore bi-directional. Focusing on the mutual impact Warschauer (2004) studies how individuals use technology in addition to assessing what kinds of technology are being used. Recognizing that the function of communication technologies is to reshape how individuals network and communicate with one another Warschauer (2004) looks at how systems encourage individual and societal transformation while developing and re-shaping technological tools.

In a similar vein, Schroeder and Ling (2014) highlight Durkheim's theory of social networks and echo Warschauer's perspective of the social embeddedness of technology by emphasizing the study of tools from a broader perspective; they acknowledge it as an integral part of the environment rather than as an outside, independent force. Schroeder and Ling (2014) also note the macro and micro-level perspective that Durkheim & Weber emphasize when studying the social impact of technology. Durkheim and Weber point to the structural influence of communication technologies on social transformation (Schroeder & Ling, 2014). According to Schroeder and Ling (2014) Durkheim proposes the concept of mechanical solidarity, which describes an atmosphere where individuals who find themselves in the same particular situation come together to form a social network. As society is transformed from a pre-industrial into an industrial society Durkheim expects a shift from mechanical solidarity to one that he coins as organic in which individuals interact in an increasingly interdependent system with more defined roles (Schroeder & Ling, 2014). In an organic society it is no longer the homogenous makeup of the community that helps develop social cohesion, but rather that individuals rely more and more on each other. What Schroeder and Ling (2014) further suggest is that modern-day information and communications technologies (ICTs) lead us to what they call a neo-mechanical solidarity, where social networks are formed within individual environments and that is developed by the use of mediums that encourage digital sharing. In other words, in a society that functions on neo-mechanical solidarity, the social networks are focused around the practice of sharing, as is evident both in the online and social media contexts today. Given that studies of technology and social change in the current mobile app environment focus on communication technologies that encourage a culture of sharing and social networking the critical question for today's educators therefore is: "how can we better harness mobile technologies that are used extensively by youth and educators, to promote democratic education?"

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

YOUTH, MOBILE PHONES AND CIVIC ENGAGEMENT: APPS FOR SOCIAL CHANGE

According to a 2013 report on teens and technology, published by Pew Internet and the Berkman Center for Internet & Society at Harvard University, approximately 95% of youth communicate online with 25% of them accessing the Internet via mobile phone (Madden et al., 2013). Although the digital divide continues to exist between white and minority teens as well as those residing in low-income neighborhoods, the Pew Internet reports, however, that teens from lower socioeconomic backgrounds were just as likely as their peers in high-income communities to utilize mobile phone as their primary communication tool (Madden et al., 2013). Students in the United States and abroad have already taken the personal initiative to develop and use mobile app technologies to solve social problems at the local, state and national levels. In 2012, a sixth grade student, Victoria Walker, submitted her mobile app design that discouraged teenagers from texting while driving and won $20,000 as part of AT&T's 'It Can Wait' campaign. To prevent car accidents Walker's app includes a feature that taps into an individual's social network to send out an alert anytime a group member uses their phone while driving (Almendraia, 2012) -- the idea being that your social network can virtually connect with you, and remind you to avoid life-threatening behaviors. The app, named Rode Dog, will also bark at the driver till the phone is shut off. Walker's efforts to develop an app to prevent motor accidents in her community can be seen as an example of the personally-responsible and participatory citizen using mobile technology to promote both law-abiding citizenship and safer communities.

What about mobile app projects by justice-oriented teen citizens? 13-year old Illinois native Trisha Prabhu submitted her Rethink Cyberbullying Prevention app to the 2014 Google Science Fair and was announced as a finalist (Klein, 2014). According to the National Crime Prevention Council (NCPC), as use of digital technologies increase among teens so does the problem of cyberbullying. NCPC's survey of 824 teens aged 13-17 reveals that over 43% of teens have been victims of cyberbullying (NCPC.org). Prabhu aims to get to the root of this social problem by providing adolescents with an opportunity to rethink and deliberate on their intentions in order to prevent the online posting or publishing of hateful comments. The mobile app encourages a participant to care about the societal consequences of his/her actions, and in the study that Prabhu conducted to test her app she found that a dramatic 93% reduction in the number of youth who intended to post messages considered to be akin to cyberbullying (Klein, 2014). Issues such as cyberbullying can be remedied in many ways, including increasing awareness and providing resources to assist individuals who are victims, but perhaps the best way is preventive -- stopping people from being cyberbullies in the first place. Prabhu's project and mobile app hopes to promote such a systemic change.

After-School and Community-Based Mobile App Development Programs

Most of the examples found within the school environment are relegated to after-school activities teaching students how to code, or curriculums run by non-profits who are developing tech-based training programs for schools. The Flatiron after-school coding conservatory, for example, showcases a curriculum of various programming languages including Javascript, HTML, and Ruby on Rails, with the goal of having students perceive technology as a creative tool allowing them to become producers rather than simply passive consumers. Under the section of the school's web site entitled 'How We Teach' the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

coding curriculum is described as collaborative learning with a core featuring human-centered design (Flatironschool.com, 2014). Here, students are trained to be creative makers, not only of technology but also of applications that can be used for democratic education and social change. Students participating in the Flatiron after school coding academy are not passive learners; they are being empowered to design or re-conceptualize mobile apps in a manner that is more relevant to their own everyday experiences, and they are learning to do so in the peripheries of a school system. Such lessons are by default imbued with elements of democratic education.

Launched in Berkeley, California in 1992 Youth Radio is another example of an organization that trains youths – approximately 420 each year. In 2014 Youth Radio launched its Innovation Lab and became one of the world's first programs to train youth in mobile app-making skills (Youthradio.org). The innovation lab has partnered with MIT Media Lab Center for Mobile Learning to teach teens how to connect journalism and media studies with coding and programming skills with the aim of designing innovative storytelling platforms. Like the Flatiron school training program, the Innovation Lab supports the notion that youth can be mobile app developers who themselves create the tools to tell their stories as drivers of change. As Youth Radio's website aptly puts it teens can take the lead to research and disseminate news (Youthradio.org). The Youth Radio Innovation Lab defines its vision as providing data-driven journalism created by youth through the use of various communication technologies including mobiles (Youthradio.org). This aim seems quintessentially Dewey-esque in that the Innovation Lab breaks down the barrier between teacher and student – those roles become interchangeable in this type of environment. While the educational experience is certainly directed growth, it also provides a space for exploration, creativity, and a strong pursuit to connect the learning of skills with its application in society in a meaningful and relevant manner. Dewey (1934) emphasizes a human-centered classroom environment that incorporates social values into the learning environment, and the journalistic and mobile development training that teens receive via Youth Radio's Innovation Lab echoes this philosophy of education as they use their knowledge and skills to go out into the world and practice journalism, highlighting the social justice concerns of fellow citizens in their communities. The opportunity to dialogue with their peers as well as community members, to research stories and gather data while preparing journalistic reports allows these youth to become informed citizens at an early age.

MACRO-LEVEL CIVIC ENGAGEMENT AND MOBILE ACTIVISM

In 2005 one of the first conferences on mobile activism was held in Toronto. Following the three-day conference that brought together individuals interested in using mobiles for social change, Katrin Verclas, an IT professional, founded an organization called MobileActive to continue the dialogues and collaborations (Boyle, 2010). Currently, the MobileActive site includes guides for various types of activism including environmental and human rights, as well as case studies of how mobiles have been used to empower citizens in transforming various sectors including education, healthcare, and political elections (MobileActive, 2015). Three years after the MobileActive conference the United Nations Foundation and the Vodaphone Group Foundation commissioned a report entitled *Wireless Technology for Social Change: Trends in Mobile Use by NGOs* and examined emerging trends in mobile activism through 11 case studies focusing on mobile use for global health, humanitarian assistance, and environmental conservation across five continents (Kinkade & Verclas, 2008). The case studies were based on a survey conducted between December 2007 and January 2008, which gathered the responses of over 500 NGO

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

employees about mobile phone use (Kinkade & Verclas, 2008). Survey results showed that 86% of the participants were using mobiles in their jobs -- particularly in African or Asian countries -- and that 99% of the participants felt mobiles made a largely positive social impact within their communities. The survey also showed a wide range of mobile use that included text messaging, camera and video use, data collection or transmission, data analysis, mapping, logistics management (Kinkade & Verclas, 2008). Moreover, 91% of participants noted that mobiles assisted them for more faster and efficient organizing as well as networking with individuals, especially in connecting with those who resided in hard-to-reach areas. The survey also showed that a vast majority, 76% of participants, wanted to continue to increase use of mobiles for work (Kinkade & Verclas, 2008). The use of mobiles for civic engagement and social change has continued to grow since this early mobile era.

The United Nations Educational, Scientific, and Cultural Organization has also reviewed trends in mobile activism and in 2015 published a report entitled *Mobile Phones & Literacy: Empowerment in Women's Hands*, which featured nine case studies of mobile phone use for literacy projects in Niger, Senegal, Somalia, Afghanistan, Cambodia, Pakistan, India and Morocco (UNESCO, 2015). The publication studied how mobiles were used to engage and empower women in underserved, rural communities to build their literacy skills by primarily utilizing SMS texting features. UNESCO's recommendations included improving access to communication technologies and necessary infrastructure in rural areas; engaging both women and men in the communities as stakeholders in both the design and implementation of mobile-based literacy projects; connecting mobile-based literacy projects to additional areas of empowerment such as increasing job opportunities and community participation for women; and encouraging teachers to promote digital skills in literacy programs along with inquiry-based learning components (UNESCO, 2015).

Crowdmapping for Disaster Preparedness and Participatory Citizenship

Mobile phone use at the macro-level is evident in the disaster response and preparedness sector. Activists around the world have harnessed the power of mobiles to collect and report information in order to assist individuals in crises or to reach those affected by natural disasters. In such a case using geo-location tools with mobiles has launched the era of crowdmapping. One of the earliest examples of mobile activism for crowdmapping was spearheaded by the Kenya-based organization Ushahidi. Initially developed to track and report incidences of violence during a turbulent election season in 2008 in Kenya, Ushahidi – which means testimony in the Swahili language – rapidly morphed into a global crowdsourcing platform utilized in various situation including: tracking anti-immigrant violence in South Africa as well as monitoring election activity in Mexico and India. The Ushahidi platform primarily allows the collection, management and analysis of data as well as data visualization and status updates via an automatic alert system. Data is collected from several sources including mobile apps, SMS, email and Twitter using customized forms submitted by volunteers worldwide, and the information is stored in a format that is searchable (Ushahidi, 2015). Data collection and analysis also takes place virtually across multiple users of the platform in an open-source team environment. Ushahidi's data visualization features include street-level data developed to work with Open Street Maps and MapQuest and can provide specific location-based information that is essential to disaster response work on the ground.

Ushahidi's crowdsourcing features were successfully used to provide emergency location-based data during the devastating 2010 earthquake in Haiti in collaboration with the International Network of Crisis Mappers. The Haiti Crisis mapping project included approximately 2000 reports with hundreds of vol-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

unteers networking globally and working around the clock to monitor the crisis (Meier, 2012). Shortly after launching of the Ushahidi-based crowdsourcing effort for disaster relief, a global SMS number was set up so that anyone in Haiti needing urgent assistance could send a message regarding their physical location (Meier, 2012). The setup of a SMS number and the subsequent responses received greatly assisted humanitarian organizations on the ground and their workers to reach individuals requiring dire assistance by accurately identifying their location and estimating the logistics needed to provide relief.

In another utilization of Ushahidi's crowdmapping capabilities The Louisiana Bucket Brigade (LABB), in collaboration with the Gulf Monitoring Consortium, launched the iWitness Pollution Map in May 2010 to gather eyewitness reports of one of the largest oil spill in American history that occurred at the Deepwater Horizon rig in the Gulf of Mexico. The iWitness Pollution Map was one of the first instances of Ushahidi use for disaster relief in the United States (LABB, n.d) where the large-scale pollution included over 205 million gallons of crude oil spilling over the course of 87 days damaging the Gulf coastline from Texas to Alabama (Hoch, 2010). To date the Ushahidi-driven iWitness Pollution Map has gathered more than 19,000 reports regarding the spill and its effects on the Gulf coastline, which was submitted via the Internet, mobile texts, phone messages and emails. The data received was later visualized and analyzed on the iWitness Pollution Map platform. The tracking of the oil spill through crowdmapping not only helped collect data from citizens, witnesses and volunteers, but also helped record public efforts to document the impact as well as government and business responses to the environmental disaster (Leson, H., 2013). The reports remain archived on the iWitness Pollution site so both scholars and citizens continue to have access to the information.

Crowdmapping has also assisted the country of Philippines to monitor flooding issues nationwide via a mobile app called Flood Patrol. In 2012 the Philstar Global Business News section featured the Android app developed by the Ateneo Java Wireless Competency Center, which allows citizens in the Philippines to report flooding information that is shared via the Internet, as well as to receive alerts via the mobile app of areas affected by flooding in real time. The app works in conjunction with a project aptly named NOAH (Nationwide Operational Assessment of Hazards), which provides rainfall statistics across the country (Evangelista, 2012). Mobile-based civic engagement for flood monitoring in the Philippines not only shows the power of developing digital tools for civic engagement but also strengthens national data collection and reporting efforts that are more often than not left up to governmental institutions. Through crowdsourcing mobile apps the human toll from natural disasters may be reduced, and those needing emergency assistance are better able to be reached through geo-location powered tools such as the features available on open-source Ushahidi-based platforms.

Crowdmapping using Ushahidi is not only for disaster preparedness and relief; it can also be used to collect information on structural violence and shed light on chronic inequalities faced by marginalized groups. In February 2016 the digital journalism site, The Quint, reported the launch of an Ushahidi powered project to gather data on discrimination faced by individuals belonging to the Dalit caste in India, particularly in institutions of higher learning. The crowdmapping effort to track caste discrimination in higher education aimed to collect information directly from Dalits who face various barriers including delays in receiving fellowships as well as becoming victims of sexual violence due to their lower caste status. Marginalized individuals facing the repercussions of caste discrimination were able to send data to the crowdmapping platform via the Ushahidi Android and iPhone apps, tweets, and via an email address set up for data gathering (Rattanpal, 2016). The information collected was then visualized on Ushahidi maps and a real time database was available for activists as well as governmental agencies to utilize while implementing informed long-term solutions.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moreover, youth are also developing mobile apps to crowdsource information for disaster preparedness and relief. In the Summer of 2015, three teenagers from North Texas made it as one of the finalist teams to present at the U.S. Army's annual eCybermission STEM competition (Eliseev, 2015). Their app named CERTPRO – an acronym for Commuity Emergency Response Team – was developed after disaster-hit areas during the 2013 tornado in Moore, Oklahoma saw lags in federal emergency response. CERTPRO is designed to track volunteers who can assist in a disaster relief effort, the number of which can determine how much aid is disbursed by the Federal Emergency Management Agency (FEMA) (Eliseev, 2015). What is striking about this youth-led civic effort is that the three teens had no prior experience developing mobile apps and had spent time outside of the classroom to work on their project using the MIT App Inventor (Eliseev, 2015). The team working on the CERTPRO prototype later received a $17,000 award which includes the eCybermission's Stem-in-Action grant reserved for projects that may show significant real-world impact (Eliseev, 2015).

What Ushahidi has revealed is how flexibile open-source crowdmapping tools are in engaging ordinary citizens as volunteers in times of emergency as well as to gather the statistics needed to act upon chronic social problems from a more informed platform. Crowdmapping and crowdsourcing using mobile applications has also allowed citizens around the globe to create a vibrant social network for humanitarian assistance. Volunteers on the ground are able to work alongside virtual volunteers and experts for better tracking, reporting, and management of disaster relief. In the mobile era, every witness also has the power to act for social change. Mobile crowdmapping and crowdsourcing is opening a new era of participatory citizenship.

Civic Crowdfunding Initiatives and Entrepreneurship in the Mobile Age

Mobile activism and civic engagement has also permeated into the growing world of social entrepreneurship. Democratizing spaces through economic empowerment can help citizens to actively address socioeconomic inequalities in their communities and around the world. Take for instance the mobile app Babajob developed by social entrepreneur Sean Blagsvedt with the mission to provide workforce information to employers in Bangalore, India. With many citizens still without access to computers and the Internet, Blagsvedt is using cellphones, mobile apps, and cellular data to connect those in the informal work sector with potential jobs (PBS, 2014). While Babajob's initial advertising of its services was conducted via radio and offline methods including print ads and billboards their ultimate success occurred when they launched an Interactive Voice Response (IVR) application via mobile phone that jobseekers can use to access their services (Chang, 2016). According to Babajob's web site the organization has harnessed the power of mobile technologies to register more than 5 million individuals and raise $12 million in funding including from the United States Agency for International Development (USAID) and venture capital firm Gray Ghost Ventures (Babajob, 2015).

Likewise, social entrepreneurship efforts in Malawi have focused on improving access to healthcare and health-related information at the national level. One prominent pilot launched in 2011 was the health center by phone (chipatala cha pa foni) project, which was created to increase access to prenatal health services for mothers and their newborn children. The health center by phone service allowed mothers to connect with healthcare providers to get health information as well as receive appointment alerts via mobile phone (Innovations for MNCH, n.d.). The two-pronged approach to prenatal care -- that includes a toll-free information and referral phone number for mothers as well as a mobile-based appointment reminder alert system – is increasing the landscape of health services in Malawi, which currently has

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

one of the highest global maternal and newborn mortality rates (Villagereach.com, 2016). The health center by phone pilot has had significant impact on maternal and newborn health in Malawi with more than 300,000 women and children benefiting from the service to date (Villagereach.com, 2016). The pilot affirms the growing field of mobile health as social entrepreneurs continue to harness the power of mobile networking and mobile apps to address issues of equity and access to life-saving healthcare services in places that once seemed underfunded and overburdened by lack of adequate resources.

Youth are also engaged in mobile activism as social entrepreneurs by acquiring coding skills, blending it with lessons in economics; a new generation of content creators and entrepreneurs for social change is on the rise. Wisenberg Brin (2013) note a feature in Entrepreneur magazine highlighting seventeen-year-old developer Nick D'Aloisio who released the mobile app, Summly, which provided news content in summarized format for more efficient browsing. Summly was subsequently bought by Yahoo for approximately $30 million. Four weeks after its initial release for iPhone it attracted over half a million users and published a prolific 30 million summaries (Wisenberg Brin, 2013). Successful teen mobile app makers like D'Aloisio not only inspire youth to start coding and developing apps at an early stage, but also pave the way for how individuals could create digital platforms that address real-life issues while at the same time generating income and developing a sustainable business.

Another example of a mobile app for social change is Recyclebank, where individuals are encouraged to recycle possessions that they don't need while earning points, getting discounts, or donating to a Green Schools program and funding environmentally-friendly student-led programs (Recyclebank.com, 2016). Launched as a pilot in 2004 by two Philadelphia based friends Recyclebank has increased recycling efforts in over 300 communities with 4 million participants using the app (Recyclebank.com, 2016). Recyclebank has also provided approximately half a million dollars to more than 150 schools under their Green School program in addition to donating 5% of the organization's profits towards school proposals that promote their vision of eco-friendly entrepreneurship (Recyclebank.com, 2016). By working with government run municipalities and encouraging citizens to participate in recycling programs with economic and savings-related benefits – or encouraging donations for social good – Recyclebank is promoting both justice-oriented and participatory citizenship in communities across the country.

Similarly, the Social Impact app developed by Rolfe Larson Associates identifies and lists local social enterprises and green businesses in the United States, Canada, United Kingdom, and Australia that citizens can support as conscious consumers. By geo-mapping business listings and allowing individuals to browse a range of local enterprises the Social Impact app is a civic crowdsourcing initiative that encourages citizens to financially support businesses that are aligned with their social justice passions (iTunes, 2016). The range of mobile crowdfunding initiatives launched by governments, organizations and youth is diverse and features efforts ranging from economic empowerment to green consumerism as well as activism to reduce socioeconomic inequities. The crowdfunding movement has only just begun and time will tell how vast the networks and platforms become and how wide-reaching their civic and social impact will be.

MOBILES AND DEMOCRATIC EDUCATION: FUTURE RESEARCH DIRECTIONS

While this analysis of using mobile technologies for democratic education focuses on the benefits of mobile apps, it is also critical to look at the nature of the technology itself and how the artifact's inherent design shapes our activities as human beings. The design of mobile technologies, from their portabil-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ity to the social networking that can take place through apps, can be viewed as promoting democratic values of independence and self-expression. Winner (1986) asks us to consider evaluating the political nature of technologies. One may further describe smartphones and other similar mobile technologies as providing a more decentralized and egalitarian system, much like the Internet. When students use apps to collect viewpoints on a social issue, or design apps to promote citizen-based mobile journalism it can be argued that the accessibility of mobile technologies allows for a continuous form of democratic education in the sense that students remain engaged with the local environment in their dual role as trained experts and knowledge seekers. The learning is continuous and socially oriented, both within and outside of the school environment. In describing democratic education and self-publishing on the web, for example, Budin (2005) argues that while providing access to the Internet blogging tools may be an inevitable tools for democratic education, emphasizing that what is most relevant is what we do with the tools and how we use them. And as teens who have built apps for social change have shown to the world, mobile technologies can be compatible with democratic education and can empower individuals to become personally-responsible, participatory and justice-oriented citizens.

Rheingold (2008) would describe the work of the organizations highlighted in this chapter as using participatory media to engage individuals in a democratic society, and it is in line with the proposition of utilizing digital tools to help youth develop their own public voice. Similarly, Jenkins (2009) calls for the integration of these new participatory cultures into classrooms not only through team collaborations, but likewise through networks beyond school walls and across diverse communities. This chapter and case study of designing mobile technologies for social change is a call for schools and educators to embrace the power of mobiles and to integrate it with core curriculums across the humanities and science fields so that students can be active *producers* of both knowledge and democratic technologies.

CONCLUSION

While youth have demonstrated their personal interests by unleashing their own apps for good, and non-profits have partnered with schools to provide the resources and the curriculum for mobile app design in schools, educators in the digital age should hear this clarion call for blending mobile technologies with democratic education in the quest to provide a strong foundation for civic-minded citizens of the future.

As Warschauer (2004, p215) notes regarding the digital age that preceded the mobile era, the Internet is not simply a technology but also a platform and space that transforms social networks. This notion is equally relevant in the mobile age where cell phones have become not only the preferred tools of communication, but likewise tools of civic empowerment and engagement. Utilizing mobiles for social change need not only be defined at the micro and individual levels but also at the global, macro-level. Democratic education and the principles of participatory citizenship can be taught in schools and communities as well as through mobile applications that help individuals extend their virtual and physical networks to address social justice issues in various fields including media, healthcare, social entrepreneurship, humanitarian assistance and political governance. The use of mobile technologies comes with both challenges and opportunities. Allowing students to share their interest in these tools in the classroom also allows them to have the opportunity to address the challenges while experiencing a continuous learning environment that is not isolated from the greater democratic society -- this can encourage youth to aspire to contribute to society in their own way, their own voice, and with their own personally designed mobile tools.

KEY TERMS AND DEFINITIONS

Civic Education: Education about how government and how self-governance works.

Civic Engagement: Active engagement as a citizen in local, state, or national issues and concerns for social change.

Democratic Education: A method of education where democratic values are taught as well as experienced within the instructional environment.

Justice-Oriented Citizen: A citizen that inquires about social justice issues by reflecting and acting upon structural issues to promote systemic change.

Mobile Activism: Addressing social justice issues through the utilization of mobile technologies through various means including dissemination of information, gathering of data, and promoting social networks to bring about social change.

Mobile Application: An application developed to typically run on smartphones and tablets.

Participatory Citizen: A citizen that is active at local, state, or national levels in addressing social issues relevant to the community by learning how government systems work and taking part in community-based initiatives.

Chapter 34
Deploying ICT to Enhance Small Businesses and Achieving Sustainable Development:
A Paradigm to Reducing Poverty and Unemployment and Enhancing a Sustainable National Development in Nigeria

Ojinga Gideon Omiunu
University of Ibadan, Nigeria

ABSTRACT

Beside the SMEs, families operate small and fragmented businesses due to poverty and unemployment to help cater for their needs and family needs. These small and fragmented businesses are common among the poor due to lack of credit to expand such businesses. In addition, with the mandate from the federal government of Nigeria, every business must be registered with the Corporate Affairs Commission of the federal republic of Nigeria and pay a certain amount of money every year depending on level of business growth and development. Suffice to note that despite the payment of these charges by businesses, nothing is done by the federal government to assist them.

INTRODUCTION

In the past, less attention was given to SMEs development as the major contribution to GDP and sustenance of the economy was oil. Nevertheless, in recent years, due to high level of poverty, unemployment and the inability of the oil sector to meet the economic demand for national development, attention has been drawn towards SMEs development. It is very obvious that, in Nigeria, individuals and families, in trying to break out of the yoke of poverty and unemployment bewildering individuals and the nation indulge in one or more businesses or the other so as to meet individuals and family needs. These busi-

ness are so fragmented and so small because of access to vital resources, there turnovers are so small that they can't be fitted into the micro and small enterprises categories of the nation, yet the businesses are so important to the various individuals and families in meeting their needs.

According to the Central Bank of Nigeria (1989) quoted by the Nigeria Vision 2020 (2009), small scale enterprises should have an annual turnover not exceeding 500,000 naira. In addition, in section 37 (2) of the Companies and Allied Matters Decree of 1990, small company should have at least annual turnover of 2 million naira. Ekpenyong & Nyong (1992) had used both limits to draw conclusion in classifying small scale enterprises- not lower than 500,000 naira and not higher than 2 million naira. However in a more recent classification, the Vision 2020 (2009) also provide its own small scale classification. Small scale enterprise should have employees between 10-49 and also have an asset of between 5-50 million naira. Howbeit, it seems the Vision 2020 perceived a wide gap of other businesses whose gap was farfetched from the small enterprise perspective, this brings about the micro enterprise. The micro enterprise, which a lower level than the small enterprise should have less than 10 employees and have assets not less than 5 million naira. This shows a higher upgrade than the limit provided by the Central Bank of Nigeria and the Companies and Allied Matters Decree. This could be due to the depreciating value of the naira and the Nigeria economy.

However, to an average Nigerian, living in a country with average poverty of 70% (NEEDS, 2006) and with approximately 24% of unemployment rate (although various sources have stated that in recent years it has reduced however, obviously the rate of unemployment has sky rocketed as one could notice in every nook and craning of the nation unemployed individuals and graduates rooming the streets with no jobs and searching for menial jobs just to keep living) and with no government support for its citizens, such annual return or turnover and asset based limit might be a mirage. Omiunu (2014) found that, average turnover of SMEs was 375,356 naira which is much more lower as compared to the 500,000 naira of the Central Bank of Nigeria of 1989 and also far from more recent standard of the vision 2020 (2009) which should have an asset of between 5-50 million naira for micro enterprises. This implies that most small businesses in Nigeria are far from achieving the annual turnover and the standard assets possession and may not be among the categories stated by the Central Bank of Nigeria, Companies and Allied Matters Decree and the Vision 2020. Thus, this category of businesses are not acknowledged and recognized in the Nigeria economy, yet they constitute a higher percentage but fragmented businesses of the businesses in Nigeria. Also of importance is their incapability to grow and reach other higher businesses levels in the economy.

This incapability has been caused by so many factors such as lack of planning, poor marketing strategies, lack of availability and accessibility to credit (Ekpenyong & Nyong, 1992); lack of finance and lack of business ethnics (Omiunu, 2014); shortage and inadequacy of financial institutions for SMEs support, high rate of collateral requirements and restriction of collateral to specific assets, lack of effective coordination mechanism to centralise information on possible sources of finance and other resources, misuse of government sources, concentration of finance sources in urban areas (UNEP, 2007); lack of infrastructural facilities, corruption, lack of awareness of necessary information for SMEs development among owners, lack of skills and training, cultural factors, lack of government policies that support SMEs (Apulu & Latham, 2009).

In addition, the lack of effective deployment of Information Communication Technology (ICT) could be another important factor. In addition, studies such as Croteau & Bergeran (2001), Laudon, Laudon & Dass (2006), Ajiferenu & Olatokun (2009), Omiunu (2014), among others have revealed the importance of ICT to business enterprises. However, Omiunu (2014) and Ajiferune & Olatokun (2009) among others

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

have shown that business enterprises in Nigeria do not use ICT or use it at a low level to enhance their performance, and that the benefits of ICT are not experienced in their fullest by businesses in Nigeria. This scenario is worse among small business as Onugu (2005) affirmed that, small businesses mostly believed that innovations which include ICT innovation and use are for larger organizations. Major problems that a led to lack of deployment in ICT as stated by Onugu (2005) and Omiunu (2014) are ignorance of lack of awareness of ICT user to business, lack of skills high cost of ICT, credits electricity failure, lack of experience and competence in using ICT, among others. Also, of importance are the low of ICT and information literacy among business owners. From these, perceptible arguments, one can affirmed that, although ICT can benefit businesses, nevertheless, businesses in Nigeria are facing several challenges that are reducing their potential to deploy ICT and this would at the long run limit their performances. To this end, there is need to deploy strategies to make it possible for small business to deploy ICT and tap into the benefits it brings for enhanced development which include personal, business, community and national development.

Luftman (1996) and Gartlan & Shanks (2007) stated that deploying ICT by businesses is a function of business scope, distinctive, competencies business governance, administrative structure, administrative processes administrative skills, technological scope, systematic competencies, IT governance, IT architecture, IT processes and it skills. These twelve functions are important variables needed to be inculcated by businesses especially in developing countries with and ever changing and stochastic environment.

The Vision 2020 (2009) clearly states that, the micro enterprises are widely spread in Nigeria and are numerous, in most cases with time, they tend to develop into the small scale enterprises and may also with time develop into medium scale enterprise. In addition, this will create impetus and a multiplier effect on employment generation, poverty reduction and also national development.

It could also be important to note that, if attention is given and drawn to these small businesses which are not up to the micro and small enterprises by the governments and various private investors and organisations/agencies to train, mentor/monitor, develop and provide necessary resources such as financial resources, they may also develop into the micro and small business enterprises, thereby reducing poverty, increasing employment and also national development. Thus, achieving a sustainable development if well maintained and sustained. Thus far, in the Nigeria economy, achieving sustainable development in the SME sector has been a mirage as many programmes (such as Small Scale Industries Credit Scheme; Nigerian Bank for Commerce and Industries; Nigerian Industrial Development Bank; SME Apex Unit of Central Bank; National Economic Reconstruction Fund; Nigerian Export Import Bank; National Directorate of Employment; Industrial Development Co-ordinating Centre; Family Economic Advancement programmes, State Ministry Industries Equity Investment Scheme; Small and Medium Enterprises Developing Agency of Nigeria; Credit Guarantee Scheme for SMEs among others) that are been introduced and established by the federal, state and local government and other private agencies to enhance growth and development in the SME sector had not have lasting impact on businesses in this sector. Yet various researches still provided evidences of numerous problems and challenges militating businesses and reducing their potentials to grow and develop, living the small and fragmented business that could not meet up with the micro and small enterprises standards to their fate, thereby leading to increase poverty and unemployment and also influencing national development negatively (Hashim, 1999; Basil, 2005, Altenburg and Eckhardt, 2006; and Omiunu, 2014). To this end, this paper tends to provide a paradigm to reducing poverty and unemployment and enhancing national development through concentrating on and developing the small and fragmented businesses in Nigeria.

LITERATURE REVIEW

Micro, Small, and Medium Enterprises and the National Economy

The impact of small and medium enterprises in the nation cannot be overemphasised. Micro small and medium enterprise has been a major sector in both developed and developing nations and can form the bedrock on which all activities are built and can also be the mainstay of any economy (UNEP, 2007). Mahmood & Hanafi (2013) states that, small and medium enterprises (SMEs) play an increasingly important role in the economic growth of most nations and are also important as a major source of employment and job creation for the nation's work force. Also, SMEs are known to represent over 90% of businesses in Africa, account for approximately 63% of employment and also contribute to over 50% of nation's employment and GDP. There had been an increasing recognition of SMEs as major tool for economic development, a chief source of employment, revenue generation, innovation and technological advancement in both developed and developing nations. Apulu & Latham (2009) have stated that, researches have shown that, SMEs play a major role in poverty alleviation, and also stimulate domestic and regional economic growth in both national and regional economies. In addition, Ongori (2009) in Apulu & Latham (2009) notes that, they can also help to diversify economic activities and are flexible to changing market demands.

In Nigeria, about 97% of the enterprises are SMEs and employ an average of 50% of the work force and contributes approximately 50% to its industrial output (Ihua, 2009). Okpara & Kumbiadis (2008) clearly states that, several nations including developing nations such as Nigeria have recognised the importance of SMEs and have formulated policies to encourage, support and fund them. He further outlines the various benefits that SMEs can bring to the economy. These include job creation, development of skill and semi skilled workers among others. Other benefits may also include providing experiences, skills and training for the nation's work force that could be needed by bigger companies and industries, poverty reduction, enhancing quality of lives among others.

SMEs and Sustainable Development in Nigeria

The concept of sustainable development has been approached from different perspectives. Although, it can be self defined without channelling it to the various sectors of the economy such as oil, agriculture, education, telecommunication among others, howbeit, other times, its definition becomes more meaningful when it is channelled towards these sectors in the economy. Sustainable development is defined as the development that is stable, endurable, and consistent (Omiunu, 2012).

The World Commission on Environment and Development (1987) states that, sustainable development has nine important objectives. These include: reviving growth; changing the quality of growth; meeting essential needs for jobs, food, energy, water, and sanitation; ensuring a sustainable level of population; conserving and enhancing the resource base; reorienting technology and managing risk; merging environmental considerations and economics in decision making; reorienting international economic relations; and making development more participatory. It will be unreasonable to try to neglect the important aspects of the definition of sustainable development provided by WCED (1987) with regards to SMEs development.

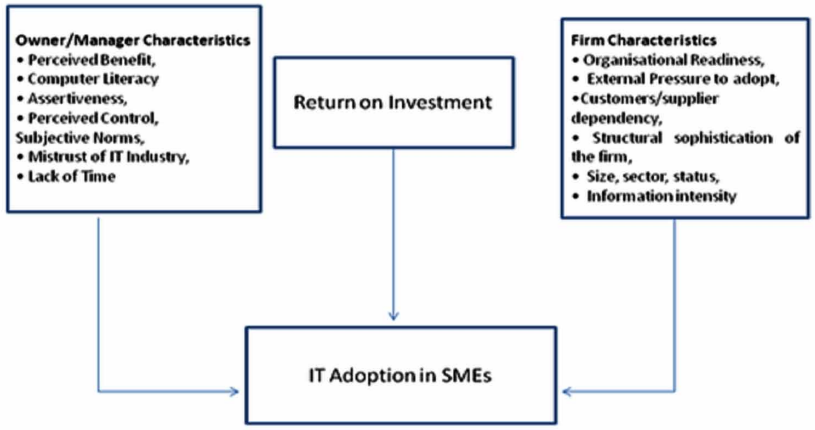
ICT Deployment and Utilization Level by Small Business Development in Nigeria

Information Communication Technology deployment involves the way small businesses plan, manage and use ICT to benefit from its potential and effectiveness (Omiunu, 2014). ICT refers to technology such as computers, laptops mobile phones, internets, emails, wireless communication devices social network sites, flashes CD/VCD/DVD. etc. (Ministry of Economic Development, 2004). ICT is perceived as a tool that makes business activities easier (Van Akkeran & Harker, 2003) and can improve critical thinking, information handling skills, increase problem-solving capacity in businesses among owners (Branford et al., 2000). Van Akkeran and Harker (2003) outlined four stages in ICT deployment and use by businesses. These four stages include "no ICT", "basic ICT", "intermediate ICT" and "advanced ICT" adoption groups. Businesses that belong to the "no ICT" adoption group are businesses that do not use ICTs at all. The "basic ICT" groups are those businesses that have adopted ICTs such as internet for collecting information, use email or use latest phones such as the 3rd generation, 3G, among others. The "intermediate ICT" adoption group include businesses that have a basic or static website or information systems and are also engaged in electronic commerce. The "advanced ICT" adoption group are those businesses that conduct business-to-business transactions electronically, business-to-customers transactions and/or have any other complex ICT integration in their business processes.

Putting into consideration the study of the National Agency for Information and Communication Technologies (2008) that although there have been substantial efforts to increase the use if ICT especially by businesses however, the level of ICT mastery and use especially in Sub-Sahara Africa which Nigeria is a part is very low and poor. Also Omiunu (2014) found that, majority of businesses in Nigeria do not use ICT nevertheless, a few percentage (less than 40%) that used ICTs only use mobile phone for their businesses. Thus, majority of Nigerian businesses belong to the "No ICT" adoption group while the very few that use ICT belong to the 'basic ICT' adoption group. This situation is more ambiguous and severe for the small businesses in Nigeria.

It is expedient at this point to also draw attention to the fact that, if more businesses belonged to the "no ICT" adoption group and only a very few belong to the 'basic ICT" adoption group, then it is very impossible for these business to deploy businesses information strategy and management information system to enhance their business development. According to Durodoye (2005), business information strategy is a top dog between business strategy and information system strategy. This implies that business information comprises of two important variables, business strategy and information and communication system and strategy (Omiunu, 2014). Usually for a business to deploy and adapt an effective business information strategy, such must have passed the "No ICT" adoption stage, the "basic ICT" adoption stage, and must have passed to the "intermediate ICT" and "advanced ICT" adoption stage. This makes the state of ICT use by business in Nigeria infinitesimal and thus businesses in Nigeria could not stand their counterparts in other developed and/or developing countries. This at the long run may lead to under-development. In addition, SMEs in developing countries such as Nigeria are incapable to deploy business information strategies less the small business. To this end, it is important to pay cognizance to the deployment of ICT among businesses especially in developing countries such as Nigeria to enhance business growth and development and thus increasing the net possible outcome of the national Gross Domestic product.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



Challenges of ICT Use and Deployment in Nigeria

These barriers that the influence the successful implementation of ICTs in SMEs which could also include small businesses includes (Igbaria and Tan, 1997): the cost of ICTs—this is perhaps not so much of an issue these days (well, in developed countries anyway); lack of time to devote to the implementation and maintenance of ICT; a lack of ICTs knowledge combined with difficulty in finding useful, impartial advice; lack of use of external consultants and vendors; short-range management perspectives; a lack of understanding of the benefits that ICTs can provide and how to measure those benefits; and a lack of formal planning or control procedures. In addition to this, many SMEs are unaware of the potential of e-commerce to enhance their business; some SMEs occupy clearly defined (and small) niche markets that they are satisfied with; there are still perceptions of unresolved security and privacy issues related to use of the Internet; many SMEs lack the necessary skill base to engage in the digital economy; the perceived high initial and ongoing costs associated with ICTs and e-business can be seen as a barrier; and many SMEs cannot experiment with ICT investments like larger businesses. They need to be sure that there will be returns for the e-commerce investments they make. In addition, lack of understanding of the benefit of ICT by SMEs owners can also serve as barrier to ICT deployment and use (Apulu & Latham, 2009).

The drivers of ICT use are broad, as they are very important because they influence the tendency for SMEs to deploy and use ICTs. According to Thong, Yap & Raman (1997), they include: the involvement of owner/managers in the implementation of ICTs; the involvement of users (employees) in development and installation; the training of users; the use of disciplined planning methodologies in setting up applications; the number of analytical/strategic (versus transactional) applications being run; the level of ICTs expertise within the organisation; and the role of the external environment (especially consultants and vendors). Also, Mehrtens, Cragg, and Mills (2001) stated some other factors SMEs must identify to be able to use and deploy ICT. These are: Identifying perceived benefits, Organisational readiness and dealing and coping with external pressure. In addition, of importance to ICT deployment and use in an SME is the owner/managers perception and exposure, the location of the business, the differences between industries and employee skill levels and training.

According to Van Akkeren & Cavaye (1999) in Manueli, Latu & Koh (2007), the factors that influence IT adoption are divided into three: Owners/managers characteristics, firms; characteristics and the

Figure 1. Factors affecting ICT adoption by SMEs

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

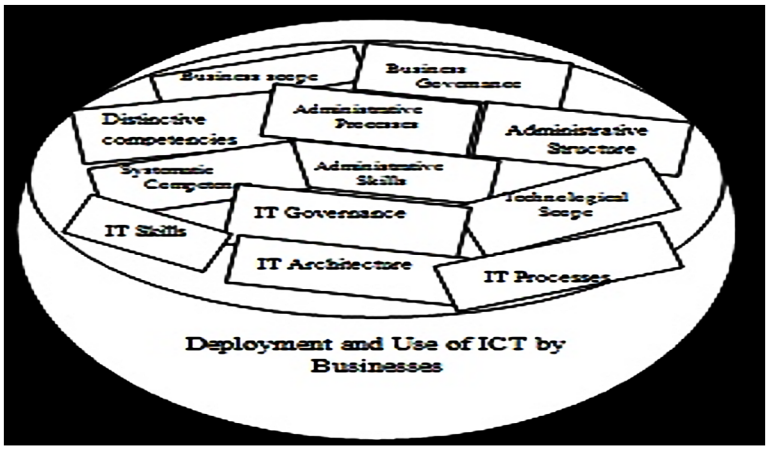
firms return on investment. The firm/business characteristics include: the organisation's ICT readiness; external pressure to adopt; customer/supplier dependency; structural sophistication of the business; size, sector and status; and its information intensity. The business's ICT readiness refers to its current level of technology use in its business processes. Little or no technology use reflects low ICT readiness and a strong reluctance for ICT adoption. External pressure may come from suppliers and/or customers for ICT adoption. Consequently, customer/supplier dependency may arise from the external pressure, whereby a small business tows the line to ensure its continuous survival. The structural sophistication of the firm/business refers to its ability to incorporate ICT into its existing business processes.

A complex structure may encourage ICT adoption because ICT is perceived as a tool for making work easier, whereas a simple structure may not readily adopt ICT because of the perception that everything is working smoothly and there is no need to change it. The size, sector and status of a firm/business influence its ICT adoption. If competitors, suppliers, customers in a certain sector have adopted ICT, a firm/business is inclined to do so because are already in it. Finally, the level of information intensity within the firm/business can be a contributing factor for ICT adoption. For example, if a firm/business handles large amounts of information, it is most likely that ICT adoption will be undertaken to improve its efficiencies (Van Akkeren and Harker, 2003 in Manueli, Latu & Koh (2007).

Also, Windrum and de Berranger (2002), in his own view outlined the contributing factors that influence ICT adoption and that these can be categorised into five major clusters that include: the business characteristics; business action; system characteristic; internal expertise; and external expertise. Business characteristics such as size, determines the business structure that in turn strongly influence the business's ICT uptake. Small businesses have simple business structures when compared to larger businesses and have less internal requirements for extensive communication technologies. Small businesses communicate and store smaller volumes of information and as a result far lesser need to use ICT.

Typically, business action is driven from the top management. In this case, if the business owner or top management establishes appropriate ICT goals, identifies critical ICT business needs, and allocates financial resources then ICT adoption is possible. For small businesses, age and the experience of the owner strongly influences ICT adoption. System characteristics within a business assist in ICT adoption. For instance, small businesses with a large number of administrative applications readily support management control, operational control and administration. In addition, access to ICT expertise within a business and externally is another contributing factors to ICT adoption. If the business owner or employees are ICT literate, there is a strong tendency to adopt ICT for business processes. In the event that they face difficulties, the availability of external expert will provide support and motivation to succeed (Windrum and de Berranger, 2002 in Manueli, Latu & Koh 2007).

How ICT Can Affect Small Business Development in Nigeria



Studies such as Croteau & Bergeran (2001), Laudon, Laudon & Dass (2006) Ajiferenu & Olatokun (2009), Omiunu (2014), among others have revealed the importance of ICT to business enterprises. However, Omiunu (2014) and Ajiferune & Olatokun (2009) among others have shown that the use of ICT by business enterprises in Nigeria is low where many businesses do not use it at all and that the benefits of ICT are not experienced in their fullest by businesses in Nigeria. This scenario is worse among small business as Onugu (2005) affirmed, businesses in Nigeria believed that such innovations which include ICT innovation and use is for larger organizations.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Major problems that led to the lack of deployment of ICT as stated by Onugu (2005) and Omiunu (2014) are ignorance or lack of awareness of ICT use to business, lack of skills, high cost of ICT, credits, electricity failure, lack of experience and competence in using ICT, among others. From these perceptible arguments, one can affirmed that, although ICT can benefit businesses nevertheless, businesses in Nigeria are facing several challenges that are reducing their potential to deploy and use ICT and this would at the long run limit their performances. To this end, there is need to addressing these challenges and make it possible for small business to deploy and use ICT thereby are able to tap into the benefits it brings for enhanced development which include personal, business, community and national development. Luftman 1996 and Gartlan & Shanks (2007) state that deploying ICT by businesses is a function of business scope, distinctive competencies business governance, administrative structure, administrative processes administrative skills, technological scope, systematic competencies, IT governance, IT architecture, IT processes and it skills. Thus one can come up with the following nested relationship between the deployment/use of ICT and Businesses characteristics. These can be represented in Figure 2.

Putting into cognizance the studies of Luftman 1996 and Gartlan & Shanks (2007) that deploying ICT by businesses is a function of business scope, distinctive competencies business governance, administrative structure, administrative processes administrative skills, technological scope, systematic competencies, IT governance, IT architecture, IT processes and it skills; and of the problems faced by small businesses in Nigeria, it can be noted that making businesses enjoy the benefits that ICT brings in Nigeria would involves providing resources and materials for businesses by governments and other interested agencies such as non-government organisations and international organisations with regard to their businesses function thus, achieving development that can be sustainable at the long run. This is because a certain ICT of benefit to one type or category of business may not fit well into another type of business.

Figure 2. A nested relationship between the deployment/use of ICT and Businesses characteristics

Challenges and Problems Militating Small Businesses Growth and Development in Nigeria

Despite SMEs significant role in the economy, studies have detected various problems militating against their growth and development. From early to recent studies, there are proofs of the undying problems and challenges facing SMEs especially in developing countries such as Nigeria. Despite the continuous effort of the government and other interested organisations, SMEs are still plagued by high failure rates and poor performance levels despite their recognition as major contributor to nations' economy. These problems seem perennial as one observes their trends, dynamics and elastic spread of setbacks they cause on SMEs.

Hashim (1999) had earlier discovered that the recurring problems of SMEs included a lack of capital and credit facilities; shortage of skilled workers and raw materials; inadequate infrastructure; lack of managerial, marketing and technical expertise; and limited applications of new technology. In addition, external environmental factors, such as fast changing technology, competition, economics, socio-cultural and international factors also have a significant effect on the success and failure of SMEs.

The Liberal feminist theory by Fischer et al. (1993) suggests that SMEs run by women exhibit poorer performances than those run by men because women are overtly discriminated against (by lenders, for example) and/or because of other systematic factors that deprive women of important resources (for example: business education and experience). By way of contrast, social feminist theory (Fischer et al. 1993) suggests that men and women are inherently different due to differences in their early and ongoing socialization. Nevertheless, these differences do not imply that women will be less effective in business than men, but only that they may adopt different approaches which may, or may not, be equally as effective as the approaches adopted by men (Watson, 2003).

Attention has also been expanded into other variables affecting SMEs performances and growth. Moorthy, Tan, Choo, Wei, Ping, and Leong (2012) outlined factors that can influence growth and performance of SMEs. They include lack of effective entrepreneurship in the nation, bad human resource management lack of the use of or no marketing information, and lack or low level of application of IT. In addition to this, Neneh & van Zyl (2012) also outlined problems faced by SMEs. They include lack of planning, improper financing, poor management, lack of skilled labour, brain drain, unavailability of financial skills, lack of performance analyses of business operations and incompetent senior managers. Studies have also revealed that, another major challenge to SMEs is gender inequality to access to vital resources which are important to their development. Other problems may also include poor knowledge and information consciousness culture among SMEs owners, poor reading culture, poor or bad regard for information, lack of awareness of the importance of information to SMEs development, poor information environment, among others. Omiunu (2014) found that, infrastructural problems such as electricity failure, faulty machines, among others, lack of skills, experience and competence, network problems, lack of credit, economic meltdown, etc. are major problems facing businesses in Nigeria.

The Increased Nigeria Population Trap

It is not a story that Nigeria has a population of 140,003,542, which most often has been approximated to 150 million, with male population of 71,709,859 and a female population of

68,293,683 (Nigeria Population Census, 2006). Also, the Nigeria population is placed at an average growth rate of 3.3%, and known to be the fastest growing population especially in Africa (Daily News,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sunday, August 05, 2012 in Omiunu, 2014). According to Omiunu (2014), with this estimate in mind, the Nigeria population was 88,992,201 in 1991 (NPC, 1991), increased to 140,003,542 in 2006 (NPC, 2006) by 51,111,341, which shows a 57.4% increase of the Nigerian population of 1991. However, the estimate of the Nigeria population by the Federal Ministry of Agriculture and Natural Resources (1997), was that, by 2013, Nigerian population will double the 1991 population with the growth rate increase of 3.2% assumed, which will show a 100% increase from 1991-2013. However, there is no accurate data for the recent data of Nigerian population because of the fact that census count is done every ten years and the next census in Nigeria would be in 2016.

However, according to estimate, the Nigerian population would produce an estimated population of 177,984,402 at 2013 and this would have increased by 2015. In addition, there is a 7-year lag between 2006 to 2013 compared with the 15-year lag between 1991-2006. This implies that, between 2006-2013, an addition of 37,980,860 average would be added to the Nigerian 2006 population of 140,003,542 to give a total of approximately 177,984,402. Although, looking at the population growth rate and dynamics, by 2013, the Nigeria population might even be greater than the assumed forecasted 177,984,402 (Omiunu, 2014). However, with the advent of child reduction and spacing may put the figure between ±177,984,402. This high population will also have significant effect on the resource allocation which also include the use of ICT and the access to resources (such as ICT) to maintain livelihood and thus will increase competition of resources (which may also include in businesses) where it would be the survival of the fittest. This however poses a big problem to the sectoral and national development.

Poverty and Unemployment: The Two Great Monsters of National (Nigerian) Development

With a geometric progression of the Nigerian population, the two great monsters for national development are poverty and unemployment. Economic stagnation, deepening poverty and weakening human development are known to be major problems of Sub-Sahara Africa which Nigeria is part and there have been progress in governance and regional collaboration, and concerted international endeavours to achieve sustainable development in this region (Aboderin, 2005). These features are pivotal in shaping the policy developments and emerging challenges for to achieving sustainable development in the region (Aboderin, 2005). In addition, poverty is been felt and has been a major issue in both rural and urban areas (Heeks, 2009). In addition, Heeks (2009) stated that for any problem especially in developing countries, It is the poor who are suffered it the most. And, of course, they suffer from that other blot on the world's conscience – poverty – with more than half the global population living on less than two US dollars per day. Alexander (2014) stated that in Nigeria, over 75% of the citizens are living below 1 dollar per day while the microscopic few kleptocrats living in corridor of power cart away our money in billions of dollars

According to United Nations Development Programme (UNDP) (2002; 2004) and the Commission for Africa (CfA) (2005), over the last decade, economic growth in most of sub-Saharan Africa including Nigeria did not outstrip the increase in its population. In contrast to all other developing world regions (which have seen drastic improvements in their fortunes in recent times), therefore, sub-Saharan Africa ended the Millennium poorer than it was in 1990. Also, 23 countries in the region are now poorer than they were in 1975. Today, over 50% of sub-Saharan Africa's inhabitants live under $1 per day which also include Nigeria, the great majority under $2, and it is globally the only region where the proportion of people living in poverty is expected to grow with their drastic geometrically increasing population.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This has for a long time has effect and impetus of the development of this region and thus the sustainable development.

Poverty is a condition characterized by severe deprivation of basic human needs including food, safe drinking water, sanitation facilities, health, shelter, education and information (World Summit for Social Development, 1995). It includes people who earn and spend less than one US Dollars per Day and it is lack of, or inadequate access to social services (Agba, Ushie, Bassey & Agba 2009). Nigeria over the past five decades has embarked on various health, economic, educational, political, cultural and social reforms that are either home initiated or as a response to international agreed on poverty reduction. Despite government efforts, the incidence of poverty in Nigeria has been galloping since the 1980s (Agba et al, 2009). Statistics shows that poverty level on Nigeria move from 28.1 percent in 1980 to 46.3 percent in 1985; it escalated to 65.6 percent in 1996 and 71.3 percent in 2005 (Central Bank of Nigeria, 2005; Onyeagba, 2008). According to Agba, Ocheni and Nkpoyen (2014), stated that plethora of literature continue to show that over 70 percent of Nigerians live on less than one US Dollar per day only better than Mali 73 percent, compared to Ghana 45 percent and Brazil 8 percent. In 2002 according to Ekong (2003), NEEDS (2006), Vision 2020 (2009), over 70 percent of Nigerians were still living below the international poverty line despite government's multiple poverty alleviation programmes. Till date, this data of over 70% poverty level in Nigeria has not changed and thus, gives birth to other monsters of development such as unemployment. Alexander (2014) added that critically looking at Nigeria, malnutrition, poverty, illiteracy, diseases, and joblessness (unemployment) are still prevalent which proves Nigeria is an underdeveloped nation.

Unemployment covers persons (aged 15–64) who during the reference period were currently available for work, actively seeking for work but were without work. A person is regarded as employed if he/she is engaged in the production of goods and services, thereby contributing to the Gross Domestic Product (GDP) in a legitimate manner, which is a component of the national accounts and receives any form or amount of compensation for that activity (National Bureau of Statistics, 2015). The category of persons considered not in the labour force include those not between 15-64 (economic active population) as well as those within the economically active population (15-64 years), who are unable to work, not actively seeking for work or choose not to work and/or are not available for work.

When one conceptualizes the effect and burden of this population on the economic, one will realize that the nation's dependency ratio is high. Dependency ratio refers to the number of population of a nation who are not working, are unemployed and are not able to work to contribute their quota to national development, therefore these sets of people depend on any actively unemployed person. This is why nations and developmental indices use the per capita income to measure poverty- which is the ratio of the total income of any household divided by the number of persons in such household. In developing countries such as Nigeria, dependency ratio is very high and perfectly elastic.

Alexander (2014) stated that in Nigeria, over one million unemployed youths are readily applying for jobs where less than five thousand people are needed. The country is in the verge of revolution which undoubtedly will be triggered by this terrible economic menace called unemployment. It has been stated that unemployment is one of the most critical socio-economic problems facing Nigeria (Atufe, Okojie, Echenim, Ogunmola and Bello, 2014). According to the National Bureau of Statistics (NBS), the unemployment rate in Nigeria increased to 23.90 per cent in 2011 from 21.10 per cent in 2010 while the unemployment rate averaged 14.60 percent from 2006 until 2011, reaching an all time high of 23.90 percent in 2011 and a record low of 5.30 per cent in 2006 (Atufe et al., 2014).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Unemployment also has social consequences as it increases the rate of crime. School graduates consist of the principal fraction of the unemployed accounting for nearly 35 per cent to 50 per cent of the unemployed group. The rate of unemployment within the age group of 20 to 24 years is 40 per cent and between 15 to 19 years it is 31 per cent. The statement by Comrade Issa Aremu, vice president, Nigeria Labour Congress (NLC) and General Secretary, Textile Workers' union, Federal Republic of Nigeria that with 50 per cent unemployment, Nigeria is not just seating on time bombs but as we can see the bombs are exploding in scores through murderous insurgencies (Alexander, 2014) shows that the level of unemployment in Nigeria has reached climax where it can destroy the Nigerian economy. Therefore, there is need to address poverty and unemployment in Nigeria to enhance development which include individual, community and national development.

THEORETICAL UNDERPINNING

Restriction of Opportunities Theory of Poverty (ROTP) was introduced Appadurai (2004) and Chakravarti (2006) developed upon it. ROTP posit that poverty is caused by unstable environmental conditions and lack of social and economic capital. Lack of social and economic capital can be lack of small business development because it is a social and economic activity that requires social and economic capital. Restriction of Opportunities Theory of Poverty emphasized the influence of human environment on people's daily lives; and since people's lives are condition by their environment, the individual's daily decisions/actions are dependent upon what is present or what is not in the environment (Agba et al. 2014). As the poor continue to navigate within the environment of poverty, they develop fluency within the environment, but a near illiterate in the larger society or environment (Chakravarti, 2006).

Lack of capacities, such as include the development of small businesses among household families could cause an individual to enter the environment of poverty. This implies that, an individual who is poor lack adequate capacities with which to change his/her position (Agba et al. 2014). The capacity to inspire is paramount in this regard; the individual through social interactions develops aspirations that would change his/her socio-economic environment. It suggests that, a person's aspiration is conditioned by his/her environment. It therefore holds that, the better one is placed in his/her environment, the more chances he/she has to not only aspire but to fulfill his/her aspiration (Appadurai, 2004).

ROTP posit that the capacity to aspire required practice in a stable environment and that the environment of poverty is unstable with a high prevalence of unemployment. The unstable life of poverty as defined by unstable environment, often limits the poor's aspiration to basic necessities of life such as food, cloth and shelter; and this reinforces lowered aspiration levels and could significantly obstruct change of environment or condition (Agba et al. 2014). It implies that the way out of poverty is to expand the aspiration horizon of the poor such as given attention to the small businesses they are involved in and helping to grow such businesses through then deployment and use of ICT, to escape the reinforcement that perpetuate the poor in the environment of poverty. It entails creating programmes or making policies that provide the poor and household small businesses with an arena that enables he/she to practice and boost his/her aspiration. It includes designing schemes that enables the poor to meet his/her basic needs; and motivate him/her to higher aspirations (Appadurai, 2004; Chakravarti, 2006).

This Restriction of Opportunities Theory of Poverty differs from the neoclassical growth model proposed by Solow (1956) which argues that low capital cannot explain underdevelopment and contends that the particular set of institutions in an economy does not matter. This position rests on three points:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

(a) outcomes are determined by fundamental forces (reflecting resources, preferences, and technology), (b) these forces lead to Pareto-efficient outcomes, and (c) institutions do not even influence the choice of the equilibrium. Solow (1956) also stated that it is government impediments to markets (such as small businesses or SMEs) that prevent the economy from working smoothly. However, such theories are inherently unsatisfactory and in most versions, the government failures are assumed to be exogenous, leaving unexplained why they should be larger in some societies than in others and why some other institutions should come to play to stabilize the economy.

The theory of Solow (1956) may have to be re-worked to fit into the environment of Nigeria- bringing together the government, the people and other institutions that may be interested in developing small businesses in Nigeria. For example, apart from government failures, market failures in other institutions such as the banks, SMEs, telecommunications, among others are pervasive, especially in developing countries and these can affect the economy (e.g. Stiglitz, 1989; Floro and Yotopoulos, 1991 and Hoff, Braverman and Stiglitz, 1993). This was why Omiunu (2012) noted that theories imbibed into new environment such as developing economies) are like square pegs in round holes until they are reshaped to fit in such holes (developmental plans and strategies). Although, technology deployment in Solow (1956) is important, however, ICT deployment should be done in a way that such ICT introduced could fit in the business activities and could be useful to such businesses both at the short and long run. Therefore, theoretical work that focused on institutional issues and the scope for policy in development attempted to identify specific institutional characteristics of developing countries such as related to SMEs and small business among the poor and unemployed and incorporated them as features of models are of interest to development theories (Hoff and Stiglitz, 2000).

Also, of importance is the Endogenous growth or the new growth theory which emerged in the 1990s to explain the poor performance of many less developed countries thus can be used to explain sectoral poor performance also. Unlike the Solow model that considers technological change as an exogenous factor, the new growth model notes that technological change has not been equal nor has it been exogenously transmitted in most developing countries (World Bank, 2000). The new growth theorists such as Romer (1986), Lucas (1988), Aghion and Howitt (1992), among others linked the technological change to the production of knowledge thus making it endogenous. Such knowledge can be an enhancer of development among households small business. The new growth theory emphasizes that economic growth results from increasing returns to the use of knowledge (which could include both tacit and explicit) in addition to labour and capital. The theory argues that the higher rate of returns as expected in the Solow model is greatly eroded by lower levels of complementary investments in human capital (education which include conducting training and workshops), infrastructure such as ICT, or research and development (R&D). Meanwhile, knowledge is different from other economic goods because of its possibility to grow boundlessly. Knowledge or ICT innovation can be reused at zero additional cost. Investments in knowledge creation therefore can bring about sustained growth in SMEs and small business among households. Moreover, the knowledge could create the spillover benefits to other firms once they obtained the knowledge.

Bringing in the "Big Push" theory of Rosenstein-Rodan (1943), until there is need in a particular market system, the need to produce a product for the population does not arise. To this end, there have been continuous needs to give attention to reducing poverty and unemployment and also enhance small business development thus, the "Big Push" theory.

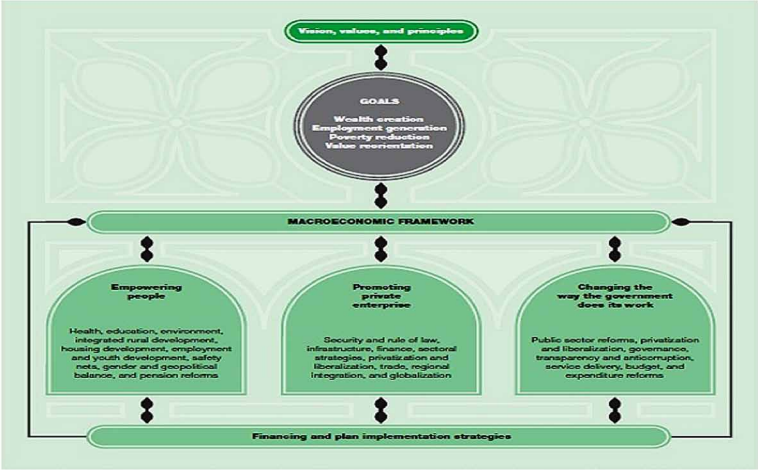
Also, with regards to the framework of National Economic Empowerment Development Strategies (NEEDS) (2006), it focuses on four key strategies: reorienting values; reducing poverty; creating wealth,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and generating employment. NEEDS is about the Nigerian people: their welfare, health, employment, education, political power, physical security, and empowerment.

NEEDS gives special support to all types of businesses such as agriculture, industry, small and medium-scale enterprises, and oil and gas. Under the plan, the government will seek long-term capital for investment. NEEDS strategy consists of:

- **Empowering People:** By allowing the private sector to thrive which include small business of the poor people operating in a fragmented and small form, NEEDS creates opportunities for employment and wealth creation. It empowers people to take advantage of these opportunities by creating a system of incentives that reward hard work and punish corruption, by investing in education, and by providing special programmes for the most vulnerable members of society. This could cut across providing ICT for various businesses and organizing workshop training for them on how they can deploy ICT to enhance their business productivity.
- **Promoting Private Enterprise:** The private sector will be the engine of economic growth under needs. It will be the executor, investor, and manager of businesses. The government will play the role of enabler, facilitator, and regulator, helping the private sector grow, create jobs, and generate wealth. Deregulation and liberalization will diminish governmental control and attract private sector investment.
- **Changing the Way the Government Does Its Work:** NEEDS aims to restructure the government to make it smaller, stronger, better skilled, and more efficient at delivering essential services. It seeks to transform the government from a haven of corruption to an institution that spurs development and serves the people. The number of government jobs will decline, and the cost of running the government will fall dramatically, as in-kind benefits for civil servants, such as subsidized housing, transport, and utilities, are monetized. Reforms and regulations will be implemented to ensure greater transparency and accountability, and corrupt practices will be outlawed. Government activities and budgeting will be informed by a framework that connects policy with government income and expenditure.



The NEEDS document articulates the strong commitment of the federal government to a programme of collaboration with and strengthening of the private sector. Therefore, the NEEDS aims to alter the strategy for industrial development and make it less import- dependent, more local resource - based and more related to local research and development, particularly in the area of small medium enterprises (SMEs). Economic empowerment of indigenous SME businesses which include small businesses through patronage of their products by improved tendering and procurement processes that stipulates minimum levels of local content would be encouraged.

Developing Small Businesses to Achieving Sustainable Development

Small businesses are less able to address weaknesses in the investment climate and also in their environment as they have less competitive advantage over the larger ones. Attentions have been placed on small, medium and large business enterprises and have been drawn away from the minute or smaller businesses in the nation. This has caused a lot of damaged to those smaller and minute businesses. Of the strategies to develop the small, medium and large business enterprises in Nigeria, they are still plagued by so many problems, less the smaller businesses.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. NEEDS at a glance
Source: NEEDS (2006).

Onugu (2005) had revealed that, only 5% of SMEs survived and between 20-25 struggled to survive within the first five years of their initiation. It shows that, approximately 95% of SMEs were either between struggling to survive or dead. This would be more conceptualize when one noticed that, as great as the potential of SMEs are to contribute to national development, only 5% of SMEs survived and nothing are being done for the 95% to be revived and stand. In addition, the smaller businesses are not given attention to fill in the gap of the potential dead SMEs in the nation. Major reasons for the inability for the dead of SMEs and the inability for small businesses to be able to grow to fill in the gaps of the dead SMEs can also be attributed to lack of capital and credit facilities; shortage of skilled workers and raw materials; inadequate infrastructure; lack of managerial, marketing and technical expertise; and limited applications of new technology which also include major ICTs that could enhance their growth and productivity as provided by Hashim (1999) in early study. This is a tragedy scenario and if not tackled will eventually lead to increase in unemployment, poverty and draw back in the national development. This is because the dependency ratio of the population of Nigeria will increase as their source of income which is either the SMEs or the smaller businesses are gone.

To tackle this problem, it is necessary for attentions to be drawn to both the approximately 95% of the either struggling to survive or dead SMEs and the smaller business which do not have access to resources to develop themselves or metamorphose to SMEs as they grow. Rather they are been limited by various problems which, could also be the same problems militating against the dead or surviving SMEs but could be in a higher dimension because of their little capability to pave way for growth and development in the face of all these challenges.

Drawing attention to smaller businesses could be a vital tool to achieving and enhancing sustainable development in Nigeria. If sustainable development has been defined as the development that is stable, endurable, and consistent, it revealed that, various developmental programmes that has been embarked on by governments and other private agencies had not been sustainable because of the consistent and perennial problems and challenges militating against SMEs including small businesses in Nigeria. In addition, in view of the World Commission on Environment and Development's (1987) definition of sustainable development, important aspect in respect to SMEs development are the reviving growth

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

(which could be reviving the growth and development of SMEs which also include small businesses in the nation); changing the quality of growth (this could also be the transition of the fragmented smaller businesses into the micro, small and medium enterprises in the Nigerian economy); meeting essential needs for jobs, food, energy, water, and sanitation (thereby reducing unemployment, poverty levels and providing infrastructures for the use and development of these smaller businesses); ensuring a sustainable level of population (this could be sustaining the level of smaller business population in the country so as not cause easy exit out of the businesses by putting higher pressure, demand, standard and criteria on this businesses that they cannot meet, however encouraging increase in their population); conserving and enhancing the resource base (this could cut across the human and natural resource base of the nation made available for SMEs); reorienting technology and managing risk, merging environmental considerations and economics in decision making, reorienting international economic relations and making development more participatory (that will be conducive for and influence positively SMEs development in the nation).

In addition, in respect to business enterprises, sustainable development refers to the adoption of business strategies and activities that meet the needs of the enterprise (the SMEs sector) and its stakeholders today while protecting, sustaining and enhancing the human and natural resources that will be needed in the future (International Institute for Sustainable Development, 1992). Stakeholders in this context refer to shareholders, lenders, customers, employees, suppliers, and communities who are affected by the business's or organisation's activities.

Using ICT to Enhance Small Business Development to Address Poverty and Unemployment Issues in Nigeria

Heeks (2009) affirmed that poverty is the mother to invention and innovation. The epidemics of poverty have made various governments and international bodies to collaborate to curtailing its effect on the populace and the development of such nation such as Nigeria. In Nigeria, to enhance SMEs development, reduce poverty and unemployment, various strategies and agencies have been instituted such as include Small and Medium Enterprises Development Agency (SMEDAN), National Economic Summit Group (NESG), National Association of Small-Scale Industrialists (NASSI), Manufacturers Association of Nigeria (MAN), Small Scale Industries Credit Scheme (SSICS) 1971), Nigerian Bank for Commerce and Industries (NBCI) (1973), Nigerian Industrial Development Bank (NIDB) (1964), SME Apex Unit of Central Bank (1989), National Economic Reconstruction Fund (NERFUND) (1989), The African Development Bank/ Export Stimulation Loan (ADB/ESL) (1989), Nigerian Export Import Bank (NEXIM), National Directorate of Employment (NDE), Industrial Development Co-ordinating Centre (IDDC), Community Banks, People's Bank, Family Economic Advancement Programme (FEAP), State Ministry of Industry SME Schemes, Small and Medium Industries Equity Investment Scheme (SMIEIS), Bank of Industry (BOI), Credit Guarantee Scheme for SMEs, among others. Others include Operation Feed the Nation (OFN). National Directorate of Employment, The Family Support Programme (FSP), The national poverty eradication programme (NAPEP), The Youth Empowerment Scheme (YES), National Economic Reconstruction Fund (NERFUND), among others (Emmanuel and Daniya, 2012). However, despite all these developmental plans and strategies to ameliorate poverty, unemployment and also enhance SMEs growth and development, studies such as Onugu (2005), and Altenburg and Eckhardt (2006), Agba et al. (2014), Alexander (2014), Atufe et al. (2014) still revealed that the level of poverty, unemployment are still high and SMEs are still facing considerable challenges militating against their

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

growth and development, thus development in this sector has not been achieved. This could be worse among the small businesses in Nigeria.

It showed that much still need to be done and attention need to be drawn to small businesses to fill in the gap of dead SMEs which according to Onugu (2005) that, only 5% of SMEs survived and between 20-25 struggled to survive and 75% died within the first five years of their initiation which implied that approximately 95% of SMEs were either between struggling to survive or dead. If nothing is done to revive this 95%, and nothing is done for the small neglected businesses in the economy especially among the poor, and unemployed thus, one can affirm that the statement of the time bomb issue by Comrade Issa Aremu, vice president, Nigeria Labour Congress (NLC) and General Secretary, Textile Workers' union, Federal Republic of Nigeria as stated by Alexander (2014) is not far-reached in Nigeria.

In addition, to fill in this gap, there is need to deploy ICT for businesses which include the SMEs and these small businesses. Heeks (2009), added that ICTs can be deployed to deliver information and services that might address poverty, health, education and gender equality – the four areas that form the bulk of the Millennium Development Goals (MDGs). In addition, Omiunu (2014) has stated that ICT can also be deployed and used to enhance the performance, growth and development of businesses which include small businesses in Nigeria. Thus, the neglect of ICT may further aggravate the present problems of SMEs and small businesses in the Nigerian economy because these business cannot compete with international businesses and standards from developed economies such as the UK, US, Japan, among others. To this end, ICT deployment and innovations can be a source of emergence from the long time confusion and problems of poverty, unemployment and problems militating against SMEs including small businesses in Nigeria.

Drawing attention to small business to addressing the issue of poverty and unemployment through the help of ICT is of paramount importance. This could be achieved by the following strategy below:

According to Sofowora (2009), the assumption of the Nigerian government is that if there is a conducive environment for business to thrive and when the people are empowered (which in this context may include empowerment with respect to business development), to take the advantages of the new opportunities, then poverty and unemployment problem will be curtailed in the nation. Mchombu and Mchombu (2014) stated that sustainable development is a very important factor in the provision of information and knowledge support for poverty eradication. Talisayon and Suministrado (2008) noted that the sustainability movement which began in 1992 concluded that sustainability depends on preservation and enhancement of three forms of capital: social capital (which include community cohesiveness and trust, relationships, local values and local support system); natural capital (which refers to the natural environment), and economic and financial capital (which refers to economic benefits, participation and control and ownership).

Talisayon and Suministrado (2008) argue that successful knowledge for poverty alleviation interventions should make use of both the tangible and intangible assets found in a poor community. To this end, Omiunu (2012) affirmed that sustainable development should be participatory, people centred, and Mchombu and Mchombu (2014) added that such development should be in line with what the community already has in the form of financial, human, social and physical and natural assets and structures which affect livelihoods of the dwellers. Suffice to note that most of the livelihoods of Nigerians are small and minute businesses due to their incapability to raise capital and the lack of capital to enrich their businesses. To this end, any sustainable development plan coming from the government to enhance small businesses such as the deployment and use of ICT must match the kind of businesses they do which could include subsistence farming, provisions, stores including medical stores, fish farming, snacks and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

drinks, salon which include hair and barbing salon, tailoring, sales of food items, canteens, and other consumables, shoes, clothes, and jewelries, and other telecommunication-like small businesses such as sales of recharge cards, phone repair, electricians, computer operators, typesetting and engineering, graphic designs, photo editing, photocopies, etc. It is also expedient to draw attention to the major fact that most of these businesses operate is a very small and minute scale and do not have capital to grow their businesses.

Therefore, to enhance their sustainability and growth, it is expedient to take a complete census of these businesses and then have a database for them, and deploy and provide ICTs that can help them to maximize their sales and growth. According to FAO (2006) and Mchombu and Mchombu (2014) stated that to achieve sustainable developments in businesses which include small and family businesses, governments and other responsible bodies which include national and international should give attention to these five categories of assets or capital:

- **Natural Capital:** Access to land and to other resources such ICT resources to allow people to invest in productive processes.
- **Social Capital:** Relations among people are shaped by histories of interactions which regulate further interaction, including their understanding of their rights over national resources.
- **Human Capital:** Development and poverty eradication requires good health, nutrition and access to medicine, among others. Moreover, development require skills and knowledge, which are in short supply when access to and information or other ICTs is weak or non-existent.
- **Financial Capital:** People need money to make long-term investments and also to acquire some resources such as ICT and other infrastructure that may be helpful for their businesses but access to financing is often problematic for Nigerians mostly for those who live in rural and remote areas. Most commercial banks will not lend money without collateral.
- **Physical (Built) Capital:** Buildings, roads and tools provide the security, mobility and capability that allow people to produce, transform, exchange and consume goods.

Each one of these dimensions has an information and knowledge implication and can use ICT to enhance their achievement. For example, for social capital- enable knowledge sharing; human capital which refers to capacity to acquire and absorb knowledge; and financial capital which is a frequent constraint in development situations where the poorest do not have sufficient information and no or low availability of financial resources thus, unable to utilize the limited collateral at their disposal. To this end, ICT can be provided by the government and other various bodies (nationally and internationally based) interested in the development of businesses among the poor either for free or for a subsidized price. First, to achieve this, the government has to have all businesses at local, state and federal level at its database. The corporate affair commission could be deployed and registered businesses with this federal government organization should be used to obtain the information of various businesses. In addition, year in-year out, these various businesses pay a certain amount to the federal government, it won't be a gain saying to state that the government should try to use part of this money also to provide such ICT that could be of benefit to these businesses in Nigeria.

CONCLUSION AND RECOMMENDATION

To ensure the developing of smaller business and achieving sustainable development, it has been revealed that attention should be drawn to them providing for them access to resources that will enhance their potential to grow and develop to becoming micro, small, medium and even large business enterprises so as to reduce poverty, increase employment and enhance sustainable development in Nigeria. In addition, the following recommendations would be of importance from this study:

1. Various governments at all tiers should be encouraged and involved in conducting research that will benefit both the SMEs and smaller businesses in Nigeria. Such researcher will outlined the needs of SMEs and smaller businesses in Nigeria through owners oriented study and such needs should be directed to them to enhance their growth and development.
2. Governments should increase the access of private agencies to support small business either within or outside the country so as to enhance their growth and development.
3. Programmes and workshop to provide skills, training and mentoring and monitoring services (consultancy services) should be geared by the governments and various private agencies to enhance the growth, performance and development of small businesses in Nigeria.
4. The provision of grants for business development should be encouraged by governments and other private agencies interested in their development and reward entrepreneur in Nigeria.
5. Organisational body spread in all round the state, local and federation should be instituted and established which can be a vital point of access for help for small business owners. This may be controlled by either government or private agencies.
6. Also, of importance is the provision of loan by banks with a reduced interest rate and provision with very little or no collateral and access to loan by smaller business owners to help them develop.
7. In addition, access to information and various information system should be design for smaller businesses and even the SMEs to ensure that, they tap into the benefits of ICT to developing their businesses and also enhancing the Nigeria economy when those information and information system are been used.
8. Also, the federal government can use some of the money paid in by various businesses to provide ICTs for them with regard to their activities. This could boost commitment from the side of the business owners to be faithful in paying taxes and other dues.
9. Infrastructural problems in Nigeria should be addressed by the federal government so as to enhance SMEs growth, development and performance, because small business development is highly dependent on infrastructure availability.

KEY TERMS AND DEFINITIONS

ICT: Tools that can be used to enhance the various activities of small business to enhance productivity in businesses.

Poor: Individuals in the society or economy who are deprived from the resources of the nation and are not able to meet up with the demands of the society.

Poverty: The lack of resources to meet the demands of life and the society by individuals in the economy.

Small Businesses: Business that do not fall into the category of Small and medium enterprises but are operated as fragments in the economy and are mostly owned by the poor in the society.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Small Business Development: The development that is geared towards small businesses in the economy to enhance their productivity and development in the long run.

Sustainable Development: The development that is geared to enhancing the livelihood and wellbeing of the poor in the economy and which could be sustained over time.

Sustainable National Development: The development that is geared towards the enhancement of individuals in the economy and which would also enhance the development of the nation and such development should be sustainable over time.

Unemployment: The inability of individuals to be able to get a job or such individual is living without a job.

Chapter 35
Corruption, Business Climate, and Economic Growth

Harish C. Chandan
Argosy University, USA

ABSTRACT

Corruption is globally pervasive. Defined as abuse of entrusted power for private gain (Transparency International, 2013), corruption represents a set of economic, social, cultural, and political practices that are secretive and rooted in greed, ambition, or quest for power. This chapter reviews causes of corruption including the macro- and micro-level determinants of corruption such as leadership, management, and organizational culture. Various subjective and objective measures of corruption are discussed. Transparency International's Corruption Perception Index (CPI) and Heritage Foundation's Economic Freedom Index (EFI) are reviewed. The World Bank's Business Environment and Enterprise Performance Survey (BEEPS), Doing Business Indicator (DBI), and World Bank Institute's Governance Indicator (WBI-GI) are also reviewed, as is the role of global anti-corruption agencies and various instruments. Additionally, the relationship between corruption and foreign domestic investment, economic growth, and economic and political institutions are considered, as are anti-corruption intervention strategies for corruption and business ethics training.

INTRODUCTION

Corruption is pervasive globally and represents a set of economic, social, cultural, and political practices that are secretive and rooted in greed, ambition, or quest for power. These practices occur in government institutions, non-profit organizations, multi-national corporations, and private businesses (Kaufmann & Vicente, 2011). Some of these practices include bribery, embezzlement, money laundering, abuse of entrusted power, trading influence, and diverting organizational funds or property for personal gain. Other corrupt practices include avoiding taxes, skirting the law, financial fraud, insider trading, money laundering, manipulating the system using legal loopholes, nepotism, and discrimination. Some examples of the political corruption include voter fraud, political finance, political payback and retribution. Cor-

ruption is a very large global 'underground industry' in both emerging economies with high growth rates and developed economies with relatively small growth rates.

Corruption is defined as abuse of entrusted power for private gain (Transparency International, 2013). The abuse of power, secret dealings, and bribery continue to ravage societies around the world. An international survey of 114,000 respondents in 107 countries revealed that more than one in four people (27%) reported having paid a bribe in the last 12 months (Global Corruption Barometer, 2013). The scale of corruption varies significantly from country to country. While many developing countries face the challenge of addressing systemic corruption, some emerging economies, in fact, have lower levels of corruption than some wealthy countries (Kaufmann, 2013).

Corruption is not a victimless transaction as the victims of corruption are outside the parties who participate in a corrupt act and benefit from it. Corruption is associated with increased income inequality in a country, and may be viewed as unreported white-collar crime that is often considered a way of doing business. The World Bank estimates approximately US$1 trillion is paid in bribes each year around the world, representing 5% of world Gross Domestic Product (GDP). This estimate of annual worldwide bribery does not include the extent of embezzlement or 'leakage' of public funds. Corruption is equivalent to a 20% tax on foreign investors (World Bank, 2013). The African Union estimates the African continent loses 25% of GDP to corrupt practices.

A study on the causal relationship between economic growth and corruption in 42 developing countries concludes that adequate institutional facilities must be in place in developing economies to reduce losses from corruption especially within and after periods of economic growth (Wright & Craigwell, 2013). The business sector grows significantly faster where corruption is lower and property rights and rule of law are safeguarded. Good governance and anti-corruption measures lead to an improved investment climate and business environment. Both the public and private sectors have responsibility in improving investment climate since they interface each other (World Bank, 2013).

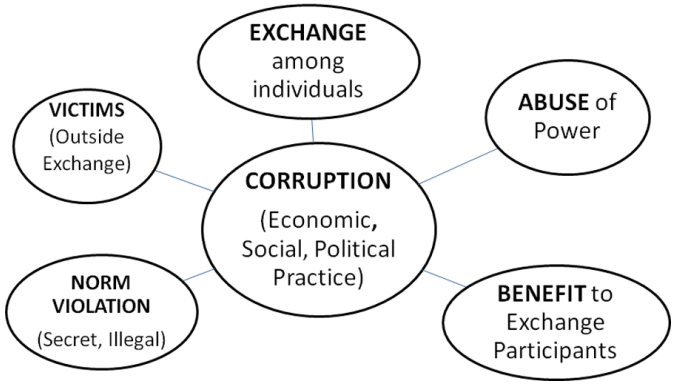
This chapter reviews causes of corruption including the macro- and micro-level determinants of corruption such as leadership, management, and organizational culture. Various subjective and objective measures of corruption are discussed. Transparency International's Corruption Perception Index (CPI) and Heritage Foundation's Economic Freedom Index (EFI) are reviewed. The World Bank's "Business Environment and Enterprise Performance Survey (BEEPS)", "Doing Business Indicator (DBI)" and "World Bank Institute's Governance Indicator (WBI-GI)" are also reviewed, as is the role of global anti-corruption agencies and various instruments. Additionally, the relationship between corruption and foreign domestic investment, economic growth, and economic and political institutions are considered, as are anti-corruption intervention strategies for corruption and business ethics training.

CAUSES OF CORRUPTION

Corruption is a social and cultural transaction between at least two parties motivated by rational calculations of individual gain (David, 2010). Once it reaches a critical mass point, corruption spreads like a virus and gets entrenched in an institution and spreads to other institutions within a country. One must understand corruption in the context of the national culture and the individuals involved in the corrupt act. Corruption affects public institutions and private businesses in all countries to varying degrees. Some practices are illegal in one country but can be perfectly legal in another country. These practices

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

are motivated by ambition, success, and/or economic gain. Bribing government officials appears to be an inevitable ritual for business leaders operating globally, especially in many developing countries.



People are 'social animals' embedded in their relationships and networks in the organizations. An otherwise honest citizen, investor, bidder, or a firm may act in a corrupt manner due to the belief that their competitors are doing it and the probability of getting caught is low. The investigation into the United Nations oil-for-food program suggests that more than half of the 4,500 companies involved in the program paid illegal surcharges and kickbacks to Saddam Hussein. Some of the implicated companies avoided corruption in their own country where the level of corruption was low. However, in a different context, the same companies decided to engage in corrupt practices (Hoge, 2005).

The shared social perception about corruption in a given country determines the incidence of corruption. Internationally, business practices in many countries are in direct conflict with laws and regulations in other countries which makes it difficult for multi-nationals to conduct business. Corruption has emerged as an "institution" in many emerging economies as it becomes a part of the local culture and has a strong negative influence on the business climate. Anti-corruption measures should reduce the gain and increase the cost of the illegal and harmful act of the violation of public trust (Ackermann, 1999, 2004).

Corruption affects public institutions and private businesses in all countries to varying degrees, involves abusing the organizational position or power for personal gain (Triesman, 2000), and is not an individual phenomenon. One must understand corruption in the context of the individuals involved in the corrupt act as it represents social, political, and economic practices involving a secretive exchange resulting in mutual benefit. The exchange occurs by mutual agreement and for mutual benefit (Rabl & Kuhlmann, 2008; Park, 2003; Ashforth & Anand, 2003). The benefit can be economic, social influence, or political advantage. Corruption is not a victimless crime or transaction. The victims of corruption are outside the parties who participate in a corrupt act. Corruption may be viewed as unreported white-collar crime that is often considered a way of doing business, but it is an immoral/criminal proactive practice whose victims are always outside the exchange group. Since the exchange often violates moral, ethical and/or legal norms (Van Duyne, 2001), the practice of corruption is mostly hidden or secretive. Figure 1 illustrates a conceptual framework for corruption.

The macro-level determinants of corruption include economics, culture, history, and political systems. The micro-level of causes of corruption includes the structural variables in organizations including leadership styles and organizational culture. The management in an organization is directed towards processes

Figure 1. Conceptual framework for corruption

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and the leadership towards people (Davenport & Harding, 2010). Managers and leaders communicate desirable values and act as role models to the employees. The managers' reputation for integrity has an impact on the likelihood of corruption in an organization. An inconsistency between organizations' declared values and its managers' actual behavior may result in corrupt behavior and inferior performance by the employees (Carvajal, 1999). Corruption becomes normalized in an organization through the processes of socialization, rationalization, and institutionalization. Leaders and mangers do not have to actively engage in corruption, but they can reinforce the culture of corruption by ignoring corruption or otherwise facilitating unethical behavior (Ashforth & Anand, 2003).

Moralists and behaviorists view corruption as an immoral individual phenomenon which manifests itself in "selfish and improper" conduct of individuals (Gould, 1991). The incidence of corruption in organizations is related to low ethical standards and insufficient professionalism (Tanzi, 1988). However, corruption is not an individual phenomenon. One has to understand corruption in the context of the individuals and organizations involved in the corrupt act. Individual characteristics alone are not sufficient to account for a person's deviant behavior. It has been suggested that such behavior is partly induced by the unfair treatment the employees experience in the organization by the unethical actions of supervisors (Biron, 2010). Management's unjust actions and /or decisions may result in counterproductive behavior on the part of employees (Sauser, 2007). The social choices are shaped, mediated, and channeled by institutional arrangements (Powell & DiMaggio, 1991). Normative systems in organizations play a key role in generating criminal activity. They may even cause deviant behavior in those who would act in a socially acceptable manner in other types of setting (Apel & Paternoster, 2009).

Various aspects of organizational culture have the potential to facilitate corruption in an organization. A formalistic approach towards corruption does not help employees to make decisions about what constitutes corruption and corrupt decisions can be a 'grey area' for employees and management. The understanding of corruption depends on the social class to which an employee belongs (Collier, 2002). The formal code of ethics itself does not prevent management and employees to engage in corrupt practices. Complex, excessive, and ambiguous regulations that allow multiple interpretations may encourage the use of position for personal gain. They encourage discretion over the rule of law and weak legal systems can be a source and consequence of corruption simultaneously (Jain, 2001). Laws that are inconsistent with prevailing morals may create pressure on employees and management to enforce them selectively. The notion that the corrupt act does not break any law or harm anyone perpetuates the practice. Managing ethical problems through legal instruments alone is not very effective. Along with legal instruments, organizational expectations regarding acceptable and unacceptable behavior have to be communicated (Gorta, 1998). Along with legal sanctions, a change in organizational culture is necessary to ensure to reduce corruption.

Corruption represents both legal and illegal abuse of public office or entrusted power for private gain (Bardhan, 1997; Kaufmann, 2005). Examples of these include the exchange of legal political contribution for the passage of legislation favoring specific firms and exchange of public-sector procurement for private sector jobs. Many developing countries face illegal corruption in a context of high social inequality and low income. The motivation for corruption in poor countries is to increase income. The relative power of the general population in challenging the elite's corruption practice is low due to large income inequality. However, the elite are forced out of power once the frustration of the population reaches a tipping point. Income inequality in many developed nations is low, but the elite-built legal defenses lead to legal corruption that burdens the poor disproportionately and increases the income disparity. The motivation for legal corruption may be to maintain status quo for the elite. Low political accountability

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in many rich countries can lead to legal corruption in the context of private firms lobbying the government for legislation favoring specific firms. Nordic countries, in general, have low corruption due to emphasis on rule of law and egalitarian attitudes. Higher accountability determines the lower levels of legal corruption in more equal and richer societies.

Political economy model of legal and illegal corruption (Kaufman & Vicente, 2011; Vicente, 2007) considers both public and private sectors together responsible for corruption. Society represents a collection of elite public official, general population, and private agents. The elite may build a legal framework to protect their own the conduct of corruption. The public officials and private agents compete with the general population regarding allocation of goods. Corruption transaction occurs when a public official allocates a good to the private agent who competes with the general population. Corruption is also present when the private agent allocates a good to the public official who competes with the population. Bribery is the simple case of having money as the good allocated by the private agent. The rent at stake in these allocations is divided in some manner between the public official and the private agent. The political economy model of corruption suggests three types of outcomes regarding corruption. First is illegal corruption in which the elite do not face any binding incentives to limit corruption. Second is legal corruption in which the elite must incur a cost to legally protect corruption. The third outcome represents a case where the population is able to effectively react to corruption leading to no corruption (Kaufman & Vicente, 2011; Ackermann, 2004; Danon, 2010). Transparency, accountability, and the rule of law in dealing with corrupt government officials and politicians can lead to improved CPI ranking, induce investment, and foster economic growth (Nageri et al., 2013).

Based on the relationship between wealth and power, four distinctive syndromes of corruption have been suggested in Asian economies: "influence markets", "elite cartels", "oligarchs and clans", and "official mogul". Japan is an example of influence markets where the powerful private interests buy influence over specific policy outcomes. Korea represents the "elite cartels" where collusion and corrupt incentives enable elites to cooperate in governing, enriching themselves and resisting political competition. The Philippines represent the oligarchs and clan type of corruption where powerful families dominate the weak state. China experiences the "official mogul" type of corruption where state officials abuse power with impunity (Johnston, 2008).

MEASURES OF CORRUPTION

Since corruption is hidden and illegal, it is difficult to quantify. Surveys are often used to measure the level of perceived corruption but may not necessarily reflect the actual degree of corruption (Pederson & Johannsen, 2006). The respondents may overestimate due to hearsay, latest scandals, and a general mistrust of politicians and administrators alike (Rose & Mishler, 2007). If the survey questions ask about first-hand experience of corruption, it may underestimate the level of corruption as the respondents will refrain from reporting their own involvement despite anonymity.

Corruption can be measured subjectively based on perceptions or objectively based on convictions. The objective measures of corruption include the use of reports from anti-corruption agencies (Spector et al., 2005), press reports (Rehren, 1997) and court conviction records (Della Porta & Vannucci, 1999; Hill, 2003). The validity and reliability of these published data is questionable due to the possibility of bias in the press reports, political manipulation, and possible corruption in judiciary.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Subjective perception of corruption is not the same as actual corruption. The subjective measures include perception-based and participation-based. A second subjective measure of corruption concentrates on people's direct experience with or participation in corruption in terms of victimization index (Saligson, 2006). The victimization index focuses on the observed behavior of people involved in actual corruption. This is different from the perception of corruption based on peoples' beliefs. A weak correlation has been observed between the perception of corruption and actual corruption (Morrris, 2008).

CORRUPTION PERCEPTIONS INDEX (CPI)

First launched in 1995, cross-national data on subjective corruption perceptions index by Transparency International has been widely credited with putting the systemic issue of corruption on the international policy agenda (CPI, TI, 2013). Transparency International is a non-governmental organization that monitors and publicizes corporate and political corruption in international development. Transparency International data is a subjective measure of perceived corruption based on people's beliefs about the nature of the system.

The Corruption Perceptions Index ranks 177 countries and territories based on how corrupt their public sector is perceived to be on a scale of 0 - 100, where 0 means that a country is perceived as highly corrupt and 100 means it is perceived as very clean. A country's rank indicates its position relative to the other countries and territories included in the index. No country has a perfect score, and two-thirds of all countries score below 50. This indicates a serious, worldwide corruption problem. Denmark and New Zealand lead the world with the highest score of 91. The USA and Uruguay both placed 19th in the world with a score of 73. China and India score 40 and 36, respectively (Transparency International, 2013). The CPI ratings of select nations around the world represent undeveloped, developing, and developed economies (Table 1).

CORRUPTION AND ECONOMIC FREEDOM INDEX

The Heritage Foundation (2014) reports the Economic Freedom Index (EFI) based on 10 quantitative and qualitative factors, grouped into four broad categories, or pillars, of economic freedom for 186 countries. They include rule of law (property rights, freedom from corruption); limited government (fiscal freedom, government spending); regulatory efficiency (business freedom, labor freedom, monetary freedom) and open markets (trade freedom, investment freedom. Each of the 10 economic freedoms within these categories is graded on a scale of 0 to 100. Averaging these 10 economic freedoms, with equal weight being given to each, derives a country's overall score. The index of economic freedom is a measure of the fundamentals of economic growth. Hong Kong leads the world with a score of 90.1, followed by Singapore (89.4), Australia (82.0), Switzerland (81.6), New Zealand (81.2), and Canada (80.2). The USA is ranked 12th with a score of 75.5.

Table 1 compares the corruption score from the Economic Freedom Index and (EFI) and Corruption Perception Index (CPI). Economic Freedom Index (EFI) documents the positive relationship between economic freedom and a variety of positive social and economic goals. EFI is strongly associated with prosperity, healthier societies, cleaner environments, greater per capita wealth, human development, democracy, and poverty elimination. In an economically free society, individuals are free to work, produce,

Economic Freedom Index (EFI), Heritage Foundation, www.heritage.org

consume, and invest in any way they please. In economically free societies, governments allow labor, capital, and goods to move freely and refrain from coercion or constraint of liberty beyond the extent necessary to protect and maintain liberty itself. Economic freedom brings greater prosperity. Correlations between economic freedom, globalization, corruption and GDP were determined for 114 countries.

CORRUPTION AND "DOING BUSINESS INDICATOR"

Engaging in corrupt practices also creates a very unfavorable business environment by encouraging unfair advantage and anti-competitive practices. Paying off government officials appears to be an inevitable ritual for business leaders operating globally, especially in many developing countries. The World Bank collects data on "Doing Business" by measuring business regulations. The Doing Business project provides objective measures of business regulations for local firms in 189 economies and selected cities at the sub national level (Doing Business, 2014; World Bank, 2014). The report examines five areas as

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

measured by Doing Business: starting a business, dealing with construction permits, registering property, enforcing contracts, and trading across borders.

The ease of doing business indicator ranks economies from 1 to 189. Rank of 1 represents the regulatory environment that is most conducive to doing business. The index ranks the simple average of the country's percentile rankings on 10 topics covered in the World Bank's Doing Business project (World Bank, 2013). The ranking on each topic is the simple average of the percentile rankings on its component indicators. The ranking for ease of doing business is similar to that for corruption perception index. For ease of doing business, the ranking for New Zealand (3), Denmark (5), China (96), and India (134) is similar to the ranking for the corruption perception index (CPI) for New Zealand (91), Denmark (91), China (40), and India (36). Note that the high score for CPI represents less corruption whereas the small score for Doing Business means less regulation.

CORRUPTION AND "BEEPS"

The Business Environment and Enterprise Performance Survey (BEEPS) provides firm-level data on a broad range of issues about the business environment and performance of firms including business-government relations, firm financing, labor, infrastructure, informal payments and corruption, and other topics such as training and innovation. The Business and Enterprise Environment Survey (BEEPS) addresses the corruption at the firm and country levels. It was designed to assess the quality of governance across 20 countries of Central and Eastern Europe and the former Soviet Union from a firm level perspective (Hellman, et al. 2000). The BEEPS asks 200-600 firms in each country questions about their business environment and their interactions with the state. The samples are chosen in a uniform way in each country, with sector composition divided according to contribution to GDP. The BEEPS can be thought of as a compilation of indicators about what firms are saying about the ways that government policies, rules, and procedures are implemented in practice.

The BEEPS allows one to explore the relationship between different characteristics of firms (such as ownership, control, size, sector, etc.) and their effects on the firms' interactions with the state. Second, it provides an opportunity to investigate in depth the types of "services" for which firms pay bribes and the characteristics of these transactions. Third, it provides a micro-economic perspective on the costs and benefits to firms associated with corruption and different levels of governance.

The firm-level perspective provides one of the first opportunities to analyze empirically the problem of "state capture"; that is, the efforts of firms to shape and influence the underlying rules of the game (i.e., legislation, laws, rules, and decrees) through private payments to public officials. There has been analysis of how firms in the transition economies use their political influence to distort both the legal framework and the policymaking process in an effort to gain concentrated rents with detrimental consequences for the economy and society at large. The BEEPS provides the first opportunity to explore empirically the methods and mechanisms by which firms seek to influence the state, providing a new perspective on the phenomenon of state capture in the region and opening insights into larger questions of the political economy of reform.

The BEEPS is not just a corruption survey. Although corruption is one of the topics covered by the questionnaire, many other aspects of the business environment and enterprise performance are also present, including: crime, regulations and red tape, customs and taxes, labor issues, firm financing, legal and judicial issues, infrastructure, etc. To place matters in perspective, of the more than 400 variables

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the BEEPS dataset, fewer than 25 pertain to corruption, unofficial payments, or tax evasion which represents less than 7% of the database.

"Doing Business" and BEEPS often suggest the same conclusions. In countries where the results do not seem congruent, there are many possible explanations. Firms may have found ways to work around problematic regulations so that they are less burdensome; conversely, the formal rules and procedures may appear benign, while non-transparent implementation may cause firms considerable difficulty. In addition, improvements captured in the Doing Business indicators may take time to be recognized by the business community. For example, reductions in the minimum capital requirements to start a company will not help the firms already in existence. Preparatory work conducted on the basis of previous surveys and within the framework of the recent cooperation agreement between United Nations Office on Drug and Crime (UNODC) has produced a questionnaire and methodology for international standardized "Crime and Corruption Business Surveys" (CCBS). The questionnaire addresses bribery/ corruption, fraud, extortion and several forms of crime, which impact on business and industry.

CORRUPTION AND WORLD BANK INSTITUTE GOVERNANCE INDEX

There is a tremendous amount of overlap between the questionnaires used in the BEEPS and the ones used in Investment Climate Surveys (ICS). The participation of the World Bank's Investment Climate Unit in the BEEPS helped to enhance cross-regional comparability of results. There are, however, differences in the sampling approach used in the ICS which tend to focus on manufacturing firms.

The BEEPS is different from the World Bank Institute's Governance Indicator (WBI-GI) and Transparency International's Corruption Perception Index (CPI). Aggregate governance indicators, such as WBI-GI and TI-CPI, attempt to take various forms of existing indicators (expert opinions and surveys) and merge them together into a single index (In the case of WBI-GI, six indexes.) Neither WBI's indicators nor the TI-CPI is an original source of data as they are both essentially compilations and manipulations of other indicators. These indexes are popular among researchers because they cover hundreds of countries and have been useful for raising the profile of corruption and governance issues. The BEEPS, in contrast, is an original source of data that offers several useful features not found in aggregate indicators: The aggregate indicators employ different combinations of indicators in different countries. In contrast, the BEEPS apply a common yardstick to country comparisons.

Neither WBI's indicators nor Transparency International's Corruption Perception Index (CPI) allows for examination of changes over time, although they are often improperly used for this purpose. The WBI indicators are scaled to have a mean of zero every year, and the TI-CPI focuses only on relative ranks. The TI-CPI uses data up to three years old, and both TI-CPI and the WBI indicators offer heavy weight to expert opinions which tend to be adjusted infrequently. The WBI indicators generally do not reuse identical data, although the 2002 round of the BEEPS was included in both the 2002 and 2004 sets of WBI indicators. BEEPS, in contrast, allows for simple statistical checks for changes over time using techniques that have been around for some 80 years.

Aggregates such as WBI's indicators and the TI-CPI lump everything together as "corruption" or "control of corruption." In contrast, the BEEPS allows for an examination of different types of corruption, how much, how frequent, to which sorts of government officials, etc. The BEEPS also allow an examination of which firms are most impacted.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Business regulatory environment indicator assesses the extent to which the legal, regulatory, and policy environments help or hinder private businesses in investing, creating jobs, and becoming more productive. Countries are rated from 1 to 6 (World Bank Group, CPIA database).

IMPACT OF CORRUPTION ON FOREIGN DOMESTIC INVESTMENT (FDI)

Foreign domestic investment (FDI) and local domestic investment (LDI) are necessary for economic development of a country. FDI refers to the economic investment coming from abroad and is influenced by several economic and political variables of the host country. These include the size of the economy (GDP), GDP/capita, GDP growth rate, export orientation, political stability, inflation rate, and fiscal strength of a country (Habib & Zurawicki, 2001). In the short-term, corruption can have a beneficial effect for FDI since the corruption allows the businesses to get started quickly by paying bribes and bypassing the institutional and regulatory framework. However, corruption has a negative effect on FDI in the long-term. The corruption promotes arbitrariness and facilitates bypassing the regulations. This represents an uncertainty for the new foreign businesses and reduces FDI (Tanzi, 1998). In addition to FDI, local direct investment (LDI) is also necessary for economic development. The uncertainty in the business climate due to corruption affects both FDI and LDI negatively. However, FDI is affected more than LDI since the local investors are better informed regarding the 'voluntary tax' due to corruption (Habib & Zurawicki, 2001). Thus, in the long run, the level of FDI and economic development are lowered by the presence of corruption in the host country.

In addition to lowering the FDI, corruption in the host country changes the nature of technology transfer. When corruption is high, the foreign partner in the joint ventures limits the technology transfer to low technology goods and services (Smarzynska & Wei, 2000). A decline in corruption of 1% led to a 20% increase in FDI per capita for the 117 countries studied. Foreign investors prefer institutional stability and good governance to corruption (Al Sadig, 2009).

The relationship between corruption and FDI inflow works both ways. Corruption facilitates FDI inflow and FDI inflows cause an increase in corruption. The massive FDI influx in Ecuador was followed by a 13% increase in corruption since a simultaneous establishment of regulations and controls did not occur. However, in Estonia a gradual increase in FDI was accompanied by a gradual drop in corruption where new institutions, regulations and controls were put in place to manage the incoming new business (Robertson & Watson, 2004; Danon, 2010). A power law functional dependence was found between FDI and corruption perception index, CPI. In other words, FDI increase as CPI increased or FDI increased for less corrupt countries (Podobnik et al., 2008).

IMPACT OF CORRUPTION ON ECONOMIC GROWTH

The effect of corruption on the economy of a nation is influenced by four factors simultaneously including: unobserved country specific fixed effects, endogeneity of corruption and investment, the persistence of growth, and differences in how the corruption market is organized (Swaleheen, 2011). The first factor is time-invariant heterogeneity among countries in terms of religion, culture, and institutions. Cross-country differences in corruption (Treisman, 2000) and rate of growth (Islam, 1995) are influenced by

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

this time-invariant heterogeneity. The second factor is that the corruption and investment for economic growth are endogenously or internally determined for a country and are correlated with exogenous or external shocks that affect the rate of economic growth. Third, as a variable, the current rate of economic growth is correlated with its own lagged value. The fourth factor is related to the corruption level in a country and how the corruption participants are organized (Swaleheen, 2011).

In studying effect of corruption on economic growth, three factors are crucial. These include political stability, property rights, and the political system. The interplay between these three institutional factors determines whether the institutional environment hampers or fosters growth. Removing a distortion does not automatically increase economic growth and corruption is considered a distortion. Removing corruption does not automatically increase economic growth. Corruption affects the relationship between institutions and growth. Efforts to eliminate corruption can lead to political instability since corruption serves as a positive function to hold the society together. When property rights are not strong, corruption may become a positive element to reduce uncertainty and facilitate investment and production (Vaal & Ebben, 2011).

Human capital is considered the engine of economic growth. In the presence of corruption, firms must spend resources on business facilitation which reduces the resources available for developing human capital. This leads to lower economic growth (Kaufman & Wei, 2000). The growth reducing effect of corruption is larger in countries with a low level of human capital; typically low income countries (Ehrlich & Lui, 1999). The opponents of the growth-reducing view of corruption argue that corruption weakens the restrictions on output by greasing the wheels of the government for firms burdened by controls. Therefore, corruption is growth enhancing (Nye, 1989).

The country wealth is negatively associated with corruption (i.e., richer countries are less corrupt) (Svensoon, 2005). The corruption perception index (CPI) is positively related to GDP per capita growth rates. In other words, less corrupt countries show higher growth rates. For all countries in the world during the period 1999-2004, an increase in one unit of CPI (i.e., a decrease in corruption) led to an increase of GDP per capita growth rate increase of 1.7%. For European countries with transition economies, an increase in CPI by one unit delivered an increase in GDP per capita growth rate of 2.4% (Podobnik et al., 2008).

The role of corruption is different in a democratic system and a totalitarian system. Corruption is a distortion misusing resources and infects economic agent's incentives. Corruption is decentralized in a democratic political system and is detrimental to economic growth since it does not reduce uncertainty. In a totalitarian government, corruption is centralized and removes the uncertainty. In a totalitarian system, corruption can be conducive to economic growth (Vaal & Ebben, 2011). Corruption slows down the long-term growth through a wide range of channels and it can also have a beneficial effect on economic growth.

Corruption undermines firm growth and reduces the propensity to growth (Kimuyu, 2007). Most instances of implementation of economic reform (making the economy more open) and anti-corruption measures do not produce growth acceleration immediately (Hausman et al., 2005). The economic reform affected the growth positively after a lag of four years and the perception of the quality of governance (corruption) after a lag of three years (Giavazzi & Tabellini, 2005). China's unique experience of economic transition is characterized by the duality forms and effects of crony corruption underlying local corporatism in a dual track (i.e., market and political tracks) (Li, 2009).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

IMPACT OF LEGAL AND REGULATORY INSTITUTIONS ON CORRUPTION

The economic growth in a country depends of institutions that deal with property rights and contracting institutions (labor and finance). Institutions establish the rules of the game in a society that shape human interaction (North, 1990). Property rights institutions provide private agents protection from predation by the state or powerful elites, while contacting institution regulate contracts between private parties. The major role of the institutions is to reduce uncertainty by establishing a stable structure for human interaction. They provide a framework for transactions and cooperation to occur. Institutions that regulate contracting, property rights, labor, and finance have an influence on economic activity. Corruption may efficiently grease the wheels of institutional framework. Institutions influence the transaction cost of the human economic interactions. Institutions affect economic performance by their effect on the cost of exchange and production (North, 1990). Good institutions promote economic growth by establishing a good business environment where economic transactions occur under trust and order. When property rights are well established, the business partners do not need to spend resources to monitor and enforce transactions and can focus on production or doing business. The institutional feature of property rights enhances economic growth (Fedderke, 2001).

Corruption can be viewed as a proxy for the quality of institutions of property rights (Fernandes & Kraay, 2006). Corruption represents the use of political authority in order to make private economic gain in the form bribes. Corruption should therefore be higher where property rights institutions are weaker. Corruption can also influence the labor regulation, financial institutions, and availability of power (Acemoglu & Johnson, 2005). Specifically, one would expect weak contracting institutions to be a binding constraint on business performance only where property rights institutions are not (Honorati & Mengistae, 2007). Based on the study of the interaction between corruption, aggregate efficiency, and other dimensions of governance for a panel of 69 developed and developing countries, it was found that corruption is less detrimental or even positively related to efficiency in countries with less effective institutions When the institutions are not effective, people have to invest resources to track transactions, which take away resources from production. Diverting resources from production to transaction hampers economic growth (Meon & Weill, 2010).

Some institutions are formal while others are informal. Formal institutions have laws and contracts. The legal system deals with specific problems but it does not cover all possible human interactions. The informal institutions cover the areas of human interaction that formal laws do not. The informal institutions include codes of conduct, norms of behavior and conventions. These informal institutions are embedded in the national culture of a society and change very slowly. Both formal and informal institutions complement each other and are necessary for efficient functioning of a society. The quality of the formal institutions is the most important determinant of differences in income levels between countries (Roderick et al., 2002). The quality of informal institutions offers a statistically significant explanation for inter-country variations in growth rates of real per capita income (Scully, 1988).

Property institutions exert stronger influence on long term economic outcomes than contracting institutions Private agents usually circumvent the problem of poor contracting institutions by developing informal substitutes for them even if there is an added cost in terms of bribes. Businesses withdraw if property rights are not secure. In other words, the economic outcomes of the failure of contracting institutions tend to be less extreme than those of the failure of property rights institutions (Acemoglu & Johnson, 2005).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Corruption and tax evasion can have ambiguous effects on economic growth. Tax evasion increases the capital available to entrepreneurs. It also reduces the amount of public services offered by the government. Lin and Yang (2001) extended the portfolio choice model of tax evasion from static to dynamic setting. In the dynamic setting model, the public services represent non-productive capital. Diverting resources from the non-productive public sector to productive private sector, tax evasion is conducive to economic growth. The growth decreases with respect to the tax rate in the absence of tax evasion. In the presence of tax evasion, the growth rate is U-shaped with respect to the tax rate (Lin & Yang, 2001). Historical factors, geographic influence, and the government influence corruption, and both the size and scope of government impacts corruption. The historical inertia of institutions that induce corruption persists, and some geographic factors can mitigate corruption (Goel & Nelson, 2010). Nations with more government regulation for business nurture corruption (Woodside et al., 2012).

IMPACT OF GOVERNANCE ON CORRUPTION

Most existing cross-country surveys of national governance and corruption rely on the subjective views of outsiders, namely expert assessments, country analysts, or foreign investors. Corruption thrives where states are too weak to control the discretionary power of their bureaucrats, to protect property and contract rights, and to provide the institutions that enforce the rule of law. Recent studies of corruption have tended to focus on key characteristics and policies of the state, especially the extent of state intervention in the economy and the degree of discretionary power of bureaucrats.

The Worldwide Governance Indicators (WGI) project reports aggregate and individual governance indicators for 215 economies over the period 1996–2012, for six dimensions of governance including Voice and Accountability, Political Stability and Absence of Violence, Government Effectiveness, Regulatory Quality, Rule of Law and Control of Corruption (World Bank, 2014). National governance consists of the traditions and institutions by which authority in a country is exercised. This includes the process by which governments are selected, monitored, and replaced; the capacity of the government to effectively formulate and implement sound policies; and the respect of citizens and the state for the institutions that govern economic and social interactions among them.

The links between corporate governance and national governance have been largely unexplored. The interaction between corporate governance and national governance shape the business environment. Corruption is associated with a variety of problems such as impeding economic development. Effective corporate governance that restricts corruption benefits not only the business firm but also economic activity in host countries. Using data obtained from the Organization for Economic Co-operation and Development's (OECD) and Transparency International (TI), bribery, corporate fraud, cartels, and corruption in supply chains and transnational transactions have been investigated. Countries with lower corruption levels have experience significantly less unemployment than higher-corruption countries. In addition, gross fixed capital formation and foreign direct investment were more favorable (though not significantly different) for the lower-corruption countries (Smith et al., 2011).

In Asia, the most dominant form of the private sector is a family-owned business group. The corporate governance of such businesses is not as formal and lacks checks and balances found in the board-type governance structures in large corporations in advanced economies. Using Rose-Ackerman's typology of petty and grand corruption, results show the dilemmas faced when trying to operate within the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

precepts of corporate governance while dealing with the practical reality of corruption in public sector institutions (Rama, 2012).

Corruption is related to growth volatility. From the empirical analysis of 121 developed and developing countries, it was discovered that only corruption control and government effectiveness adversely affect the growth rate. A higher corruption control, expropriation risk control, government effectiveness and government consumption decreases growth volatility (Evrensel, 2010).

Corruption and economic growth are determined by political accountability. In countries with high quality political institutions, corruption has a substantial negative impact on growth. In countries with low quality political institutions, corruption has no impact on growth (Aidt et al., 2008; Blackburn et al., 2009). Political institutions influence the perception of corruption. Ideological polarization predicts perception of corruption. The perception of corruption is influenced by specific institutional features of the political system such as elements of the voting system, ballot structure, and separation of powers (Brown et al., 2011)

INTERVENTION STRATEGIES FOR CORRUPTION

Corruption circumvents the fairness and impartiality of the rule of law and benefits the private actors who practice it. The most effective strategy for these actors to behave ethically needs to be a combination of the carrot and the stick. To combat corruption, Singapore instituted the reversal of burden of proof and increased punishment and extraordinary investigation rights (Klitgaard, 1988). These measures may be in conflict with the democratic virtues of human rights and respect for the individual. The reverse burden of proof assumes the individual is guilty until proven otherwise. Granting extraordinary investigation rights to special anti-corruption units can create corruption in these units if the judiciary lacks independence and transparency.

Based on more than 1,500 interviews in Estonia, Latavia, and Lithuania, civil servants' perception found that increased detection and punishment for corrupt officials was effective. Conducting campaigns and ethical training was also helpful in reducing corruption. Women believed more in the effectiveness of sanctions, control and awareness instruments (Johannsen & Hilmer, 2012).

Corruption is a multifaceted and context specific problem. One requires a context-specific approach to diagnose and intervene in corruption cases. Four prevailing frameworks or intervention policy approaches include law enforcement, economics, moralism, and cultural relativism (Bellows, 2013). First, the law enforcement framework treats corruption as violation of law. This legal approach is used by anticorruption agencies, the International Bar Association's Anti-Corruption Committee, and legal conventions such as the OECD and the Anti-Bribery Convention. Intervening in corruption using the legal approach requires increasing resources for the law enforcement agencies and promoting their political independence.

Second, the economic framework views corruption as a product of incentives. Bribes are paid to or demanded by rational participants when the benefits of bribery exceed the costs. The focus is on monetary trade-offs. The risk of legal conviction or loss of reputation becomes secondary. The economic intervention involves adjusting incentives and external conditions to change behavior of the participants to reduce corruption. There is no value judgment in the economic framework.

The third corruption intervention strategy is based on moralism as corruption is considered intrinsically wrong and is not simply illegal and economically conditioned. Corrupt officials who become prosperous through corruption are not viewed favorably. A moralistic perspective on corruption uses the "name

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and shame" approach. The TI Corruption Perceptions Index is such an approach. A moral rejection of corruption can lead to the citizen activism to demand accountability. However, the moral perceptions of the citizens can be influenced by domestic law enforcement which may ignore corruption. This can lead to a sense of resignation on the part of the citizens about the possibility of eliminating corruption.

The fourth corruption intervention strategy recognizes cultural relativism regarding what is considered corruption in a specific culture. This perspective is based on the view that corruption is in the "eye of the beholder" and views corruption through the lens of local culture. What is seen as a corrupt practice in one country can be perceived as a legitimate action in another country (Dion, 2010). In some cultures, corruption is so pervasive that people believe nothing can be done about it so it is considered a necessary evil. They believe corruption may be ugly but it is unavoidable and here to stay. Using such arguments, savvy bribe payers continue bypassing regulations to promote their business interests in countries where corruption is pervasive. Elites from developing countries assert that permitting bribes in international business transactions is their competitive advantage, well-deserved after decades of economic subservience (Bellows, 2013). In many developing countries, corruption has evolved over time to serve a social function. In the absence of a social safety net, earnings from corruption are considered as retirement savings. A context-specific integrated approach using all four frameworks is proposed for diagnosing corruption and taking corrective action (Bellows, 2013).

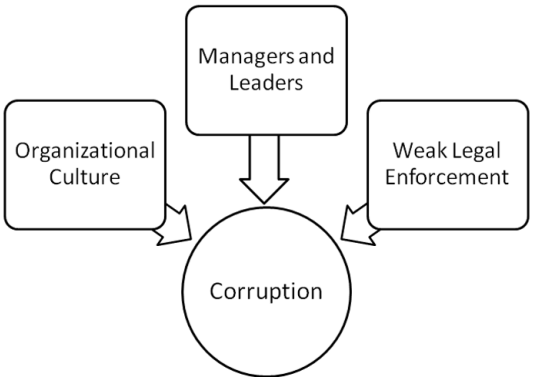
Most of the anti-corruption measures focus on the enforcement of controls and punishment of violations. These functional measures designed to combat corruption can be outmaneuvered by corruption. Transformative measures like amnesty as an anti-corruption strategy can also be effective since corruption is a social and cultural phenomenon (David, 2010). The idea of functional and transformative measures to combat corruption is based on the Rustow's (1970) concepts of 'function' and 'genesis' in the context of transition to democracy. This view distinguishes between correlation and causation. In other words, the factors that keep democracy stable may not be the ones that brought it into existence. Applying that to corruption, measures leading to less corruption differ from those that contribute to maintaining less corruption. Amnesty has been proposed as an anti-corruption measure (David, 2010).

Hong Kong created an independent commission against corruption (ICAC) in 1974. The success of ICAC in reducing corruption rests on the structural and resource independence. It uses a three-pronged approach of operations, corruption prevention and community relations (Wong, 1981). Amnesty was granted to the Royal Police Force in Hong Kong in 1977 and was a transformative measure targeting corruption as a social and cultural phenomenon. The transformative role of the amnesty paved the way for ICAC's success and reduced corruption in Hong Kong (David, 2010).

The United Nations Convention against Corruption (UNCAC) is the only legally binding, comprehensive, global anti-corruption instrument to fight corruption and promote integrity. The UNCAC covers five main areas: prevention, law enforcement measures, international cooperation, asset recovery and information exchange. The United Nations' (UN) office on Drugs and Crime (UNODC), acts as a catalyst and a resource to help effectively implement the provisions of the UNCAC. The UNODC provides practical assistance and helps build the technical capacity needed to develop effective anti-corruption policies and institutions, including preventive anticorruption frameworks in the public and private sector. This is especially helpful for vulnerable developing or transitional economies. The UNODC has a web-based anti-corruption portal known as TRACK (Tools and Resources for Anti-Corruption Knowledge). The portal features a legal library on the UNCAC, thus providing a unique gateway to an electronic database of legislation and jurisprudence relevant to UNCAC from over 175 countries systematized in accordance with the requirements of the convention.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The TRACK portal brings together legal and non-legal knowledge on anti-corruption and asset recovery enabling member states, the anti-corruption community, and the general public to access this information in a central location. An anti-corruption learning platform is also incorporated, providing a common space where analytical tools generated by partner organizations can be searched and accessed by users worldwide. An anti-corruption learning platform is also incorporated, providing a common space where analytical tools generated by partner organizations can be searched and accessed by users worldwide. A further key objective of TRACK is to create a community of practice where registered users can communicate, exchange information and schedule events. The common workspace is intended for partner institutions, anti-corruption practitioners and experts to communicate and collaborate directly with each other.



IMPACT OF ORGANIZATIONAL CULTURE AND LEADERSHIP ON CORRUPTION

Corruption should not be regarded as primarily an individual phenomenon. Corrupt individuals represent a network that is embedded in an organization whose culture tolerates corruption. Corruption becomes normalized in organizations through the process of institutionalization, rationalization, and socialization (Figure 2). It represents a cultural and societal phenomenon. Normative systems in an organization play an important role in generating corrupt activities. They may even cause deviant behavior in some who would act in a responsible manner in other settings (Apel & Paternoster, 2009). Leaders do not have to actively engage in corruption, but they can reinforce the culture of corruption by ignoring corruption or facilitating unethical behavior (Ashforth & Anand, 2003).

Good managerial ethics is essential to curbing corporate crime in organizations (Paternoster & Simpson, 1996). Both managers and leaders act as role models for the employees. They strongly influence the organizational culture and set the ethical tone of an organization. Management in an organization is directed towards processes and the leadership towards people (Davenport & Harding, 2010). Role modeling, openness and strictness of leaders have a direct impact on the frequency of integrity violations by employees (Huberts et al., 2007).

At the macro-level, corruption is influenced by economics, national culture, and political systems. At the micro-level, organizational culture plays a significant role. The organizations shape, mediate, and

Figure 2. Causes of corruption in an organization

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

channel social choices (Powell & DiMaggio, 1991). An individual's values alone are not sufficient to explain a person's deviant behavior. Unethical actions by supervisors and the unfair treatment experienced by employees also contribute to their illegal behavior (Sauser, 2007; Biron, 2010).

Organizations have written code-of conduct for the employees to follow. This requires a clear understanding of what is considered corruption. For employees, there may be "grey areas" and their interpretation may depend upon the social class they belong to (Heidenheimer, 2002; Collier, 2002). Written ethical norms in organizations must be converted into everyday practices so that management and employees behave morally (Pucetaite et al., 2010). Management must act as a role model in this regard. Organizations often tend to manage the corruption issues through legal action alone. A two-pronged approach is necessary where one combines the legal action with an effective communication of organizational expectations of non-corrupt conduct. Weak legal system can be a source of corruption and also a a consequence of corruption.

Complex and ambiguous regulations that permit multiple interpretations may encourage the use of position of authority for personal gain (Jain, 2001). Laws that are not consistent with prevailing norms may create pressure on employees and management to enforce them selectively (Carvajal, 1999). Employees and management may interpret that since their actions are not harming anyone, they are not corrupt. Clear and consistent communication of what is corruption, converting written code of conduct into everyday practices, role modeling by management, sanctions against corrupt actions, and ethical training are effective ways for an organization to be corruption-free. Ethical training makes people behave in non-corrupt ways not because of sanctions, but because people believe corruption is not good for the individual and the organization (Mulder et al., 2009).

IMPACT OF BUSINESS ETHICS TRAINING ON REDUCING CORRUPTION

Increased teaching of business ethics can have a positive effect on the fight against corruption (Niekirk, 2003). Can theory influence practice? A Hegelian approach to the problem, in terms of which theory can and does influence practice, is compared to a Marxist approach in terms of which theory is only a reflection of practice. The author chooses a position mediating between these two extremes and develops a model that relies heavily on the idea of an ethics of responsibility based on Aristotle's idea of phronesis (practical wisdom based on deliberation). The practical implications of these ideas for the utilization of business ethics teaching in companies are consequently explained. While more teaching of this discipline cannot guarantee better morals in a company, it can better equip all involved to deal with the ever increasing moral problems facing business people. There can be no doubt about the seriousness of the crisis faced by morality.

SUMMARY

Corruption represents the abuse of entrusted power for personal gain and is a social, economic, and political issue for all nations. Corruption is pervasive globally in both developed and developing economies and provides an economic advantage to the parties participating in the act. Corruption exists in government institutions, non-profit organizations, small and medium enterprises, multi-national corpo-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

rations and private businesses, and also exists in democratic, dictatorial, feudal, capitalist, and socialist or centrally-planned economies. Corruption exists in societies practicing Christianity, Islam, Hinduism, Jewish, Buddhism, and no religion. Corruption ranges from petty corruption to political/bureaucratic or systemic corruption and becomes embedded in a society's culture and way of life.

Corruption is one of the primary obstacles to the economic development of a country and also decreases firm growth. Corruption and rapid growth have coexisted in many Asian countries. Nations with many rules nurture growth in corruption which undermines the rule of law, weakens trust in public institutions, and challenges democratic institutions which leads to government instability. Corruption attacks the foundation of democratic institutions by influencing the electoral processes. Economic development is hampered due to reduced foreign direct investment and adverse business climate. Corruption is a multifaceted and context specific problem. One requires a context-specific approach to diagnose and intervene in cases of corruption.

Various approaches to combat corruption include legal, economic, moral and organizational culture. Strengthening the legal and regulatory agencies help combat the corruption. Legal enforcement of anti-corruption practices, protecting property rights and rule of law help reduce corruption. Transparency and accountability promote ethical behavior. Positive role-modeling by leadership and management creates an organizational culture of integrity. Ethical training also helps to reduce the corrupt practices. Combating corruption in the local and international business has become the 21st century ethical, social, and political challenge.

KEY TERMS AND DEFINITIONS

Business Climate: Refers to the attitude of government and lending institutions towards business activity. It also includes the tax rate, inflation and attitude of labor unions towards employers.

Business Ethics: A form of applied ethics that examines ethical or moral problems that arise in a business environment. It applies to all aspects of business conduct and is relevant to the conduct of individuals and entire organizations.

Corruption Perception Index (CPI): Is the annual ranking of countries "by their perceived levels of public sector corruption, as determined by expert assessments and opinion surveys. The CPI generally defines corruption as 'the misuse of public power for private benefit'."

Corruption: Is defined as abuse of entrusted power for private gain.

Doing Business Indicator: Ranks the economies in 10 areas of business regulation, such as starting a business, resolving insolvency and trading across borders.

Economic Freedom Index (EFI): Is an annual guide published by The Wall Street Journal and The Heritage Foundation. The Index covers 10 freedoms – from property rights to entrepreneurship – in 186 countries.

Chapter 36
Grassroots Innovation for Human Development:
Exploring the Potential of Participatory Video

ABSTRACT

Can digital technologies serve to highlight and strengthen the work of social organizations that promote human development? This is the question the authors want to answer in this article, in which they analyse an eight-month participatory video (PV) process, promoted by a group of university researchers and conducted in collaboration with two grassroots innovations (GI) in the city of Valencia (Spain): the Fuel Poverty Group and Sólar Dómada. The innovative component of PV is situated in two areas: firstly, as an action research methodology, the PV process enables people's participation, with the aim of generating learning, agency and contextual knowledge from the participants; secondly, the innovation is found in the product, the video itself. The video narratives can be used to disseminate the practices of the GIs and offer a space for critical reflection on the structural constraints that may hamper the diffusion of innovations. Furthermore, the audiovisual work itself has its own agency and has the potential to create opportunities for advocacy and contribute towards removing barriers that limit human development.

INTRODUCTION

Can digital technologies serve to highlight and strengthen the work of social organizations that promote a model of a more equitable and sustainable development? This is the question we want to answer in this article, in which we will analyse an eight-month participatory video (PV) process, promoted by a group of university researchers and conducted in collaboration with two social organizations in the city of Valencia (Spain): the Fuel Poverty Group and Sólar Dómada. We call these two groups Grassroots Innovations (GI) according to the definition by Seyfang and Smith (2007), who understand GIs as:

networks of activists and organizations generating novel bottom-up solutions for sustainable development; solutions that respond to the local situation and the interests and values of the communities involved (p. 585).

Business and industry are no longer the only actors of innovation, but also groups of people from civil society, mainly activists or non-profit organizations, that generate bottom-up innovation in response to local needs. The aim of this kind of innovation is to lead to a transition to a more sustainable society, introducing a normative direction of innovation (Smith et al., 2010).

In this paper, we complement this normative perspective of innovation for sustainability with the human development and capability approach, which arises from such a tradition in humanist social philosophy and humanist economics (e.g., Haq, 1999; Nussbaum, 2000; Gasper, 2009). It stresses: a plurality of values, not only the values of economic utility as expressed and promoted within markets; secondly, a human-wide concern and solidarity, as in human rights philosophy: the field of reference is all humans, where ever in the world, and in particular all those affected by one's actions; and thirdly, it recognises the normality and centrality of interconnections: side-effects of markets mean that market calculation is insufficient even if we only use a value of economic utility. Human development theory, represented for example in the UNDP Human Development Reports, moves to analyse processes and connections not only within disciplinary and national boundaries. Economic policies towards low-income countries for example can have major wider impacts, on conflict and violence, the flow of arms and the creation or strengthening of international crime networks, disease, migration, international epidemics, and more efficiency (Boni & Gasper, 2012).

Following previous attempts of dialogue between GI and human development (Pellicer, 2016), we can call this kind of innovation GI for Human Development.

The first GI is the Fuel Poverty Group, a new group of volunteers, mainly university students that want to challenge fuel poverty[1] by giving advice on how to reduce fuel consumption. This group is part of a wider network named the Platform for a New Energy Model[2], which works towards a more democratic and sustainable energy model.

The other group is the Solar Dómada[3], a group of people who are occupying a private plot, highly deteriorated at the time of their occupation (2013), as a way to assert the need for social spaces in the neighbourhood. Solar Dómada also seek to highlight that another kind of coexistence between neighbours is possible; one based on respect and intercultural coexistence. In the centre of the plot is the Garden of Ca Favara, one of the symbols of neighbourhood participation, involving more sustainable practices of food production and consumption.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are, therefore, two experiences of GI that have a common aim behind their activism in that they both seek a more equitable, democratic and sustainable livelihood. The differences between them lie in: the area in which they are located (energy and production of urban space); the age and characteristics of their members (university students in the case of Fuel Poverty Group and people of different ages, educational levels and careers in the case of Solar Dómada); and their strategies (information and technical advice in the case of Fuel Poverty Group and occupation of urban space in the case of the Solar).

Over a period of six months (from October 2015 to March 2016), a group of researchers (including the authors of this article) worked with these two groups and facilitated a PV; understood here as a participatory action research where people created their own film, using digital video technology. This PV was a five-stage PV process, from the initial definition and planning to the public screening and debate on the videos.

From our perspective, the innovative component (towards human development) of the PV is situated in two areas: firstly, as an action research methodology, the PV process enables people's participation with the aim of generating learning, agency and contextual knowledge from the participants (Lunch & Lunch, 2006; White, 2003; Millán & Boni, 2016; López-Fogués et al., 2016). In this sense, the methodology is totally coherent with the core values of human development and can itself be considered as a kind of innovation towards human development. Secondly, the innovation is found in the product, the video itself. The video narratives can disseminate the practices of the GIs; offering a space for critical reflection on the structural constraints that may hamper the diffusion of innovations. Furthermore, the audiovisual work itself has its own agency (Latour, 2005); not only does the PV create opportunities for learning, agency expansion and empowerment during the process, but the product also has the potential to create opportunities for advocacy (Wheeler, 2012), and to contribute towards removing the barriers that limit human development.

In this paper we want to examine to what extent this PV process has been a tool of human development innovation. We will explore both the process and the product using different categories belonging to the participatory action research and human development literatures. With regard to the process, we will pay attention to the communicative spaces developed using the PV. As stated by Kemmis and McTaggart (2005), communicative spaces are forums "in which people can join one another as co-participants in the struggle to remake the practices in which they interact" (p. 563). Inside these communicative spaces, the co-participants interact, discuss, learn (consciously and unconsciously), create knowledge and are exposed to power dynamics that can hamper, boost and, in any event, influence participation dynamics (Gaventa & Cornwall, 2008; Millán & Boni, 2016). Therefore, the three main questions to be explored will be: 1) To what extent, in the different communicative spaces created during the PV, did participation take place? 2) What kind of knowledge was co-created? 3) Did participants expanded their agency and capabilities? Both agency and capabilities are two main categories of the human development approach, to which we will refer in depth in section 3. Agency refers to the ability of the individual to pursue and achieve the objectives they value. An agent is someone "who acts and makes change happen" (Sen, 1999, p. 87). Capabilities are the substantive freedoms (which the same author also names "the real opportunities") to lead the kind of life that people value. It is important to understand the idea of capabilities as freedoms or opportunities. They cannot be desires, but must be something that can be put into practice. They include both material things and the states of people (Sen, 1999). With regard to the product, we will analyse to what extent the narratives of the two videos produced are coherent with human development values and whether the video achieved its potential as an agent of change.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

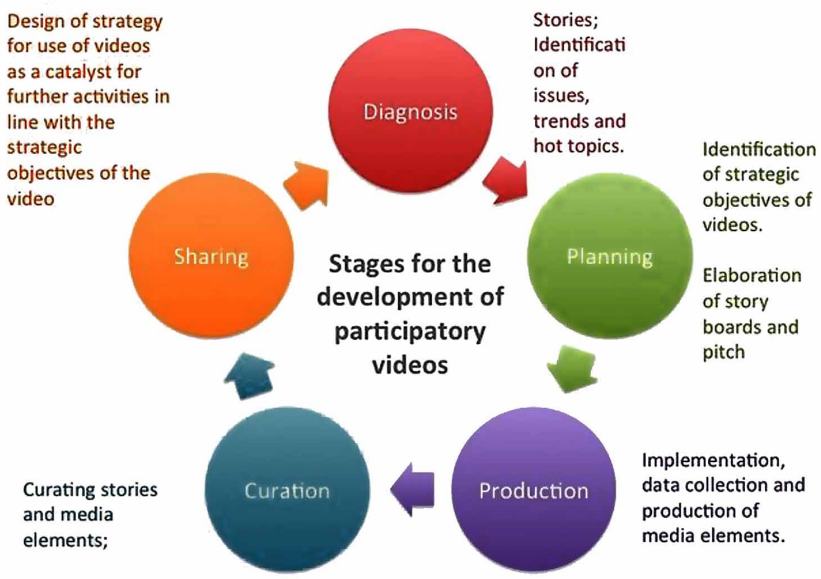
In the next part, section 2, we describe the PV process developed, identifying the different communicative spaces produced; in section 3 we address the main characteristics of the theoretical framework applied; in section 4 we discuss the evidences obtained and, lastly, in section 5 we conclude with some considerations of PV as a tool for action-research in GI for human development.

THE PV PROCESS

According to several authors, PV can be understood as a manifestation of the relationship between the media and the world of development (Scott, 2014; Plush, 2012), but it is also identified as a methodological tool within the scope of Participatory Action Research (Fals-Borda & Rahman, 1991). PV like Participatory Action Research is a method of research and collaborative action characterized by the active involvement of people, the participants of the process. The facilitators are those who help structure the process and encourage interaction and discussion among participants to deepen contextual knowledge and, thus, look for possible solutions (Millán & Boni, 2016).

Video is considered a means of creative communication; it is easily accessible and also, when basic technical support is provided, easy to use. In PV, the art of "storytelling" and the collaborative construction of the audiovisual content, mainly seek to provide a space for critical reflection on processes and social struggles and to appeal for advocacy and action on injustices that affect the participants. The PV process also enables those involved to exercise power and take control while generating agency and empowerment between participants (Lunch & Lunch, 2006; Wheeler, 2012; White, 2003).

In our particular case, PV was used as an action-research method to try to grasp the contextual knowledge produced and as a way to empower members of the two local initiatives through various cycles of reflection and action. An additional objective was to produce an output – the two videos[4] – that can be useful tools for the goals of the various participants: for the local organizations, as a tool to show and disseminate their activities and add new constituencies; and for the group of facilitators, members of INGENIO a Spanish Institute devoted to knowledge management and innovation[5], as a way of illustrating a way of conducting research and discussing its social relevance.



The 8-minute video by Solar Dómada presents the occupied plot as a place where coexistence between neighbourhoods is promoted and more sustainable lifestyles are demanded, which are respectful of the differences between cultures and between generations. At the heart of the plot there is a small orchard, literally dug into the cement, symbolizing a space of resistance against a model of the unsustainable and individualistic city in a peripheral and difficult urban environment. The second video (6'50") illustrates a recent problem in the Spanish context; that of fuel poverty. The video shows evidence of what is meant by fuel poverty and how conducting a review of the entire energy consumption of a household can lead to improved energy efficiency.

In Figure 1, we illustrate the different phases of PV (diagnosis, planning, production, curation and sharing) according to a definition developed by Millán and Frediani (2014) and later used to guide other PV processes (Boni & Walker, 2016; Boni & Millán, 2016; Millán & Boni, 2016; López-Fogués et al., 2016). During the five phases we identify the three different communicative spaces that occurred during the PV: inside the GIs, between GIs and facilitators and between GIs, facilitators and other people.

In the first phase, diagnosis, participants identified the most relevant issues. This phase occurred in two types of communicative spaces: inside GIs and between groups and facilitators. In the case of Solar

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Stages of participatory video development (Millán and Frediani, 2014)

Dómada, the intra-group space was particularly important as it enabled a reconstruction of the history of the group. In the case of the Fuel Poverty Group, the interaction between this group and the other participants enabled them to think about the narrative of the video, embracing a broader perspective of fuel poverty.

The second phase was planning, where the storyboard was developed. This occurred primarily inside groups and then it was socialized in a communicative space of a collective nature, which was also very much appreciated by the participants, allowing them to reflect on the narratives and contents of the two videos.

The third phase was the video production. In the case of the Fuel Poverty Group, the participants asked people outside the action research about the significance of fuel poverty or how they felt about being labelled "energy poor". As we will discuss in section 4, these interactions were a very important source of learning about rethinking the idea of fuel poverty and the scope of performing energy consultancy as a mechanism to deal with it. In the case of Solar Dómada, the production phase stimulated a variety of communicative spaces between group members and the neighbourhood, providing various perspectives on the plot. The contribution of the facilitators at this stage was to provide technical assistance in recording.

The fourth phase was the publication (curation) of the two videos, which in the case of Solar Dómada was conducted with the help of an external facilitator, while in the case of the Fuel Poverty Group, the task was taken on by the group itself. There was a collective communication space where videos were pre-viewed internally. For the Fuel Poverty Group, this space of collective discussion allowed them to refine the video narrative.

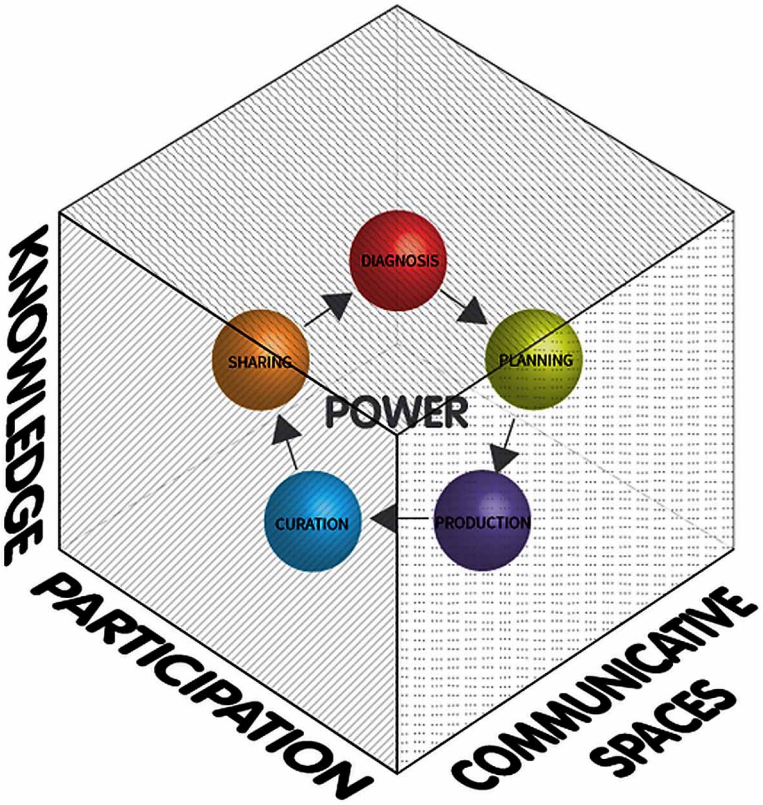
The PV cycle ended with the public presentation of the videos in an emblematic site in the city of Valencia, due to its political character (Ca Revolta). After the screening there was an interesting dialogue between group members, facilitators and the audience, composed of activists and academics and neighbours of the Solar Dómada.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

MAIN CATEGORIES TO EXPLORE INNOVATION FOR HUMAN DEVELOPMENT

As stated at the introduction, to analyse the PV process we use three categories frequently mentioned as significant in the participatory action research and the capability approach for human development literature. The first is "communicative spaces". As Kemmis and McTaggart state (2005, p. 563), "PAR offers an opportunity to create forums in which people can join one another as co-participants in the struggle to remake the practices in which they interact". The same authors define practice as the real, material, concrete and particular actions of particular people in specific places, which can "comprehend what people do, how people interact with the world and with the others, what people mean and what they value, the discourses in which people understand and interpret the world" (Kemmis & McTaggart, 2005, p. 565). The second category is participation. According to Bradbury-Huang (2010), participation can be considered on a broad spectrum: from a minimum involvement of practitioners (for example, in a needed consultation) to having those practitioners as co-researchers and co-designers. The third category is knowledge. As we mentioned at the beginning of this paper, through participation in communicative spaces, knowledge is produced. This knowledge is assumed to not only be the understanding of the topics addressed, but also practical knowledge (the skills developed) and the values that underpin the knowledge produced (Kemmis & McTaggart, 2005).

As occurred in previous analyses of other processes of PV (López-Fogués et al., 2016; Boni et al., 2016a), we can represent each of these three elements – communicative spaces, participation and knowledge – as the axes of a three-dimensional figure, a cube, taking inspiration from the work of Frediani (2015) and Gaventa (2006), and first developed in Boni and Walker (2016). The use of the cube aims at visualising complex interactions among dimensions in the analysis of participatory processes. In our case, it aims at representing the intersections that occur between knowledge and participation within communicative spaces that take place during the cycles of reflection and action in the phases of the PV. The representation of our analytical understanding is presented in Figure 2, in this we find the cycles of the PV process (see Fig. 1) inside the cube. In the interactions between the three axes, issues of power emerge and shape the kind of participation and knowledge produced (Gaventa & Cornwall, 2008).



The other theoretical perspective is the capability approach for human development, which was developed in answer to the question "Equality of what?". Sen's response (1992) was to insert capabilities into the evaluative space, that is to understand and measure development as a process of expanding the real freedoms (the capabilities or well-being freedoms, the opportunity aspect of freedom), that people enjoy to be and do what they have reason to value (their plural function or well-being achievements). Well-being is thus understood in terms of how a person can "function", or what a person can actually be and do.

If capability is freedom of opportunity, agency is freedom of process. Agency refers to the ability of the individual to pursue and achieve the objectives they value. An agent is, as Sen notes (1999), someone who acts and makes change happen. As Deneulin (2014) explains, "well-being not only depends on what a person does or is, but on *how* [author's emphasis] she achieved that functioning, whether she was actively involved in the process of achieving that functioning or not" (p. 27). Sen's answer to his famous question "Equality of what?" is not only equality and democratically decided basic capabilities, but also, and just as importantly, equality of agency and process freedoms (Crocker, 2008).

The last characteristic of the capability approach for human development we want to highlight is its multidimensional and integral understanding of good lives. The plurality of dimensions and underpinning of values constitute a crucial anchor and guard against its easy domestication (Boni et al., 2016b).

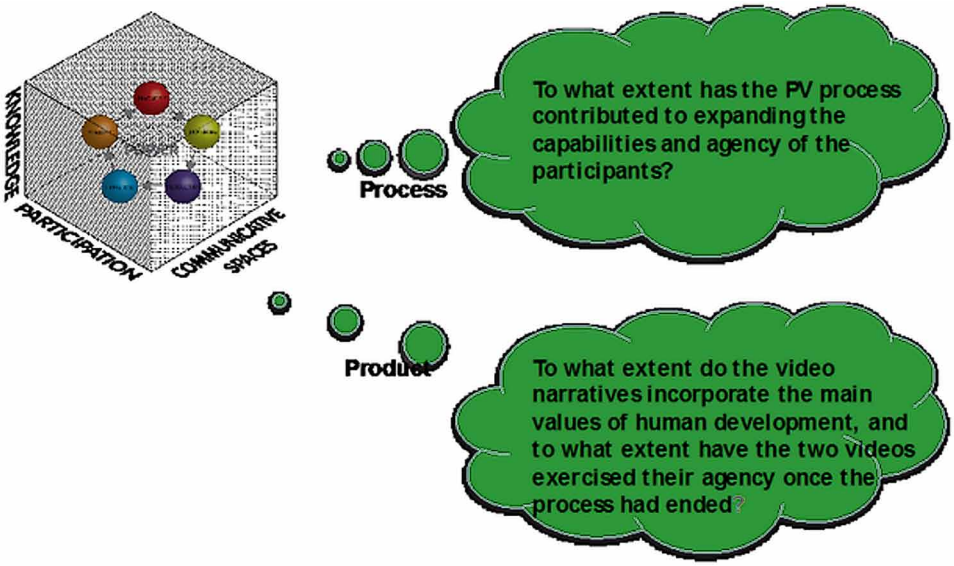
EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Three-dimensional framework to analyse PV processes (Boni et al., 2016a; López-Fogués et al., 2016)

All the values matter and support and reinforce each other. In a more detailed definition of the central values of human development, Alkire and Deneulin (2009) identify four interlocking principles of equity, efficiency, participation and empowerment, and sustainability and elaborate each as follows:

1. *Equity* draws on the concept of justice, impartiality and fairness and incorporates a consideration for distributive justice between groups. In human development, we seek equity in the space of people's freedom to live valuable lives. It is related to, but different from, the concept of equality, which implies the equality of all people in some space. In human development, equity draws attention to those who have unequal opportunities due to various disadvantages and may require preferential treatment or affirmative action.
2. *Efficiency* refers to the optimal use of existing resources. It is necessary to demonstrate that the chosen intervention offers the highest impact in terms of people's opportunities. When applying this principle, one must conceive of efficiency in a dynamic context since what is efficient at one point in time may not necessarily be efficient in the long run.
3. *Participation* and empowerment is about processes in which people act as agents – individually and as groups. It is about the freedom to make decisions in matters that affect their lives; the freedom to hold others accountable for their promises, the freedom to influence development in their

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



communities. Whether at the level of policy-making or implementation, this principle implies that people need to be involved at every stage, not merely as beneficiaries or spectators, but as agents who are able to pursue and realize goals that they value and have reason to value.

4. *Sustainability* is often used to introduce the durability of development in the face of environmental limitations but is not confined to this dimension alone. It refers to advancing human development such that progress in all spheres – social, political and financial – endures over time. Environmental sustainability implies achieving developmental results without jeopardizing the natural resource base and biodiversity of the region and without affecting the resource base for future generations. Financial sustainability refers to the way in which development is financed without penalizing future generations or economic stability. Social sustainability refers to the way in which social groups and other institutions are involved and support development initiatives over time, avoiding disruptive and destructive elements. Cultural liberty and respect for diversity are also important values that can contribute to socially-sustainable development.

As Alkire and Deneulin point out, these four principles are not exhaustive; other values, such as responsibility or justice, could also be considered. However, we agree with Ibrahim (2014) that an intervention inspired by the human development approach should incorporate all four dimensions; even if its main focus is on one dimension of value, the others must also be considered in relation to the main value chosen. For example, efficiency should not be considered on its own.

Thus, departing from the four values identified by Alkire and Deneulin (2009) and the categories of capabilities and agency illustrated above, in the next section we analyse to what extent the capabilities and agency of participants were expanded through the PV process (also analysed through the interaction between communicative spaces, knowledge and participation) and if and how the main narratives of the two videos inspire and adhere to the main values of human development. Finally, we consider whether the audiovisual products were able to exert their agency once the PV process had ended. Figure 3 depicts our understanding of this analysis.

Figure 3. Capability approach for human development analysis of the PV (Source: the authors)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

We will base our evidence on participant observation conducted throughout the process along with three groups interviews to members of the two GIs at the end of the PV process. In the case of Solar Dómada, two group interviews were conducted: the first with 3 women participating in the GI and the second with two men. The reason for doing it this way is that, during the PV, a difficult power relation between one of the women and the two men was detected. To enable the interview to flow more naturally, it was decided to separate the two groups. In the case of the Fuel Poverty Group a single group interview was conducted with a woman and a man. All the interviewees give us their informed consent.

The exploration of the narrative of the two videos has been performed by analysing the dialogues that appear in both videos, regardless of any other characteristics thereof (for example, non-verbal expressions). It is, therefore, an exploratory study that paves the way for future applications of the capabilities approach for human development in the analysis of audiovisual content. One limitation of this exploration is it has been made only by the authors of this paper, without involving the participants of the PV process. The authors are aware that incorporating the participants in the analysis could be more coherent with principles of human development and PV. Also, could be a more fruitful way as it can provoque new communicative spaces that can produce meaningful learning and knowledge.

THE PROCESS: EXPANDING CAPABILITIES AND AGENCY THROUGH COMMUNICATIVE SPACES

We will begin this section by analysing the potential of communicative spaces (both collective and within the groups) to create knowledge and foster participation. Starting with the collective communicative spaces mentioned before, both groups acknowledge that the first collective meeting was highly motivating and exciting. As noted by one of the members of the Solar Dómada:

It was very encouraging to see that your team [INGENIO team] was interested in our initiatives and because the problems we often have is making ourselves understood by our neighbours... I thought it was a good opportunity to become known in the neighbourhood... also to try something new, editing a video is far from what we normally do.

In terms of the knowledge produced, we can identify the second collective moment that happened at the planning phase as being extremely powerful – when the two organizations shared storyboards. During moments of dialogue, participants were able to contrast their visions on the themes that would be address in the videos. For example, one of the members of the Fuel Poverty Group indicated:

XX told us that energy is not only electricity… there is solar thermal energy in the roofs of the houses... [all of these] are reflections from other points of view that you can get if you talk to people, and especially if you talk to groups that are already committed... [this is] where richness lies

In the case of the Fuel Poverty Group, the collective moment helped the group to adopt a less paternalistic perspective of fuel poverty. Their first option was to show one person affected by fuel poverty and how the energy consultancy could help to reduce her energy expenditure. After the ideas exchange during the second collective moment, the group decided to include a more political perspective of fuel

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

poverty, introducing references in the storyboard concerning the energy oligopoly that exists in Spain and which hinders better energy consumption.

Regarding facilitation, members of the two groups expressed that horizontal relations between facilitators and members of the two GIs had a positive and significant impact on communication and exchange of ideas. It was also highlighted in the final meeting that collective spaces had been planned and managed in a very careful way. They were experienced as pleasant and friendly spaces, where people felt comfortable and relaxed, having a positive effect on people's participation. The importance of the emotional aspect in the process has been one of the greatest learning aspects for the facilitation team. Relationships between people are crossed by emotions, and creating communicative spaces where these emotions can be channelled positively is essential in order to generate more knowledge sharing and enhance participation.

With regard to the communicative spaces that have occurred within groups, for Solar Domada's members, the exchanges that happened during the diagnostic and planning phases were very important to reconstruct the history of the organization and the role played by each of its members. As noted by one of the participants:

We remember especially when we were recalling those moments with pictures... they were very emotional moments... I loved it when all of us answered without digressions what we wanted to show in the video... we had never seen such an organized and respectful relationship as the one that occurred that day

In the case of the Fuel Poverty Group, one of the most interesting communicative spaces from the perspective of knowledge production took place at the production stage when interviewing a woman affected by fuel poverty. The interviewer noted that the most shocking thing was to realize that the woman wouldn't have considered herself fuel-poor if she had been living on her own but she would reconsider this position if this affected her ability to meet the basic needs of her family.

Another important learning aspect for the members of the GIs was the limitations of their voluntary action as a way to challenge fuel poverty. As one of them indicated:

The difficult part is that we can help reducing the bill but we can't help you to get reconnected to the power supply... it's an economic issue... this where we say: we can only go so far as fuel poverty volunteers…

Finally, the act of making the two videos has also contributed to the acquisition of new technical skills. At the beginning of the process, some of the participants believed they were totally incapable of making a video.

A special mention must be made regarding the power relations that occurred throughout the process; on one side, although the PV process puts the team of facilitators in a position of superiority due to their mastery of the audiovisual tool (Millán & Boni, 2016), this was not a hindrance throughout the process. In the case of the Fuel Poverty Group, the group requested technical support when needed, but much of the technical work was done by the group itself. Participants recognized that the video could have had a higher technical quality, but their attitude was that this was a first approach to the tool, which would enable them to make more videos in the future.

On the other hand, in the Sólar Dómada group, power relations played an important role. In fact, one of the external facilitators ended up in charge of technical tasks and coordination of the PV process, precisely as a way to mediate between group members. This was viewed positively by most participants,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

because it was the way to "save" the process and finalize the video. However, one of the participants said he would have liked to have more control over the process, but the difficult relations inside the group favoured the delegation of coordination and technical tasks to an outsider.

With regard to the expansion of capabilities and agency among the participants, one of the main capabilities developed was the awareness capability or the capability to carry out self-critical investigation and an analysis of their own reality (Gaventa & Cornwall, 2008) that contributes towards rethinking and reframing the particular practices of the participants (Kemmis & McTaggart, 2005). Examining the PV results from a capability lens shows that, throughout the five stages, the process provided the necessary communicative spaces (internal and external) for participants to formulate and express how they understand the challenges they were facing.

Regarding the facilitators, we can say that this PV process enhanced their capability to reflect and improve their understanding of their role as facilitators in the social development field (Boni & Walker, 2016). The facilitators were able to clearly envisage the drivers than can bring about a better performance of PV processes. Paying attention to emotions, or providing safe spaces for participants to share and exchange knowledge, feelings and emotions, was crucial during the PV process.

We can also highlight the expansion of more "instrumental" capabilities such as the "social relations and social network" capability, or the capability to "Participate in a group for learning, working with others to solve problems and tasks and form effective or good groups for collaborative and participatory learning", both described by Walker (2006, p. 128). All of these capabilities were developed in the interaction between different communicative spaces both inside groups and in the relationship between groups and facilitators, with the exception of what happened with one of the people from the Solar Dómada who, for personal reasons also related to power dynamics, distanced herself from the process.

With regard to the expansion of agency, we must say that prior to starting the PV, all members of the two GIs recognized themselves as agents of change. What was provided by the PV was a major focus on that capacity for change. For example, as we said above, for the Fuel Poverty Group, the PV involved them becoming aware of the limitations of energy consultancy and volunteering as a way to fight and reverse such a complex issue as fuel poverty, which is linked to economic and political factors. However, the fact that the group exists within a wider movement, that of the Platform for a New Energetic Model, also allowed the GI to form a deeper understanding of the group's "room for manoeuvre" to change a structural problem like fuel poverty. In this regard, we note that the communicative space of the final presentation of the two videos, in which there was an interesting debate on these issues, was very positive for the formation of agency of the members of the Fuel Poverty Group. On the other hand, this collective space served to increase the visibility of the Fuel Poverty Group within the Platform, which also indicates an increase in the agency space of this group.

Concerning the Solar Dómada, in the case of the two men, they entered the PV with a strong impression of being agents of change; in this sense, the process strengthened this agency capacity to some extent. For two of the three women, they gained more recognition from their peers as agents of change and, at the same time, they reinforced their perception of being change makers. In this sense, we can say that the process was extremely empowering for them. But, for the other woman, as a result of power imbalances with its male peers, the process was extremely disempowering and she decided to abandon it. In that sense, the PV was not positive for this participant and, as in other Participatory Action Research processes, more attention from the facilitators should be paid to power relations, as these are crucial in those kind of research.

THE PRODUCTS: COMPLEMENTARY APPROACHES FROM THE HUMAN DEVELOPMENT PERSPECTIVE

In this section we address the content analysis of two videos from the perspective of the four values of human development: equity, efficiency, participation and empowerment, and sustainability. In the video of the Solar Dómada, entitled "The Orchard of Ca Favara", the most relevant values are those of participation and sustainability. The Orchard is represented as a space "where things can happen" or "where values contrary to individualism and competitiveness are practiced", as narrated by two neighbours. Other characters highlight that the Garden is almost the only green space in the neighbourhood and gives it a better quality of life, making it possible to grow plants and vegetables in the middle of an extremely industrial environment. Additionally, the plot is a place to carry out recreational activities, and used by people of various origins and ages. Somehow, though not predominantly, the value of equity is shown, understood as equal opportunities to make use of the Garden.

By contrast, the videos by the Fuel Poverty Group, emphasize the values of equity and efficiency. The first value is expressed in much of the dialogues and testimonies that appear in the video. Fuel poverty is presented as a problem that affects many people, more than it seems, and that can happen in "ordinary" households. In fact, one third of the video is a conversation that occurs in a "normal" home where the mother of two children narrates how fuel poverty not only impedes her from heating water or warming her home, but also makes her feel ashamed. This is a really multidimensional view of poverty and very much aligned with the values of human development. Another key aspect that appears in the video is efficiency; the second part of the video narrative is dedicated to showing how homes can be more energy efficient with the help of the Fuel Poverty Group, that performs energy consultancy. The video concludes by briefly highlighting the various activities of the group to illustrate the value of collective participation in order to change the energy model. Interestingly, one value that does not appear, despite being closely related to the theme of energy, is that of sustainability.

We can conclude that neither of the two videos incorporates all four values of human development as a whole; rather they are complementary. Also, it is true that there are no counter-values to those of human development.

The final analysis we want to address in relation to the two videos is the capacity of the video itself to exert its agency, detached from the process of its creation. We consider three different communicative spaces to address this issue: the public screening at the end of the PV cycle and the presentations of the videos in two additional spaces: in a training session aimed at Cuban practitioners, and in a Spanish Master's degree on development aid. Both of them took place at the Polytechnic University of Valencia.

The public screening was the most interesting communicative space, leading to meaningful debates on central questions in the two narratives. On the one hand, in the case of the Fuel Poverty Group, the discussion focused on the difficulty both of measuring fuel poverty and knowing who can be considered as a fuel poor – those who cannot afford the electricity bill, or those unable to heat their house, or those who have to choose between cooking, heating or having hot water? The name itself somehow stigmatizes people as "poor", and many people do not want to be recognized in this way, which makes it difficult to obtain information from them. Also, the discussion touched upon role of gender in fuel poverty, as it is women who are trying more to cope with its effects in the home.

In the case of the video by Solar Domada, the discussion focused on the importance of making visible the work done in peripheral and industrial areas, such as that where the plot is located. This led to a debate about the role that PV can play in the long term and with different audiences. The role of the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

university in accompanying these kinds of long-term processes was also discussed, with the intention of trying to avoid temporary collaborations, as various activists remarked at the public screening.

The communicative space with Cuban practitioners was interesting because it allowed, on the one hand, to show the PV as a communication tool for social change and, on the other hand, to bring about an exchange of perspectives on the potential of GIs in recovered urban environments in Cuba and in Valencia. Finally, the projection in the Master's course served to illustrate the potential of PV as a tool of participatory action research and the role the university can play.

Something that was verified is the potential of video as a very good communicative tool; its visual nature makes it more comprehensible, regardless of the literacy of the audience and its easily reproducible properties make communication possible without the need of those who appear in the images to attend (Millán & Boni, 2016). In a global context where the low cost and easy access to platforms and digital devices are making it easier for citizens to propose and communicate alternatives participation and influence to the traditional structures of political and social power, video is currently emerging as the audiovisual medium with the greatest social influence on digital content (Vallet et al., 2015).

CONCLUDING THOUGHTS AND WAYS FORWARD

From the analysis in terms of the expansion of capabilities and agency and the alignment of the narratives of the two videos with the values of human development, we can say that the PV has proven to be a methodology that enhances GI for Human Development.

The process has expanded the capabilities of the participants, particularly those relating to rethinking and re-signifying their own innovative practices, and the more instrumental capabilities developed in connection with the use of video and teamwork. This capabilities expansion occurs through participation in communicative spaces in which knowledge is created from the internal interaction of the members of the GI and in the relationship between the GI and facilitators. There is also an enabling communicative space when the participants interact with outsiders.

As in other processes of action-research, the capabilities expansion is limited by power relations, as seen in the case of Solar Dómada. In relation to agency, although members of both GIs can be considered agents of change in the sense given by Amartya Sen (1999), we can conclude that, especially in the case of the Fuel Poverty Group, through rethinking their practice, individual and collective agency has been fostered. The idea that it is necessary to go beyond energy consultancy to combat fuel poverty gives a more structural approach to the practice of the Fuel Poverty Group.

Furthermore, the two audiovisual products can also be considered as part of the innovation for human development. As illustrated in the example, videos contribute, firstly, towards spreading a certain vision of the GI aligned with the values of human development and, secondly, to creating communicative spaces where such innovation can be shown and discussed. In spite of this, we cannot conclude from the examples that the videos have had an impact on policy change, which may be one of the potentials of PV (Wheeler, 2012).

As a limit of this work we can point out that both the analysis of the process and the outputs (the two videos) can be done with a major involvment of the participants. Indoubtely, this can reinforce the participatory side of the research and can provide new communicative spaces to produce learning and knowledge.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Also, it would be of interest to explore the potential of PV innovation in the production system of scientific knowledge itself. The fact that it is a methodology of participatory action research, that is being promoted from a research group that is embedded in a university, leads us to an interesting reflection regarding the potential of these research methodologies to promote innovation in ways that generate and disseminate a kind of knowledge aligned with human development values. This would be an even greater contribution of PV towards contributing to a more equitable and sustainable development model.

ACKNOWLEDGMENT

We are grateful to the Centro de Cooperación al Desarrollo of UPV from its support to the Toma Social Project. We have also received the support of the Spanish Ministry of Economics and Competitiveness with the grant agreement CSO2013-41985-R.

ENDNOTES

1 Fuel poverty can be understood as the difficult situation faced by a household that can't afford to pay for their energy consumption, leading to a lack of normalized access to gas and electricity. This situation brings about a deprivation of the freedom to live a decent life (Pellicer & Lillo, 2014).

Chapter 37
The Arts, Civic Engagement, and Urban Youth

Amy M. Grebe
ACPPA Community Art Center, USA

ABSTRACT

The Arts, Civic Engagement, and Urban Youth explores methods for using the arts as a vehicle to empower urban youth to become critically engaged in their communities and positively improve their quality of life. Barriers that prevent urban youth from critically engaging social injustices and inequalities are examined and arts-based responses offered. An arts-integrated methodology is woven into previously researched and proposed pathways to civic engagement in order to offer urban youth opportunities for hope and healing from chronic adversity. This arts-integrated methodology facilitates in the development of self-efficacy and knowledge for youth to successfully affect sustainable change in their communities.

INTRODUCTION

Media venues are teeming with feel good stories of youth engaged in public art and arts-based community service projects. The youth group that painted a mural on the side of the community center that was on the brink of closing forever. Exhibiting photos taken by children that visually convey the dangerous areas of their neighborhood. The concert of youth created hip hop that shares their daily struggles with oppressive poverty that they cannot escape. A play performed by elementary students for an audience of local politicians to highlight the importance of arts education in their public school curriculum.

Viewing these stories provides a momentary surge of pride that the youth are giving back to their community and builds hope for these future community caretakers. Yet the more cynical viewer might question how involved the youth were in the project. Did they originally identify the issue to be addressed? Were they asked for input on solutions to these issues? Are they leaving the project with more than they started? Could civic engagement provide opportunities for personal transformation alongside social change?

Without over-simplifying the matter, it would appear that disadvantaged urban youth would appear to have more opportunities for civic engagement than suburban or rural youth if for no other reason than the environment in which they live. Many face racial injustices, intergenerational poverty, violence, and under-resourced schools and community centers on a daily basis. Families are threatened by unemployment or underemployment and lack of quality healthcare. (Ginwright & James, 2002; O'Donoghue & Kirshner, 2003) These issues are woven into the very fabric of their community, threatening community well-being and decreasing healthy development of young people. Issues of adversity can become a perpetual cycle with urban youth being born into adversity, struggling to survive and thrive under the oppression, and eventually giving up hope and allowing the cycle to begin again with the next generation. So why, with so very many issues to overcome, would urban youth not do all that is within their power to create change in their community and demand a brighter future for themselves?

The urban youth described in the case studies found later in this chapter are fortunate to be involved in a community art center, afterschool program, and school that provides opportunities for self-development and community engagement. Unfortunately, most urban youth do not have similar opportunities. More frequently, urban youth lack access to opportunities to participate in addressing the rising poverty, joblessness, violence, and inequality plaguing their communities. Public schools offer little in the way of educating students on the democratic process or providing skills necessary to organize and mobilize on behalf of public interests. Youth seeking to confront inequalities and injustices are often dismissed because of their age or because they are viewed as "part of the problem." With so many obstacles to becoming civically engaged, it is no wonder that urban youth begin to lose hope for their futures.

Yet, perhaps not all hope is lost. Arts-based civic engagement not only offers a voice to those seeking to address social injustices, but a pathway for building self-identity and efficacy along the way. When youth are engaged in arts-based civic engagement, their comprehension and ownership of issues and challenges is stronger. They develop a deeper understanding of social issues and awareness of the root causes of injustices and inequalities. They develop skills that are less frequently taught in school such as creative problem solving, collaboration, and cross-cultural communication that promote the development of creative solutions to social problems. When urban youth contribute to community change through the arts, their social concerns are heard by more adults and the larger community, and their creative ideas are validated. Further, youth who are engaged in the arts are more likely to volunteer in their communities into their adulthood than youth who do not. (Borrup, 2009; Caterall, 2009) Soon they find strength and confidence in their voice which prompts them to continue to spiral upwards, expelling injustices, and eventually and hopefully, breaking through the cycle of adversity. (Innovations in Civic Participation, 2010, p. iii) Through the art-making process, urban youth are able to remove the labels placed on them by life's adversities, and begin the process of healing. With healing, hope is restored and youth become empowered to confront pressing community problems.

BACKGROUND

Spanning several decades, youth participation in community involvement had steadily declined from its height in the 1960s. During that decade, large numbers of youth were involved in the civic arena, whether through their school, church or other community groups. (Putnam, 2000) Youth were instrumental in the Civil Rights Movement, American Indian Movement and the Second Wave of Feminism. (Grebe,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2014; Reed, 2009) Since that time, mistrust of politicians and their institutions coupled with feelings of powerlessness played a part in the steady decrease of civically engaged youth, more greatly seen among black and Hispanic youth. A study in 2000 indicated that within just a few years, civic engagement decreased by 10% in minority groups; a pattern echoed in other studies of disadvantaged youth. (O'Donoghue & Kirshner, 2003)

Today, however, civic engagement among youth seems to be experiencing a resurgence. The recent happenings at the University of Missouri are a clear indicator of the desire for today's youth to overcome archaic and oppressive policies. In the fall of 2015, students at the University of Missouri brought attention to rising incidents of racism both on campus and throughout the education system of the university. Numerous protests were held, a graduate student went on a hunger strike, and the football team refused to play until the president of the university resigned. The students led a well-coordinated protest with clear expectations. They were successful in affecting change and bringing about the president's resignation. (Sabatke, 2015) The success of these students is indicative of the power of youth. Youth rallying behind a cause have the potential to be an unstoppable force.

Research confirms that urban youth understand the negative experiences facing their communities and understand that these toxic issues are disproportionate to their peers in neighborhoods of different socioeconomic status. They are aware that the challenges faced on a daily basis impede their growth and potential. Most even display a sense of hope for their futures and indicate the desire to effect change for themselves and their communities. (Kirshner et al., 2002) Still, inactivity prevails. While these youth may recognize the issues in their communities, research by Atkins and Hart "suggests that youth living in urban contexts are more likely to encounter obstacles depriving them of knowledge about their communities or access to opportunities to participate" (Kirshner et al., 2002, p. 3).

Barriers preventing youth from civic engagement often reflect the societal and environmental stressors they may wish to address. Negative perceptions of youth often lead to feelings of alienation and isolation contributing to intergenerational, intercultural, and leadership gaps. Lacking education and employment opportunities coupled with housing and food insecurities lead to feelings of victimhood and a loss of hope. Further understanding these barriers allows for the identification and implementation of arts-based initiatives leading towards sustained civic engagement and systemic social change.

Alienation and Isolation

Urban communities in the past were the very illustration of the adage "it takes a village to raise a child." It was not uncommon for children to roam the neighborhood while the adults watched over them from their front stoops. Over time, family structure has shifted as a result of generations of poverty. Youth are more likely to be responsible for their own well-being with little interactions or guidance from adults. This shift results in a breakdown of the "feeling" of community leaving individuals to feel isolated or alienated from those around them. (Spencer, 1999)

Frequent relocations from house to house or neighborhood to neighborhood compound these feelings. Youth living in poor families are more likely to move to a new home five or more times during their youth than families with at least twice the income level. Youth of single parents as well as those of African-American or Hispanic ethnicity also experience a higher level of residential mobility. (Murphey et al., 2012, p. 2-3) Whether it is to escape abuse, inability to pay rent, or an immigrant family settling only for a short time before moving on; urban youth are less likely to remain in one home for any large

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

chunk of their lives. This transitory lifestyle increases feelings of alienation and isolation. Youth struggle to feel a sense of ownership or inclusion in their community, perhaps resisting becoming involved knowing that they will need to move on soon.

Additionally, the perception created in society and reinforced in policy that young people of color are criminals serves to further marginalize and isolate urban youth. (Ginwright, 2011; O'Donoghue & Kirshner, 2003) Policy is created based on the concept that youth cause their own problems rather than understanding that the violence, drug use, theft and other behaviors are the result of societal and environmental stressors. "Policymakers usually respond to these issues by blaming youth themselves or simply writing them off as a threat to civil society" (Ginwright & James, 2002, p. 29). Urban youth are identified as a problem to be solved with policies that allow for police brutality and disproportionate incarceration rather than preventive or symptomatic systems that directly address stressors. What hope can a young person have to overcome systemic inequalities when faced with policy meant to devalue their very existence?

Leadership Gaps

While adults allow themselves to believe that youth are the cause of their own problems, they also often underestimate the power of youth to be agents of change. Priorities and values change from generation to generation, as does language, particularly jargon, that lead adults to misunderstand, mistrust, and disengage from youth. Further, a young person's outlook or understanding of a problem differs from that of an adult who may be quick to devalue a thought process or insight different than their own. In these situations, adults are quick to lead with a top-down or hierarchical style further motivating youth. Without efforts towards understanding how youth make sense of their world, adults will continue to create barriers preventing youth civic engagement. (Clement et al., 2014; Kirscher & O'Donoghue, 2001; Kirshner et al., 2002)

Youth perception of adults create an equal number of barriers preventing civic engagement. An increasing gap is growing between leadership and today's urban youth. Youth have observed the change agents of yesterday seamlessly integrate themselves into the political arena, appearing to take sides with those who seek to create policy that perpetuates oppression and inequality. This integration diminishes urban youth's opinion of adults, in particular, those in leadership, no longer seeing them as agents of change. As urban youth seek mentors among those in power, they find they are few and far between. Lacking mentors, not only are urban youth less likely to engage in change, the chain of information on historical roots of the issues and how to overcome adversity is broken. Knowledge and skill needed to successfully affect change is no longer transferred from adult to youth. (Kincheloe & Hayes, 2007)

However, leadership gaps do not exist just between adults and youth. Even among urban youth, an elite group often floats to the surface. These elite youth are frequently engaged in multiple activities and are viewed as leaders. Their role as leaders in the community separates them from their peers causing detrimental rifts between youth. This is particularly evident when the youth leaders are tasked with supporting the agenda of the adults who have hand selected them rather than taking on the more urgent needs of the community. Constantly engaging these elite youth undermines the willingness of others to become involved while diminishing the capabilities of the elite youth by spreading their energy, time, and talent too thin. (Clement et al., 2014)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Efficacy, Victimhood, and Loss of Hope

The broken chain of knowledge transfer coupled with hierarchical teaching institutions not only demotivates urban youth from engaging in the community issues, it actively decreases their ability to do so. Public schools are moving away from democratic methods of teaching and engaging in more hierarchical methods as demands for increased standardized testing changes the climate of education. In this context, youth are offered few opportunities that allow them to build the skills necessary to participate in engaged citizenship. Urban schools, in particular, offer the fewest opportunities for youth to build efficacy. (O'Donoghue & Kirshner, 2003)

In order for youth to successfully affect change they must possess strong communication skills, critical thinking and analysis, creative problem solving skills, understanding of the democratic process, and empathy. (Clement et al., 2014) Coincidentally, these skills are most often gained through arts-based education. (Desai, 2010) Research could be done to examine the extent to which a decrease in the skills associated with civic engagement has occurred since arts programming in public schools has declined. When these skills are not learned or demonstrated, those youth that want to call attention to issues are quickly dismissed by adults in authority or may have a difficult time effectively communicating the urgency or importance in a manner that will gain attention and momentum.

"For young people, a diminished capacity for hope is one of the most significant threats to civic engagement" (Ginwright, 2011). Urban youth are aware of society's perception of them and aware of the inequities that exist between themselves and other youth of differing socioeconomic statuses. They understand that other youth possess more resources and have better opportunities presented to them. Urban youth not only understand that they are the "victim" of their environment, but understand the opportunities to obtain the skills needed to overcome their "perpetrators" are rarely available them. Experiencing that reality on a daily basis has vast potential to destroy hopefulness for a better future for themselves and their families. Garbino speaks of "social toxins," the factors that prevent healthy development in youth, that include violence and abuse, racist systems, unemployment, and lack of proper housing and health care. (Ginwright & James, 2002) When those social toxins are considered to contribute to allostatic trauma, it is easy to understand how youth can become rooted in the present moment, unable to possess future orientation or hope.

As urban youth allow the perceptions of others to color how they view themselves, as they struggle to make themselves heard and understood, as they see themselves as powerless to affect change, they can quickly slide into an ever looming sense of victimhood. As the victim, they will no longer seek avenues to confront and challenge broken systems. They will simply begin to exist within the broken systems allowing the policies to continue to perpetuate injustice and inequity. Once one sees oneself as a victim of the environmental issues surrounding his or her life, it is difficult to break out of cycles of victimhood.

Despite these many obstacles, sparks of hope for a better future remain with urban youth though they have every reason to be cynical. (Kirshner et al., 2002) Those seeking to enlist urban youth in participating in social change and civic engagement must capitalize on those sparks of hope. Dr. Babatunde Osotimehim has said that youth "have the potential to disrupt inertia and be the most creative forces for social change." For those leaders wanting to engage youth in critical social change, they must be willing to facilitate not only the projects that could affect change, but be willing to dig deeply into the roots of the problem, reach way down into the hurts of the child, and provide some healing at a personal level, before preparing the child to heal the hurts of the community.

Overcoming Barriers to Civic Engagement Using the Arts

Jim Borling, a music therapist and professor at Radford College in Virginia, peppers his lectures with personal anecdotes that perfectly illustrate his point. During an arts in healing lecture, he shared the story of his field work prior to becoming a licensed therapist. He was meeting with his clients and beginning to feel that they were all unable to move forward. No matter what method he tried or where he attempted to steer the conversation, the clients simply could not progress. Sharing his frustrations with his mentor, he was reminded that his clients can only go as far as he had gone for himself. Clearly, he needed to get back into some therapy of his own and work through something for himself so that he could move others forward alongside him. What a powerful metaphor for this work with urban youth. If the youth of a community are angry and hopeless, how can they be expected to affect change? If the wounds have turned to scars, how can they move others forward?

If civic engagement is understood partly as the process of instilling hope and healing to the community at large, the amount of change that can be hoped for is proportionately connected to the amount of hope and healing experienced by the participants. For that reason, it is critical that the community artist first address the underlying causes for barriers to critical engagement for youth, and work towards building a strong foundation. The arts provide many natural mechanisms that instill hope and healing through the creative process. For every barrier experienced by an urban youth desiring to become civically engaged, the arts respond to counter that obstacle.

Self-Identify

Paolo Freire referred to the process in which individuals and communities are persuaded to adopt the inaccurate stereotypes assigned by their oppressors as "internalization of the oppressor." (Freire, 1968) Through the arts, urban youth are able to reclaim their cultural rights and identity by making and celebrating artwork that is native and traditional of their culture. They become empowered by discarding the self-images forced on themselves by others and embracing those aspects of self that make them unique and powerful. By reclaiming one's identity, "individuals and community can meet as equals - different and yet the same" (Goldbard, 2006).

Alienation and Isolation

Art-making offers common ground for people of all walks of life to come together and create; combatting the disconnection of youth to adults or ethnic groups. Intergenerational art-making reduces "generational prejudice" and creates an environment where trust can be built and values shared. (Whiteland, 2012) Intercultural art-making can reduce marginalization by helping participants see others in a different light, begin to better understand other's emotions, and regard others at a deeper level than their race, ethnicity, or social class. (Cooper & Sjostrom, 2006; Rubin 1997). Collaborative art-making allows participants to "externalise their stereotypes, exchange thoughts and ideas on diversity and democracy, and empathise with the others" (Hajisoterious & Angelides, 2014). Any arts discipline may be considered to do so, but art-making done for the sake of overcoming alienation and isolation should aim to build understanding and trust between groups and form stronger community bonds that overcome differences.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Efficacy

While art-making should stress self-expression, at any and every opportunity for art-making, arts skills must be taught and explored. Whenever possible, professional teaching artists should become involved so that the skills taught are of a high level of quality. Mastery of art skills translates to confidence in other skills. (Catterall & Peppler, 2007) However, differing art disciplines may be better suited than others for building certain skill sets. Writing and reciting poetry or raps increase both written and verbal language skills. Participating in improvisational drama activities encourage quick thinking and negotiation skills. Choreography and music composition support critical thinking and creative problem solving skills. (Camilleri, 2007)

Knowledge of Issue

Too often, urban youth face a plethora of adversity without knowledge or understanding of the root of the problem. Viewing artwork, films, and plays or listening to poetry and songs that represent periods of conflict not only teaches youth about historical events, but assists them in interpreting and absorbing the emotional reaction to the event. History lessons taught in school rarely explore the spiritual or emotional response to events making it difficult to critically "look at their own biases and how oppression gets internalized and embodied" (Desai, 2010, p. 174). Additionally, community artists make history learning more dynamic and interactive through participatory action research that encourages dialogue with family members and neighbors. (Goldbard, 2006)

Victimhood and Loss of Hope

Urban youth can retain the victim identity and hopelessness when they blame society for their problems and lack agency and efficacy. Collaborative art-making allows participants to see that their adversities are shared and that collectively, they have the resources necessary to address these shared adversities. Additionally, art-making is empowering and prompts youth to reimagine themselves based on their assets and strengths. (Huss, 2015)

Through the process of healing, hope can be reclaimed. Youth can begin to envision positive outcomes for their future when they are uplifted from their oppressive present. Art-making is a hope-infused experience when it incorporates aspects of future orientation, positive expectation, intentionality, initiative, realism, goal-setting, and interconnectedness. (Benzein & Saveman, 1998) By being intentional to include aspects of hope and healing, facilitators of urban youth civic engagement can help to develop a microcosm of a healthy community within the participating group that then serves as a model for affecting social change on a larger scale.

These arts-based responses to civic engagement barriers offer piecemeal opportunities to shift the dynamic from powerless to powerful. They foster the "capacity to see, cultivate and use power a community didn't know it had" (Borrup, 2006, p. 14). Table 1 offers suggestions for specific arts- based responses to barriers. Where art-making and civic engagement intersect, higher levels of effective social change occur. (Borrup, 2006) Yet, to truly develop urban youth into effective change agents, an entirely holistic approach must be employed. Through this holistic approach, urban youth can see their way forward to not only healing from the social toxins, but transforming their social environments.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Arts-based responses to overcoming barriers

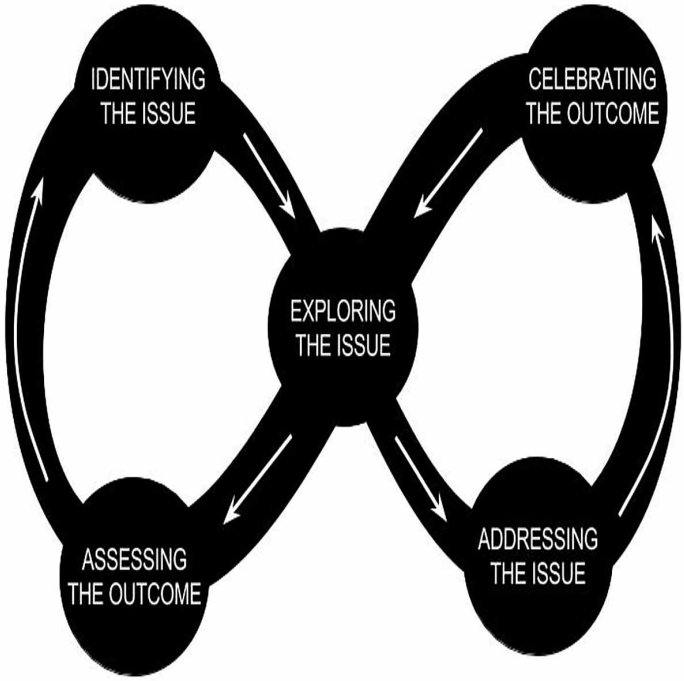
Barrier	Response	Outcome
Identity	• Identity collage using media images, sounds, and videos. • Reading books or watching plays/films where identity is celebrated. • Creating imagery, movement, sounds that depict overcoming adversity. • Art-making that focuses on positive attributes, strengths. • Engage in art forms native to culture.	• Feeling inclusive of something bigger than oneself. • Empathy or understanding of another culture is developed. • Creative ideas are rewarded and celebrated. • Improved image of youth among general public. • Sense of pride in identity and empowerment of self.
Alienation & Isolation	• Intergenerational or intercultural art-making. • Collaboratively creating choreography, mural, poem. • Performing or exhibiting traditional ethnic art.	• Cross cultural relationships formed among youth. • Enter fully into roles as co-directors of the project. • Engagement of extremely marginalized youth. • Increased diversity in community dialogue.
Efficacy	• Song or poetry writing. • Non-verbal communication opportunities such as movement or painting. • Writing or acting plays, improvisional games. • Sharing personal responses to artwork and art-making experiences; sometimes defending points of view.	• Marketable job skills gained. • Ability to imagine creative and innovative solutions to community problems. • Critical thinking and creative problem solving skills gained. • Influencing publicpolicy, particularly in regards to needs of youth.
Knowledge of issue	• Experience art forms surrounding issues of injustice or oppression. • Perform plays that invite the audience to interact with the issue at hand. • Role playing characters and situations of historical events.	• Opportunities to address issues that directly affect youth lives. • Broaden historical and cultural knowledge. • Empathy for suffering of others.
Loss of hope	• Creating imagery around future, successful event. • Creating imagery, songs, or plays that offer advise to others facing adversity. • Art-making focused on positive emotions.	• Gained belief in one's capabilities to find pathways to a goal. • Gain belief in one's ability to initiate and sustain movement towards goals. • Sense of life purpose and optimism about social change.

CREATING A CONCEPTUAL FRAMEWORK

Elizabeth Beaumont suggests four pathways for developing strong capacities for civic engagement. The first pathway is to offer opportunities for skill mastery, particularly in the political arena. The second is to strengthen efficacy and involvement through the use of practice models. Next, work should focus on building positive relationships and networks between youth and from youth to adults. Finally, interactions between adults and youth should foster hope and perseverance. (2010) Shawn Ginwright further posits that in order for urban youth to affect meaningful civic engagement and social change, they must first enter through the healing process in order to gain hope. He believes that community organizations can provide pathways to critical consciousness, action, and well-being. Urban youth must gain awareness of the roots of social injustices, "claim power" over discouraging individual and community issues and create conditions that foster healthier development and higher quality of life. (2011)

The arts naturally incorporate the many avenues through which urban youth can overcome their barriers to civic engagement while experiencing healing from social toxins and building skills needed for social transformation. Corbitt and Nix-Early write that the power of the creative experience is its ability to facilitate resilience, increase agency and efficacy and provide the ability to discern choice and pathways for problem solving while offering hope and healing. (2014) The following conceptual framework is specifically designed to offer growth in artistic, academic, and social skills while using art as a symbol or metaphor for transformation. Used in conjunction with the civic engagement process, this model deepens the engagement from something "cosmetic" towards that of systemic change. Simultaneously these arts explorations offer room for personal transformation creating lifelong agents of change and social justice.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



Suggested Framework

The civic engagement process is often broken into two to six stages, usually containing at least an issue identification step and a response design step. Many see the process as cyclical or a spiral; while assessing the results of the response to the initial issue, another issue surfaces and the process begins again. Arts-based civic engagement with urban youth would follow a similar process, including five main steps. First youth would identify the issue and then the process should be explored to understand its systemic or historical roots followed by a designed response to the issue. Once the project goals have been reached, a celebration should occur while longer term goals are assessed further away from the end of the project. Figure 1 demonstrates this process overlaid on an infinity sign to demonstrate the continual need for civic engagement. In some cases, the "exploring the issue" stage may happen twice both to inform the response design as well as the outcome assessment.

Identifying the Issue

For youth to successfully see this process to the end, they must be allowed to identify the issue or issues they are most moved by and willing to address. The issue may be raised unexpectedly and organically with adult leaders then willing to commit to the process. Alternatively, a specific issue may be identified after a group of youth have already been brought together for the purpose of engaging its community in transformation.

Figure 1. Arts-based civic engagement conceptual model

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Exploring the Issue

When working with youth, this stage is the most critical. Two things should be occurring simultaneously during this stage. A deep exploration of the roots of the issue should occur while being mindful to process the reaction to the newly learned information. At the same time, personal growth of the youth should be encouraged. Opportunities for mastering skills, regaining hope, or finding an empathetic response should be presented during this stage.

Addressing the Issue

Designing a response to the issue will occur during this stage. Additional assets should be identified as well as any other partnerships or persons to be involved. Adults involved in the process should help to facilitate the planning, being cautious to not interject their own ideas or agenda.

Celebrating the Outcome

Each celebration should bring the larger community together to see and share in all that the youth have accomplished along the way. It may be an opportunity to further educate the community and potentially ignite a spark for a greater number of community members to join in the civic engagement process. In the celebrating, confidence and hope are amplified, powering the next cycle of transformative community change.

Assessing the Outcomes

After an appropriate amount of time, an assessment of the outcomes should be conducted to determine if the goals and results sought have been attained. Sharing the assessment findings with stakeholders and policy makers encourages continued policy reform and open channels of communication.

Infusing Holism

As outlined above, this engagement process is no different than any other. However, where it may differ to create a more holistic process is the inclusion of the following elements. Intentionally injecting these elements into the outline process effectively removes barriers preventing engagement, provides opportunities for skill mastery and efficacy, reignites hope, and offers healing through positive relationship building. Youth participating in this engagement process as outlined in entirety have consistently recognized their personal power and ability to be change agents, moving towards a better quality of life while lifting up others alongside them.

Trauma Informed Safe Spaces

Urban youth exposed to social toxins and environmental stressors likely exhibit trauma or stress symptoms that may appear as maladaptive behaviors. Trauma informed care involves understanding and being responsive to the effects of trauma and the symptoms it causes. It provides physical, psychological, and emotional safety for both youth and those leading them in order to prevent opportunities of being

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

re-traumatized. In a trauma informed environment, trauma survivors are provided space to "rebuild a sense of control and empowerment" ("Trauma informed care," n.d.). When taking on civic engagement projects with urban youth, it is of critical importance to remember that the social issues being confronted are often the same issues responsible for traumatizing youth.

Self-expression and creative exploration are more likely to succeed in a space where youth feel secure enough to take risks. "Spaces of meaning, recognition and comfort 'restore a sense of possibility for themselves and their peers'" (Borrup, 2006, p. 94). Painting a mural together in the space or decorating the space with youth created artwork will infuse the space with creative energy and a sense of ownership and pride.

Safe spaces consider the physical, psychological, and emotional safety of those who enter. All aspects of safety can be established through clear behavioral expectations and boundaries. These expectations decrease chances for re-traumatizing youth while increasing opportunities for youth to share with others. Trust and intimacy build community, but is often difficult to accomplish when working with a vulnerable population.

A simple, yet powerful, method for creating safe spaces is the incorporation of ritual or routine into the space. Committing to a ritual or routine at every community meeting assures attendees that the meeting will be predictable, helps to mitigate anxiety, and provides the space needed for honest self-expression. Structured art activities provide boundaries and routine. Opening and closing of sessions involving voice and movement create predictability and intimacy. (Camilleri, 2007, p. 68).

Arts-Integrated Learning

Arts-integrated learning goes beyond simply providing access to arts education or supplies. Rather, arts-integrated learning uses the arts as a vehicle for exploring new information or subjects. Youth engaged in arts-integrated activities use the creative process to gain skills and knowledge in both the art form and another subject in order to forge a deeper understanding. Arts-integrated learning allows youth to build on their strengths and assets, provide experiences that lead to skill mastery, facilitate emotional growth and empathy, and promote positive interactions with peers and adults. (Borrup, 2006; Corbitt & Nix-Early, 2014) Arts-integrated methods and classrooms not only assist youth with developing skills needed for effective social change, they reawaken their creativity in order to imagine a more positive future for themselves and reestablish hope.

Youth Centered

Youth centered learning does not rely on hierarchical methods of teaching, but rather fosters discovery and exploration, in this particular instance, through the art-making process. "De-centering of knowledge and authority in teaching strategies changes the dynamic of a traditional power structure in a learning environment and creates new opportunities for marginalized students to be empowered to participate in the learning process." (Holloway & LeCompte, 2001) Youth centered learning also draws on the inherent strengths and abilities of youth while taking into consideration developmental milestones. (Corbitt & Nix-Early, 2014) Work in this capacity is centered on the needs and concerns of the youth, not the agenda of the leadership. (Goldbard, 2006) In this manner, youth begin to understand that their voice and ideas are valued and they can contribute in a meaningful way to discussions surrounding social issues and resolutions.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Symbolic Acts of Transformation

The use of art as a metaphor for life is prevalent in arts-based civic engagement. Artwork may offer a metaphor to an issue being explored or addressed while the process of art-making serves as a symbol of the transformation experienced by the art maker or community. Considering the metaphor contained within art urges youth to think critically or differently about situations and events, and how that information may be applicable to present situations and reactions. Using art as a metaphor for life serves to build pathways to critical consciousness.

Culturally Sensitive and Inclusive

Simply put, marginalized youth are usually marginalized because of their cultural background. When working with urban youth, it is important to meet them where they are. This means holding classes in their neighborhood and understanding where they are developmentally while also being sensitive to their cultural values and background. Including elements and traditions rooted in their culture (consider both their ethnic culture and youth pop culture), reinforces the concept that their identity is an asset to be valued and has a place in the process of civic engagement. "By speaking to young people in their language, groups are able to engage marginalized youth in large numbers." (Ginwright & James, 2002, p. 39) For example, hip hop culture, rooted in urban communities, provides a ready platform from which urban youth can both express themselves and call attention to social injustices. (Ginwright & James, 2002)

Goal Oriented

Setting goals for each group meeting with youth is important and differs significantly from having leadership arrive with an "agenda." Community or teaching artists should arrive to meetings with definitive goals in mind in order to keep the process moving forward, even if forward means going sideways or backwards in order to arrive at a shared place. Setting goals has two purposes. First, by setting goals and outcomes, youth are working within a future orientation frame of reference. Future orientation is a critical aspect of increasing hope. Second, setting goals necessitates planning. Planning provides opportunities for youth to build necessary skills and confidence in their skills to be successful in their change campaign and evaluate whether objectives were met.

Positive Interactions

Empowering youth begins with positive interactions between one another and between youth and adults. Positive interactions reaffirm self-identity, provide opportunities for healing, and develop hope for a better life. Creative expression creates a "multidimensional experience" and builds relationships between participants. (Camilleri, 2007, p.66) Much social bridging occurs while hands are busy creating, defenses are distracted and conversation can freely flow. Community artists or group leaders can further encourage relational growth by offering affirmation and valuing the contributions of youth and imagining how such talents will lead to future successes. (Corbitt & Nix-Early, 2014)

The following case studies help to illustrate various aspects of this conceptual framework. Each case study provides background information surrounding the issues being addressed while outlining both the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

strategies employed and goals attained. The inclusion of all elements listed above may not be necessary in all cases or even appropriate at times. Community or teaching artists should take measures to properly prepare themselves for work with each differing group of youth in order to best serve the community.

CASE STUDY ONE: A HOME FOR THE HOMELESS

Background

With river and rail travel making access easy to Philadelphia, Norristown at its height, was an industrial, banking, and retail center. Once the prosperous county seat with a thriving economy, the 1970's building of a large shopping mall in the neighboring town sent Norristown's economy into a downward spiral from which it has never fully recovered. The community is comprised of a highly socioeconomically and racially diverse population, though nearly a quarter of its 34,000 residents live at or below the federal poverty line. Intergenerational poverty plagues many families leaving children highly susceptible to adverse childhood experiences.

Tucked into the lower level of a church on the west end of Norristown, ACPPA Community Art Center offers a safe and welcoming environment for neighborhood youth. Since its inception in 2006, ACPPA has strived to be a model organization utilizing best practices in the field of community arts. The organization's various programs use the arts as a vehicle for creative self-development and community revitalization. Understanding the therapeutic qualities of art-making, the teaching model developed by the artists of ACPPA offers a holistic approach to creative explorations. Classes and programming balance intensive learning of artistic skills and techniques with academic, character, and social skills. Students are encouraged to become creative problem solvers and critical thinkers while seeking opportunities to engage the community at large.

Identifying the Problem

Quite unexpectedly during a field trip with their summer arts camp, youth stumbled upon the makeshift shelters of several homeless people while exploring the wooded area around the river. When they returned to the community art center, they excitedly shared their news of finding a "hobo's home." A maladaptive response to the trauma experienced in their lives, these youth were quick to dehumanize others and reluctant to invest emotional energy in strangers. A debriefing of the trip provided a moment to explore their attitudes toward homelessness and their knowledge of its root causes. The shift from the hobo caricature to a reality of a person who had lost their home began to elicit feelings of sorrow and compassion.

Though many of the youth face life challenges typically associated with distressed urban neighborhoods, none had ever faced homelessness. They could not grasp why anyone would "choose" to live out of doors. Yet they felt compelled to do something that would better the quality of life for those living near the river.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Exploring the Problem

The youth requested to revisit the makeshift shelters in the woods in the hopes of meeting the inhabitants. On the return trip, the youth met a man as they hiked through the woods who introduced himself as Billy. Billy seemed comfortable speaking with the youth and reveled in sharing with them his survival techniques shutting down only when one child pointedly asked how he had become homeless. The debrief from this trip included drawings and sketches depicting the thoughts and emotions experienced during their conversations with Billy.

The following week, the art center invited caseworkers from a local homeless shelter to visit with the camp. They brought paintings and photographs created by the shelter's residents that helped to illustrate some of the causes behind homelessness. These conversations and explorations were becoming increasingly difficult for the youth as they began to realize how many stories were similar to their own families' struggles. To quell the anxiety rising in the youth, teaching artists provided safety mandalas for everyone to complete at the end of the session, reminding youth of all of the positive aspects and resources also available to them.

Addressing the Problem

Following several weeks of exploring the roots of homelessness, this group of urban youth proposed a project that would raise awareness about issues of homelessness in their community and provide support for homeless community members. The youth had learned that a large challenge facing the homeless sleeping out of doors was the ability to carry enough blankets to stay warm on cold nights and dry in the rain. They adopted a project that many other youth across the country had been doing for some time: crocheting strips of plastic grocery bags together to make lightweight, water resistant sleeping mats.

Over the following year, they youth recruited many neighbors and family members to collect grocery bags and cut them into strips. They invited mothers and grandmothers to crochet the strips together, eventually learning how to crochet themselves and making their own sleeping mats. As each mat was finished, color cards with messages of hope and friendship were attached before the mat was passed along to someone in need.

- **Strategies Used:**
  - Using arts explorations to understand root problems/challenges associated with homelessness.
  - Using arts explorations to reinforce positive assets of youth to mitigate potential stress response to difficult discussions.
  - Forming a partnership between the community art center and local homeless shelter.
  - Creating new resources by upcycling found materials and mastering crochet techniques.
  - Creating opportunities to engage with older community members.
- **Community Outcomes:**
  - Public awareness was heightened around homelessness.
  - Homeless community members provided with convenient and comfortable bedding.
  - Encouraged civic engagement by mobilizing neighborhood volunteers.
  - Social bridging across varying generational and socioeconomic groups.
- **Personal Outcomes for Youth:**
  - Developed empathy for a previously under recognized population.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Recognized their own role and responsibility to the community.
- Felt empowered to affect change for self by successfully helping others.
- Developed ability to connect with people who are different from themselves.

CASE STUDY TWO: THE VOICE OF HIP HOP

Background

The Philadelphia School District's ongoing financial crisis have left thousands of children with substandard education and few, if any, support services. Over the years, many of its 214 schools were closed perpetuating overcrowding in others. Alongside teachers losing their jobs, many of the "unnecessary" positions of guidance counselor and school nurse were cut as well. Neighborhood schools once considered a community hub have become dangerous as too few adults in the building are left to worry about teens from rival neighborhood groups now under the same roof. Dedicated teachers are doing their best to teach with limited resources but are rarely able to offer students support regarding the insecurities facing their families.

In response, small groups of youth in the city of Philadelphia have been gathering after school to address social toxins through creative writing and beatmaking in a program known as Blackboard Labs (BBL). The mission of BBL is to initiate "social change by empowering Philadelphia youth through innovative creative arts programming rooted in hip-hop culture" (Blackboard Labs, 2010). BBL grew out of a graduate school project that co-founder Jim Wells, conducted with Philadelphia middle school students. The students were writing narratives in rap form that were later overlaid on a beat in order to assist the emergent readers in building their expressive reading and reading fluency. Rather than continue to work in the classroom, Wells felt he could effect more change in an after school setting. After connecting with an arts therapist and a beat-making and music producer, BBL began meeting with students during out of school time hours.

Identifying the Problem

When youth enter the BBL program, the raps that they create are superficial; speaking about ludicrous lifestyles they imagine for themselves when they "make it big." Over time, as trust is built and raps become more personal, the more difficult reality facing the youth is revealed. These students are so tightly wound in their minute to minute and day to day struggles, truly imagining a different future is difficult. The youth that attend BBL sessions are motivated and intelligent young people, but frequently do not complete high school on time, if at all. They see the public school system failing them, unable to cope with the trauma response to their toxic environment while ensuring their growth in the skills and knowledge that could propel them out of the vicious cycle in which they exist.

Exploring the Problem

While the highlight for many of the youth may be the weekly beat-making classes, Blackboard Labs uses the full depth of hip hop to guide youth toward making realizations and connections in their lives. Teaching artists lead explorations of both contemporary and classical hip hop artists, using the work of both to

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

discuss the roots of the music as well as the social commentary written into the lyrics. Discussions that delve deeper than the face value of the music allow youth to connect to the hip hop artists and see that they share the same struggles and challenges. After some time, youth begin to hear a pathway towards addressing, changing, and in some instances, overcoming the various forms of oppression in their lives.

During beat-making sessions, students look at their own lives to inspire their lyrics, capturing their own narratives and creating a rhythm to match their story. These sessions help youth find "pro-social ways to express, articulate, and process these experiences" (Blackboard Labs, 2010). Though the teaching artists allow the youth to use any language they feel is necessary to express themselves, when it comes time to record, all lyrics must be "radio edited." Occasionally, an artist of a different media will join in the sessions, bringing cameras or paint to help youth explore their environment from a different angle, adding further depth and perspective to their understanding of the issues.

Community within the youth is grown organically, facilitated by the music and the teaching artists. This safe space allows for a level of intimacy to be reached that encourages the youth to not only truly open up and speak freely about their struggles, but grow in their ability to work through interpersonal problems and resolve conflict.

Addressing the Problem

Imbued in the culture of BBL is the idea that each person's music and talents can be applied for the greater good and each person has a place in and a responsibility to their greater community. BBL stresses the civic responsibility of the youth; involving them in other social justice programs, arranging for them to take part in rallies, and providing opportunities for them to perform their raps and share their messages that desperately need to be heard. At times, their music brings awareness to a specific issue while other times, their presence attracts the attendance of peers at events with a message the youth need to hear. Several times, BBL has performed at the Philadelphia FIGHT'S Hip-Hop For Philly campaign, an event that offers free HIV screenings to youth aged 13 to 24. More recently, the students have been involved in #BlackLivesMatter rallies, strengthening the movement by adding their voices.

However, BBL does not simply place the onus on the youth to be the messengers for their communities. Running parallel to the youth's participation in community events are partnerships with other local organizations that deliver opportunities for youth to expand on the skills they acquire through BBL. These partnerships offer a glimpse of the many career options available in the creative economy that go well beyond just being a rock-star or music mogul. Through lyric writing and beat making, these youth are able to envision a future for themselves while finding the strength and efficacy to affect change for themselves and others.

- **Strategies Used:**
  - Using an artform relevant to the youth to explore issues.
  - Offering potential career paths in the creative economy through exposure to the many aspects of writing, recording, producing, and performing hip hop.
  - Providing a platform from which the youth can perform and have their voices heard.
  - Meeting at schools and community centers, where the youth already are.
  - Connecting youth to artists who share in their struggles but have found ways to survive and thrive.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Community Outcomes:**
  - Increased number of adults hearing the messages of the youth.
  - Community leadership gaining awareness of the state of the school system.
  - More youth becoming engaged in positive, prosocial movements.
- **Personal Outcomes for Youth:**
  - Youth empowered by having their messages heard.
  - Ability to find hope and healing through their artistic explorations.
  - Positive relationships built with peers and teaching artists.
  - Effective communication greatly increased, youth better able to discuss personal and community problems.
  - Interpersonal conflict more readily resolved amicably.

CASE STUDY THREE: CLEANER WATER FOR THE HAVEN OF LOVE

Background

Pastor Ramiro Maldonado founded Remanso de Amor, a school and church in the heart of Argelia Alta, an impoverished community nestled in the hills of southern Quito, Ecuador. Years of endless poverty facing the families of this community have manifested into issues of abuse, mental illness, and alcoholism and drug use. The children who attend Remanso de Amor come from broken homes and often rely on the school to provide necessary nutrition and healthcare.

The houses in this community are cobbled together with whatever materials can be found, many with dogs protecting the home from the roof. More stray dogs roam the neighborhood, knocking over trashcans and spreading trash in the streets in the hopes of finding a meal. The school and church building itself is only partially complete as Pastor Ramiro relies on outside groups to donate necessary funds and work. The third floor of the building does not yet have a roof. Curls of rebar protrude from the top of walls stunted by the lack of funds and volunteers to build any higher.

Yet, the pastor sees hope within his young students and wants to capitalize on that hope and diffuse it through his community. Through a missionary organization in Quito, he learned of BuildaBridge International and requested to have a team visit his school. The group of community artists and arts therapists worked with the pastor to create a weeklong camp for children aged 5 to 12. He was hopeful that this arts-based group would help the community find their inner strength to begin the process of overcoming their many adversities. Appendix 1 offers an abridged version of the curriculum developed in response to concerns as addressed by the youth.

Identifying the Problem

On the first day of the camp immediately following a song that would become the routine opening, the arts team asked the children to lead them on an asset walk of the neighborhood. The children had been asked to point out places or things that made them feel safe or happy as well as to point out places where they felt things could be fixed. The children introduced the team to the many dogs roaming the neighborhood or barking down from rooftops. They pointed out a beautiful playground located next to

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the police station that was not often safe due to the drunks and drug addicts that occupied the park. One teen pointed out a bridge that spanned the nearby highway and led to a gas station and road side shop. It was dangerous to cross the bridge due to thieves that lurked on either side. Throughout the entire walk, the team could not help but notice water spilling into the streets from exposed pipes. The children explained that this was "agua contaminado" (contaminated water). The water that came through the pipes was unsafe to drink. Many pipes were broken under and above ground allowing garbage and dirt to enter the water flow. Safe drinking water could be bought in the local stores, but water from the tap could make a person ill.

Exploring the Problem

Through an arts-based assessment, it was found that while the students had a firm grasp of academic aspects related to water, they were reluctant to indulge their creativity. Knowing that all successful projects begin with identified assets, the team had designed a lesson plan that infused opportunities to be creative into the well understood water cycle. A group dance began to form as the children assigned movement qualities to the various parts of the water cycle. They arranged themselves within the room depending on the state of the molecules in the water. They directed the tempo of the accompanying drum to match the movement of the molecules. Typically, a community artist might use the arts to teach an academic subject; here the opposite occurred. A well understood subject laid the foundation for creative exploration.

Further exploration of the water cycle and how water becomes contaminated included a short skit that was built sentence by sentence, each child contributing the next twist or turn. While a silly story, the process allowed each child to be engaged and included while encouraging creative ways to solve the problems in the story. Camp participants also created watercolor paintings of drops of water as viewed through a microscope. Water for these paintings were collected from a bottle of water, from a spigot at the school, and from water leaking onto the streets from a broken water line. Though these paintings looked harmless in the soft pastel colors of the watercolor paint, a powerful realization of the state of drinking water in the community was no longer an imagined thing.

Addressing the Problem

On the final day of the camp, the arts team revisited the children's community map and their identified concerns. By this time, the youth had become passionate about making their water sources safer for all to drink and wash in. Allowing their re-ignited creativity to guide their ideas, they devised a plan that would decrease the amount of litter falling into the streets and water sources. It educated the community on the effects of drinking unsafe water. The plan was simple, but one that the youth could successfully execute. Fortunately for all involved, a community meeting was scheduled to be held that evening. The older youth were given permission to present to the meeting's attendees on what they had been working on that week and what solutions they were seeking. The information was confidently presented and met with an unexpected, but altogether pleasant surprise. A local business, upon hearing their presentation, offered to purchase several trash cans to be installed in the community. These trash cans were specifically designed to keep stray dogs from knocking the cans over. In celebration, the children were asked to paint the cans in bright colors and patterns to help beautify the neighborhoods and encourage community members to use the new cans.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Strategies Employed:**
  - Using a routine song with movement to build trust and relationships across cultures and languages.
  - Encouraging youth to develop their own solutions through experiential learning and creative problem solving.
  - Using collaborative storytelling to allow each child to have a voice and value their contributions to the group.
  - Using the arts as a way to view identified issues through a different lens.
- **Community Outcomes:**
  - Awareness brought to root of local water contamination.
  - A solution to the trash and litter problem was found.
  - Community leaders were given an opportunity to see the power of young people.
  - Neighborhoods beautified by youth created artwork and decreased litter in streets.
- **Personal Outcomes for Youth:**
  - Youth were reconnected with their own sense of creativity and self-expression.
  - Youth were empowered through positive relationships with artists to effectively communicate with community leaders.
  - Language barriers were broken down by utilizing the arts to communicate.

CONCLUSION

Each case study presents a different population, a different environment, and a different issue to be addressed. Yet all followed a similar process that ended with powerful results. The very same issues that create adversity in the lives of urban youth are often the barriers that stop them from the critical engagement of addressing and resolving societal and community adversity. Chronic adversity begins to fade hope for many as they age but is still likely to exist in the youth. These sparks of hope, however small, make urban youth well positioned to be great catalysts of change. Community artists nurture that opportunity by facilitating safe and creative spaces for urban youth to engage in the arts and gather the necessary skills and knowledge needed for sustained and authentic civic engagement.

Arts-based civic engagement does not limit art-making to the final project, but rather integrates art-making and arts explorations into each and every stage of the process. Why limit the power of the arts to only play the role of social commentator rather than embrace its benefits from the start? Similarly, transformation does not need to wait for policy makers to create new policies, transformation can start within each individual so that self-efficacy can grow towards collective efficacy. Systemic change is only possible when the hearts and minds of individuals have changed. The power of the arts allows urban youth to recognize and accept their potential power as change agents while increasing their sense of self value and worth. Balancing arts explorations with the civic engagement process creates a pathway for generating the powerful, personal transformation necessary to drive successful and sustainable social change.

KEY TERMS AND DEFINITIONS

Adversity: Issues present in one's life that affect quality of life.

Arts-Based Civic Engagement: In arts-based civic engagement, art-making and the creative process are the vehicle driving the civic engagement process or project. Participants in arts-based civic engagement may either use an arts performance or exhibition to call attention to the issue to be addressed or explore the issue to be addressed through the process of making art.

Civic Engagement: Civic engagement includes those activities that seek to improve the well-being of a community or society in general. Conventionally, civic engagement was often associated with the realm of politics and the ability to influence decision makers through collective action. In a broader sense, civic engagement can be considered any meaningful participation of members of a community working to identity and address issues related to injustice and to effect social change. Civic engagement may include simple tasks such as volunteering with a local organization or voting to community organizing (protests or acts of civil disobedience) for political advocacy.

Community Arts: Art-making in any media, genre, or discipline with the goal of engaging artists with the community to facilitate creative explorations that support development and improve quality of life.

Hope: The expectation of positive outcomes related to events or circumstances.

Social Toxins: Chronic instances of adversity rooted in social injustices that prevent healthy development.

Urban Youth: For the purpose of this chapter, urban youth will be defined as young people between the ages of 12 and 18 living in an urban context. While significant diversity exists in urban communities, the contents of this chapter offer a greater scale of influence for those youth living in distressed neighborhoods and are consistently marginalized from society due to race, income, and lacking opportunities.

This research was previously published in the Handbook of Research on the Facilitation of Civic Engagement through Community Art edited by Leigh Nanney Hersey and Bryna Bobick, pages 294-319, copyright year 2017 by Information Science Reference (an imprint of IGI Global).

APPENDIX: RESPONDING TO ISSUES OF WATER

This curriculum was developed by Amy Grebe and Jenny Bopp specifically in response to water issues as identified by youth in Argelia Alta, Ecuador. While the entire curriculum is not included here, this abridged version should offer an in depth look at the identification and exploration stages of an arts-based civic engagement process. This was designed to be easily replicated in other areas with non-potable water.

Curricular Outcomes

- **Academic Goals:**
  - Youth will understand the water cycle and forms of water.
  - Youth will understand ways in which water can be life giving and life taking.
- **Artistic Goals:**
  - Youth will explore movement qualities and apply the qualities to appropriate situations.
  - Youth will explore watercolor painting as a form of expression.
  - Youth will understand elements of stories.
  - Youth will create and dramatize a story using structured improvisation
- **Civic Engagement Goals:**
  - Youth will identify resources and issues within their community.
  - Youth will understand the root cause of the identified issue.
  - Youth will develop a sustainable solution/project to address local water issues.
  - Youth will present their project to community leaders.

Day One: Transect Walk and Mapping

- **Materials Needed:** Blank paper, pen and pencils; raindrop papers, markers or colored pencils; large board or paper.
- **Opening Ritual:**
  - Each person entering the space should be greeted at the entrance. If no physical entrance exists in the space, create a symbolic threshold that signifies where each person should enter the safe space. Greetings may include handshakes, high fives, cheek kisses, or other forms of physical greeting that are culturally acceptable and only if it is appropriate.
  - Gathering all participants in a circle, lead group through song with movement. This song will be used at the opening of every meeting moving forward.
  - Working together, create rules that promote physical and emotional safety that are agreed upon by the entire group.
- **Transect Walk and Mapping:**
  - **Before the Walk:** Explain that the entire group is going on a walk to identify both the assets and the needs of the community. Decide on a route that is both walkable within a short amount of time and is representative of the local community. During this walk, everyone should be taking note of and recording the following things:
    - Places or items that promote safety.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

        - People in the community who are leaders that may be met along the way.
        - Resources available to the community (churches, schools, stores, police, etc.).
        - Places or items that are unsafe.
    - **During the Walk:** Depending upon size of group, it may be best to divide into smaller subgroups with one recorder taking notes per group. Walk slowly and stop frequently along the route to both record what has been noticed as well as to speak with people met along the way. It is important that everyone who wants to contribute be included in this process.
    - **After the Walk:** Using a large surface or projector, create a master map capturing observations made by all during the walk. Analyze the map as a group looking at the collective resources and community issues that could be addressed. Determine which of the identified issues might be something that the group could address.
- **Arts-Based Assessment:** In order to best serve youth and understand how to "meet them where they are", some form of assessment should take place. The assessment should be designed to measure skill, knowledge, or attitude in relationship to the general desired outcome of the project or process. The assessment may be made in any form of art and can have an informal evaluation or a formal, detailed rubric. Give each youth a sheet of paper with a large, empty raindrop along with colored pencils. Ask youth to "draw the story of this raindrop" on the paper.
- **Closing Ritual:** Gather everyone in a circle again. Repeat the rules that were decided on earlier in the day. Read the group motto together (this can be something that was brought by the group facilitators or something created as a group).

Day Two: Water Cycle

- **Materials Needed:** Handouts that illustrate water cycle
- **Art Skills:** Elements of dance, choreography
- **Academic Skills:** Water cycle, forms of water, differing molecular states
- **Metaphor:** Sometimes unhealthy things enter our lives and become disruptive or cause change.
- **Opening Ritual:**
    - Greet everyone at the door.
    - Gather in the circle for opening song and rule review.
- **Opening Discussion - What Is the Water Cycle:**
    - **Explore Water Cycle:** Discuss water forms of liquid and gas and how water molecules interact in differing states
- **Creative Exploration - Create a Water Cycle Dance:**
    - **Create:** Youth assign a movement to represent each stage of the cycle:
        - Explore and incorporate different movement qualities (sharp vs. soft, choppy vs. smooth, etc.) as well as levels and space.
        - Link movements as a sequence to show transition through cycle.
        - All students perform movements together.
    - **Link to Issue:** Ask: How might the water cycle be affected in your community? (What might the water molecules pick up along their route? Where might the cycle be stopped?)
    - **Re-Create:** Youth will redesign the dance with added characters, differing movements, change in sequence to incorporate local issues related to water cycle

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Closing Ritual:** Gather everyone in a circle again. Repeat safe spaces group rules. Read the group motto together.

Day Three: Water Is Life Giving

- **Materials Needed:** Painting featuring water to be shared; watercolor paints, pencils; brushes, paper; large paper or board.
- **Art Skills:** Watercolor painting, storytelling, structured dramatic improvisation.
- **Academics:** Life giving properties of water; story questions.
- **Metaphor Presented:** One will always be given the opportunity to write the next part of their story. How one chooses to write it is entirely up to oneself.
- **Opening Ritual:**
  - Greet everyone at the door.
  - Gather in the circle for opening song and rule review.
- **Opening Discussion - Water Is Life Giving**
  - Introduce *Village XVIII* painting by Chitra Vaidya; ask "what do you see?" Follow up with additional questions based on responses.
  - Ask "how does water give life?" Follow up with additional questions based on responses.
  - Present water is life giving facts.
  - Ask "what part or parts of the water cycle can be life giving?" Follow up with additional questions based on responses.
  - **Creative Response:** Using pencil and water colors, create a painting that depicts how water gives life in one's family or community.
- **Creative Exploration - Storytelling through Drama:**
  - Review the questions answered by stories (who, what, where, when, why).
  - Review water cycle dance and story from previous day to determine how these questions may have been answered by the dance.
  - Introduce structured improvisation:
    - Have youth sit in a circle.
    - Invite one youth to be the recorder.
    - Facilitator begins the story with "Once upon a time, this drop of water fell from the sky..."
    - Working around the circle, each youth will have the opportunity to add on to the story.
    - Allow story to go in any direction but review rules for safe spaces prior to remind youth to keep the story appropriate.
    - Have recorder repeat story in entirety back to group.
    - Revisit story questions and apply to story just created.
- **Conclusion/Summary:** Share watercolor paintings. How are they alike, how are they different?
- **Closing Ritual:** Gather everyone in a circle again. Repeat safe spaces group rules. Read the group motto together.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Final Day: Youth Project Creation

- **Materials Needed:** Items needed to display artwork.
- **Opening Ritual:**
  - Greet everyone at the door.
  - Gather in the circle for opening song and rule review.
- **Assessment:** Present youth with same water drop assessment sheet and give the same prompt, "draw the story of this raindrop"
- **Opening Discussion - How Can We Solve Our Water Problems:**
  - Review the issues in the community surrounding water.
  - Brainstorm ideas for creative ways to solve the water related issues.
  - Determine resources needed to effect needed change.
  - Develop a procedure to bring about the change. Project should be able to answer same questions as presented with stories as well as define clear benchmarks for success.
  - Determine the most appropriate audience for the project plan for greatest rate of success.
- **Creative Exploration - Celebration of Art-Making:**
  - Additional community members and leaders should be invited to the celebration. All visual artwork and community map should be exhibited.
  - Begin celebration with demonstration of opening ritual. Youth will then perform water cycle dance and dramatized water drop story. Facilitator will celebrate each participant with a few words of recognition of their special assets and abilities. Audience members will be invited to discuss what they have seen and how it relates to community issues.
  - The youth will close the celebration by sharing their project idea with the community, outlining the procedure, resources needed, and benchmarks for success.
- **Closing Ritual:** Gather everyone in a circle again, including audience members. Repeat safe spaces group rules. Read the group motto together.

Chapter 38
Meaningful Youth Engagement Through Media Usage

Yoshitaka Iwasaki
University of Alberta, Canada

ABSTRACT

Guided by the literature on youth engagement and media studies globally, this conceptual article examines the key engagement-related notions involving youth and media usage. A central argument of the article is that meaningful youth engagement can be considered a key concept in describing youth's use of hybrid media that reflects the diversity of youth populations and their media usage. Specifically, such media-involved youth engagement can be seen as an important meaning-making activity within youth's lives that can potentially build social and cultural capital, including through social relationships and youth-led political activism. Aligned theoretically with positive youth development (PYD) and social justice youth development (SJYD) frameworks, this article suggests that youth's hybrid media usage can be seen as a meaningful youth-engagement activity that can provide opportunities to promote skills/competences leading to positive development, and to address human rights and other social justice issues in an empowered, meaningful way.

INTRODUCTION

Occasioned by the rise of new media, engaging youth in the practice of civic involvement has important implications in our increasingly global society. Guided by the current literature on youth engagement and media studies, this paper examines the key engagement-related concepts involving youth and media usage. In particular, the paper provides critical analyses and interpretations of the outcomes/learnings from local, regional, national, and international case studies on youth engagement through the use of media. Specifically, attention is given to how new and traditional media is being applied to youth engagement in international socio-cultural contexts.

A key argument emphasized in this paper is that hybrid forms of communications through digital and social media, face-to-face interactions, and traditional media can promote youth engagement, in which relationship-building (both within youth and between youth and adults) is a critical concept. Another

main argument is that appreciation of the diversity of youth populations and their media usage from an intersectional perspective is essential to better understand the ways in which youth are engaged via media that can provide meaning-making, for example, on identity and cultural issues. Briefly, an intersectional framework addresses the complex ways in which the key axes of power in society (e.g., gender, race/ethnicity, class, ability, sexual orientation) intersect with each other (Crenshaw, 1995; Garnets, 2002; Iglesias & Cormier, 2002). In addition, the paper suggests that youth engagement through media usage can help build global social relationships and social and cultural capital and can facilitate a youth-led transformation of our society to address social justice issues. Importantly, such multi-media usage can provide youth with creative outlets for civic engagement, community connections, and meaning-making within their lives.

Furthermore, this paper posits that meaningful youth engagement is a key concept for both positive youth development (PYD; Alicea et al., 2012; Delgado, 2002; Lind, 2008) and social justice youth development (SJYD; Cammarota, 2011; Gharabaghi & Anderson-Nathe, 2012; Ross, 2011) and facilitates social/system change to more effectively support youth (Blanchet-Cohen & Salazar, 2009; Davidson et al., 2010; Yohalem & Martin, 2007; Wexler et al., 2009). Indeed, the integration of PYD and SJYD is proposed applicable to the use of hybrid forms of communications to promote youth engagement and development by appreciating the diversity of youth populations and their media usage (from an intersectional perspective), and by promoting meaning-making and social and cultural capital, and to facilitate a youth-led/guided transformation of our society to address social justice issues. Importantly, the power of youth in social change should not be underestimated, and this role can be effectively promoted by the use of hybrid forms of communications for youth engagement.

Accordingly, the paper addresses such concepts as intersectionality, meaning-making, and global social relationships and social and cultural capital to appreciate the diversity in the types and forms of youth engagement through media usage. Before describing each of these key concepts, the paper begins with summarizing a framework of PYD and SJYD and then providing insights into the role of various forms of media in youth engagement broadly.

POSITIVE YOUTH DEVELOPMENT (PYD) AND SOCIAL JUSTICE YOUTH DEVELOPMENT (SJYD)

Youth's media usage is seen as a key youth-engagement activity, which has significant implications for youth development (Conner & Slattery, 2014; Dedman, 2011; Garcia et al., 2015; Kahne et al., 2012). Two of the most popular concepts concerning youth development include positive youth development (PYD; Alicea et al., 2012; Delgado, 2002; Lind, 2008) and social justice youth development (SJYD; Cammarota, 2011; Gharabaghi & Anderson-Nathe, 2012; Ross, 2011). First, PYD seeks to promote a variety of developmental competencies that young people need at individual, social, and system levels to become productive, contributing members of society (Alicea et al., 2012; Ersing, 2009; Lind, 2008; Yohalem & Martin, 2007). Rather than a pathological focus, PYD adopts a holistic view of development, giving attention to youth's physical, personal, social, emotional, intellectual, and spiritual development, and emphasizes the strengths, resources, and potentials of youth (Alicea et al., 2012; Ersing, 2009; Lind, 2008; Yohalem & Martin, 2007).

Second, SJYD involves youth's awareness of their personal potential, community responsibility, and broader humanity, and the engagement in social justice activities that counter oppressive conditions (Cam-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

marota, 2011; Gharabaghi & Anderson-Nathe, 2012; Ginwright & James, 2002; Ross, 2011). Specifically, SJYD involves a critical analysis of social, economic, and political factors including race, gender, class, and culture, and addresses the systemic root causes of community problems (Suleiman, Soleimanpour, & London, 2006; Wilson et al., 2006). Importantly, the integration of PYD and SJYD conceptually supports the vital role of youth as a proactive agent for changes at personal (e.g., self-identity; constructive behaviours), social (e.g., advocacy for social change), and community (e.g., policy and practice change from social justice perspectives) levels (Ross, 2011). Accordingly, these two concepts are considered as a key framework throughout the paper.

THE ROLE OF "HYBRID" MEDIA IN YOUTH ENGAGEMENT

Research has shown that the optimal use of digital and social media can complement and strengthen face-to-face interactions and traditional media, supporting the role of hybrid forms of communications in promoting youth engagement. These hybrid forms of communications can promote meaningful youth engagement and activism, in which relationship-building (both within youth and between youth and adults) is a critical concept.

Specifically, hybrid communication methods including various forms of politically driven, nonpolitical interest-driven, and friendship-driven online participation have been shown to promote youth engagement and youth activism (e.g., Chan & Guo, 2013; Kahne et al., 2011; Xenos et al., 2014). For example, Conner and Slattery (2014) reported the efforts of the Philadelphia Student Union, using the youth-led hybridization principle of social movements that combine online/new/informal and real-world/traditional/formal activism. In particular, their study showed how "youth organizing" through the use of new media offers a bridge across the three divines (the academic achievement gap, the digital participation gap, and the civic engagement gap) and facilitates the digital literacy, civic engagement, and academic achievement of low-income youth of color who might otherwise experience limited opportunities in these domains. Youth organizing refers to "a strategy that trains young people to engage in collective action to improve the institutions in their communities that directly affect them" (Conner & Slattery, 2014; p. 18). Youth organizing has implications for youth engagement and public involvement through hybrid forms of communications and activism, showing the power of youth in capacity-building and social change in line with PYD and SJYD frameworks.

The importance of hybrid media systems and public spaces is further demonstrated through the use of different media platforms and online and offline spaces that reinforce one another and promote youth engagement and youth-led social and political movements. Sloam's (2014) paper reported such importance using four case studies to examine the role that the Internet and new media have played in the political mobilization of young Europeans. Specifically, four case studies (in Germany, Italy, Portugal, and Spain) highlighted the stories of young, highly educated 'stand-by citizens' who have become activated by crises of youth unemployment, frustration with politics and public policy, and anger with corporate greed into 'digitally networked action' utilizing new technology platforms. The new media also provided a central tool to directly appeal to citizens (particularly, the young and highly educated) and facilitate youth-oriented movements in the digital age without having to play by the rules of the old media or channel their energies through established political institutions (Sloam, 2014).

Also, the use of digital media has been shown to mobilize young people into more active engagement with civic and political life through deliberative activities in schools, democratic peer norms,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

news consumption, and citizen communication. For example, Lee et al.'s (2013) examination of an U.S. national panel survey of parent-child pairs — the Future Voters Study — emphasized the centrality of communication, whether at schools, among peers, or through the media, to youth engagement in civic and political life. Results indicate that information consumption through hybrid forms of traditional and digital media works through citizen communication to encourage civic engagement, including influences stemming from peers and schools onto civic engagement. Specifically, the results show strong online pathways to youth participation and engagement especially through news consumption and political expression via digital media technologies (Lee et al., 2013).

Using data from Dutch grade-eight students, van Kruistum et al. (2014) examined youth media lifestyles that encompass new media, traditional print-based media, and face-to-face (offline) interaction as "hybrid" forms. This examination was completed by exploring both interest-driven media engagement (e.g., for entertainment, to gain knowledge) and friendship-driven media engagement. They found four distinct media lifestyles defined in terms of: (a) the medium through which a particular media activity took place, (b) the social distance involved between sender and receiver, and (c) the function of the particular activity. These youth-media lifestyles were named as: (1) omnivores (appropriating all media for multiple functions in diverse social contexts), (2) networkers (staying connected with known others across offline and online), (3) gamers (specializing in a medium of entertainment within a distant social context), and (4) low-frequency users (not bringing offline interests and relationship online) (van Kruistum et al., 2014). Such study is useful to better understand the diversity in youth media lifestyles with respect to the role of media in youth engagement including friendship-driven and interest-driven media engagement.

Drawing on international survey data from mentoring program staff and volunteer mentors primarily in US and Canada, Schwartz et al. (2014) examined the use of digital and social media in youth mentoring relationships. Their findings show that this media use does not seem to detract from the closeness and quality of face-to-face mentoring relationships but may actually supplement and strengthen them. The findings also highlight the importance of creating an environment of reciprocity and mutuality and reducing the chance of shaming and patronizing youth. Indeed, relationship-building (both within youth and between youth and adults) is a critical concept in youth engagement, which can be facilitated by the optimal use of new media that can complement face-to-face interactions and traditional media, again, supporting the effective use of hybrid forms of communications (Schwartz et al., 2014).

Also focusing on the use of hybrid forms of media, Skoric and Poor's (2013) study with young people in Singapore examined how youth navigate between the traditional and new media for civic and political participation. They found that social media use is positively related to traditional political participation (because new media are a means for political mobilization and organization of citizens due to their low barriers to entry and quick diffusion of information), while also providing evidence of the continued importance of traditional media for political engagement. Keipi and Oksanen (2014) explored youth narratives of the interaction of both opportunities and risks in the use of social media by youth in Finland. Their findings illuminated the role of new media in youth need-fulfillment toward self-exploration/expression, self-determination, and identity development, and relationship-building, as well as the social risks that youth's new media use involves (e.g., cyberbullying, harassment).

Not surprisingly, the rapid dispersion of digital communication technologies in the last decade has spurred interest in how changes in communication technology might be reshaping and possibly reinvigorating youth's opportunities and inclinations for engagement. Research has been particularly focused on the engagement of young citizens, a population historically under-engaged and among the most active

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

users of digital media. Existing literature suggests that recently created, online organizations will be most likely to embrace a newer, more youth-friendly communication style; those organizations working within the formal political realm may be most reticent (Bimber et al., 2012; Castells, 2009; Karpf, 2012). Wells' (2014) study of 60 organizations' (including government, interest groups, and community groups) communications through Facebook mainly confirms these expectations, but low levels of youth-friendly communications across the sample raise doubts about the likelihood of a civil society resurgence through social media.

In summary, research supports the role of hybrid forms of communications in promoting youth engagement by showing that the optimal use of digital/online and social media can complement face-to-face interactions and traditional media. Specifically, hybrid communication methods including various forms of politically driven, nonpolitical interest-driven, and friendship-driven online participation have been shown to promote youth engagement and activism. In particular, the youth-led hybridization principle of social movements combine online/new/informal and real-world/traditional/formal activism. Hybrid forms of communications for youth engagement provide youth activist opportunities that emphasize the power of youth in capacity-building and social change in line/alignment with PYD and SJYD frameworks. Indeed, the use of digital media has been shown to mobilize young people into more active engagement with civic and political life through activities in schools, democratic peer norms, news consumption, and citizen communication for the development of active citizens. Importantly, relationship-building (both within youth and between youth and adults) is a critical concept in youth engagement, which can be effectively facilitated by hybrid forms of communications. Furthermore, it is important to recognize the role of new media in youth need-fulfillment toward self-exploration/expression, self-determination, and identity development, as well as the social risks that youth's new media use involves (e.g., cyberbullying, harassment).

INTERSECTIONALITY: DIVERSITY OF YOUTH POPULATIONS AND THEIR MEDIA USAGE

Apparently, youth populations are diverse based on socio-demographic factors including: gender, race/ethnicity, age, social class, disability/ability, and sexual orientation. The framework of intersectionality is helpful to better understand influences of these diverse human characteristics on youth engagement via the use of media. In particular, an intersectional framework addresses the complex ways in which the *key axes of power* in society (e.g., gender, race/ethnicity, class, ability, sexual orientation) intersect with each other (Crenshaw, 1995; Garnets, 2002; Iglesias & Cormier, 2002). Indeed, most people in our society have more than one identity in terms of gender roles, racial or ethnic identities, and identities related to social class, age, ability, and sexual orientation. These identities are linked to different experiences of social power, privilege, and oppression as related to the dominant culture. Intersectionality is a framework being used in various different disciplines (e.g., women's studies, cultural studies) to help recognize and analyze the multiple nature of identities and the interlocking systems of privilege and oppression in a non-additive sense within specific life contexts (Iwasaki et al., 2006; Razack, 1998; Ristock, 2002).

In addition to looking at such human characteristics separately, this section of the paper explores how young women and men with different races/ethnicities are engaged through various types of media. Besides the intersection of gender with race/ethnicity, we give attention to the other dimensions of human diversity including sexual orientation, disability/ability, and social class. Through the lens of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

intersectionality, we address in what ways and how the diversity among youth populations should be acknowledged to better understand opportunities and challenges of youth engagement through media. A key point emphasized in this section is that diversity is the lived reality and intersectionality is a perspective that sheds light on how diverse identities and structures may both constrain and enable media and youth engagement. Importantly, intersectionality is not based only on identity per se, but this notion also addresses how power and privilege emerge through structures of socially constructed concepts such as gender, race/ethnicity, class, sexual orientation, and disability/ability.

One such community group characterizing the diversity of youth populations represents sexual minority youth. Research has shown that their engagement with online technology is a critical feature of their daily lives and development because this offers them with significantly safer spaces and vital community support and connectedness (e.g., Craig et al., 2014). For example, using a feminist, intersectional framework, Singh's (2013) qualitative study found a key theme for the use of social media to affirm one's identity as a transgendered youth of color and promote sense of connectedness. Also, Asakura and Craig (2014) explored resilience development in the accounts of lesbian, gay, bisexual, transgender, and queer (LGBTQ) youth, by analyzing videos posted for the *It Gets Better* social media campaign. The findings offer a nuanced look at the pathways to resilience development, which are described by four major themes emerged from the data: (1) leaving hostile social environments, (2) experiencing "coming out" in meaningful ways, (3) re-membering the social environment, and (4) turning challenges into opportunities and strengths. For instance, "by re-membering, many participants have developed their own clubs of life with selective members who have supported them through difficult times and valued their beings" (p. 261), whereas "the difficulties they experienced as youths also prepared them well to manage their adult lives" (p. 262).

Another instance of the diversity in youth populations and their media usage involves everyday use of digital technology and online social media by adolescents and young adults with physical disabilities and complex communication needs. To exemplify this notion, those youths in Hynan et al.'s (2014) study showed a desire to use the Internet and online social media as it is perceived to increase opportunities for self-determination and self-representation, while enriching friendships. The wide diversity of literacy and communication skills among youth with disabilities, as well as accessibility challenges, mean that the use of a collaborative approach is vital, for example, through receiving technical and social support from educational settings, families, and friends (Hynan et al., 2014).

Along with the growth of research on young women, we have seen the emergence of research on ethnic youth, implying the intersection of gender with ethnicity contextualized within the notion of youth subculture (e.g., Clark, 2012; Dedman, 2011; Gunter, 2010). Originally, Blackman (1995) advanced the idea of "youth cultural forms" and Thornton (1995) adapted Bourdieu's theory of cultural capital to speak about "subcultural capital." As emphasized by Blackman (2014), subcultures attract attention in culture, society, and the media because these have been theorized as not merely distinct from, but also in opposition to, the dominant culture. The new forms of subcultural communication through social media are considered as a key domain to promote knowledge, flexibility, participation, and collectivity transmitted through a subcultural network (Hodkinson & Lincoln, 2008; Williams, 2011). Blackman (2014) argues that youth cultural identities based on consumption, in which communications through social media play a key role, are structured by both material and social conditions of inequality (e.g., various forms of "isms"), while engagement with youth subcultures at a social and political level is critical by looking at, for example, deviant behaviour, connectedness, and social change to address social justice issues.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Importantly, the intersection of gender with ethnicity contextualized within the notion of youth subculture has implications for the broad topics of culture, society, and the media. Specifically, communications through social media play a key role in developing youth cultural identities. In this way, the use of media provides a key cultural sphere to create youth activist subcultures, which seek to contest a range of global injustices through collective means consistent with SJYD and PYD frameworks described earlier.

For example, youth activist involvement includes the use of media, contextualized within the raced, classed, and gendered challenges of youth activist cultures from an intersectional perspective. To illustrate this notion, Kennelly's (2011) book, entitled "Citizen Youth: Culture, Activism, and Agency in a Neoliberal Era" explores youth activist subcultures undertaken as part of a year-long multi-sited ethnography in Canada's three largest urban centres: Toronto, Montreal and Vancouver. Specifically, the book examines the dilemmas and cultural dynamics of being young and politically engaged, including the use of media as a key cultural sphere. The book interrogates both macro-structural forces such as education, media, and politics, and micro-sociological factors shaping youth activists' lived realities, resulting in a portrayal of the day-to-day experiences of young people who seek to contest a range of global injustices through collective means. The major issues shaping youth activist engagement described include the use of media as a key resource to sustain activist involvement, and the development of raced, classed, and gendered activist cultures from an interactional perspective (Kennelly, 2011).

Contextualizing mobile media in teens' lives, Vickey's (2015) paper examines how ethnically diverse low-income, non-dominant teens mitigate reduced privacy levels in and through mobile technologies and social media, and with what consequences. Teens in the study utilized a variety of social media platforms (e.g., Facebook, Twitter, Tumblr, Instagram, YouTube) to reach different audiences, explore different identities, and form different communities. They deliberately used these multiple platforms as a way to cope with evolving privacy settings, social norms, and technological affordances — this was a deliberate strategy intended to resist social convergence (Vickey, 2015). As such, the boundaries of sharing and privacy are constantly renegotiated at the intersection of localized social norms, economic and social capital, and the technical affordances of particular platforms and devices. As shown in Vickey's study, mobile media provide youth with a sense of autonomy, independence, and privacy from adults (Ling, 2010) and facilitate more personalized forms of communication (Campbell & Park, 2008).

As an emerging form of culture, digital culture can be broadly defined as the multiple ways in which people engage with digital media and technologies in their daily lives (Livingstone, 2009). As a unique domain of digital culture, non-urban areas of a developing country would generate a distinct set of experiences. As shown by Pathak-Shelat and DeShano (2014), youth digital cultures in rural and small-town India are influenced by and negotiate local, regional, national, and global discourses, for example, through homes, peers, schools, and official public messages. Youth in their study treat new media and technologies as one limited component of otherwise rich lives and social experiences. For example, financial interests that drive commercial aspects of digital culture obscure its layered power differentials through contradictory media experiences and end results (Pathak-Shelat & DeShano, 2014). Obviously, power dynamics play a role in the construction of digital culture among youth, which is contextualized both locally and globally.

As exemplified in this section, an intersectional perspective addresses the complex ways in which the *key axes of power* in society (e.g., gender, race/ethnicity, class, ability, sexual orientation) intersect with each other (Crenshaw, 1995; Garnets, 2002; Iglesias & Cormier, 2002). A variety of media forms, through which youth are engaged, address these power issues such as the intersection of various identi-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ties including gender roles, racial or ethnic identities, and identities related to social class, disability/ability, and sexual orientation. Indeed, these identities represent key factors for personal and collective experiences within the systems of social power, privilege, and oppression (Iwasaki et al., 2006; Razack, 1998; Ristock, 2002). In particular, the new forms of subcultural communication through new media promote knowledge, flexibility, participation, and collectivity transmitted through a subcultural network. Specifically, communications through new media play a major role in developing youth's cultural identities. Accordingly, the use of media provides a key cultural milieu to create youth activist subcultures, as a collective space to address social justice issues, in line/alignment with SJYD and PYD frameworks. For example, youth activism includes the use of media, contextualized within the raced, classed, and gendered youth activist cultures from an intersectional perspective. Importantly, the use of new media can be seen as a means of reclaiming and reshaping the ways in which youth are engaged to address these power issues.

MEANING-MAKING THROUGH MEDIA USAGE AMONG YOUTH

Another important idea is that the use of media in youth engagement is considered as an effective means of promoting meaning-making that can provide a variety of personal and collective benefits for youth. Meaning-making refers to the ways in which and how people gain meanings within life that are important for personal, social, cultural, spiritual, and community reasons (Markman, Proulx, & Lindberg, 2013; Park, 2010). Relevant to this paper, the use of new media is seen as a key meaning-making process or activity to address identity, socio-cultural, and power-related issues. For example, Halverson (2010) explored youth film-making as a medium for meaning-making, by seeing youth as producers of digital media. Her analysis demonstrated how films such as Rules of Engagement display the construction of a viable social identity where youth actively insert their understanding of: (a) how to represent complex portraits of how they see themselves, (b) how others see them, and (c) how they fit into their communities. The study showed how youth (in particular, youth living within marginalized conditions) engage with and make sense of identity issues as a critical meaning-making process through the media they create (Halverson, 2010).

Mutere et al. (2014) examined the roles of popular culture, media, and the arts in the health-seeking concerns and behaviours of 54 homeless youth in California, USA, with a focus on what they saw as barriers and aids. Their findings highlighted the importance of a creative arts-media intervention (e.g., graffiti as a multi-media platform) for homeless youth to promote a sense of life-meaning, civic engagement, and positive community connections and health outcomes in an age-appropriate and culturally-sensitive way. Specifically, multi-media usage (e.g., poetry, screenplays, stories, and web-logs) provided homeless youth with creative outlets for civic engagement, community connections, and meaning-making within their lives (Mutere et al., 2014). In particular, a peer-to-peer mentorship has been found to be beneficial for marginalized youth to meet their desire for a sense of meaning as demonstrated through a quote from a street-involved youth in Mutere et al.'s (2014) study:

I like to write raps. I like to draw. I'm really talented at it. Marijuana doesn't stop me from that. Those are things that I know I have a gift in. It's like everyone else… electronics, computers, whatever the case may be… A mentor can help them get past that problem and help them go somewhere in life… 'Cause

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

that's what most people feel like they don't have… no life-meaning. You can't just directly say "no". You have to explain to them and encourage them to do better now. (p. 282)

Once again, such voice highlights the important role of relationship-building in youth engagement as facilitated by media usage as a meaning-making activity.

Awan and Gauntlett's (2013) in-depth qualitative study with youth aged 14-15 from six locations across England provided detailed data about young people's online practices based on their lived experiences within their everyday lives. Their analyses of the data identified three themes: (1) 'Connecting and convenience' (being engaged with social networking sites and instant messaging tools to maintain contact, develop relationships, and communicate with friends and family); (2) 'Openness and control' (online communication seen as a medium through which youth can express themselves openly without having to face negative repercussions); and (3) 'Privacy and authenticity' (their profiles being broad and non-specific, simply functioned as a general display for others). Awan and Gauntlett concluded that:

The internet, for the young people in our study, was not simply an extension of, or alternate forum for, their friendships, but enabled them to develop layers of emotional bonding which would otherwise be seen as difficult, and perhaps best avoided. As such, our results help to illustrate the importance of social media to young people's everyday lives, identities and relationships, through highlighting intersections between their online and offline worlds… Participants were able to recall important and meaningful elements and to make connections between them (p. 127-128).

As alluded within their findings, these meaningful elements represent the three key themes identified, namely, (a) connecting and convenience, (b) openness and control, and (c) privacy and authenticity, described above as meaning-making functions especially to "develop layers of emotional bonding" (p. 127) with youth's friends and family within their daily lives. Importantly, youth's online practices can facilitate these various forms of communication, relationship-building, and meaning-making.

By focusing on the construction of meaning and identity, Zemmels' (2012) study with 11 American teens (13-17 years of age) in New Orleans documented those participants' engagement with new media in networked spaces and the everyday practices that surround their participation. The findings showed a complex pattern of relationships between interpersonal communication channels, the relative immediacy and intimacy of the channel, and the social relationship between participants. This pattern appeared to have a structuring influence on everyday communication practices of youth in networked publics, as they negotiate and construct meaning (e.g., aesthetic and social meaning through visual media) and identity in these networked publics (Zemmels, 2012). In particular, this study showed that "the examination of media as cultural artifacts of meaning-making is directed connected to everyday practices of media participation" (p. 37), while youth become active agents in this meaning-making process.

In addition, it is useful to consider the digital media creation, distribution, and consumption process as "storytelling" in a shared space, in which a variety of perspectives and meanings are presented (Lambert et al, 2007). Accordingly, the space in which stories are shared and collaborated on becomes an entity with a life of its own. As mobile communication media and the internet become more pervasive, young people from different cultures and communities are afforded more opportunities for sharing and collaboration across previously unbridgeable distances (Botha et al., 2009). Botha et al.'s (2009) study with five teenagers from USA and five teenagers from South Africa demonstrated the role of mobile

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

phones and the web as mediating technologies in the development of intercultural competencies and communication skills. Specifically, their study has shown that mobile phones have a place in the creation of meaningful user-generated content for improved cross-cultural awareness and communication — as communication devices, they have progressed "from text to context" (Botha et al., 2009). Increasingly, technology facilitates the ways in which the youth around the world communicate, consume content, and create meaning (e.g., South African teens mindful of explaining local slang and the meaning of Afrikaans words to American teens) across diverse cultural contexts.

For another example, with 35 young people in Philippine between the ages of thirteen and twenty-six in four focus groups, Portus (2008) explored how the urban poor acquire, use, and ascribe meaning to the mobile phone. This study found that the mobile phone allows the urban poor to pursue their gender-defined functions more effectively, being a source of desire and envy, most apparently among the women, as a highly sought-after and increasingly vital, meaningful part of their lives, despite grinding poverty (Portus, 2008). Specifically, the use of this media enabled Filipino urban poor youth to gain valued meanings through promoting social role fulfillment and self-perception.

A recent special issue of *Educational Studies* on "Youth, New Media, and Education" featured several papers that examined youth as both consumers and producers of popular culture, which lies at the intersections of traditional media and new digital media. As the issue editors, Luschen and Bogad (2010) commented that "youth representations of themselves have the capacity to shape the cultural landscape, interrupt and collude with existing discourses of youth, and teach what it means to be a youth in all its complexity, within and across difference… Reaching across boundaries between conventional and new media, these texts illustrate the complexities that a newly constituted popular culture provides" (p. 454-455). Through the process of youth's negotiations using various media forms, they produce, consume, and learn about popular culture as ways of meaning-making in their daily lives. Importantly, the use of new media can be seen as a means of reclaiming and reshaping the ways in which youth are engaged, as key meaning-making processes, to address significant identity, socio-cultural, and power-related issues in their everyday lives in support of PYD and SJYD frameworks.

BUILDING GLOBAL SOCIAL RELATIONSHIPS AND SOCIAL AND CULTURAL CAPITAL THROUGH YOUTH'S MEDIA USAGE

Given the resurgence of digital and social media, youth engagement has become more globalized across cultural boundaries. One obvious outcome from this global process represents building cross-border social relationships and social and cultural capital facilitated by youth engagement through the use of media. A number of examples from the literature support the idea that the role of media in meaningful youth engagement contributes to building global social relationships and social and cultural capital. First, drawing from a comparative case study of the digital literacy practices of immigrant youth of Chinese descent, Lam (2014) examined the cross-border social relationships that are fostered between the youth and their peers in China. She showed how these cross-border relationships create unique social, linguistic, and cultural capital. The findings suggest that youth's online literacy practices need to be understood within the particular social fields/networks in which they are situated and how they allow the youth to navigate and take up a position within social fields across national boundaries. Importantly, media usage is considered as one of the significant and meaningful daily human activities within structured social spaces. Consequently, relationships built from using communication technologies can promote social

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

capital (e.g., affiliations and networks) and cultural capital (e.g., cultural knowledge, skills such as bilingual or multilingual skills, and cultural dispositions/customs) (Bourdieu 1991). Specifically described in Lam's study include "bridging capital" to connect with the monolingual majority population in society, and "bonding capital" to connect with the minority population, as well as transnational engagement and resource development in digital art.

For another example, de Haan et al. (2014) examined the networked configurations for learning of migrant youth in the Netherlands, in relation to particular offline and online connections, their historical geographies, the development of learning 'places,' and particular learning affinities. Specifically, they described three ethnically different groups: (a) Dutch youth as 'unrooted' learners (who are networked according to individually expressed interests for exploration), (b) Moroccan-Dutch youth as 'routed' learners (who form collective affinities and interests within same generation ethnically informed spaces), and (c) Turkish-Dutch youth as 'rooted' learners (defined by more collectively formed interests embedded in family and ethnically based networks). This grouping shows examples of the diversity in globally dispersed, highly individualized yet collective networks within migrant youth to pursue tailored knowledge. Even within a single country at a local level, the development of global social relationships and social and cultural capital is a reality as increasingly facilitated by the use of media within youth populations internationally.

Furthermore, Garcia et al.'s (2015) study focused on civic engagement enacted through digital media participation by exploring the relationships between critical literacy practice, digital media production, and civic agency in the Council of Youth Research, a youth participatory action research program in Los Angeles, USA. In particular, their study articulates a vision of literacy that is tied to societal power structures as a way of building personal and social capital for the purpose of personal and social transformation. Specifically, the study highlights the ways in which student digital literacy production manifested powerful civic agency. The authors argue, "Academic and critical literacy development are crucial to beginning the process of empowerment for students to become critical consumers of information. When youth are empowered with the ability to make sense of the unjust conditions in their community and the skills to act, they become powerful agents of transformation" (p. 165). Importantly, meaning-making and mobilization of actions to promote personal and social capital, and address social justice issues are key empowerment and transformation processes, again, consistent with PYD and SJYD frameworks described earlier.

Attractive to young people, modern music festivals have become sites of mediated brand management where commodified hyper-experiences are considered as new forms of contested cultural capital. As described by Flinna and Frewb (2014), the realm of music festivity has grown into a global circuit that responds to the demand for emotive experiential products and taps into postmodern themes that celebrate a lifestyle attitude of extended youth. Their study explored the phenomenon of festival culture through a case study of Glastonbury Festival of Contemporary Performing Arts in England. The study presented an innovative interpretation of festivity through multi and social media, showing that identity is a hybrid construct where the localised ephemeral and embodied experiences of festivity demand a simultaneously mediated and socially globalised reflection. The study portrayed that festivity is moving beyond management as it is increasingly dependent on the co-creative social media activity of consumers to perpetuate the fantasy and capital of festivity. This study depicted how festivity works in an age of ubiquitous social media where lifestyles are increasingly digitised and networked. Undoubtedly, the power of technology is a driving, transformational force in festivity as a form of building cultural capital.

As shown in this section of the paper, youth engagement has become a more hybrid concept ranging from localized to globalized experiences across cultural boundaries prompted by the resurgence of digital and social media. Indeed, one key consequence of this emerging process includes building cross-border social relationships and social and cultural capital facilitated by meaningful youth engagement through the use of media.

INTEGRATION OF THE KEY NOTIONS DESCRIBED IN THE PAPER

Overall, a central argument of the paper is that meaningful youth engagement can be considered as a key concept in describing youth's use of hybrid media that reflects the diversity of youth populations and their media usage. In particular, such media-involved (including new media) youth engagement can be seen as an important meaning-making activity within youth's lives that can potentially build social and cultural capital, including through social relationships (at multiple levels — both local and global) and youth-led activism.

Although the literature reviewed above provides, at least, partial support for an element(s) of this claim, we would like to note that the findings from the following two large-scale case studies broadly/comprehensively address and support such claim. First, Ito et al.'s (2013) three-year ethnographic study, based on interviews with over 800 American youth and young adults and over 5,000 hours of online observations, identified the key themes of "extending friendships and interests" and "self-directed, peer-based learning." As guided by these findings, they have provided recommendations/implications regarding: (a) social and recreational new media use as a site of learning, (b) recognizing important distinctions in youth culture and literacy, (c) capitalizing on peer-based learning, and (d) a new role for education as a process guiding youths' participation in public life more generally. In particular, Ito et al. have suggested that "rather than assuming that education is primarily about preparing for jobs and careers," it is important "to think of education as a process of guiding kids' participation in public life more generally, a public life that includes social, recreational, and civic engagement" — i.e., "an engaged and diverse set of publics that are broader than what we traditionally think of as educational and civic institutions… In addition to publics that are dominated by adult interests, these publics should include those that are relevant and accessible to kids now, where they can find role models, recognition, friends, and collaborators who are co-participants in the journey of growing up in a digital age." Apparently, youth-led meaningful engagement and development of youth through media was broadly captured in this study.

Second, Jenkins et al.'s (2016) recent book, entitled *By Any Media Necessary: The New Youth Activism*, discusses different case studies of youth activism building on popular culture and new media engagement. In a series of case studies covering a diverse range of organizations, networks, and movements involving young people in the political process — from the Harry Potter Alliance, which fights for human rights in the name of the popular fantasy franchise to immigration rights advocates using superheroes to dramatize their struggles — this work has examined new forms of political activities and identities emerging from the practice of participatory culture. Overall, Jenkins et al. have revealed how these shifts in communication have unleashed a new political dynamism in American youth, as they conclude, "This book has offered a range of examples of young people working together to try to change the world, some working within 'the system' (institutional politics), some working around 'the system' (seeking change through other mechanisms)… They are seeking political change by any media necessary."

Accordingly, youth's media usage can be considered as a meaning-making activity to build social and cultural capital and promote social change through engaging in a public/civic life and youth activism by providing youth with opportunities to promote skills/competences leading to positive development, and to address human rights and other social justice issues in an empowered, meaningful way in line with PYD and SJYD perspectives.

CONCLUSION

Contextualized within the popularity of new media, youth engagement is a very important concept in international youth research. Guided by the current literature on youth engagement and media studies, this paper examined the key engagement-related notions involving youth and media usage. Being informed by a variety of case studies on youth engagement through the use of media within various contexts globally, the paper discussed the key issues of engaging youth through media. Better understanding the ways in which youth use media for their engagement has significant implications for practice and policy on youth and civic involvement at all system levels globally. The specific notions covered in this paper include: (a) the role of "hybrid" media in youth engagement; (b) "intersectionality" illustrating the diversity of youth populations and their media usage; (c) meaning-making through media usage among youth; and (d) building global social relationships and social and cultural capital through youth's media usage.

In summary, hybrid forms of communications through digital and social media, face-to-face interactions, and traditional media can promote meaningful youth engagement and activism, in which relationship-building (both within youth and between youth and adults) is a critical concept. Appreciation of the diversity of youth populations and their media usage from an intersectional perspective is helpful to better understand the ways of youth engagement and activism via media that can promote meaning-making, for example, on identity and cultural issues. In addition, youth engagement through media usage can help build global social relationships and social, linguistic, and cultural capital and can facilitate a youth-led transformation of our society to address social justice issues. Importantly, multimedia usage provides youth with creative outlets for civic engagement, community connections, and meaning-making within their lives.

As noted earlier, a central argument of the paper is that meaningful youth engagement can be considered as a key concept in describing youth's use of hybrid media that reflects the diversity of youth populations and their media usage. In particular, such media-involved (including new media) youth engagement can be seen as an important meaning-making activity within youth's lives that can potentially build social and cultural capital including social relationships (at multiple levels — both local and global) and youth-led political activism.

These claims are indeed in line/alignment with the PYD and SJYD frameworks. Briefly, the PYD framework illustrates how the promotion of competencies at both individual and system levels leads to desired youth development outcomes, while the SJYD paradigm involves youth's awareness of their personal potential, community responsibility, and broader humanity, and the engagement in social justice activities that counter oppressive conditions. Importantly, the integration of PYD and SJYD conceptually supports the vital role of youth as a proactive agent for changes at personal (e.g., self-identity, constructive behaviours), social (e.g., collective identity, advocacy for social change), and community (e.g., policy and practice change from social justice perspectives) levels (Ross, 2011).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Indeed, this notion (i.e., the integration of PYD and SJYD) is highly applicable to the use of hybrid forms of communications to promote youth engagement and development by appreciating the diversity of youth populations and their media usage (from an intersectional perspective), and by promoting meaning-making and social and cultural capital, as well as to facilitate a youth-led/guided transformation of our society to address social justice issues. The specific examples illustrated in this paper to support the relevance of PYD and SJYD frameworks include the use of hybrid forms of media in:

1. Communications (e.g., story-telling), relationship-building (e.g., youth mentoring), and meaning-making (e.g., identity formation, community connections);
2. Youth engagement and social and political mobilization (e.g., empowerment, social and cultural capital); and
3. Youth activism to address socially and culturally constructed power issues (e.g., active agents for transformation).

Specifically, youth's hybrid media usage can be seen as a meaningful way of youth engagement that provides opportunities to promote skills/competences leading to positive youth development outcomes, while such a meaningfully engaged media usage can be also seen as a social justice activity to address oppressive conditions in an empowered, meaningful way. Such a claim represents the integration of PYD and SJYD frameworks, as well as bringing together the other elements of the paper, namely, (a) hybrid media, (b) intersectionality, (c) meaning-making, and (d) building relationships and social and cultural capital.

The power of youth in leading/guiding social change should not be underestimated, and this role can be effectively promoted by the use of hybrid forms of communications for youth engagement. Importantly, the use of new media provides youth with opportunities to re-define and re-create the ways in which youth are engaged, as key meaning-making processes, to address significant identity, socio-cultural, and political issues.

Chapter 39
Opportunities and Challenges of Visualization and Open Data in Food Security Analysis

Thida Chaw Hlaing
University of New England, Australia

Julian Prior
University of New England, Australia

ABSTRACT

Statistical literacy presents many aspects about food security in the world. It highlights weaknesses, it creates awareness of threats in current situations, helps overcome challenges and creates opportunities for the future. Statistical data analysis enables existing food security interventions and programs to be reviewed and revised, and this better understanding of current situations enables more authoritative and relevant decision-making processes for the future. Statistical literacy involves skills and expertise in data description and interpretation (in words as well as in numbers) to name, explore and amend beliefs, opinions and suggestions. It helps decision-making processes about food security in a sub-nation, nation and region, as well as the world. This chapter will demonstrate the importance of open data and visualization, including its challenges and opportunities, in the food security context at national and global level to make decision-makers aware of the need to enhance their capacity for and investment in statistical literacy.

INTRODUCTION

In this era of information, communication and technological innovations, data dissemination systems and the diverse varieties of data present a number of technical challenges for various kinds of research and analysis. Private sector data and information service providers have been expanding their business by obtaining open data sets released by government and the public sector and offering them for sale. It greatly helps researchers and scientists to access open data for the analysis, modelling and visualization of their particular research topic or area. The realistic research outcomes they produce may challenge

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

our beliefs and suggest actions for the future. The Open Knowledge Foundation describes open data as data that can be freely used, re-used and redistributed by anyone without legal, technical or social restrictions (Tammisto & Lindman, 2012, p. 298).

Accessing open dataset supports and applying them to the decision-making process could improve the lives of all people. Technological challenges have been encountered, however, due to insufficient metadata, because it is disseminated increasingly by different data organizations worldwide. For this reason, the food security situation in some developing countries goes unrecognized, mainly due to weak data analysis and visualization. A country's government or agencies and departments are always under pressure to release their big data for open access. They often cannot release the big data if they don't have permission, as is the case of isolated countries like Myanmar. In addition, profit-making data suppliers focus more on income generation from their data streams and networks than on making big data freely available.

In terms of the world's development agenda, solving the issues of food insecurity and poverty will be critical to improving rural livelihoods as well as developing very country's economy, from individual household up to the national level. However, the level of food insecurity varies from one country to another, even between regions in the same country because of different factors, causes and consequences (Joachim Von Braun, 1992). In the analysis of food security, it is hard to find major causes and provide appropriate suggestions to decision-makers, due to the limitations of data availability, accessibility and government support to re-use data.

Since data visualization has become very popular in the multisector research area, various visualization tools to process datasets have been developed and applied in the areas of agriculture and food security. In this respect, statistical analysis initially requires data visualization to give a basic understanding on which to base decisions that can reduce the stress of food insecurity. The availability and accessibility of data are therefore crucial, even though there are many reasons for insufficient data, such as weaknesses in transparency, integrity and accountability, to convey the key message that freely available open data offers great social, economic and good governance benefits to every country (Organization for Economic Cooperation and Development [OECD], 2016). Given open data availability and accessibility in the public sector, many potential research tools can give a basic understanding of food security with a model that shows multiple inter-related causes through visualized graphs, tables, charts. Open data from various sources can be applied to validate and refine these visualized food security causal models which in turn could be used to identify solutions to food insecurity.

OBJECTIVE

Without statistical literacy of data interpretation and visualization, it is not easy to explore the strength and weakness of any industry. However, when statistical literacy is applied to agriculture, which is the focus of this chapter, it can give a complete picture in order to address a situation of food insecurity, including looming risks and potential solutions. For this reason, open data and big data statistical literacy are integral both to supply of and demand for data and information.

The statistical tools used will differ, depending on data availability and accessibility as well as differences in terms of research themes and the mandate of the organizations, institutions and governments involved. Nevertheless, statistical tools will support the use of vizualisation for data interpretation, bringing more resources or skills to address the situation than just reading a text. To understand a food

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

insecurity situation in given open data and big data, the tools the researchers apply and the way they summarise or interpret or visualize the statistical data are major challenges in order to get information and understand the data characteristics. Applying statistical concepts, methods and processes to open data and big data, that is, extending statistical literacy, will give more precise data interpretation than data reading of conventional statistics.

Statistical data presents many aspects about food security in the world. It can reveal or highlight weakness, raise awareness of threats in current situation, help overcome challenges and create opportunities for the future. Existing interventions and programs of food security can be reviewed and revised if the statistical data analysis gives better understanding of a current food insecurity situation; this better understanding in turn enables more authoritative and relevant decision-making processes for the future. Statistical literacy involves skills and expertise in data description and interpretation (in words as well as in numbers) to name, explore and amend beliefs, opinions and suggestions. It helps decision-making processes about food security in a sub-nation, nation and region, as well as the world.

This chapter will give an understanding of the importance to food security of open and big data and of the challenges of and opportunities for applying open data and big data to the agriculture sector, and by implication to food security.

THE IMPORTANCE OF VISUALIZATION AND OPEN DATA

Visualization is a better approach to understand the problems and possible solutions in multisector development issues. Having data only is not enough and we have to let the people understand what these data are and how to utilize these data. Visualization presents the available data in a form of pictures or graphs and it easily explores the concepts and trend of a particular issue to the decision-makers (Statistical Analysis System [SAS], n.d.). It helps to present the huge historical progress and future trend in trade, economic, social development, etc. at national, regional and global level. Technology-oriented-data visualization can give better interpretation of healthy and wealthy corner of the world (Rosling, 2010). Certainly, complex datasets may be applied to generate these visualized information map which is more time-effective instead of time-consuming reading text.

Liberalization of government data is very essential but the maximization of effectiveness of using open data is more crucial for the public (OECD, 2016). Ordinary citizens rarely use government datasets what researchers and business people do (OECD, 2016). The huge amounts of complex data and information in the spreadsheets and reports are not as easy to understand the given concepts as we learned from visualized graphs or charts (SAS, n.d.). Thus, the data covering the relevant information about people daily lives and habits should be available and accessible with visual presentation to allow the individual people take note and adjust their behaviour (OECD, 2016). Visualization become popular and it is internationally well accepted and applied to convey any messages and scenarios as a quick and easy tool (SAS, n.d.). Because it can point out a specific area where needs recognition or improvement with the help of researchers, practitioners, scholars in the development agenda. In the business sector, it helps to find out the influencing factors of sales and marketing, such as customer behaviour, product allocation, sales volume.

Consequently, without information and statistics, there will be no sound interpretation and visualization to explore the condition of a particular development research. Today, the availability of open data is

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

growing through various service providers of both profit and non-profit agencies (Ubaldi, 2013). Open Knowledge Foundation (James, 2013) described the summary of full definition of open data in 2005:

Open data is data that can be freely used, shared and built-on by anyone, anywhere, for any purpose.

The more open data movement develops with the recognition of many governments and organizations, the clearer definition of open data is critical to be well-accepted. It helps to grasp the benefits of openness, and escape the risks of inconsistency between the research project and its enabling community (James, 2013). According to the OECD, the importance of open data released by the Government has been prominently recently recognized after setting the principle of this Open Government Data (OGD) in the United States in 2008 (Ubaldi, 2013).

In reality, the focus on releasing those data from public departments is not yet significant to liberalize the data as a resource to use. In addition, the potential of re-use of open data still does not meet the expected levels (Lassinantti, 2016). On the other hand, the reproduction of scientific-paper through open data should be transformed in different discipline to solve social problems out of consideration. At the same time, the researchers must be proficient to access required data in line with other discipline. Because, the transmission of scientific-research-data will not always be open and free but it must be available to access and re-use it (KAKUTA, 2016). Surprisingly, the massive quantities of data and larger datasets are gathered and delivered across the public sectors. The importance of social and economic value of the big-data creates the significant usage of data in terms of velocity and variety through socio-economic model which investigate new initiatives, sustainable growth and development.

But, such kind of dataset is not easily presentable by managing with normal tools or traditional data interpretation methods. It needs to process with the support of technological software or tools for the data organizing, searching, allocation, transporting, analysing and visualization. Then, the result of this big database analysis will be comparable with the smaller data sets of similar variety of data with the findings of disease prevalence, research quality, criminal conflicts, etc. (Ubaldi). In this connection, the importance of free big-data sets is vital to produce data visualization to determine the prevalence of food insecurity problems to help the daily lives of people.

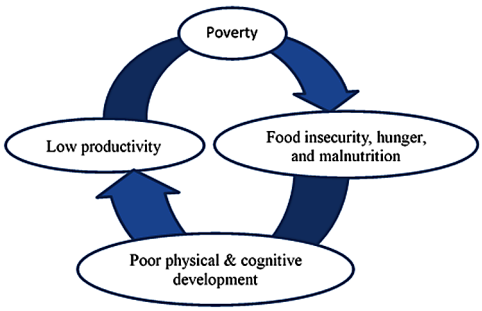
THE IMPORTANCE OF VISUALIZATION AND OPEN DATA IN FOOD SECURITY

What Is Food Security?

A common understanding of food security, in its broadest sense is required to bridge the gap between the demand and supply of information. This requires a clear conceptual framework that embraces the full scope and all dimensions of food security as a foundation for food security information systems. Past perceptions of food security that focused on production, self-sufficiency and filling food gaps with food aid are no longer adequate given today's challenges. With growing market economies and trade liberalization, consideration of comparative advantage has helped ensure more efficient production, including of non-food commodities. With poor and traditionally food insecure communities becoming more integrated into market economies, peoples' livelihoods and opportunities for household income have become more and more important in ensuring food security. The importance of food safety and good nutritional practices has become well understood as prerequisites to ensure good health and food

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

security (Shwe & Hlaing, 2011). The most common definition of food security was adopted by the country Leaders at the World Food Security and World Food Summit, the Rome Declaration of Food and Agriculture Organization (FAO; 1996):



Food security exists when all people, at all times, have physical and economic access to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life. (FAO, 1996, p. 298, para. 12, 2009, para. 2)

Also, FAO has demonstrated the four dimensions of food security: Availability; Accessibility, Utilization, and Stability (Food and Agriculture Organization [FAO], 2006, p. 1). In fact, food insecurity is not stand alone (Bhutta et al., 2008; Black et al., 2008; Dangour et al., 2013; Ghattas, Barbour, Nord, Zurayk, & Sahyoun, 2013; International Food Policy Research Institute, [IFPRI], 2016; Iram & Butt, 2004; Jenkins & Scanlan, 2001; Mason, 2002; Myanmar Times, 2016; Johshin Von Braun, 1993; Wahlqvist et al., 2009). Food insecurity has other three related concepts, hunger, malnutrition and poverty as shown in Figure 1 (Food and Agriculture Organization [FAO], 2008b). If there is food deprivation in both availability and accessibility issues, it results hunger but all food insecure people will not be hungry. It may have other causes, such as inadequate micro-nutrient intake. Malnutrition occurs from food deficiencies, over-eating or imbalance of nutrient intake and it relate health care, services and environment for children. The causes of hunger and malnutrition result to poverty which relates to food insecurity, health care, education, etc. This is widely accepted concept and relates to food insecurity agenda (FAO, 2008b).

Over many discussion and dialogues about food security initiatives, a number of major causes and possible solutions have been discussing to overcome the influencing factors of food insecurity, globally, regionally and nationally. For example, in relation to food availability, crop yield has been declining in many areas due to lower investment priorities in research and infrastructures. In addition, climate change as well as water scarcity and the prevalence of HIV/AIDS are also influencing factors to cause food insecurity in many regions (Rosegrant & Cline, 2003). There will be possible solutions to overcome the risks of those influencing problems, such as more investment for better yield and initiative of agriculture reform policies (Rosegrant & Cline, 2003).

It shows multiple inter-related causes of food insecurity. We need to identify major problems by providing the evidence of information and statistics. The written document of food security data and information is not very helpful to have the attention of the decision-makers immediately since it takes

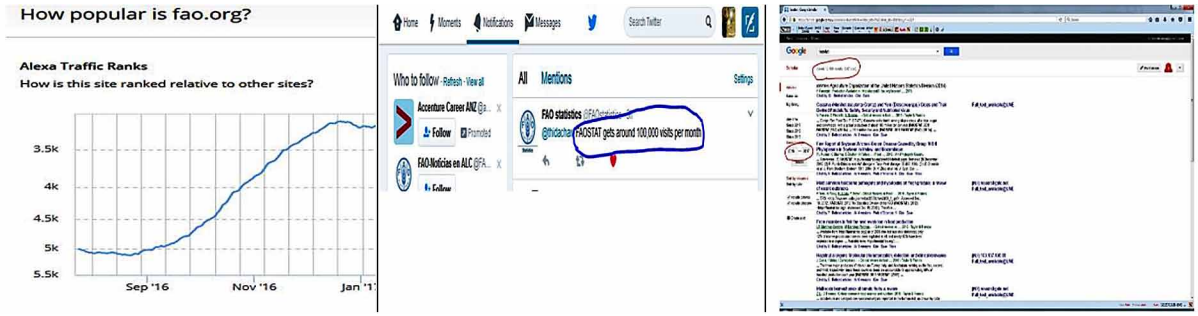
Figure 1. Interrelationship of food security, malnutrition, and poverty
FAO (2008b)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

time to understand and judge the given information. The casual factors of food insecurity, their relationships and interconnectedness as well as the strength of their relationship may be easily recognized with the power of data analysis and visualization instead of providing the situation model in words. Data visualization is the best approach to underline the major risk factors but it could also be a technical barrier in some economic model to analysis food insecurity due to loss of statistics in some parameters.

Why Is Visualization and Open Data Important in the Analysis of Food Security in the World?

Since after the United Nations Conference of Food and Agriculture held in USA in 1943, achieving the goal of freedom from the needs of food and agriculture has taken into consideration of the world's food and agriculture problems to improve the health and nutrition of the world's population (Shaw, 2007). As a first initiative, the Conference principally agreed to establish the Food and Agriculture Organization of the United Nations (FAO) in 1943 and it was officially formed in 1945 (Shaw, 2007) emphasizing agriculture and economic policies to ensure an adequate and a suitable supply of food for all people (Shaw, 2007). FAO was intended to be a service centre of information and statistics with regards to food and agriculture as well as to provide advice to all agriculture and nutritional issues raised from all nations.



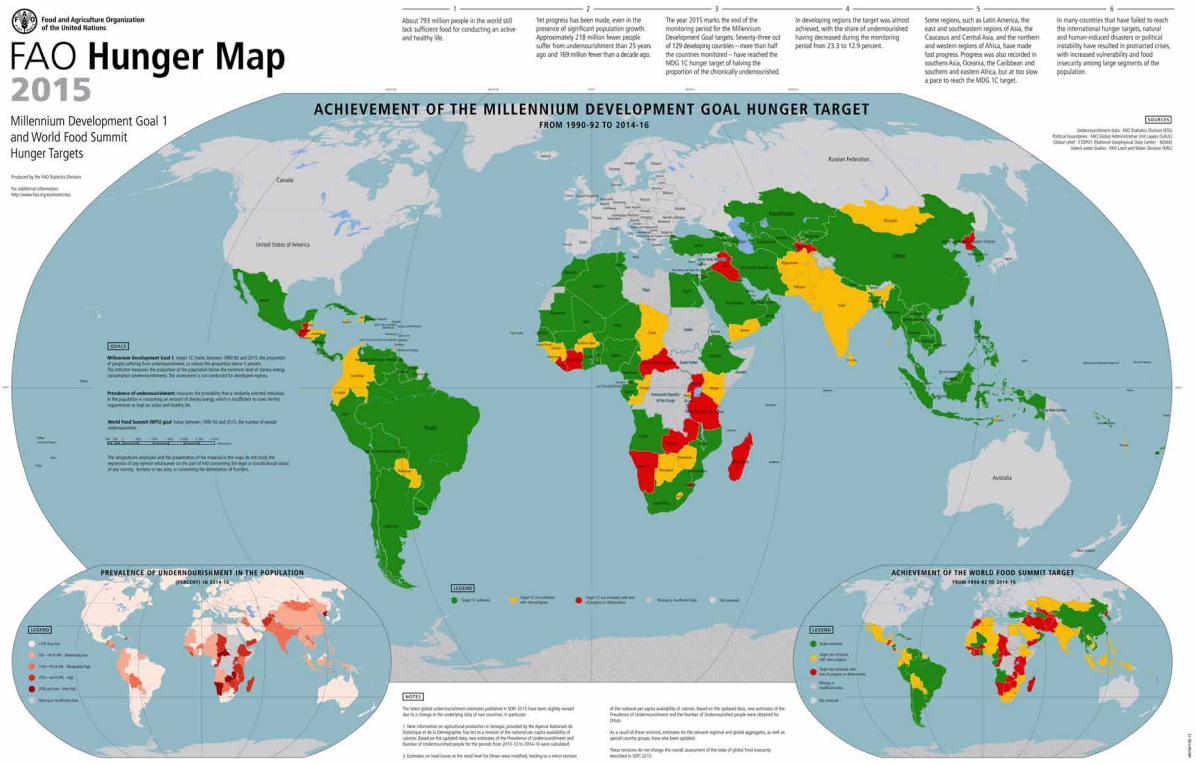
Then, FAO was initiated as a world's largest database system through Food and Agriculture Organization Statistics (FAOSTAT) (before AGROSTAT) (Food and Agriculture Organization - Economic and Social Development Department [FAO-ESDD], 2017). It became operational database system since 1986. FAOSTAT provides free datasets for 245 countries and 35 regional areas. Time series data is freely and easily accessible in most domains from the year of 1961 to most recent year (FAO, 2017). The corporate database of FAO contains a comprehensive topics of food and agriculture of production, consumption, trade, prices and resources, nutrition, etc. Besides, FAO provides the capacity development assistance for the standard methodology and national data as well as metadata collection to ensure harmonization of the collection and dissemination of reliable data for the statistical data analysis and policy making.

Also main data users of FAOSTAT are data analysts from the research institutes, International Organizations (i.e. UN, World Bank, International NGOs) as well as Universities. Data sharing from FAOSTAT depends on the indicator which the organization or agency needs and it is mostly coordinated with UN Population Division, World Bank, WHO, UNICEF, ILO, WWGI, International Road Federation, World Road Statistics and Electronic Divisions. The update of data is timely in every August of a year. Although FAOSTAT don't make user satisfaction survey (Alexa, 2017; FAOSTAT, 2017). According to the official FAOSTAT Twitter "@FAOstatistics", the number of usage to FAOSTAT reach about 100,000 visits per month. Also, from the result of preliminary assessment to study the usage of FAOSTAT, the audience are mostly from India, United States, Nigeria, Mexico and China. Based on the internet average monitoring, the visitors to FAOSTAT are the most from work followed by the school and home as shown in Figure 2 (Alexa, 2017). There is a large number of indexes of FAO Statistical database applied in the publications shown in "Google scholars". Generally, there are many number of data user access to FAO database not only for academic research purposes but also for the reporting or assessment of International Organizations and Government agencies.

As a result, FAO database is widely accepted among the global data users but there may be many variables of missing data due to weak cooperation from the country government to release the official data. It highlighted that country governments must be aware to be stronger international incentives for a more comprehensive open data policy of food and agriculture.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Interrelationship of food security, malnutrition, and poverty
FAO (2008b)



For instance, Yearly FAO Hunger Map is one of the excellent visualized products released from FAO. It presents the progress of food insecurity stories of the entire world even though the written documents of "The State of Food Security in the World 2015" is available as free online published document with many reading text, data tables and visualized charts and graphs (Food and Agriculture Organization [FAO], 2016; Food and Agriculture Organization [FAO], International Fund for Agricultural Development [IFAD], & World Food Programme [WFP], 2015). But, a single colourful map briefs the overall progress of World Hunger Eradication Scheme by spotting the hunger targets driven from the Millennium Development Goals (MDGs), the update of prevalence of malnutrition of the population, and the achievement of World Food Summit target. Behind producing this map, it need big datasets to process statistical analysis and visualize the orientation of World Hunger Situation. It is comprehensive work to complete as well as the availability of all-inclusive dataset is major factor to generate visualized World Hunger Map. But it is worth to be occupied by this comprehensive work because the visualized map may draw great attention from decision-makers and policy developers which is easier to understand the problems area and the location which needs further supports for long term development.

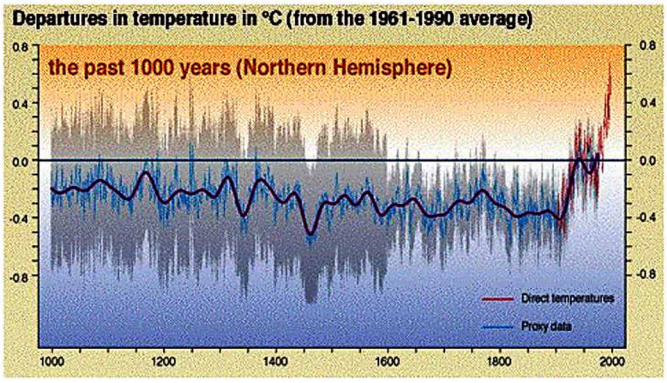
As indicated in the FAO Hunger Map 2015 in Figure 3, the progress of every country and region can be seen through time series data process of relevant indicators from 1990-1992 to 2014-2016. At the end of MDG monitoring periods by 2015, 73 countries have achieved the target of MDG 1 to cut half of malnourished people among 129 developing countries (FAO et al., 2015). Across the developing regions, the target of MDG 1 was almost achieved from 23.3 percent in 1990-1992 to 12.9 percent in 2014-2016. Among developing regions, some regions such as East, Central regions of Asia and northern and western regions of Africa shows fast progress of MDG Target 1 while other regions of Asia, African and Oceania does not give significant progress of MDG 1 target.

To address the prevalence of undernourishment, the measurement indicators are undernourishment or hunger as well as the prevalence of underweight children who are under five years old. It clearly illustrates to understand the vulnerable regions still under the high prevalence of malnourishment, such as south and central Africa as well as west and central Asia regions. Statistically, estimated 793 million of world population are still under food insufficiency situation and it may still be hard to overcome the risk of food insecurity. It present the conditions of availability and accessibility of dietary energy of individual people can be major constraints in the prevalence regions of Africa and Asia. As a result, the target of World Food Summit was not completely achieved but with noticeable progress although some other regions has lack of progress. In the populated regions, there will be many influencing factors

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. FAO hunger map 2015
FAO et al. (2015)

caused to increased food insecurity and vulnerability, such as, natural and man-made disasters, political instability and domestic conflicts.



Since visualization is not just a better way to interpret the data with infographic more comprehensible, it is also a better way to achieve understanding of issues, problems, causes and solutions. Developing infographic can create descriptions which build understanding and communication to different level of audience. Another good example of world's famous infographic, namely "Hockey Stick" is one of the famous plot in statistical tools to measure climate change impact in food insecurity.

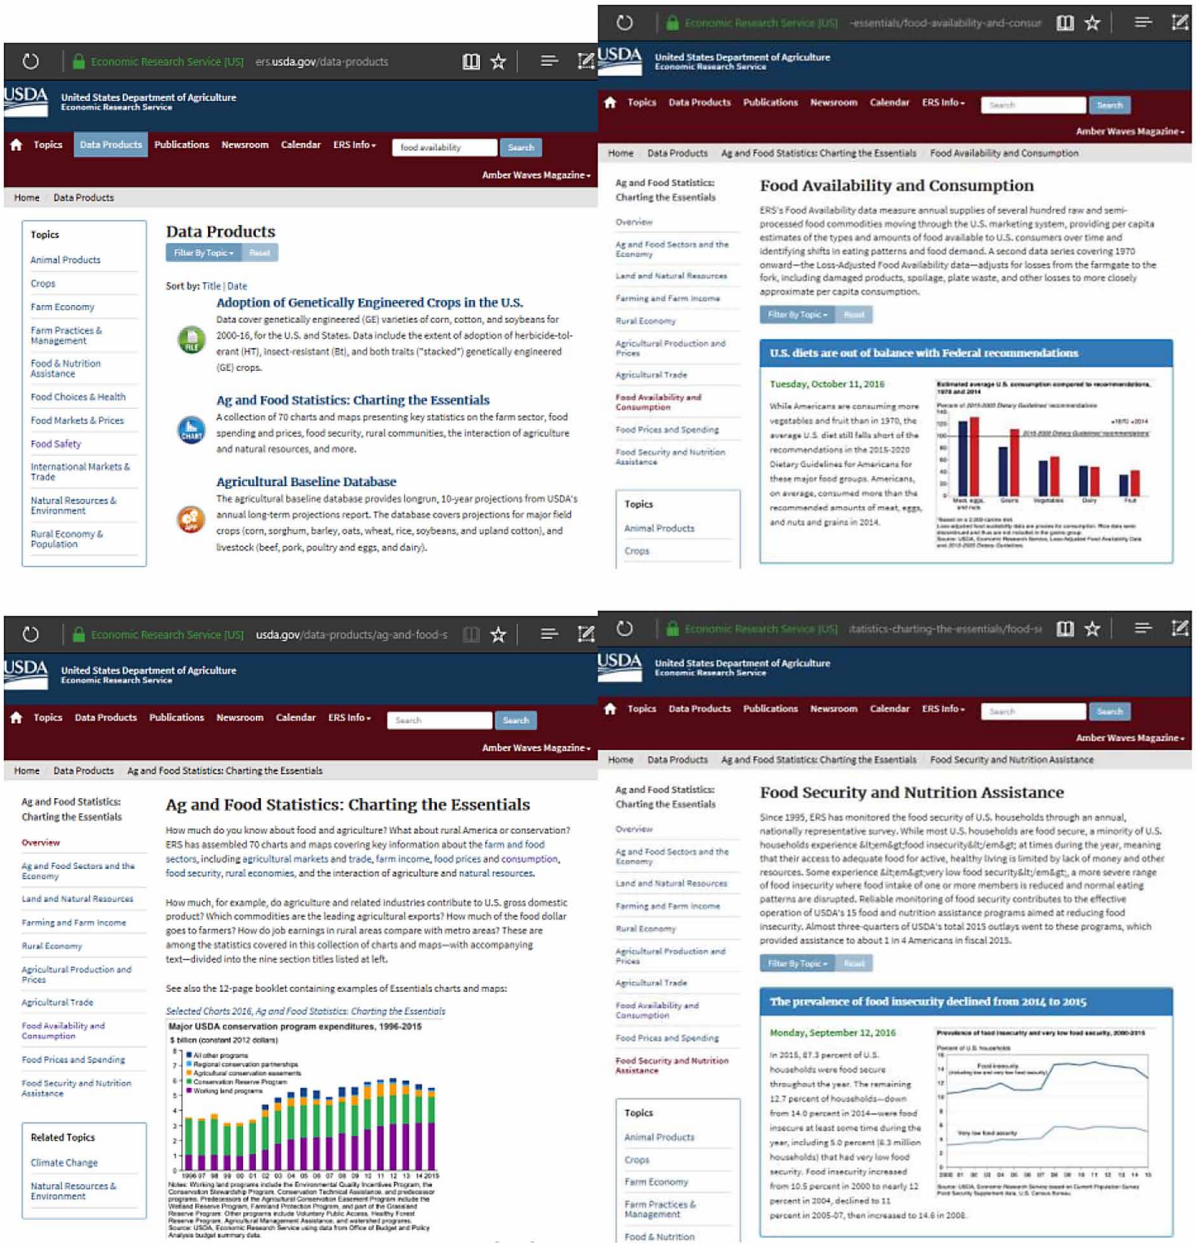
This scientific visualization as per Figure 4 shows that the world is experiencing the warmest climate in 20th Century started from 19th Century. It happened in the industrialization page of the world due to the extensive burn of coal and oil led to increase carbon dioxide in the atmosphere. It affects declination of world food production and it directly link with food availability of the households, especially in agriculture sector as well as prevalence of disease and health problems in some regions (Mann, 2013; Muller, 2004). Beside this kind of food security casual graphs, many more metaphors can produce for the better understanding of the inter-related causes to find possible solutions to improve food security.

In fact, there are some statistics and information missing which did not allow to study the situation of food insecurity and malnourishment in some regions. It was one of unfavourable technical barriers found in any statistical big-data process and analysis conducted by the scholars, researchers, practitioners and statisticians. This kind of visualized map or Hockey Stick provide the brief understanding of not only the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Hockey stick climate change
Mann (2013) and Muller (2004)

progress of the global Food Insecurity and its related causes but also the consideration of the possible problems of vulnerable conditions of food insecurity in the world. If the further information and detailed discussions are required to find out, the written documents are helpful to extend more understanding and knowledge. However, policy-makers as well as decision-makers will have more preferences on statistical visualization than the multiple reading text and data sheets.



Likewise, there are many acceptable free data sources globally available to access and it makes data users convenient to analyse for various reason of food and agriculture research (Marr, 2016). They are brilliant and internationally well-accepted in order to provide open and big data for statistical literacy. Beside world's largest online database provider of FAO in relation to the information and statistics of food and agriculture, the data sources are not really limited but the reliability and the free access of big data is a constraint for the scholars, researchers and practitioners. Among these data agencies from public sector, the United States Department of Agriculture (USDA) is one of the popular agency in terms of national and international dataset. Economic Research Service of USDA provides various data products, such as the statistics and information of food and agriculture, food safety, international markets and trade, rural economy and population, natural resources and management, etc. Apart from the statistical datasets and written documents, the Economic Research USDA has collected 70 charts and maps of the above domains and make it free available to the public as learned in Figure 5.

The statistical visualizations maps, graphs and charts together with a short summary text provided by USDA are incredibly supportive to the statistical literacy as well as it draw the attention of citizen to easily understand how agriculture contributes to National GDP, the situation of rural economy or environmental and natural resources management. Most importantly to the awareness of reducing the risks of food insecurity, the information and visualized maps, graphs, charts direct benefits firstly to the U.S citizen to understand the progress of food security at the macro and micro level.

As a brief understanding of food security in the U.S. (USDA, 2016) shown in the Figure 6, the share of food expense in total expenditure is the highest in the lowest income households in U.S in 2014; the calories intake is the highest in U.S. at 3,639 calories per day while it is only 2,206 calories in Kenya in 2013 and 2015; the income spent on total food falls from 17.5 to 9.6 percent between 1960-2014 together with declination of income share spent on food at home by showing the ignorance of recommended food balance among the citizens; the prevalence of food security in the U.S. shows that the rate of food

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

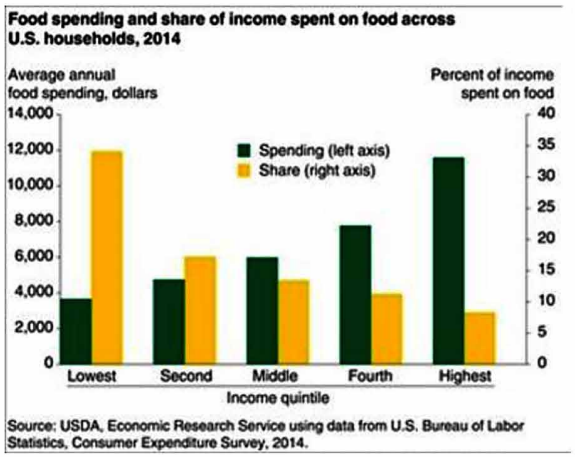


Figure 5. Open data and statistical visualization
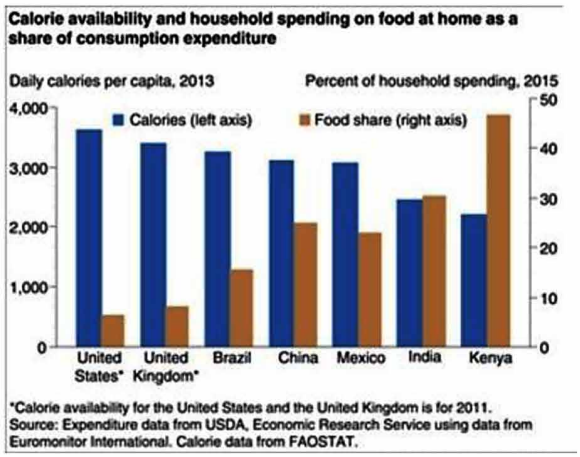
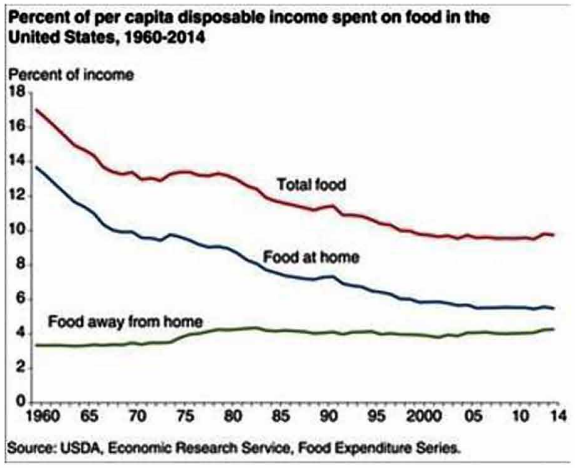
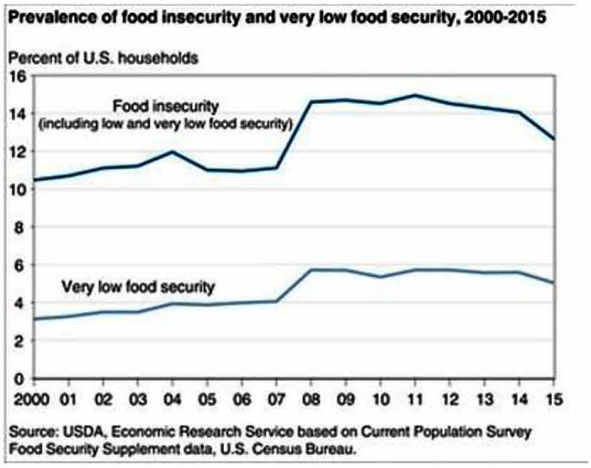
USDA (2016)





insecure decline from 14% to 12.7% in 2014 to 2015 while 87.3% of U.S. households are recorded as food secure in 2015; For insecurity can be found more in rural and urban than in suburban areas and the significant high rate of food insecurity found at single parent, Black and Hispanic households in the U.S.; food insecurity found more in the adults than in the children but one out of six households with children experienced food insecurity in U.S. in 2015.



EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

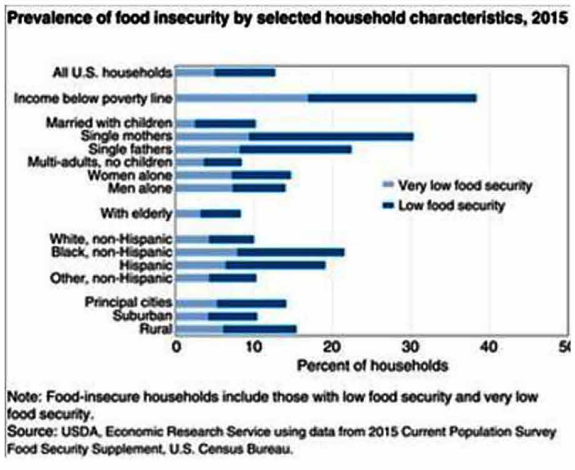


Figure 6. Open data and visualization
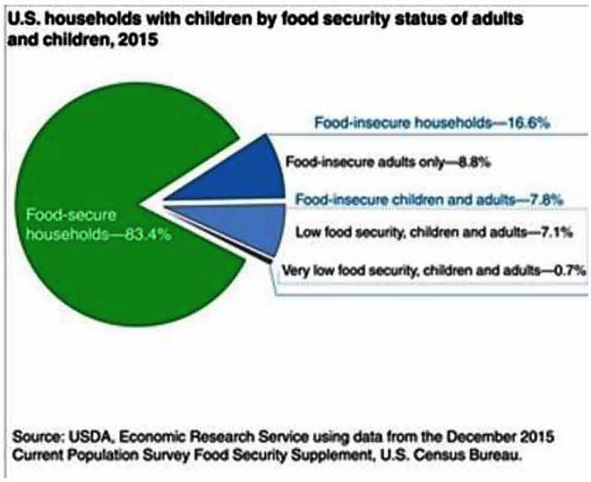
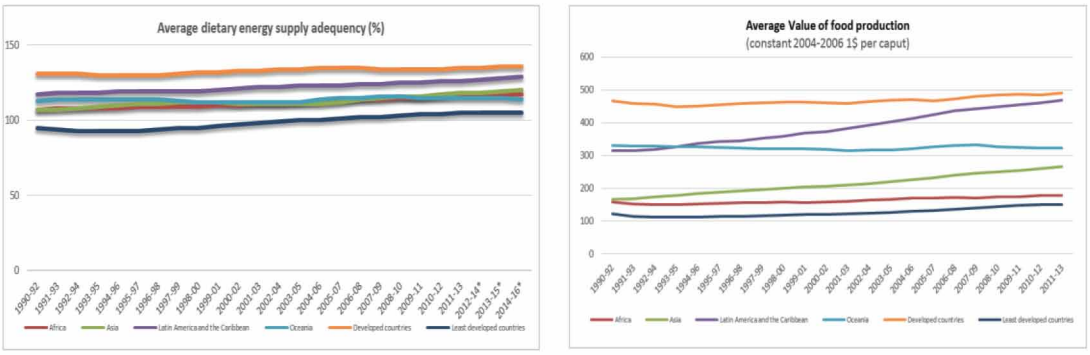
USDA (2016)



EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

These visualization about food security makes ordinary people understand straightforwardly what the situation happening in the U.S. Also, it is very accommodating to the high level decision-makers to see the actual condition of food security in both good progress and the area where the attention need to have. But, the statistics and information dissemination in terms of food security in many other government agencies are not as comprehensive and productive as the USDA do to let the data users convenient in both big datasets, visualization charts and graphs. That's the reason, the scholars, researchers and practitioners have been encouraging to the public agencies and departments to aware the usefulness and importance of open data in the world today.



Visualization of Food Availability Across World Regions

In 2011, standard indicators to measure four components of food security were recommended by technical experts of the Committee on World Food Security (Committee on World Food Security (CFS)) Round Table with the consultation and judgment to analysis food security in various reasons (FAO, 2016). Based on the open database available in FAOSTAT, the status of food availability can easily be demonstrated by statistical visualization and economic modelling. Data presentation supported by visualized graphs gives better understanding of food insecurity in terms of food availability in all regions in the world. For example, it is easy to see who needs helps most and where the most vulnerable region is. Consequently, attention can be directed to further corrections or new initiatives to improve the supply of food for those people. Without this assessment enabled through visualised data, it can be hard to measure progress and to make the right decisions about food supply in vulnerable regions.

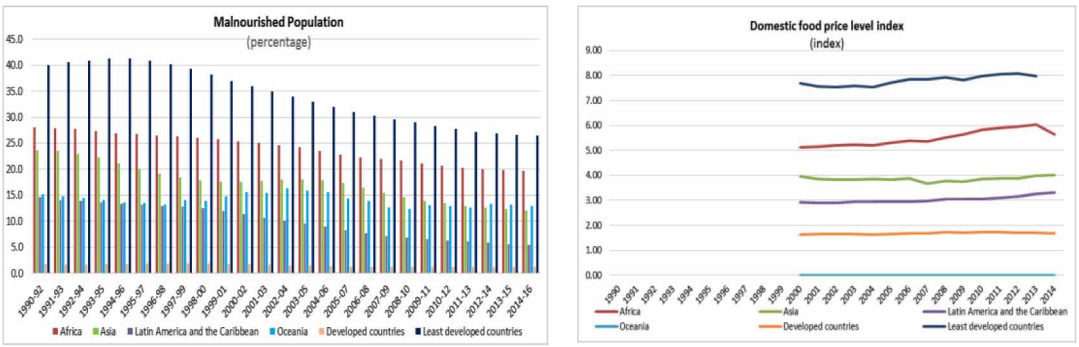
The indicators of food availability are adequacy of average dietary energy supply, average value of food production, share of dietary energy supply derived from cereals, roots and tubers, average protein supply, and average supply of animal protein (FAO, 2016).

The visualized graphs in Figure 7 present a quick snapshot of food availability in developing regions across the world. They cover Asia, Africa, Latin America and the Caribbean, Oceania, developed countries and least developed countries to illustrate the different levels of food security based on the recommended indicators. The visualized graphs demonstrated the time series datasets from 1990-1992 to 2014-2016 to compare regional trends from one period to the next. The graphs demonstrate, as an example, that the average dietary energy supply adequacy of developed countries was significantly higher than other

Figure 7. Visualization of food availability across the regions in the world
FAO (2016)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

regions, while the fastest rising trend occurred in least developed countries from 2000. This indicator allows viewers to predict the sufficiency of food supply and thereby to address the causes of malnutrition in regions. In terms of average value of food production, this is steadily increasing in Latin America, the Caribbean and Asia but other regions remain the same. There is no argument that the poorer we are, the more we need a secure food supply.



Again thanks to these visualized indicators of food availability, it is easy to see that food supply is significantly high in developed countries, followed by the some other developing regions, such as Oceania, Latin America and the Caribbean. The regions where the nutritional energy supply is highly dependent on cereal, roots and tubers, such as Asia, Africa and the least developed countries, may be at high risk of food insecurity, due to such issues as political instability, climate change, and man-made and natural disasters. However, we cannot determine the prevalence of food security by food availability indicators only.

Visualization of Food Accessibility Across World Regions

Similar to food availability, the indicators of food accessibility were produced by the Committee on World Food Security (Committee on World Food Security (CFS)) Round Table in 2011. The indicators of food accessibility comprise percentage of paved roads over total roads, road density, rail line density, GDP per capita (purchasing power equivalent), domestic food price index, prevalence of undernourishment, proportion of food expenditure by the poor, and depth of food deficit. For the purposes of visualizing food accessibility in relation to food availability, the regions are the same as those mentioned above. The indicators identify mainly the socio-economic characteristics of households to find the affordability of food in the region.

Using the indicators of food accessibility, the graphs in Figure 8 are a visualization of the malnutrition experienced in poor regions, such as the least developed countries of the world, followed by developing countries in Africa, Asia, Oceania, Latin America and Caribbean. It is clear that the developed countries experience enough food accessibility. In terms of the domestic food price indicator, the least developed countries, followed by Africa and Asia, experience higher prices compared with other regions and there could be an unstable food market in these regions. Basically, it is necessary to measure the indicators of transportation resources, such as road and rail density, to establish the exact status of food accessibility.

Figure 8. Visualization of food accessibility indicators across the regions in the world
FAO (2016)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In addition, the average proportion of total household expenditure on food is an important indicator. In this respect, the statistics of some indicators of food accessibility are missing from the FAO database. This may be caused by a technical constraint or by lack of resources to identify the major poor and their needs in the regions. Such technical barriers and poor resources make it harder to make the best decisions about what attention and support should be added to improve food security in vulnerable regions of the world.

In summary, this section shows emphatically the importance of statistical literacy to get quick understanding of food security in all regions of the world. It is not completely possible to collect time-based food security data across the regions of the world due to a number of constraints, including the technical capacity and investment. However, there is great benefit in having open data services that allow the public to access time-based data easily and freely without having to undertake their own field surveys and data collection. This open free data is a valuable resource for research, and for the preliminary or initial assessment of food security in a particular country or region or the world as a whole. Visualized data also helps attract the interest and attention of policy makers in meeting the needs of food accessibility worldwide.

Why Is Visualization and Open Data Important in Food Security Analysis at National Level: Myanmar?

Food security is a global as well as a regional and national issue, and every nation should have a strong will and perception to reduce food insecurity for the better lives of its citizens. Consequently, policy makers must have enough understanding of social and economic strategies in relation to food security to develop evidence-based policies. In this respect, food security assessments with available information and statistics are the initial step needed to address potential problems specifically and recommend possible solutions sensibly. It is best to supply adequate and affordable food to the people of a nation before sharing surplus food with the region and the world. The right policy will not be laid down if there is no right decision. For this reason, the information stream as well as open data sources at the national level must be strong enough, with good functionality and technical capacity since it is crucial to make the right decisions and the right investment to fill gaps in food security. This section discusses these issues specifically in relation to Myanmar.

Despite open access to big datasets from the non-government sector, there are many debates and different findings in studies of poverty in Myanmar by UN agencies and other international organizations. Although they have used the same datasets, different organizations have reached different conclusions about food insecurity in Myanmar. Additional analysis using open source data, plus perhaps using other datasets not used in the original analysis, may help explain these differences and lead to greater understanding of the true situation. As food security is a complex issue, it requires big datasets from various sources to deal with the many parameters that cause food insecurity.

Many studies shows the high prevalence of poverty in all rural areas. These studies include the findings of Integrated Household Living Consumption (IHLC) surveys done by United Nations development Programme (UNDP) in collaboration with the Myanmar Ministry of National Planning and Economic Development (NPED) in 2005 and 2010 (Institute for Democracy and Electoral Assistance [IDEA] & Integrated Household Living Conditions Assistance [IHLCA], 2007; Integrated Household Living Conditions Assistance [IHLCA], 2011). These were the most comprehensive surveys and primary data collection processes ever undertaken to assess poverty levels in Myanmar. Interestingly, however, Myanmar was

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

also recorded as reducing the prevalence of malnutrition from 62.6% in 1999-92 to 14.2% in 2014-16, an achievement that ranked it at Millennium Development Goals (MDGs) No. 1 in 2015. The number of undernourished people fell from 26.8 million in 1999-92 to 7.7 million in 2014-16 (FAO et al., 2015).

However, there was confusion over the findings of these food security assessments, due to two major constraints. The first constraint was the lack of up-to-date total population figures for 1999-92 (the last population census was done in 1974 and the updated one was done in 2014). The second constraint was the exclusion of the population in the border areas (where samples were not taken due to ongoing conflict at the time of survey) (Livelihoods and Food Security Trust Fund [LIFT], 2016). Nevertheless, the IHLCA result is the single most reliable source of knowledge and a comprehensive picture of poverty prevalence in Myanmar. In 2011, the Livelihoods and Food Security Trust Fund (LIFT) Myanmar conducted a baseline survey and a household survey to measure poverty using household consumption data. It covered 252 villages in three agro-ecological zones of the Delta/Coastal region, the Hilly region and the Central Dry Zones, as well as Rakhine State. A total of 200 samples was collected ((Livelihoods and Food Security Trust Fund [LIFT], 2012, 2016). This was one of the most popular and single food security baseline survey done in Myanmar and the outcome and baseline datasets are available to the public through the LIFT website and the Myanmar Information Management Unit (MIMU, 2014-2016).

In terms of food poverty (based on minimum food expenditure on caloric requirement for household members), 10% of the total population was affected in 2005 (IDEA & IHLCA, 2007) but this had declined to 5% by 2010 (IHLCA, 2011). Food poverty in rural areas is higher (about 5.6%) than in urban areas (2.5%). Almost 85% of total food poverty occurs in rural areas and the Ayeyarwady (18.7%), Mandalay (16%), Shan (15.4%) and Rakhine State (14.9%) are the four major contributing state/regions in national food poverty. Follow up assessment by the IHLCA (IHLCA, 2011) five after years the previous IHLCA found that 25% of the total population are below the poverty line (based on (i) minimum food expenditure on the caloric requirement of household members and (ii) reasonable non-food expenditure to meet basic needs) and this has declined from 25.6% in 2005 (IDEA & IHLCA, 2007). Poverty prevalence in rural areas is double (at 29%) that of urban areas (15%). Almost 85% of total poverty in Myanmar can be found in rural areas. The findings of UNDP show that the highest poverty occurs in mountain, coastal and delta regions, such as Chin (73%), Rakhine (44%), Tanintharyi (33%), Shan (33%) and Ayeyarwady (32%). The four major contributing states and regions to food poverty namely, Ayeyarwady (19%), followed by Mandalay (15%), Rakhine (12%) and Shan State (11%) (IHLCA, 2011) are also major contributors to national poverty rates.

It is interesting to note that the prevalence of poverty differed in the studies analysis done by the UNDP and the World Bank although they applied the same dataset and time frame of Integrated Household Living Consumption Analysis (LIFT, 2016). In 2014, the World Bank announced poverty rate for Myanmar of 37.5% in 2014, with the worst poverty in the Rakhine (78%) and Chin (71.5%) regions. (World Bank, 2014). By zone, the World Bank found that the central dry zone had the lowest poverty rate (29.5%), while the coastal area had the highest (53.1%). These are the complete opposite of previous findings from the UNDP. The World Bank applied an international method, using the cost of basic consumption expenditure (less than US$1 per household member per day), the caloric threshold of 2300 calories/day/adult and other related indicators, such as health costs, cost of durable goods, etc. to measure the poverty line across the region. Poverty occurred in landless households or those with less than 2 acres of land (World Bank, 2014).

Conversely, the result of the Household Survey (2013) undertaken by LIFT showed that 29% of the population in these zones is living in poverty. The poverty figure was completely different to a previ-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ous analysis done by the UNDP and the World Bank. It showed that the lowest poverty rate occurred in the Hilly region and the highest poverty rate was in the Central Dry Zone (LIFT, 2012, 2016). LIFT applied the extreme poverty measurement of consumption rate (less than US$1.25 per person per day). Thus, it is not possible to compare all findings of poverty rates in Myanmar since the methodologies applied by the UNDP, The World Bank and LIFT all differed (IHLCA, 2011; LIFT, 2016; World Bank, 2014). However, it cannot be denied that the highest poverty occurred in the most populated rural area in Myanmar, an area which has also suffered from prolonged food insecurity. The point here is that a single research project or assessment through statistical analysis is not always enough to examine a number of problems and recommend potential solutions, in this case to solving food insecurity.

On the other hand, however, some literature (Fujita, 2003; Kurosaki, Okamoto, Kurita, & Fujita, 2004; Okamoto, 2009) has identified two major causes of household food insecurity in relation to the agriculture sector in Myanmar. These causes are: 1) low agricultural production (and therefore low food availability) associated with less crop diversification, limited access to land, irrigation facilities, climate variability and climate change problems, and 2) weak market performance, including poor income and investment and road infrastructure in relation to food accessibility. These are the underlying causes that disrupt the food production sector on the supply side and make food access a burden, especially for the rural poor in Myanmar. Access to open data will be required in order to examine and validate these causalities and then find potential solutions to food insecurity.

A successful food security and statistic information system needs continuous monitoring as well as reliable data collection methodology to regulate the data and information. It will help to meet the demand from decision-makers for food security information and statistics, as well as from data users at different levels for different purposes, such as development partners, donor organizations, scholars, researchers, etc. In Myanmar, the public has very limited access to open data sources released by government agencies. The only source for open data released by the government in Myanmar is the Central Statistical Office (CSO; 2017 February 2), under the Ministry of Planning and Finance, where data are gathered from all ministries. Historically, the statistical data collection system of the CSO seems to have been internal data reporting from the ministries to central government and the open data is available to the public only as a published book (Shwe & Hlaing, 2011).

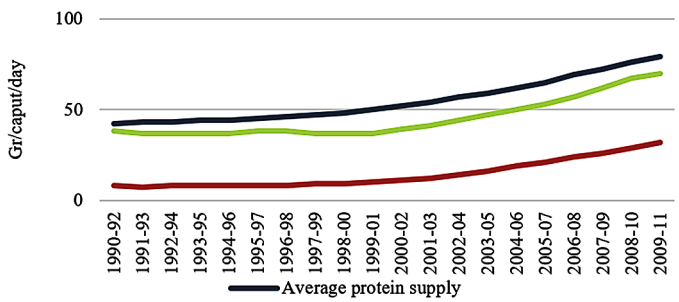
At present, the statistics and information of food and agriculture can access through the official Government website of CSO and Myanmar Statistical Information Service (MMSIS; 2015) (CSO, 2008; MMSIS, 2015; Planning Department, 2012, 2014). The data is divided into 17 domains at the national level and, as stated above, it is a statistical year book published by the CSO but it is not open data to access freely (CSO, 2008). The Myanmar Statistical Information Service releases the statistical database with 12 domains. Unlike the USDA database system, the CSO database service has no statistical visualization graphs or charts with short explanation text to let the citizen understand the social and economic situation with regard to food security in Myanmar. Thus, data availability and accessibility in Myanmar is a critical constraint for all users of food and agriculture sector data (Shwe & Hlaing, 2011).

In this respect, the primary data collection relating to food security was initiated by international technical agencies and development partners in Myanmar. Most of the outcomes of food security assessment or analysis are available to the international network through Myanmar Food Security Information Network (FSIN). FSIN Myanmar is a network of technical experts and information managers from 30 lead food security stakeholders joined by UN agencies, international and local NGOs and CBOs, funded by the Livelihoods and Food Security Trust Fund (LIFT) Myanmar (Food Security Information Network [FSIN], 2013a, 2013b). Thus, the information and statistical literacy of food and agriculture is stronger in

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the non-government organizations than in the Myanmar government agencies, although the nation-wide primary data collection is done periodically by the CSO and its related ministries. It is totally opposite to the open data services provided by the USDA, due to the statistical literacy of the database system and visualization and affordable resources. It may be that the political instability in Myanmar affects the awareness of the value of data transparency and the lack of statistical literacy in the country.

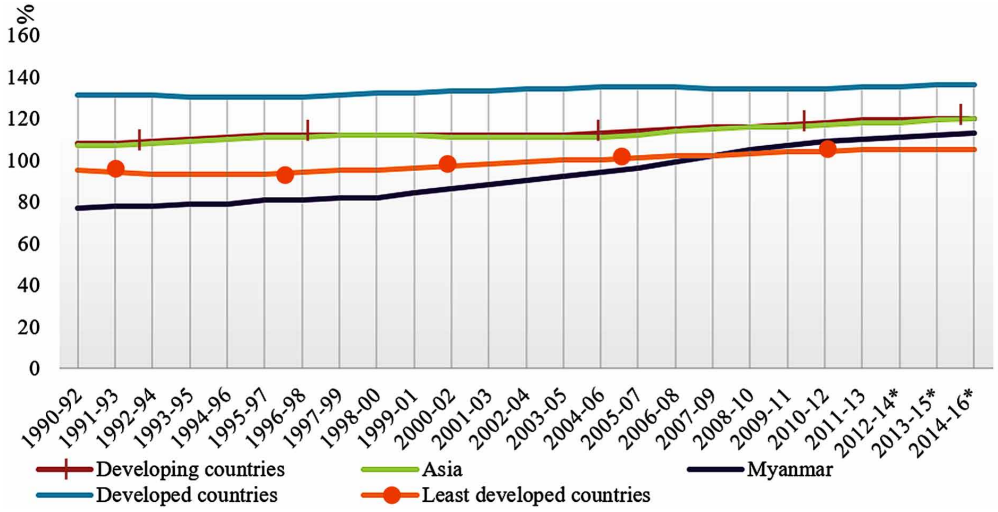
Visualization of Food Availability at National Level: Myanmar



In terms of the concept of food availability, Myanmar has been nationally food self-sufficient, with rich resources in production staple food, such as rice, pulses and fish, for decades (Byerlee, Kyaw, Thein, & Kham, 2014; Denning, Baroang, Sandar, MDRI team members, & MSU members, 2013; Food and Agriculture Organization [FAO] / World Food Programme [WFP], 2009, 2016; Haggblade & Boughton, 2013; Haggblade et al., 2014; Kyaw, 2006, 2009; Kyaw & Routray, 2006; Oo, 2012; Rammohan & Pritchard, 2014). According to the visualized graphs derived from the FAO database, the average dietary energy supply in Myanmar increased to 113% in 2014-2016 from 109% in 2012-2014 (LIFT, 2016) and 77% in 1990-1992 (FAO, 2016). Despite these indicators showing that the national food supply means self-sufficiency in terms of total calories (LIFT, 2016), there are many food-deficit households in the remotest hilly region and central dry zone area (World Food Programme. [WFP], 2012).

To food availability at the national level, food adequacy of staple grains for carbohydrate and protein in terms of total calories can be applied. Figure 9 compares the Myanmar average supply of fat, protein and animal protein per person per day (averaged over 3 years) from 1990-1992 to 2009-2011. The average protein supply increased from 42 grams per person per day in 1990-1992 to 79 grams per person per day in 2009-2011. In a similar trend, the quantity of average animal protein rose from 8 grams per person per day in 1990-1992 to 32s gram per person per day in 2009-2011. The average fat supply rose from 38 grams to 70 grams per person per day in the same years. According to this result, the supply of protein and fat presents no burden at the national level in Myanmar.

In comparing the average dietary energy supply adequacy of Myanmar with developed countries, developing countries, least developed countries and Asia, Myanmar's rising trend is significant in relation to the improvement of the least developing countries, as can be clearly seen in Figure 10. While Myanmar has improved its dietary energy supply sufficiently to move up and out of the least-developing-country category, it still needs to improve its energy supply to reach the level of Asia and developing countries.



Interestingly, the percentage of energy derived from cereals, roots and tubers in the average dietary supply adequacy, as shown in Figure 11, has been declining slightly from 2002-2004. This may be

Figure 9. Quantity of average supply of fat, protein and animal protein in Myanmar (averaged over 3 years)
FAO (2016)

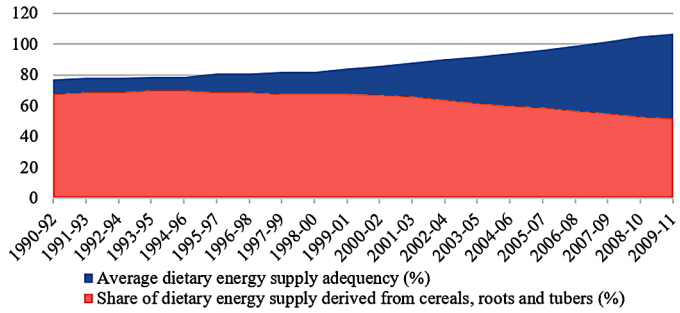
Figure 10. Average dietary energy supply adequacy (%) in terms of total calories in Myanmar
FAO (2016)



interpreted not as a result of lower overall food production but because of increasing quantities of fat, protein and animal protein, as shown in Figure 9.

With the benefit of visualization from the FAO datasets, the state of food availability in Myanmar is quickly understandable. These data are not available from the open database of the Myanmar government sector, even though they have been reported inter-ministries and central government. As discussed earlier, this is one of the major obstacles to data availability and transparency in the country.

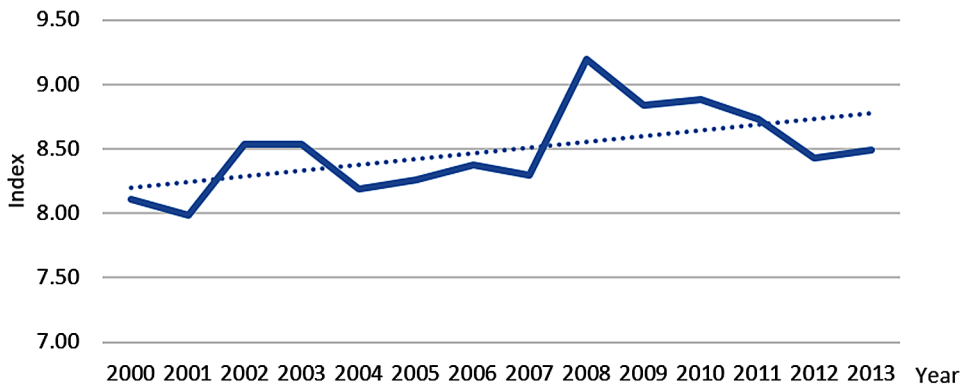
Visualization of Food Accessibility at National Level: Myanmar

Household food accessibility is problematic in Myanmar and it can be difficult for many families to secure their daily dietary needs. This indicator measures the quality and quantity of food that the family consume in their daily life. In addition, socio economic indicators such as the cost of food as a proportion of total expenditure, market performance and road infrastructure are important if we are to understand the problems of food accessibility (Food and Agriculture Organization [FAO], 2008a, 2008b, 2016).

Figure 11. Share of dietary energy supply derived from cereals, roots, and tubers in average dietary energy supply in Myanmar
FAO (2016)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the past, the cost of food as a proportion of total household expenditure could not be differentiated between rural and urban households in Myanmar. Thanks to big data, however, this difference can now be identified and analysed. The 2007 IHLCA survey found that national food expenditure is at a high rate of 73% of total expenditure. Food accounted for 76.3% of household expenditure in rural areas, compared to 66.3% in urban households. Poor households used 75.4% of total expenditure for food while the non-poor used a slightly smaller proportion of 72.6% (IDEA, & IHLCA. (2007). In this regard, the price of food is integral to accessing food for households. In Myanmar, the domestic food price trend is not stable, as shown in Figure 12.



The peak of domestic food costs in 2001-2003 reflect changes in market policy and the compulsory rice procurement system in Myanmar (Fujita, 2003; Kurosaki et al., 2004; Okamoto, 2009). Another spike in 2008 reflects increases in domestic food prices due to the negative impacts of the global food and oil crises on the Myanmar agriculture sector, principally higher food production costs (Hlaing et al., 2009). Thus, the fluctuation of domestic food price has associated with negative impacts to the affordable of food in rural households.

One of the most significant indicators of a household's dietary diversity (HDDS) is to measure its socioeconomic status. However, Myanmar has no national HDDS data (LIFT, 2016). According to a LIFT survey (LIFT, 2012), the lowest mean of HDD in Myanmar occurs in the Hill Region (4.80) and Rakhine State (4.74), while the Coastal Region and Dry Zone are at 5.45 and 6.28 respectively.

As discussed above, the published research and analysis of food security by researchers, practitioners, development organizations and donor agencies do help address the possible causes of and potential solutions to food insecurity in Myanmar. Although something is better than nothing, data users are still in great need of statistical analysis through modelling. Most importantly, statistical visualization is too undeveloped to give policy-makers, donors and development partners a quick overview of food insecurity and support the country's food security development program better. Interpreting Myanmar's open data and big data with visualization and relevant literature, the food security status of Myanmar can be noted as sufficient at the national level of food availability. However, it clearly shows the threats to food accessibility at household level.

The benefits of statistical literacy are well accepted and recognized worldwide as an important aspect of open and big data. In this regard, Myanmar policy makers need to consider the potential value of developing a time series visualization of food security, which does need a certain level of investment

Figure 12. Domestic food price level index in Myanmar
FAO (2016)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

to develop a well-functioning food security open database system. Because most food security analysis begins with impact assessment, a major assumption and an economic model, these food security activities have been hindered by poor access to open data and limited data transparency on the part of the government. Such an analysis can be channelled directly to decision-makers and politicians to help them understand who are suffering the most from food shortages and where.

Poor data will continue to cause problems in many areas, from researchers and analysts all the way through to the highest-level decision makers. Poor quality data produces poor evidence and research results. Poor results lead to poor communication in terms of advice and guidance to policy makers, governments, NGOs, development agencies and donors, as well as to business leaders, and ultimately sub-optimal performance and failure to meet goals. The benefits of open data sources on infographics will give policymakers and politicians a visualized concept of the factors influencing food insecurity. Such visualized concepts will also help them to overcome the risks of food insecurity, such as resources allocation in both technical literacy and investment in food-deficit regions and the country as a whole. Visualization can become a powerful communication strategy to convey key messages about food security to decision-makers. It is a good strategic tool to educate and inform policy makers, guide food security investments, and provide a tool for monitoring and evaluating impacts.

CONCLUSION: OPPORTUNITIES AND CHALLENGES

Statistical literacy helps the decision making process to some extent, and gives development partners and donors better information with which to recognize the strengths and weakness of a current food security situation and from there to take necessary action and support the people. Food security policy objectives are positively associated with the causes of food insecurity in many households in relation to marketing policies, land policies, and cropping patterns, supported by sufficient investment in agriculture to stimulate the livelihoods of rural people in Myanmar. If insufficient investment and resources are put into the statistics and information database system, better policies and actions will never be developed in the country.

We have many opportunities in big data sites but we have many challenges as well. For example, there are three key challenges around big data currently. These are (1) possible risks from investing in data, understanding how the data will be driven and what its value is, (2) regulatory issues faced by customers in accessing and using big data, such as removing legal and technical barriers openness to accessing and using big, open data, and (3) conflicting interests between business and government over ownership and dissemination of big data via the interest. Data visualization is fundamental to understanding more about future trends of a business or industry. The application of data analysis supports the idea of key business drivers to improve weaknesses or change incorrect actions in existing programs (Samuel, n.d.). While the data itself is understandable, the data analysis adds value to the questions of what, why and how to overcome a problem and improve the business. The use of open data and big data is proliferating, governments are expanding their recognition of its many benefits, researchers and practitioners have more opportunities to use open data and the use of visualization is increasing. Thus, the opportunity to gain better understanding of food insecurity situations based on upgraded statistical data analysis tools for researchers and practitioners globally is extremely promising.

However, there are still many challenges to attaining ideal conditions of data availability and accessibility, such as transparency, integrity and accountability; these challenges continue to hinder researchers

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and practitioners as well as scholars and academia from finding out the root causes of, in this case, food insecurity in a particular nation or region in the world. In many research areas, the continuing problems that we face include the poor communication links between evidence gathered through research and investigation, and the influence of this evidence on policy makers, and guiding governments' and donors' investments. Visualization may become an important and powerful communication strategy to convey particularly complex concepts, such as causes of food insecurity, explaining findings, and recommending actions and investments. Thus visualization in this complex food security policy area becomes a very important strategic tool to educate and inform policy makers, guide good food security investments, and provide a tool for monitoring and evaluating impacts in a country, a region and the world as a whole.

Chapter 40
Reducing Poverty and Sustaining Growth:
A Microfinance Approach

Nabila Nisha
North South University, Bangladesh

Afrin Rifat
North South University, Bangladesh

ABSTRACT

Microfinance institutions have been effective rural banking channels that extended financial services to low-income individuals, particularly women in developing country settings. Since its inception, microfinance has evolved as an economic development approach and has grown to enormous scale in Bangladesh, with a reported approximate 23 million borrowers in a country of roughly 150 million people. These numbers reveal the highest population saturation of microfinance in any country. However, with the maturity of the microfinance market in recent years, competition has subsequently increased among various financial and non-financial institutions. Against this backdrop of intense competition, this chapter aims to focus on the current institutions of Bangladesh that has made the microfinance service almost a sole option for the downtrodden segment of the low-income society. In particular, various approaches of microfinance and its operational structure by these institutions including the challenges and attributions of a dynamic micro credit concept will be highlighted.

INTRODUCTION

The concept of microfinance has evolved as an economic development approach targeted as a potential weapon in uprooting poverty and assisting the poor effectively to improve their living status and livelihoods significantly. The popularity of microfinance has made it the core activities of hundreds of microfinance institutions (MFIs) across the world, particularly in developing countries like Bangladesh. In fact, it was Bangladesh which pioneered and fostered the institutional development of microfinance

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and today it has reached an enormous scale with approximately 23 million borrowers in a country of roughly 150 million people.

Microfinance institutions have extended financial services mostly to rural areas where otherwise it would be more expensive and unprofitable to open branches of traditional banking institutions. Moreover, since the rural population living under the poverty line and the poor with lower income is still out of any formal credit services in Bangladesh, microfinance institutions have made it a point to provide credit to the poor through small savings under the dynamic microcredit concept. Microfinance has thus become the main form of rural finance in Bangladesh. The effectiveness of the microfinance concept is such in Bangladesh that its systematic, group-based and institutionalized operations have been replicated all over the world with local modifications and adaptations.

In the context of Bangladesh, microfinance institutions have gained credence as the providers of an effective poverty alleviation tool from both practitioners' donors and policy makers of the country. However, the case of microfinance in Bangladesh and its success as the largest and most efficient sector has only been achieved through the support of both government and non-governmental organizations, subsequently increasing competition among various institutions of the microfinance market. This chapter therefore aims to shed some light into the present status of the microfinance institutions currently operating in Bangladesh. To pursue this purpose, four prominent institutions involved in the provision of microfinance in the country have been highlighted. Findings of this chapter will provide further insights into understanding the microfinance models followed by these institutions, their operational structures and the generalized challenges they face. In addition, this study can assist various financial and non-financial institutions to understand the importance of microfinance and develop and implement microfinance concepts in a more profound way in Bangladesh.

BACKGROUND

Microfinance is generally known as a sustainable means of poverty alleviation leading to lasting, holistic development, particularly in the settings of developing countries. It has evolved from the time of its inception as an economic development approach that benefits the financially disadvantaged people, like those with low and unstable incomes, little or no land/assets and low social status in rural and urban areas (Maanen, 2004). The main idea behind microfinance is to provide these people with credit and other financial services of very small amounts so that they can raise their income levels and improve their living standards (Khalily, 2004). The concept of microfinance is a trial and tested one which believes that the involvement of lending-repayment process with different socio-cultural activities can result in the empowerment and social development of the overall community, especially the women (Yunus, 1998). Microfinance has also been viewed as a sustainable finance option and an effective rural banking channel for the unbanked population of developing countries.

Microfinance first evolved in the 1970s with the name "microcredit" and eventually became a tremendous movement of implementation by receiving the widest coverage compared to other poverty alleviation programs across the world (Ahmed, 2001). As such, around 160 million people in various developing countries are today served by microfinance. Historical context evidences that it was during the 1980s that non-governmental organizations (NGOs) came into existence and initiated the service offerings of small loans to women, so that they can invest in business, accumulate assets and increase their income

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

to a substantial level (Zaman, 2013). Moreover, since banks could not afford to provide micro loans to poor people owing to the lack of collateral and financial assets, NGOs gained further momentum in this micro credit arena. Although there always have been other non-commercial and informal money-lenders like credit unions and lending co-operatives, lack of insecurity in the lending and borrowing process and mostly the absence of collateral made micro credit through NGOs a popular phenomenon.

The concept of micro credit was then transformed into a modernized version of microfinance and the credit of pioneering this goes to Dr. Mohammad Yunus. Yunus initially began experimenting with lending to poor women in the village of Jobra, Bangladesh and over time established an institutionalized version of the micro credit model, namely Grameen Bank (Rahman, Luo, Ahmed & Xiaolin, 2012). The Grameen model mainly involves small loans to women with fixed terms and amounts, group liability, weekly meetings, forced payments into a group savings account, etc. The basic idea is to provide the poor people of Bangladesh with credit without collateral (Shil, 2009). This simple yet classic method of delivering micro credit soon became a global movement and managed to capture publicity, billions of dollars of financing, large numbers of customers and even earned a Nobel Peace Prize for Dr. Yunus (Leikem, 2012).

According to Morduch (1998), Grameen Bank is the flagship of the international microfinance movement, whose model has been replicated on four continents and consequently, it became a formal tool for global poverty reduction across the world. With the progress of commercialization, microfinance facilities also got initiated in different institutions and other NGOs in Bangladesh in order to ensure smooth economic development. Thus, the golden era for the microfinance industry of Bangladesh begun in 1990s as various models of microfinance, with some local modifications and adaptations, converged towards the comparatively uniform "Grameen-model" of delivering microfinance to the impoverished without requiring any collateral (Alamgir, 2010).

Microfinance thereby became a popular economic development practice in Bangladesh, as a result of which, the microfinance sector of Bangladesh is currently considered as the most dominant and efficient one in the world (Zaman, 2013). This growth, however, took place during several distinct phases over more than three decades after the country got its independence. There was a time when commercial banks, agricultural banks and cooperative societies were the primary sources of small loans for various types of borrowers like farmers, traders and cottage industries, particularly before the arrival of micro credit concepts in Bangladesh. However, these institutions were more inclined to provide small loans to special borrowers rather than to the poor population. Moreover, these banks used to demand for collateral in order to sanction any loan and have rarely been interested in small loans with the exception of Islami Bank Bangladesh Limited which had large retail microcredit operations even at that point of time (Alamgir, 2010). On the other hand, there were agricultural development banks like Bangladesh Krishi Bank (BKB) and Rajshahi Krishi Unnayan Bank (RAKUB) that used to target and still targets only the small, medium and large farmers who could offer land as mortgage (Aziz, 2012). According to Hulme and Moore (2006), it is the microfinance industry, particularly the micro credit operations that has drastically changed this scenario and made it possible for more than 13 million poor households of Bangladesh to have access to credit. This easy accessibility of microfinance, in turn, has directly or indirectly affected the social conditions of the country to a large extent.

Today, there are four types of institutions involved in microfinance activities, namely Grameen Bank (GB): a member-owned specialized institution; NGOs like Bangladesh Rural Advancement Committee (BRAC), Proshika, Association for Social Advancement (ASA), BURO, etc; commercial and specialized

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

banks like Bangladesh Krishi Bank (BKB), Rajshahi Krishi Unnayan Bank (RAKUB), Dhaka Mercantile Cooperative Bank Ltd. (DMCBL), etc; and, government sponsored microfinance projects like BRDB, Swanirvar Bangladesh, etc. Even though there are hundreds of such organizations offering microcredit in Bangladesh, the bulk of the borrowers borrow from a handful of large organizations like Grameen Bank, BRAC, ASA, and Proshika. Hence, this study focuses on these four major institutions, which played revolutionary roles in alleviating poverty to a great extent from the rural areas of Bangladesh.

ISSUES, CONTROVERSIES, AND PROBLEMS

Bangladesh is often cited as the birth place of microcredit and one of those countries where the impact of the microfinance programs have been massive. Yet, the present coverage of the microfinance industry only stands about at one-third of rural households of the country through several hundreds of small to giant microfinance organizations (Mia & Ramage, 2011). This has resulted in yielding mixed impressions about the impacts of microfinance programs as rural banking channels in the context of Bangladesh.

In general, one of the major issues that surrounded the operations of MFIs has been the problem of overlapping. Since the concept of microfinance programs does not require documentary collateral against credit on the basis of the assumption that the targeted poor population owns no collateral, many borrowers tend to hide information about their current loans and try to obtain multiple loans from different sources in the same time periods. This causes a complex situation in this collateral-free lending system for people who are economically vulnerable and incapable of generating income from any other activities. Moreover, there are various other contextual controversies that are directly or indirectly related to this issue of overlapping in the microfinance programs. For instance, the profit-making objective of particularly the large MFIs resulted in high interest rates and an unhealthy competition among the operators in the microfinance sector. Additionally, the absence of regulatory authorities in this large and distributed financial market of the country further paced these competitions. Even the funds channeled by the Palli Karma Sahayak Foundation (PKSF), the world's largest apex microcredit funding institution, forced MFIs towards multiple lending to continue their operations. This is because the creation of high supply of micro credit through PKSF did not match the lack of demand for the MFIs in the borrower community of the rural areas. Consequently, the MFIs ended up taking probable borrowers into the grips of a higher degree of overlapping in Bangladesh (McIntosh & Wydick, 2005).

Besides high competition and pressures of disbursement, the information gap between the loan seeker and the loan provider also aggravated the issue of overlapping. As a result, the overlapped borrower became inclined to enter into a vicious cycle of loans, approaching local moneylenders, liquidating their remaining assets, and ultimately inviting a series of economic and social problems due to their over-indebting loans. It thus becomes imperative that the lack of control over this problem of overlapping is managed in the operational models of the microfinance programs. However, the MFIs have failed in managing this issue in countries like Bangladesh and this has been mostly evident in the operations of giant MFIs like Grameen Bank, BRAC, ASA and Proshika. In fact, concrete evidence of the effectiveness and efficiency of these four large MFIs is still inconclusive.

A number of studies have been previously conducted in order to examine the effectiveness and efficiency of the MFIs with regard to their operations, problems and challenges in Bangladesh. For instance, Khandker (2005) identified some major challenges that are faced by MFIs like overlapping membership

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

growth, rising credit risk, etc. Barua (2009) further added some problematic issues encountered by the giant MFIs in Bangladesh like dependency on a single revenue generation model, multiple borrowing or overlapping, severe lack of training and education, lack of innovation and central database, misuse of credit by borrowers, sector-wise disbursement without technical expertise, etc. Alamgir (2010) supported these findings by highlighting other challenges faced by the MFIs like institutional capacity, quality and diversity of services, fallout from political and macroeconomic factors and so forth.

In line with the above studies, Mia & Ramage (2011) and Yuge (2011) also examined the nature, causes and consequences of overlapping in micro credit while Rahman et al. (2012) analyzed the operational mechanism and institutional innovation of large MFIs with regard to their outreach, outstanding loans, savings and efficient service deliveries. Alternatively, Zaman (2013) supported all findings of previous microfinance studies and provided evidence of problems like overlapping in multiple borrowing, lack of reliable database, lack of trained and skilled workforce, less concentration on ultra poor, etc as major issues that the MFIs face in Bangladesh.

Since the livelihood of a large number of people is affected by the microfinance programs of these MFIs, extensive and continuous research is necessary to keep track of their effectiveness. As such, this chapter focuses upon the present status of the microfinance institutions currently operating in Bangladesh, particularly the ones which have the largest micro credit operations across the country.

METHODOLOGY

In designing this research, a case study approach has been incorporated. According to Yin (2009), the case study approach is preferred to conduct exploratory investigations and one of the essential characteristics of using this approach is that it focuses on one instance of the thing that is to be investigated.

Case studies can actually employ various methods, including documentation, archival records, interviews, direct observations, participant observations and physical artifacts (Saunders, Saunders, Lewis & Thornhill, 2011). As such, a case study methodology is seen as an appropriate approach here since case studies can provide a rich understanding of the organization or organizations in question. Case study methodology also emphasize the ability of qualitative research to capture the real-life context within which events take place and to capture the essence of events, especially as they unfold (Gerring, 2007). In addition, Bryman & Bell (2015) argue that case studies can be valuable in situations where existing knowledge is limited, often providing in-depth contextual information, which may result in an in-depth level of understanding. Case studies can even be advantageous when the focus of the study is not typical but something unusual, unexpected, covert or illicit (Johnson, Onwuegbuzie & Turner, 2007). For instance, research on microfinance institutions and their operational activities are limited in number and most of them are simple comparative analysis of the success stories of such institutions. The focus on the activities and product portfolios of the selected microfinance institutions can provide further insights as to the operational structures of the microfinance programs in Bangladesh and the challenges surrounding such activities in the microfinance market. Based on the findings, recommendations have been proposed to promote the development and implementation of the microfinance programs at a larger scale in the country.

The research methods thus include in-depth interviews and secondary sources. Interviews were conducted with the officials and clerical staffs working for each of the microfinance institutions studied

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in this chapter. The representatives from the selected MFIs were particularly interviewed regarding the concept of microfinance, their offerings and how they operate, the problems and challenges they face in serving the rural market, and so on. Based on their responses, a general picture has been represented in this study which reflects the perceptions and perspectives of people involved in the microfinance programs and various aspects of the four large MFIs, currently operating in Bangladesh.

OVERVIEW OF MAJOR MICROFINANCE INSTITUTIONS

The following section provides an overview of the four major and giant institutions that took microfinance to a new height in the country, namely BRAC, Grameen Bank, ASA and Proshika.

BRAC

Bangladesh Rural Advancement Committee or more popularly known as BRAC is a finance-plus NGO that was established in 1972. BRAC was set up as a response to humanitarian need in order to help rural people in a war-torn Bangladesh during the post-independence period (Ahmed & Rafi, 1999). However, within a very short period of time after its inception, BRAC realized that relief work was a short-term measure given the multiple problems that the people faced. Thus, there was a shift in the objectives and BRAC evolved from a relief and rehabilitation organization to a development organization (Rahman et al., 2012).

Eventually, BRAC became a mainstreamed microfinance institution and started housing a very large range of non-financial social and supportive services such as functional, education, livelihoods training, logistical assistance and various social support services (Kabeer, Mahmud & Isaza Castro, 2010). It works particularly with the women from poor families whose lives are struck by acute poverty, illiteracy, diseases and malnutrition (Ahmed & Rafi, 1999). Besides, BRAC has contributed significantly to the educational sector of Bangladesh as well, by helping to achieve gender parity in enrolment and by targeting dropouts and non-enrolled children, particularly girls, in marginalized communities (Asadullah, Savoia & Mahmud, 2014).

Currently BRAC has its branches in all 64 districts of Bangladesh as well as in Afghanistan, Pakistan, Sri Lanka, Uganda, Tanzania, South Sudan, Sierra Leone, Liberia, Haiti and the Philippines. It works in over 68,000 villages and over 4,000 urban slums in every district of Bangladesh and employs over 100,000 people, roughly 70 per cent of who are women, reaching more than 126 million people (Kabeer et al., 2010). BRAC has thus gone through a series of evolutions and has now become one of the largest NGO-MFIs of the country in terms of the scale and diversity of its intervention.

Grameen Bank

The Grameen Bank is a finance-minimalist bank that offers a broad range of financial products and limited organizational support. It originated in 1976, in the work of Professor Muhammad Yunus, who launched a research project to study how to design a credit delivery system to provide banking services to the rural poor. In the beginning, the Bank was developed to experiment the hypothesis that if financial resources were made available to the poor at reasonable interest rates, they would be able to gener-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ate productive self-employment without external assistance (Wahid, 1994). The target groups for this experiment were the poorest of the poor, who are almost exclusively women (McDonnell, 1999). The reason behind targeting this group for loans, particularly for micro credit is that the poor have skills that are under-utilized and with incentive they can earn more money. Besides, in order to develop a system of mutual accountability, Grameen Bank pioneered a peer group lending structure with joint liability, a mechanism that reduces problems of moral hazard and adverse selection where households are too poor to offer collateral (Morduch, 1999). Based on the positive results it achieved, Grameen Bank was authorized by national legislation as an independent bank in 1983.

Grameen Bank was always a provider of financial services to poor households, but it soon underwent a major change in its approach. In 2001-2, all Grameen Bank branches began to operate the new Grameen II (Grameen Generalised System) model more vigorously (Hulme & Moore, 2006). Under this new financial system, the bank started lending to both men and women, but their focus remained exclusively on women. This is because the bank believed women to be both more reliable in repaying their loans and more effective agents of change within the family (Kabeer et al., 2010).

Today, the success of the Grameen model has touched such a height that it has been replicated in various other parts of the world. Currently, it has approximately 6 million members in Bangladesh and around 96 per cent of them are women.

ASA

Association for Social Advancement or commonly known as ASA is the one of the largest and finest MFI of Bangladesh, whose transition from social movement to minimalist microfinance organization has been the most dramatic within the NGO sector (Kabeer et al., 2010). It established in 1978, with the objective to build consciousness and organize the poor and deprived people in realizing their rights. However, over time it realized that mere awareness-building motivation was not adequate enough for people who repeatedly asked for loans to invest in economic activities (Jain, 2007). This realization, later in 1989, paved way for the organization to transform into a microfinance provider through a cost-effective sustainable model.

ASA started its full fledged microfinance operations and reformed itself as a finance-only MFI in 1991. In the beginning, ASA introduced microfinance program as a pilot project where the sole focus was on using micro credit as its tool in fighting poverty. The distinctive feature of these microfinance programs has always been the easy credit access of the poor who get it at their doorstep in a flexible terms based on personal guarantee instead of group guarantee (Jain, 2007). Moreover, ASA also created employment opportunities by providing microfinance services for the socio-economic empowerment of the poor in Bangladesh.

Currently, ASA is the third largest MFI in the country, offering a range of savings, credit and insurance facilities. ASA has taken around 70000 villages under its wings by providing services to approximately 8.45 million people through its 3236 branch offices spread all over Bangladesh (Rahman et al., 2012). Also, there are 17 countries including India, Pakistan, Sri Lanka, Philippines, Ghana and Nigeria in which ASA has its own branches, where an appreciable number of workers are deployed to provide technical assistance and on-the-spot support to their microcredit programs (Jain, 2007). ASA's unique low-cost credit delivery mechanism has been replicated in several other countries and this particularly says a lot about its current success as a MFI (Hulme & Moore, 2006).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Proshika

Proshika was set up in 1974 by a group of student activists with a strong commitment to social mobilization, but it was registered as a formal organization in 1976 (Kabeer et al., 2010). Initially, it had a credit-program that was led and managed by its borrower groups and this borrower-driven feature of Proshika made it unique compared to other conventional microfinance organizations.

By the mid-1990s, it began to move in the direction of the financial sustainability model and started its microfinance programs, focusing mainly upon men and women from landless and marginal farming households. Like other large MFIs, Proshika also works closely with women, although around 30 percent of its membership remains male (Kabeer et al., 2010).

Currently, Proshika has its presence in 21,272 villages and 2,380 urban slums in 55 districts of Bangladesh. It works with nearly 1.36 million men and women members drawn from rural and urban poor households of the country. They have been organized into 104,295 primary groups and with an average 1.3 member from each household having 5.5 family members, this translates into over 5.77 million programme beneficiaries of Proshika (Daley-Harris, 2005). Moreover, it has created 12.33 million employment/self-employment opportunities for the poor and brought over one million households out of poverty while making over one million people literate and planting nearly one billion trees towards the greening of Bangladesh.

APPLICATIONS OF MICROFINANCE MODELS

There are various microfinance models used by MFIs throughout the world, but the four key models that have got immense popularity are: Grameen model, MC2 Model, Village Banking Model of FINCA and the SKS and Non Banking Finance Company (NBFC) Model. The following section discusses these four leading models of microfinance programs.

Grameen Model

One of the most successful models of microfinance that has been replicated around the world is the Grameen model. The Grameen model, introduced by the Grameen Bank of Bangladesh, is based on the voluntary formation of small groups of four to eight persons to provide mutual, morally binding group guarantees instead of the collateral required by conventional banks (Shil, 2009). As per the requirement of this model, the group has to self-select its members before obtaining a loan (Fotabong, 2011). After the formation of the group, the Bank grants loans to the selected members of the group first and then to the rest of the members. Moreover, the model requires the borrower to save 5 percentage of the loan beforehand, which basically acts as collateral. One of the best features of this group-based lending practice is the joint accountability that this model enforces. If one member of the group becomes a defaulter, the entire group will be ineligible and will not be entitled to receive further loans.

Besides, this model has placed strong focus on women on the basis of the belief that they are not only reliable borrowers but also perceptive and intelligent entrepreneurs as well. In this process, the bank has successfully developed a new banking system based on mutual trust, accountability, participation and creativity (Fotabong, 2011).

MC2 Model

The MC2 model originally stands for rural development micro-banking. The objectives of this model are one, economic and financial sustainability from the perspective of the micro bank, individuals and group members and two, social dimension (Atuya, 2014). In 1992, the first MC2 model was developed by drawing inspiration from Einstein's famous formula: Victory over Poverty (VP) is possible if the Means (M) and the Competences (C) of the Community (C) are combined (Atuya, 2014). Therefore, the formula VP= M x C x C = MC2 (Fotabong, 2011).

MC2 model has two versions: a rural version, MC2 and an urban version dubbed MUFFA (Rudrabhatla, Roy & Bose, 2015). The rural version of the model is exclusively for women who are most dominated by poverty while MUFFA is aimed at the disadvantageous women of urban areas. Both aim to provide easy access to financial services so that the two groups of women can become independent.

Developing MC2 microfinance model involves five stages. The first stage deals with sensitizing the poor and raising awareness among them regarding the importance of savings and self-reliance; the second stage deals with mobilizing resources through raising the startup capital, paying individual shares subscription and fees, registering the micro-bank, and opening of individual accounts; the third stage deals with financing individual income generating activities while stage four deals with financing common interest economic projects; and, the final stage deals with carrying out social development projects with the resources generated in stage three and four (Fotabong, 2011).

Village Banking Model of FINCA

The Village Banking model was first developed in the 1980s in Bolivia, wherein the village banking institution of Foundation for International Community Assistance (FINCA) first implemented the model in order to create financially-sustainable solidarity groups (Atuya, 2014). The policy of FINCA is to train small community groups in a 22-module program to establish Community Credit Enterprises (CCE), form groups of 30-60 members, mostly comprising of women and later permit these members to buy shares as shareholders and generate capital to offer sustainable credit and business models (Fotabong, 2011).

Under this model, the village bank usually receives its first loan from the implementing agency as soon as it gets inaugurated. Then, as per the requirement of the model, the first individual loan (usually US$ 50) needs to be repaid on a weekly basis in equal installments of principal and interest over a four-month period (Atuya, 2014). The village bank collects these payments at regular meetings. Besides, the village bank is required to repay the entire loan-principal plus interest-to the implementing agency at the end of the 16th week of the loan (Atuya, 2014). If the village bank repays the entire loan timely, it will be eligible for a second loan. However, if the bank cannot pay the amount due on time, the implementing agency stops further credit until reimbursement is made (Fotabong, 2011).

SKS and Non-Banking Finance Company (NBFC) Model

This model is one of the prominent microfinance models in the context of India. It is basically an investor-driven model with an objective of profit maximization (Fotabong, 2011). All MFIs that use SKS and NBFC microfinance model mobilize resource through capital market investments and borrowings from commercial banks. These NGO-MFIs believe that poor people are bankable and lending to them

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is a trustable and profitable venture without relying on low cost funds for lending (Rudrabhatla et al., 2015). Besides, they also collect capital from the capital market on the ground that their institutions need huge amount of money to finance micro projects where financial markets are the only way to mobilize resources. Hence, these NGO-MFIs use debts and mezzanine assets and mobilize debt at market interest rates (Fotabong, 2011). The funds they receive in turn are made available to the poor to finance their various business activities that very often end up pushing the poor further below the poverty line.

PRODUCT PORTFOLIOS

Generally, microfinance includes loans, savings, insurances, transfer services and other financial products for low-income clients. So, basically it represents all the financial (credit, savings, insurance, remittance, etc) and non-financial (non-formal schooling for disadvantaged children or community-delivered health care, training, legal aid and social awareness) services provided to different groups of poor and non-poor clients who are not fortunate enough to be served by the conventional financial institutions. This section therefore focuses upon the product diversity of the four major MFIs of Bangladesh. Even though all these four giant MFIs started out with the same goal of socio-economic development of Bangladesh, interestingly there is a hidden competition among them in innovating new products and services suiting to poor people livelihoods (Rahman et al., 2012).

Grameen Bank, BRAC, ASA and Proshika have experience in more or less all kind of microfinance services, currently providing micro-credit, savings, micro-insurance and educational services in the country. All of them have subdivided loan and saving products targeting different socio-economic strata. Beside some common services, they are also involved in providing some services which are only unique to them.

One of the most important features of the microfinance model that BRAC follows is its sustainability. Considering this, the main motto of BRAC's microfinance program is to make credit available to poor women at a reasonable price and to promote the economic development of the country by increasing the income level of the rural poor and operate self-sustaining credit activities (Rahman et al., 2012). The several financial and nonfinancial services offered by BRAC include credit, savings, insurance, education, health, training, social development, legal aid services program, research and development, human rights and advocacy, public affairs and communications, human resource development, etc.

On the other hand, apart from the regular savings, credit, micro-insurance and educational services, Grameen Bank has introduced many services that make them unique. For instance, special services for beggars that it has initiated as a part of its microfinance scheme were an outstanding innovation (Alamgir, 2010). Another excellent innovation by Grameen Bank has been the provision of guarantee to shop-owners to give goods of maximum of BDT 2000 on credit to a poor woman to sell door-to-door in villages. Furthermore, the Bank has education schemes for member's children and social businesses as well.

Alternatively, ASA functions as a pure MFI and is well-known for its innovative product portfolios, wherein it provides diversified loan products, deposit services, saving, insurance and educational products, health care services, etc (Kabeer et al., 2010). Moreover, with a pledge for making poverty-free society, ASA pursues a consciousness raising program to reduce health hazard and maintain sound health among its clients predominantly bracketed in low income and uneducated segment of the society (Aziz, 2012). Besides, to widen primary healthcare facilities, ASA launched Extended Health Program in the remotest and backward areas of the country where state owned and other public or private health

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

services are inadequate (Aziz, 2012). ASA has initiated Water and Sanitation Program as well to develop sanitation facilities and improve access to pure drinking water to the people of lower segment of the society in Bangladesh.

Unlike BRAC, Grameen Bank and ASA, Proshika offers a loan portfolio that has a relatively large agricultural component - a sector which is usually shunned by most credit programs dedicated to the poor. Another distinctive but significant feature of Proshika's credit program has been the relatively large proportion of male group members in the total population unlike other MFIs where groups are almost 100 percent women. Even though Proshika's outreach is not broad enough, it still has its own share of innovation. This includes: Proshika Savings Scheme (PSS), which is based on principles such as security of savings, life insurance, risk coverage for damaged houses caused by natural disasters, accessibility, etc; and, Economic-Social Security Program (ESSP), which is a voluntary savings product that has been offered to group members of Proshika (Banking with the Poor Network, 2013).

OPERATIONAL STRUCTURES

Even though Grameen Bank, BRAC, ASA and Proshika were developed to provide financial and other nonfinancial services to the poor, their operational structure is quite different from each other.

The basic features of Grameen Banks' microfinance operation is poor people's access to credit with women as a priority by forming small solidarity groups of 5 members, exemption from collateral, small loans repaid in weekly installments, eligibility for higher loan amount for succeeding loans. Grameen Bank does not extend loans to all the members of the group at the same time. In the first stage, only two of them are eligible for a loan. If only the first two borrowers begin to repay the principals plus interest over six weeks, the other members of the group will be eligible for a loan.

On the other hand, BRAC forms group of 30-40 people which is known as Village Organization (VO). The purpose behind developing VO is basically to bring a group of poor, landless people together and improve their socio-economic positions. Besides, this VO works as a platform for launching and implementing BRAC's various activities (Rahman et al., 2012). Apart from the group approach, BRAC is also involved in providing individual credit facilities, wherein they consider the member's capacity to utilize the loan money, type of business and profitability of the Income Generating Activity (IGA)/business.

ASA's microfinance operation is slightly different from Grameen Bank and BRAC. It forms a similar group of 30-40 people for the financing purpose, but their operational mechanism is the most sustainable and cost-effective approach. The distinct feature of ASA is its decentralized nature. Each branch acts as its own cost and profit center. The branches have freedom to carry out all the activities as long as these conform to ASA's Operations Manual. For example, branch offices of ASA have no accountants; rather, it has simplified accounting and cash-handling for its branch offices by distributing the job between the branch manager and the three or four loan officers which is then monitored by senior staffs at four different levels leading up to the head office (Rahman et al., 2012). Moreover, each branch prepares its own annual work plan with fiscal targets and cash flow projection. As a result, funds are distributed evenly through the entire ASA structure.

Alternatively, Proshika's operation is based upon matching member savings with credit and to provide various forms of training, technical and skills development assistance. It also encourages members to expand their income-generating activities with credit provided by the organization (Kabeer et al., 2010). It typically works in those areas where many poor families live; a majority of people have a low level

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of education; sanitation systems are deficient or nonexistent and there is a low level of land ownership. Even though initially Proshika fulfilled its social intermediation objectives through group formation and consciousness rising rather than service provision, it has now moved into the provision of a wider range of social programmes. Proshika's credit microloan program now targets the agricultural workers, factory workers, small farmers, micro entrepreneurs and such others (Banking with the Poor Network, 2013).

CHALLENGES OF THE MICROFINANCE MARKET

An in-depth overview of the four MFIs, their product portfolios and their operational structures provide clear evidence for the success of the microfinance industry of Bangladesh. This growth of the microfinance market has given the poor access to credit and around 13 million poor households in the country today are provided with financial services like loan, savings, insurance, etc despite having low or moderate incomes (Armendáriz & Morduch, 2010). This saturation in the microfinance market of the country is truly remarkable, wherein approximately twelve hundred microfinance institutions function in several distinct phases, including the four large MFIs.

The MFIs currently host a variety of microfinance programs in the areas of agriculture, financial services, health, electricity, telecommunication, water, housing, tourism, handicrafts, consumer goods and services (Yuge, 2011). In the process, these NGOs have become the potent driver of financial inclusion for the poor; promoter of self-employment, poverty alleviation, savings and investment programs, empowerment of women; sources of human capital formation and employment of large numbers of graduates in the country, and so on (Ahmed, 2009). However, even after such achievements and success stories of the microfinance program, MFIs face a number of challenges and problems to operate in the rural areas.

Studies of microfinance programs through these four large MFIs show that the economic conditions of the poor people have greatly improved, yet there has not been any significant decline in the overall level of poverty of Bangladesh. Most of the poor population has been left out from the grasp of the microfinance programs due to the lack of sufficient creditworthiness and entrepreneurial ability necessary to handle money properly (Morduch, 1998). It can thus be stated that MFIs have not been able to reach effectively among the people of economically backward regions of the country (Sarder & Golzare, 2012). This implies that the MFIs have not very successful in including the entire population below the poverty line of the country.

Previous studies like Alamgir (2010) and Rahman et al. (2012) stated that the efforts of MFIs during the period of 1990-2006 reduced poverty at a rate of 1.8% annually, with an impressive economic growth of 7% in the country. A change in the scenario then occurred with an unprecedented price hike of food and other essential commodities in 2007-08, following which came recession (Chemin, 2008). Moreover, almost every year Bangladesh encountered natural calamities like floods and cyclones that resulted in the loss of lives, properties and livelihoods and created more poor people in the country. These external events, macro-economic instability and natural calamities have serious implications on the management and viability of microfinance institutions (Duvendack & Palmer-Jones, 2012). Several MFIs are forced to suspend microfinance operations like recovery and disbursement that leads to the loss of income and portfolio (Yuge, 2011). Some large MFIs even have to write off large amounts of loans and provide relief to the victims of the natural calamities (Ahmed, 2009). As such, MFIs often

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

curb provision of loans and limit the withdrawal of savings, which create further problems for the poor people and results in the generation of an ultra poor level of population in Bangladesh.

Issues of weak governance and management often characterize the operations of microfinance programs in these large MFIs as well. For instance, Hulme & Moore (2006) mentioned about the Microcredit Regulatory Authority and claimed that it is the only supervisory body of the vast microfinance market of the country. However, lack of manpower, resource base and geographical concentration of this organization tends to aggravate governance and regulatory issues in large MFIs (Hassan, 2002). A crucial element that is therefore missing in the operations of these MFIs is the quality of leadership and management due to the interference of politicians and lobbyists. This is a major challenge for the MFIs particularly in a developing country like Bangladesh as the overpowering nature of lobbyists and governing bodies tend to alter decision-making in these institutions and change of rules with regard to credit and financial services targeted for the poor.

Additionally, a high dependence of these large MFIs on the availability of subsidies and donor funds tends to create further problems in the microfinance market. This is because if donor funding for microfinance diminishes, MFIs may have to charge higher interest rates to recover their operational costs and even look out for new avenues to fund their activities (Morduch, 1999). Lack of capital therefore poses quite a challenge for the MFIs. Owing to this, often these large institutions end up giving insufficient time for repayment to the borrowers. For example, most of the micro-loans from these four large MFIs are granted for a short period of time, following which the loan has to be rapidly repaid from the small amounts of cash flows generated from the business (Khandker, 2005). This step by the MFIs further creates hassles for the operations of these organizations, since shorter periods of repayments in majority of the cases results in the increase of the number of defaulters.

Moreover, instances of multiple borrowing or overlapping take place in large numbers due to this lack of time for repayment. Growing numbers of overlapping borrowers can destroy sustainable development among these large MFIs in the long-run (Zaman, 2013). This is because the MFIs highlighted in this study often compete to acquire new customers in order to expand their scale and maintain their operations. As a result, MFIs get engaged in excessive competition and end up lending multiple loans to a number of borrowers. This, in turn, encourages heavy debt which can later destroy many poor household economies. In fact, there are many reported cases wherein borrowers have misused these micro-loans in order to generate cash flows so that they can make repayments to the MFIs on time and avoid paying high interest rates (Godquin, 2004). On the other hand, multiple loans results in an increase in the amount of non-performing microfinance loans, irregular repayments among overlapping borrowers and a rise in the amounts of loan-loss reserves for these major MFIs (Karim, 2011). Overlapping borrowers thus often poses a systemic risk among major MFIs that undermines the basis of the entire microfinance industry in Bangladesh as a whole. Unfortunately, MFIs have failed to make any changes in their models which can provide corrective steps to cease these shorter periods of loan recovery (Ahmed, 2009). This need of innovation in the operations and microfinance models followed by these large MFIs is no less than a challenge in the current microfinance market.

Another burning issue for the large MFIs is the high cost of recruitment and training that they often have to undertake to run their organizations (Hulme & Moore, 2006). This is crucial since avoidance of training and education costs leads to the lack of skilled manpower within these MFIs and less research work on borrowers and the overall microfinance market of the country (Zaman, 2013). As such, this is yet another challenge for the MFIs in the context of Bangladesh.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Despite all these challenges, the activities and functionalities by these four large MFIs have evidenced that microfinance, on average and in general, did have a positive economic impact on the poor population in terms of income growth and reduced vulnerability and are continuing to do so even today. However, it is important that necessary steps be taken in order to reduce the impact of the identified challenges for the four players of the microfinance market.

SOLUTIONS AND RECOMMENDATIONS

Domination of the microfinance market by the four large MFIs is the root cause of many challenges that has been identified in the previous section. Encouraging new entrants can be a mainstream solution to the systematic risk of this sector in the context of Bangladesh (Hassan, 2002). Already there are many small NGOs and co-operative banks that are now part of the microfinance market of the country with an objective to work towards poverty alleviation, consumption smoothing and asset building of the poor (Hulme & Moore, 2006). While the new entrants can be a threat for the large MFIs, an overall outlook evidences otherwise. The joint effort of many microfinance institutions can not only bring in more development for the country, they can also establish an effective information sharing system in order to prevent overlapping borrowing among microfinance borrowers (Yuge, 2011). An example would be to initiate a credit bureau, wherein a screening effect can improve the risk assessment of all loan applicants. This will ultimately raise portfolio quality, which in turn, can reduce the rates of amounts overdue. In addition, the mere existence of such an information system can act as a deterrent which may prevent borrowers from taking a risk of borrowing excessive loans, particularly if they know the information available and the risks involved (Duvendack & Palmer-Jones, 2012). Moreover, if the large MFIs join hands with the new entrants and engage in informal information sharing activities like sharing the list of overlapping borrowers or households, this can safeguard the operations of the MFIs and reduce the number of non-performing microfinance loans and irregular repayments from the borrowers (Armendáriz & Morduch, 2010). It can also ensure accountability and transparency in the microfinance operations of these four MFIs.

Once the issues of overlapping borrowers are brought into control, these large MFIs can solve other minor issues as well. For instance, a major reason for the high interest rates of these MFIs is their high operational costs. The use of technology can reduce these operational costs and the institutions can plan to invest in staff training or educating their field staffs to further promote their microfinance programs in rural areas (Zaman, 2013). Trained staff can enable proper supervision and monitoring of loan disbursements and recollections in these MFIs and therefore prevent any kind of fraud and miss appropriations of funds. Additionally, if the credit officers are trained and educated, they can better guide borrowers about the various microfinance programs being offered in the microfinance market by these large MFIs. Adequate knowledge about microfinance programs and the overall market of these credit officers can even help the management of these MFIs to run a completely decentralized institution and target for expansion and cost-effective operations in the long-run (Karim, 2011). Besides, research platforms related to microfinance borrowers and micro-credit programs can be strengthened too, if operational costs are controlled by the MFIs.

It is also imperative that these four key players of the microfinance market consider providing flexibility in repayment schedules of their micro-loans and introduce flexible financial services for the microfinance borrowers (Meyer, 2002). The increasing number of overlapping borrowers indicates the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

lack of satisfaction from the financial services provided by the MFIs due to factors like weekly repayment schedules and loan sizes. Microfinance borrowers can actually make more productive investments if these MFIs meet their demands for loans by allowing more flexibility in loan disbursement and repayment schedules (Mallick, 2012). This will particularly be helpful for borrowers whose enterprises are entering an expansionary phase, since when the business is growing borrowers need more money to satisfy their financial demands of working capital. Due to high operational costs and even high interest rates, the four large MFIs often fail to satisfy such financial requirements and this inflexibility incurs the costs of multiple memberships among dynamic clients with good repayment capacity (Chemin, 2008).

Furthermore, the MFIs could offer new product lines for the most disadvantaged people by offering savings and insurance product portfolios under the microfinance programs. This can help the poor people to reduce vulnerability and deal with risks such as disease and accidents, thereby enabling them to avoid borrowing an additional loan (Khandker, 1998). In fact, the mobilization of funds through savings and insurance programs can strengthen the financial sustainability of the MFIs as well.

Currently, a growing number of poor people have access to financial market through microfinance. Hence, it is necessary to introduce financial education to these people, so that they know that excessive loans may cause serious damage to their household economies (Godquin, 2004). MFIs initially should ensure that loans are only given to those microfinance borrowers who are going to utilize it to earn a living rather than for any other purpose (Alamgir, 2010). Next, the MFIs should improve the financial literacy of their clients to maintain the quality of their portfolios by focusing upon financial options and strategies of poor individuals and households in the rural setting of Bangladesh. To enhance this outreach to the remote areas of the country, these four large MFIs can also use mobile financial services by establishing partnerships with mobile phone operators and banks to reach the unbanked low income people (Sardar & Golzare, 2012).

Since its inception, microfinance has made an important transition with various innovations in the market of Bangladesh. As such, it is highly likely that such continued endeavors and innovations can help the four large MFIs to deal with the problems and challenges of the microfinance market of the country. The introduction of a legal framework for information sharing may also be established within the umbrella of the Microcredit Regulatory Act (MRA) to help the MFIs in the combat process. This, in turn, can help these MFIs to survive the excessive competition posed by each other and other new entrants of the microfinance sector and work towards the continued development of Bangladesh.

FUTURE RESEARCH DIRECTIONS

The present study is solely based upon the four major microfinance institutions of Bangladesh, which includes mainly government and non-governmental organizations. Future research can examine other forms of organizations like co-operative banks or small-scale MFIs which have recently started taking interest in the microfinance concept. A similar research can also be conducted for a different developing country to do a more in-depth analysis of microfinance models and approaches. Moreover, this study has mainly emphasized on the assessment of the operational structures and challenges of the selected microfinance institutions. A longitudinal study can be adopted in future works to examine a research model in order to examine the perspectives and attitudes of officials of the microfinance institutions regarding the microfinance concept in Bangladesh. This will provide a better insight into the perceptions of people related to the implementation of microfinance and can help to enhance the understanding of individual users of microfinance institutions in the context of Bangladesh.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

MFIs in Bangladesh have created innovative financial products and services to enable the poor, particularly in the remote or rural areas of the country, to become productive through various income-generating activities. Undoubtedly, this objective of the MFIs has created employment, leading to huge money circulation in the economy and thereby helping poverty alleviation across the entire country. This chapter therefore seeks to highlight the activities and present status of the four giant institutions – Grameen Bank, BRAC, ASA and Proshika – that are involved in the provision of microfinance in the context of Bangladesh. The study reveals the microfinance models followed by these institutions, their product portfolios, operational structures and the challenges they face in their operations. Findings of this chapter also state that these four MFIs commonly encounter problems like overlapping or multiple borrowing, lack of training and education, misuse of credit by borrowers, etc. However, they adopt a clear-cut strategy developed with experience gained over the years in order to deal with such problems and continue to contribute to the development of the economy. Bangladesh has thus become one of the most advanced countries in the field of microfinance today.

KEY TERMS AND DEFINITIONS

Microfinance: A general term that describes financial services to low-income individuals or to those people who do not have access to typical banking services. It includes services like loans, savings, insurance and other basic financial services to the poor. It mainly targets women entrepreneurs and aims to create employment, particularly in rural areas of developing countries.

Microfinance Institutions (MFIs): Institutions like small non-profit organizations, co-operative banks or in some cases, commercial banks that provides microfinance services to the unbanked or poor people of a country.

MRA: This Act is responsible for empowering, monitoring and supervising the microfinance activities of the MFIs. According to the Act, no MFI can operate microfinance program without obtaining license from this regulatory body.

Non-Governmental Organizations (NGOs): A non-profit organization that can operate on a national or international level without any government affiliations and is usually driven by people with common interest in areas like economic development, sustainability, human rights, environmental issues, etc.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Overlapping Borrowers: Includes the borrowers who take multiple loans within the same repayment period or secure loans from multiple MFIs. This is usually done by concealing the accurate information of their loans from the providers of microfinance.

PKSF: It is a public-private apex body that channels funds for microfinance to MFIs, and has been critical to the expansion and improved professionalism of the microcredit industry in Bangladesh.

Poverty Alleviation: Reduction of poverty in order to improve the livelihoods of poor people. A number of programs and strategic tools are used for this purpose so that any social and legal barriers to income growth among the poor can be removed. This primarily includes the use of microfinance to empower the poor and to increase their access to all factors of production, including credit.

Chapter 41
Real-Time Monitoring of Intercity Passenger Flows Based on Big Data:
A Decision Support Tool for Urban Sustainability

Zheng Li
Xi'an Eurasia University, China

Yan Wang
Xi'an Eurasia University, China

Qin Chen
Business Big Data (BBD), China

ABSTRACT

Managing population mobility is a key to urban growth and sustainable development. This study uses administrative and business data from a number of trustworthy and publicly-available websites for public transport to access passenger flows in a real-time manner. A case study is used to illustrate the application, with intercity passenger flows by public transport mode (rail or air), by rail service type and by time. Moreover, a model is developed for monitoring the implications of population movements, which can be a decision support tool for governments and policy makers to manage population mobility. The big-data approach to accessing public transport passenger movement has the following characteristics: (1) low cost, (2) a population scale, (3) instantaneous data collection/update, and (4) high quality.

1. INTRODUCTION

Urbanization plays an important role in economic growth, welfare, environment, and changes in social and human behaviour, which presents both opportunities and challenges to sustainability (Bettencourt et al., 2007). Governments across the globe keep a close watch on population movements. One traditional

source of data is the census. For example, in China, a national census is conducted every five years. A series of censuses illustrate that 1.17 billion Chinese moved to cities from rural areas between 2000 and 2010, where 35 percent moved to Beijing, Dongguan, Guangzhou and Shanghai metropolitan regions (International Organization for Migration, 2016). However, the cost of a national census is enormous, for example, the direct cost of the 2010 Census of China was 50 billion RMB (about 7.5 billion US$). Another source is research studies mainly based on travel diaries or surveys via phone, web or phone interviews; however, these studies are often associated with sampling issues. In addition to the high-cost and sampling issues of traditional approaches to population flow, other inherent limitations are statics and hysteresis. Therefore, these traditional approaches are incapable of continuously monitoring dynamics in population movements in a real-time manner.

Real-time monitoring of population mobility requires the following data characteristics: (1) low cost, (2) a population scale rather than a sample of the population, (3) instantaneous data collection/update, and (4) reliability. With technological development, big data provides such an opportunity. Big data has three dimensions (Daas and Puts, 2014): (1) Volume, that is the number of data records, attributes and linkages; (2) Velocity, that is the speed that data produced, changed processed and analyzed; and (3) Variety, that is the diversity of data sources, formats, media and contents. Wamba et al. (2015) add two "Vs": Veracity and Value, and defines big data as "a holistic approach to manage, process and analyze 5 Vs in order to create actionable insights for sustained value delivery, measuring performance and establishing competitive advantages" (p. 235). These characteristics are in line with the data needs for population mobility.

The existing big-data studies on population mobility and broader literature of urban studies have mainly used the following sources: mobile phones, transportation devices (e.g., public transportation smartcards and in-vehicle Global Position Systems (GPS)), and social-networking media (see Toole 2005; Williams et al. 2015; Sobolevsky et al. 2015; Tam and Clarke 2015; Hao et al. 2015 for detailed literature review). Compared to the existing studies, a unique property of this study is that administrative data and business data from trustworthy and publicly-available websites are captured in a real-time manner and on a population scale to establish reliable big data on intercity population flow. In addition, other significant advantages include reliability, consistency and accessibility. These merits, in turn, would ensure the quality of data analysis.

The paper is organized as follows. The next section introduces the procedures to generate big data sets on passenger flow of air and rail transportation. Then, Wuhan City is used as the case study to illustrate the applications of big data, investigates the changes in net inflow by mode (air and rail), by service type (intercity and longer-distance high speed rail (HSR)) and time (day and month), followed by a model for monitoring the condition of population mobility. The final section highlights the key conclusions of this study.

2. DATA

Among the existing studies of population mobility using big data, the dominant source is mobile phones (see e.g., Smoreda et al., 2013; Buckee et al., 2013; Smoreda et al., 2013; Zhang and Zhou, 2014; Wang and Tang 2014; Toole 2015 among others), where location data can be obtained by the tower that the phone is connected. Mobile phone data has these merits: (1) spatiotemporal precision, (2) low cost, and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

(3) population scale. However, such data source is not easily accessed, unless special agreements are reached. Other sources include GPS (e.g., Chen et al., 2016), smart travel card (e.g., Batty, 2013), and social-networking media and applications (e.g., Cottrill et al., 2013); however, these sources are often associated with sampling, quality or privacy issues.

In this study, a number of open and reliable websites are used as the source of big data such as air and rail passenger net inflow/outflow. Intercity coach service is not included when calculating net inflow/outflow numbers in this study, given that its daily inbound and outbound passengers tend to be symmetrical (i.e., net flow is close to zero). The air-mode population flow figures are directly obtained from a Chinese national website, where the numbers of departure and arrival passengers are collected by each airport in China, and updated by this website service in a real-time manner. Given this, the daily net inflow or outflow air passenger numbers for each city for each day can be directly calculated as the difference between the total arrival and the total departure for all airports in that city on that day. Therefore, the big data on air-mode population mobility is from administrative source with high accuracy.

The rail passenger numbers are derived on the basis of a two-stage approach. At the first stage, we grab each station's remaining tickets five minutes before departure from a national rail service website. At the second stage, the net inflow passenger numbers are calculated as follows. Suppose, as an example, City X has a rail station (Station X) and a rail line serves five stations for different cities: A, B, C, X, and D; the net inflow passenger number of Station X (City X) is needed. For the direction from A to B, the remaining tickets numbers before departure for Section CX (Station C to Station X: Xb) and Section XD (Station X to Station D: Xa) are obtained from the website. The net inflow (NI) of City X is approximately equal to Xa minus Xb. There are multiple rail lines that stop over City X and each line has multiple services on a single day. The net inflow number for City X is the sum of all differences between the remaining tickets for the section right after Station X (Xa) and for the section right before Station X (Xb), given in Equation (1):

$$NI\left(X\right)=\sum_{\substack{0\le i\le m\\0\le j\le n}} Xa\left(i,j\right)-Xb\left(i,j\right) \tag{1}$$

where:

- i is the train line;
- j is the service number for each train line.

In order to investigate the potential influence on population mobility of job market, on-line job advertisements are captured from China's leading recruitment service providers. This paper uses business data (i.e., train ticket sales data) and administrative data (i.e., information arising from the administration of airports) to construct population flow figures by rail and air respectively, along with informative data of on-line job advertisements. The big data sets are summarised in Table 1. These sources offer five significant advantages compared to other big data sources used in the existing population mobility studies (mainly tracking or location based device such as GPS and mobile phones): (1) being publicly-available, (2) no privacy issue, (3) better data quality, (4) accessibility, and (5) reliability.

3. BIG DATA ANALYSIS OF PASSENGER FLOWS: A CASE STUDY

Wuhan is the capital of Hubei province, which is the economic, political and financial center, as well as transportation hub of inland China, with approximately 10 million inhabitants. Figure 1 illustrates the fluctuations of daily air net inflow (= the number of arrival minus the number of departure) of Wuhan in May and June, based on the data captured on line. With the exception of May 17th, all daily net inflow numbers in May are negative, which means departure outnumbered arrival (i.e., net outflow); however, the situation in June is opposite, with the majority being net inflow towards Wuhan. The aggregated monthly net inflow for May is -63,807 and 56,255 for June, i.e., an increase of 120,062 in net inflow.

Figure 2 shows the dynamics in daily rail passenger movements. Most of daily numbers are negative in May, and the monthly net outflow number is 183,532. This is much improved in June with a net outflow is 2934. There is an increase of 180,598 in net inflow from May to June. For rail mode, the figures can be further classified into intercity rail and longer-distance high speed rail (HSR) according to the initial English letter on the ticket, where an intercity rail ticket series number starts with 'C', and 'G' or 'D' for HSR where the major difference between 'D' and 'G' is the speed of travel. The net flow numbers by rail service type are given in Figure 3. Despite that the aggregated number is negative in June; the net inflow number is 31,933 by intercity rail. This also applies to the situation in May, which has net inflow of 18,898 through intercity rail services. These figures suggest that Wuhan has attracted population from

Figure 1. Daily air net inflow/outflow of Wuhan (>0: net inflow; <0: net outflow)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Daily rail net inflow/outflow of Wuhan (>0: net inflow; <0: net outflow)

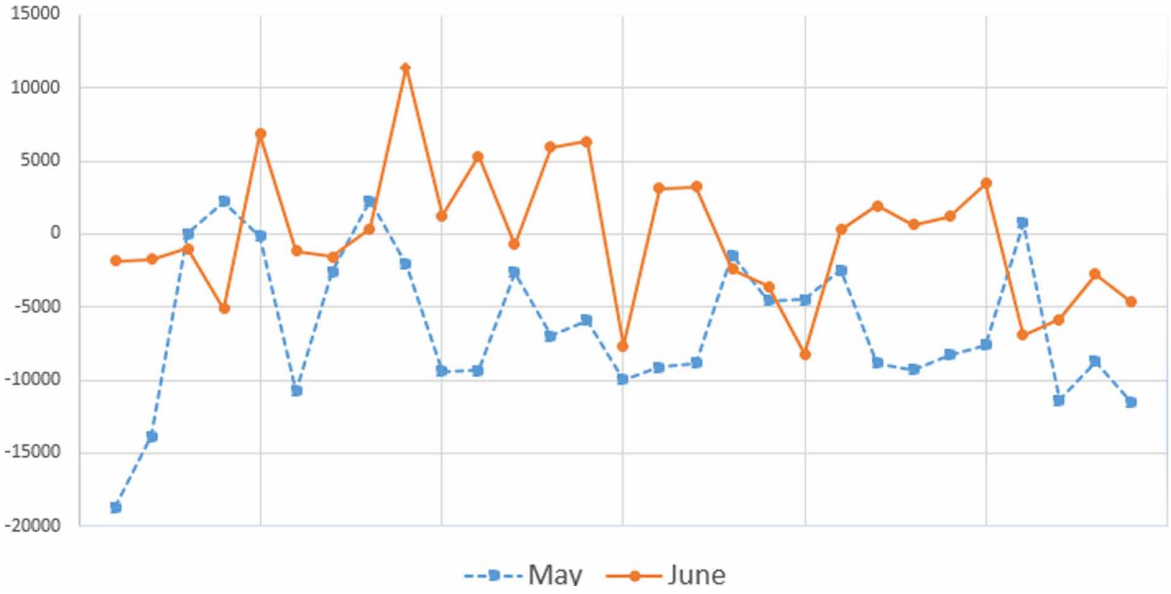

Figure 3. Daily intercity rail and HSQ net inflow/outflow (>0: net inflow; <0: net outflow)

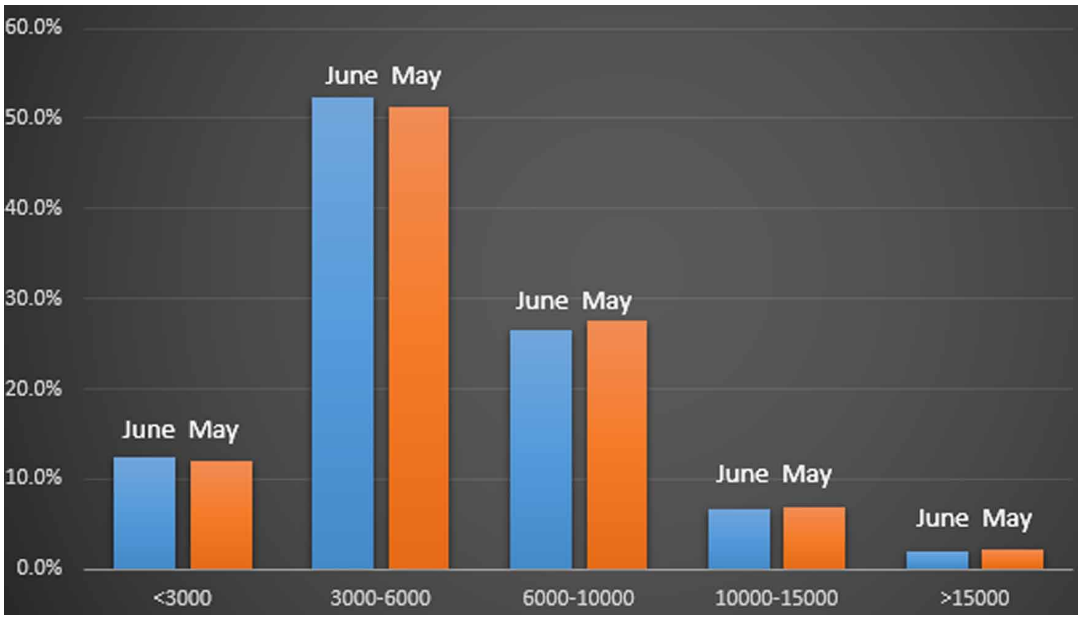

its surrounding cities. This direction of movements towards metropolis is logical. However, a significant increase of 13,035 in net inflow through intercity rail from May to June needs a further explanation.

In China, migrant workers account for a large proportion of population movements, with over 220 million internal migrant workers, or one sixth of its population (International Organization for Migration, 2016). For Wuhan region, the number surged by 25,943 from May to June, compared to an increase of 8,913 from April to May 2016, i.e. 17,030 more jobs. These figures, along with surged net inflow, suggest that more jobs provided in Wuhan might attract people moving into its metropolitan area. The distributions of monthly salary based on on-line job advertisements in May and June are shown in Figure 4. These two distributions are quite similar with the major difference being that for the salary range

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Monthly salary distributions

between 3,000 and 6,000 RMB (1RMB = 0.15 US$), June's figure is one percent higher than May's; while for the range between 6,000 and 10,000, May's number is one percent higher than June's. The mean salary for June is 5865.5RMB (standard error: 8.8) with a standard deviation of 3508.1, and the mean for May is 5948.2 (standard error = 9.8) with a standard deviation of 3553.8.

4. A MODEL FOR MONITORING POPULATION MOBILITY

Population mobility is a major contributor to urbanization, more so to China, given that occupational relocation (migrant workforce) accounts for the majority of China's internal population flow (Zhou and Yao, 2016). Urbanization is defined as a movement of people from rural areas to urban areas with population growth equal to urban migration (United Nations, 2010). Urbanization could be a key driver to economic development. However, overheated urbanization would result in negative impacts on society and environment, which may in turn weaken the economy. Therefore, the progress of urbanization needs to be carefully planned and monitored according to the size and development stage of the city so as to achieve sustainable growth (Henderson, 2003). From economic, social, and ecological perspectives, urbanization presents both opportunities and challenges to achieving urban sustainability (e.g., Bettencourt et al., 2007; Christopher 2008; Yigitcanlar, 2009). Given that urbanization is a dynamic process, the number of net inflow needs to be monitored continuously in order to ensure urban sustainability. Given this, a model that monitors the healthiness of population mobility is developed in Equation (2):

$$h_t = \left[1 - \left(\frac{\Delta\gamma_t}{\gamma_t^*}\right)^2\right] * 100\% \quad (2)$$

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

where h_t is the healthiness index of population movement, which may be weekly, monthly, quarterly or yearly; $h \leq 100\%$, and $h = 100\%$ indicates the most healthy or ideal situation, and the farther the value of *h* deviates from 100%, the worse the situation is: γ is the actual net inflow number during the monitoring period; $\Delta\gamma_t = \gamma_t - \gamma_t^*$; γ_t^* is the optimal or target number of population flow during the corresponding period.

If $\Delta\gamma > 0$, and the value of *h* is below the *threshold+* established by the government, this would suggest that there is 'overheating' in population inflow; $\Delta\gamma < 0$, and the value of *h* is below the *threshold-* suggest 'undercooling'. Hence, the value of *h* can be a key indicator to city's urbanization status, through which policy makers can implement corresponding policy interventions to encourage or discourage net inflow so as to address arising issues in time.

The index developed in this paper (see Equation (2)) directly monitors the influence of population inflow, which is different to existing studies measuring the rate of urbanization (e.g., Cam et al. 2000; Gasparatos et al. 2008). This approach might be of more political value, given that this healthiness index takes into accounts the desired or planned number set by the city government, which can be a changing number $\left(\gamma_t^*\right)$ according to a city's growth status and urban strategies, and hence reflecting the dynamic nature of urbanization and better addressing sustainability, which has important implications on planning and providing adequate infrastructure, resource, service and employment. In addition to its monitoring purpose, Equation (2) can also be used to make alarms as soon as dramatic changes surface, given that net inflow/outflow can be captured in a real-time manner. For example, a significant decrease in *h* due to surged net inflow suggests that more public transportation need to be provided to serve the airport or train stations so as to avoid overcrowding.

In a long run, the process of urbanization is dynamic, shown as the fluctuations in ratios of urban population at different stages. According to Shen et al. (2012 the percentage of urban population moderately climbs during the initial stage of urbanization. With the improved attractiveness of the city during the acceleration stage, the urban population ratio surges to a high level. This is followed by the terminal stage, and then counter-urbanization during which people leave urban areas. As the ratio further declines below a certain level, policy makers would implement strategies to attract population movements towards urban areas (i.e., re-urbanization stage).

5. CONCLUSION

According to International Organization for Migration (2016), the world urban population number was about 3.9 billion in 2015, and might reach 6.4 billion by 2050. To successfully manage population mobility is the key to urban growth and sustainable development. This study has used public websites as the source of big data to access rail and air passenger flows, and the constructed big date sets have the following characteristics: low cost, high quality, and real-time acquisition of data. A case study is used to illustrate the applications, with empirical evidence on passenger flows of Wuhan City by mode (air and rail), by service type (intercity and longer-distance HSR), and by time (day and month). A model for monitoring the level of population mobility is developed for governments to immediately make responses, effectively adjust their policies and appropriately implement interventions.

Chapter 42
Tourism Marketing in Developing Countries

Nermeen Atef Ahmed Hegazy
Cairo University, Egypt

ABSTRACT

Tourism is an attractive tool for economic development, especially in the developing world because tourism industry is considered as one of the largest and the most diverse industries in the world and it is one of the fastest growing sectors of the global economic. Many countries are seeking a way to improve their economic conditions; they see tourism as a major source of income, employment, and development of economic. The World Travel & Tourism Council (WTTC) researches assesses that the Travel & Tourism industry's contribution to GDP and jobs for 184 countries and 24 regions and economic groups in the world[1].

INTRODUCTION

According to an International Labor Organization (ILO) report international tourism was affected by the global economic crisis but is projected to grow significantly over the coming decade. The United Nations World Tourism Organization (UNWTO) is expecting the sector's global economy to provide 296 million jobs by 2019[2]. Tourism's importance to the wider economy continued to grow in 2012, Its total contribution comprised 9% of global GDP (US $6.6 trillion) and generated over 260 million jobs – 1 in 11 of the world's total jobs[1]. When we are talking about Tourism sector, we are talking about one of priority sectors of investments, but we should know how to make the tourism sector in developing countries more attractive for tourists and investors because it would be very beneficial for public people in these countries.

We will address the tourism marketing in developing countries clearly as below:

TOURISM

Tourism Definitions

Tourism is part of the leisure sector which is rapidly gaining economic importance. The volume of tourist flows at a world - wide level is showing a continued growth path, mainly as a result of income increase and improvement of transport systems (Pearce, 1981).

According to W.T.O. recommendations – "*Tourism* comprises the activities of persons travelling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and other purposes". The W.T.O. also defines – "*An international tourist* as a person who travels to a country which usual residence but outside his/her environment for at least one night but less than one year".

The origin of the word "*Tourist*" can be traced from *the Latin* word "*Tornus*" meaning a tool for describing a cycle. This word dates back to the year 1292 AD which reflect to the desire to discover the unknown, and explore new and strange places.

Tourism Categories

There is more than one classification for tourism; it can be classified into (Mccabe, 2009):

1. *Domestic Tourism:* involves *residents* of a country visiting their own country.
2. *Inbound Tourism:* involves *non-residents* visiting a country other than their own country.
3. *Outbound Tourism:* involves *residents* of a country visiting other countries.

Tourism also can be classified into three categories as:

1. *Internal Tourism:* comprises domestic tourism and outbound tourism.
2. *National Tourism:* comprises domestic tourism and outbound tourism.
3. *International Tourism:* comprises inbound tourism and outbound tourism.

Tourism Forms

There are many forms of tourism classified as:

Health Tourism

This form may also develop facilities for curative tourism. For example, thermal waters are recommended for people with rheumatic problems, bronchitis, back aches, skin diseases etc. Bath facilities, Spas, fitness, relaxation and wellness may be improved or established. Medical tourism seems to become an increasingly important part of the tourism market.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Cultural Tourism

Historical sites, buildings, monuments place of historical events, art exhibitions and museums may offer more interesting places to visit. By upgrading the level of and access to these attractions, the country will gain cultural prestige.

Shopping Tourism

Go for shopping abroad due to lower prices of goods.

Seaside Tourism

The sea lends itself to (swimming, rowing, sailing, surfing, skiing, snorkeling, wind surfing). Establishment of modern water sports facilities may be established at some tourist resorts.

Education Tourism

Tourism may also be developed on the basis of meetings, conferences or seminars. Language or cultural courses may also be considered.

Adventure/Sports Tourism

Many regions lend themselves for specialization in sport and leisure tourism. Such as, wildlife /discovery tours, panoramic trips and see the countryside by walking, climbing and hiking. Other examples are bird watching, camping, horse-riding, cycling. Sport tourism may also include winter sports – skiing, snowboarding, cross-country skiing summer sports, extreme sports (rafting, paragliding, sky diving, etc.) sport events (world championships).

Rural Tourism

Besides relaxation people work in farms rearing animals, participating in farming processes, i.e. dairying, processing of vines, taking care of horses, etc.

Tourism Marketing Components

There are three main components of tourism marketing can be illustrated as follows (Mccabe, 2009):

1. **Product Orientation:** Affirms that the products and services of tourism supply are based on physical, cultural, historical, and folkloric attributes or a combination of several of them.
2. **Market Orientation:** Marketer should take the needs and the desires of the tourists in his consideration.
3. **Societal Orientation:** Combines the best of the product as well as market orientation.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Tourism Characteristics

Tourism is a composite package of goods and services geographically segmented across specific geographical areas. It includes accommodation, transport facilities (air transport and vehicles), activities (what tourists do during their stay), attractions and ancillary services (banking, telecommunications, hospitals) (wig, 2003), and it also plays an important role in terms of employment. Tourism has a significant impact on social, economic and business sector, as it's one of the world's largest growing industries nowadays.

According to (Middleton, et al., 2009) there are three particular relevant characteristics for tourism:

- Seasonality and other major variations in the pattern of demand.
- The high fixed costs of operations, allied to fixed capacity at any point in time.
- The interdependence of tourism products.

Marketing in tourism is shaped and determined by the nature of the demand for tourism and the operating characteristics of supplying industries.

Tourism Benefits

Tourism has many benefits can illustrate as:

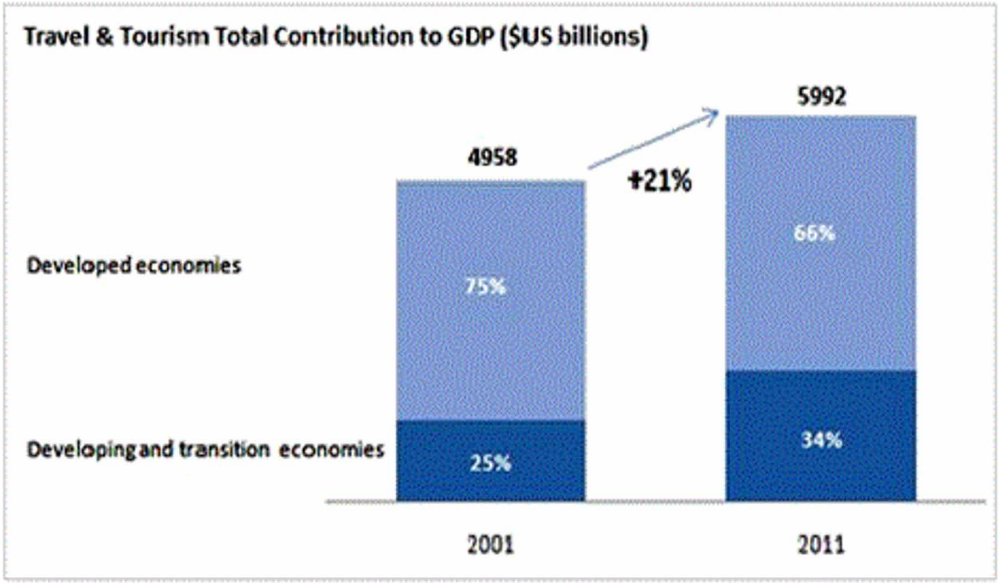
- **Economic Benefits:** Tourism provides foreign exchange earnings, Income for individuals & business, Employment & opportunities for training, and Overall development in underdeveloped areas.
- **Social and Cultural Benefits:** Tourism plays a vital role in art & monuments retention, and community empowerment.
- **Environmental Benefits:** Tourism has a very important role in environmental appreciation, and takes care of natural areas & wildlife.

THE MAGIC OF TOURISM

In the eyes of many decision-makers tourism has a magic potential. It generates income and is based on indigenous resources of the tourist areas at hand. Tourism has indeed been a rapidly growing sector. There seems to be significant structural changes in tourist demand which are likely to influence the traditional model of 'mass tourism', as the sector has been experiencing dramatic changes over the last few years in response to broader patterns of globalization of economic activities (Nijkamp, 1998). Over the past forty years tourism has become a major activity in the society and an increasingly important sector in terms of economic development. It forms an increasing share in discretionary income and often provides new opportunities for upgrading local environment. On the other hand Tourism is in a paradoxical position in developing countries, despite the weight it carries in these countries' economies and donors lend little importance to it.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

TOURISM AND ECONOMIC GROWTH



Tourism has a strong links with economic growth for all countries, especially developing countries because International tourism can be in fact an important source of economic growth in developing countries. This holds particularly true for least developed and other small, structurally weak countries which otherwise face tremendous challenges in a rapidly changing and highly competitive global trading system[3]. As illustrated in Figure 1. The tourism sector is growing in developing countries and its total contribution to GDP has grown by 21% in the last decade. So we can say that tourism can provide opportunities for economic development and diversification in developing countries. Fayissa, et al., (2007) examines the relationship between tourism and economic growth for African countries based on GMM approach for 1995-2004. The findings confirmed the Tourism-led growth hypothesis (Samimi, et al., 2011).

TOURISM DEVELOPMENT IN DEVELOPING COUNTRIES

Tourism sector can serve to diversify the economy and generate social and environmental benefits. Developing country governments must actively manage tourism through policies and actions aimed at maximizing the beneficial development impacts of tourism. Tourism can be generator of:

1. **Employment:** Tourism and tourism-support activities create a high proportion of employment and career opportunities for low-skilled and semi-skilled workers, particularly for poor, female and younger workers. *The World Travel and Tourism Council* reports that the industry currently provides over 220 million jobs and accounts for 8 per cent of employment, or 1 in 12 jobs, and about 10 per cent of GDP. The tourism sector can be an important source of employment for many of unemployed workers.

Figure 1. Travel and tourism total contribution to GDP

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

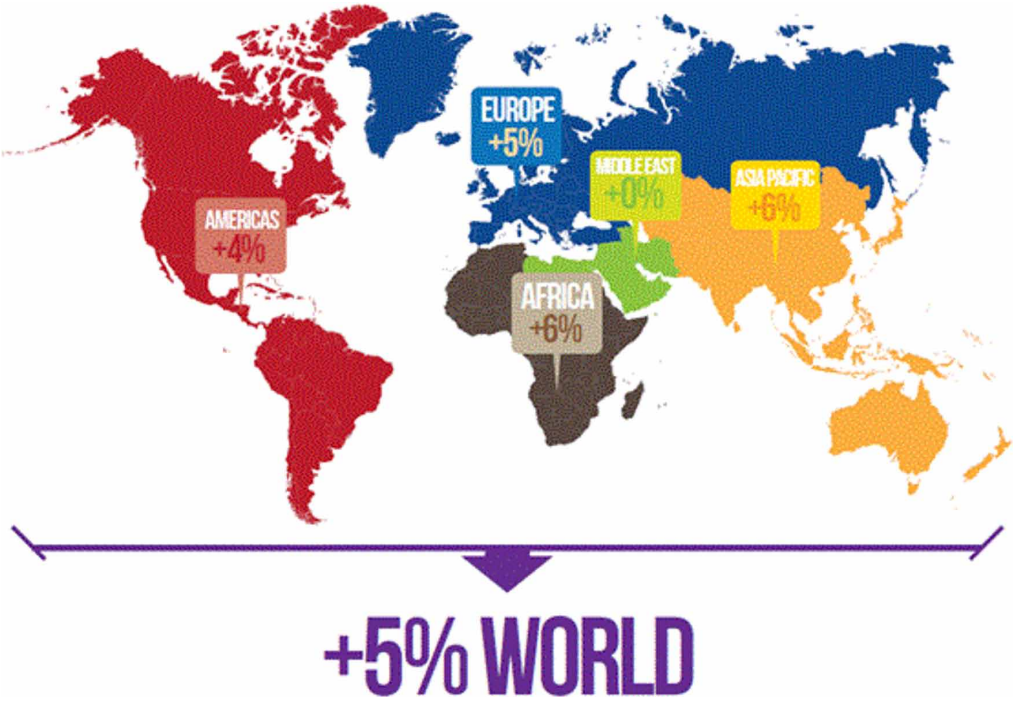
2. **National Economy:** Tourism linkages to other economic sectors are diverse and deep. Building linkages requires ensuring effective national strategies comprising policy, regulatory and institutional framework. Countries with strong linkages have developed tourism-supporting infrastructure, provide access to good quality basic services, and offer a tourism product at competitive prices (UNCTAD, 2010).

THE IMPORTANCE OF TOURISM IN DEVELOPING COUNTRIES

The tourism industry is increasingly important in less economically developed countries[4]. But although the industry is expanding rapidly, it remains unclear if and how tourism can help reduce poverty in these countries? Tourism in many developing and least developed countries is the most viable and sustainable economic development option, and in some countries, the main source of foreign exchange earnings[5]. If tourism is managed with a strong focus on poverty alleviation, it can directly benefit the poorer groups through different ways; employment of local people in tourism enterprises, goods and services provided to tourists, or the running of small and community-based enterprises, so tourism have a positive impacts on reducing poverty levels.

Tourism is one of five top export earners; it is the main source of foreign exchange for one third of developing countries and one half of LDCs (least developed countries), where it accounts for up to 40 per cent of GDP[6]. The World Tourism Organization (UNWTO) states that tourism returned to growth in the last quarter of 2009 and growth will continue in 2010. This recovery has been partly due to measures – through fiscal, monetary and marketing support to the tourism sector – that some 70 countries have implemented to stimulate their economies and restore growth[7]. These countries include many developing countries such as Argentina, Brazil, China, Egypt, India, Morocco, Nepal and Viet Nam. The recovery is expected to endure over the longer term with 4 per cent annual growth in international arrivals projected through 2020.

There has been a substantial diversification of destinations, and many developing countries have seen their tourist arrivals increase significantly. Arrivals to developing countries accounted for 46% of the total international arrivals in 2011. Tourism has become a major player in the economy of developing countries[5].



TOURISM INDUSTRY

Tourism is a complex industry that involves a wide range of businesses working at different levels; it's one of the world's largest industries, generating an estimated 9% of the world's GDP (Gross Domestic Product) and over 200 million jobs. In the analysis of tourism in literature review, economists emphasize the economic effects of tourism development on the economy, because tourism is a multidisciplinary activity that involves several industries and draws upon a variety of skills. In order to diversify the sources of economic growth, foreign exchange earnings and employment opportunities in different countries, development of tourism industry has aroused much more attention.

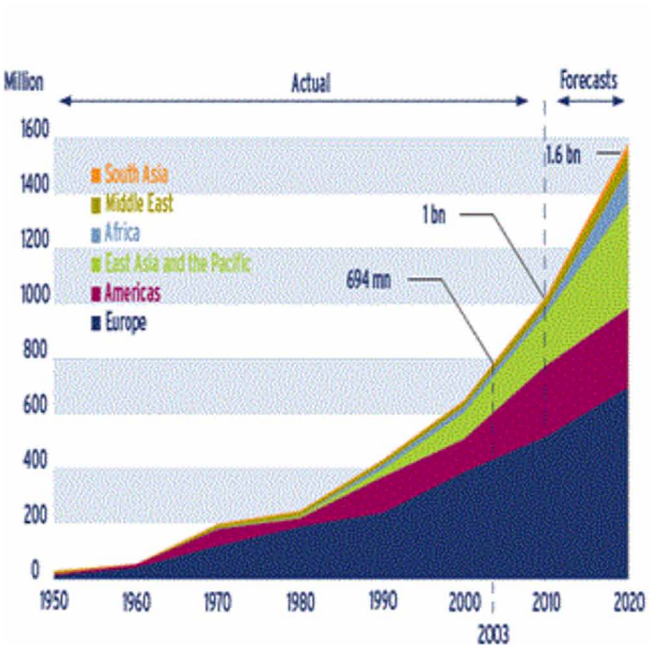
In 2012, international tourists spent US$386 billion in emerging market and developing countries (Figure 2), over five times the level of official development assistance which goes to these countries;

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. International tourist arrivals 2013

this is why tourism is one of the main sources of foreign exchange earnings to emerging market and developing countries.

Developing countries are active tourism suppliers in world markets. For them, the sector is a primary source of income-creating jobs and new development pathways. Tourism accounts for 7 per cent of their goods and services exports and 45 per cent of their commercial services exports, making it developing countries' largest single services export (UNCTAD, 2010) (Figure 3).



TOURISM AND POVERTY REDUCTION

Poverty is a multidimensional phenomenon that consists of a 'lack' of certain things upon which human health, well-being, and autonomous social functioning depend, including the ability to meet 'basic needs' (i.e., food, shelter, clothing, etc.) (Cattarinich, 2001).

The reduction of poverty has become one of the most compelling challenges of our time. Poverty is more than a lack of income – it is multidimensional and complex phenomenon with an intricate relationship to issues such as disease, illiteracy, infant mortality, environmental degradation and many other aspects (Okech, 2010). There is a belief that tourism industry development could lead to benefit poor people, and help them to a rise their living level, introducing the concept of "pro-poor tourism" (Ashley and Mitchell, 2006). Thus, the tourism industry may contribute significantly poverty reduction, especially in the countries that suffer from low levels of per capita GDP.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

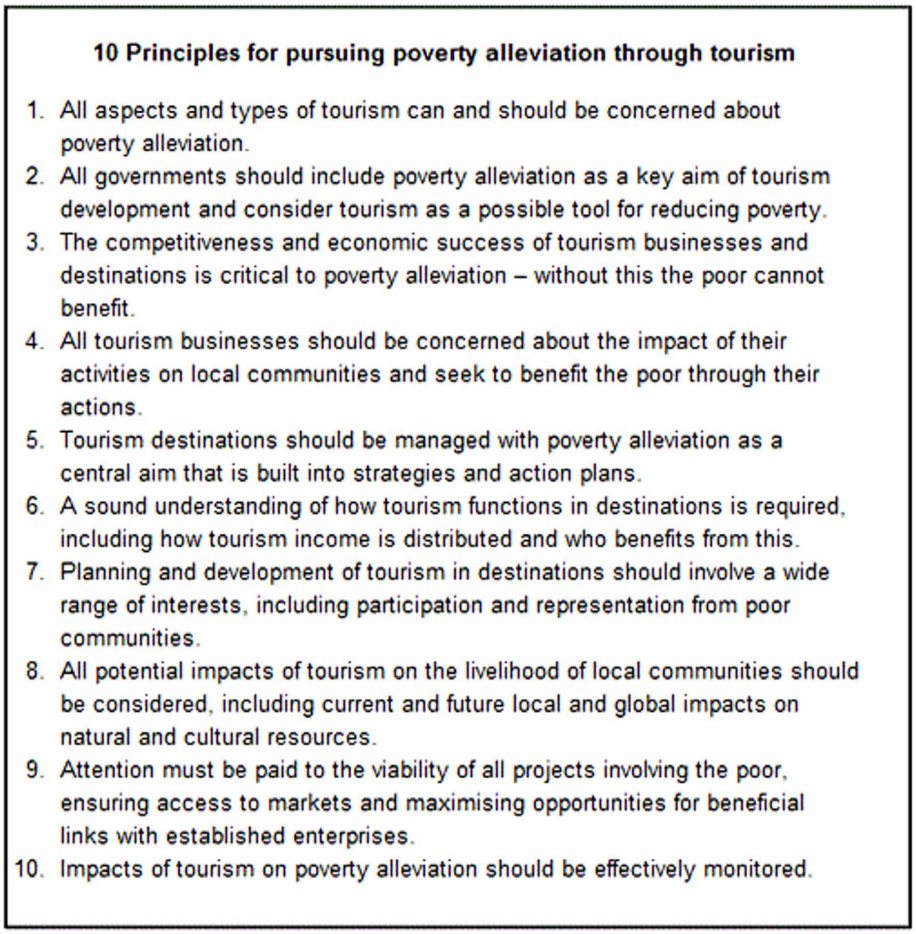
Figure 3. International tourist arrivals by regions since 1950 and forecasts for 2020

	Base Year 1995	Forecasts 2020 (Million)	Market Share (%) 1995	2020
World	565	1561	100	100
South Asia	4	19	0.7	1.2
Middle East	14	69	2.2	4.4
Africa	20	77	3.6	5.0
East Asia and the Pacific	81	397	14.4	25.4
Americas	110	282	19.3	18.1
Europe	336	717	59.8	45.9

The tourist industry represents an interesting avenue for poverty reduction and economic development (ODI, 1999; Sinclair, 1998). Tourism is potential links with other industries such as construction, agriculture and transport; and the poor may have access to tourist assets such as natural resources and culture (Wiig, 2003).

Roe, et al. (2004) mentioned in there Working Paper about pro-poor tourism (PPT) - according to The WTO/OMT/UNCTAD report on tourism in the LDCs (WTO/OMT 2001) - that there are a number of different ways of defining 'poor' countries, as:

1. Countries which contain *the greatest numbers* of the 1.2 billion people who live on less than $1/day;
2. Those with the *highest proportion* of their population living on less that $1/day;
3. Those defined by the United Nations as the *'Least Developed Countries'* (LDCs).



The world tourism organization says that success in poverty alleviation through tourism depends on effective community-public-private partnership that serves to reduce financial leakages and increase economic linkages to local economy. The UNWTO put ten principles of pursuing poverty alleviation through tourism as shows in (Figure 4).

Tourism can contribute to poverty reduction by providing employment and diversified livelihood opportunities. Tourism products can be built on natural resources and culture, which are assets, that some of the poor have and as an additional source of income "tourism" can play an important part in improving living standards and raising people above the poverty threshold (WTO, 2002).

Tourism can be considered one of the most remarkable socio-economic phenomena of the twentieth century. Countries where the economy is driven by the tourism industry have become increasingly

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Principles of pursuing poverty alleviation through tourism

concerned with the socio-cultural problems associated with unsustainable tourism. As a result, there is now increasing agreement on the need to promote sustainable tourism development to maximize socio-economic benefits (Neto, 2003). So sustainable tourism can considered a tool for local socio-economic development in developing countries as we will show.

SUSTAINABLE TOURISM AS A DEVELOPMENT TOOL

The concept of sustainable tourism, as developed by the World Tourism Organization (WTO) in the context of the United Nations sustainable development process, refers to "tourist activities leading to management of all resources in such a way that economic, social and aesthetic needs can be fulfilled while maintaining cultural integrity, essential ecological processes, biological diversity and life support systems" (UN, 2001).

The idea of *sustainable tourism development* is now a popular concept and refers to allowing tourism growth while at the same time preventing degradation of the environment. There is a special relation-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ship between tourism and sustainable development; this special relationship arises because, unlike most other sectors, the consumer of tourism (the tourist) travels to the producer and the product. This leads to three important and unique aspects of the relationship between tourism and sustainable development (UNEP & WTO, 2005):

1. **Interaction:** Between visitors, host communities and their local environments because of the nature of tourism, as a service industry which based on delivering an experience of new places.
2. **Awareness:** Tourism makes visitors become far more conscious of environmental issues and differences between nations and cultures.
3. **Dependency:** Much of tourism is based on visitors seeking to experience intact and clean environments, attractive natural areas, authentic historic and cultural traditions, and welcoming hosts with whom they have a good relationship.

This close and direct relationship creates a sensitive situation, whereby tourism can be both very damaging but also very positive for sustainable development.

Over the last fifty years tourism has become one of the largest economic sectors globally. Tourism accounts for a great proportion of world trade, and the market share of emerging economies increased from 30% in 1980 to 47% in 2012, and are expected to reach 57% by 2030, equivalent to over one billion international tourist arrivals. The international tourist arrivals worldwide will increase by 3.3% a year from 2010 to 2030 to reach 1.8 billion by 2030 according to UNWTO long term forecast Tourism towards 2030 (UNWTO, 2013). (figure3.).

In order to develop the tourism sector in a sustainable manner, many developing countries have made tourism a priority in their national development policies. They also should consider that sustainable tourism should not be regarded as a separate component of tourism, but rather as a condition of the tourism sector as a whole. The UNWTO has defined sustainable tourism as "tourism that takes full account of its current and future economic, social and environmental impacts, addressing the needs of visitors, the industry, the environment and host communities"[8]. A further elaboration of sustainable tourism by UNWTO refers to the need for it to:

- Make optimal use of environmental resources and helping to conserve natural heritage and biodiversity.
- Respect the socio-cultural authenticity of host communities.
- Ensure viable, long-term economic operations, providing socio-economic benefits to all stakeholders, and contributing to poverty alleviation.

A fundamental characteristic of the tourism sector is its ability to link the economic, social, cultural and environmental aspects of sustainability and to act as a driving force for their mutual enhancement.

Sustainable Tourism can be one of the few development opportunities for the poor. The tourism business can provide sustainable benefits for both those working in the sector and the host countries – including the least developed of them. The World Tourism Organization (2002) points out that sustainable tourism developed in certain geographical areas may become a fundamental tool in the economic development of and the reduction of poverty in certain areas. More generally, tourism development

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

enhances the "visibility" of the country on the international scene, which gives its domestic problems more chances of being taken into consideration (poverty, etc.).

A problem in achieving sustainable tourism development is the lack of experience, knowledge and financial resources, and the limited involvement of local authorities (Briassoulis and Van der Straaten, 1992). So sustainable tourism should also maintain a high level of tourist satisfaction and ensure a meaningful experience to the tourists, raising their awareness about sustainability issues and promoting sustainable tourism practices amongst them. It is important that decisions which influence life at the local level will be taken at the lowest possible level of governance. Knowledge of the area involved and its problems increases local support in the development of a suitable action plan for sustainable tourism. Tourism has become a 'normal' part of a developed economy and will continue to do so in the future. As a consequence, our world is getting smaller all the time (Nijkamp, 1998).

TOURISM GROWING IN DEVELOPING COUNTRIES

Growing tourism levels in developing countries have stimulated increased tourism supply capacity and higher levels of investment in infrastructure, human capital and technologies to manage and efficiently transact higher levels of tourism activity (UNCTAD, 2010).

The world tourism organization says that there is a strong economic case for promoting tourism in developing countries (WTO, 2002).

Table 1 illustrates international tourists' arrivals in the world, (2011-2012). The table shows that there is a noticeable shift of tourism arrivals towards developing countries; this is may be because developing countries are becoming popular destinations for tourists. Also (Figure 5. International tourism receipts by type of country between 1990 and 2008) shows the growing in the international tourism in developing countries.

STRATEGIES TO MAXIMIZE THE ECONOMIC BENEFITS FROM TOURISM IN DEVELOPING COUNTRIES

The way that developing countries can maximize the economic benefits from tourism is to bring in more money from visitors and organize tourism to minimize leakage of both money and jobs. Tourism in the developing countries differs in the role that government and the private sector play in establishing policy and encouraging development. In most developing countries, owing to the small size of the private sector and the shortage of funds, the government necessarily takes on the role of entrepreneur (Shurland, 1998). There are many ways to maximize the economic benefits of tourism (Vaugeois) such as; bring in tourists who spend money in the developing country, and to encourage import substitution within developing countries in a good quality and reasonable price. So governments of developing countries should consider implementing incentive programs to local and foreign investors to encourage the use of local architecture, design and materials, and to develop tourism.

TOURISM AS A DOUBLE-EDGED SWORD

Tourism represents a double-edged sword for the socio-environmental movement in that it is an activity which is both reviled and revered. It has become a focus for both criticisms, as a result of its impacts, and promotions, as one means of achieving sustainable development. Tourism may have positive economic impacts on the balance of payments, employment, gross income and production. Also, tourism development may considered a main instrument for regional development, as it encourages new economic in a certain area. Nevertheless, because of its complexity and connection with other economic activities, the nature of tourism is multi-activity and multi-sectoral, so the direct impact of tourism development on a national or regional economy is difficult to assess.

Figure 5. International tourism receipts by type of country between 1990 and 2008

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Marketing is a subject of vital concern in tourism because it is the principles management influence that can be brought to bear on the size and behavior of the major global market. Tourism also offers huge opportunities for developing countries to increase their income, as tourism carries more weight in the economies of developing countries than in developed countries; it is also destined to play an even greater role in the coming years. Finally, we can say that tourism has become a popular addition to economic development policies in many countries, because its ability to bring in needed foreign exchange earnings, income and employment.

This chapter has shown the importance of tourism in developing countries, there is no doubt that tourism has a significant impact on reduce poverty in these countries. It opened new domains and new opportunities for these developing countries. So we advise governments, businessmen, marketers to give tourism marketing development more attention.

KEY TERMS AND DEFINITIONS

Developing Country: Is one in which the majority lives on far less money—with far fewer basic public services—than the population in highly industrialized countries. Five million of the world's 6 billion people live in developing countries where incomes are usually under $2 per day and a significant portion of the population lives in extreme poverty (under $1.25 per day).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Domestic Tourism: Involves residents of a country visiting their own country.

Inbound Tourism: Involves non-residents visiting a country other than their own country.

International Tourist: A person who travels to a country which usual residence but outside his/her environment for at least one night but less than one year.

Outbound Tourism: Involves residents of a country visiting other countries.

Pro-Poor Tourism (PPT): According to the Pro-Poor Tourism Partnership PPT is tourism that results in increased net benefits for poor people. PPT is not a specific product or niche sector but an approach to tourism development and management. It enhances the linkages between tourism businesses and poor people so that tourism's contribution to poverty reduction is increased and poor people are able to participate more effectively in product development.

Sustainable Development: The UN defines it as development that meets the needs of the present without compromising the ability of future generations to meet their own needs.

Sustainable Tourism: Can be defined as tourism that takes full account of its current and future economic, social and environmental impacts, addressing the needs of visitors, the industry, the environment and host communities. It can also defined as tourist activities leading to management of all resources in such a way that economic, social and aesthetic needs can be fulfilled while maintaining cultural integrity, essential ecological processes, biological diversity and life support systems.

Tourism: Comprises the activities of persons travelling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and other purposes.

World Tourism Organization (UNTWO): Is the United Nations agency responsible for the promotion of responsible, sustainable and universally accessible tourism. As the leading international organization in the field of tourism, UNWTO promotes tourism as a driver of economic growth, inclusive development and environmental sustainability and offers leadership and support to the sector in advancing knowledge and tourism policies worldwide.

Chapter 43
Utopia, Labor, and Informational Capitalism:
Lights and Shadows of Social Media

Marco Briziarelli
University of New Mexico, USA

ABSTRACT

Through the lens of a political economic approach, I consider the question whether or not social media can promote social change. I claim that whereas media have consistently channeled technological utopia/dystopia, thus be constantly linked to aspirations and fear of social change, the answer to that question does not depend on their specific nature but on historically specific social relations in which media operate. In the case here considered, it requires examining the social relations re-producing and produced by informational capitalism. More specifically, I examine how the productive relations that support user generated content practices of Facebook users affect social media in their capability to reproduce and transform existing social contexts. Drawing on Fuchs and Sevignani's (2013) distinction between "work" and "labor" I claim that social media reflect the ambivalent nature of current capitalist mode of production: a contest in which exploitative/emancipatory as well as reproductive/transformative aspects are articulated by liberal ideology.

INTRODUCTION

Mosco (2005) claims that every new wave of media technology seems to bring with it contradictory declarations of ultimate ends, a mixture of messianic and apocalyptic predictions of future, a *Telos* that simultaneously implies modernity and anti-modernity. The radio for instance could connect distant communities, thus enhancing a common understanding of the world, but could also generate phenomena of mass hysteria. In the specific case of social media platforms, they are simultaneously perceived to be rescuing the public sphere (Habermas, 1991), promoting new sociability (boyd, 2010) and, concurrently, to be deteriorating more genuine forms of communication such as interpersonal and dialogic ones, and facilitating further levels of commodification of previously un-colonized spheres of social life (Terranova,2004).

In relation to such a debate, this chapter provides a framework that tries to synthetize both utopian and dystopian, socially reproductive and reformative aspects of media by focusing on the ways in which the user generated content activity of Facebook users mediate the structural and cultural contradictions of operating in the high-tech environment such as the tension between the liberal ideology of agency and the necessities to monetize their activity. Thus, drawing on Fuchs and Sevignani's (2013) distinction between the exploitative "labor" and the emancipatory "work," the chapter suggests looking at Facebook practices as representative of such a synthesis. This is a political economic perspective that focuses on how social media activities are capable of emancipating and coercing their users and how those ambivalences are mediated by liberal ideology. As a result, the contradictions between viewing technology as emancipating or coercive tend to be normatively framed as politically engaged practices, which could simultaneously be considered as the unpaid labor of producing content for Facebook.

The main theoretical contribution of the chapter consists in providing a political economic critical inquiry of the capability of social media to "mediate" multiple messages, to concurrently generate social transformation and social reproduction (Bloch, 1986).In order to advance my argument, I structure this chapter in three main sections: the first one concerning the link between media and utopian/dystopian societal dispositions in which I show how consistent those aspirations and fears of social change triggered by media are; the second one expounding a perspective that understands those tensions within media as an ideological process that links two aspects of user generated content, i.e. working and laboring; and the third one that uses the case of Facebook to exemplify my framework, the synthesis between working/utopic/transformative and laboring/dystopic/reproductive features of social media.

THE AMBIVALENT FEELING OF MEDIATION

In this section of the chapter, I would like to explore the consistent ambivalent feelings associated to mediated communication that regard media as alternatively determining a feared or a welcome social change. More specifically, I see media as channeling technological utopia and dystopia. By technological utopia I refer to the specific modern ideology assuming that progress of science and technology will eventually fulfill an ideal society in which human scarcity, sufferance and mortality will be overcome (Gendron, 1977). It s*alter*, technological dystopia, describes how technology has been also consistently associated to catastrophic changes, images of technology mediating so much to actually contaminate our humanness as well as compromising genuine social intercourse (Gendron, 1977). As a consequence, almost consistently media have been celebrated to overcome physical and temporal distance among human beings (e.g. the book, the telegraph, the radio, the email), and at the same time distancing otherwise close social relations (Jacobs, 1992). According to Peters (1999) fascination and fear for media went hand in hand with the first groundbreaking physics discoveries about magnetism and gravitational forces. In fact in both cases, people fantasized about the power of "*actio in distans*," the God-like idea of controlling an object without touching it, but also the utopic theory of labor in which production does not require physical force.

For Peters, the stupefying experience of receiving a message from wireless devices, or transposing bodily existences of a person into images were interpreted as the power of human intentions overcoming natural barriers but also as the bizarre and horrific way to create a fake double of a living person, i.e. a "doppelgänger," ghostly appearances and monstrosities. In more recent times, the cultural circumstances in which media operate have significantly changed but are also still consistent with the ideology of a

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

technological driven history. In fact, according to Gendron (1977)post-industrial capitalism— the mode of economic development that has shifted its main goals from industrial production to consumption— serves as a base for utopian perspectives by bringing about a technological revolution, which supposedly will bring growth, progress and the elimination of any societal issues. Examined from the teleology of progress, in the end, postindustrial technological utopianism is not distant from earlier utopias of Owen (1995), Fourier (1971), and De Saint-Simon (1964).Those authors believe in the so called "utopian socialism" the project of realizing human being's happiness not in the state of nature as in Rousseau's *bonne savage* (2014)but in the state of culture, in other words in a society enlightens by rational (and therefore just) principles and technology.

However, as already mentioned, mediation, as a metaphor belonging to a conceptualization of modernity understood in its contradictory nature (Horkheimer & Adorno, 1973), has also consistently produced fear, anxiety and dystopic images, which materialized in different forms, as the literary and scholarly tradition of mass society theory confirms: mediation as the a lost of contact with nature (Peters, 1999); mediation as alienating new model of society and rational apparatus that imprisons people in Kafka bureaucratic labyrinths (Marx, 1867);or more recently, mediation as a simulation of reality (Baudrillard, 1988).

To summarize, mediated communication embodies the dialectics of modernity, with its promise of human emancipation and its constant danger to degenerate into humanity's imprisonment. Both represent dichotomous aspects of a general acknowledgment about the power of media to shape our society. In the next section, I will show how the aspirations and anxieties expressed via mediation have perpetrated in the so-called web 2.0 applications and social media as well.

New Media, Old Ambivalences

Ambivalent sentiments seem to have continuously accompanied (mediated) communication (Mosco, 1996), to the point that is possible to draw a parallelism between the preoccupation of Classic Greek philosophy for diverse mode of communication and modern social media, understood here as Internet-based applications that allow the creation and exchange of user-generated content through web 2.0 technology (Kaplan & Haenlein, 2010).

Plato, in his seminal work *Phaedrus* (Peters, 1999), resumes very effectively the anxieties that mediated communication carried with its message. He narrates about the rhetorical confrontation between Socrates's apologies of dialogism against Phaedrus's support of written communication. The former, being face-to-face, direct and personal aims at the communion (*ergo* communication) of the communicating souls involved in the dialogue. The second one, reified into written word, puts distance between the author and his/her audience, between the original communicative goal and how the message is received. The first one is *ad personam* and fill the distance between two people/minds, the second one is wasteful because disseminates indiscriminately messages.

Both modes of communications are considered to be fundamental in the social and political organization of a given community. According to Socrates, whereas the immediacy of dialogue creates bond, love and social relations, the mediation of written word can potentially create social lacunas, misunderstandings and it is lavish because it disseminates words that are not necessarily heard, received or understood (Peters, 1999). Phaedrus instead sees in mediation, the power of "mass" communication in mobilizing society as a whole, in broadcasting knowledge, therefore the power of affecting an entire community.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Phaedrus is a supporter of what in the early twentieth century mass communication scholars would have called as propaganda.

Dissemination versus dialogue remains a fairly up-to-date category when it comes to examine inherent tensions of social media. For instance, in many ways, the same ambivalence about mediation is reproduced by the controversial notion of virality. A virus metaphorically embodies the idea of the dissemination of a disease that exploits the potential of modern means of communication as a vehicle of infection. At the same time, in a networked culture, a phenomenon can spread or gain popularity by digital vernacularity, by collective conversation, which for Hardt and Negri (2000) has a revolutionary potential. Thus, viruses embody the fear of contagion and the aspiration of social amelioration via interpersonal communication.

In similar ways, Jekins, Green and Ford (2013), explore the phenomenon of "virality" as both the beneficial objective of business marketing to exploit close affective social relations (such as among friends and family),and at the same time as an impoverishing metaphor of audiences' agency. On the one hand, the term viral has been used to describe so many different practices such as buzz marketing, guerrilla marketing video mash-ups and remixes posted to YouTube that trigger dialogue and discussions, which all rely on the amplifying potential of robust communication among people, what Arvidsson and Colleoni define as "affective relations." (2012, p.135).On the other, the idea of virality builds on the concept of quick replication of an original message, which implies a fairly passive conceptualization of the audience/consumer because it assumes an almost automatic and unaware process of communication predominantly propelled by marketing kind of interested.

Virality is only one of many examples that confirm how the critical question of mediation continues to emerge in current media applications as in the case of web 2.0 media and its specific application in social media. In fact, those utopic/dystopic-loaded narratives appear as constitutive of the paradigm shift represented by the transition from web 1.0 to Web 2.0, the second generation in the development of the World Wide Web and successive development of social media (Barbrook & Cameron, 1996). The passage to Web 2.0 implied the evolution from the production of software that created bounded environments in which users where constrained in utilizing the products into flexible platforms in which previously considered passive audiences now have the agency to participate in the provision of content and the construction of the web environment.

The philosophy behind web 2.0 reproduces the social Enlightenment utopia of creating a general intellect, a collective effort to produce human intellectual wealth though collaboration. Certainly, the Web 2.0 changeover did not happen in a vacuum but reflects the general economic shift of post-industrialism and its tendency to shift froman economy selling products to one providing services (Lazzarato, 1996). Both the post-industrial political economic model and the new a participatory perspective materialized via web 2.0 based applications have created a milieu allowing the creation, re-creation and exchange of user generated content: i.e. social media.

Social media offer a highly interactive experience in which both individuals and communities produce cultural content as well as new practices. They have been integrated into practices that go well beyond the social sharing of the first weblogs of early 2000s, such as building reputation and bringing in career opportunities and monetary income, as discussed in Tang, Gu, and Whinston (2012).In the scholarly literature there have been some debates about their definition (boyd &Ellison, 2007; Selwyn, 2007), however there is also a significant consensus in using the term to refer to web-based multimedia production and distribution tools incorporating text (blogs, wikis, Twitter), audio(podcasting, Skype), photo (Flickr) and video (video casting, YouTube) capabilities.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The ongoing debate about how to best theorize social media is also propelled by the very utopic/dystopic ambivalences we have just discussed. *De facto*, whereas most scholarship agrees on the significant novelty brought by social media as well as the need to develop adequate theoretical tools to study them, a lively debate exists about the their larger social and cultural implications. For instance, in the field of media studies much of the interest in social media could be explained in relation to their alleged capability of radically redefining the meaning of mass communication: the re-discovery of sociability; the blurring of boundaries between the moment of production and moment consumption, the moment of dissemination and reception of the message (Napoli, 2010).

Such a debate reproduces the utopic /dystopic ambivalence, which, in media theory discourse, corresponds to the re-proposing of the classical question: "whether social media do things with people" or "people do things with social media" (Blumer & Katz, 1974).In other words, involving questions about where the meaning of a given text comes from or whether the audience can be consider passively or actively involved in the process of communication.

According to such a narrative, while Internet applications until early 2000 were broadcasting information by the similar logic of traditional media (e.g. radio, TV), i.e. functioning by the logic of one to many, the evolution propelled by Web 2.0 information technology allegedly allowed a democratization and liberalization of information and communication technologies, that led to a many to many logic (Boyd, 2010). For instance, Starke Meyerring(2008) describes the democratic potential of social media to enable, challenge, reproduce or question established practices and social hierarchies rooted in print material, while offering alternative writing practices to those established around print.

As a result, social media such as Facebook are considered to have acquired a greater transparency and permitted cooperative formation of knowledge (Shirky, 2008), which would lead to an empowering experience of social media: "people build their own net-works of mass self-communication, thus empowering themselves" (Castells, 2009, p.421). Furthermore, online social networks contribute to the personal development of people by facilitating self-expression (boyd, 2010).

However, interest in social media could be linked to the dystopian concerns about this technology as well. As mentioned before, media mirrors the betrayal of modernity towards the dream of human emancipation. Accordingly, social media can be seen as limiting freedom and augmenting surveillance through monitoring of personal media practices to the point that Willcocks (2006)compares information society to "control society"(p.4). Other dystopian views of social media include the intrusion into private communication and into classrooms (Dalsgaard & Paulsen, 2008); the potential for identity theft and lurking (Siciliano, 2013); and the way social media facilitates academic dishonesty during tests and examinations (Seitz, Orsini &Gringle, 2011).

Moreover, several scholars have scrutinized new media practices from the point of view of power, labor and value creation (e.g. Arvidsson & Colleoni, 2012; Dyer-Witheford, 1999; Fuchs, 2010, 2012; Hesmondhalg, 2010; Margonelli 1999; Napoli, 2008; Petersen 2008; Scholz, 2008; Willmott, 2010; Zwick et al., 2009). Such a perspective rejects neoliberal "methodological individualism" (Popper, 1971) supposedly characterizing most positive depiction of social media. Most of this critical literature links social media to "digital labor," a productive activity of creating value (especially financial value) in digital environments.

According to Scholz (2012) digital labor has become one of the key concepts in order to both understand the political economic environment of new media and the reason why there is so much discussion around it. One the most critical position in such a debate states that internet has been incorporated in a dominant corporate model of capital accumulation, which is grounded on the exploitation of unpaid

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

labor of so-called "prod-users,", i.e. the activity of creating content by users while involved in activates such as blogging, social networking (Terranova, 2004; Cohen, 2008; Fuchs, 2010).

Toffler (1980), more than three decades ago, by the notion of "pro-sumer" (p.*i*) provided an influential standpoint through which understanding the user-driven, cooperative processes of content generation, which are currently associated to Web 2.0 and more in particular social media. However, the pro-sumer is not actually the producer of content but rather a more active, well-informed consumer, capable of orienting his/herself in the universe of consumer culture. Such an expert knowledge on consumer products would allow the pro-sumer to be having better insights about production.

Only later on, when the so-called pro-sumer acquires inexpensive digital production tools, high internet connection, powerful computers, from the sophisticated consumer identified by Toefler, he/she becomes the generator of content by producing blog material, joining social media such as Twitter and Facebook, producing audio visual material, a "prod-user" (Bruns, 2008).The "prod-user" seems to capture more closely those recent changes in the media landscapes. Prod-users are agents that come into this new collaborative space provided by web 2.0 as users but then become producers, thus occupying a liminal position between production and consumption. The kind of production prod-users engage with is not centralized or coordinated but extemporaneous, ongoing, open-ended process. For Bruns (2008), the concept of prod-usage is intended as "a means of connecting such development in the cultural social commercial, intellectual, economic social realms" (p.5). Hepoints out how prod-usage is characterized by open collaborative participation, fluid hierarchic structure of production, unfinished artifacts and common property and individual rewards.

According to the critical political economists of media previously mentioned, it is in such porous boundaries of producing/consuming that the active user of social media, freely generate content for media corporations' interests. Therefore, in contrast to the positive depiction of social media previously exposed, linking those media practices to a process of liberalization and democratization of media, the political economic perspective tends to highlight the level of exploitation of audience labor.

To sum up, web 2.0 and social media seem to reproduce the same ambivalences about media, which can be synthetized into the opposition between utopia and dystopia but also the opposition between human emancipation or human subjugation via media technology. In this sense, a fundamental aspect of this chapter's argument is that those ambivalences, and their apparent consistent reproduction in current media settings, should not be considered as linked to any inherent ideology of media but rather associated to the social relations in which those media emerge, operate and re-produce. Therefore, as I will explain in the next section, in such a contest of material production, ideology does not produce those contradictions but actually mediates between them, thus defusing their potential frictions.

MEDIA AS MEANS OF MATERIAL PRODUCTION

In this section, I provide a political economic account that incorporates the utopic/dystopic media perspectives as ideological reflections of an inherent contradiction of the post-industrial capitalism between emancipatory/transformative and exploitative/reproductive dimensions. In order to accomplish that, I first discuss the need to re-conceptualize ideology as a material force that allows the function of media as a means of production. Then, I discuss how one fundamental task of ideology in these particular productive relations is to weld together the tension between "work and "labor."

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ideology entered the dominant discourse of the media studies field possibly thanks to the intervention of Critical theory and Cultural Studies and their interest for non-orthodox Marxist perspectives. Ideology represented the main access to a culturally materialist narrative of power (and counter power) in which media appeared as the main protagonists (e.g. Althusser, 1971; Horkheimer & Adorno, 1974; Debord, 1967; Gramsci, 1971; Hall, 1982).However, as Peck (2006), Artz, Maceck and Cloud (2006) and Aune (2004) claim, most of media research seems to still operate within the idealist assumption that ideas produces social reality instead of social reality producing ideas. Furthermore, in many instances, the interest of media scholars for ideology is more focused on the communication process that channels ideology rather than ideology itself. As a result, ideology is almost never linked to labor and material production but reduced to a "result" within the still powerful tradition of mass communication effects.

Conversely, what intrigues the present author about social media is that the practical productive activity of the audience leads to problematize or at least sophisticate the idea of the audience as the alleged recipient of the ideological process. The audience should be regarded as simultaneously being the "predicate" and the 'predicated" of ideology. Such a perspective leads to conceptualization of ideology not as "media effects" merely operating upon people but also actively operated by them, which echoes the Marxian notion of "productive consumption" (Nixon, 2012, p.443). That consists of the audience producing consciousness but also articulating ideas by consuming commodified culture

Marx and Engels in *German Ideology* (2001) maintain that the production of consciousness and the production of ideology are tightly linked to concrete human activity: "the production of ideas, concepts and consciousness is first of all directly interwoven with the material intercourse of man, the language of real life. Conceiving, thinking, the spiritual intercourse of men, appear here as the direct efflux of men's material behavior [...] Consciousness does not determine life: life determines consciousness" (pp.35-36).

However, the audience's consciousness and his/her adoption of specific worldviews do not passively reflect so-called "real life" but interacts with it and therefore cannot simply be reduced to an instrumentalized epiphenomenon of productive logics. Following Bloch's (1986) consideration of the complexity of the ideological phenomenon, I would argue that the ideology of the prod-users is not simply false consciousness— in other words deception— in the same way as consciousness is not simply false ideology because, aside its concealing of exploitation, it comprises a genuine desire of the community for a better society. As Kellner and O'Hara explain (1976), Bloch considers ideology as an ambiguous two-sided phenomenon as it encompasses distortion, mystifications, techniques of manipulation and domination, but it also incorporates a utopian residue. Thus, the cognitive error of ideology and the cognitive accuracy of consciousness (as opposed to false consciousness) maybe distinct but also are highly intertwined, as I will show in a moment when talking about the distinction between "work" and "labor."

Such a process of production of ideology and consciousness generating through the prod-users' activity does not take place in a vacuum, but is immerged in a pre-existing ensemble of ideas and practices. In other words, it interacts also with previous existing worldviews that contribute to give meaning to both media and their usages. I see in social media practices, both the resurgence of a liberal public sphere ideology that tries to colonize all social experiences (Negt & Kluge, 1993) and the assertion of a technological utopianism that equates hi-tech progress with social progress and that consistently manifests with the introduction of (relatively) new means of communication (Mosco, 2005).

So how does more concretely this interaction between "practical consciousness" and practical activity function? In the next section I try to clarify how ideology mediates between two distinct but interconnected aspects of social media's productive practices (and capitalism in general): working and laboring.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Working and Laboring

I believe that one of ideology's agencies in the social media environment consists in its capability to combine the "objective" element of producing media content and the subjective element of consciousness, thus combining the necessity of production of value with the subjective motivations that lead users to do that for free or to enjoy doing it. In this sense, Fuchs and Sevignani (2013) spell the dialectical aspects of producing. With their investigation on how Marx conceives human practical activity, they suggest the need to distinguish between "labor" and "work." They differentiate the two concepts as follows: "Labor is a necessarily alienated form of work, in which humans do not control and own the means and results of production. Work in contrast is a much more general concept common to all societies. It is a process in which humans in social relations make use of technologies in order to transform nature, culture and society in such a way that goods and services are created that satisfy human needs"(p. 240).

Fuchs and Sevignani base their distinction on Marx (1867) statement that "Labor which creates use-values and is qualitatively determined is called 'work' as opposed to 'labor'; labor which creates value and is only measured quantitatively is called 'labor', as opposed to 'work'"(p.138). The two moments oppose each other when it comes to human emancipation because the realm of freedom only begins where labors ends. Through work human intentions become bound into the product and in such a product people see and recognize themselves. Conversely, labor causes multiple kinds of alienation to the workers, thus disrupting the moment of genuine creative activity intrinsic in the experience of "working."

The two authors point out how productive work seems to be an inherent characteristic of human beings, which then turns into "labor" due to the development of capitalist social organization. However, work is not simply the general anthropological conceptualization of human productive activity. In relation to how historically labor developed in capitalist societies, work remains as more positive *alter*. In fact, Marx (1867) believes that work gives people the chance for human expression and signification, thus a chance to make of the product into signified matter. Instead waged labor appears as alienated work, the denial of the latter. Thus, one can find a dialectic unity of alienation and emancipation, which seems to be inherent in how human practical activity historically developed in capitalist societies.

Such a dual character of producing activities is also embodied in commodities, which present a series of binary oppositions along the axis of work/labor. Commodities comprise the distinct and concrete use-value of work and the abstract de-personalized exchange value of labor; the anthropological necessity of work and the artificial/historical surplus value of labor; the creative side of work and the automatism of labor. Thus a given commodity crystallizes the basic contradiction between freedom and exploitation, but also their fusion in the object itself.

Despite their contradiction, the two productive aspects coexist in capitalism and the survival of capital in fact depends on the interaction of those two aspects. This seemed true at the time Marx wrote and seems an even more fundamental characteristic in the postindustrial contest, in which manual labor is increasingly giving up to intellectual labor. Especially in the contest of knowledge working, the valorization of labor heavily depends on the imaginative creative activity of people (Lazzarato, 1996).

In the concrete social relations that surround social media, working and laboring are in fact synthetized: on the one hand, the social media user is unpaid, alienated from his/her own product and from the work process and becomes a commodity sold to the advertising industry; on the other hand the user is a worker who enjoys constructing his/her own identity by generating the social environment around and is also propelled by a sense of social and political engagement. Thus, the social media user is alienated by his/her unpaid laboring but feels emancipated by his/her working in building sociability.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Jenkins, Ford and Green (2013) provide an account that seems to acknowledge some of those aspects. In their reading, media landscape is characterized by multi dimensional system, in which different broadcast logics, economies, media and cultural practices converge. Their interpretation of social media describes a reality in which for instance a top-down hierarchy of the broadcast era now coexists with the integrated system of participatory channels, thus suggesting that the same media operating in different social contests may function with different logics.

In fact, their concept of audience labor synthetizes "activity" and "passivity." That is because they acknowledge the fundamental objective of monetizing such labor but also stressing how audience labor generate multiple values: "by contrast, engagement-based models see the audience as a collective of active agents whose labor may generate alternative forms of market value" (p. 117). Some of those values are monetizable, some other actually constitute subversive acts such as parody, mockery of capitalist values.

Dean (2009) would probably find the meaningful participation described by Jenkins, Ford and Green as an ideological fantasy used to sell products and services rather than a description of contemporary political and economic realities. In my view, both the "fantasy" and "reality" are comprised in the ideological phenomenon: as meaningful participation coexists with the instrumental side just described, which are fused together in the audiences productive activities.

To sum up, so far I tried to show how the utopic /dystopic ideologies of media may depend not on the very nature of media but rather on the "nature" of the social relations in which operate. Historically, in the West, that implies acknowledging the overwhelming presence of capitalist relations and, in my view, it is the internal capitalist contradiction between work and labor that create utopia/dystopia, emancipatory/exploitative and transformative/reproductive ambivalences of social media as well as the ideology that mediates between them. In the next and last part of this chapter, I take Facebook as a powerful exemplification of how concretely digital social media reproduces such ambivalences and how those are articulated by liberal ideology.

FACEBOOK: SOCIAL REPRODUCTION AND SOCIAL TRANSFORMATION

Since its first formulations, Liberalism has consistently been capable of fusing together a political and an economic project (Marx, 1867). When for instance in his manifesto of 1644 *Aeropagitica* demanded a "free open encounter" (p.50) of ideas and trade implied that the liberalization of the market and the public sphere were tightly connected (Rosenblatt, 2011). In fact, the link between the two aspects is so profound that both in the public and academic discourse the market frequently becomes metaphor for democracy and democracy becomes a metaphor for the market.

In this sense, if it is true that communication technology has very often-embodied such a link in powerful ways, this is also the case of Facebook. Facebook, currently the world's most popular social network service, which has reached almost 1300 million by June 2014 (Statistica, 2014), is a perfect example, as its rhetoric intermeshes together political and economic arguments. Following the framework just discussed, in this last section of the chapter I examine how the working and laboring aspect of Facebook help us explain how this particular media application is at the same time advancing both social reproduction and social transformation.

The two dimensions can only be analytically distinguished for exposition purposes though, as in reality appear to be consistently overlapping. In this sense, despite the important historical changes that brought capitalism to its current "informational" forms, I think that Marx's observation about the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

contradiction of the capitalist system caught in between revolution and reproduction of its logic are still very pertinent. In *Grundisse* (1973), Marx on the one hand affirms that consistent extraction of surplus value from labor requires a consistent reproduction of exploitation, on the other hand that capitalism to do that must also "revolutionize" its forms:

There appears here the universalizing tendency of capital, which distinguishes it from all previous stages of production and thus becomes the presupposition of a new mode of production, which is founded not on the development of the forces of production for the purpose of reproducing or at most expanding a given condition, but where the free, unobstructed, progressive and universal development of the forces of production is itself the presupposition of society and hence of its reproduction; where advance beyond the point of departure is the only presupposition (p.540).

Capitalism constantly changes everything so everything can remain the same. In other words, it constantly modifies the ways it shapes its labor relations in order to keep producing profit. Such a tension can be consistently found in Facebook. Let us first examine some examples of how Facebook and the labor it exploits contribute to reproduce existing social relations.

Social Reproduction

First of all, from a general point of view, Facebook outsources and crowdsources the labor of media production through the producer-consumer, a practice of cost reducing that not accidentally coincided with rising layoffs in media industries (Deuze, 2007). As Huws notices (2003) the exploitative aspect of unpaid labor in social media comes from a general tendency of capital to offload labor costs onto consumers juts like on the case of self-service gasoline stations, ATM, grocery checkout, which "burden the consumers of unpaid labor" (p. 69). Such a system of exploitation of prod-users has in the case of Facebook exhibited itself rather explicitly as in the case of the program *Facebook Diaries* (Cohen, 2008), which asks Facebook users to send stories and therefore "participate" to a contest that rewards the best stories by broadcasting them on TV.

More concretely, in order to start examining the reproductive function of this social network, Smythe's political economy (1981) and his concern of withdrawing attention to the place of communications in the wider system of social reproduction of capital"(Jhally & Livant 1986, p.129) offers a valuable point of view. According to such a perspective, Facebook represents a means of production, which transforms audience labor of lending attention and providing information/content to media program as commodities to be sold to the advertising industry. Smythe's analysis concerned media such as TV and radio. Consequently, the question at this point is how the contest of an online social network such as Facebook— characterized by high levels of participation, by user-generated content, and by the ability to create varied channels of communication— can allow the application of audience labor just mentioned.

In this sense, Scholz (2010) argues that Facebook produces value through the audience by first of all providing invaluable information for advertisers. According to Fuchs (2012) the primary source of Facebook's value is communication and sociability, which derive from Facebook's extraordinary facility to have access to information, to store it, to process it, to analyze it, and finally to deliver it to its customers. The informational content consists of a variety of data: specific demographics of Facebook users; personal information regarding their tastes, habits, status; information about the kind communicative channels users utilize to socialize; performative information about the specific themes used for impres-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

sion management, and associational information about the specific ways users socialize. In doing that, Facebook provides very detailed profiles of individuals, localized and networked communities, therefore offering important clues on consumers habits and consumer affective relations (Scholz, 2010).

Second, Facebook valorizes audience labor in having the audience providing unpaid services and volunteer work. Scholz (2010) indicates that many Facebook users deliver willingly their time and energy for Facebook usage. He provides the example of a translation application, where users translate Facebook into different languages totally for free. Thus, the more content and the more users join the more profit can be made by advertisements. Hence the users are exploited as they "produce digital content for free in non-wage labor relationship" (Fuchs, 2011, p.299). Third, Facebook monetizes audience's labor by providing data and content for the site, making it more appealing for users who can enjoy looking at photos, videos, comments and links. In other words, the audience provides value to the social network by providing content that is used to attract and invite new users to join the network. Thus, the more content the higher the profit from audience's labor, and the more the content higher the chance to employ more labor by opening more accounts.

In the already discussed contest of informational capitalism, the fact of Facebook being capable of monetizing unpaid knowledge work has an incredible reproductive power by replicating a logic of both labor and extraction of value from labor that, as already mentioned, tends to move an increasingly larger part of the economy. This is the kind of informational economy based on affective relations (Arvidsson & Colleoni, 2012), also described by terms such as "Thank you economy," "Social Economy," or the "Gift economy" (Vaynerchuck, 2011).

Another way in which Facebook reproduces existing social relations is by alienating its workers/users, estranging them from a possible awareness of their actual position within Facebook's process of valorization. According to Fuchs and Sevignani (2013), users are alienated from themselves because they are coerced to use Facebook by way of peer pressure and a lack of viable alternatives (p.257); users are alienated from "the instruments of labor" (p.257) because they do not own the communication platform itself and because their "brains, hands, mouths, ears and speech, the Internet and platforms" (p.258) are instrumentalized "for advertising" (p. 258); moreover, users are alienated from the "objects of labor" (p.259) on Facebook—which the authors identify as shared representations of experiences "through a legally binding agreement" (p. 259); and finally users are alienated from the product of labor due to the peculiar divide between use-value and exchange-value of symbolic produce online: the "use-values that Facebook users create are at the same time commodities that Facebook offers for sale on a market" (p.259).

The two authors also talk about an inverse kind of fetishism (2013), which describes how users deny the reifying aspects in their relationship with Facebook by stressing the social gratifications they obtain from using the service:

In the world of digital labor, the fetish character of the commodity takes on an inverted form. We can speak of an inverse fetish character of the social media commodity. The commodity character of Facebook data is hidden behind the social use-value of Facebook, i.e. the social relations and functions enabled by platform use. The inverse fetish of Facebook is typically expressed in statements like "Facebook does not exploit me because I benefit from it by connecting to other users." (p.261).

Valtysson, (2012) also notices that Facebook reproduces the existing mode of production by enhancing the colonization process of exchange logic (commodities, instrumentalism) to more amore private spheres, thus opening more ground to the process of commodification and the subsumption by capital. For the author, services like instant personalization and user's "timeline" represent a continuation of the process of receiving/sharing information about its users to and from other websites. This information is

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

used for commercial purposes, which makes it an act of colonization, as users are turned into consumers. Similarly, Netchitailova (2012), talking about privacy, claims that Facebook reproduces the same contradictory and discriminatory understanding of private property that capitalism conveys: socialization of production and privatization of the gains from that. On the one hand, privacy is celebrated as a universal value that protects private property; on the other hand, corporate interests of businesses like Facebook surveys and lure audience private lives in order to extract profit out of it. Such a contradiction manifests in the inconsistency between Facebook's rhetoric of discretionary privacy settings, and its systematic collecting of data from users.

Finally, Facebook has acquired another important role in replicating the existing social relations by becoming a fundamental factor in the reproduction of social and cultural capital (Fuchs, 2012; Briziarelli, 2013). In fact, users build and preserve relations not only for sociability purposes but also for the objective to perform networking kind of socialization. According to Bourdieu's notion of social, cultural and symbolic capitals (1986), users spends time on Facebook (and other social media) to generate that kind of capital of affective relations that may facilitate their continuous effort of manage an impression but also useful for a business activity or for credentials.

To sum up, Facebook operates as a powerful re-producer of the necessary social relations (i.e. audience unpaid labor, link to the advertising industry), and more broadly, the necessary ideological and cultural logic of capitalism. However, as previously mentioned, ideology does not simply serve instrumental goals but also link those to more utopic aspirations. Thus, in the next section, I examine how by reproducing main ideological components such as consumer choice as individual freedom and the liberal idea of civic engagement, Facebook also offers a potentially transformative potential. I will show how liberal ideology is the mediating bridge that can manage to keep united two apparently opposed poles: exploitative labor and (potentially) emancipatory work.

Social Transformation

Kushner in a *Rolling Stone* article applauded Facebook in terms of "citizen" and "consumer" choice (2006): "the long epoch of top-down culture […] is fading faster than anyone predicted. The more vibrant world is bottom up, powered by the people" (p.1). As Cohen notices (2008), innovations information and communication technology tend to be accompanied by the teleological narratives of progress and human perfectibility.

Indeed Facebook reflects the liberal normative social projects to emancipate people through the market, through Smith's public use of instrumental and individualist reason, through Kantian publicity (i.e. the public use of reason), and through technology and communication ideological representations. Those are all facets of the liberal discourse/ideology of modernity (Passerin & Benhabib, 1997). They are at same time ideological fictions but also relevant existing promises that have historically mobilized people for some time now and they still operate through the utopia of media as technological promises of human comprehension and social pacification. Facebook indeed combines both the already mentioned exploitative and utopic aspects of media.

As Kessler (2007) notices, Zuckerberg, the founder of Facebook, consistently utilizes the rhetoric of novelty, social change and promise of social amelioration through media technology, which, in its clear instrumentality, also resonates with genuine existing democratic sentiments. In the Facebook "manifesto," (2007), the founder describes the "social mission" of the platform as it follows:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Facebook aspires to build the services that give people the power to share and help them once again transform many of our core institutions and industries […] We believe building tools to help people share can bring a more honest and transparent dialogue around government that could lead to more direct empowerment of people, more accountability for officials and better solutions to some of the biggest problems of our time. By giving people the power to share, we are starting to see people make their voices heard on a different scale from what has historically been possible. These voices will increase in number and volume. They cannot be ignored. Over time, we expect governments will become more responsive to issues and concerns rose directly by all their people rather than through intermediaries controlled by a select few (p.1).

Zuckerberg rhetorical arguments makes leverage on the technologic utopianism which recovers liberal ideology through the reassertion of the public sphere and Kantian publicity, which is represented in the text by both the use of reason in public and the idea of political power under public scrutiny. Such a rhetoric is also conveyed by a more general narrative of social media, which are often described in the public discourse as "Web 2.0," "social media," "participatory media," "citizen journalism," "user generated content," "user driven innovation," or "social software." Such a civic consciousness ultimately re-articulates in terms of "ethical work" and "ethical citizenship" the (neo-) liberal ideological fiction of a civic society not ruled by the state as external apparatus but by the market as an internal, ethical, self-sufficient and self-balancing system.

However, the civic engagement that Facebook proposes reflects the kind of confusing all-encompassing civic engagement that Berger (2011) problematizes as being even potentially counter-productive for the development of a truly democratic system. In this sense, when it comes to digital media, Ekman and Amnå (2012) point out the need to distinguish different degree of political activisms. They distinguish between "political participation" (including formal political behavior as well as protest or extra-parliamentary) and less direct or "latent" forms of participation, conceptualized here as "civic engagement." Still, regardless of its actual effectiveness, the perception of a usage of Facebook for some degree of political activism reveals an important source of normativism towards alternative or improved forms of sociability (Valtysson, 2012).

Such a normative thrust is not simply present in the rhetoric of its founder but also in the daily practices of Facebook users. In fact, aside the significant aspect of management impression according which users utilize this platform to construct, negotiate and reproduce a given identity, many users understand the function of "sharing" links and content as a way to establish a platform for discussion of matter of public interests, to sensitize specific issues. Furthermore, as the study conducted by DeRosa (2013) confirms, people use web 2.0 platform in order to construct a new understanding of citizenship, a digital citizenship that re-interpret democratic deliberation as "e-democracy." As Dean (2009) observes social media are less places enhancing critical debate than platforms devoted to corporate profit. However, as I tried to demonstrate they also work as platforms providing an ideological rationalization and moralization of "free labor" because they produce the impression of subjective visibility and social and political agency.

Thus, as Bloch recognizes, although often mirroring" how the ruling class wishes the wishes of the weak to be" (1986, p.13), the ideologies in Facebook can also provide a 'transition' stage and display a drive towards a better life, and real possibilities to transform societies. In Facebook, Bloch (2004, p.40) would probably find two different ideological utopian aspects First, via Facebook users embrace what Bloch defines as "wish-fulfillment" (p.40) aspects, which consist in the elimination of the roots of human

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

un-happiness such as social solipsism, alienation, physical, social and cultural distance that otherwise would separate society's members. The second aspect, instead of eliminating "constructs" (p.40) the utopia by contributing to re-agreements of organization, civic order and political arrangements.

The apparent openness of Facebook to whatever content or community organization would appear as promise of the reality "not yet" realized. The anticipatory consciousness of Facebook users perceives the unrealized emancipatory potential in Facebook. Indeed, as already mentioned, Facebook is not a public sphere for critical thought. Nevertheless, in that ideological surplus value of the bourgeois notion of citizenship with its individual rights, civil liberties, and actively engaged autonomy, users express something more than mere legitimation and apologetics for bourgeois institutions and practices.

Thus, what Facebook points out is an ambiguous reality. On the one hand, Facebook can and should be considered as phenomenon that further rationalizes, colonizes and commodifies more spheres of our lives. On the other, the fact that our private sphere becomes a commodity that is a sold in a particular market makes that market as a liberal arena in which, aside goods, ideas can, wishful-thinkingly enough, move freely. As a result, the unpaid and exploited labor of generating content also gives the impression of a more constructive and positive working.

Another aspect that reveals the potentially transformative feature of Facebook is its connectivity capability, which facilitated the mobilization of people in specific circumstances. In other words, the very bases of Facebook political economy, what we described as "affective relations," allow exploitation and radical insurgency. In fact, Facebook is considered to have played an increasingly central role in facilitating and organizing social movements and political upheavals from the Anti-Globalization movement to the Arab Spring. Pollock (2011) reports how two underground Tunisian hackers known as "Foetus" and "Waterman," and their organization, Takriz, played a remarkable role in the Arab Spring by taking advantage of social media such as Facebook, in order to send messages, to document police repressions and to mobilize people.

Finally, if Facebook may be considered as a source of alienation, should also be evaluated for its de-alienating effects. Trying to explain the coexistence of exploitative and normative features, Fisher (2012) points out Facebook's promise of de-alienation: if alienation is about the lose "authorship" of the product of labor, social media such as Facebook grant users much more control over the production of process of communication, thus the self expression, identity building aspects that frequently celebrated are for Fisher de-alienating mechanisms. According to Fisher, the paradox of Facebook consists of the fact that the more socially reproductive is the higher the potential for de-alienation.

To conclude, Facebook reproduces the ambivalences of a productive activity that in the Twenty First century capitalism involves a complex reality in which extraction of labor value and a degree of self-realization are all combined in a complicate picture held together by a liberal ideology.

CONCLUSION

To conclude this chapter, I would like to provide a synthetic answer to my original question: Facebook indeed is capable of producing social change but such a change is limited by the social relations in which it works, thus, at a higher level, it can only accomplish that by reproducing the underlying capitalist relations that created it. In the end, the evaluation of the capability of social media to promote or repress social change needs to take into account the specific social relations in which those media operate and are operated.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This is a conclusion that celebrates human agency because after all social relations are only and exclusively produced by people working, playing, consuming producing, chatting and discussing. At the same time, it is a statement that problematizes individual and immediate kind of agency because those social relations, throughout time and because of specific interests annexed to them, become crystallized in institutions such as the market, the law, the state, and in worldviews, such as liberal ideology or democracy. Quite evidently, those social relations are not easily changeable in the same way in which a single user can re-appropriate and re-signify a given media text. Thus, the moral of the story, to paraphrase Marx is that people via media make history but not under the conditions of their own making.

Another important conclusion for this chapter and its objective to examine both transformative and reproductive aspects, is that I tried to advance the understanding of one distinctive characteristic defining social media: the " relationship between willing participation and commercial exploitation" (Andrejevic, 2011, p. 83).From such a perspective, the utopia /dystopia associated to media become dimensions subsumed by capitalism as "work" and "labor" aspects: whereas applications such as Facebook appear to provide agency for "pro-sumers," they also provide a powerful access for capitalist interests to exploit social media's sociability.

Thus, I claimed that the utopian aspect of "work" and the dystopian aspect of "labor" can coexist thanks to the mediation of ideology. That is understood as a conception of the world as well as a consciousness that both develops thanks to the productive activity of Facebook users as well as echoes existing ideologies such as the liberal conceptualization of the market and the liberal democratic political process. In this sense, from a broader perspective, this chapter has explored the richness of the concept of mediation, which in this case, presents various and distinct facets deserved to be explored more thoroughly in their complex interaction: mediation as communication, as technology, as ideology, as an embodied metaphor for social anxieties and social aspiration. Thus, as theorists such as McLuhan (1964) have observed, what is actually transmitted (or mediated) in a communication process consistently exceeds the mere message; it is a synthetic social commentary that speaks about a society as a whole.

KEY TERMS AND DEFINITIONS

Audience Labor: A particular political economic perspective that considers audience as a key productive factor in media business.

Ideology: A particular worldview (such as liberal ideology) that acts as a mediating and reproductive force of a given set of social relations.

Labor: It is a historic specific kind of work resulting from a highly developed social organization of production, therefore specific social relations. It is coercive and exploitative.

Mediation: Both a concrete and conceptual way to talk about mediated communication.

Political Economy of Media: The study of the social relations, particularly the power relations, which mutually constitute the production, distribution, and consumption of resources, including communication resources.

Pros-User: The user that operating in web 2.0 environment blurs the boundaries between production and consumption of media material.

Social Media: Web-based multimedia production and distribution tools incorporating text audio, photo, and video, capabilities, which are characterized by enabling users to create and share content or to participate in social networking.

Social Reproduction: A process that tends to significantly reproduce a given set of social relations.

Social Transformation: A process that tends to significantly change a given set of social relations.

Technological Utopia: The specific modern ideology assuming that progress of science and technology will eventually fulfill an ideal society in which human scarcity, sufferance and mortality will be overcome.

Work: A basic anthropological necessity, which leads human beings to act upon nature and to "produce" material products for their own survival. It is also a practical and creative activity that allows people to express themselves through objects.

Chapter 44
The Inter-Linkage Between Governance and Poverty: Evidences from SAARC Countries

Maniklal Adhikary
The University of Burdwan, India

Dyuti Sinha
The Bhawanipur Education Society College, India

ABSTRACT

This chapter aims at assessing the impact of governance on the country's economic and human well-being in the selected South Asian countries. The study finds that for the countries-India, Pakistan, Bangladesh, Sri Lanka and Nepal, over the years 1990-2012, the growing rate of GDP per capita (PPP) and growing employment to population ratio has a significant negative impact on the Global Hunger Index as expected. Also the panel regression run for the eight SAARC countries over the period 2007-13 to find out the impact of each of the six governance indicators on the per capita GDP showed that political stability and absence of violence, government effectiveness and regulatory quality have very strong and significant role in augmenting the economic output besides the remaining indicators. The trends for each of the indicators across countries over time show that except Bhutan, none of the countries are exhibiting good performance of the governance indicators.

INTRODUCTION

It is undeniable that governance is an indispensable regulatory parameter in upbringing the health of an economy. The public expenditures made in the past periods have a positive correlation with the human development index in the current period (UNDP, 2013). Likewise, efficient governance is a precondition for any nation to benefit from the various development programs taken up for the mass human development. Over the past few decades, policy measures have been taken up in the developing and underdeveloped countries all over the world through provision of certain basic entitlements necessary for a decent living like providing food, education, health services, safe drinking water, besides several

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

other entitlements which in turn enables the people to work and earn their living thereby promoting human and economic development.

The target of a state is to maximize the welfare. This act of maximizing the welfare is successful if the welfare is inclusive: that which involves all the sections of the society irrespective of economic class, topography, age, gender, caste, creed, political affiliation, education etc. and the public services that the state provides should percolate equally to all the targeted beneficiaries. The public welfare entwined with the welfare of the state thus depends on how efficiently the state runs its administration for implementing the various schemes taken for the well-being of its stake-holders (public). It also depends on the level and extent of participation of the public in the decision making process and in policy framework for those specific beneficiaries. The Government should be maintaining a transparent system which would involve an active participation of the stake-holders (both providers and beneficiaries) thereby promoting public confidence on the Government. The stronger the public confidence on the Government, the larger is the scope for the state to receive foreign and domestic investment, which, if sustains, would further promote production.

Several outcomes act as parameters for a sustained growth and development. Higher investment occurs due to sustained increased consumption which augments labor employment and hence better job prospects. Thus proper resource allocation, distribution and utilization are very important aspects for a sustained development. When public resources are privately used up by the public servants for their personal gain, there appears the failure of strong governance, resulting in corruption. International confidence on the concerned domestic countries is very much dependent on the perception of corruption. If the beneficiaries and stakeholders of the public services perceive and express satisfaction about good functioning of the government thereby facilitating all the stakeholders equally and justly, there is said to exist good governance. Thus growing and sustained international confidence in an economy invites more of foreign investment and aid which promote development. So, a good governance results in higher economic growth, better redistributive policies implying equitable distribution of wealth and resources, increased employment opportunities, rising income, production, consumption, investment and economic growth. In economies where the inequality is high, the differences between the rich and the poor are demarcated well; there exists poverty among the lower sections of the society. If inequality is high, the aggregate demand made by the consumers in the society as a whole lowers which in turn affects production. As production goes down due to reduced demand, the producers cut short their production expenses, as a result of which, unemployment occurs resulting in loss of earning opportunities. Thus, in an economy with persistent inequality and poverty, there is less equity in all the sectors of the economy. The sectors may be economic, social or political. So a welfare oriented state which always aims at good governance reduces poverty, lowers economic inequality and promotes equitable distribution and participation.

The international organizations and regulatory bodies like the World Bank and the IMF are concerned with the issues of governance and institutions in the developing economies, particularly with corruption. Evidences are there which say that good governance and institutions help in accelerating development and in reducing poverty in the developing countries. Thus good governance impedes corruption and poverty in developing economies.

DEFINING GOVERNANCE AND GOOD GOVERNANCE

Governance is the exercise of economic, political and administrative authority to manage a country's affairs at all levels. The dimensions of good governance as proposed by the World Bank Institute's Kauffmann, Kray and Mastruzzi (2010) are as follows

- **Political Stability and the Absence of Violence:** Capturing perceptions of the likelihood that the government will be destabilized or overthrown by unconstitutional or violent means, including politically motivated violence and terrorism. Economic and social integrity is very much necessary for efficient execution of the various development programs.
- **The Rule of Law:** capturing perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence. Maintenance of proper law and order in the state augments smooth functioning of the administration for implementing its policies is necessary.
- **Voice and Accountability:** Capturing perceptions of the extent to which a country's citizens are able to participate in selecting their government, as well as freedom of expression, freedom of association, and a free media. Participation of the beneficiaries and their ability to contribute in the policy making process, giving feedback and standing against the motion. The government should make every possible attempt to maintain a transparency in their policy implementation process. There should not be ethnic, gender and class bias and all citizens can equally raise their voice against any sort of corruption.
- **Regulatory Quality:** Capturing perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development. The government should act as a facilitator for encouraging private sector development in certain basic sectors like health, education, etc. in developing nations.
- **Government Effectiveness:** Capturing perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government's commitment to such policies.
- **Control of Corruption:** Capturing perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as "capture" of the state by elites and private interests.

Thus, to be precise, these parameters are very much decisive in determining the effectiveness of various policies that are implemented for reducing poverty and inequality across nations for promoting growth with economic development. Although good governance focuses on the interactions of the state and society, its origin lies in economic concerns. Aid donors believe that development depends on the issues of governance. The purpose of good governance is commonly seen as a promoter of development. 'Bad' governance is identified with corruption, wastefulness, incompetence, and unresponsiveness, all of which impede economic development and perpetuate poverty. The World Bank's view of good governance is seen as a strategy for development, or a principle to guide donors and investors when they make decisions. The Bank's economic liberalism ensures that its wish-list includes the promotion not

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

only of liberal democratic political institutions, but also of a market economy, free trade, and reduced public sectors.

The term 'good governance' became popular in the 1990s when it was used in relation to economic and social development by the World Bank as a part of its lending requirements. A better governance results in improved functioning of the social and economic development policies which tends to reduce persistent inequality and poverty. Failure of political governance results in corruption.

Governance in South Asia

The lack of effective governance has emerged as one of the foremost challenges in South Asia. South Asia is amongst the most vulnerable regions of the world after Africa to hunger due to high levels of poverty and deprivation. Heavy reliance of the region on climate sensitive sectors such as crops, livestock, forestry and fisheries also place it in a vulnerable position. Despite the developed economies' recession in the recent years, South Asia has experienced the fastest growth in the world in the recent years. The South Asian region has achieved an economic growth averaging 6.5 percent annually during 2000-12, however, this is not enough to reduce poverty and ensure food security[1]. South Asia is a region rich in culture and tradition, but poor in governance for human development. It has three-fifths of the world's population and positive growth rates, which managed to sustain in the face of the global financial crisis since 2009. Though South Asia has shown much potential towards sustained economic growth, poverty alleviation and human development, poor governance has deterred the improvement. Social, economic and political factors are equally responsible for human deprivation in the region. South Asia is unable to cope up with the problems of poverty, deprivation of the masses, social exclusion, rapid urbanization and environmental degradation caused by the forces of development. The region reports highest incidence of child malnourishment. The maternal mortality rates in some countries are very high and majority of the births take place unattended by the skilled medical professionals. Women are forced to work in the informal sector where wages are very low and minimum standards are even not maintained. Rapid urbanization is putting more strain on urban water and sanitation systems. *Table 1* provides a highlight on different magnitudes of the six governance indicators across the countries of the list.

Table 1. Regional profile of the governance indicators across SAARC countries 2012

Country	GDPPC (current US$)*	GE	RQ	RL	CC	VA	PSAV
Afghanistan	678.3479	-1.4	-1.21	-1.72	-1.41	-1.32	-2.42
Bangladesh	829.2515	-0.83	-0.96	-0.91	-0.87	-0.42	-1.35
Bhutan	2498.391	0.48	-1.12	0.19	0.82	-0.32	0.81
India	1498.872	-0.18	-0.47	-0.1	-0.57	0.35	-1.25
Maldives	6665.768	-0.16	-0.35	-0.5	-0.44	-0.52	-0.28
Nepal	694.1048	-0.99	-0.81	-0.79	-0.83	-0.7	-1.38
Pakistan	1299.119	-0.79	-0.73	-0.91	-1.06	-0.87	-2.68
Sri Lanka	3279.891	-0.24	-0.12	-0.11	-0.24	-0.6	-0.71

* implies data for GDP per capita corresponds to the year 2013

The six governance indicators are government effectiveness, regulatory quality, rule of law, control of corruption, voice accountability, and political stability & absence of violence.

Corruption and Poverty

Following Chetwynd and Spector (2003) report on corruption and poverty which concludes that *corruption has direct consequences on economic and governance factors, intermediaries that in turn produce poverty*, this study proceeds with the structural framework as has been given by the said authors. Corruption in the public sector -- the misuse of public office for private gain -- is often viewed as stimulating conditions of poverty (low income, poor health and education status, vulnerability to shocks and other characteristics) in countries already struggling with the strains of economic growth and democratic transition. Alternatively, countries experiencing chronic poverty are seen as natural breeding grounds for systemic corruption due to social and income inequalities and perverse economic incentives. They discuss two major models explaining the moderated linkage between corruption and poverty: an economic model and a governance model.

The Economic Model postulates that corruption affects poverty by first impacting economic growth factors, which, in turn, affect poverty levels. Economic theory and empirical evidence both demonstrate that there is a direct causal link between corruption and economic growth. Corruption hampers economic growth by discouraging foreign and domestic investment, taxing and dampening entrepreneurship, lowering the quality of public infrastructure, decreasing tax revenues, diverting public talent into rent-seeking, and distorting the composition of public expenditure. Besides limiting economic growth, corruption also aggravates income inequality. Corruption distorts the economy and the legal and policy frameworks allowing some to benefit more than others; there is unfair distribution of government resources and services; corruption reduces the progressivity of the tax system; corruption increases the inequality of factor ownership; and lower income households (and businesses) pay a higher proportion of their income in bribes than do middle or upper-income households. Thus corruption impedes economic growth thereby resulting in income inequality which aggravates poverty.

On the other hand, there are evidences that an increase in GDP produces an increase in the income of the poor. However, income distribution is an important mediating factor because economic growth may not always benefit the poor.

The Governance Model asserts that corruption affects poverty by influencing governance factors, which, in turn, impact poverty levels.

- Corruption reduces governance capacity, i.e. it weakens political institutions and citizen participation and leads to lower quality government services and infrastructure. The poor suffer disproportionately from reduced public services. When health and basic education expenditures are given lower priority, for example, in favor of capital intensive programs that offer more opportunities for high-level rent taking, lower income groups lose services on which they depend. Corruption is consistently correlated with higher school dropout rates and high levels of infant mortality.
- Secondly, impaired governance increases poverty by restricting economic growth and, coming full circle, by its inability to control corruption.
- Thirdly, corruption that reduces governance capacity also may inflict critical collateral damage: reduced public trust in government institutions. As trust -- an important element of social capital -- declines, research has shown that vulnerability of the poor increases as their economic productivity is affected. When people perceive that the social system is untrustworthy and inequitable, their incentive to engage in productive economic activities declines.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Thus, anti-corruption programs that are crafted to address issues of economic growth, income distribution, and governance capacity, government services in health and education, and public trust in government are likely to not only reduce corruption, but reduce poverty as well.

RATIONALE, BACKGROUND AND MOTIVATION OF THE STUDY

In developing countries, characterized by high growth rate of population and large volumes of underutilized resources, inequality is an outcome of unequal distribution and utilization of resources. Inequality in access to public services, contribution to the country's GDP etc. makes weaker section of the people vulnerable to situations of poverty. The concept of class differentiation between the 'have's and the 'have-not's hence comes into play which gradually creates inequality which widens over time if no sudden big-push pulls them out of the well. Education, health services, housing, sanitation and communication are the chief areas which create the gap between the rich and the poor. Those suffering from lack of access to these basic amenities hence become weak in terms of their physical, mental and economic ability to get them employed. Thus unemployment results in widening the persistent gap resulting in poverty, which when worsens, results to situations of hunger and malnutrition. Thus inequality leads to violence and corruption which are causal factors for weak governance.

The first decade of the 21st century experienced the global financial crisis and worldwide recession which made the policy makers in South Asian countries re-evaluate their planning and budgeting priorities thereby making major cuts in development spending. Besides experiencing frequent natural calamities, the region also suffers from increased military, extremist activities which make governance vulnerable. Despite all these negative forces which tend to deter human development in South Asia, the economies of South Asia- India, being the largest of its kind among the SAARC countries, has experienced a sustained economic upsurge led by the rapid emergence of the information and communication technology (ICT) sector. In the face of the recent crisis, where developed economies had run bankrupt, India and China managed to grow with a positive growth rate. This phenomenal success has earned these countries the confidence of the foreign investors and has henceforth started being the favorite destinations of foreign investment and aid which will promote economic and social development. On the other hand, the crisis has taught the economies to cut short their expenses by means of better governance. Evidences say that when an economy curbs its public expenses on any public program it is the poor who suffer the most. Thus the austerity measures of the government should be such that it does not affect the masses, or even if it affects, the intensity should be minimum.

In this context, it is relevant to discuss the various dimensions of governance as developed and practiced in the South Asian region. It is the state's responsibility to provide basic amenities that enable its citizens to enjoy their 'right to life with dignity'[2].

RESEARCH GAP

This work is very elementary in its approach to the linkage between governance and the country's economic output and poverty

The poverty measures were not available for all the SAARC countries over the common time frame. Data for Afghanistan, Nepal etc. are not available preceding 2002 and for all the years following it for

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

aggregate national income. Due to the irregularities in the household surveys and variations in the methodologies for calculating the poverty estimates, the popularly used poverty indices could not be used. Thus another important dimension of poverty, viz. the per capita gross domestic product is being used which would also signify the economic growth pattern of the concerned countries. Data on poverty head count ratio, Gini coefficient measure of inequality is not available for all the years for all the countries, hence we cannot use the data for comparison.

REVIEW OF LITERATURE

Mahbub ul Haq Human Development Centre's (2012, 2013) approach to Governance is from the stand point of economic, human and social development which has been described in the following section.

Good governance from the standpoint of human development is redefined as humane governance. This definition is based on the fact that the costs of poor governance, whether in terms of un-enforceable property rights and contracts, deteriorating law and order, or widespread absenteeism by teachers and doctors are largely borne by the poor people. Hence human development takes the centre-stage of any governance agenda where humane governance is simply defined as good governance dedicated to securing human development.

Good governance requires participation of people in the state, civil society and the private sector to build the capacity of all people including deprived and marginalized. Humane governance is conceptualized in three interlocking dimensions: good political governance, good economic governance and good civic governance.

Chetwynd and Spector (2003) in a report containing a vast review of literature on corruption and poverty explore the linkages between corrupt free governance and an economy's well being, both socially and economically.

ECONOMIC MODELS OF CORRUPTION

A vast literature is available showing an inverse correlation between aggregate economic growth and corruption; in general, countries with higher corruption experience less economic growth. Corruption affects economic growth, through deterring investment and entrepreneurship, distorting markets, and undermining productivity.

Corruption Impedes Economic Growth

The relationship between corruption and economic growth is complex. Economic theory supports the notion that corruption hinders economic growth in the following ways:

- *Corruption discourages foreign and domestic investment*: Rent seeking behavior increases costs and creates uncertainty, reducing incentives to both foreign and domestic investors.
- *Corruption taxes entrepreneurship*: Entrepreneurs and innovators require licenses and permits and paying bribes for these services cuts into profit margins.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- *Corruption lowers the quality of public infrastructure:* Public resources are diverted to private uses, standards are waived; funds for operations and maintenance are diverted in favor of more rent seeking activity.
- *Corruption decreases tax revenue:* Firms and activities are driven into the informal or gray sector by excessive rent taking and taxes are reduced in exchange for payoffs to tax officials.
- *Corruption diverts talent into rent seeking:* Officials who otherwise would be engaged in productive activity become pre-occupied with rent taking, in which increasing returns encourage more rent taking.
- *Corruption distorts the composition of public expenditure*: Rent seekers execute those projects for which rent seeking is easiest and best disguised, diverting funds from other key social sectors like education and health.
- *Corruption discourages domestic investment*: In countries like Bulgaria and Latvia, planned investments were dropped due to corruption.
- *Corruption hurts entrepreneurship especially among small businesses:* Several studies reported that small businesses tend to pay the most bribes as a percentage of total revenue.
- *Corruption decreases revenue from taxes and fees*
- *Corruption invigorates income inequality*

Several studies have demonstrated a relationship between corruption and income inequality. The theoretical foundations for this relationship are derived from rent theory and draw on the ideas of Rose-Ackerman (1978) and Krueger (1974), among others. Propositions include:

- Corruption may create permanent distortions from which some groups or individuals can benefit more than others.
- The distributional consequences of corruption are likely to be more severe the more persistent the corruption.

Gupta, Davoodi, and Alonso-Terme (1998) studied the impact of corruption on income distribution When Gini coefficients for income per capita (measures of income inequality) were graphed against the Transparency International (TI) Corruption Perceptions Index (CPI), *lower levels of corruption were seen to be statistically associated with lower levels of income inequality* (simple correlation was +0.72).

In another study of 35 countries (mostly OECD countries), Karstedt hypothesized that corruption supports, stabilizes and deepens inequality.

In conclusion, the literature establishes clearly that corruption impedes economic growth and augments income inequalities. Since inefficient governance results in corruption, corruption has been taken as a major indicator of governance in the following literature.

Impeded Economic Growth Rates Aggravates Poverty

There is evidence that the absence of economic growth (or negative growth) increases poverty. Quibria's study (2002) suggests that the burden of rapid economic retrenchment, such as was seen in Thailand and Indonesia, hurts the poor most heavily.

Dollar and Kraay (2002) of the World Bank Development Research Group studied a sample of 80 countries over four decades and showed that income of the lowest 20 percent of the population increases

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

one for one with increases in per capita GDP. Moreover, using tests for directionality, they concluded that a 1 per cent increase in GDP actually causes a 1 per cent increase in the incomes of the poor.

Similarly, Ravallion and Chen (in Easterly, 2001: 13-14) examined 65 developing countries between 1981 and 1999. They found that the number of people below the poverty line of $1 per day was reduced in countries with positive economic growth. However, they concluded that "measures of inequality show no tendency to get either better or worse with economic growth."

In conclusion, these studies show conclusively that income rises with economic growth and vice versa. It should be noted that economic growth does not necessarily lead to *more equal* income distribution; an increase in income may benefit the better-off rather than bringing the poor out of poverty. Income distribution seems to be an important moderating factor in the relationship between economic growth and poverty reduction.

GOVERNANCE MODELS OF CORRUPTION

The governance model postulates that increased corruption reduces governance capacity, which, in turn, increases poverty conditions.

Kaufmann, Kraay and Pablo Zoido- Lobaton (1999) define governance as, "the traditions and institutions by which authority in a country is exercised. This includes (1) the process by which governments are selected, monitored and replaced, (2) the capacity of the government to effectively formulate and implement sound policies, and (3) the respect of citizens and the state for the institutions that govern economic and social interactions among them."

Corruption Degrades Governance

Johnston (2000) suggests that serious corruption threatens democracy and governance by weakening political institutions and mass participation, and by delaying and distorting the economic development needed to sustain democracy.

As government revenues decline through leakage brought on by corruption, public funds for poverty programs and programs to stimulate growth also become scarcer.

Gupta, Davoodi and Tiongson (2000) used regression analysis across a large sample of countries to assess an aggregate measure of education outcome and health status in a model that includes several corruption indices, per capita income, public spending on health care and education, and average years of education completed. The results supported the proposition that better health care and education outcomes are positively correlated with lower corruption. In particular, corruption is consistently correlated with higher school dropout rates and corruption is significantly correlated with higher levels of infant mortality and lower-birth weights of babies.

Gupta, Davoodi and Terme (1998) also found that corruption can lead to reduced social spending on health and education. Countries with higher corruption tend to have lower levels of social spending, regardless of level of development. Corruption lowers tax revenues, increases government operating costs, increases government spending for wages and reduces spending on operations and maintenance, and often biases government toward spending on higher education and tertiary health care (rather than basic education and primary health care).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Impaired Governance Increases Poverty

Pioneering research on the relationship among corruption, governance and poverty has been conducted at the World Bank by the team of Kaufmann, Kraay and Zoido-Lobaton. Their studies suggest an association between good governance (with control of corruption as an important component) and poverty alleviation.

Kaufmann and Kraay (2002) found (i) better governance tends to yield higher per capita incomes, but (ii) higher per capita incomes tend to produce reduced governance capacity.

The effect of governance on corruption and poverty is illuminated by another World Bank study (2000a). The deterioration in governance discussed in this study was accompanied by an increase in both corruption and poverty. Thus, as seen earlier, increases in corruption tend to deteriorate governance practices, but the reverse holds true as well – reduction in governance capacity increases the opportunities for corruption.

Reduced Public Trust in Government Increases Vulnerability of the Poor

Corruption that reduces governance capacity also may inflict critical collateral damage: reduced public trust in government institutions. As trust, an important element of social capital, declines, research has shown that vulnerability of the poor increases as their economic productivity is affected.

Zak and Knack (1998) found that trust is higher in nations with stronger formal institutions for enforcing contracts and reducing corruption, and in nations with less polarized populations (as measured by income or land inequality, ethnic heterogeneity, and a subjective measure of the intensity of economic discrimination). They also showed that formal institutions and polarization appear to influence growth rates in part through their impacts on trust. For example, income inequality, land inequality, discrimination and corruption are associated with significantly lower growth rates, but the association of these variables with growth dramatically weakens when trust is controlled for.

Knack (1999) also looked at the effect of social capital on income inequality. His study has made regression of various indicators of social capital and trust against income data by quintile and found that higher scores on property rights measures were associated with declines in income inequality. Knack concludes that "social capital reduces poverty rates and improves – or at a minimum does not exacerbate – income inequality."

With the vast literature describing the causal relationships between the elements of good governance, corruption, economic growth, and poverty the study now delves into the empirical evidences from the eight SAARC countries over the past seven years.

OBJECTIVE OF THE STUDY

This paper concentrates on three major objectives to establish the various causes and effects of corruption (which is a result of weak governance) with respect to the country's economic output and state of poverty, which results in hunger. The employment to population ratio also has an important role to play in determining a country's social and economic well being. The principal objectives are

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. To explore the trend in poverty, hunger, and inequality across the SAARC countries and to map the trend in GDP growth and governance indicators across countries over time as per the availability of data.
2. To analyze the impact of GDP per capita (PPP) and employment to population ratio on the country's hunger index over the period 1990-2012.
3. To study the impact of the six dimensions of governance on the country's GDP per capita (PPP).

DATA AND METHODOLOGY

The study is based completely on the World Bank data available on the gross domestic product (current US$) and the six dimensions of governance as given by the Worldwide Governance Indicators for the selected South Asian countries. The study covers eight SAARC countries namely Afghanistan, Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan and Sri Lanka. Data on the governance indicators are available since 1996 biennially to 2002 after which annual data is available. In order to test the degree of causality of the governance indicators on the nation's GDP, a regression analysis is proposed. The model assumes that the governance indicators have a long term effect in determining the current value of GDP. Thus for the governance indicators one period lag has been taken. For example the governance indicators corresponding to the year 2012 are decisive in determining the GDP for the next year viz. 2013.

We have assumed a linear relationship between the variables with general Classical Linear Regression Model following the standard assumptions and Ordinary Least Squares technique is applied.

The six governance indicators on which the quantitative data is available are:

- Government Effectiveness (ge)
- Regulatory Quality (rq)
- Rule of Law (rl)
- Control of Corruption (cc)
- Voice and Accountability (va)
- Political Stability and Absence of Violence (psav)

These estimates of governance range from approximately minus 2.5 (weak) to plus 2.5 (strong) for the concerned governance indicator.

Since the estimates of governance are measured on a scale which has got such a narrow range, the dependent variable here which is the GDP per capita is normalized by taking the log of the actual GDP per capita (loggdppc) for the ease of parity. Hence the huge gap between the GDP per capita expressed in US $, and the dimensions of governance are minimized and are hence comparable.

The hunch is, if the country's GDP increases, the global hunger score should decline as increased income of the individuals is used to meet the expenses of food. Similarly, if people find more jobs, which results in increased income, the hunger score should be on a decline for all countries in general. In the first place, we measure the impact of employment growth rate and growing output on the growth rate of hunger index of the country. It is expected that if country's employment to population ratio (EMP_POP) goes up, the hunger score (GHI) is suppose to go down as fewer cases of hunger and inequality should be reported. The regression equation is

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$log\left(GHI\right) \; = \; \beta_0 + \; \beta_1.log\left(GDPPCPPP\right) \; + \; \beta_2.log\left(EMP_POP\right) \; + \; u_t$$

The study aims at testing the significance and depth of association between GDP, employment and global hunger index. It is expected, that for developing countries, as the employed population ratio increases thereby resulting in greater money at dispose, the incidence of poverty, hunger and malnutrition should go down. The test statistic is

H_0: $\beta_1 = 0$, against the alternative hypothesis H_1: $\beta_1 < 0$

Similarly, H_0: $\beta_2 = 0$ against H_1: $\beta_2 < 0$. The coefficients are expected to be significant and having a negative sign denoting inverse relation with the explained variable (GHI)

Coming down to the governance indicators, we assume a linear relationship between the governance parameters and GDP growth as follows:

$$log\left(gdppc_{n+1}\right) \; = \; \alpha_0 + \alpha_1 * ge_n + \alpha_2 * rq_n + \alpha_3 * rl_n + \alpha_4 * cc_n + \alpha_5 * va_n + \alpha_6 * psav_{n\,+} u_t$$

This model is used to measure the impact of each of the governance parameters in determining the national product in the next period.

The recent rankings by the Transparency International on the Corruption Perception Index (CPI) in 2013 finds Bhutan (rank 31) as the least corrupt country among the other SAARC countries, followed by Sri Lanka (91), India (94), Nepal (116), Pakistan (127), Bangladesh(136) and Afghanistan (175) among 177 countries. Thus among the SAARC countries, Bhutan has the lowest incidence of poor governance in terms of control of corruption, political stability and absence of violence and government effectiveness. Although one may argue, that Bhutan is a very small country, landlocked on all sides and runs entirely on its strategic relationships with its neighboring countries, especially India; Sri Lanka among the major SAARC countries has the second lowest CPI rank[3].

SUMMARY STATISTICS

The summary statistics for the variables under study has been depicted in Table 2.

Figure 1 depicts the box plot diagram showing the lower quartile ($Q_{1)}$, median ($Q_{2)}$ and upper quartile (Q_3) for each of the six governance indicators. The lower and upper fences are shown by the lines bounding each of the box plots for each variable. The variable control of corruption has three outliers during the years under study for different countries. This does not signify any abnormality in the value of the index but shows that Bhutan has the best control of corruption and the index is highly positive implying good governance. The position of the median ($Q_{2)}$ signifies the nature of the distribution.

Figure 1. Pattern of the data on governance measured over the time period 2006- 12

EMPIRICAL RESULTS AND ESTIMATES

The South Asian countries have emerged to be one of the largest information communication technology (ICT) hubs, India being the most popular destination among SAARC countries besides Malaysia, China, Singapore, and Thailand in the region. The gradual dependence in the ICT sector on these countries is due to abundance of cheap skilled labor which makes the production cost effective besides several other infrastructural factors. Several researchers have emphasized on the growing importance of the various non-income measures of poverty which are very significant indicators of human well being. If a person earns enough to keep him above the respective poverty line, but is denied access to or is deprived of certain basic entitlements like proper healthcare facilities and education, then he is said to be suffer from poverty of opportunity. If there are not enough income-earning opportunities, then even if the state is well equipped with improved medical and better teaching facilities, the state would suffer from unemployment problem.

So the availability of opportunities for earning a healthy living is significant parameter for determining the well being of the people. Thus the poverty of opportunity index has been tabulated for the major four SAARC countries (Table 3). The table compares income poverty measured by the percentage of population living below the PPP $1.25 per day, with the measure of poverty estimated using POPI value for four South Asian countries. It shows that income poverty tells only a part f the story. The incidence of poverty for Pakistan as measured by POPI at 29.2 per cent is much higher than income poverty (US

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Non-income measure of poverty in selected SAARC countries: Poverty of Opportunity Index (POPI)

Poverty of Opportunity in South Asia,2010				
	Bangladesh	**India**	**Pakistan**	**Sri Lanka**
Poverty of health opportunities (%)	16.3	13.4	11.6	7.8
Poverty of education opportunities (%)	39.6	32.7	41.3	9
Poverty of income opportunities (%)	43.3	32.7	22.6	7
Poverty of opportunity index (POPI) value (%)	35.2	27.8	29.2	7.8

Sources: UIS 2012, UNDP 2010c, UNDP 2012, World Bank 2012b,e and i and MHHDC staff computations

$1.25 per day) at 22.6 per cent. This implies that individuals living above the income poverty line may still suffer from deprivations in education, health and other living conditions. Countries like India that perform better with respect to poverty of education opportunities, have a lower incidence of poverty as measured by POPI, despite suffering from a greater incidence of income poverty compared to Pakistan.

The next section discusses the decadal trend in the Global Hunger Index for selected South Asian countries over the recent past (Table 4). The data on sub-components of the GHI were not available for all the SAARC countries; hence, we have taken few other South Asian countries. On the scale of 0 to 100, where 0 indicates no reported cases of undernourishment, underweight children and underweight child mortality under five, the countries are ranked according to their hunger scores. So the lower the index, the better it is. From the statistics, it is evident that among the selected South Asian countries, which were chosen based on data availability, Bangladesh, India and Nepal had their GHI score nearing to 30, which was quite high, compared to their neighboring counterparts. China, which also has a huge population as India scored strikingly, just 13 on the GHI scale in 1990 when India and Bangladesh had a GHI more than twice as that of China. Economies of Malaysia and Mauritius which are not as large as that of India or China scored the lowest among all the countries on GHI in 1990. The pace of reduction in the GHI parameters has been fastest in Thailand followed by China. Among the booming developing economies China records the fastest reduction in hunger index. India has been one of the struggling

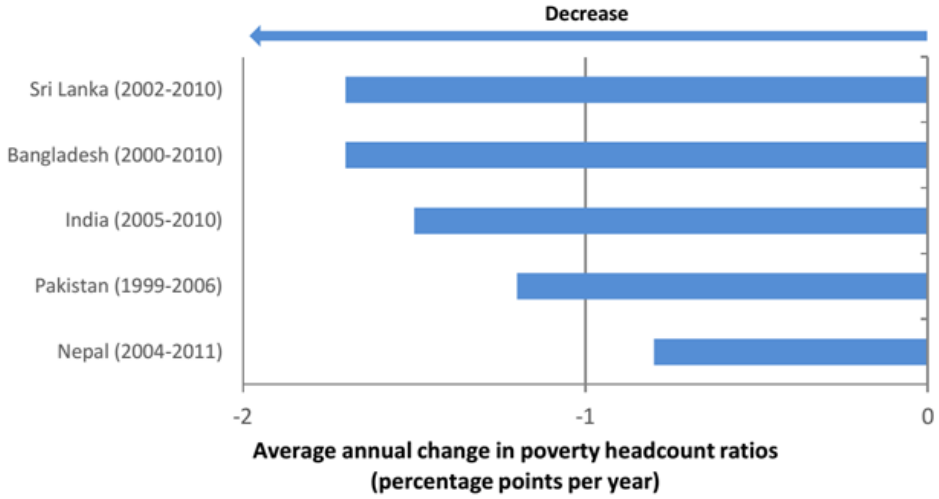
economies in the region to reduce hunger and undernourishment given its huge territorial extent and population pressure.

In the next section (Table 5), based on the most recently available data on consumption expenditure, various income measures of poverty have been tabulated. The reference poverty line is the international poverty line of US$38 PPP per month. From the table, we find that of all the SAARC countries except Myanmar (data unavailable), Bangladesh tops the list of poverty measured in terms poverty head count ratio, poverty gap ratio and squared poverty gap ratio. Poverty head count ratio simply gives the proportion of the population living below the reference poverty line. Poverty gap ratio gives the extent of inequality in consumption expenditure or income. The squared poverty gap ratio gives the strength or intensity of the poverty measured in terms of inequality. Thus in terms of income poverty, Bangladesh has the highest amount of consumption (income) deprivations followed by India and Nepal. The population proportion living below the international poverty line is highest in Bangladesh.



The following figure (Figure 2) shows the average annual change in poverty for the major SAARC countries on which the data is available. It is seen that all the selected South Asian countries have un-

Table 5. Various consumption measures of poverty for SAARC countries except Afghanistan

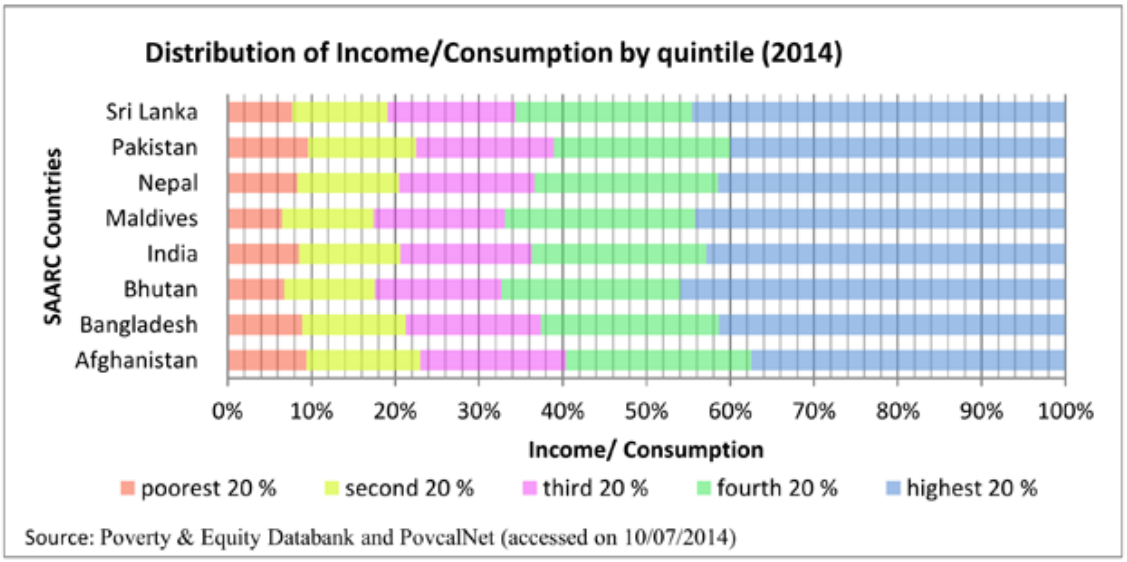
dergone a significant decrease in the poverty head count ratio over the past decade. The highest rate of decline in poverty head count ratio has been recorded by Sri Lanka and Bangladesh followed by India.

The following chart (Figure 3) shows the quintile distribution of the total consumption expenditure which is taken as a proxy of income.

The bottom(poorest) 20 per cent of the population contribute just about 8 per cent to the total national income while the top(richest) 20 per cent of the population contribute about 40 per cent to the total national income in general across all the SAARC countries. This shows that there is a wide gap between the rich and the poor in terms of the distribution of the income generated.

In the following figure (Figure 4), the poverty head count ratios for the selected South Asian countries measured at the international poverty lines have been estimated for the year 2010 at PPP.

Figure 3. Quintile distribution of the total income generated: Evidence on persistent Inequality



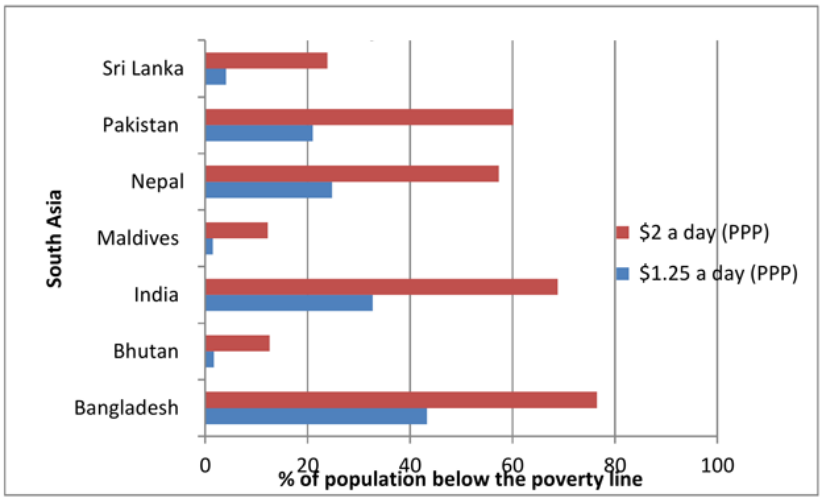


Figure 4. Poverty head count ratio for the south Asian countries
Source: *Poverty & Equity Databank and PovcalNet*

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

When measured with respect to the $2 a day (PPP) as the international poverty line, about 70 per cent of the population lies below the poverty line for the countries like India and Bangladesh. Bhutan and Maldives report the lowest incidence of income or consumption poverty at both the $2 and $1.25 daily poverty line (PPP).Pakistan fares better than India and Bangladesh in terms of the number of people living below the poverty line.

Nonetheless, the various non-income parameters of poverty measurement are very significant indicators of human development and well being. Such parameters like nutrition status of the children, their access to the basic entitlements like primary education, shelter, food, income earning opportunities etc. are important as well. Hence we look at the recent trend in the human development index for the selected South Asian countries (Table 6). The Human Development indices for the countries have been tabulated and the changes in the ranks indicate whether there has been any improvement in the human development indicators.

Except Afghanistan, which scores abysmally low in the human development index, all other selected South Asian countries which are members of the SAARC fare moderately in terms of human development index. In the latest two years as available with the UNDP, we find that Sri Lanka and Maldives have improved their ranks whereas India and Afghanistan have gone down in the international ranking although all the countries have got a better HDI in 2012 than in 2011. The annual rate of change clearly shows that the quality of life in Afghanistan has degraded remarkably and thus the HDI has gone down by about 6 per cent in a year. Among other SAARC countries, Sri Lanka, Bangladesh and Bhutan have improved on the HDI by about 3 per cent over the previous year. India, Nepal and Maldives are the strugglers in improving the HDI with a marginal 1 per cent improvement in HDI.

From the chart (Figure 5), it is evident that among all the SAARC countries, Maldives stands alone as the topmost generator of GDP per capita over the past 13 years. The country's high GDP per capita is mainly attributed to the growing popularity of the country over the recent years as a popular holiday destination from all over the world. The tourism industry generates the major revenue for the country with small territorial bound and less dense population compared to its other SAARC counterparts. The GDP per capita of Maldives is about five times as that of India. Among the other SAARC countries, Sri

Figure 5. Trend in GDP per capita across the SAARC countries
Source: World Bank Data,2001-13

Lankan economy is the second highest generator of GDP followed by Bhutan, India and Pakistan. Over the past six years, the growth rate of GDP seems to have accelerated in nearly all the countries but the progress is shooting in Maldives.

In this section, we show the trend in the six indicators of governance as listed by the World Bank across the eight SAARC countries since 2000. The estimates of Governance are measured on a scale ranging from - 2.5 for the worst performance to + 2.5 for the best performance in terms of the concerned governance indicator.

Among the SAARC countries, except India all other member countries exhibit a negative estimate of the indicator of voice and accountability which implies that Indians irrespective of their caste, gender and ethnic background exercise the freedom of expression, freedom of speech, the right to participate in the selection of the government and standing against the motion. Among the other countries, Afghanistan fares worst where the people don't exercise their freedom to express and to participate in the country's decision making process. Countries like Bhutan and Pakistan has shown an improvement in terms of the said indicator (Figure 6).

In terms of the government's effectiveness, it can be seen that countries like Bhutan and Maldives, where the index of government effectiveness was high during 2000 gradually decreased and converged in 2004 with that of India which maintained a steady index of about -0.15 over the past 12 years. Afghanistan over years has managed to fare slightly better than in terms of the index from -2.4 in 2000 showing ineffective government which improved gradually and stabilized around -1.5 from 2006 and onwards. This can be well related to the crisis that Afghanistan has been facing after the war (Figure 7).

The regulatory quality of a Government captures the perception of the ability of the government to implement and promote policies featuring private sector development.

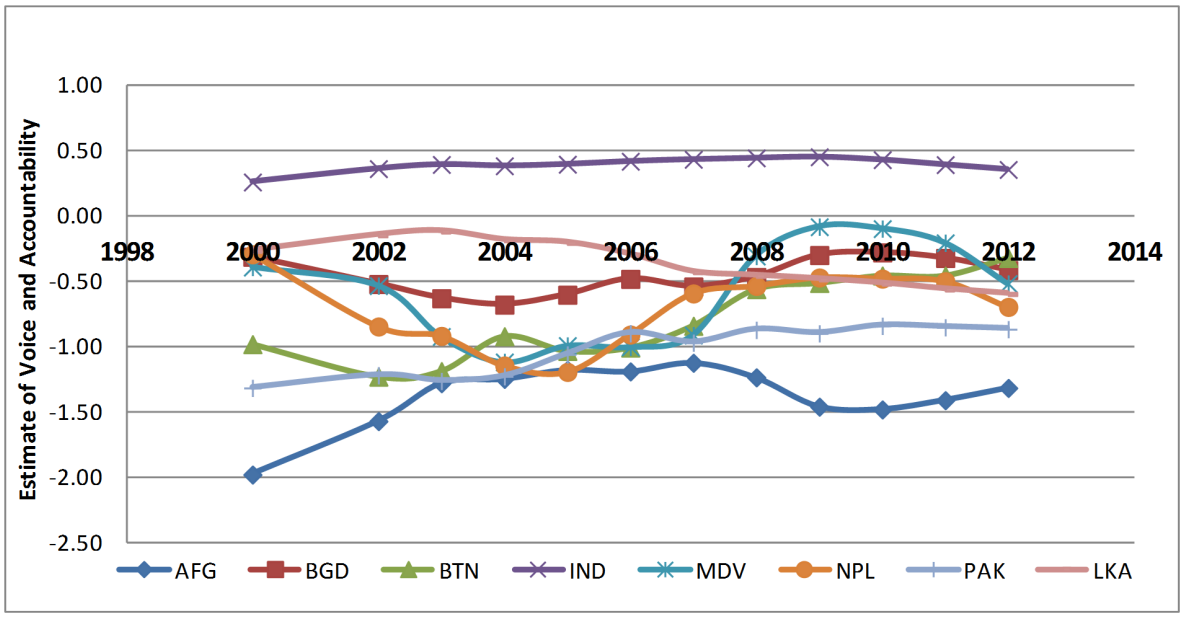
Figure 6. Voice and accountability in SAARC countries, 2000-2012
Source: World Bank Data,2000-12



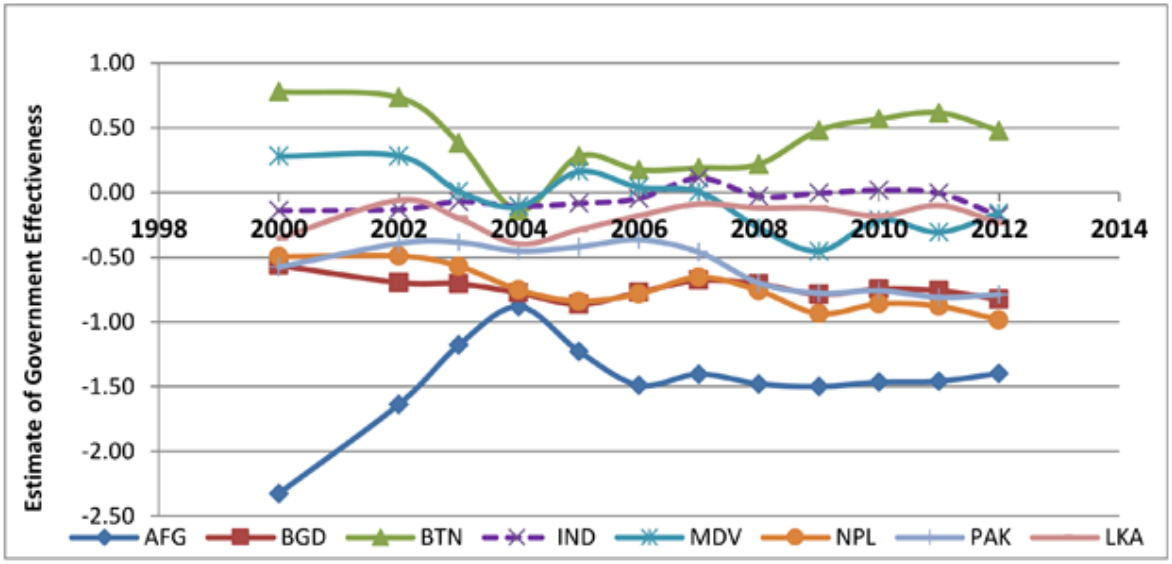


Figure 7. Government effectiveness in SAARC countries, 2000-2012
Source: World Bank Data,2000-12

Maldives, besides Sri Lanka, was the only country among the SAARC countries to have positive index of regulatory quality (Figure 8) in early 2000s which later deteriorated and signifies a weak state of governance in terms of the said indicator. As usual, war in Afghanistan has left the country devastated which has resulted in weak governance catered by poor execution of rule of law thereby resulting in awful regulatory quality of the government (Figure 9).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

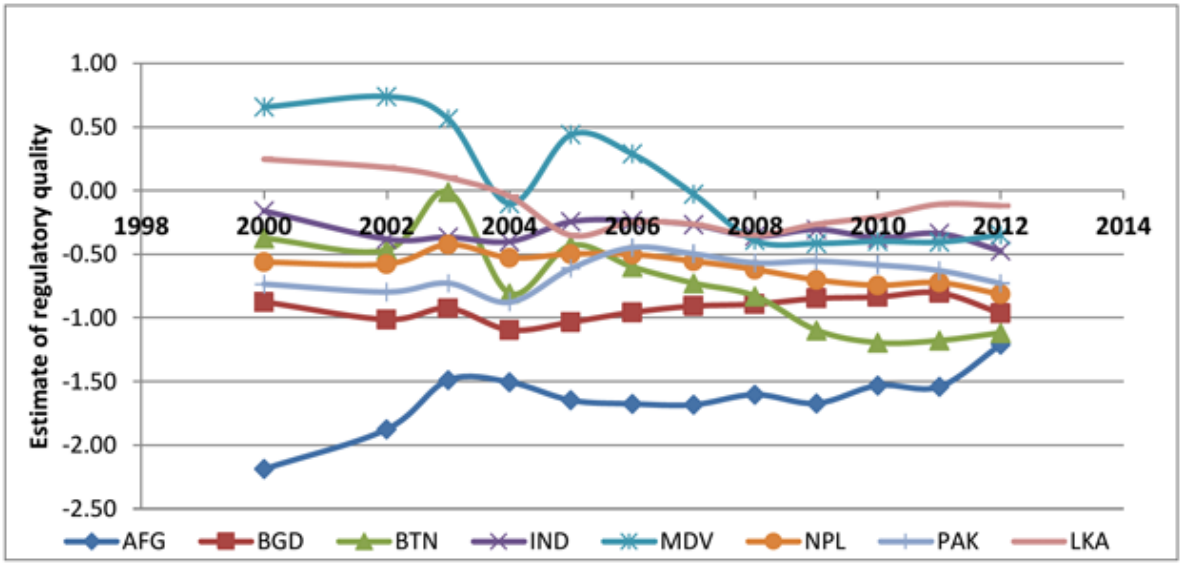
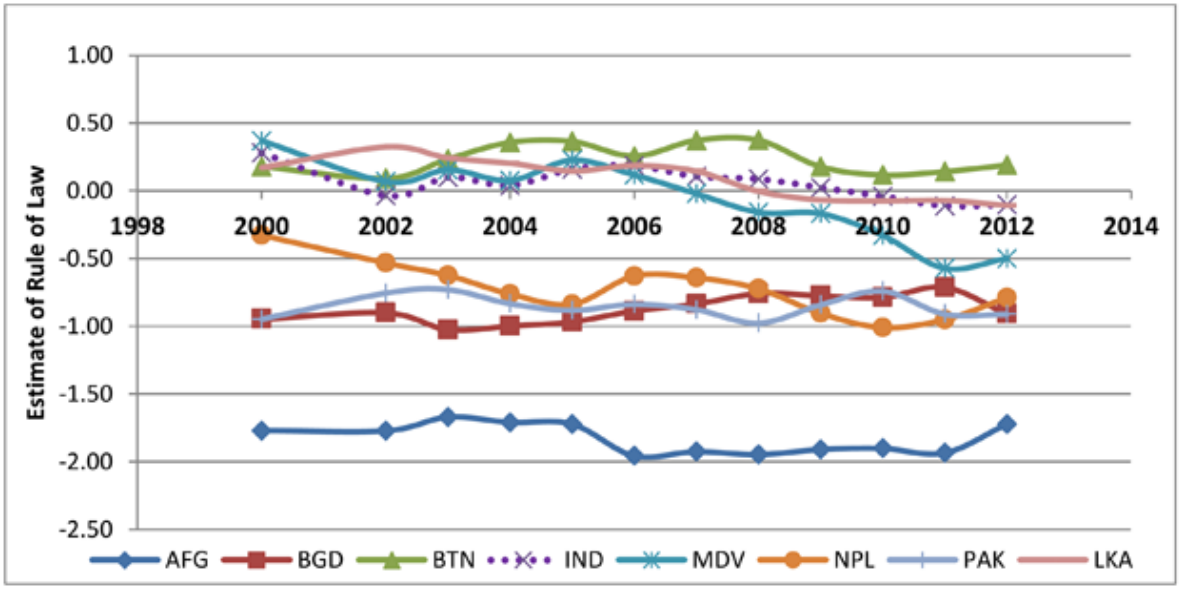
Source: World Bank Data,2001-12





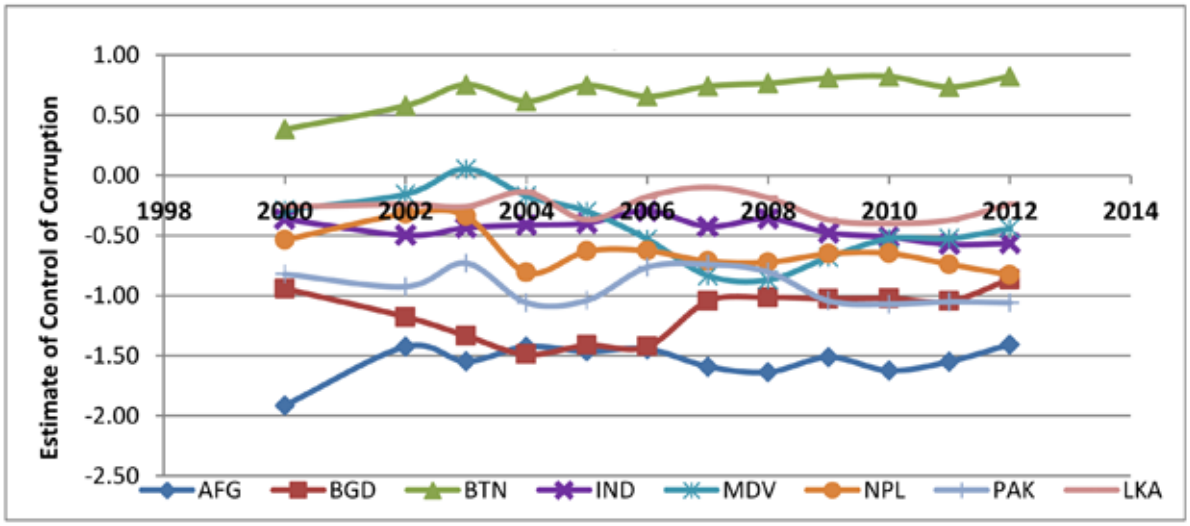


Figure 9. Rule of law in SAARC countries, 2000-2012
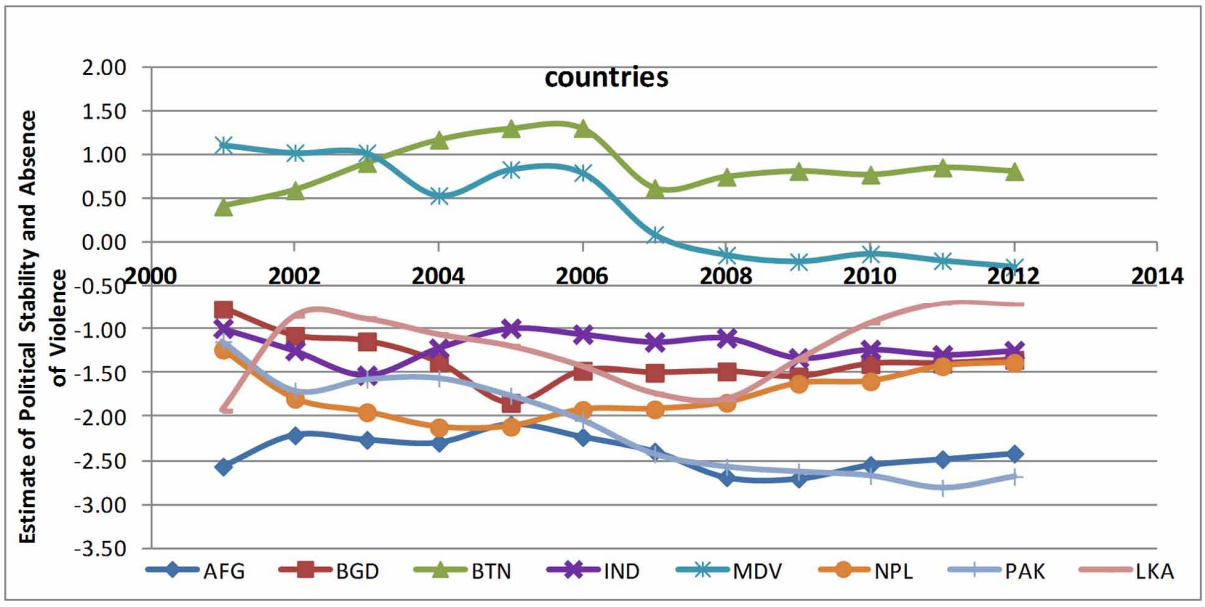
Source: World Bank Data,2000-12

The trend in control of corruption has been plotted in the following figure (Figure 10) which shows that only Bhutan among the SAARC countries has a positive estimate of corruption over the years of study and the index has been improving moderately over years. All other countries managed to remain below the benchmark of fair governance.



EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 10. Control of corruption in SAARC countries, 2000-2012
Source: World Bank Data,2000-12

In terms of political stability and absence of violence (Figure 11), only Maldives and Bhutan reported to be politically stable since 2001 which has declined in 2007 but has stabilized since then. But other SAARC countries have consistently been politically unstable and violent featuring the instances of weak governance in these countries which are dense in population with varied ethnic and religious backgrounds.

Figure 11. Political stability and absence of violence in SAARC countries, 2000-2012

Summary of Results

In this section, which simply analyses the trend in GDP per capita across countries over the last twelve years shows that all SAARC countries have experienced a rise in GDP per capita but Maldives has been doing exceptionally well among all its counterparts with a GDP per capita which is more than five times as that of India. In terms of the governance indicators, we find that Afghanistan reports very weak state of governance as measured by all six indicators, whereas Bhutan reports positive index of governance like control of corruption, rule of law, government effectiveness, and political stability. To our surprise, the regulatory quality and the freedom of people to raise their voices against the motion is quite poor in the said country. Maldives continues to be one of the popular holiday destinations in the South East Asia due to its consistent political stability and absence of violence and terrorism. This has a huge positive impact on the GDP of the country at large. All other countries like India, Nepal, Bangladesh, Sri Lanka and Pakistan have weak indices of governance with India as the only country among its counterparts which has a good estimate of voice and accountability pertaining to the freedom of speech, freedom to move against the motion and freedom of media.

This section illustrates impact of GDP per capita and the employment population ratio on the global hunger index (Table 7). The coefficient of log(GDPPCPPP) being -0.514 implies that Global Hunger Index is inelastic with rising GDP per capita measured at purchasing power parity. If GDP per capita rises by 1 per cent, GHI decreases by 0.51 per cent which is very obvious. Hunger and undernourish-

Source: Calculated from secondary data available from IFPRI, World Bank and ADB, 1990-2012

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment ought to decline with rising income or GDP per capita. Again, the coefficient of log (EMP_POP) is -0.723 implies that GHI is highly inelastic with rising employment-population ratio. If employment to population ratio increases by 1 per cent, GHI decreases by 0.72 per cent which makes sense. As employment increases, income goes up; hence households get the required food for their survival and also the basic health services. Thus the incidence of child mortality due to undernourishment and prevalence of underweight children become very rare with increasing employment opportunities.

Thus we can arrive at a conclusion that over the years from 1990, for the five SAARC countries viz. Bangladesh, Nepal, Pakistan, India and Sri Lanka, data for which were available for all the parameters under our consideration, the incidence of hunger and hence poverty has been declining over years from 1990 to 2012 with rising GDP per capita (PPP) and employment. The other three SAARC countries could not be included in the analysis due to unavailability of data for the specified years and the variables of concern.

Table 8 tabulates the results of the panel regression which has been based on data pertaining to the per capita GDP of the selected South Asian countries and the worldwide governance indicators. A balanced panel is prepared consisting of 8 cross-sections over the years 2007-13. Thus we have 56 observations in all. The dependent variable is the log of GDP per capita and the six dimensions of governance are the independent variables respectively. Besides these, there are certain other explanatory variables which are important determinants of the national output.

From the analysis, it is found that good government effectiveness, regulatory quality and a stable political situation with absence of violence stimulate the GDP per capita to a large extent. On the other hand, the ability of the people to raise their voice, the government's action to control corruption and the rule of law are seen to be having a detrimental effect on the per capita GDP of the SAARC countries. The most significant variable affecting the growth rate of GDP in the next period is government effectiveness with a coefficient of 1.27, a high 't' value at 94 per cent level of significance. Similarly, regulatory

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

quality and political stability and absence of violence were also found to be positively affecting the GDP growth at 96 per cent and 100 per cent level of significance respectively. The model fits well as the R^2 is moderately high for 56 observations only. The rest of the indicators were moderately significant in augmenting the SAARC countries' economic output. However, the dynamics may vary from country to country depending on the country's internal situations, the economic and political situation of the country.

Thus, from the analysis, it is clear, that counties with poor state of governance have low income. In terms of the indicator of government effectiveness, only Bhutan has a positive estimate of governance and a higher income (2013). On the other hand, exceptions are also there in countries like Maldives and Sri Lanka where in spite of having a poor state of government effectiveness, the GDP per capita is even higher than that of Bhutan which showed moderately good government effectiveness in 2013. Thus certain indicators act as important dimension of governance for certain countries and they cannot be generalized for all the countries across the entire time period of study.

CONCLUSION

To sum up, the growing rate of GDP per capita measured at purchasing power parity is found to have a significant negative impact on the Global Hunger Index of the SAARC countries of concern. As the GDP improves, the instances of poverty, hunger and malnourishment reported keeps on declining. The employment to population ratio was found to be having significant impact on the GDP per capita. As the country's employment to population ratio goes up, citizens are empowered with income, the instances of poverty, hunger and malnutrition show significant reduction.

To conclude, the developing nations with huge prospects for development must focus on administering the policy measures efficiently by effective and strict execution of the rule of law thereby acting as a facilitator for market transactions and social development. The respective governments must keep strict vigilance to check the rent seeking behavior among the public servants in developing nations who are very susceptible to taking bribes from the vulnerable low income vendors and beneficiaries which when exercised, plunge them into darker dens of poverty.

KEY WORDS AND DEFINITIONS

Corruption: Corruption is the misuse of *entrusted* power (by heritage, education, marriage, election, appointment or whatever else) for private gain.

Developing Countries: Developing country is a term generally used to describe a nation with a low level of material well-being (not to be confused with third world countries). Since no single definition of the term *developed country* is recognized internationally, the levels of development may vary widely within so-called developing countries. Some developing countries have high average standards of living. Countries with more advanced economies than other developing nations, but which have not yet fully demonstrated the signs of a developed country, are categorized under the term *newly industrialized countries*.

Economic Development: The act or process of growing or causing something to grow or become larger or more advanced

Economic Inequality: Economic inequality (also described as the gap between rich and poor, income inequality, wealth disparity, wealth and income differences or wealth gap) is the state of affairs in which assets, wealth, or income are distributed unequally among individuals in a group, among groups in a population, or among countries. The issue of economic inequality can implicate notions of equity, equality of outcome, and equality of opportunity.

Governance: The way that a city, company, etc. is controlled by the people who run it.

Hunger: It is a craving, desire, or urgent need for food and an uneasy sensation occasioned normally by the lack of food and resulting directly from stimulation of the sensory nerves of the stomach by the contraction and churning movement of the empty stomach.

SAARC Countries: The South Asian Association for Regional Cooperation (SAARC) is an economic and geopolitical organization of eight countries that are primarily located in South Asia.

Chapter 45
Games for Social Change:
Review of the Potential for Multi Player Online Gaming to Facilitate the Emergence and Growth of Progressive Movements for Social Change Within Youth and Community Work

Paul Keating
Limerick Institute of Technology Tipperary, Ireland

ABSTRACT

Building on the use of the internet and social media as sites for activism, this paper highlights the emergence of political activism and collective protest in the online gaming environment. Referencing social movement theory and the rapidly evolving capacity of multiplayer online games to facilitate the development of strong group identities and real-time, real-world collaboration, the paper explores the potential of such games to create a space and a mechanism for enabling the emergence of movements for social change. Highlighting the growing number of social activist games designers, building values of equality and social justice into their gameplay, the paper draws an epistemological link between the work of these "conscientious designers" and the process of Conscientization within youth and community work inspired by the critical analysis of political activists such as Paulo Freire and Augusto Boal.

INTRODUCTION

The rationale informing this review has emerged from the author's background as a Community Development academic and practitioner committed to addressing social exclusion among marginalised groups. The author has a particular interest in creative approaches to youth engagement and has concerns about the limited and contracting public space for critical discourse and mobilisation around issues of social justice. In this context the potential of multiplayer online gaming to provide such a space is worth exploring.

The objective of this review is to explore the extent to which there exists an ontological and epistemological overlap between those researching and developing digital games and those researching and engaged in critical social change through community development. The proposition informing this paper

is that should such shared values and vision exist to a significant extent across these two fields, there is the potential to build collaboration harnessing the power of games to the principals of community development. Such a collaboration could open up a new medium for undertaking community work and a new arena in which games can play a direct and considered role in driving positive social change.

The paper opens with a critique of the declining space for critical public discourse in the face of increased managerialism within the community and voluntary sector and posits that the internet provides an effective mechanics to facilitate such discourse and that Multiplayer online Games may provide a New Public Space in which progressive movements for social change can emerge. In order to assess the potential of digital games to facilitate the emergence and growth of such movements this paper goes on to present an overview of The Scale and the Scope of Online Gaming in terms of technical capabilities, applications and the structure of the digital gaming sector. This juxtaposition between the gradual decline in realworld spaces and the rapid growth in virtual spaces for interaction and discourse, especially among people, provides the social context informing this review.

The next issue to be explored is the nature of the space for critical discourse in the digital gaming sector and the lessons which can be learned from social activism within other media. The paper highlights the emergence of critical, or social impact gaming in response to the perceived and real hegemony and misogamy inherent in many Digital Games. Having presented Games for Social Change, as a movement within contemporary games development, informed by progressive social values, the paper examines the evolution, impact and limitations of Cyber Activism in the more conventional environments of blogs, websites and social media. This is important in mapping the potential of multiplayer online computer games, as it highlights the factors influencing the impact of those media and acknowledges the existence of two opposing camps with regard to the potential of electronic activism as a means of advocating for social change. The principal criticisms being levelled at cyber activism, highlight the superfluous nature of much of the engagement with critical issues and the limited meaningful interaction that such media facilitates between activists.

Research reviewed on social movement theory acknowledges the importance of shared values, identities, collective action, and sustained engagement in the emergence of movements for social change, characteristics which, as outlined, are underdeveloped in many digital media used by activists. The research reviewed would suggest that if gaming is to build on the achievements of conventional cyber activism then its capacity to generate Games-based Identity, Community and Solidarity may prove its greatest asset. This capacity for interaction inherent in multiplayer online games, coupled with the ability to design games informed by themes of social justice, establishes a clear potential for the use of this medium by social activists. Indeed simulation and role play games have been used for many years in community development as a method of undertaking critical social education, This ideological link between the epistemologies informing progressive gaming with those in critical community work provides the common ground upon which collaborations may be built.

While the main focus of this review has been the establishment of common ideological ground between progressive games designers and community activists in order to highlight the potential of multiplayer online games as a space for critical social discourse and the emergence of social movements, perhaps the most important characteristics of critical social education is that it encourages people to act to confront the causes of oppression. This presents the challenge addressed in the closing section of this review, that is ensuring that Real World Outcomes emerge from using ‘virtual world’ media. While the literature would indicate mixed results in this regard it does indicate that there are mechanics which can be designed into games in order to maximise the potential for action.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This review falls within a broader piece of research being undertaken by the author as part of Doctoral Research in Applied Social Sciences at University College Cork. The research, which is a collaboration with international development NGOs, seeks to define the characteristics of physical games used in critical Development Education practice and to investigate the extent to which these characteristics can be maintained within a digital gaming environment. The author is also lead investigator on a European project to facilitate young people develop digital games for use in youth work. Both of these require bringing Games Designers together with Development Practitioners in order to negotiate a shared framework from which they can collaborate. This review seeks to establish the common ground upon which they can stand solidly together to begin to construct such a framework.

New Public Space: Multiplayer Online Games as a New Public Spaces for Critical Discourse and Activism in Youth Work and Community Development.

In critiquing the status of contemporary Youth and Community Development in Ireland, O' Byrne (2012) highlights the general thrust of government policy towards the sector as being informed by neoliberal principles. She cites Meade and O Donovan (2002) as expressing concern that by the early 2000s youth work and community development, (despite the rhetoric), had lost much of its social change ethos. From 2008 onwards there has been; a centralising of control of the community development and youth sectors in Ireland; a reduction in the number and diversity of community development groups and programmes; an imposition of a managerialist financing and reporting regime; a contraction in funding and the abolition of national research and advocacy groups such as Combat Poverty and The Equality Authority. All of these measures have contributed to a significant contraction in the space that state supported youth and community development organisations have been able to provide for critical discourse and community based activism. In his analysis of participation in public policy, McInerney (2013) is led to suspect that the space for public participation in decision making is likely to contract even further in the coming years. In her critique of the emergence of the 'Claiming Our Future' movement in Ireland Murphy (2013) highlights the importance of, and the challenge in, nurturing public spaces where people can "deliberate and develop their political imaginations" Murphy (2013, pp. 122).

Duncombe (2007) posits that the conservative right in America has, throughout the 1990s and 2000s, manufactured cultural spectacles through the media and popular entertainment, which celebrate and reinforce their political position and defines popular discourse on social issues in the US. He points to the recent emergence of anti-capitalist counter cultural 'Sites of Resistance' around open-sourced-software and free exchange and collaborative websites. These are, he claims, opening up space for political activism and exploration. Duncombe (2007, pp. 73), citing the example of MoveOn.org where gaming platforms have been integrated with social media in order to mobilise around progressive political issues. Describing this as a promising start, he challenges progressive political movements to embrace a politics that recognises the allure of the creativity and spectacle in harnessing the power of rebellion, "It is not just winning or losing that matters but how the game is played," Duncombe (2007, pp. 75). Duncombe proposes that in the absence of a progressive ideological foundation such initiatives are often usurped by corporate interests.

In 2006 Mary Flanagan predicted that the popularity of computer games would lead to a cultural revolution. Citing Poole (2000) she asserted that: "Computer artefacts, over cinema, television, literature, and sport, are at the forefront of defining culture in the West," Flanagan (2006, pp. 495). Flanagan contended that this position of cultural dominance is overwhelming, affirming, and is affirmed by, capitalism through the game play itself and the commercial structure and financial dynamic of the industry. In a call to subversive action, Flanagan recalls the tradition of artistic intervention in public spaces intended to

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

radicalise and mobilise for social change. She defines second life and shared multiplayer games as public space and called on games designers to shift the authority and power in games toward non-hierarchical and participatory relations, thus challenging the social reality upon which the hegemony within gaming and broader society depends. Flanagan (2006). Given the potential that Digital Games present as a medium for critical public discourse it is important to look at its scale and technical capabilities.

The Scale and the Scope of Online Gaming.

The growth in participation in gaming over the past twenty years and the interactive capabilities that online gaming provides is nothing short of revolutionary. Jane McGonigal documents the 183 million gamers in the US spending on average 13 hours per week on their PCs, consoles or smartphones. This figure is mirrored across the developed, and indeed the developing world, with 100 million active gamers in Europe and twice that number in China, McGonigal (2011). A recent European Commission report highlights the fact that while 90 per cent of European 11-14 year olds play online games, the level of participation by the overall 11+ population stands at 35% in the UK, France 46%, Germany 25% and Spain 29% C, Centeno. (2013).

In parallel with this explosion in popular engagement, there has been a number of technological paradigm shifts in gaming which have seen the genre move from the single player arcade style games of the 1980s, to mobile and massive multiplayer online role play games (MMORPG). Such MMORPGs typically involve players embarking on quests, or missions within a virtual world and there encountering puzzles, obstacles and opponents that need to be overcome. These games have the added dimension that players may construct an online persona for themselves from a menu of characteristics and they often join a clan or a tribe with whom they collaborate. Such collaboration can be enhanced by text communication or by audio chat between otherwise anonymous players. In the course of play, players are typically encouraged to interact with other clans or individual players in a confrontational or collaborative mode. McGonigal points out that, “every single day, gamers worldwide spend a collective 30 million hours working on world of warcraft (the largest global MMORPG)” McGonigal (2011, pp. 60). According to Pearce (2009) this intensive, prolonged, interaction can generate a strong sense of community and collective identity.

The second significant technological advance in the hardware of the gaming industry has been in the technical capabilities and proliferation of hand held mobile devices. This has facilitated the emergence of real time interactive games which link with players’ locations and social media profiles. Games such as Farmville and Candy Crush, mimic real-world work tasks and accomplishments and integrate collaboration and interaction with friends into gameplay. This ability to play with, and assist, real world friends in such a casual and accessible manner builds the social connections of players and, according to McGonigal (2011, pp. 87), helps address the decline in social capital highlighted by Robert Putnam (2000) in his reflection on the deterioration in extended community within the US. (His well-known book on the subject employs a suitable gaming metaphor for its title ‘Bowling Alone’). While the proliferation of MMORPG and Social media games sets the context for this paper, the vast majority of games are designed, produced and marketed for commercial purposes. They provide limited public good and indeed many researchers highlight the negative social values inherent in many such games, attributes such as racism (Daniels 2012, Nakamura 2009), sexism (Harvey 2011, Flanagan 2009), exploitation and greed, (Wark 2007, Crocco 2011), aggression and the erosion of empathy. (Anderson 2010, Fraser 2012).

Games for Social Change: Towards a Higher Purpose

The leading industry forum "Game Developers Conference" held in March 2014 opened with a keynote address by Manveer Heir focusing on 'misogyny, sexism, racism, ethnocentrism, nationalism, ageism, ableism, homophobia, transphobia, queerphobia and other types of social injustice.' He challenged the industry to … "use the ability of our medium to show players the issues first-hand, or give them a unique understanding of the issues and complexities by crafting game mechanics along with narrative components that result in dynamics of play that create meaning for the player in ways that other media isn't capable of." Purchese (2014).

There are emerging movements challenging the emphasis on "trivial play" within the games industry. 'Serious Games', 'Social Games' and 'Social Impact Games' have all emerged as initiatives whereby the main purpose of the game is other than to provide entertainment. Marsh (2011) highlights some of the alternative objectives that games have been developed to serve within the business, health, military and education sectors. Marsh goes on to draw attention to the lack of coherence in the serious gaming sector and argues that this will give rise to a fragmented and unconnected movement…. "wherein, at best, factions or sub-groups begin to be formed and at worst, separate or detach themselves completely from the wider serious games community." Marsh (2011, pp. 67). Marsh proposes a descriptive scale or continuum based on the extent to which the game either contains the attributes of conventional games, i.e. fun and challenging gameplay, or the extent to which its main purpose is to provide experience and emotion in order to convey meaning.

One of the challenges associated with serious games is the diverse and often incompatible purposes to which the principles of serious games are applied, reflecting Marche's contention that the applications for serious games lie in the commercial and governmental sectors. An alternative perspective within the serious gaming genre would posit that the thing which distinguishes such games is not their format nor their gameplay attributes but rather the values which inform their design and development. With roots in both a feminist reaction to the misogyny within games and the critical analysis inherited from radical initiatives such as 'The New Games Movement' which surrounded the 1960s California counterculture, Critical Gaming, Activist Gaming and Games for Change are initiatives promoting the use of games for positive social change. Flanagan and Nissenbaum (2007). Crocco (2011) defines Critical Gaming as games where the principles embodied by games are used to promote critical thinking about hegemonic ideas and institutions rather than to propagate them.

Assuming therefore that Digital Games provide a space for critical discourse, that they have the scale and technical capabilities to engage on a global level and acknowledging the existence of a movement within gaming which sees games playing a role in social change, it is instructive to look at what has been achieved using other digital media and what can be learned from this experience.

Cyberactivism: From Blogs to MMORPGs - The Emergence and Evolution of Cyberactivism

In his analysis of cyber power and the internet, Jordan (1999) contends that the classic perspectives on power in society presented by Max Weber, Barry Barnes and Michel Foucault (REF) also apply to interactions on the internet. Power has been defined by these three sociologists as being the possession of the individual, as the constituent of social order or as domination by an elite over the masses, respec-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tively. The use of the internet to challenge dominant power structures was highlighted by Mayo (2005) in her analysis of the effective use of the internet by the anti-globalisation protests in the late 1990s. Increasingly, Mayo contends, electronic communication provides an opportunity for "solidarity globally and for enhancing local struggles" (Mayo 2005, pp. 120). Many researchers such as Chiluwa (2012) attribute a significant role to new media in facilitating popular protest in the Majority world. Others such as Howard and Parks (2012) claim that the key to such protest was not technology itself or even the scale of the use of technology, but rather how the discourse resonates with people within a context of political oppression and heightened expectation for change. In their comprehensive study of the Arab Spring, Wolfsfeld, Segev and Sheafer (2013) conclude that social media followed the protest, rather than lead it.

Bennett (2012) identifies three conditions which have contributed to the potential of social media as a mechanism for mobilising for social change: the ethos of diversity and inclusiveness, the rise of "crowd sourced" personalised calls to action, and thirdly, the fact that individuals can become the primary catalysts of change by launching stories or appeals through "often dense networks of social contacts". Jorden (1999, 208) defines cyberpower as existing in three arena, the individual, the social and the imaginary. The imaginary, which is concerned with imagining evolving social possibilities, drives the internet forward, creating a conflict between the expanding access to power by the grassroots and attempts to control it by the elite in order to exert social control or domination.

In Europe and North America the emergence of social media as a vehicle for political participation and collective action has been highlighted by Bennett. He proposes that the rise in personalised forms of political participation, through social media is the defining change in the political culture of our time Bennett (2012). This theme of digital activism among young people is further developed by Ficher (2012). She highlights numerous studies which have explored the effects of the so-called "technology Tsunami" on youth participation in United States politics, social movements and society more generally. The technologies in question include wireless handheld devices, the Internet, and social media such as Twitter and Facebook, known collectively as Web 2.0. One general finding cited by Ficher is that information and communications technologies facilitate protest and collective action. In fact, she finds that youth activists who were mobilized through the Internet were more likely to attend protest events than those who were mobilized through their personal connections.

Salters (2011) review of the use of social media by community groups suggests that it aligns with the values of participatory inclusiveness and builds on existing social relations and structures. with the potential to enable non-hierarchical community building. Obermeyer (1998) highlights the potential role of ICT as a democratizing force. Thrall, Stecula and Sweet (2014) highlight how international human rights groups use social media in their activist activities. Langman (2005) highlights the need for contemporary theory of social movements to consider the central role of electronic media and global networks in enabling 'virtual public spheres'. Activism can be defined from an individual perspective as engaging in specific steps with the intention of creating social change. It can also be focused on reacting to immediate social, political, economic, or environmental issues. Activism can also involve groups of people acting together in order to achieve a common goal.

According to Tarrow (2011), cited in Sandoval-Almazan and Gil-Garcia (2014), these social movements have four defining characteristics: collective challenge, common purpose, social solidarity, and sustained interaction. Ostrom (1990) adds to this a characteristic that social movements have a common pool of resources. As pointed out by Van der Donk et al (2004), social movements vary greatly in ideology, objectives, scale, structure and social profile. This diversity has led to a range of different theories and typologies by which such movements are described and critiqued. Historically, the study of social

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

movements has been divided into two traditions: 'new social movement' which emanated from European critique, and "resource mobilization theory" which has its roots in the US. Blodgett (2011) presents Frame Analysis as being accepted by both 'schools' and she sees it as particularly useful in the context of online social movements. She cites Snow and Bedfords' (1988) explanation that social movements organisations (SMOs) contain and produce views of the world that resonate with their individual members while also shaping how those members think about certain topics. Snow et al (1986) elaborate by referring to the necessary alignment between individual and SMO "interpretive orientations", such that the individual interests, values and beliefs and SMO activities, goals, and ideology are congruent and complementary.

Garner, R., Zald, M. (2012) acknowledges the influence of Marxist theories in analysing the way movements emerge from capitalism, albeit outside the classical Marxist class boundaries. She sees social movements as a form of reaction to advanced capitalism and the role of mainstream media in supporting the capitalist paradigm. It is not surprising then that she anticipates a defining role for information technologies in the growth of radical social movements, citing 'The Information Age' (Castells 1997) and the recent attention being paid by sociologists to the role of social media and the Internet in this field.

Game On!!: "Cyber-Sceptics" vs. "Cyber-Enthusiasts"

Wolfsfeld, Segev and Sheafer (2013) refer to the presence of two camps regarding the role of the internet in facilitating radical social change: the "cyber-enthusiasts" and the "cyber-sceptics." Miles (2014:112) critiques the "hype" associated with the internet not only as an "illusion" but a distraction which facilitates the accumulation of power by the elite. Wolfson's (2014, pp. 673) analysis of early internet based social activist initiatives concluded that the technology created a detachment between the activists and the social oppression about which they were advocating, making it difficult to build "long-term powerful social movements". Cabalin's (2014) rejection of the possibility of technological determinism in the analysis of student protest in Chile and their use of facebook proposes that the use of such technology simply aligns with classic theories of social movements by taking traditional action in innovative ways, but cannot be considered a trigger for political actions.

In his highly influential article in the New Yorker, titled "small change", Gladwell (2010) argues that social media has made it easier for activists to express themselves but more difficult for them to make a significant impact. The argument he makes reflects the treatise in "The Tipping Point" that social movements emerge through social networks, leadership on issues of critical importance to a community, community based action and reaction. He dismissed social media as being effective at increasing participation but only by lessening the level of motivation that participation requires. This "Slacktivism", he contends, happens among a large number of loose acquaintances, thus neutralising the impetus for action which common cause within a small group of committed activists creates (Gladwell 2011). Similarly, Bondes and Schucher (2013) highlight how many new forms of social activism are loosely connected and are based on the individual expression of emotions and personalized interpretations of the world. Such activism is often short-lived, they claim, attracting large numbers of participants but fading away rapidly. This perspective on cyber activism is reinforced by the observed lack of political radicalisation of Chinese youth in the aftermath of mass participation in online protest which, they conclude, "implies that expectations about the democratizing impact of online activism might be premature" Bondes and Schucher, (2013).

Youmans and York (2012) point out that social media, its governance, rules and structure are driven by commercial considerations, rather than being designed to facilitate activist users. The goals of platform

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

owners, developers and those legislating over the conditions for their use can often conflict with their use as tools for civil society and popular mobilization. One of the measures that the authors suggest to counter this hegemony is the development of ‘‘civic technologies,’’ such as Wikipedia, unconstrained by government or commercial gatekeepers. Thigo (2013) calls for the development of technology tools whose objective is to mobilise for change and which are constructed and remain rooted in the terrain of those who aspire for real social transformation. Such emancipatory technologies must not be neutral, must be people-centred and work in the interest of improving the lives of those in need. Konieczny (2014) reinforces the status of Wikipedia as a social movement organisation and highlights the political impact of its 2012 anti-SOPA protests whereby a global blackout of Wikipedia forced US Congress to retract proposed legislation which was seen as potentially threatening the future of the movement of over 20 million volunteers and 500 million distinct monthly viewers.

da Silveira (2013) highlights the impact on activists such as Aaron Swartz who, at the time of his death, faced prosecution by US authorities for making publicly funded academic research freely available online. His campaign proposing civic insurgence against the privatization of knowledge used hacking technology to pursue his ideology of freedom of access to cultural and scientific resources. da Silvera (2013) documents the rebranding of Hackers, from being a North American counterculture as depicted in Steven Levys' (1984) "Hackers: Heroes of the Computer Revolution". In her 2002 paper Laura Illia depicts hackers as cyberactivists engaged in different levels of criminality depending on the extent to which they interfere with the computer systems and information in the possession of private and state corporations. She uses terms such as "technical attacks" and "criminal intent" within the context of cyberactivism. In studying the way that hackers were portrayed in the mass media, Sandor Vegh (2005) noticed that after September 11, 2001, there was a change in the discourse. Hackers, who had, to this point, been depicted as common criminals, came to be described in the news as cyberterrorists (Vegh 2005). Vegh found that articles in the United States media increasingly used a sensational tone when talking about hackers, opening the way for the approval of laws and regulations that limit cyberactivism and "hacktivism."

Hal Budish (2012) highlights the real world impact that online activism can have, both in changing the social and political context against which the activism is directed but also in the consequences for the activists when those in power react against them. He responds to Malcolm Gladwell's criticism of cyber-activism by suggesting that perhaps those who limit their activism to "clicking a button" may not ever have mobilised behind a campaign in the first place. He goes on to suggest that rather than online activist campaigns mimicking conventional campaigning strategies by measuring success by the number of members secured or the number of emails sent, that new technology-enabled ways of participating and protesting should be used. He points out that rather than using the internet as a means of promoting an event or a protest that the lesson from The Egyptian experience showed that;

"By using the Internet to create opportunities for small, safe tasks that make it easy for individuals to contribute to a cause, it will allow many more to share in those transformative experiences, while laying the groundwork for greater forms of participation later on." Hal Budish (2012, pp. 772)

Taking this point that growing protest movements involves building trust, collective identity and a sense of communities, it is instructive to explore the extent to which digital Games might contribute to this process more effectively than other digital media.

Games-Based Identity, Community and Solidarity: From 'Theatre of the Oppressed' to Critical Gaming

In her analysis of the strength of shared identity within a second life community of gameplayers, Pearce cites Bernie DeKoven's concept of a "play community," sharing a strong social connection, as well as inclusive and flexible styles of play which can be transformed by the group themselves and by the spaces they interact in. The depth of the relationship and shared identity comes from the intensity of gameplay where players produce "... a 'CoLiberation', an optimal balance of individual self-awareness and group connectedness" (Pearce & Artemesia 2007, pp. 315). In her particular study of the game 'Uru: Ages Beyond a Myst' Pearce noted that when the game closed in 2006 players migrated on masse to other MMORPG s and brought with them their own culture and style of play, many choosing to reconnect with other Uru players to maintain their "play community". Leung (2013) builds on this analysis drawing from Anderson's (1991) notion of 'imagined communities' as a means of explaining the level of solidarity she found amongst participants in online activism. She proposes that the 'imagined solidarity' experienced by activists, and particularly anonymous activists, is both flexible and interactive, facilitating the emergence of non-hierarchical, democratic organisations. She goes on to suggest that cyberactivist identity is fundamentally different to the concepts of 'solidarity' which characterise conventional social movements. Her research findings show that bonds of solidarity are constantly changing depending on the individual activists' perception and the differing styles of group identity formation (Leung 2013). Leung presents the notion of 'imagined communities' made possible in an online contest because of the development of open spaces for participation, such as public cyber-space and interactive networks'.

Sanchez (2009) documents how a second life gaming environment allows users to connect with people with common interests and goals. This is being used by nonprofit organizations who are locating in Second Life, within a space called "Commonwealth Island" and the "Nonprofit Commons". They are connecting with potential supporters and undertaking development education projects directed at young people and schools in particular. This, claims Sanchez, shows the potential this space creates as "a virtual-world platform for real-life community engagement" Sanchez (2009, pp. 26).

Flanagan & Nissenbaum (2007) contend that games have long held a significant place in social activist movements in the US. The New Games Movement, for example, emerged in response to the social change and questioning surrounding the 1960s California counterculture. The members of the movement believed that the types of games people play, as well as the way they play them, were culturally significant. Many involved in the movement developed games informed by critical analysis of anti-racism, anti-sexism and social justice. Their intention was to transform culture through play.

Kims' (2014) analysis of the mass protests in Korea which mobilised behind a real time, mobile phone enabled, youtube campaign driven by young women, draws on the German Critical Dramatist, Bertolt Brecht's call for the use of theatrical art as a means of "criticising social injustices and inequalities and raising people's critical consciousness and agency – and, ultimately, create social change". Kims' (2014, pp. 130). She compares the popular forum created by theatre in the 1930s Germany with creative social media today. Julie Uldam (2014) develops this theme in her analysis of the use of pop-up theatre and video download as a means of increasing the visibility of social movements and protest.

Activist theatre director Augusto Boal's methods were derived from his work with marginalised communities in Latin America. In collaborating with Paul Freire he created the 'Theatre of the Oppressed'. This medium for social mobilisation incorporated games that could serve to 'act out' problematic social situations that directly affected participants' rights Boal (2002). This approach has been further developed

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in 'Training For Transformation' and 'Participatory Learning and Action' among many other critical methodologies for community development and social mobilisation.

Drawing directly from Freirean philosophy, Crocco (2011), presents two ways in which gaming can practise a critical pedagogy, that is, simulation and codification. Simulation sets out specifically to build social empathy with a marginalised grouping, while codification, in the tradition of 'Training For Transformation', involves analysis of a generative theme which is represented or "codified" in a media format, Hope & Timmel (2014), in this case within a game. The group analysis of the theme is the culmination in a process of identification, co creation and presentation of the code. Drawing from this radical tradition, Flanagan and Nissenbaum (2007) observe that given the power and proliferation of online gaming, similar values should form the basis by which contemporary gaming technology is judged.

While rooting Games for Social Chang in solid critical epistemological foundations it is also important that there are clear real world outcomes generated through engagement through games.

Real World Outcomes: Gamification…. and Beyond!!

The term Gamification is widely used to describe the application of game design elements into existing social, commercial or educational processes in order to attract an audience, generate feedback and moderate behaviour. O'Donnell (2014) acknowledges the potential of social and educational gaming; however, she is sceptical as to whether this can be sustained and mobilised for real world social change. This questioning is based on the fact that obedience to the rules is core to gameplay and most current game development is consumption-oriented, with "proper socially responsible rules" hidden beneath "the thin veneer of a game". O'Donnell (2014, pp. 356). The concept of Gamification has been popularised by games designers such as Jane McGonigal whose book, "Reality is Broken," presented the potential for positive real world change through games, McGonigal (2011). Jesse Schell's predicted a coming Gamepocalypse where "...every second of your life you're playing a game in some way". Most notably he gave the example of a toothbrush being connected to a lifestyle game where the player receives points for each time the brush is used, and the dental products companies receive valuable customer information. Zyga (2010).

Research into gamified drug prevention programmes undertaken by Schoech et al (2013), investigated games as a means of moderating young people's behaviour. They concluded that while there was a positive response from the young participants, it proved very difficult to measure the effectiveness of the game versus the potential of real world interventions. O Donnell (2014) presents the dichotomy between the games designers' Objectivism and the social activists' Constructivism, whereby the designer sees the outcome as being the performance of the game while the activist wants to know how things have played out in the real world. Even the best serious games are eventually posed the question, "Well, did you really do X?" At which point, you've broken the game designers' epistemological frame. She will cock her head and ask, "Well, did they play it? Did they have a meaningful experience? What story did they tell?" The person asking for proof will respond again, "But, did they really do it, get it, or learn it?" To which the designer will shrug and walk away. O'Donnell (2014, pp. 357)

In order to address this concern, Lundgren & Torgersson (2013) argue convincingly for the development of Hybrid applications which combine mobile technology with real world interventions, for example incorporating a requirement to go to a particular location and undertake a real world task as part of the gameplay. The potential use of hybrid games has been researched by Flanagan (2007) who concluded that these types of experiences could facilitate "empowerment, community building, and cultural change".

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Flanagan (2007). Further research into the use of Hybrid games in education undertaken by Avouris & Yiannoutsou (2012) concluded that "the social and collaborative aspect of these games helped in teaching skills like interpretation, acceptance of diverse perspectives, team work, information management, problem solving etc." cited in Lundgren & Torgersson (2013).

DISCUSSION AND RECOMMENDATIONS

This paper presents a strong case, and an epistemological basis for building strategic collaboration between digital games designers and community developers. Such a collaboration could produce a new way of doing community development, building on established Freirean methods but harnessing the power and omnipresence of digital games to engage, motivate and mobilise for change. This is undoubtedly a very appealing proposition given the potential for connecting with young people and forging transnational alliances as well as scaling up in a way unimaginable in "real world "community development. However there are undoubtedly many challenges in seeking to pursue a significant methodological paradigm shift.

Moderating such a collaboration is complicated by the fact that it straddles Social Sciences, Computer Sciences, the Creative Arts and Politics, disciplines with very distinct cultures and identities. There are many within youth and community work who would be horrified by the prospect of aligning their work with an industry that perhaps they don't understand, value, or believe has the capacity to engage on critical social issues with integrity. On the other hand, those who thrive on the fast tempo and creative energy of the games design and development industry might be challenged by the slow and uncertain pace necessary when working with marginalised individuals and communities. However, within this review the common theme connecting the analysis across these various fields is defined by values of social inclusion, creative engagement and a commitment to generating positive change. The starting point must therefore be the values inherent in progressive youth and community work and engagement with researchers and practitioners in other fields who share a commitment to these values. This is about taking a political position, articulating it and working with those who share it. While in the social sciences we are comfortable in doing this, it can be new and challenging for those in other disciplines. This may be best enabled through the creation of a community of practice, led by key Community Development Practitioners and Games Designers who share this common commitment to social change using games and community development methods and the medium and the mechanism for engagement.

The second challenge relates to, and emerges from, the first. It is the importance in creating interdisciplinary understanding and collaboration between academics and practitioners in the youth and community work sectors and games developers and designers. Common values are the foundation upon which this relationship can be built. However, action research and community based projects must form the mechanism for building working relationships, trust and mutual understanding. The challenges in designing and delivering collaborative projects which engage Academics, Community Activists and Games Designers as co-creators should not be underestimated as it requires a recalibration of our sectoral expectations of the outcomes of research. Assuming that the goal is to achieve optimal impact, such pilot projects can then be shared across sectors which are particularly adept at networking and adopting new ways of working. At the heart of this approach is a commitment to the principals of open source and the creative commons, principals perhaps, which challenge all, equally.

A further key challenge within this field of research relates to ensuring real world outcomes using virtual engagement. From this review, there is evidence to suggest that games combining interaction in

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

both the real and online worlds may better enable social impact. The potential for such hybrid gaming as a format is deserving of further research as a means of mobilising the player but also as a tool to balance engagement by games designers and community workers within gameplay. There is also the issues of how to measure outcomes from such an initiative. While it is tempting to focus on measuring and tracking online activity, the most significant impact of engagement with such games may not be reflected in game behaviour but rather in attitudes and behaviour in other digital media and in the real world. As with community development, an overemphasis on quantifiable outcome based evaluation often misses the most profound impacts in development processes and certainly feeds into the positivist, managerialist commitment to a direct cause and effect analysis and the control which goes hand in hand with this analysis. Perhaps, while not abandoning positivist evaluation entirely, we should be open to the possibility that community development processes which have integrity, as with art and education, are worthwhile in and of themselves, and that we must trust that they will lead to the creation of a more inclusive and equitable society.

CONCLUSION

Acknowledging the scale and intensity of engagement elicited by online computer games within contemporary culture and its emergence as a social space, particularly among young people. The paper points to the emerging common ground between progressive games designers and community development practitioners and building on the experience of activism in other digital media highlights the potential that exists for new social movements, to emerge within this space.

The challenges in constructing such collaboration are not inconsiderable. It be founded on clearly articulated shared values, must invest ownership of the process in the community and accept a degree of creative ambiguity in the outcomes. If the potential identified in this paper is to be achieved it will require a significant amount of trust. Trust across academic disciplines, trust between very different sectors and trust in a process and an idea which promises progressive social change.

Chapter 46
Holistic, Evolving Aspects of Nonviolence for Bringing About Needed Social-Political Change and Important Practitioners of Nonviolence

Linda Groff
California State University – Dominguez Hills, USA

ABSTRACT

This article examines holistic, evolving aspects of nonviolence—as a goal and as the desired means for bringing about needed social-political change, whether in schools or society, along with important practitioners of nonviolence. It covers Gandhi's principled and spiritually-based nonviolence for collective social-political change (Part 1); a number of other nonviolence practitioners in the Gandhian tradition—from different countries and spiritual-religious traditions working for different goals in their respective countries (Part 2); strategic nonviolence of Gene Sharp and others (Part 3); and additional forms of working nonviolently within existing systems that have emerged since Gandhi's time (Part 4).

INTRODUCTION

In addition to seven plus evolving aspects of peace—as visions and goals for society and the world from the Peace Studies Field, covered in other writing by this author (see, for example, Groff, January 2001; Groff, 2007; Groff, 2008; and Groff, 2009a and 2009b), one can also identify at least ten or more evolving aspects of nonviolence—defined as a desired goal and also as the desired means used to bring about needed social-political change, whether in schools or society, from the Peace Studies and Conflict Resolution fields. One can also study the lives and nonviolent struggles of various practitioners of nonviolence who have led their peoples in movements to achieve various goals needed in their respective societies. These nonviolent efforts can be either principled or spiritually-based, as part of a whole philosophy of

life, including Gandhi's pioneering use of nonviolence for *collective* social-political change (Part I), with a number of other purposive and spiritually-based practitioners of nonviolence in the Gandhian tradition (Part II), or they can be in the Gene Sharp tradition of strategic nonviolence, where nonviolence is used as a temporary strategy for bringing about needed social-political change that need not be spiritually-based (Part III). In addition to all the above uses of nonviolence to bring about needed change—initially *within* existing political systems, but eventually *outside* those systems, when particular laws must be challenged as unjust—a number of additional nonviolent methods for working *within* existing systems have also been developed since Gandhi's time, which will also be briefly summarized below (Part IV).

PART I: MAHATMA GANDHI'S *SATYAGRAHA* OR TRUTH FORCE – THE FIRST TO USE SPIRITUALLY-BASED NONVIOLENCE FOR *COLLECTIVE* SOCIAL-POLITICAL CHANGE

Introduction to the Great Significance of Gandhi's Nonviolence

While there have always been religious leaders historically who lived lives of nonviolence, as well as important *individual* practitioners of nonviolence in more recent periods before Gandhi—such as Leo Tolstoy in Russia (Green, 1986; Murthy, 1987; and Tolstoy and Garnett, 2006) and Henry David Thoreau in the United States (Thoreau, 2012; and other editions of his work)--modern nonviolent movements began with Mahatma Gandhi, who was the first person who led a *collective* movement using nonviolence for social-political change, in Gandhi's case first against discrimination that he experienced for being Indian in South Africa, and later when he returned to India to lead India's movement for independence from the British Empire. (See, for example, from the many writings on Gandhi's life: Carter, 1995; Easwaran and Flinders, 3rd Ed., 1997; Gandhi and Fischer, 2002; Gandhi and Brown, Eds., 2008; Gandhi and Mahadev, 1993; and Johnson, 2005.) All later practitioners of collective movements of principled and spiritually-based nonviolence, as part of a whole philosophy of how one lives one's life, go back to Gandhi as their inspiration. Gandhi was nominated five times for a Nobel Peace Prize before he was murdered in 1948—an irony for someone so committed to nonviolence. (The same happened to Martin Luther King.)

Stages in Gandhi's Nonviolent Movement

Gandhi believed that there were a series of stages that a nonviolent movement for social-political change needed to go through. He also believed that one must exhaust all of the possibilities of each stage before proceeding on to the next stage. In short, one cannot skip stages, and one hopes that each stage will be successful in achieving the goals of one's movement so that one need not go on to the next stage. Nonetheless, if necessary, a nonviolent movement will end up going through all the stages he outlined. (Ibid.; Dalton, 2012; Gandhi, 2001; and summarized from Gandhi's lifetime of nonviolent struggle.)

Gandhi's stages included:

Stage I- Utilization of All Regular Constitutional Machinery: Work through the existing system for change.

Stage II- Agitation Stage: Educate the people about the issues involved.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Stage III- Ultimatum Stage: Present demands to the government—which they can accept or reject.

Stage IV- Self-Purification Stage: Prepare for direct action by being sure one's motives are pure and not self-serving or egotistical.

Stage V- Direct Action Stage: Protests, boycotts, strikes, civil disobedience, etc.—but one only disobeys and challenges those laws which are deemed unjust.

Stage VI: If all else fails, *Set up a Counter-Government in Exile,* which is basically saying that the existing government has failed to respond to the legitimate needs of the people and demands of the nonviolent movement and has thus lost its legitimacy to represent the people. (Ibid.)

Characteristics of Gandhi's Nonviolence: Which All Later Practitioners of Collective Nonviolence Go Back To

Mahatma Gandhi's use of nonviolence, based on Satyagraha or Truth-Force, had the following characteristics (synthesized from this author's years of university teaching of courses on peace, conflict resolution, and nonviolence; Ibid.; Johnson, 2005; Borman, 1986; and Merton, 1965.) Gandhi believed: (1) The means are as important as the ends. This means that however noble and important one's cause, using violence to achieve one's goals can corrupt those ends. (2) One only opposes unjust laws, not all laws. (3) One's strength comes, not because one has superior military power, but because one has a just, moral issue on one's side. (4) One must exhaust all the possibilities within the existing system and within each stage, before going on to the next stage. (5) Nonviolence seeks to keep the conflict on a human level and seeks to get one's opponent, and world public opinion, to see that one does have a just issue on one's side. (6) Finally, one does not dehumanize one's opponent (which one must do before using violence against anyone), but one appeals to their moral conscience, to help them understand that one does indeed have a just and moral issue on one's side, which should be supported.

This is why, in nonviolence, one only opposes unjust laws, not all laws. As one example, Gandhi began his nonviolent efforts in South Africa, when he experienced being discriminated against just because of the color of his skin, which he saw as unjust, just as he later saw the continued British rule of India, and the British salt tax as one specific example, as unjust and worthy of nonviolent opposition to rectify the situation.

In using violence, in contrast, one must first go through a psychological process of making one's opponent seem less than human, via using derogatory terms to describe them, so that one can justify to oneself and others that one is indeed justified to use violence against them, including killing them. For this reason, it can be argued that nonviolence is a superior, more humane, and just form of seeking needed social-political change than violence.

The Spiritual Basis for Gandhi's Nonviolence

Gandhi was a devout Hindu who loved the *Bagavad Gita* (Gandhi and Desai, 2000), but he was clearly also open to the wisdom of other spiritual traditions. He thus regularly read to his children, and they in turn read to their children, from the scriptures of different world religions. (From conversations of this author with both Gandhi's grandson, Arun Gandhi in the U.S. at Summer Peace Institute, Antioch College, and with his grandaugher, Ela Gandhi at interfaith conference in South Africa.) Gandhi thus said: "I am also a Christian, a Muslim, a Buddhist, and a Jew," who also rejected the Hindu caste system. (Gandhi, 1993, 1957) In his childhood, Gandhi's mother, Putalibai, was also greatly influenced by the Jain

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

religion, which also practices nonviolence as a way of life, with Jain monks often visiting his household growing up. (Hay, 1971; and Willeford, 2014) The Jain monk, Shrimad Rajchandra, was also a spiritual guide to Gandhi and influenced his nonviolent thinking. (Rakeshbhai, 2014) These different spiritual principles and people that Gandhi was exposed to were also an important part of his later commitment to nonviolence as a philosophy and way of life. Others that influenced him were also Tolstoy (Green, 1986; and Murthy, 1987) and Ruskin.

PART II: EXAMPLES OF VARIOUS PRINCIPLED AND SPIRITUALLY-BASED PRACTITIONERS OF COLLECTIVE NONVIOLENT MOVEMENTS FOR SOCIAL-POLITICAL CHANGE IN THE GANDHIAN TRADITION

Introduction to Principled and Spiritually-Based Practitioners of Nonviolence in the Gandhian Tradition

There are a number of principled and spiritually-based practitioners of collective, nonviolent movements in the Gandhian tradition around the world who have been inspired by Gandhi's path-breaking initial efforts in using nonviolence for *collective* social-political change. They each go back to Gandhi to learn how he led a collective nonviolent movement, and how they can apply similar nonviolent methods to their own particular social-political goals in their respective countries and groups. These will each be briefly noted below (and elaborated in a forthcoming book, *Sustainable Peacebuilding,* by this author, 2017). This version of nonviolence is often called Principled Nonviolence (Holmes and Gan, Third Ed., 2012), with many such practitioners also coming from different spiritual-religious traditions—including Hindu, Muslim, Christian, and Buddhist traditions, amongst others--on which their respective practice of nonviolence is at least partly based.

Some Examples of Principled/Spiritually-Based Practitioners of Collective Nonviolence

The first group of nonviolence leaders in the Gandhian tradition to be covered here include: Badshah Khan; Martin Luther King, Cesar Chavez, and Desmond Tutu, after which various socially-engaged Buddhists will be covered.

1. *Badshah Khan* (or Khan Abdul Ghaffar Khan) was a devout Muslim of Pashtun origin, an independent political activist, lifelong pacifist, and spiritual leader opposed to British rule in the subcontinent of India. He was a good friend of Gandhi and was known as the "Frontier Gandhi." He strongly opposed the British partition of India, which nonetheless occurred (which also broke Gandhi's heart), favoring instead a united, secular India. Based on a belief in Gandhi's Satyagraha or Truth-Force, he started a monthly journal and founded a "Servants of God" movement, which included the world's first nonviolent army, which then led to a strong British crackdown. Under partition, the Pashtuns became part of Pakistan, where Khan sought autonomy for the Pashtuns, which was rejected by Pakistan. He spent time jailed or in exile, dying in 1988 while under house arrest in Peshawar, though allowed to have his remains sent to Afghanistan, according to his wishes. He remained a Pashtun national hero. (Easwaran, 2nd Ed., 1999; and Gandhi, R., 2008)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. The *Rev. Dr. Martin Luther King* was a Christian Baptist Minister and nonviolence leader of the U.S. Civil Rights struggle, who was inspired by Gandhi's use of nonviolence. He was a great orator. During his life, he organized bus boycotts, nonviolent protests, sit-ins, the Selma to Montgomery march, and the March on Washington, where he gave his famous "I Have a Dream" speech. His "Letter from a Birmingham Jail" is another famous statement. He was elected President of the Southern Christian Leadership Conference. Later in his life he also began dealing with poverty and the Vietnam War, making him even more controversial to some people. He received a Nobel Peace Prize for fighting racial inequality nonviolently. He was assassinated in 1968 (despite his commitment to nonviolence)—a day after giving another famous "I Have Been to the Mountaintop" speech saying: "we will get there as a people," even though I might not get there with you." (Washington, Ed., 1986; Carson, 1998; and King, 2003)
3. *Cesar Chavez* was a Christian nonviolence leader, union organizer, and civil rights activist in the U.S., who led the effort for the right of farm workers to organize a union to gain higher wages and improve their very bad working conditions. He co-founded with Dolores Huerta the National Farm Workers Association, which became the United Farm Workers in 1972. He participated in marches, boycotts (of grapes), and strikes. His hunger strikes may have contributed to his death in 1993. He was nominated three times for a Nobel Peace Prize, and was called "the Mexican Martin Luther King." (Pawel, 2014; Pawel, 2009; Levy, 2007; and Day, 1971)
4. *Bishop Desmond Tutu* is a retired Anglican Bishop from Johannesburg and Lesotho and a retired Archbishop of Cape Town, South Africa. He worked tirelessly and nonviolently to end Apartheid in South Africa, supporting disinvestment in South Africa at the time. He was a co-founder and Chair of the Truth and Reconciliation Commission that tried to help heal the deep wounds left from Apartheid. The Reconciliation process got people to account for their past sins under Apartheid, but it was criticized by others for not going far enough, since people who confessed their past sins under Apartheid were not further prosecuted or jailed. Tutu then worked to eliminate poverty, racism, homophobia, and other forms of discrimination and support human rights. He is credited with the term "Rainbow Nation" to describe South Africa's ethnic diversity. He is a Nobel Peace Prize winner and the winner of numerous other awards. (Tutu, 2nd Ed., 2007; and Tutu, 1995)

Further Examples of Practitioners of Collective Principled and Spiritually-Based Nonviolence in the Socially-Engaged Buddhist Tradition – Combining Inner Peace and Meditation With Social Engagement in the World

In addition to the above nonviolence practitioners, there are a number of important Buddhist practitioners of nonviolence from different Asian countries (some, but not all Buddhist monks), who were all deeply influenced by Gandhi in developing their own national nonviolent movements for various types of social-political change. They also combined their Buddhist spiritual traditions seeking inner peace through meditation with social engagement in the world that they learned more from Western practitioners of nonviolence, leading to the term "socially-engaged Buddhism"—first used by Thich Nhat Hanh. (King, 2009; and Queen and King, 1996) They include:

1. His Holiness the *Fourteenth Dalai Lama* is the spiritual and longtime, now retired political leader of the Tibetan people (only recently giving up his political role in 2011), who had to flee in 1959 to Dharmasala, Northern India to escape from the Chinese invasion of Tibet. Previously the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

two countries existed side-by-side, but after the Chinese invasion, the new Chinese Communist Government has claimed that Tibet is an integral part of China. In contrast, the Dalai Lama has sought autonomy, not independence, for Tibet within China, which has so far ignored his requests to resolve this issue. China instead has taken over much of the territory of Tibet, including its capital, Lhasa, moved many Chinese people into Tibet (making the Tibetans a minority within their own country), and also destroyed thousands of Buddhist monasteries—the center of Tibetan Buddhist spiritual and cultural life. An important goal of HH the Dalai Lama is to preserve the spiritual lineages of Tibetan Buddhism, through which the rich cultural and spiritual traditions of Tibet can survive. While Tibetan Buddhism within Tibet has suffered greatly, one consequence of the Dalai Lama's exile from Tibet is that he has brought Tibetan Buddhism to the rest of the world and become one of the most recognized and respected spiritual leaders on the planet. He is a Nobel Peace Prize recipient and author of many, many books. (Dalai Lama XIV, 2010; Ayer, 2008; Salty, 2011; and numerous other books by and about HH the Dalai Lama.)

The Dalai Lama has worked closely for years with Lobsang Tenzin (a Tibetan monk and Rinpoche better known as Venerable Professor Samdhong Rinpoche and to Tibetans as the 5th Samdhong Rinpoche)—the past Kalon Tripa or Prime Minister of the Central Tibetan Administration or Tibetan Government in Exile. Like HH the Dalai Lama, he is a lifelong advocate of nonviolence, based on Buddhist teachings, who also had to flee Tibet when the Chinese arrived. He was initially appointed as Prime Minister by HH the Dalai Lama and then, beginning in 2001, democratically elected by the Tibetan exile voters. ("Professor Samdhong Rinpoche," October 31, 2016) In 2011, HH the Dalai Lama gave up his position as political leader of the Tibetan people (while remaining its spiritual leader), with democratic elections being held that elected Lobsang Sangay to the new position of sikyong, or Prime Minister. He was recently re-elected in April 2016, pledging to continue to push for dialogue with China to resolve the future of Tibet, while also using the "middle way" of dialogue and nonviolence. (Anand and Tsering, April 27, 2016) He also represents a new generation of Tibetan leadership.

2. *Thich Nhat Hanh* is a Zen Buddhist monk from Vietnam & later Plum Village, France, who was the originator of "socially-engaged Buddhism" (Thich Nhat Hanh, 1967), which combined the traditional Buddhist focus on meditation and inner peace with social-engagement in the world, specifically choosing, during the Vietnam War, to also help the suffering of his people from the war. Besides being a Buddhist monk, he studied at Princeton University and taught at Columbia University. When North Vietnam invaded South Vietnam, he was banned from returning to Vietnam, though later given permission to return to visit. His efforts have inspired the work of the many other Buddhists (noted below) and peace-loving people globally. He has published many books, including: *Peace Is Every Step* (1991)*;* and *Being Peace* (2005). His theme is through mindfulness we can find happiness in the moment and inner peace—the only true way to peace in the world. He was nominated for the Nobel Peace Prize in 1967 by Martin Luther King. (Thich is his family name in Vietnamese.) (Thich Nhat Hanh, with Kotler, 1991; Thich Naht Hanh, 2005; and Willis, 2003)
3. *Maha Ghosananda* was a socially-engaged Buddhist monk and Supreme Patriarch of Cambodian Buddhism during the Khmer Rouge period and post-Communist transition period. He led numer-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ous peace marches and walks for reconciliation in Cambodia, in an effort to help heal the country after the killing fields of Pol Pot and the Khmer Rouge, while also working to clear land mines in the country. He was nominated for a Nobel Peace Prize four times and was called the "Gandhi of Cambodia." He passed away in 2007. (Bhikkhu, 2009)

4. *Sulak Sivaraksa* is a socially-engaged Buddhist intellectual, social critic, and peace activist from Thailand, who is Founder/Director of the Thai "Sathirakoses-Nagapradeepa Foundation" NGO, concerned with poverty and other social, economic, and environmental issues, has led peace marches and protests on such issues, and has challenged existing government policies. He is the author of over 100 books. He was awarded the Alternative Nobel Prize (Right Livelihood Award) in 1995. (Campbell, 2014; and Sivaraksa, 2005)
5. *A. T. Ariyaratne* is a socially-engaged Buddhist from Sri Lanka, and Founder/President of the Sarvodaya Shramadana Movement, which aids self-help development projects in 15,000 villages and helps people harmed by the years of civil war between the Sri Lankan government and the separatist Tamil Tigers. He works to empower the poor spiritually, as well as socially, economically, & technologically. He has been called the "Gandhi of Sri Lanka" and the "living Gandhi." He has also been nominated for a Nobel Peace Prize. (Ariyaratne, 1999; Ariyaratne and Nandesena, 1996; and Ariyaratne and Ratnapala, 1978)
6. *Aung San Suu Kyi* is from Myanmar, formerly Burma, who became a symbol and nonviolent, pro-democracy leader for her country's people after her father was killed by a military dictatorship. She lived under military house arrest various times and was unable to leave the country to even see her own husband, or her two sons, in England. She heads the National League for Democracy (NLD) and is a Nobel Peace Prize recipient. More recently, policies changed and elections were permitted, which led her to run for office and be elected to the Parliament, and later to be selected head of her country. Her neglect to speak out against oppressive policies against a Muslim minority group, the Rohingya, within her country today, has led to human rights criticism of her on this issue (Amnesty International, 2016), given her history as a symbol of the humans rights struggle of the Burmese people against a military dictatorship and her earlier Nobel Peace Prize. The transition to democracy in Myanmar is still, however, in its early stages. (Aung San Suu Kyi, 2003; Popham, 2013; and Winkle, 2007)

Important books have been written (as noted) on each of the above principled and spiritually-based practitioners of nonviolence, highlighting both their philosophies of nonviolence, as well as their nonviolent actions in their respective countries to bring about needed change—often against foreign occupying powers, authoritarian governments, or military dictatorships which were oppressing their own people in very undemocratic ways. For more on each of these practitioners of nonviolence—treated briefly here, see this author's forthcoming book, *Sustainable Peacebuilding* (2017).

PART III: STRATEGIC NONVIOLENCE FOR COLLECTIVE SOCIAL-POLITICAL CHANGE – GENE SHARP'S LIFETIME WORK, AND *A FORCE MORE POWERFUL,* BY PETER ACKERMAN AND JACK DUVALL

Gene Sharp's Pioneering Work on Strategic Nonviolence as a Temporary Strategy for Social-Political Change and His Lifetime Work Documenting Historical Cases of Nonviolence

Gene Sharp spent a lifetime documenting historical and current cases of nonviolence as a strategy for bringing about needed social-political change. He coined the term "strategic nonviolence," advocating that nonviolence could be used as a temporary strategy for needed social-political change, which need not be spiritually-based or part of a whole philosophy of life. Indeed, he did not want people to think that they needed to ground their use of nonviolence to some spiritual foundation in order to productively use nonviolence to bring about change. His commitment was to nonviolence as a far superior method than violence for creating needed change in the world (Sharp, 1970; Sharp, 1973a, 1973b, and 1973c; Sharp, 2003; Sharp, 2005; and Sharp, 2013).

Sharp also advocated the training of whole populations of a country in the use of methods of strategic nonviolence. First, he believed that this would ensure that a nonviolent movement would not be dependent only on a strong nonviolent leader for their movement to continue and succeed, particularly if their leader was jailed or killed by violence. Secondly, Sharp also advocated a policy of Civilian Defense, where whole populations are trained in how to resist a foreign occupying power, if that occurred, via non-military means, just by making that occupation extremely difficult for the occupying power to carry out. In this way, nonviolence could even be the basis for a whole non-cooperation strategy for national defense (Ibid.).

Peter Ackerman and Jack DuVall's Ongoing Work on Strategic Nonviolence in the Gene Sharp Tradition

Peter Ackerman and Jack DuVall follow in the Gene Sharp tradition of documenting many historical cases of strategic nonviolence, which they cover in their book, *A Force More Powerful: A Century of Nonviolent Conflict*, which also formed the basis for a PBS public television series (available on DVD). In their book, they examine many cases where nonviolence has been used successfully to accomplish different goals for social-political change, thus building on Gene Sharp's work (Ackerman and Duvall, 2000).

PART IV: ADDITIONAL NONVIOLENT WAYS TO CREATE SOCIAL-POLITICAL CHANGE – *WITHIN EXISTING SYSTEMS* – SINCE GANDHI'S TIME

There are a number of additional ways to work nonviolently *within* existing systems to bring about needed social-political change, which methods have all emerged since Gandhi's day. These various methods--each briefly summarized below—expand the nonviolent methods available for those seeking needed change.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Conflict Resolution, Management, and Transformation

Initially there was a view that the goal was to resolve all conflicts, but with time it was realized that conflict seems to be part of life and the goal is not to eliminate all conflict, which is impossible, but to find more constructive ways to deal with conflict—including when it could not be immediately resolved. Thus at least three different versions of how to deal with conflict have emerged in the field over time, including conflict resolution, conflict management, and conflict transformation—all ways to help parties to resolve their conflicts and differences over different time periods. (For a good overview of the field, see Ramsbotham, Woodhouse, and Miall, 2011.)

1. **Conflict Resolution:** The oldest form of dealing with conflict is conflict resolution, where the goal was to resolve conflicts when they occurred. Conflict and conflict resolution was thus examined from the perspectives of a range of different social and behavioral sciences. (See McNeil, 1965 as a great example of examining conflict from the perspective of many different social and behavioral sciences; and Deutsch and Coleman, 2000. Other studies examined conflict from the perspective of particular social sciences, such as: Kriesberg and Dayton, 2012; Coser, 1956; and 1967; Frank, 1967; Nye, 1973; and White, 1970.)
2. **Conflict Management:** Next came conflict management, where it was recognized that not all conflicts can be immediately resolved, but maybe they can be managed, so that they do not get totally out of control. (See, for example, Kahn, 1988; and Ricigliano, 2012) A good example of conflict management was the whole history of U.S.-Soviet relations during the Cold War, where despite arms races and sizeable numbers of nuclear weapons pointed at each other, and despite the Cuban Missile Crisis in October 1962 (when both parties probably came closest to all-out nuclear war), both sides somehow managed to keep the conflict "cold" (and not hot). They did this via focusing on arms races based on nuclear deterrence theory (where the goal was to build up nuclear weapons to *deter* one's opponent from attacking one and not have to actually *use* those weapons—as crazy as that seems), on periodic arms control and disarmament negotiations and agreements, and on competition for support in the rest of the world, especially the developing countries of the Third World, without letting the conflict degenerate into all-out nuclear war, which would have destroyed *both* sides. Here avoiding a nuclear war was win-win, while actually having one would have been lose-lose. (See Allison and Zelikow, Second Ed., 1999; Kennedy, 1971; and Peters, 2016, on the Cuban Missile Crisis.)
3. **Conflict Transformation:** The most recent term is conflict transformation, which takes a longer-term perspective, recognizing that before certain conflicts can be resolved or even addressed, a transformation must first occur in how the parties view each other and/or the conflict, leading to a longer term peacebuilding perspective. (See Lederach, 2003; and Lederach, 1996 as examples.) Conflict transformation has thus become an important addition to the field.

Alternative Dispute Resolution (ADR), as an Alternative to Litigation, and Including Negotiation, Arbitration, and Mediation

Alternative Dispute Resolution or ADR is a huge topic with various forms that have evolved over time that all seek various alternatives to litigation. ADR is sometimes tied to existing court systems, as a required or recommended alternative to litigation, or independent of court systems. ADR also varies with

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

different countries and cultures. It is only possible to give a brief introduction to some aspects of ADR here. For a more in-depth discussion of ADR, see other articles in this book, or other outside sources, including legal sources on forms of ADR. What is significant here is that various forms of ADR provide additional examples of nonviolent methods for working within existing social-political systems that have evolved since Gandhi's time. Of the various forms of ADR available, only negotiation, arbitration, and mediation will be briefly covered below.

Traditionally, litigation was a dominant form of conflict resolution in the West, while non-Western countries traditionally focused on mediation to resolve conflicts. ADR then arose more recently as an alternative to litigation in the West (which can often be quite adversarial, and costly—both financially and emotionally). It includes a number of different forms, including but not limited to, negotiation, arbitration, and mediation (though mediation is practiced a bit differently in Western and non-Western countries, as noted below). (See, for example, Esplugues and Barona, 2014) Alternative dispute resolution then began being taught in law schools, business schools, and the social sciences in the West. (Nolan-Haley, 2001) It is interesting here that Gandhi, as a product of both East and West, was both trained as a lawyer/barrister in England, but also enjoyed resolving conflicts informally (Disalvo, 2015).

1. **Negotiation:** This is an age-old method where parties to a conflict talk directly with each other in trying to resolve their conflict, and where they may or may not come to a final agreement that would resolve the conflict. Power for resolving the conflict thus resides with the parties to the conflict themselves. *Getting to Yes* is one very popular model for negotiation in the West, based on getting beyond initial positions of both parties to finding their real underlying needs on which a solid agreement can be based. (See, for example, Fisher, Ury, and Patton, 2011) A goal of negotiation is thus to try to move the conflict from win-lose to win-win, where both parties get some of their underlying needs met, which also gives both parties more incentive to continue to support the treaty or agreement afterwards. In addition to this Western model of negotiation, the influence of cultural differences on negotiating styles of people from different countries must also be taken into account, when parties come from different cultures. (Binnendijk, Ed. 1987; and McDonald, 1996 as examples)
2. **Arbitration:** Here an outside third party, who is often a trained lawyer and arbitrator, is selected by the parties to the conflict to resolves the conflict. The parties each present their case to the arbitrator, who then decides the outcome, and therefore has the real power in the situation. One can also have both legally binding or non-binding arbitration. As an example, medical offices often require that patients sign an agreement to go to binding arbitration, if they have a conflict with their Doctor over the services performed and cost (although such agreements are being challenged in court today). Sports owners also often require players to sign an agreement to go to binding arbitration, if they have a conflict with the owners or management.
3. **Mediation:** Mediation has been the preferred form for resolving conflicts in the non-Western world for centuries. In the West, in contrast, mediation is a much more recent phenomenon that has emerged as one of the ADR methods providing alternatives to litigation. It is also practiced somewhat differently in Eastern/Indigenous versus Western cultures. In the West, the mediator is supposed to be someone totally neutral and not connected to either of the parties to the conflict, in an effort to be "objective." In non-Western cultures and communities, in contrast, mediators are regular members of a community, known by everyone in the community as someone who can help mediate conflicts between members of the community when needed.

With mediation in the West, an outside third party—agreed to by the parties to the conflict--is brought in to help facilitate the parties resolving their conflict. Like negotiation, it is up to the parties themselves whether they can come up with a final agreement resolving the conflict or not. The power therefore rests with the parties to the conflict. Sometimes there is also co-mediation, as during divorce proceedings, when both a male and a female co-mediation team may help with the mediation. If the parties to the mediation come to an agreement, which is non-binding, they can then sign a separate legal agreement after the mediation, making their agreement binding. If no agreement occurs as a result of the mediation, then the parties can always go back to litigation. (See, for example, Bush and Folger, 1996; and Roberts, 2007.)

For other forms of ADR, such as neutral evaluation, collaborative law or collaborative divorce, conciliation, and ombudsmen (within organizations), please see other outside sources or articles in this book.

Dialogue, as an Alternative to Debate, and Search for Common Ground

Dialogue

It is common in legal circles, as well as cultures like India, to honor rigorous debate as a way of getting better at the truth of a situation or issue. In contrast to this, dialogue has emerged as a global social movement taking a number of different forms today, but all aimed at providing an alternative to debate that can lead to greater understanding between parties, even if not total agreement. In this view, in debate people too often seek to totally win at the other party's expense. They then also seek to make the other side wrong so that they can be right. This seems based on a psychological fear that if they acknowledge the validity of the claims of the other side, that this will undermine their own claims in the situation. In contrast, dialogue aims at listening to increase understanding between parties, even if they don't totally agree, while also seeking areas of common ground, wherever and whenever possible. Ideally, dialogue thus aims at helping parties move from different initial positions to a new third position created by both parties together (Dallmayr, 2013; Flick, 1998; and Tannen, 1998).

Dialogue is often done informally, not always in a formal negotiation setting. Dialogue can also occur between groups over long periods of time, again with the goal of creating greater understanding, as well as better relations and even friendships, but not necessarily agreement on all issues. One example is ongoing dialogue between Muslims and Jews in the U.S. over the future of Palestine and the Middle East.

Search for Common Ground

Related to dialogue and various forms of Alternative Dispute Resolution is the life work of John Marks, a journalist who founded "Search for Common Ground" in 1982, during the height of the Cold War, based on a commitment to "transform the way the world deals with conflict—away from adversarial approaches and towards collaborative problem solving." They work with local groups at all levels of society to build sustainable peace using "dialogue, media, and community," helping people "discover and achieve shared goals" (Skoll, May 28, 2014).

Some years ago, John Marks created a video program on *Search for Common Ground* for public television, which brought together representative leaders of hawks and doves on national defense, with a third party facilitator (William Ury of *Getting to* Yes fame) with the goal of finding areas of common ground amongst leaders of organizations who initially thought they had nothing in common. Marks also shared another example of a group formed of advocates who were pro-life and pro-choice on the issue of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

abortion. He said they met for years, never totally agreed, but developed greater understanding of each other's positions, and actually became friends over time, thereby illustrating how ongoing dialogue can have a positive effect in creating more understanding between parties (*Search for Common Ground.* N.d.).

It is not an accident that dialogue is also occurring, in different forms, as a global movement today, since the diversity of humanity is now coming together and interacting –not only within countries and societies, but also internationally in our increasingly interdependent world. This is all necessitating the need to create greater understanding across all our cultural, civilizational, religious, and other differences. Additional forms of dialogue, in response to this need, include: Intercultural Communication and Dialogue; the Dialogue of Civilizations; Interreligious/Interfaith Dialogue; and Interpersonal Dialogue—all covered next.

Intercultural Communication and Dialogue

There is a whole field of Intercultural Communication and Dialogue, teaching people how to constructively deal with cultural diversity and communication between peoples of different cultures. (Storti, 1999; and Trompenaars and Hampten-Turner, 1998 as examples.) Two basic principles in this field are: (1) the message sent is often not the message received, even though we often assume that people interpret what we are saying with the same meaning that we had when saying those words. (2) The Intercultural field thus teaches people to distinguish between DIE: (a) *Describing the behavior* of someone from another country, which is a strictly factual statement, such as: "Tom just walked into the room." (b) *Interpreting the meaning of the behavio*r of someone—especially from another culture, and this is where problems occur, since people—if they don't know much about another culture—will tend to interpret the meaning of that behavior based on what it would mean in *one's own* culture, not the other person's culture, thereby *misinterpreting* the reasons for, and meaning of, that behavior. (c) *Evaluating or Judging that behavior* as positive/acceptable or negative/unacceptable, based on one's interpretation, or misinterpretation (Groff, 2011; Groff, 2005b; and Groff, 2002).

One good example of this between the U.S. and Japan is as follows: In the U.S., people interrupt each other all the time when they speak, whereas in Japan it is considered very rude to interrupt anyone when they are speaking. Another example is that in Japan, one traditionally does not look directly into another person's eyes, whereas in the U.S. this is interpreted as not being honest. If one does not know the other person's culture, then one can interpret such behaviors very negatively, without realizing that such behavior is the accepted, proper behavior in the other person's culture. People thus tend to end up using *Judgment* terms about the behavior of a person from another culture when they think they are just *Describing* that behavior, not even realizing that they have jumped from Description to Interpretation to Judgment. So becoming *conscious* of *DIE* can help one better interact and communicate with someone from another culture, but this require some familiarity with the underlining cultural values and accepted behavior patterns of someone from another culture (Ibid.; and Groff, 2009).

The Dialogue of Civilizations

Another related global cultural debate was between Samuel Huntington's "Clash of Civilizations" versus the "Dialogue of Civilizations" proposed by others. Huntington hypothesized that the end of the Cold War would be replaced by a "Clash of Civilizations," and outlined his version of eight global civiliza-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions, where he proposed that differences between the values underlying these civilizations would lead to global conflicts dominating the world in future. (Huntington, 1996; and Huntington, Summer s' 1993) This thesis has been used by some to highlight differences between Western and Islamic civilizations—in particular Al Qaeda and ISIS, not realizing that both these movements are great aberrations in the fundamental beliefs of Islam that the vast majority of Muslims adhere to. In response to Huntington's thesis, a whole global movement arose advocating the "Dialogue of Civilizations" as the only healthy path to follow and promote in our increasingly interdependent world going forward (Groff, 2011; Groff, 2006; and Groff, 2005a).

Interreligious/Interfaith Dialogue

In addition to Intercultural Communication and the Dialogue of Civilizations, there is also a whole global movement called Interreligious or Interfaith Dialogue. Religion is both part of culture and learning, but also sometimes transcendent and based on direct inner spiritual experiences of people that go beyond social and religious learning. A few principles of interfaith dialogue—when people come together across different faith traditions to interact and dialogue with each other—include the following: (1) Be open and listen, without judgment, to the spiritual-religious views and experiences of others; (2) Don't try to convert people; (3) Don't try to create one world religion; (4) Let people speak from their own experiences within their own religion, i.e., don't say what it means to be a member of someone else's religion that you are not part of; (5) Allow the possibility of some common spirituality that connects people across different religions; (6) Realize you can enrich your own religious life and practice via being open to sharing beliefs and practices with people from other traditions, without having to leave one's own tradition; and (7) Realize that throughout prehistory and history, people have sought—via different spiritual-religious traditions—to seek some deeper meaning in life that connects them to the great mysteries of life, which search connects people across different faith traditions (Beversluis, 2000; Groff, 2005b; Groff, 2005a; and Groff, 2002).

Much global, grassroots interfaith dialogue is also occurring today under organizations such as The Council for a Parliament of the World's Religions and United Religions Initiative, along with dialogue also occurring between leaders of the world's faith traditions under the former organizations, as well as under the World Council on Religion and Peace and via Intermonastic Dialogue.

Interpersonal Dialogue

In addition to the above forms of dialogue, there is also interpersonal communication and dialogue between people on an individual level, which is also important. (Bolton, 1979; and Lasater, 2009) Principles from all the above forms of dialogue—cultural, civilizational, and religious--can also impact interpersonal dialogue in different cases.

Please note that all the above forms of dialogue—intercultural, civilizational, and interfaith—are all covered under this writer's fifth (of seven) evolving aspects of peace, i.e., Intercultural Peace, with different aspects of peace defined as visions and goals for society and the world, that if addressed would help create a more peaceful society and world and help to build cultures of peace on planet earth. (See Groff, Jan. ///2001; Groff, 2007; Groff, 2008; and Groff, 2009a; and Groff, 2009b, as examples.)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Prayer/Meditation, Love/Compassion: From All the World's Spiritual-Religious Traditions

It is important to also mention the role of prayer and meditation in helping people to become centered and find inner peace as a way to become more peaceful in their relations with others in the world. Western religions, like Christianity, have focused on love, while Eastern religions, like Buddhism, have focused on compassion, but both involve ways to recognize one's interdependence and interconnectedness with others, including an ability to put oneself in another person's shoes or situation in the world—all things that can help to nonviolently create a more peaceful world. (See, as examples, the Dalai Lama, 2016, and Thich Nhat Hanh, 1991, and 2005, on meditation; and Merton, 2004, and 1971 on prayer.)

Summary Conclusions on Nonviolence as the Means Used to Create Social-Political Change in Support of Different Aspects and Goals of Peace

In summary, this article has shown how methods of nonviolence have evolved over time as the desired means for bringing about needed social-political change and for creating a more peaceful society and world. Thus nonviolence has evolved from individual efforts at change to a number of collective efforts, with purposive and spiritually-based practitioners, beginning with Mahatma Gandhi, leading these collective efforts, followed by strategic nonviolence in the tradition of Gene Sharp. A number of additional nonviolent methods for bringing about needed change *within* existing systems have also emerged since Gandhi's time.

For more details on all these nonviolent methods and practitioners of nonviolence, see this author's forthcoming book: *Sustainable Peacebuilding* (Groff, 2017, Part II). For good case studies on the use of Nonviolence, see Holmes and Gan (Third Ed., 2012)*;* and Ackerman and Duvall (2000), as examples.

Given the great destructiveness of modern weapons and technology today, and the ongoing occurrence of way too much violence—both within societies and internationally, it becomes more imperative than ever that we commit to resolving conflicts in nonviolent ways in our communities and in our increasingly interdependent world. If this is to occur, we must in turn work towards including the teaching of nonviolent methods of conflict resolution in our schools—to students at all levels and ages—as well as to other members of society in religious and other community organizations. We must learn to break the cycles of violence, and retaliation with more violence, by learning and committing to use nonviolent methods of conflict resolution and social change.

The future world that we will all be living and working in will be greatly impacted by whether or not humanity is able to move towards more nonviolent methods of conflict resolution. One could even say that our human survival may depend on this! In short, we must evolve our thinking and consciousness, and based on that our human behavior, if we want to create a better future for humanity as a whole, and for each and every human being on this Earth. We must wake up and consciously and responsibly make such a decision.

One final point: given that everything in the universe keeps evolving, it is safe to also conclude that nonviolent methods will also continue to evolve in future, as the world keeps changing and the types of issues needing to be addressed also keep evolving. But despite different methods of nonviolent action, one thing is clear: the future evolution of humanity depends on humanity moving increasingly to finding creative, conscious, and responsible nonviolent ways to resolve our conflicts and differences, based on a recognition and acceptance of our increasing interdependence on this precious planet Earth that we all call home!

KEY TERMS AND DEFINITIONS

Alternative Dispute Resolution (or ADR): A movement that arose in the West based on finding alternatives to litigation (the dominant form of conflict resolution at the time), which is often adversarial and costly—both financially and emotionally. Forms of ADR include: Negotiation, Arbitration, and Mediation.

Arbitration: When parties to a conflict go to a third party arbitrator to each present their positions on the conflict to the arbitrator, who then decides the outcome.

Conflict Management: View that not all conflicts can be totally resolved, and in this case, the goal should be to try to manage conflicts, so that they don't get totally out of control.

Conflict Resolution: View originally that the goal was to resolve all conflicts and try to eliminate conflict from society. This evolved into view that conflict is part of society and life, and that the goal is instead to find better, more nonviolent, more win-win ways to resolve conflicts when they occur. Includes analysis of conflict and conflict resolution from the perspective of many different social-behavioral sciences.

Conflict Transformation: View that sometimes before conflicts can be resolved, there must be some transformation and change in how the parties to the conflict view the conflict and each other, requiring a longer-term perspectives.

Culture of Peace: A term adopted first by UNESCO (United National Educational, Scientific, and Cultural Organization) and then by the United Nations General Assembly as a goal for societies to seek to create.

Dialogue as an Alternative to Debate: Dialogue—in various forms—has become a global movement that seeks to promote greater understanding between people via listening and seeking areas of common ground—where they can be found—without requiring agreement on all issues. In contrast, debate is more adversarial and usually seeks to promote one's own position on an issue, while negating the validity of the other party's position. Dialogue can be intercultural, intercivilizational, interfaith, and interpersonal.

Mahatma Gandhi: Leader of the Indian movement for independence from the British Empire. He was the first to use nonviolence for *collective* social-political change, leading to many later practitioners of principled and spiritually-based nonviolence to go back to Gandhi to learn how he used nonviolence, so they could apply those lessons to their own nonviolent movements in their own countries—often for different goals.

Mediation: When parties to a conflict agree to ask a third party mediator to help facilitate their interactions in an effort to resolve their conflict, which may or may not occur. If the mediation leads to an agreement, then it can be followed up with a legally-binding agreement. If no agreement occurs, then the parties can return to litigation instead to resolve their conflict.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Negotiation: When parties to a conflict come together to talk and "negotiate" directly with each other to try to resolve their conflict and differences. This may or may not lead to a formal agreement.

Nonviolence: A goal for society and the world (in contrast to violence), and also the desired means to use for bringing about needed social-political change.

Peace: The desired goals that one seeks to achieve to bring about a more "peaceful" society and world, and to help in building "cultures of peace" on planet earth.

Peace Studies: A field dedicated to the question of how to bring about a more peaceful society and world. This includes supporting goals for social justice, opportunities for all members of society, sustainable development, and other goals, as well as bringing about such needed social-political change via nonviolent means.

Principled and Spiritually-Based Nonviolence: This is when practitioners of nonviolence use nonviolence to bring about needed social-political change based on certain principles, including often spiritual principles, on which they practice their nonviolence as part of a whole philosophy of life, believing that the means used to bring about change are as important as the goals being sought.

Socially-Engaged Buddhism: A movement amongst Buddhist practitioners of nonviolence, begun by Thich Nhat Hanh, who have combined the traditional Buddhist focus on meditation and inner peace—as a precondition for peace in the world—with the goal of social-engagement and action for social justice in the world that they have learned especially from Gandhi and Western peace activists.

Strategic Nonviolence: This is when nonviolence is used as a temporary means for bringing about needed social-political change, without having to be committed to nonviolence as a whole philosophy of life (in contrast to principled and spiritually-based nonviolence). This version of nonviolence is based on the world of Gene Sharp and others following in his tradition.

Chapter 47
Poverty Reduction, Wealth Creation, and Tourism in Ethnic Minority Communities in Mainland Southeast Asia

Scott Hipsher
Webster University, Thailand

ABSTRACT

This article describes how there is a debate over the benefits and costs of international tourism and engagement with international trading networks for people living in areas where poverty continues to affect a large percentage of the population. An examination of the perspectives of ethnic minority micro-entrepreneurs on the impact of tourism on their lives and communities is presented. It was found most individuals from these communities find tourism increases livelihood opportunities and neither want to be isolated from the global economy nor want to abandon their traditional cultural values; instead it is preferred to have additional the additional livelihood options which tourism creates.

INTRODUCTION: EXPLOITATION OR INCREASED OPPORTUNTIES?

There is considerable debate over the impact of foreign investment, engaging in international trading networks, and hosting tourists as a means to improve the lives of individuals living in poverty. On one side are the claims international tourism and other forms of engaging in international economic activities result in exploitation and damage to individuals and communities in developing economies (e.g., Britton, 1982; Chok, Macbeth, & Warren, 2007; Hall & Brown, 2010). While on the other side it is argued foreign investment, engaging in international trading networks, and international tourism help to reduce poverty and improve the lives of the people living in areas where poverty is widespread (e.g. Hipsher, 2013; Khaleh, Hadavi, & Zamani, 2016; Seetanah, 2011). However, these debates are normally carried out between individuals in developed economies and the views of individuals in developing economies working in the tourism industry are rarely included in these debates (Pleumarom, 2012, pp. 101-102).

Therefore, the objective of this research article is to present the viewpoints of a few micro-entrepreneurs, who have chosen to take advantage of the opportunities international tourism and engaging in international economic activities have provided in a specific context, in this case individuals belonging to ethnic minority communities commonly referred as hilltribes working in Northern Thailand:

The major policy challenges facing developing Asia are how to sustain the rapid economic growth that reduces multidimensional poverty and is both socially inclusive and environmentally sustainable. (Heshmati, Maasoumi, & Wan, 2015, p. 1)

INTERNATIONAL CONNECTIVITY

If eliminating or reducing poverty were a simple affair, poverty would no longer be a concern globally or within Mainland Southeast Asia (SEA). Throughout parts of Asia, some amazing progress has been seen in reducing poverty and lessening its negative impact, yet all poverty in the region has not been eliminated. Studying the basic principles which have previously been used successfully in reducing poverty in some areas can be viewed as valuable guides for creating further progress in the region. The two basic principles which have generally been associated with substantial poverty reduction are integration into the global economy and the existence of a dynamic private sector.

Throughout history, engaging in trade and having personal interactions with people from different cultural or geographical backgrounds have been associated with economic development, increases in innovation, and poverty reduction while isolationism and having more limited contacts with the outside world has been associated with poverty and a lack of innovation (e.g., Bhagwati, 2004, 2005; Bhagwati & Panagariya, 2013; Srinivasan, 2009). Today, engaging in trade and having personal interactions across cultures are often achieved through becoming integrated in international trading networks, which can be accomplished through exporting, importing, or sending or receiving foreign direct investment. However, some locations due to concerns over geographic location, population size, or level of development might be less attractive places to trade with for other members of global manufacturing value chains or other international trading networks. An alternative approach to becoming involved in economic activities with individuals from different geographical or cultural background is to engage in the international tourism industry.

Engaging in international trading networks or international tourism to reduce poverty and improve standards of living could be considered as following the wealth creation approach to reduce poverty. The term wealth creation could be considered synonymous with poverty reduction (Hipsher, 2013). But our choice of phrases and terms to frame a problem can have implications on how a problem is perceived. Wealth creation is primarily accomplished though the activities of the private sector. One view is, "Poverty occurs automatically. It is wealth that must be produced, and must be explained" (Sowell, 2015, p. 177). This view implies poverty is not the result of exploitation or outside forces stripping the wealth away from the poor which would have occurred if the people living in poverty remained isolated. Instead it is assumed conditions and connections have not been created which allowed wealth creation to take place. A wealth creation approach to reducing poverty focuses on creating conditions, connections, and opportunities resulting in an increase in economic activities and personal choices as opposed to top-down approaches designed by governments or other non-profit agencies to eliminate poverty, often through redistribution of wealth.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The concept of a wealth creation approach for those currently in poverty might deemphasise and lessen the perception of victimization and instead assumes individuals in areas of poverty have the ability to become business partners, customers, employees, and innovative entrepreneurs when presented with increased opportunities. Wealth creation assumes improvements in standards of living are created through the choices and efforts of individuals and communities when responding to new and increasing numbers of opportunities. However, the wealth creation approach does not imply the poor should simply pull themselves up by their bootstraps, and there is no role for governments, individuals, NGOs, private companies, or individuals from the outside in reducing poverty. However, this viewpoint does require a shift from a focus on mostly a top-down approach designed to rescue victims of poverty to an approach which provides additional choices and opportunities, and then allowing individuals and communities to select their own paths to their individual versions of the good life (Hipsher, 2013).

"The poor are not a homogeneous group" (Caspary, 2008, p. 92); and different individuals living in poverty often have very different individual preferences and needs. Bureaucrats, government officials, and experts from non-profit organizations have not proven to be effective in producing one-size-fits-all top-down approaches which have substantially reduced poverty or met the needs of the majority of people living in poverty, despite decades of efforts (e.g., Easterly, 2006; Hancock, 1997; Moyo, 2009; Pritchett & Woolcock, 2008; Ramalingam, 2013).

Poverty reduction approaches generally follow one of two different principles: redistribution of the wealth created in more productive communities and individuals to less productive ones, or the creation of more and better livelihood opportunities and increased productivity through economic growth and investment within the communities where poverty is widespread, the wealth creation approach. Reducing poverty through redistribution, without accompanying economic growth, has not consistently shown positive results (e.g., Easterly, 2007; Kigabo, 2010; Miller & Kim, 2015; Okidi, Ssewanyana, Betegeka, & Muhumuza, 2007; Srinivasan, 2009). However, a very strong correlation has been found between economic growth and sustainable poverty reduction, even when the growth has not been accompanied by substantial domestic or international redistribution efforts (e.g. Acemoglu & Robinson, 2010; Deneweth, Gelderblom, & Jonker, 2014; Handley, Higgens, Sharma, Birde, & Cammack, 2009; Hoang, Pham, & Ulubasoglu, 2014; Williamson, 2005; Ying, Eng, & Robinson, 2010).

Scholars, politicians, and leaders of international organizations who have studied the issue of poverty reduction in detail have often come to similar conclusions, including acknowledging a dynamic private sector creates jobs and a dynamic private sector is a vital component of nearly all sustained poverty reduction experiences (e.g., Chino, 2004; Fukasaku, 2007; Miller & Kim, 2015; Mkapa, 2010; Pietrobelli, 2007; Rodrik, 2005). Governments have a role to play in creating stable economic conditions and the rules under which economic competition takes place, but governments have not shown the ability to generate wealth as effectively as has the private sector operating in a competitive marketplace. Most tourism activities take place with the private sector.

POVERTY REDUCTION, WEALTH CREATION, AND TOURISM IN MAINLAND SOUTHEAST ASIA

Tourism

Tourism is a composite commodity to which many industries contribute. When this is fully accounted for, tourism is the world's largest 'industry' in terms of employment and global production. Moreover, it is an industry that continues to expand. (Tisdell, 2013, p. 3)

Exporting manufactured goods has been extremely successful in creating economic growth and poverty reduction in many East Asian economics, such as South Korea, Japan, Taiwan, and China in the last century; however, this exporting approach might not be as appropriate for many emerging markets in the 21st century, especially for countries, regions, or communities with relatively small and dispersed populations. Sahli and Carey (2013) believed tourism is often associated with increasing employment, income, and economic activities, and "has been considered by many countries around the world as an alternative to the export of traded goods" (p. 623).

Income generated by tourism in developing economies is already over three times greater than the amounts received through international aid payments (Asian Development Bank (ADB), 2012a, 2012b). The tourism industry has shown it can create jobs and economic growth in the emerging markets of Mainland SEA; however there have also been criticisms of the impact of international tourism as it has been suggested much of the work is seasonal with little in the way of security or skills development for the workers in the industry (e.g., Cole & Eriksson, 2010; Holden, 2013; Muangasame & McKercher, 2015; Southiseng & Walsh, 2011). While there are also many critics of the impact of tourism on the environment and as an effective means of poverty reduction (e.g., Becken, 2015; Hall, Gössling, & Scott, 2015; Hall & Brown, 2010; Jakobsson & Dragun, 2013; Le-Klähn, 2015; Peeters & Bongaerts 2015; Pleumarom, 2012; Rutty, Gössling, Scott, & Hall, 2015; Somerville, 2012); in empirical studies and when looking at the perceptions of individuals working and living in tourist areas, tourism has more often been associated with increased livelihood options, economic growth, poverty reduction, and improved standards of living for host communities (e.g., Divisekera, 2013; Harrison & Prasad, 2013; Mihalic, 2013; Nonthapot, 2015; Ong & Smith, 2014; Uysal, Woo, & Singal, 2012). Tourism connects local communities with global markets and provides an increasing number of opportunities for private sector activities.

Tourism in Thailand

Thailand is one of the most developed mass tourist destinations in Southeast Asia and has multiple tourist attractions. (Winzeler, 2011, p. 224)

Tourism is an important part of the Thai economy. The World Travel and Tourism Council (WTTC) (2015) reported travel and tourism make an 8.6% direct contribution to the nation's GDP while the overall contribution through both direct and indirect channels is 19.2% while directly creating 2,210,000 jobs in 2014. About 70% of travel and tourism's contribution to the Thai economy come from international visitors while the remaining 30% come from domestic tourists.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ethnic Minorities

Southeast Asia is an ethnically very complex region. (Winzeler, 2011, p. 67)

In most countries of Mainland SEA, there are significant numbers of people who are members of linguistic, cultural, or religious groups which can be labelled as ethnic minority communities. As ethnic identity is a fluid and not always mutually exclusive concept, defining exactly who is and who is not an ethnic minority is a problematic and imprecise endeavour. ADB (2012b, p. 12) makes the case that nearly 25% of the people in the Greater Mekong Subregion (Mainland Southeast Asia) could be classified as ethnic minorities.

Hilltribes

This article concentrates on the lives and experiences of the ethnic minorities in Mainland SEA who "live in remote areas and face problems of marginality, poverty, and lack of basic infrastructure" (ADB, 2012b, p. 59) in the upland regions. The term hilltribe is commonly used to describe the groups of ethnic minorities living in remote mountainous areas of the region, and who often face many challenges which are not normally faced by members of the majority communities. The term hilltribe was first used by the British during the colonial era in Burma/Myanmar; although McKinnon and Vienne (1989) and Winzeler (2011, p. 113) felt the use of this term is not really appropriate as it brings to mind a negative image of primitive and backward peoples. The negative or exotic implications coming from using this term can influence how governments and outside agencies approach creating policies affecting these minority groups. Nevertheless, as the term has become commonly used both within the region and internationally to identify a specific set of ethnic minority communities living in the uplands throughout SEA, it is used in this article while acknowledging the possibility of the inappropriateness of this term.

Osborne (1990, p. 54) found throughout Mainland SEA there has been a fairly recent practice of distinguishing between the majority populations who mostly live in the lowlands and the minorities mostly living in the highlands, although historically this distinction was not as clear cut and therefore current specific ethnic identities and labels are often fairly modern creations. Due to differing agricultural techniques, individuals living in the highlands have traditionally been more nomadic than people living in the lowlands and therefore have been less adaptive in adjusting to the fixed national borders brought about by the European colonial expansion into the region (Kammerer, 1989). Kammerer also pointed out extensive anthropological research on ethnic minorities in the region has focused mostly on ethnic differentiation and identification, yet "…the role of ethnic identity may differ from community to community…" (p. 265). Therefore, the emphasis on specific "tribal" identities and use of mutually exclusive labels might not always accurately reflect the complex ethnic self-identification of the people living in these communities. McGee (2011) made the point that much of our understanding of ethnic minorities in the region has been colored by assumptions these rural people are less open to change and innovation than are individuals from the majority populations in the region. Yet these stereotypes might not always be accurate; although the concepts of change and innovation might be thought of and implemented in a unique manner by the people living in the specific geographical, cultural, and economic environments found in the highlands of Mainland SEA.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Development in Ethnic Minority (Hilltribe) Communities

Members of hilltribe communities tend to have much lower incomes and are more likely to live in poverty than are members of ethic majority populations throughout Mainland SEA. Therefore, governments from around the region have often attempted to create programs to force changes in livelihoods and lifestyles upon ethnic minority groups to increase incomes, but usually without much success (Baird, 2011; Daviau, 2011; Gros, 2011; McKinnon, 2011; Mellac, 2011; To, 2011). However, when left to their own initiatives, members of ethnic minority communities have shown the ability to make their own choices and adapt to new technologies and opportunities, while retaining the most prized parts of their native cultures. For example, Akha and Tai Lue farmers in China have integrated into the global rubber supply chain, even going so far as outsourcing some production to relatives in Laos, which has significantly increased incomes in the communities (Sturgeon, 2011).

Forsyth and Michaud (2011) felt most members of ethnic minority communities in the region are not stuck in a time warp and do not want to remain completely isolated and segregated from the rest of the world; and in fact, are heavily influenced by external forces, such as government programs within the region and global markets, as well as by various internal individual and group motivations. There is great diversity across the different ethnic minority groups as well as diversity in individual values and ideas within each group about the desirability of further integration into national or global communities. This diversity would appear to have made it difficult for top-down government-led generic programs aimed at improving lives of multiple communities or individuals using a single set of approaches to be effective.

Tourism, Entrepreneurship, and Preservation of Ethnic Minority Cultures

The ethnic minority communities living in the highlands of Mainland Southeast Asia have traditionally relied on agriculture as well as hunting and gathering activities to support themselves. Most of these ethnic minority people live in regions which are mountainous, sparsely populated, and distant from seaports. Therefore, manufacturing companies tend to avoid operating and creating jobs in the areas where these communities live. Also, environmental concerns are putting pressures on these communities to abandon their traditional slash and burn agricultural practices, as well as limiting opportunities for hunting and gathering, resulting in the increased importance of finding additional livelihood options.

One of competitive advantages these communities have in the tourism sector comes from the fact seeing ethnic minorities and their exotic dress and lifestyles are often important features attracting tourists to visit remote locations in Mainland SEA (Trupp, 2014a; Phommavong & Sörensson, 2014; Swain, 2011, Winzeler, 2011, pp. 229-237). In a study of the effects of tourism in an ethnic minority community located in Mae Hong Son Province in Northern Thailand, Lortanavanit (2009) found when left to the private sector, "Tourism helped the locals, both directly and indirectly, to improve their quality of life without radically transforming it" (p. 159). Other studies in the region show tourism creates both opportunities and challenges for local ethnic minority communities, but the perceived benefits from the perspective of the members of the hilltribe communities appear to outweigh the perceived problems created (Trupp, 2014b). Although tourism activities do tend to provide more livelihood opportunities for women, who are expected to wear traditional costumes, and the young, than for men and more mature members of the communities (Ishii, 2012).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ethnic Minority Entrepreneurs in Northern Thailand

When exploring the impact of the international tourism industry or government policies, the ideas and perspectives of lower income families and individuals whose lives have been most affected by private sector investment in the tourism industry are not always considered (Truong, Hall, & Garry, 2014). Therefore, an exploration of the experiences of a few individuals affected by international tourism was conducted. The following reports are based on interviews with ethnic minority entrepreneurs selling products at tourist attractions in Chiang Rai province in Northern Thailand.

Research Methodology and Methods

An exploratory qualitative research approach was taken as this approach is considered appropriate when exploring an understudied phenomenon (e.g., Eisenhardt, 2002/1989, p. 12; Miles & Huberman, 1994, p. 35; Poggenpoel, Myburgh, & van Der Linde, 2001). Therefore, the goal of the study is not to find specific answers to specific questions, but to explore, take the first step in theory development, and create hypotheses or proposals to be used in further and more specific research projects (e.g., Cooper & Schindler, 2003, p. 62; Marshal & Rossman, 1999, p. 41; Yin, 1995, p. 5). The population for the study is ethnic minority micro-entrepreneurs in Mainland SEA while the sample was taken from ethnic minority-entrepreneurs in Northern Thailand due to issues of access and convenience. Due to the informal nature of micro-entrepreneurship in developing economies, using some form of random sampling to find a representative sample was not feasible, therefore a convenience sampling method was used. Semi-structured interviews were employed as a data collection technique as considered appropriate when following an exploratory approach (Cooper & Schindler, 2003, pp. 62, 146, 409; Robson, 2002, pp. 270, 311). Names of the participants have been changed when reported in this study to avoid creating possible problems for the participants.

Interviews With Ethnic Minority Micro-Entrepreneurs

Apoe works selling souvenirs outside a temple in the mountains where tourists, sometimes foreign but more often Thai, visit when traveling in the northern part of Chiang Rai Province. Apoe comes from a village in Chiang Rai Province not far from where she works. She thinks tourism benefits her local community as it creates jobs, such as sewing traditional style clothing which can be sold to tourists. She believes tourism helps maintain the creation and use of traditional style clothing and bags, but engaging in tourism industries can also spark innovation as new products and production techniques are combined with traditional styles to create products tourists think are both authentic and fashionable. She felt Chiang Rai had many interesting tourist attractions, as well as nice weather and beautiful natural scenery, and the creation of tourist attractions, by the government and local businesses, was important in bringing tourists into the region and creating new livelihood opportunities. She responded that if she was not selling souvenirs to tourists she would probably be planting vegetables in her mountain village.

Pilawh also comes from a village in the Chiang Rai province of Thailand and works outside the same temple as Apoe. While officially his business competes with Apoe's, there is more a sense of cooperation than competition as all the entrepreneurs selling food, drinks, or souvenirs to the tourists in this

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

area are from the same Akha village. Pilawh sells silver jewelry, clothing, and other items to the tourists who come to visit the temple. For the most part he enjoys his job, but it does involve a lot of slow time waiting for tourists, who often arrive by the busload. He enjoys the freedom of being self-employed and the opportunity to be his own boss in a business outside of his village, an opportunity that tourism brought. He felt if he was not running a business of this kind, most likely he would be an employee of someone else.

Mii Chuu sells souvenirs at a royal development project in Chiang Rai province in Thailand. Mii Chuu says she makes enough money to earn a living while the work is not as hard as being an employee for someone else. If sales continue to increase, she hopes to expand the business. She believes tourism is beneficial as it provides local people an opportunity to create micro-businesses catering to the needs of the tourists. As the location, she works at is government funded, she appreciates the help the government has given by creating tourist attractions which bring in customers which entrepreneurs, such as herself, rely on to earn a living. If she was not selling souvenirs in her own business, she thinks she would probably be working growing coffee in the mountains near her home town.

Michu grew up in the Yunnan province in China but she is considered ethnically to be basically the same as the members of Akha communities in Thailand and is not considered an outsider or foreigner within her community. She is now working selling tea and coffee grown by members of various hilltribe communities, including in Yunnan and Laos, to tourists at a royal project supported by the Thai government. She feels this project opens up additional markets for the growers of tea and coffee in the region. When tourists come to visit this project, they learn more about her culture and often want to take home products associated with the local community, such as tea and coffee. She believes being a royal project associated with the Queen helps bring in more domestic tourists and therefore more customers for the small businesses operating in or near the royal project. She felt if she was not selling coffee and tea to tourists, she would be at home raising chickens and growing vegetables. She felt this particular project and tourism in general have increased her opportunities and improved her standard of living.

Gao owns a small stand, where she sells locally grown food items such as honey, tea, and fruits, outside of a major tourist attraction in Northern Thailand. Gao is ethnically Akha and she originally comes from the province of Chiang Rai, close to where she is currently working. Previously she worked in a food processing factory, and if it were possible, she would like to work in a company in a nice air-conditioned office, but she thought she lacked the education or experience for that type of employment. The thing she likes most about her work is the freedom that comes with the job, if she needs to take a day off to take care of personal or family obligations she can do so without having to ask for permission, and the money she earns helps support her family. She thought if this option were not available, she would probably be working in a factory or a farm. While most of her customers are Thai, she does meet foreigners and she thinks tourism, both international and domestic, not only helps her to earn more money, but it is also good for the local economy and her community.

Pawn owns a shop in the same general location as Gao's stand, which sells souvenirs and ethnic style clothing associated with the hilltribe communities of the region. She is ethnically Lawa and prior to owning this small business she provided babysitting/child care services in her home village. Much like Gao, she enjoys being her own boss. She started working as an employee in a similar shop, but as she gained experience and confidence, she started off on her own and set up her own shop. She has grown her business over the past 8 years and now she makes a comfortable living for herself and her family. Most of her customers are Thai with many of them coming from Bangkok, and to the ethnic minority populations of the region, these customers are seen as coming from a culture almost as different as do

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

customers from China, Japan, Europe, or other foreign locations and therefore the distinction between foreign and domestic tourist is not clearly acknowledged by many of ethnic minority entrepreneurs in the area. She likes tourists, especially Thai tourists, to come to the region as visitors are the source of her livelihood.

Ba has a job working as a paid laborer on a coffee plantation in Northern Thailand, but when she has time off, she often goes to the same area where Gao and Pawn have set up their businesses to sell locally grow products to add to her income. Her salary as a paid agricultural employee is not very high, and having the opportunity to make a little extra by selling to tourists on her days off allows her to improve the standards of living for herself and her family. Ba comes from the Akha community and has limited skills in speaking English, Chinese, or Thai (much of the interview was conducted using her children who attend a Thai school and therefore can speak Thai as interpreters), limiting her ability to sell large quantities of items, thus she has decided to keep her paid employment as opposed to trying to become a full-time micro-entrepreneur. She enjoys seeing people coming to visit the mountainous regions of Northern Thailand where she and other members of her community originate and continue to make their homes, and she felt the additional options to sell local products to visitors helped her and other local residents improve their standards of living.

Mayju is also from the Akha community, originally coming from the Chiang Rai providence, where she still lives and works. She owns a small business selling hilltribe themed souvenirs and clothing to tourists in the same location as Gao, Pawn, and Ba. Prior to starting this business, she worked on her own small farm in the mountains growing coffee. She felt she was too old to engage in strenuous farm work but did not have the resources, or desire, to completely retire so she joined other members of her community in becoming a micro-entrepreneur selling various items to tourists near a government sponsored tourism attraction. If she was not doing this work, she felt she would probably just stay on the farm and do light chores while caring for her grandchildren. Recently she has noticed a large increase in Chinese tourists, but these tourists rarely bought much from her and she mostly sold to tourists coming from other parts of Thailand. She felt her lack of education and foreign language skills limited her livelihood options, but she was contributing to the family's finances and the work was not physically demanding. She said she enjoyed the freedom of being her own boss while there were plenty of opportunities for socializing during slack periods. She is grateful the government created this tourist attraction in the region she lives in as it helps her earn more money and she thinks tourism is good for the entire Akha community.

ANALYSIS

As an exploratory study, the results of the research are intended as a starting point for future more specific research and therefore the findings should not be considered as being representative of the population under study. But a number of propositions are presented based on these initial findings. In analysing the interviews, it can be observed each person interviewed believed tourism was beneficial to both themselves and their communities. Other results show individuals had other livelihood options and each person had his or her own unique motivations and reasons for becoming micro-entrepreneurs. Another observation showed these micro-entrepreneurs were primarily engaged in selling products associated with their culture and were using their cultural heritage as a competitive advantage instead of trying to compete with businesses which sell more general items.

Proposition 1: Ethnic Minority Micro-Entrepreneurs in Mainland SEA Choose Entrepreneurship Primary Due to the Lack of Other Livelihood Opportunities

Studies in less and least developed economies show micro-entrepreneurs are often pushed into starting a micro-enterprise due to the lack of availability of paid employment (e.g., Kalantaridis & Labrianidis, 2004; Kristiansen, 2002; Pitamber, 2000). These micro-entrepreneurs could be considered as creating their own jobs as opposed to being pulled into starting a business by opportunities to achieve a high level of professional success (Hipsher, 2010). The micro-entrepreneurs interviewed in this study for the most part appeared to be pushed into starting a micro-business due to the lack of opportunities for quality paid employment and the difficulties in earning a living in agriculture. Being considered outsiders by the majority populations might make taking advantage of formal employment opportunities in the tourism and other sectors more difficult for members of ethnic minority communities, thus making entrepreneurship a more attractive option.

Micro-entrepreneurship is frequently the livelihood option chosen in many areas where poverty is widespread due to the lack of employment opportunities, and large numbers of tourist arrivals increases both employment and micro-entrepreneur options, especially for individuals without high levels of education or specialized skills. Further regional integration and increases in tourist visits would be expected to provide additional livelihood opportunities for ethnic minority communities living in remote regions. Tourism allows local residents to create wealth locally through integration in the global economy.

Proposition 2: Opportunities in the Private Sector Will Be More Effective in Reducing Poverty in Ethnic Minority Communities in Mainland SEA Than Government Programs

Projects designed by outsiders to force local people in the mountainous regions of Mainland SEA to change their lifestyles have generally been resisted and have not significantly improved the lives of the people in these regions. However, when presented with new livelihood opportunities, the people in these regions have responded and have made intelligent choices which have helped reduce levels of poverty and increase living standards in their communities.

Proposition 3: Tourism Creates Opportunities to Strengthen Ethnic Identity While Engaging in International Trade and Intercultural Relationships in Ethnic Minority Communities in Mainland SEA

Attempting to retain one's ethnic minority identity while integrating into the broader economy can be a difficult process; partially due to the hilltribe communities' unique social and cultural ideas and values not always being accepted by members of the majority communities (McKinnon & Vienne, 1989). However, as expressed by those interviewed, opportunities coming from the tourism sector may provide opportunities where individuals and communities can make their own choices about how much to integrate culturally while engaging with the broader world to create economic opportunities.

Proposition 4: Tourism Can Help Reduce the Level and Impact of Poverty in Ethnic Minority Communities in Mainland SEA by Allowing Wealth to Be Created Locally

Each individual and community is unique and each has a unique set of values and vision of the good life. Trying to impose outside values and ways of living on others rarely produce the desired results. Instead, it may be better to offer additional opportunities which individuals can choose or reject after evaluating the benefits and costs of each opportunity. If the new opportunities presented by the increases in tourism into the region are less attractive than pre-existing opportunities, the new opportunities will not be selected. As many individuals and communities have chosen to engage in tourism activities it indicates these individuals and communities believe the benefits coming from international and domestic tourism outweigh the costs.

CONCLUSION

It is not being suggested tourism alone will eliminate all poverty in ethnic minority communities in the mountainous regions of Mainland SEA. However, having more livelihood options is always better than having fewer. The introduction of livelihood options in other industries or sectors of the economy would be expected to also have positive effects, but ethnic minority communities living in the uplands of Mainland SEA might have more comparative advantages in tourism than in many other industries. Tourism creates wealth locally, and therefore reduces poverty through wealth creation which is expected to be more effective than relying on redistribution or other efforts controlled by outsiders.

Ethnic minority individuals and communities have the right to decide for themselves to what degree they wish to integrate into global value chains, what aspects of modern life to accept, and what parts of traditional cultures to retain. It would not appear the majority of ethnic minority individuals and communities in Mainland SEA want to either completely isolate themselves from the modern world or to totally assimilate into the majority cultures. Tourism might provide an attractive alternative where ethnic minority individuals and communities can retain and strengthen their ethnic identities while engaging with global economic forces. Further and deeper research on the topic is encouraged.

Chapter 48
Digital Entrepreneurial Charity, Solidarity, and Social Change

José Manuel Saiz-Alvarez
Tecnologico de Monterrey, Mexico

Jorge Colvin-Díez
Schiller International University, Spain

Jorge Hernando Cuñado
Nebrija University, Spain

ABSTRACT

Microcredit has been studied from many perspectives. In this work, the authors analyze KIVA, the most important Person-to-Person microfinance organization from the viewpoint of social change, and they consider how it has impacted on the nascent of a new wave of entrepreneurs known as digital entrepreneurial charity. Applied to KIVA, the authors analyze the impact of the digital space and its Internet-based Peer-to-Peer Lending to create social change in the poor, while alleviating the poverty thanks to solidarity and charity. This work concludes affirming that banking the poor and education, with the intensive use of Internet-based devices, is the best way to alleviate poverty in the digital and globalized economic world. Finally, after their last research, the authors found some critics about Kiva and microcredits which might be interesting to be considered and these have been analyzed at the end of this work.

INTRODUCTION

The nascent field of microcredit is growing rapidly and attracting increased attention from many sectors. There is something inherently attractive and appealing about microfinance and increasingly new stories as KIVA. These extraordinary people, who started helping others after the seminal work carried out by the Nobel Peace Prize laureate Muhammad Yunus, came up with brilliant ideas, and against all the odds, succeed at creating new products and services that dramatically improved people's lives.

We can define KIVA as a collective movement based on solidarity and generosity with the final scope of achieving social change based a new entrepreneurial movement. As a result, we have analyzed as a background the principles of microfinance as a way of alleviating poverty, but also for impulsing social change derived from:

1. A financial approach and the banking of poverty
2. An increasingly used Digital Space and its Internet-based Peer-to-Peer Micro-lending
3. An entrepreneurial-based approach based on solidarity
4. Organizational dynamics
5. Virtuous Approach

As a result, and using this in-depth study, it has allowed us to focus on Kiva.org or the Social-on-Linezation of poverty.

Can KIVA experience and success be applied to other NGOs? What is the impact of ICT on microfinance? What are the advantages using Joint Liability Lending? To answer these questions, the objective of this work is to analyze how the strategy and the good results obtained in KIVA can serve as learning from practice to other NGOs pursuing similar goals. Our work begins describing the theoretical background that exists on this issue. Then the model of KIVA's loan cycle will be described to analyze the impact of the digital space through this case study. Finally, future research directions and conclusions will be added.

THEORETICAL BACKGROUND

Alleviating the Poverty: Main Global Initiatives

Before understanding the deepness of the case of KIVA within its social-on-linezation of poverty, it does make important to comprehend what is poverty and the principles of microfinance which underlines as a new wave of alleviating the poverty. According to the World Bank Group (n.d.), there are an estimated 2.5 billion financially excluded adults today, with almost 80 percent of those living under $2 per day, and having no accounts at formal financial institutions. This matter holds back the fulfillment of the World Bank Group's goals of eradicating extreme poverty by 2030 while increasing the share of income held by the bottom 40 percent of the population. The World Bank's Global Financial Inclusion Database (Global Findex) reports that three-quarters of the world's poor lack a bank account, because of poverty, costs, travel distances and the often burdensome requirements involved in opening an account. As a result, this population does not have a current account's holders. Only 25 percent of adults earning less than $2 a day have saved money at a formal financial institution. Being "unbanked" is linked to income inequality, so they are exposed to be victims of loan sharks.

On the other hand, from micro, small and medium-sized enterprises (MSMEs) perspective, there is still a lack of access to credit and savings services that would enable them to grow. Indeed, and according to the World Bank Group (n. d.), about 200 million formal and informal businesses in developing countries lack the financing they need to grow, with a funding shortfall of $2.1 trillion to $2.6 trillion for MSMEs in developing economies. As a result, business growth is inexistent in many cases, and a

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

survival economy is created. So, in the poorest countries arise populist political movements based on a strong state intervention, even tending toward dictatorship, which further impairs the development and financing of these companies.

In this scenario, over the last few decades and from private sector, we are seeing an increasing growth of different types of financial-services providers for poor people offering new possibilities, such as non-government organizations; cooperatives; community-based development institutions, like self-help groups and credit unions; commercial and state banks; insurance and credit card companies; telecommunications and wire services (World Bank, n. d.); post offices; and other points of sale. But all this type of new services targeted towards future clients is valid for emergent countries only, so the poor continue in the same situation in countries and regions mainly on the African continent.

Other initiatives have been coming up with from developed countries, and in particular:

1. The well-known G-20, which has made financial inclusion a permanent policy priority by establishing the Global Partnership for Financial Inclusion (GPFI), which includes the World Bank Group (WBG), the International Finance Corporation (IFC), and the Consultative Group to Assist the Poor (CGAP)1 and
2. The Alliance for Financial Inclusion and the Organization for Economic Co-operation and Development (OECD) which have been designated as implementing partners.

Principles of Microfinance

Regarding this new wave of possibilities, it posed the microfinance as one of the most effective means of poverty alleviation whose principles (Ramírez & Anderson, 2007) base on:

1. Poor people need a variety of financial services, not just loans
2. It is a powerful tool to fight poverty by poor people earning more, build their assets, and cushion themselves against external shocks
3. It means building financial systems that serve the poor. Indeed, although microfinance is often seen as a marginal sector—a "development" activity that donors, governments, or social investors might care about, but not as part of the country's mainstream financial system, microfinance can reach the maximum number of low-income clients only when it is integrated into the financial sector
4. Microfinance can pay for itself, and must do so if it is to reach vast numbers of poor people. Achieving sustainability means lowering transaction costs, offering more useful services to the clients, and finding new ways to reach more of the unbanked poor
5. Micro finance is about building permanent local financial institutions. Which need to attract domestic savings, recycle those savings into loans, and provide other services;
6. Microcredit is not always the answer. In many cases, other tools will alleviate poverty better—for instance, small grants, employment and training programs, or infrastructure improvements;
7. Both interest rate ceilings hurt poor people by making it harder for them to get credit, and the scarce and uncertain supply soft money from donors or governments should be avoided, as they usually set them at levels so low that microcredit cannot cover its costs;
8. The role of government is to enable financial services, improving the environment for "micro-businesses" and access to markets and infrastructure, and not to provide them directly, and finally,
9. Donor funds should complement private capital, not compete with it.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

All these principles are summed up in just one phrase: 'the poor know that credit is their only opportunity to break out of poverty' (Yunus, 1999: 59). Credit loans granted individually or in groups (Joint Liability Lending) to bring social and economic changes in the short term, and these effects are stronger when directed to women. Poor women are often more conservative in their investment strategies and are often more easily swayed by peer pressure and the intervention of loans officers, making women more solid bets for banks worried about repayment (Armendáriz & Morduch, 2007). Besides, women are more concerned about children's health and education than men, and they are usually over-represented among the poorest of the poor and are too often oppressed by their husbands and by prevailing social norms. As a result, they are more socially vulnerable.

MICROFINANCE, SOCIAL CHANGE, AND FINANCE: THE "FINANCIALIZATION" OF POVERTY

One effect of conceptualizing poverty in financial terms is that it enables the 'financialization of development' (Roy, 2010, p. 31). Roy uses this term to refer to the integration of the world's poor into global financial markets, especially by way of the Consultative Group to Assist the Poor's (CGAP) version of microfinance. But still, the academic literature on conceptualizing poverty from financial perspective remains inconclusive. For instance, as we have seen before, the World Bank's global poverty line has an 'essentially mono-dimensional conception of "extreme poverty" (as lack of income or consumption)' (Edward, 2006, p. 381) by defining the extremely poor those who live under $1/day and as poor those who live under $1.25/day, giving, therefore, exclusively a financial indicator. Financially speaking, the need for broader definitions of poverty is quite clear, being necessary to analyze a multidimensional character of poverty. This multifaceted approach we can be seen on microfinance when, not only does it enable the creation of 'social value maximization of the disposable income of the poor' (Chun, 2005, p. 14) but also microfinance is being one of the effects of poverty's process of banking, too.

Taking into account this multidimensional approach, it makes essential:

1. Understanding of poor people's financial profile through methodologies ranging from financial diaries to ethnographic research and in particular, being the poor people made knowable not just low income, but also fluctuating and unpredictable income, which forced them to develop sophisticated money management skills centering on borrowing and saving (Collins et al., 2009, p. 3);
2. New financial values, based on financial literacy education which is the forefront of any poverty alleviation initiative.

According to a World Bank (n. d.), financial literacy has come to play an increasingly prominent role in financial reform in both developed and developing countries2. These training initiatives are focused on expanding poor people's knowledge of formal financial services, budgeting, and asset building. Indeed, promoting savings is a central component of financial literacy strategies, working to inculcate practices of planning for the future rather than succumbing to day-to-day struggle (Ilcan & Phillips, 2010).

To sum up, the social change of microfinance from financial approach is observing the poverty from a multidimensional perspective:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Showing that poor fiscal subjects are also rebranded as financial consumers, being targeted by the marketing of formal financial instruments designed specifically for them. —indeed, microfinance has captured the corporate imagination of global financial giants like Citibank and Deutsche Bank, who see the potential for profits to be made at the next financial frontier (Roy, 2010), and
2. Researching the poor people's lives while educating and promoting financial values by creating financial schemes which take the social, cultural and religious complexities of poor people's lives into account.

Social Change and Digital Space: Internet Peer-to-Peer Micro-Lending

Moving towards new forms of lending beyond the traditional microfinance literature, we found the Internet Peer-to-Peer literature where, instead of specifically being the loan associated with group borrowing, it highlights new forms of Internet-based Peer-to-Peer micro-lending based on technology (Chae et al., 2016; Lu, Wang & Li, 2016; Cha, Yang & Kim, 2016; Jung et al., 2016) or social sciences (Li, Park & Park, 2016; Carr et al., 2016). Obviously, there is a lot of controversies, as long as these forms of lending are similar to online shopping (Hartley, 2010). We refuse this consumer-focused conception, as the primary objective of this Internet Peer-to-Peer micro-lending is to help others, so social values prevail over economic ones.

Meanwhile, although we analyze later the Case Study of KIVA on the online peer-to-peer micro-lending landscape, the Internet-based peer-to-peer micro-lending has become an increasingly prominent global means of capital acquisition, and also an increasingly popular form of crowd-sourced microfinance (Hartley, 2010). Thus, differing in its mission and scope, we observe a significant number of lending institutions which exist alongside Kiva.org such as

1. Prosper.com, launched in 2006, is the pioneer in the Internet-based peer-to-peer micro-lending, allowing individuals to provide capital to borrowers in need while concurrently obtaining interest on their investment. Within Prosper, borrowers can request between loans of between $1,000 and $25,000, and stipulate terms under which they'd be amenable to borrowing, While Prosper provides loans to individuals in need, much of the site dedicated to lenders;
2. Similar to Prosper.com and touting its ability to provide online matching of savvy investors and smart borrowers, there is another institution named as Lending Club which also offers lenders the opportunity to, while assuming some managed risk, earn a return on their investment. Borrowers with a sufficiently high credit score can seek personal loans for amounts between $1,000 and $25,000 online;
3. Accion.org which is a private non-profit umbrella microfinance institute under which Acción USA, the Acción Network, iLab, EB-Acción Savings and Loans, and Center for Financial Inclusion at Acción International operate. Established in 1961, Acción has been a global leader in microfinance since 1973. Its business model is sustainable thanks to borrowers pay interest on loans sufficient to cover the expenses of credit creation, though remunerative returns are not provided to the lender; and finally,
4. TrickleUp, Global Giving, Grameen Foundation, UniThrive, among others.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the end, all these Internet based Peer-to-Peer micro-lending platforms have on shared that they have other motivations beyond the "Solidarity" lever and the Social change as neither they do provide zero-interest loans to borrowers in need or they are uniquely international.

Microfinance, Social Change, and Entrepreneurship

It has long been argued that an organization's entrepreneurial approach is positively associated with some organizational outcomes related to growth and success in the microcredit environment (e.g., Moss & Meyskens, 2015; Wiklund & Shepherd, 2005), which consists of

1. **Autonomy:** Where individuals or teams can act independently to foster new ideas and bring those to fruition (Lumpkin & Dess, 1996), is free to pursue new opportunities without being constrained actively. The outcomes of autonomy are quite clear such as innovation, the creation of new businesses, and organizational effectiveness;
2. **Competitive Aggressiveness:** As several offensive tactics aimed at gaining a strong competitive position, or aggressive reactions intended to maintain a position in the face of a substantial threat from industry rivals (D'Aveni, 1994). According to Prahalad and Hart (2002) and comparing to the developed world's micro-enterprises, the developing economies' micro-enterprises are harder to survive due to the scarcity of resources their survival;
3. **Innovativeness:** With consequences similar to the previous concept of autonomy, as it means the propensity of companies to introduce new products, processes, and routines resulted from experimentation and creativity (Lumpkin & Dess, 1996) and committed to disrupting current market conditions by stimulating new demand or creating novel resources combinations;
4. **Proactiveness:** This which means anticipating changes forth coming in the environment and position themselves in advance (Lumpkin & Dess, 1996). For instance, organizational initiatives through crowdfunding, such as KIVA, has allowed microfinance to become a globalized phenomenon, placing opportunities within reach of micro-enterprises (Zahra, Newey, & Li, 2014) and finally;
5. **Risk-Taking:** By reflecting the capacity and comfortability in launching new, bold, and often costly action in the face of considerable uncertainty (Moss & Meyskens, 2015).

At this respect, Mossand Meyskens (2015) affirms that micro-businesses which have entrepreneurial attitudes will be perceived presumably as more desirable investments, and therefore, in our view, these will be more proactive to promote social change. Social change based on building and executing robust business models, which will lead to revenue growth and profitability. This entrepreneurial spirit among KIVA borrowers can be observed in the importance of the micro-businesses supported by KIVA (more than 60%), and the active collaboration with more than 300 field partners located in 84 countries and 450 volunteers around the world. When applied this entrepreneurial spirit of business, two more concepts are born:

1. **Social Entrepreneurship:** When all efforts are focused on ameliorating the standard of living of the population influenced by the entrepreneur, and
2. **Social Business:** When mature companies use Corporate Social Responsibility (CSR) and ethics to benefit the population at risk of social exclusion, or even in social exclusion derived from economic poverty and social rejection.

Microfinance, Social Change, and Organizational Dynamics

Since the 1976 founding of Grameen Bank, lending to groups has become an increasingly popular tool for poverty alleviation. It has also become a widely studied phenomenon from Organizational dynamics and in particular, the potential for loan default behind these dynamics. Capital provided to groups who – through having mutually re-enforcing loans– put internal pressure on those likely to default to maintain their credibility. Therefore, the theory and practice behind group lending are fundamentally both for peer pressure encouraging repayment and a way of cutting back on transaction costs associated with loan distribution and collection.

"Group lending" within microfinance literature therefore typically refers to a single lender – often a microfinance institution (MFI) –providing capital to groups of borrowers rather than groups of lenders providing capital to one borrower. On the borrower's side, microcredit institutions employ various institutional structures to provide loans to group-based borrowers3.

The problem is that this literature is predominately focused on borrower-side dynamics with the goal of lowering borrower default rates –more traditional forms of microfinance, rather than the nascent field of Internet-based peer-to-peer micro-lending (Hartley, 2010) based on lending-side dynamics.

Therefore, before looking into the Case Study of KIVA and according to Hartley (2010), we will outline the main characteristics of these novel lending-side dynamics which are many-to-many platform named as "crowd-sourced" microfinance, improving the outcome thanks to the homogeneity of the group (Hermes, Lensink, & Habteab, 2006)

Microfinance, Social Change, and the Virtuous Approach

One of the highlights of social change rooted in microcredits is its revolutionary orientation to organizational virtue, defined as "ethical character traits that are learnt from an accumulative perception of a firm's behaviors in everyday business life, that drives internal and external stakeholder satisfaction, and that is aligned with its ethical values used for strategic positioning" (Chun, 2005, p. 272), and is an integrated set of beliefs that inform the organization's moral traits and virtuous behavior.

According to Payne et al. (2011), an organization's virtuous approach can impact on:

1. The organization's processes, methods, and decisions (Cameron, Bright, & Caza, 2004) and how they conduct their operations (Moss & Meyskens, 2015), and
2. The manner in which it outlined itself to its stakeholders.

This virtuous approach strengthens when social values are being incorporated into it, generating a broad social impact, mainly on the poor. As a result, a kind of private-public cooperation is created, which causes positive externalities.

The character traits associated with organization's virtuous approach has been analyzed by numerous researchers (e.g., Murphy, 1999; Shanahan & Hyman, 2003; Solomon, 1992, 1999). In this respect, Paine (1991) includes principles such as honesty, fairness, reliability, trustworthiness, and commitment to others. Traits which are deeply developed by Chun (2005), and Moss & Meyskens (2015) by providing an empirically verified list of six dimensions of organization virtue, namely:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. **Conscientiousness:** The extent to which an organization can be considered dependable and hard-working (Barrick & Mount, 1991)
2. **Courage:** The attainment of success in achieving a desired goal or objective and the level of effort taken to accomplish the outcome (Harris, 2001)
3. **Empathy:** Portrayed by the ability to perceive or consider the feeling of others (Sawyer, 1975)
4. **Integrity:** The trustworthiness and honesty of an individual or organization (Butler & Cantrell, 1984)
5. **Warmth:** Characterized by open and pleasant expressions of courtesy, friendliness, and generosity to others (Chun, 2005)
6. **Zeal:** An organizational virtue described by including elements such as humor, excitement, passion, or fun

This research has also been analyzed to improve the micro-enterprises' performance. For instance, in the case of conscientiousness, conscientious employees are more likely to have a calling orientation in their work and are thus more productive (Wright & Cropanzano, 2004). Besides, with conscientiousness empathic microenterprises are concerned, reassuring, supportive, and sympathetic. As a result, empathic organizations are thought to have higher stakeholder satisfaction (Chun, 2005) by creating a social capital defined by trust and cooperation. Both factors are vital for baking the poor.

Referred to the microcredit environment, an organization's virtuous approach will likely increase lender confidence, which will increase the likelihood of funding (Moss& Meyskens, 2015). The assurance of this donor confidence will invite others to lend, so a virtuous circle is created. In fact, microfinance is one of those small ideas that turn out to have enormous social and economic implications, as this lending movement has grown, particularly in Asia and Latin America, through cross-pollination thanks to the Internet. As a result, and by recognizing its energy and activity, the United Nations designated 2005 as the International Year of Microcredit.

THE KIVA.ORG ICT-BASED MODEL: THE "SOCIAL-ON-LINEZATION" OF POVERTY

Based on Information and Communication Technologies (ICTs), Kiva.org (KIVA) as the world's first Peer-to-Peer micro-lending website has seen incredible growth over the past years. Media exposure such as an appearance on the Oprah Winfrey Show and a mention in Bill Clinton's book, *Giving*, resulted in an enormous number of lenders coming to the KIVA website in hopes of lending money to entrepreneurs in the developing world.

In 2005, KIVA introduced microfinance to the Internet, and since then, has created a global community of people connected through lending. By partnering with microfinance institutions (300 field partners) in over 84 different countries, 1,395,969 KIVA lenders, $831,829,700 in loans and a 98.36% repayment rate (Kiva, n. d.), KIVA has given small businesses in developing countries the opportunity to grow and thrive. The company's microfinance partners post profiles of loan applicants on the website, where anyone with a credit card and an Internet connection in United States, Canada, Japan, Europe, and beyond, can provide small loans to the businesses of their choice. Loans conceded depending on local ONGs as they make a selection of aid applicants.

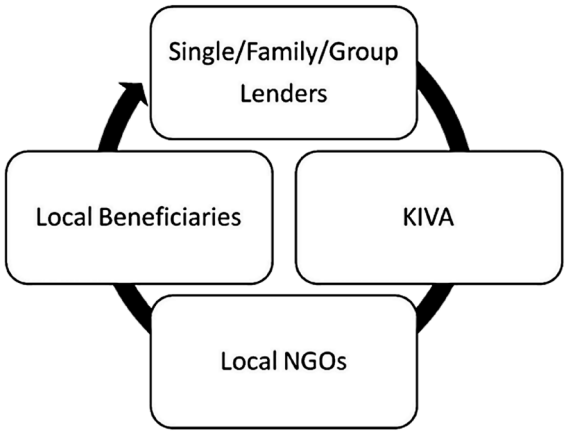
KIVA's Social Change Indicators

Before analyzing social change from previous quoted approaches, first of all, we should measure what social change is and how it works from KIVA perspective. Social change is defined by KIVA as a way to "create good in the world, a lot of good," which is measured by bringing financial concepts into the social reality through social performance. According to KIVA, this social performance is "one way" that they "try to maximize the good created … by partnering with organizations that go above and beyond to generate positive outcomes for the communities they serve" (Kiva, n. d.).

Using the KIVA social indicators, which are named "KIVA Social Performance Badges," based on their "Field partners," we found out in which social change –and thus, social reality—is focused. From a KIVA perspective, this organization is focused on:



1. **Anti-Poverty Focus:** Working locally with other microfinance institutions to combat poverty
2. **Client Voice:** By serving and adapting their business practices and product offerings to meet their needs
3. **Family and Community Empowerment:** Offering support services that address the needs of their clients' families: their health, education, and well-being
4. **Entrepreneurial Support:** By training and support to help people start, manage and grow their businesses
5. **Facilitation of Savings:** By promoting savings as a practice to the people they serve
6. **Innovation:** By embracing technology and innovation to address better the needs of the people they serve

The final result of this social performance badges is to fight for a better society defined by its social justice, equal opportunities, and reduced poverty degree.

The primary tool is the KIVA's Loan Cycle, as we can see in Figure 1.

Intentionally or subconsciously people identify risks, consider their potential impacts, and develop strategies to manage them. In this sense, the poor are retaining risk oriented, as they try to avoid or to

Figure 1. Model of KIVA's loan cycle (Source: Adapted from Kiva.org web)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

share risk through groups, although their quality of living is deficient. That is why the Joint Liability Lending (JLL), especially among women, is preferred when lending through KIVA (Domen, 2011).

Most poor people, particularly those working in the informal economy and rural areas, earn and spend in cash. Banks have at least two ICT options to handle a cash transaction where there is no bank branch. They may use an Automated Teller Machine (ATM) that can accept, store, and dispense cash, or they can use devices placed at an outlet where cash is kept on hand. Both situations, however, are not at disposal in remote rural areas where microfinance has a vital role to play.

Complementary to KIVA lending, and derived from microfinance, the poor can also opt for creating basic micro-savings, medium-term commitment savings plans, endowments, and annuities, as shown in Table 1.

Regarding Table 1, microcredits are increasingly well established and are profitably practiced by specialists and more recently, by formal banks. This fact is fostered by micro-borrowing to complement the traditional systems of inter-generational care that have been used by the poor. Globalization tends to create a new medium-class society, and mainly in the BRICS (Brazil, Russia, India, China, and South Africa), the poor are being banked very rapidly. As a result, financially-based activities have emerged as investment options for investors in the Third World, such as insurance brokerages, development of efficiency-enhancing infrastructures, efficiency claims settlement companies, long-term savings custodian, and licenses for joint-ventures in third countries for successful domestic SMEs and NGOs with good microfinance operations.

The biggest problem for banking the poor is that the high cost of technology infrastructure is beyond the capacity of individual MFIs. As a result, it is necessary to find a balance between product innovation (Point of Sale (PoS) Devices, smart cards for the poor and Internet-based microfinance), local realities, and business process change, as appropriate technologies must be designed for scale. That is the reason why all micro finance initiatives are born in the First World countries, as Internet-based technologies and the facility for receiving donations anywhere in the world. We think that this technology gap will continue over time, despite the economic growth achieved by emergent countries.

Table 1. Current and future microfinance products focused on the poor

Products	Opportunities	Challenges
Microcredit	Loans can be stored and converted to larger assets (like land)	---
Primary microsavings	Focused on the reliable low-income people with current accounts and passbook savings	Safety of deposits
Medium-term commitment savings plans	Clients amass financial assets over time in rhythm with their own savings capacity	• Fund management • Inflation losses • Privacy and client identity
Endowments	Endowments attach life insurance policies to commitment savings plans and therefore add further security	• Partnership • Risk of overselling and fraudulent selling
Annuities	Directed towards formally-employed low-paid workers	Formal actuarial skills are required

Social Change From a Financial Approach: Banking the Poor

Kiva.org has become one of the world's first Peer-to-Peer micro-lending website (Flannery, 2007, 2009). The social change is measured not only by social indicators but also by financial indicators pointed out at the beginning of this work. The Boone indicator shows a relatively new method of measurement able to measure competition on a yearly basis in market segments affected by microfinance without considering the entire market to avoid distortions (Kar, 2016). According to this indicator, and over the period 2003-2010, India and Nicaragua had the most competitive microfinance loan markets, while competition among the microfinance institutions in Bangladesh and Bolivia declined significantly over time. The organization's website presents its visitors, many of whom learn about microfinance through the site, with the World Bank/CGAP financialized explanations of poverty and the importance of microfinance in its alleviation. From financial approach, this suggests a revolutionary social change in developed countries by giving financial support and contributing to KIVA's success (Black, 2009, p. 277) and in turn raising an "intimate mediations with poverty' (Roy, 2012, p. 149). Building up financial connections materialized in millions of microloans, the social impact emerges among thousands of lenders' inboxes and blog posts from KIVA fellows, telling their offline and online stories (Gajjala & Birzescu, 2011). It is an important remark that the borrowed money does not directly go to a person, if not it is transferred into a local KIVA partner (MFI), which fills another loan to that end borrower. All being possible thanks to Internet-based technologies, which make these connections possible. Financially, this method allows the aggregation of thousands of microloans and their disbursement to local MFI partners as intermediaries. Flannery, KIVA's co-founder and CEO, called it "connected capital."

According to Schwittay (2013), the "connected capital" have certain characteristics such as:

1. Long-term vision
2. Catalytic by taking significant risks to having big impacts
3. Accountable as KIVA lenders want feedback on their loans
4. Democratic by being the KIVA lenders hundreds of thousands

What results is a relationship between people and money that enables action towards poverty alleviation through microfinance and consequently has a positive social impact? In other words, this "connected capital" allows banking the poor by avoiding usury and by inserting them into the market. The world has sufficient productive resources for all humanity. The biggest problem is their unfair product and economic resources distribution.

KIVA has changed the interrelationships between money and social impact by:

1. Arising new concepts, such as social capital which sets the capital as force for good
2. Bridging the worlds of finance and development ("social world") into one world: the global financial-capitalist marketplace
3. Helping to its partner MFIs to enter into this market (Gajjala & Birzescu, 2011) (see Kiva supporters in Table 2)
4. Emulating the same feeling of well-known philanthrocapitalists through microfinance, leaving out the charity and celebrating a new equality based on entrepreneurial partnerships (Flannery, 2009).

As Premal Shah, KIVA's President observes, 'we let the average person be like a Bill Gates or a Rockefeller' (cited in Schwittay, 2013)

5. Widening the vocabulary of finance by including other forms of return not thought before such as being KIVA lenders paid with stock success stories

Social Change From Entrepreneurial and Virtuous Approach: Digital Entrepreneurial Charity

The charitable sector has witnessed considerable experimentation with new ideas and practices, in particular, those adopted from the entrepreneurial sphere (Wagner, 2002; Moody, 2008). For instance, KIVA is a charitable nonprofit that combines microfinancing and internet technology to enable individuals to lend (without interest) small amounts of money to entrepreneurs in the developing world, representing a fertile ground for charitable giving. Charitable giving based on imaginary conceptions and how individuals envision the world and their role in it (Godelier, 1986) make lending through KIVA meaningful to its creators and supporters by combining the analysis of consumer narratives (Kozinets, 2008), through different online platforms, such as information sites (KIVAFriends.org), networking sites (Change.org, Paris KIVACup 2009; Facebook, n. d.;, LinkedIn, n. d.) and blogging initiatives (Inside KIVA), with the analysis of KIVA's brand genealogy (Flannery, 2007; Holt, 2004).

KIVA means another way of thinking in the charity field, unifying utopian ideology of entrepreneurial charity, which challenges the view(s) of charitable giving and poverty alleviation. This utopian ideology has been created both by joining the KIVA's creators with the media and KIVA's supporters by building up their KIVA "portfolios" and actively assuming the entrepreneurial role of "angel investors."

What is new from the Entrepreneurial and Virtuous Approach is that KIVA replaces the traditional "hands-off" charitable giving by inspiring visions of "hands-on" entrepreneurial charity. This revolutionary concept is to see the poor as an entrepreneur waiting to be found out by microloans instead of seeing the poor as a beggar. This "cultural innovation" (Holt & Cameron, 2010) means complementing the patronizing hand out of traditional charity with a dignified "hand-up" partnership between entrepreneurial investors and borrowers.

Social Change From Organizational and Digital Dynamics Approach

What is new in the developing countries from social and financial perspective is the social transformation from innovative "traditional" social models of finance, such as microfinance, into a digital transformation based on new organizational and digital dynamics. KIVA, a novel Internet-based, peer-to-peer micro-lending model of crowd-sourced microfinance is an example of this digital transformation. Indeed, until now, no organization as KIVA has gone so deep as on-site cooperation on group lending and none has impacted so much on the online solidarity.

Looking at our background where we have compared KIVA to other organizations (Hartley, 2010), we observe big differences with Kiva.org such as:

1. TrickleUp and Global Giving both offer robust online platforms on which to find Internet-based cooperation, but both diverge from KIVA in the scope of their model. TrickleUp provides business development services, and Global Giving caters to individual and institutional groups looking to choose between charities;
2. Acción International and Grameen Foundation are less focused on providing capital to developing world borrowers to target and mitigate global poverty. Therefore, their scope is microfinance; they are less involved in peer-to-peer micro-lending than they are in the mentorship of MFIs and credit bureaus to improve access to capital on the ground in developing nations;
3. UniThrive has moved into the space of providing Internet-based peer-to-peer, zero-interest loans, similar to KIVA, but they differ in its scope from KIVA, which is tightly restricted to Harvard students.

Despite the diverse ecosystem of Internet-based peer-to-peer micro-lending, substantive variations among these loan providers' positions KIVA as unique in its Internet-based peer-to-peer platform, membership, breadth, and scope of international lender and borrowers, its zero-interest lending scope.

Founded in 2005 by Matt and Jessica Flannery, Kiva.org seeks "to connect people through lending for the sake of alleviating poverty." On Kiva.org, internationally based lenders create and personalize individual profiles. Lenders can act individually or can join "Lending Teams" to attribute their loans to a concerted campaign or to compare their collective impact on other like-interest, regional or demographic groups. Lenders capitalize their Kiva.org accounts with personal money, browse the profiles of entrepreneurs located around the world, and choose those to whom they would like to lend money. The platform is additionally built with systemic checks and balances, such as the feature that lenders cannot view or post to message boards until their account is capitalized with at least $25, the minimum lending amount. Lenders are advised on the potential country, Microfinance Institute, and personal loan default potential described respectively as "Country Risk," "Field Partner Risk," and "Entrepreneur Risk." Loans are provided globally to KIVA "Field Partners," or MFIs, located in 83 countries that then distribute money to individual entrepreneurs. Capital is provided in minimum $25 loans at zero percent-interest, though repayment to the lender comes incrementally, with small cash installments that recapitalize personal accounts. Field Partner risk assessed by KIVA employees based on financial audits, organizational experience, and existing loan portfolio size and risk. Risk ratings do not indicate the probability of default, and exposure at default, but are qualitative one-to-five star ratings that have implications on first entrepreneur loan requests. In this way, Kiva.org additionally helps regional MFIs establish credit histories by allowing even historically poor performers to seek loans to build a positive portfolio.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

KIVA Field Partners are regionally located MFIs and are often guided by the on-site expertise of centrally trained, pro-bono KIVA Fellows. KIVA has over 300 Field Partners around the world, and it is the responsibility of the MFI to screen entrepreneurs, determine whether entrepreneurs belong to borrowing groups wherein individual default is linked to group outcome, and post loan requests on KIVA. Once the MFI has approved an entrepreneur, they can create a KIVA profile, and specify the loan amount they require. The MFI is additionally responsible for the disbursement and collection of the loan provided to the entrepreneur, and for documenting credit impact.

Although Kiva.org is neither the first nor the only web-based peer-to-peer micro-lending institution with a global focus, they are the first to pioneer zero-interest entrepreneurial lending. Indeed, Kiva.org offers an online platform in which lenders collaborate, in various sized open and closed groups, and around various topical categories, to provide affordable debt capital to entrepreneurs in need. For instance, KIVA provides powerful Lending Team analytics, feedback, or explicit training. This analytics would visually –like Google Analytics, Google Insights for Search or Google Finance– illustrate to group members participation rates over time.

By transparently explaining the value and effectiveness of their on-site design levers, Kiva.org could help facilitate digital growth and entrepreneurial engagement, offering to the developing market a unique online platform where to provoke the social and corporate change. Information and Communication Technologies (ICTs) provide new opportunities to help the poor as potential lenders are virtually connected. The first microfinance revolution took a supply-side perspective and showed that the poor were a bankable. The second revolution highlighted demand-side concerns to meet the complex livelihood needs of the poor. As a result, there is a need to improve the design and outreach of MFIs on a continuous basis and to put these institutions in a perspective which matches demand and supply concerns (Arun, Hulme, Matin, & Rutherford, 2005).

As stated in the objectives set in this book work, the impact of the digital space through this case study has been important, as more than nearly USD 850 million has been given to more than 2 million borrowers at risk of social exclusion. These results are possible thanks to the use of ICTs where lenders are connected through the cyberspace and are informed in real time on the granting and repayment of their loans.

Moreover, regarding the possible replication of this ICTs-based model, the following three-fold practical solutions and lessons to be applied in other NGOs, as follows (Hartley, 2010):

1. KIVA's Top Large Closed Lending Teams have, on average, more members;
2. KIVA's Top Large Open Lending Teams provide over three times as many loans and three times as much money per loan; and
3. KIVA's Top Small Closed Lending Teams have greater per capita credit.

Indeed, these lending teams tend to transform borrowers into entrepreneurs defined by their use of economic resources to create both social and economic wealth. Given this social impact linked to solidarity, social entrepreneurship is generated, and social businesses are formed to reduce the risk of social exclusion.

FUTURE RESEARCH DIRECTIONS

Transnational microfinance socio-financial networks like KIVA are responding to global problems, such as poverty. Under normal circumstances, nation states are responsible for their citizens, for implementing social policies, and providing banking and saving services. However, NGOs have taken over some of these responsibilities through services rendered by digital entrepreneurs to citizens globally. Given the global-scale financial crisis, socio-financial networks like Kiva.org play a critical role in helping bring about social change by providing economic relief to millions of people worldwide. There is a transnational level of participation in socio-financial networks like KIVA, despite not having any tax advantage for lenders whose residence is outside of the United States.

Kiva.org is one of the many transnational public spheres where donors and borrowers (digital entrepreneurs) connect in a disruptive space to participate in social and financial transactions to alleviate poverty as we have named social-on-linezation of poverty. Given its success, it is foreseeable that other Peer-to-Peer microcredit initiatives will be put into action rooted on ICT-based microfinance. According to Yartey (2014), the concept of the transnational public sphere can be theorized as a real virtual space where people congregate to develop online socio-financial entrepreneurial relationships, share goodwill through microfinance, and establish connections that have the potential of lasting a lifetime to alleviate poverty. Therefore, the transnational public sphere is also a stage for performance; it is an open space where potential donors from the Global North provide financial relief to the poor in the Global South. It is a space where individuals and groups in Third World countries exhibit their eligibility for loans through various communication strategies.

We see that future research might be focused on the advent of a new profile of entrepreneurs, the digital entrepreneur, and its environments (Appadurai, 1990):

1. Appadurai's technoscapes can be conceptualized as a technological public sphere that exists in cyberspace. This space consists of computers linked together by the fabric of the Internet with various inter-nodal connections that link up local microfinance institutions to Kiva.org in a sophisticated communication network. The technoscapes are web 2.0 technological tools for lenders who help bring social change by improving the lives of the poor through
2. Finanscapes theoretically are paths that financial transactions flow to and from globally. The transfer of money through digital mediums like Kiva.org to developing countries follows paths created by finanscapes and technoscapes.

These assumptions base on:

1. In light of present transnational globalization trends, cultural economies flounder
2. Cultural economies also move seamlessly between ethnoscapes, technoscapes, financescapes, mediascapes, and ideoscapes
3. Social-on-Linezation to alleviate poverty (Yartey, 2014)

Globalization is bringing many First-world households in developed countries who have never been in direct contact with it the reality of poverty so that solidarity can flourish. So, and in addition to these new cultural trends, they coexist with traditional values such as solidarity and charity, following the latter a religious sense.

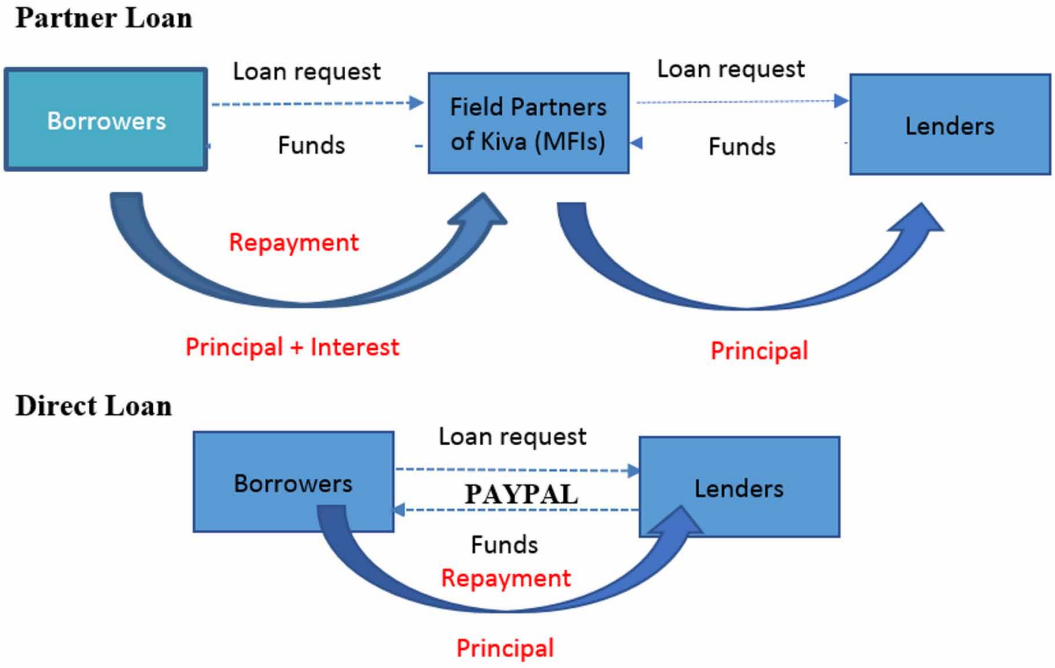
RECENT FINDINGS ON MICROCREDITS



It is important to point out the difference between a direct loan and a partner loan. Although Kiva and Kiva lenders never receive any interest from loans, the situation is different when referring to borrowers. When using local field partners, most borrowers do pay interest to them. On the other hand, direct loans using Paypal charge 0% interest. Direct loans are only available in the United States and don't use Field Partners. Some researchers have studied how lenders choose between these two modalities concluding that only highly altruistic lenders prefer direct loans to borrowers (Ge, Guo & Luo, 2016). These direct loans are riskier as there aren´t intermediaries to look into loans and collect repayments.

We can compare a partner loan and a direct loan in Figure 2.

One important aspect is the speed of funding, as time can be a critical factor for financing in the third world. The option of forming groups of borrowers when requesting loans has different effects. First of all, there is a joint liability. This fact increases peer pressure to repay loans as responsibility is shared; if one member fails to repay the debt, the other members must cover the loss. Moreover, the risk for lenders decreases as they diversify the investment. Therefore, it should be easier to obtain financing. Recent research shows that making groups speed up funding time by 3.3 days on average when using Kiva. (Pham & Shen, 2017).

Microcredits have also been examined from an anthropological perspective. Hayes (2017) researched microloan repayments in northern Honduras and focused on Honduran women who request microcredits to start a small and informal business. He observed that there is a significant and hidden labor of repayment unaccounted for in reports. Women in the study carried out different strategies to meet loan repayment schedules. Sometimes they requested microloans from multiple agencies to getting money

Figure 2. Kiva's Partner Loan vs. Kiva's Direct Loan (Source: adapted from Pham & Shen, 2017)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

to meet other microloan deadlines and seeking aid from friends or family was common. Many times, they needed to use social relations with clients to adjust microloans repayment periods with local payment habits. Some of them combined temporary wage work and small commercial activities to fulfill the financial obligation.

Other authors criticize microcredits as a way of eradicating poverty. According to Mull (2016), Kiva doesn´t have a process to know what happens when an MFI receives funds. Therefore, Kiva must provide resources to MFI, the experts in the field, and doesn´t have direct relation or accountability with final users. The attention is drawn to the loan and the risk of the lender and not to the borrower. In addition to this, Mull points out the assumption that any person can be an entrepreneur regardless of background, intelligence or market limitations. Furthermore, he affirms that loans are often used for purposes different than those stated when requesting them.

Waidi (2017) has studied the features of borrowers of microcredits granted by microfinance institutions in Lebanon from 1984 to 2015. The agencies that provide micro-loans in this country are NGOs. Research results showed that NGO microfinance institutions gave more credit to men than women and a reduced part of credit ended up in start-ups. Borrowers were usually poor, lived in rural areas and had a low level of education. The MFI´s officials preferred to give microcredits to men. These findings are consistent with gender discrimination in patriarchal societies.

The research carried out by Banerjee et al. (2015), six randomized evaluations of microcredits using six countries on four continents, urban and rural areas and borrowers, loan and lender characteristics, showed that the effects of microfinancing are positive but not transformative. This result supports the notion that microcredits must be combined with other actions to eradicate poverty

CONCLUSION

From Digital Entrepreneurs for Social Change by analyzing the KIVA's Case of Study, there is no doubt that an organization is well meaning while striving to bring economic relief to the poor, ending up the superiority of the Global North over the Global South. KIVA complements the informal lending practices based on family and friends. These arrangements can usually be distinguished from those of moneylenders in that there is no usury, as lenders do not receive any interest rate. KIVA lenders do not expect to gain money from their lending, as all money received given to benefit the poor.

These disruptive practices of empowering the poor as Kiva.org has opened new ways of understanding the relationships between developing and developed countries, relationships based on equal social exchange, losing traditional forms of developed countries rooted on charity. The new wave has come beyond the microcredit frontiers by transforming the organizational dynamics based on borrowing side into lending groups and what is more, losing the financial return by moving forward to other forms of "return" as feeling the Gate's philanthropy.

Organizations, like the Grameen Bank of Bangladesh, have paved the way for social change, development of countries' entrepreneurship and empowerment of the poor through microfinance. Technology has complicated and introduced new challenges to global lending. Using online platforms using implementing what we have named as social-on-linezation of poverty or action of alleviation of poverty through entrepreneurial online platforms which impact directly on society and their change, this work has also shown the need for global communication processes and empowerment through online microfinance. Web 2.0 digital technologies and its complex tools make it possible for borrowers living in developing

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

countries to receive loans, adding a new dimension to global lending, providing people who otherwise would not have had access to loan products with the support needed to improve their lives and in turn, the social change.

Finally, scholars and researchers need to continue exploring new ways in theorizing global processes of communication, and in exploring new financial and social concepts based on the flow of money, return communication, and interrelationships in cyberspace to deal with this disruptive social digital entrepreneurial movement known as Kiva.org. We are sure that this first Peer-to-Peer microfinance institution in the world will be soon followed by others with the unique objective of offering a better life for the poor, acting lenders, either from philanthropy (to help others through donations) or from religious beliefs (charity).

KEY TERMS AND DEFINITIONS

Banking the Poor: It consists in providing microcredit-based financial opportunities to the poor to insert them in today's financial world.

Digital Entrepreneurial Charity: Entrepreneurs full of human and/or religious values who use the Internet for alleviating the poor.

KIVA: Based on the Information and Communication Technologies (ICTs), this organization is the first Peer-to-Peer microfinance organization in the world.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Microfinance: Small loans that benefit the poorest who live in Third World countries.

Peer-to-Peer Micro-Lending: Small quantities of financial aid donated at no interest rate directly given through the Internet from First and Second World lenders to Third World beneficiaries.

Social Change: The creation of fairer and values-based societies defined by a higher standard of living through microfinance and digital entrepreneurial charity.

Social-on-Linezation of Poverty: It is determined by the sense of internalization and awareness of poverty by the most favored population of the world by using the Internet.

ENDNOTES

1 The Consultative Group to Assist the Poor (CGAP) is a consortium of 31 public and private development agencies working together to expand access to financial services for the poor, referred to as microfinance. These principles were developed and endorsed by CGAP and its 33 member donors and further supported by the Group of Eight leaders at the G8 Summit on 10 June 2004.

2 For instance, in November 2010, the World Bank launched a Global Program on Consumer Protection and Financial Literacy, which focuses on shielding poor financial clients from abusive and predatory practices and on providing "consumer education."

3 Grameen Bank and Muhammad Yunus pioneered in Bangladesh what it titled the "solidarity circle."

4 There are "self-help" and "community-based organizations" that have evolved from traditional credit groups. These intermediaries were especially popular in India. While "solidarity circles" and "self-help" groups of borrowers are similar, the former involves remote oversight whereas the latter strives to create independent, locally run micro-banks that encourage borrower repayment but there is no paucity of academic and popular media coverage of group lending (Hartley, 2010).

5 KIVA lenders cannot receive interest for legal reasons, among other, because KIVA is a 501(c)(3) what means being a nonprofit for tax purposes.

6 KIVA Friends is perhaps the most comprehensive off-KIVA website for coordination. Touted as "A community of lenders, by lenders," its look and feel are similar to Kiva.org. On the homepage, daily statistics are displayed which show the total value of loans made, number of KIVA lenders, number of countries represented, number of entrepreneurs who have received loans, the percentage of loans made to women, the number of KIVA Field Partners, and the number of countries hosting Field Partners. Additionally, KIVAFriends.org provides links to other off-KIVA coordination sites. KIVAFriends is the most prominent platform for understanding extant online options on lending cooperation.

7 The KIVA profile on Change.org shows the support of over 1,000 individuals, fundraising, supporter biographies, blogs, embedded videos, recent news, and job postings.

8 KIVA means "unity" in Swahili.

Chapter 49
The Social Economy and Role of Government in South Africa

O. E. Okeke-Uzodike
University of KwaZulu-Natal, South Africa

Mogie Subban
University of KwaZulu-Natal, South Africa

ABSTRACT

Social economy, as a relatively new concept, is considered the 'third sector' of the economy in government discourse. It plays significant roles in socio-economic and political spheres of any nation. Emphasis on social economy has been as a result of the global recession which caused economic depression in several countries all over the world. In South Africa, the impact of the economic recession has reflected mostly in increased unemployment and poverty levels resulting in maximization of discrepancies between the rich and poor with inequalities, creating disenabling environments for foreign investments. These social problems have called for an examination of the role of the social economy in liberating the South African economy from its current dire state. This chapter on tracing the developmental agenda of the South African government, will examine how the social economy has fed into the National Development Plan and the impact of implementation of government policies and regulatory frameworks to ensure achievement of various national imperatives aligned to the Millennium Development Goals in the context of the social economy. The authors state that whilst there is a growing trend towards the social economy in the current context of government, multi-faceted effects of poverty needs to be targeted through robust entrepreneurial opportunities for growth and development of the economy.

1. INTRODUCTION

Society is the support system on which government is built, hence for every democratic government, much is expected to ensure the societal wellbeing. The primary role of governments all over the world is presumably the provision of public services for the general welfare of communities at large. As globalization is driving the world, governments are facing challenges of meeting the demands of the citizens in creating enabling environments and providing essential public services. Public service delivery is considered a

huge task which the government would not be able to implement on its own. As such, involvement and participation by the private sector and fostering a culture of entrepreneurship are contributory factors towards a social economy encouraged by government to implement its policies. The social economies are grouped as those organizations whose primary objectives are not profit-driven, but contribute to the economic growth and well-being of the society. The alignment with the Millennium Development Goals (MDG's) as a strategic focus, has raised more concerns on the role of the social economy in society. These *tenets* of the MDG's underpin the concerns of the societal well-being, such as poverty and unemployment; health issues, inequality, education, environmental sustainability and global partnerships.

However, globalization has re-enforced the need for societies to move towards a better world which implies more responsibilities for government, the private sector and the social economy at large. The differences in the value systems and multi-cultures reflect diverse roles of the social economy and the government in developing, emerging and advanced economies. In a developing economy such as South Africa, challenges such as increasing unemployment rate, poverty, high mortality rates, poor education, poor enabling environment, population growth and migration challenges have significantly impacted heavily on the society. In addition, the adoption of various national, regional and international goals to ensure citizens' well-being have increased the expectations of the citizens; thus raising more concerns on the role of government and the social economy. The objective of this paper is to re-examine the current state of the South African social economy, and to appreciate the government regulatory framework that encourages entrepreneurship. The preferential policy framework for procurement reform is an important milestone to foster a spirit of 'entrepreneurial government' encouraging and investing in the growth of the social economy through direct and increased participation of small, medium and micro businesses.

However, the rest of the chapter will discuss the overview of the social economy, concept and structure of the social economy, global recession and the South African economy, towards achieving a prosperous nation, the social economy and entrepreneurship, future research direction and conclusion.

2. OVERVIEW OF SOCIAL ECONOMY

The social economy is considered a 'third sector' amongst economies operating between the private (business) and public sectors (government). Historically, literature have linked social economy to associations and co-operatives structured to respond to the living conditions of the most vulnerable and defenceless social groups. In support of this movement, the International Labour Organisation's (ILO) recently adopted a Declaration of Social Justice for a Fair Globalisation which underpins the need for effective social economy and envisions placing people at the centre of the economic policy of government. Given this background, ILO defined social economy as "a concept designating enterprises and organizations, in particular cooperatives, mutual benefit societies, associations, foundations and social enterprises, which has the specific feature of producing goods, services and knowledge while pursuing both economic and social aims and fostering solidarity" (ILO, 2009, p.1). Another contemporary definition of the social economy comes from Mook *et al.,*(2007, p.17), "A bridging concept for organizations that have social objectives central to their mission and their practice, and either have explicit economic objectives or generate some economic value through the services they provide and purchases they undertake". The aim of social economy from both definitions is that it is based on democratic values and is not profit-driven. The concept of the social economy is influenced by the philosophy of ensuring social

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ethics and morality--solidarity, equality, liberty and social responsibility particularly for the vulnerable groups within society.

The concept of social economy and its impact on the economy has prompted much global debate lately. Social economy theory attempts to study the relationship between the economy and social behaviour influenced by morals, ethics and philosophies. Since the introduction of the MDG's, much concern has been raised on the citizens' living conditions. Such concerns include social, economic, and environmental conditions of communities, most especially the disadvantaged and economically impoverished persons in society. The inception of the sector of social economy has resulted in satisfying the citizens' needs which are being overlooked or compromised by the public and private sectors. With evidence from the report of the meeting on Gender Mainstreaming in the African Union, it was documented that "social economy plays an important and growing role in our economies and societies by providing employment and social protection, as well as other social and economic benefits", as evidenced by Femme Africa Solidarité, (2011, p.1). In addition, according to the CIRIEC research conference report, (2009, p.9), "social economy enhances wealth distribution and poverty alleviation". Furthermore, literature has documented other roles played by social economy such as increasing productivity and competitiveness; contributing to socially-inclusive wealth creation; enabling individuals and communities to renew local neighbourhoods; demonstrating new ways to deliver public services; developing an inclusive society and active citizenship, asserts O'Sullivan and Sheffrin, (2011). Thus, the social economy plays an important role in creating a sustainable and prosperous society.

3. CONTEXT OF SOUTH AFRICAN SOCIAL ECONOMY

The global recession of 2008 resulted in economic crises and posed varying degrees of challenges to the South Africa economy. According to Ntshalintshali, (2009, pp. 1-2), a report of the Congress of South African Trade Union (COSATU), the economic downturn caused a wide range of issues such as "gross imbalances and inequalities in the global system (South Africa inclusive), the impact of the financing of economies, ineffectual regulation in several of the major world economies and poor business practices have resulted in significant asset depreciation, closures of companies, rising unemployment and sharp slowing down of economic growth".

The government's immediate strategic plan includes the revision of the 2011 National Development Plan (NDP). The contents of the NDP which includes poverty alleviation, unemployment and inequalities has been evidenced in the 1994, Reconstruction and Development Programme (RDP), in the 1996 Growth, Employment and Redistribution Program (GEAR) Policy, the Accelerated Shared Growth Initiative (AsgiSA) and the 2010 New Growth Path. According to Williams and Taylor in (Sebola & Nkuna 2014: 930), government has through the RDP policy committed itself to driving transformation by maximally spending on social needs, especially with regard to the historically disadvantaged communities. Following on, Mears (2006: 200) advances that the intention of AsgiSA was to become a national shared growth initiative rather than merely a government programme, together with other key policy and strategic frameworks which impact on the triple bottom line. This will need the co-operation of individuals, households, business and government in a concerted effort to promote social entrepreneurship.

In the words of South Africa's Minister of Economic Development, Ebrahim Patel, "the New Growth Path has placed employment at the centre of economic framework because it has an absolute important to role to play in addressing a number of social challenges" (SA Government. 2011: 1). Against this

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

background, it is worthwhile to note that employment creation would be enhanced in an environment where social economy and entrepreneurship are fostered. The impact of recession has drawn more attention to the prevailing social issues in the society. The revised version of 2011 laid much emphasis on *amongst others,* the need to eradicate poverty, inequality and enhance job creation. These social, economic and environmental issues as contained in the policy documents were aligned to the concept of NEPAD and the attainment of the Millennium Development Goal1: Eradicate Extreme Poverty and Hunger, and Goal 7: Ensure Environmental Sustainability. In support of these documents, the 2012 NDP thus reads as follows:

The National Development Plan is a plan for the country to eliminate poverty and reduce inequality by 2030 through uniting South Africans, unleashing the energies of its citizens, growing an inclusive economy, building capabilities, enhancing the capability of the state and leaders working together to solve complex problems (NPC, NDP 2030, p. 1 - 2012 version).

The NDP core implementation principles were built on broad ownership, continuous capacity building, policy consistency, prioritisation and sequencing, clarity of responsibility and accountability, continuous learning and improvement and coordinated action (SA News 2013).

Going by the principles of NDP plan, government envisaged that the solution to the growing issues of social, economic and environmental wellbeing of the society requires full integration of all stakeholders, government, citizens, businesses, and mostly, the third sector economy, that of the social economy. However, although the NDP focuses on the need for sustainable livelihoods, the plan appears to regard employment as the only means of achieving this goal and there seems to be very little due consideration to stimulating alternative means of work in the form of self-employment to realize this goal, posits Roux (2013: 509).

This is because the social economy has been documented to play an important role in creating a strong, sustainable, prosperous and inclusive society. According to the South African Local Economic Development Network (2010), the South African economy consists of the following pertinent points:

1. The private sector which is privately-owned and profit-oriented;
2. The public sector, state-owned and to a large extent welfare-oriented;
3. The social economy, usually referred to as the 'third economy' that comprises of three sub-sectors;
    a. the community sector: This include voluntary organizations operating at local or community levels which may include vigilante groups, sports club, parent associations'.
    b. the voluntary sector: According to Perth and Kinross Council (2012),this sector is made up of organizations that have a formal constitution (for example a governing document); independent of government and self-governing; *not-for-profit* and usually operating with a meaningful degree of volunteer involvement. Such organizations include housing associations, charities and national campaign organisations.
    c. The social enterprise sector deals with businesses trading for social, health and environmental purposes. These businesses deliver goods and services and aim to be financially profitable. The profit is reinvested towards achieving the purpose of setting up the organization (Perth & Kinross Council, 2012).
4. The informal economy is characterised by enterprises that are not legally regulated and therefore outside the formal economy.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The mainstream of the government sustainable development, job creation, poverty alleviation and equality has been maintained in the policy objectives. However, the practicality of integrating these policies and aligning them within the framework that supports social economy and entrepreneurship remains a challenge to South African government. Thus, effective translation of the policies into practice is considered at the core of government's agenda for social inclusion.

4. GLOBAL RECESSION AND SOUTH AFRICAN ECONOMY

The International Labour Organization pointed out that "as the recession comes into effect, poverty reduction unravels and the middle classes worldwide are weakened, the risk is that social and political tensions will multiply" (ILO Global Crisis Observatory 21 May 2009, p. 1). According to CODESRIA (2012), the social repercussions of the economic downturn was mostly evident in issues related to high unemployment, more debt, and low growth, as well as greater difficulties in having access to finance for developing countries. Evidence from South Africa shows that the recession impacted heavily on the economy. At the dawn of the 2008 economic downturn, the South African economy shrunk by 1.8% in the final quarter of 2008 and by an annual quarter-on-quarter 6.4% in the first three months of 2009 (Bell, 2009).Contributing to the weakened national economy, was the shrinking of the mining sector output by 33%:the shrinking of the manufacturing sector output by 22% (considered the biggest decrease on record ever); shrinking of consumer spending by almost 5%, (its biggest contraction for 13 years); a 47% rise in company failures in the first four months of 2009; and rise in the household debt to about 80% of disposable income (from around 50% six years ago) (Bell, 2009; Hazelhurst, 2009; Isa 2009). The third quarter of 2009 saw 484, 000 workers lose their jobs with the largest number in manufacturing (about 150, 000). Added to this impact, is 1.6 million workers who are excluded from the calculations because they have ceased actively searching for work that is the so-called discouraged workers syndrome, highlights The Business Day, (30 October 2009).

Six years on into the recovery path, the effect of global recession still lingers on. The recent statistical report indicates that the gross domestic product (GDP) shrunk by an annualized rate of 0.6 percent in the first quarter of 2014, unemployment rate increased to 25.2%, and youth unemployment jumped to 36.1% (Stats SA, 2014). With the level of unemployment amongst youth, it appears that one in two young South Africans remain unemployed, 5.067 million people are without job mainly due to job losses in key sectors such as agriculture, trade and transport (Stats SA, 2014). Job losses in these key industries have been mostly evident from the inception of 2008 global recession and have lingered on for the past six years. The high rate of unemployment has also unravels the poverty level. The society lives in absolute poverty and income inequalities. The poverty trends analysis reported by Stats SA (2014, p. 26) shows "poverty level decline from 57.2% in 2006 to 56.8% in 2009 and further 45.5% in 2011 for South Africans living below the national poverty line level (upper bound poverty line of R620 per capita per month in). This reflects a 20% reduction from 2006 to 2011 and sounds like a good news for the government because at this point, the national goals of halving poverty by 2015 have been achieved".

Against this backdrop, South Africa is considered as a middle-income country though the society's income is very unevenly distributed. In comparing the national poverty line of R620 a month with the international standard of $2.50 a day (for middle income countries), using indicators such as the Gini coefficient, dollar-based poverty measures, employment, income per capita, social services and government-based social assistance programmes, the report indicated that the international target is likely to

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

be achieved by the year 2015 (UNDP, 2013). However, there is much work for the government, because currently 23 million South Africans are living in absolute poverty (below the upper-bound poverty line) with lower income levels. The disparity in the income levels has resulted in the rich becoming richer and the poor becoming poorer. Going by the use of the Gini coefficient indicator for measuring inequality, the value ranges from 0 to 1. A Gini value of zero implies equal proportion of population access commensurate proportion of income, thus a Gini of zero would imply equal income distribution across the population. A Gini coefficient of one on the other hand implies an extremely unequal distribution of income (UNDP, 2010). The Gini coefficient in 2011 measured 0.69or 0.65 (from Stats SA Quarterly Labour Force Survey QLFS_Q4:2011 or Stats SA 2014-poverty trends report respectively). The value to be considered shows high levels of inequality for a middle income country such as South Africa. The report of inequality at sex level indicates "that females' had a higher poverty gap of 20.5% compared to their male counterparts at 18.8%" (Stats SA, 2014, p. 26). In addition, the inequality measured at population group using Gini coefficient indicates 0.55 for Black African, 0.53 for Coloured, 0.45 for Indian/Asian and 0.42 for Whites respectively (Stats SA, 2014, p. 16). None of the Gini coefficients implies equal group proportion with or across the population group. The poverty trends in South Africa between 2006 and 2011 highlight the socio-economic deprivation in the country. Furthermore, "the average annual income levels by population group represents R60, 613 for Black African, R112 172 for Coloured, R251 541 for Indian/Asians, and R365 134 for Whites" (Stats SA, 2012, p. 42).

The implication of these inequality data is that the gap between the poor and the rich whether by population, group or sex is becoming wider and wider. At this rate, it becomes highly unlikely to achieve the MDG goal of eradicating poverty and promote gender equality as the target year is achievable in the short-term. The reality of the current economic situation is compelling in the desire for government to reduce the number of people who live in households with a monthly income of R620 per person (in 2014 prices) from 39 percent to zero; reduce inequality, as measured by the Gini coefficient, whether from 0.69 or 0.65 to 0.6 and to increase employment from 13 million in 2010 to 24 million in 2030 remains a challenge.

5. SOCIAL ECONOMY AND THE NATIONAL DEVELOPMENT PLAN

The NDP adopted the use of lower-bound poverty line (LBPL) of R443 (as in 2011 prices) as the poverty target line for eliminating poverty by the year 2030. According to Stats SA, (*see Table 1*), "32.3% of the population or 16.3 million people (as at 2011 census), are living below the lower bound poverty line". The poverty gap at LBPL is 11.8% as at 2011, and therefore would require an estimate of R31.7 billion per annum to fight the poverty" (2014, p.14).

Table 1. Progress towards NDP's Poverty Targets

Poverty Indicators	2006	2009	2011
Percentage of the population that is below the LBPL	42.2%	44.6%	32.3%
Number of people living below the LBPL (millions)	20.0%	21.8%	16.3%
Poverty gap for the LBPL	16.4%	18.9%	11.8%

Source: Statistics South Africa. 2014. Poverty Trends in South Africa: An examination of absolute poverty between 2006 and 2011. p. 14

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The South African economy has experienced high level of economic stability since the transition to democracy in 1994. It has been noted as the largest economy in Africa contributing about 40% of the continent's gross domestic product (GDP) with significant influence on trade and investment. The annual growth rate in GDP stood at 3% at the close of 2010. However, the currently Stats SA report indicated a decrease of 0.6% in the gross domestic product (GDP) in the first quarter of 2014 (Stats SA, 2014). In addition, highest inflation of 6.6% in the past five years was recorded in May 2014 resulting in an increase in the price of food. Recent rebase of GDP of African countries' economies placed South Africa as the second largest economy in Africa. The resultant effect is the lingering poverty, unemployment, and inequality hitting the masses. With the youth unemployment at 36.1%, it becomes challenging of the hope of the youths being the future leaders. The economic prospects for the youth and the poor masses become limited. At the estimated growth rate of 3.5% per annum, the economy would require more support to generate the required amount of money needed to alleviate poverty by 2030.

Addressing poverty, unemployment and inequality and the commitment to achieving the Millennium Development Goals (MDGs) has been the priority of the democratic government in various pre-existed programmes and initiatives and the most recent NDP. The government comprehensive approach in NDP involves broadening access to employment, strengthening the social wage, improving public transport system and raising rural incomes (NPC, 2012). Thus far, evidence has been recorded in the decline in poverty level from 57% in 2006 to 46% in 2011 which has been linked to a combination factors such as social grants, expanding social safety net, income growth, decelerating inflationary pressures on households, expansion of credit and growth in formal housing (Stats SA, 2014). Irrespective of the progress made so far, the fact that 23 million South Africans live below the poverty line remains a daunting challenge. According to Le Roux (2009: 509), the NDP regards agriculture in rural areas as an opportunity for employment creation and anticipates a well-implemented strategy to boost agricultural output towards the creation of up to 1 million jobs by 2030. The author deems this to be unrealistic due to uneven spatial patterns and high levels of unemployment in the outlying rural areas. This augurs for involvement of the informal sector and the social economy towards sustainable employment leading to sustainable development.

Hence, this calls for further government intervention processes, and more emphasis on the use of strategies such as full integration of the social economy and re-examination of policies to complement the existing approach.

6. SEMIOTICS OF SOCIAL ECONOMY AND ENTREPRENEURSHIP

According to Monzon and Chaves, (2008, p. 552), "social economy has not only asserted its ability to make an effective contribution to solving the social problems, it has also strengthened its position as a necessary institution for stable and sustainable economic growth, fairer income and wealth distribution, matching services to needs, increasing the value of economic activities serving social needs, correcting labour market imbalances and, in short, deepening and strengthening economic democracy". There has been a tremendous growth in organizations who have integrated social economy in proving basic services. The contribution of the social economy in solving the societal problems has been recognized by most governments in the world today.

With this in mind, the South African government has recognized the value of social economy as evidenced in the pre-existed initiatives such RDP, GEAR, NGP and the present NDP. The two areas of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

centrality for NDP employment creation strategy are through the small and micro medium sized enterprises (SMME) and deregulation of the labour market. Against the backdrop of SMMEs, is the concept of social entrepreneurship which has become a vital business model. According to Volkmann *et.al.,*(2012, p. 8), social entrepreneurship means "acting within markets to help a societal cause, by creating additional value, aiming at sustainable solutions" while Wolk, (2008) defined social entrepreneurs as agents that respond to market failures with innovations that are transformational and financially sustainable, thereby helping the government in addressing the various social dearth. According to Martin and Osberg, (2007, p. 35), "social entrepreneurship may be regarded as comprising of three elements:

- *Firstly,* identifying a stable but inherently unjust equilibrium causing the exclusion, marginalization, or suffering of a segment of humanity that does not have the financial means or political power to generate advantageous changes;

- *Secondly,* identifying an opportunity, in this unjust equilibrium, to develop a social value proposition, and bring inspiration, creativity, direct action, courage, and fortitude, thereby challenging the stable state's hegemony; and

- *Thirdly,* creating a new, stable equilibrium which exploits the potential, or eases the suffering of the targeted group, as well as creating a stable ecosystem around the new equilibrium, ensuring a better future for the targeted group and even society at large".

South Africa's adoption of the social economy was in line with the global trend of positioning social economy as a potential solution to social shortfalls. The idea lies in the application of the concept of social enterprise and entrepreneurship which has gained popularity in most countries today. Indeed, it is believed that social entrepreneurship and the contributions of social entrepreneurs have the possibility of being transformative change agents in society and that developing nations such as South Africa could benefit from increased government and public support for the phenomenon of social entrepreneurship (Bornstein, 2004; Urban, 2008). In addition, Urban, (2008, p. 347), believed that social entrepreneurship has an "unequivocal application" in South Africa because the various existed government initiatives such as RDP and GEAR were not able to satisfy the entire social deficit in terms of bringing the envisaged socioeconomic change. The introduction of the NDP to reduce the poverty level; create11 million new jobs and reduce unemployment to about 6 per cent; as well as reduce inequalities by 2030 shows that the government approach is more of a people-centred towards development approach. The role of government in realising the vision 2030 is of utmost importance. According to COSATU report, a critical examination of the NDP plan acknowledges the changing nature of job but appears to be fixated with full employment as the ultimate goal without intention of revisiting labour legislation. In addition, the NDP acknowledges the importance of the social economy but the action plan appears to show little emphasis on self-employment through SMMEs (Ntshalintshali, 2009).

The fact that entrepreneurship results from the creativity, drive, and skills of individuals or groups of individuals requires government support for it to flourish. In support of the organizations in the social economy, the government core actions include the development of a strategy to support social economy organisations amongst others in obtaining marketing, bookkeeping, technological and financial services and training, and in developing linkages within the social economy to encourage learning and mutual support; work with union and community investment companies to develop a Charter with commitments to job creation; encourage state procurement and service delivery (The South African LED Network, 2010).Given this context, government policies and actions are key elements in dealing with the social challenges. The government has a role in setting the appropriate macro-economic framework and con-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ditions to ensure best social and economic outcomes, which determines the level of economic growth and employment. The NDP vision for 2030 stipulates "the need for the government to regulate market participation, identify and resolve market failures, provide appropriate public infrastructure and services and help in lowering transaction costs across the economy" (NPC, 2012, p. 134), but the extent to which all these have been implemented remains a challenge to the government.

With the present level of unemployment, poverty and inequality, the first recommendation to ensure achieving vision 2030 is the application of Keynesian economics. With government being a key player in the economy, it has the potential to alter interest rates, repo rates and issuing of bonds. This model proposes interventionist approach where government spending can create demand for goods and services. By so doing, it enhances the improvement of GDP and employment without waiting for the market forces to do so, thus resulting in deficit spending (Radcliffe 2009). In addition, government, has the ability to control the economy and prevent the negative effects of recessions or pulling the economy out of a depression. It requires a closer monitoring of the fiscal and monetary policies. The second recommendation points to review of government policies and regulatory frameworks for SMME's. According to DTI, (2008), SMMEs in South Africa employ 47 per cent of the economically active population and constitute close to 45 per cent of GDP. Irrespective of this, studies have shown that SMME's are confronted by factors related to *among others*, the inefficient legal framework and regulatory environment, lack of access to markets, information and advice, lack of access to finance, poor physical infrastructure and business premises, lack of entrepreneurial training, skills acquisition and managerial expertise, limited access to appropriate technologies, lack of capacity-building and institutional strengthening (uMgungundlovu SMME Development & Support Plan, 2011, p.27). Thus, as a result, "the state of entrepreneurship and small business development in South Africa presents a picture of under-performance relative to other countries at similar levels of development" (Luiz & Mariotti, 2011, p. 50).

7. FUTURE RESEARCH DIRECTIONS

Various governments have realized the contributions of the role of social enterprises and social entrepreneurship as part of the social economy. This is why the South African NDP is believed to be led by the concept and principles of social enterprises and social entrepreneurship as part of the emphasis on the social economy. Various policies in South Africa have contributed to social development by addressing the socio-economic needs of the population, especially the poor, marginalized and historically disadvantaged. The capacity to stimulate and foster productive economic activities and growth in improving the living conditions of people whilst reducing poverty, is the view held by Van Dijk and Croucamp (in Subban & Vyas-Doorgapersad 2014:500) which idea is generically linked to stimulating the social economy.

The fundamental role of government is to provide an enabling environment and adequate regulatory frameworks for SMMEs to flourish as alternate employment. Future research ought to be directed towards efficiency and effectiveness of government policies towards building a stronger social economy. Aligned to this notion in the context of rural development, Subban and Theron (2012: 28) state that, although research has been done on the review and assessment of integrated development plans to ensure that governance in municipalities is less generic and more public participatory, less descriptive and more prescriptive in nature, less institution-oriented and more client-output and impact-oriented – these integrated development plans must address and target rural development initiatives in contributing to

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

social entrepreneurship and job creation. A good example in this regard also includes local economic development projects as potential avenues in the social economy. In addition, another dimension is to review the sustainability of the enabling environment for the booming of the social economy.

8. CONCLUSION

The conclusion of the chapter brings together the notion that social challenges of contemporary society requires more than government structures for solutions. As such, the potential of the social economy or the third sector is a paradigm of modern approaches mostly recognised by governments today for solving societal problems through the involvement of both public and private sectors including a focus on co-operatives. The social economy tends to assist in filling the gaps in the emerging social spaces where public and private sectors are coalescing with the provision of basic societal services. The relationship between the social economy and labour markets cannot be underestimated. There is a continuation of provision of social services and employment creation. In so doing, the social economy and social entrepreneurship represent important spheres for societal and economic development. Globally, the presence of the social economy and social entrepreneurship has created much impact and popularity, especially in the areas of job creation and poverty alleviation.

In South Africa, the post-apartheid government has been involved in political, social and economic changes that inform social transformation. The global recession of 2008 prompted more government intervention processes to tackle the challenges of poverty, unemployment, inequalities and also to move the economy away from its current poor state. Prioritizing poverty, unemployment, inequalities and the provision of policy framework to support the development of social economy and social entrepreneurship are considered positive initiatives from the government. However, with the shrinking of the GDP and persistence rise in the societal upheavals, one tends to question if a focus on the social economy and social entrepreneurship can reposition the South African society to achieve the vision of 2030. Having said this, much is still needed from the government's side to ensure an enabling environment and a sustainable platform for the social economy to operate within the current dispensation in the country. The authors concede that there is a need to move away from economic oppression towards entrepreneurial freedom in the quest for advancing the social economy.

KEY TERMS AND DEFINITIONS

Economy: The general overview of the health of the nation.

Entrepreneurship: An innovative means of survival which contributes into the economy.

Poverty: A situation where one is not able to provide for himself the basic necessities beyond a limit.

Recession: Decline in the global economy.

Role of Government: The responsibilities or expectations of people from the governing body.

Social Economy: This is neither a private nor a public sector with the aim to assist government in ensuring service delivery.

Unemployment: A situation where a person is not able to get a job to satisfy his/her basic needs.

Chapter 50
Shrinkage of Rural Areas as a Result of Urbanization and Migration Processes in Mexico

José G. Vargas-Hernández
University of Guadalajara, Mexico

ABSTRACT

The study of tendencies in economic and environmental shrinkage is tied to the expressions of substantive changes in complexity of determinant contexts of internal and migration flows. This chapter answers the challenges posed by economic tendencies, using the theories and models and does not fall victim to simplistic projections and conjectures and theories based more in speculation than in fact. The method used is the critical analysis of economic, social, and political tendencies in relation to the situation of shrinking cities in Mexico. The results of this analysis led to the finding that the shrinkage process in Mexico, as a developing economy, does not follow the same patterns of well-developed countries, and an increase in shrinking cities has occurred since the middle of the 1950s and the use of incentives in some localities to attract economic growth have had modest success in turning around the shrinking process.

INTRODUCTION

The study and research on shrinking cities is a new field in Mexico. Research in the topic of shrinking cities in México is often criticized for lacking theoretical foundations or for insufficient reference to theory to explain the findings from empirical studies. This paper is aimed to address this criticism.

The issue of shrinking and decline in population and economic prowess provokes always reactions due to political sensitivity. In general terms, shrinkage is only one side of the coin, being growth the other one. Mexican researchers and academics are more worried on the fast growing rate of population and its spatial and territorial implications. While the more advanced and post industrial economies of the world are thinking in how to turn around city shrinkage into a steady growth, less developed economies are worrying in the implications of the urban fast growing rate of population and its territorial redistribution to stabilize development.

Maybe it is necessary to develop shrinkage typology to better characterize the phenomena. One point is important to stress here. While in the advanced countries are talking about the shrinkage process as the result of post industrial, post modern development, here in México where the industrialization process is still initiating, the process is taking place due to other causes, such as the most urgent drive of people for survival.

In general terms, the situation of shrinking cities in México does not follow the same patterns of well developed countries, where an increase in shrinking cities occurs since the middle of the 1950s (Oswalt, 2005) and the use of incentives in some localities to attract economic growth have had modest success to turn around the shrinking process

The concept of urban development is the way to analyze relationships between society, nature and progress and their representations in socioeconomic and political terms. The idea of progress is basic to understand and assess the different elements of contemporary society through different theories of development, from lineal development of Rostow to theories of Zero growth.

There are a variation of conceptual and theoretical proposals to analyze the decline and shrinking of human settlements: flows, decisions, phases, stages and composition of migration (Tuirán et al., 2000:31; Brown, 1991) sometimes inserted in evolutionist schemas, theories about the phases of economic development or social modernization that leads to an urban transition and mobility models based on a pioneering trajectory. Of course, these evolutionary schemes do not have a general applicability because in some cases are related only to determined movements such as exchanges between regions, urban and rural zones, and intra urban, between center and periphery in metropolitan areas, etc.

The study of tendencies in economic and environmental shrinkage is tide to the expressions of substantive changes in the complexity of determinant contexts of internal and migration flows. Population mobility is the strategic rational response of survival in an instable economic, social and political environment. At the same time, it is important to analyze the tendencies according to the economic changes using the theories and models and no to fall down victim of simplistic projections and conjectures or resound theories based more in speculation than in facts.

Over all, the determinant factors of shrinkage are suffering mutations as the result of the new economics and the emergence of new forms of population mobility. The base of these changes in Mexico is the economic liberalization and structural adjustment programs, the increasing capital mobility, major requests and demands from the labor market, advances in telecommunications and transport, productivity conversion, increasing of export activities, comparative advantages and relocation of industrial activities.

An approximation to the most classic analysis of shrinkage and its coverage allows that any theory can operate under its logic. The clue is the fact that factors can be attributes of the spatial areas which are interpreted over a common base by the agents. Although originally were close the gravitational approaches which depended of migration flows of distance and population of localities and communities, rapidly the attraction and expulsion factors widen and start to include economic, social, environmental and political factors.

MACROECONOMIC THEORY

From a macroeconomic perspective, economic shrinkage is analyzed according to its functions in the economic system in which it occurs. Macroeconomics and neo-classical models explain the shrinkage decision as a cost-benefit calculation (Davis, Stecklov & Winters, 2002, p. 292). The classic economic

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

theory supposes that the agents can determine with certainty the occurrence of events and anticipate the utility in front of results which will provoke different future events. Agents have the capacity to compare alternatives and are capable to choice in a coherent way the one that represents the best utility.

The macroeconomics theory departs from the assumption that economic shrinking contributes to the equilibrium of local and regional markets, such as labor and real estate markets or economic sectors with patterns of specific territorial localization. The classic model of sector equilibrium (Yúñez, 1978; Renis & Fei, 1961) tries to explain rural shrinkage due to movements of labor force to the urban industrial sector of high productivity and better wages. Disarrangement between periods of growth and periods of lack of growth leads to disorders in a steady community growth or shrinkage.

The velocity of these processes depends of capital accumulation rate in the modern sector. Still now, theories and conceptual frameworks consider shrinkage of localities as an adjustment mechanism of economic and labor disequilibrium. (Maré & Timmins, 2000, p. 1). However, there are studies that doubt about the homeostatic capacity of shrinkage to equilibrate relative salaries and to harmonize employment levels or to assess sector productivity. Aroca (2003) has found that all the revised studies use diverse methodologies and arrive to the same conclusion: The market is not enough to equilibrate regional differentials in employment.

THEORY OF SOCIAL PROCESSES AND PUBLIC ACTION

One strand in the research of the economic development shrinkage processes is indirectly achieved by the analysis of social, political and economic development using the theory of social processes. Sociology recognizes the role of rationality and the importance of aggregated disequilibria as causes leading to social processes and individual decisions. The theory of social processes contains a series of concepts which mediate without eliminate or substitute the primacy of economic factors to explain the shrinkage phenomena.

Social processes also recognize as a force the orientation of the action and the distinction of diverse types of rationality behind this orientation: Means to ends, means to values, traditional or routine, charismatic (Weber, 1992). Other force is the motivations no conscious discovered and underlined by Freud and the psychoanalysis (Alsted, 2001); although these motivations are related to the heterogeneity of economic preferences. Also, the social construction (Berger & Luckmann, 1968) and the influence of external factors such as group of pairs, media, power and authority, etc., make complex the individual evaluation of behavior from costs and benefits analysis.

Shrinking and decline of cities can be understood as a process or decisions determined by public action or inaction. Political scientists concentrate in the sense and effects of population policies, and legal and managerial dispositions that limit displacements and mobilizations of people, direct incentives to promote or avoid migration displacements, investments and policies of sectors oriented to spatial redistribution of people, local government actions, etc. Other processes promote shrinkage and decline of cities, such as governance crisis, internal armed movements, political violence, etc. Some explicit restrictions derived from public action, such as prohibition of population of protected areas by historical, cultural or environmental reasons, dangerous areas exposed to natural catastrophes, etc.

The hypothesis that territorial disparities of natural growth are the responsible of population transformations is rejected. There is evidence that factors which drive migration are the clue.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The research and study of shrinkage in México is focused mostly on patterns and tendencies of the population spatial distribution, internal and external migration and other expressions of mobility, and maintain some specificity for the relevant actors in the processes of spatial occupation according to the rural and urban characteristics of localities. Internal and external migration is a decisive factor in territorial distribution, taking into consideration the low fecundity rate and contextual transformations of the economic and social considerations.

Spatial Distribution of Mexican Population

The actual spatial distribution of population in Mexico is marked by the path dependence based on circular and accumulative causation properly oriented by large investments, irreversible and operating with increasing returns by scope and scale economies. Some areas of high population density were established since the Aztec period.

At the international level, Mexico is the 11th among the more populated nations, the second one in Latin America and the 14th in territorial extension in the World. Mexican population is unequally distributed all over the Mexican territory.

In 1950, the population density was 13.1 inhabitants per square kilometer and 1995 was 46 inhabitants per square kilometer. In population density Mexico occupies the number 8 with 46.7 inhabitants per square kilometer. México is among the ten countries with higher population density (Banco Mundial, 1994). During 1940-1980, the birth rate grew achieving 3.4 percent. The last decades, Mexico has reduced its annual birth rate, expecting to achieve 1.19 percent by the year 2010 (INEGI, 2005).

To determine if the population of a city is growing or shrinking, should be calculated with data of natural growth rate of population and added or subtracted the net migration rate. Studies suggest that population redistribution is originated basically by the existence of positive and negative migration and not for the territorial differences of vegetative growth.

In the last 50 years in México have taken place powerful process of spatial redistribution, achieving almost 80 percent of urbanization and maintained demographic stagnation in rural areas and its condition of population expulsion. Among other tendencies presented during the last 50 years, has been the occupation of traditional empty spaces in the Yucatan Peninsula and the adjacent area to the Rio Bravo or Rio Grande in the USA-Mexico border. When many maquiladora (in bound) enterprises of northern Mexico closed as their owners have moved the businesses to China in search of lower costs and higher profits, in a race to the bottom, still the large cities (Tijuana, Mexicali, Cd. Juárez, Nuevo Laredo, Reynosa, Matamoros, etc.) alongside de Mexican border continued receiving migrants from the South of Mexico and central America.

Population is more concentrated in the states neighboring Mexico City, the states with important economic and industrial development: City of México, Federal district, Veracruz, Jalisco and Puebla, These states account for 10.7% the national territory and have 41.2% of national population.

Urbanization Process and Rural Shrinkage

By its gravitation in the growth of urban population, rural – urban movements have been singular in the last 50 years in Mexico. Before 1940, México counted on larger rural population than urban population. In 1940 the urban population was only 35.1 considered who lived in localities larger than 2 500 inhabit-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ants. The accelerated process of urbanization starting the 1940s was paralleled with a strong population growth and migration movements from the rural areas to the large cities. Peasants abandoned the country side lured by the employment offered by the promising industrialization by import substitution model of development. During the period 1940-1970, Mexico City, Guadalajara and Monterrey become greater metropolitan areas.

The development model of Industrialization by import substitution, from 1940 to 1982, had profound demographic, territorial and economic impact derived from its economic, political and sociocultural urban locus. It disentangled urbanization, rural exodus and population concentration in large cities which offered better opportunities than in the rest of the territory. The exhaustion of the substitutive strategy and the accumulation of numerous problems in large cities led to a catastrophic vision of the future and generated incentives and pressures to relocate population. People started to displace from large cities to small localities around the large cities.

Among other reasons to explain why inhabitants of Mexican rural areas abandoned their towns and villages and migrate to the large cities, is the demographic growth in the countryside and the socio-economic dynamism in the cities and consolidation of higher life levels in urban areas. The ten largest metropolitan areas in Mexico, accounts for one third of the country's population and generate 62 per cent of national value added. There are numerous empirical studies based on gravitational models with an economic component that provide evidences to support this finding.

Evidences of a New Rural: Low Growth and Depopulation

Transition from a situation of predominant demographic growth by the mid XX Century to a new stage of large increase in urban population at the beginning of the XXI Century, is the most characteristic expression of spatial and territorial redistribution. Rural communities have achieved low rate of population growth and even depopulation. Empirical evidences suggest that the advance of urbanization is a general tendency linked to rural depopulation

However, some analysts have concluded that the notion of depopulation in rural areas has not empirical evidence because population is stable since the 70s. This assertion may be truth when considering the national level but when looking at specific rural communities, easily can be found that some of them are already depopulated and even had disappeared, such as some localities in the state of Zacatecas, Jalisco, Michoacán, etc.

The differential of demographic growth between the rural and urban areas can be attributed to the population mobilization, transfer and migration of people from the rural areas to the cities. Starting the decade of the 1960s the relation rural – urban population changes until nowadays when the population is predominantly urban while the rural communities have been shrinking. Until the 1970s the demographic increment of Mexican cities was due to the internal migration process. Internal migration is one of the components of population change, a variable of the compensation equation at local scale and as a force modeling the territorial distribution of population, metropolitan concentration, urbanization, regional shrinkage, etc. As important as the direct impact on population growth are the consequences for the characteristics of population, in particular the structure of gender and age.

The exchange dynamics of rural – urban population explains the fast growing of some cities in Mexico (Rodríguez & Villa, 1998; 1996). By the mid 1970s an increasing level of urbanization is tied to an inter cities and intra urban movements more related with residence motivations in the suburban areas.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Evidences indicate that during the 1980s with the economic crisis in México, the economic liberalization centered on the neoliberal economic policy of development, there were some pressure in survival for the poor rural and urban people to find better employments.

Young people have more necessities and probabilities to migrate from the rural to urban areas to continue their studies, improve education and look for higher labor and economic perspectives in other places than their own localities. Depending of the diversification level of productive structures and labor demand linked to informal jobs and services offered in the cities, it has been detected a visible attraction for women and younger people coming from other rural or urban localities (CEPAL, 1995a; Lattes & Recchini, 1996).

The rate of rural poverty diminished 15 percent between 1970 and 1990 while the urban poverty increased in 30 percent. An explanation maybe that rural poor migrated to the urban areas searching for new employment opportunities. 80 percent of the poor people live in rural areas (Hoffman & Centeno, 2004). These data shows also that the rural areas are shrinking. Still nowadays, in a country like Mexico that has significant levels of rural areas, the movements from rural to urban areas continue having quantitative importance, leaving behind the countryside in a shrinkage and disaster. The renovated dynamism of intermediate cities was the attraction for internal immigrants canceling or attenuating the attraction of traditional large cities like Mexico City and Guadalajara after the 1985 earthquake.

Cities alongside the Mexican-United States of America border are receiving an important influx of migration from Mexican states with less economic growth. Agriculture development in the Northwest states of México, birth of the "green revolution" produced growing commercial and distribution centers. Important touristy cities and urban centers associated to oil exploitation became large. In 1970 only 4 cities had more than 500 thousand inhabitants and in 1990 the number of cities was 21, in 1995, were 28 out of which, 7 had more than one million inhabitants and 14 Mexican states counted with localities of more than 500 thousand inhabitants, and 108 cities had more than 100 inhabitants (INEGI, 1996).

The export oriented strategy implemented in Mexico since 1982 based on an intensive use of raw materials and abundant and cheap labor, untied expectations for the revitalization of rural areas. Unfortunately the results have been negative due to the structural adjustment programs implemented and the lack of negotiations in the agricultural chapter of the North American Free Trade Agreement (NAFTA). However, masculine rural migration to the urban areas and to the United States of America has increased as a consequence of bad negotiations in the agriculture chapter of NAFTA.

Empirical studies linked to the process of migration give support to the hypothesis of rural declining but also some studies show a declining urban and metropolization processes. Constant population decline in rural areas is an effect of migration to the urban areas due to factors such as the increment of mono cultivation and the lack of competitive advantages for traditional crops after the introduction of North American Free Trade Agreement. The rural productive structures have a direct influence in minor masculine migration from the rural areas before 1994 when the North American Free Trade Agreement (NAFTA) began.

NAFTA is adding more negative results to the dismantled agricultural activities, and thus, has created a segmented production: Those who have technology, capital and have inserted in the international commercial networks and the immense majority who even can not produce at the level of self consumption because is more expensive to cultivate grains that to buy them in the import market. A massive migration from the countryside has been the result when the assumption was just the opposite: NAFTA would bring the needed employments.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The population living in rural areas changed from 41.3 percent in 1970, to 28.7 percent in 1990 and 25 percent in the year 2000. In 1970, the number of localities with less than 2, 500 inhabitants was 97.8 percent; for 1995 was 98. 6 percent and its participation in the total population had diminished from 41,3 percent to 26.3 percent. Most of the rural communities are shrinking. There is an inverse tendency between the proportion of number of rural localities and the proportion that live in there. The exceptions are the localities of less than 100 inhabitants maintaining 2.9 percent of total population. An explanation maybe the need to live nearby the cultivated land is related with the foundation of new micro settlements. This phenomenon of increasing small communities has important effects in biodiversity.

Scholars reject the hypothesis that sustained the recovery of rural demographic growth although based on the assumption that there is a direct relationship between the movement of production and the movement of people. Although the Mexican agricultural economy has been transformed and liberalized, however this fact has not reverted the tendency of rural migration to the urban areas (Kay, 1999), and even to the USA. Also, liberalization of agricultural economy has created a more segmented producers (Tejo & Nagel, 2002), incremented the mobility of more urban skilled workers who maintain double residence (David, 2001; Ahsley & Maxwell, 2001; Kay, 1999; Dirven, 2001).

The economic development model leads to a major territorial concentration of agricultural land and therefore, to reduce the number of real estates (fincas) and to increase the number of small localities and communities. The marginalized rural communities also lack of acceptable conditions for human life such as infrastructure for utilities, household water supply, schooling, health services, etc. It is possible to consider the population without any grounding to the economic and political development of the country.

New Rural and Urban Spatial Distribution

There is, however, a clear negative correlation between the urban percentage and rural percent of growth population. More precisely are the evidences for rural dispersion, instability and heterogeneity of population. for the case of Mexico in 1995 more than 10 million people lived in almost 185 thousand localities with less than 500 inhabitants (CONAPO, 1999; Rubalcava, 2001). They also concluded the instability of these localities which increased dramatically between 1990 and 1995 which can be associated to historical patterns of mobility for survival purposes.

Nowadays, the tendency of rural – urban transference is changing; the intensity of transference of rural people to the large cities in México has an inverse relation to the urbanization levels. This means and in the near future, large cities, like Mexico City, Guadalajara, Monterrey, Puebla, León, etc., will have some shrinking areas, like is already occurring in the downtown and commercial oriented zones of these cities, due to changing of soil use.

Following the overall crisis of the Mexican economy in the early 1980s and mid 1990s and the restructuring and liberalization that ensued, a large number of smaller establishments were forced to close down as they could not keep up with foreign competitors. In parallel to these processes of de-industrialization, Mexico City has experienced uneven economic growth, stagnation and decline of formal economy, formal retail has shrunk in relative terms, and the counterpart to this growth at the top has been the spread of micro businesses and the unprecedented expansion of the informal sector (Potkin, 2002).

Even though Mexico City still represents the largest concentration of industrial activities in Mexico, the significance of this sector in the local economy has decreased significantly over the past few decades, and the tertiary sector has become the driving force of the regional economy. The problematic transition

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of Mexico City has produced an increasingly fragmented metropolis, evident signs of special unevenness and territorial disjointedness. The majority of the inhabitants of Mexico City stays at home rather than use the city in their free time. However, the persistence gravitation of Mexico City, although it registers natural growth rate of population below the national average, is explained by sustainable immigration

A generalized and enduring economic crisis is marked by an absence of local alternatives of employment and conditions of limited economic options. Every year, around 1.2 million people need to be incorporated to the labor force. However, in recent years as a response to a new socioeconomic scenario, other new forms of population mobility have appeared differentiated from the traditional migration, such as temporal movements, cyclical, seasonal and periodical related to the rural component.

Population movements directed toward the internal frontiers or colonization's fronts, attract young people and have been characterized in great proportion by being temporal. Some colonization areas suddenly experienced notable growth in rural population for a period of time, but suddenly shrunk (Reboratti, 1992, 1990). People involved in these displacements moves from one front to a new one, always looking to improve living conditions and higher returns.

Most of these displacements are caused by the effects of the new economic activities, such as tourism and recreation, seasonal exports, mining and others, always in function of the labor flexibility that characterizes temporal agriculture activities. Some Mexican cities are considered artifacts of globalization linked to life styles and increasing global network of demographic and economic relationships, as it is the case of Cancun, Acapulco, Vallarta, Mazatlán, Los Cabos, etc. Cancún, in Quintana Roo registers important immigration associated to the tourism expansion.

A similar situation is observed in large cities on the states near the United States border: Baja California, Sonora, Chihuahua, Coahuila, Tamaulipas y Nuevo León, already inserted in global economic and production processes. The ongoing economic globalization process is reinforcing the border economies of Mexico because their privileged position for commercial exchange. As a result, Tijuana is the fastest growing city in México.

Central and Southern Mexican states which have important concentrations of rural and indigenous populations; however they register small concentrations of young people. There is a tendency that will continue in the following years: Young people will have more relative representation in the urban than in rural environment in the future. However, the percentage of young urban population and the total urban population is almost close, probably as the product of major urbanization processes.

Mexico City's development in the global economy is considerably vulnerable due to its lack of resilience to macroeconomic shifts and its dependent position within the international urban hierarchy. The globalized enclaves of Mexico City are functionally and territorially disconnected from the rest of the city, where the most alarming sign of urban change manifests itself, namely the enormous swelling of the informal economy.

Internal Conflicts and Natural Disasters

Internal conflicts and natural disasters have provoked massive displacements of population, affected families, severe social, economic and environmental consequences, and the shrinkage of towns and villages. In the history of Mexico is registered the facts that Mayan cities had been devastated by catastrophes and natural disasters. Some of the Mayan cities, like Tikal, had shrunk and most of them had disappeared.

Population displacements from México City to the suburban areas, was incremented from 9 percent between 1950.1960 to 22 percent in 1990-1995 (CONAPO, 1998). A large sector of the population which

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is unable both to afford rising prices in the center and to find housing in the rest of Mexico City, has been expelled to the neighboring State of Mexico, where commercial builders are developing massive subdivisions of low quality affordable housing

This migration influences the depopulation of the center of Mexico City (Tuirán, 2000; Sabatini, 1999; Jordán & Simioni, 1998; Gilbert, 1996; Paviani, 1985). Within the historical processes, the dialectics between the rapid peripheral expansion enhanced by the translation of poor population and gradual of depopulation of central areas in large cities like Mexico and Guadalajara. The orientation and selectivity of this migration makes it a factor of spatial demographic and socioeconomic differentiation and creates socio-spatial and residential segregation.

From the perspective of territorial occupancy, there are manifestations of new forms of residential segregation patterns since the economic crisis of 1980, although it is an old phenomenon and not exclusive of México. In 1970 existed 4000 and by 1996 were more than 100 thousand of these closed urbanizations.

The literature on structure of intra urban neighborhoods, colonies and suburban areas has identified opposing forces, although is marked by the real estate market behavior and population policies. Sometimes, these policies and market behavior implies the programmed virtual displacement of poor families to get rid off them from the wealthy residential areas (Villa & Rodríguez, 1997).

In Mexico, while the middle class is impoverishing, the higher class looks for closed urbanizations in protected areas. Gated communities legitimize residential segregation, increase inequality and polarization of cities. The sprawling and fragmented Mexican large cities face the challenges to reintegrate the mosaic of segregated settlements and built typologies, respond adequately to the mounting needs for housing and urban space and to alleviate the still increasing housing shortage while at the same time controlling metropolitan expansion. By reinforcing the existing segregation pattern of a rich west and south and a poor north and east, they are the new face of today's urban sprawl in Mexico City's metropolitan area (Potkin, 2002).

Insufficiency of Policies

The lack of research in this topic does not allow affirming seriously regarding the relationship between the emergence of small locations and communities and the economic problems of the Mexican country in the last decade, although the increment of dispersed population in smaller rural communities and the shrinkage of larger ones, signal a worrying situation for the provision of infrastructure and utilities. The dispersion of rural locations and communities had increased in terms of poverty and internal exodus. The absence, discontinuity and quality of data on natural growth do not allow assessing correctly the future scenarios.

From the geographical perspective, the spatial concentration of these small settlements takes place in territories that have poor accessibility and a weak functional integration to important central locations. Considering the high supply costs of basic utilities to benefit all the communities, and the generalized extreme poverty conditions of people living there, it is required more productive strategies targeted toward the improvement of economic and social conditions.

Other serious problem is the population pressure over the scarce and not renewable natural resources such as water, forest, soil, etc., related to the food capacity. Greater concentration of population settled in a rural community is related to diminish the cultivable land per capita, and gradually the supplies have to be seeking in other regions. In this sense, the greater urban concentrations are related with the environmental deterioration, as it is the case of the central part and the Northern border line of Mexico.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Some studies are aimed to anticipate the environmental consequences of future tendencies of population distribution, over all in fragile and high vulnerable ecosystems (Gómez de León & Rabell Romero, 2001. P. 595).

Among the population policies, there has been governmental intention to achieve population - territory equilibrium through programs for medium size cities such as public management decentralization, health and education services decentralization and municipal promotion. There is a territorial valorization in the strategies targeted to promote economic growth and policies to combat territorial mechanisms that reproduce poverty such as the program Progresa-oportunidades in México.

Policies as instruments for intervention must have as objectives to sustainable exploit territorial potentialities, reduce social exclusion and avoid natural catastrophic disasters. The dramatic effects of natural disasters are devastating and require territorial ordering plans to avoid human settlements in areas of high risks or to prevent possible threats. There are not empirical evidences in the studies that the free operation of the market leads naturally to better process of spatial redistribution of population and economic development.

On the contrary, there is a wide consensus that the market failures can cause more troubles than solutions. Public policies are necessary to create incentives, for the transparency of costs, to compensate externalities, to avoid asymmetric information and imperfect competency, etc. in order to develop programs of territorial distribution of population and promotion of programs for sustainable economic, social and political development.

HISTORICAL APPROACHES AND RESOURCE BASED THEORY

There is a strong strand of literature in the analysis of case studies recounting the rise and fall of mining cities and towns in Mexico, depending of mining firms. Most of these studies are historical and sociological recounts and not necessarily sustained by a specific theoretical framework.

Most of the case studies are not historiography properly speaking but historic interpretation, and more closely, economic history. Their limitations and the risk of misinterpretations depend of the analyses done by the historians regarding the history of mining in Mexico and the colonial history. The method of historic exploration used is the revision and compilation of studies related to the topic of shrinking cities, which have been interpreted under the optic of historic materialism, procuring to show the contradictions that characterized the mining activities as part of the colonial exploitation scheme. With the theory development of second contradiction of capitalism, O´Connor (2001) sustains that economic growth since the industrial revolution has been achieved at expensive costs for the autonomy of human communities and for the natural environment

The historic materialism and the outlined Marxist revisionism set the theoretical framework to focus the problem, without being this approach necessarily the radicalization of the point of view and leaving an open space to the scientific reasoning of different theoretical perspectives that can provide support to the analysis of the problem being under study. This focus to the problem do not necessarily means to embrace

Thus, the methodological resource is deductive procuring disentangle the inherent logic in the social and economic formation of New Spain, as it was named Mexico during the colonial times, regarding the reproductive infrastructural scheme. The method of historic interpretation used is the sociologic that

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

begins understanding the inherent logic of the studied phenomenology in general, in deductive manner, and proved through inferential statistics in the particularities of the related phenomenon. In this form are deducted the interactions of the laws that explain the phenomenology treated at macro-social level and lately, are proved the outlined asseverations as a research hypothesis at micro level.

The resource based theory may offer a framework to further the study and research of these historical and sociological recounts in the field of shrinking cities. Resource-based theory provides the framework to explain how organizations achieve sustainable competitive advantages. A resource is a kind of production factor which is at the firms' disposal, that is, each one is controlled by the firm in spite of having no property right to it. Additionally, any resource is able to create a competitive advantage if it has certain features. Resource based theory treats enterprises as potential creators of value-added capabilities.

The theory focuses on the idea of costly-to-copy attributes of the firm as sources of business returns and the means to achieve superior performance and competitive advantage (Barney, 1986; Conner, 1991; Hamel & Prahalad, 1996). As Grover Grover, Teng & Cheon (1998) explain, "the essence of a resource-based theory is that given resource heterogeneity and resource immobility and satisfaction of the requirement of value, rareness, imperfect immitability, and non substitutability, firms' resources can be a source of sustained competitive advantage". One of the objectives of the theory is to appreciate why competences can be perceived as a firms' most valuable asset and, at the same time, to understand how those assets can be used to improve business performance. Undervaluing urban areas can unwittingly place the economic and social futures of countries at risk.

The historic roots of the urban profile are found in the logic of the conquerors that valuated urban localization for the achievement of economic, political and ideological objectives. During the colonial period in México, mining was the gravitational sector of socio economic development inserted in the primary extracting and export scheme logic under the metropolitan- periphery colonial dependency context of the capitalism in transition from the bilateral mercantilism to the multilateral industrial capital. The local economies of the different Mexican regions were more obedient to transnational interests during the different stages of development: Colonialism, economic liberalism, industrialization by import substitution and the neoliberal regimes.

Colonization of New Spain is characterized by an abrupt demographic reduction of indigenous population. By 1518, a year before the arrival of Cortés to the Mexican land, the indigenous population was estimated between 16 and 25 million people (Borah, 1982; Cook & Borah, 1980; Cook & Simpson, 1948). One century later the indigenous population were roughly one million 200 hundred thousand due to several causes such as epidemic ills and the mortally rates resulted from the war of conquest.

The metal orientation mentality of the Spaniards is going to be the main reason of population mobility toward the exploration of new territories to find the silver and gold mines. The Iberian migrants had the mentality that the wealth was given by God through the precious metals and not as the product of work. The discovery of silver deposits in Zacatecas in 1546 is the first colonial antecedent that started the population mobilizations to form new settlements near the mines. Other natural deposits of gold and silver were discovered in Chihuahua and lately in San Luis Potosi. The Northern region of Mexico was populated and a heavy transit and traffic followed between this places and the metropolis, México City.

The disarticulated internal economic structure has been more oriented toward the exploitation of natural resources more for the transnational capital than for the welfare of the Mexican population and its demographic development. Numerous cities, towns and villages were founded under this logic. When the economic gravitational centers moved to the Northern countries, following the interests of the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

international economic structure these cities and towns declined and shrunk, showing that the colonial heritage is the development of underdevelopment. Today, most of these affluent and wealthy cities are ghost towns or have already disappeared. These are analysis of case studies in the literature of shrinking cities, towns and villages.

The successful periods of mining exploitations are related to the population growth and the increase of economic development of the mining cities and towns. During these successful periods, distinct clusters emerged against which patterns of factors could be distinguished that appeared to account for the variations in successful adoption in the firms studied. To explain these findings a number of theories can be initially considered, but, building on the recent work of others cited above, resource-based theory appears to offer possible explanations, given that the determinant factors identified are both clearly associated with the internal contexts of the firms. Moreover, resource-based theory argues that sustained advantage results from unique attributes of a firm developed over time – therefore it could explain why some firms had evolved to become more successful than others in this context.

Vargas-Hernández (2007) analyzes the shrinkage of mining towns in Mexico which are going through a shrinking and declining processes after having an enormous impact in economic development. This shrinking process of the mining towns posits a trap and a dilemma in economic development: From being ghost towns, at the turning point the inhabitants are mobilizing to defend historical and cultural heritage and environmental survival from the mining companies and to find alternative activities such as cultural tourism which may brings the needed resources.

The Evidence of the Mining Towns' Shrinkage in México

Mining had a tremendous importance to Mexico's economy. The mining industry was an economic indicator during the colonial times in Mexico. Since the pre-hispanic times, mining has played an important role in political and economic history of Mexico. Spanish colonizers were attracted by the rich mines and with the discovery of new ones. The mining activity was the incentive for the foundation of new villages and towns far away from the large cities and with difficult access. Houses were built with adobes covered with tejamanil on the slops of the mountains and between a dark and dense fog, without any order or sense of space according to the needs of the mines (Flores Clair, 1997). These new villages and towns were populated and had grown until reach the status of cities during the colonial times.

Starting from the discovery of the first mine in the Nueva España in 1532 it followed a giddy exploitation of precious metals all over the territory. In 1546 in the Hill La Bufa, State of Zacatecas started the process of colonization centered in the indicator the location of gold and silver as the mineral resources to be exploited. The precious metal oriented mentality of the Spanish conquerors was the main cause of population mobility in the exploration of new territories and the foundation of new towns and villages mainly in the highlands (Zacatecas, Chihuahua, San Luis Potosí, etc.) and lowlands (El Bajío, Guanajuato, etc.) around the mines of gold and silver.

In 1564 the mines of Guanajuato initiated activities followed by a massive migration to populate Guanajuato and the Bajío. The productive schema of Guanajuato was linked to the mining production by providing the necessary goods and services to Zacatecas and further to the North. The scattered Haciendas (Ranchs), villages and towns founded in the El Bajío were the economic units that produced the goods and services supplied. Mining activities had a sustainable growth before 1600 when the towns and villages also grew and some achieved the status of cities, such as Zacatecas and Guanajuato.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

During the XVI Century, the populated areas were concentrated around the mining centers, congregations and haciendas, according to the economic activities restricted by the physical territory and oriented toward the agricultural production for self consumption and mining for the export of gold and silver to Spain not for commercial purposes but to accumulate and treasure. The mining sector was the gravitational center of the colonial productive scheme. Villages, towns and cities founded followed this logic and also began to shrink when the mines lower or stopped production.

The demographic catastrophe of the XVI and XVII Centuries caused a scarcity of manpower and the shrinking of mining cities and towns. The Crown protected the indigenous of what was considered inhuman works, such as mining, agricultural activities, and other industrial jobs. This protection to the indigenous people caused that goods and services were expensive, and thus spoliation had to be used. The indigenous population is substituted by Afro-Caribbean people who were introduced to México. The mining development established a sustainable demographic growth until the beginning of the years 1620-30 when the crisis started due to the insufficient supply of mercury necessary for the exploitation of silver. Mining cities, towns and villages also began to shrink.

There were no regulations over the civil population in the mining cities and towns. At the middle of the XVI Century, exploitation of prolific seams was the main cause of the emergence of mining towns spread all over the New Spain territory.

Most of these became cities of great economic and social importance, among them Pachuca, Hidalgo, Parral, etc. The exploitation of precious metals had achieved an outstanding growth by the end of the XVI Century represented more than 80% of total exports from the Nueva España (Estrada, 2001). Around the activities of the mining industry were the motor of the economy around it had emerged other economic activities which provided employment, allowed commercial trade with the metropolis and gave rise to prosperity in the mining towns and cities.

There are many issues regarding the economic history of México to explain. One of these issues is the debate on the decay of the Mexican economic in the XVII and XVIII Centuries. One of the arguments has been the mining production. There is not economic evidence to prove the hypothesis that mining in Mexico had a profound crisis during the XVIII Century and also the parameters used to sustain are not the right data (Ibarra, 1995). Production of silver was multiplied for tour times through the XVIII Century.

To understand and comprehend the meaning of the colonial mining activity, Galeano has said: "En Potosí the silver built temples and palaces, monasteries and gambling dens, offered motive to tragedy and the feast, spilled over blood and wine, inflamed greed and untied squandering and adventure" (Ibarra, 1995). Life in mining cities became harsh and troubled, all type of contrasts, ambitions, and concupiscence and disorder are manifested with harshness.

The decline of the mining industry originated in 1810 although it is questionable the cause: The movement of the Mexican independence and the lack of stable political and social institutions. With the independence of Mexico in 1821, the colonial production scheme based on mining lost the relevant economic role. Mining cities, towns and villages shrunk. The mining activities lost their impulse avoiding to lead an industrial revolution in México.

However, during the second half of the last Century, the decline of the mining activities brought also a shrinking process of the mining cities to the level of converting them in ghost towns. It was until the era of Porfirio Diaz (1880-1910) that the mining activities had a modest growth exploited by English and American mining companies, insufficient to provide work for the expansive growth of populated areas. Recent changes in Mexican legislation have liberalized the mining sector and after the opening of North America Free Trade Agreement (NAFTA) foreign companies have increased investments.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In Mexico, some early mining towns faded into obscurity while others became centers for ranching and commerce but were abandoned after the declining of mining activities. Mining towns, containing rich Baroque architecture, generally located in mountain areas, did not follow the geometric layout but were adapted to the topographic condition of the sites.

The conquest of northwest Mexico lead to the establishment during colonial times of towns located on the Sierra Madre Occidental where mining was the main economic activity. The State of Sonora in the northwest of Mexico is wealthy in mineral resources. It is the first producer of gold and also produces silver, cooper, and other metals. After the opening of NAFTA, more than 70 foreign mining companies have established offices in Hermosillo the capital of the State. During the XVI century, exploitation of mines located around Guadalupe de los Reyes, San José de las Bocas and Cosalá started. Cosalá was founded in 1562 and became in the XIX century the most important in this region, and in 1898 it produced 50% of the silver exported by the State of Sinaloa.

Among the outstanding mining towns in the North of Mexico are La Bufa, Batopilas, Cerro Colorado, the Raramuri communities of Munérachi, La Yerbabuena, and the Jesuit mission of Satevó with important mining centers as Urique, Maguarichi, Uruachi and Ocampo, Batopilas and the veins of La Bufa reached renown of a world level. Batopilas has preserved, to a great extent, it's architectural heritage from the richness of those times. In it's greatest mining period at the end of the 19th century, Batopilas had up to 7,000 inhabitants. Today, the town is a community of 800 inhabitants.

The mining towns Concepción del Oro y Mazapil were far away from Real de Minas Zacatecas. In 1569, Mazapil had around 150 Spanish settlers. Both mining towns achieved economic relevance in the Province of Nueva Vizcaya during the XVII y XVIII. However, today both cities are ignored by the maps of México. In the Northeast of México, the first foundations such as San Gregorio (1577) and La Trinidad (1577) were based on the discovery of silver mines. The mines of La Iguana were discovered in 1757 near Lampazos.

Mineral de Pozos (a rough translation might be Mineral Wells) is an old mining town in the State of Guanajuato, founded in 1576, when it was built a Fort to protect the silver route, from Zacatecas to México City. During the XIX Century, the town had large periods of abandonment due to the armed movements. It became one of the richest of the colonial mining towns, reaching its peak about 1890. As 20th-century revolution closed the town fell into poverty.

Now, Pozos is gradually reawakening from a small village trapped in the abandonment after being a prosperous city during the mining exploitation. Everywhere in the paved streets can be seen semi destroyed large colonial adobed homes and dismantled buildings that once before were sumptuous. On 1982 was declared Historic Monument of the Nation. From a population of more than 70,000, it shrank to less than 4,000 10 years ago. Today, the 8 thousand remaining inhabitants lived in misery.

At the turn of the XX Century, population started to growth reaching 80, 000 mainly immigrants from abroad and from the neighboring states who were attracted for the facilities to get wealthy. It was established important infrastructure, schools, commercial centers, hotels, restaurants, etc. However, the town was ignored and its buildings looted and ignored, until the fifties when had only 1,000 inhabitants, a ghost town in complete abandonment. Today it has around 5,000 people living there.

San Sebastian in the State of Jalisco is one of the oldest mining towns in Mexico founded in 1605 and reached the highest rate of growth and prosperity during the 17th and 18th Centuries when more than 20, 000 inhabitants populated the town. The population fluctuated in relation to the production of gold until 1930. Nowadays, it has only 600 inhabitants retaining the colonial heritage in public buildings and houses, as an extraordinary example of the traditional living forms of labor in a remote village.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Real de Arriba in the State of Mexico is an enchanting mining town with a splendorous past. Today, some of the remaining walls and rocks within the forest are ruins that remind us of the great colonial miners' homes and infrastructure buildings which witness the past economic boom of the area. The city of el Oro de Hidalgo also in the State of Mexico were considered the second most rich just after Transvaal, in Africa and still now shows the wealthy architecture of its mining past. Its Museum shows mineral from the mines La Esperanza, Chihuahua, Tiro México, Tiro Skip, La Calera, La Providencia, San Patricio, El Nolan, El Consuelo, La Victoria, Santo Domingo y La Aurora.

The mining district of Pachuca-Real del Monte and El Chico in the second half of the XVIII Century, the most prosperous period, has been studied by Navarrete (2004). Real del Monte received its name in 1577. An anonymous source mentions that there were 1, 300 inhabitants at the end of the XVI Century. In 1610, were 1, 683 inhabitants. At the end of the XVII Century the traveler Giovanni Francesco Gemelli Carreri calculated 12, 000 inhabitants. Using parish church data of 1768, which only registered population in communion, he estimated that Real Del Monte achieved its largest population around the middle of the XVIII Century and it started a gradual drop until it reached its lowest point at the end of the first decade in the XIX Century. Real del Monte produced 10% of the silver of the Nueva Spain (Hausberger, 1995) and had a population of 7, 152 inhabitants.

The military census of 1791 reported that the Jurisdiction of Pachuca had a population of 9 615 inhabitants out of which the 26.7% or 2567 persons forming 608 families belonged to Real del Monte, although the Census did not considered indigenous people, women and children under 16 years old. After 1824, Real del Monte changed its name to Mineral del Monte. In 1858 the population of Mineral del Monte was around 6000 inhabitants and in the Census of 1854 registered 5 310. In 1865 a Census of men older than 18 years registered 1 005 hombres integrated to 700 families. Comparing the data of the Censuses of 1791 and 1865, the number of inhabitants was almost similar, which lead us to conclude that for around 7 decades the growth of population was almost null.

Very good examples of these trends are Charcas, Real de Catorce, Guadalcazar y Cerro de San Pedro en San Luis Potosi, ghost towns that once were important mining cities. Nowhere in Mexico are the changing styles and fortunes of former gold and silver mining towns better displayed than in these four towns. Charcas was refounded in 1584 and had produced more than 3 million dollars worth of silver each year.

Today only survive a few old buildings and large stoned houses. Real de Catorce had a grandeur past with gorgeous buildings, outstanding church and beautiful Palenque. In Guadalcazar, the miners built two magnificent churches and a Casa de Moneda was founded. Cerro de San Pedro now is a ghost town where handful of old buildings has been restored reluctant to completely relinquish their hold over real estate. San Pedro, founded in 1592, was abandoned about fifty years ago.

Analysis of Case Studies on Resource Based Firms Related to Shrinking Cities

There are some case studies that analyze the relationships between resource based firms and the shrinking of cities, more specifically the so called "corporative city" and "Corporative town". One this case study is aimed to analyze the environmental economic development shrinkage of Atenquique after the industrial boom of the paper mill during the second half of the last Century (Vargas-Hernandez, 2007). The town of Atenquique was settled down and grew up in terms of population, social and economic development in the same proportion that the Industrial Company of Atenquique did during the period when the company was property owned by the Mexican State.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

After the Company has been privatized, the town started declining and shrinking in population, social and economic development, and the most disastrous is the environmental hazards. The turning point of this increasing regional development was a conflict between the Union and the new owners of the Company, which represents a struggle for the survival of the old project of development welfare State oriented and the new hegemonic project, the neoliberal model of development.

The impact on the environmental and economic development has initiated the shrinking and declining of Atenquique but also of the surrounding cities and towns, while the new owners are increasing the levels of productivity and profitability. Therefore in order to relate the findings to the core tenets of resource-based theory the focus of the analysis of the case study evidence should be contrasted where appropriate between the successful firm and the shrinkage of the town.

AN AGENDA FOR FUTURE RESEARCH

Further research on shrinking cities should be done in México. Some of the important issues and problems to set an agenda for future research in Mexico are:

Research on economic territorial valuation, real estate markets and its dimensions on social sciences should be done using tools, such as the so called "new economic geography" (Fujita, Krugman & Venables, 2000, p. 3) to outline the dynamics of economic activities on a special distribution and in the context of local and global forces. This research would help to explain which cities can play a role as global cities. The results of this research suggest the feasibility sustainable economic concentration processes in opposition to the classical spatial economic analysis and concentration based on scenarios of relative territorial symmetry.

A simple hypothesis may be suggesting patterns of spatial redistribution of population. Supposing the existence of diseconomies of agglomeration and decreasing yield, it should be expected that the area of major growth should be the less populated

Research should determine the productive vocation of regions and cities. A multidisciplinary approach to differentiate winners and losers areas (Benko & Lipietz, 2000; Caravaca, 1998) associated to a diffuse localization of productive activities and territory should be assessed to reject the geographic determinism under the tendencies of creating the competitive advantage. Caravaca (1998) identifies urban regions inserted globally, innovation and development areas and industrial districts. (Sassen, 1998) identify global cities as winners with concentration.

Also it is important to determine the losers because have been under process of deindustrialization and can not convert their local economies, losers with rural economies of low productivity and scarce human capital not able to insert in a global economy. Territorial expressions of productive structure are relevant to understand patterns of spatial redistribution of population but they are not enough and not always oriented in the same direction.

Research should provide conceptual frameworks for the analysis of relocation processes of economic activities in relation to the spatial redistribution of population to achieve more sustainable productive, economic and demographic dynamics through generation of employment.

The increasing flows of migration inter cities open new challenges for research on tendencies related to residential localization and displacement of population, intra urban segmentation, socioeconomic territorial segmentation, and contra-tendencies such as suburbanization of high income groups in rural areas, etc.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social and economic stagnation of rural areas can not continue being postponed as the main cause responsible of the accelerated urbanization process, despite the innumerable signals of exhaustion and overuse of absorption capacity of cities (Castells, 1977, p.58) and the emergent phenomena of local identity projects and dynamism should be recongnized.

Research on rural labor market and urban labor market should be done to analyze the impact on spatial redistribution of population. This analysis should consider the effects of erosion that represents the best qualified people who move from rural communities settlements to large cities or to other country, leaving behind children an old people.

Rehabilitation of inner areas in large cities may improve their living conditions and contribute greatly to social cohesion. Integrated preservation may have an impact on economic development and fosters employment through small scale business development.

Colonial cities, towns and villages spread all over Mexico that are starting to experience economic and demographic decline should begin programs of urban heritage preservation, urban revitalisation, urban rehabilitation, urban regeneration, urban renewal or urban preservation, as tools that can contribute to economic growth through job creation as they are labour intensive. Urban heritage is the built heritage, customs, traditions and identity. Urban heritage preserved in an integrated way in modern life and as part of the living environment, there are more far-reaching benefits.

Preservation of urban heritage contributes to attractive and unique cities, with its own distinctive identity, which are more likely to attract tourism and other kinds of investment than cities with less pronounced identity. People can identify themselves to the place they live in, which contributes to sense of belonging and also has positive impact on the social development of a city.

KEY TERMS AND DEFINITIONS

Corporative Town: A place where practically all stores and housing is owned by the one company that is the only employer. The company provides infrastructure (housing, stores, transportation, sewage and water) to enable workers to move there and live.

Green Revolution: Increasing of agricultural production worldwide, particularly in the developing world, beginning most markedly in the late 1960s.

Historical Materialism: A theory of socioeconomic development according to which changes in material conditions (technology and productive capacity) are the primary influence on how society and the economy are organized. Historical materialism looks for the causes of developments and changes in human society in the means by which humans collectively produce the necessities of life.

Indigenous People: Groups specially protected in specified international or national legislation as having a set of specific rights based on their historical ties to a particular territory, and their cultural or historical distinctiveness from other populations.

Industrialization: A period of social and economic change that transforms a human group from an agrarian society into an industrial one.

Residential Segregation: A physical separation of two or more groups into different neighborhoods or a form of segregation that sorts population groups into various neighborhood contexts and shapes the living environment at the neighborhood level.

Chapter 51
Using Creativity and Social Innovation to Create Social Value and Change

Ziska Fields
University of KwaZulu-Natal, South Africa

ABSTRACT

Social challenges are numerous, complex, urgent and multidisciplinary in nature. The old ways of looking for solutions to social problems like unemployment, climate change, an ageing population, poverty, supply of clean water, chronic disease and so on, do not offer sustainable solutions and global implementation. Societies can also no longer hold governments responsible to find solutions to all these social problems only. Social innovation is needed and seeks new answers to social problems by identifying and delivering new services that improve the quality of life of individuals and communities. The main aim of this chapter is to create awareness of social innovation as an emerging field. This chapter explain what social creativity and innovation are and explains the creative and innovative processes. Barriers and support for social innovation are also discussed.

INTRODUCTION

Today's global challenges have economic and social implications on societies and the world at large. Many governmental and philanthropic efforts today are not creating the required social change as required by societies across the world and major social sector institutions are often viewed as ineffective to resolve social issues (Dees, 1998). The importance of social entrepreneurship in economies cannot be underestimated or ignored. Drayton (2010) explains that more social entrepreneurs are needed to solve social problems and to ensure effective and sustainable solutions to social problems.

Social entrepreneurship, according to Peredo and McLean (2006:64), is exercised where some person or group: "(1) aims to create social value exclusively or in some prominent way; (2) shows capacity to recognise and take advantage of opportunities to create value; (3) employs innovation, ranging from

outright invention to adapting someone else's novelty, in creating and/or distributing social value; (4) is willing to accept a degree of risk in creating and disseminating social value; and (5) is unusually resourceful in being relatively undaunted by scarce assets in pursuing their social value." Social entrepreneurship involves the recognition, evaluation and exploitation of opportunities that result in social value, which differs from the traditional conceptualization of entrepreneurship, which focuses on profit generation and building personal or shareholder wealth (Austin, Stevenson & Wei-Skillern, 2006). The creation of social value is what makes social entrepreneurship a specialised sub-discipline within the field of entrepreneurship. Social value is the fulfilment of basic and long-standing needs in society and normally has to do with food, shelter, education, employment and medical services, according to Certo and Miller (2008). Social entrepreneurs also have a good understanding of social needs and aim to fulfil these needs and make a difference in their communities by creating socially-orientated ventures, for example, the Better World Books UK organisation which addresses the global literacy problem by funding community reading programmes via sales of donated books.

Social entrepreneurs establish new ventures to generate social value and achieve social change and often come up with "an innovative approach for dealing with complex social needs'' (Johnson, 2002:1). Austin et al. (2006:2) explain that social entrepreneurship is the "innovative, social value creating activity that can occur within or across the non-profit, business or government sectors". Social entrepreneurs can therefore be viewed as social innovators (Casson, 2005) due to their engagement in a process of continuous innovation, adaptation and learning (Dees, 1998). Social entrepreneurs are needed to develop new models for a new century and to create new and innovative solutions to solve social problems.

Social innovation is much broader than either social entrepreneurship or social enterprise – although it will often include one or both of these (Social Innovation eXchange (SIX) and the Young Foundation, 2010). Social innovation specifically is critical to tackling issues like economic growth and ensuring long-term sustainability and competitiveness for the future, unemployment, an ageing population, social exclusion due to ageing, poverty and/or cultural diversity, supply of clean water, chronic disease and the need for radically new and innovative public service models, to name a few.

This chapter focuses on social creativity and innovation specifically as means to generate social solutions to complex social problems. The chapter will explain the role of creativity in social innovation and highlight the creative process that social innovators can use to generate novel ideas. Social innovation will be explained, the social innovation process will be described, barriers to social innovation will be identified and ways to support social innovation will be discussed. The main aim of this chapter is to create awareness of social innovation as an emerging and very important field and its link to social entrepreneurship and social enterprises.

BACKGROUND

Today's social challenges are numerous, complex, urgent and multidisciplinary in nature; and the disconnection between economic growth and social wellbeing is increasing (OECD, 2011). In addition, there has been an increase of interest in social entrepreneurship over recent years as it became evident that social entrepreneurship should be conceptualised within the broader competitive environment and that the line between for-profit and not-for-profit enterprises cannot be sustained. Mair and Marti (2006) indicate that social entrepreneurship can take place on a for-profit basis as well as depending on the specific business model and specific social needs being addressed. Social entrepreneurs' main focus is

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

on social value creation, but it does not mean that these social initiatives could not embrace an "earned income" strategy as well, according to Mair and Marti (2006). However, people using social initiatives can often not pay for the products or services which can have a huge impact on the for-profit business model. To overcome this, social entrepreneurs require creativity and innovation to think differently when they create social value, combining limited resources to stimulate social change or meeting social needs and when they create products, services or social organisations. This means that social innovation has become a key source for the creation of social value.

Traditionally, innovation was seen as the key source to economic growth and focused on the generation of economic value only (OECD, 2011). However, looking at societies of the future and the social challenges societies are faced with, innovation has become critical to address social challenges and to find better ways to generate social and public value (OECD, 2011). Currently, using social innovation to create innovative solutions is costly and the mobilisation of different shareholders to address social issues can be challenging, although social challenges have a strong mobilising effect. Irrespective of these challenges, innovation to solve social challenges is more apparent now than ever before as a core component towards achieving social wellbeing, as well as social and public value (OECD, 2011).

Social innovation, according to Babu and Pinstrup-Andersen (2007), refers to new strategies, concepts, ideas and organisations that meet social needs. However, before innovation can take place, creativity needs to be applied. For the OECD (2011), social innovation:

seeks new answers to social problems by: identifying and delivering new services that improve the quality of life of individuals and communities; identifying and implementing new labour market integration processes, new competencies, new jobs, and new forms of participation, as diverse elements that each contribute to improving the position of individuals in the workforce. Social innovation deals with improving the welfare of individuals and communities through employment, consumption and/or participation, its expressed purpose being to provide solutions for individual and community problems.

Social innovation is clearly linked to local development and is seen as a way to improve the welfare of individuals and communities by providing social change for improving people's quality of life (Social Innovation eXchange (SIX) and the Young Foundation, 2010).

From the discussion thus far, it appears that social innovation can be used to find workable solutions for unsolved social problems, which are often resistant to conventional approaches.

LITERATURE REVIEW

Creativity as Part of Social Innovation

Before innovation can take place, creativity needs to be applied. Creativity is "a successful step into the unknown, getting away from the main track, breaking out of the mould, being open to experience and permitting one thing to lead to another, recombining ideas or seeing new relationships among ideas" (Afolabi, Dionne & Lewis, 2009:2). Creativity leads to the development of new knowledge, products, services and other advances to improve human life and solve problems (Baron & Shane, 2008). Creativity emerges from two cognitive processes primarily. The first cognitive process involves stretching or expanding the internal cognitive frameworks humans construct to organise information and the second

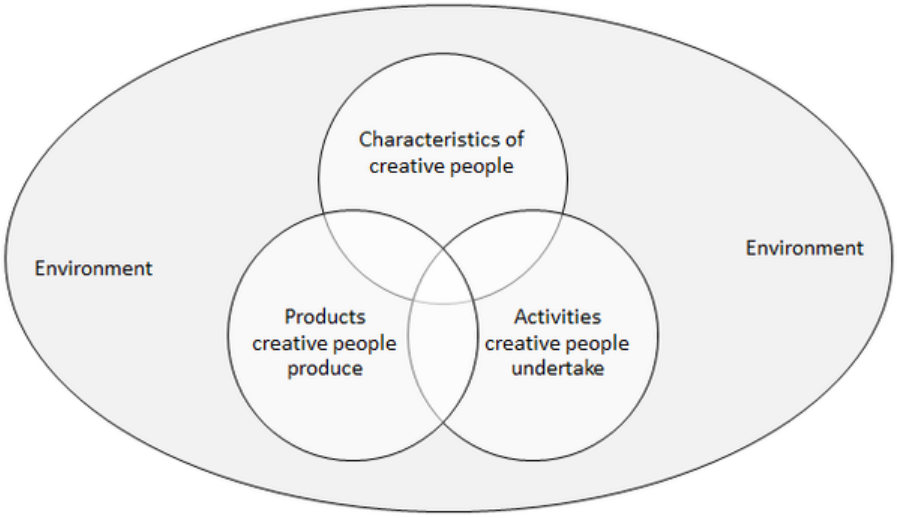
EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

involves the operation of various facets of human intelligence (Baron & Shane, 2008). Stretching and expanding internal cognitive frameworks take place when concepts are combined to generate something new, expanding existing concepts or using analogy to identify similarities between objects or events that are otherwise dissimilar.

Intelligence can be defined as an individual's ability to understand complex ideas, to adapt effectively to the world around them, to learn from experience, to engage in various forms of reasoning, and to overcome a wide range of obstacles (Baron & Shane, 2008). Human intelligence can be divided into three kinds according to Sternberg (2004, in Baron and Shane, 2008) and is referred to as successful intelligence. These are: (1) *practical intelligence* – the ability to solve everyday life problems; (2) *analytical creativity* – the ability to think critically and analytically and (3) *creative intelligence* – the ability to formulate new ideas and new ways of solving problems. A fourth kind of intelligence is *social intelligence* which can be combined with practical intelligence. This kind refers to the ability to understand others and to get along well with others. Successful intelligence is needed by social innovators. *Emotional intelligence* is linked to social intelligence and refers to self-awareness, self-management, social awareness and relationship management, which are critical for people to understand and manage their own and others' emotions in social interactions (Goleman, Boyatzis & McKee, 2001) and in the creation of social ventures.

Some researchers, for example Rhodes (in Cropley, 2008), Amabile (in Baer & Kaufman, 2005) and Csikszentmihalyi (in Plsek, 1996), explain that creativity is influenced by more than the characteristics of creative people. Aspects like culture, rewards, support, team effectiveness and the freedom to do as one pleases impacts on an individual's creativity (Allen, 2012). Fields and Bisschoff (2014) indicated that factors like challenging the status quo, detachment, synthesis, cognition, association and communication, awareness, similarity, external motivation, sensitivity, experimentation and combination, dimensional thinking, problem-solving, religion, culture, country of origin, family and uniqueness can be used to measure creativity and it can impact on the creative behaviour of social innovators most probably as well.

Four general themes were identified to explain creativity as a phenomenon (Isaksen et al.,1984) and this is indicated in Figure 1.



Theme one refers to the personal characteristics of creative people. Stanford GSB Center for Social Innovation (2013) identified the following attributes to make social innovation successful, which can be seen as part of the first theme – personal characteristics of creative people:

- Knowledge is critical and must stretch beyond a specific domain to relate to a broad ecosystem and to make unique connections to find effective solutions to social problems.
- Trust and engagement are required for deep and ongoing collaboration, which is essential for leading social change.
- Innovation must be rooted in deep empathy in terms of the understanding of and sensitivity to the experience of another person.
- Social innovators must be comfortable with ambiguity, risk and be able to see opportunities where others see only obstacles.

Theme two refers to products creative people produce. Products created by social innovators include, to name a few, the Open University which opened up education across the world, Grameen Bank which created the microcredit model to make finance possible for poor people; Oxfam that offers relief of famine and spread humanitarian relief, and NHS Direct ranging from Doctor Foster to the Expert Patients

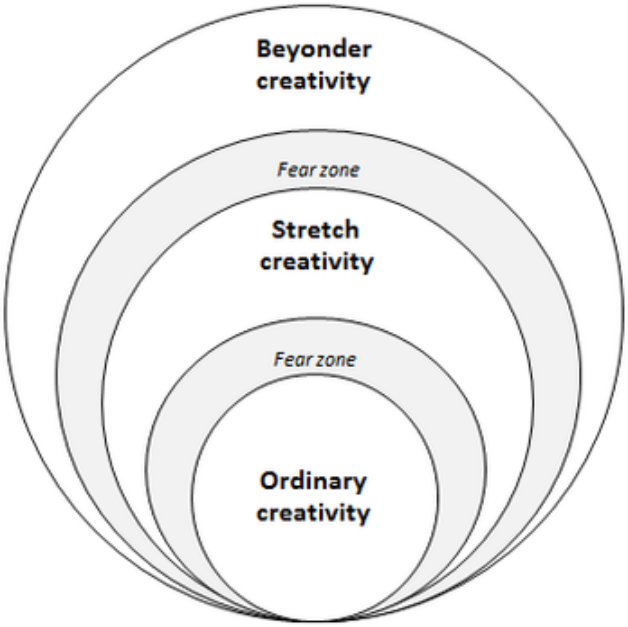
Figure 1. Creativity themes
Source: Adapted from Isaksen et al. (1984:67-75)

Programme, which have opened up access to health to ordinary people. These products or services are often created to solve or alleviate social challenges and obstacles to create social value for people. To make these profitable for social innovators and entrepreneurs require skills and tapping into a market that appears to be not profitable to profit driven businesses.

Theme three refers to activities creative people undertake. Activities of social innovators engage in social collaboration, idea generation, searching for funding, engaging with society, listening, and searching for information and knowledge.



Theme four refers to the environment or context of creativity. The environment can also stimulate or stifle social innovation. In some societies, social innovation is stifled due to power that is tightly monopolized, where free communication is inhibited and where there are no independent sources of funding (Mulgan, 2006). Some innovations might also be seen as too radical and too far ahead of the prevailing levels of technology (Mulgan, 2006). The first three themes overlap and the fourth theme impacts on the other three themes.

Neethling in Ebersohn (2011) explained that individuals fall into one of a number of creativity zones, but are often trapped in one zone due to their fear for change. These zones are illustrated in Figure 2.

As illustrated in Figure 2, people falling in the *ordinary creativity* zone want to make progress, but are trapped by the fear zone that surrounds them. Those people who break through the first fear zone barrier reach a stage of creativity called *stretch creativity*. People in this zone are willing to take risks, are open to new ideas, are willing to reject obsolete beliefs and are willing to be creative even in uncomfortable circumstances. This zone has barriers as well that are imposed by fear. Breaking through these barriers enables an individual to move to the *beyonder creativity* zone where the seemingly impossible becomes possible. At this level a synergy occurs between courage and creativity and the individual remains excited and passionate to find better ideas and solutions (Ebersohn, 2011). This is the level that social innovators should function on to ensure sustainable social innovation takes place. Resolving social challenges is complex and often requires moving beyond current levels of creativity.

Figure 2. Creativity zones
Source: Neethling (in Ebersohn, 2011:19)

Creativity is part of social innovation and is the first step in the process. At this stage an awareness of a need that is not met and some idea of how it could be met are created (Mulgan, 2006). Creativity methods are used by social innovators to generate as many possibilities to resolve the need as possible. Ideo was created by Edward de Bono to help people to think more laterally and to force creativity when people are faced with more serious problems, like poverty, for example. Design thinking has also been created by Ideo to help tackle problems that seemed almost impossible to solve, which are often the case for social innovators. Design thinking taps into capabilities people have like intuition, to recognise patterns and to construct ideas that are functional and have emotional meaning (Brown & Wyatt, 2010). Except for Ideo, social innovators can also explore ideas from others that can stimulate new idea generation; for example, the Institute for Social inventions, the Global Ideas Bank, MIT's Community Innovation Lab, Melbourne's Social Action Laboratory and South Africa's Affirmative Action Laboratory (Mulgan, 2006).

Social innovators are creative entrepreneurs according to the OECD (2011). They come up with creative solutions and find new ways to deal with complex social issues driven by their vision of social impact. Social innovators are "not content just to give a fish or teach how to fish. They will not rest until they have revolutionized the fishing industry," (Drayton in Bornstein, 2007). The question now is: how can social innovators become more creative?

Approaches Social Innovators Can Use to Become Creative

According to Brabandere and Ivy (2013), to be more creative requires that people do more than simply think "outside the box". They suggest that people need to learn to think in new boxes and create a range of fresh mental models, which are methodically explored and prioritized. The saying to rather think "without boxes" is not supported by them, because according to Brabandere and Ivy (2013: 6), no one

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

can "create new ideas without using a range of mental models to simplify things". The brain needs these mental models or boxes according to them. The key to being creative in practical ways and to generate ideas to solve social problems, is to firstly understand existing boxes and then to develop a range of new boxes to solve challenging situations and issues.

To be creative requires divergent thinking when many unique ideas are generated and then convergent thinking when those ideas are combined into the best result (Bronson & Merryman, 2010: 21). Thinking in new boxes will require divergent and convergent thinking and enable a person to gain more control over current boxes as mental representations of reality. In addition, it will also create new boxes to test assumptions, envision new opportunities and strengthen the capacity for innovation (Brabandere & Ivy, 2013). This is extremely important for a social innovator to do. A five-step approach to thinking in new boxes was identified by Brabandere and Ivy (2013) as: (1) Doubt everything; (2) Probe the possible; (3) Diverge where the mind is freed up; (4) Converge where ideas are selected and implemented and; (5) Re-evaluate relentlessly. This process is not easy and requires constant focus and it will lead to a whole new mindset about new boxes.

The creative process consists of five stages according to Kuratko, Morris and Covin (2011) and Table 1 explains how social innovators can apply this. Some of the creative techniques are also explained briefly after Table 1.

Table 1. The creative process

Stage	Explanation of the stage and what social innovators can do at each stage	Creative techniques to use during each creative stage
Preparation	The social innovator becomes aware of a social need, challenge or problem. The social innovator attempts to define the problem and gather information. To do this, s/he must formulate creative questions which are surprising, destabilising and open new routes to a specific issue. The simplest questions can serve to get around constraining assumptions and limiting research methods.	Progressive abstraction, boundary examination, the 5Ws/H technique
Frustration	Asking creative questions does not generate immediate solutions and the social innovator might become frustrated and can even experience creative blocks at this stage. Finding good answers to a social problem can be a lengthy and challenging process, because social issues are often difficult to resolve. The frustration can cause a social innovator to give up on his/her social effort, select inappropriate or short term solutions, or settle for a non-creative solution.	Published materials, interviews, discussions, observations, impressions, Lotus blossom technique and bug list technique
Incubation	A very important stage is to step away from the social problem. The social innovator needs to focus on removing barriers to creativity, for example perceptual barriers (using a narrow mindset when analysing problems), emotional barriers (fearing to make a mistake and to take risks), cultural barriers (stereotyping), environmental barriers (distractions like phones and physical intrusions) and intellectual barriers. During this stage more information may be gathered which could be unintentional and insights may be found in unexpected places. The social innovator needs to open his/her mind to new possibilities and even try to forget about the social challenge for a while. It will be helpful to mobilize key stakeholder groups to gain more insight and to open opportunities for collaboration. The Internet can be valuable as it opens an avenue for social networks, pool resources, capital and integrated social value chains.	Brainstorming, analogies/ metaphors, technique, problem reversal technique, wildest ideas technique, forced relationship and free association technique
Illumination	This is the stage where social innovative solutions can be created and applied to find the answers to social problems and challenges. The social answer often needs to be refined, adapted and expanded upon.	Advantages-disadvantages technique, decision balance sheet, reverse brainstorming
Elaboration	The methods or solutions to the problem are refined and adapted. The social innovator may make changes to the solution to make it clearer and even consult with other key shareholders to determine if the social solution is workable.	This is the doing stage which is linked to social innovation.

The creative techniques that can be used during each creative stage are crucial for the social innovator to understand before applying it. Groenewald (2013) describes some of the creative techniques listed in Table 1 in the following ways:

- The *progressive abstraction technique* is used to generate alternative definitions of the problem by moving from one level of the problem abstraction to another, until a suitable level of abstraction is achieved. This technique makes it easier to identify possible solutions.
- The *boundary examination technique* provides new ways of looking at the problem. The technique provides more provocative problem definitions, clarifying problem boundaries and demonstrating the importance of flexible problem definitions.
- The *wishful thinking technique* aims to expand on possible alternatives by permitting a degree of fantasy by asking "What would be the best possible outcome that we could hope for?"
- The *5Ws/H technique* is used when the problem is not clear and separate lists for questions relevant to the problem is asked in terms of: Who?, What?, Where?, When?, Why? and How?
- The *Lotus Blossom technique* utilises a form that has a core square surrounded with eight circles. The core question is "what assumptions tend to constrain the creative view of the future" according to Groenewald (2013: 38). The petals represent the assumptions that are the questioned to determine if these are appropriate.
- The *bug list technique* focuses on finding things that irritate or "bug" people and then the most irritating issues are listed. Brainstorming is then used to come up with ideas to resolve the irritating issues. This technique often leads to the invention process in creativity and innovation.
- The *analogies/ metaphors technique* generates more ideas than any other mode of thinking. By using analogies, a new insight and approach to the problem and the resolution can be generated. A metaphor is applied to another, unrelated term to create a non-traditional relationship.
- The *problem reversal technique* helps to reverse assumptions about a problem and to generate original ideas. The problem statement often contains a verb or action. When this technique is used, the meaning of the verb or action is reversed and the problem is restated in question. Answers are then generated to the question and then reversed to come up with better solutions to the original problem.
- The *wildest idea technique* encourages people to come up with the wildest ideas they can think of and to image that everything is possible. Most of the ideas might be impractical, but often a useful idea emerges, which the group will then develop in their search for practical uses of the wild idea.
- The *forced relationship and free association technique* involves the creation of relations between ideas and objects that seemingly have no relationship to come up with creative ways about an idea or concept.
- *Reversed brainstorming* is when a group of people try to uncover possible weaknesses of an idea, rather than generating ideas. The group then generates solutions for each weakness identified.
- The *advantage-disadvantage technique* is used to list alternative ideas and highlighting the strengths and weaknesses of the ideas. The idea with the most strengths and least weaknesses is then selected.
- The *decision balance sheet* explores ideas based on the costs and benefits of the ideas. Ideas are ranked and the preferred alternative is listed first. The balance sheet then shows the positives and negatives clearly.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sawyer (2013) identified eight steps to become more creative: (1) ask the right questions to lead to the most novel answers; (2) learn to prepare your mind for constant creativity; (3) look for good answers; (4) play to free your mind to imagine; (5) think to find more ideas than needed; (6) fuse to combine ideas in surprising new ways; (7) choose the best ideas and then make them even better; and finally (8) make to get ideas out into the world and drive creativity forward.

Social innovators need to focus on developing their creativity constantly and cannot see it as something that will happen automatically. Creativity emerges in the presence of the following factors, according to Baron and Shane (2008):

- Intellectual abilities (a combination of successful and social intelligence);
- A broad and rich knowledge base of the specific social issue (social innovators understand specific social issues very well and have knowledge about these issues);
- An appropriate style of thinking (thinking in novel ways is very important to succeed as a social innovator. In addition, social innovators need to think globally and locally to tackle complex social challenges);
- Personality attributes (traits like the willingness to take risks, tolerance of ambiguity);
- Intrinsic, task-focused motivation (a social innovator is motivated to make a real difference in the world and to create sustainable social value); and
- An environment that is supportive of creative ideas and encourages change.

Social innovators have the ability to look at social problems from various angles and can push back the boundaries of the problems they want to address (OECD, 2011). They also know that collaboration is an important aspect to infuse new ideas and that various key stakeholders hold pieces of solutions. Social innovators also have vision. They find what is not working and solve the problem by changing systems, and persuading societies to try new things. They are also able to combine existing innovations and or apply them to new target groups and different sectors (OECD, 2011). Social innovation occurs after the creativity process and turn creative ideas into workable and sustainable social solutions.

Social Innovation

Innovation is the process of both generating and applying creative ideas in some specific area. In other words, innovation involves the introduction of something new and valuable – an artefact or a method – into a functioning production, marketing, or management system according to Cropley (2008). Leadbeater (2008, in OECD, 2011:34) explains that: "all innovation involves the application of new ideas – or reapplication of old ideas in new ways – to devise better solutions to people's needs. Innovation is invariably a cumulative, collaborative activity in which ideas are shared, tested, refined, developed and applied. Social innovation applies this thinking to social issues: education and health, issues of inequality and inclusion." Social innovation is "social responses to unsolved social problems and needs, which have not been successfully tackled by the State or the market."

The major aim of social innovation is to resolve complex social challenges and to produce social change. Social innovation "can take place everywhere" and is the "result of joint effort, creativity and a shared vision" of a better future for all (OECD, 2011:23).

Social innovation requires cross-pollination and intermediaries, like policy makers, to be successful. This is often referred to as the "bees and trees" concept. The "bees" are the social entrepreneurs (small

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

organisations, individuals or groups) who have new ideas and can adapt and cross-pollinate quickly. The "trees" are the big organisations (like government, companies or non-governmental organisations) which are poor in creativity but have the financial capacity and infrastructure to implement new ideas (OECD, 2011). Intermediaries need to create the links between "bees" and "trees".

Social innovators need to understand the social innovation process well to enable them to work effectively as "bees", and to bring together like-minded people and organisations to share ideas, and to speed up the resolution of pressing social challenges.

Social Innovation Process

Luecke and Katz (in Cropley, 2008) highlight two stages in the process of innovation, namely the *invention* that consists of idea generation, idea evaluation and opportunity recognition (creativity), and the *exploitation* that consists of development and commercialisation (innovation).

Mulgan (2006) takes the two stages further and identifies the following five stages that innovations must pass through.

- Stage 1 involves the generation of ideas by understanding the social needs and identifying potential social solutions (also seen as the creativity stage). Normally innovators spot needs (for example, those reflected by angry individuals and groups, campaigns, picketing and strike action) which are not adequately met by the market or state and they start to delve deeper to understand people's real needs and issues.
- Stage 2 takes place when ideas are developed, prototyped and piloted. Social innovators take promising ideas and test these ideas in practice (either in real environments or in protected conditions). Only a few ideas survive this reality check.
- Stage 3 involves assessment, scaling up and diffusing good ideas. Good ideas are grown, replicated, adapted or franchised and require skilful strategy, vision, resources and supportive "trees".
- Stage 4 is the final stage in social innovation and involves learning and evolving. Ideas are turned into forms that may be very different from the expectations of the pioneers and can evolve by becoming more explicit. Ideas can also lead to the development of new social models and can become a powerful tool for bringing "bees" and "trees" together.

However, there are barriers that can prevent the social innovation process from taking place effectively.

Barriers to Social Innovation

Social entrepreneurs and innovators should realize that barriers to change exist at various levels in society. People can resist even the most appealing reforms to social change if there is a possibility that things can worsen in the short term during the transition period (Mulgan, 2006). People also prefer the status quo due to the perception that it offers stability. In addition, various interest groups have certain stakes in maintaining the status quo and the benefits of continuity. Diverse needs, norms, values and assumptions can also create barriers to social innovation, according to Mulgan (2006).

Social Innovation eXchange (SIX) and the Young Foundation (2010) identified three key barriers to social innovation, namely (1) access to finance, (2) skills and formation, and (3) networks and inter-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

mediaries. In terms of finance, current finance systems in most countries are not fit for the new types of innovation required to address societal challenges. Many social organisations are also dependent on grants, which include charities, and the reliability of these funding sources are often problematic and directed away from operational costs, making long-term planning difficult. Social innovators also struggle to secure growth capital, although grants are available for prototyping and the start-up phases of social innovation. Innovation skills are lacking across the world. Small companies are more likely to experience skills gaps and can often not afford training programmes. Volunteering and the tendency to hire staff on an ad hoc basis impact negatively on skill development and retention as well. Networks and intermediaries are critical for social innovation. There is a significant absence of intermediaries able to link the right organisational forms to put social innovation into practice, according to the Social Innovation eXchange (SIX) and the Young Foundation (2010).

McElroy (2002:33) defines social innovation capital (SIC) as "*the structural manner in which whole social systems (i.e., firms) organize themselves around – and carry out – the production and integration of new knowledge*". McElroy (2002) highlights two issues of social innovation capital (SIC) that can be seen as barriers to social innovation. Firstly, social innovation capital is developed in a collective manner, which can be risky due to individual learning, group formation and learning, organisational adoption (of knowledge), knowledge sharing and diffusion and knowledge use. Secondly, social innovation capital and social innovations need to be protected as intellectual property. Certain policies will need to be implemented, like learning policies, knowledge processing policies and connectedness policies, and agreed amongst the social innovators to ensure ideas are protected. This can be challenging due to the various role-players involved.

Supporting Social Innovation

Social innovation is more likely to happen when there is basic legal protection, open media, open cultures, accessible capital and innovation funds, think tanks, incubators and accelerators, research opportunities and research funding, technology labs, support of progressive foundations and philanthropists, willing experts and leaders in the field to assist, strong civic organisations and global links (Mulgan, 2006).

Mumford (2002) investigated various cases of social innovation and made the following observations which also indicate how social innovation could be supported. The first observation is that social innovation is experientially based and innovation seemed to emerge almost directly from a network of enterprises. Social innovators should be developed and supported to recognise emerging ideas and envision their broader implications. Training and development are therefore crucial. The second observation is that experience is important and that individuality plays an important role in social innovation. Social innovators should therefore be encouraged to use their life and business experience and to expose themselves to various opportunities to gain more life and business experience. They should also be encouraged to develop their uniqueness. The third observation was that social innovation requires ideas and solutions. Social innovators should therefore be encouraged to use the creativity process and innovation process to create and identify workable solutions to social problems. The fourth observation showed that a viable solution can set the stage for further development. Social innovators should therefore be encouraged to collaborate and network with various key stakeholders to test and build on possible social solutions. The private and public sectors need to play a role in making collaboration and networking possible across sectors. The fifth observation indicates that social innovation is a practical activity in

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

which benefit must be demonstrated in a short period. Social innovators should therefore be supported by incubators, accelerators and funders to ensure that they can experiment and remain positive and optimistic. The sixth observation is that funding is critical. Financial mechanisms and financing schemes must therefore be available to social innovators to be successful. The seventh observation showed that social innovators require self-promotion and they must be able to positively influence key stakeholders. Training and development can be helpful, and marketing agents to develop the image of social innovators can be used to promote innovators and their ideas. These services should be part of incubators, for example. The final observation by Mumford (2002) reflects that social innovation involves a willingness to rearrange and restructure existing social relationships. Social innovators should constantly question, rearrange and restructure social relationships and be able to "sell" their social value to key stakeholders to ensure successful social innovation. Training, in the form of roleplaying for example, can develop these skills and can be practiced in social innovation forums.

The success of social innovation also depends on effective leadership. Stanford GSB Centre for social innovation (2013) identified four attributes that effective leaders for social innovation should have. Firstly, a social innovator's knowledge should stretch across various domains to enable him/her to relate to a broad ecosystem and to make unprecedented connections to find more effective solutions. Leaders should be able to guide social innovators to consider the interplay between factors and forces in the environment, national and globally. Secondly, leaders should ensure that there are clear values and trust amongst all the collaborators and stakeholders to ensure a foundation for effective collaboration. Thirdly, a leader should have passion and have social change empathy. Fourthly, leaders should develop and encourage social innovators to be able to have multiple ideas in their minds at once and then to combine these ideas to improve each idea. This requires skill and effective leadership.

Social innovation leadership is therefore critical to create a better future for all. Mulgan (2006:160) stresses that "social innovation is likely to be most successful when there is close involvement of people with the strongest understanding of needs and where there are sophisticated metrics of success that can reward rapid learning and evolving end goals". Social innovation cannot take place in isolation and requires effective collaboration between "bees", "trees" and intermediates.

FUTURE RESEARCH DIRECTIONS

Social innovation is an emerging field which is advancing rapidly; however, there is still much to learn and much to achieve in terms of social innovation. World leaders need to recognise that there is an urgent need to speed up social solutions to resolve the often crippling and complex social challenges countries and the world are facing. The old ways of thinking can no longer serve the needs of the planet and humans. Humans will need to take bold and innovative steps to ensure survival and sustainability of the planet. More research is therefore needed to explore how social innovation can be encouraged, developed and funded across sectors and nations. Collaborative social innovation should be explored specifically to ensure that solutions in one country can be adapted to other countries, or developed into a better global social solution. The effectiveness of the above "approaches" used by Social Innovators should also be explored. The impact of social innovation on social problems such as poor health outcomes, poverty, and other social issues should be examined as well.

CONCLUSION

Mulgan (2006) states that "successful social innovators plant the seeds to social ideas in many minds, and these ideas became more powerful than individuals or institutions". Social innovation can change societies for the better and make a real difference; however, like most things in life, support is needed to develop, train and support social innovators. Creativity, thinking in new boxes and collaborative initiatives are also critical to make social innovation possible and successful.

This chapter highlighted the role of creativity in social innovation, explained the creativity process and focused specifically on social innovation, the process of social innovation, as well as the barriers thereof and ways to support social innovation. The main aim of the chapter was to create an awareness of social innovation.

In terms of creativity, successful intelligence, creativity themes, the creativity zone and the creative process were discussed. It can be concluded that practical-, analytical-, creative- and social intelligence are needed for social innovators. These should also be combined. Various factors can also impact on creativity like culture, rewards, support and the environment, to name a few. It was also highlighted in the chapter that "Beyonder creativity" is needed for social innovation. At this level, a synergy occurs between courage and creativity and the individual remains excited and passionate to find better ideas and solutions. Social innovators also need to focus on developing their creativity constantly.

Social innovation requires cross-pollination and intermediaries. The OECD (2011) refers to this as the "bees" and "trees" concept. Mulgan (2006) also explained that innovation, as well as social innovation, requires four steps: (1) generating ideas (creativity); (2) ideas are developed and tested which includes prototyping and piloting; (3) assessment of ideas and (4) implementation and involves learning and evolving. Support is also needed for social innovation, like training and development, financial support, collaboration between private and public sectors as well as various other key stakeholders, incubators and accelerators, as well as self-promotion training and exposure. Social innovators do not teach people or communities to fish, but they revolutionize the fishing industry. Social innovation therefore matters because it can help to generate sustainable social value and social change.

KEY TERMS AND DEFINITIONS

Convergent Thinking: The process of finding a single best solution to problem that you are trying to solve.

Divergent Thinking: The process of creating many unique solutions in order to solve a problem.

Social Creativity: It protects the integrity of the individual creator and at the same time manages a group creative process to achieve common ends to a social problem.

Social Enterprise: An organization that applies commercial strategies to maximize improvements in human and environmental well-being, rather than maximizing profits for external shareholders.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Entrepreneurship: The attempt to draw upon business techniques to find solutions to social problems.

Social Innovation: New strategies, concepts, ideas and organizations that meet the social needs or overcome social challenges in society.

Social Innovation Capital: The collective capacity of a firm to innovate.

Social Value: A way of thinking about how scarce resources are allocated and used.

Chapter 52
The Role of Entrepreneurial Spirit in Indonesian Youths and Housewives to Reduce Unemployment and Poverty Rate

Ati Cahayani
Atma Jaya Catholic University, Indonesia

ABSTRACT

Unemployment and poverty are problems experienced especially by developing countries. The higher level of unemployment and poverty will lead the higher level of crime. The unemployment rate in Indonesia in August 2014 is 5.94% or 7,244,905 people, and 4% of Indonesian people living on less than $1.25 a day. One of the things that can reduce the unemployment rate and the percentage of poor people is entrepreneurship. This chapter wants to explain that the level of unemployment and poverty can be minimized by the spirit of entrepreneurship of housewives and youths, who has a micro, small, and medium business. From six women and youth entrepreneurs who start their micro and small business that described in this book chapter, it can be seen that their effort could empower themselves and make themselves and their family exit from poverty. But, they are facing barriers to starting up. The government must push and encourage Indonesian people to become an entrepreneur by designing entrepreneurship development program, which includes government, educational institution, and family.

INTRODUCTION

Unemployment and poverty are problems experienced by all countries. The higher the level of unemployment and poverty will lead the higher the level of crime. Therefore, the problem of unemployment and poverty should receive serious attention from the government.

Developing countries usually face heavy problems of unemployment and poverty, including Indonesia which has a population of around 300 million is facing quite heavy problems of unemployment

and poverty. Indonesian Government realized that Indonesia's large population has great potential for unemployment problems. One of the government's efforts to tackle the problem of unemployment is by opening new work opportunity, especially with the labor-intensive program. October 2015, Indonesian President, Joko Widodo, has launched a labor-intensive program, which is expected could decrease the rate of unemployment (Praditya, 2015). Opening new work opportunity is not an easy thing to do. Indonesian government needs to cooperate with entrepreneurs, including entrepreneurs who have micro, small, medium enterprises (MSME), to open new work opportunity.

But, it must be remembered that the availability of employment is determined by economic growth in the country, including in Indonesia. If a country is not experiencing economic growth, then many companies bankrupt and mass layoff occurs. In the end, it will create a level of unemployment and poverty increased. In Old Order Era, the focus of Government is in politics, and that made the economy condition in Indonesia was bad. In New Order Era, the conditions of Indonesia's economy improve (Subandi, 2006). One of the famous economic development programs at the time of New Order is the Five Years Development (PELITA) and Plan of Five Years Development (REPELITA). That development program that was published to the community was created as a reference for the development that must be achieved within 5 years. In the reformation era, the term is no longer used, but any President in this era has a work plan to improve the Indonesia economy. President Joko Widodo, for instance, issued packages of economy policies to improve the economy in Indonesia (Waluyo, 2015).

One indicator of economic growth is growth of Gross Domestic Product (Sanusi, 2007). Data from BPS (2016b) shows that the growth of GDP Indonesia on 2014 is 3.6%, decline from 4.1% on 2013. The Central Bureau of statistics (BPS) recorded that economic growth in Indonesia is 4.79 percent on an annual basis (year-on-year (yoy)), where this figure is smaller than the previous year's close of 5.02 percent (Gumelar, 2016). The condition of the economy that is not too good makes this unemployment rate and poverty ever hard to be pressed.

The problems of unemployment and poverty increased since Indonesia entered the Era of ASEAN Economic Community since 2015. With the ASEAN Economic Community, the boundaries between countries of ASEAN seemed to be lost, the labor of one country can easily work in other countries in ASEAN, and trade between ASEAN countries has become easier with low import tax. ASEAN Economic Community can be seen as an opportunity or a threat. With the ASEAN economic community, then the opportunities for Indonesia's labor force to work in other countries in ASEAN increased, but also can make the unemployment rate in Indonesia is increasing and ultimately could raise the rate of poverty. With the ASEAN economic community, the market becomes large, but the level of competition and the demand for good quality is high.

This book chapter wants to explain that the level of unemployment and poverty can be overcome by the spirit of entrepreneurship of housewives and youths, who have a micro, small, and medium business. The structure of this book chapter: The first section is the introduction that describes the benefits or the importance of this book chapter; in the second and third sections are explained about important aspect in this book chapter i.e. unemployment and poverty; the fourth section describes the main focus of this book chapter, which is about entrepreneurship in Indonesia; the fifth section describes solution and recommendation, that is entrepreneurship development program in Indonesia; and the sixth section is the conclusion.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

EMPLOYMENT, UNEMPLOYMENT, HALF UNEMPLOYMENT

People who categorized as employed are those who worked as paid employees, worked in their own business, or worked as unpaid workers in a family member's business. It also includes those who were not working but who had jobs from which they were temporarily absent because of, for example, vacation, illness, or bad weather (Mankiw, 2007).

Muana (2005, p. 249) said that unemployment is a condition where people who include in workforce category but do not have a job and also not try to find job actively. This condition is also known as open unemployment. Djohanputro (2006) said, there are four types of unemployment: open unemployment, under-employment, people who work actively but less utilized (include: premature retirement, hidden retirement, disguised underemployment), and the impaired. During this time, the government only records the data of open unemployment, as seen in Table 1, because open unemployment is easy to see, and the other three types of unemployment are not clearly visible so the data cannot collect easily.

Indonesia Statistics Center (BPS) shows data that on August 2013, Indonesia has a workforce of 120.2 million people but only 112.7 million people have a job, or it can say that 7.41 million people or 6.17% of the workforce are unemployment. And as shown in Table 1, in August 2014, the unemployment rate has decreased to 5.94% (BPS, 2016a). But according to Indonesia Statistic Center (BPS, 2016e), total unemployment of people with a bachelor's degree are 495,143 in August 2014 or increase from 398,298 in February 2014 as shown in Table 2. This means that workforce whom graduate from college cannot be absorbed in labor market. Those people are called as educated unemployment. Actually, educated unemployment is workforce who graduate from high school or more but jobless (Tobing, 2005).

The educated unemployment that likely to rise by 2014 is caused by two factors: frictional and structural. Those two factors make 2 conditions of unemployment (Mankiw, 2007): frictional unemployment and structural unemployment. Frictional unemployment is the unemployment that results because it takes time for workers to search for the jobs that best suit their tastes and skills and structural unemployment is

Table 1. Type of activity of Indonesian people above 15 years old

Type of Activity		2013		2014	
		February	August	February	August
1	Indonesian people above 15 years old	178,130,470	179,967,361	181,169,972	182,992,204

the unemployment that result because the number of jobs available in some labor markets is insufficient to provide a job for everyone who wants one (Mankiw, 2007). Frictional and structural unemployment usually become long-term unemployment. Long-term unemployment creates new problems because the longer a worker is unemployed, the more difficult for him or her to find a job (Hornstein & Lubik, 2010). To overcome this problem, they could be encouraged to develop their own business or become an entrepreneur.

There are those who argue that more women are unemployed than men. But, what is the actual fact? ILO said, in many countries around the world, they are more unemployment women than unemployment man (around 6.2% unemployment women comparing to 5.5% unemployment men) due to discrimination to women (Detik, 2016). How about in Indonesia? Data from Indonesia Statistic Center shows that men are more unemployed than women (men 4.86% and women 3.48%) on 2012 (as shown in Table 3). But in recent data, Indonesian Gender Gap Index from Global Gender Gap Report (World Economic Forum, 2015) shows that women are more unemployed than men (women 6.4% and men 6%).

But on Table 4, it can be seen that for household activity, percentages of women (36.97%) who do household activity are bigger than men (1.63%), and that usual for Indonesian culture that think men as husband and father do work to provide family needs and women as wife and mother do household work.

Indeed, there are groups of people who can help the family economy, although not included in the labor force. They are household and student above 15 years old. From Table 1 and Table 4, it can be

Table 2. Unemployment data according to educational level

Table 4. Non-workforce activity by gender on 2012 (percentage)

People on Working Age	Type of Activity		
		Women	Men
		2012	2012
Non-workforce	Students above 15 years old	7.94	8.26
	Household	36.97	1.63
	Others	3.70	5.69

Source: BPS (2016d)

seen that households and students above 15 years old (youths) are not considered as workforce or labor force. According to Indonesia Center of Statistics, on August 2014 Indonesia has 36,019,249 household and 16,769,494 students above 15 years old (youths) (BPS, 2016a) from 61,119,273 non-workforce. It is a large enough number.

Under the conditions that exist in Indonesia today, the author wants to focus on housewives and youths that are not included in the labor force in reducing unemployment and poverty levels, but from some data that author gets, some of them gain profit from doing some kind of work for instance as part-time entrepreneur or freelance worker. That means they also can help the government to reduce the unemployment rate by open new work opportunity and also reduce the poverty rate.

For the household, the authors only limit on household women (housewives), as the number of household women in Indonesia is much more than a household men (as can be seen in Table 4). But before the author discusses the role of entrepreneurial spirit in housewives and youths, will be presented first a number of definitions of employment, unemployment, half-employment, entrepreneurship and entrepreneurial spirit, and micro, small, and medium enterprises. These definitions should be understood in order to understand this book chapter comprehensively.

POVERTY

Mc Quibria (as cited in Stone, 1992, p. 24), explain about poverty and people who poor socially and economically: "It's the lack of ability to employ assets that cause poverty. If your only asset is labor and you are unemployed, you are poor. If you are in a rural area and you don't own land, then you are also poor." From that definition, it can be seen that people who don't have any assets, and he/she does not work, then he/she is categorized as a poor. But if you have a lot of assets and do not work, you are not categorized as poor. That definition implicitly explains that unemployment usually causes poverty.

Beside the term of poverty in general like Mc Quibria said above, in Economic Studies, it is also known the term of poverty line and poverty rate. Poverty rate is the percentage of the population whose family income falls below an absolute level called the poverty line (Mankiw, 2007). And, poverty line is an absolute level of income set by the federal government for each family size below which a family is deemed to be in poverty (Mankiw, 2007).

What will take to end poverty and improve the lives of the poor? Economic growth will prove paramount, but, beyond growth itself, it must ensure that all members of society share in the benefits of that growth (World Bank and International Monetary Fund [IMF], 2014). In 1966, New Order Era got inherited

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

from the Old Order Era, i.e. inflation amounted to 670% (Sanusi, 2007). Inflation is an increase in the overall level of prices (Mankiw, 2007). Inflation will cause the price of goods, in particular the major commodities, rose sharply, which ultimately makes the purchasing power decreases and economic growth will stagnant. And, that is the reason that inflation is often assumed by people can affect the poverty rate. As mentioned in Section 2, New Order Era makes program PELITA (Five Years Development) and REPELITA (Five Years Development Plan) to develop the economic conditions. And, specifically for poverty alleviation programs, the New Order Era issued a variety of programs, including Presidential Instruction Program for Poor Village, Independent Young Families, and Health Aid Project. In the era of reformation, the Government issued a variety of programs to suppress the poverty, including Direct Cash Assistance (BLT), Smart Indonesia Card, Healthy Indonesia Card, and Prosperous Family Card.

According to data from World Bank and IMF, it can be seen that poverty has been more prevalent in Sub-Saharan Africa and South Asia than in other developing regions, accounting for about 80 percent of the global poor (2014). Data of World Bank and IMF shows that in 2011 there are 4% of Indonesian people living on less than $1.25 a day (2014). $1.25 per day is poverty line. People who spend less than $1.25 per month are considered as poor.

How about poverty in Indonesia in 2015? Data from BPS show that Indonesia has 28,513.57 thousand (11.13% of total population) poor people in the second half of 2015 or the number of poor people decrease from 28,592.79 thousand (11.22%of total population) in the first half of 2015 to 28,513.57 in the second half (BPS, 2016c). The decrease of poverty rate is not significant. Indonesian government still has a lot of things to do to reduce or minimize the poverty rate.

ENTREPRENEURSHIP DEVELOPMENT IN INDONESIA

As mentioned in Introduction Section, Indonesian government needs to cooperate with entrepreneurs to open new work opportunity. In essence, entrepreneurs have an important role in economic growth and prosperity of a country (Salimath & Cullen, 2010). The Indonesian government also must encourage people to be an entrepreneur.

Ciputra said, entrepreneurs in Indonesia are around 0.18 percent or 400,000 entrepreneurs (Ciputra, 2008). On March 2015, Minister of Cooperative and Small-Medium Enterprises Anak Agung Gede Ngurah Puspayoga said that entrepreneurs in Indonesia only 1.65% of total Indonesian population (Republika, 2015).

According to data from Global Entrepreneurship Monitor 2013, Indonesia Report based on APS (Adult Population Survey) survey in their (adults') perception of entrepreneurial activities, three measures were obtained: perceived opportunity (perception of entrepreneurial opportunity), perceived capability (perception of required knowledge, skill, and experience to start business), and fear of failure (of starting your own business) (Nawangpalupi, Pawitan, Gunawan, Widyarini, & Iskandarsjah, 2014). From those three measures, perceived capability gain relatively high percentage, i.e. 62%, and only 46.6% respondents have a perception of entrepreneurial opportunity. And from 46.6% respondents who have a perception of entrepreneurial opportunity, 35% have a fear of failure (Nawangpalupi et. al., 2014). So, it can be seen that there are only a few of Indonesia adulthood whom can see a business opportunity and not be afraid to fail. Global Entrepreneurship Monitor Report on 2013 said that if compared with other

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

countries in South East Asia and Asia Pacific, Indonesia is in the second position under the Philippines (47.9%) for perceived opportunity and also second position under the Philippines (68.4%) for perceived capability, but for fear of failure Indonesia is on number 9 from 11 countries in South East Asia and Asia Pacific (Amorós & Bosma, 2013).

Entrepreneur and Entrepreneurial Spirit

Emzen, as cited by Bulut and Sayin (2010, pp. 559-568), define an entrepreneur as "the person who generally sets up his or her own business and who brings various production factors together and takes risks in order to produce something and subsequently aims to profit." Amorós and Bosma (2013) divide entrepreneur into 2 types: necessity-driven entrepreneur and opportunity-driven entrepreneur. Joardar, Wu, and Chen (2014) said that GEM defined that the two types differ from each other in that opportunity entrepreneur is motivated by opportunity and necessity entrepreneur type is more requirement-based.

Everybody actually can be an entrepreneur, even an uneducated person. The most important thing is that person must have an entrepreneurial spirit. According to Ciputra (2008, p. 19), people with an entrepreneurial spirit have some characteristics, such as innovative, creative, want to take calculated risk. John Kao (Kuratko & Hodgetts, 2007, p. 118) explain about 11 entrepreneurial characteristics: *total commitment, determination and perseverance; drive to achieve and grow; opportunity and goal orientation; taking initiative and personal responsibility; persistent problem solving; realism and a sense of humor; seeking and using feedback; internal locus of control; calculated risk taking and risk seeking; low need for status and power; integrity and reliability*. Stevenson and Gumpert (Kuratko & Hodgetts, 2007, p. 118) said that *imagination, flexibility* and *willingness to accept risk* as the characteristics of those who have an entrepreneurial spirit in the organization. Hornaday in Kuratko and Hodgetts (2007, p.119) explained clearly the 42 characteristics that are often shown inside of an entrepreneur. Are people who want to be entrepreneur must have all those 42 characteristics? Kuratko and Hodgetts (2007) says that the thing that differentiates a successful and reliable entrepreneur with the other ones is the way they process the imagination and creative thinking with the systematic and logical processing ability.

Even though it said that everybody could be an entrepreneur as long as he or she has an entrepreneurial spirit, but actually, there are some barriers to building a new business or known as barriers to starting up. The author know several people who actually want to be entrepreneurs and have an entrepreneurial spirit but do not know how to start a business, do not have enough money to fund their business, and afraid of the risks. Meanwhile, the results of Robertson, Collins, Medeira, and Slater (2003) showed that there are few barriers to starting a business, such as unmotivated, no business idea, no skills, and no confidence, too risky, do not get help, and there are no funds.

Micro, Small, and Medium Enterprises

Usually, people think that entrepreneur must be a rich person with large enterprise or company. But, actually, a person who only makes and sells homemade cupcake is also considered as an entrepreneur. People who only own small grocery store also considered as an entrepreneur. Those businesses are categorized into Micro, Small, and Medium Enterprise.

These are criteria of Micro, Small, and Medium Enterprise according Act No. 20 year 2008, as retrieved from Bank Indonesia website:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. **Micro Enterprise:**
   a. Net worth maximal Rp. 50,000,000 (around $3,600) per year.
   b. Net sales maximal Rp. 300,000,000 (around $ 21,000) per year.
2. **Small Enterprise:**
   a. Net worth Rp. 50,000,000-Rp. 500,000,000 (around $3,600-$36,000) per year.
   b. Net sales Rp. 300,000,000-Rp. 2,500,000,000 (around $21,000-$178,571) per year.
3. **Medium Enterprise:**
   a. Net worth Rp. 500,000,000-10,000,000,000 (around $36,000-$714,286).
   b. Net sales Rp. 2,500,000,000-50,000,000,000 (around $178,571-$3,571,429).

In 2013, Indonesia has 57,895,721 MSME or increase 2.41% from 2012 and only has 5,066 big enterprises or BE (Department of Cooperative and Small Medium Enterprise, 2016). It can be seen that MSME have almost 99% of market and BE only has less than 1% of the market, as shown in Table 5.

From that data, the researcher assumes that MSMEs in Indonesia play a great role. When Indonesia was faced with a great crisis in 1997, the MSME became the savior for Indonesia people. Around that time, the amount of small business increased drastically, from only 7,000 small businesses in 1980 to 40 million in 2001 (Margiman, 2008). The MSME in Indonesia are dominated by the agriculture, forestry, farming, and fishery sectors (53.5%), and large businesses in the processing sector (35.4%) (Margiman, 2008). Those sectors have been existing for a long time in the Indonesia's. But, now, with the development of knowledge, technology, and managerial skills, new industries start to emerge in the business field, such as creative industry.

The development of technology is not only creating a new industry. The development of technology also creates a new way to do business. Now, people are all familiar with e-business. E-business emerged because of the development of internet technology. With e-business, people can sell and promote their product via the internet; the customers can buy and order things via the internet. With the convenience offered by Internet technology, more and more people could become entrepreneurs in more cheap and easy way. Why? With e-business, people do not need much cost for things, such as for store, for advertising and promotion, and for storage the product. And with e-business, people can do business in more flexible time and way.

Table 5. Data of micro, small, and medium enterprise and big enterprise year 2012 and 2013

Enterprise	2012	2013	Percentage of Increasing
Micro, Small, Medium Enterprise	***56,534,592***	***57,895,721***	***2.41***
Micro Enterprise	*55,856,176*	*57,189,393*	*2.39*
Small Enterprise	*629,418*	*654,222*	*3.94*
Medium Enterprise	*48,997*	*52,106*	*6.35*
Big Enterprise	***4,968***	***5,066***	**1.97**

Women and Youths Entrepreneurship in Micro and Small Business

Women and youths entrepreneurs have unique characteristics. Cahayani, Gunawan, and Isololipu (2016) quoted research result regarding the entrepreneurial spirit in women entrepreneurs who are also the member of cooperative in Bojonegoro by Iedarwati, Isololipu, and Cahayani. It said that personality characteristic is more prominent if compared to other two characteristics, which are managerial and agent of change. Cahayani et al. (2016) also quoted research result regarding the entrepreneurial spirit in young entrepreneurs who are Business Administration Department alumni by Cahayani, Gunawan, Iedarwati, Isololipu. It said that the characteristics of an agent of change are stronger than the other two characteristics. Despite those research results, this book chapter section wants to describe the role of women and youths entrepreneurs in micro and small business to reduce unemployment and poverty rate.

Indonesia has some famous women entrepreneurship, such as Martha Tilaar (owner of Martha Tilaar Group), Mooryati Sudibyo (owner of Mustika Ratu brand), and Wendy Sui Cheng Yap (President Director and CEO of PT Nippon Indosari Tbk). For youth entrepreneur, Nina Moran and her sisters (owner of Go Girl Magazine) can also be categorized as quite successful youth entrepreneur. All of them already have a lot of employees and absolutely could help government program to reduce unemployment and poverty rate because their business can absorb a lot of people to be their employees. This subsection does not want to describe successful women and youths entrepreneurs. This subsection wants to show the portrait of few housewives and youths that try to do business, even though only part time and micro and small business.

One of the people who talk to the author is a young housewife, lady A. Before she married, she was a career woman, but after married she decided to be a housewife. But after a while, she tried to do something. She tried to do an activity to fill her spare time. She wants it to be a productive activity and not consumptive. At first, she had no idea. But, after talking with her high school friend, she gets an idea, which received orders for screen printing T-shirt. At first, she did not have a brand for her micro and part-time business. But, after a while, she decided to name her business as D'Juno Custom. Her screen printing T-shirt did not last long. After she had quite a lot order, she had difficulties in managing time between business and parenting, and finally, she decided to stop that business.

A few years after that, Lady A tried a new business which still survives today. She makes hairpins and bandanas for children and also brooches for hijabs women with brand Lara Handycraft. The idea of doing this business is obtained after she is invited by her friends to learn how to make hair pin, brooch, and bandana. After being able to make hair pin, brooch, and a bandana, she was challenged by her trainer to try selling her work.

She is doing her micro business in her home when her son has a nap or already falls asleep at night or when she has spare time. She prefers to use e-business because it can reduce the cost of promotion and production. She only makes hairpins, bandanas, or brooches after she receives the order. She always uses Internet technology to promote her products. Usually, she puts the photo of her product on her social media, and it proved to be an effective way to promote their products. And, she also learned new techniques to create a bandana, brooch and hair pin from the internet.

She chooses to be a part-time entrepreneur because it flexible and easy to manage and she also can still do her job as wife and mother. Even though she is not categorized as a poor family, but what she does makes her able to achieve self-actualization.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

When asked, who inspired her to try to do business; she said that she was inspired by some people. First is her father who had retired as permanent employees but has a variety of micro-business to fulfill the needs of her family. Second are some of her friends who also are housewives but can still make money by being a part-time entrepreneur.

How about her son, is she teach something about this business skill to her son? Lady A said, one day, she told her five years old son to sell all of his comic books before he can buy new comic books. She and her son made a small garage sale to sell her son's comic books. By doing that, she teaches her son to be entrepreneur unwittingly. And by doing that, she also teaches her son that you must do something first to get what you want or no pain no gain.

A little bit different with Lady A, miss B is a single parent with two teenage girls. Her condition pushes her to do something to earn money, but at the same time, she still has time to do house chores and parenting things. With her skills to make cookies, she decided to accept the orders for making cookies, especially in Eidul-Fitr season and Christmas season. How does she promote her products? She distributed flyers to her neighbors around the house and also to parents of her daughters' school friends. When she is getting a lot of orders, she hires someone else to help her complete that order. She also accepts the orders for daily catering. Miss B who only graduated from high school also is a part-time taxi driver. In short, she will do everything she can to fulfill her two teenage girl's needs. Is she feeling ashamed with what she does? No, she said, she has no time to feel ashamed.

She also said, that her two teenage daughters also help her to bake cakes or make cookies or deliver the catering to customers. So actually, unwittingly, miss B taught her children about entrepreneurship and entrepreneurial spirit. Miss B also taught her children a value of life: no need to feel ashamed doing something legal.

Now, miss B is a full-time entrepreneur and part-time worker, but when she still married, she was a part-time entrepreneur doing her cookies and catering business. At first, she did cookies and catering business as for leisure activities.

Actually, miss B learned to be an entrepreneur from her ex-husband. Her ex-husband has a small business, and she usually helped at administrative things, such as buy the material, do accounting, and some other things. When they divorced, she already has some knowledge to do business and already has entrepreneurial skill and spirit and ready to run her own business as a full-time entrepreneur.

Mrs. C is a young housewife with two little sons. Before married, she already has plans to become a housewife with income. She has a business that can be done at home, such as make cake, cupcake, cookies by order, sell Indonesia traditional crackers and cookies, make Indonesia traditional snack and food by order. How she promotes her business? She uses some ways to promote her business, such as making the web that contains all about her culinary business, joining the bazaar at his son's school, word of mouth, and also giving a sample of cake to her friends or families or neighbor and ask the endorsement.

Mrs. C has the intention to be an entrepreneur since before she married and graduated from university. She has a value that family is number one, and parenting is mother's primary responsibility so she decided to be a housewife with a small business that she can handle in her spare time. She also has a small shop that sells traditional snacks from some province and city of Indonesia. She has a worker that standby at her shop every day, and she only visits her shop occasionally. She also helps her sister in law to do travel business. All those business activities were conducted in her spare time.

D is a young man who still is a student in one of a university in Jakarta. In his spare time, he and some of his friend make and sell traditional cloth from East Nusa Tenggara just for a hobby. They do word to mouth promotions to sell that product. Even he does that just for hobby and cannot sell a lot of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

cloth up until now, but actually what he does still can help his family because the money that he earned is for his pocket money, so he does not have to ask from his parents. He does not come from rich family, so what he does help his family. Is he wants to become a full-time entrepreneur after he graduates from university? He said he is still not sure about that because he worries that he will not have enough money to fund his business even though he finds that entrepreneurship is an interesting field. He also said, his father does not support him to be a full-time entrepreneur, and that is the reason why he was not chosen major on entrepreneur at his university. But he said, he still want to be a part-time entrepreneur especially in the industry or field that he likes.

Mr. E is a young full-time entrepreneur and already had a business since still in university as a student, which is he tried to sell hamburger. In addition to the hamburger business, Mr. E also opened an "ayam penyet" (fried chicken with traditional chili sauce and some vegetable) diner, joint with his sister/brother in law. When the hamburger shop is closed because of its location contract expired, his "ayam penyet" diner has been running. In addition to the "ayam penyet" diner, Mr. E also has a pizzeria that initially he was peddling in the food truck. In addition to the two types of business, Mr. E had also tried to open a coffee shop but did not last long. Of the several types of business that he started since in university, he has been able to hire a few employees. This means he can create jobs for others and help the government to reduce the unemployment rate.

Mr. E is the risk taker. That is why he runs several businesses at the same time. For him, if there is a chance, then it should be used. That principle makes him runs a business selling hamburgers and "ayam penyet" restaurant. When there is a friend or relative who offered the location, he immediately accepted it, and the idea about hamburger corner came after he accepted that offering. What about with "ayam penyet" restaurant? He accepted the offer from his brother/sister in law to run business "ayam penyet" restaurant though he did not know anything about the business. His actions seem reckless, but entrepreneurs are required to be able to make decisions quickly and precisely in exploiting existing opportunities. He said, after getting married and having children, although more considerations to be made, but he continues to make decisions quickly and accurately.

The last person is Miss F. Miss F is a young lady that already has been a part-time entrepreneur before graduated from university. Now, she is a full-time entrepreneur. She has culinary business made from catfish: meatball catfish, nugget catfish, cracker from catfish skin and catfish bone. She also has business with her friend from her university with brand Salt Factory. Salt Factory produces rice bowl with some topping: catfish salted egg, chicken, and more. Salt Factory has some new menus now, mantau (Chinese bun) that filled with chicken mayo and crabmeat mayo and skelly scallop. She is the determinant and creative person. She always tries to find new recipes to make a new product and new ways to promote and sell his product. She and her friend do not have a permanent store. They usually join event or bazaar to sell their product and accept order via social media. They do this method of business because they still do not enough money to rent or own a store.

Miss F said, she has no intention to be an employee, because she cannot have flexible time, cannot do something that she like, and cannot express and do innovative and creative things without permission from boss or company. Yes, she is a unique young lady that is not afraid to try her idea.

From those six people, it can be seen that A, C, and D who are not included in the labor force could receive income, although not a lot, and help their husbands or parents, which included in the labor force, to fulfill the family needs. Mrs. B even now is a full-time entrepreneur and part-time worker and included in the labor force, but when she started her business, she was doing that as a housewife and not included

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the labor force. E and F even though now are full-time entrepreneurs and included in the labor force, but they try to become an entrepreneur when they were still a student and not included in the labor force.

From those six people, it can be seen that all of them have an entrepreneurial spirit, even some of them only housewives and part-time entrepreneurs. And from these data, it can be seen that even entrepreneurs in micro business can hire someone else to help them when they got a lot of orders. They also could have the networking to help buy raw materials or sell their products, so it can also indirectly drive the country's economy. This suggests that entrepreneurs could be a government partner to reduce the level of poverty and unemployment.

So, it can be said that entrepreneurial spirit is the core to reduce the level of poverty and unemployment. Why? Because only housewives and students above 15 years old who have an entrepreneurial spirit are trying to do something to create jobs so they can earn money. It can be seen that people who have an entrepreneurial spirit will show some unique characteristics, such as think creatively, unyielding, and proactive in life. They are also adaptive to the changes, as seen from the results of talking with Miss. B. Those characteristics make people with an entrepreneurial spirit will not just do nothing when fired from the company, or when cannot get a job. They will always find a way out of it by doing their own business.

The entrepreneurial spirit can be owned and developed in various ways. The entrepreneurial spirit can be transferred to people around those six entrepreneurs, either consciously or unconsciously. Miss B learned about the business and the entrepreneurial spirit from her ex-husband, lady A has an entrepreneurial spirit that is learned from her father, and Mr. E that has learned about spiritual spirit from his parent since childhood. The entrepreneurial spirit can indeed be transmitted by the nearest person, but the most influencing person in growing and developing the entrepreneurial spirit are the parents, especially mothers, who care for their children from infancy. So when the children of A, B, C, and E saw their parents own and run a business, even if only part-time, or even when they asked for helping parents in running the business, it is one of the most effective ways to instill and develop an entrepreneurial spirit. Their parents can be their role model. Unmarried young entrepreneurs, such as D and F, can transmit their entrepreneurial spirit to relatives or people closest to them.

Those six people above are just a small sample taken by the author to show that housewives and students who do not include in the labor force could also play a role in the movement of the Indonesian economy, such as reducing unemployment and alleviating poverty, by becoming a part-time entrepreneur. If there are many housewives and students over 15 years old who can own a business, part time or full time, the Indonesian economy can be increased considerably. It is time for the government to empower them, for the improvement of the economy of Indonesia.

ENTREPRENEURSHIP DEVELOPMENT PROGRAM IN INDONESIA

It can be seen above that the entrepreneurial spirit is the core. However, the barrier to start-ups often prevents people from starting trying to do business. Therefore, in addition to empowering entrepreneurial spirit, there are also some programs that must also be taken to deter barrier to start-up.

There are some suggestions that have been expressed by government officials or leaders of companies in Indonesia to empower those who are interested in becoming entrepreneurs but do not know what to do. Former Indonesian Vice President Boediono have been asked a business owner to reach out to young

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

entrepreneurs, who generally still in college, by providing a place for entrepreneurial business practices (business incubator). He said the business practice is important (Kompas, 2013, January 18, p. 20).

But, what about the young entrepreneurs in college or university who do not get a chance to practice in the corporate-owned business incubator? D, E, and F actually do not get a chance to practice in the corporate-owned business incubator. They said, they only learned from the experience and learn from others who run a similar business. It can be said that it is important to gather with the person who also runs a business to find a new idea, new knowledge, new spirit, and new perspective to run a business. D, E, and F also said, networking is the important thing to face the barrier to start up. They said friendship and wide networking enabling them to learn about how to start a business and can improve business capabilities. And by having a networking and socializing with people who run a similar business, they said, it can also empower their entrepreneurial spirit.

What is the most considered as a barrier to starting up by housewives? They said that the biggest obstacle is the lack of knowledge to start a business. And how about housewives who are interested in becoming entrepreneurs but do not know how to start it? A, B, and C said that they are looking for and get information on the internet and their friends or relatives. After that, they tried to run the business, step by step. In essence, they said, they learned from the experience. That is why, before making and selling a new product, they make sample products to be given to their relatives or friends to get feedback for the product. Usually, they bring their cookies or cake or food to "arisan" (regular social gathering). In Indonesia, many housewives are joining "arisan". Arisan is an activity to raise money or goods of the same value by a few people and then drawn between them to see who will get it, sweepstakes conducted in a regular meeting until all members get it. The authors argue, this regular social gathering could be an activity where the housewives who want to do business to learn to do business by inviting a speaker or trainer who can teach the participants gathering to conduct micro business. It is actually experienced by lady A when she was learning how to make a brooch, bandana, and a hair pin.

For housewives like A, B, C, what they do to empower their entrepreneurial spirit? Miss B said that she has an entrepreneurial spirit although she became an entrepreneur because the conditions forced her to become an entrepreneur. She thanked that condition that forced her to learn to do business and it removes the barrier to start-up. Actually, the author thinks that she has the characteristic of determination and perseverance and does not afraid of change and that condition strengthens her entrepreneurial characteristic and also entrepreneurial spirit. But Miss B also acknowledged that to foster creativity, as one of the characteristics of entrepreneurs, she must learn from a lot of people. She admits that it is important for an entrepreneur to have networking. Similar to Miss B, lady A, and Mrs. C think that they can empower their entrepreneurial spirit by gather with the person who runs a similar business and by having great networking. Based on the statement of A, B, and C, it can be said that "arisan" (regular social gathering) could also serve to empower the entrepreneurial spirit.

In addition to the ways above, there are a few more ways to empower the entrepreneurial spirit and also deter barrier to a start-up that can be done by the government, educational institutions, and parents, especially housewives. First, the government could increase the role of cooperative. Cooperative is a union that aims to meet the needs of its members by selling grocery items at a bargain price (does not intend to make a profit). There are several types of a cooperative. One is specifically aimed at the service or requires its members to save money, in addition, to being able to provide loans to its members. People call it credit cooperative. In Indonesia, there are a lot of a cooperative. Minister of Cooperative and MSME said, on February 2014, they registered 200,808 cooperatives in Indonesia (Sikumbang, 2014, February 1).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In 2010, the author visited a region in East Java, namely Bojonegoro. There, the author meet and talk with members of credit cooperative from various villages in Bojonegoro were all women. They all find it useful because they can obtain loans with much lower interest than the interest from the bank.

Indonesia already has a government ministry specifically address the issue of cooperative, namely a cooperative and MSME ministry. But the socialization of the role of cooperative, especially for youths and women, are less widely applied. Many Indonesian people are familiar with the word "cooperative" but did not know the specific role of the cooperative for its members. This makes many people in Indonesia who have not felt the need to become a member of a cooperative, even Mr. D.

Besides the government, educational institutions, ranging from early childhood education to higher education, will be expected to teach about entrepreneurship, both theory and practice. By always taught about entrepreneurship, it is expected that students will start to have an entrepreneurial spirit and also have an idea of the barrier to start up that they will face when starting a business.

Currently, there are already many kindergartens, elementary schools, junior high schools, and high schools held a business day every year, in which students are asked to sell goods at a school bazaar. It is a good activity to introduce the business practice to students, but not a lot of schools conduct an evaluation of the event for the students, so students do not understand the mistake that they have already done. In addition, many schools and colleges that are not balanced in giving the practice and theory of entrepreneurship. Theories about entrepreneurship cannot be considered trivial because it becomes a basic knowledge of entrepreneurship and also the basis of the philosophy of entrepreneurship.

It is better if the university or college have a business incubator. A business incubator can help students, especially who have an interest in becoming entrepreneurs. The business incubator provides consulting service; help student to liaise with investors and to bridge the relationship between alumni entrepreneurs and students who will become entrepreneurs. Business Incubator will be very helpful for students like Mr. D who are interested in becoming entrepreneurs but still have some doubts.

In addition to government and educational institutions, parents, especially housewives who are fully engaged in early childhood education for their children at home, played a major role in instilling entrepreneurial values to their children. Of interaction in daily life, the housewife can teach their children to be creative and innovative, driven and diligent, and proactive to change and adaptive to whatever environment they encounter. A simple example, the actions of Lady A, who taught her son to sell his comic book before her son could buy a new comic book. The simple action of an entrepreneurial spirit performed by housewives for their children will actually firmly plant in the child mind. And housewives who become entrepreneurs can be a role model in fostering the entrepreneurial spirit within their children. Children can see firsthand the entrepreneurial practice in their home.

CONCLUSION

From the discussion above, it can be concluded that a housewife and students above 15 years old (youths) who are not considered as workers also can help reduce poverty and help reduce unemployment. They can play a role as a pillar of the Indonesia's economy, especially in times of economic crisis and employee firing occurs everywhere. Although they only have a micro business, and only do business in their spare time, but they still have a market and remain able to sustain the country's economy. Imagine if all youths and all housewives who in August 2014 amounted to more than 40 million people have their

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

own business. They certainly also can help the Indonesian economy in the era of the ASEAN economic community when the level of competition increases and the market became wide.

And from those discussions above, it also can be seen that college students who already have started a business, although only as a part-time entrepreneur, have a tendency to continue their business after graduating from college. This is because, at the moment they still have parents to finance their lives, they've tried to do business and face barriers to starting up. When they've finished college, they've managed to face barriers to starting up. And, the entrepreneurial spirit has inherent strongly within them.

Given such conditions, it would better if the government extends the program to empower entrepreneurial spirit and also to deter barrier to starting up for housewives and youths, either with the status of a part-time or full-time entrepreneur, which actually includes the criteria of the owner of Micro, Small, and Medium Enterprises. In an effort to empower the housewives and youths, the government is expected to strengthen the role of a cooperative to help entrepreneurs MSME owners. Educational institutions, parents, especially housewives, and networking have a major role in the empowerment of entrepreneurial spirit and also deter barrier to starting up.

Chapter 53
The Crossroads That Were Never Meant to Be:
An Account of Promises and Challenges in an Orphan's Empowerment Journey

Oitshepile MmaB Modise
University of Botswana, Botswana

Rebecca Nthogo Lekoko
University of Botswana, Botswana

ABSTRACT

Today's world faces challenges of increased number of orphans. In Botswana, HIV/AIDS scourge widens figures and poverty increases vulnerability. Beyond existing empowerment supporting schemes, and policies, orphans are responsible for complementing government's efforts. In this chapter, the orphan had hoped for economic empowerment through his old barber shop. His hope was drowned when he got a kiosk instead of barber equipment. The kiosk in his yard stands as a promise of government support, on the other hand, it is a symbol of no voice and choice over improvement of his future life. Challenges to improvement include government's prescriptive procedures and bureaucracy. These challenges have in turn created self-doubt, bitterness and a feeling of betrayal on his part. This chapter illustrates that for empowerment strategies to succeed, there should be synergy between beneficiaries' needs and government support. Monitoring too is an essential part of successful practices.

INTRODUCTION

The case reported here is that of an orphan who is a citizen of Botswana. He is given a pseudo name Orx for ethical and professional reasons. In the context of Botswana, Vision 2016 sets a tone for support and inclusion of orphans in government services by emphatically stating that no one should be disadvantaged by the circumstances of their birth. It thus compels the government and their agents to ensure that orphans especially the poor ones are not disadvantaged in life because of having lost parents who, in most cases, were breadwinners.

Support for orphans varies, for example, psychosocial support is an important component of any intervention aimed at improving the lives of orphans and vulnerable children (Boler & Caroll, 2003; Strebel, 2004; Miller, 2007). The Botswana government has also focused attention on providing restorative activities such as education, health, food, occupational and revenue generating activities to help these children lead a dignified life and have hope for the future. An important raison d'être for these interventions is to ensure that these children are protected from further social ills associated with poverty and vulnerability.

BIDPA (2007) reports a significant amount spent on the care of orphans, for example, in 2000 to 2001, Botswana had expended about P7 million and in 2002–2003 the figure had risen to P34 million. BIDPA further reports that in 2003/04, a more significant rise occurred amounting to P150 million while in 2004/05, the amount escalated to P212 million, making the orphan care program the most costly of all the social safety net programs. Against the background given above of the importance of paying attending to the welfare of orphans, this chapter focuses on an individual poor young adult orphan in the outskirt of the city of Gaborone called Old Naledi. This place started as a squatter place some years back and now has developed into a big residential place with modern brick-walled houses and some shacks. The place is mainly characterized by dwellings for the very poor. Many of these structures are bricks and roofed with corrugated iron. Many people in this location are not working. Some households have thus built rental units as source of survival. In some cases, this has led to overcrowding. The situation is complicated by sewages like pit latrines, some not maintained well. This is a place in which 'Orx' (pseudo-name) lives with his relatives.

As already stated, Orx may not pass the test of an orphan as per international standards and especially using the World Bank's (2004) definition. If age is used as the sole descriptor, he is already over 18 years of age and now a young adult, but still a youth as per the definition of Botswana (12-35 years). Apart from age, Orx exhibits all other characteristics of an orphan, the basic being both parents are late and he has no one to support. Also, he is still a youth.

The chapter will thus present a detailed background describing the situation of poor orphans in the context of a developing country like Botswana. Thereafter, the case is fully described recognizing Orx (pseudo name) as an orphan who needed support and had hopes on the government existing support for people like him. The section that follows describes what defeated his promises especially the self-started barber business. Other challenges that made it impossible for him to take advantage of available opportunity, (a kiosk) shall also be explored. The chapter closes with some future trends pointing to what may be done by both parties (Orx the beneficiary and the government of Botswana, the funder) to bring out mutuality, differences and work out strategies that can be used to address the needs if fruitful empowerment journey is to be maintained.

BACKGROUND

This background presents general understanding of the concepts of orphans, empowerment and poverty. It gives preferences to examples taken from the context of Botswana, a country from which the case presented in this chapter is derived. Below are brief discussions of the three main ideas of this paper.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Inside the World of Orphans

In this chapter, orphans and vulnerable children could be defined as those children who are most at risk of facing increased negative outcomes compared with the "average" child in their society (UNAIDS, 2004). The World Bank (2004), for example, define an orphan as a child aged zero to 17 years whose mother, father, or both have died. In the context of Botswana too, this definition is applied in government documents dealing with orphans as part of the vulnerable children (Republic of Botswana, 2008). While the concept of orphan is influenced greatly by age, there are other basic characteristics used to define who an orphan is. The World Bank (2004), for example, gives another category called social orphans. In this category, one or both parents may still be alive but are unable to perform parental duties for various reasons like illness or acute poverty. While these categories may differ, they, however, converge at pointing out the need for addressing the vulnerability of orphans. While the degree of vulnerability differs, they all need to be supported appropriately to manage specific risks in their lives. The poor orphans, for example, would look for support in the forms of materials or financial support while those orphans with money or material may look for psycho-social support.

Globally, there is an increasing awareness amongst governments and support agencies that support should be tailored to the specific needs of orphans. Stover et al. (2006), for example, recommend that for better quality of life, orphans need education, psychosocial support and economic self-sufficiency. They are, however, susceptible to various other social ills. It has to be recognized that because of their tender age of zero to seventeen (World Bank, 2004), they are unable to fend for themselves. Furthermore, they cannot cope with life challenges/demands such as being able to pay for their school, clothe themselves and they are defenceless in the face of abuse and exploitation. This type of vulnerability catches the eye, ear and feelings of all those with sympathetic hearts.

Botswana has been praised for having directed extensive efforts to improving the lives of orphans and other susceptible children particularly those who have lost their parents to HIV/AIDS (Mushunje & Mafico, 2010). In sub-Saharan Africa alone, the 2004 statistics estimated the number of orphans to about 43.4 million which meant that one in seven children are orphaned (UNAIDS, UNICEF, & USAID, 2004). Given this high numbers that continue to rise, many African countries are faced with the biggest challenge of catering for these children (SAFAIDS, 2011).

Care of orphans is a complex task. This complexity stems from the dynamics of this group. Some live in extreme poverty. Others live with some disabilities, still some are challenged in some various ways, like being sexually abused, exploited and marginalized. Additionally, it has been observed that in many African countries, orphans live in households headed by people with very low levels of education (Bicego et al., 2003; Miller, 2005; Miller, 2007). For instance, these authors indicate that in countries like Botswana, Kenya, and Tanzania, orphans were more likely than non-orphans to live in households where the head had no education. This adds to their vulnerability as they too may not progress any far because of the lack of support or encouragement. This in turn exposes them to the high chances of failure in schools and less or no chances of being employed in better paying jobs. They are then pushed to jobs that attract low wages like kitchen hands or a care giver.

The problem of orphans is not a new phenomenon in Botswana. However, in the past, this problem was not as much pronounced as now because relatives and the community at large provided a safety net for these children. Traditionally, this kind of care applied to all African countries. Wallis (2010), for example, observes that the magnitude of this problem has strained the traditional safety net provided by extended families to its breaking point. However, not all is lost. Few still find support in relatives and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the bulk of support is shifted to the government. For the government, responsibility comes along with the escalating number of orphans, for instance, Government of Botswana (2008) reveals that in 2002 there were 39, 571 registered orphans and by 2004, this number had increased to 47,964. According to Botswana Federation of Trade Unions (2007) there were 51,600 orphans registered throughout Botswana. These numbers could have been compromised as relatives continue to refuse to register orphans especially those resulting from HIV/AIDS because of the stigma associated with this epidemic.

Understanding the risks of orphans and vulnerable children is critical for attaining the Millennium Development Goals set by the United Nations in (2000) for education, health, nutrition, and poverty. The World Bank (2004), for example, warns that failure to attend to this vulnerable group may impact negatively on their socio-economic wellbeing and this in turn affects the development of the country. It is on the basis of the seriousness of the problem of orphans that several interventions are developed aimed at giving a fair chance of living to this vulnerable group. In Botswana, there is political will to ensure a better life for orphans and this willingness can be traced as far back as 1999 when a Short Term Plan of Action on Care for Orphans (STPA) was introduced by the government of Botswana to respond to the mounting figures of orphans in the country (Government of Botswana, 1999). The key intent of this plan was to;

1. Respond to the pressing needs of orphans (food, clothing, education, shelter, protection and care),
2. Identify the various stakeholders and identify their roles and responsibilities in responding to the orphan crisis,
3. Identify mechanisms for supporting community based responses to the orphan problem, and
4. Develop a framework for guiding the long term programme development for orphans (Government of Botswana, 1999).

A point to note coming out of these objectives is the realization that government alone could not succeed in addressing the challenges of poverty and issues affecting orphans. A number of interest groups such as communities, non-governmental organizations (NGOs), and individuals should be brought on board to assist. UNAIDS et al. (2004) in support of partnership to address the needs of orphans, state that "through committed partnerships and collaboration, millions of children and adolescents can have a chance of a better future" (p. 5). This type of life improvement is generally referred to in this chapter as empowerment. A brief explanation of what this empowerment entails in this chapter is presented below.

A Note on Empowerment

There are various definitions of empowerment. One such definition is that it is a process through which individuals/groups gain personal or collective resources to better their lives. In many cases and especially these days, monetary gains are considered basic empowering assets. However, life experiences support Page and Czuba's (1999) argument that empowerment is much more than just aiming for money or material possession. It is also about emotions, capability and health. For example, the grassroots groups such as the poor, people with disability are sometimes considered less able to work to improve their situations, basically because they do not have money. This disregards other empowering assets like knowledge of life's circumstances and ability to act. This understanding challenges some basic assumptions about power, especially where power denotes those with money to support those who do not have money or materials. While not denying the fact that the 'haves' can help the 'have nots' to improve their

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

lives, respect for each other's strength is crucial. Parties involved should decide to plan, implement, and evaluate in unison for empowerment to be appreciated. Empowerment is simply realizing one's potential, strengths and using them to explore existing opportunities to make a better living.

A Focus on Poverty Reduction Strategies

Focusing on government reduction strategies is a means to establish opportunities that exist for a poor orphan person like Orx for survival. Over the past years, the government of Botswana has come up with different strategies to address poverty. The current and most popularized one is the backyard garden whose objective is to serve as an income generating activity and also for domestic consumption. In addition to this strategy, there are many others such as the Revised National Policy for Rural Development, National Policy on Women in Development, Revised National Youth Policy, Destitute Policy, National Food Strategy, National Health Policy, National Plan on action for nutrition and National Policy on HIV/AIDS. Some are specifically tailored to address the needs of the youth, a category in which Orx, a case of this chapter falls. The Revised National Youth Policy, for example, is intended to guide all national efforts in the development and implementation of youth programs, mobilization of resources, strengthening implementation mechanisms and improving overall coordination within the youth sector (Republic of Botswana, 2010). It is in the context of these support schemes that Orx had hoped to empower himself by operating a barber shop. The specific strategy/scheme that Orx applied for is the Poverty Alleviation Program. The main objective of this support program is to improve "the livelihoods of Batswana by addressing all aspects of poverty including among others, policy environment, institutional framework and establishment of sustainable economic empowerment projects" (Republic of Botswana, 2012, p. 6). It is expected that potential beneficiaries should apply to be considered for support. In other words, each applicant states what he/she wishes to be helped with guided by the criteria for support as stated in the policy. For example,

- Beneficiaries should be able bodied Batswana citizens aged 18 years and above and should demonstrate ability to, interest and commitment to undertake the project.
- An individual can only benefit once from the program and priority will be given to first applicants.
- At the commencement of the project, beneficiaries will be required to enter into a Memorandum of Agreement (MOA) which also stipulates the location of the project (Government of Botswana, 2012, p. 8).

The implication is that not everyone gets supported. The support is given on the basis of what the applicant demonstrates as viable income generating activity. As well, an applicant should have the requisite ability, interest and commitment to undertake the project. Orx's story indicates that he had convinced government officials that his proposed project would generate income and make his life better. However, what surprised him was to be given what he did not apply for. He was offered a kiosk shop instead of equipment for a barber shop.

In discussing with Orx, he was now close to the edge of depression as he did not know what to do with the kiosk shop. Orx's story may demonstrate a critical element of empowerment processes; that, empowering citizens is a significant challenge that requires mutual understanding and agreement between the two parties. It takes not only relevant policies but carefully directed processes to ensure the usability of resources and materials allocated to the beneficiaries. In the case of Orx, good policies exist but chal-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

lenges or barriers to proper access have also been demonstrated. Of particular interest to this chapter are those policies that are directed at combating the negative outcomes that poor orphans and other vulnerable groups are likely to face due to effects of poverty. The main National Strategy for Poverty Reduction (2003) is directed at finding out appropriate mechanisms to complement and synchronize various poverty reduction initiatives. The distinctive attribute of this strategy is to avoid the piece-meal approach to the problem of poverty and use an integrated approach to ensure maximum use of resources. The Revised Policy on Rural Development (2002), on the other hand, is intended to expand the coverage defined by the National Strategy for Poverty Reduction (NSPR). It gives preference to reducing rural poverty, promoting sustainable livelihoods, stimulating rural employment and income generation, diversifying the rural economy, reducing dependency on Government (Ministry of Finance and Development, 2002).

One other important policy is the Botswana Vision 2016 which was developed in 1996 after wide national consultations. It was officially adopted in 1997. This Vision emphasizes three critical principles of effective empowerment, namely, equal participation by all in national development, fair treatment where no one would be disadvantaged as a result of their status in life as well as Botswana being "a compassionate and caring society" by 2016. This means that by using diverse approaches, Botswana should guarantee that no person in Botswana lives below the poverty datum line. Vision 2016 projected that all people will have access to productive resources regardless of ethnic origin, gender, disability, or misfortune by the year 2016. It further goes on to say that Botswana will have succeeded in helping people to escape from the poverty trap through means such as social safety nets for those who find themselves in poverty for any reason (Presidential Task Force, 1997, p.9). However, with only two years left before 2016, poverty still remains one of the greatest challenges the country faces. The poverty map, for example, indicates pockets of dire poverty in a number of districts of Botswana including Kgalagadi, Gantsi, Ngamiland, Southern District, Central, Kweneng and the Chobe (Government of Botswana, 2011). This may mean that government interventions alone cannot effectively address the needs of all these poor people. Blanchette (2007) has actually observed that quite often, people are deceived to believe that government alone with its vast infrastructure and immense financial resources can improve the plight of the poor but experiences prove otherwise. Individuals and communities too have to commit to the eradication of poverty. In as far as the orphans are concerned; a crucial step towards assisting them is to assess the risks they face. These risks include the economic, social, psychological ones and trauma (World Bank, 2004; Candace Miller, 2007). Policies are there in Botswana to address these needs, as already discussed.

It has already been mentioned that Orx is a youth who can benefit from youth empowerment policies. A number of policies have been directed at helping them to live their lives in a more decent manner. In 1996, the Botswana Parliament endorsed the National Youth Policy (NYP) meant to uplift and advance the participation and empowerment of youth in the national public policy agenda. It identified six strategic areas, namely, education and training, health promotion, employment, participation of young people in recreation, sports and leisure and harnessing youth talent (Republic of Botswana, 1996). The policy was followed in 2001 by the establishment of the National Action Plan for Youth 2001-2010 (NDP 10) that also complemented the priority areas along with plans to enable young people to develop better life and entrepreneurship skills (BFTU, 2007). The Plan also emphasizes the need to align economic opportunities with competencies as well as the development of skills that employers want. It also encourages harnessing of youth talents (BFTU, 2007). Cases can be cited of youths who have benefitted from these policies. However, this is not the focus of this chapter.

THE CASE AND ITS SETTING

This chapter documents an experience of an orphaned young man living in the vicinity of Gaborone called Old Naledi located in southern part of the city. It is one of the oldest squatter locations having existed way before independence. It carries a notorious brand of poverty and crime. The researchers obtained access to use the case through the Poverty Eradication Officers in the Office of the State President. When directed to it, it was described as a success story. By a success story meant that the beneficiary was successful utilizing what the government offered him. However, the reality on the ground was opposite. When we (researchers) arrived at a place of operation, we were met by a young man in his twenties, quite distraught. He shared his disappointment at the government of Botswana for offering him the kiosk shop while he had applied for a barber shop.

A brief description of Orx is presented below. This will help readers to appreciate his background and why he desperately needed government support to sustain his life. He was born in 1987 and his mother died in 1999 while he was doing Grade Seven (7). He grew up in Gaborone where he did his junior secondary school education (Grade 8-10) at one of the community junior secondary schools in the city. He, however, did not complete this level of education having been expelled due to bad conduct. The lack of completion of at least a junior high school for Orx could perhaps be equated to a beginning of life full of hardships. Education in Botswana and elsewhere is considered a stepping stone to a brighter future especially for children in a distressed situation like Orx. The literature is clear that education occupies the top in the list of activities that have appositive for orphans because it is common knowledge that the more educated the greater the chance of earning a higher income than those without education. While there is an outcry to keep these children in schools, there are still situations when they are expelled from schools for various reasons, a very unfortunate reality that escalates their difficulty. Obviously, an expulsion from school usually leads to anger on the part of the expelled if they believe it was unjustified. These sentiments were expressed by Orx. It became clear from the conversation that having been expelled from school has actually increased Orx's vulnerability and sensitiveness to anything that seems to further threaten his life. For this reason, it is vital that development practitioners should fully understand the circumstances of orphans when interacting with them to ensure that they uplift not downplay their positive spirit (Tooney, 2011, p.182).

It is worth noting that Orx's entrepreneurial skills started at a very early age of about twelve (12) through what can best be explained as "sitting next to Nelly". He watched and learned by trial and error as well as engaging in hands-on experience as his uncle cut hair in his home-based barber shop. The barber shop was a source of living for him and the family. He watched his uncle earning money through it, and buying clothes as well as paying whatever fees needed at school. When his uncle passed on in 2001, life for Orx, the orphan took a new direction, a new phase of despondency. He knew by then that he either did something to survive or starve. He had learned enough from his uncle to continue what the uncle did for them to survive. He started operating a barber shop during school holidays. After being expelled, it was a regular business. He was on his own until 2012 when he heard of the poverty eradication program commonly known as 'nyeletso lehuma' (Setswana name that translates into poverty eradication). He was informed by a neighbour who also wanted to enrol in the program.

He took the neighbour's advice seriously and went to the community development office to apply where he was informed of all the requirements that needed to be met. He applied and met all the requirements and was subsequently awarded funding. The award process involves looking for proper materials

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and equipment for the business and these were purchased by government through its poverty reduction scheme. Orx had applied for barber shop equipment.

He was surprised when one day government officials delivered a kiosk shop to him, something he did not apply for. He was informed that during the assessment of the location of the business, the officials realized that Orx's choice of a business place was not suitable for the project he proposed. His home, for example, did not have electricity and hence operating the equipment for a barber shop was not possible. It was then rationalized that since there was no kiosk shop close by, he could utilize one for income generation purposes. His initial thinking was to accept the kiosk shop and determine what to do with it thereafter. It was a spacious new shop. The total price for it was about P6, 000.00 (approximately USD600.00 with the current exchange rate).

To kickstart the business, he asked his sister to run the kiosk for him. Initially, the business did well and with the gains from it he had already started building a house at his home village. Things took a different turn when his sister developed a habit of misusing the money gained. His relationship with his sister soured. Orx portrayed his sister as a "snake" ("ke noga") as he said in his native language of Setswana). This expression is usually used in the Setswana culture to indicate brutal betrayal and a complete lack of trust on a person. His bitterness stems from the fact that his own sister connived with outsiders to cheat him and rob him of the only source of survival. This experience has bred some fresh and different kind of resentment to the kiosk shop that was imposed on him. He no longer wanted to use it and would do whatever it took to return it to the government.

Orx's only hope was to turn back to the barber business. It was quite a very small structure with an old chair for customers. It was operated in an open space not far from Orx's residential home. He continued working in his barbershop without support from the government.

The barber shop was not doing so well because of lack of equipment. However, he revealed that his customers were very happy with his service and skills and at times some paid him more than he asked for, as a gesture of appreciating his skilful job. He believed that if he operated in a proper barber shop, his business would be flourishing. He was worried about the future of his business. When he reported to the social workers that he was closing the kiosk, he was hopeful that he would get guidance and assistance on a way forward. Since closing, none of the social workers ever visited him. His hopes of self-sufficiency were drowned. Orx faced a number of challenges and some of these challenges are explored below.

HOPE DROWNED! THE CHALLENGES IN ORX'S EMPOWERMENT EFFORTS

The section focuses on the challenges that have made it impossible for Orx, the orphan, to pursue his dreams of operating a barber shop as a way of generating money for survival. While many challenges can be cited, only three main ones are discussed in this chapter.

Self-Defeating Behaviors

Orx, the beneficiary, displayed attributes that could make it difficult for him to take advantage of existing opportunity of a kiosk shop. Lacking proper words to explain his behaviour, we decided to use the phrase "decontextualized best". This phrase implies that, Orx has decided that the best project for him was the barber shop and was completely closed up to other options. It has been explained that the barber shop was difficult to operate in his location due to unavailability of electricity. Orx had closed his

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

thinking to this reality. No one knew how he intended to operate the equipment that needed electricity in the midst of the unavailability of electricity. In a way, he had removed the business out of its context (hence the term "decontextualized best". If, for example, Orx were to be open to other alternatives, he could be innovative enough to use the kiosk shop that has been turned into a 'white elephant'. In a way, his refusal of appreciating other options is self-defeating in the sense that there are very good reasons to believe that Orx may not get the barber shop when he had already benefitted from a kiosk shop. Rather, it may take years for the bureaucrats to consider his case and come up with something that may please him, because government mechanisms operate best on internal/inner logic of doing things rather than the inner feelings of the beneficiaries. The social workers have assessed and found that the barber shop would not work and decided to offer him something that would work. The government of Botswana would normally not take empty high risks, when awarding funding for poverty reduction projects.

Furthermore, it is important to underscore a Setswana proverb that cautions against being overly/strictly selective. A Motswana should understand that "motlhopha ntsi ke yo o kgorang" (beggars are not choosers). As the saying goes, as long as you are not overly selective, everything remains possible. This speaks to the need to be flexible when opportunities present themselves. It is possible that the kiosk can be used for some income generating activity. As of now, the kiosk is abandoned and the possibilities of it being vandalized are there. The fact that it remains unused because it was not his choice indicates his inability to be open up to other possibilities and perhaps also to a lack of initiative on his part.

Incomprehensibility of Bureaucracy on the Part of Orx, the Beneficiary

The case indicates the need for beneficiaries to understand how government bureaucracy works. It was clear that Orx had no idea of how government bureaucracy worked. The fact that he reported having gone to the offices as many times as he wished, demanding to be awarded what he had applied for, indicates lack of knowledge between privileges and rights. Important to note, is that Orx has lower levels of education and the environment in which he resides would not help him to comprehend how bureaucrats operate. He should be helped to appreciate how bureaucratic procedures operate. These bureaucratic structures usually result in highly rigid decision making procedures that according to Blanchette (2007) have a tendency to favour more powerful than powerless individuals. Orx can be described as powerless in the sense that he had no source of living.

Common sense would want us to believe that openness to alternatives rather than insisting on making a choice even where prospects for chances are dim, defeats prospects for empowerment. In this case, for example, 'Orx' has been provided with a spacious kiosk shop. The fact that it remains unused because it was not his choice indicates his inability to be open to other opportunities and perhaps a lack of initiative to think of other projects. While it is good to assert oneself and speak up for what one believes in, Orx should be helped to understand that government procedures are not easily altered to favour an individual, especially the disadvantaged like him.

The fact that Orx has decided to operate a barber shop that has been a source of survival for the family for as long as his uncle was alive may indicate that social workers' decision may have overlooked alternative ways of running the business in such conditions. Orx's unfortunate situation (as he himself explained it) may have resulted from government's officials' limited understanding of the environment. Borrowing from Griffin's et al. (1998) words, one can say that government officials involved in Orx's case only half-know or did not know at all how he intended to operate his business. This statement becomes particularly true in situations where agents of poverty reduction hardly involve the beneficiaries

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the discussions of what they want to do for them. Chambers (2003) actually advises that as long as the poor are placed at the periphery when decisions about how to take them out of poverty are done, the exercise is just a play round about activity that cannot be fully achieved. This idea seems to attract an increasingly number of thinkers, researchers, practitioners, policy and law makers and other stakeholders alike. There has to be a strong sympathy to the situation of orphans especially those that are poor.

Weak Monitoring/Feedback on the Progress of the Project

It is worth noting that the Department of Social Services is highly understaffed. This acute shortage of staff is the main obstacle in the execution of the poverty reduction program. A study conducted by BFTU (2007) indicates that there are only 82 positions at the D3-C4 level to manage the case load of 51,600 registered orphans. This translates into a case load of 629 orphans for each post annually. Given this case load ratio, it is virtually impractical for social workers to monitor the progress of projects of all orphans. It may be for this reason that Orx's project has never been visited. Clearly, this reveals the need for instantaneous capacity building for the Social Welfare Department (Miller, 2005). Appropriate action needs to be taken to augment the number of social workers to improve the situation so that one social worker could take care of 200 orphans. Development practitioners themselves, attest to the problem of staffing as a major challenge in addressing issues of this nature particularly when it comes to monitoring of projects.

SUMMARY

More than any other things, Orx's case revealed the lack of voice of the vulnerable in the decisions that affect how they live. It may be true that government eradication project can be helpful to others; however, it becomes a problem when people are given project that they have no interest in and no skills to run. While it is appreciated that the government or any other funder should prioritize, such priority should take into consideration the felt needs and capabilities of the beneficiaries.

In as far as Orx, the beneficiary is concerned, common sense makes us believe that where innovation is exercised, the kiosk would be put to use. Simply stated, Orx has his share of negligence or resistance to think and utilize an opportunity he has been given. He can reasonably discuss the situation with leading government authorities responsible for poverty reduction who can advise on a way forward. To reduce expectation that the government awards exactly what has been applied for, implementers of poverty reduction hand-outs should ensure that beneficiaries are aware of how government programs operate. Orx's reaction to the kiosk shop awarded to him affirms that he was not aware that applying for support does not automatically translate into awarding exactly what has been requested. He is not aware that government could set its own priority areas of support.

FUTURE TRENDS

The challenges experienced by Orx indicate that a participatory and multi-sectoral approach in the delivery of services to orphans is urgently required if these children are to be empowered, to be helped to uplift themselves from poverty. This approach would involve all stakeholders including the poor, orphans

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and the youth among others. It has already been observed that empowerment becomes possible through holistic and comprehensive psychosocial support for the orphans and poor (Mushaandja (2013). In the case of Orx, there are some social workers, for example, in the nearby community hall where Orx can be helped to deal with some of the deeper feelings of betrayal and to be assisted to disentangle from his conscious or unconscious resistance to make use of the kiosk shop. These counsellors may gain better access to Orx's business (presently the barber shop operated in a shack under a tree) and even advise him how he can run the kiosk. Experience can help to spark and strengthen his interest over time, especially if it is paying. If Orx focuses his energy on making the money through the kiosk shop, his goal of self-empowerment may be achieved. He will not gain it by being in the negative spotlight through harbouring anger towards the government, as this has bred self-sabotage by refusing to open up to suggestions of how to make use of what he has been given. It has been illustrated that those who manage to be empowered "exhibit a sense of openness to new ideas and alternatives (Centre for Community Enterprise, 2000, p. 11).

While most of the claims made by Orx were not corroborated by the government officials, the implications of them are that where two parties fail to agree, resources are wasted. What stuck out as wasteful in this case is a kiosk shop that lies unused. While we are aware that a tendency by those who feel they were deprived an opportunity is to drift to the negative attitudes, it has also been clear that Orx's conscious or unconscious intention to close out any suggestions of using the kiosk that he has been supplied with is self-defeating. Despite the fact that he is emotionally attached to the barber business, he has to find his way forward with the kiosk rather than remain stuck in anger, disappointment and discouragement. Counselling is necessary. Lay counsellors such as members of village development committees or community based social workers can be involved to help Orx become more aware of the kiosk as an opportunity for income generating activities. This approach which calls for mutual respect will help people to feel a sense of ownership and responsibilities to community problems and be encouraged to act on them.

Furthermore, it is accepted that prior experiences are normally guiding principles in helping a person to come out of undesirable situations. This means that any strategy intended to help a poor person to come out of poverty without taking into consideration how his or her real experience of poverty is bound to fail. In this case, evidence indicates that the beneficiary had applied for a project that he had experience on and had been doing for a long time. By offering him a project he lacked both knowledge and interest on, was tantamount to nullifying his rich experiences and portraying him as an incapable person. Very often when development strategies ignore experiences of beneficiaries, resources are wasted and talents are frustrated. There is ample literature supporting and illustrating the benefits of mutual understanding and working together of developments agents and beneficiaries. It is worth reiterating this perspective to a point that all stakeholders become active supporters and implementers of this noble idea.

KEY TERMS AND DEFINITIONS

Bureaucracy: A highly rigid decision making procedure with many levels making it difficult for an ordinary person to understand the nature of the delay and the consequences of such on needy clients.

Decontextualized Best: A situation where the best choice is not possible given prevailing circumstances yet they close up to other options.

Empowerment: A process where an individual becomes aware of his/her potential to use available opportunities for life improvement.

Entrepreneurial Skills: The ability to work with opportunities and risks involved in income generating enterprises.

Income Generation: Means of obtaining cash.

Poverty Reduction: Ideas and strategies intended to bridge the gap between deprivation of some life needs and needed resources for better livelihood.

Vulnerable Children: Those young people of ages 12 – 29 who find themselves in situations that expose them to multiple injustices of the world e.g. poverty, exploitation, abuse, hunger, and disease.

Chapter 54
Functional Effectiveness and Modern Mechanisms for National Urban Systems Globalization: The Case of Russia

Alexey Arkhipov
South Federal University, Russia

Denis Ushakov
International College Suan Sunandha Rajabhat University, Thailand & Russian Academy of National Economy and Public Administration–South Branch, Russia

ABSTRACT

Cities' transformation into active actors of international economic relations and their participation in international competition form a complex of relevant problems about efficiency of relationships between business and government, global competitive advantages of urban economies, quality of municipal governance, and development and international integration of the urban system of the modern countries (including Russia). This chapter examines a development of the modern features of the urban system in Russia, analyzes its macroeconomic indicators, actual problems, and evaluates various scenarios for the development of both individual urban economies and the entire urban system of Russia.

INTRODUCTION

Modernization of economy of Russia with world's largest natural resource, personnel, innovation and technological potential should be based on transformation of mechanisms for Russian industries' integration in world globalizing economic space. Improvement of efficiency of Russia's involvement in globalization trends requires an adaptation of the Russian economy to leading global trends - growth of modern cities economic importance and concentration of world economic activity within the boundaries of magapolices' global network.

Features of formation of Russian urban model and national system of Russia' cities' territorial distribution, as well as modern problems of Russian cities' functioning that became particularly acute in conditions of Russia' economic growth slowing, reducing of indigenous population and growth of international migration, identified an importance and relevance of finding modern approaches to urban management systems in Russia and scenarios of Russia further urban environment development.

The purpose of the study is to define, based on the analysis of factors and features of Russia urban economy development, the possible scenarios of Russian urban economic systems progress, as well as the tools to modernize Russian city network for its adaptation to needs of the global economy and world market trends .

Objectives of the study:

- To assess current economic role of cities in the functioning of Russia economic system;
- To identify patterns of economic development of Russia cities during the past 20 years;
- To consider the main problems of formation and present stage of Russia urban economy development;
- To clear possible scenarios of Russia urban system progress, to assess abilities of achieving an optimal performance of the Russian system of municipal services in the future;
- To set recommendations for modernization of the Russian urban economy in the short term.

The main hypotheses of the study:

H1: The economic importance of Russia cities does not correspond to their role in formation of the Russian population;
H2: The system of Russia municipal economy is not effective in terms of its capabilities of territorial distribution of economic activity, distribution of income and potential for economic progress;
H3: Structure of Russia urban economy mostly doesn't meet logic of today's global cities and urban business systems;
H4: Russian cities are low effective in terms of implementing their functions for innovative development and technological progress stimulators;
H5: The most important trends determining development of Russian cities, as well as probability of formation of Russia modern urban economies, deeply integrated into the global economic production and trade processes are growth of labor migration, introduction of the principles of entrepreneurship in city management, as well as development of international economic relations between cities.

MAIN FOCUS OF THE CHAPTER

Russian Cities in Modern Conditions of Economic Globalization

Russia is a geographically largest country in the world and leading economic system in the structure of global economy. Cities are places for residence and employment of almost 2/3 of Russians. This, on the one hand, allows considering Russia as an urbanized state. On the other hand, evaluation of the sources of Russia's GDP shows diametrically opposite results - a large part of Russia's gross domestic product is not formed in the cities but in rural areas (primarily in the regions of natural resources location).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Russian cities are very different by their population, specialization of urban economic system, and own importance in national economy.

We can analyze an economic performance of Russian cities based on the largest cities classification on two categories – cities with population over 1 million (category A) and cities with population 0.5 - 1 million (category B) people (Tab. 1).

Analysis of Russian statistic (Rosstat) data allows determination a share of cities of both categories in fixed assets, number of enterprises, retail trade and direct investments of Russia in 2011.

Fixed assets and number of enterprises of the cities of category B, in general, is proportional to share of these cities in population of Russia.

At the same time, cities of category B have less achievements in spheres of investment and retail (if comparing with cities of category A). It's obvious that most of fixed assets, entrepreneurs, retail sales and investments belong to medium and small towns and countryside of Russian Federation; and confirms that Russia is not a country of urban economies.

Table 1. Russian cities and their population in 2011, mln[1]

Category A			**Category B**		
1	Moscow	10563	1	Perm	986,5
2	S - Petersburg	4600	2	Volgograd	979,6

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Share of megacities (category A) in general population of Russia slightly decreased, while share of second-tier cities significantly increased.

At the same time, the share of cities with a population of 0.5-1 million in the total number of Russian enterprises significantly increased (more than for 2%).

The share of large Russian cities in retail trade critically fell. Meanwhile the share of category A cities in retail trade fell in two times (!) to 25%, and share of category B cities fell in three times (to 4.6%). This statistic data confirms an increasing role of provincial consumer markets in Russia, and is also evidenced by formation of federal retailers, their access to regions, and growth of consumer activity in the village due to implementation of federal and regional programs for countryside supporting.

Leadership of the largest cities in Russia in attracting of local and international investment retained in 2011 (the share of biggest Russian cities in total national investment stream increased for 3%), while similar index for cities of category B fell to 5,6%.

Such gap can be explained by relatively high level of development of financial and business infrastructure in metropolitan areas, as well as by fact that majority of largest Russian companies is registered in big cities. In general, such differentiation in the investment flows is typical for most countries, including geographically large ones that have similar socio-economic characteristics with Russia.

Using data of Rosstat we can characterize modern role of Russian cities in the national economy.

A general trend of Russia urban economy is obvious – share of most cities in the population of Russia is above of their share in the value of fixed assets of the country.

Only few industrial centers (Ulyanovsk, Khabarovsk, Orenburg, Ryazan, Samara, Krasnodar) has share in national value of fixed assets higher than share in country's population (in the case of Ulyanovsk a value of fixed assets is higher in times). Moscow is close to a parity. Maximum imbalance in favor of population is observed in Yekaterinburg, Omsk, Yaroslavl, Makhachkala, Tyumen and Lipetsk.

Assessment of the current distribution of retail sales between Russian cities demonstrates that only a share of the country's largest cities (Moscow, St. Petersburg) and Tyumen in national retail trade is higher than their share in population of the country.

Worst indicators of retail trade were considered in Omsk, Chelyabinsk and Novosibirsk. Yaroslavl, Makhachkala, Orenburg and Lipetsk lead in this disparity among the cities with population of 0.5 - 1 million. The result of analysis of retail trade in the largest cities of Russia confirms a previously made conclusion that role of the major cities in formation of Russian GDP reduces.

Despite a high proportion of large cities in national investment flows, an analysis of correlation between cities' shares in total investment flow and cities' shares in total population of Russia shows that most cities has high disparity in favor of demographic importance. Only Moscow, St. Petersburg, Krasnodar and Vladivostok has invest role higher than demographic one. And cities such as Togliatti, Yaroslavl, Lipetsk and Makhachkala are clear outsiders among the largest cities in Russia in the process of investments' attracting.

Synthesized indicators of cities' shares in total value of fixed assets, total number of enterprises, total retail trade and total investment in fixed capital of the country, we can distinguish so-called "average economic role of the city in national economy of Russia' and its correlation with cities' shares in total population of Russian Federation.

Economic roles of urban economies of largest Russian metropolises, as well as Krasnodar, Ulyanovsk, Vladivostok, Irkutsk, Tyumen is higher than their share in total population of the country.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Inverse dynamics can be seen in Omsk, Togliatti, Yaroslavl, Novokuznetsk, Makhachkala, Naberezhnye Chelny and Lipetsk. Obviously, economic functions of these cities do not correspond with their population. Therefore these cities suffer under lower labor productivity and efficiency of local economic systems.

Famous business magazine "Forbes" also published a ranking of the best Russian cities for business[2]. Experts estimated 103 Russian cities with a population over 150,000 people. Cities are evaluated by 18 indicators of socio-economic development such as: city's stability, social characteristics, business climate, and purchasing power of local population, infrastructure, and convenience of doing business.

First and second places by Forbes rating in 2011 belonged to Krasnodar and Khabarovsk. Another eight positions in Top-10 belonged to Yekaterinburg, Chelyabinsk, Novosibirsk, Omsk, Rostov-on-Don, Samara, Sochi, and Krasnoyarsk. First time Sochi got a ninth rank in top-10.

One of trends can seen in the ranking is a falling of Samara that was one of the fastest growing business centers few years ago. Now Samara was not included even in top-5. Interestingly, by indexes of "purchasing power" Samara fell from first place (that city previously occupied) on the 13th place. Now not only nearby Nizhny Novgorod, but even provincial centers such as Kaluga and Vladimir are in front of Samara.

By indexes of "business climate" Samara took only 17th place, behind neighboring Kazan and Nizhny Novgorod and traditionally "depressive" Vologda and Kaluga.

Finally in the category "resistance to the crisis" Samara got only 22nd positions. In contrast to the capital of Samara region cities of Novosibirsk, Rostov-on-Don, Omsk, Chelyabinsk were much better prepared for adverse economic conditions.

Even in such situation that characterizes a current state of Russian urban economies, cities are the clear leaders in the national development and concentrate enormous economic potential.

Thus, in most regions of Russia (60%) capital city generates over 2/3 of the regional budget. In 30 subjects of Russian Federation revenues of capital city budget is equal or bigger than budget of whole province (region), where this city is located (eg, Omsk and Omsk region)[3].

Table 2. Business environment of Russian cities, ranking, 2011[4]

Russian Cities with Population:					
Over 1 mln		**0.5 – 1 mln**		**Under 0.5 mln**	
1	Ekaterinburg	1	Krasnodar	1	Surgut
2	Ufa	2	Krasnoyarsk	2	Sochi
3	Kazan	3	Tyumen	3	Belgorod

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Oftenly income of some cities' budgets is bigger than incomes of some Russia' provinces (subjects). For example, Ekaterinburg' budget is more than budget of Samara region, Omsk' income exceeds income of Nizhny Novgorod region, Perm collects budget similar with Volgograd region.

As everywhere in the world, Russian cities concentrate great economic, managerial and intellectual potential; have capabilities for own integration into the world economy, and easy can turn into a "growth pole" of the Russian economy in the new situation.

Development of Russian cities and other municipalities occurs in difficult conditions. Specificity of urban settlements formation (especially in the Soviet era), consequences of extremely swift and painful changes of socio-economic system in Russia affects national urban system's formation and development.

Distortions in the economic and social structure of municipalities established under the administrative-command system and the Soviet planned economy are also relevant. These disparities violate patterns and experience of world urban development, and are clearly demonstrated by even a cursory analysis of the economic systems of Russian cities.

Thus, according to international experience, a rating of typical urban economic sector looks like: services, finance / trade, construction, food processing, machinery, metallurgy, mining, and agriculture. The structure of "urban" economy of Russia is almost opposite: mining, metallurgy, food processing, machinery, construction, finance / trade, services and agriculture.

Such sharp industrial discrepancy in the country where more than ¾ of population lives in urban areas suggests that circumstances of urban development in Russia were stronger than relevant urban environment.

Structural mismatch of Russia urban economies and, for example, Western European, existing instruments of Russian urban economic influence, lead to very sharp science conclusions and findings.

For example, Russian specialist in field of urban economy Glazichev V. notes that Russia has not any developed city in European sense of the term (Glazychev, 2009).

Urban development within a "policy distribution of productive forces", led to formation of at least four problems that Russian cities are facing now:

- Narrowness of urban tax base, when municipal (regional) budgets are heavily dependent on a limited number of companies;
- Congestion of major cities' tax base, lack of sources to reduce a tax burden due to emergence of new growth points outside of major cities or urban agglomerations (in rural areas);
- Urban manufacturing sector's burdened by "costs of scale" such as high communal tariffs, big governmental housing fund, and significant "social costs" (price of maintaining an appropriate level of social infrastructure);
- Presence of number of urban settlements that peculiar only to USSR (for example, capitals of national republics, that are initially unable to be large inter-regional economic centers; poorly located city; towns of one-company (mono-towns), that are strictly depending on one main enterprise development). The prospects of these cities' development in actual economic conditions are extremely uncertain. Any progressive experience of these cities' management is absent.

The peculiarities of modern budgetary relations redistribute funds not in favor of cities or other municipalities. According to data of Russia Ministry of Regional Development, during last three years a share of subjects of Federation (regions) in consolidated Federal budget of Russia increased for 8%, while the share of municipal budgets decreased for 7%.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

A modern trend of sharp reduction of municipal funds allocated for local development becomes particularly dangerous. Today most of municipal budgets in Russia consist only of current expenditures. The share of funds in municipal budgets that are allocated for local development since 1992 in Russia has decreased from 7 to 2.5%. Even in the most affluent cities it fell from 22 to 6%.

Management of urban economy in market conditions is incomparably more difficult than in the Soviet ones. Now city management faces a great number of autonomous organizations and owners, with thousands of countervailing factors with objective character (Starodubrovskaya, 2004).

One of the biggest dangers faced by city authorities in market environment is need to resist a pressure of urban real estate speculators. Russian cities' authorities are poorly armed for this opposition, for fighting against "slumizations" of parts of the cities, with randomization of cities' development and rampant land speculation.

Almost all XX century Russia (USSR) lived in virtual isolation from other world, and is rapidly opening now.

Despite all achievements of Russia globalization, its integration into modern global processes is still relatively low.

According to the index of globalization, published annually in the journal "Foreign Policy" in 2011[5], Russia got only 47th place (from 62) in the world rank.

Moscow, with 13.5 million populations, is a largest city in the world. But only 10 years ago Russian capital was not even included in a list of global cities (by a version of University of Loughborough, England (Beaverstock, Smith, Taylor, 1999). After revising this list five years later, in 2004, same group put Moscow on a par with Amsterdam, Boston, Chicago, Madrid, Milan and Toronto[6].

However, this success in field of globalization should not be exaggerated - it refers only to Moscow, and the rest of Russia' urban economic system looks very weak.

Because of own "under-globalizing" economies of Russian cities do not cope with important functions of the major cities in developed countries: spread of innovations and positive results of globalization across the country.

These processes will inevitably be late, and the gap between regions by level and nature of their development will increase.

With increasing of depopulation Russian cities will have to compete for residents. This competition can start even today, but Russian population is immobile due to the costs for transportation and property.

Depopulation will lead to an excess of housing; the cities' authorities will distribute different promises (related with good job, living environment and free education) and subsidies to potential new citizens. A considerable flow of immigrants from abroad certainly will go in the cities country.

Extremely limited opportunities to increase a tax burden in the cities of Russia demanded changes of approaches to urban managing. The solution was found in rejection of old "bureaucratic" urban governance and in transition to more flexible and predictive policy borrowed from business.

Analyzing these changes, David Harvey defined them as a shift of urban policy from managing urban economies without a direct participation to new concept of city-management – "entrepreneurial city-management» (Harvey, 1989).

The main features of entrepreneurial urban management can be summarized in the following points:

1. Changing the principles of city budget formation; expansion of non-tax revenues by receiving profits from city' participation in business projects and by budget funds directing in the property market (for interests of the urban community).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. Public-Private partnerships - the city authorities can support development of local businesses using legal mechanisms and participating in collaborative projects (Berg, van der Braun, 1999). Local business also can participate in urban development and carrys a share of social responsibility, "earns" money for the city's budget through implementation of various social projects.
3. Strategy for long-term development. According to entrepreneurial paradigm of city management, a strategy for city development should (Bramezza, 1996; Feagin & Smith, 1987): 1) be innovative, create competitive advantages of the city, 2) set clear goals and ways to achieve them in the foreseeable future, and 3) not only use entrepreneurial methods discourses and terminology, but to promote themselves on the market, actively form city brand and image.
4. Creation of municipal agencies that can take coordinating and mediating role in project implementation. These agencies work with every project individually and can find individual solutions.
5. Creation and using of expert networks and institutions to "test" urban development projects at various levels (from individual expertise to the international debate).
6. Strong mayor (head of the city) and managerial team, that allows mobilizing resources for urban "enterprise" projects implementation. In this sense, an entrepreneurial city seems like authoritarian-driven, more than democratically-controlled. High risks of errors in authoritarian decision-making process have to be leveled by open public and expert debates, as well as by procedures for different interests' coordination.
7. Favorable business climate. Entrepreneurial cities are not only active business participants, but also create financial and non-financial incentives and benefits, work for investment attractiveness, improve transport and communications infrastructure (that is necessary for effective operation of enterprises and business life of the city), reduce bureaucratic obstacles and administrative barriers. In fact, a social sphere of urban economy starts to work for the growth of business profitability (Duffy, 1995).

Thus, the Russian cities are not well-functioning economic systems that are deeply integrated with both a national economy and international production and distribution. Causes of national urban networks fragmentation are internal problems of urban economic systems' functioning (eg, mismatched of most cities' economic structure to modern requirements and standards of international experience, extreme dependence of urban development on interactions with regional and federal authorities, poorly functioning of social infrastructure, etc.) and external conditions (low development of mechanisms of interaction between municipal and Federal authorities, sustained urban development due to political rather than economic reasons).

Currently, the economic system of the Russian cities has low efficiency also due to discrepancy of urban economies to basic principles of cities territorial distribution and existing differentiation of business environment in the cities of Russia.

Meanwhile, even in such difficult conditions we can note some progress in implementing of municipal economic policy (for example, city management transition to entrepreneurial principles, growth of municipal investments in city reputation and image), and in organization and structure of urban economy (development of foreign economic relations, partnerships, seeking for additional resources for city development, improving the city competitiveness and investment attractiveness).

These transformations are not only requirements for urban economy effectivization but are also a factor of maintaining the cities as unique socio-economic systems in the difficult conditions of present stage of Russia development, under influence of internal and external factors analyzing further.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Directions of Infrastructural and Institutional Economic Modernization of Russian Cities

Analyzing scenarios of Russian cities' economic development we have to consider negative / positive effects of two groups of factors – internal (related with urban social-economical systems) and external (features of urban development).

Factors determining development of a modern urban economy of Russia are given in Table 3.

Among internal problems of Russian cities' development we can highlight:

Real threat of loss economic and geopolitical importance of the city. Global trends in the world economy substantially transform relationships between cities. In these conditions urban economies more involved in international relations network, acquire a number of obvious advantages and high competitiveness. At the same time cities, dropping out of the world's economic, political, cultural and other ties move on the periphery of global processes of economic, political and cultural development.

Efficiency of Russia economy, ceteris paribus, increases. But at the same time border between Russia and Kazakhstan and China is laid bare. So we can't be sure that Russia integration into the world economy will not stimulate new problem occurrence. Also we cannot surely forecast situation in neighboring Kazakhstan and rapidly growing China.

Flourishing of Russia, Kazakhstan and China border cities as a result of cross-border cooperation will not save stability. Likelihood of ethnic problems, stimulated by difficulties of ethnic migrants' assimilation in Russian major urban centers is very high. Very high concentration of foreign migrants in the border areas (where migrants are agreeing to live in conditions that are not accepted by Russian urban population) will stimulate replacement of Russian population primarily by Chinese.

Table 3. Factors of Russia' urban economic systems development in the long-term

Groups of Factors	Sub-Groups of Factors	Factors
Internal	Studied Well forecasted	- threat to lose key economic and geo-politic positions
		- deindustrialization
		- immigration
		- pollution
	Poor forecasted	- population aging;
		- aggressive policy in the real estate market
		- social-economical differentiation
		- increasing of social mobility and importance of human capital
External	Macroeconomic	- growth of prices for natural resources - integration in global markets - legacy of Soviet economy
	Social – demographic	- depopulation, population aging- growth of ethnic migration - new requirements for the quality and mobility of human resources
	Innovative – technological	- computerization and development of communication- cities' turning into conductors of innovations

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Computerization and development of communications in general leads to a softening of the "burden of Russian distances". But at the same time we can assume that in Russia this effect will be much weaker than in the West. Level of social services, that can be obtained in 10-15 major cities and cannot be informatized or digitized, is not comparable with other area of the country. Hence a conclusion that people involved in the processes of informatization in the foreseeable future will seek to resettle in the major cities.

Another side of transformation processes in the cities is their innovativeness and openness for innovations. Specifics of the current economy require involvement in innovative processes for large part of society. In Russia, the share of this economy is about 10%, while the share of population's employment there is even less.

Cities are multifunctional by their nature and ensure an implementation of multiple social goals. However, in practice, from all variety of urban functions "production" and "consumption" of money has disproportionate importance. Despite this importance, the cities which life philosophy is reduced and limited by these two principles and activities can eventually lose their economic power.

There are many historical examples of sunsets of the cities. For example, rich trade cities that once "paid off" for saving their trade business out of railways; or modern export-oriented industrial centers, that squeeze existing industrial and resources capacities until the last drop (Hall, 1966; King, 1990).

Other dynamics inherent for cities in difficult economic situation, when they are forced to generate changes and quickly find domestic sources of develop. This does not surely mean a prosperity, but cities are moving forward; local people can see prospects; urban processes of gentrification switch on; symbolic capital of the cities mobilizes and cities gradually become more attractive for foreign investment.

Soviet urbanization gave a vivid example of differences between achieved economic growth and poor living conditions. Even if to not look back at the era of Stalinist industrialization, Brezhnev era of rapid urbanization was accompanied by multiple and acute housing and transport problems, by sharp deterioration of environment, man-made disasters, and other social cleavages.

However, social sphere was financed and maintained in that time much better than in previous and subsequent years. It certainly contributed to the accumulation of human capital. This intellectual and professional reserve, despite the catastrophic collapse of economy in early 1990s, allowed quick and successful passing the whole transitional period, also to adapt and to use new technologies, new skills and activities. At the same time, cities with higher level of accumulated human capital passed a transit stage and were included in the process of economic recovery and growth quicker and more successfully.

Previous forms of urban governance mobilization, based on a combination of three basic principles: monopoly - concentration - competition (previously reliably provide an economic growth), now significantly reduce their effectiveness and must be balanced by another triad mobility - coordination – specialization (Vendina, 2006).

Mobility suggests that cities' involvement in networking and inter-cities relationships become more important for successful development of urban economy than cities' geographical proximity or administrative subordination. Cities' accessibility now is a key parameter for urban progress.

Movement up by the social lifts is completed by to change a place of residence and to obtain necessary social services. Mobility and accessibility naturally reduces a level of centralization and helps to equalize the living standards. Cities' coordination involves an information disclosure and reconciliation of interests.

Finally, a specialization does not mean increasing of cities' competitive advantages but to achieve a high level of development is priority and socially important area for management in every city.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Gaining of own image means not only an increasing of autonomy of decision-making process, but also an importance of functions' and responsibilities' redistribution between the Federal and provincial centers and intensifying of services' exchanges.

It is incredibly difficult to implement because Russian cities and provinces still divide spheres of influence. However, various crises Russia's facing now (such as demographic, economic and political) do not leave any chances to live in the previous logic of power and money domination.

The most obvious steps allowing to move from policy of economic growth stimulation to policies of development stimulation and feasible at the municipal government level, are, firstly, support of changes.

Cities need their own sources for innovation to be less dependent on the activities of large corporations. These changes have not only economic but also institutional or organizational nature, affecting the scope of decision-making, management, and building relationships between state and society.

Secondly, formation of unified information space serving any form of intercity exchanges, including the education system, students and professors, providing monitoring of the labor market and real estate, transportation, and cultural ties.

Thirdly, co-usage and co-service of unique and expensive infrastructure, rationalization of necessary infrastructure costs and existing system of health and social welfare in accordance with the structure of the population and its real needs.

Fourthly, sustaining and increasing of capital of diversity that includes not only local features but also possibility of international culture and lifestyle allowing start up of gentrification processes.

Fifthly, environmental problems that are closely connected with improvement of people's health, duration and quality of life.

Finally, a rejection of authoritarian approaches to management in favor of cooperation and more flexible system of decision-making (based on the interests of different groups represented by actors or institutions who share common goals but have different competencies and are not subjects for urban governance).

Thus, in the modern conditions internal characteristic of the cities' economic systems, as well as external characteristics determined by development of the national economy and social trends and factors identify prospects of Russian cities' development, urban system formation, and Russian cities integration into the world economy, as well as the structure of the national economy of Russia.

Probability of scenarios for Russian urban economic systems development will depend primarily on the effectiveness of consolidation of municipal government, local business and local community to overcome social inertia in the context of slow economic growth. The solution of many urban problems is largely not related only with additional financing or technical support, but also with overcoming a social resistance to change and Russian federal government approach to solve the problems of urban development.

Prospects for International Business Development in Russian Cities

Analysis of prospects of urban entrepreneurship development in conditions of Russian economic system modernization has to be based on factors allowing a predictive description of future of various Russian cities types.

As one of these factors we can consider people mobility in a broader sense (not just a physical movement of people in space, but also legal and economic conditions and opportunities for territorial, occupational and social mobility).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another factor is a qualitative assessment of urban management systems and business environment, expressed through the set of specific parameters, such as lifestyle, relationship of the city authorities and businesses, features of budget management, social and territorial differentiation in the city, etc.

Based on this we can consider the possible scenarios of development of Russia' cities within the space of two axes. One axes describes a quality of urban governance and business environment and the second axis – reflects an assessment of people mobility (Table 4).

It seems that in any realistic scenarios of urban development no one city can be proposed in the fourth quadrant of offered coordinate system, because development of democratic institutions and civil society is always associated with freedom of people movement and human rights to choose place of residence ("City of a mirage").

Third quadrant is Russia of resources, based on Soviet system of economic and political values, undeveloped democratic institutions and restricted people mobility.

Second quadrant is a "rotational city" when people mobility is not determined by economic freedom of citizens but by economic feasibility of industrial corporations or "public interests" development.

Quadrant "developed city" is obviously the most attractive.

Development of scenarios for further Russia' urban system progress also requires to take into account long-term external factors, primarily macroeconomic (such as prices on the commodities market), socio-demographic (aging population) and technological (computerization, development of communications).

The current situation of Russia, its transition to a post-industrial society with corresponding economic restructuring and social interactions, largely determines a duality of domestic cities development.

Russian cities, following, for example, an European experience, can be locomotives for regional development, or, can be finally integrated into the world economy without remaining of any positive impact on local economy (like global cities in some developing States).

Both strategies of further urban development are really possible in Russia. First one is a transition of 10-15 Russian cities in postindustrial world while the rest of the Russia territory wallows in conditions close to subsistence farming. Second one is a formation of hierarchical urban network effectively stimulating a development of the whole country.

"Inertia" scenario of Russia urban development is also possible. According to this scenario Russia will "wander" in the lower left quadrant of proposed axes. Obviously, numerous barriers for people mobility will persist, and different options of state bureaucratic models will be predominant in urban development.

During the years of reform a mobility of Russians decreased from 5.4 to 2.2% (1993 - 2008). In addition to economic (unavailability of housing for the majority of Russians, ineffectiveness of the national database of job vacancies and employment services), social (fear of displacement, loss of communication with friends and relatives) factors there are also political reasons (local bureaucracy are responsible for a certain group of the population living in the certain area, and are interested in the preservation of this group, tries all possible ways to reduce the outflow and growth of population).

Table 4. Scenarios for Russian cities development

Quality of Urban Governance and Urban Business Environment		
5. City – mirage	3. Developed city	*People Mobility*
2. Resources provider	4. Rotational city	

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The development of this scenario may be traced by analyzing of the population dynamics of Russian cities. Almost every major city of Russia lost 5% of population. At the same time population of "second tier" cities (with population 0,6 – 1 mln people) decreased only in Vladivostok and Saratov, but significantly increased in Voronezh, Krasnodar, Izhevsk and Irkutsk.

More positive dynamics is observing in the cities with populations 0,3 – 0,6 mln people where only three cities (Murmansk, Nizhny Tagil and Arkhangelsk) significantly drop in the number of citizens. All other cities demonstrate enviable stability and development. These patterns are typical for towns with population of 0, 1-0, 3 mln (there are only 2 crisis points – Magadan and Petropavlovsk-Kamchatsky in this group).

Realistic scenario assumes a sharp increase of share of the cities that develop according to corporate model of sustainable economic growth. With the growth of business it's reluctance to "share" with local bureaucracy will grow up. This can lead to corporative representatives' victory in the municipal elections of.

Utility of corporations' relations with the cities stimulates a formation of new urban hierarchy within the domestic production and distribution system. Cities where headquarters related with planning, research and development, innovation and design are located will become major educational, cultural centers. Corporation will maintain versatility and completeness of the spectrum of urban life in these cities by providing grants for universities engaged in the sponsorship of cultural activities and etc.

In Russia regions informal economic centers (that are not administrative capitals, smaller than the provincial town, but attractive for corporations) will strengthen and accelerate develop.

Medium-sized cities that are only provincial centers and are not integrated into the global economic network gradually lose their importance. Numerous small industrial and semi-urban settlements rapidly reduce. New towns - State outposts do not form. Moreover, a spatial concentration of urbanization activity in the most profitable areas along transport arteries is noticeable.

In the future, corporations (that require an optimization of the ratio between quality and price of labor) will finance resettlement programs, transform institutions that constrain mobility and legalization of migration processes (Heenan, 1977; Jensen-Butler, 1997).

In case of business development by Western model formed system of values may give a conclusion that development of civil society is the most favorable for business. Business begins to play a more constructive role in the triangle "business - local authorities - society" and supports the processes of civil society development.

Gradually distortions of Russian urban system, generated by planned economy, will be "straightened". Largest Russian cities (Moscow and St. Petersburg) is increasingly obtaining features of the "global cities" and becoming zones of active contacts between Russia and outside world. Full-fledged regional centers (about 10 cities) will develop with the urban functions of "second order".

A complete network of medium and small cities as a system of central places will be formed. A network of small towns will be "normalized" also – some small towns will be included in the zone of larger urban agglomerations (suburbs), or enter in the system of central places with the function of service areas (service, processing of local products), or gradually naturally eliminated due to the outflow of the population.

In initial phase of the optimistic scenario bureaucratic model of development is dominated, the state periodically makes ineffective attempts to intervene in the processes of urban development.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Simultaneously, elements of civil society are developing stimulated by computerization. Need for decision-making and implementation of specific actions in local community will lead to an increase of the real value of local government.

Migration is not a problem more, it becomes an ordinal matter. Alternative to physical movement of people is a flexible and versatile professional specialization, work through the Internet. Savings allow a person to work part time and to have free time for personal leisure and public affairs in the city.

Settlement system, developed in conditions of national economy isolation transforms in two directions. Proximity to Tokyo and Shanghai for Vladivostok as well as Warsaw, Helsinki and Berlin for Kaliningrad becomes more principled than the distance to Moscow. Settlement system focuses on dozens of major cities that provide a contact function. The rest perform the same function on a smaller scale, or die without any ways to compensate their distance from the contact boundaries of communications systems.

In order to effectively integrate into the global network, Russian cities need to integrate narrow clan and corporate interests and to unite them with the interests of the urban community. Combining of these interests is a very difficult task that can be solved on the basis of purely materialistic approach (receiving greater benefits from the partnership within the city than from fighting without rules alone).

Benefits from such association (the so-called synergistic effect) mostly belong to modern multinationals.

Important elements in the development of regional centers of Russia can be roughly grouped into blocks:

- Improved an "economic environment" in the city (creation of favorable conditions for preservation and development of existing business and attraction of new companies). Implementation of these measures is aimed at broadening tax base and employment, effect of their implementation can not occur so quickly and obviously.
- More efficient usage of budgetary funds, primarily by improving the work of housing and communal services and optimization of costs for social and cultural goals. This trend is one of the most urgent and allows to "sanitizing" the expenditure part of the city budget.
- Creation of "business environment" to promote a conservation of existing and development of new business can be carried out using a set of instruments of financial and non-financial nature.

Financial instruments aimed at improving the working conditions of business mainly in the following areas:

- Direct funding of projects (usually to finance a social infrastructure).
- Tax policy - tax breaks, tax credits, preferential loans (often to stimulate investment).
- Policy of guarantees of local administration (mainly to attract loans).

Non-financial instruments are largely arrangements. Their list is large enough and includes:

- Improving quality and accessibility of public services (upgrading facilities, expansion of networks, and reduction of tariffs).
- Improvement of transport infrastructure.
- Improvement of provision by land and property (zoning system for the sale and registration of ownership, ordering tax and lease payments, preparation of urban areas and real estate for sale or lease).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Improving conditions for small and medium business (establishment of a center to support SME, programs for retraining of the workforce).
- Creating a favorable image of the city (improving the appearance of the city, an active advertising campaign).

Strategic directions for development of small and medium-sized cities may be:

- Strengthening their role as centers of gravitation for agricultural, recreational, timber areas;
- Strengthening their role as structural centers in metropolitan areas (transport hubs, placements of industries moving out of the main city or interconnected with the main enterprises of the city, etc.);
- Development of functions, based on the existing potential of the city, especially skilled personnel.

Thus, the current situation in Russian cities can be represented as developed by bureaucratic and corporate type.

Nevertheless, slow "stagnating" scenario of Russian cities is not the most possible, because the processes of civil society formation and national development will contribute to more optimistic scenarios.

SOLUTIONS AND RECOMMENDATIONS

Cities of Russia concentrate almost two thirds of the population of the country. However the most of Russian gross domestic product is generated outside the cities but in the regions with natural resources.

The current dynamics of Russian cities development is experiencing a negative impact of historical features of their formation (structure of the Russian urban economy not biased in favor of the "traditionally urban" finance, trade, service, but in favor of mining and manufacturing industries; municipal budgets' dependence on a limited number of local enterprises; high social burden on the municipal budgets; and the lack of opportunities to reduce tax burden by emerging of new growth points outside of major cities or urban agglomerations) and consequences of extremely painful change of socio- economic structures in Russia in 1990th.

The system of Russian cities is low effective also due its inconsistency to basic principles of urban territorial distribution; differentiation of business environment and cities' involvement in international economic relations.

So why cities of Russia don't effectively play their major global and post-industrial functions - spread of innovations, connection to the multinational production and distribution structures, stimulating of economic development of the country, generation and commercialization of new knowledge, attracting of highly skilled labor and foreign capital.

In such difficult conditions some progress in implementing of municipal economic competencies (for example, transition to entrepreneurial principles of city management, growth of investment in reputation and image of the city) and also in organization and structure of the urban economy (development of foreign economic relations, partnerships, increasing of additional resources for cities development, improving of the cities competitiveness and investment attractiveness) is significant.

As internal factors of Russian urban economy development in the long term we can consider:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Decreasing of economic importance of the cities that are not involved in international relations;
- Disparity in wages in industry and service;
- Deindustrialization;
- International migration;
- Deterioration of the environment;
- Increasing of the share of pensioners in urban population;
- Possibility of urban and natural environment destroying in aggressive real property market policy;
- Destabilization of urban society as a result of growing importance of cultural and social capital crisis.

As factors determining urban development of Russia we may consider:

- Situation on world commodity markets, that determines a potential of the federal government to implement national programs for urban development;
- Unconditional increasing of importance of municipal economic regulation that directly determines a quality of urban business environment and cities competitiveness in global economy.

The most obvious tools to stimulate an economic growth of cities, enforceable at the municipal level, are:

- Support of changes that can be not only economic but also institutional or organizational by origin;
- Formation of unified information space serving any forms of inter-city exchanges;
- Joint usage and maintenance of expensive and unique infrastructure, rationalization of necessary infrastructure costs and existing system of health and social welfare in accordance with structure and real needs of local population;
- Sustaining and building of capital diversity;
- Mobilizing efforts to solve common environmental problems;
- Rejection of authoritarian management approaches in favor of cooperation and more flexible decision-making system based on the interests of different groups.

Taking in account trends of Russian economic system modernization, based on the presence of two dynamic factors for urban development (population mobility in its wider sense and quality of urban management systems and business environment) we proposed four possible scenarios for urban economic systems development: city in conditions of strong public authorities, city in terms of public- private partnership, city in extreme liberalization of business activities and developed city with a stable trend of democratic self-governance.

Probability of scenarios for urban development of Russia will depend on effectiveness of consolidation of municipal government, business and society in overcoming inertia and social development in the context of economic recession or low economic growth.

Development of Russia urban system by optimistic scenario requires a set of measures that were classified in this study into three groups:

Effective entry of largest Russian megacities into the global cities network requires an integration of corporate interests and interests of the urban community on materialistic basis (big benefits from the partnership); redistribution of internal (to the detriment of Russia finance' concentration in Moscow)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and international (elimination of monopoly of Moscow as an international financial center in Russia) financial flows.

Important elements for Russian regional centers development are improvement of economic environment, increasing of budgeting efficiency, improving the work of housing and communal services, social and cultural costs optimization. Non-financial instruments for regional cities development includes improving the quality and accessibility of public services, improvement of the transport infrastructure, provision of land and real estate, creating a centers to support small and medium-sized businesses and favorable image of the city.

Strategic directions for development of small and medium-sized cities are enhancing of their role as centers of gravitating areas, including agricultural, recreational, timber; strengthening their role as structural centers in major metropolitan areas of cities; development of functions, based on existing potential of the city (especially skilled personnel).

The process of development of the Russian urban system is irreversible and logical - they will seek an own "ideal" model allowing the most effective further development to ensure cities progress and entering in the national production and distribution system.

KEY TERMS AND DEFINITIONS

Agglomeration Economies: Are closely associated with economies of scale and the network effects mentioned above. It is important to understand that a positive outcome of agglomeration economies will only be achieved if the benefits outweigh the disadvantages. The ultimate end to agglomeration economies is the formation and growth of a city. The processes and factors contributing to the formation and growth of cities are considered here in the types of economies that are formed, their sources that are the contributing factor, network linkages, and the advantages and disadvantages that may or may not occur in the growth and formation of cities (Borowiecki, K. (2014) Agglomeration Economies).

Business Cluster: Is a geographic concentration of interconnected businesses, suppliers, and associated institutions in a particular field. Clusters are considered to increase the productivity with which companies can compete, nationally and globally (Porter, M. E. (1998). Clusters and the new economics of competition, Harvard Business Review, Nov/Dec98, Vol. 76 Issue 6, p77).

City Manager: Is an official appointed as the administrative manager of a city, in a council-manager form of city government. Local officials serving in this position are sometimes referred to as the chief executive officer (CEO) or chief administrative officer (CAO) in some municipalities.[1] However, in a technical sense, the term "city manager," as opposed to CAO, implies more discretion and independent authority that is set forth in a charter or some other body of codified law, as opposed to duties being assigned on a varying basis by a single superior such as a mayor (Svara, J. & Kimberly, L. (2008, August). Taking Stock of the Council-Manager Form at 100. Public Management Magazine, pp 6-14).

Economies of Agglomeration: Is used in urban economics to describe the benefits that firms obtain by locating near each other ('agglomerating'). This concept relates to the idea of economies of scale and network effects. Simply put, as more firms in related fields of business cluster together, their costs of production may decline significantly (firms have competing multiple suppliers, greater specialization and division of labor result). Even when competing firms in the same sector cluster, there may be advantages because the cluster attracts more suppliers and customers than a single firm could achieve alone. Cities form and grow to exploit economies of agglomeration.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Local Government: Is a form of public administration which in a majority of contexts, exists as the lowest tier of administration within a given state. The term is used to contrast with offices at state level, which are referred to as the central government, national government, or (where appropriate) federal government and also to supranational government which deals with governing institutions between states. Local governments generally act within powers delegated to them by legislation or directives of the higher level of government. In federal states, local government generally comprises the third (or sometimes fourth) tier of government, whereas in unitary states, local government usually occupies the second or third tier of government, often with greater powers than higher-level administrative divisions (City managing, a new profession. The Independent. Dec 14, 1914. Retrieved July 24, 2012).

Monotown: Is a city/town whose economy is dominated by a single industry or company. The term is especially often used in Russia, where the Soviet planned economy created hundreds of monotowns in supposedly rational locations, often in geographically inhospitable areas. The situation in many of Russia's monotowns is highly problematic: they are entirely dependent on the competitiveness of a single company or factory, very unflexible and based on Soviet-era economics and technologies (Darkness on the Edge of Monotown. The New York Times. 2009).

Research-Intensive Clusters (RICs): Are regions with a high density of research-oriented organizations. These regions may be informally designated, or may be represented by a formal association. Member organizations are often universities, businesses, and non-profit research institutes. Closely related concepts include research associations (in general), research parks, technology clusters, and economic clusters. RICs differ from generic research associations in that the member organizations must be geographically close to one another. RICs differ from research parks in that the member organizations are in separate locations within a geographical region, and are not sharing the same exact location. RICs differ from technology and economic clusters because they focus on more research rather than on economic development per se, though for-profit businesses may certainly be members of both types of groups (Phillip, R. (2000). Developing Cluster Policies in Seven European Regions. European Policies Research Center, University of Strathclyde).

Chapter 55
Sustainable Rural Development in the Conditions of Trade Integration:
From Challenges to Opportunities

Anna Ivolga
Stavropol State Agrarian University, Russia

ABSTRACT

The chapter aims at overview of the main approaches to agricultural policies in developed and developing countries and investigation of perspective ways to ensure sustainable rural development in the conditions of liberalization of trade in agricultural commodities and food. The issues of sustainable rural development and main influences of trade liberalization are considered in the light of food security, alternative income opportunities in rural areas, and support of local identities. When analyzing the economic potential of rural areas, the following indicators are studied: natural conditions; assets; general characteristics of labor resources. Some of the indicators, used to be considered as secondary for economic results of agricultural activity, are also considered: living conditions in rural areas; demographic situation; rural social, cultural and leisure infrastructure; access of rural people to modern services of communication, transport, education, medicine, consumer services and other benefits, accustomed for urban citizens.

INTRODUCTION

According to the United Nations Environment Program (UNEP), by the year 2025, 83% of the global population (about 8.5 billion people) will be living in developing countries. Vast changes are required in macroeconomic policy in developing as well as developed countries, to satisfy the demands of this growing population for food and other agricultural commodities, as well as to create conditions for sustainable rural development. Rural areas have to meet this challenge, by increasing production in a sustainable way, maintaining and improving the capacity of the higher potential agricultural lands.

Interest in agricultural activities is rising worldwide. However, commodity price volatility, growing human and environmental pressures, and worries about food security threaten sustainability of agricultural production and rural development. In the contemporary conditions of liberalization of trade in agricultural commodities and food rural development is influenced by trade regimes, changing import tariffs, national agricultural policies, and state support of agricultural producers. Developed countries, primarily the USA and the EU, lay emphasis on implementation of a wide range of tools that affect competitiveness of domestic farmers and character of rural development directly and indirectly. Such policies support effective elimination of prices disparity and increase of farmers' incomes. Obviously, developing countries fail to ensure their sustainable rural development proportionally with the USA, the EU, and other developed states. Volumes of domestic support gained by farmers and rural people in developing countries are tenfold lower than in the developed states.

BACKGROUND

Globalization has created unprecedented growth in global markets. Various researches demonstrate clear links between globalization, trade liberalization, and economic growth. Andersen and Babula (2008) discovered positive relationship between international trade and economic growth. As of Manni and Ibne Afzal (2012), liberalization policy improves export of a country, which leads to the higher economic growth. Parikh and Stirbu (2004) also conclude, that trade liberalization may promote growth from a supply (export) side through a more efficient allocation of resources while it may constrain growth from a demand (import) side.

However, the effects of trade liberalization and integration are different for developed and developing economies. There are two major reasons why liberalization of foreign trade activities and integration are beneficial for developing countries (Krugman, 1990). First reason is a narrow domestic market, since the demand growth in developing countries is usually constrained by low per capita incomes. In such a situation, a liberalized trade regime allows domestic producers to increase exports and expand their outlet area. While the first reason deals with increasing export opportunities, the second one is related to market access. It is an increase in welfare derived from an improved allocation of domestic resources (Manni & Ibne Afzal, 2012, p. 38). Removal of import restrictions through trade liberalization encourages a shift of resources from production of import substitutes to production of export-oriented goods. This, in turn, generates growth as a country adjusts to a new allocation of resources more in keeping with its comparative advantage (McCulloch, Winters, & Cirera, 2001).

While some of the researchers conclude that developing countries and economies in transition could benefit from liberalization, others find the opposite. Open trade regimes force greater reliance on the international market, which is not always good for "weaker" and less competitive developing countries and economies in transition. Many developing countries currently rely on export-oriented production as a mean of generating foreign exchange earnings with which to purchase manufactured goods and food products (Gonzalez, 2004, p. 423). As of Erokhin, Ivolga, and Heijman (2014), developing countries are to a far greater degree concerned that the major part of benefits of trade liberalization goes to the developed states. Kneller, Morgan, and Kanchanahatakij (2008) agree that there is a positive but small impact of trade liberalization on growth.

Greenaway, Morgan, and Wright (2002) find that liberalization affects growth, albeit with a lag. Their study of trade liberalization and growth in developing countries shows that liberalization may af-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

fect favourably the growth of real GDP per capita. The effect, however, is relatively small and lagged. As developing economies and economies in transition become more open to international trade, factors other than liberalization itself affect economic growth (transportation and communication costs, technological change, etc.).

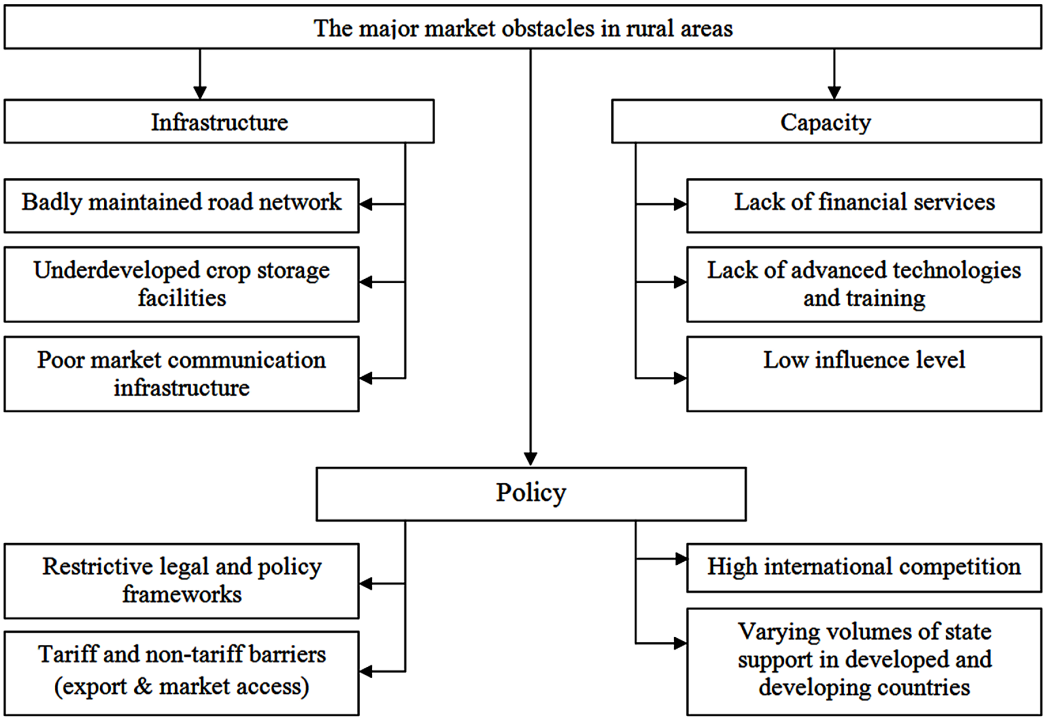
As of Dollar and Kraay (2001), only one third of the developing countries benefited from trade liberalization in terms of income growth and poverty reduction over the past two decades, while the remaining two-thirds did not experience any positive effects due to a number of internal problems and a lack of outward orientation. Many people in those countries still live in poverty, which arises from constraints that limit their ability to compete in national and international markets.

Poverty problems are important in developing countries, where income inequality is typically pronounced, and there are large vulnerable populations. Hasan, Quibria, and Kim (2003) argue, that policies that support economic freedom, integration and liberalization, are critical for poverty reduction. However, while Winters, McCulloch, and McKay (2004) suggest trade liberalization can be an important component of a "pro-poor" development strategy (p. 108), in many economies in transition there is still a strong movement against the integration into the global trade system, especially in the frameworks of the World Trade Organization (WTO) (Erokhin & Ivolga, 2012).

Most of the poor people in developing countries live in rural areas and make their living in agriculture. Agriculture employs almost three-quarters of the population in developing countries and accounts for about half of Gross Domestic Product (GDP) (Tutwiler & Straub, 2005). However, employment opportunities in rural areas are limited to agricultural production, which is likely to shrink as the domestic market gets open for foreign competition (Erokhin, Heijman, & Ivolga, 2014). Taylor (2002) defines two scenarios of trade liberalization for rural areas. The optimistic one is that "trade reforms open up new markets for goods or factors (labor) supplied by rural households" (Taylor, 2002, p. 4). The pessimistic scenario is that rural people suffer from negative impacts of liberalization on previously protected markets, and high transaction costs exclude many rural households from new market opportunities. According to Topalova (2007), rural districts where industries more exposed to trade liberalization are concentrated experience a slower progress in poverty reduction.

The effect of agricultural trade liberalization on rural development and poverty varies widely across developing countries and economies in transition. Net effect of liberalization on domestic food markets depends partly on the country's trade patterns, original level of protection and specifics of liberalization. Any changes in trade policies have to be carefully considered, especially with regard to the effects of trade integration and liberalization on rural communities and sustainability of rural development.

MAIN FOCUS OF THE CHAPTER



Food Market Access in Rural Areas

Enabling rural people to reach opportunities in markets beyond their communities and to improve the terms on which they interact with them is a powerful tool to reduce poverty and fuel economic growth. However, there are many market constraints, which rural people and agricultural producers in rural areas experience. The major ones are infrastructure, capacity, and policy (Figure 1).

Rural communities are usually badly linked with larger markets because of the underdeveloped road networks. The bigger the country, the more critical this obstacle is. Poor communication routes and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The major market obstacles in rural areas
Source: Author's development

vast geographical distances increase transportation costs, what makes products more expensive and less competitive on the market. Because of the underdeveloped storage facilities, farmers are forced to sell their crops after harvesting, when market prices are the lowest. Underdeveloped physical infrastructure increases costs and harms competitiveness of agricultural and food producers in rural areas. Poor market communication infrastructure makes access to reliable information about current prices and market forecasts difficult.

Capacity constraints are significant as well. Farmers in rural areas lack the necessary financial services, especially credits, which would enable them to invest in the productivity of their businesses. They also lack advanced technologies (such as crop processing, fertilizers, etc.), effective trainings and extension support, what makes them less efficient and competitive on the market. As of Káposzta and Nagy (2008), "Agricultural development must not be realized only with improving the conditions of production, but also with improving the human resource of the farming society" (p. 213). Additionally, farmers are low influential when interacting with governmental bodies. They have to associate with other farmers in their rural communities or from other rural areas to protect common interests in a more effective manner.

As for the policy obstacles, they are related to tariff and non-tariff barriers on the market, which are applied to both domestically produced food and agricultural products and imported goods. Various combinations of tariff and non-tariff protective measures create unique national market regimes. Developed countries tend to be more protective and supportive to national farmers, while developing ones are usually weaker in terms of state support and level of tariff barriers. International trade in food and agricultural commodities is highly monopolized by transnational agribusiness companies, what places

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

farmers from developing country at an enormous competitive disadvantage (Gonzalez, 2004). Billions of US dollars that developed countries (mostly the USA and the EU) give as subsidies to their domestic farmers increase surplus production and export, that in turn lowers global prices and reduces incomes of farmers and rural people in developing countries.

The key concern is enabling small and medium agricultural producers to respond to market obstacles in terms of cost and quality, so that they can function effectively in the conditions of liberalizing and integrating international food market and benefit from new opportunities. Trade liberalization does not automatically bring sales growth, because many other conditions, apart from a market entry itself, have to be met (product quality, adequate quantity of production, marketing campaigns, health and environmental issues, which are specific to each country).

It is evident, that small rural producers are particularly disadvantaged in these respects. In general, small and medium producers in rural areas are not as productive as big agricultural enterprises (Trukhachev, Ivolga, & Lescheva, 2015) and experience higher costs because of the economy of scale (Bokusheva, Hockmann, & Kumbhakar, 2012). In case of the economies in transition, where the size of domestic food market is limited by low effective demand, increased productivity may lead to reduced earnings in spite of increased sales. Growing supply decreases market prices for output, while unstable macroeconomic situation and inflation in most of the economies in transition increase cost of inputs (fuel, fertilizers, seeds, transportation and storage costs, etc.).

Macroeconomic reforms of the 1990s and food market transformations in the economies in transition have contributed to increased efficiency of agricultural production and greater transparency of domestic food markets. Nevertheless, in most of the economies in transition, as of Trukhachev et al. (2015) and Erokhin and Ivolga (2014), such reforms have left small agricultural producers in rural areas highly vulnerable to competition from larger enterprises and adverse market conditions. Liberalization of the 1990-2000s, in various degrees experienced by the economies in transition, intensified the links between domestic and international market conditions and increased exposure of the rural sector to fluctuations of the international agricultural and food markets. Every adverse change (falling prices on agricultural products, sanitarian restrictions, import bans, export quotations, etc.) have immediate effect on rural areas (reduced farm incomes, lower wages, and reduced employment in rural areas).

Trade Policies in Selected Economies in Transition: Implications for Rural Areas

Summarizing the discussion of various trade integration effects for rural areas, author concludes, that liberalization influences rural development in four major ways:

1. Pace of economic growth (discussed in Andersen & Babula, 2008; Greenaway et al., 2002; Kneller et al., 2008; Manni & Ibne Afzal, 2012; Parikh & Stirbu, 2004).
2. Food market access (discussed in Erokhin, Ivolga, & Heijman, 2014; Gonzalez, 2004; Krugman, 1990).
3. Employment in rural areas (discussed in Erokhin, Heijman, & Ivolga, 2014; Káposzta & Nagy, 2008; Tutwiler & Straub, 2005).
4. Poverty in rural areas (discussed in Dollar & Kraay, 2001; Hasan et al., 2003; Topalova, 2007; Winters et al., 2004).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

As it has been already stated, the effects are different for developed and developing countries. Kneller, Morgan and Kanchanahatakij (2008) believe a case-by-case approach to be more appropriate to the developing countries and economies in transition. They suggest that the "countries that were successful post-liberalization were those that were relatively successful pre-liberalization" (p. 716). In order to test their conclusion, the author studied cases of the five economies in transition of the Commonwealth of Independent States (CIS): Armenia, Kyrgyzstan, Moldova, Russia, and Ukraine. These countries are now the members of the WTO. The idea is to assess the pre-accession levels of the selected parameters and see if they have been changed by trade integration and liberalization (after accession to the WTO).

The following parameters are considered:

1. GDP by type of expenditure (agriculture, hunting, forestry, fishing). As most of the rural people in economies in transition make their living in agriculture (Tutwiler & Straub, 2005) and accompanying types of rural activities (hunting, fishing, etc.), the author considers this parameter as a distinctive characteristic of size of rural economy.
2. Agriculture value added per worker. It is a measure of agricultural productivity and effectiveness of rural labour. The parameter measures value added from forestry, hunting, and fishing as well as cultivation of crops and livestock production.
3. Import of food and agricultural products. Trade liberalization primarily means reduction of import barriers. Domestic production of basic agricultural commodities and food in many economies in transition fails to meet demand. Most of the economies in transition rely on agricultural imports, opening their domestic markets and leaving local agricultural producers vulnerable to global price fluctuations. Growing import competition presses small and medium rural households out of the domestic market, what aggravates existing problems of rural poverty, unemployment, outflow migration, and threats national food security.
4. Rural population, percentage of total. The indicator refers to people living in rural areas as defined by national statistical offices. It shows the "importance" of rural areas and rural way of life for the entire economy.
5. Agriculture labour force, percentage of the total labour force. Agriculture labour force refers to people aged 15 and older who are engaged in or seeking work in agriculture, hunting, fishing, and forestry.
6. Poverty level is the percentage of the population living on less than $5 a day.
7. Gini index. As Hasan, Quibria, and Kim (2003) emphasize income inequality as one of the restrictions to effective development of economies in transition, the author considers Gini Index, which measures the extent to which the distribution of income or consumption expenditure among individuals or households within a rural economy deviates from a perfectly equal distribution.

The above-explained parameters are presented for the period from 1995 until 2014; the year of the accession to the WTO for each country is highlighted. Table 1 includes parameters of agricultural production, trade in food and rural development for Armenia.

Armenia accessed the WTO in 2003, what makes the country a perfect model of an economy in transition, which experienced both pre-accession challenges and post-accession effects. The essential rise of GDP is observed after 2003 – by 73% during the post-accession decade (in comparison: 34% during the pre-accession decade). Agriculture value added per worker increased twofold, which means

that agricultural sector in Armenia moves towards production of high value added goods. Import of food and agricultural products, rather stable during 1995-2003, increased fourfold during the post-accession decade of 2003-2014.

However, regional disparities within Armenia increased along with the country's economic growth, which was largely driven by the rapid development of urban areas and degradation of rural regions. Although Armenia experienced a decline in its national poverty rate from 92.9% in 2003 to 84.5% in 2011, the poverty rate remains extremely high. Most of the people in rural areas still live under the poverty level. Low rural living standards serve as a "push" factor responsible for rural outmigration (both to Yerevan and abroad), particularly for young generations.

Along with the WTO, Armenia is going to entry to the Eurasian Economic Union, what requires essential adjustments of national rural development policies. The main goal is sustaining and improving competitiveness of agricultural sector in Armenia in the light of the customs union membership (Urutyan, Yeritsyan, & Mnatsakanyan, 2015, p. 57). Armenia is a mountainous country; most of its rural settlements in mountainous areas specialize in livestock breeding. In terms of trade liberalization, meat and dairy sectors have always been among the most suffered, even in the developed countries. That is why the policy has to be directed towards improved competitiveness of meat and dairy sectors of Armenia's economy, increased levels of production that will result in replacement of imports by locally produced goods and ensure incomes of rural people.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another CIS country, Kyrgyzstan, experiences the similar challenges in the sector of rural development. Livestock remains a major economic driver for many mountainous rural communities of this country. Among the CIS countries, Kyrgyzstan has the longest history of the WTO membership. Nevertheless, trade integration has not had an essential impact on the effectiveness of agricultural production and sustainability of rural development in Kyrgyzstan. Decennial GDP growth rates before and after WTO accession are rather similar (about 30%) (Table 2).

Until now, the only effect of trade integration and liberalization for Kyrgyzstan has been in increasing import supplies of food and agricultural products. There was a rapid rise in imports after 1999 – almost tenfold during the period of 1999-2014. Although the poverty rate has stabilized and decreased in recent years, the country is one of the poorest in the world. Rural population includes three quarters of the country's poor – 1.8 million people.

Poor rural people were particularly vulnerable to the effects of the economic transition from a command economy to a free market economy. As of the International Fund for Agricultural Development (2015), the transition severely disrupted agriculture and increased rural poverty in Kyrgyzstan. In rural development, Kyrgyzstan needs to enhance the productivity of domestic agriculture and improve animal health as a way of increasing rural incomes. Rural activities have to be diversified and re-oriented from local rural communities and internal consumption towards the market. In order to benefit from trade

integration, rural policies have to consider improvement of farming practices, expansion of access to agricultural inputs, and rehabilitation of rural infrastructure.

Contrary to Kyrgyzstan, Moldova performed rather well after its accession to the WTO in 2001. Although GDP has remained stable, agriculture value added per worker increased twofold during the period of 2001-2014 (Table 3).

Although the poverty rate has halved since 2001, it remains high (48.9 in 2012). Household income from agricultural activities has been decreasing over the years, down to 19.1% in 2010, from 28.4% in 2007 (Food and Agriculture Organization of the United Nations, 2012a). Poverty remains one of the main issues for the social and political sustainability of rural areas in Moldova.

Moldova's top priority on its way to trade integration was not rural development, but market access. The goal has been definitely achieved in imports: food and agricultural imports, driven by processed products, grew sixfold, resulting in a deterioration of the overall trade balance. Moldova's domestic food market has a significant potential. Although import substitution is not a goal for Moldova, development of domestic market would provide local producers with better opportunities. Moldova's food market is too narrow for major producers (primarily, wine and fruit producers), that is why the country

vitally needs to expand access to foreign markets. For this reason, Moldova joined the WTO in 2001. The country is currently negotiating the framework of a deep and comprehensive free trade agreement with the EU (DCFTA).

As of Gazuda (2013), trade integration processes, particularly integration of the economies in transition to the EU, require a new model of rural development, adapted to international standards. EU integration is a goal for such countries as Moldova and, most recently, Ukraine, but also a tool for development. The EU is Moldova's and Ukraine's main commercial partner and accounts for over 30% of their external trade. National governments of both countries consider closer economic integration through the DCFTA as a powerful stimulant to economic growth. According to Taras Kachka, former acting President of the American Chamber of Commerce in Ukraine, "DCFTA would help Ukraine by boosting competitiveness nationally and abroad; the adoption of EU standards will also help, due to gradual globalization of production standards" (Khomei, 2015, para. 2).

Ukraine joined the WTO in 2008, seven years after Moldova. Certain positive developments are observed: rise of GDP by 14%, agriculture value added per worker by 48% during 2008-2013, decrease of poverty level and Gini Index (Table 4). Noteworthy is that import of food and agricultural products after 2008 increased insignificantly (by 27%) in comparison to the pre-accession period (threefold increase during 2003-2008; twofold increase during 1999-2003). Trade integration itself has not caused essential rise of import inflows.

Ukraine has always been a net exporter of food and agricultural products. The leading export oriented crops are wheat, sunflower seeds, and rape. FAO's assessment in 2012 (before political and economic conflicts in Ukraine emerged) indicated that Ukraine as a food producer would be a critical player with the capacity to significantly ameliorate the global food crisis (Food and Agriculture Organization of the United Nations, 2012b). The Food and Agriculture Organization of the United Nations (2012b) also forecasted that development of agricultural sector in Ukraine could help to further reduce imports and increase rural incomes. Agricultural sector and food industry have served as the pillars of stability, as the only economic sectors, which continued to grow during the global economic crisis. Agriculture is likely to continue to lead Ukraine's economic recovery during turbulent years of political and economic transformation after 2014.

Yet, as of Khomei (2015), Ukrainian agriculture is constrained by a number of factors, including limited land availability; old infrastructure; insufficient financing; ineffective government development policies; low quality of production; complicated customs regulations, and weak control systems. To take advantage of the WTO membership and European integration, the Ukrainian government still needs to undertake significant institutional reforms to implement the WTO regulatory rules and experiences of the EU countries in ways that facilitate integration of domestic rural sector into the global market and provide benefits to rural people. Ukraine should work on the long-term rural development policy, which will give good possibilities to improve socio-economic situation in rural districts, to increase standard of living of rural people, and to enhance competitiveness of the rural economy (Moroz, 2010).

Currently, Ukraine's Ministry of Agrarian Policy and Food is working on a project titled "Comprehensive Strategy for the Development of Agriculture and Rural Lands for 2015-2020". The project seeks to boost the competitiveness of Ukrainian agriculture while sustaining ongoing development in rural areas through the adoption of European and international standards (Khomei, 2015). Domestic agricultural producers should be able to enter new markets, to become competitive in the EU market and be attractive to European consumers.

* Data are in constant USD (2005)

As of Josling (2011), agricultural trade policy instruments should never be used solely to promote national interests but must also take account of regional partners and agreements. To an increasing extent, governments are recognizing the potentials that regional integration holds for rural development and food security (Pannhausen & Untied, 2010). Regional integration creates larger sales markets and facilitates establishment of value chains within regions. Fluctuations in production volumes and export earnings are lower in regional markets than in national markets (Hoffken & Dill, 2013).

A supportive macroeconomic environment both at the national and international levels is a necessary condition for the development of the rural sector. However, the contemporary situation on the international agricultural market drives volatility and brings additional threats to sustainability of agricultural production and rural development in general (Trukhachev et al., 2015). Market reforms and structural policies in the economies in transition, which are expected to increase efficiency of agricultural producers, often fail.

According to Vos (2007), "The purpose of trade reform is to switch production away from non-tradables and inefficient import substitutes toward exportables in which countries have a comparative advantage" (p. 5). However, most of the economies in transition strongly protect their domestic food

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

markets and encourage import substitution, even in contrast to the theory of comparative advantage. The most striking instance of such an import substitution trend is Russia, which in 2014 banned imports of a variety of food and agricultural products from the EU, the USA, and several other Western countries.

Russia accessed the WTO in 2012, shortly before a chain of unfavorable events: deceleration of economic growth, falling oil prices, Russia-Ukraine crisis, Western sanctions in retaliation of the Crimea's situation, and depreciating national currency. Therefore, it is rather challenging to assess a pure effect of trade integration on domestic agricultural production, food market, and rural development. Significant changes are observed neither in GDP nor in agriculture value added (Table 5).

Current macroeconomic processes with involvement of Russia require new approaches to rural areas in order to ensure their economic, social and environmental sustainability. Russia's rural areas lag behind urban ones in terms of living standards and quality of life. Gaps in infrastructural development between rural and urban areas are continuing to grow. Number of rural settlements decreases because of huge migration outflow from rural areas to cities. Migration brings together related negatives: ageing of population in rural areas, lack of labour of high qualification, degradation of population, growing social tensions, abandonment of rural settlements and agricultural lands, lowering effectiveness of agricultural production, and growing environmental load because of outdated machineries and low culture of farming. In such conditions, rural areas in general and agricultural sector in particular are not able to drive economic growth, ensure import substitution and food security of Russia.

SOLUTIONS AND RECOMMENDATIONS

Ensurance of sustainable rural development in the contemporary conditions of growing globalization and liberalization of food markets is only possible on a basis of exploitation the opportunities that agricultural trade and advancing market integration offer. In order to benefit from those opportunities, it is essential to enable frameworks in place and a strategic orientation of agricultural and trade policies at national, regional and international level. An appropriate agricultural trade policy is a prerequisite for the promotion of agricultural production and trade, and can achieve leveraging effects for rural development and food security (Hoffken & Dill, 2013, p. 66).

Author studied cases of the five economies in transition, and discovered different effects of trade integration for rural development. Consequently, there are differences in emphasis regarding the objectives that can be influenced by agricultural trade policy instruments. Governments may rely on promotion of import substitution (Russia), export-oriented growth (Ukraine and Moldova), competitive production of high value added goods (Armenia), or saturation of domestic food market (Kyrgyzstan). Agricultural policies can reduce domestic price fluctuations and protect particularly vulnerable population groups in rural areas.

Analysis shows, that role of agriculture in terms of incomes and employment of rural population in the economies in transition is declining. In order to ensure sustainable rural development, it is necessary to promote diversification of the rural economy. Development of off-farm employment opportunities, including rural tourism, has to be supported by various governmental and international programs (Káposzta, Nagy, & Nagy, 2014). Integration of efforts and internationalization of technical and financial assistance to the rural sector are urgently required, especially since many economies in transition are increasingly unable to provide these services owing to budgetary, institutional and technical constraints.

Taking into account different objectives of the economies in transition in the sphere of agricultural and rural development, effects of certain agricultural trade policy instruments have to be carefully studied. Impacts from the instruments in different economic and market environments become apparent at different rates, with some having a direct effect on rural people and agricultural producers and others only becoming noticeable in the long term (Hoffken & Dill, 2013, p. 67). Agricultural trade policy interventions therefore have to be carefully analyzed and designed on a case-by-case basis.

FUTURE RESEARCH DIRECTIONS

Integration and liberalization processes influence trade in food and agricultural commodities in various ways. Consequently, targeted analysis, consideration and eventually influencing of trade integration on rural development are crucial accompanying measures for the successful promotion of sustainable agricultural value chains. Current study included a limited number of parameters of agricultural trade, production and rural development. In order to provide a complex assessment of influences of trade on rural development by means of market access, price or quantity regulations, state support measures, etc., a wider range of parameters have to be addressed (tariffs, quotas, taxes, volumes of support).

Another research direction is an examination of the optimum relationship between production and trade. Results of such a research, conducted on a case of each of the economies in transition, can help to

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

substantiate a need for either deeper integration to interregional and international markets, or protection or support of domestic food market. Analysis has to be conducted for each subsector or each agricultural commodity to determine positive and negative effects.

CONCLUSION

Economies in transition face many challenges as a result of trade liberalization that globalization and increased international integration bring. Some of the challenges are similar to those of the developed countries, while many of them are specific ones.

Since the very beginning of market reforms in the early 1990s, economic growth in the economies in transition has been closely correlated with export performance. Abundance of natural resources, including agricultural land, became a source of steady income in the new market environment, while output of high-value products reduced severely.

Heavily agricultural economies tend to grow less rapidly than more industrialized and more service-oriented ones. Market liberalization decreased substantially or eliminated subsidies, which agricultural sector received under the planned economy system. Higher relative market prices for inputs generated a severe drop in profitability of agricultural producers, which in turn reduced production and employment in agricultural sector.

The specific of the economies in transition is that most of the poor people live in rural areas. International trade has been one of the key driving forces behind much of the poverty reduction that has occurred over the years of transition in Russia, Ukraine, and Moldova. In Armenia, Moldova, and Ukraine integration to the global trade system (WTO accession) has caused increase of productivity in agricultural sector.

International trade enables efficient allocation of scarce resources through competition and realization of comparative advantages. Liberalization of international trade in food and agricultural commodities therefore promotes growth and generates income in agricultural sector and, respectively, in rural areas. Further, such a marked-oriented rural economy provides incentives for productivity and output increase, competitive production and value-added processing. Therefore, one of the outcomes of trade integration is a national food security – both in terms of larger domestic output of qualitative food products and greater availability of food owing to increasing purchasing power. Moreover, liberalized agricultural trade can mitigate the negative repercussions of national and regional production fluctuations by acting as a distribution instrument between areas of surplus and deficit.

KEY TERMS AND DEFINITIONS

Agricultural Production: An animal breeding and plant production by means of natural forces.

Rural Area: A geographic area of a country, that is located outside urban areas.

Rural Poverty: Poverty in rural areas, including factors of agricultural production, rural society, and rural economy.

Sustainable Development: A model of social development, which implementation satisfies all major vital requirements of current and every other generation under preservation of natural and environmental diversity.

Trade Integration: A unification of economic and trade policies between a group of countries through the reduction and/or abolition of tariff and non-tariff restrictions on trade.

Trade Liberalization: An elimination of tariff and nontariff barriers to the flow of agricultural commodities and food products between groups of countries.

Transition: A process of state transition, when radical transformation of entire social and economic systems occurs (transformation of property relations, social and economic institutes, management tools, and targets of economic development).

Chapter 56
Effective Urban Infrastructure Governance in Africa:
Resolving the Wealth–Poverty Paradox

Peter Elias
University of Lagos, Nigeria

Olatunji Babatola
University of Lagos, Nigeria

Ademola Omojola
University of Lagos, Nigeria

ABSTRACT

The main thrust of this chapter is to examine effective urban infrastructure governance in Africa: resolving the wealth-poverty paradox. The chapter is organized into five main sections according to the identified objectives with the introduction: infrastructure deficit and poverty nexus in urban Africa as section one. Section two is the background emphasizing Africa's poverty in wealth paradox. Section three focuses on urban revolution in Africa which is characterized by growing poverty instead of wealth and its implication for resolving infrastructure deficit. The nature of urban infrastructure demand and supply in Africa is the emphasis in section four while section five underlines the strategy for future infrastructure governance in Africa. Effective urban infrastructure governance in Africa is particularly challenging the strategies for dealing with the wealth-poverty nexus.

INTRODUCTION: INFRASTRUCTURE DEFICIT AND POVERTY NEXUS IN URBAN AFRICA

The world's population and economic opportunities are increasingly shifting to the cities. The number of city dwellers in developing countries is projected to continue to rise compared to their counterparts in developed countries (UN-Habitat, 2014, Cohen, 2006). Meanwhile, Africa's 2014 population with an average growth rate of two per cent was estimated at 1.069 billion, about 15 percent of world popu-

lation, extends over 30 million square kilometers (The World Bank, 2014). By 2030 more than half of this number will be living in urban centers. How is this urban population happening and what is the implications for urban infrastructure governance? Urban policies and programs in many developing countries have decentralized service delivery and income generation to lower tiers of governments. With the characteristic low capacities of governments to administer urban policies and programs, there is overwhelming gap between needs and delivery of basic infrastructure and services (Cohen, 2006; Elias and Ademola, 2015).

Another dimension to this is the hierarchical fragmentation of urban settlements creating incredible disparities in the functions, economic opportunities and choices, infrastructure and basic services, historic origins and patterns of growth and intensities of formal planning (Cohen, 2006). The obvious disparities between the more affluent and the relatively lower neighborhoods manifests in levels of access to basic services. In developing countries, the failure of the municipal authorities responsible for these critical sectors implies that many low income urban dwellers rely on other sources such as private vendors for basic services (Gandy, 2006). This poor urban governance is also an indication of the failure to effectively and efficiently implement master plans meant to guide infrastructure development and delivery of basic services. Thus, devising development policies is a daunting problem facing urban governance and planning in developing countries (Cohen, 2006).

Urban infrastructures are the necessary foundation for an economy. All industrial, agricultural and economic activities depend on infrastructures to develop (Knox and McCarthy, 2005). Urban infrastructures influence economic efficiency and productivity, public health and safety and prosperity and well-being of the society. According to Saxena (2001), urban infrastructures basically consists of the physical framework of facilities, utilities and support system which form the base for the provision of essential public goods and services. Urban infrastructures are many and diverse including power, education, housing, health, transport, communication, water, waste disposal and recreation. Generally, they provide the measures or indicators for assessing and comparing levels of prosperity and poverty within and between nations. The availability of urban infrastructures create opportunity and choices, generate income and wealth. On the other hand, infrastructure deficit limit opportunities and choices, create poverty and inequality and hold society back from development.

The main thrust of this chapter therefore is to examine effective urban infrastructure governance in Africa towards resolving the wealth-poverty paradox. The chapter is organized into five main sections. This section is the introduction and deals with infrastructure deficit and poverty nexus in urban Africa. The background of this chapter is in section two which emphasizes Africa's poverty in wealth paradox. Section three examines urban revolution in Africa which is characterized by growing poverty instead of wealth and its implication for resolving the infrastructure deficit. In section four, the nature of urban infrastructure demand and supply in Africa is analyzed while section five underlines the strategy for future infrastructure governance in Africa.

BACKGROUND: AFRICA'S POVERTY IN WEALTH PARADOX

Recent urban studies have attempted to explain the relationship between urbanization and urban growth with different characteristics and implications in the context of urban infrastructure governance (Potts, 2012; Muggah, 2012; Fox, 2011). These studies also enumerate some of the conditions that are limiting Africa's capacity for effective urban infrastructure governance. The works by Barrios, Bertinelli, & Strobl

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

(2006) and Annez, Buckley & Kalarickal (2010) linked African urbanization to geographical factors including location, low agricultural productivity and climate variability. According to their submission, it is not just the attractiveness of the cities that encourage migration but also the unfavorable conditions in the countryside for agriculture-related livelihoods. The abundance of natural resources does not only limit Africa to primary activities but also confines the continent to low investments, poor income and increasing poverty. Further, policy distortions in favor of city-based investment also account for the injustice and poverty in Africa despite the huge natural resources. These policies keep rural dwellers poor and make cities unduly attractive. Cohen (2006) listed some factors which make both the pull to the cities and the push away from the countryside irresistible. First, cities especially, the capital cities, where modern productive activities are concentrated offer vast opportunities and choices for social and economic development. Second, they have the highest indicators of health and well-being, social and cultural development. Finally, the high population densities which imply low per capita in cities encourage the provision of infrastructure and basic services.

The factors which influence the process and pattern of urbanizing Africa include demographic change, weak urban policies and institutions which together promote increasing densities, sprawling and large urban agglomerations (Elias and Omojola, 2015; Lwasa 2014). Similarly, Cohen (2006) in the context of developing countries, identified drivers of urbanization to include rural-urban transformations and reclassification of rural villages into small urban settlements. Likewise, globalization with its associated advances in transportation and telecommunication and a positive political climate has also caused unprecedented levels of urbanization, urban agglomerations and economic growth. Unfortunately, the economies of scale is leading to lopsided prosperity in an unjust world. This underlies the economic explanation for the pattern of urbanization as most of the world's largest businesses are found in cities (Cohen, 2006). African urbanization have also been triggered by uninsurable expected risks from agricultural losses (Poelhekke, 2011). In a related submission, Brückner (2012) indicated that a decrease in the share of agricultural value added during 1960–2007 leads to a significant increase in urbanization for a group of 41 African countries. Unfortunately, the concern is that urbanization which enhances poverty reduction in other regions has failed to produce similar results in the case of Africa (Arouri, Youssef, Nguyen-Viet and Soucat, 2014).

Presently, there are both high level optimism and pessimism about urbanization scales, trends, features and drivers in the region (Potts, 2012). According to the optimist, urbanization could benefit from economies of scale, accelerate provision of infrastructure and growth of industries, industries could benefit from concentration of suppliers and consumers with big and diverse labor market which ultimately create centers of innovation, commerce, and administration. According to Abbot (1996), the four facets (i.e. legitimacy, affordability, institutional capacity and use convenience) of urban infrastructure either as a technical or social service are under serious pressure in Africa. Many municipal governments in Africa faces the challenge of lacking the political will, fiscal resources and professional capacity to provide the rapidly growing urban populations with urban infrastructures and services (Elias et al, 2014).

The definitional and operational controversies associated with urban infrastructure governance have continued to attract tremendous concern (Gandy, 2006, Lockwood, 2005). Generally, effective urban governance is perceived as the solution to the massive failure of infrastructure and basic services. In a truly just and egalitarian society, effective urban governance will ensure social inclusiveness and cohesion as well as economic development and shared wealth (Abiodun, 1997, Olukoju, 2003, Rakodi, 2002). Indeed, Gandy (2006) observed that the general poor condition of human settlements are not just a crisis of legitimacy for urban governance in general but also engenders a fragmentary, refracted and truncated

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

political discourse. This may lead to the emergence of a self-service city where both the rich and poor neighborhoods attempt to provide their basic services.

No doubt, the connection among urban infrastructure, wealth and poverty is revealing. For rapidly urbanizing Africa, the challenge associated with the pace and scale is creating a burden for cities. These limit the capacity of the cities to provide public goods and services, impede the creation of wealth, and escalate poverty growth. Analysis of global poverty suggest that urbanization in Africa has failed to promote poverty reduction (Ravallion, Chen and Sangraula, 2007, White, Mberu, and Collinson, 2008). Mohamed, Youssef, Nguyen-Viet and Soucat (2014) suggest that sub-Saharan African countries have the highest levels of urban poverty in the world. For instance, 43% of urban dwellers in Africa live below the poverty line despite African cities generating about 55–60% of the continent's GDP. A closer look at the urban revolution will give more insights into the rapidly urbanizing Africa amidst growing poverty and the implication for infrastructure deficit.

URBAN REVOLUTION IN AFRICA: WEALTH-POVERTY PARADOX AND ITS IMPLICATIONS FOR RESOLVING INFRASTRUCTURE DEFICIT

There are tremendous differences in the level and pattern of urbanization with major urban revolutions occurring in developing countries especially in Africa and Asia. Table 1 shows urban populations, proportion urban and average annual rate of change by regions as reported by United Nations World Urbanization Prospects (2014). The figures show that the average annual rate of change for Africa (1.1%) and Asia (1.9%) have been generally higher accounting for the large absolute urban populations and rising proportion of people living in urban areas compared to very low average annual rate of change in Europe (0.3%), Latin America & the Caribbean (0.3%), Northern America (0.2%) and Oceania (0.0%) accounting for steady urban populations and proportion of urban dwellers. It is observed that rapid urban population growth is due to the fact that urbanization in Africa and Asia is recent and on-going while it has reached the stage of stability in the other regions.

Table 1. Urban Populations, proportion of urban and average annual rate of change by regions (000's)

Region	Urban Populations (000's)			Proportion Urban (%)			Average Annual Rate of Change
	1990	2014	2050	1990	2014	2050	2010-2015
World	2,285,031	3,880,128	6338611	43	54	66	0.9
Africa	196,923	455,345	1,338,566	31	40	56	1.1
Asia	1,036,247	2,064,211	3,313,424	32	48	64	1.5
Europe	505,991	545,382	581,113	70	73	82	0.3
Latin America & the Caribbean	313,876	495,857	673,631	71	80	86	0.3
Northern America	212,935	291,860	390,070	75	81	87	0.2
Oceania	19,059	27,473	41,807	71	71	74	0.0

(Data Source: World population prospects 2014)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2 shows the population size and ranking of urban agglomerations with more than five million inhabitants as of 1 July 2014 according to World Urbanization Prospects. There are marked differences within and between regions in terms of absolute populations, rankings and average annual rate of change. Generally, there is rapid and sustained urban growth in Africa and Asia with high average annual rate of change between 2.1- 4.2 and 0.6-4.6 respectively compared to Europe and Northern America with consistently slow pace of urbanization since the 1990s and very low average annual rate of change between 0.7-1.4 and 0.2-1.7 respectively. The global ranking of large urban agglomerations shows a steady rise of African and Asian cities compared to a drop in the ranking of cities of Europe and Northern America. Giving these urban agglomeration scenarios, the hope of African cities overturning urban infrastructure deficit and poverty is still daunting with resources presently stretched to unbearable limits.

Table 3 compares urbanization indicators in two selected countries for each of the six sub-regions of Africa. These countries have been selected based on expediency of data collection including availability/accessibility of data, historical antecedents of the sub-regions in the continent and their role in

Table 2. Population size and ranking of urban agglomerations by regions (Data Source: World population prospects 2014)

Region	Urban Agglomerations	Population (000's)			Rankings			Average Annual Rate of Change
		1990	2014	2030	1990	2014	2030	2010-2015

Table 3. Comparative urbanization indicators in selected African countries (2012)

Sub-African Regions	Countries	Population (millions)	Land Area (km^2)	Population Density (people/ km^2)	Urban Population (%)	Growth Rate (%)
West Africa	Ghana	25.4	238.5	111	53	2.4
	Nigeria	168.8	923.8	185	50	2.5
East Africa	Kenya	43.2	580.4	76	24	2.6
	Tanzania	47.8	947.3	54	27	0.7
Central Africa	Angola	20.8	1,246.7	17	60	2.9
	DRC	65.7	2,344.9	29	35	2.8
North Africa	Egypt	80.7	1,001.5	81	44	1.8
	Tunisia	10.8	163.6	69	67	1.1
Southern Africa	South Africa	52.3	1,219.1	43	62	1.0
	Zimbabwe	13.7	390.8	35	39	0.0
Africa	Sub-Saharan	911.5	24,262.3	39	37	
World		7.04 billion	134,289.9	54	53	

(Data Source: World Development Indicators, 2014)

the economic prosperity of their sub-regions. These countries are Ghana and Nigeria in West Africa, Kenya and Tanzania in East Africa, Angola and DRC in Central Africa and South Africa and Zimbabwe in Southern Africa. The urban indicators depict that the top countries are Nigeria, West Africa, which has the highest total population followed by Egypt in North Africa among the 12 selected countries. The country with the least population is Tunisia, North Africa. Again, more than 60 percent of the selected countries have population densities higher than the sub-Sahara Africa's and the world's average of 39 and 54 persons/km^2 respectively with Nigeria (111 persons /km^2) topping the selected countries with the highest densities while the country with the least population density is Angola, Central Africa (17 persons /km^2). The pattern of population densities could help these countries to benefit from large economies of agglomeration in the provision of basic infrastructure and services whose costs are reported to be twice as much as that required in other developing cities (Dorosh et al, 2008). The proportion of urban population also shows that three countries (Tunisia, Angola and South Africa) are higher than the world average with Tunisia, North Africa recording the highest. Large urban growth and populations are stretching infrastructure service providers. Some studies have shown evidence of declining urban service delivery and the growth of cheap and low-quality self-serviced piped water, stand posts, improved latrines or flush toilets (Banerjee et al, 2008; Morella et al, 2008).

The infrastructure deficit is because the population tends to outgrow the availability of electricity, energy, water supply, sanitation and other infrastructures. African continent also has one of the least records of access to basic infrastructure. Indeed, in comparison with other developing regions, Africa presently has the capacity to supply only a fraction of the infrastructure demand (Eberhard et al, 2008). In the same perspective, Yepes, Pierce, and Foster (2008) presented in Table 4, Africa's infrastructure needs compared to other low-income countries which shows that all measures of Africa's infrastructure fall below other low-income regions. The gaps will continue to widen even with African countries' efforts to expand them as a result of rapid urban populations and percentage of persons living in the cities.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Africa's infrastructure deficit

Normalized Units	Sub-Saharan Africa Low-Income Countries	Other Low-Income Countries
Paved road density (km per 100 square kilometer of arable land)	31	134
Total road density (km per 100 square kilometer of arable land)	137	211
Mainline density (lines per thousand population)	10	78
Mobile density (lines per thousand population)	55	76
Internet density (lines per thousand population)	2	3
Generation capacity (megawatts per million population)	37	326
Electricity coverage (percentage of population)	16	41
Improved water (percentage of population)	60	72
Improved sanitation (percentage of population)	34	51

(Data Source: Yepes, Pierce, and Foster, 2008)

In like manner, the price of delivering Africa's infrastructure is generally higher in addition to its low coverage. The immediate explanation for Africa's higher costs of infrastructure delivery is in fact the genuinely higher costs of execution, policies and even high profits (Cohen, 2006). As shown in Table 5 Africa's infrastructure tariffs whether it is for power, water or telephone double that of other regions (Briceño-Garmendia, Smits, and Foster, 2008).

The analysis of overall infrastructure spending needs also indicate that total expenditure including capital expenditure and operation and maintenance will require USD 93.3 billion annually (Table 6). Further analysis shows that the power sector and operation and maintenance will cost about half of the total expenditure and capital expenditure respectively.

To address Africa's infrastructure deficit there is need to properly handle efficiency gap and funding gap by putting in place appropriate policies, strengthening institutions against bottlenecks and promoting financial probity. Briceño-Garmendia, Smits, and Foster (2008) argued that by addressing excess expenditure of 3.3 billion annually particularly in ICT which the private sector can deliver will correct the efficiency gap (Table 7). Proper needs assessment and prioritization of programs and projects will encourage gain from eliminating operational inefficiencies, gain from cost recovery and the potential for reallocation of spending.

Table 5. Africa's high cost infrastructure

Infrastructure Sector	Sub-Saharan Africa	Other Developing Regions
Power tariffs ($ per kilowatt-hour)	0.02-0.46	0.05-0.10
Water ($ per cubic meter)	0.86-6.56	0.03-0.60
Road freight tariffs ($ per ton kilometer)	0.04-0.14	0.01-0.04
Mobile telephony ($ per basket per month)	2.60-21.00	9.90
International telephony ($ per 3-minute call to the United States)	0.44-12.50	2.00
Internet dial-up service	6.70-148.00	11.00

(Data Source: Briceño-Garmendia, Smits, and Foster, 2008)

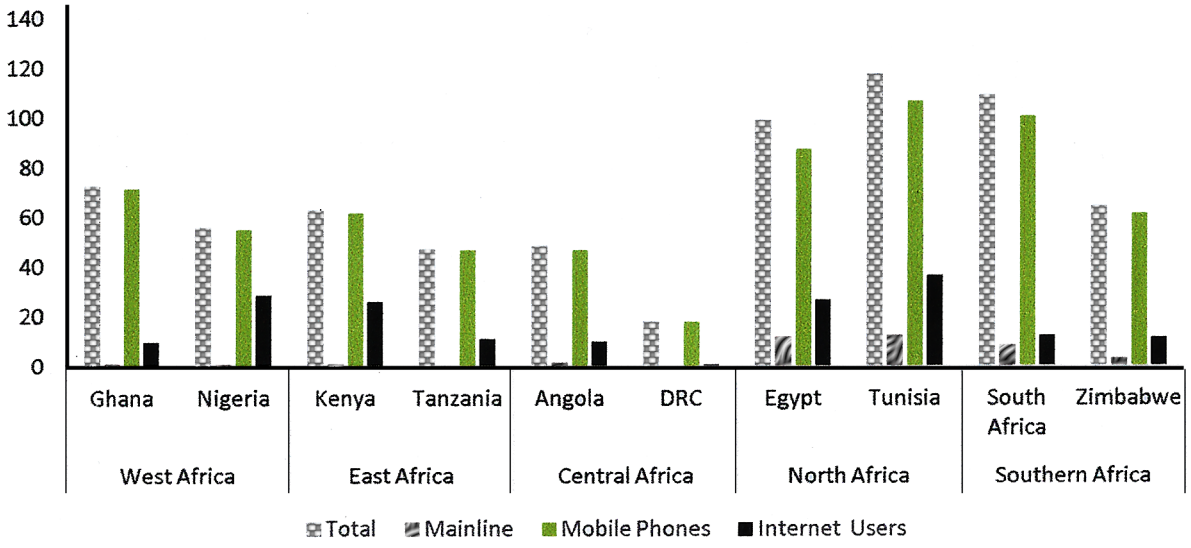
There is also high variation in energy sources within the African region. Table 8 describes the pattern of energy supply in selected African countries which shows that half of the selected countries are on less than 10 billion kWh while South Africa and Egypt record appreciable amount. As many as eight of the selected countries depend on hydroelectric power as source of energy, Tanzania, South Africa and Zimbabwe also utilize coal for energy, Nigeria, Tanzania, Egypt and Tunisia in addition utilize natural gas, South Africa uses nuclear while all the selected countries except South Africa also use oil.

In like manner, with regards to ICT, Africa is staying closer to developments elsewhere in the world. The percentage of Africa's population living within the range of a GSM signal rose dramatically from 5 percent in 1999 to 57 percent in 2006 (Minges et al, 2008). The analysis of telephone subscribers in the selected countries are presented in Figure 1. Generally, total telephone subscription per 100 people appear to be commendable but the breakdown reveals that there are variations among the available ICT facilities in the selected countries.

Again, total expenditure on fixed broadband internet subscription in relation to GDP per capita is presented in Table 9 depicting the mean and standard deviation of the monthly expenditure on fixed



EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 8. Energy sources in selected countries in Africa

Sub-African Regions	Countries	Total (billion/ kwh)	HEP % of Total	Coal % of Total	Natural gas % of Total	Nuclear % of Total	Oil % of Total	GDP/Capita

	Zimbabwe	7.9	53.3	46.4	0.0	0.0	0.3	321

(Data Source: World Development Indicators, 2014)

Figure 1. Telephone subscription in selected African countries, 2010

broadband internet subscription for the selected countries. Further analysis depicts a very low negative correlation between monthly expenditure on fixed broadband internet subscription and GDP per capita.

A multi-correlation matrix between transport infrastructure and GDP was computed and presented in Table 10. The summary shows that there is a positive correlation between all the selected transport infrastructures with GDP per capita albeit in different degrees. The analysis shows that rail (0.71), commercial vehicle (0.761) and passenger vehicle (0.647) correlated very highly with GDP per capita while road network and road density have low correlation with GDP per capita.

Commercial vehicle	0.761	0.415	0.643	0.643	1	
Passenger vehicle	0.647	0.423	0.577	0.709	0.975	1

(Source: Computed with data from WDI, 2014)

Furthermore, the analysis of energy consumption and GDP per capita is presented in Table 11 showing the mean value and the standard deviation for the selected countries in Africa. Six of the countries have energy consumption below the average for the selected countries while four countries only have GDP per capita above the mean value. In addition, the standard deviation of the energy consumption and GDP per capita is large while there is high positive correlation between energy consumption and GDP per capita for the selected countries in Africa.

Indeed, infrastructure deficit has been found to contribute to Africa's underdevelopment and downscaling of economic growth by 2% a year (ADB, 2009). The amount of investment in infrastructures is short of the total requirements. For example, according to the report of Africa Development Bank (2009), Africa will require infrastructure investments of about fifteen percent of GDP, or around US$93 billion a year to achieve the 7% annual growth requirement for MDGs by 2015. Indeed, the report indicates that over thirty-seven percent of GDP would be required in poorer regions. In Sub-Saharan Africa, the

(Source: Computed with data from WDI, 2014)

government spends around US$9.4 billion out of a total of US$24.9 billion. These efforts of government aside being inadequate in the context of the expanding populations are taking place within weak policies and institutions and paltry budgetary provisions for infrastructure. Recent global crisis including fluctuating global prices and unstable incomes for African nations are further exacerbating the situations which calls for proactive approach for sustainability. Thus, in terms of Gross National Income per capita most African nations lies between 1000-4000 USD compared to more than 10,000-25000USD for other development regions (Smith, 2012). The percentage of urban population living on less than 2USD per day is between 51-75% and higher while in terms of inequality index many African countries are the most unequal (Smith, 2012).

THE NATURE OF URBAN INFRASTRUCTURE DEMAND AND SUPPLY IN AFRICA

There are Africa-wide and national efforts to bridge the infrastructure gap in Africa. Different bodies have taken the initiatives to set up programs and projects towards infrastructural development for poverty reduction. This section reviews various policies and programs of different governments on urban infrastructure delivery in Africa. The African Union Commission (AUC) with the support of the NEPAD Secretariat and the African Development Bank submitted a request to the NEPAD Infrastructure Project Preparation Facility (IPPF) in July 2009 for financial support towards the cost of undertaking the Sector Studies for the Program for Infrastructure Development in Africa (PIDA). The request is for a grant amount of USD 2 million to the African Union Commission (AUC), to co-finance the PIDA sector studies and fill the financing gap in the study cost estimates. The PIDA comes out of the merging and restructuring of AUC and NEPAD Secretariat led ongoing regional and continental infrastructure

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

study initiatives – (AUC - Continental Master Plans and Policies Initiative and ii) the NEPAD-Medium to Long Term Strategic Frame Work Study) into one (African Development Bank, 2009).

The Program for Infrastructure Development in Africa (PIDA), a Multi sector program covering four sectors including Transport, Energy, Trans-boundary water and ICT is dedicated to facilitating Africa-wide integration in Africa through improved regional infrastructure and is designed to support implementation of the African Union Abuja Treaty and the creation of the African Economic Community. The overall goal of PIDA is to promote socio-economic development and poverty reduction in Africa through improved access to integrated regional and Africa-wide infrastructure networks and services. It is hoped that implementing it will transform the way business is done and help deliver a well-connected and prosperous Africa.

According to African Development Bank (2009), PIDA offers a platform for fast tracking socio economic development and integration in Africa through collective approach for infrastructure delivery by leveraging the gains of economics of scale. The PIDA project is aimed specifically at:

1. Evolving a strategy and sustainable development pathways and decisions which cover all critical infrastructures by 2030;
2. Providing a holistic and common platform for infrastructure development in Africa;
3. Rationalizing a plethora of different initiatives;
4. Helping to harmonize public, private and development partners intervention in Africa-wide and regional infrastructure, and
5. Promoting private sector participation in regional approach to infrastructure provision.

Energy Infrastructure Demand and Supply in Africa

Ghana

Ghana is making tremendous progress in infrastructure provision especially with regards to energy and transport. According to BMI (2015a) Nigeria's Sahara Group is to construct a 2,000MW thermal power plant in Ghana to enhance the generation capacity of the country. This project will involve Volta River Authority who is to build the plant. The Volta River Authority (VRA) plans to invest USD4.5bn to add 2,500MW of electricity generation capacity over the next decade through the development of 16 projects, including thermal plants and renewable energy facilities. Meanwhile, there are promising programs on renewable energy in response to the 2011 Renewable Energy Act. There is also an ambitious Nzema 155MW solar PV power plant which is being handled by Blue Energy (BMI, 2015a). According to the same report, construction on the USD400mn project was also due to start in 2013 and will be completed in October 2015. In addition, Ghana also plans to build a 360MW combined-cycle thermal power plant at Inchaban in Shama District and another 200MW combined-cycle thermal power plant in Prampram in 2015. There is the public-private partnership power plant Jacobson Jelco Ghana, which will run on natural gas and light crude oil, will be built on a 45-acre site.

Kenya

The Kenyan government is pushing for a very aggressive energy development plan. It hinges its power sector on the independent power project (IPPs) which will be guaranteed by the World Bank's Mul-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tilateral Investment Guarantee Agency (MIGA) (BMI, 2015b). According to the report, Kenya needs USD5.5bn to step up its electricity generation to 5,000MW, from its current 1,700MW installed capacity, by 2017. Kenya also plans to actively develop renewable energy potential, and is set to finance half of an ambitious USD1.2bn plan aimed at providing half of the country's electricity needs by 2016 using solar energy (BMI, 2015b).

Nigeria

The Nigeria government has put in place the National Integrated Infrastructure Masterplan (NIIMP) which spans 30-years and attempts to better guide the development of infrastructure. The plan involves an NGN464trn masterplan. As at today, the country's electricity production stands at 4000MW while the actual distribution is much less (Buhari, 2015). The Nigerian government under the immediate past administration launched the National Integrated Power Project (NIPP) as a core component of Nigeria's reform of the power sector. The reform includes the unbundling of state-owned Power Holding Company of Nigeria (PHCN), constructing a new 700 kilovolt (kV) national transmission grid by 2014 and allowing private sector participation in the form of independent power producers (IPPs) and the privatization of Nigeria's power sector to yield USD10bn of investment annually (BMI, 2015c). According to the Business Monitor International (2015c) already, the Transcorp Consortium, including Transcorp, Wood Rock, Symbion Power LLC, Medea Development, PSL Engineering and Thomassen Holding, which bid USD300mn for Ughelli Power gas-fired plant have announced their investment plans. In addition, Business Monitor International reports that the Nigerian government signed an agreement with Strancton to build a 1,000MW gas-fired power plant in Katsina State, Nigeria, on December 1 2014. The project, which will be developed in collaboration with the Katsina State Government, is estimated to cost USD1bn (BMI, 2015c). The government also launched the construction of the 450MW Azura-Edo IPP, an USD1bn gas-fired facility on the outskirts of Benin City. As at the moment, the IPP has received USD220mn of equity and USD530mn of debt from a consortium of local and international investors, as well as USD300mn from Nigeria's Seplat Petroleum Development Corporation (BMI, 2015c).

On renewable energy, the Federal Government of Nigeria has signed a memorandum of understanding (MoU) with three firms namely, Solius NGPC, Peoples Home Association and Solar Force Nigeria to add 1,700MW of solar capacity to the national grid (BMI, 2015c). The report indicates that Solius plans to add 1,000MW of solar capacity, starting with a 100MW plant at any site recommended by the power ministry, Peoples Home Association will build five solar parks at different locations with capacity of 100MW each and Solar Force plans to install 1MW solar systems in 200 villages across six states and will be self-funded by the companies (BMI, 2015c). In addition, the US conglomerate General Electric (GE) has signed an agreement with the Nigerian government to invest USD350mn into Nigeria's power sector for providing 100% renewable energy to electricity consumers (BMI, 2015c). In the same vein, Dangote Group sealed a financial agreement with 12 banks for a USD3.3billion loan to build a greenfield refinery and petrochemicals complex in Olokola, in the south of Nigeria (BMI, 2015c).

South Africa

South Africa remains the country with the best infrastructure in Africa by moderately large margin - for example the country has nearly 21,000km of rail lines which accounts for 80% of the total network on the continent (BMI, 2015d). According to BMI report, South Africa budgets 8% which is targeted towards

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Transport, Energy and Communications investment, while 15% will go towards government housing and local amenities in the 2014/15 financial year. Earlier, it plans to raise spending on social infrastructure - which includes health, education and community facilities – from USD2.8bn in 2012/2013 financial year to USD4bn in 2016/2017 financial year (BMI, 2015d). The large Medupi and Kusile coal power plants will continue to support forecasts from 2015 to 2019, with the first units expected to come online in 2014 and 2015 respectively and around 800MW added in eight-to-nine month instalments over the coming years (BMI, 2015d). The BMI report indicates that the real opportunity for investors comes in the form of the planned expansion of the Independent Power Producer (IPP) Procurement Program, which has so far focused on the renewable sector under the REIPPP, to include the procurement of 2,500MW of coal projects and 800MW of cogeneration. There are a number of thermal IPPs in Infrastructure Key Projects Database, such as the USD1.7bn Grootegeluk coal fired power plant in Lephalale and a planned USD900mn facility in Coega (BMI, 2015d). According to the report, South Africa is considering adding up to 9600MW of nuclear capacity to its power mix by 2030.

Zimbabwe

The Business Monitor International reports that the Zimbabwe Power Company (ZPC) seeks to produce more than 9,000GWh of power in 2015.The projected output is 9,799.06GWh, up from the target of 9,766.39GWh in 2014 (BMI, 2015e). Zimbabwe's government has started implementing projects, including the expansion of the Kariba and Hwange power plants to meet demand. Additional units to be built at Kariba and Hwange will add another 900MW to the grid (BMI, 2015e). The report indicates that ZPC is expected to complete the construction of a 120MW emergency/peaking power plant which is estimated at about USD1.2bn in Mutare, Zimbabwe, by 2018. The gas and diesel power plant is one of the planned priority projects under the Zimbabwe Agenda for Sustainable Socio-Economic Transformation 2014/2018 financial year. There is also a plan by a Zimbabwean to build a second petroleum pipeline carrying nearly 500mn liters of fuel a month from Savanna, north of Beira in Mozambique, to Zimbabwe has been rejected by Mozambique, according to government officials. In addition, ZPC seeks to produce more than 9,000GWh of power in 2015.The projected output is 9,799.06GWh, up from the target of 9,766.39GWh in 2014 (BMI, 2015e). Further data from BMI indicates that in June 2014, China's Sino Hydro won a USD1.3bn contract to add 600MW at the coal-fired Hwange power station in Zimbabwe, after another Chinese firm was unsuccessful in starting the project. Zimbabwe, currently operates at 63% of its 900MW installed capacity. The Zimbabwe Power Company (ZPC) is expected to complete the construction of a 120MW emergency/ peaking power plant which is estimated at about USD1.2bn.in Mutare, Zimbabwe, by 2018 (BMI, 2015e).

Transport Infrastructure Demand and Supply in Africa

Ghana

According to BMI report, Ghana's transport network also requires sizeable investment, especially to support the national economy with emphasis in improving connectivity, upgrading existing road network, and adding new transport capacity (BMI, 2015a). The report indicates that there are major upgrades of the rail network with a contract to rebuild the 330km eastern railway corridor, under Ghana's Railway Master Plan, which will be awarded by the end of 2015. Presently, China Communications Construction

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Company has established a USD3bn credit line in 2012 which it is to be put towards roads, railways and ports in Ghana. The government is also looking to PPPs to attract international investors into infrastructure which includes the exciting transport PPP projects of Tamale Airport. The government of Ghana has approved USD100mn in April 2013 and construction services will be provided by Brazil's Queiroz Galvao with financial support from Brazil's ExIm Bank and development bank BNDES (BMI, 2015a).

Kenya

An East African Community's (EAC's) Corridor Diagnostic Study, the Northern Corridor, which is anchored by Mombasa as reported in the BMI report, is estimated to need USD2.1bn in investment, while the Central Corridor will need USD2.0bn. In addition, the report notes that overall, the region needs USD20bn to bring the region's transport infrastructure up to standard to support unlimited economic growth (BMI, 2015b). Expenditure on transport in the EAC countries accounts for 45% of the total cost of goods and this is 30% higher than in Southern Africa, making commodities produced in the region uncompetitive (BMI, 2015b). Similarly, construction of the 158km regional road that will run from Arusha in Tanzania to Voi in Kenya - a key trading artery - will start in November 2014, according to Tanzania's Ministry of East African Cooperation. The project has been boosted by the AfDB approved loans in 2015 worth a total of about USD230mn, out of which Tanzania will receive USD120mn and Kenya USD113.12mn (BMI, 2015b).

Nigeria

There continues to be progress with implementing public-private partnerships (PPPs) across the transport sector, which will help to leverage more private capital into projects. There are a number of strategies including the proposed National Transport Commission Bill (2014), the Nigerian Railway Bill (2014), The Nigerian Ports and Harbor Authority Bill (2014) and the National Inland Waterways Authority Bill (2014) which should energize the sector. It is Nigeria's government's priority to connect it burgeoning cities with each and the rest of West Africa and as a result in January 2014, the heads of state and government of the Economic Community of West African States (ECOWAS) approved a USD50mn funding for the feasibility study and design of the six-lane dual carriageway leading from Lagos to Abidjan and, in the future, from Abidjan to Dakar (BMI, 2015c). Nigeria government hope to drive this initiative through well-articulated partnership strategy with the private sector. It hopes to receive international assistance from the World Bank through its public private partnership program up to the USD1bn by 2017 (BMI, 2015c).

Some of the modest accomplishments in transportation include the CCECC- Costain West Africa shared upgrade of the Lagos-Kano, and the completion of track laying of the 186.5km final section of the Abuja-Kaduna standard-gauge railway line which cost USD850mn (BMI, 2015c). Also, Turkish contracting and engineering firm Eser has completed the 243km Port Harcourt-Enugu rail line in Nigeria to Nigerian Railway Corporation. Lagos's 35km light rail network being designed and developed by China Civil Engineering Construction Company (CCECC has seven proposed lines in the network: Red, Blue, Green, Yellow, Purple, Brown and Orange. The light rail network has seen progress thanks to the appointment of the Infrastructure Bank Plc as the fund manager for the NGN25bn project since June 2013. Also, Lagos has been issuing bonds to raise capital for the project, which should help see the project at least partly realized. The first two lines of the urban rail project are estimated to cost USD1.4bn.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Meanwhile, in July 2014, the Federal Executive Council (FEC) of Nigeria approved a NGN1.3bn (USD8mn) contract for feasibility studies on six standard gauge rail corridors across the country. The six standard gauge routes are:

1. Kano-Dayi-Katsina-Jibiya
2. Ilela-Sokoto-Jega-Yauti-Makera
3. Aba-Ikot Ekpene-Ibiono-Itu (including a spur line to Uyo)-Odupkani-Calabar
4. Kano-Nguru-Gashua-Damaturu/Gamborun-Ngala
5. Calabar-Ikom-Obudu-Ogoja-Katsina Ala-Wukari-Jalingo-Yola-Maiduguri
6. PortHarcourt-Aba-Umuahia-Enugu-Makurdi-Lafia-Jos-Bauchi-Gombe-Biu-Maiduguri

The selection of these routes will connect population centers, airports and areas of industrial and agricultural activity.

Egypt

Egypt has 5,083km of railways and, according to information made available by the government's portal, the railways have a capacity to handle an estimated 4.5mn tons/km (BMI, 2015f). According to the report, in June 2010, the Egyptian Railway Authority (ERA) announced an EGP40bn (USD7.04bn) 10-year plan to develop the railway infrastructure in the country, with a focus on the Nile Delta region. Projects under this framework include the high-speed railway link between Alexandria and Cairo, and a 77km railway between Cairo and Tenth of Ramadan City (BMI, 2015f). Egypt has been the beneficiary of a significant amount of aid including the Gulf Cooperation Council (GCC) funding since the 2011 revolution. The country has received more than USD5bn in loans and grants for transport infrastructure (BMI, 2015d) (BMI, 2015f). The BMI report also shows that already to boost her transport infrastructure the Egyptian government has awarded two contracts for Suez Canal expansion worth USD8.5bn (BMI, 2015f).

South Africa

The BMI report shows that in 2011, the South African government announced that it intends to spend USD16bn on the development of the country's transport infrastructure by 2016. The funds will be invested primarily in new rail lines, rail vehicles and port capacity which include expansion plans for the period include the purchase of 2,500 South African-made rail vehicles and boosting the handling capacity at Durban port to 1.6bn twenty-foot equivalent units (TEUs), the spending of USD4.81bn on commuter rail infrastructure and new rolling stock for South Africa's transport infrastructure over the next three years. Also, Transnet and Swazi Rail signed an agreement in January 2012 to build a USD2bn railway between South Africa's coal-rich Mpumalanga province and western Swaziland. There is another USD231mn project to upgrade an existing railway running between the manganese-rich Northern Cape Province to the port of Ngqura, in the Eastern Cape, which started in 2013.

There is construction of roads in the province of Gauteng, one of the main economic regions of South Africa, worth USD2.74bn by 2016, the agreement between the Chinese Development Bank and the South African government to provide about USD5bn in open-ended financial assistance to South African state-owned freight logistics operator Transnet, the Tambo Springs Inland Port and Logistics Gateway scheduled to become operational in 2017, and the 1,037-hectare multimodal freight gateway

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

being developed by Tambo Springs Development Company and the government. The BMI report also noted that Johannesburg has approved a USD3.2bn infrastructure for the cities 'Freedom corridors', which is a mass transport system made of affordable buses and rail services.

Zimbabwe

The 2015 report of the Business Monitor International observed that Road Motor Services, a subsidiary of National Railways of Zimbabwe, has initiated work in order to prepare for construction at the Walvis Bay dry port in Namibia. The government of Namibia provided 19,000sq m of land to the Zimbabwean government to build its own dry port to boost trade. Similarly, in July 2014, the Development Bank of Southern Africa offered a loan worth USD460mn to the National Railways of Zimbabwe (NRZ) to rehabilitate its infrastructure which requires more than USD2bn after 10 years of decay (BMI, 2015e).

STRATEGIES FOR FUTURE URBAN INFRASTRUCTURE GOVERNANCE

1. **Transform from Primary to Secondary Production**: Africa is blessed with abundant natural resources but lacks the basic infrastructures to take a large number of the populace out of poverty. Africa lacks what it takes to be able to add value to natural resources through competitive investments, income expansion and employment generation. By insisting on adding values to natural resources for local markets and exports will widen the horizon for opportunities and choices which trickles down among the populace. It is the failure to move Africa from a primary to secondary production that presently peg the continent among the world's poorest and under-developed regions.
2. **Transform Fiscal Policy**: The economies of large African nations are dominated by informal sector activities. The process and pattern of the activities of these informal sectors are difficult to capture and calculate for proper taxation. This makes it difficult to include these large segments of the economy presently being estimated at close to 70 percent into the tax net. This ultimately limits the prospects of growing infrastructures that are highly capital intensive. African nations should engage devise means to resolve this debacle.
3. **Eradicate Corruption**: The continent is also plagued with corrupt government officials, insecurity, serious human rights violations, failed central planning, high level of illiteracy and low capital base. These factors are the underlying reasons for the acute shortage of basic infrastructure and services creating cyclic poverty. Corruption must be proscribed and criminals prosecuted without sentiments and political considerations.
4. **Improve Human Capital Development**: According to United Nations' Human Development report in 2003, the bottom 25 ranked nations (151st to 175th) were all African. Therefore, there must be concerted efforts to progressively raise education levels of the citizens across age and gender. Africans must be able to compete favorably in all areas including knowledge and skill to be able to improve in the human development ranking.
5. **Sustain Economic Growth**: Africa's economic growth rate increased averaging 5% in 2005 but this has failed to address unemployment, reduce poverty and develop infrastructures. Global GDP at purchasing power parity rankings (Table 12) has positioned African nations among the first 20. Indeed, African nations including Kenya and Nigeria are already listed among the fastest growing economies in the world. Africa should leverage this economic explosion to expand its infrastruc-

29	South Africa	South Africa (31)	South Africa (27)

(Source: IMF WEO database (October 2014) for 2014 estimates, PwC projections for 2030 and 2050)

tures. Some of the critical factors to be considered in order to sustain this growth include: size of the economy, economic performance, resilience and disparities, labor force, regulations and governance, and market size.

6. **Deploy Strong Policy of Rural Development and Adaptation to Climate Change:** The proportion of Africans involved in agricultural activities is still high. The process and pattern of agricultural activities are presently characterized by low productivity, weak market structure and seasonal incomes. Besides, agricultural activities are climate-sensitive. These explain the high rate of rural-urban migration. It also excludes many citizens from the opportunities for improved livelihoods in non-agricultural activities. Also, the lack of adequate social and economic infrastructure in African rural communities seriously hinders short- and medium-term poverty reduction (TMSA, 2012). Efforts should be channeled towards turning these gaps into opportunities with so much natural resources in Africa. This requires appropriate adaptation techniques at the local level including reskilling of the agricultural population and production mechanisms to adopt high-yielding crops, disease-resistant species, improved farming methods and flexible skills. Similarly, the provision

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of infrastructures and establishments of markets to link farmers and buyers will be desirable at the regional or national levels.

7. **Use Best Practices of Urban Infrastructure Maintenance:** In like manner, with the rising urban populations in African cities, the available infrastructure that are hardly adequate are being stretched beyond limits and coupled with the poor maintenance culture, there is growing number of dilapidated, deteriorating and unserviceable infrastructures and facilities. Use of sustainable system of urban infrastructure maintenance will not only enhance their lifespan but also avoid wastes associated with unnecessary replacement costs.
8. **Mobilise for Urban Infrastructure Governance:** The need for sustainable mobilization of resources for infrastructure development, operation and maintenance at least costs cannot be overemphasized. This is to overturn the challenge of urban governance for infrastructure in Africa and reduce urban poverty and inequality. This will entail:
    a. Identification of private, public and international sources of funding and collaborations.
    b. Preparation to satisfy the requirements for accessing these resources and collaborations.
    c. Establishment of institutions for managing these resources and collaborations.
    d. Recruitment of urban infrastructure governance champions.
    e. Promotion of the rule of law and good governance.
    f. Management of resources/collaborations using international best practices.
    g. Proper evaluation, monitoring and review of urban infrastructure.
9. **Evolve Sustainable Urban Policy**: The unsustainable fragmentation of urban areas should also be interrogated for effective urban infrastructure governance. Classifying and designating settlements as urban based on sentiments and political considerations will create cities of burdens for the African continent. Urban centers should be allowed to evolve naturally rather than by legislations to avoid creating dysfunctional urban settlements bereft of creativity, productivity and resilience. For example, a report of African Development Bank in 2009 observed that many cities of African continent are small, with populations fewer than 20 million and economies of less than $10 billion. This has implications for effective urban infrastructure development, operations and maintenance.

CONCLUSION

The process and pattern of urban revolution, the paradox of poverty amidst wealth and urban infrastructure gap are revealing on low productivity, cyclic poverty and large inequality in Africa. The manner of African urbanization, proliferation of slums, rising crime rates, unemployment, and exert pressure on available infrastructure including transport and energy which is critical for industrialization. In most African countries, particularly the lower-income countries, infrastructure emerges as a major constraint on doing business and is found to depress firms' productivity by around 40 percent (Escribano et al, 2008). African Development Bank (2009) in terms of PIDA noted that improved infrastructure would facilitate domestic and international trade, reduce the cost of doing business and enhance Africa's competitiveness both as an exporter and a destination for investors. In this regards, governance in Africa should emphasize infrastructure delivery based on justice, inclusiveness and accountability. This will build public trust and confidence thereby promoting legitimacy and democracy in the African institutions and municipal governments.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The abundance of natural resources in Africa with high prospects for wealth generation makes the current state of poverty inexcusable. By sustainably harnessing these resources and adding values to them will make African continent enhance the living conditions of the populace. Africa's relatively rapid average annual rate of change which account for rising urban revolution and proportion of persons living in the cities in comparison to other regions calls for concern. While, it may be agreed that the urban revolution in Africa is indeed young yet it is necessary to learn from other regions who have attained stability within a short period of urbanization. This will help to urgently address the rising poverty in the midst of wealth associated with failure of service provision to match urban agglomerations. Africa should be both pragmatic in sustaining the present economic growth levels and learn from other regions who have used such advantage. This compels the need for appropriate urban and fiscal policies to integrate African economies and markets. Distortion of policies and programs hinders growth and truncate prosperity.

Deficits of infrastructure have a clear impact on African competitiveness. Most African countries, particularly those south of the Sahara, are among the least competitive in the world. The reason for this largely is due to shortage of infrastructures. For instance, poor infrastructure increases logistics costs. Deficient infrastructure in today's Africa has been found to sap economic growth by as much as 2% a year (African Development Bank, 2009). This is a regional problem that requires a regional solution.

The way forward is that Africa looks inward and evolve truly home grown strategies built on indigenous knowledge and systems. Africa should reconstruct her history and earlier aspirations for a truly just and egalitarian society based on the peculiarities of her history and traditions which would help to harness local assets and integrate the region. Indeed, while the contributions of external aids may not be eliminated in the short-term, appropriate efforts should be identified towards transiting from urbanization to sustainability. This calls for research not just on the contribution of external aids for infrastructure delivery but interrogating the role of these external aids in reducing poverty in Africa.

KEY TERMS AND DEFINITIONS

Globalization: The process leading to increased interconnection and trade relations among nations as a result of improved transportation, communication and technology.

Infrastructure: The facilities that are required for the running of society.

Paradox: A situation is described as a paradox when it involves two or more ideas or characteristics which appear to oppose each other.

Poverty: The lack of resources (physical, social and cultural) required to realize personal life goals.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Urban Governance: The available institutions and organizational structure in cities for addressing the needs in society.

Urban Growth: A process involved with increase in the population of cities.

Urban Revolution: This refers to the process of transiting to non-agricultural related activities in cities.

Urbanization: This refers to the process of making cities.

Wealth: This refers to a condition whereby an individual, household or nation possesses plenty of valued material possession or resources.

Chapter 57
Poverty as a Tourism Attraction: Travelling on the Web

Donatella Privitera
University of Catania, Italy

ABSTRACT

The visit of the favela or slum into a tourist destination is seen as a part of the so-called reality tours phenomenon and of the global circulation of the favela as a trademark. Tourist behaviour involves a search for leisure experiences from interactions with features or characteristics of places they choose to visit. Examples are the favelas in Brazil, the township of South Africa, the slum in India that have led to different definitions of "slum tourism", "poor-poor tourism", "reality tourism". Web heavily affect today most of the online activities and their effect on tourism is obviously rather important. The aim of the chapter is to discuss about slum tourism definitions. At the same time, taking Reality Tours and Travel - a wholesaler slum websites - as a case, this study attempts to explore issues of the quality of strategic choices on the web. Considering that the content of web site includes a wide variety of technologies, is important that website offer also interactivity with e-tourists. Through the results of the study, it is possible to gain knowledge of the slum e-tourism.

INTRODUCTION

Cities contain extremes of wealth and poverty, each concentrated in one or more sections. The wealthy areas are generally well insulated from the city around them; in contrast, areas inhabited by the poor are marginalised, i.e. generally unconnected to the social and economic life of the city flourishing around them. This leads to a number of questions: are poor people actually poor or are the contexts in which they live poor? Who are the poor? Although 'poor' may be a stable descriptive identity for people in some groups, for most, poverty is a situation, not an identity (Narayan, Pritchett, & Kapoor, 2009). Poverty is not defined in terms of low incomes, but uses broader concepts of deprivation and insecurity (Hossain, 2005).

Poverty is everywhere and anywhere to a different degree but often does not arouse interest. Conversely, poverty actually creates curiosity because of difference in ways of life. It is a common phenomenon and is one of the top forms of tourism in some parts of the world (Delic, 2011). Examples are common throughout South and Central America as well as in Asian countries which have the same characteristics as the favela in Brazil, the townships in South Africa, or the slums in India, which have led to different definitions of favela, township and reality tourism: places where poverty is more concentrated in neighbourhoods.

Slums are particular, unstable areas representing otherness in terms of vandalism and deprivation with an emotive power denoting opposition to order and security (Durr, 2012a). The term slum usually has derogatory connotations. A slum is defined in several ways by different organizations. Slums are usually characterized by urban decay, high rates of poverty, illiteracy, and unemployment. According to the latest UN-Habitat publication regarding Urban Development and Management (2013), the absolute number of slum dwellers continues to grow, due to the fast time of urbanization. UN-Habitat states that the number of people living in slum conditions is now estimated at 863 million, in contrast to 760 million in 2000 and 650 million in 1990.

In recent times, due to changing social conditions and the development of international tourism, so-called *poverty* or *slum tourism* has increasingly come into focus: organised tours of destinations in degradation and poverty, and in some cases also illegal places fully run by gangs. In the past there have been a lot of violent confrontations between these gangs and states (e.g. favela in Brazil, barrio in Colombia). Tourism today is characterised by diversification and enrichment of the tourist product offered, where the tourist is satisfied not only by the contemplation of a landscape (authentic or romantic), but intends to turn it into an experience to feel a real part of (Schmitt, 1999).

Research of authentic and unexplored regions, places with forms of social tension and ethical issues, contrasts with the particularities that distinguish purely hedonistic and recreational, traditional tourism. The 'regular' tourist travels to sites for the purpose of learning and gaining knowledge and information. A slum tourist, in contrast, is seeking some sort of emotional pleasure and is interested in seeing 'reality', or gaining authenticity, insight into power relations or a window onto other lives when there are ethical sentiments.

At the same time, with consumers playing a participatory role in the production and consumption process (Buhalis & Law, 2008), it has become dominant for businesses to use technology to engage consumers in a more individual way. The internet is rapidly becoming the number one information source for travel. In fact, the choices of the consumer are aided by the information picked up through the Internet, which is an ideal place to communicate, promote, and 'sell' destinations and where potential clients can undertake comparisons and choices more responsibly. The more consumers submit their online interests, the more companies seek to offer solutions that meet their potential costumers. Porter (2001) demonstrated how the internet has changed industry forces. Previous research has shown that innovation, organisation and external factors can influence a firm's decision to adopt e-commerce as a marketing and selling strategy (Wan, 2002). The use of the Internet has become a key competitive tool and essential also for tourist destinations (Murphy et al., 2007) and offers great potential to influence consumers' perceived images. In addition internet promotes the mass customization of tourism products as it supports the tourist operators to target niche markets in different geographical locations (Buhalis et al., 2005; 2011).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

As tourists have gained more experience in tourism travel, they have also grown more critical of tour wholesalers and their products. Online channels have played a crucial role in changing the attitude of them towards their customers. They have built a direct relationship with potential tourists. Following this trend, tour operators have also been adapting their strategies for online travel retail (Dwyer et al., 2009). By using the web and the Internet as marketing tools, tourism organizations have gained some distinct advantages in cost reduction, revenue growth, marketing research and database development, and customer retention (Morrison et al., 1999). Wang and Fesenmaier (2006) argued that a successful web marketing strategy requires the integration and coordination of web-site features, promotion techniques and customer relationship management programmes. Thus integrating technologies with relationship marketing could help tourism organizations and destinations to maintain competitiveness and improve the management of business relationships with customers (Álvarez et al., 2007).

Therefore it is important to study tour salers sites as sources of tourist information (i.e. the ways in which these are seen online). Web-site performance can be measured in various ways (Buhalis et al., 2011).

This chapter first assesses the current literature on slum tourism and importance of the web sites to influence the perceived image of destination as a virtual experience for the tourist. It then goes on precedent research that evaluates tour operators websites to analyse strategic choices enacted, the attractiveness of the websites, tourist information given on slum tours and marketing effectiveness. The goal of the current study is to find out how organisations can improve their websites and gain competitive advantage in the marketing of slum tourism. A recent research (Privitera, 2015) show that slum tour organisations on the web are at a relatively sophisticated stage of development, it presents as a viable tool for promotion of slum tourism and complementary information channels. In fact an overview of websites of slum tourism operators were evaluated using the extended Model of Internet Commerce Adoption (eMICA), methodological approach which draws on the evolutionary development of electronic commerce. Now we are focusing on a case study *Reality Tours and Travel*, a well know and large tourism operator in Mumbai (India). This website has been selected due to its reputation and easy access to information for the purpose of a research study. The following study is of an exploratory nature. Finally, it highlights several critical managerial implications and discusses limitations and suggestions for further research. The results of the study allow a gainful contribution to the promotion of slum tourism on the web.

BACKGROUND TO THE DEBATE SURROUNDING POVERTY AS A TOURISM ATTRACTION

One of the major challenges facing urban planners globally is the proliferation of slums predominant in the urban economies of developing countries. The extent and spread of slums not only helps us to recognise that they are not anomalous and pathological phenomena in the urban landscape but also a manifestation of urban poverty (Goswani, 2013). The term slum, in vogue since the beginning of the 18th century, is used to describe squalid housing in densely populated areas of industrial cities. A slum is a compact area of an overcrowding population and poorly built congested dwelling conditions, an unhygienic environment usually with inadequate infrastructure lacking in proper sanitary and drinking water facilities (Goswami, 2013). The concept of slum varies widely from country to country and depends on a variety of defining parameters. In some countries slums are largely forgotten parts of a city; in others the poorest areas (Diekmann & Hannan, 2012).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

From Rio de Janeiro to Mumbai, short, organised tours of poor areas have grown in popularity. And so too have ethical discussions on whether slum tourism or poverty tourism is educational and philanthropic, or voyeuristic and exploitative. Poverty tourism intersects with places of urban misery and their representation: slums representing the negative sides of cities, marginalised districts or ghettos and, in less developed countries, places of danger, crime and violence (Durr, 2012b). Slum tourism involves the commodification of urban deprivation (Durr & Jaffe, 2012). Slum tourism has expanded in popularity, probably due to the spread of communication routes (Delic, 2011) and media events; similarly, tourists who write about their experiences in virtual spaces create an increase in the demand for similar tours. Slum tourism is thus a mass tourism phenomenon occurring only in few destinations and a niche form of tourism in a growing number of other destinations (Frenzel et al., 2015). It's as viral marketing: from the Global South across destinations in Northern Europe. Recent estimates by Frenzel et. al. (2015) confirm an annual number of over one million slum tourists. Most of these tourists (80%) will do guided tours in just two destinations: the townships of South Africa and the favelas of Brazil.

The development of guided tours in destinations and places of poverty and degradation is controversial, probably because the combination of pleasure and poverty affects the sensitivity and moral values of public opinion (Freire-Medeiros, 2009). Researchers believe there are positive aspects of slum tourism (Steinbrink, 2012; Obrien, 2012) when proposed according to ethical and sustainable principles (Caldieron, 2013).

Exchanges can be positive but must improve the transformations of the neighbourhoods. In some cases, these tours offer travellers a glimpse of life in an area they might not visit otherwise, often because of logistic or safety concerns. But is slum tourism profiting from the poor? Slum tours can be unfair if communities aren't involved. In fact, it could be suggested that inhabitants have positive attitudes towards slum tourists (Mekawy, 2012), so that the appropriate form is collaborative and responsible participation in small-scale cooperatives (e.g. the government of Egypt uses cooperatives to reduce poverty). Another example is the social urbanism policy in Medellin, Colombia, a holistic approach to the development of the poorest areas, building a more authentic and inclusive image of the city (Hernandez-Garcia, 2013).

Slum tourism can be fabulously well-managed; an exchange of culture with local people ; very representative of a society; a confrontation with certain stereotypes; and at the same time an escape from monotony (MacCannel, 1976) or a search for absolutely real, objective authenticity, an experience which genuinely samples the culture of the society and the host people (Frenzel & Koens, 2012).

However, it appears that slum tourism is the organisation of tours in poor areas and thus different to 'dark' tourism, i.e. visiting sites, attractions, or events that have death, suffering or the macabre as a main theme (Stone & Sharpley, 2008) and different from pro-poor tourism. Specially pro-poor tourism (PPT) is aim to increase the net benefits for the poor from tourism, and ensure that tourism growth contributes to poverty reduction. PPT is not a specific product or sector of tourism as slum tourism but an approach (Ashley et al., 2001).

It is note that holidays are perfect opportunities for so-called experiential tourists, driven by their emotions, to see what is imagined and be immersed in a culture and lifestyle of a destination; or an affirmation of the so-called 'epidemic' of the imaginary (Zizek, 2004), in which images and desires tend to progressively replace reality. In fact, tourist experience seems less and less like a discovery and is characterised as more of a 'check'. The sociologist Urry (2002) has shown that in the era of hypermobility the tourist experience is mere observation of spectacular places. Tourists are quick and fleeting but must prove that they have also 'consumed' the holiday (Cohen, 1972). The tourism of poverty may therefore be defined as tourism diversion (Cohen, 2007; Ma, 2010) or experiencing a difference from the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

boredom of daily routine (Ryan, 2002), which are justified by curiosity but where a voyeuristic aspect is definitely a component (Williams, 2008). There are other important but not major reasons for travel, such as the provision of benefits to the environment and local communities, typical of social tourism (Butcher, 2003). In fact many tour operators say they give back to the communities they visit and create jobs (www.favelatour.com.br).

It appears that poverty tourism could include educational aspects typical of township tourism as defined by Ramchander (2004), such as the observation of expressions of culture and ways of life typical of South Africa, or the Brazilian *favela* as examined by Freire-Medeiros (2007; 2009), which became a trademark and at the same time was marketed as a tourist destination. Destinations may include any landscape, an ecological site, a tourist experience, extremes or places offering consumer goods (Duarte, 2010; Rolfes, 2010; Meschkank, 2011). Roogerson (2004; 2008) also includes poverty in this form of tourism, e.g. bringing visitors to the sites of significance to the anti-apartheid movement as well as improving tourists' understanding of poverty issues of historically oppressed communities.

Whyte et al. (2011) contend that the driving purpose is for tourists to observe poverty personally. They believe that the activities will provide an authentic experience of poverty and the decision to go on a tour does not involve meaningful collaboration and consent between residents and tourists. Also, Robertson (2007, p. 546), in downtown eastside Vancouver, for example, notes a form of "misery tourism" in which people visit the area solely to see its infamous poverty. The voyeuristic gaze of outsiders to the community has been remarked and decried, although this gaze is more regularly mediated through media rather than direct visits to the neighborhood.

Examples of organisations who organise such tours are numerous, but sometimes it is necessary to specify that there are operators with social or ethical purposes which benefit local residents and improve local economies. In this sense, the aim is to involve residents in decision-making processes, where they may receive benefits from this particular type of tourism. The studies demonstrate that isolated efforts from individual tourism companies have little tangible impact on the majority of people living in highly populated rural communities but impacts are substantial for the few people who directly benefit (Goodwin, 2009). Yet we need to ask which roles and functions illegal powers have developed in these areas. Much study on township tourism in South Africa has dealt with pro-poor aspects. Policy in South Africa is positive to promote township tourism as a tool of economic development so far business tourism is also likely to be a factor for tourism revenue for township (Frenzel, 2014; Rogerson, 2013). Other operators which offer regular sightseeing tours in cities have added the slum experience as an integral part of urban representation (Durr, 2012b) though slum tourism remains significant for creating economic opportunities in developing countries and contribute to shared growth in urban tourism (George & Booyens, 2014).

IMPORTANCE OF WEB: THE GEOGRAPHY OF INTERNET USERS

Internet and the new technologies have become an integrated part of our lives making is easier to communicate, research information and purchase any kind of products and services. The online transactions are becoming simpler and faster and have definitely made our lives easier since only one click can bring in a few days whatever we want. The web has an important role either to consumers than business operators. Previous research has shown that innovation, organization and external factors can influence a firm's decision to adopt e-commerce as a marketing and selling strategy (Guimaraes, 2012; Wan, 2002). There are 3.4 billions internet users in the world (see Table 1) with significant penetration

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ratios in countries like Asia (45.7%), Europe (19.2%) and North America (10.2%) (Internet World Stats, www.internetworldstats.com, 2014). Internet users in Europe as UK, Russia and Germany have a high amount: in 2014 the percentage of users exceeds 12-15%. Internet penetration in Europe is growing and travel e-commerce represents the largest item, surpassing more traditional uses such as internet banking or research information for health. Between top 20 Countries with the highest number of internet users there are Japan and Germany (86.2%), China (45.8%), Brazil (54.2%). However, the web also has the additional benefits of higher user involvement and user capture at opportune moments. Traditional mass media has been characterized by information push. In contrast, communication processes on the web are driven by information pull (Turban et al., 2008). Consumers control what information they access, which parts they explore, what routes they navigate, and when they view. The hyperlink function also allows users to move from one source of information to another. This further enhances user control in the communication process, and therefore allows users to pursue their specific interests. Therefore becomes important to study websites as places of business, the ways in which these can be seen online (Hax, 2010).

Globally, 4 billion people remain unconnected from the Web, 90% of whom are in the developing world. At the same time, we are currently undergoing a rapid shift from feature phones to smartphones, even in the world's less economically developed regions. Nowadays almost everyone, from children in playgrounds to seniors, have mobile phones or/and tablets connected to the internet and the number grows every year. At the end of 2014, half of the world's population had at least one mobile subscription, totalling over 3.6 billion unique mobile subscribers. The global mobile subscriber base increased by just over 5% in 2014 (GSMA, 2015). Millions are also converting to smartphones. In practice, the growing number of smartphones and tablets means significant changes in the behaviour of users (Kumar et al., 2006). This will affect the ways in which they spend their leisure time, the frequency of browsing the web, and increase their appetite for mobile apps (Rayport & Bernard, 2004). Mobile is confirmed as a strong youth medium with 48% of users between 18-34 years old, compared to 40% for the fixed Internet and 29% for the TV audience. Mobile is also more tilted towards men, who represent 63% of total users (GSMA, 2015).

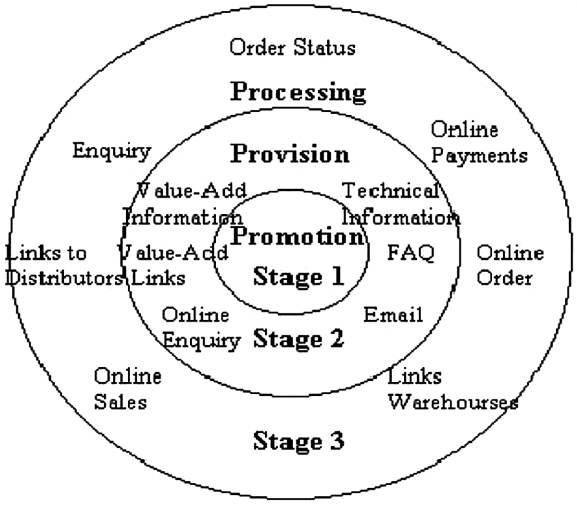
STUDYING SLUM TOUR ORGANISATIONS WEBSITES

Methodology

As indicated in the research aims, the goal was to assess the attractiveness and other aspects of the websites as contributors to slum tourism. Some sites offering opportunities for consumers to interact had a higher number of unique features than other sites. Good quality website design is not only based on the developer's perceptions, but also customer acceptance and perception (Day, 1997). On the web, the competitive advantage of a "place" does not depend only of localizing factors, but also on the diffusion of information and on the image that it manages to create through the virtual experience.

The study of the tourism operators websites, in a precedent research (Privitera, 2015), was developed through fact-finding data collection using the eMICA model. In current literature of the quality of web sites it is possible to identify three groups of models (Mich et al., 2003). Some were created with the aim of developing instruments for automatically assessing quality, above all in the cases where it is necessary to assess a large number of web sites. The indicators used in this type of model are, for example, the average time needed to download the home page, the number of errors found in the code or in the script, the number of broken links which exist on the pages. Other models were created to respond to aim related to the evolution of the web site or to compare web sites, for example, in order to improve some particular aspects (usability, surfability, etc). Finally, a third category is tied to the increasing importance that e-commerce has assumed. According to the original MICA model (Burgess & Cooper, 2000), an e-commerce model, a number of stages and layers of maturity are proposed (Figure 1), from infancy to maturity: promotion, provision, and processing. During the promotion stage, companies start simply by establishing a presence on the web. In doing so, they provide basic information covering business scope and post news relevant to their operations; some use animation and multimedia to draw visitors' attention toward an important promotion offered. Users, however, cannot send anything to the site and can only receive information from promotion websites.

The second stage of website development (provision) is dynamic and offers users the functionality of sending and receiving information. This involves value-added links, access to search engines, and even choices of languages. More complex applications are also embedded as integral components of interactive websites. Customers or visitors can search for information regarding products and prices. They can also register online and take part in message boards. Interactive websites encourage and entice visitors to inquire, request, complain, challenge, or make recommendations.



In the processing stage, customers play the most influential role. One of the main utilities here is customer relationship management, from initiation to maintenance. Other electronic services such as online orders or inquiries are all completed through websites. In this layer the company creates an integrated function.

The reworking of the MICA model, or extended version, provides an increased number of layers within the three main stages with the aim of deepening the study of processes in terms of functionality and sophistication of the applications of e-commerce (Doolin et. al., 2002; Hashim et al., 2009; Karake & Shalhoub, 2007).

In the research, each website was evaluated and assessed. In total, 49 variables were defined; their composition differed from the MICA model. In fact the variables used in the study resulted from the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

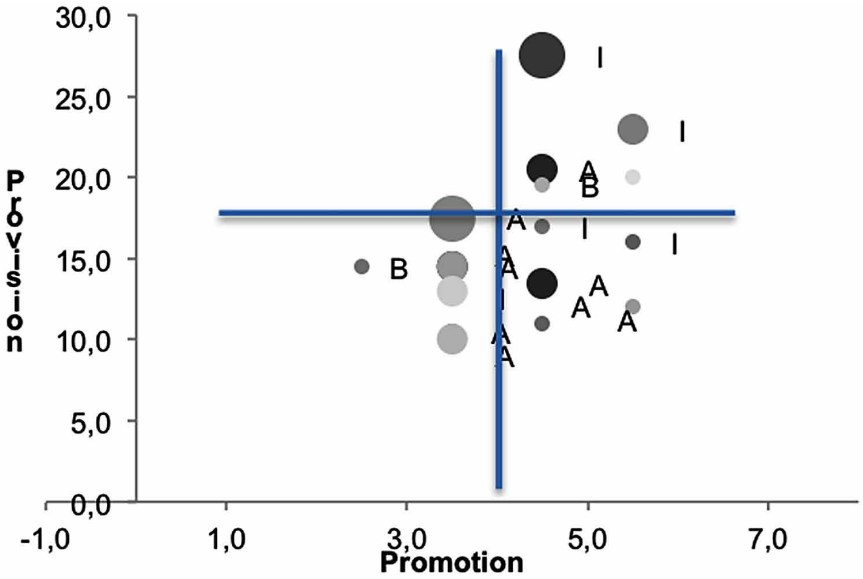
Figure 1. The model of internet commerce adoption (MICA)
Source: Burgess, Cooper, 2000

adaptation of ideas from several authors who had previously published on the tourism sector (Pesonen & Palo-oja, 2010; Ting et al., 2013). This study covered a sample of websites in a group of developing economies for the first time: Africa nations (specifically Kenya), Brazil and India. The 19 websites (15.8% Brazilian operators, 31.6% Indian and 52.6% African) were evaluated in December 2013. The sample was drawn from various sources, including search engines (e.g. Google) utilising keyword searches using the names of countries in which slum tourism is prevalent[1].

Comparing the sites, we built a positioning map of the tour operators (Figure 2) in terms of market orientation. The questions about the sites were: the structure and navigation of the site adequate. The site reaches its communication objectives. The functions of the site are correct. The information content is appropriate to the purpose of the site. The operation of the site is well managed. Is it easily accessible to all. Although the technology of the web can allow users with little computer experts to realize in short time sites elementary, the design of professional sites, such as sites of companies or institutions, can be a very complex process. The research showed that all of the websites under examination were in the promotion and provision stages and only two were in the processing stage. One of this two was *Reality Tours And Travel*. A case study has become frequently used in the business context to describe leading industry cases as role models to increase success. Given the uncommon practical, and in turn theoretical, knowledge about businesses implementing technology for experience creation to date, the adoption of a case study was significant to gather the necessary practice insights, explain and clarify current practices. The adopted case study method, in particular was explanatory due to the nature of the research topic. Explanatory case studies offer the opportunity for explaining a case in a more understandable and meaningful way (Yin, 2012). The case study method is often criticised for the lack of objectivity. However, in comparison with other types of social science research methods, the case study method has wider validity for producing research based on issues relating to human behaviour (Merriam, 2014). The case study *Reality Tours And Trave*l was selected based on three main defined criteria. First, the company had to be embedded in the tourism and hospitality context and second, it had to represent a

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

best practice example by providing evidence for the current successful realization of slum experiences as demonstrate from travel reviews via Tripadvisor. The third, *Reality tours and Travel* is one with the major results after the application of eMica model.



A Map of Slum Operators Websites

The map is based on two main dimensions: promotion and provision (variables detected in the two stages of the eMica model). These were also given a score for a third stage (processing), measuring the size of the point identified by the two previous measures.

Firstly, the concentration of sites near mid to high values for both stages is evident (x=4.2; y=15.7). The finding was: few tour operators that fully exploit the potential of the web to match demand and supply and to contribute to slum tourism promotion.

It was possible to hypothesise three sets of strategic behaviour. A first group is formed by a set of organisations that does not seem to attribute any importance to Web strategy. In this group, the levels of provision and promotion do not reach high scores. The sites appear as a presence on the Web with no particular goals (as basic information is not provided). There is a second group of sites among which the home page is dedicated to slum tourism and which are fairly complete from the point of view of information; the levels of interactivity reach discrete scores. The presence on the Web seems based on information content of a good quality, sometimes aimed at different users with respect to technological innovation. Finally, there is a third group of organisations which is very small (two sites), where in addition to levels of promotion and provision reaching satisfactory results, business transactions were also practised which gave international promotion to slum tourism. These operators have voluntarily designed a strategy behind the site and the use of the Web as a tool for image promotion and communication, as well as a vehicle of information for the market.

Some Empirical Evidence From a Case Study

The focus is to study the *Reality Tours and Travel* website (Figure 3). The goal of the *Reality Tours and Travel* is to provide authentic and thought-provoking local experiences through slum tours and to use the profits to create change in local communities, to promote cross-cultural understanding and local development. Their most famous tour takes people around the industrial and residential areas of Dharavi in order to breakdown negative stereotypes about slums and raise funds for community projects. 80% of the profits from the tours are used to fund local education projects through their sister-NGO Reality Gives.Reality Tours & Travel was founded in 2005 by Chris Way and Krishna Pujari. Chris Way, originally from England, moved to Mumbai in 2004 in order to bring slum tourism to Mumbai. Inspired by favela tours in Brazil, Chris wanted to use slum tours in India as a way to raise awareness about life in slums and to raise funds for community projects. Despite only having 367 visitors in 2006. The big break came when Lonely Planet included them in their 2007 guidebook. By 2011, Reality Tours was welcoming nearly 10,000 annual visitors into Dharavi. Reality currently runs six programs and supports eight others in the fields of education, health and livelihood. In 2011, Reality Tours started offering tours in South Mumbai with the creation of the Public Transport, Market Tours and Night Tour. They also made a first move outside of Mumbai with our 1 and 2 day village tours to Chinchoti. In 2013, they added an early morning Bicycle Tour and a Street Food Tour. In the summer of 2014, Reality Tours expanded to New Delhi and began working with the New Delhi slum, Sanjay Colony, which is located in the Okhla Industrial Area, India's largest industrial area.

The web site of *Reality* resulted with high scores located within the provision stage, particularly has numerous links to further information such as prices, awards and certification, photos. This result

Figure 3. The web site of Reality Tours & Travel
Source: www.realitytoursandtravel.com (accessed May 2015)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is supported by data of Rolfes (2010), where reports that the majority of operators intend to present an authentic image of slum, favelas to show the everyday and real life also to correct the public insight of these places, which is dominated by crime, violence. Also ethical information were ranked at the high position. The tour company have to work to economic aims but some of them remarked using a share of their profit to support particular projects in the local communities. Reality Tours and Travel started its operations in Dharavi in January 2006. Since then, most of the work of the Reality Group has been for the benefit of the Dharavi community. After, as Reality Tours and Travel expands its tours (Delhi and multi-day tours of Kerala and Rajasthan) they are also expanding projects to local communities in these areas.

Applying the eMica model at layers three and four of stage provision, the value-added site became increasingly interactive and included integration of social media (e.g. Facebook, Twitter) and to give virtual trips with many photos. Although the degree to which site were linked to other sites was satisfactory, the website did not include sitemaps or the date on which information had been updated. The site highlights travel reviews. Word of mouth marketing is very powerful this is the most frequently used source of information by consumers when booking or buying travel. Howewer, visitors tell about the best services they received, in the section "feedback".

An example:

From International Visitors

An essential part of a visit to India. The most thought provoking thing I have ever seen. Compassionately done with 80% of profits going to the slum. A real eye opener! (wwww.realitoursandtravel.com, May 2014 via TripAdvisor).

However, the incorporation of higher levels of functionality such as blogs was not evidenced in the site evaluated.

A significant finding is tourists to make bookings online and also buy the slum tours; generally on the websites of slum operators the potential client could fill in an inquiry form determining availability of tours. In the site is not present offered discussion forums; it had not a currency converter or others languages than English or meteo. These findings are surprising, especially since these organisation is geared towards promoting internationally orientated businesses like slum tourism. A point of weakness is the description of the team guides. An example from the site:

Krishna, co-founder of Reality Tours, is the tour guide for all of our multi-day tours. Born and raised in India, Krishna makes friends wherever he goes – he's your connection to the locals and will help you experience the "real" India all throughout your journey.

DISCUSSION AND PROSPECTS

There no doubt an important information channel is internet and the website's attractiveness of the operators. There are more and more studies about web site marketing effectiveness in tourism but it seems clear that slum tourism operators, like all operators, could benefit from good marketing of their products. There were no mistakes made regarding the identification of features that could attract tourists

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

if a web strategy is developed. The entrepreneurial behaviour dynamics makes the analysis of websites and complex marketing tool. The transferability of finding highlighted is influenced by the specificity of studied context in relation to the product as slum tourism.

As the design and maintenance of an electronic marketplace on the web about slum tourism is still in relative infancy, there is limited knowledge for businesses. The results of the map can be interpreted as showing that the slum operators analysed are in order to learn and understand. Slum tourism represents a very actual concept not only in promoting the poverty communities values, but also in developing a new dimension of the tourism in a larger context of global change. A few of these organizations had strategies to rapidly develop and incorporate poverty tourism features into existing mainstream tourism plans. Slum tourism is not and has never been a political priority so the consequences is hard for the private small operators also for a web strategy. *Reality tours* is a good example but tourists products cannot be delivered without a strong distribution network with others operators as hotels, transports, institution, etc.. Since tour operators have the know-how in organising holiday travel, they are heading towards demonstrating their ability in adapting to new market trends. It is evident that the future of eTourism, which supported by Buhalis et al. (2011) will be focused on consumer-centric technologies that will support organizations in interacting with their customers dynamically. Howewer, the case study demonstrates the importance to be attractive according to the criteria used. Multimedia is also one of key area of technological development, in fact photo and short video to provide a tangible sense of place. It is here that *Reality tour*s operator have the opportunity to improve his offering distinct. It need to be borne in mind in this regard that tourists seek extensive travel information on a destination's website. The internet allows people to interact with the virtual tours so the experience on the web could communicate a sense of what the tour is like.

The results of the present study provide some guidelines for improving the possibilities of a website of slum operators. Yet they need of continual monitoring of development, functionality and more sophisticate. The eMica model displays the requirements and processes of technologies necessary for personalized experiences to be facilitated. In contrast to traditional static information collection from the consumer to the company and the one-way experience delivery from the company to the consumer, smart technologies have opened more dynamic service encounters, in which experiences are co-created in an agile manner. The integration of technologies for the creation of personalized experiences is critical for businesses to remain competitive in today's dynamic market place. This is of particular interest to the tourism and hospitality industry, in which commoditization, competition and high customer expectations drive the need for differentiation (Peterson 2011). Innovative technologies will support interoperability, personalization and competitiveness respect others tourist operators. It's important to slum wholesalers more education and training to optimize adoption on the Internet. Internet marketing and website design is important for all travel companies. In reality, it might not be the case as different companies have different marketing strategies. Some companies can emphasise on traditional brochures to reach their target markets whereas some use book guide or other media as a marketing channel.

The results of the study allow a gainful contribution to the promotion of slum tourism. It's true the potential opportunities for local development by enhancing tourism in slum, it is important to realise that the poor generally benefit little from slum tourism. This analysis is refers to provide managerial implications and the point of view is the perception of websites and specially of a case study. Existing market competition becomes ever more intense with the involvement of increased numbers of technology or product service providers. Existing literature and evidences demonstrate slum tourism can be a

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

great opportunity to grow business plus online. This chapter points to is that built environment professionals with the interest and passion for advancing slum tourism plans must explore the approaches that successfully identifies, programmes and implements relevant and functional strategies. A limit of this analysis is that the results cannot be generalised because the case study is limited and exist between organisational dimensions and investments, especially in using the web to compete. Also is that tourist's opinions on their satisfaction of what was presented on the website were not included. Future research may therefore conduct tourist surveys since destination sites could be as competitive if it can attract potential slum tourists.

KEY TERMS AND DEFINITIONS

Case Study: Documented, in-depth study about a specific situation or methodology used as a training tool.

Competitive Advantage: A superior performance relative to other competitors in the same market based on factors, like: skillful scientific and technical support of specialized knowledge, research, specific competence, innovative products, processes or new business models apply, high productivity.

E-Tourism: The use of Information and Communication Technologies (ICT) in the tourism industry. It involves the buying and selling of tourism products and services principally via internet but includes all intranet, extranet and internet applications as well as all the strategic management and marketing issues related to the use of technology.

Slum Tourism: Touristic tours to informal settlements in India metropolis. They are designed as reality tours. They focus on showing the tourists as realistic a view of real life in the slum.

ENDNOTE

[1] Examples of keywords used were "poverty tourism", "favela tour", "slum tourism", "township tourism", and "poverty tour". An other source to construct the sample was Tripadvisor.it. It is important to mention the results about the reviews on tripadvisor.it with keywords used as "favela-tour", "slum tourism India", "township tour South Africa", "slum tour Kenya". The shortresearch (accessed on the web 02/09/2015) showed 31 tourists reviews about township tour South Africa

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

(CapeTown), 47 about favela tour (Rio de Janeiro), 162 on slum walk tour India (New Delhi) and only 1 on Kenya (*Tour durch Kangemi Slum*). According to Gretzel and Yoo (2008), tourists have considered online consumer reviews as an information source when planning their trips. While it is likely that other companies offering tours do exist the author contend that any others have very low online visibility (to deepen looks Privitera, 2015). It seems that so a few operators are actually selling the tours online in the studied Countries. Probably given that slum tourists often get booked into tours through hotels or traditional travel agencies, considered that the tourists' image of slum is not positive because is demonstrated that major percentage of tourists associate township with poverty and also crime before the booking of the tour (Rolfes, 2010).

Chapter 58
Integrating Spatial Technologies in Urban Environments for Food Security:
A Vision for Economic, Environmental, and Social Responsibility in South Bend, Indiana

Edwin Joseph
Indiana University – South Bend, USA

Elizabeth O'Dea
Indiana University – South Bend, USA

ABSTRACT

Food security for the urban poor has been an important topic for both developed and developing countries over the last 15 years. Although South Bend Indiana is a city in a developed country, declining economic circumstances have caused the city to show significant urban decay somewhat similar to some cities in developing countries. In this chapter, we explore South Bend's history and economic development strategies, and review practices aimed at strengthening food security for the urban poor. The chapter documents how numerous disparate organizations have been trying to help alleviate urban poverty and hunger, and reviews previous strategies used to foster sustainable growth and development. The integration of spatial technologies will become a key factor for promoting community social networks, participatory planning, and collaboration. The case is presented for the use of Geographic Information Systems (GIS) and associated technologies to help organizations, community leaders, local organizations, city planners, higher education institutions and the urban poor, work together to alleviate poverty and malnutrition through networking and sustainable urban agriculture.

INTRODUCTION

The World Food Summit of 1996 defined food security as *"when all people, at all times, have physical, social and economic access to sufficient, safe and nutritious food which meets their dietary needs and food preferences for an active and healthy life"*. Food insecurity is defined as, *"a household-level economic and social condition of limited or uncertain access to adequate food"* (World Health Organization, 2015). The United States Department of Agriculture (USDA)'s definition of food security is, *"access by all people at all times to enough food for an active, healthy life* (USDA, 2015)*."*

ECONOMIC PROFILE: SOUTH BEND (2015)

The city of South Bend is considered the economic and cultural hub of the greater seven-county region known as Michiana, Indiana in the United States of America. The Chamber of Commerce of St. Joseph County, Indiana defines Michiana as St. Joseph County and "counties that contribute at least 500 inbound commuting workers to St. Joseph County daily." Those counties include Elkhart, La Porte, Marshall, St. Joseph, and Starke in Indiana, and Berrien and Cass in Michigan (Wikipedia, 2016). South Bend is the fourth largest city in the state, with a population of 101,190 (Indiana Demographics, 2016).

The 2015 unemployment rate in St Joseph County was 4.8%. The top three employers came from education [Notre Dame University], health care [Beacon Health System], and K-12 Public Schools [South Bend Community School Corporation] (South Bend Region Economic Development, 2016). There are concerns over the ecological unsustainability within some areas of the city. There is also growing inequality among the urban poor. The big issue is to identify possible remedies for inner city poverty in South Bend, knowing that the gap in the wealth among American households is more extreme than at any time since the Great Depression (Matthews, 2014). Seeking solutions for these problems may take many forms. One way is to explore pathways towards economic growth through urban sustainable agriculture. It is also instructive to review trends that are currently occurring in developing countries.

POVERTY AND SUSTAINABLE DEVELOPMENT WORLDWIDE

There seems to be much programmatic interest about living standards and health among neighborhoods in developing countries, but very little in developed countries. Researchers have indicated that population growth will be concentrated in cities and towns by 2030 (Montgomery & Hewett, 2005). This statistic is supported by the United Nations Department of Economic and Social Affairs world population and distribution research data, which shows that 66% of the world's population would be urban, with North America currently having 82%.

At the 2012 Rio+20 meetings, political leaders acknowledged that there were many challenges to sustainable development, and reiterated that many of the world's poor depend on rapidly disappearing and fragile biodiverse ecosystems (Chappell, et al., 2013). The United Nations department of Economic and Social Affairs stated that there are more than 1 billion people living in extreme poverty and income inequality worldwide. As a result, inadequate and unsustainable consumption and production patterns exist, but at huge economic and social costs (DESA, 2013).

URBAN FOOD SYSTEMS

The term "food system" describes the complex and interconnected activities of agricultural food production, processing, marketing, consumption, and disposal. It is an emerging discipline that brings together scientists and humanists to help address the cultural, social, ecological, physical, ethical and political aspects of food (Berman, 2011). According to Berman (2011), there is no single accepted definition for local food systems, but it is often defined as an area within a 400-mile radius of food origin. The scale of urban agriculture can vary from less than an acre of land worked by a handful of people to several acres.

Simply put, urban agriculture is growing or producing food in a city or heavily populated town or municipality. Producers vary from individuals, friends, non-profits, neighborhood groups and so forth. Reasons for production also vary from sales to restaurants, farmers' markets and donations to local food kitchens and churches. Urban agriculture increases access to locally grown food, and reinforces the importance of community and culture. In short, it is the front line of the food system (Greensgrow, 2016)

Urban Poverty in America: A Brief Overview

In his book about the causes of urban poverty in 1987, Harvard Professor, William Julius Wilson argued that changes in the structure of the U.S. economy were the primary drivers of increased social and economic dislocation of the urban poor. As the American economy shifted from predominantly manufacturing to service-driven, the urban underclass was severely impacted. According to Wilson, joblessness, low socioeconomic status, social isolation, impoverished neighborhoods, low education, lack of community safeguards, resources, and support were typical features of African-American urban communities. It wasn't a cultural problem, but a problem of isolation from community and necessary resources. Discrimination facilitated the persistence of an urban "underclass." (Wilson, 1987).

Urban Sustainable Agriculture: Examples Across the US

Agriculture in the United States has been in social and economic turmoil for over two decades while Urban Sustainable Agriculture and Community Supported Agriculture (CSA) has been gaining in popularity. We can trace CSAs from the 1960s in Japan, when women who were frustrated with the pesticide laden, process prepared, imported food formed an alliance with farmers to supplement their food needs from locally grown, nutritious, organic food. The alliance was known as Teikei, or partnership—a more detailed/literal Japanese translation is "food with the farmer's face on it." Teikei therefore was born out of the rejection of conventional agriculture, on grounds of social, environmental, and economic justice in addition to a simple desire for fresh, quality food (Schnell, 2007) (Henderson & Van En, 2007). The concept eventually made its way to the United States.

Farmers, consumers, and activists in the sustainable agriculture community in Pennsylvania learned to exploit ruptures in the conventional food system and developed new forms of food provisioning in local economies. The partnership has aided in local economic development and poverty alleviation, and demonstrated that this alternative model of food production and consumption has encouraged the rise of urban gardens all over the nation (Trauger, 2009).

In May 2000, Greenpoint Manufacturing and Design Center (GMDC) embarked on a $6 million development of The Greenpoint Wood Exchange—a rehabilitation of an 80,000 square foot former bowling alley building at 810 Humboldt Street Brooklyn New York, and built a rooftop garden. The rooftop

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

accommodates a 15,000 square-foot hydroponic greenhouse that produces over 100 tons of food per year and supplies year-round produce to nearby grocery stores and restaurants (GMDC, 2015).

The Will Allen organization, Growing Power, designed a system of greenhouses and farm locations around Milwaukee that divert and compost more than 44 million pounds of food waste per year from nearby households, beer breweries, coffee shops, and even corporations like Walmart. The organization also produces one million pounds of organically-grown food each year (Kumar, 2015).

In 2011, Noah Link and Alex Bryan built an urban farm in Detroit Michigan known as Food Field that offers a CSA (Community-Supported Agriculture) service. Their goal is to create an alternative to the corporate food system. Local residents enjoy the sustainable produce in weekly CSA boxes containing salad greens, mulberries, and other food items. Food Field now has an aquaponics system for raising Catfish and Blue Gill. The farm also raises chickens and ducks for eggs (FoodTank.com, 2013).

The Distributed Urban Farming Initiative (DUFI) in Bryant Texas transformed vacant lots to produce healthy food. The goal is to build gardens in empty spaces, inspire Bryan residents to eat healthy food, and drive entrepreneurship and tourism. The initiative has been able to successfully grow broccoli, cauliflower, cabbage, and lettuce on raised beds and pallet gardens. DUFI has been working hard to reconnect the Bryan community with the food system (DUFI, 2015).

The Chicago Council on Global Affairs published a report highlighting the importance of urban food security, and offers an action plan for addressing urban food security and nutrition (Lee, 2013).

What is known about many urban centers in the US is that healthy, safe, nutritious food at affordable prices is difficult to find (The Chicago Council on Global Affairs, 2013). In many ways, the City of South Bend Indiana is no different from other cities in its quest to feed its growing population. Although over the past few years there have been efforts to address poverty and malnutrition through community gardens, much more collaborative work is needed to make these efforts sustainable.

URBAN SUSTAINABLE AGRICULTURE IN SOUTH BEND, INDIANA

A report published by the American Planning Association (APA), provides guidance for supporting and expanding urban agriculture. Like Chicago, Cleveland, Detroit, Missouri, Milwaukee, Philadelphia, among others, South Bend is an old industrial city, and possess acres of vacant abandoned city lots. These areas are potential centers for urban agriculture initiatives (Hodgson, Campbell, & Bailkey, 2011). Currently, the most popular form of urban agriculture in the city is community gardening, which contributes significantly to developing social connections, capacity building, and community empowerment. Our investigation seeks to find out how much collaboration exists to support important social networks to help in closing the gap in the wealth among households, and in the satisfaction of food needs.

There is a growing awareness about the role of urban sustainable agriculture in the context of food security and poverty alleviation in South Bend Indiana; however, its implementation is very informal. The local government verbally supports the grassroots efforts of the urban agricultural movement in South Bend. However, the city has yet to incorporate its support into the City Plan (Radican, August 2010). This makes urban agriculture vulnerable, and may also jeopardize its sustainability. Nonetheless, urban sustainable agriculture in the city seems to be steadily increasing. There is also a growing demand for a greener city, social justice, job security, and increased wildlife restoration.

Currently, there is a public listing of active community gardens and food services for individuals and families at risk in South Bend. The original listing included contact persons, telephone numbers,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and emails (these have been removed from the Table 1.). In order to view the distribution of the gardens and food services within a Geographic Information System (GIS), we geocoded the addresses by assigning geographic coordinates to each location (latitude/longitude). This made it convenient to view other spatial entities such as roads, parks and schools, to understand trends, patterns and distribution in relation to each other.

Table 1. Distribution of community gardens in South Bend IN

Food Entity	Address	Zip	Latitude	Longitude	Description
Corvilla - Bulla	18443 Bulla Road	46637	41.7043715	-86.2273586	Garden

A review was undertaken of other aspects of urban agriculture that are being used to raise awareness, and inform neighborhoods, decision makers, and planners about the different types of urban agriculture that have the potential to increase household incomes, promote healthy lifestyles, and generate a distribution chain through strong community networks. The importance of GIS cannot be understated since it can transform the way people network, communicate, and collaborate to make decisions—in this case, improve the standard of living for the urban poor. The significance of GIS technology to boost ongoing initiatives by key players and stakeholders in South Bend to improve the livelihoods of the urban poor must be recognized and factored into solutions.

HISTORY AND ITS EFFECTS ON AFRICAN-AMERICANS IN SOUTH BEND

African-American historical narratives not only document the lives of enslaved people, but offer invaluable perspectives of first-hand experience and mistreatment of people of color throughout an important period of American history. After the Civil War, former slaves continued documenting their experiences to ensure social and economic progress as affirmed by the nation's leaders. The African-American History narrative in South Bend mirrors some of the characteristics of post-war slavery, but is unique in many ways. For this reason, this should not be a truncated, incomplete, or untold story. It is a narrative

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

that has the "potential to evoke pride and add a level of complexity" to South Bend's black heritage and history (Andrews & Adams, 2016).

Despite its rich history, little is known about the African-American experience in South Bend, or the efforts that were made to improve the quality of life within the black community; and enhance educational and economic opportunities. The South Bend History Museum documents the life of John Charles Bryant—a descendant of one of South Bend's first African American families with portraits dating back to the 1800s. For Bryant, portraits of his grandparents and great-grand parents have special meaning because they tell the story of how against all odds the Bryant-Powell family were able to escape the south, and settle in Indiana.

John Charles Bryant's grandfather worked at Studebaker, his father worked the tables at the Old La-Salle Hotel, his mother Georgia Bryant, was an organist for 42 years at the Olivet AME church, South Bend's first established African American church. This and other narratives are intertwined with the fabric of American History .

A brief review of South Bend's history and economy reveals that like most of America, African Americans experienced a measure of discrimination in the workplace and in the community. South Bend was a hub of manufacturing fueled by the presence of the Studebaker car company and other significant industries. The 1883 South Bend City Directory lists several African American men employed by local industries such as Wilson Brothers Shirt Factory, Birdsell Manufacturing Company, Singer Sewing Machine Company and the F.P. Box Company, The Oliver Chilled Plow Works (The History Museum, 2016).

Between 1870 and 1910, the African American population increased from 73 to 640; and in 1903 when Booker T. Washington visited South Bend, he found additional opportunities for employment for African Americans at Studebaker. Unfortunately, employment for African-Americans became difficult after the end of World War I when they had to compete with European immigrants for jobs. In the early 1920s the population of South Bend Indiana was 70,983, occupying a land area of 15.4 square miles, and an average population density of 4,609 per square mile. The city was ranked 100 out of the 100 largest urban places in America (U.S. Bureau of Census, 1998).

The population of African-Americans in South Bend was estimated around 1,269 during the 1920s, and increased to 3,431 in 1930 (Robinson, 2015). Studebaker employed more than 400 African-Americans, and at times up to 700. This was considered unique for the period, as several other local companies did not employ African Americans until the 1940s (WNDU, 2010). However, Studebaker underwent financial problems and the plant ceased production in 1963. As a result, the city lost about one-third of its population, and experienced severe growth and economic problems.

During World War II, South Bend became part of the wartime employment boom. Many African-Americans were employed as factory workers, but by the early 1950s, employment for African-Americans was again on the downturn in South Bend. In spite of the unemployment challenges, the 1950s Great Migration of African-Americans from the South caused an increase in the African-American population. And by the mid-1950s, the African-American population exceeded the foreign-born population (South Bend Tribune, 2015).

Based on archived reports, there was a concerted effort to end racial policies in South Bend. For example, in 1963, South Bend Mayor Frank J. Bruggner appointed a 34-man Bi-racial Committee to study the problems of racial discrimination in South Bend. The committee met with community leaders to help eliminate, by voluntary measures, the cause of racial tension (Mayor's Biracial Committee Progress Report, 1963). South Bend also passed an ordinance (4091) known as the South Bend Fair

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Employment Practice Ordinance which prohibited discrimination in employment because of race, color etc. (City of South Bend Common Council, 1965).

In 1968, the South Bend Human Relations and Fair Employment Practices Commission endorsed open housing, thus raising the possibility of an open housing ordinance at the county level (The Reformer Newspaper Vol. 1, No. 29, 1968). In spite of these efforts, there were many examples of discrimination in the sale, rental, and financing of private housing in South Bend. One important example is the public hearing on March 19, 1963, in Notre Dame Law School Auditorium (Citizen's Fair Housing Committee of South Bend-Mishawaka, 1963)

South Bend Today

In 2011, Newsweek put South Bend on its list of America's Dying Cities, underscoring the 2.5% decline in the number of young people over the previous decade. (Newsweek, 2011). In 2014 South Bend was listed among the least happy regions in the United States by a Harvard and University of British Columbia study, taking the number 3 spot (UBC News, 2014). This was based on a survey of 300,000 people in 2009. The 2013 Gallup-Healthways Well-Being Index also lists South Bend as one of the "most unhappy" regions in the nation. The degree of unhappiness was based on a number of factors such as physical and emotional health, healthy behaviors, work environment, social and community factors, financial security and access to necessities like food, shelter and health care (South Bend Tribune, 2016).

Moreover, economists have established volumes of literature on the relationship between food insecurity and household incomes (classified by the poverty line). Researchers have concluded that food insecurity has increased dramatically in recent years, and is one of the most important nutrition-related public health issues in the U.S. (Gundersen, Kreider, & Pepper, 2011)

In 2015, South Bend's poverty rate stood at 23.9%, with almost 70% of students in the public school system eligible for free or reduced-cost lunch. South Bend also has double the national average rate of families living in poverty (Buttigieg, 2015). Crime risk statistics show South Bend to be above the US average for personal crime risk, murder risk, rape risk, robbery risk, property crime risk, burglary risk, larceny risk, and automotive theft risk. Assault risk, however, is lower than the US average (Point2Homes, 2016). The mayor of South Bend acknowledged that there were many excellent organizations working on problems, but needed partnership with the city.

In spite of these troubling statistics, the city of South Bend was ranked third in the nation for America's Best Complete Streets Policies of 2015 with a score of 98.2/100. This is an integrated transportation system that supports safe travel for pedestrians, cyclists, transit riders, motorists and others, within the city. The policy is one milestone encouraged in the Mayors' Challenge, a U.S. Department of Transportation initiative in which South Bend is a participant, committed to improving sidewalks, bike lanes, public transportation stops, frequent and safe crossing opportunities, median islands, accessible pedestrian signals, curb extensions, narrower travel lanes, and roundabouts (Smart Growth America, 2016).

A recent article by the South Bend Tribune discussed how it may be possible to develop, attract and keep talent so that South Bend area can compete in the modern economy. The Tribune acknowledges that at its heart, the region is still a manufacturing center, and manufacturing accounts for more than one out of every four jobs. (South Bend Tribune, 2014). Young, talented people are looking for quality of life, and will choose a community with a rich lifestyle over a good job elsewhere. The city knows that young people are more likely to locate near "livable" communities with bike trails, public transportation,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and vibrant downtowns among others. South Bend agreed to work together with institutions of higher learning to include significant grass-roots involvement in visioning such a future.

As we fast-forward to the year 2016, we believe it is important to review a 30-year old problem, and carefully examine the issue of how food and other essential needs can be better satisfied among the urban poor in South Bend Indiana, and how we can use Geographic Information Systems Technology (GIS) to analyze proximities, adjacencies, intersections, and containment issues to help solve urban poverty.

For example, one may wish to know how close a community garden might be to a landfill in an urban area; or city planners may want to identify roads that pass within a certain distance of a city park. These are proximity issues. Questions such as, what is the shortest street network route to all community gardens are important proximity questions for understanding distance relationships, and are applicable for both developing and developed countries. Adjacency is generally about objects that are zero distance away from each other—in short, they share at least one common boundary.

An intersection analysis calculates the geometric intersection of features on a landscape. A simple analysis could be which river or stream crosses a major road—at what specific location; or which trail passes through a particular parcel in the city. The analysis does not limit itself to linear objects, but may extend to point on point analysis. In other words, where are the houses (point location) that have gardens on the lot (another point location) - that is considered an intersection of two points. Containment analysis answers questions such as which gardens are within which neighborhoods. These are very important spatial questions that we can query on-the-fly, and use for decision-making related to urban poverty.

Facing the Realities in South Bend: There Is Hope

Many organizations work towards the goal of a sustainable South Bend. They include the Food Bank of Northern Indiana, Unity Gardens, Young Professionals Against Poverty (YPAP), City of South Bend Division of Sustainability, Center for a Sustainable Future, Links Incorporated (South Bend Chapter), The Civil Rights Heritage Center, United Way, 100 Black Men, and a few others can be located using the University of Notre Dame's link http://green.nd.edu/sustainability-in-action/community/.

These disparate groups tend to work independently, but would be more effective if there are stronger collaborations. For example, the Food Bank of Northern Indiana works in partnership with the community to feed the hungry, increase awareness of the effects of hunger and lead programs designed to alleviate hunger (Food Bank of Northern Indiana, 2016). The Food Bank describes that the rate of hunger insecurity in Northern Indiana as a silent epidemic, and sees the challenge for the city of South Bend as addressing food and nutritional security in a sustainable way given very high poverty levels (Foodbank of Northern Indiana, 2015). Their programs include Healthy Choices Market, Senior Bag Program, Mobile Food Pantry program, and Food 4 Kids.

The Unity Gardens, a 501(c)3 Non-profit in South Bend, is committed to improving community health by increasing accessibility to fruits and vegetables by developing a local food system. The goal of Unity Gardens is community building through a "framework of gardens". The gardens would not only provide healthy food for those in need, but also educate the community on how to grow, and utilize healthy food. The overall mission is to improve community health which includes access to locally grown fruits and vegetables, education on food preparation and consumption, increasing social capital, and opportunities for the disadvantaged (Unity Gardens, 2009).

Young Professionals Against Poverty (YPAP) was founded in 2006 by Steve Camilleri and Matt Money. They wanted to raise awareness about poverty in South Bend, and brought young professionals

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

together to help organize events and raise money geared towards improving the quality of life. Steve Camilleri is also the Executive Director of the Center for the Homeless which has been endorsed by the US Department of Housing and Urban Development (HUD). The Center has provided more than 700,000 safe nights and over 1.5 million meals to more than 44,000 men, women, and children since opening in December 1988. The focus is on providing life-changing services to their guests (Center for the Homeless, 1988).

South Bend's chapter of Links Incorporated is an organization whose mission is to promote and engage in educational, civic, and intercultural activities in order to enrich the lives, and to work together toward achieving community goals. The organization's vision is to eliminate disparities by reducing barriers to services through advocacy, education, and service. Their goal is to empower communities and increase the number of sustainable and measurable programs; expand collaborative partnerships; and identify communities with greatest needs (The Links Incorporated, 2015).

The Civil Rights Heritage Center (CRHC) was established on the campus of Indiana University South Bend for the study and documentation of civil rights history. The Center engages in scholarly inquiry, student research, and community education, and is dedicated to creating partnerships with the state and local communities and offer leadership in creative solutions for 21st-century problems. (Civil Rights Heritage Center, 2015). The center sponsors group discussions related to equity and social justice, wages and income, access to healthy food and barriers to employment, among others.

In 2016 the center hosted a number of significant events. Some included community lectures on asset building, and civil rights. Other events were partnerships, for example, the center partnered with the University of Notre Dame to host a Wikipedia Edit-A-Thon to teach people how to become a Wikipedia editor and use proper guidelines for writing articles and finding resources for researching and writing about South Bend's history.

The Center also celebrated the history and experience of African Americans in South Bend through stories from the Black LGBT experience, and explored the significance of open-access, digital resources using The Black Press Research Collective (BPRC). It hosted a scanning event to preserve and share photographs and documents that tell about black history and the black experience. Guests were encouraged to bring artifacts to the Civil Rights Heritage for scanning and inclusion in Michiana Memory, the free, online archive (http://michianamemory.sjcpl.org/). In celebration of Women's History Month, the Civil Rights Heritage Center part sponsored a public talk on the topic "A Band of Sisters: Fighting for Employment Equality from the Assembly Line"—the story of a small group of blue-collar women who, in a class action lawsuit, uncovered endemic gender discrimination in South Bend.

South Bend Reconnecting People Through Sustainable Programs

Recently the city of South Bend has been working in conjunction with the Environmental Protection Agency (EPA) and participating in their program called the Food Recovery Program (FRP), which helps prevent food waste by diverting leftover food from local restaurants to impoverished people in need (Rivest, 2015). There is also renewed interest in traditional food systems in South Bend. In an attempt to reconnect land and people through sustainable gardening, Indiana University South Bend (IUSB) is currently conducting research on urban sustainable agriculture. IUSB has developed agricultural courses focusing on sustainable local food production techniques, and is well on the way to developing a Sustainability Showcase—an area on campus dedicated to demonstrating urban sustainable practices.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Showcase would contain a plaza/entryway featuring native plants, a zero impact home with the capacity to continue to showcase new home building design and products. It would also serve as a site for constructing Tiny Homes, and invite community participation for the regular construction of this new concept to increase accessibility to low cost housing in South Bend. The showcase will be open to area schools, neighborhood groups, non-profits, and so forth; all working together to solve social, economic, and environmental problems in the city. It will also serve as an open living laboratory to compare best practices for urban gardening. The goal is to share information and strengthen community relationships and networking.

TECHNOLOGY: A PATHWAY TO ECONOMIC RECOVERY IN SOUTH BEND

We believe that introducing new technology may be an appropriate pathway to economic recovery and progress in South Bend. Information and spatial technologies have the potential to provide a platform for people with similar interests to solve problems in the community. These technologies can provide a technical framework for food production and act as a communications platform even in low-income communities. New technologies can be separated into two categories—sustaining, and disruptive. A sustaining technology relies on incremental improvements to an already established technology, while a disruptive technology may not yet have a proven practical application, but has the potential to significantly alter the way organizations operate (Christensen, 1997).

Geographic Information Systems (GIS) technology falls into the category of a disruptive technology. It is a location-based technology that has made people more aware of the dynamic world in which we live. It has improved our ability to interpret our environment, and understand spatial interactions. Therefore, by nature, GIS technology is adaptive, and suited for dynamic, fast-paced innovations. Many entrepreneurs view GIS as a survival imperative that creates revenue opportunities. Some companies see it as a tool to expand their markets, new products or services. Dynamic leaders are curious, and welcome a challenging future, and are constantly looking for institutional changes that adapt to "urgent" disruptive technologies. GIS technology, therefore, encourages a growth mindset—essentially welcoming change instead of fearing it. Yet, GIS technology has not been fully embraced and exploited for solving urban design and environmental problems in South Bend. Integrating GIS with urban sustainable land use planning that includes gardening is crucial for realizing the aim of food security in South Bend Indiana. The city is able to explore and exploit the potential of GIS technologies not only for monitoring the urban infrastructure, but also as an information technology which when shared at the grassroots level through participatory planning, has the potential to promote sustainable gardening and responsible land use. No other technology can provide a powerful combination of digital, mobile, social, geographic and video innovations as tools for investigating different land use options as with GIS. In the case of South Bend Indiana, existing community collaborations provide a solid network of private organizations and individuals, community leaders, government institutions, and educators, to develop urban food networks and related economic activities that fit local realities.

GIS in South Bend, Indiana

Developed in the late 1960s, very few planning departments could afford a GIS because of the prohibitive cost of hardware and the limited capabilities of the software. But by the 1980s, GIS technology was

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

considered the formalized computer-based information system for effective decision-making in urban planning (Han & Kim, 1989). South Bend's GIS department has been using ArcGIS software since 1999 to manage geographic data, and generate maps for different city projects. The city uses GIS to provide services such as; hot spot mapping of crime, tracking of basement flooding, utility inventory and similar others. The city also makes data and information available via an on-line map server (ESRI, 2011). Currently, the system provides basic information about property within the city, and maps include aerial photographs (orthophotos), parcel boundaries containing parcel identification number, property address, and property owner information (City of South Bend Indiana, 2016).

Among the geographic layers that are available for download from the City of South Bend's website are:

- Demographic Data
- Vacant and abandoned properties
- Street centerlines
- Public facilities
- Social services location
- Parks
- Businesses

These information layers are valuable for environmental research, public safety, marketing, etc. (Government Technology, 2016). It is now possible for organizations in the city to invest their time to perform tasks that were previously impractical or impossible without the current datasets. For example, modeling, predictions, and analysis can now be done through dynamic map overlays of physical, cultural, and economic features within the city landscape. GIS technology will enhance public participation, promote greater collaboration among public agencies, and would also be useful to city planners and educators who focus on geographic literacy/education and GIS mapping.

In the quest to acquire data for spatial analysis, several problems were encountered. Important metadata for datasets were missing or incomplete. Online map servers run by the city allowed minimum analyses. Data export was also limited to graphic formats. When GIS data was available for download, they were usually from other sources such as the Census Bureau which, because of scale, did not satisfy the desired unit of analysis.

EVALUATING POPULATION AND INCOME DISTRIBUTION IN SOUTH BEND

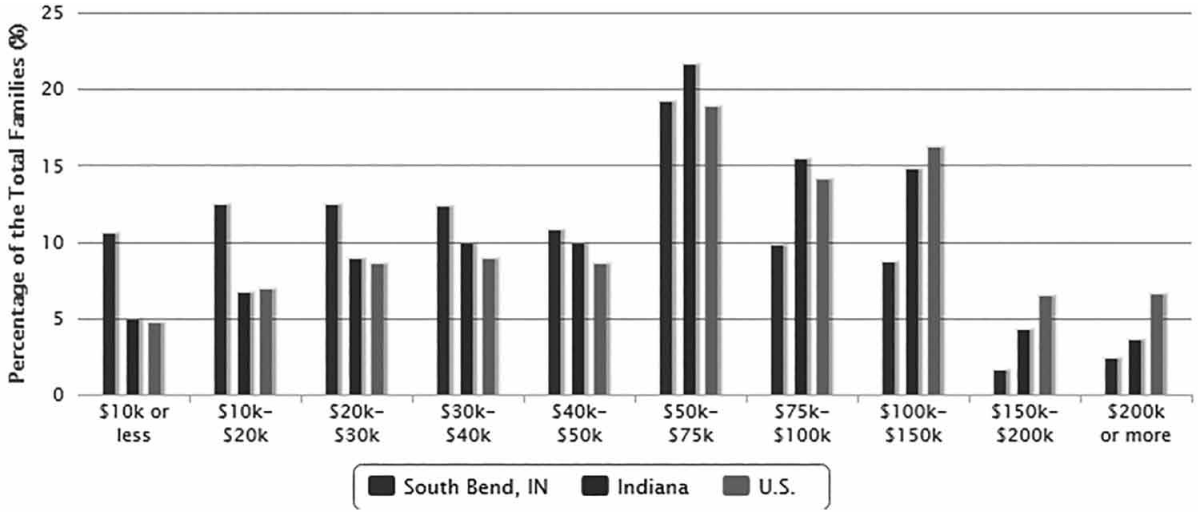
South Bend is the largest city in St Joseph County, Indiana, and occupies 457.9 square miles. South Bend's population distribution per square mile was 584.4; with a total population of 101,190 in 2014. This is a 0.2% rise in population from 2010 (STATSINDIANA, 2015). Table 2 shows that the 2015 South Bend population dropped to 101,168 with a race distribution of 60% white, 26% African American, 12% Hispanic or Latino. These three races account for more than 98% of the population. Source shows small variations in population distribution[1].

The 2015 median age in South Bend was 33, with average income for people within the age group 25-44 being $36,620 (Suburban Stats, 2016). Family income distribution when compared with the State

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. 2015 South Bend population by race

Race	Population	% of Total
Total Population	***101,168***	***100***
White	61,199	60
Black or African American	26,906	26
Hispanic or Latino	13,116	12
Asian	1,318	1
American Indian	478	Below 1
Three or more races	313	Below 1



Source: suburbanstats.org

of Indiana and the U.S show that above $50,000 family income in South Bend is lower than the State of Indiana, and the U.S (USA.com, 2016). However, when we compare family income below $50,000, South Bend is higher (see Figure 1).

Poverty by Zip Codes

Sixteen zip codes are included in the city of south Bend; 46601, 46613, 46614, 46615, 46616, 46617, 46619, 46624, 46626, 46628, 46634, 46635, 46637, 46660, 46680, 46699 with some zip code routes intersecting the city boundary (zipcode.org, 2016). Population, race, and income characteristics for Whites, Blacks, and Hispanics (the largest three groups) are presented in Table 3 below, for each zip code[2]. Zip codes 46601, 46613, 46616, 46617, and 46619 show the highest poverty rates.

AARP Livability Index

The AARP (American Association of Retired Persons) Public Policy Institute developed a Livability Index to measure community livability. The scores are based on affordability and access to housing, access to live, work and play, safe and convenient options for transportation, clean air and water, health, civic and social involvement, opportunities for inclusion. The 2015 livability index[3] for South Bend Indiana,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Zip code map of South Bend Indiana

was 51 out of 100p (AARP, 2016). Areavibes.com has also developed livability indexes based on their opinion of important metrics. They include amenities, cost of living, crime rates, education, employment, housing and weather. The individual category scores for AARP are presented in Tables 4 – 17.

Areavibes.com Livability Index

Areavibes.com (2016) assigns South Bend a livability index of 71. This was derived from a distribution and number of important amenities such as grocery stores, other food and drink establishments, shopping malls, coffee shops, schools, parks, libraries, entertainment, fitness. The spatial distribution for these amenities is shown in Figures 3 – 12.

The City of South Bend Department of Community and Economic Development, with assistance from the Area Plan Commission of St. Joseph County, gathered data from the 2010 census and other recent

census products and compiled maps for displaying population, race, housing units, and income. This community profile provides information about demographic trends in St. Joseph County. Much of this data is presented at the census tract level. The data shows that St. Joseph County became more racially diverse with a decrease in the white population. The number of residents who are African American, another race, or of two or more races all increased in absolute and percentage terms. Minority groups remained concentrated within South Bend, where the vacancy rate was relatively high—particularly on the near south and west sides of town. (Department of Community & Economic Development, 2011)

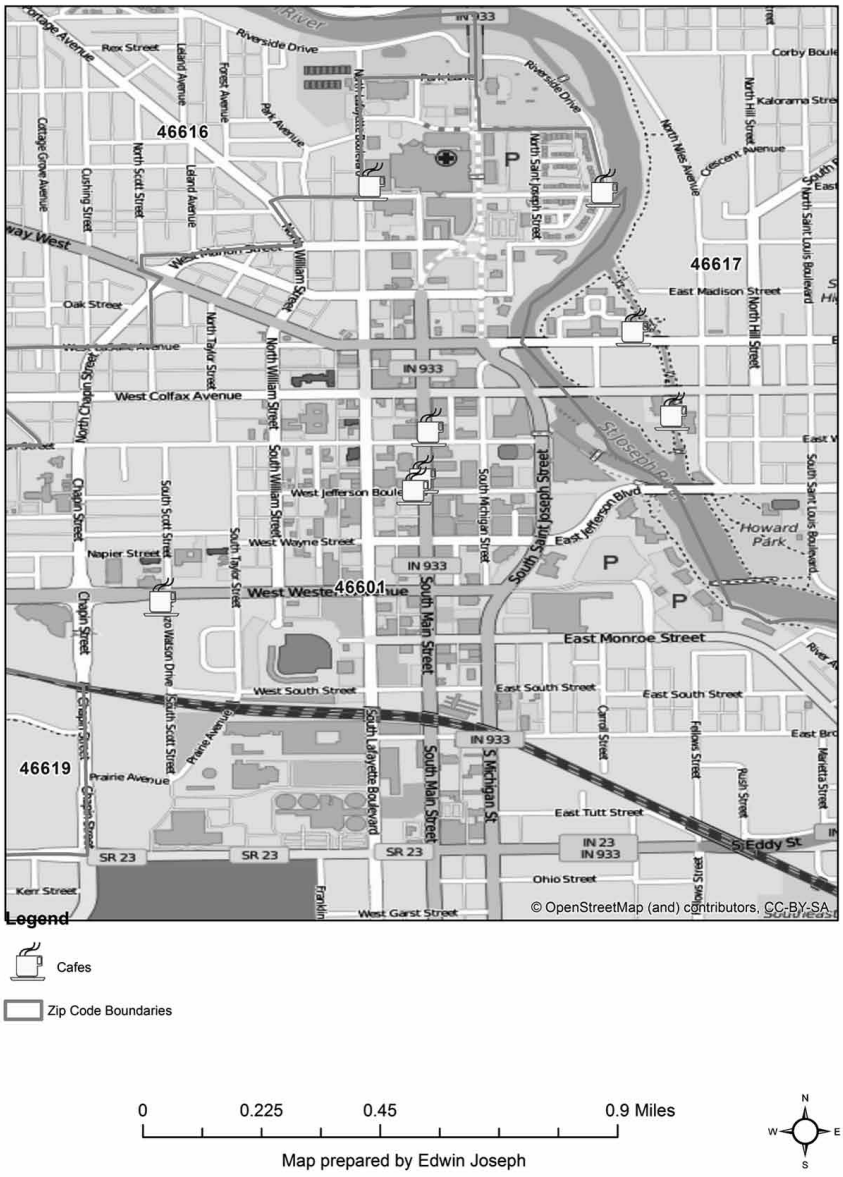
Figure 5. Shopping locations
Shopping—20 locations



A recent review of the status of the urban poor in South Bend (based on 2000-2013 census block group data) revealed that 16.7% of residents had incomes below the poverty level in 2013 while that for the whole state was 9.5% (CDW Services, 2015).

The spatial distribution of poverty shown at a larger scale identifies 4 census blocks with the highest poverty rates (Figures 13 – 16). These blocks are located either south or west of the city center.

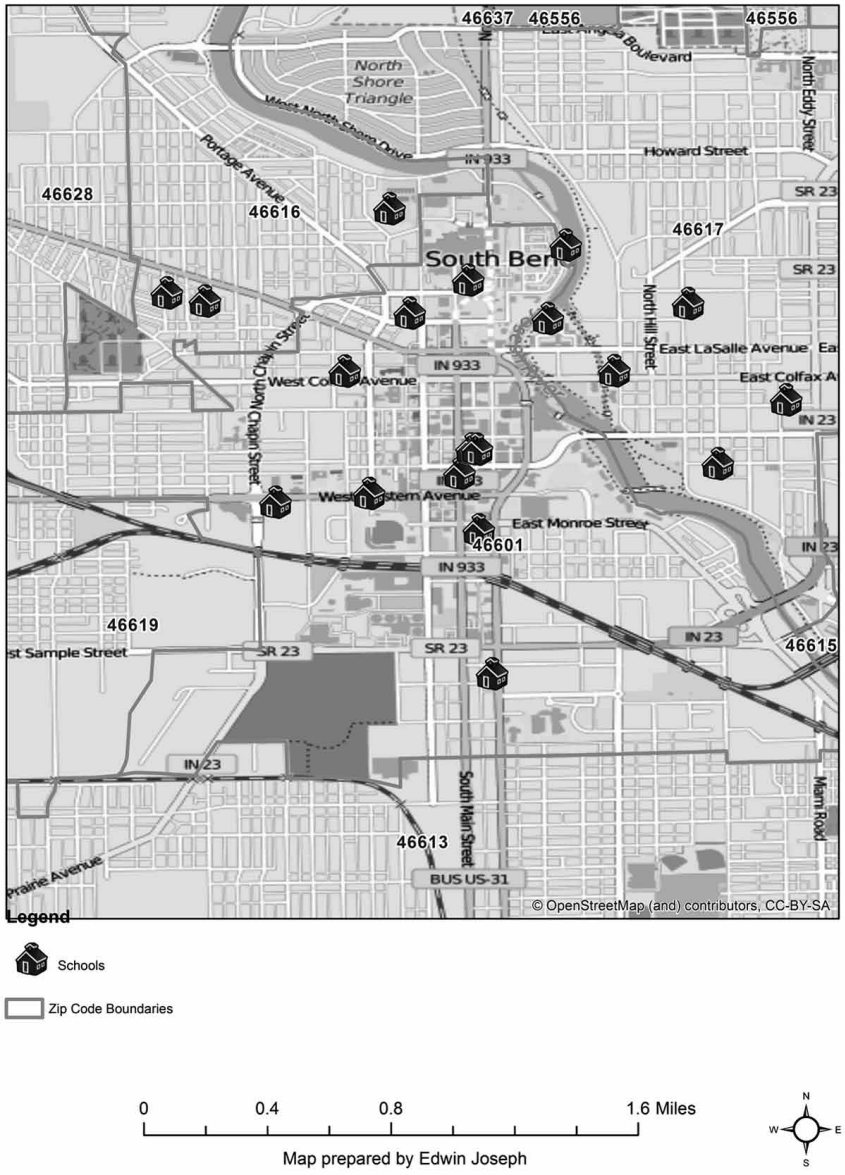

Figure 6. Locations of cafe
Coffee—7 locations

Given the spatial distribution of poverty in South Bend, it is important to understand the use of GIS technology to seek solutions for solving environmental, social, and economic problems. Some critical areas range from public safety, to health, and to transportation (Government Technology, 2016). South Bend city planners have invested much time in regulating land use, monitoring infrastructure, and traffic management among other things. And like many other cities, GIS is now used for performing spatial analyses. Planners also realize that the spatial and temporal aspects of GIS not only allow for modeling and predictions, but also useful for in-depth analysis.

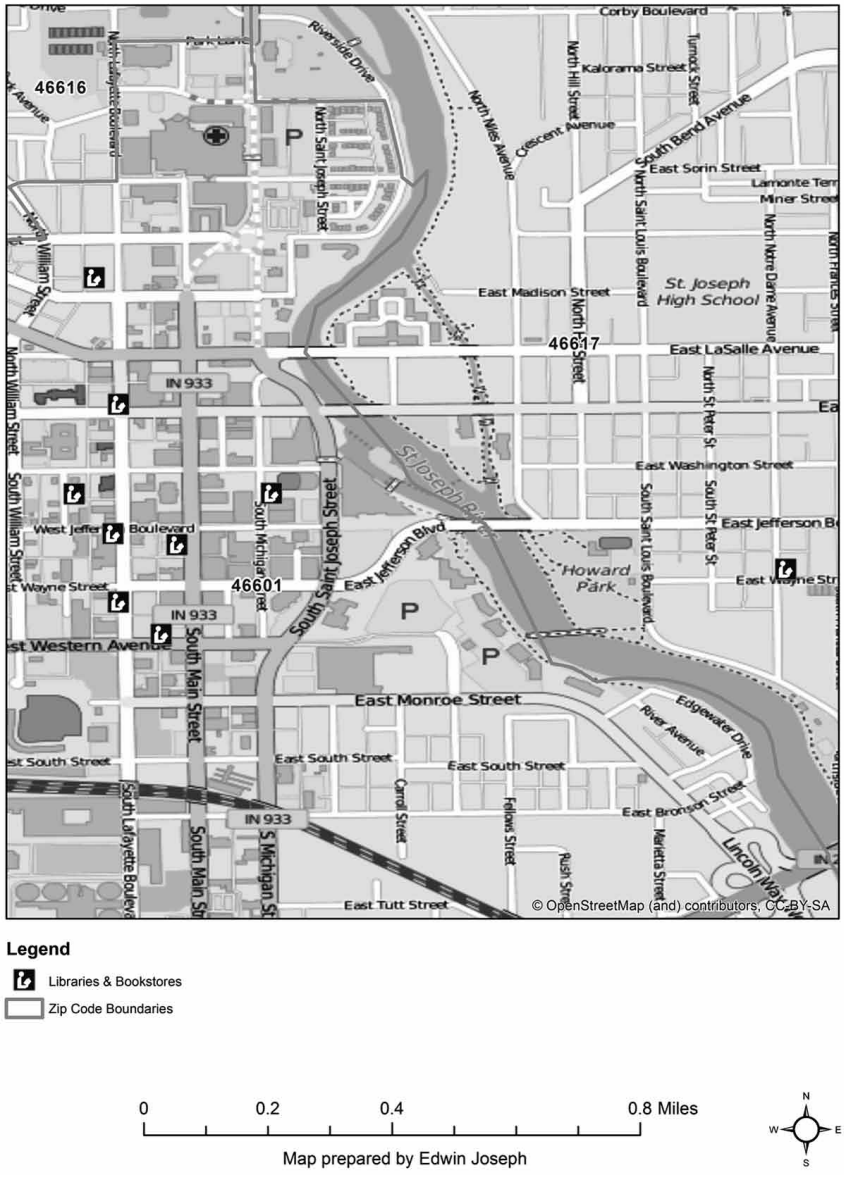
HOW GIS CAN HELP URBAN AGRICULTURE AND INCREASE FOOD SECURITY IN SOUTH BEND

There are many strategic advantages for integrating GIS in Sustainable Urban Agriculture. GIS is a location-based system and is ideal for environmental monitoring, flood management, soil classification, pest and disease management, strategic planning, among others. For the average gardener, planning is generally some combination of guesswork and luck, but integrating GIS allows for more spatial organi-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 8. Distribution of parks
Parks—11 locations



zation. Factors that can affect urban agriculture are sunlight, shade, soil moisture content, pH, soil type, artificial materials, dust and lead; all of which can affect the quality and quantity of crops.

A combination of GIS, GPS and Multimedia mapping will provide continuous data for sustainable food production in the city. Surveying new areas to plant crops, or examining soil and air quality will be an enormous challenge without spatial technologies. These technologies lend themselves to crowd sourcing projects, and greatly assist in managing food production and distribution. The World Food Program, the division of the United Nations recognizes the importance of GIS in food production and is one of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

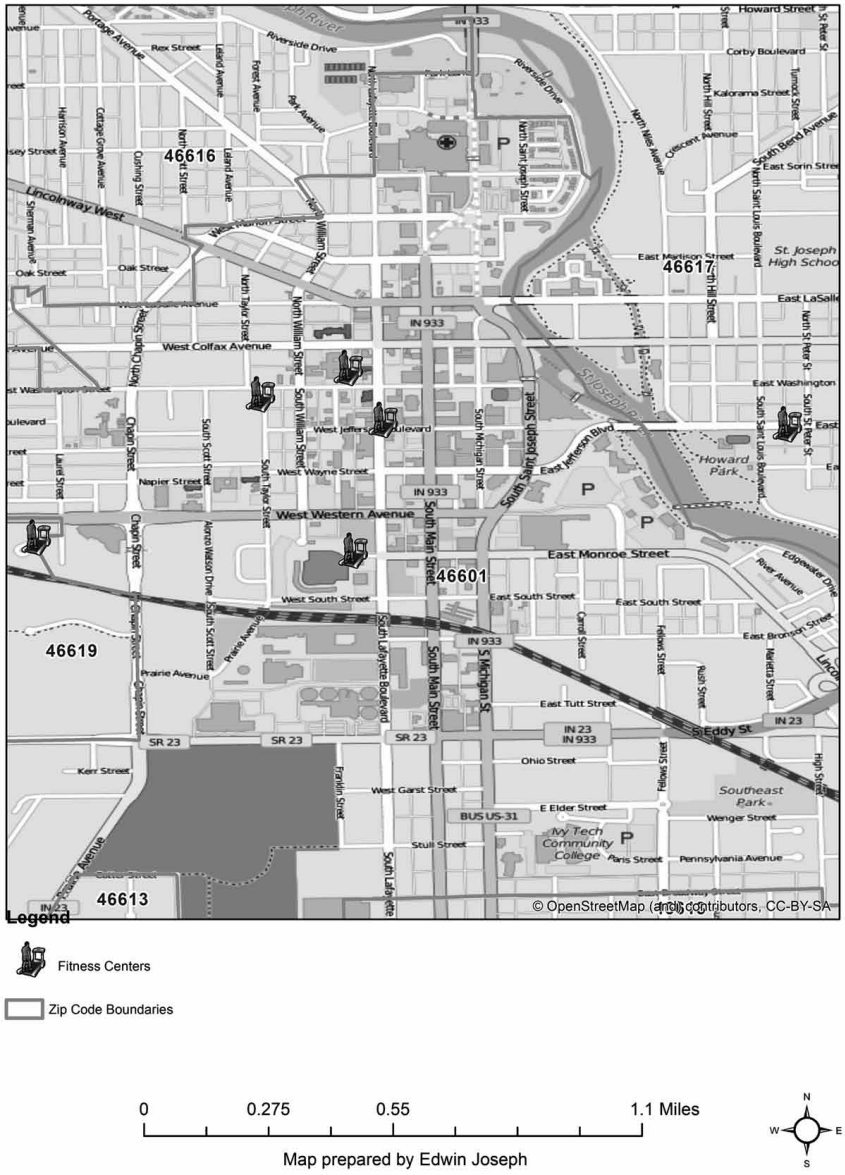
Figure 9. Distribution of libraries
Libraries—11 locations

the biggest users of GIS data (ArcNews, 2014). The program recognizes the importance of safeguarding food sources, and engages communities in activities such as land use planning, biodiversity education, and soil fertility management. The World Food Program also monitors changes in the environment, and uses remote sensing to identify disaster prone regions.

In South Bend it is possible to use drone mapping technology to capture high resolution imagery of urban gardens to monitor production. The addition of high resolution orthoimagery (photographic maps)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 10. Entertainment locations
Entertainment—11 locations



provides information necessary to adapt sustainable agriculture practices. Orthoimagery from drone mapping creates 3-D models of urban spaces that are critical for landscape analysis. Thus, generating models for potential gardens will ensure better planning for future generations.

Urban Sustainable Agriculture has the potential to become a dynamic economic sector in South Bend. City planners need to establish a proper program for developing the social, economic and ecological framework for urban agriculture. They must work closely with the urban poor, and as partners, develop

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

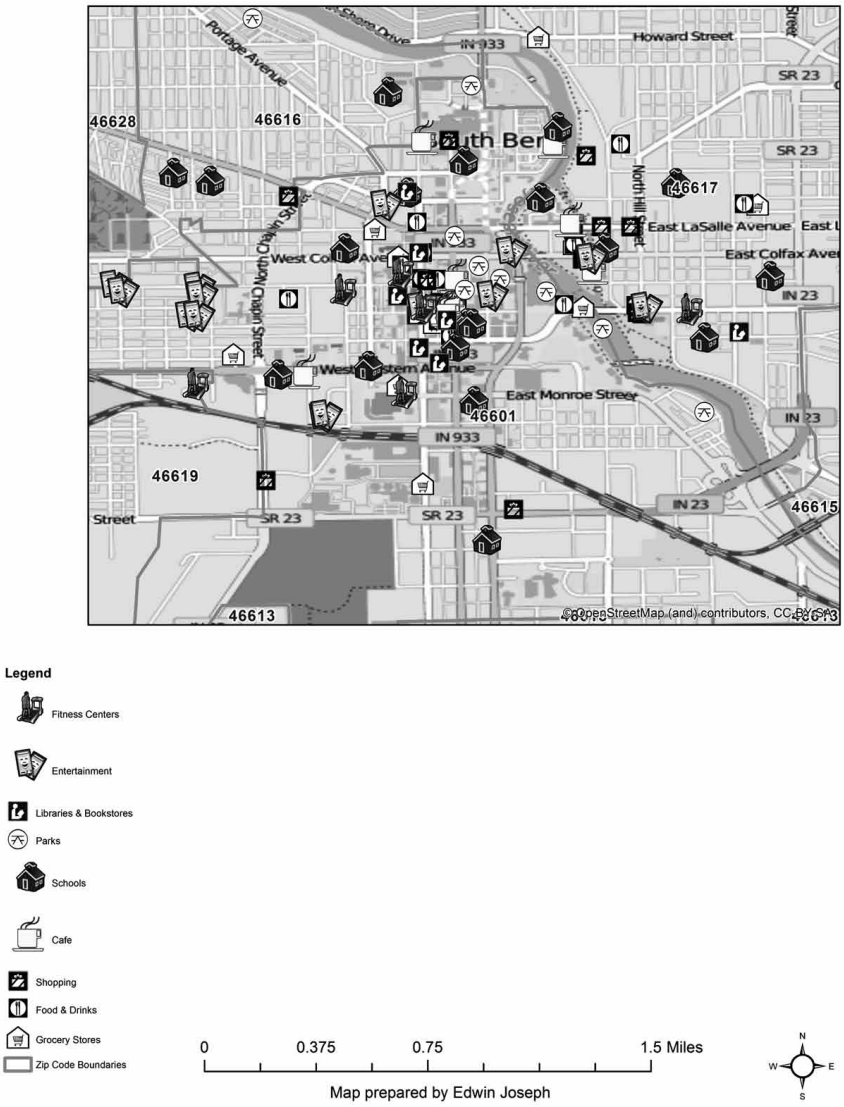


Figure 11. Distribution of fitness centers
Fitness—6 locations

a sustainable and resilient city that is socially inclusive, safe, and environmentally-healthy. The challenge for South Bend is putting together a conducive policy for urban agriculture, and urban land use. The city also has to provide easy access to vacant open urban spaces and partner with higher education institutions to develop formal urban garden programs that include technical workshops, participatory action research, and specific skills field training. Potential urban gardeners should not only have access to technical advice, but also credit (in the case where they seek agri-business opportunities within the city) for activities such as urban beekeeping, hydroponics, aquaponics, egg production and small stock (rabbits) production.

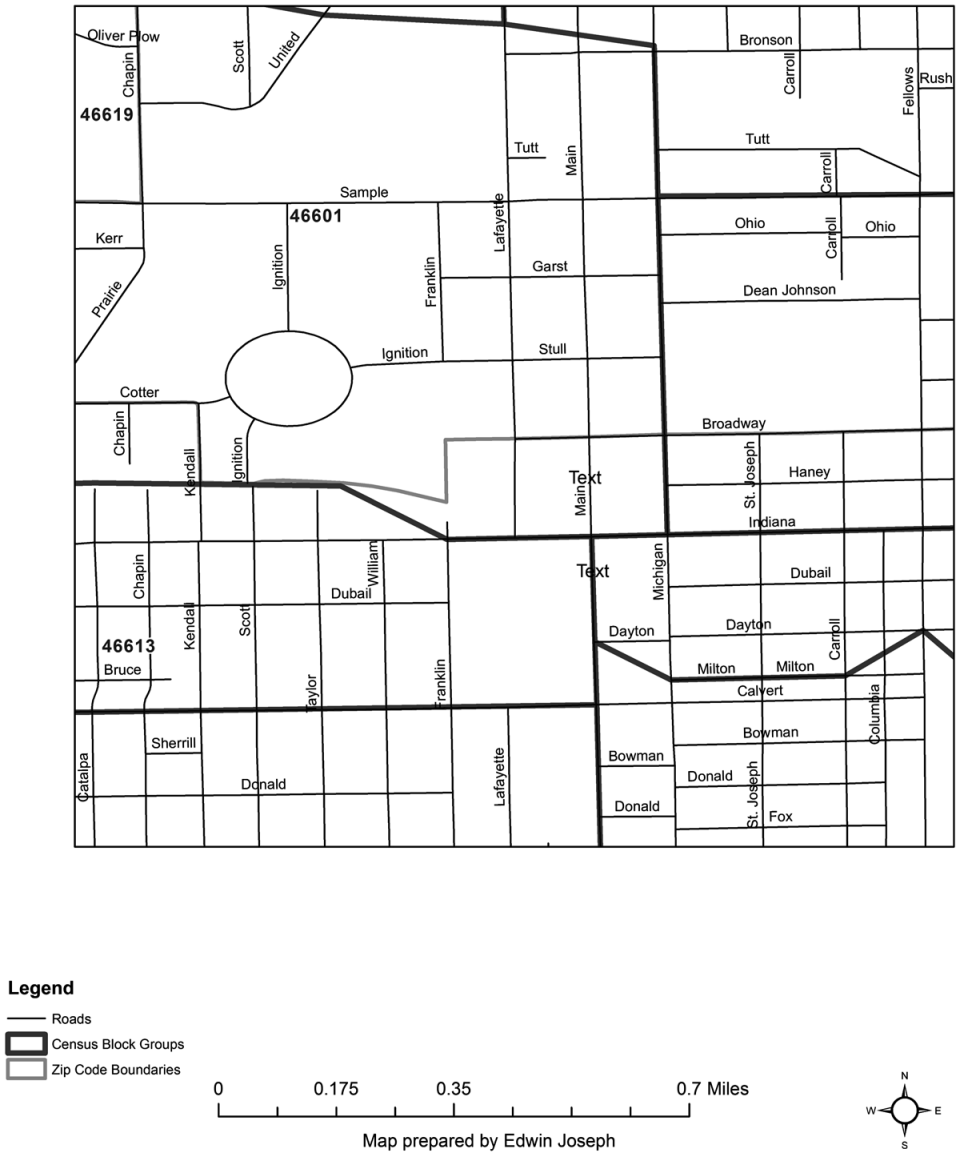
All amenities



NEW DIRECTIONS FOR A FUTURE SOUTH BEND

At the 2016 State of the City address, Mayor Pete Buttigieg declared that South Bend was at the midpoint of a decade that would go down in history as the most transformative period for the city in modern times (Catanzarite, 2016). The Mayor reported that in 2015, four hundred and thirty-three houses were repaired through a combination of code enforcement and strong community partnerships. The Mayor identified community partners, for example, social service providers, neighborhood representatives, respected pastors, nonprofit stakeholders, police officers and local, county, and federal law enforcement officials working toward stopping violence.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

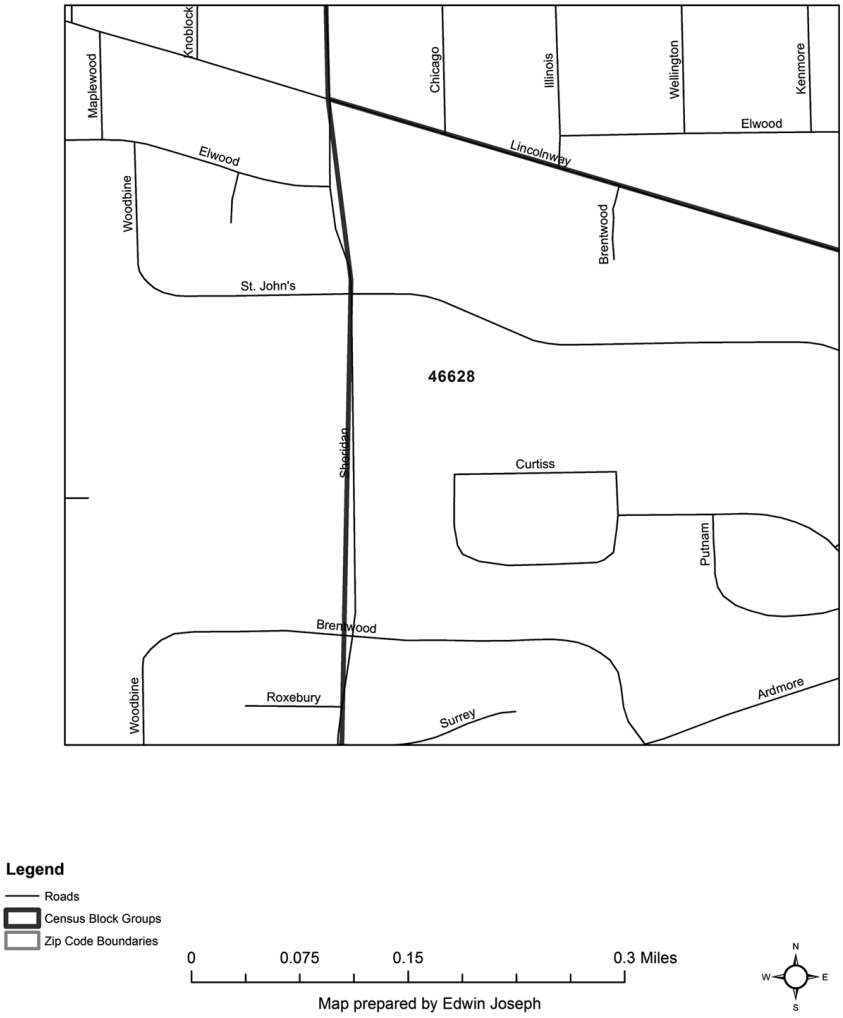


Figure 13. Residents with income below the poverty level (74.5%): Located roughly along West Sample St., & South Michigan St., zip code 46601 & 46613 (74.1%-76% poverty).

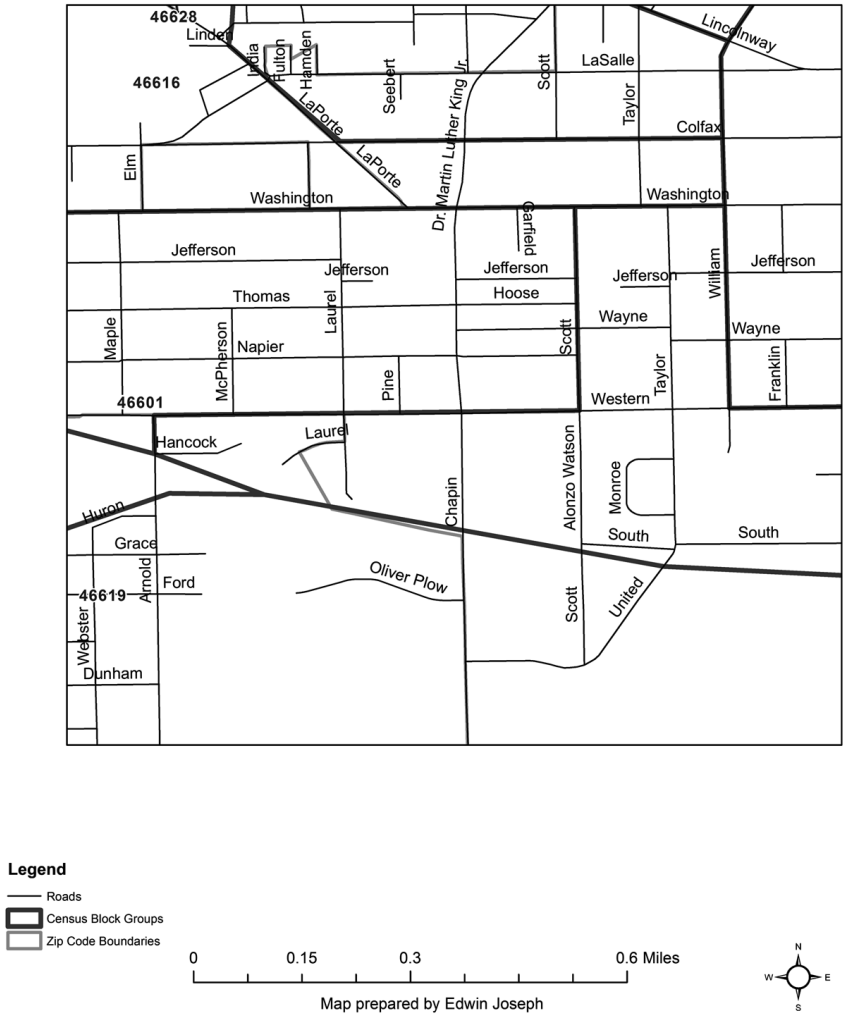
The 2016 address also promised funding ($700 million) to improve the community, empower people, and allow individuals to live the life of their choosing. The Mayor stated that investing in people and places meant investing in neighborhoods, and outlined the quality of life enhancements such as curbs and sidewalks, ramps, intersections, and wheelchair access completed. The city also invested in parks and recreation, and planted approximately 821 trees in 2015. A common theme in the address was the importance of including diverse community voices and perspectives, and focusing on unlimited imagination. In some ways, the mayor encourages imagination and sees it as a precursor to innovation.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 14. Residents with income below the poverty level (64%): Located roughly along Lincoln Way West, and Ardmore Trail, zip code 46628 (62.7%-64.6% poverty)

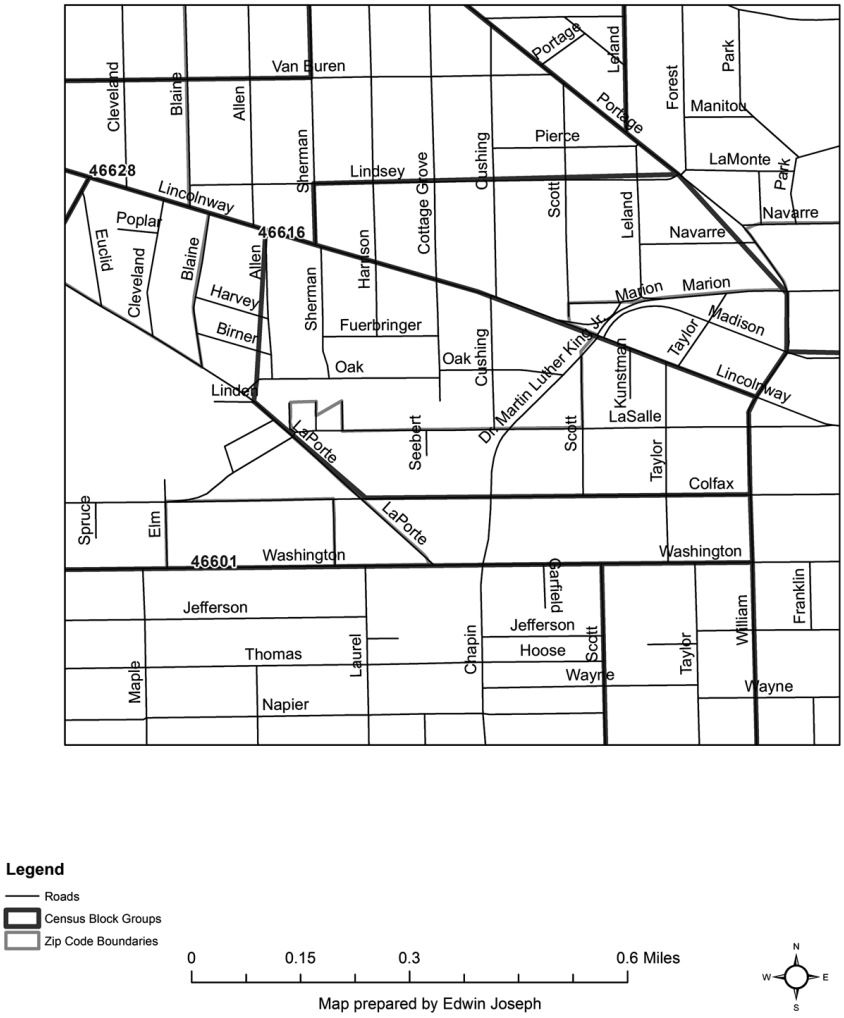


The city's interest in gardening was apparent in the Mayor's address when he spoke about his summer 2015 tour of a vegetable garden with a hundred 4th-graders. He also publically thanked the leadership of the St. Joseph County Health Department and the Reducing Obesity Coalition of St. Joseph County because South Bend was recognized by First Lady Michelle Obama as the first city in Indiana to meet all five goals of the "Let's Move!" initiative for healthy kids.

The city passed an innovative food truck ordinance, and created an online tracker that shows on a dynamic map where the food trucks are actually located, and is now working on an online tool to visualize vacant lots, so residents and potential investors or nonprofits could find ways to research and evaluate vacant land. These two initiatives demonstrate the need for expanding the use of GIS because the obvious benefits of GIS is the location factor. Knowing where things are, and how they change in space and time can be viewed in real time. This, however, requires dedicated programming, time, and effort.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 15. Residents with income below the poverty level (59.4%): Located roughly along West Washington St., & South William St., zip code 46601 (58.9%-60.8% poverty).



DISCUSSION AND CONCLUSION

GIS and GPS technology are indispensable but neglected tools. These spatial technologies have the potential to generate partnerships among food producers, volunteers, government and other institutions. Developing geographic awareness through collaborative mapping projects will help foster learning communities that can work together to develop sustainable urban garden initiatives—and may include the use of Free and Open Source Software (FOSS) as valuable tools to help satisfy an overwhelming demand for spatial information.

In South Bend, spatial technologies will help maximize food production because of the ability to visualize spatial relationships and patterns, which will contribute to building a more sustainable envi-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 16. Residents with income below the poverty level (49%): Located roughly within Lindsey St., Lincoln Way West, & North William St., zip code 46601 & 46616

ronment (ArcUser, 2010). Through spatial analysis, we will understand the relationship among factors such as, soil type, pH, soil moisture, and nutrient deficiency. We can generate maps identifying where things are, how they move, and other important relationships.

Spatial technologies will also connect community gardeners by introducing visual components to aid in site selection, planning, and modeling; and enable timely responses to issues that affect production. Integrating spatial technologies with urban gardening will provide an ideal platform for networking. As South Bend thrives to become a leader in sustainability, it has been shown how community participation will strengthen social relationships. South Bend needs to concentrate on growing more of its vegetables within the city. This will ensure healthier lifestyles and stronger communities. The aim is not just to improve health and decrease obesity, but create a more cohesive society with an equal distribution of incomes (Wilkinson & Pickett, 2009).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

GIS and GPS technology has proven to be a quick and efficient approach for acquiring field data. GIS therefore, has the potential to become the hub or major planning tool for urban sustainability in South Bend. When a GIS is combined with GPS, multimedia, and internet technologies, it provides a complete range of quantitative and qualitative research opportunities for future planning. Adopting these technologies would likely foster worthwhile sustainable investments, and would keep the momentum of GIS moving. However, the social, political, economic, and institutional climate must be supportive (North, 1990). A typical example of GIS in agriculture that is immediately applicable is pest and disease monitoring. Cell phones are now equipped with GPS, and a picture taken of a disease in the field can be crowdsourced and mapped in real time. Gardeners can seek information/solutions by uploading their images via community map servers where they can be viewed by experts.

There are many examples of communities transforming desolate landscapes into food oases. At Indiana University South Bend (IUSB), we recognize the importance of effective and sustainable urban land management practices, and have utilized geospatial technologies to map and monitor urban gardens in the city. As we look into the future we believe that the next wave of mapping technology would include AUVs (Aerial Unmanned Vehicles) for capturing landscape details that are otherwise unavailable to community gardeners. We believe that high resolution orthophotos (photographic maps) as overlays in Google Earth would help urban gardeners see the potential for online networking and collaboration. AUVs fitted with high-resolution visible-spectrum cameras and integrated GPS (Global Positioning System) are capable of acquiring overlapping aerial photos and elevations at garden sites. These would be invaluable for 3-D visualization, collaborative planning, and viewing temporal changes in the landscape.

It is hoped that in the near future, there would be more open access to city data so researchers would be able to share a platform that is built on collaboration. The current review of the spatial distribution of poverty in South Bend reveals a spatial pattern, but in-depth analysis was difficult because of incomplete and sometimes incorrect data entry from the data sources. Most of the analysis were limited to using on-line GIS resources that could not integrate new/external data, but simply reclassified in-house data, and generated outputs as static maps.

The extent of inner city agriculture can be easily mapped and monitored using crowdsourcing techniques. Crowdsourcing is an important data mining activity that taps into the collective intelligence of the public. Developing countries can take advantage of this platform to acquire data through user-generated media for example, blogs, Tweets, Wikipedia, Wikimapia, Facebook, and YouTube. GIS can be easily integrated onto these platforms. The integration of these services will enable the promotion of a network of food producers who can work together to alleviate poverty and malnutrition through community mapping and sustainable urban agriculture.

Chapter 59
Operation Sukuma-Sakhe:
A New Social Contract for Decentralized Service Delivery and Responsive Governance in KwaZulu-Natal

Ndwakhulu Tshishonga
University of KwaZulu-Natal, South Africa

ABSTRACT

This chapter explores the emerging new social contract that connects government departments, communities, civil society, and the private sector through Operation Sukuma-Sakhe (OSS) in the Province of KwaZulu-Natal (KZN), South Africa. This program is designed to expedite service delivery and development by addressing communal challenges such as poor or non-existent service delivery and lack of coordinated government programs and cooperative governance efforts. Social contract theory forms an analytical and conceptual framework to gauge the government's commitment through the OSS program in delivering decentralized services in partnership with communities and other development sectors. The effective functioning of OSS depends on the full and equal commitment of government, underpinned by a new social contract with other departments, the community, and citizens as both recipients and agents of decentralized service delivery. Primary data sources were interviews with OSS regional officials, supplemented by documentary data from the literature and state and local government sources.

INTRODUCTION

In South Africa the endemic lack of basic services not only impacts on standards of living, health, and well-being, but also affects the overall socio-political and socio-economic conditions of communities and ultimately impacts on the overall quality of life (Cebekhulu, 2013). The situation has led to a "massive crisis of delivery" (Zulu, 2013, p. 70) underpinned by gross poverty, high unemployment rates, and income inequality, and without quality and sustainable basic services, the poor will continue to sink into destitution and underdevelopment. Only a package of integrated structural reform can reverse this dire situation (Gumede, 2014). With the prevailing socio-economic challenges, communities are poor and

fragmented due to the lack of human and financial resources, and their poverty is aggravated by few of the available resources and assets being utilized for their own development and empowerment (Cebekhulu, 2013; Malala, 2015; Terreblanche, 2012). This unresolved service delivery crisis has led to escalating anger and frustration as people feel cheated out of their long-cherished hope of "liberation [that] would bring with it freedom from political oppression inflicted by racism with its attendant ills-poverty, hunger, homelessness, ignorance and diseases" (Zulu, 2013, p. 65). Indeed, service delivery that is non-existent or of poor quality remains an aggravating issue for South African development.

South Africa is currently engulfed by multiple challenges: poor service delivery, high profile cases of corruption, high cost of living, slow economic growth, high rates of unemployment, death on the roads, a high crime rate, and a threat to the independence of public institutions (Sunday Independent Newspaper, 2013). One could argue that the political center is disintegrating. South African citizens have long sought a democratically elected government which would effectively address their needs and aspirations (Thakahthi, 2000), and the failure to meet these challenges has triggered nation-wide strikes and demonstrations. President Zuma, during his State of the Nation address, dismissed the link between strikes and poor service delivery (2014, p. 14):

…the right to protest, peacefully and unarmed, is enshrined in the Constitution. However, when protests threaten lives and property and destroy valuable infrastructure intended to serve the community, they undermine the very democracy that upholds the right to protest. The dominant narrative in the case of the protests in South Africa attributes to government's failure to deliver on its development, democratic and service delivery mandate.

Zuma went on to argue that:

…however the protests are not simply the result of failures of government but also of the success in delivering basic services. When 95% of households have access to water, the 5% who still need to be provided for, feel they cannot wait a moment longer.

Zuma (2014) suggested that people's expectations could be addressed through a National Development Plan (NDP) that calls for the convergence of a capable state and an active and responsible citizenry. The NDP was adopted in 2012, with the aim of eliminating poverty and reducing inequality by 2030. This would require the South African Government to reconfirm the commitment made in its Reconstruction and Development Programme in 1994. However, South Africa still faces the triple challenge of poverty, inequality, and unemployment, challenges faced by all democratic administrations. The Zuma administration is focusing on five priorities: education, health, the fight against crime and corruption, rural development and land reform, and job creation (Zuma, 2014). Zuma acknowledges that the government cannot achieve these aims in isolation, but must work collaboratively with the business and employment sectors to increase South Africa's economic growth rates above 5% in order to create the much-needed jobs.

Development in South Africa faces three major challenges: the state's fiscal foundation, the capacity of the public service, and the international environment (Habib, 2014). Demands and expectations to deliver basic services are enormous but resources are limited. Nengwekhulu (2009) blames poor or

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

non-existent public service delivery on skill deficiencies and the situation is further exacerbated by rising unemployment levels, leading to communities going on strike over poor or non-existent services (Malala, 2015). South Africa is currently at a crossroads as it faces the challenging combination of pedestrian rates of growth, deepening inequality, stubborn poverty, and youth marginalization (Netshitenzhe, 2012). In reality, South Africa continues to produce poor-quality skills (Nengwekhulu, 2009), and even the quality of academic qualifications today leaves much to be desired. If South Africa wishes to be a developmental state and advance the dream as outlined in the National Development Plan, improving the country's human capabilities is essential. Improving human capability requires both government and citizens to embrace a human development framework as proposed by the United Nations Development Programme (UNDP, 1997, p. 15), which involves:

…the process of enlarging people's choices and rising levels of well-being … it is holistic, integrated process in which economic and political forces continually interact with one another in dynamic and diverse ways to improve the lives of and opportunities available to the poorest.to here

If South Africa is to achieve its NDP of sustainable human development, the UNDP (2000, p. ix) suggests the government needs to adopt a rapid process of redress, social reconciliation, nation building, economic growth with equality, and the sustainable utilization of natural resources. Since poverty is closely related to unequal development in terms of infrastructure, administrative capacity, assets, access to information, knowledge, and opportunities, the development of human capital should go beyond human resources to embrace the broader notion of educating the nation through capacity building programs (see Malala, 2015; Terreblanche, 2012).

This chapter explores the emerging new social contract among government departments, communities, civil society, and the private sector through Operation Sukuma-Sakhe (OSS) in the Province of KwaZulu-Natal (KZN). This program is designed to expedite service delivery and development, and focuses on addressing communal challenges such as poor or absent service delivery and lack of co-ordinated, co-operative government programs. KZN is South Africa's most populous province and remains predominantly rural. Dependency ratios and poverty levels are highest in the rural areas, although the greatest numbers of poor people and greatest poverty density are to be found in the major urban centers (BroadReach HealthCare, 2014). The province is confronted by multiple challenges such as poverty, lack of food, unemployment, crime, violence against women and children, and substance abuse. There are also health challenges such as heart disease, HIV and AIDS, and TB. Many of these problems are inextricably linked and therefore require an integrated approach (BroadReach HealthCare, 2014). OSS was initiated as a beacon of hope, and forms part of the provincial government's attempt to deal with socio-economic challenges.

Primary data sources for this study were interviews with OSS regional officials and OSS co-ordinators in the jurisdiction of KZN province, including non-government organizations such as BroadReach Healthcare (BRHC), the implementing agent. Interviewees were a politician, seven OSS members, two government officials, two community members, three community leaders and one member from civil society as well as one person from a vulnerable group. Secondary data were also obtained from books, journal articles and governmental policies and documents from both municipalities and the KZN Premier's office. From this limited sample the findings here are tentative and exploratory.

BACKGROUND

This study adopted social contract theory as an analytical and conceptual framework to gauge the government's commitment to the OSS program to deliver decentralized services, in partnership with communities and other developmental sectors such as civil society and the private sector. Social contract theory is grounded in related theories such as cooperative governance and intergovernmental relations (IGR). According to social contract theory, a government enters into a contractual agreement with its citizens. Social contract is also known as a theory of social order, which became popular in the 17th and 18th centuries (Marshall, 1998: 609), and the theory can be traced back to the ideas of Plato as an unwritten agreement between the state and its citizens that expresses rights and duties. Rousseau (in Marshall, 1998), for example, laid the foundation for the ideal contract, unfortunately with no real distribution of power, while Hobbes (in Marshall, 1998) argued that security and order for all citizens can only be achieved through a contract that requires all citizens give up their individual powers to a central power (the sovereign), in return for the state's protection of their life and property (Van Niekerk, 2001) has suggested that the social contract approach was developed in reaction to the belief in the divine right of kings. Social contract theory justifies the origin of the state being based on a contractual agreement among members of the society aimed at promoting the general good (Fox & Meyer, 1996).

The theory advocates popular sovereignty as the ultimate source of the powers whereby the ruler governs with the consent of the governed (Van Niekerk, 2001). Within the social contract, the state exists to provide collective goods and services on a non-profit basis, thus enabling the benefits of these goods and services to be distributed among all inhabitants, irrespective of race, religion, gender, or personal wealth (Venter & Thenissen, 2010). Through social contract theory, the government advocates that it "cannot do it alone", and so the private and civil society sectors, for example, form part of the governance equation. In a democratic social order, the state is created by contract, and hence its ultimate source of power is the people who, in turn, delegate their governing power to their representatives. Social contract manifests itself in the form of co-operative governance that shapes the nature of intergovernmental relations (IGR).

Both the notions of co-operative governance and intergovernmental relations (IGR) are contained in the South African Constitution of 1996. In this context, Chapter 3 of the Constitution (Republic of South Africa, 1996) lays the foundation for Cooperative Governance (CG) and IGR, and Thornhill (2002) argues that the Constitution establishes contractual relations amongst three spheres of government – national, provincial, and local – which are, however, distinct, interdependent, and interrelated (Republic of South Africa, 1996; Nkuna & Nemutanzhela, 2012; Thornhill, 2002). Despite the spheres of government being distinct and separate, they are also interdependent and interrelated and so they are unable to act arbitrarily against each other (Craythorne, 2006). The various spheres' interdependence can be viewed as the degree to which one sphere depends on the other in order to properly fulfil its constitutional functions (Tapscott, 2001), and this interdependence can also reflect a core relationship in which a particular sphere (national or provincial) has the responsibility of empowerment and oversight, and, under certain circumstances, intervention into the more dependent sphere (Craythorne, 2006).

A government that is strategically effective must align its policy framework and implementation, which can be enhanced through effective intergovernmental relations mechanisms (Ile, 2010). Through CG and IGR, all organs of the state and their respective spheres are obliged by law and entrusted *inter alia* to provide effective, transparent, accountable, and coherent government for the country as a whole. Importantly, the system of intergovernmental relations must ensure that all services for which the three spheres are individually or jointly responsible are administered effectively and efficiently (Thornhill,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2002). Through OSS, various sectors are called to account, and this entails not only the government machinery but also organs of civil society, the private sector, and people as the agents and beneficiaries of the program.) IGRs are important as they promote the mutual relations between all spheres of government and all organs of the state in South Africa (Kahn, Madue, & Kalema, 2011). In practice, intergovernmental relations relate to the geographical division of powers among the various spheres of government in the nation-state (Cameron, 1994). The division of power implies that each structure has a unique and independent role in the intergovernmental domain. Despite these constitutional provisions, Kahn et al. (2011, p. 65) have argued that:

…the relationship between the different spheres of government, both vertical and horizontal, is not always harmonious and does not lead to the promotion of democracy and service delivery as intended.

Intergovernmental relations have been defined in other ways by various authors. Wright (1988, p. 1), for example, has described the relationship as an interacting network of institutions at national, provincial, and local levels, created and refined to enable the various parts of government to co-operate in a manner appropriate to its institutional arrangements. Thus, intergovernmental relations encompass the interaction between the various levels of government (Siddle & Koeble, 2012; Thornhill, 2002) and sphere has an independent and unique role to play. For example, the local sphere is charged with the responsibility of delivering basic services and advancing its civic duties, while the provincial sphere deals with the coordination of public policies. Indeed, central to the notion of intergovernmental relations is the "interdependent relationship that exist[s] between various levels of government" (Siddle & Koeble, 2012, p. 58).

The importance of intergovernmental relations is not only the veins and life blood of effective, accountable, proactive and responsive government but also a panacea in the government's quest to deliver sustainable services in partnership with communities. Achieving government objectives efficiently and effectively depends to a large extent on the organizational structuring of the particular government (Tshishonga, 2012). Also important is the extent to which the different structures are able to co-ordinate their efforts in an organized manner within the spirit of intergovernmental relations. Intergovernmental relations refer to mutual horizontal and vertical relations and interactions between governmental institutions (Reddy, 2001). These mutual relations translate into actions and interactions, which enable effective implementation of the public service delivery programs. The term "mutual" in this definition may be misleading in cases where tension exists between and within the various government structures. Gildenhuys and Knipe (2000, p. 285) have defined intergovernmental relations as "a process by which governments seriously negotiate for power, money and problem-solving responsibilities. Thus, whereas constitutionally government structures may be obliged to mutually work together, the relations are often characterized by intense debates of negotiated power relations". Thornhill (2002, p. 36) has suggested intergovernmental relations reside within all the official actions and interactions amongst politicians and officials of national, provincial, and local spheres of government when they are performing their duties. Even though all spheres are constitutionally pronounced as "distinctive and independent" (Constitution, 1996; Thornhill, 2002), in practice this is not the case as the provincial and national spheres exercise control over local government, necessitated in part by the recent "incapacitated state of most local government structures" (Nkuna & Nemutanzhela, 2012, p. 358). Finally, Plano (in by Du Toit, 1998, p. x) defines intergovernmental relations "as continuous administrative political and legal relation between the various spheres of government including formal and informal networks that enable effective and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

efficient delivery of continuous negotiations for power and resources aimed at achieving government objectives in an effective and efficient manner". Thus, through intergovernmental relations, spheres of government are socialized to collaborate for a common good especially in using public resources to address socio-economic challenges. The next section provides the background of OSS as implemented in KZN province.

OPERATION SUKUMA-SAKHE AS A SERVICE DELIVERY MODEL

OSS engages members of the community to work hand in hand with the government to develop their communities. Currently OSS is being implemented in KZN province as part of a push for people to overcome socio-economic and health related challenges such as poverty, unemployment, crime, substance abuse, HIV and AIDS, and TB (Thekwnini Integrated Development Plan, 2012/13–2016/17). OSS encourages self-reliance by engaging communities in their own process of learning, growth, and change as they become part of the process of development services. OSS has five top priorities in terms of service delivery: rural development/agrarian reform and food security, creating decent work and economic growth, fighting crime, increasing education, and promoting health (KwaZulu-Natal Province, 2012). The project started in February 2008 under former President Mbeki's "War on Poverty" campaign in his State of the Nation Address. The campaign was launched in three presidential nodal areas, and was then adopted in 2011 by the Provincial Government as part of the KZN Flagship program. The Provincial Government relaunched it as OSS, which co-ordinates service providers such as government departments, state-owned enterprises, and civil society. OSS integrates these service providers as a collective that effectively fights poverty and assists communities to access the required services (KwaZulu-Natal Province, 2012).

OSS is a service delivery model that implements a comprehensive, efficient, effective, and quality service delivery. The model is designed to integrate services from government, NGOs and the private sector, together with contributions from a self-reliant society, in a sustainable manner. The project does not treat beneficiaries as passive recipients of services but as active participants who also look for solutions to issues that affect them. This service delivery model also affords individuals the opportunity to connect with each other and places them in a better position to make decisions for their individual and collective efforts towards a better life for themselves (KwaZulu-Natal Province, 2012).

Building Blocks for Effective Operation Sukuma Sakhe Program Operation Sukuma Sakhe as a Service Delivery Model

Through the Constitution of 1996 the delivery of sustainable services has become a right for every South African citizen. As contained in the Reconstruction and Development Programme (RDP) and other white papers, service delivery, especially to the poor and marginalized, is often linked to redressing the injustices and legacy of apartheid. Given the harsh realities of soaring poverty, sky-rocketing unemployment rates, and gross inequalities, the democratic government has committed itself to creating a responsible and people-centered society by addressing socio-economic challenges, as highlighted by the politician interviewee:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In South Africa rendering services to the poor is regarded as a means to address socio-economic challenges confronting the less privileged masses, more particularly those residing in rural areas. As a government we have learnt that top-down approaches to community development do not work; instead, such approaches consolidate the culture of dependency and culture of entitlement. Operation Sukuma Sakhe is an implementation model designed to fast-track service delivery in the province of KwaZulu-Natal.

OSS is in line with the RDP, which represents a paradigm shift from a separate development approach to an approach that is inter-sectoral and people-centered. The new approach for meeting basic needs is anchored to creating opportunities for all South Africans to develop to their full potential, while at the same time boosting production and household income through creating jobs, increasing productivity and efficiency, improving conditions of employment, and creating opportunities for all to sustain themselves through productive activity (African National Congress, 1994). This is to happen simultaneously with improving living conditions through better access to basic physical and social services, health care, and education and training for urban and rural communities.

OSS is anticipated to expand service delivery, especially to the needy and the unemployed, as part of the strategy of addressing poverty and deprivation. War on Poverty is a radical campaign aimed at eradicating poverty. For a society to be self-reliant, KwaZulu-Natal Province (2012, p. 1) notes that:

…is it important that its members are not passive recipients of services but that they participate actively in local interventions which will have an impact on their lives. Through community participation, individuals are able to connect with each other and they will be better placed to make decisions in terms of their individual and collective efforts towards a better life for themselves.

Lack of skills, capacity (ability), and capability (competency) has led to poor service delivery. The government's failure, especially at the local level, has contributed enormously to widespread protests and demonstrations. It is evident that the government is overburdened by a huge population in dire need of basic services, as described by a provincial official behind OSS:

For OSS to be effective in delivering services and dealing with problems facing the vulnerable groups such as children, the elderly, sick, women, you, unemployed, etc., all stakeholders should contribute either through participation in decision making, planning or financial resources.

Gumede (2009 has pointed out that unemployment, poverty, and lack of opportunity are direct results of apartheid, and so the social welfare net must be extended to the most vulnerable, who are unlikely to benefit even if the economy grows to doubles digits. This approach must be one of the pillars of any new consensus in South Africa.

The government can best tackle these multiple predicaments by enabling the bureaucracy to operate through intergovernmental relations. It could be argued that OSS is a strategy recommitting public servants deployed within the three spheres of government and across different departments, working towards the creation of a society free from poverty, unemployment, hunger, and starvation. In addition, OSS develops and deploys skilled and competent people, as opposed to employing cadres who are party loyalists. Thus Section 195 of the Constitution 1996 cautions that public administration at all levels

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

must incorporate democratic values and principles, promoting efficient, economic, and effective use of resources, and using good human resource management and career development practices to maximize human potential.

SOCIAL MOBILIZATION OF STAKEHOLDERS THROUGH SOCIAL CONTRACT

Social contract is the hallmark of liberal democracy. In a liberal democracy, people are afforded the right to vote for their own representatives, through either proportional representation (PR) or the constituency system (Phillips, 2007). Through PR, people vote not for their representatives directly, but rather for political parties who then assume the responsibility of enlisting their candidates. PR is an electoral system based on the idea of representing parties and is associated with government by coalition (Van der Waldt, 2001). Social contract plays both a mobilizing and uniting role in intergovernmental relations, and hence the sovereignty of the state is by the people. Since power is a contested notion, people – either as individuals or through representative structures – wrestle to influence political decisions as part of governance. Social contract is capable of making governance possible by ordering groups, community, and other structures in a society to act collectively for the common good (Jonker, 2001).

Using a social contract approach, OSS brings all spheres of government and its departments or units together, including the private sector and community members. The rationale behind OSS is to democratize the services that government is obliged to offer its citizens. The program has the potential to include both primary (people) and secondary (public, private, or civil society) stakeholders. This application of a social contract approach is premised on galvanizing society, with people charged to hold the state accountable. The establishment of OSS is based on the paradox that a community may participate regularly in informal social interactions and yet still be socially isolated from the valuable resources in the wider city or region. Most of the rural and township communities find themselves in a quandary, aggravated by the social evils such as poverty, unemployment, and income inequality, coupled with the scourge of HIV/AIDS (Terrenblanche, 2012). Thus, delivery of basic services such as water, sanitation, and housing have become a safety net for the poor and disadvantaged who, without government support, are likely to slide into socio-economic deprivation and destitution. One of the strengths of OSS is to bring together affected communities and public institutions who, by law, are charged through their ministries and sectors to deliver services to the people. A provincial officer summarized this approach:

The War Room by its very nature provides a forum whereby both primary (people and communities) and secondary (spheres of government and departments) meet in order to deliberate on how effective programs such as Sukuma Sakhe could be instrumental in addressing community based challenges, hence Sukuma Sakhe in Zulu means "stand up and build".

Importantly, Sukuma Sakhe operationalizes CG and IGR, in which social contract can be envisaged as both glue and vehicle to deliver services earmarked by the program. In this regard, social contract through OSS connects the poor to the mainstream resources and improving access to available economic opportunities. Thus, OSS makes people aware of the available services and uses the War Room as a forum to engage stakeholders on the best alternative to resolve the identified challenges. In this regard,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the OSS program mobilizes resources (both financial and human) and better positions itself to serve the needs of the people, especially the indigenous. Narayan (1999: 13) added that "when power between groups is asymmetrically distributed, it is cross-cutting ties, the linkages between social groups that become critical to both economic opportunity and social cohesion".

A government official highlighted the importance of people and communities in rolling out the OSS program:

Through program such as OSS, different spheres of government are cascaded to where people are, and obliged to enter into a social contract in which their commit to take people and communities' issues and concerns more seriously. In the weekly meeting known as "War Room", various stakeholders, including the concern departments, as matter of urgency have to report back on what they have done regarding addressing the identified needs.

The South African Government is structured into specific departments, each with specific responsibilities, even though all spheres are interrelated and interdependent. The interdependence of government spheres is the degree to which one sphere depends upon the other to fulfil its constitutional rights to serve its citizens (Tapscott, 2001). The following are comments from different stakeholder interviewees:

KZN provincial officer: through OSS, communities are mobilized around common issues and such responsibility could not be relegated to government but the affected people should be part of the solutions.

Community leader: as community leaders we are often blamed for lack of services, our lives are being threated on a daily basis and our houses are being burnt. The involved community members and their respective structures will not only make people bond to each other but will enable them to mobilize themselves to challenge the government, more particularly when it comes to corruption, mismanagement, and abuse of power.

Civil society organizations: through OSS, government will cease to be the only player in the fight against poverty, unemployment, and income inequality. In most cases you find that our mandate is undermined by the lack of human and financial resources; at least we work in partnership with government and vulnerable people and communities.

Vulnerable groups: most of the program, especially those designed by government, bypass us if we are disabled. We might not have financial resources but we could also contribute through participation in decision making and labor. Our involvement is important because without us such initiatives would not be sustainable and there will not be any ownership of development processes.

In the context of OSS, social capital is seen as a vital ingredient in driving integrated community development, more particularly in attending to the needs of mainly children, elderly, working poor, youth, unskilled and illiterate, women, disabled, and sick (Province of KwaZulu-Natal, 2012). Effective social capital could also have economic benefits for the poor.

Activation of Co-Operative Governance and IGR Through Developmental Partnerships

A literal understanding of partnering and partnership is often associated with grouping people or communities to achieve common good. Partnership has emerged in the development sector as a strategy to deal with problems of poverty and service delivery. Lombard and du Preez (2004) postulated that the primary goal of partnerships in social development is to strategically join efforts to reduce poverty, address inequality, and social injustices through the redistribution of resources, and through social and economic development programs. Harrow (2004) defined partnerships as formalized structures that bring together institutions and organizations to address an identified problem or work towards specific organizational goals. Painter and Clarence (2001) noted that fundamental characteristics of partnerships include a focus on organizational rather than individual relationships; evident working boundaries; relatively stable composition; and membership defined by formal agreement. Most of the interviewees stressed the importance of partnership to the OSS program, as illustrated by the following comment from a provincial Task Team official:

Operation Sukuma Sakhe is a program based on partnerships whereby various spheres of government, together with departments, are brought together with local people and organs of civil society, not only to identify needs and challenges but to explore alternative solutions pertaining to challenges besetting our communities, especially in the rural areas.

In essence, OSS could be understood as a service delivery framework that brings together government departments, civil society, the private sector, and vulnerable communities to engage in development. If implemented effectively, therefore, OSS could be instrumental in closing the gap between government and the people by creating productive partnerships. This in turn could deepen social contracts based on accountability and commitment, making KZN province free from poverty and underdevelopment. Partnerships are perceived as a salvation to the many-sided ills and development challenges facing public sector institutions and organizations, organs of civil society, and the private sector alike. This is better explained by partnership approach whereby the various stakeholders such as public, private or community-civil society forge inclusive and participatory relationships as agents to deliver sustainable services. The proponents of this approach believe that there is a single best solution for organizing labor, raw materials, and capital in order to manufacture and distribute goods and services (Hollingsworth, 2004). In this context, Fowler, (2001, p. 17) has redefined partnerships as:

Working together to accomplish agreed results and accepting joint responsibility for achieving them; partnership requires defined mutual roles and responsibilities- as covenants not contracts and partnership is about trust, respect, integrity, accountability and equality.

It could be concluded from these descriptions that partnerships evolve over time. For OSS to benefit from the partnership arrangement and accomplish positive changes, the government should cultivate a balanced power relationship that entails reciprocal respect for fellow partners. As one citizen said:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

I have been attending the War Room forum where Community Caregivers give their feedback, but as community representatives, at times we have nothing to contribute. The program itself made us the receivers of services offered by the government and private sector, without much contribution from the community.

In most cases effective partnerships engage partners equally to assume and to exercise their rights in decision-making, as well as taking responsibility for their actions. Through OSS, citizens are encouraged to know their human rights. Community participation plays a pivotal role in OSS official documents since it creates a platform where communities can discuss their concerns about government services and topics such as staff attitudes, professionalism of civil servants, efficiency, access to services, etc. (KwaZulu-Natal Province, 2012). The lack of a clear role has resulted in people shifting service delivery responsibility to the government without making any contribution. This in turn has created a dependency culture in most of the communities in KZN. In addition to using partnerships to deliver services, the OSS program could help to mitigate the widespread dependency syndrome and entitlement mentality, which are so detrimental to communities. In order to avoid the dependency syndrome, OSS should be approached and implemented through an asset-based methodology developed by Kretzmann and Mcknight (1993), whereby focusing on people's strengths, talents, and abilities should lead to sustainable community development.

Enhancing Active Citizenship Through Communities of Practice

If community development is to benefit the primary stakeholders, people and communities need to take an active role in the development process from onset to completion. Active citizenship would not only facilitate centralizing power within communities but it would also unlock people's energies towards ownership and sustainability of the development processes. In this regard, an OSS Task Team member highlighted the importance of community participation:

OSS should be understood not as a government program but as a community-run initiative where government and other stakeholders are brought on board to engage with poverty-stricken communities regarding the possible ways in which their challenges can be addressed. Our people should be active citizens, as opposed to being passive recipients of government handouts.

One of the departmental officials commented on the role of OSS as a poverty and service delivery model:

The program should recognize under-utilized resources within local communities in order to mobilize empower and energize people, which could result in citizens gaining access to opportunities to influence decisions affecting their conditions of life.

This chapter differentiates between deeply active and passive acts of citizenship, arguing that the former requires people to take an active role in both governance and development-related activities, while the latter relegates people to a passive, inactive role whereby they wait for the government to provide services to them. The African National Congress (1994) distances itself from providing goods and services to a passive citizenry and embraces active involvement as part of increasing people's and communities' empowerment. One of the community members aptly said:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

As a community we should get involved, since the people who are affected by poverty are mainly the unemployed, those with HIV/AIDS, our elderly, youth, and the disabled, and this is good enough for us to take a leading role in development initiatives aimed at empowering and uplifting us.

OSS is a community-based forum whose agenda is met with active citizenship and heightened civic participation of members (Valtonnen, 2008). In the context of the program, Hart (cited by Mngxitama, 2006, p. 164) has argued that "citizenship alone does not guarantee living rights, and without basic livelihood guaranteed the promise of citizenship remains hollow". Klausen and Sweeting (2005, p. 214) associate direct involvement as an obvious solution to the problems of "democratic deficit".

ACCOUNTABILITY, MONITORING, AND EVALUATION

OSS involves multiple stakeholders, and hence accountability, monitoring, and evaluation are important facets of the program. The stakeholders meet monthly to report on the project's progress, and any who are absent are reported to their supervisors and superiors and are reprimanded. This process both creates and reinforces the program's formalization and institutionalization. Community representatives, such as ward committees and traditional leaders, are obliged to give feedback to their respective communities. Monitoring and evaluation (M&E) plays a crucial role in consolidating lessons learnt from the program. However, due to constant change of stakeholders, including community people and officials from government departments, it has proven difficult to engage stakeholders in rigorous M&E of the program. Government officials highlighted that OSS is more reactionary to the needs of the people and the communities, which makes it impossible to effectively monitor and evaluate the program's activities. KwaZulu-Natal Province (2012, p. 33) highlighted the importance of M&E in the context of OSS:

Monitoring is defined as the routine collection of data to measure the progress made towards the achievement of OSS. In the case of OSS, monitoring entails the use of selected indicators to track inputs, processes and inputs. Through this mechanism, the different Task Teams are able to identify gaps on in the process and adjust existing activities to reach the revised targets and outcome.

Monitoring is ongoing while evaluation is often conducted at the end of the program. Importantly, KwaZulu-Natal Province (2012, p. 33) describes evaluation as:

…about measuring the impact of the intervention as one will need to determine whether the action taken has made a difference to the beneficiaries' lives. Evaluation is also a yardstick with which to measure what has been completed and what still needs to be done, as well whether additional resources as required.

Accountability through M&E should not only decentralize decision-making processes when it comes to OSS projects, but should also help participants working in partnership with other stakeholders adhere to the principles of Ubuntu, such as respect, love, humility, and solidarity. The success of OSS decision-making processes should not be left to spheres of government and its departments but should galvanize a sense of responsibility and ownership. Gran (1983, p. 23) has argued that, for a program like OSS to be people centered and managed, it should emulate what he calls a:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Small based organisation with a flat or horizontal decision making structure, open membership and decision-making procedures geared to ensure consensus. Base organisations should have as their principal task the conscientisation and education of the members with a further view to enabling them to fulfil their roles as active and socially responsible citizens.

In essence, the implementation of OSS strategy is anchored on empowering the poor and deprived and to conscientize the political elites about their situation and the possibilities available. OSS is centered on discouraging dependency by adhering to the golden rule of development as articulated by Burkey (1993, p. 211): "Don't do anything for people that they can do for themselves". In order to increase organizations' responsiveness, Rondinelli (1983) argues that organizations should be better structured and more sensitive to pressures from their environment, and they should provide incentives that reinforce and reward staff performance that satisfies the needs of their clientele.

Opportunities for Communities Through OSS

OSS, together with other proposed programs such as One Home One Garden and Area-based Development and Management (ABDM), are government initiatives aimed at addressing some of the challenges identified above. In 2005 the former President Thabo Mbeki introduced the Community Development Worker Programme in order to speed service delivery and devolve resources at a local level.

OSS is a service delivery model with the potential to activate intergovernmental relations by bringing together all spheres of government, including various departments, to a common space under the auspices of "War Room". It is a brand which says to citizens that government cannot go it alone – the community must stand up and join government to rebuild the fabric of society (Mkhize, 2012). From this articulation OSS signals a paradigm shift, no longer treating people who are physically and mentally disabled as passive recipients of handouts of services. If affected communities are to benefit from a program such as OSS, communities should be active participants and their efforts should complement those of the government. Indeed, OSS reflects the definition of community development put forward by the United Nations:

…community development embraces the 'processes by which the efforts of the people themselves are joined with those of government authorities to improve the economic, social and cultural conditions of communities, to integrate these communities into the life of the nation and to enable them to contribute to national progress (Ferrinho, 1980, p. 40).

The OSS program takes an inter- and intra-sector approach to community development, operating at community level. The main thrust of project Sukuma-Sakhe is to engage every member of the community to embrace and accept that government alone cannot bring about development (Ngidi, 2012). Democracy entails taking responsibility for our own lives. The government wishes to inculcate a culture of self-reliance through OSS, while at the same time acknowledging that a community is built by each and every member of that unit. OSS must be understood within the context of "community of practice" (Wenger, 1998 in Ledwith & Aspringett, 2010).) if it is to benefit its stakeholders. These communities of practice involve people mutually sharing insights and gaining new knowledge, engaging in learning, and creating new meanings together. Through OSS, government is able to provide services in an integrated and co-ordinated manner, as was emphasized by the official responsible for implementing OSS:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The reality is that our provincial government has various programs as well as its department; unfortunately not all its citizens are aware of these services. Some people due to poverty and transport cost are unable to access available services and OSS is from the side of government a golden opportunity to ensure government through its spheres and department reaches the people and engage on issues relating to the best strategies on how to deal with these multiple challenges.

OSS provides the opportunity for communities and their leaders to partner with government and other stakeholders to make meaningful difference in service delivery at community level. A community leader described this process:

One of our tasks as community leaders is to mobilize and conscientize people to be active and responsible citizens, thus citizens who do not only demand services from the government without having something to contribute especially in building interdependent communities as opposed to dependent and passive communities who wait for government handouts.

Civil society organizations are therefore accessing opportunities to network and partner with government departments and stakeholders operating in the ward (KwaZulu-Natal Province, 2012).

CHALLENGES CONFRONTING THE IMPLEMENTATION OF OSS: THE ENTITLEMENT CULTURE AND DEPENDENCY MENTALITY AMONG COMMUNITY MEMBERS

A long history of colonialism and apartheid not only left people marginalized and excluded from the mainstream socio-economic and political participation, but it also created a culture of entitlement among the poor and disenfranchised. With regard to the marginalization of native people, Mashele and Qobo (2014, p. 2) argued that "apartheid could not be secured without their total economic disempowerment. This meant that the natives had to be deprived of their means of livelihood in order for them to be transformed from their conditions of self-sufficiency into purchasable and exploitable labour".

KZN is one of the poorest South African provinces, with rural communities feeling the brunt of underdevelopment (Twenty Year Review, South Africa, 1994-2014). Rural communities in KZN are not only confronted by the "evil triplets" of poverty, unemployment, and income inequality, but it is also one of the provinces with the highest number of people affected by HIV/AIDS (Terreblanche, 2012). Dire poverty exists mainly in the Eastern Cape and KZN, where more than half of the population, mainly women and young people, live in households with an income less than 300 Rand per month (Twenty Year Review, South Africa, 1994-2014). Cebekhulu (2010, p. 119) has argued that:

…the endemic lack of basic services impacts not only on standards of living, health status and well-being but also affects the overall socio-political and socio-economic conditions of communities and therefore impacts on the overall quality of life the scourge of could not be secured without total economic disempowerment but also engendered, both people and communities.

The ingrained sense of entitlement has devastating outcomes on people and negative impacts on their communities. Such a mentality deprives communities, especially the poor, of partaking in their

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

own development, while their lack of participation gives politicians and community elites an upper hand when it comes to budgeting and resource acquisition and allocation.

OVERBURDENING CHALLENGES VERSUS RESOURCES AND CAPACITY

The majority of South Africans have been waiting patiently for socio-economic transformation since 1994, when the RDP was introduced. Eradicating poverty has become a major political, social, and moral imperative for citizens. South Africa has also made international commitments to eradicate poverty by adopting the Millennium Development Goals (MDGs) (Davids, Theron, & Maphunye, 2009). However, these commitments are not easy to implement. KZN is the second most populous province in South Africa, with an estimated population of 10.2 million people (Twenty Year Review, 1994-2014) that is an enormous challenge for a province with limited resources. The South African National Burden for Disease study of 2000 estimates the average life expectancy in the province at 52 years (Province of KwaZulu-Natal, 2013, p. 5), with the main causes of mortality associated with poverty and underdevelopment, HIV/AIDS, tuberculosis (TB), parasitic disease, and perinatal and maternal and malnutrition.

Statistics for KZN paint a dire picture. The 2008 Human Sciences Research Council (HSRC) South African National HIV prevalence, incidence, behavior, and communication survey results put KZN above other provinces with a 15.8% HIV prevalence rate. The survey also found that the HIV/AIDS burden is carried by the female population, where 1 in 3 females aged over 25 is infected. The second leading cause of mortality is TB, with diagnoses increasing from 98,498 in 2004 to 109,556 in 2007 (Province of KwaZulu-Natal, 2012, p. 1), representing a caseload of 1,054 cases per 100,00, five times above the epidemic threshold described by the WHO. Of these TB infections at least 70% are co-infected with HIV (Province of KwaZulu-Natal, 2012, p. 1). The emergence of drug-resistant TB, with a higher mortality rate than conventional TB, has made matters worse in the province.

KZN has a large population and the highest HIV/AIDS and TB infection rates in the country. It is against this background that OSS finds itself facing challenges of implementing the project: many in the province are vulnerable, illiterate, or semi-skilled, and hence many people may not be able to participate in their own development. It is obvious that the province is poverty-stricken and has scarce resources and capacity to implement a project of this magnitude, even though it has good intentions. One of the community representatives in the task team described the situation:

Government and its municipalities have a bad record in delivering services. People in the communities have urgent needs for basic needs and want them now and become very impatient, hence the service delivery protests.

The issue of trust among other stakeholders, particularly the beneficiaries, is fundamental to the implementation of OSS within communities. Mistrust develops from poor service delivery and this tends to hamper the implementation of projects, especially those which work in partnership with the government. Indeed, the erosion of service quality is one of the reasons that public trust in the government is declining (Roberts, 2005), as highlighted by a government official:

Once the needs are identified and prioritized, respective departments are charged with the responsibility of ensuring that services are offered. Unfortunately the urgency to address community needs is met

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

with bureaucracy where certain procedures, protocols, and policies have to be followed before financial resources are released, more particularly infrastructural services that require huge funding.

Most of the department's officials interviewed were optimistic about the institutionalization and implementation of OSS as a program, highlighting its potential to conquer challenges such as poverty and unemployment. It became clear that if the program is to achieve its developmental and service delivery mandate, the culture of dependency and the entitlement mentality should be overcome and replaced by self-reliance and interdependence among the people.

FUTURE RESEARCH DIRECTION

Through the case study of OSS, this chapter has demonstrated the program's potential to not only deal with service delivery deficit, but also to partner with various stakeholders interested in mitigating the effects of socio-economic challenges. Thus, institutionalizing and benchmarking OSS as a service delivery model is a decisive and giant commitment by the provincial government of KZN. Future research could comprise a comparative study aimed at gauging the impact of the program to the participating and non-participating communities. Such a study would not only highlight the lessons learnt, but could also be instrumental in developing a model that balances the delivery of services through the convergence of active citizenry and an effective state.

CONCLUSION

If a government, especially local government, is to be effective and efficient in delivering sustainable services, it needs commitment to the ethos of good and responsive governance. This entails dealing with the evil triplet of poverty, unemployment, and inequality. Various structures and forums have been established since democracy was introduced, with the aim of facilitating, entrenching, and enhancing the effective functioning of government; however, these programs have had minimal success. Such failure has resulted in mistrust of the government and widespread strikes and demonstrations.

This chapter has examined Operation Sukuma-Sakhe (OSS) as a service delivery model aimed at curtailing people's dependency on the state and addressing the socio-economic challenges in the province of KZN. These challenges include poverty, unemployment, inequality, TB, the scourge of HIV/AIDS, as well as poor infrastructure. Thus OSS is seen as a program that can fight crime, educate, and facilitate health. OSS has the potential to not only activate intergovernmental relations for service delivery but also act as vehicle to reconnect government and people for the common good. Through OSS the efforts of the government and its various spheres and units are united with those of the people and organs of civil society to forge communities of practice. The success of the OSS will be manifest as active and genuine community participation, and this should be promoted and encouraged amongst all stakeholders.

This study found that the effective functioning of OSS depends on the full commitment of government, underpinned by a new social contract with various spheres and departments, communities, and citizens, as both recipients and agents of service delivery. Despite the stakeholders' commitment and political will, values such as integrity and honesty, as well as constant feedback, are fundamental to the program's effectiveness, efficiency, and proactive implementation.

Chapter 60
Foreign Land Acquisitions: Household Livelihood With Some Evidence on Nigeria

Ben E. Aigbokhan
Samuel Adegboyega University, Nigeria

Kehinde O. Ola
Samuel Adegboyega University, Nigeria

ABSTRACT

This chapter focuses on the impact of foreign land acquisition on the livelihood of the host communities. The chapter investigates Presco Industries, which has been in existence for the past 23 years in Obaretin and Ologbo Estates in Edo State. The impact on employment, entrepreneurship, community relation, environment, and farming, which are the main sustenance of rural communities, are also considered. The result of the Binary Probit Estimator employed shows that the existence of the company in the communities has not offered any significant impact on the livelihood of the people. All indicators of economic wellbeing are not significant for all the households. Therefore, there is need to incorporate the host communities' economic sustenance into the programmes of large-scale agricultural business before land acquisition.

INTRODUCTION

The means to economic well being of African people determine their livelihood. In traditional African society, the people are mainly farmers. Farming provides all live support for the people ranging from food supply to medicinal herbs. The early 1980s saw many African countries entering into extreme poverty trap with unemployment and stunt economic growth characterising their economies. The crises occurred as a result of world economic glut in which Africans became the major sufferers as they were producers of primary products with high elastic demand. Their foreign earnings depreciated heavily and they became entangled in loans from various financial institutions both at home and abroad. The government could not meet the demand of the economy which resulted in excessive cutting of government expenditure cum with high corrupt practices.

The subsistence farming commonly practised cannot sustain the households' needs because the households became the major recipients of the effect of the economic hardship. Recent statistics reveals that over 70.0% of Nigerians are poor and very high in the rural areas where large number of people resides. The rural areas have abundant supply of arable land that can be used for farming activities but the use of crude farm implements make this unreliable. The livelihood of the people can be improved through cultivation of the land and this can be achieved through large scale use of the land. The emergence of large scale land users for agricultural activities provides the opportunities for rural households to have their livelihood improved. Advantageously, they are the major suppliers of the arable land to the users. They can offer their land in return for employment, increased agricultural productivity, and increased income earnings.

The focus of this chapter is to examine the impact of foreign land acquisitions on the livelihood of the host communities. To achieve this, the chapter will investigate the impact of Presco Industries Limited on the livelihood of the people of Agbomoba and other neighbouring communities in Edo State. The company acquired 18,000 hectares of land in the communities 23 years ago and intensive cultivation of the land for palm trees and palm oil production began 2001. The chapter achieves the following objectives: to identify the contribution of Presco Industries in terms of gainful employment; to examine whether the presence of Preso Industries has created social fragmentation in Agbomoba and the other communities; to examine the long term viability of Presco Industries in the communities; and to identify the possibility of Presco Industries enhancing even development in the communities.

BACKGROUND

Large scale land acquisition deals with acquisitions of several thousands of hectares of land for agricultural activities. This has become a common phenomenon in the recent times with demand rising from three major factors: food security for the citizens of the investing countries; energy security as a result of European Union's energy policies of capping greenhouse gas emission and other climate change incidents and therefore the need to produce bio- fuels; and the financial returns. Sub Saharan Africa has abundant land supply which is cheap in nature compare to elsewhere in the world. The cheap nature of this land comes from the fact that their money is highly depreciated (Brown, 2013). The continent has the largest reserves of arable land in the world (Wouterse et al, 2011). The total land deals in Africa alone accounted for over 134 million hectares of land in 2012 (IRIN, 2012).

Africa has large labour force in agriculture with 80 million small scale farmers supplying 95% of African food needs (Sindayigaya, 2012). The people of Africa are specially noted for farming. More than half of the sub- Saharan Africa involve in farming and in countries such as Burundi, Uganda, Rwanda and Burkina Faso, it is as high as 40% - 50% of the population (Block, 2010). It accounts for 32% of the gross domestic product and 65% of the labour force. There is low productivity and this comes from declining real prices on world market for agricultural exports; and from protectionism in countries that are members of Organisation for Economic Cooperation and Development. African countries are plagued with low income earning activities and there is high need for investment that will create avenues for rapid growth.

Large scale agriculture investment on land can provide means to end the problems of poverty and unemployment. These large scale acquisitions of land for agricultural activities can create sustainable economic development through the proceeds derived from the leasing. It will also provide employment opportunities and technology transfer that has hindered large scale utilisation of land for farming activi-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ties in Africa. This increases agricultural productivity of the host countries; although this depends on how the host countries are able to hold the investors accountable. Evidence from Tanzania shows that large scale usage of land for agricultural activities by Green Resources in Tanzania, (a firm operating tree plantation), employed some local people as permanent and casual worker (Larsen, 2012).

There is possibility also that the presence of these investors in land may not lead to improvement in the livelihood of the rural people in terms of wealth generation; employment creation and unemployment reduction. This can come in the form of low labour retention as farming become mechanised (Brown, 2012). Stickler (2012) reveals that large scale agricultural activities generate low employment and low earnings in Uganda; and to when people have small holdings they are worse off.

They are associated with high capital intensive production with few labour demands. In the same vein, the produce may not be meant for host countries and host communities. The target may be solely for home countries which will lead to non- availability of the produce in the local markets in a way that will generate earnings for the rural people. Uganda's experience confirms this assumption. In that country, Stickler (2012) observes that large scale agricultural activities generate low employment and offer low earnings compared to what the people should have earned on their small farm holding.

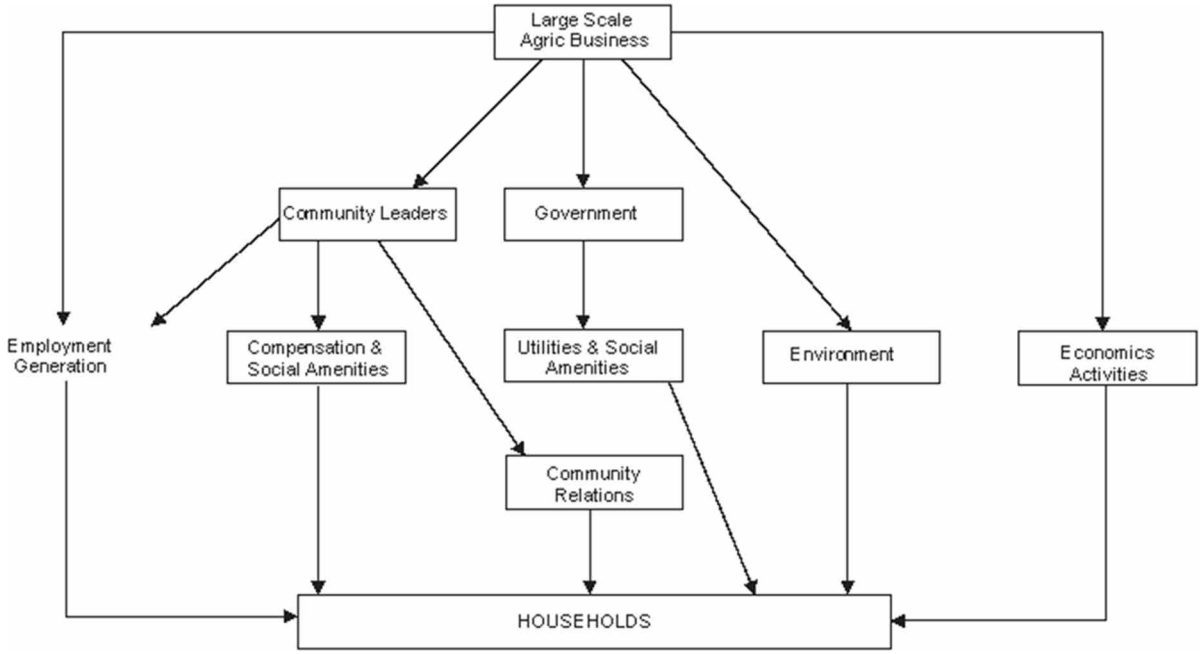
It is a notable fact that there will be loss of farmlands to rural people because the large quantities of land under negotiations or already negotiated ones are those found in fertile land with water supply access and crop yield is relatively high; and additional inputs such as fertilizers, seeds, infrastructure and know- how will create abundant yields (FAO Report, 2012). These are the land already under cultivation by rural farmers and their livelihood is enshrined in whatever proceeds are derived from the produce. Since they live and work on the land, they have to relocate to other lands where the conditions prevailing in the previous ones may not be available and therefore they are reduced substantially to dependants.

These problems necessitate the need to investigate the impact of foreign land acquisitions on the rural households' livelihood. Nigeria is a potential target for the various seekers of land for agricultural practices and the present weak land institution in the country calls for a complementary effort to provide contractual modalities that balance the need for investment security and the imperative to protect poor farmers' access to land and improve their livelihood. What is the essence of land acquisitions in Nigeria if the livelihood of the people remains stagnant or depressed? Land acquisition should serve as economic empowerment for the people and provide a lasting means to unemployment problem in the country.

CONCEPTUAL FRAMEWORK

This chapter assumes that the presence of large scale agricultural firm in the host communities would lead to improved livelihood of the people through direct and indirect investment. Hence, there is a link between people's livelihood and large scale agriculture investment. The "Big Push Theory" states that a comprehensive investment package can be helpful to bring economic development. In this regards, an investment from large scale agricultural firm can produce the necessary development in the economic well- being of the host communities.

Figure 1 shows that the households are at the receiving ends and this indicates that they are the beneficiaries or losers in making their lands available to the large scale agricultural investment. The government and community leaders are at the centre and they are the major initiators of agreement between the community and the investors. There is a link between the communities and the large scale agricultural industry through community associations.



EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The government compensates the households through community leaders. There is a direct link between the government and community leaders rather than between the government and the people. The same occurs between the large scale industry and people. This weakens the power of the people to improve their livelihood in the community. In actual sense, there are shadow links between people, government and the large scale agricultural industry. There is no direct contact and this creates inequality in access to the some benefits provided by the government and large scale agricultural industry for the people (Burdenwerper, 2012).

The host community gives up the most arable part of their land to the company. The loss of this fertile region leaves the households with poor soil which cannot sustain the current livelihood. The current livelihood of the households depends on the contribution from the company, the community leaders and the households themselves. The company may have employment policies with the host communities and being socially responsible to them as well. The community leaders may evenly share the proceeds from the sales or leasing of land with each beneficiary household and may decide to pull some resources from the proceeds to provide amenities such as pipe- borne water, electricity, community hall, recreation centre, vocational skill centres and so on. The households cultivate the remaining land for both household consumption and sales.

In situation where the remaining land is poor in fertility, the households' economic wellbeing will be greatly reduced or the households do not have any land to farm on. The households' sustenance depends on the proceeds obtained from the large scale agricultural firm; access to employment from the company and the ability of the households to create enterprises that are meant to service the company or its workers. Firstly, proceeds received as compensation for land loss can serve as means to economic wellbeing when the money is judiciously used for productive investment. The community leaders mainly the traditional leaders of the host communities can create social fragmentation among the people when

Figure 1. Conceptual framework

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

they have other motives. This is the time there will be confrontation on who owns a particular portion of land and rising up of contenders for the ownership of such lands. This leads to some beneficiaries losing out their right to compensation and thereby reducing the means to their livelihood.

Second, access to employment depends on level of education of the head of the household and also on the number of workers required by the company. Since the company is highly capital intensive, the number of workers needed depends on the number of those that will serve the machine. Few workers will be required by the company. The potentiality of the households' head to secure a paid employment therefore depends on extent of education. The well paid employment requires higher level of education.

Lastly, the ability of the households to create business enterprises to service the company and workers depends on the company's products that can be traded by the people or the residential nature of the company. In situation where the company's products service outside markets and the company makes delivery at point of sales, the households have nothing to gain. Also, when the workers reside outside the company the local markets will not service their demand.

LITERATURE REVIEW

Africa has large labour force in agriculture with 80 million small scale farmers supplying 95% of African food needs (Sindayigaya, 2012). The people of Africa are specially noted for farming. More than half of the sub- Saharan Africa involved in farming and in countries such as Burundi, Uganda, Rwanda and Burkina Faso, it is as high as 40% - 50% of the population (Block, 2010). It accounts for 32% of the gross domestic product and 65% of the labour force. Though there is low productivity and this comes from declining real prices on world market for agricultural exports; and from protectionism in countries that are members of Organisation for Economic Cooperation and Development. The high level of poverty and unemployment currently plaguing many countries in Africa is searching for potential investors that will bring about increased employment. The coming of large scale agriculture can solve unemployment problem. For instance, Green Resources in Tanzania, a firm operating tree plantation, employed some local people as permanent and casual worker (Larsen, 2012). There is possibility of low labour retention as farm become mechanised (Brown, 2012). Stickler (2012) reveals that large scale agricultural activities generates low employment and low earnings in Uganda; and in comparing to when people have small holdings they are worse off.

Proceeds from the sales of land to investors on large land scale users have economic implication on the recipient households. It can lead to increase in their economic well- being. Several studies (Gurara &Burhanu, 2012; Arezki, Deininger & Selod, 2012) have discussed the benefits this brings on the host countries. Since the host communities are made up of different households, it means the proceeds have to be divided among them. The possibility of having occurrence of social fragmentation is very high. Social fragmentation is defined in this chapter as loss of unit or cohesion by the people of a unified settlement that arises as a result of unmet demands. There may be acrimony among the people in not being compensated evenly. In African society, land is held with high esteem and people can die in seeking redress over land. During proceeds sharing, those households who cannot lay strong claim to the ownership of their land may lose their entitlement because as Bowman (2012) notes, more than 90% of sub- Saharan African land is not titled.

The increase in the numbers of foreign large scale land users in Africa is showing that there is high potential for the sector to uplift the economic well- being of the people. The host countries can derive

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

monetary and other benefits from such opportunities. Provision of social services has been identified as one of the indirect benefits of foreign land acquisitions. For instance, Green Resources, a firm operating tree plantation in Tanzania has provided schools, health posts, transportation farmers' produce to markets, roads and they have remitted money for community development. This money is managed by Green Resources for the infrastructural development of the communities. Local people are engaged as permanent workers and casual workers, though few of the people have permanent employment (Larsen, 2012). Such development in infrastructures is the construction of 40km irrigation canal and 40km paved road in Bougouwere by China National Hybrid Rice Company that acquired 25,000 hectares of land in Niger Republic. These were constructed at the cost of 55 million US dollar (Von Braun & Meinien-Dick, 2009).

The possibility of large scale farm creating unevenness in the host communities is very high. The cultivation of certain crops can lead to destruction of farmlands. The other available land may not be suitable for farming activities. In Niger Republic, the construction of 40km canal to irrigate hybrid rice made local farmers to lose their farmland and also close small irrigation outlet they were using to supply water to their farmland (Von Braun & Meinien- Dick, 2009). The farmers are denied abundant supply of water to their farmland thereby causing poor farm produce.

Creating entrepreneurship in the people is a way of paving for sustainable economic development in the host communities. The only way the host communities can become economically balanced is for them to have access to opportunities that will increase entrepreneurship potential. It has been observed that the existence of large scale agriculture business may kill the spirit of entrepreneurship in African people. African people have varieties of crops they cultivate on their land and make use of forest resources in such a way that maximise their livelihood. Many of the cultivated crops may have to give way for hybrid crops. The crops that are associated with industrial agriculture in the present times are hybrid rice, bio- fuels, sugar cane, and palm oil and so on. These are export crops that have no economic importance to the local communities. Losing their land means losing their food supply (Von Braun & Meinien- Dick, 2009).

The operation of the large scale farms is highly mechanised which means that there is little or no knowledge that is useful for the growth of local farm to learn and since the crops are not adaptable to subsistence farming system common in rural areas there will be a deficient of local earning by the people. Thus, the loss of their farm land will make them to depend on the land investors for gainful employment. Training Africans is essential for improving their livelihood but the production of bio- fuels and other hybrid crops on small scale may not support the livelihood of the people. These crops do not have immediate markets in the localities thereby increasing the cost of transaction.

METHODOLOGY

This chapter adopts a descriptive survey method that allows the authors to investigate some of the existing large scale agricultural firms in the country. The authors also adopt Binary Probit Estimator to estimate the nominal scale data collected from the field questionnaire. The authors focus on Presco Industries PLC because of its nearness to the host communities and the authors designed a questionnaire to elicit information from the erstwhile farmers of the land. Enumerators were recruited from the people in the localities that have the rudimentary knowledge of the areas. A total of 100 respondents were used in the survey. Presco Industries is a Belgian agro-industrial company specialized in industrial as well as

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

smallholder plantations of tree crops, mainly oil palm and rubber, and allied processing industries such as palm oil mills, palm oil refining / fractionation, soap making and crumb rubber factories. The company holds a total of 20,800 hectares with 18,000 hectares in Edo State alone and the remaining 2,800 hectares in Delta State.

The company has its head office in Obaretin Estate where it holds a concession of 7,000 hectares and there is another 11,000 hectares in Ologbo Estate. The communities under the survey are those find within these estates. The company has oil palm plantation of 11,760 hectares of which 8,347 are mature; a palm oil mill with a capacity of 60 tonnes fresh fruit bunches/hour; a refinery/fractionation plant with a capacity of 100 tons/day; and a palm kernel crushing plant with a capacity of 60 metric tons/day. The company employs about 3,580 people, out of which 476 are permanent staff. The remaining 3,104 people are contract workers. This low sample comes from the fact that host communities are small in size and the number of households is less than 30 in some communities- Agbomoba and Uteis. The host communities such as Agbomoba, Obaghe, Obadan, Utesi and Uhohu are villages of few hundred people having farming as the main occupation. In terms of age distribution, the communities are mainly aging with few children. Many of the youth have migrated to the cities in search of jobs and other opportunities. Large number of the old people is illiterate; they depend on their children for information.

There is presence of formidable youth groups that strive for the development of their various communities. These youth only reside in the communities during the day in eagerness of the appearance of land buyers. The proximity of the communities from Benin City has negative impact on the development of the communities in the sense that this allows some of the people in the village to live in Benin City and operate their farms or business in the communities. The workers in the company also reside in Benin City where there is access to basic amenities. It provides easy access for people to live in Benin City and use the communities as transitory settlement where they own farmland and practise their trades. People come in the morning to carry out their economic activities and leave in the evening to Benin City. One settlement, Agbomoba has some indications of being isolated at a particular time because of civil unrest. There were signs of demolition and reconstruction and this is community that is next to the company.

Participation from the communities was very poor in the sense that people are afraid of being interviewed and large numbers of the people are illiterate. It was through the help of the three enumerators engaged that the people made themselves available for interview after demanding sitting allowance. All interviews took place with the support of one of the children that acted as the mouth piece for the elderly people. One disadvantage of this method is lack of full disclosure of information. There are possibilities of the households hiding certain information. The authors limit this problem by ensuring that the enumerators are people well known to the community people and people that participate in community development. Another limitation perceived is that the people can see it as opportunity to express their grief about the company. The authors informed them this is merely academic work and they are not social or human right activists; and this study has nothing with whatever transpired between them and the company or their community leaders.

The Empirical Model

The study has the aim of identifying the impact of large scale agricultural investment on the livelihood of the host communities. The study examines variables that have impact on influencing the livelihood of the people. Variables are education of the head of the household, employment of the household head, access to farm land, community relations, perceived environmental hazard of the company, indirect

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

income earning activities as a result of the company and the economic well- being of the people. The Probit regression model is formulated as follows:

$$PR\ (EC_i = 1) = (\beta_0 + \beta 1 X_i + e_i) \quad (1)$$

The Probit regression model specified as Equation (1) is derived from the work of the following authors: Moore (2013), O' Hallan (2014) and Osabuohien (2014).

- **EC:** This is the dependent variable and the value of the variable is obtained by categorising the household. It is defined to mean the extent to which the people have access to basic/essential needs of life. This is to identify the extent to which the presence of large scale agricultural investment has changed the livelihood of the people.
- **X_i:** All these variables denoted by X are categorical variables and they are education of the head of the household, employment of the household head, access to farm land, community relations, perceived environment hazard of the company, indirect income earning activities as a result of the company and the economic well- being of the people. They are obtained from the survey conducted. They are all binary values.

Definition of Variables

- **Economic Well-Being of the Households (EC):** Since the chapter entails assessing the impact of large scale agricultural investment on household livelihood, there is need to examine the economic well- being of the households. The following are considered in determine whether a household lives economically well; assets owned by the household, access to basic social services, sex of the household head, access to electricity and clean cooking facilities; access to clean water and ownership of houses. They take a value of 1 and 0 to households with and without these facilities respectively. The authors assert that 23 years of operation of the company should have improved the livelihood of the people through direct or indirect contact.
- **Education Level of the Household Head (EH):** This variable is included because it determines the chance of the households having access to employment opportunities. The industry in the community is highly capital intensive and as such it requires few numbers of unskilled labor. The head of the household with higher certificate can have opportunity of securing paid employment in the company which will enhance the wellbeing of the household. If the head has certificate higher than teacher training certificate, it earns 1; otherwise 0. The expected sign is positive, the higher the status of education attainment, the higher the opportunity of good earnings.
- **Employment of the Head of the Household (EP):** The chapter considers household that the head works in the company. If the head of the household works in the company, this takes 1 and 0 if otherwise. The income earned by the head of the household will enhance the economic wellbeing of the household. Since the consideration is on Presco Industries, it is considered that working in the company by the head of the household will increase economic well- being of the household. The expected sign is positive.
- **Farmland (FL):** The household that has farmland takes 1, and the one without farmland takes 0. The household whose land was not acquired will fare better than the one that loses their own.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

It will therefore contribute to the well- being of the households. The expected sign is positive. Households that have farmland will have high standard of living.

- **Community Relations (CR):** The payment on the sales of land obtained from Presco Industries can lead to improved livelihood of the people or otherwise. When the proceeds are evenly shared and no rancour exists, the beneficiaries can invest the money prudently. If otherwise it can lead to instability and people live in fear. The affected may quit the community or unable to invest the money on productive investment. This leads to low standard of living. This variable includes the unrest that happened 23 years ago when the company commenced operation on the land. There was civil fight in the community that led to imprisonment and destruction of properties when the people revolted against government's decision to allocate the land to the company. The expected sign is negative. The occurrence of communal clash will lead to loss of economic wellbeing for the households. If household indicates no occurrence of rancour they take 1, if otherwise they take 0.
- **Environmental Hazard (EV):** The production of palm oil and other palm product may have environmental or health effects on the people. The chapter considers the side- effects of company's operations. The company has some heavy- duty trucks that supply palm kernels from the farm to the factory. These heavy- duty trucks ply on bad road. The road is dusty and produces heavy dust when the trucks ply on it. The factory workers, villagers and other users of this road are exposed to dust. If the households perceived that it will have effects on them, they indicate it and this takes 1. Otherwise, if the households fail to indicate, it takes 0. The expected sign is negative because this will reduce economic wellbeing of the household.
- **Economic Activities (SI):** These are defined as the activities that earn income for the households that emanate as a result of the company existence in the community. If the households indicate that the existence of the company makes them to start a business or involves in a productive ventures, they have 1, otherwise 0.

EMPIRICAL EVIDENCE AND DISCUSSION

Descriptive Aspect

The household survey conducted in the month of March and April, 2014 revealed the following information about the livelihood of the households in the communities. The host are made up communities of peasant people and only few are workers in public and private establishment. Few of the host communities- Agbomoba, Obaghe, Obadan, Utesi and Uhohu participated in the survey.

1. Economic Status of the Host Communities

Gainful employment is an indication of the wellbeing of a household especially where the head of the household is gainfully employed. The chapter investigates the numbers of people in the households that have gained employment as a result of the presence of the company. Their previous employment with their present employment is compared to identify whether there has been a significant change. Figure 2 shows the number of people in the households who are presently employed.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Nature of households employment

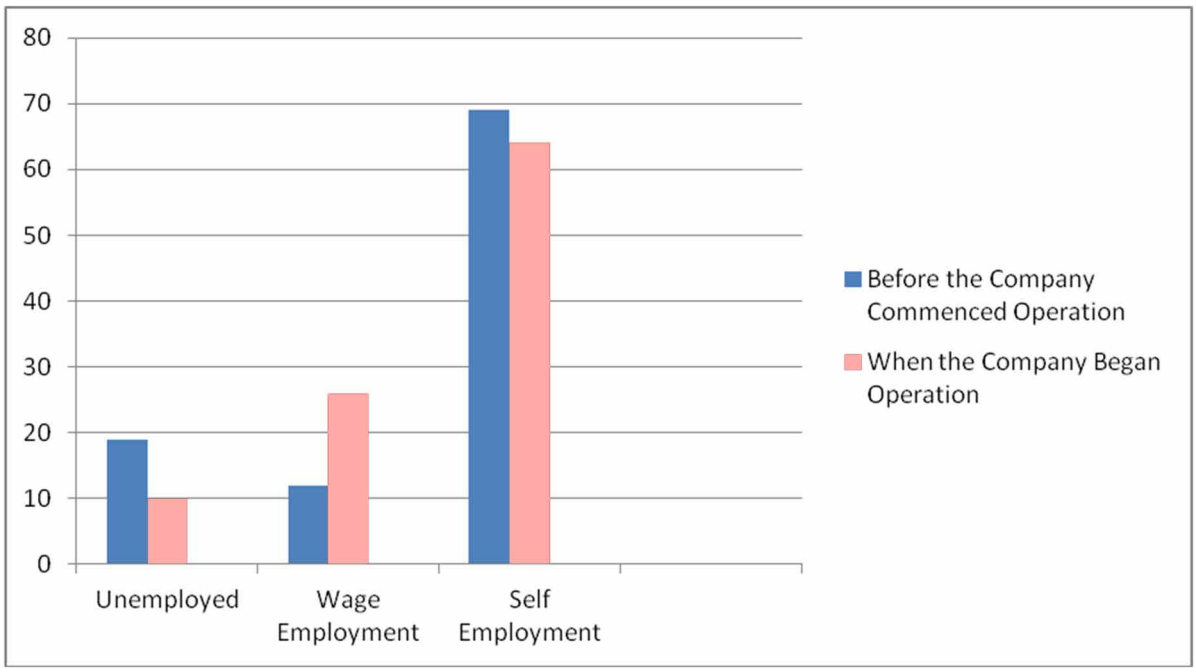


Figure 2 shows that the company has contributed to reduction in the number of unemployed people in the communities. Nineteen respondents indicated that they were unemployed before the company came into the communities and nine of these respondents have secured jobs. It can be seen that the existence of the company has made some people before who operate business of their own to seek paid employment. The number of people who are self- employed has reduced by nine. The category of self-employed includes farmers, traders and artisans. Only one respondent indicated that the existence of the company has made him to lose his trade.

The present standard of living of the people is examined vis-a-vis the facilities they have currently in comparison with previous ones. This information is provided in Table 1.

Table 1 shows the facilities available in the households situated in the communities. There are significant changes in the type of houses they live in. Many households still make use of pit latrines. Electricity provided by Power Holding Company of Nigeria (PHCN) is available to all households and this might have been due to the existence of the company. Another significant change is water. The number of households making of use of borehole water has increased to 64 from 13. The company constructed boreholes for the households and it is piped to different streets. Information obtained reveals that the communities take the responsibility of maintenance when the company failed to repair it.

The chapter goes further to make comparison between the previous standard of living of the people before the company came into existence and after its existence in terms of facilities acquired by the households such as ownership of houses, household equipment, means of mobility, access to modern energy and essential amenities. The information obtained is given in Table 2.

Table 1. Facilities in the household of respondents

S/N	Facilities	Number Available Before	Number Available Presently
1	Type of buildings: Single room Flats Detached house Bungalow Duplex	 60 38 1 - 1	 57 40 2 - 1
2	Water supply: Pipe Well River Borehole	 48 38 1 13	 9 26 - 64
3	Electricity: PHCN	 86	 100
4	Toilet Facilities: Pit Pail Water Cistern	 76 5 19	 74 - 26

Source: Authors' Survey, 2014

Table 2. Items in the household of respondents

S/N	Household Items	Number Available Before	Number Available Presently
1	Bicycle	76	76
2	Motorcycle	53	81
3	Motor Vehicle	12	14
4	Stereo	21	35
5	Gas Cooker	-	1
6	Cooking Stove	59	74
7	Radio	84	92
8	Television	35	73
9	Electric Fan	39	68
10	Air Conditioner	-	1
11	Refrigerator	-	18
12	Carpet/Rug	58	85

Source: Authors' Survey, 2014

Table 2 gives the household items that are found in the houses of the respondents. The items available in the households of the respondents before the company commenced operation can be compared with items presently in their households. It can be seen that items of luxury such as air conditioner, refrigerator, and gas cooker are very rare in the households of the respondents. More households were able to acquire motor cycles, television sets and other items when the company commenced operation in their communities. The change in asset base may not be attributed to the company alone, the changes may have come from other income earning activities of the people. At present, the people are selling their land and the proceeds may have been used in increasing their asset base. There is a clear indication that the company opens economic opportunities for the people.

2. Income Generation Sources of the Households

The chapter considers the means by which the people generate income through their involvement in economic activities. In this aspect, a comparison is also made between their economic activities before the company acquired the land and after. The information obtained is given in Table 3.

In Table 3, all economic activities that provide income for the households are surveyed to know number of household members involved and monthly earnings from the economic activities. There is a decline in the number of people involved in some economic activities and decline in income also. This necessitates the need to know some economic activities that have been stopped by the existence of the company. Table 4 provides the information.

Table 3. Economic activities of the households

S/N	Economic Activities	Number Involved Before/ Monthly Earnings	Number at Present/Monthly Income
1.	Sales of livestock	12 (N2500.00)	8 (N1,000.00)
2.	Sales of field crops	33 (N9,000.00)	22 (N6,250.00)
3.	Sales of vegetables	32 (N2,900.00)	29 (1450.00)
4.	Sales of fruits	26 (N3,000.00)	24 (4,000.00)
5.	Sales of bush meat or fish	13 (N6,000.00)	17 (N3,500.00)
6.	Sales of medicinal herbs	8 (N1,500.00)	3 (N1,500.00)
7.	Sales of wood, bamboo, raffia	22 (N12,000.00)	14 (N17,500.00)
8.	Sales of handicrafts	12 (N2,500.00)	14 (N2,000.00)
9.	Other self-employment	69 (N4,000.00)	65 (N10,000.00)
10.	Wage employment	12 (N10,000.00)	26 (N40,000.00)

Note: The median monthly income is given in parenthesis

Table 4 reveals the number of economic activities that have been stopped by the respondents. From Table 4, farming activities have been greatly affected by the coming of the company into the communities. One, it makes some economic activities to be stopped. Two, it has made many people to seek for paid employment and 3 respondents affirmed that they abandoned their trades in order to seek employment in the company.

Efforts were made to identify the properties that the households have lost due to the coming of the firm into the communities. Table 5 provides the details of the information obtained from the respondents.

Table 5 shows that the households acknowledge the loss of landed property and cultivated farmland. Twenty four households affirmed that they have lost landed property to the company and the estimated monetary value is put at N11, 850,000.00. Seventy one households also affirmed the loss of cultivated farmland and this is valued at N81, 970,000.00. Thus, the major negative effect to households arising from foreign large scale land acquisition is loss of land by indigenes or host communities.

3. Communal Relationship in the Community

The authors asked the villagers to indicate whether they were compensated when the land was acquired 21 years ago. 18 households in Agbomoba community indicated that they were not compensated. All households in other communities such as Obaghe, Obadan, Utesi and Uhohu indicated that they were compensated. The households indicated that the compensation was judiciously spent in the communities but a thorough survey of the communities did not reflect this compliment. There is infrastructure such as community town hall, market stalls, community health centers, community schools or skill acquisition centers and good roads. Though there is pipe borne water that supplies water to every house and a strong youth movement with special interest in land mongering, all the households affirm that each family, clan and community was well catered for by the compensation and the compensation did not lead to disunity. The 18 households in Agbomoba that were not compensated might not be among the land owners in the community because the author interviewed some people who were non-natives of Benin City.

Table 5. Properties of the households

S/N	Properties	Number	Monetary Value
1.	Landed property	24	N11, 850,000.00
2.	Cultivated farmland	71	N81,970,000.00

4. Viability of the Community Through Large Scale Agricultural Investment

The company has a policy of recruiting five people from the community annually to promote their social responsibility. In terms of employment generation, the company has been able to reduce unemployment in the community. 49.0% of the community dwellers affirm the potency of the company in employment generation. The main problem is that the employment generation has not been transformed into entrepreneurship development. As the time of conducting the survey, the community has no vocational centers. The youth are without any vocations or skill acquisition. They participate in local politics and land mongers. They are enticed with the proceeds they received from the company and this made them to be in search of land buyers. When the authors first visited the community, they wanted to know whether they had come to buy land and when they knew their mission they sought their help in securing buyers for them.

Summary of Statistics of Selected Variables

The mean and standard deviation obtained from the analysis for comparison are reported in the subsection. The authors separate the households in the communities with reference to their current economic wellbeing. There are two categories- high standard of living (HSL) and low standard of living (LSL). The findings are reported in Table 6.

Examining some of the variables such as employment in Presco, access to farmland, involvement in economic activities due to the existence of Presco (enterprising) and community relations (no occurrence of unrest), there are quite differences in the values of mean and standard deviation between households with high standard of living and those households with low standard of living. The mean of the households with low standard of living that are employed in Presco Industries is higher than that of those households with high standard of living that are also working in the company. One implication of this is that these households are losing some economic rewards by working in the company. Many of them are contract employees and this may hinder their ability to seek for better employment or start profitable ventures. Contract workers have high level of vulnerability to instability which may make them to live in uncertainty.

Table 6. Summary of statistics of variable of households with HSL and LSL

Variable	Description	All		With HSL		With LSL	
		MEAN	SD	MEAN	SD	MEAN	SD
EH	NCE and above =1,0 if otherwise	0.13	0.347	0.18	0.39	0.097	0.29
EP	Employed in Presco =1, 0 if otherwise	0.51	0.502	0.06	0.25	0.65	0.25
FL	Farmland not acquired = 1, 0 if otherwise	0.615	0.479	0.61	0.49	0.677	0.47
CR	No occurrence of unrest=1, 0 if otherwise	0.85	0.359	0.79	0.41	0.89	0.32
EV	Occurrence of air pollution=1, 0 if otherwise	0.10	0.301	0.47	0.506	0.53	0.50
SI	Enterprising= 1, 0 If otherwise	0.22	0.402	0.16	0.37	0.26	0.44

Source: Authors' computation, 2014

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The company has over 3,580 workers with 3,104 contract workers. The earnings from working in the company by contract workers may not be high to sustain their economic wellbeing. The mean value for education (0.098) further indicates that many of them have below NCE, which means that the employment opportunities they should have access to is casual work. Similar situation occurred in Uganda, Stickler (2012) finds that the earnings from working in large scale farms is low compared to what the people should have earned on their small farm holdings.

The current employment quota given to the community made over 44.0% of the people surveyed to accept that the capital intensive nature of the company can lead to low employment generation in the future. The community has not met the target of providing five people annually to work in the company. Information from a reliable source hinted that the youth leaders allow people from other communities to fill the vacancy for a fee. The aging nature of the population can be cited as one possible reason for inability of the people in the communities to occupy the five jobs given them each year; though this is mainly contract works with low pay and may not be suited for the aged.

From the descriptive statistics presented above, working in the company has created occupational mobility. People who previously have trades or vocations of their own have abandoned them in search of wage employment and there are some individuals in anticipation of securing employment in the company abandoned their current profession. This mobility has reduced the number of people that are engaged in farming activities. They do not spare time to engage in farming because many of them work for seven days in a week. Households' dependency on the company for employment rather than maintaining their small holding farms is the major factor in reducing their standard of living.

Further investigation shows that the households with low standard of living have mean value (0.677) of farmland which is higher than the mean value (0.605) of the households with high standard of living. The households that lost their farmlands to the company are many in number. This indicates that loss of farmland reduces the economic wellbeing of the households. They are unable to cultivate their land to increase their wellbeing. The livelihood of rural communities depends on land. Examining the descriptive data supplied above in line with this finding shows that 24 households in the host communities have lost landed property and 71 households have lost cultivated farmland valued at N11, 850,000.00 and N81, 970,000.00 respectively. The loss of land has reduced farming activities and some economic activities such as sales of wood bamboo and raffia, and sales of bush meat that provide high income for the people has declined. These two economic activities require large portion of land which has been lost to the company.

The households with low standard of living are more industrious than their counterparts. Their mean value of enterprising, 0.258 is better than the mean value of 0.158 of those with high standard of living. The reason may be that the households with high standard of living engage in well- paid jobs or productive business. One implication of this finding is that the poor wants to increase their wellbeing and this should have risen if the company supplies products that can be sold by the community people. The company mainly supplies speciality fats and oils. These two products have no relevance to the communities. They are industrial commodities sold on large scale.

Regression Result

The results obtained from probit regression computed on economic wellbeing of the rural households. The information is given in Table 7.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Source: Authors' computation

The economic wellbeing of the households has been indicated as the dependent variable; noting that the presence of large scale agricultural business will lead to increase in wellbeing of the households. As expected, the education of the heads of the household and employment of the heads of households in Presco Industries Limited has positive impact on the economic wellbeing of the households, though they are not significant. This means that if the heads of the households have opportunity of employment in the company and secure permanent employment in the company through having certificates higher than NCE their wellbeing would have been enhanced. At present, these two variables do not have significant impact on the economic wellbeing of the households. A conclusion that can be drawn here is that the company mainly employed contract workers.

This supports the generalized findings that employment in large scale agricultural business does not increase the wages of the workers. The low paid nature of contract workers has negative impact on their economic wellbeing. The non- significant of the company with employment generation can also be observed from the fact that the company mainly employed contract employees which leads to job insecurity. The job insecurity associated with contract employment may cause low labor retention in the company. Also, the chance of reengaging an old worker is very low in the company because of the need to convert them to permanent staff. Another reason for the insignificant can be derived mechanized nature of the company. The rise in employment of more capital leads to decrease in the number of labor employed (Brown, 2012).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The existence of the company does not have significant impact on the economic wellbeing of the households in terms of becoming enterprising. The sign is negative and this means that it does not create enterprises in people. This is because the company does not have any sales outlet in the communities where the people can benefit through establishment of cottage business to service the patronisers of the company. The products are supplied directly to sales point without any contact with the community and they are not made available in the local markets because they are industrial products. In column B, it is also negative and insignificant. This shows that the households with low standard of living have not really derived benefits from the existence of the company in terms of venturing into cottage business. These households should be the main beneficiaries of the company in the communities.

From Table 6, community relation was introduced to assess whether the existence of civil unrest that happened in the communities when the company came into being has impact on the economic wellbeing of the people. As specified, the sign is negative but not significant. This means that the existence of community unrest reduces the economic wellbeing of the households in the community. This means community relation does not have impact of economic wellbeing but its existence in the community can make people to live in fear and this may have their chance of involving in activities that enhance their wellbeing. The chapter expects farmland to contribute the economic wellbeing of the people and positive sign is expected but the loss of farmland to the company reduces their economic wellbeing. This is positive in Column B, but not significant. This can come from the fact that households with low standard of living depend greatly on the communities for support and they may support whatever decisions are made by the community leaders. Another reason may be fear. The first time the authors went to the communities people were afraid of being interviewed and they directed them to the youth leader in one of the communities.

The Column B shows that the educational status of the head of the households, ownership of farmland and employment of the head of the households are significant and positive with economic wellbeing of the households with low standard of living. This indicates that if these households have heads that have certificates higher than NCE, there will be high possibility of securing well paid job in the company and also access to farmland will increase their economic wellbeing. Their farmland should have been of economic benefits for them. Though employment in the company variable statistically is significant and positive with their economic wellbeing, their earnings may be low because of the nature of employment in the company which is mainly on contract. It is only when they achieve some level of education that qualifies them for administrative and professional jobs in the company will they be able to earn better wages.

Considering the households with high standard of living in Column C, it can be seen that the variables employed are not significant and are negative. Farmland and employment of the heads of the households are not significant and are positive. The existence of the company has not offered significant contribution to the economic wellbeing of these households. These may come from the fact that they have lost their farmland in which the yield is higher than what they earned by working in the company. One other reason is that the head of the households may have some level of education in which the contract nature of employment in the company may not be suited for. The implication that can be drawn here is that large scale agricultural business may not have significant impact on households with high standard of living. This is because these households are educated; have potential of securing well- paid job and may have large farms that yield good returns for them than employment with the company.

SUMMARY AND CONCLUSION

This chapter has examined the impact of the existence of Presco Industries on the livelihood of the host communities. The host communities are mainly peasant farmers, with few government workers. The chapter categorized the households into those with high standard of living and those with low standard of living, based on their current economic wellbeing, and the general economic wellbeing of the communities. The company has been in existence for 23 years; as such its impact in the communities on their livelihood can be easily assessed. The chapter identifies factors that contribute to the economic wellbeing of the households to investigate the impact of Presco Industries on the communities. Employment is imperative to the wellbeing of the people but the company has not being able to improve the livelihood of the people through it. The company does not play significant role in employment creation. The contractual nature of the employment is not beneficial to the communities. Moreover, many of the employees are not resident in the communities, they commute from Benin City.

Entrepreneurship is another important factor in economic development. The existence of the company supposed to lead to creation of cottage business in the land but this is far from being the case. The company produces commodities that require large scale commercial outlet which is not relevant in peasant communities. The loss of farmland to the company further reduces their livelihood as the compensation could not lift their standard of living. The policy issue in this respect is how government policy can encourage companies with such limited local multiplier effect to implement corporate social responsibility programs for their host communities.

KEY TERMS AND DEFINITIONS

Agbomola: A community near Benin City, Nigeria. The people are mainly peasant and are subjects of the old Benin Kingdom.

Community: A living together of people who share the same cultural heritage.

Contract Workers: Workers on temporary employment.

Economic Activities: All activities that promote the wellbeing of rural households.

Economic Wellbeing: A variable that describes the extent to which a household has access to essential of life.

Host Community: The community that provides land for the use of large scale agricultural business.

Household: A group of people living together under the same roof.

Large Scale Agricultural Business: A firm that acquires land in developing countries for large scale farming.

Large Scale Land Acquisition: This deals with acquisition of several thousands of land for agricultural activities.

Self-Employed: People operate business of their own.

This research was previously published in the Handbook of Research on In-Country Determinants and Implications of Foreign Land Acquisitions edited by Evans Osabuohien, pages 287-305, copyright year 2015 by Business Science Reference (an imprint of IGI Global).

Chapter 61
ICT: A Magic Wand for Social Change in Rural India

Orance Mahaldar
Ghent University, Belgium

Kinkini Bhadra
Jadavpur University, India

ABSTRACT

The concept of automation was first seeded worldwide by Industrial Revolution. Liberalization and privatization has contributed much in the welcome of updated and upgraded technology in India. World Wide Web being the core connector of earth rightly supports Mc Luhan's concept of the 'Global Village'. ICT- Information and Communication Technology is an initiative cum phenomenon that is taken on Public-Private Partnership (PPP) in order to build a bridge between the two sections of the society (technology haves and have nots) so that it is accessible to all. e-Governance, e-Health and e-Commerce are some of its applications. India has witnessed a number of successful E- Projects. Nonetheless, the argument of social exclusion, questions on technology support communication and information dissemination is still on. The article intends to throw light on various aspects keeping in line with the ICT projects in India, the type of ICT usage and a comparison between the already established communication models.

INTRODUCTION

The seeds of Industrial Revolution and technological innovation have grown up to spread its roots much strongly in the 21st Century in the form of telecommunication, computation and World Wide Web. Landing in the technology driven era where automation is the central concept; distances are shortened and spaces are virtually killed while paving a way to a more transformed and transparent world. Communication technology has made it possible to propagate information in a much faster and easier way. This has enabled to build a society enriched with information – "Information Society".

Information society is one of the key terms that describe the modern world we live in today. It is said to be an outcome of the industrial and post-industrial society (Sarrocco, n.d.), where the creation, dis-

tribution, use and integration of information is recognized as an active political, cultural and economic activity in order to enhance participation and promote social inclusion (DESA, 2009). But information dissemination alone is not the magic solution of problems like hunger or poverty. In fact 'Right information at the right time' is the key to solution (Chhavi, 2008). Be it the cost of seeds and other raw materials required by farmers or the recent health care planning by the government, that plans to provide free health check up for expecting mothers; information stand alone is not important, but dissemination of it at the right time such that the end users can utilize the information and benefit themselves from the same is vital. Rural population in India are undereducated in terms of the policies, plans and programmes taken to aid them of facilities and amenities required for sustainable development and better living.

Information society concerns the use of information for societal upliftment, social control, management of innovation in order to ensure a better quality of living, break the boundaries of community and ensure better and organized work, that also finds application in solving rural problems of poverty, inequality, illiteracy and environmental degradation (Rahman, 2008). Therefore, information deals with human intellect. In a nutshell, information society combines human intelligence and technical innovation together to give rise to the concept of 'technology-support development' where the 'way to use' a technology is focused at. It can be put in two ways- One, technology providers make use of the right technology at the right place (also referred to as 'context' by some experts), i.e. at the planning and execution level. Two, the end users make use of the technology for their own benefits (with reference to e-literacy). For example, installation of kiosks and computers in rural areas are not enough until it is the right technology for the purpose targeted and the target mass is capable of using them for own benefits.

A quick sneak peak in the history of social & technical development unearths the fact of the matter of the long going debate of technology supporting development. The first seed of development paradigm, as highly known today among the academicians, is the modernization theory or the dominant paradigm of development. This era was marked by technological innovation, capitalistic capability and experimentation to pave the way towards an economic boost. Advocates of the theory- Wilber Schramm (1964), Everett M. Rogers (1969) and Lerner (1958) greatly believed in technology bringing development (Figure 1). Some of the primary features of the industrial society could be categorized as power production, increase of per capita production, high mass consumption, human liberalization and maximization of profit. However the negative peripheries include strikes, labour movement, urbanization and unemployment (Masuda, 1980).

Figure 1. The model describes the course of development according to modernization theory

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The process of innovation in the West eventually penetrated in the developing nation like India, where application of technological innovation can be rightly segregated in two forms:

- **Setting up of Industries:** For better & speedy productivity leading to economic development and growth of
- **Mass Communication Technologies:** For reaching the mass people and encouraging the implementation of the Right to Information Act.

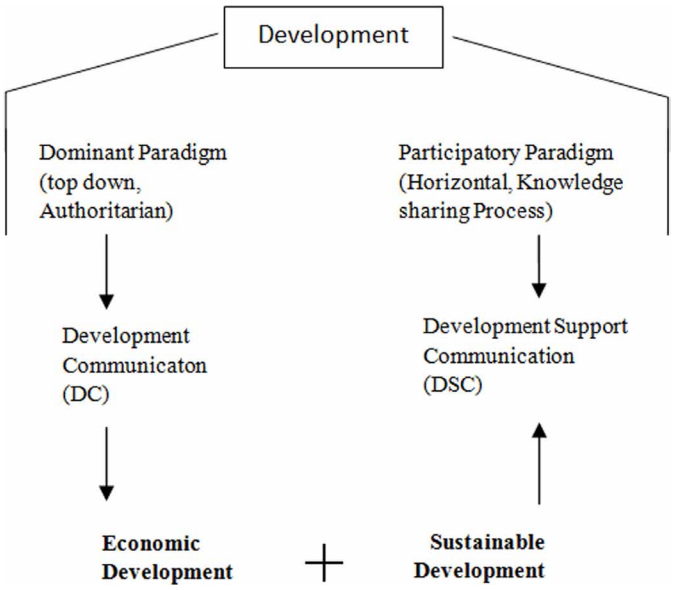
Setting up of industries provided employment and improved the quality of living; while mass communication technologies made it possible to diffuse information into every layer of the society. Another important goal which is achieved with the development of mass media technology in India is less dependency on foreign sources of news or biased news[1].

ICT in Indian Context

The journey of technology as a catalyst to social change was started in India by proper, systematic and equal dissemination of news and information. Later it was relayed forward with the help of several experiments done with Television and Radio. Both the government owned mediums were used successfully in educating a brief segment of people living in remote villages on an experimental basis (*SITE & KHEDA* projects, 1975). The economic liberalization in India opened the door to several Multinational Companies (MNCs) and 100% FDI in selected sectors boosted the journey of technology in India. Internet being one of the greatest inventions and innovations of the modern society, standing in 2014, Information and Communication Technology (ICT) has taken over most of the charge as more and more private companies as well as the government sector takes aid of ICT at domestic level in the form of e-Governance, e-commerce and e-health to bring up the information revolution close to the people of rural and remote areas (Thomas, 2009).

Even in the present scenario, 70% of India depends on agricultural source of income. Thereby, agriculture plays a vital role in India's economy in terms of poverty mitigation and employment generation, and contributes up to a quarter of national income (Siriginidi, 2009). Rural poverty is a complex phenomenon. The idea of several factors made responsible for rural poverty, like economic, social and environmental (Reimer, 1997; Bosworth & Atterton, 2012), make 'rural poverty' more complex as a concept and problem. (Giles, Bosworth & Willett, 2013). ICT is a fuel to global economy (Siriginidi, 2009; Chhavi, 2008). But its share in the recent past saw a steep declination from 56.5% in 1951 to 24.3% in 2002. The agricultural workforce too saw the retardation from 76% in 1961 to 60% in 2000 and with the continuous growth of the population of 15.5 million and existing government polices is would be very difficult to develop rural areas successfully. Therefore, new plans and programmes should be developed in order to keep pace with the recent changes, install 'innovations of information technologies' (ICTs) with active participation from development organizations (Siriginidi, 2009). ICT is the new hope that can eradicate problems of rural poverty, inequality and environmental degradation (Bhatnagar, 2000).

In a country like India where 3/4th of the population still depends on agrarian source of income, introduction of innovations of technology and digitalization has created a digital divide between the technology haves and have-nots as most of the people are either uninformed and technology illiterate or



EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

they do not have the purchasing power to avail the same. Also, in the developing scenario, it is greatly important for a country like India to penetrate information at every level in order to minimize communication lag and foster transparency in each of the three tiers of the government. Another important thing that also became necessary to develop is the logical reasoning and power to differentiate between the right and the wrong. ICT serves the bridge between them and tries to teach the rural mass how to drive the technology for their own benefit. This is one of the features of information society where it advocates the concept of technology being driven by human intellect and for their own benefit and not the other way round.

ICT avoids dependency on technology and favours development support communication. Rural poverty with reference to India is a complex phenomenon and a dominant approach to solve it can only cut down the ambition. (Bhatnagar, 2000). Development Support Communication- the word and concept was coined and ideated by one of the communication scientist Robert Erskine Childers (1976). It was re-postulated and recognized that development communication is an offshoot of dominant paradigm where economic development forms the main route to development. But later it was found that, in Indian scenario, sustainable growth and development was important over/ at par with economic development as most of the rural India is deprived of the modern facilities and stay in poor conditions of live (Melkote & Steeves, 2001).

But ICT alone cannot solve all rural problems. It requires infrastructure to establish distribution channels. Also, it is important to reduce costs of reaching to the people (Siriginidi, 2009). Hence, The rural ICT applications mostly tries to offer the services of governmental bodies like district administration, cooperative union and the state and central bodies to the citizens at their door step. Steps have also been taken to smoother the procedure by implementation of several Government- Citizen (GC) e-Governance pilot projects. Some of the numerous factors of ICT for which it is being highly recommended today may be summarized as:

Figure 2. DSC Model vs. DC Model

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. It supports participatory method of communication which is highly preferred as a developmental model in rural India.
2. It is cost-effective, user friendly and efficient.
3. It is a people inclusive medium and involves knowledge sharing process.
4. It intends to promote the transparency between public and the government.
5. It acts to build an information society by active learning process and development of human intellect.
6. It helps to build true democracy by encouraging mass participation.
7. It helps enhancement of revenue for the government and the service provider.
8. It supports Right to Information Act and the universal right to freedom of Speech and Expression.

Information and Communication Technology (ICT) in India has spread its tentacles through Reliance Infocom's roll out of low-cost mobile cellular phones, numerous civil society based initiatives aimed at establishing affordable access to information and knowledge and Village Public Telephones (VPTs) to its enabling the computerization of land records such as the *Bhoomi* project in Karnataka. Some other similar projects include that of *APSWAN* (Andhra Pradesh), *Sustainable Access in Rural India* (*SARI* in Tamil Nadu), *Akshaya* Project (Kerala), *SETU* (Maharashtra), *Gyan Ganga* (Gujarat) and *WBSWAN*- a government-to-citizen portal (West Bengal), *LOKMITRA* Project (Himachal Pradesh) to name a few. ICT has also spread wings in the health sector with projecs like '*Solidarity and action against the HIV infection in India*' or *SAATHII* (2000), *Sisu Samrakshak* or *SSK* (2000) and *Apollo Telemedicine* (2000). India accounts for 60% of the ICTs projects in Asia tracked by The World Resources Institute (Thomas, 2009).

The present article would discuss about the success of the ICT in India keeping account of its type of usage which is of primary importance in this matter. The chapter would highly discuss the ways and features that made it greatly penetrating by doing a thorough case-study based on the past and ongoing E-projects in India. Since the success of ICT is recognized today, thereby analyzing, comparing and contrasting the model of ICT with that of several communication models in mass communication like- Shannon & Weaver, Newcomb and Gerbner will give a different angle to observe it. The chapter would also include in itself the problems and hindrances (both from social and individual perspective) faced by ICT in its acceptance among the masses (if any).

BACKGROUND

To move on with the article it is important to define ICT for better understanding. A proper and apposite definition will help conceptualize the whole term in terms of application and improved academic understanding.

Information and Communication Technology *aka* ICT also referred to as IT or Information Technology previously, is the most modern and upgraded technology used in order to foster better communication and information dissemination for the joint purpose of education, health and rural empowerment in a developing society especially in the rural sector. ICT is a technology that deals with information gathering and dissemination to storing and presenting of data in the desired format (Ifueko, Omoigui, Okauru, 2011; Accra, 2012). ICT comprises of elements of processes which link different entities and locations leading to compression of space, coordination in time, and globalization (Castells, 2000; Sahay et al., 2003, Hayes & Westrup, 2012, Niall & Chris, 2012). It may also be noted that ICT, in other terms may also be referred to as computer or computer technology and network while including television and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

radio also (Chandler, Daniel; Munday, Rod, Iaugust 2012; Accra, 2012). ICT is a broader concept that comprises of three main things- services, applications and technologies. ICT serves by providing sole or a combination of telecom services such as telephony, mobile telephony, fax and computer services like internet, e-mail, file transfers, etc. The applications of ICT cover video conferencing, teleworking, e-commerce, e-health, distance learning, management information systems (MIS), stocktaking, etc. Technologies used by ICT in providing the services range from old technologies such as radio and TV to new ones such as cellular mobile communications (Siriginidi, 2009).

ICT therefore has three key terms: *Technology, Information* and *Communication*. All the three terms in ICT are highly interlinked with each other and are also interdependent aiming for a certain fixed role. For example: Technologies like television and radio started to be used as a part of developmental project since its early advent with projects like *SITE* (1975) and *KHEDA* (1975) for television and various other projects related to health and agriculture through radio were broadcasted. Counting on the results of these experiments it was concluded that these technologies had effect on the target people and that it could, with well structured and planned programmes, may serve a social purpose and help eradicate rural problems and issues. It was then predicted that radio and television had high capability to create change in the society and can penetrate at the grassroots level. Since then development programmes were structured keeping in mind the acceptability in the rural sections of the society and were also designed skillfully and tactfully. In recent days, internet has formed a World Wide Web which unifies every individual and also exposes to innumerable ideas and information. After The United Nations has already declared access to the internet as another basic human right, The Govt. of India's National Telecom Policy too envision the implementation of 'Right to Broadband' scenario by the year 2020 (Ganapathy, 2014). Also, in the recent endeavour to improve ICT services according to NeGP 2006 (National e-Governance Plan), Government of India (GI) has aimed to transform all the Government activities from manual to computerized system (Sanyal et al, 2014).

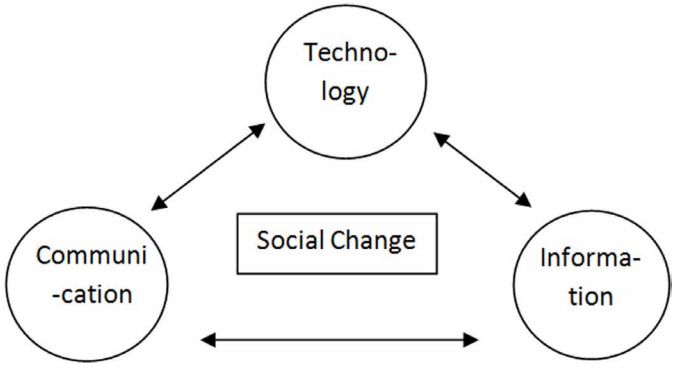
Information can be interpreted as a message or better said, the content of any message, which is usually encoded by the speaker and then processed through a well recognized channel to reach the receiver in its understandable form. The channel may be of various types that includes verbal, telephonic and written forms. Information encoding is an important part and should be done carefully in case of rural program designing. The message should be in favour of the target audience and therefore must be understandable for them. One of the significant hindrances in the way of rural communication is the language. Since, computers talk in universal language English; therefore it does not favour rural understanding. In order to enable rural understanding, soon options to convert into language were allowed by Microsoft and started practicing. This created a revolution on its own as the language barrier was overcome. Information is a supporting hand to carry forward basic human right which includes right to information and freedom of expression (Chhavi, 2008). Therefore, uniform information dissemination is the key to democracy and information empowerment is essential for successful democracy (Siriginidi, 2009). Social exclusion is much deep a problem. It marks the exclusion of people from a range of benefits, access and services which mark the basic human rights in the modern society from exchanging (Commission of the European Communities 1993; Magno, 2014).

But for successful and effective *communication* there are two more important things: targeted decoding of the message or proper and correct understanding of the meaning along with the positive feedback mechanism. Medium has a close relationship with message interpretation or 'Medium is the message' (McLuhan, 1964) and are therefore symbiotic in nature. Marshall McLuhan's concept of medium was broad and he put together that it was the medium, which 'shaped and controlled the scale and form of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

human association and action'. Therefore it might be concluded that medium of communication should be chosen very carefully as it is very much specific for a defined purpose and rural communication is that defined area.

ICT plays a major role in nation's politics, economy, social and cultural development (Siriginidi, 2009; Chhavi, 2008). It is not just limited to rural development alone. ICT has changed our lives from the way we do business, shopping, and do banking to access information, get entertained and communicate with people (Chhavi, 2008). Role of ICT in both established medium like radio, TV, video, computer disc, etc. and emerging medium like internet, wireless and broadband as a powerful tool is responsible for speedy scaling up and inter-linkage of development interventions and its outcomes (Siriginidi, 2009). ICT has an integrated relation with human rights also, i.e. it supports the freedom of expression and right to information according to Article 19 of the Universal Declaration of Human Rights. (Siriginidi, 2009; Chhavi, 2008)



However, the unification of specific technology for the transmission of specific information will lead to effective communication in rural areas which may act as the weapon for social change in India. ICT in the 21st century is one such magic wand for social change (Figure 3).

ICT or Information and Communication Technology is a special extension of IT or Information Technology which deals with the skills of bridging the communication gap between the urban and rural area through effective and structured plans and programs. The World Wide Web with high speed internet plans is now installed even in the remotest villages of Gujarat and Andhra Pradesh in India. ICT negates social exclusion and supports social inclusion, participation and democracy by bringing transparency of information in each tier of the administration. ICT helps upgrade the rural mass to match the urban tech savvy society and also to make them e-Literate. ICT helps them to be 'future ready' in the globalised world.

Eradicating the Digital Divide

Digitalization is inherent with the concept of *social exclusion*. Technology has its own advantages that embed our daily life including the way of living, but not all the citizens get close to its friendly assistance on equal share. This unequal distribution of Information and Communication technology disapproves equal participation in social, economic and cultural forum. This can be briefly called as social exclusion. The problem is not to be measured just in economic terms, but it also includes unequal rights in educa-

Figure 3. ICT- A weapon for social change

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion, health, housing, and access to services (Commission of the European Communities 1993; Magno, 2014). Therefore, we see that social exclusion has a multi disciplinary approach. (Daly et al. 2014).

The concept of social exclusion gained notice only in the 1990s. It is related to the lack of engagement in governance processes. (Magno, 2014). Segment suffering from social exclusion experience intricacy in claiming a range of citizen rights, which also includes access to adequate health care and education. This can be attributed to their weak social integration and incapacity to participate in public decision-making (Shortall, 2008; Magno, 2014). In social exclusion, poverty must be seen as the refusal of basic capabilities and not just the lack of income (Sen, 1999). Exclusion in the information age can be identified in two ways- (i) When a person is not connected to the digital network. (ii) When a person is unable to participate in the debates and discussion related to politics and public discourse (Magno, 2014); while another side of exclusion in the information age can emanate from existing social and cultural circumstances along with institutional and political factors (Zheng & Walsham, 2008; Magno, 2014). Therefore, it can be said that social exclusion is caused by irregular employment, gender, ethnicity, disability or ill health, and lack of opportunities for participation, along with low income.

The concept of social inclusion can therefore be seen in terms of underprivileged people acquiring rights, access, and benefits from improved education, health, governance services, and digital connectivity (Magno, 2014). Social inclusion is the primary objective of the government organizations as they are now trying to implement ICT at the grassroots level and targets to empower the underprivileged. Social inclusion is a double layered concept (Daly et al. 2014) like social exclusion which not only deals with equal participation in the labour market and economic life but also includes their participation in social and cultural issues in a broader sense (Brants & Frissen, 2003). The primary do of social inclusion is to create equitable access to Internet and other technologies. It is also very important to focus on another factor which is 'context', i.e. the framework required by the technologies to alleviate key problems of development in rural areas (Bhatnagar, 2014). Social inclusion is required and preferred for it gives the person the capability to think and make his own decisions. In a developing and democratic country like India, it becomes very necessary for every citizen to take part in economic as well as political activities for national benefit. Without being able to keep updated with the technological changes of the modern world, 70% of the total population (who reside in the rural structure) would be vulnerable to economic and social crisis.

Digital divide is another offshoot of social exclusion that again can be related to a dichotomous concept and has multiple levels (Brants & Frissen, 2003). Digital divide is directly proportional to the inability to use or access of technology (Archmann & Guiffart, 2014). However there is another argument which highlights the fact that digital divide or digital exclusion may be a voluntary choice of an individual also (Bhalla & Lapeyre, 1997), whereby exclusion may reflect un-intention to participate, negligence towards technological use, social and cultural taboos that reject interaction with the upgraded world, patterns of interests or a contractual relationship between actors or 'distortions' to the system, such as discrimination, market failures and unenforced rights. Therefore, the much argued digital divide needs to be diminished and replaced with digital dividend in order to wipe out poverty (Chhavi, 2008). ICT, as it is believed, can be identified as the tool which has the capability to diminish spatial and temporal inequalities (Magno, 2014). Fostering social inclusion through e-Governance requires bridging the digital divide that prevent slow income communities and marginalized groups from using ICT to access public services (Magno, 2014). Again, digital divide should not be seen simply in terms of technology access. It is a wider concept. Several social, political, institutional, and cultural conditions should be considered in understanding why particular communities are deprived in gaining access, developing content and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

using ICT (Warschauer, 2003). The digital divide is a long time concern of the government and internet being recognized as essential for economic competitiveness, government services, citizen participation and engagement, social inclusion and learning; is gaining priorities in government policies (Daly et al. 2014). There are international evidences that authenticate the negative effect of digital divide in exacerbating inequality by failing to equip its audience with the needed skills and other personal characteristics required to pave way to the knowledge society. Therefore, it implies that the divide can reduce the life chances of the disadvantaged, reducing learning opportunities and chances for career advancement and adversely impacting on access to government information and services (Selwyn, 2002; Daly et al. 2014). But on the other hand, there is also a group of policy makers who believe that the diffusion of internet can alone lessen the digital divide (Daly et al. 2014). Therefore, a paradigm shift is required in the sense that understanding and recognizing the problems of the poor and then enacting the best technology innovation for the purpose would be the correct way to solve any part of the problem instead of vice versa (Mc Namar, 2003; Bhatnagar, 2014).

In order to fulfil the target which is to eradicate the poverty, requirement of third person involvement becomes highly necessary in the form of Opinion Leaders (Lazarsfled, Berelson & Gaudet, 1944; Katz & Lazarsfled, 1955). They together postulated the Two-step Flow of Information, where it was predicted that the rural mass do not readily accept the norms of the urban society and thereby rejects the ideas coming from the same. With the help of opinion leaders it was much easier to reach and get connected to the rural mass. Opinion leaders are generally the most influential people in a village like headmaster, village doctor, *sarpanch*, etc. If ICT is one such taboo, then it can be well introduced with the help of opinion leaders via NGOs and Integrated Rural Development plans by the public sector. This is also one of the way by which participation of the rural mass can be encouraged and made successfully acceptable. In the recent ICT initiatives, the role of opinion leaders has been kept in mind to get high rated success in the developmental programs.

The role of ICT in rural development do not just relate to the ease in daily life with e-Literacy, but it also deals with other phenomenal factors like awareness to social, political, environment and health threats, ability to take own decision, develop critical thinking and opinion formation and thus resulting into equal participation, attitude and personality formation, building self confidence by involving into discussion forums and taking part in dialogic communication. ICT in this way enables smooth functioning of the administration by enabling horizontal knowledge sharing process and vertical flow of information.

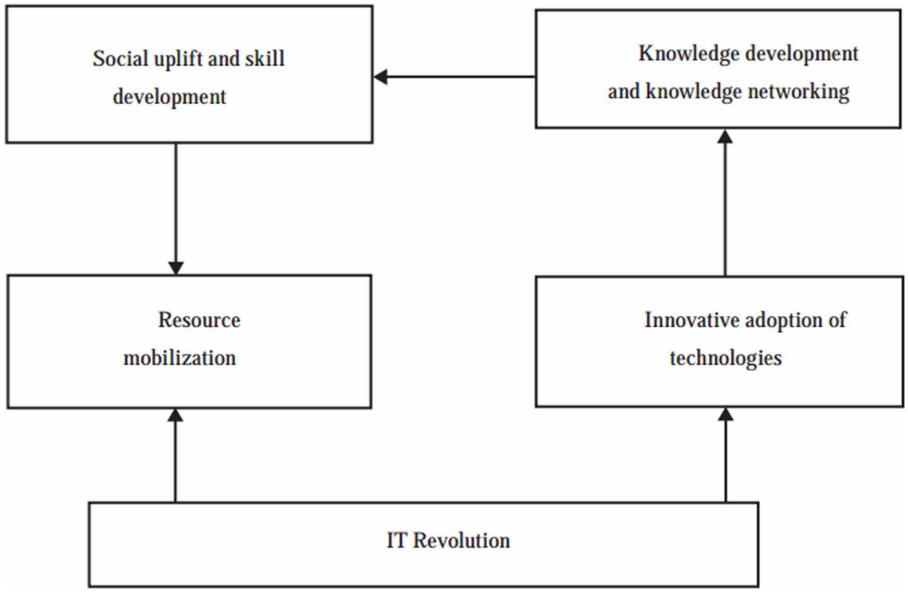
Digitalization comes with yet another concept called *convergence*. The technology used in ICT fairly involves internet as the primary tool. Most of the ICT devices are for multipurpose usage like mobile phones, laptops, tabs, computers and cable television networks offering phone services, internet television and mergers between media and telecommunication firms (Singh & Raja, 2010). These devices find an integrated approach for communication by enabling speedy access to all types of information in the local or native language. ICT convergence plays a promising positive role in the fields of education, health, medicine, finance and government (Huang, Guo, Xie, & Wu, 2012). ICT convergence in health sector and medical industry can help people from the less developed areas gain access to superior health care resources worldwide. With ICT one can take the aid from medical expert sitting miles away through HD video equipments and medical apparatus that may pass on vital datas from medical devices at a lightning fast speed. In case of education sector ICT convergence can take to the world's biggest library for information as well as provide distance learning facilities from the world's top most universities. Similarly, ICT convergence finds its applications in other sectors related to finance and economy too.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ICT, another form of digitalization, aims to form e-democracy as a part of its successful implementation and usage marked by political engagement and open discussion among educated mass to help create a space of convergence in which all the citizens are enabled to recognize themselves as co-working for a common deed (Molinari, McPherson & Singh, 2014). E- Democracy is the new horizon… the outcome of specially designed plans and programmes where the scattered mass gets accumulated, each with motivation and an opinion that constructs a true democracy. It is the individual level motivation that can lead to collective movement of the population for future establishment of a better public administration and knowledge society. E-democracy is free from constraints of conflict, orthodox ideas and leads to innovation and better future. E- Democracy, as the authoritative source like OECD says in an often quoted 2004 publication, can be achieved in terms of e-participation, whose objectives are as follows (Macintosh, 2004):

- Reaching out and engaging a broader audience of active participants;
- Support participation through a range of technologies to cater for the diverse technical and communicative skills of citizens;
- Provide relevant information in a format that is both more accessible and more understandable to the target audience to enable more informed contributions.
- Engage with a wider audience to enable deeper contributions and support deliberative debate.

E-Governance: It is the concept shaped through the policy of e-Government which essentially targets the use of information technologies (typically the internet) to foster the delivery of government information and services, re-structure administrative procedures, and enhance citizen participation (Mahizhnan, 2014). The term governance is also a 'goal oriented process which denotes the outcomes of interaction of government, public services and citizens throughout the political process' (Das, 2010). It is also recognized as a set of 'technology mediated process' that are changing the ways of public service delivery and also the interaction between the citizen and the government (Kate, 2002). Thereby the right technological use will result in bringing social upliftment and skill development (Figure 4).



ICT: THE MAGIC WAND FOR SOCIAL CHANGE IN RURAL INDIA

Information and Communication Technology in the 21st Century has created a sensation by showcasing its vast use in various fields like health, finance, administration, politics, education and several others. Not just in name, but also in deed did ICT become one of the important bridges to level down the gap between the rural and urban areas. With proper planning and strategies along with the merge of the private and the public partnerships, ICT flourished in Indian rural sector within a short span of time. Villagers started accepting soon the technology as their friend in their daily life as it helped them in greater productivity and yield of crops through e-krishi and other similar agriculture programs.

Through effective changing of government policies and increasing public- private partnerships, a lot of improvements are carried out in effective e-Governance programs (Jamaluddin, 2013). Application of ICT can be done in diverse platform; from accelerating information dissemination, improve efficiency of public services and increase the transparency and accountability of government administration to reduce corruption and facilitate citizen participation in local governance. But full potential of ICT in terms of its application and usage as a catalyst for development is yet to be reached (Bhatnagar, 2014).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Information dynamics in social uplift (Rahman, 2008)

ICT costing was cumbersome. But the rapid smooth technological advancement is making it more affordable to reach a place where the high cost will no more be the biggest barrier in bridging the digital divide. Government as a part of successful ICT implementation has correctly used the same for proper execution of internal efficiency and improved delivery of services (Bhatnagar & Singh, 2010; Bhatnagar, 2014). Some of the most successful ICT projects in India owe their credits to several partnerships. For example, the incredible success of e-Choupal is one such example where experts from their respective fields came in to make it a successful mission. In e-Choupal, ICT agents provide the infrastructure (lab or warehouses), government provided information like weather forecasts and commodity prices from government mandis, while experts from Universities were reached for their valuable advice all throughout the implementation process (Bhatnagar, 2014).

India is the first address, when it comes to experimentation with ICT for sustainable development (Bhatnagar, 2014). Internet plays a vital role in agribusiness leading to new market places and also as an information resource (Jamaluddin, 2013). e-Commerce has found its way successfully to agriculture. Both the B2B and B2C categories of transactions have used Internet in Agriculture, Remote service, and Maintenance referred to as agribusiness –to–agribusiness (A2A) and agribusiness-to-grower (A2G). Therefore, the participation is directly linked with the adoption o internet mutually by both the ends- buyers and sellers (Jamaluddin, 2013). m- Governance hold a major division in the National e-Governance Plan which establish the exceptional growth and development in ICT (Ganapathy, 2014). With the motto of providing high quality and affordable healthcare to people irrespective of their financial, technological and geographical reach, Apollo started with Apollo Telemedicine whereby patients health are investigated, monitored and treated via image acquisition, storage, display, processing, and transfer, thereby eliminating the physical travelling of patients (Ganapathy, 2014). One of the important applications of ICT is the "Telecenters". It is a life support in communities where individual computer ownership is uncommon and internet use is infrequent (Gomez et al., 1999; Heeks, 2008; Best & Kumar, 2008).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ICT applications in a broader sense need to be developed to achieve certain objectives like- (i) Improved access to social services; expanded reach, better quality and better targeting. (ii) Community involvement. (iii) Enhanced income for the poor and lower cost of access to public services (Bhatnagar, 2014). More productivity is directly linked with greater source of income and less dependency on natural climatic conditions favourable for agriculture. A hand in hand debate which follows at parallel argues the dependency of technology vs dependency on natural climate? The dependency on natural climatic conditions for yield of crops often curtailed their profit with huge loss. Thereby acceptance of technological aid seemed to be a better option. Services like weather report, land conditions, use of fertilizers and very importantly the actual rates in the market helped the farmers. Apart from this ICT use in the field of education and health is beyond parallel. As discussed earlier, rural population is very orthodox in nature and they tend to reject any foreign ideas and imagination readily. In order to gain trust and acceptance, messages and programmes were designed just in the way best acceptable. For example, most of the girl children are not allowed to move out of home for education purpose. ICT, with distance learning programmes made it possible to get higher education sitting from home itself. Even the whole library is digitalized today in order to make it accessible from any nook and corner of the world. The prime key area of ICT that makes it this much accessible is the affordability. Government of India has taken great initiatives in rural development projects by installing devices that would impart high speed internet connection in the rural areas. ICT projects relating to employment generation include DTP learning, basic computer skills learning like hardware and software helps to e-literate the underprivileged and make them 'future ready' in the era of automation. The health sector under the aid of ICT has helped serve better delivery of infants, the result of which can be rightly measured by the lessened death rates of newly born babies. Also, the tips to protect self from deadly viral diseases are being given. Several kiosks are also set up as an extension of ICT aid to help those who are underprivileged.

The present chapter aims to discuss the victory ride of ICT in India by making a case study analysis along with finding the DNA of its success by comparing and contrasting it with several other communication models and theories.

Case Study

The chapter aims to see the success of ICT in India for which some of the important projects are being discussed and analyzed here. This analysis of the several important projects will help infer the effective penetration of ICT in rural India and the overview will highly serve to get to an anawer of one of the objectives. The primary projects discussed in here are The *Akshaya* Project (Kerala), *E-Gram* (Gujarat), *Gyan Ganga* (Gujarat) and *WBSWAN* (West Bengal).

The Akshaya Project

This is one of the biggest ICT projects that India has ever witnessed. Introduced in Malappuram district of Kerala, this initiative soon spread its web to the other parts of the state. The high success project was the first of its kind which extended the 'district-wide e-literacy' in the state. The project included the largest Internet Protocol (IP) based wireless networks in the world to make Malappuram India's first E-literate district. In Phase I of the project 100% e-literacy was achieved in 8 districts of the state. The project has conducted one of the largest awareness missions for the need of computer literacy and has reached over 3.6 million people to fulfil its mission of generating e-literacy awareness. Multiple computer

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

access centres has been set up throughout the state, primarily funded and run by the state government, leading to a colossal wireless communication infrastructure which has opened up multiple opportunities and wide range of services. Prof. Kenneth Keniston, Founder and Director of MIT India Programme commented on the project and added his valuable views on it:

There are many good projects sponsored by State Governments and NGOs which are admirable; but nowhere has the kind of vision and strategy been as demonstrable as in Akshaya. Neither do I think any other state has the wherewithal for accomplishing these because without literacy, without commitment on the part of the people concerned, without a certain level of social justice, these things would be very difficult to achieve.

The services that are conducted by the project include (i) e-Pay: Electronic paying system helps the online payment of monthly bills such as electricity, land phone, drinking water, university fees etc. sitting in the comfort of home. (ii) e-Krishi: It primarily aimed to help and provide online agricultural information to rural people, particularly farmers. Through this program the farmers were made literate of the several modern techniques that can be up brought for better growth and productivity of crops. It also helped to provide the price and values of seeds and other trading requirements in order to help them overcome fraud situations. (iii) e-Vidya: Vidya means knowledge and e- Vidya dealt with electronic advanced education courses on Information Technology (IT) for e-literates and others. (iv) e-Ticketing: It helped to pre book online train, flight and bus ticket reservations over internet. (v) Village Kiosks were set up aiming for transparent collectorate program to facilitate citizen- government interface and minimize the gaps in communication by access to information.

"ICT accessibility for anyone and everyone" was the primary concern for the project which was carried out with much success. ICT accessibility for all sections of people had led to better lifestyles, information accessibility and transparency in governance and welfare programmes funded by the state government. The project has resulted in considerable socio-economic growth for the state. The project, as of now, is being conducted in other districts as well like Thiruvanathapuram, Kollam, Alappuzha, Kottayam, Kannur and Idukki to name a few.

However the CAG audit report on Kerala's Akshaya contradicts some points by saying that billions of money would be wasted if bureaucracy does not learn quickly from its failures as it challenges the success of the project by saying that the target of giving 50,000 jobs by means of this project in three years (2003- 2006) was not fulfilled as the employment generated was just 6,818 in eight years (Upadhyaya, 2010).

Gyan Ganga

Like Akshaya Project in Kerala, Gyan Ganga too is one of the ICT initiatives taken by the government of Gujarat with the sole objective of providing wireless internet connectivity to all 18,000 villages. The project was initiated by the Department of science and technology on behalf of the Government of Gujarat (GOG) and has signed MOU with M/s n- Logue communications Pvt. Ltd. It can therefore be identified as one of the Public-Private-Partnership (PPP) aiming common goals of providing internet connectivity through wireless technology called CorDect in order to provide employment to village entrepreneurs and building of knowledge societies at the grassroots level. The ICT facilities provided

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

by *Gyan Ganga* includes online registration of various applications, online public grievance forum, information on Government programmes, online application forms, update Government information, etc.

Gyan Ganga undertook quite a few progressive steps to achieve considerable economic growth by reducing farming costs, increasing crop yield, enabling effective post harvest management, reducing risks, providing expertise in animal husbandry and watershed management and enabling better credit options and facilities to the rural mass.

Some of the services offered by *Gyan Ganga* include- Computer education, Blue book, Green book, Red book, Online testing tutorial, Online Photoshop tutorial, Health, E-mail and web browsing, e-Governance and Bio data maker. The *Gyan Ganga* project enabled top class services in a single click, provided solutions with an Agriculture expert, veterinary services, e-Government services, Distance health care or e-health, Distance learning or e-learning, Remote Eye Care, e- Agriculture and many more with the help of internet.

E-Gram

The primary objective of this mission is to enable the gram panchayats to adopt a computerized official system. The initiation of this project was a huge step to develop the rural areas particularly for official purposes such as instant processing of birth and death registration, issuance of certificates such as caste, income and electricity. The success of existing ICT services in the state had led the state government to take up this project to expand ICT services in the rural areas. The state government had planned to cover 1400 villages in the initial phase of the project. The *E-gram* project enables the villagers to have access to relevant and full information through e-mails and government websites. The *E-gram* remains one of the most successful projects undertaken by the government of Gujarat.

Some of the services carried on by *E-gram* include: (i) Birth and death registration along with issuance of respective certificates via computerised and easily handled system. (ii) Property Assessment was easily accessible and reproducible. (iii) Tax Collection, availability of printed bills and details of taxes. (iv) Accounts of gram panchayats were made easily accessible and available. (vi) Issuance of various certificates such as caste certificate, income certificate, farmer certificate, availability of easy verification and easily maintained records. *E-Gram* is initiated by a software system specially developed by the Government of Gujarat. The technologies used for incorporating IT in e-Governance include Back end - MS-Office 2000, MS-Access 2000, SQL Server 2000, Front end – Visual Basic, ASP, ODBC, Operating System- Windows 2000, Networking -GSWAN dial up connectivity. Computer system, Dot matrix Printer, Modem, Telephone and Inverter were among the hardware that as a part of the project was provided along with *E-Gram* panchayat as the only software (Kokil, n.d.).

West Bengal State Wide Area Network (WBSWAN)

Based on Internet Protocol (IP), *WBSWAN* is a modern networking system for computerized connectivity within the administration run by the West Bengal state government. It enables the government to function more productively and effectively by supporting both horizontal and vertical flow of information and communication in order to carry out its initiatives better. *WBSWAN* is a network system for data, voice and video communication that runs throughout the state of West Bengal. This network helps the government to carry out administrative programmes through a computerized system. The project is officially run by West Bengal Electronics Industry Development Corporation Limited or Webel

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Technology Limited. IIT (Kharagpur) is the formally appointed 'External Network Consultant' for the project. WBSWAN network offers connectivity of Data, Voice & Video Communication facilities from State Switching Centre at Kolkata up to all District Headquarters on 2 Mbps (E-1 link) leased line of BSNL. According to the guidelines of DIT, GOI, twenty horizontal offices are to be linked with WB-SWAN backbone at the District, sub- division level and five horizontal at the block level. Each District Headquarter has video conferencing facility along with Multi- conferencing facility through Multipoint Conferencing Unit (MCU).

The primary objective of this networking system is to provide connectivity among all the government departments as well as to improve government-citizen and government-industry ties. It also supports projects such as government Application Service Provider (ASP).

An Inference From the Case Study

From the above four case studies, it could therefore be outlined that ICT is highly preferred as a tool for social change in the government sector and that it can bring transparency between the administration and the public. It is for this reason that both the private companies and public wings are now collaborating together for the betterment of the rural societies. Some of the facts and figures coming out of the case studies can be inferred as:

- Government bodies are putting their step forward for ICT Implementation at various levels with the aim of equal dissemination of information.
- Rural population is now more e-literate and has access to high speed internet connectivity to make their daily life easier.
- More job options have opened up in the form of business entrepreneurs and DTP learning.
- ICT is securing transparency at several levels of the government administration and therefore supporting the Right to Information Act 2005.
- ICT initiates having a public forum which encourages debates and discussion in a pluralistic society.
- ICT is able to bridge the gap between the rich and the rural section of the society, between the technology haves and have-nots.
- ICT favours social inclusion by more easy access to technology at affordability.
- It is also very necessary to use ICT in the most effective way or there are chances of it to be misused and loss or drainage of money may occur.
- Successful Public-Private coordination for social purpose.

COMPARISON WITH DIFFERENT MODELS OF COMMUNICATION

The core area involving ICT is 'technology' as the medium for communication. In ICT a message is passed on via technologies like telephone, fax, computer, e-mail etc. Which means a message from the source (here the policy makers) is first encoded in the machine language (binary language or others) and is transmitted via signal (internet). The encoded message then reaches the receiver who decodes the message and perceives the meaning and gives his/her feedback. The same notion can be traced in one of the founding communication models 'Shannon and Weaver Model', 1949.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Shannon and Weaver Model too talks about an Information source, who is also the decision maker and designs the message accordingly, the message is transmitted via a transmitter in the form of signal and then received by the receiver who decodes it and gives a feedback. Some of the converging areas in both the cases may be listed as below:

1. **Source as the Primary Decision Maker:** Shannon and Weaver says that 'source' designs the message and is the primary 'decision maker' who selects over which message and how much information is to be passed on. In case of ICT, the source or the decision maker is The State i.e. the government plans and programs meant for rural upliftment.
2. **Identification of Noise:** Since the message passes through a machine (technology) and has to undergo several conversion procedures in order to be 'transmission ready', therefore, high chances of intervention are there. These interventions are recognized by Shannon and Weaver as 'noise'. In case of ICT, 'noise' may occur with slow internet connectivity. Lower the noise, better the communication. For this reason, government has installed high speed internet connection in rural areas. Noise in this model also gets a different dimension of barrier. In such a case ICT has a language barrier which is also overcome by recent options of translations provided by technology.
3. **Identification of 3-Tier Problems in Communication:** Shannon and Weaver identified three levels of problem. Level A dealt with technical problems, Level B with semantic problems and Level C with effectiveness problems…one complex than the other. In ICT too, the same problems are identified and care has been taken on all the three factors to minimize the problem.

Drawbacks

1. **Linear Model of Communication:** While ICT approaches for two way communication with transparency and interaction, Shannon and Weaver does not recognize the same, instead the model identifies communication as a linear movement of information from left to right.
2. **No Place for Feedback Mechanism:** Shannon and Weaver Model do not talk about feedback, but is very concerned about the 'effect' of the information on the receiver. In ICT also, the effect of message on the receiver is given priority and so the message is designed in the way understandable and absorbed by the audience.

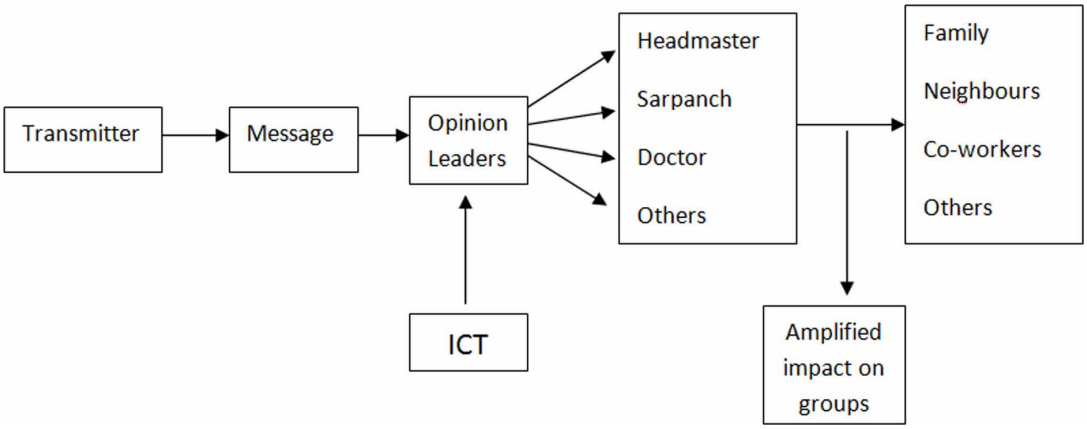
Keeping in mind the use of ICT in rural development it may also be compared to two-step-flow theory: the theory developed by Elihu Katz and Paul Lazarsfeld in 1944 and later in 1955, states the importance of a middleman in the process of communication. The middleman is termed here as Opinion Leader. He, the opinion leader is a member of the same group of people who are targeted. The function of opinion leader is to build a bridge between the outer world and his group. Since, he is a person of primary importance in the group; his opinions are readily acceptable to the rural mass.

It is here, where ICT's success can be identified. ICT deals with installation of technologies at fixed places in the village. Selected volunteers are given the duties of providing training session to a group of people and then they are asked to relay the learnt lessons. In this way, ICT do not directly communicate with the rural mass, but it goes via opinion leaders.

Two-step-flow theory has certain advantageous factors identified as under:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

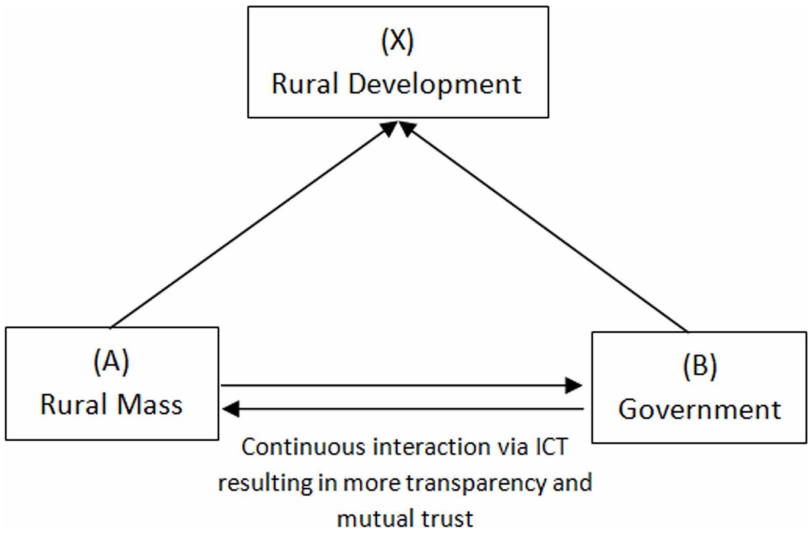
- High level of penetration in the rural mass
- Enactment of regular interaction
- Enactment of horizontal communication
- Systematic involvement
- Less risk of failure
- Integrated approach



Since ICT works at multilevel, therefore it can rightly be compared with Newcomb's Model (Das, 2010). Also, it must be noted that Newcomb's model aims for a social equilibrium as his proposition was based on consistency or balance theory (Andal, 2010). His approach is much broader than just transmission of message; but deals with the interpretative process involved between individuals or groups or institutions during the process of communication.

Newcomb's model, 1953, briefly states that there is high interdependency between the members taking part in a communication. Newcomb argues by saying that if A and B are communicators and X is a part of their system, then ABX altogether are interdependent. All the three must have equal attitudes towards each other in order to maintain equilibrium. Change of any one of the member would break the structure.

In case of ICT, the interaction between the rural mass and the government plays a crucial in fostering rural development. Since, the target approached is 'integrated development' of the rural sector by increasing the quality of living, sanitation, health and economy, through proper flow of information (via e-Governance) between the target people and the government; we can say that rural development is dependent on the relation between public (rural mass) and government. Other way round, we may also say that, both the public (rural mass) and government must have the same approach or goal, in this case 'the rural development' in order to achieve it.



From Figure 6, it can be stated that through transparency between the government and the rural mass, there can be a healthy relationship attained between the both. It can also be speculated that increased transparency will build a problem solving area between the both which could lead to 'Integrated Rural Development'. This model can be applied to the North Eastern states of India also in order to bring the underprivileged close to the nation and its administration. If achieved, then according to this model, peace and harmony along with integrated development can be achieved.

Figure 5. ICT in Two-step flow theory

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. ICT in Newcomb's Model

Not just this, in fact any kind of national conflict (inter or intra) may also be avoided and resolved following the above structure.

Inference From the Models of Communication

It can therefore be concluded that ICT uses the right portions of every model and theories to suit best in the position of weapon for social change. It can also be speculated that ICT has a role at micro as well as macro levels of the society. One of the primary things that should be kept in mind is the know-how to use it in the way to usher development. Inference can be summarized as:

1. Proper message (policies and schemes) should be designed in order to get the desired result.
2. ICT success depends on the way it is used. Proper use of ICT can bring peace and harmony and lessening misunderstandings and minimizing conflict. Improper use of ICT for rural development may serve the other way by making the target audience lose interest and trust in it thus leading to maximization of agitation and conflict.
3. ICT through proper planning can be strategically placed to gain higher degree of penetration at the grassroots level, i.e. through opinion leaders; thereby ICT can minimize the gaps between those privileged and underprivileged.
4. ICT, as in the technological part should be updated and upgraded for smooth flow of information in order to reduce miscommunication or technical noise that may hinder the flow of information. For example, slow internet connection may cause serious problems in the e- health sector.
5. ICT has effective role both at the micro as well as macro level, which means, its scope is not just limited to rural development programs.
6. ICT requires systematic functioning of the planned programs. The State is responsible for proper training and guidance as infrastructure building won't help alone.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ICT: A Look Into the Future Journey

Till now the journey of ICT in India has been discussed in this chapter, but it is also very important to know what is happening outside India and thereby an overview of the outside world is also very important. Predicting the future is one of the important areas in research and thereby a statistical data is very important. As the progress of ICT is highly measurable by its daily usage, therefore a mathematical view of the same will give the clear picture. Statistically proved and stated that, by the end of 2014, there will be almost 3 billion internet users of which two-third of them coming from the developing countries. Also speculated that the number of mobile-broadband subscription will reach 2.3 billion globally by the end of 2014 and Fifty-five per cent of these subscriptions are expected to be in the developing world (Sanou, 2014).

The facts and figures also throw light on that there is 44% growth in all fixed-broadband subscriptions in Asia-Pacific, compared with only 0.5% in Africa.

The above stated statistics greatly predict a bright future of ICT in the developing countries and India being a microcosm of it also shows great hopes in the coming future as universally experts and specialists are looking into the investment from an optimistic point of view. ICT apart from rural development also fosters macro level communication, which also guarantees its longer stay.

Future Research Directions

Since the success of ICT is a proven fact, therefore future research directions may include the ways to improve it more in terms of application and maintenance. Maintenance is a markable factor in ICT implementation as contradictions are there (Upadhyaya, 2010) and several academic authors have criticized about it. Crores of money is being spent in ICT rural developmental projects and technologies are installed, but lack of maintenance pulls all the effort backward. So, improving maintenance and developing policies for that is the first initiative that should be concerning the future research.

Again, ICT implementation for rural development, although gained success in a short span, however it is felt that still, in the remote village; for instance take Meghalaya where a lady sitting in the government office affirmed that she did not know how to use it (Dutta, 2012). Therefore it can be inferred that building infrastructure won't work alone. So, focus should also be given on exhaustive training programs over 'just' building infrastructure and very importantly, there should be no compromise made in the way with these training programs.

ICT rural development plans still need to be developed in the North- East India. Proper plans and programs require to be implemented in the underprivileged area. E-literacy needs to be promoted more. Social Inclusion and proper citizen participation is of high requirement here in the North- Eastern part of India in order to foster development, peace and prosperity in this region of India. Therefore, one-step-ahead of state level plans like SWAN and national level plans like NeGP is required as the ethnographic culture and population demands that.

Like the concept of development is limitless and always expanding, thereby, ICT development plans must also look for the other sides in order to find ideas to develop it more giving a better result. After all it's the age of technological innovation and every individual is targeting to form an information society. So, the future research area may include in finding and inventing ways to develop it more for voluntary participation and integrated development.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Crossing the boundaries of digital divide, social exclusion and technology driven development concept; developing countries worldwide are steadily moving towards the acceptance of ICT's role in fostering integrated development. With lots of e-Governance projects launching more recently each year, government too takes active role in it by building infrastructure supporting the cause. Not just this, the public-private venture is also adding a lot of positivity in the scenario.

In a developing country like India, where the population is counted to be one of the largest in the world, development is hard to penetrate the grassroots due to social taboos, less understanding, poor education and mental rigidity. Rural sector in India is highly pluralistic in nature as one can witness a large variety of culture, systems and norms prevailing even till today. The challenge therefore is to meet the minds of this heterogeneous audience and bring development at individual level primarily. Development in such a heterogeneous society demands regular interaction with the modern world through e-Governance, assisted by specialized and trained volunteers, NGO workers and formation of SHGs.

E-Governance lets every individual to participate in the program and exchange vital resources necessary for smooth flow of information and thereby participate in the horizontal communication process. In order to initiate this communication and make it highly successful it is also very necessary to reach the audience in their own language and today's computer technology highly supports it. Kudos to Software options for language and translation! Receiving information from the new media technology in 'my own language' creates a 'my space' which is not just motivating but highly emotional. The rural vulnerable mass, which often alienate themselves from the outer world 'Our World, Their World' concept is instantly broken down and they could actually open up their emotion and cognition to necessary information and perceive things to get persuaded. Actually, the acceptance level both in sensory terms as well as psychological terms are attained which readily initiates active participation through motivation. This is also the aim of e-Governance. e- Governance therefore fosters social inclusion and breaks the digital divide. ICT is the right medium to do the needful and the overall responsibility goes in the hands of the State. Keeping an eye over the penetration factor of ICT, The State should initiate some more programs relating to rural development. ICT strategies not just handovers the power of technology in the hands of the poor but also empowers them with e-Learning facility. Distance Learning, DTP classes and basic hardware and software trainings help find employment in the modern world.

The summary of all the factors on basis of observations and inferences with respect to this chapter can compiled as under:

1. ICT is a technology driven endeavour to foster 'sustainable development' in rural India.
2. ICT uses schemes and programmes that directly relates to the rural audience and their problems.
3. ICT supports Development Support Communication (DSC) and therefore involves greater audience participation.
4. ICT imbibes two-step-flow theory in order to gain greater acceptance among the rural mass.
5. ICT brings transparency through smooth flow of information, thus the rural mass gets close to the administration and its policies. Therefore, the public- government conflict is minimized.
6. ICT enhances horizontal knowledge sharing process which is followed by group debates and discussions forming opinions.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

7. ICT takes aid in building an information society, whereby every individual will be an equal participant irrespective of their financial background.
8. ICT serves to provide an integrated sustainable development to its target group that includes better quality of living, sanitation, health, employment and less climatic an economic vulnerabilities.

In a nutshell, ICT serves towards bringing positive and radical change in a developing society, blessing it with harmony, peace and prosperity. The State playing a crucial role; it is predicted that, with proper planning and better schemes, ICT will prove to bring about more positive changes in the near future.

KEY TERMS AND DEFINITIONS

Communication Model: Models of communication refer to the conceptual diagrammatic representation used to explain the human communication process which primarily consists of a transmitter, a channel, a receiver and a destination. Models are used for the sake of simplification and presentation of the complex communication structure and often help to identify the type or pattern of communication. Models also help to predict the nature of communication and the type of its outcome.

Convergence: Convergence is the coming together of telecommunications, computing and broadcasting into a single digital bit-stream. The rise of digital communication in the late 20th century has made it possible for media organizations (or individuals) to deliver text, audio, and video material over the same wired, wireless, or fibre-optic connections. This digital convergence of news media, in particular, was called "Mediamorphosis" by researcher Roger Fidler, in his 1997 book by that name. An example of device supporting convergence is smart phone that can involve n parallel work of a phone, pc, music system, compass, library, newspaper and so on.

Digital Divide: Digital divide is used to describe the discrepancy between people who have access to and the resources to use new information and communication tools and people who do not have the resources and access to such technology. The term also describes the discrepancy between those who have the skills, knowledge and abilities to use the technologies and those who do not. The digital divide can exist between those living in rural areas and those living in urban areas, between the educated and uneducated, between economic classes, and on a global scale between more and less industrially developed nations.

Digitalization: Digitalization is the integration of digital technologies into everyday life by the digitization of everything that can be digitized. The literal meaning of digitalization gives an apparent idea of development and technology dependent world. In this chapter, digitalization means computerization of systems and jobs for better ease and accessibility.

Development Communication: Development communication refers to the use of communication to facilitate social development. Development communication techniques include information dissemination and education, behaviour change, social marketing, social mobilization, media advocacy, communication for social change and community participation. Erskine Childers defined it as development support communications which is a discipline in development planning and implementation in which more adequate account is taken of human behavioural factors in the design of development projects and their objectives.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

E-Governance: E-Governance is the public sector's use of the most innovative information and communication technologies, like the Internet, in order to deliver citizens with improved services, reliable information and greater knowledge in order to facilitate access to the governing process and encourage deeper participation (UNESCO). It is a generic term that refers to any government functions or processes that are carried out in digital form over the Internet. Local, state and federal governments essentially set up central websites from which the public (both private citizens and businesses) can find public information, download government forms and contact government representatives.

ICT: The term ICT (Information and Communication Technology) is used to refer to the convergence of audio-visual and telephone networks with computer networks through a single cabling or link system. There are large economic incentives (huge cost savings due to elimination of the telephone network) to merge the telephone network with the computer network system using a single unified system of cabling, signal distribution and management.

Information Society: Information Society is a term for a society in which the creation, distribution, use, integration and manipulation of information is a significant economic, political, and cultural activity. The aim of the information society is to gain competitive advantage internationally, through using information technology (IT) in a creative and productive way. The knowledge economy is its economic counterpart, whereby wealth is created through the economic exploitation of understanding. People who have the means to partake in this form of society are sometimes called digital citizens. This is one of many dozen labels that have been identified to suggest that humans are entering a new phase of society.

Public Participation: Public participation is a political principle or practice, and may also be recognized as a right (right to public participation). Public participation may be regarded as a way of empowerment and as vital part of the democratic governance. Public participation is marked by debates and discussion along with social inclusion. Generally public participation seeks and facilitates the involvement of those potentially affected by or interested in a decision. The principle of public participation holds that those who are affected by a decision have a right to be involved in the decision-making process. It initiates and enhances the knowledge sharing process within a community.

Social Inclusion: Social inclusion is a process by which efforts are made to ensure equal opportunities for all. The multi-dimensional process aimed at creating conditions which enable full and active participation of every member of the society in all aspects of life, including civic, social, economic, and political activities, as well as participation in decision making processes. Social inclusion may also be interpreted as the process by which societies combat poverty and social exclusion. Social inclusion aims to empower poor and marginalized people to take advantage of burgeoning global opportunities. It ensures that people have a voice in decisions which affect their lives and that they enjoy equal access to markets, services and political, social and physical spaces.

Social Exclusion: Social exclusion (or marginalization) is social disadvantage and relegation to the fringe of society. Social exclusion is the process in which individuals or entire communities of people are systematically blocked from (or denied full access to) various rights, opportunities and resources that are normally available to members of a society, and which are fundamental to social integration within that particular society.

Sustainable Development: Sustainable development or integrated development deals with an overall development which includes improved quality of living, health, education, employment along with economic development. Sustainable development can greatly be related to developing countries like India, where economy is not just the problem, but lack of proper sanitation and clean drinking water also.

ENDNOTE

[1] The development of mass media technology in the developed nations imparted news about themselves, amplifying and glorifying their own society, events and people as the primary content of news; while portraying the third world or the developing nations to be a poor place to live in by mostly referring to the crimes and issues of distress. This was recognized as the one way flow of information or biased information from developed nations to the developing ones.

Chapter 62
Foreign Direct Investment in Land Acquisitions in India: Evidence and Challenges

Falendra Kumar Sudan
University of Jammu, India & University of South Australia, Australia

ABSTRACT

There has been large-scale Foreign Direct Investment (FDI) in land in India for promotion of Special Economic Zones (SEZs). The key drivers of land acquisitions are food security, the bio-fuels boom, growing business opportunities, and policy reforms. Increased foreign land investment may increase economic growth and raise government revenues and create new livelihood opportunities through new capital, technology, know-how, infrastructure, and better market access. At the same time, foreign land acquisitions may result in local people losing access to the resources. Therefore, there is a need for wider public consultation involving all stakeholders to ensure improved livelihoods and food security. The creation of robust institutions and social and environmental impact assessments of FDI in land acquisitions are called for to promote inclusive growth through more job creation, infrastructure development, public revenues, environmental protection, and to protect local food security, particularly in times of food crisis. This chapter explores FDI in land acquisition in India.

INTRODUCTION

There has been increasing pressure on land resources to meet increasing demand for food, biofuels, minerals and environmental services. About 40% of the Earth's land surface is used for agriculture (Turner et al., 2007). The human-land relations are changing due to dynamic interaction between socio-economic and bio-physical drivers. The land of the developing countries is considered as a potential source of meeting increasing demand for biofuels, food crops, mineral deposits and reservoirs of environmental services. The rapid population growth has increased pressure on agricultural land to increase productivity. Currently, the increase in agricultural productivity has failed to keep pace with the demand for food. There has been huge demand for investment in agriculture in developing countries. Therefore, private

investment in agriculture has been an option to meet food demand in post-food crisis period. Agricultural land acquisitions take place ignoring the livelihood rights of affected communities undermining national and local food security in developing countries (von Braun & Meinzen-Dick, 2009; Daniel & Mittal, 2010). The comprehensive data on regional or national land acquisition is scanty (Taylor & Bending, 2009). The governments play an active role in large-scale land acquisitions both domestically and internationally, even though the unoccupied arable land available for acquisition is very small and statutes and constitutional provisions also prevent large-scale land acquisition. The International Financial Institutions (IFIs) influence large-scale land acquisition by financing land acquisition projects and suggesting guidelines and policies (Cotula, 2012). However, the IFIs have failed to protect the rights of the poorest communities and most vulnerable from food insecurity and hunger.

The demand for land is increasing (Haberl et al., 2009) in both developed and developing countries to meet growing demand for food, biomass and fibers. Agricultural investment in the past mainly came from Western countries and companies seeking comparative advantages in their production for the global market. The current land deals are increasingly driven by the desire to secure rights to land and fresh water for the domestic food and energy needs of the investor (Smaller & Mann, 2009; United Nations, 2010). The "new" investors are predominantly oil-rich but food-insecure Gulf States like Saudi Arabia, Qatar and the United Arab Emirates and populous but capital strong countries in Asia like China, South Korea and India (Gorgen et al., 2009; Smaller & Mann, 2009; von Braun & Meinzen-Dick, 2009). Moreover, Western companies are still investing in land in Africa for bio-fuel production or investment objectives.

The international trade in biofuels is increasing to meet growing demand for energy (Erb, 2004; Erb et al., 2009). The local land use changes in developing countries are also influenced by increased global demand for products. There are causal relations between land uses over large geographical distances due to growing global trade of food, biomass and fibers (Haberl et al., 2009). Numerous studies von Braun and Meinzen-Dick (2009), Cotula et al. (2009), Gorgen et al. (2009), Mbow (2010), and Smaller and Mann (2009) see increased economic opportunity for local communities from the leasing or selling of the land. There has been growing trend in the land acquisitions by foreign investors, which is termed as "land grabbing" in developing countries. The land investment is termed as land grabbing if there is a purchase or lease of vast tracts of land by wealthier, food-insecure nations and private investors from mostly poor, developing countries in order to produce crops for export (Daniel & Mittal, 2009). The "land grabbing" took place if the investment exceeds 1000 ha. The economic and political significance of the land dispossession is generally increasing and becoming one of the major global issues (Amanor, 2012; Hall, 2012; Lavers, 2012**;** Woodhouse, 2012).

DRIVERS OF FOREIGN LAND ACQUISITIONS

The foreign land acquisitions are an old phenomenon in developing countries (Kugelman, 2009; Songwe & Deininger, 2009; Taylor & Bending, 2009). Nearly 15-20 million hectares of farmland have been acquired by foreign investors between 2006 and 2009 globally (von Braun & Meinzen-Dick, 2009). The principle origins of demand are from the Gulf States of Saudi Arabia, UAE, Qatar, Kuwait and Bahrain, China, South Africa, Japan, Russia, South Korea, the US, and UK and other EU members (Cotula et al., 2009). There are various types of buyers, including state-owned enterprises, sovereign wealth funds, foreign and domestic private sector investors, and central government agencies. The key drivers of foreign

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

land acquisitions include rapid population growth, demand for biofuels, food security and urbanization and shift in food habits (Daniel & Mittal, 2009; Friends of the Earth, 2010; Mitchell, 2010; Smaller & Mann, 2009; Zoomers, 2010).

The acquisition of land by foreign land users to meet food deficiencies is an increasing trend over the past few years (Cotula et al., 2009). Water is also a key driver in the land grab phenomena (Rockstrom et al., 2003; Smaller & Mann, 2009; Woodhouse & Ganho, 2011). The Earth's resources are under increasing pressure caused by a growing population, per capita land demands and increasing environmental degradation. There is rapid global land transformation due to the human-environmental interactions (DeFries et al., 2004; Foley et al., 2005; Turner et al., 2007). The global population pressure on land is likely to increase from 6.8 billion in 2010 to 9.2 billion in 2050 causing the average amount of land per person to decline from 7.9 ha in 1900 to 2 ha in 2005 and 1.6 ha by 2050 (Gitay et al., 2007). The competition for investment in agricultural land increased with more value and power in the land rights (Smaller & Mann, 2009).

With the onset of food price crisis, there has been emergence of a new growing phenomenon of outsourcing food production (Songwe & Deinigner, 2009). In the post-'food crisis' period, the prices of maize, wheat and rice have increased multiple times (Headey, 2010), which further strengthened the attractiveness of investment in agricultural production (Cotula et al., 2009). There has been shift in food habits with greater preferences for animal-based diets due to general increase in wealth (Galloway et al., 2007), thus requiring significantly more land for livestock production (Dickson & Reenberg, 2009). Around 37% of transnational land deals aim at either food crop or livestock production (Ries, 2010). The raw materials for industries and fodder can also be the driver of land investments (Bickel & Breuer, 2009). Besides, climatic change may also influence the incentives to grab land as it can render previously fertile land useless for agricultural purposes due to change in rain patterns.

The increasing emission of greenhouse gases has caused growing interest in green energy, including bio-fuels, which require more land. Besides, high oil prices have also created an incentive for diversification of the energy sector (Cotula et al., 2008; Daniel & Mittal, 2009). A complete global shift to bio-ethanol will require a 20-fold increase in the production of bio-fuels and a doubling of the total cultivated land. The production of bio-fuels has been growing worldwide and between 2000 and 2005, ethanol production doubled and bio-diesel production tripled (Peters & Thielmann, 2008). Consequently, large-scale land acquisitions have been rising rapidly to produce more bio-fuels (Cotula et al., 2008; Haralambous et al., 2009). Around 35% of foreign land acquisitions have been used for bio-fuel production in developing countries by the multinational enterprises (Ries, 2010) and investors are mainly from Europe, Brazil, China and India.

Not only this, rapid global urbanization need additional land away from agriculture (Foley et al., 2005). Around 1-2 million ha of agricultural land per year is taken away from agriculture for the expansion of built areas in developing countries (Lambin et al., 2003). In recent past, agricultural investment from developed countries and multinational companies were increasingly driven by the desire to secure domestic food and energy needs of the investor (Smaller & Mann, 2009; United Nations, 2010). The "new" investors are food-insecure and populous countries (von Braun & Meinzen-Dick, 2009; Gorgen et al., 2009; Smaller & Mann, 2009). The recipient countries see the land deals as an opportunity to get funds for the development of agriculture or infrastructure. The contemporary land investments in developing countries are also meant for promotion of eco-tourism and tourist complexes, the establishment of SEZs and their infrastructure (Zoomers, 2010). However, the international land deals have been

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

severely criticized due to their focus on cultivation of bio-fuels and the full export rights to the production, thereby threatening local food security and livelihoods in developing countries. The large-scale land acquisitions by foreign investors have more visibly back on the development agenda in developing countries. The foreign land acquisitions pose threats to the smallholders' land rights and livelihoods of rural communities.

SMALLHOLDERS AND LAND ACQUISITIONS

Smallholders have lower literacy rates and poor human development indicators compared to large land dominance (Nugent & Robinson, 2010) with limited impact on employment and poverty reduction (Pacheco & Chapuis, 2009). Large scale agriculture were promoted to overcome technological, infrastructural and institutional challenges faced by smallholder agriculture through well-resourced schemes like "bonanza farms" in the Dakotas in 1860-1900 (Drache, 1964) and Brazilian rubber plantations in the 1920s (Grandin, 2009), which were ended in spectacular failure and reverted back to smallholder agriculture. The provisions for subsidies and tax breaks in Uruguay in 1987 helped attract FDI to establish a globally competitive forestry industry for employment and income generation (Morales, 2007). In Brazil, long term investments in agricultural technology helped the expansion into vast areas of previously uncultivated lands in the 1970s (World Bank, 2009). In Peru, large agricultural investment helped the country to emerge as a major high-value agro-exporter of horticultural produce and generating many jobs (Hernandez, 2010). In Indonesia, large farming has failed to lead to sustainable investment and contributed to the loss of land with high biodiversity (Koh & Wilcove, 2008).

The existence of smallholders is threatened by global economy processes and only a small proportion of entrepreneurial smallholder will survive (Akram-Lodhi, 2008; World Bank, 2007). With liberalization of land market, FDI has increased in exploitation of minerals, the production of bio-fuels and food, and the construction of infrastructure, including tourism and estimated at US $379 million in 2006 in developing countries with favorable conditions from the national governments in developing countries (Zoomers, 2010) and by the end of 2009, FDI in agricultural farmland was amounted to an estimated 56 million hectares and up to 20 million hectares of land have been acquired by foreign investors since 2006 and widely practiced in Latin America, Southeast Asia, Eastern Europe and most significantly, Sub-Saharan Africa. Around 1-3 billion smallholders will be excluded from job markets and subsequently unable to escape rural poverty. At the same time, the smallholder sector provides more rural employment opportunities than large farms and reduces poverty (Songwe & Deininger, 2009; Taylor & Bending, 2009). Therefore, agrarian future depends on smallholders through increased investment in agricultural training and extension but there is no denying the fact that the smallholders live in precarious conditions. But the modernized agriculture requires large-scale farms (Vermeulen et al., 2009), which support large-scale land acquisitions. However, the smallholder production is economically more efficient than large-scale production (Taylor & Bending, 2009). A combination of smallholders along with commercial enterprises promotes scale economies in processing and marketing (Collier & Dercon, 2009). Therefore, contract farming could be the best option for smallholders.

The process of "de-agrarianization" is taking place through occupational adjustment, reorientation of income-earning, social identification and spatial relocation of rural dwellers (Bryceson, 1999, 2002). Forests are becoming subject to profit-seeking behavior for their carbon sequestration value to reduce

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

climate change impact (Taylor & Bending, 2009). Eco-tourism and large-scale tourist complexes, the establishment of SEZs and their infrastructure are causing shift in land from agriculture to other activities. Not only this, sometimes, companies use land acquired as collateral for bank loans. Agricultural land and water have become contested commodity (Smaller & Mann, 2010), attracting investors from the financial sector who have more traditional market-oriented aims. Smallholders live on diversified farm and non-farm income activities and remittances (Bah et al., 2003; Barrett et al., 2001; Bryceson, 1999, 2002). Besides, population pressure, smallholders may face new challenges due to climate change (Collier & Dercon, 2009). The foreign land investors are additional "players" causing more competition for natural resources for livelihood amelioration (Braun & Dick, 2009). Foreign investors are not interested in marginal land and require fertile soils with irrigation potential and access to ports (Cotula et al., 2008). Most usable land is already being used (Braun & Dick, 2009; Taylor & Bending, 2009), therefore, the current "unused" land is an important source of rural poor livelihood strategies (Taylor & Bending, 2009) and can contribute up to one-fourth income of a poor household (Oxfam, 2011). The foreign acquisition of 'unused' land might affect survival of poor rural population.

The current land deals are called 'foreignization' of space and commoditization of land and other natural resources (Zoomers, 2010). With the liberalization of land market, FDI in developing countries increased rapidly as the national governments accommodate foreign investors and provide them favorable conditions (Zoomers, 2010) and welcome the new source of foreign currency income and other offered benefits (Cotula et al., 2009; Zoomers, 2010). In recent past, large scale land acquisitions have been done by foreign investors for growing food for their home markets (Sahai, 2010). Majority of the agricultural land acquisitions have taken place in Sub-Saharan Africa-SSA (World Bank, 2010). More than 80 Indian companies have invested in buying or leasing huge plantations in SSA to grow food grains and cash crops for the Indian market (Mihretie, 2010). Foreign investors use large mechanized farms to produce output for export, leaving little or nothing for the local populations (Sachs, 2011). Local residents and smallholders have been displaced to enable the land acquisitions by foreign investors, often referred as "accumulation by dispossession" (Harvey, 2006). Therefore, the foreign investments in agricultural land should recognize the rights of smallholders and domestic food security. The agreements for foreign land acquisitions should be based on balanced contracts and partnerships safeguarding the interests of all stakeholders (Food and Agriculture Organization - FAO, 2011).

LAND ACQUISITIONS AND INDIAN EXPERIENCES

Globally, the total land acquisitions by foreign investors range from 43 million ha (World Bank, 2010) to 80 million ha (International Land Coalition-ILC, 2011), and 227 million ha (Oxfam, 2011), of which 60% land acquisitions is in SSA. The land acquisitions are often in excess of 10,000 hectares and up to one million hectares. The main investors are states, sovereign wealth funds and the private sector, including agri-businesses, investment banks, commodity traders and mining companies. The current investment flows fall into different categories. The private sector in Europe, the U.S. and Japan are looking for land all over the place, from Russia to Sudan to Australia. They are likely to produce crops for food, feed and fuel; whichever takes the highest price or supplies other integrated production chains (Daniel & Mittal, 2009; Görgen et al., 2009; Smaller & Mann, 2009). Many agri-business companies have been at the forefront of large-scale land acquisitions for many years (Amanor, 2012), which involve investments

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and dispossession that expel people from agriculture without absorbing their labor in manufactures and creating large surplus dispossessed populations (Araghi, 2010; Li, 2009, 2010). This represents capitalist agrarian transitions worldwide (Tanner, 2010).

FDI and Land Acquisitions

The magnitude and distribution of capital flows to developing countries depend on its determinants (Calvo et al., 1996). The cultural and geographical factors influence the bilateral flows between specific investor and host countries (Benassy-Quere et al., 2007). FDI between two countries depend on the bilateral motives and relative costs (Markusen & Venables, 1998). There are both horizontal and vertical motives (Markusen & Venables, 2000), which explain bilateral FDI (Wei, 2000). FDI into agricultural land is an emerging trend in post-volatile prices of agricultural commodities (von Braun & Meinzen-Dick, 2009). In recent past, the liberalization of capital markets has considerably increased capital flows to developing countries. The countries with the weak law, high political risk, underdeveloped financial markets, high transaction cost, and governance deficits attract limited FDI flows (Shleifer & Wolfenzon, 2002). Institutional factors have significant role in unilateral capital flows to developing and emerging economies (Alfaro et al., 2008). Therefore, the magnitude and nature of capital flows varies across countries (Schnitzer, 2002). Investment is also determined by the length of commitment and managerial control. The potential to technology transfer, knowledge and skills, and FDI is more conducive to local development. In the past, the large scale transnational land acquisitions were part of colonial expansion. There are long-term effects of foreign land acquisitions in developing countries (Banerjee & Iyer, 2005; Iyer, 2010) and developed countries (Libecap & Lueck, 2011).

India is experiencing stagnant agricultural yields in recent years. Increasing population and reduction of poverty are both likely to contribute to rising food demand (Bhaskar, 2010). India's current annual food grain production is 230 million tons. By 2020, food demand will grow to 250 million tons (Hazra, 2009). The retail wheat prices have been higher than global prices of wheat (Chandrasekhar & Ghosh, 2011). With large consuming markets, India decides to purchase anything in large quantities to ensure food security (Bhaskar, 2010). The financial speculation by institutional investors has also become a major factor in global market price volatility (Ghosh, 2011). There has been mounting water shortages in India. Northern India is losing about one foot of its groundwater each year and groundwater levels in Punjab is estimated to fall below 100 feet by 2020. Besides meeting food security, the low cost of farming in SSA is also a potent factor driving food production outsourcing in India (IANS, 2011). The availability of huge cheap arable land is a major advantage (Ramsurya, 2010). The land lease rate in Punjab's Doaba region is a minimum of Rs. 40,000 per acre compared to Rs. 700 per acre in most African nations (Vashisht, 2010). The Department of Agriculture and Cooperation of the Ministry of Agriculture has received offer to increase agricultural production in the respective SSA countries to reduce their dependence on imports of food grains and export of surplus food grains to third countries.

Institutions and Land Acquisitions

There are institutional arrangements for land deals (Hall, 2011) such as stripping of resources for mining, outright takeover of land and related resources for commercial enterprise (Kydd & Christiansen, 1982**;** Loewenson, 1992), commercial operators taking over a block or area (Ariyo & Mortimore, 2011; Hammar, 2010), the development of processing facilities for value chains (Amanor, 2008), and com-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

mercialization *in situ* for commercial value chains (Amanor-Wilks, 2009; Chalfin, 2004). Each of these institutional arrangements involves different requirements for investment in roads, irrigation systems, schools, and health clinics. The last two institutional arrangements result in dispossession of local cultivators (Julia & White, 2012).

The Constitution of India empowers the State to acquire land based on payment of compensation at a rate which shall not be less than the market value prevailing. The Land Acquisition Act 1894 was comprehensively amended in 1984. The National Policy on Rehabilitation and Resettlement, 2007 has replaced the National Policy on Resettlement and Rehabilitation for Project Affected Families, 2003 (Chakrabarty & Dhar, 2010). The Land Acquisition (Amendment) Bill, 2007 was introduced in the Parliament in November 2007. It acknowledged that land acquisition would lead to displacement of people and deprive them of their livelihood and shelter. Land acquisition would have traumatic psychological and socio-cultural consequences for the affected population, which call for protecting their rights.

SPECIAL ECONOMIC ZONES AND LAND ACQUISITIONS

A Special Economic Zone (SEZ) is a specifically delineated duty free enclave and shall be deemed to be foreign territory for the purposes of trade operations and duties and tariffs and comprise both processing and non-processing areas (Citizens' Research Collective - CRC, 2012). It is a geographical region that has economic laws different from a country's generally applicable economic laws and established for spurring economic growth (Maharashtra Economic Development Council - MEDC, 2008). It is a geographically delimited area administered by a single body (World Bank Group, 2008). According to Tantri (2010), SEZs are considered essential for export promotion. Export Processing Zone (EPZ) is a type of SEZ within the host state territory (Muchlinski, 2007). SEZ and EPZ are implementing regional economic development strategies (Guangwen, 2003). The SEZ is a subset within the geographical boundaries of the state. Political and economic stability, reliable infrastructure, inexpensive labor, market access, and efficient bureaucracy are determinants of not only attractiveness of the SEZ, but the success of the SEZ. India is the first country in Asia which set an EPZ in Kandla in 1965. The Government of India has introduced the policies of the liberalization, privatization and globalization (LPG) in early 1990s. As a part of the LPG, the SEZ has been introduced in April 2000 to promote export-oriented growth through FDI, for which a lot of land is being acquired by both the state and central governments in India (SEZ, India, 2011a). The Foreign Trade Policy governed SEZs in India prior to the implementation of the SEZ Act, 2005 (Chandrasekhar & Ghosh, 2007). The SEZ Act, 2005 was passed on 23 June, 2005. It is targeted to generate additional economic activity, promote exports of goods and services, create employment opportunities, and develop infrastructure, all while maintaining the sovereignty and integrity of India. SEZs are an engine of exports expansion, economic growth and employment generation (Sharma, 2009).

In post-liberalized period, there was a dire need of investment in infrastructure. Foreign investment in energy, power, road, and rail welcomed through a single window clearance. SEZs create economic relationships between state governments and private foreign investors. For promotion of SEZs, greater reliance had to be placed on the private sector. FDI is vital to SEZ creation and implementation. SEZs have created few regions of wealth in India. Indian labor is used within country by foreign companies for business, administrative, clerical, and information technology (IT) support. Like FDI investment, SEZs were introduced and established in those states of India that could adapt to economic reform.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Across India, there were 19 SEZs before the SEZ Act, 2005. Up to 2011, the government has approved 581 SEZs (SEZ India, 2011b) of which 154 SEZs were approved in-principle (SEZ India, 2011c) and 130 SEZs are operational. These 581 approved SEZs represent a total of 67680 hectares. Out of 581 approved SEZs, 283 SEZs are located in Andhra Pradesh, Maharashtra and Tamil Nadu (SEZ India, 2011d). Andhra Pradesh has received formal approval for 109 SEZs. Maharashtra and Tamil Nadu ranks second and third with 104 and 70 SEZs respectively. In 2010, 25843 hectares of land have been acquired for 195 SEZs. The share of Andhra Pradesh, Gujarat and Maharashtra accounts for about 77%. Gujarat has the highest share (32.4%) followed by Andhra Pradesh (28.5%) and Maharashtra (15.8%). The land allocations vary from about 25 hectares to vast stretches of land which gave rise to suspicions of corporate land grabbing with political and commercial motivations.

The Information Technology (IT) and IT enabled services sector has 61% share of SEZs. The biotech, pharmacy, textile and multi-product SEZs have less than 10% share each. There are three airport based multi-product and eight port-based multi-product SEZs (SEZ India, 2011e). For the promotion of the SEZs, tax holidays are generous. SEZs are so-called "tax havens" as the developers would be exempted from tax in the SEZs. Besides, exemption from Custom Tariff Act, 1975, Central Excise Act, 1944, Central Excise Tariff Act, 1985 and other similar laws, there is 100% Income Tax exemption on export income for the first 5 years, and 50% for the next 5 years (SEZ India, 2011a). Land is given to developers at low rates (Dutta, 2009). There are heavy losses to the state exchequer in terms of forgone revenue (Chandrasekhar & Ghosh, 2007). The Commerce Ministry of the Government of India considers SEZs as "engines of growth" (Pannu, 2011). The investment in approved SEZs stood at £416 million, however, the SEZs failed to attract desired FDI (Arunachalam, 2010). The value of exports from SEZs increased from £1.9 billion in 2003-04 to £30.6 billion in 2009-10. The growth rate of exports increased from 25% before the SEZ Act, 2005 to 52% after its implementation, which increased to 121.40% in 2009-2010 (SEZ India, 2011a). The total employment by all types of SEZs across India was 370,000 in 2008 (Reddy et al., 2010).

However, the acquisition of agricultural land by the SEZs has resulted in fall in food-grain output and agricultural employment (Mahanta, 2010) and the fall in agricultural employment is not offset by employment gain in the SEZs. The total amount of land likely to be acquired across India is estimated at 150,000 hectares and this land is predominantly agricultural and typically multi-cropped and capable of producing nearly 1 million tons of food grains. If SEZs are seen to be successful in the future and more cultivated land is acquired, they will likely to endanger the food security of the country. Therefore, the large scale land acquisition is the burning issue of the SEZ development in India. The SEZ Act, 2005 is silent on this issue. Rather, out-dated Land Acquisition Act, 1894, is applicable in case of land acquisition for SEZs. The Land Acquisition (Amendment) Bill, 1998 has also several shortcomings such as the land losers could have their land acquired even if a stated compensation is not paid (Asif, 1999). Land acquisition is highly contentious and problematic if it is displacing huge population as has been experienced in Nandigram, West Bengal. The real-estate developers can also grab land in the name of setting up SEZs (Chandrasekhar & Ghosh, 2007).

According to Balasubramanian (2010), a total of 95,000 hectares of land has been consumed by the SEZs in 2008, whereas, the land allocated to SEZs was 0.070% of the total land area nationally and 0.128% of the total agricultural area of the country (Reddy et al., 2010). According to the Commerce Ministry, Mundra SEZ has brought infrastructure to the hinterland of Gujarat and increased the wealth of the poor due to high land rates in barren and unproductive land. In some cases, the wastelands mostly owned by the government have been used in the coastal regions of Gujarat. Therefore, there has been

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

no land acquisition (Bhatt, 2007). In Tamil Nadu, the rural population has welcomed the SEZs, which led to their improved livelihood (Murugesan & Bandgar, 2010). Despite their apparent success, the SEZs have faced intense resistance due to forced land acquisition and the users' eviction under the Land Acquisition Act of 1894. The compensation paid is woefully inadequate compared to loss of land and non-land assets including livelihood opportunities. Therefore, the irony of the policy is that the proper rehabilitation and resettlement (R&R) schemes for the displaced population have not been prepared.

The 1894 Land Acquisition Act empowers the Government to acquire any land from private hands for public purposes (GOI, The Land Acquisition Act, 1894). Land acquisition actually implies acquisition of a physical area. The Transnational Corporations (TNCs) have been targeting the mining of land and hills in Orissa, Jharkhand, and Chhattisgarh. In 2005, the South Korean Steel Company – Posco had set up a plant near Paradip port in Orissa to produce 12 million tons of steel per annum. In 2010, the Government of Orissa announced a Rs. 70-crore rehabilitation package for 3,000 displaced persons by land acquisition. Vedanta, Reliance, ESSAR, and Jaypee group of companies have also resorted to large scale land acquisitions for power generation and mining thereby displacing thousands of people (Sharma & Singh, 2009). In India, the land question has become most acute (World Bank, 2012). More than 60 million people have been displaced due to development since independence and displacement rate has increased rapidly in post-liberalized era (Fernandes, 2008) with larger state role in acquiring land from farmers (Government of India, 1994). In March 2007, the land acquisition of 10,000 acres of land by foreign investors in the SEZ of West Bengal caused massacre of farmers, rapes and assaults in the villages of Nandigram and subsequently ousting the Left Front government from state power in 2011 (Bag, 2011; Vinayak, 2011). Between 2011 and 2012, uncertainties in land availability contributed to stalling capital investments of about 3% of India's GDP (Center for Monitoring Indian Economy - CMIE, 2012). The Government of India announced that the timely completion of infrastructure projects was a top priority, for which there is the urgent need to streamline land acquisition (Economic Times, 2011).

Thousands of acres of land were acquired for SEZs in Andhra Pradesh without any industry worth its name. Large scale agricultural lands were being hurriedly diverted for non-agricultural purposes and thousands of poor Scheduled Caste families were displaced. The non-tribals have taken over the lands of tribals in a big way. During 1969-2002, 1.71 million hectares of government lands have been assigned to 2.9 million landless households in Andhra Pradesh. In the name of public purpose for the SEZs, these assigned lands are being resumed back. Recently, the Government of India introduced Land Acquisition (Amendment) Bill 2007 to make it much easier for the governments to take over people's lands. The Andhra Pradesh Industrial Infrastructure Corporation (APIIC) was created for industrial development. There was a land bank of 48579 acres (19659 ha) during 1974-2004 with APIIC. During 2004-09, land bank has increased three times with 121,655 acres (49233 ha). The APIIC has transformed to a land broker and has 300 industrial parks and 80,000 acres of land bank with turnover of Rs. 1,080 crore in 2006-07. There is no guiding principle in the SEZ Act as to how the land should be used by the developer. How the developers have to allot land to the industrialists is also not clearly specified. There are no guiding principles in SEZ Act about the basis of which the developer will make the land available to the private industrialists in respect of rate of rent, mode of rent fixation and selection criteria of industrialists. The time given to a developer is 3 years for the establishment of an SEZ, which is extendable by 2 years i.e., totally 5 years. If the developer fails to do so, then only government may take it back or allocate it to a new developer. As already mentioned, the SEZs are also displacing people on a large scale. In Andhra Pradesh, some SEZs have affected livelihoods of thousands of fishermen, artisans and rural workers and small agriculturists. The village level institutions and the local communities are not

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

involved in decision-making. The government should recognize the inherent rights of the local communities to their land and resources (Sarma, 2007). The displaced and affected population has shown resistance against forceful takeover of their lands and resorted to demonstrations and protests. In Raigarh district of Maharashtra, people resisted acquisition of 10,000 hectares of land in 83 villages and forced the government to cancel the SEZ. Most of the time, the State has been very brutal and resorted to force against the demonstrators and protestors.

CONCLUSION AND POLICY IMPLICATIONS

In the recent past, India has become a hotspot for FDI in land acquisitions due to unstable poor smallholders farming practices and unsustainable diversified non-farm activities. This transition is caused by high pressure on environmental resources due to rapid population growth and climate change supplemented by structural adjustment programs and market liberalization. The key drivers of land acquisitions are food security, the bio-fuels boom, growing business opportunities, and policy reforms. Increased foreign land investment may increase economic growth and raise government revenues, and create new livelihood opportunities through new capital, technology, know-how, infrastructure and better market access. At the same time, foreign land acquisitions may result in local people losing access to the resources. Laws may not have sufficient mechanisms to protect local rights and take account of local interests, livelihoods and welfare. Insecure resource rights, inaccessible registration procedures, inadequate compensation and legislative gaps often undermine the benefits flowing to the local people. At the same time, transparency in foreign land negotiations, information and decision-making are major challenge. FDI in land acquisitions through SEZs has potentially profound implications for the future global economic and social transformations including livelihoods and food security. Therefore, there is a need for wider public consultation involving all stakeholders to ensure improved livelihoods and food security. The creation of robust institutions and social and environmental impact assessments of FDI in land acquisitions are called for, to promote inclusive growth through more job creation, infrastructure development, public revenues, environmental protection, and to protect local food security, particularly in times of food crisis.

Besides above, the following suggestions will go a long way in ameliorating the livelihood conditions of smallholders. Keeping in view the rapid population growth, changing consumer preferences for food, climate change, shrinking natural resource base, extreme poverty and vulnerability in rural areas, there is a need to increase investment in agriculture with more focus on smallholders. There is need to secure their rights on land, water and other natural resources with greater access to capital investment, expertise, appropriate technology and markets. Smallholders play a key role in poverty reduction and food security. Therefore, they must receive priority attention from government, the development community and other investors for solution to food security. Women play a critical role in agricultural production. Hence, economic and social empowerment of women should be another priority intervention by the government and other stakeholders.

Besides government, private-sector investment can also play a major role in meeting shortfall in agricultural investment on the part of smallholders. Socially responsible private-sector investors can play a significant role in providing much needed capital for appropriate technologies focusing on local and national markets for poverty reduction, food security and economic growth. There is need to promote mutually beneficial partnerships between smallholder farmers and private-sector investors without large-scale land acquisitions using contract farming or joint share equity schemes. The success of such

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

partnerships depends on the level of ownership, governance, risk-sharing and benefit-sharing between them. In this context, there is need to empower smallholder farmers and rural communities to engage on equal terms with outside investors. Besides, there is need to monitor the implementation of agreements to ensure that the anticipated benefits are realized.

Government has a key role to play in promoting sustainable agricultural investment for which there is need to develop transparent, accountable and accessible land administration institutions. Social mobilization against 'land grabbing' as well as outside investors is essential using documentation and dissemination of examples of sustainable and mutually beneficial partnerships. In this context, civil society and private-sector service providers can play a major role in empowering rural communities and strengthening good land governance. The principles of good land governance and responsible investment in agriculture need to be framed and followed which includes recognizing existing rights to land and other natural resources, strengthening food security, transparent and accountable investment, robust legal and regulatory environment, sustainable consultations, economic viability, and quantification of social and distributional aspects including environmental impacts and sustainable resource use.
