KEY TERMS AND DEFINITIONS

Dispossession: The use of extra-economic coercion to expropriate non-labor assets from one group for the use of another.

Food Security: It refers to achieving reliable access to adequate, affordable and nutritious food supplies sufficient to avoid chronic hunger.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Foreign Direct Investment: An activity in which an investor resident in one country obtains a lasting interest in, and a significant influence on the management of, an entity resident in another country.

Grabbing: It creates specific kinds of property dynamics, namely dispossession of land, water, forests and other common property resources; their concentration, privatization and transaction as corporate (owned or leased) property; and in turn the transformation of agrarian labor regimes.

Land Grabbing: The purchase of vast tracts of land from poor, developing countries by wealthier, food-insecure nations and private investors is called land grabs.

Large-Scale Land Acquisitions: A large-scale land acquisition can be defined as the acquisition of any tract of land larger than 200 hectares (ha), or twice the median land-holding, according to the national context.

Special Economic Zone: It is a geographical region that has economic laws different from a country's generally applicable economic laws.

Tele-Connection: The term 'tele-connections' is employed to describe causal relations between land uses over large geographical distances.

Chapter 63
Urban Economy and Sources of Its Efficiency as Factors Addressing the Challenges Faced by Urban Economy:
The Case Study of Southern African Region

Evelyn Chiloane-Tsoka
University of South Africa, South Africa

Junior Mabiza-ma Mabiza
University of Johannesburg, South Africa

ABSTRACT

Rapid growth of density of population and overcrowded and congested cities in the Southern African region due to urban migration from people seeking a better lifestyle and job opportunities, despite high levels of urban unemployment, infrastructure and sanitation, is embedded by lack of accelerated innovation to create sustainable future for most people. However, in South Africa infrastructure is seen as an enabler weapon of development to cultivate growth and confront challenges of efficient operations that are to reduce costs of production and create access to application of modern society. With this in mind, the chapter aims to look at the extent to which sources of efficiency can be used as a tool to address the urban economic challenges affecting the global economic development in the region.

INTRODUCTION

Rapid urban growth throughout the developing world has seriously outstripped the capacity of most cities to provide adequate basic services for their citizens. Urban congestion and the sprawl are further hampering local authorities in attempting to improve basic infrastructure and deliver essential services, across the border of Southern African region .As a result, urban poverty is a reflection based on high rise in urban slums created by lack of standards of housing and proper sanitation. In a regional perspec-

tive, high levels of land degradation, deforestation, lack of access to clean water and sanitation services in remote areas lead to poor urban conditions and undermine the sustainability of the socio-economic development of large cities in the region. Urban poverty is also regarded as a major drive of environmental degradation. Due to limited resources in the cities, residents and migrants are unable to compete for these limited resources becoming scarce or either protect themselves against harmful environmental conditions mostly affected by impacts of urbanization. In addition independent female migration has become a major survival strategy in response to deepening poverty. As men increasingly lose their jobs, and incomes become irregular, women, like men are turning to migration to meet their economic obligations (Oppong, 1997).

Driven by poverty, they are now migrating to urban areas in greater numbers in search of wage employment in the face of deteriorating living and working conditions in rural areas. Increasing access to education means that educated women are having greater opportunities for employment in the urban formal sector and are able to participate perhaps more effectively, in both non-domestic and formal sector activities (UNFPA, 2006). The increasing proportion of educated females is also reflected in the accelerated migration of females (especially the young ones) into urban areas to seek further education and jobs. While migrant mine workers in South Africa are living in overcrowded hostels and particularly are vulnerable to tuberculosis infection; dual residence and long absence from spouses have also resulted in migrants contracting sexually transmitted infections through casual partners. All these conditions raise issues of vulnerability of migrants, limited access to medical care, entitlement to basic health services, and the need to incorporate the health care of migrant populations squarely into public health, and social policies. In Adepoju (2008) it is lamented that lack of information on migrant rights in respect of access to social services, immigrants usually experience greater difficulties than other groups in accessing services and hence in exercising their rights, as a result of cultural problems and discriminatory policies and practices in host countries. Often, immigrants are unaware of their rights or are afraid to claim them. They may not understand the local language or are simply unfamiliar with the available social services.

Rural and cross border migration led to the increase indensity of urbanization population, for which by definition, urbanization does not proceed in any orderly fashion, social and economic disarticulation within cities that are intensified by frequently hostile receptions to migrant populations, for example the xenophobia outbreak of May 2008 in South Africa. In its terms of reference, xenophobia allows the exclusion of foreign nationals from vital services that they may be entitled to; for instance, health and education, and further marginalizes and excludes vulnerable communities by increasing inequalities even for foreign nationals who are in the country legally. Often the migrants are perceived as disease carriers and they take up the citizen's employment and other opportunities by hosting countries. Although, the regulatory regime looks relatively protective of migrants, immigrants, refugees and asylum seekers, most governments in the Southern African region (including wealthier countries like South Africa) lack the resources to effectively enforce legislation. Over and above, Zimbabwe's economic implosion and political oppression have created a global Zimbabwean diaspora over the last decade. Most unskilled and semiskilled migrants have migrated to Botswana and South Africa. As a result, the xenophobic attack of May 2008 was directed at Zimbabweans. The South African government claims that the number of Zimbabweans is estimated at 3 million and rising. Obviously, the rationale is almost certainly an exaggeration. Most realistic estimates put the number at 500,000 in 2008 by now the number has escalated to more than 3 million (Statistics South Africa, 2011).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Prior to 1994, immigration policy was a naked instrument of racial domination in South Africa, where influx control was highly regulated. Until 1991, the official definition of an immigrant was that he or she had to be able to assimilate into the white population. Africans from other parts of Africa were not considered immigrants in South Africa. Rather, they came to South Africa as temporary contract migrants under bilateral agreements between the apartheid government and its neighbors including Lesotho, Mozambique, and Malawi. This gave rise to the infamous South African migrant labor system, a system still very much in place today. After 1994, the South African government struggled to formulate a policy appropriate to the country's new role in a changing regional, continental, and global migration regime. This necessitated crafting a new policy that would define a post –apartheid migration that was to respond to South Africa's changing role in Africa. This migration and development policy would have avoided the problem of rampant xenophobia ever seen in the shameful events of May 2008 in South Africa, in which over 70 migrants were killed and tens of thousands were hounded out of their communities by South African citizens. A survey conducted by South African Migration Project (Crush, 2008) indicated that attitudes of high levels of intolerance exist nationally across the entire population of South Africans.

Creative policy thinking about immigration in South Africa has been hampered by the country's unsavory immigration history and uncertainty about the compatibility between immigration and post-apartheid transformation, and a citizenry that shows no appetite whatsoever for immigration. South Africa did not recognize refugees until 1993, and it was only following the transition to democracy that South Africa became a signatory to the United Nations and Organization of African Unity conventions on refugees and bound by the principle of non-repression.

Due to the political and economic degradation in the region and beyond, South Africa was now seen as a beacon of hope to host refugees and all types of asylum seekers, and this orchestrated the increase of influx movements in the country and in the region. In essence, one of the fundamental problems facing South African Home Affairs and any drafters of a new regionalist and development-oriented immigration policy is that of a challenge of hostility towards to immigration as a principle and to migrants in general. Therefore, the problems of maintaining these sizable numbers of urban residents in a position of uncertainty in terms of accessing livelihood opportunities, and their capacity to consolidate secure niches in urban space, local government and municipalities are to engage in policy formulation on how to address the challenges of migrant integration in the region as well as the infrastructural dilemmas in terms of limited space (Simone at al., 2003).

Growth of large cities, particularly in developing countries has been accompanied by an increase in poverty which tends to be concentrated in certain social groups and particular locations. The fundamental premise is based on labor opportunities available in urban sectors. The cost and benefit of obtaining urban jobs that accelerate rural –urban migration causes rising urban unemployment and therefore rising urban poverty levels, poor urban conditions and negative impacts of environmental levels, whereas cities in the Southern African region reflect a rapid urbanization. Botswana and South Africa have the highest levels of urbanization in the region with about 60% of their population living in cities in 2010 and expected to rise to 80% by 2050 (Muller, 2008). With regard to Angola majority of urban residents are poor and live and work in insecure, overcrowded conditions that lack adequate services. While in Mozambique 80% of urban populations live in informal settlements on the edges of the cities resulting in formal supply of land which does not keep with the demand for land and lack of access to proper sanitation and water. Notwithstanding that water is a source of efficiency and a critical aspect facing the continent's development (USAID, 2013).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this chapter, urban economic challenges affecting the global economic development in the Southern African region are discussed. In addition, aspects such as cross-border migration, foreign aid, policy planning strategies on economic and social services, development efficiency, adaptation and mitigation of urban-migration factors affecting global economic development in the Southern African region are outlined. Furthermore, sources of efficiency, managerial implications and recommendations are provided.

BACKGROUND

Definition

Urban migration is defined as density of population in the cities caused by rural migration and immigration seeking for better livelihood in cities such as job opportunities, health, education, sanitations and electricity. Rapid urban growth include increasing unemployment, environmental degradation, lack of urban services, overburdening on existing infrastructure and lack of land, finance and adequate shelters (UNCHS,2001b).Urban migration in cities is further identified with settlements developed on fragile environments such as steep slopes, natural drainage, waterways and floods prone areas with inadequate housing and settlements designed tailor-made to deteriorating morality, security and increasing levels of crime within the continent in African cities(Shaw and Louw, 1998).

Africa's Perspectives

Africa as a continent faces endemic poverty and strain food insecurity, pure water scarcity, poor sanitation, and lack of infrastructure in general. The lack of access to sanitation is further embedded on massive health burden as many people who lack sanitation engage in unsanitary activities like open defection. The practice of open defection is the primary cause of fecal-oral transmission of diseases with children being the most vulnerable in the region (WHO, 2014). Africa's population base remains young in part as life expectancy remains at an average of fifty years (Statista, 2014),and this is contributed by the impact of malaria, tuberculosis, cancers, heart diseases, HIV/AIDs, malnutrition.

64% of African household income is spent on food while 80% of the population controls only 6% of national incomes. Despite urban growth rates, on aggregate, access to clean water and sanitation facilities have not improved in twenty years, with a statistical majority of the region's population still without basic amenities (Simone et al., 2003). In a general climate, impoverishment and diminishing human services are often marked discrepancies in access to health services and education, safe water, and economic opportunities for women. Nonetheless, in South Africa, 90% of safe water is provided for of its urban population where as in Mozambique the coverage of safe water is only at 17% (Simone et al. 2003).

In the disparity distribution patterns and impoverishment of urban cities, city dwellers make concerted efforts to invest in an urban existence. Even when their consumption levels decline significantly, there remains an on-going attempt to secure greater access to basic conditions of sustenance, such as water and electricity. One of the main reasons for rural migration to cities is attributed to electrification and declining agricultural productivity, lack of access to basic physical and social infrastructure resulting in overcrowded, informal settlements, characterized by inadequate housing, poor provision of infrastructure such as roads, street lights, water supplies, sanitation and waste management services manifesting themselves in overburdening infrastructure and environmental degradation in cities.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In South Africa for example, the government has prioritized one of its strategies on addressing housing in urban areas countrywide to meet the demand for housing through Reconstruction Development Program (RDP).The aim of the project was to curb lack of housing and reduce informal settlement and squatter camps. During the first six years of the democracy, more than one million low-cost houses were built. This number has since increased. However, lack of awareness of resources, efficient construction practices and corruption have resulted in excessive use of natural resources and generation of large amounts of construction waste that are rarely recycled (Macozoma,2000).Furthermore, increased levels of urbanization are also caused by natural growth of the urban population and the migration of the rural population towards cities. Rising urban poverty is amongst the major drivers of environmental degradation. The urban poor, who are unable to compete for scarce resources or protect themselves from harmful environmental conditions, are most affected by these negative impacts of urbanization.

Thus, managing environmental sustainability becomes a core stride of challenge for future economic development even at the regional scale. Municipalities are confronted with financial difficulties and the institutional capacity to absorb what is available is limited. Inadequate staffing in the municipalities and government department that handle environmental issues is another factor in the downward trend in environmental sustainability, while draught and flooding adaptations are a dominant climate change risk in the region. Since 2002 in Mozambique, a countrywide program was initiated to undertake the government of Mozambique to align urban development efforts at the national, municipal and community levels respectively. The aim of the program was to include the urban poor in the planning and decision-making processes on issues including urban vulnerability, slum upgrading and city development strategies in cities throughout the country (Cities Alliance, 2012).

MITIGATION STRATEGIES AS FACTORS ADDRESSING CHALLENGES FACED BY URBAN ECONOMY IN THE SOUTHERN AFRICAN REGION

Regional Historical Overview

Three factors strongly increase the threat of environmental degradation in Southern Africa region, namely demographics, foreign debt, and the absence of democracy. Throughout the region, the end of the colonial period saw an expansion of social services, especially in the areas of education and health care. This led to a decline in infant mortality and an increase in population. During the last 25 years, this increase in population rose from 2.5% to 3.5% annually and has caused the Southern African population to double at the current rate of 570 million. This is anticipated to double again in the next 25 years (Mabogunje, 1995). In terms of foreign debt, countries in Southern African region incurred large foreign debts in their efforts to industrialize and to provide their rapidly growing populations with modern social services. Most of these loans have been long-term ones from international official sources and on concessional terms; as the need for borrowing has become more urgent, however, countries have turned increasingly to private, short-term loans at market rates. Thus, while in 1970 the region's total official debt (excluding that of South Africa and Namibia) was slightly more than $5 billion (US dollars); but by 1990 it had risen to nearly $140 billion. The total private debt, which was zero in 1970, was more than $20 billion in 1990. Other external foreign loans amount at a total of more than $171 billion by 1990 (Mabogunje, 1995).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

High dependence on the export of primary products also left Southern African region countries vulnerable to the long decline of commodity prices that began in the 1970s. The total value of the region's agricultural exports has fallen dramatically, with the decline averaging to 2.5%t a year in 1988. For some countries the decline has been even more pronounced. As a result, the burden of debt has risen markedly for most countries in the region. Between 1980 and 1989, the total external debt rose from 27% to 97% of gross national product and from 975 to 362% of exports. The consequences of the foreign debts in the region created a need for the region to undergo major structural adjustments. This has entailed not only a drastic compression of imports and a sharp devaluation of national currencies but also the retrenchment of a sizable portion of the wage- and salary-earning population. As living conditions deteriorated, more people turned to survival agriculture, both in urban and rural areas. At the same time, sharply rising prices for imported energy products forced many families to fall back on wood and charcoal for their domestic energy needs, which put acute strain on the environment everywhere in the region (Mabogunje, 1995).

Governance

Many urban problems in environmental issues are as a result of poor management, poor planning and absent of coherent urban policies rather than urbanization itself. Corruption, war, dictatorship, economic instability and lack of good governance by heads of states contribute immensely to the challenges facing regional urban economy. No amount of finance, technology or expertise can secure environmentally sustainable developments or protect environment. Fundamentals of good governance seem not to be democratic or participatory or pluralistic. Worsening environmental conditions can have serious effects on human health and welfare especially to the poor (Global Policy Forum, 2013). Poor sanitation, air and water pollution causes chronic and infectious, respiratory and intestinal diseases. The lack of good governance such as corruption, foreign debt and democracy in the region further worsens the global economic development and challenges the stabilization of regional operations.

Urban Management Planning

Environmental problems occur because of the concentration of environmentally negative impacts. Absence of good urban planning infrastructure impacts heavily on environmental problems and further increases the degradation. Well planned density of population reformed can reduce the need for land conversion and provide energy savings and make recycling cost effective. If cities are well managed with adequate attention to social developments and the environment, the present problems of rapid urbanization particularly in the Southern African region can be avoided. A clear step of direction is if national governments can incorporate a clear urban component in their economic and social budget costs, increase in resources efficiency, reduction in waste generation, improved urban infrastructure for waste service supply, management of water supply and conservation of water resources in urban areas, improved waste control through legislation, using recycling schemes, development of more efficient waste collection systems. Strict legislation for the treatment of hazardous waste collection through public-private partnership and adoption of energy technologies by industries and household, and restoration of brown fields that could positively rescue impact on urban influx control. In addition, if local authorities are to assess the impact on utilization of local services i.e. schools, health facilities, welfare services or local employment, sanitation, infrastructure, waste disposal, energy and air pollution as factors that can contribute to environmental challenges in order to harmonize regional bilateral.

Food Security

Urban Food Security in the Context of Urbanization and the Economy

The world's rural urban tipping point was reached in 2007, marking the first time in the history of the planet that more people lived in urban centres than in rural areas. As the global population continues to grow towards a mid-century estimate of 9 to10 billion (Frayne et al., 2009),the majority of this demographic increase will be in cities; and 95% of that growth will be concentrated in the cities of the developing world (UN-HABITAT, 2007: 4). Research indicates that future urban growth will be most intense in Asia and Africa and that these two regions will have the largest populations on the planet by 2030 – 2.66 billion and 748 million respectively (UN-HABITAT, 2007: 8). At twice the global average, the pace of urbanization is already highest in Sub-Saharan Africa. The average rate of urban growth for Southern African region is close to 4% and is expected to persist for decades to come (Frayne et al., 2009). Although uneven between countries, as far back as 1995, more than 50% of Southern Africa's population was urban based, and it is expected that at current rates of urbanization the population of the region will exceed 60% by 2015.With urbanization, the transfer of rural poverty to urban areas is rising globally.

Although economic development is uneven across countries in Southern Africa, urban poverty remains a chronic challenge to development, even in the more successful cases such as Namibia, Botswana and South Africa. For South Africa, national level data indicate that despite relatively high levels of recent economic growth, poverty incidence has not improved. Based on income/consumption expenditure surveys for the years 1993, 1995 and 2000, average monthly per capita values have declined in real terms. As a further indication of persistent poverty, the percentage of the population living in households with consumption or income per person below the poverty line (H %) has also increased. Finally, although the Gini index 2 has improved over this period, it has done so by only one point, indicating that economic inequality has remained significant and stagnant (Frayne et al., 2009).

Regional Environmental Problems

Air Pollution

The growing concerns in many urban centres, particularly large cities in the region are as a result of the level of air pollution, mainly from vehicle exhausts, industrial emissions, and domestic use of wood fuel, coal, paraffin and refuse for heating and cooking. Levels of suspended particulate matter and lead poisoning or pollution are among the highest in the world, creating a high risk of respiratory disorders to the 10.6million inhabitants (UNCHS, 1996). In dense, informal settlements, the use of traditional fuel sources contributes to rising ambient levels of sulphur dioxide, nitrogen oxides, carbon monoxide, ozone and suspended particulate matter. Exposure to these pollutants is associated with increased risk of acute respiratory infections, particularly among children. Electrification of households, promotion of low-smoke fuels, and improved ventilation of houses are some of the measures that have been adopted to reduce health risks.

The mining and industrialization sectors, mainly in South Africa, have a huge contribution to the environmental pollution at the regional scale. Minerals exploitation is a factual damage impacts caused in the surroundings of processing plants and held responsible of real environmental challenges namely, air pollution with volatile organic compounds and dust emission, acid mine drainage, noise pollution

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

that interact with local communities, affecting human health, underground water, livestock, fauna, flora and forced relocation. These may be attributed to migration in the urban areas particularly for South Africa. Sometimes located in the neighborhood of urban areas, mining exploitation activities have been promoted in detriment of environmental impacts exposure of the population. The same is observed in regional countries such as DRC, Zambia, Angola, and Zimbabwe. Of utmost challenging in the South African context is the fact the mining sector is fed with energy produced from coal-based power generation resulting in enormous greenhouse gas emissions (CO2, NOX, SOX)polluting the environment (Mabiza, 2013).

Road traffic germs in the region are escalated to an alarming situation given the poor road infrastructure in general, increase of automotive trading movements which count as regional challenge. The non-existence of echo-friendly high-speed train systems has an impact on the escalation of pollution from automotive industry as assumed the number of cars on the road doubling in every seven years.

Land Degradation and Deforestation

The process of land degradation in Southern Africa is blamed on water and wind erosion, sedimentation, long-term destruction of vegetation and diminution of the bio-resources. External forces including the state of the global economy, inaccessible markets and unfavorable commodity prices, the debt burden, unequal terms of trade and protectionism plus import barriers in developed countries, may increase rates of natural resource exploitation by preventing diversification. Land degradation is often caused by population pressure and human activities such as over-cultivation which exhausts the soil, overgrazing which removes the vegetation cover that protects soil from erosion, deforestation which removes trees and vegetation which binds the soil to the land and poorly designed irrigation that turn cropland saline. In most countries, inadequate budgetary allocations and lack of or poorly articulated regulations on implementation of the policies and coordination remain the greatest challenge. Others include inadequate capacity to enforce these policies as well as lack of commitment and political will.

Most farmers who live in the rural areas are poor and practice small-scale rain-fed agriculture and/or agro-pastoralism Other than agriculture, approximately 17% of land is formally protected as forest/game reserves and/or national parks where animals are protected for tourists viewing or periodic trophy hunting as a form of land management. Many indigenous people displaced by conservation move to adjacent areas where they upset previous land carrying capacities causing land, thus diminishing land productivity. Similarly, large mining concessions or settlement schemes have also caused land degradation through pollution and over use. Expansive areas are owned by commercial farmers producing for export. They own large ranches or practice irrigated agriculture (predominantly so in South Africa, Namibia and Botswana and pre-land reforms Zimbabwe).

Various policies and management programs and projects have been put in place including farmers' training on relevant activities such as grass seeding for marginal and degraded lands, construction of grade stabilization structures and stone lines on the rangelands, check dams and progressive soil survey and mapping. Many governments in the region lack the staff or financial resources to administer their protected areas, much less invest in new ones. Innovative strategies, such as involving private groups and non-governmental organizations, are being considered and may provide another option for conservation management. Such groups are believed to be better able to raise funds to purchase land, to support conservation activities in existing parks and reserves, to incorporate the local population in management

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

decisions, and to negotiate land-use disputes within and between communities. While public investment, regulation, and conservation are important, it is institutional development that offers the most hope for alleviating poverty and protecting the environment.

Climate Change Impacts and the Need for Adaptation

The phenomenon "climate change" refers to a continuing trend of changes in the earth's global weather conditions as a result of an average rise in the temperature of the earth's surface often referred to as global warming. At present the global climate is changing much more rapidly as a result of global warming, leading to, among others, the melting of polar and glacier ice, sea-level rise, ocean acidification, changes in snowfall and rainfall patterns, more frequent floods and droughts and increased frequency and intensity of extreme weather events. The rapid rate of this climate change does not allow the earth's bio-physical systems to adapt to these changes naturally (Parry et al., 2007).

The climate-related migration in the Southern Africa region is with reference to activities of agriculture in the remote areas affected by climate change effects, resulting in climatic variations that have effects at multiple scales. Extreme weather conditions such as droughts and sporadic rainfall patterns affect agricultural productivity and parts of primary foods that are important for poor households, causing higher prices for consumers and decrease in the income of farmers (Odeku, 2012).

In the region, remote areas are predominantly vulnerable to the impacts of climates because of their high dependence on natural resources, farming for survival and agriculture, and limited capacity to cope with these impacts. Without any action taken by authorities climate-related migration effect is only going to get worse. Local institutions and governance will be the most important drivers of adaptation and coping mechanisms.

There are some models suitable to computerize solution of climate change adaptation. The most used is the Ricardian Analysis of the impact of climate, slightly described below:

Empirical Model Specification

$$V = \sum P_i Q_i \left(X, F, H, Z, G\right) - \sum P_x X \tag{1}$$

where P_i is the price of crops *i,* Q_i output of crop *i,* X a vector of purchased inputs (other than land), F is a vector of climate variables, H is hydrology variable or water flow, Z is a vector of soil variables, G is a vector of economic variables, such as market access and access to capital, and P_X is a vector of input prices. The model assumes that:

- The land values have attained the long-run equilibrium associated with regional climates
- Climate change has shifted the production function for crops and livestock through changes in temperature and rainfall, assuming that adaptation costs are not important
- The farmer has chosen inputs X to maximize net revenues, given the characteristics of the farm and market prices.
- To measure the impact of climate change on agriculture in South Africa, the study used the Ricardian approach, which includes climatic variables through an econometric analysis of cross-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

sectional data (Mendelsohn et al., 1994). This approach has been used extensively in the literature to investigate the relationship between farmland value and climate, soil and other control variables. The Ricardian method's strength is its ability to capture the adaptation responses of farmers. The use of net revenues in the analysis reflects the benefits and costs of implicit adaptation strategies. Following Kurukulasuriya and Mendelsohn (2008), farmland net revenue (V) reflects the net productivity and costs of individual crops and livestock as follows:

- where is the price of crops, is output of crop, X is a vector of purchased inputs (other than land), F is a vector of climatic variables, H is hydrology variable or water flow, Z is a vector of soil variables, G is a vector of economic variables, such as market access and access to capital, and is a vector of input prices. The model assumes that;
- The land values have attained the long-run equilibrium associated with regional climates;
- Climate change has shifted the production function for crops and livestock through changes in temperature and rainfall, assuming that adaptation costs are not important;
- The farmer has chosen inputs X to maximize net revenues, given the characteristics of the farm and market prices. Although the model seems too comprehensive to user friendly but it however provide a mitigation on adaptability on climate change and its impact on the region

Regional Perspective on Infrastructure

Sound infrastructure is a necessary determinant of growth in Southern Africa. Energy, water and sanitation, and meteorology are critical components of regional infrastructure affecting global economic development. Over the period 1995–2005, infrastructure improvements have boosted Southern Africa's growth by 1.2% points per capita per year. This positive growth effect has come almost entirely from the growth of mobile telephonic improvements regardless of the fact that the road network made small contributions. Inadequate power infrastructure has eroded growth more in Southern Africa than in other parts of the continent. If Southern Africa's infrastructure could be improved to the level of the strongest-performing country in Africa (Mauritius), regional per capita growth performance would be boosted by some 3% points.

Infrastructure in the Southern African Development Community (SADC) ranks consistently above the other regions on a range of infrastructure indicators. But in some areas, such as access to household services mainly, water, sanitation and power, the differences between the SADC and the leading region for these indicators, the Economic Community of West African States (ECOWAS), are not significant.

The economic geography of the SADC is challenging and reinforces the importance of adopting a regional approach to infrastructure development. The region is compost of the 15 member countries, 6 are landlocked, 6 have populations below 10 million people, 10 have economies smaller than $10 billion per annum, and several rely on transnational river basins for their water. South Africa is the economic anchor of the region, but half a dozen of the SADC's member states are large or potentially large economies (including Angola, the Democratic Republic of Congo, Mozambique, Tanzania, Zambia, and Zimbabwe).

Knitting these emerging economies closely together and linking them to markets in South Africa would help to create a larger market and greater economic opportunities in the region. The SADC has a well-developed regional road network that is in relatively good condition; almost all corridors, with the exception of Nacala and Lobito, are paved. The north-south corridor is the main trading artery connecting South Africa with landlocked Botswana, the Democratic Republic of Congo, Malawi, Zambia, and Zimbabwe and is the preferred route for sea access. Two corridors run east to west and connect South

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Africa with Namibia through Botswana and Mozambique with Zimbabwe and Malawi. Dar es Salaam serves as an alternative gateway to the sea for Zambia, Malawi, and the Democratic Republic of Congo but is not as heavily used as Durban.

Transport in Southern Africa is the cheapest in Africa, but still more expensive than other developing countries. The trucking industry in Southern Africa is competitive, with lower profit margins than in West and Central Africa. Road transport tariffs are of the order of $0.05 per tonne-kilometre, slightly more expensive than the typical range of $0.01 to $0.04 per tonne-km in much of the rest of the developing world. The implicit velocity of vehicles is 11.6 km per hour, faster than all other regions of Africa but still rather slow. This slow speed has little to do with road infrastructure which is generally of reasonable quality and much to do with administrative barriers such as border and customs clearance processes that keep trucks stationary for extended periods of time.

Regional Ports and Rail Transport

Southern Africa has an extensive railway system; with national systems form a network centered on Durban and offering direct competition to road transport. Railway tariffs are generally set to be competitive with parallel road freight routes. Nevertheless, rail freight often encounters long delays as it moves across borders. A lack of coordination among national rail systems leads to lengthy locomotive interchange periods. The long delays and poor reliability of rail service often diverts freight to the road network. The pressing priority is to improve the performance of national systems to allow them to compete more effectively with road transport, and to play their appropriate role within a multi-modal transport system.

Regional Air Transport

The air transport market in the SADC is the largest in Africa, with a clear hub-and-spoke structure centered on Johannesburg. Air connectivity in the SADC is strong, as nearly all countries have at least one daily flight to Johannesburg. But the fact that South African Airlines remains the dominant player means that the percentage of flights flown under fifth-freedom arrangements (that is, by carriers that are not registered either in the origin or destination country) is lower than in other parts of Africa. The SADC has made relatively little progress toward implementing the Yamoussoukro Decision. Liberalization of the air transport market ranks behind most regions of Africa.

The power transmission network in Southern Africa is rather well developed; it leads the rest of the continent in generation capacity and offers power at relatively low costs. Until the recent power crisis in South Africa, outages were lower than in other regions. But despite the relatively high generation capacity, access to power in the SADC is surprisingly low. With power demand likely to increase by 40% over the next decade, expanding power infrastructure is critical to the region's economic future.

The Southern African Power Pool (SAPP) has already established the principle of regional trade. Further pursuit of such trade could bring substantial benefits, but this depends on the Democratic Republic of Congo's ability to become a hydropower exporter. The SAPP is the most active trader in the region; the actual volumes of power traded are not large. There is tremendous potential to develop trade much further in fact, many countries in the region would be better off if they imported more than half of their power needs. Such regional integration would bring numerous advantages. The region's cost of energy would be reduced by $1.1 billion annually. Most countries would significantly cut their national power development costs, and several smaller countries could substantially reduce their long-run marginal costs

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of power. In addition, regional trade would allow a shift to cleaner energy that would reduce regional carbon emissions by a significant 41 million tons per year. Overall, investments in regional interconnection yield an average rate of return of over 160 percent. But most of these benefits hinge on the development of 7,640 megawatts of cost-effective hydropower in the Democratic Republic of Congo, where a host of technical, financial, and political challenges make this a challenging prospect(Musaba, 2013).

Regional ICT

The SADC offers the best access to ICT services of any regional economic community, but these services are priced high. While the SADC has some roaming arrangements in place (where customers of a mobile operator can use their phones while visiting another country) these have a number of restrictions and limitations, rendering the SADC less advanced than ECOWAS in this regard. The telecommunications market in the SADC has been open to foreign investors since the early 1990s, several large companies dominate the market. Three countries gained access to a submarine cable and several more will be connected through projects that are under way. No landlocked country has been connected as of yet. Creating competition among landing stations is critical to providing affordable service. In order for the benefits of submarine access to spread throughout the region, it is necessary to complete the 5,100 missing kilometers of terrestrial fiber optic network. Associated investments are small and anticipated returns on reducing the price of broadband access relatively high, with payback periods of less than a year.

Regional infrastructure development creates a larger market and greater economic opportunities, and the development of infrastructure is critical for promoting and sustaining regional economic development, trade and investment, and will contributes to poverty eradication and improved social conditions infrastructure sectors that represent 1 percent of regional GDP, but for small countries in the SADC, this burden may be insurmountable. In absolute terms, the largest burden would fall on the Democratic Republic of Congo, which would need to spend $961 million a year over the next decade to deliver the infrastructure assets (mainly power) needed for the region. At $265 million a year, Mozambique's spending needs concentrated in the power sector pale in comparison to the Democratic Republic of Congo's. The Democratic Republic of Congo's regional spending requirement translates to almost 14 percent of GDP, manifestly beyond what the national economy could plausibly deliver without external assistance. A large group of countries will need to spend between 1 and 5 percent of their GDP for regional infrastructure. Even 2 percent of GDP for a country like Zambia might pose an insurmountable challenge. In terms of current infrastructure spending, the Democratic Republic of Congo would need to spend over 190 percent on regional infrastructure for which is an impossible proposition towards regional global infrastructural development (Musaba, 2013).

Challenges Facing Regional Infrastructure's Economic Development

Although infrastructure in the region seems to be advanced compared to other regions, there are however challenges that are prone in addressing the sustainability of regional global development. The following are but some that are of critical concern:

- Insufficient energy supply to serve increased production and to extend access;
- Highly priced, unpredictable transport and logistics services, especially for landlocked states;

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Lack of low-cost access to information and communications technologies;
- Inadequate meteorological services for effective and efficient planning and management of water resources, energy production, transport services and other climate-sensitive sectors;
- Unacceptably high number of citizens without access to safe drinking water, adequate sanitation and water for irrigation to improve systems for agricultural production which will contribute to food security; and
- Slow response to new tourism trends and opportunities though in South Africa as country, tourism is a booming opportunity as reflected in 2012 by 10.2% increase as compared to more than the 8 339 354 tourists who travelled to the country in 2011 (Statistics South Africa, 2012).

Investment in Infrastructure

Private sector participation in the provision of infrastructure in an environmentally sustainable should be fostered. Key functions of the Infrastructure and Services Directorate:

- Promotion and monitoring the implementation of regional protocols, policies and strategies on energy, transport and communication, tourism and water that contribute to poverty alleviation;
- Development, promotion and harmonization of Energy, Transport and Communications, Tourism and Water policies, strategies, programs and projects;
- Promotion of an enabling environment for investment in infrastructure;
- Promotion of the development of physical and social infrastructures that contributes to poverty alleviation;
- Promotion of capacity building and training programs to enhance regional integration; and
- Promotion of stakeholder participation through, gender mainstreaming and increased private sector investment.

Strategies for Regional Infrastructure Development

The regional Infrastructure Development Master Plan guides development was signed at the SADC Summit in August 2012. The key infrastructure such as road, rail and ports also acts as a framework for planning and cooperation with development partners and the private sector. Infrastructure serves as a key component of the Regional Indicative Strategic Development Plan.

The master plan is to be implemented over three five-year intervals 2012 -2027). This is in line with the SADC Vision 2027, a 15-year implementation horizon for forecasting infrastructure requirements in the region. It is in line with the African Union's Program for Infrastructure Development in Africa (PIDA) and will constitute a key input into the Inter-Regional Infrastructure Master Plan and proposed tripartite Free Trade Area of SADC, the Common Market for Eastern and Southern Africa (COMESA) and the East African Community (EAC).

The Regional Infrastructure Development Master Plan contains ambitious targets, but the SADC region is embarking on the fundamental task of creating an enabling environment by delivering infrastructure requirements by 2027 in order to facilitate the realization of sustainable regional socio-economic development and integration within the framework of the SADC Infrastructure Vision 2027.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Potential of Regional Sustainable Development

The development strategy pursued in most of these countries has wrought serious havoc on the environment without necessarily improving the average person's standard of living, despite the region's relatively ample natural resources and most importantly knowledge about the region's environment and its degradation that remains inadequate. In the Southern Africa region the heart of the problem is that the natural resource base of Africa is being degraded and destroyed at a rate which will soon make food and agricultural production un-sustainable. Poverty, coupled with increasing population pressure, is the biggest single cause of this degradation. The rural poor, the overwhelming majority of Africa's citizens, destroy their own environment, not out of ignorance, but simply to survive. Peasant farmers preoccupied with survival over-crop marginal and because there is no alternative employment and no better technologies they can afford. Pastoralists overstock to improve their chances of surviving the next drought. Rural dwellers strip trees and shrubs for fuel wood because they need fuel. In the context of the short-term basic needs of an individual, each decision is rational; in the long-run, the effects are disastrous.

Whereas in South Africa, despite the diversification of the energy systems, clean coal technologies, safe and efficient cooking fuels and appliances, bio-fuels, the pebble bed modular reactor and biomass, energy is still seen as a concern and a challenge to the local industry and the community at large. As early as 2008, Eskom was forced to step up investment in new capacity after power cuts paralyzed the key mining industry. This had been a concern with the earlier forecast of 2007 indicating that Eskom would run out of excess of electricity generation capacity by 2008. From 2011 onwards the energy supply was, and will continue to be seen as a serious concern until sufficient new power stations are built (Mabiza, 2013).

The utility expects to continue trying to catch up until at least 2020 due to lack of investment in new capacity and ageing plants. Eskom's chief officer for customer network business, Erica Johnson, was reported to have said that the company needs to build an additional 20 gigawatts of power by 2020 and 40 gigawatts by 2030 to meet the fast growing countrywide energy demand. Confronted with these real issues of energy supply shortages and the concern over the reduction of carbon emission, Eskom also started looking at renewable energy technologies including hydrogen and fuel cell technology. More than 75% of South African greenhouse gas emissions result from energy generation and notably only 2/3 of populations have access to electricity (Mabiza, 2013).

Investigations in Nigeria have found that the rising demand for fuel wood has not led to greater deforestation or desertification. Far from "overcutting their trees," farmers have been maintaining their tree stocks by planting and by protecting spontaneous seedlings. It is in this regard that SADC supports the implementation of a regional energy market, efficient use of renewable sources of energy, and increased access of rural areas to affordable electricity. This measure is put in place in order to provide sustainable energy crises in the Southern Africa region. Although challenges facing urban migration and its cost of efficiency cannot be addressed alone in terms of energy crises, it is critical to understand the problem faced by land tenure, like many of the other problems besetting the development process in Southern African region. This probably stems from the region's incomplete transition from one mode of production to another. Colonialism attempted to shift the economies of these countries from a precapitalist mode of production (based largely on kinship relations) into a global capitalist mode (based on "commoditized" factors of production whose prices were subject to the forces of supply and demand in a self-regulating market). Though praiseworthy in many ways, these efforts failed notably in the one major area where

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

they could have made a real difference in the patterns of land ownership in rural areas. By and large, colonial administrators left the traditional patterns intact, thus introducing a major contradiction into the development process.

While capitalism requires well-established individual property rights, most smallholders in Southern African region have no such rights, even though they have long-standing rights to the use of communal land. Smallholders thus have no "economic assets" in the conventional sense of the term. When one considers the heavy investment that went into producing the polders of the Netherlands or the wheat lands of North America, the disability under which African farmers' labor becomes readily apparent.

Sustainable development in Southern Africa region has focused on the region's severe poverty. Overpopulation has inevitably led to an increase in land fragmentation, over-utilization of agricultural and grazing land, more frequent famines, lower life expectancy, and considerable environmental degradation. By contrast, the renowned agricultural economist, Marquette(1997) and others argue that population growth need not result in such dire consequences. In their view, population growth can promote more intensive agricultural practices and induce more favorable attitudes toward technological and organizational innovation that will not only increase productivity but improve environmental quality as well.

MANAGERIAL IMPLICATIONS WITHIN THE REGION TOWARDS GLOBAL DEVELOPMENT

The institutional development should foster for knowledge in the region for making decisions on regional matters. The policy makers must accumulate valuable information that should be incorporated into a formal analysis of sustainable development. This is necessary to correct the numerous mistakes and provide conventional wisdom to governments in the region; better appreciation of the causes and effects of environmental damage; as well as the costs and benefits of different policy options. In this regard, independent commissions should provide a useful way for governments to draw on technical expertise both within and outside of their countries that can also be instrumental in bringing the results of advanced research to bear on local problems.

Current knowledge of the ecology of tropical forests and grasslands is still rudimentary and thus rich biological resources of these areas and the ways in which humans relate to them is yet to receive as much study as they deserve. Given the shortage of funds and trained personnel in most Southern African region countries, this is an area where bilateral and multilateral assistance could make a real difference. The Convention on Biological Diversity, signed by 153 countries at the 1992 United Nations Conference on Environment and Development (UNCED) in Rio de Janeiro, is correct in insisting that tropical countries be compensated for protecting biological diversity from which others benefit. If such compensation became the order of the day, some of it should be used to finance further study of tropical ecosystems.

Poor countries in the Southern African region could also use international assistance in reforming their environmental laws and in selecting optimal strategies for environmental management. Not enough emphasis has been given to the role of law in alleviating poverty and protecting the environment. Particularly in the area of pollution charges, the experience of developed countries could be invaluable. But countries in the tropics that are being asked to protect biodiversity and genetic resources partly for the benefit of others also need technical assistance in legally defining and protecting their rights regarding these resources.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Consequently, management strategies must go beyond assessing the impact of individual projects, as this tends to address the symptoms rather than the root causes of environmental problems. Such strategies must pay greater attention to broader issues and recognize intersectorial links and intergenerational concerns. This would entail integrating natural resource management with national economic planning as well as tailoring international assistance to specific aspects of resource conservation. To implement such strategies, African countries must strive to secure broad consensus and support, both nationally and internationally.

Policy Implications and Adaptation Plan on Climate-Related Migration

The impacts of climate change on agricultural output, effective on rural migration exodus, can be expected to have not only direct impacts on rural communities in sort of reduced income and unemployment, but also knock-on effects for rural economies as a whole. This may put considerable strain on rural local governments, which provide services and promote development at a local level. Local municipalities will therefore need to plan and adapt absorbing climate impacts models. The burden on municipalities will increase because of the expected increases in natural disasters, water scarcity and disease, and reduced agricultural production and food security. Rural communities and local municipalities will need to find appropriate and efficient ways of developing resilience to climate change through adaptation measures. These measures will need to be supported at a systemic level, including through intergovernmental finance mechanisms.

Climate change is happening and will carry on. Southern African governments have put little efforts to oppose the climate adverse to agriculture in the more remote parts of countries and to climate-related migration consequently. Urgent measures on policy action and strategies to reduce climate-related migration are to be attended to urgently. In this way, development efforts and programs to reduce poverty will lessen livelihood vulnerability, ultimately reducing the need for families to migrate because of climate change.

The Roles of States and International Assistance

Environmental challenges in Southern Africa diaspora are more complex than the simple model linking environmental degradation to population growth and inappropriate macroeconomic policies indicates. The chapter recommends that in order for policies to succeed

- It must increase people's awareness interest on protecting the environment by involving them directly in the process of reducing poverty and alleviate pressure on natural resources.
- The state can play an important role in promoting sustainable development and improving the environment by setting the correct investment priorities and provide needed infrastructure, services, education. Assist urban areas to focus on providing safe water, collecting and disposing solid waste, and improving the physical layout of congested areas. In the rural areas focus should be on health, education, and basic sanitation, urgent basic services for the present and future urban population is a necessity.
- The state should set environmental standards that are realistic in terms of the country's particular socioeconomic circumstances. For example, setting strict standards for indoor air pollution when most people cannot afford less-polluting energy sources simply makes enforcement impossible.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Structural adjustment programs should take place to improve matters, where the governments' lack of commitment has left the situation far from satisfactory and protect most natural resources from excessive use or degradation.
- Avoid nationalization and allow individual property rights than communal property system so as they can use for real collateral against which to borrow for access to the credit needed to invest in improved farm infrastructure.
- Decentralize tax structure in every rural community or locality. Provide autonomy to rural community that will create small villages. The treasury will then be charged with responsibility for national budget.
- Mitigation of automotive greenhouse gas emission since car on the road get doubled every seven years in SA resulting in huge traffic germs in the cities and pollution.
- The social impact of decentralizing economic drive will promote healthy relationship as many will now not migrate to the cities but rather stay in their communities.
- Peace in DRC and economic stability can attract foreign investment and enlighten Central Africa given its location that is surrounded by nine countries. Key measure role is the potential in natural resources and generating energy from hydro power plant supplied by stable Congo River. DR Cconnect to North, East, West and South regions that may results in business opportunities and avoid people from migrating to other countries as this can develop into booming economic opportunities for the Southern Africa region to move fast in order to reap the benefits from global integration.

FURTHER STUDY

Based on the discourse of the chapter the following are recommended for further study:

- Research should be conducted on knowledge about urbanization programs
- Knowledge on urbanization and management planning
- Forestation and environmental sustainability as well as ecology of tropical ecosystem
- Land tenure and agricultural grasslands and social entrepreneurship for job creation
- Environmental laws and urban management and build indigenous knowledge on health skills.
- Capacity on building community programs on natural resource preservation
- Trade development and transport and network of policy makers and practitioners designed for Southern African best knowledge of growth and poverty alleviation
- Regional Infrastructure, bilateral as well as multilateral trade agreements.

CONCLUSION

Migration, whether rural-urban; intra-regional or intercontinental, always responds to the pull of opportunity in the cities to escape poverty. The absence of work opportunities, in both urban and rural areas and high illiteracy continue to deteriorate in the region owing to the failure of development planning to improve living conditions. Southern African region is a region that is worst affected by poverty, wars, civil and political destabilization that has resulted in delaying the developmental progress of the post-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

colonization decades. As a results lack of social policy to tackle social injustice of poverty, inequality, perpetuate poverty in the region and impoverishing impact negatively on people's wellbeing. Adequate implementations of social policies that are tailored for collective public efforts, affecting and protecting the social well-being of the people, through education and health care provision. Habitat, food security, sanitation and infrastructure remain the key strategic issues that need urgent attention. Knowledge about natural resource preservation and mitigation policy towards climate change and adaptation is crucial in the region while ensuring the sustainability of the natural resources and avoid land degradation and deforestation.

Tackle HIV/AIDS prevalence rates, especially in the major labor sending countries Lesotho, Mozambique, Zambia, Malawi, Swaziland, and Zimbabwe and in the labor-receiving countries (Botswana, South Africa) that further creates a nightmare scenario of acute labor shortages in the region. Therefore, governments need to strengthen the democratization process and improve the quality of governance to ensure a greater and more effective participation of the people in politics and development region. Economic restructuring programmes should be seen as engines of drive in improving poor education, health, and malnutrition custom-made for improving the livelihood and fostering better family life. Structural adjustment on foreign debt and corruption are to be prioritized as well as trade agreement bilateral to seek ways in which solutions can be established and international assistance in terms of programmes and projects directed towards job creation for youth to be in place. As well as crafting strategic policies for global migrant integration that is unique for the region's needs.

KEY TERMS AND DEFINITIONS

Cities: The term cities in this context refers well development areas that rural migrate to for employment and better livelihood. The influx is due to industrialization. Manufacturing and proper facilities such as sanitation, clean water and electricity. The level of development compared to rural becomes reasons for attracting such high level of entrants in cities. Foreign inhabitants from different regions migrate to cities to seek for better lives and run away from poverty levels while they confront hostile welcome by residents.

Global Factors: Global factors relate to factors that affect the economic and Investment opportunities that are causal factors of fundamental effects of economy. The most prominent such as inflation, draught macro perspective levels that affect global downturn on economic issues. They are major determinants of whether a country is developing or developed. It mainly relates to opportunities of infrastructural such as transport, roads, and living standards. In this chapter the emphasis is on global factors affecting the Southern African region and challenges faced. The common understanding of discussions to improve and the sustainability of regional bilateral agreements.

Influx Control: The term refers to measures used to regulate the inflow of black Africans into South Africa's urban areas during the pre-Apartheid and Apartheid eras. First introduced by the Smuts' government, the Native (Black) Urban Areas Act No 21 of 1923 enforced a system of segregation which allowed black Africans access to towns only to serve white labour needs. Domestic workers were allowed to live in town, the rest would be restricted to finding housing in townships on the outskirts. Legislation in 1937 restricted black African males a window of 14 days in which to find employment or return to the reserves. The concept has evolved and currently reflects, given the South African economic development and the inflow migration of African citizens in search for greener pastures in South Africa, the tighten control over employment, providing steeply increased penalties on employers who hire illegal, unregistered workers, and maintained barriers against illegal squatting and lodging.

Infrastructure: Infrastructure is with reference to road and rail infrastructures basically. Infrastructure is considered as backbone of development as most of the southern African capitals and major urban areas still do not have adequate road infrastructure which essentially vehicle and promote economic development.

Municipalities: Simon et al. (2003) refers to policies of local government that are formulated to address the challenges of migrant integration in the region as well as infrastructural dilemmas. Growth of large cities in developing countries are accompanied by an increase in poverty trends that are orchestrated by certain specific realities that confront the smooth running of budget due to pressed burdens of overcrowding as a results of urban dwellers.

Regions: Refer to areas that share common characteristics such as geographical part of a country. In this chapter the term region refers to the Southern African Region where high levels of land, due to high increase in land demand. Rising levels of high levels of land demand in regions becomes degradation, deforestations and poor urban conditions undermining the sustainability of the socio-economic developments of the region. It also refer to all countries that share boarders some are wealthier while others are extremely poor under high political intolerance that causes global migration.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Urban: The term refers to a location characterized by high human population normally density of population without proper infrastructure, sanitation, extreme poverty, and poor planning putting high pressure to local municipalities. The consequences resulting in slum upgrading and high pressure in city strategic development and competition of scarce resources being compromised. Lack of space capacity in the urban areas also results in municipalities being pressed up by costs that are not budgeted to host the influx of migrants.

Chapter 64
Social Media for Promoting Grassroots Political Movements and Social Change

Amir Manzoor
Bahria University, Pakistan

ABSTRACT

In light of many recent Internet-led revolutions, the Internet and its tools of social media have been heralded as instrumental in facilitating the uprisings. This chapter provides a close examination of the social media role in grass roots political and social change movements. The chapter discusses the ways activists have used social media tools for organizing and generating awareness of political mobilization and the characteristics of social networking that can be harnessed in a particular cultural and historical context to achieve collective political actions. The chapter also discusses long-established theories of communication to explain how social networking tools became appealing to the activists in these Internet-led movements. The chapter will look at various Internet-led political movements around the globe to demonstrate the enormous potential of social networking tools to facilitate and expedite political mobilization.

INTRODUCTION

Social media is defined as a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0 and that allow the creation and exchange of user-generated content (Kaplan & Haenlein, 2010, p. 61). Social media tools include social networking sites such as Facebook, micro blogging sites like Twitter and Instagram, video sharing sites like YouTube, and image sharing sites such as Flickr and Tumblr. Social media studies are a relatively young but growing field (Kaplan & Haenlein, 2010). In June 2010, 22% of time spent online was spent using social media and blog sites worldwide (Neilson, 2010). Grove (2010) estimated the global average time spent per person on social media sites in 2010 was nearly five and a half hours per month. However, by early 2014 the average time spent on social media sites dropped to 3.6 hours per day (Brendan Butler, 2014).

The recent Internet-led uprisings have fostered an ongoing dialogue about the role of social networking tools for promoting grassroots political movements and social change (Conover, 2013). Social media is now being considered an undeniable force for good. According to (MacKinnon, 2011), Wael Ghonim, Google executive in Egypt, famously declared right after Egyptian President Hosni Mubarak stepped down in February,, "If you want to liberate a society just give them the Internet" (p.1). The Internet proved to be an effective weapon of the masses against their authoritarian leaders. According to the New York Times, such use of Internet was the 21st-century way to resolve conflict. As (Kristof, 2009) put it, "On one side are government thugs firing bullets and on the other side are young protesters firing tweets" (p. 1). We have also witnessed Twitter revolutions (i.e. different revolutions and protests, all of which were coordinated using Twitter) in which the young tech-savvy generations monopolized the digital gap to challenge their archaic authoritarian governments. Some examples of such revolutions include 2009 Moldova civil unrest,2009 Iranian election protests (also known as Green Revolution),2010 Tunisian revolution (also known as Jasmine Revolution), Egyptian Revolution of 2011, and Euromaidan Revolution of Ukraine in 2013. The initial success of such Internet-led revolutions has brought a great deal of attention to the role of social media and the Internet in fostering grass root political change. Nevertheless, such potential of change is dependent on the extent to which social media and the Internet is (Gibson, 2013).

The Internet-led uprisings in the Middle East (e.g., Egypt) and North Africa (e.g., Libya and Tunisia) brought significant developments in all these countries. Scholars in the academy continue to debate the role of social media in these uprisings. Because these events are recent, available data and analysis about the role of social media and the Internet in grass root political and social change is limited. Prior to such events, research concerned with social media as a vehicle for social change was largely speculative in nature. One key issue is the manner in which social media became the source of information. Meaning, the source of information was ordinary citizens who for the very first time in their history used social media more than mainstream media to react to and even cover the events of political revolutions (Hassan, 2013).

This phenomenon of social networking as a political and social change agent is very significant. We see after centuries a technological innovation used as a tool for change. The social networking tools such as Twitter, Facebook, YouTube, and personal blogs have been used as an insider perspective to the ongoing revolutions. Revolutions can occur without Internet or technology. Revolutions have been taking place before the advent of social media. The advent of social media provided a crucial facilitator role by bringing together distant people and providing gathering real time information. The data about the use of these tools as source of information, a part from their established use for socializing, provides significant evidence of their relevance in mobilizing political movements and bringing change. However, the social media tools can not only be repressed by the governments but also used in their favor. Therefore, a logical analysis of this phenomenon is needed to establish a critical perspective about the history and novelty of this phenomenon of social networking for political and social change.

This chapter aims to understand the connection between technology, society, and political movements through the creation of a network society and analyze the extent to which social media can play a positive role in grassroots political change by analyzing various case studies from different countries. The chapter also discusses the characteristics of social media that can be harnessed in a particular cultural and historical context to achieve collective political actions.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

BACKGROUND

Social Media Tools

Facebook

Facebook, a social network, emerged in 2004 as a way to connect with fellow students. Initially adopted by high school and college students, the social network now has 1.35 billion monthly active users., making it the premiere social media service in the world. If Facebook were a country, it would be the third largest behind China and India. Facebook users interact with other users, or "Facebook friends" by updating their "status", writing on other members "walls" or sending direct personal messages. Users are able to create and join interest groups, 'like' pages, import and search for contacts, and upload photos and videos. The average user is connected to 80 community pages, groups and events. Despite being a US-based product, Facebook users are mostly located outside USA. A crucial aspect of the social media role in various Internet-led uprisings was the use of mobile phones. In this regard it is important to note that in 2011 more than 350 million users of Facebook used their mobile phones to access their accounts (Storck, 2011; Finau, Prasad, Logan, & Cox, 2014).

Twitter

Launched in July 2006, Twitter is a real-time online social networking and microblogging service that has grown to 284 million monthly active users and 500 million Tweets sent per day as of 2014. Users can exchange photos, videos, and communicate via "Tweets" which are short posts limited to 140 characters. Uses can also embed media links in their tweets. Twitter users can "follow" or essentially subscribe to the updates of other users. These other users may include conventional media sources, such as Newsweek, celebrities, and friends. Additionally, tweets can be categorized using "hashtags" (e.g. #egypt) which group posts together by topic or type (Chebib & Sohail, 2011) or user-identified key words that clue readers in to what others think is important. Twitter provides very personal communication where uses choose whom they want to follow. This selection creates a unique experience specific to each user. This unique experience is dependent on various factors related to use of Twitter such as time of Twitter user, frequency to cheek Twitter feeds, the Twitter followers, and the user interface used to access Twitter. Due to this flexibility, norms among Twitter users quickly emerge and fade away (Jenkins, 2010). Since Twitter can be accessed using both computer and mobile phones, it is a lightweight communication tool especially helpful in crisis situation.

YouTube

YouTube was founded in 2005 and provides a forum for the distribution of video content of various types. YouTube was the first website dedicated solely to uploading and sharing personal video. Over 3 billion videos were viewed each day on YouTube, reaching 700 billion playbacks in 2010 and 100 hours of video were uploaded to YouTube every minute in 2014 (YouTube Statistics, 2014). As well as uploading and viewing media, users can also leave comments on videos. In 2014, YouTube was the third most frequented website online (Alexa, 2014).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Weblogs

Blogs are short form of weblogs. Belong are an easy-to-use content management tools that provides instant addition of content to a website via a web interface. Blogs do not require any programming or technical skills (Wyld, 2007). All you need is Internet access and typing skills. Such easiness of creating blogs has resulted in proliferation of personal blogs globally. In Arab region alone, there were 35,000 active blogs in 2009, growing to 40,000 by 2010 (OpenArab.Net, n.d.).

An average person, with little or no advanced computer skills, can have good success using social media services and independent blogging. This is one reason why these social media services and independent blogging have become attractive for common people. Using social media services and independent blogging, content can be created and accessed with as little as a smartphone; and it can be easily intertwined. Links to videos posted on YouTube can be embedded in blogs, Facebook, and Twitter. A Twitter post can appear on a Facebook page. In other words, large numbers of people can be contacted easily and inexpensively via a variety of services.

Social Media and Communication

International media and academic circles acknowledge the role of social media tools in various political movements. However, there are different opinions regarding effectiveness of these tools in aiding political mobilization and social change. Social media communication has brought politicians and political parties closer to their voters. Politicians can communicate fast and reach citizens in a targeted manner without an intermediate role of mass media. Citizens are using social media to post reactions, feedback, and participate in conversations and debates. Despite increased presence of social media, online political engagement is largely restricted to people who are already political activists online. For example, in most European states, television and newspapers (both offline and online) are still the most important source of political information for citizens. While social media use in some cases has resulted in toppling of authoritative regimes (such as the case of revolution in Egypt and Tunisia) in some cases the similar success was not achieved (such as in case of political uprising in Bahrain and Saudi Arabia) (Reuter & Szakonyi, 2013).

Nature and Benefits of Social Media Communication

Communication using social media tools is different from communication using traditional ways of communication such as TV, newspapers, and radio. First, communication using social media tools is two way communication where use can also respond to messages in real time. Second, receivers of information obtained from social media are not necessarily prone for action. This is even true for people who virtually join group. These uncommitted users of social media can join a Facebook group or follow a twitter feed. Doing so can provide them some anonymity without physically participating in a resolution (Papic & Noonan, 2011).

Communication using social media provides some important benefits for political and social change. Online groups can be trained, recruited, and organized at much less costs (Papic & Noonan, 2011). A large number of users of social media tools makes it easy to convince recruits to find or join another social media site (Greeley, 2011). Findings recruits online is also easy because groups are normally formed around shared causes or interests (Mainwaring, 2011).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

People active online are also likely active group participants. In a study, Pew research center found that 80% of Internet users participated in groups. Participation from social media users was even more active, with 82% of social network sites and 85% users of Twitter participated in group activities (Rainie, Purcell, & Smith, 2011). Uses were more likely to engage in group activities if they fell that their participation can make meaningful difference (Rainie et al., 2011).

In many crisis situation, such as Haiti earthquake or Mumbai attacks, users broadcasted information to a large number of people. This information was not pushed to a specific group of people (Hughes & Palen, 2009). This communication was different from the traditional way of communication using social media. In the context of disaster, such type of communication cane be every important for tactical, emotional, and community building purposes (Palen & Liu, 2007).

Activists who use social media for social change can use them to plan in-real-life and in-virtual-life meetings, keep followers informed about events and news, and gain followers. Social media use can increase users' self-efficacy to join a cause because, in part, their peers' involvement and actions are transparent. It can also be useful by giving an on-the-ground view to people not culturally or physically close to the users.

Social media also lowers traditional socio-economic barriers to commanding the spotlight. You do not have to "be somebody" to "be somebody" on social media. Politicians, governments, and activists all look to tap into the potential of social media. The Internet and social media has reconstituted the construction of social relationships especially among young people. Social media is also producing radical changes in how communication is produced, mediated, and received. Under such circumstances, state power becomes more porous and there is less control. Internet and social media provide a source of political energy that posits a new relationship between the new media technologies, politics, and public life (Giroux, 2009). These digital technologies influence the formation and activities of civil society groups: mobs, movements, and civil society organizations. While mass popular protests are by no means a new phenomenon, digital tools are facilitating their formation (Etling, Faris, & Palfrey, 2010).

Theories of Communication

There exists many established theories of communication, such as Lasswell's functionalist theory of media and Granovetter's theory of weak ties that can be used to explain the use of social media as a vehicle for organization and mobilization of people. Both of these theories are based on sociology and were developed before the advent of social media. Still these theories are adequate to explain why social media was chose as a tool of communication by activists during various Internet led political movements.

Laswell's theory provides an analytical framework for communication that is based on the multi-faceted question "who says what in which channel to whom with what effect?" (Mattelart & Mattelart 1998, p.5). Laswell's framework involves content analysis to provide on objective systematic and quantitative description of the manifest content of communication (Mattelart & Mattelart, 1998). According to Lasswell there are three functions of communication in society; (1) Surveillance of the environment, (2) Correlation of components of society, and (3) Cultural transmission from one generation to the next. Social media has a profound influence on youth outlook, behavior, education, practices etc. as the social media keep on changing and innovating, the youth are influenced and the flow is also the reverse. every time youth acquire new style etc., the media watchdogs would know and update / upload their images, stories etc. they go on looking for new trends so as to keep youth captivated. And, this is rather successful. Although, Lasswell's model is simple and easy, the disadvantage of his model is the lack of feedback.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Manual Castell's network theory (Castells, 1996) can also be used to explain the important characteristics of social media that are useful for political activism. Social network can help create weak ties, support anonymity provided by the Internet, and provide online communication that is egalitarian in nature. According to Castells (1996), weak ties are useful in providing information and opening up opportunities at a low cost. The advantage of the Internet is that it allows the forging of weak ties with strangers, in an egalitarian pattern of interaction where social characteristics are less influential in framing, or even blocking communication. The strength of a tie is based on a combination of the amount of time, the emotional intensity, the intimacy (mutual confiding), and the reciprocal services which characterize the tie (Granovetter, 1973). Social media networks are based on these weak ties- acquaintances with other people whom one might share common interests or goals with, or may have mutual friends. The strength in weak ties lies in their ability to introduce us to new ideas and new information, and the Internet allows these ties to be forged with incredible speed over vast geographical barriers (Gladwell, 2010).

Granovetter (1973) analyzed the link between micro-level interactions and macro- level patterns in social networks, concluding with the strength of weak ties lies in their potential for diffusion, social mobility, political organization, and social cohesion in general, across different networks. People can have two types of ties with the people around them (such as friends and family). Weak ties are loose acquaintances that one can use e.g. to provide creative ideas or transfer knowledge. Strong ties exist with trusted friends and family. Strong ties can be used by a person for emotional health and join hand for a common cause such as relief efforts in a crisis. Applying Granovetter's theory to political mobilization, gathering of thousands of protesters would not have been possible if activists would have spoken only to their close friends and family. By capitalizing on the weak ties forged online through social networks, such as Facebook and Twitter, the activists were able not only to circulate their calls for political mobilization, but also began a dialogue that fostered the attitude for political activism in communities. A conclusion of Granovetter's study that is germane to the Internet-led movements is that weak ties are more likely to link members of different small groups than are strong ones, which tend to be concentrated within particular groups. Weak ties established online allowed different oppositional factions to connect over a common goal of ousting repressive regimes, and to translate this into political mobilization.

According to Gladwell (2010), weak ties do not help people create social change. What matters most is the extent to which someone is personally connected with the movement to create social change. However, if strong ties are essential for social change and social media does not create those required strong ties, perhaps people have fewer strong ties now than they did previously. McPherson, Smith-Lovin, & Brashears (2004) found three times increase in the number of people who believed there was no one with whom they could discuss important matters. According to findings of McPherson et al. (2004), one important factor affecting people relationships and ties could be the modern technology (e.g. computer and mobile phone). While technology has provided opportunities to network with people across geographical boundaries it has lowered the possibility of face to face communication with people around us such as family, friends, neighbors etc. Usage of internet has even interfered with communication in home. We can see a post familial family where family members spend time interacting with electronic gadgets of communication rather than communicating with each other. This suggests that ubiquity of technology may foster wider, less localized weak ties and not the strong, tightly interconnected confidant ties.

Still we may have use of weak ties generated due to ubiquity of technology. One example is the crisis situations such as Haiti earthquake. Many people who donated money had little or no strong ties with the country. Communication using social media, such as blog post, status updates, and tweets from peers, motivated them to do good deeds. Clearly a network of weak ties generated this awareness and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

motivation to do good deeds. Individuals can have strong positions within a network despite their less strong commitment to a cause. There individual can fill certain rules defined as a result of spread of awareness due to the network of weak ties. A small donation may not make a signification impact on relief efforts but sharing of such donation on social media may attract many to follow the same path and donate (Srinivansan, 2010).

Social Media and Media Culture in the World

In order to understand the significance of social media tools, we must understand the use of social media in the context of media culture in different parts of the world.

According to Lewis (2005), the single most important development is the adoption of modern communications. Though, the world Internet penetration has increased dramatically over the last several years, the technological capabilities of modern life that are taken for granted in highly developed societies, have progressed in a relatively short span of time and have not been embraced by the authoritarian governments that dominate many significant regions of the world (such as Middle East). The rapid development of print and visual media in these regions has made the ruling elite fear the Internet as a conduit for political and moral subversion.

As Internet access has proliferated across these regions, a highly ambivalent and complex relationship between media and governments has developed, in which autocracies have encouraged Internet penetration in the name of economic development, while simultaneously attempting to maintain control over the spread of information and media sources (Khamis & Vaughn, 2011). This complex relationship between increasing Internet accessibility and a complementary increase in suppression of online freedom has led to a culture of subversion, an emerging cyberworld that knows no physical boundaries (Salmon, Fernandez, & Post, 2010) based on online social networking. With a lack of truly independent and representative media, disenfranchised youths have searched for an alternative method of participation in the public and political spheres (Storck, 2011).

CURRENT ISSUES OF SOCIAL MEDIA USE FOR SOCIAL AND POLITICAL CHANGE

Social Media for Political Change

Social media such as Facebook, Twitter and Wikis have become important political tools for citizens in countries with limitations and restrictions on media and freedom of speech (Khondker 2011; Strandberg, 2013; Stromback & Aelst, 2013). Citizens in many countries employ social media sites to voice their opinions, criticize policies, engage with their governments and even expose corrupt practices (Cave 2012; Logan 2012; Swegger, 2013; Thompson, 2013). Social media while primarily used as a social networking platform has become a popular means for citizens to discuss political issues, air dissent against politicians and government policies and even expose government corruption. Social media is thus increasingly playing an important role in how citizens become aware of information, how citizens engage in the political process and even to some extent how governments feel accountable to the public. This is especially so as various regions of the world are undergoing an ICT (Information, Communications and Technology) revolution with a number of major ICT developments. The increased availability of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

internet and mobile access is spurring the use of social media. Cave (2012) finds that ICT, specifically social media, is being used to enhance accountability and transparency by exposing negligence, poor service delivery, and corruption. The Arab spring in the Middle East is an example of the impact of social media in politics (Maghrabi and Salam 2011; Bruns, Highfield & Burgess, 2013; Wolfsfeld, Segev & Sheafer, 2013). Social media played an important role in the Arab Spring by enabling political activists in these countries to air their grievances, organize, and coordinate protests and also to share their plight with the world (Khondker, 2011; Wolfsfeld, 2014). Thus, social media is playing an important role in the facilitation of political change.

Studies that have examined the potential for social media to facilitate political change have largely been conducted in developed countries (Kushin & Yamamoto, 2010), and have produced mixed findings. These studies have examined issues such as social media as a campaign tool by political candidates (Stieglitz et al. 2012) and the offline political effect of online political discussions (Bimber & Copeland, 2013). Some authors argue that social media has significantly changed how democracy is achieved (Shirky 2011). A few studies have cited the example of how social media was able to implement democratic change in the Middle East (Maghrabi and Salam 2011; Howard et al. 2011). Social media has provided a mechanism for public dissent to be communicated. This is especially the case in countries absent of free media, civil society actors, and formal mechanisms for citizens to engage in the political process (Kaplan & Haenlein, 2010; Vaccari et al., 2013). In these countries, information that is published by the media is usually censored and comprises of government propaganda. Social media allows citizens to discuss, share, and communicate issues that are censored from traditional media. Social media also allows citizens to criticize government policies and hold government officials to account. Social media has also been used to expose corruption and engender greater transparency (Cave 2012; Logan 2012).

Issues of Social Media in Grassroots Political Movements

In order to fully evaluate the role of social media tools in the grassroots political movements, four visible issues can be identified: social media as an organizational tool, as an alternative press and outlet for citizen journalism, a tool for generating awareness both regionally and internationally, and social media as a democratic medium.

Social Media as an Organizational Tool

The relative speed at which many Internet-led political uprisings occurred is one of the defining characteristics of these uprisings. In Tunisia, the uprising took 28 days. In Libya, the uprising took roughly 9 months. While in Egypt it took mere 18 days. Effective use of social media networks was central to the acceleration of these uprisings. Social networks provided a form of organizational infrastructure that initially started as virtual networks and finally transposed to the offline networks. Activists of these uprisings successfully capitalized the strengths of social network sites notably "many-to-many" communication capabilities and the speed with which information can be transferred and spread.

In Egypt, Wael Ghonim's Facebook group "We Are All Khaled Said" was created in memory of Khaled Said, a 28-year-old Egyptian from the coastal city of Alexandria, Egypt, who was tortured to death at the hands of two police officers during Egypt uprising. This group served as an organizational platform that attracted like-minded individuals to connect over a common interest to commemorate Khaled Said. This evolved into a common interest in forming an opposition to the Egyptian police force, which

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

evolved into a movement to force Mubarak to step down. Activists in Lebanon began to unite with the goal of ousting the sectarian system. These activists managed to reach around 15,000 people through a Facebook group entitled "In favor of ousting the Lebanese sectarian system–towards a secular system." The group was comprised of youth from different sects, regions, and cultural backgrounds (Naim, 2011). However, the sectarian and divided nature of Lebanese youth partisanship rendered it difficult to use social media to mobilize young people through a common goal (Galey, 2011; Srinavasan, 2014). Social media played a different role in Tunisia and Egypt's anti-government protests than in Libya and Yemen. There was not the kind of strong tradition of online activism in Libya and Yemen as there is in other Arab countries (Riley, 2011). In Libya, there was a lack of Internet infrastructure, online access was difficult, and the Gadhafi regime had limited social media. In Yemen, government controls and extreme poverty limited Internet use (Riley, 2011). Unfortunately, in these countries, technological barriers to social media coupled with severe totalitarian regimes stymied reform efforts.

Sandwiched between Romania and Ukraine, Moldova emerged as an independent republic following the collapse of the USSR in 1991. The first widely recognized use of social media as a tool of political revolution occurred in Moldova in 2009. Activists used Facebook, LiveJournal (an electronic diary service/social network), and Twitter to organize protests and bring attention to the political unrest in the former Soviet republic. Interestingly enough, during the protests, Russian- language Tweeters debated the role of social networking tools in organizing the demonstration (Hodge, 2009).

On January 17, 2001, during the impeachment trial of Philippine President Joseph Estrada, loyalists in the Philippine Congress voted to set aside key evidence against him. Less than two hours after the decision, activists, with the help of forwarded text messages, were able to organize a protest at a major crossroads in Manila. Over the next few days, over a million people arrived. The public's ability to coordinate such a massive and rapid response, in which close to seven million text messages were sent that week, so alarmed the country's legislators that they reversed course and allowed the evidence to be presented. The event marked the first time that social media had helped force out a national leader (Shirky, 2011). On January 20, 2011, Estrada resigned.

Not only did social media provided the organizational infrastructure, but also it provided a crucial platform for potential protesters to network with one another and share their common grievances. Once individuals found out that other people would be protesting, they were more likely to join themselves. Eventually, a tipping point occurred, when the protest or activity became self-reinforcing, and increased without further direct organization or action by the leadership (Duncombe, 2011). The spread of communication using social media to offline communities was essential to reach the majority of population that, in many cases, remains offline. Very traditional forms of spreading information such as distributing flyers to citizen on the streets were also used by the activists. Every user was a potential re-broadcaster that broadcasted information to his own real world social network. The conclusion to be drawn here is that successful socio-political movements must be based on grassroots organizational structures. These structures starts offline and use both offline and online organizational tactics. On the must part, social media was a tool for acceleration and facilitation of socio political movement.

Social Media as an Alternative Press

With its low entry barriers, social media tools provide an accessible platform for citizen journalism, defined as the use of digital media tools to report on events on the ground, uploading text and videos directly to the Internet or feeding the information and videos to media outlets (Khamis & Vaughn, 2011)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

.The dialogue taking place via Facebook, Twitter and other social media networks was used by the mainstream media as a source during the height of the protests in various Internet-led political movements. During Egypt uprising, Al-Jazeera relied on reputed bloggers and Twitter users for real-time coverage of events, by using Sharek, a citizen's media platform that received and filtered through submissions by citizen journalists. Though there were obvious accuracy issues related to citizen journalism, the implication for the role of social media within the uprising is that it allowed for those directly involved to shape their own narrative and expose themselves to an international audience. Social media place the tools of documentation and truth-telling into the hands of ordinary citizens, social media networks create linked activists who can contest the narrative- crafting and information-controlling capabilities of authoritarian regimes (Duncombe, 2011).

In the political uprising of Egypt, Twitter was used by activists as a platform of discussions about events happening on the ground. Activists capitalized on Twitter's mobile-phone enabled social media to not only send regular tweet updates but also share other forms of medial such as photographs and videos. These examples aptly demonstrate the role of alternate press played by Twitter users. There user self published their own accounts of the uprising. This self published information served as their own narratives of events exposed to audience at both local and global level. This way social media allowed literally real time following of events by the user across geographical boundaries (Storck, 2011).

Although Tunisia's government practiced some of the most repressive Internet censorship, the country had one of the most connected populations in the region outside the Gulf; 33% of the population was online, 16% on Facebook and 18% using Twitter. Although the Tunisian regime blocked YouTube during the month of unrest, it did not entirely block Internet access, and seasoned cyber activists played bridging roles, re-posting videos and Facebook content about protests from closed loops of private networks to twitter and online news portals with greater reach (Oxford Analytica, 2011). Also, Tunisia witnessed a sudden eight percent surge in the number of Facebook users during the first two weeks of unrest, coupled with a shift in the usage turned from merely social in nature into primarily political (Khaleej Times, 2011).

During uprising in Egypt, the government shut down the Internet. At that time, individuals outside the country came forward and use technology to provide continuous coverage of the events. That helped continue the momentum of the political movement. According to Time Magazine (2011), social media plays a significant role for people outside the borders. These people can use social medial to bring context, understanding, and analysis of the situation. However, this new sphere of citizen journalism have also brought the issues of accuracy and anonymity. Previously unheard individuals have used anonymity provided by Internet to express their dissent without any fear of any backlash from the government. At the same time, there is a possibility that this anonymity can be abused. Take one example of Tom MacMaster, 40, a married U.S. student at the University of Edinburg. He created in February 2011 Amina Abdallah Arraf al Omari, a fictional character or hoax persona. MacMaster presented himself as a Syrian-American blogger, identifying herself as a lesbian on her weblog "A Gay Girl In Damascus" and blogging in support of increased civil and political freedom for Syrians. During the 2011 Syrian uprising, a posting on the blog purportedly by "Amina's" cousin claimed that Amina was abducted on 6 June 2011. The online response in the community, mainstream media, and social networking websites was rapid and extensive. His posts caught the attention of the world amassing thousands of followers and news organizations. On June 12, The Electronic Intifada published evidence for its claims that "Amina" was the product of one or both of husband-wife team Tom MacMaster and Britta Froelicher. McMaster

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

initially denied this, but later that day the blog was updated with MacMaster's admission that he was the sole author of the blog.

Social media proponents promoted the technology's role in the Iranian unrest, but a closer look reveals a more complicated picture. Although there was a great deal of excitement about the role of Twitter in Iran after the presidential election evidence indicated that twitter conversation about the Iranian protest occurred mostly among those in the West, and most likely was not used by Iranians to organize. Instead, Twitter and other social media were used to report protest events as they unfolded, replacing the foreign press and also creating international support for the movement (Etling et al., 2010). Research into the Iranian blogosphere showed that political and religious conservatives were no less prominent than regime critics (Etling, Palfrey & Faris, 2009). While the movement was unsuccessful in forcing change, it continued to exist, still using social media as a way to communicate within Iran and with others around the world who are sympathetic to their cause.

In Moldova, word had been spreading rapidly via Twitter and other online networking services. The official media carried no coverage, but accounts, pictures, and video of the rally were appearing in real time on Twitter and YouTube (Mungiu-Pippidi & Munteanu, 2009). Although the protestors failed to prompt a change of leadership or a new election, they got the world to focus on a small, remote country, and digital activism became recognized as a source of political power.

Social Media as a Tool to Generate Awareness

Much attention has been paid to the role that the Internet has played in generating awareness of various Internet-led uprisings. Movements started online were transposed to offline movements where they gained momentum and attention. In Egypt, the majority of Facebook users agreed that Facebook was used most effectively to raise awareness of the causes of the movements within the country (Mourtada & Salem, 2011). Take example of Facebook group "We Are All Khaled Said Khaled". Khaled became the symbol for many Egyptians who dreamed to see their country free of brutality, torture, and ill treatment. This Facebook group quickly attracted more then 500, 000 members. The group spread photos of Khaled's disfigured corpse on the Internet. This Facebook group exploited Facebook to engage users in a powerful cyber activism campaign against an authoritarian government of Egypt. Howard (2010) defines cyberactivism as "the act of using the internet to advance a political cause that is difficult to advance offline," adding that "the goal of such activism is often to create intellectually and emotionally compelling digital artifacts that tell stories of injustice, interpret history, and advocate for particular political outcomes." (p.145). The important difference between cyber activism and mobilization is that mobilization is focused on planning, execution, and facilitation of actions. Cyber activism helps in fostering and promoting civic engagement that in turn results in various forms of civic mobilization. Therefore both concepts are closely interrelated. The use of Facebook group "We are All Khaled Said Khaled" for political motives sparked a new consciousness that provided serious consequences for polities in Egypt and networking capabilities of Facebook.

It was found that those Egyptians who admit to not using social media still vouched for social media as a platform where they could enjoy free expression of political will. This shows a wider change in social consciousness of people who took part in that uprising in Egypt. Egyptian public used online tools to challenge the repressive and corrupt monopolies of power in Egypt (Chebib & Sohail, 2011). A clear and definite shift in attitude towards authorities was observed. It has been argued that this shift in attitude was collective and driven by use of social media. Social media played an important role in for-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

mulating this collective shift in social consciousness. Thus, cyberactivists were able to capitalize on the accelerating effect of social networking online to formulate a social movement that could be transferred to the offline community and then manifested in political action. Many ordinary people not particularly politically active and kept their dissent limited to discussions with friends about their dissatisfaction with the government. However, an important shift took place once they realized via Facebook that this dissatisfaction was manifest in the nation.

A final element to address is the ways in which social media, whether intentionally or unintentionally raised awareness of the ongoing political uprisings in the international community. The need for social networking tools to continue political mobilization was made evident when Western corporations Google and Twitter teamed together to offer "Speak2Tweet" services after President Mubarak shut down Internet access across the nation. The involvement of powerful non-state, transnational actors in the domestic politics was very significant for activists who were able to continue their plight against the state.

US government recognized the role of new media as a source of information in authoritative states when US Secretory of State Hillary Clinton issued a request to twitter and asked to delay a planned site maintenance. This request came in the wake of protests in Iran against controversial presidential elections of 2009. The delay in twitter's site maintenance was meant to provide Iranian protestors an opportunity to communicate via social network. It also allowed US government to access information from Iran, where US had no official diplomatic presence for last three decades (McElroy, 2009). Thus. Social media acted as a significant source of information for both civilians and governments.

Social Media as Democratic Medium

Globalization affects different stakeholders in different ways. In a similar fashion, Internet stimulates different users in different ways. The two states may react in entirely different ways to the use of Internet as a pro-democracy-tool (Morozov, 2011). Activists in Tunisia and Egypt were apparently able to exploit the benefits of social media. However activists in Bahrain and Saudi Arabia, in an attempt to replicate the same strategies, were not able to reap the same benefits of social media.

Egypt is one example of social media use to voice political dissent. In 2009, Iranian protestors initiated the green movement in which Twitter was used as a forum to register their protest against the controversial presidential elections. The use of social media by green movement to spread democratic sentiment was lauded by US and other western governments. This was because it fit nicely with motives and policies of western governments. However, in the after math of Iranian presidential elections, green movements lost its momentum and quickly faded into the background. Barack Obama made history in 2008 presidential elections of USA. He was the first presidential candidate to effectively use social media as a major campaign strategy. Given how ubiquitous social media is today, interacting with people on social media (such as sending voting reminders on Twitter) was a big deal in 2008. On the announcement of Obama's candidacy in 2007, Twitter had only just started and there wasn't even an iPhone yet. Four years later in 2012, the number of American adults who used social media increased from 37% to 69%. In 2012, 66% of American social media users were actively engaged in political activism online. This population was estimated to be the equivalent of 39% of all American adults. In 2008, McCain's campaign was as social-media-deaf as Obama's was social-media-savvy. While the Republican candidate Romney's campaign tried to replicate the 2008 success story of Obama, they did not achieve the traction that the Democrats did (Mejova, Srinivasan, & Boynton, 2013). Obama dominated the social media space

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

because his team got how networks work. The real power of social media is not in the number of posts or Tweets but in user engagement measured by content spreadability. For example, Obama logged twice as many Facebook "Likes" and nearly 20 times as many re-tweets as Romney. With his existing social media base and spreadable content, Obama had far superior reach (Pamela Rutledge, 2013; Graber & Dunaway, 2014, Gulati & Williams, 2013).

In 2014, more than 200 Nigerian schoolgirls were kidnapped from their boarding school by armed Islamist militants. The event became an issue of international importance, with a $300,000 (£177,000) cash reward offered to anyone who could help locate and rescue the girls. Social media played a pivotal role in forcing the issue onto the agenda of world leaders. Hundreds of thousands of people (including the first lady Michelle Obama) posted images of themselves holding pieces of paper with the #BringBackOurGirls hashtag written on it on Facebook, Instagram and Twitter (Collins, 2014). But the attention of the world outside Nigeria soon faded. Journalists moved on to other stories; the hashtag stopped trending, a reflection that social media is failing. As the New Yorker's Naunihal Singh put it, "a viral hashtag, it seems, is a fever that breaks quickly." (Gary Nauer, 2014, p.1).

Trayvon Martin, a 17-year-old kid from Miami, was shot and killed by a neighborhood watch volunteer in Sanford, Florida on February 26, 2012. A massive social media campaign started against the killing of Martin. On Twitter, there had been more than 600,000 mentions of the case. A single "Justice for Trayvon Martin" Facebook page was created and brought in more than 82,000 "likes" alone (Gray, 2012). On August 14, Obama spoke to the nation, urging both law enforcement officers and protesters to take a step back and think. On August 9, 2014, Brown, 18 and unarmed, was shot to death by a Ferguson police officer. By the next day, it was national news, reported by every major news outlet across the United States. The story skipped over classic media filters and, in some ways, the public was driving the story through social media, and the media was following public cues. It took less than a week for Brown's death to go from the streets of suburban Missouri to the White House. That speaks volumes about the shifting dynamics in how these stories are told. In big part, this was due to a group of media-savvy, grassroots organizers that arose after the failures of the media response in 2012 and the shooting of Oscar Grant in Oakland, California, in 2009. The Million Hoodies Movement for Justice was established in March 2012, immediately after Martin's death became national news (Elijah Wolfson, 2014). These examples are a clear proof of the fact that to sustain online activism and to transform it into an offline reality is a difficult proposition (Afouxenidis, 2014; Anduiza, Cristancho, & Sabucedo, 2013; Ceron, Curini, Iacus, & Porro, 2014; Enjolras, Steen-Johnsen, & Wollebæk, 2013; Lim, 2013).

In another case, we witnessed the use of networking capabilities of social media in 2011 London roots where police officers used social media extensively to communicate with each other and to get information from public about the riots. In fact, we also see similarities between London riots and Egyptian uprising. Besides the use of social media both were triggered by the unjustified death of a young man. In addition, in both scenarios the governments made efforts to shut down access to social media tools. The Egyptian government implemented a full nationwide Internet blackout. In UK, the government vowed to do whatever it takes to end the unrest, including blocking access to social media sites (Halliday, 2011). This comparison shows that context is very important when it comes to judge the potential of social media and Internet as force for good. In the case of Egypt the use of social media and Internet by activists was landed by western governments as a force to promote and entrench democracy. However in the case of London, the same tools were treated by western governments as foes when used to fuel civil unrest in London.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is also important to note that the Internet cannot be considered as a universal remedy for all political ills, especially regarding authoritarian regimes. Internet is a tool without a handle (Morozov, 2012). While Internet possess enormous liberating potential, harnessing this potential and translating it into political reality is a much harder task to accomplish. Different contexts give rise to different problems and thus need custom-made solutions and strategies. In Egypt, social media did play a role in organizing the protests and bringing to the attention of the international community, voices that had previously not been given a platform for dissent.

However, many years after revolution, chaos and protest continued in Egypt. The young Egyptian activists were upset by the results of the poll. Their political imagination and demands were not reflected in the polls. This situation echoed concerns of people that many deep rooted political and economic issues were behind the civic unrest in Egypt. Internet and social media played an important role in strengthening pro-democracy movement. However, it would be a mistake to think that Internet and social media alone can solve these issues.

Social Media and Social Change

Social media has significantly altered communication. This change has brought significant media attention in the recent past. Notably the Mumbai attacks, the Iranian presidential election protects in 2009, and the Haiti earthquake were situations where communication was significantly facilitated by social media. Using social media tools, people can connect and unite in a crisis situation, raise global awareness of an issue, and usurp authoritarian governments. Social media tools can provide can be provide night information at the right time e.g. location of a hospital for people injured in an accident. The awareness of a cause generated by social media can be used to raise funds for the cause. Using social media everyone can be a journalist (Finau, Prasad, Logan, & Cox, 2014).

However, transparent nature of communication using social media can also be dangerous as rumors can quickly spread on social media. For example, criminals can use social media to observe police activity by spreading false rumors. Additionally, though social media can increase awareness of an issue we cannot say for sure whether social media actually puts people in action.

There are other issues involved in the use of social media for social change. One such issue is the ability of social media companies to handle crisis situations. Twitter was praised after they delayed a schedule site maintenance activity on the request of US Department of State. The purpose of this delay was to avoid interruption of communication in Iran during protests on presidential election. However, Facebook faced severe criticism on their real name policy. This real name policy forced activists to use their real name on their Facebook accounts. Violations could result in account deletion even if non-use of real name was for safety propose.

Many believe that social change can be facilitated through new ways of communication provided by social media. Twitter co-founder Biz Stone thought that social media lowers the barriers for activism. Still many believe that social media has little role in creating social changes and real social change come from people on the ground. According to Gladwell (2010) online social networks creates only weak ties that are not sufficient for actual action. Gladwell argued that online social media communication tools have been given unnecessary importance for their role in creating social change and the role of communication itself to create social change has been under emphasized. According to Gladwell (2010), "Where activists were once defined by their causes, they are now defined by their tools" (p. 2). Shirky (2009) argues that the way social media changed the communication significantly impacted the way people

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

create change: "Group action gives human society its particular character, and anything that changes the way groups get things done will affect society as a whole" (Shirky, 2009, p. 23). So, while there is no doubt that people are using social media for communication, has it produced significant changes in the way social changes is created by activists?

Studies suggest that social media usage is context dependent (Kaplan & Haenlein, 2010; Shirky 2011). Furthermore, rapid ICT developments in many regions of the world suggest that the use of social media in these regions will increase. Social media could thus play a significant role in the political, social, and economic development of countries.

Issues of Social Media Use for Social Change

In order fully evaluate the role of social media tools for bringing social change; following visible issues can be identified.

Motivating Action for Social Change

Social change requires a lot of work. To be effective, revolutions requires organization, funding, and support from masses (Papic & Noonan, 2011). Even a well organization revaluation need to go through an activist process of social transformation. This process includes information acquisition, knowledge development, transfer and sharing; ideation and thought leadership; empathy and emotional connection; and the spread of credible ideas that inspire cognitive dissonance (Leggio, 2008).

To motivate social change, a mass appeal is needed. People need to be convinced that their participation will make a difference. This convincing is especially important if people participation involves experience of personal discomfort. This task is not small and becomes very complicated in case of large groups (such as the ones involved in a political protest). In case of large groups, contribution made to the action of each individual member of group has no discernable impact on the overall success of the group. A rational person will not bear the cost of participation in the group (such as individual's time) knowing that he/she will enjoy the public good even if he/she do not make a meaningful participation in the group (Finkel & Muller, 1989).

Gladwell (2010) argues that communication tools, used by people, are often overemphasized for their role in bringing social change. The people behind social change are often underemphasized. Regardless of the tools used for planning and organizing social change, same basic principles of motivation must be applied to bring change. Social media tools can make the task of communication easier but the same tools cannot help much in convincing the people to participate especially when participation involves personal risks.

The Influence of the Media

Social media tools have been praised for the ability to reach many people, but the transition from reach to action is debated. The argument over whether or not the media influences social change is not new. Lazarsfeld & Merton (2000) argued that the mass media could cause audiences to become knowledgeable about a subject, but take no action. They argued that media create no social change, but instead works to enforce existing social values. To understand this argument one need to analyze the overabundance of information streaming on social media. For example, a Twitter feed can possibly provide an individual

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

a false sense of understating rather than bring this individual towards action. For example, people might learn on Twitter about the killing of a protestor in Iran but not be compelled to join the protest because of the feeling that they are already involved.

Today people see abundant information on many things happening around them. In this case, prioritization of attention becomes a difficult task. According to (ReadWrite, 2009), the question arises "How does an Internet junkie, news organization, or political operative monitor rapidly evolving real-time events, from the crucial details to the bigger picture? More importantly, how can a data stream be turned into real-time action, reaching the people who need it, when they need it, and in a form they can easily digest?" (p.1). In this regard, social media is different from traditional channels of communication (such as TV and newspapers) because there is no editor on social media. This is good because social media can give voice to those who many not otherwise have one. However, those voice many be combined unreliable.

Cultural Differences in Social Media Use

Cultural difference exists, across countries, in the use of social media tools. These cultural differences profoundly impact the way people use social media. According to Sheedy (2011), cultural differences can affect communication from five aspects. These aspects include design language, language subtitles, Internet performance, and face and avatars. Due to their cultural differences, people use social media differently. While Facebook may consider all Facebook friends equal, many cultures have different expectation for different relationship. Such different anticipations can cause different perceptions of strength of social media and change the way different cultures may use social media for social change.

Legitimacy of Social Media

The wide reaching broadcast provided by social media is one strong factor why social media is preferred to disseminate information in a crisis. For example, Al Jazeera English, which offers coverage of the Middle East, often when no other media will or can, is not carried by any major American cable or satellite companies (Rich, 2011). In this case, the social media presence of Al Jazeera becomes indispensable to get real-time information about a crisis in the Middle East. Transparent form of communication, provided by social media, is changing the way people receive and interact with news and information, but one that is only now being seen as legitimate.

The Digital Divide

The digital divide refers to the potential for a divide between those connected to the Internet and those not connected, sometimes worded as the divide between the information have's and have's not (Steyaert, 2002). Digital divide is one significant challenge in using social media for social change. A large digital divide severely limits the social media use for social change.

Policy Implications

Today social media sites, such as Facebook, Twitter and YouTube provide vast amount of shared information. Much of this information is provided by citizens acting as journalist. The content provided by these citizen journalist cannot be hold to ethical standard of traditional journalists. For years, privacy

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

concerns have been on the center stage of the debate concerning social media use. As social media has become more integrated into people communication, more complex issue have arisen (Madrigal, 2011).

US Secretary of State Hillary Clinton's historic speech in January 2010 on internet freedom was celebrated as an unequivocal policy statement on global free speech and expression. Hillary Clinton said, "New technologies do not take sides in the struggle for freedom and progress but the United States does (Yee, 2011, p.1). This statement reiterates the point made by Gladwell that we tend to personify social media tools instead of actions (Gladwell, 2010). It also raises important questions about the regulation of social media. Social media platforms do offer constitutional protections such as freedom of expression (Greeley, 2011). These platforms are also used worldwide. The questions arises as to which country's rule should be followed when the social media platform developed in Country A is used a user in Country B?

Another question that concerns use of social media for social change is that who has a right to have a social media presence. Obviously, any use of social media for threatening or abusive purposes cannot be allowed. However, who is going to decide the rules to determine what constitutes an unacceptable behavior on social media platforms? Some social media platforms follow non-transparent policies on the issue of deleting accounts. That makes the issue complicated. For example, Facebook removes a user's account if another user "report" an abuse. In case a user account is removed, Facebook makes no contact with the removed user. The only option available to the removed user is to send an email to disabled@facebook.com with a reinstatement request (York, 2010).

Such policies of social media sites can have serious consequences for activists using social media for social change. The opposition can easily have an activist's Facebook account removed if they don't approve the activist organizing event and relaying messages. This way, the source of information could be cut off and group would be forced to find another way of communication. Facebook's real name policy also caused a stir when Facebook disabled the account of popular Chinese blogger and activist Michael Anti because he was not using his legal name, Zhao Jing (Tran, 2011). For activists, this real name policy brings serious threats to their secrecy, privacy, and the revolutions that organize. This is because the transparent nature of social media communication allows governments to see what activists are doing and take action against them if they deem necessary. Even social media platforms providers can turn against individuals if they feel that the content posted is inappropriate. As an example, Twitter suspended the account of Guy Adams, a British journalist, who criticized NBC's Olympics coverage. Adams encouraged his followers to email an NBC executive and express their disappointment. Adams also took a step further: He included the email of Gary Zenkel, the president of NBC Olympics. Twitter suspended Guy's account by saying "Your Twitter account has been suspended for posting an individual's private information such as private email address." After getting his account suspended, Guy responded by saying that he found Zenkel's email address on Google where it was publicly available. Later on, Twitter reinstated Guy's account. Twitter acknowledged it had flunked the situation by actively reporting the offending tweet to NBC, with which it had been working in partnership for the Olympics (Mott, 2012).

Other social media platforms, such as Twitter, YouTube, and LinkedIn do not offer account verification and do not follow strict real name policies. LinkedIn policy says "Create a user profile for anyone other than a natural person" (LinkedIn, n.d.). This creates different problems for activists— one cannot be sure that people are who they say they are. The similar confusion was caused during Green Movement in Iran when rumors of government impersonating activists were spread on social media.

In some cases, social media platforms may be asked by governments or law enforcement to turn over some user information or to help identify criminals. Facebook hasn't implemented special tools or processes for activists. According to Facebook's Chief Security Officer Joe Sullivan "We get requests

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

all the time in a few different contexts where people would like to impersonate someone else. Police wanting to go undercover or human rights activists, say. And we, just based on our core mission and core product, don't want to allow that. That's just not what Facebook is. Facebook is a place where people connect with real people in their lives using their real identities (Madrigal, 2011, p.3). Twitter attempts to notify users if they have to release any records or information about them. As Biz Stone, co-founder of Twitter, stated "Our goal is to instantly connect people everywhere to what is most meaningful to them. For this to happen, freedom of expression is essential."…"Our position on freedom of expression carries with it a mandate to protect our users' right to speak freely and preserve their ability to contest having their private information revealed.". "While we may need to release information as required by law, we try to notify Twitter users before handing over their information whenever we can so they have a fair chance to fight the request if they so choose" (Stone, 2011, p.1).

RECOMMENDATIONS/IMPLICATIONS FOR EDUCATION, CIVIC ENGAGEMENT, SOCIAL PRACTICE, AND POLICY

As civil unrest continues, Twitter remains an outlet for citizen journalism, while protesters continue their struggle for political legitimacy. Change in political culture undergoes a lengthy and challenging process and history suggests that f change cannot be expected with one year of the start of the political movement for change. Undoubtedly, the use of social media and Internet have accelerated aspects of social change and revolution. However, the capabilities of social media and Internet for a long term change are yet to be demonstrated. Perhaps the most important and successful contribution of social media is that it has allowed a more independent press to flourish. One of the essential corollaries of a democratic society is an independent and transparent media. Social media has played a key role of a watch dug on repressive governments (Iskander, 2011). Therefore, social media can be regarded as important tools for political protest. However, social media cannot be treated as a form of social activism that is not dependent on the individuals who use social media. The use of social media is an example of how speeches, articles, images, and documents are constantly being recorded and placed online to create an accessible archive of information. This has a cathartic effect for a society that has operated under oppression and censorship (Iskander, 2011).

Following are some of the recommendations for using social media as a political and social change agent.

First, we should remember that there were people behind the social media tools used for social change. However, credit is generally given to the tools used for political and social change and not the people behind them. Social media tools can be used to raise awareness, appeal masses, rise funding, and bring people together. However, to personify these tool mean that we underestimate the participation costs and risks that activists bear.

Second, the best social media tools can do is to raise world awareness of an issue and we witnessed that in the case of uprisings in Egypt, Tunisia, Iran, Ukraine etc. Perhaps the most significant impact of online protests was that rest of the world got to know a view from the ground. This impact was evident in case of fund raising for Haiti earthquake victims and raising world awareness of the protests on Iranian presidential election.

Third, social media tools allow users to help each other, regardless of location and this potential of social media tools should be leveraged to its maximum possible extent. During Mumbai attacks of 2008,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

people used social media to get help to needy people and provide information to each other. In Egypt, social media helped protesters exchange information about possible dangers and to get medical help to people in need. Nevertheless people's ability to help each other using social media was not limited by geographical boundaries. People in many countries actively observed the revolution in Egypt and helped activists in different ways. People set up proxies, hacked government website, and raised awareness about the cause of Egyptian activists. Additionally, this increased awareness can work to incite politicians. Politicians can become more vocal and open with their reaction to revolution and situation they witness on social media.

Fourth, social media use for political and social change can be dangerous and therefore activists must consider this when planning to use social media tools in their movements. It is clear that many policies of social media sites, such as real name policy, are in direct conflict with the interests of activists. These policies pose great dangers to activists as governments can use social media to spy on, misinform, or incriminate activists. Social media use in Egypt helped bring massive organizing and action. It may appear that use of online tools, such as social media, to bring social change is not dangerous However, that doesn't seem to be true. In Egypt, post-Mubarak era was even more dangerous for activists using social media. New York Times on April 11, 2011 reported that a young Egyptian blogger Maikel Nabi was sentenced to there years in jail. The reason behind the sentence was a blog written by Nabi, describing Egyptian army's abuse of female detainees. The evidence presented in the court against Nabi included screen shots of his personal Facebook page and blog (Robert Mackey, 2011). The situation may be even worse in other countries. According to Facebook's Chief of Security Joe Sullivan, "When you step back and think about how Internet traffic is routed around the world, an astonishing amount is susceptible to government access" (Madrigal, 2011, p.3). Therefore, social media must not be mistaken as either a perfect method for social change communication or a trend that will quickly pass.

GAPS IN EXISTING RESEARCH

One important aspect of Internet-led revolutions is that the costs of organizing are lowering and allowing decentralized forces of ordinary people actually push revolution. However, such organizations have slim chances of becoming long lasting structures, which, for example, can become political parties after the revolution.

Visionaries such as Manuel Castells (Castells, 2009) and Marshall McLuhan (McLuhan, 2001) predicted the transformative convergence of media and technology on society. However, at least taking the Egyptian Revolution as example, the factors of organizational presence, boots on the ground, community outreach and face to face interactions are crucial factors in creating and sustaining social change-- still more important than the magic of networking and social media, or leaderless protest movements spurred by technology. The Muslim Brotherhood came late to the revolution, was relatively unskilled at the use of social media in comparison to the young protestors of the Arab street, but nevertheless has been able to grasp the reins of government in Egypt.

According to Manuel Castells conceptualization of network configurations, new political movements allow previously disconnected, undeveloped political identities to take shape and rise to a prominent position. This is particularly applicable to those countries where religions and ethnic divides previously prevented networking. For example, many Arab regimes banned the creation of political parties and limited the right to associate or create civil rights groups. Social media helped such groups discover

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

one another and break the psychological barrier of fear between them. In Tunisia, conversations about liberty, democracy and revolution on blogs and on twitter often immediately preceded mass protests. According to Rosenberg (2011) social media has three uses: It is an efficient and cheap way to give members information. It also conveys to members the highly motivating realization that they have big numbers so that they feel more excited and less fearful than people unaware they are part of a very big group. And it is an efficient way to transfer skills and information.

According to Shirky (2011) "The more promising way to think about social media is as long-term tools that can strengthen civil society and the public sphere" and "social media can compensate for the disadvantages of undisciplined groups by reducing the costs of coordination" (, p.2). The anti-Estrada movement in the Philippines used the ease of sending and forwarding text messages to organize a massive group with no need (and no time) for standard managerial control. As a result, larger, looser groups can now take on some kinds of coordinated action, such as protest movements and public media campaigns that were previously reserved for formal organizations. For political movements, one of the main forms of coordination is what the military calls "shared awareness," the ability of each member of a group to not only understand the situation at hand but also understand that everyone else does, too. Social media increase shared awareness by propagating messages through social networks. The anti-Aznar protests in Spain gained momentum so quickly precisely because the millions of people spreading the message were not part of a hierarchical organization (Shirky, 2011). While the state can shut down easily the unorthodox tools, shutting down tools in broad use involve risk of politicizing a large number of people who were not active politically before. Another impact of shutting down such tools is that it draws external attention from citizens and governments outside the country or the region to that country or region to the place that is experiencing protest or conflict. The real threat of this attention is the external reaction that authoritarian governments will have to face.

The rise of social media in this latest wave of political mayhem has brought considerable criticism from political theorists and social scientists. The critics argue that techno utopians overstate what the technology can do and understand the conditions for use of technology. There are, broadly speaking, two arguments against the idea that social media will make a difference in national politics and social fabric of the society. The first is that the tools are themselves ineffective, and the second is that they produce as much harm to democratization as good, because repressive governments are becoming better at using these tools to suppress dissent. The critique of ineffectiveness, most recently offered by Malcolm Gladwell in The New Yorker, concentrates on examples of what has been termed "slacktivism," whereby casual participants seek social change through low-cost activities, such as joining Facebook's "Save Darfur" group, that are long on bumper-sticker sentiment and short on any useful action. According to Gladwell (2010), "platforms of social media are built around weak ties. Social networks are effective at increasing participation—by lessening the level of motivation that participation requires." (p. 3). In his point of view, the type of relationships created by use of social media were not conducive to the sustained, hierarchical, and high-risk behavior needed to make real social change. The second critique of social media as tools for political improvement points to the fact that the state is gaining increasingly sophisticated means of monitoring, interdicting, or co-opting these tools. The use of social media is just as likely to strengthen authoritarian regimes as it is to weaken them. For example, the Chinese government has spent considerable effort perfecting several systems for controlling political threats from social media (Shirky, 2011).

Social media tools suffer from one significant weakness. Using these tools to bring political change require people to have close personal connection to bring an action. This is especially true if the action

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is risky and difficult. We see many successful examples of the use of social media tools for political change. However, we also see many examples where activists failed to achieve the desired political results e.g. the political movement of Belarus in March 2006. The movement was against the allegedly rigged election of President Aleksandr Lukashenko. The movement first swelled, then faltered, leaving Lukashenko more determined than ever to control social media. During the June 2009 uprising of the Green Movement in Iran, activists used every possible technological coordinating tool to protest the controversial presidential election. The movement ultimately brought to heel by a violent crackdown. In the Red Shirt movement of Thailand in 2010, the social media savvy activists occupied the downtown Bangkok. Again, the movement ultimately brought to heel by a violent crackdown, killing dozens. The structure of social media tools also puts limits on political activism. Take example of Twitter. "There are so many messages streaming through at any moment that any single entry is unlikely to break through the din, and the limit of 140 characters -- part of the service's charm and the secret of its success -- militates against sustained argument and nuance." (Etling et al., 2009, p.2)

FUTURE RESEARCH AREAS

The Internet-led revolutions raise questions about whether citizen journalism is activism and whether participants can be journalists. The fact that social media users do not have to be vetted or held to ethical standards is both a problem and a blessing. An area that needs further research is how the rules of social media will be established and how they will be embraced by the next generation of social media users, both in crises and times that are more peaceful.

A further study of the use of social media in politics post-uprising could investigate the role of social networking in establishing new political parties or civil society groups, a process that has proven itself the main obstacle to protesters gaining political legitimacy.

While it is established that the social media strengthen a political movement and bring social change it is still unclear whether social media is more empowering to leadership or the supporters of a movement. This is a research area that needs further investigation.

While the number of social media users is increasing still, there is a large number of people who don't use social media. If social media becomes the only successful mechanism to cause social change, what happens to those who do not have access to social media? This question is very important for future uses of social media in politics and needs further investigation.

Another area that needs to be researched is the relative preference of cyber activism and conventional political activism in bringing the social and political change. Should we consider cyber-activism a lesser/inferior form of activism, compared to physical on-the-street type of political activism? The answer to this question is crucial for the future role of social media as a political and social change agent.

CONCLUSION

The advent of technology and the rise of social media are changing the political landscape around the world. Social media is empowering citizens to voice their opinions, participate in the political process, and allowing some governments to engage with citizens in a more responsive and interactive manner.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The role and power of social media in political and social change is just beginning. Social media has the potential to transform national political processes, to foster greater engagement with Governments, to develop new forms of enhanced transparency, democracy and accountability and usher in an era of political change.

The debate over whether or not the emergence of social media has changed the way people communicate for political and social change has received heightened attention.

This chapter examined use of social media in several recent cases that received worldwide attention. By analyzing the way the activists utilized the tools of social media through established theories of communication, one can see how the inherent characteristics of social media and the Internet were able to foster the necessary requirements for collective action. However, despite its success in organizing the uprisings, it would seem from the current situation in various cases that social media has been less useful in translating the needs and demands of protesters into political reality.

Several key issues related to the use and role of social media for political and social change were discussed. Though there is a range of opinion as to how influential social media was in generating political mobilization in various Internet-led political movements, it is argued that its main roles were in providing an organizational infrastructure, as a form of alternative press, and as generating awareness both domestically and internationally of the ongoing revolution. Social media tools are often personified, but for political and social change to occur there must be people behind the tools.

Social media can increase world awareness of an issue and allows people to help each other regardless of location. Social media can help start the change process but to make change happen is a task much harder than imagined. When analyzing the role of Internet in political activism it is important to know what the history tells us. A review of history tells us that behind any political activism there have always been people willing to decide that its time to stand up to the powers and publicly voice the dissent despite risk of imprisonment, death or torture. Protests, when effective, are the end of a process, rather than a replacement for it. Political freedom has to be accompanied by a society literate enough and densely connected enough to discuss the issues presented to the public. The cyber-verse gives no side a decisive, unassailable advantage. For groups that have felt powerless against repressive regimes, social media's technological leveling of the political playing field provides one of the most important components of any successful revolution – hope.

The founders of Facebook, Twitter, and YouTube did not create their products with the intent of starting revolutions and ousting repressive regimes. They probably never thought of playing a role in the revolution by providing their products as vehicles for change. The people behind the revolution were the ones that initiated the idea of revolution and chose their tools / medium of communication for the revolution. Irrespective of the choice of tools/medium of communication, the ultimate strength of a movement is determined by the will for activism.

For all that it does, social media is no "silver bullet" when it comes to political and social change. The use of social media tools does not have a single predetermined outcome. Therefore, attempts to outline their effects on political and social action are too often reduced to conflicting anecdotes. Social media has limited impact at best on an important factor affecting nascent revolutions – a regime's willingness to use force to squelch protests.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

A way forward for the Internet-led movements for political and social change in repressive regimes is to gain influence to the extent that they are able to avoid the scrutiny and controls of the state. A challenge for improving their prospects in closed societies that must rely on decentralized networks is to adapt, emulate, and transfer the benefits of highly organized civil society groups. It is important because in repressive regimes bottom-up decentralized organizing is more likely to survive.

Chapter 65
Current Trends of Education and Social Change in Balochistan:
A Sociological Analysis

Naveeda Erum
University of Balochistan, Pakistan

Naima Saeed
University of Karachi, Pakistan

Tansif Ur Rehman
University of Karachi, Pakistan

ABSTRACT

This article focuses on the current trends of education and social change in Balochistan. This article aims to point out the issues related to globalization and geopolitical changes around the region. Balochistan is the most backward area in terms of social development in Pakistan, as it has tribal societies. The political turmoil and war in Afghanistan has been present since 1979, and has brought refugees and donor agencies into the province. This article highlights the important of understanding the impact of social change in Balochistan. The modes of employment and economic activities have witnessed major changes. Education has played a crucial role in bringing about social change in Balochistan, as it is evident in many ways in the context of employment patterns. A large number of people are now in jobs which required a certain level of education, when compared to three decades ago. It is vital to understand the very dynamics of social change at this crucial juncture, when rapid social changes are taking place.

INTRODUCTION

A sociological analysis of current trends of education and social change in Balochistan demands consideration of different aspects. The province of Balochistan presents an interesting scenario in the context of geography, population, urbanization, and social structure, as these factors influence the process of social change. The present study covers the salient sociocultural features of Balochistan and the current trends of education as well as social change in Balochistan.

GEOGRAPHICAL FEATURES OF BALOCHISTAN

Balochistan is the largest province of Pakistan in terms of geographical area, and the smallest in terms of population. It is spread over an area of 347,190 km^2, i.e., almost 44% of Pakistan's total area. The population of the province is approximately 33.16 million, while Pakistan's population exceeds 200 million (World Factbook - CIA, 2017).

The four geographical characteristics of the province are:

1. Upper highlands
2. Lower highlands
3. Plains
4. Deserts

The upper highlands are in the central and east-central part of the province. The lower highlands include the Sulaiman range in the east, Kirthar and Pab ranges in the south, and Chagai, Kharan, and Makran ranges in the west (Hughes, 2002).

The geographical pattern of the province has direct bearing on the communication system of the respective province as well as social change. About 35% of an entire network of national highways of Pakistan pass through Balochistan (Dehwar, 1994).

The total black topped roads in the province are 2148 kilometers, and single roads are 17098 kilometers. The province has huge potential for development of fisheries, tourism and seaports (Hussain, 2007). The location of Balochistan serves as a hub in the communication system, as it provides ample opportunities and potential for the social change and educational development. Balochistan is the most thinly populated province (Khalid, 2005).

SOCIO-CULTURAL, ETHNIC AND RELIGIOUS DIVERSITY IN BALOCHISTAN

The three major ethnic groups of people live in different regions of the province. These groups are, Baloch (46%), Pashtun (42%), Brahui (21%), the remaining 12% comprises of Brahui, Hazara, Punjabi, Sindhi, and other settlers like Turkmens and Uzbeks. In Balochistan, the Hindu portion of the population is small. They are found only in larger towns and seaports. Their numbers are said to be greater in Qalat (Hughes, 2002).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In Balochistan multi-cultural groups are settled. In urban areas, mode of living varies from group to group and the living standard is also different between affluent classes. In the rural areas, living style is very much traditional (Chaudhry, 2006).

The major groups of Balochistan are divided into various tribes, clans, lineages, and sub-lineage. The tribe is headed by the chief of the tribe, called 'Sardar' (Jahangir, 1999). The social organization in tribal system is a kinship. It is a major institution which provides identity and socialization to its members. Tribal system is very effective in providing leadership and in resolving disputes between people in 'Jirga', which is a traditional assembly of leaders that make decisions by consensus. Jirga executes different functions, as it controls all of the related matters of social life (Khalid, 2005).

Occupational Trends

Most of the rural population is dependent for their livelihood on agriculture, rearing animals and transport. Afghan and Baloch farmers cultivate their own land. However, the Brahuis prefer to spend a pastoral life. Women perform household duties and also participate almost in all occupations with males. They have to take the flocks to graze, groom their husband's horse and help in the cultivation process. Social change is defined as, "a process responsive to many types of change, to change in the manmade condition of living, to change in the attitudes and beliefs of man and to changes that go beyond human control to the biological and physical nature of things" (McMichael, 2008).

It relates to the changes in social aspects within the society and society is a network of reciprocal social relationship. Thus, social change is the change in the social relationships. It is often used as a term used to explain deviation or alteration of features of social development, patterns, interactions, and organizations. In brief, social change is a method by which change takes place in the structure and function of a social system (Weinstein, 1997). While, Baloch tribes are spread all over Balochistan.

Social System

Balochistan has a pattern of tribal societies. Most tribes are settled in geographically defined areas. The name of the province is derived from the Baloch tribe, literally meaning 'the land of Baloch' (Sabri, 1994). Tribal people of Balochistan are called Balochis, Brahuis, and Pashtuns. Balochis and Brahuis speak different languages, but most of their words are common. They are culturally and socially so close that it is very difficult to differentiate amongst them. The majority of Brahui tribes are settled in district Qalat (Kausar, 1999).

Family System

Traditionally, families were large and joint family system is still common in Balochistan. Migration from rural to urban areas and the economic expansion in urban areas has brought about change in the family system as the nuclear type of family is now becoming more common.

Status of Women

The participation of women in the process of development cannot be denied in Balochistan. The role of women is different in both rural and urban areas. The rural women, due to social and cultural barriers,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

cannot take part in most of the social affairs. Their tasks are confined to household responsibilities, handicraft, poultry, cattle rearing, and sewing. While, some of them help their mates in the fields. To an extent, the role of urban women in Balochistan is also increasing (Achakzai, 1998).

FACTORS INFLUENCING ON SOCIAL CHANGE IN BALOCHISTAN

Biological Factors

These factors have an indirect influence on social change. The biological process indicates the numbers and the composition of the population and heredity. The qualitative aspect of the population is based upon the powerful men and their birth, which to a large extent is subject to the heredity and mutation. The size and nature of population is different from the socially determined conditions. The respective size of population and the economic conditions are interdependent. Increase in population affect the standard of living and motivates the change of attitude (Giddens, 2009).

The change in the quality and size of population has a great effect on the social change. The social organization, customs, traditions, institutions, and associations affect upon social relationship (Henslin, 1995). The size of population also affects economic institutions and association, marriage, family and the condition of women. Whereas, the birth and death rates also influence the process of social change. War is also a cause of social change, because it influences the population, economic situation and the ratio of males to females (Shahid & Rehman, 2008).

Technological Factors

Technology refers to artificial means of extending human abilities (Henslin, 2014). It has a great influence on social change. First, technology changes society by changing the environment. It is an aspect of material change. Technology leads to change and modification in the customs and social institutions. Material change in the society is a result of development and invention of new technology. For example, electricity, machines for production, means of transport, communication and various other mechanical appliances in everyday life influence the process of change (Marlow & John, 1998).

Social institutions like family and marriage system also have a great effect on the technological development. In the modern era technology is a major cause of social change (Robertson, 1987).

Information technology helps to store, retrieve and analyze the vast amount of information. In brief, technological factors cause rapid changes in the society. Use of mobile phone and desktop computers has increased the pace of change (Henslin, 2014).

Cultural Factors

Culture refers to the gestures, language, beliefs, values, norms, folkways, sanctions, mores, and material objects of an individual and society (Lindsey & Stephen, 2000). Norms, values, beliefs, and performance of a culture are likely to act in unison. Changes in one area of the culture provoke changes in other areas (Feigelman, 1993). Culture accepts changes provided it is well-suited to the existing norms and values. Culture by its very nature is prone to undergo change.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In one aspect culture is valuation; in another, it is an expression. Culture also gives a great boost to adjust to the environment. Normally, changes in culture record gap between real and ideal culture, high and popular culture, dominant and subculture (Robertson, 1987). Cultural change is unavoidable. It is caused by discovery, invention as well as diffusion. Changes in the material culture are more quickly established than changes in nonmaterial culture (Bryjak & Soroka, 1996).

Religious Factors

Religion is a belief, a supernatural power which distinguishes between right and wrong and also provides answers to some of life's ultimate problems (Rogers & Burdge, 1992). Religion is cultural universal, as every society has its own form of religion and culture. People resort to religion, superstition, magic, and other no empirical explanations, when rational and scientific approaches fail to solve problems. The basic social values and attitudes are determined by religion. It develops a sense of loyalty and hard work among the people. Ethics determined by religion, help to develop humanity, cooperation, responsibility, and citizenship among the members of a society.

In Emile Durkheim's view, "Most important functions of religion are, maintain social solidarity; providing meaningful answer to ultimate questions; reinforce social control; and offering psychological support to the individual in crises."

Karl Marx viewed religion as an element that causes social conflict between different groups. While, Max Weber perceived religion to have an influence on social change and as a potential force in different societies. Religion also plays a significant role in economic development (Robertson, 1987).

Social Institutions

Social institutions like family and education play essential functions in a society (Rogers & Burdge, 1992). Institutions develop gradually from the social life of people. Social institutions are normally unplanned, conventional and interdependent. They develop gradually on the demand of the society (Manning, 1992).

Every institution plays its own role in society. Family institution works for nurturing of children. Economic institutions produce and distribute goods and direct the flow of capital to the needed areas. Education trains and educates the young. All institutions are interrelated and interdependent. A change in one institution forces changes in others.

Marx argued that economic change motivates religious change. Weber's viewed that religious change motivates economic change (Turner, 1994). Most of the scholars are of the view that economic institutions have a paramount influence. Changes and development in the family and educational institutions also depend on the changes and development of economy. However, science and technology are independent means of change (Isaak, 1995).

EDUCATION AND SOCIAL CHANGE

There are four factors that play a crucial function in the attainment of education. These are: biological factors, cultural factors, religious factors, educational factors.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Biological Factors

Biological features are important in the educational performance of a child. In the biological factor two respective features, i.e., mental and physical features. It is said, that some children are intelligent by birth. It may be proved by their performance in the normal life. Quick response, capacity for learning, reasoning, and many other acts proof their ability is different than other kids.

According to Robert Plomin (2017) deputy director of the MRC Social, Genetic and Developmental Psychiatry Center at King's College London, there is an IQ gene which is passed on from parents.

While, physical abnormality is another barrier in the performance and achievements of a child. Physically abnormal child is not always mentally retarded. Mostly, special children have very keen and sharp IQ.

Cultural Factors

The cultural background plays very important role in the children's educational attainment. It is culture that leads people, as it stresses on the need and importance of education to children. It develops attitudes, beliefs and expectations about the school. Child performance depends upon the interest of the parents. The lifestyle or living standard of the family also depends on the child's education (Karp & William, 1993).

The social class with which an individual belongs reflect the behavior and performance in school. The educated environment of the society boosts the morale of a child towards education. The system of education also contrasts in culture. There is a great difference in terms of linguistics in education. In rural culture the difference of linguistic affects the child's performance to a great extent (Steiner, 1997).

Religious Factors

Islam is the dominant religion in Balochistan and majority of the Muslims belong to the 'Sunni' sect. There is also an effect of religion on the educational attainment. Influence of religion and religious education have also an effect on the development of society. The emphasis on education in Islam is seen very clearly as mentioned in 'Quran' and 'Hadis'. The very first revealed word in the Quran is 'iqra' meaning 'to read'. "Read: In the name of thy Lord who createth… Read: And thy Lord is the most bounteous. Who teacheth by the pen. Teacheth man that which he knew not" (Quran, Surah 96).

Knowledge comes through education and Islam laid emphasis on the role of education in these words, "The seeking of knowledge is obligatory for every Muslim" (Al-Termezi, Hadis 74). "Acquire knowledge and impart it to the people" (Al-Termezi, Hadis 107). These Hadis implies that there is no gender difference for seeking education as knowledge and its significance for the society (Baloch, 2003).

Educational Factors

In educational achievement, the role of school is also important. The infrastructure of the school, rules and regulations prevailing reflects the children performance (Coleman et al., 1996). The environment of the school and the student-teacher relationship replicate the pattern of behavior of the pupil. The classroom interaction between students with their teacher and the class fellow build-up the personality of students.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ROLE OF EDUCATION IN SOCIAL CHANGE

According to Malik (1991), the three major roles of education that exist in an educational system and serve as its signposts are:

1. The role transmission;
2. The role of adjustment;
3. The role of creation.

1. The Role of Transmission

The role which marked the beginning was that of the transmission. It passes onto the living generation. This role of education is of the nature of preservation of the past. It is the linking of the past with the present and making it a part of the present. The emphasis lies, however, on the aspects of the past. It might create an attitude of nostalgia, of the millennium that once existed, of the good things that are now non-existent. Educational theory and practice throughout the ages have accepted this role of education.

2. The Role of Adjustment

It is very true that the present owes its existence to the past. However, the point to note is that it is not a mere past which exists in the present. The issue is how much of it should become a part of history. Hence, this dilemma besets all ages. As the present grows more attractive in the eyes of people, its claims progress and advancement. The stress comes to lie on progressivism in education rather than mere essentialism based on the past.

The adaptation is distinct from the old role of adoption. The rival claims of the past and present go back in history. The more the educators become engrossed in the ever-increasing demands of the present, the less importance is given to the past.

3. The Role of Creation

Nations do not live in the present, because they also keep an eye on their future. Their conceptions of most basic life values affect their present-day efforts to reform the present. In other words, the past, present and future all merge together in the present day educational system of any country. The role of creation which is of quite recent origin, thus comes into play to reconstruct the future. This role of education can be envisioned if all the needs of the present stand satisfied. If the education for adaption is lacking comprehensiveness and role of future reconstruction cannot be profitably undertaken. It is only on the basis of the techniques of innovation and changes learnt in the present, that any attempt for the creative role of education becomes possible.

THEORETICAL BACKGROUND OF SOCIAL CHANGE

According to evolutionary theorists, all societies have the regular direction of social change through a chain of stages. These are from the initial to final stage of development. When the final stage is reached

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the evolutionary change ends (Horton & Hunt, 2004). Evolutionary theory asserts that, societies observe change from simple or initial to modern or technological phase. The process goes through many stages. Every stage has some fixed intervals. In each stage, different elements join together in an incorporated system. Many theorists have their own views about the evolutionary theory. Some of the respective notions are discussed here.

Auguste Comte (1798-1857) pointed out that society has passed through the stages namely; theological, metaphysical and positive or scientific. In the theological stage, society believed in super-natural powers and accepted the idea that these powers control social behavior. During the second stage, the ideas about supernatural power changes. The gods become an abstraction. In the positivistic or scientific stage, everything is seen by scientific laws, and the contemporary society is currently in the third stage (Giddens, 2009).

According to Herbert Spencer (1820-1903), society is originally militant and requires a struggle for existence. The militant society then passes into industrialism and at this stage there is a differentiation. Later, this differentiation changes to interrogation. The respective process is the struggle from a simple tribal group to a complex modern society.

Karl Marx's Theory (1813-1883) is considered as a theory of conflict perspective. However, this theory is evolutionary in its very nature. The Conflict perspective sees change as the result of a conflict. Change is taken to be continuous, as long conflict lasts. New groups and classes are produced by changing interests. Marx blamed the class conflict as the reason for change in society. According to him, "The most dramatic social changes occur through absolute violence" (Collins, 1990).

In cyclical theories of social change, society changes in different stages similar to evolutionary theories. These changes start and cover the initial process of growth and development. After decline, new changes are initiated. According to Oswald Spengler (1880-1936) each great civilization passes through successive stages of birth, growth and decline. The complete cycle takes thousands of years.

According to Pitirim Alexandrovich Sorokin (1889-1968) all great civilizations experience an endless cycle of three cultural changes:

1. The ideational culture, with supernatural belief and values;
2. The idealistic culture, with a blend of supernatural beliefs and evidence-based rationality;
3. The sensate culture, in this, the sensations is the test of reality and the goal of life.

According to the Functionalist perspective, change is a constant process. Changes disrupt the equilibrium of society, until the change is integrated into the culture. Changes which are considered useful are accepted and useless changes are rejected. Functionalist emphasizes social order, rather than social change. They focus on the functions of the social phenomenon in maintaining the social system as a whole.

Talcott Parsons (1902-1979) opined that social change is a process by which social equilibrium is altered and results in new equilibrium. Social change takes place when internal or external strain imbalance the system. It irritates adjustment to bring back the balance. Thus, new social arrangements and new culture components became possible. The institutions have several functions in the societies. When societies became more complexes, the segregation takes place. It is needed to maintain the equilibrium. The components are integrated with one another, and results in a changed system (Robertson, 1987).

RESEARCH METHODOLOGY

The respective research defies a simple and direct methodology of research, i.e., the secondary analysis methodology was adopted. It involved utilizing qualitative data by other scholars. This methodology provided with the advantage of saving time as well as financial resources. The disadvantages of the secondary and content analysis of other studies were to a degree, offset by reliance on the data cited by eminent scholars.

ANALYSIS OF THE LITERATURE REVIEW

The province of Balochistan presents an interesting scenario in the context of geography, population, urbanization, and social structure, as these factors influence the process of social change. It is the largest province of Pakistan in terms of geographical area, and the smallest in terms of population and has a settlement of multi-cultural groups. The major groups of Balochistan are divided into various tribes, clans, lineages, and sub-lineage. Balochistan has a pattern of tribal societies. Most tribes are settled in geographically defined areas. Traditionally, families were large and the joint family system is still common in Balochistan.

Most of the rural population is dependent for their livelihood on agriculture, rearing animals and transport. Women perform household duties and also participate almost in all occupations with males. Their tasks are confined to household responsibilities, handicraft, poultry, cattle rearing, and sewing.

The change in the quality and size of the population has a great effect on the social change. The size of the population also affects economic institutions and association, marriage, family and the condition of women. Whereas, the birth and death rates also influence the process of social change. Technology leads to change and modification in the customs and social institutions. Material change in the society is a result of development and invention of new technology.

Social institutions like family and marriage system also have a great effect on the technological development. In the modern era technology is a major cause of social change. Culture by its very nature is prone to undergo change. In one aspect culture is valuation; in another, it is an expression. Culture also gives a great boost to adjust to the environment.

People resort to religion, superstition, magic, and other no empirical explanations, when rational and scientific approaches fail to solve problems. The basic social values and attitudes are determined by religion. It develops a sense of loyalty and hard work among the people. Ethics determined by religion, help to develop humanity, cooperation, responsibility, and citizenship among the members of a society.

Institutions develop gradually from the social life of people. Social institutions are normally unplanned, conventional and interdependent. They develop gradually on the demand of the society. All institutions are interrelated and interdependent. A change in one institution forces changes in others.

There are four factors that play a crucial function in the attainment of education. These are: biological factors, cultural factors, religious factors, educational factors. While, the three major roles of education are, the role transmission, the role of adjustment, the role of creation.

According to evolutionary theorists, all societies have the regular direction of social change through a chain of stages. These are from the initial to the final stage of development. When the final stage is reached the evolutionary change ends.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Auguste Comte pointed out that society has passed through the stages namely; theological, metaphysical and positive or scientific. Herbert Spencer believed that society is originally militant and requires a struggle for existence. Karl Marx's conflict perspective sees change as the result of a conflict.

In cyclical theories of social change, society changes in different stages similar to evolutionary theories. Oswald Spengler stated that each great civilization passes through successive stages of birth, growth and decline. Pitirim Alexandrovich Sorokin inferred that all great civilizations experience an endless cycle of various cultural changes.

Functionalist perspective stress that change is a constant process. Talcott Parsons opined that social change is a process by which social equilibrium is altered and results in new equilibrium. Social change takes place when internal or external strain imbalance the system.

Recommendations

1. Community elders, religious scholars as well as community based organizations (CBOs) along with NGOs/INGOs can help in resolving the respective issues;
2. Educators, family members, curriculum designers and society at large should focus on motivating the students for utilizing their skills with confidence;
3. Government should facilitate agriculture, so that the people of the community are able to cultivate different crops for a healthy as well as sustainable environment;
4. Implementation of laws regarding the upheaval of the Baloch should be ensured at all possible levels;
5. Industries in a particular area should be built, so that it could help to reduce the poverty and unemployment of the respective communities;
6. International organizations and UN specialized agencies should assist Balochistan to lead it towards development;
7. National curriculum needs an exhaustive revision regarding the promotion of technology in a much effective manner;
8. Proper socialization by parents can help a lot in this sphere;
9. Respect as well as the dignity of the locals must be maintained with due regard to religious and cultural context;
10. Special attention must be paid towards children and women's rights in Balochistan;
11. State-run institutions should be equipped with libraries and other aids that facilitate the teachers and students to learn in a favorable environment;
12. The government must take concrete initiatives for the betterment of the masses and it should also ensure full participation of the respective people in all spheres of social life by providing them with equal opportunities;
13. The media should portray the significant role of women in the progress of Pakistan, and it should highlight the problems faced by Baloch women;
14. The women should also be given their due share in family property which may enhance their socioeconomic status;
15. The women should also be given equal rights to get proper education and be allowed to marry according to their choice;
16. Religious figures should also play their pertinent role as religion has a significant role in Pakistani society;

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

17. Youth's participation in social activities as well as workshops can also help a lot in this sphere;
18. Further researches should be conducted by concerned authorities which will help in judging the needs of the population that needs to be facilitated and should also focus on techniques as well as strategies to minimize the respective issues of inferiority in the context of Balochistan.

CONCLUSION

Education plays a vital role in the growth and development of an individual in the society. There exists a reciprocal relationship between social change and education. Social change is a motivating force for education and education itself is a motivating force for social change (Cox, Geisen, & Green, 2008).

It is because of change that new reforms in education are seen in the present system of education. Science and new technology have a marvelous worth in bringing about change in society. Education as a single element, educates the people. The citizens pursue the rules and regulations of the new era. Education helps to provide appropriate skills to the workers. The public awareness of change is the result of awareness among the educated. Education provides magnificent solutions for social problems (Tiene & Albert, 2001). In the case of Balochistan, this relationship seems lacking.

There is also a direct relationship between education and the economic system. In terms of functional perspective, improved structure of education helps in the development of the economic system (Sodhi, 1985). Social mobility develops due to improved educational system, as it also changes the class structure. Personal development of an individual is possible through education. Personal development encourages individuals to exhibit their inner talent. It guarantees harmony and order in society. The principle of merit and self-help bring in changes as a consequence of hard work. Cultural deprivation often causes failure of individual and poor socialization. In brief, education has a solid worth to overcome these difficulties (Turner, 1994).

Chapter 66
Women in Development Mobilize Grassroots Enterprises to Reduce Household Poverty

Ladislaus M. Semali
Pennsylvania State University, USA

ABSTRACT

This study examines the roles African women played in reducing household poverty through local enterprises that resulted in feeding their families, sending their children to school and contributing to community development. Their determination was to implement and invest in self-help enterprises in order to counter the incidence of household poverty and eventually bring about social change. A literature review section distinguishes theoretical from empirical approaches to study poverty and leads this study to some important conclusions. The results paint a picture that explains a world in which women live in poverty as they face gross inequalities and injustices from birth to death—from poor education, poor nutrition, vulnerable and low-pay employment, and acts of discrimination that women are likely to suffer throughout their entire life.

INTRODUCTION

Mobilizing women in poverty reduction projects in East Africa is part of a United Nations (UN) global ongoing agenda which has the broadest consensus by the international community (Noel, 2006; United Nations, 2012). Recent UN reports indicate that extreme poverty rates have fallen in every developing region. The UN claims that globally, the Millennium Development Goals MDGs) targets on the proportion of people living in extreme poverty has been met five years ahead of the target date. About 700 million fewer people lived in extreme poverty conditions in 2010 than in 1990 (United Nations, 2015a). Poverty rates and number of people living in extreme poverty fell in every developing region—including in sub-Saharan Africa, where rates are highest. The proportion of people living on less than $1.25 a day fell from 47 per cent in 1990 to 24 per cent in 2008—a reduction from over 2 billion to less than 1.4 billion (United Nations, 2010). Despite this impressive accomplishment at the global level, 1.2 billion people still live in extreme poverty.

In East Africa, and Tanzania in particular, these positive trends are visible particularly in urban areas but less observable in rural areas where most women live; and where 80% of the population is engaged in agriculture, a sector in which the incidence of poverty has only decreased by 1.3% — from 38.7% to 37.4% (Mashindano, 2009; Osberg, & Bandara, 2012). The underlying explanation for this difference between rural and urban populations seems to be the slow growth in agriculture, on which most rural poor make a living. Because agriculture is the main livelihood for many people and contributes to a quarter of the GDP, the development of agriculture becomes essential for the pursuit to reduce poverty in Tanzania.

During 2001–2007, agricultural output in Tanzania grew only by 4.5 per cent per year compared to the 9.4% annual growth in industry and 7.7% growth in services (Osberg, & Bandara, 2012). The mining and construction sub-sectors in the industrial sector grew more rapidly at 15.2% and 10.8%, respectively. The end result is that in Tanzania, agriculture's share of GDP dropped from 30.6% in 2001 to 26.2% in 2007 (Bagachwa, 1994, and declined further to 25.6 per cent in 2008 (Bank of Tanzania, 2010).

For this reason, policy-makers reckon the "poverty reduction movement" as the most important goal of development policy for a nation with goals to eradicate extreme poverty by 2025 (United Republic of Tanzania, 2005). Consequently, efforts to generate data and develop definitions of poverty are believed to be critical to policy-makers because they allow the measurement of changes in poverty over time, comparisons across space, and the identification of poor households or individuals targeted in poverty-alleviation programs (Bagachwa, 1994; Cooksey, 1994; REPOA, 2005).

This article presents a story of *Jitahidi* women entrepreneurs in Tanzania and explains how these women overcame household poverty at the micro level. The task was to establish grassroots cooperative business activities for women with assistance from microfinancing institutions. *Jitahidi* is a Kiswahili name coined to represent women's efforts that support poverty reduction and development. Simply put, *Jitahidi* is an expression that signifies a local metaphor that reflects the 'pulling up oneself by the bootstraps' or 'to improve or succeed by one's own efforts.' This metaphor represents the story of grassroots initiatives taken by women entrepreneurs poised to harness the collective power of local women in the region. Their determination was to implement and invest in self-help enterprises in order to address the incidence of household poverty and eventually bring about social change.

Through this case, the study examines the invisible but vital roles African women play in reducing household poverty through local enterprises that result in feeding their families, sending their children to school and contributing to community development. Analysis of the women's story reveals a tacit but cogent argument that women's economic enterprises are part of the global project to reduce poverty; and women entrepreneurs, though not recognized, are a great resource in Sub-Saharan Africa region (Hallyward-Driemeir, 2013). The theme that runs throughout the narrative on *Jitahidi* Women's enterprises is about aspirations and desire to address incidences of poverty and social change in order to overcome gender discrimination, socio-economic inequalities and gender oppression—for example, domestic violence (Jagire, 2014).

A study of development issues of African women requires a multifaceted approach and it is an involved task to address them. To disentangle some of the problems in view of the *Jitahidi* women's collective effort of reducing household poverty in the region is complex and intricate, especially because of the limited availability of reliable data on many non-income achievements, particularly for cross-country comparisons (Birdsall, & Londono, 1997). Previous studies that analyzed the status and trends of poverty focused on the incidence of poverty measurement (Ravallion, 2001). Studies in various disciplines such as women's studies (Namabira & Kamanzi, 2013), women's cooperatives (Kamanzi, 2010), women in agriculture (Longwe, 1990), gender studies (Malhotra, Schulte, Patel, & Petesch, 2009)), and sociology

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Kamanzi, 2012), tackled these issues and continue to strengthen whatever arguments are proffered in relation to these pertinent problems. However, poverty as experienced from women's point of view has not been a subject of social science in Tanzania.

Cooksey (1994) and Longwe, (1990) reviewed the research on poverty. Both cite the Cornell study, which shows that the extent of poverty is more widespread in rural Tanzania than in urban Tanzania. If the poverty line is set as the income required to be able to consume 2100 calories daily plus a set of other basic needs, then 58% of the rural population is poor but only 29% of the urban. Perhaps taking 2000 calories per day as the minimum requirement puts well over half the rural households below the poverty line.

For example, according to Cooksey, an annual income of Tshs. 27721 a year per adult equivalent defines this limit in monetary terms. Likewise, just over a quarter of the population of Dar es Salaam falls below the annual income limit of Tshs. 54,950 required to secure the same level of calorific intake in the city and about a third of the population in other cities. In income terms, the poverty line in Dar es Salaam therefore is twice that of the rural areas. Overall, the poor consume only 1654 calories per adult equivalent a day, compared with impressive calories for the non-poor (Cooksey, 1994, p. 59).

Concurrently, this article draws insights already posited in some of the referenced previous studies, largely by the World Bank on poverty reduction and from the case study of *Jitahidi* Women's Cooperative (JCW) in Northern Tanzania (Cammack, 2004; World Bank, 1990). Today's advocates, educators, policymakers, researchers and theorists are grappling with new and changing understandings of the causes of poverty, and priorities to overcome it (Bagachwa, 1994; United Republic of Tanzania, 2005). More importantly, the term "poverty" has gained many meanings, suggesting diverse, and sometimes, conflicting priorities for action. In common usage, however, is the distinction made between economic or financial poverty, relative poverty and extreme poverty. First, economic poverty refers primarily to financial poverty that reflects insufficient incomes or per capita consumption (Carter, & Barrett, 2006; (Ravallion, 2001). Second, relative poverty (meaning subjectively experienced poverty) is a potentially crucial determinant of social behavior, including political identity, organization and action (Cooskey, 1994; Foster, 1998).

Third, researchers take extreme poverty or absolute poverty line as the income required to meet a minimum calorific consumption level (Cooskey, 1994; Foster, 1998). The definition includes a basic basket of consumer goods which is larger for urban than rural areas. Individuals and households falling below this minimum level are considered to have chronically or acutely inadequate diets, and are defined as absolutely poor. At the extreme, insufficient food leads to ill-health, indigence, starvation and ultimately death (Cooskey, 1994). In recent years, Tanzania has not had to deal with absolute or extreme of poverty on a significant level. However, the drought years of 1978-1980 caused crop failures which in turn brought populations in rural areas to the brink of poverty, making it necessary to import and distribute to the masses tons of food aid.

Other scholars in recent reports advocate for a more broad-based definition of poverty that is not solely based on financial or calorific resources (e.g. Smeeding, 1997; Dreze and Sen, 1989). Individual reports have contributed to the human development debate by focusing on and exploring in some details; with emphasis on selected themes such as people's participation (Sugar, & Najam, 1998); gender–UNDP index (Bardhan, & Klasen, 1999)., and poverty index—UNDP (Ravallion, 1997).

For example, references to extreme poverty partly seem to rely on work by Rawls, Sen, and others who emphasize that poverty should be seen in relation to the lack of important "basic goods" (Rawls, 2001) or "basic capabilities" (Sen, 1976; 2005) some of which cannot be purchased with money since

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

they are under-provided in a market economy system. Financial resources, Rawls and Sen contend, are just one of several means to achieve well-being and therefore, efforts should be directed at measuring well-being outcomes directly, rather than focus on one or more of its imperfect proxies. These two perspectives provide a basic understanding of poverty that situates the discussion of grassroots efforts in household poverty reduction.

The article begins with tentative reactions concerning the definition of poverty and the challenges *Jitahidi* women faced while addressing the plight of household poverty. The women's determination is testimony to the movement of women everywhere in development sweeping Sub-Saharan Africa and the impetus to design collective efforts to overcome the misery that poverty inflicts on the most vulnerable groups of society. A literature review section distinguishes theoretical from empirical approaches to study poverty and it leads this study to some important conclusions. A discussion of the implications of the case study is followed by tentative conclusions. Data to support these conclusions were collected in East Africa from June 2009 to August 2012. The results paint a picture that explains a world in which women live in poverty as they face gross inequalities and injustices from birth to death—from poor education, poor nutrition, vulnerable and low pay employment, and to sequence of acts of discrimination that women are likely to suffer throughout their entire life.

POVERTY REDUCTION AND THE CONTEXT OF WOMEN IN DEVELOPMENT

Women make up half of the world's population (UN, 2005) and yet represent a staggering 70% of the world's poor (Vandemoortele, 2002). For the millions of women living in poverty, as it is for rural women in Tanzania, their lives are a litany of injustices, discrimination and obstacles that get in the way of achieving the basic needs of good health, safe childbirth, education and gainful employment. This is related to growing concerns among state and international agencies about women as a problem in production and reproduction (Mbilinyi, 1984). Extreme poverty has led to heightened concern about the political consequences of real declines in income, the high rates of malnutrition and infant and child mortality rates, and the deterioration of peasant agriculture combined with the breakdown of peasant family relations. Women became of pivotal concern in the effort to forestall revolution as well as to increase production of food and export crops, given their central role as food producers in the peasant sector, and as providers of nearly all other family needs in cash and in kind (Mbilinyi, 1984).

While awareness of the important role played by women in development might have increased in the post MDGs era, debates rage on regarding gender planning from *Women in Development* (WID) to *Gender and Development* (GAD). The distinction between WID and GAD is far from clear, as gender interests, like women themselves, are constantly changing and adapting in response to new opportunities, information, and environments (Brown, 2007). Brown argues that based on the experience of organized women in Dar es Salaam as well as elsewhere in Tanzania, WID programs are not only politically and practically easier to implement, they may actually address the priorities of poor women, who, when given the space and support to undertake their own assessments of their interests, can then start to transform gendered power relations in their families and communities.

The first United Nations Millennium Development Goal (MDG) of ending poverty and hunger illustrates the strategies of Women in Development as adopted by *Jitahidi* women. The eight MDGs – which range from halving extreme poverty rates to halting the spread of HIV/AIDS and providing universal primary education, all by the target date of 2015 – formed a blueprint agreed to by all the world's countries

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and all the world's leading development institutions. As a signatory to this commitment, the Tanzania government has mobilized its institutions to implement the MDGs, as defined in the *National Strategy for Growth and Reduction of Poverty* (NSGRP), locally known as MKUKUTA—*Mkakati wa Kukuza Uchumi na Kupunguza Umasikini* (REPOA, 2005).

The plight and pain of poverty is felt mostly by women in Tanzania and throughout the world as a problem that affects the most vulnerable people in society, particularly women, children, and the disabled. These groups live in very poor circumstances – they lack the basic amenities of life, such as food, clothing, and permanent shelter. The global mobilization of poverty reduction strategy was initiated in 1999 by the World Bank and the International Monetary Fund (IMF) has to-date emerged as the landmark commitment entered into by world leaders in 2000 to "spare no effort to free our fellow men, women and children from the abject and dehumanizing conditions of extreme poverty" (United Nations, 2015b) and enabled people across the world to improve their lives and their future prospects. Such global vision was translated into eight Millennium Development Goals (MDGs). The first goal aimed to eradicate extreme poverty and hunger with the following set targets:

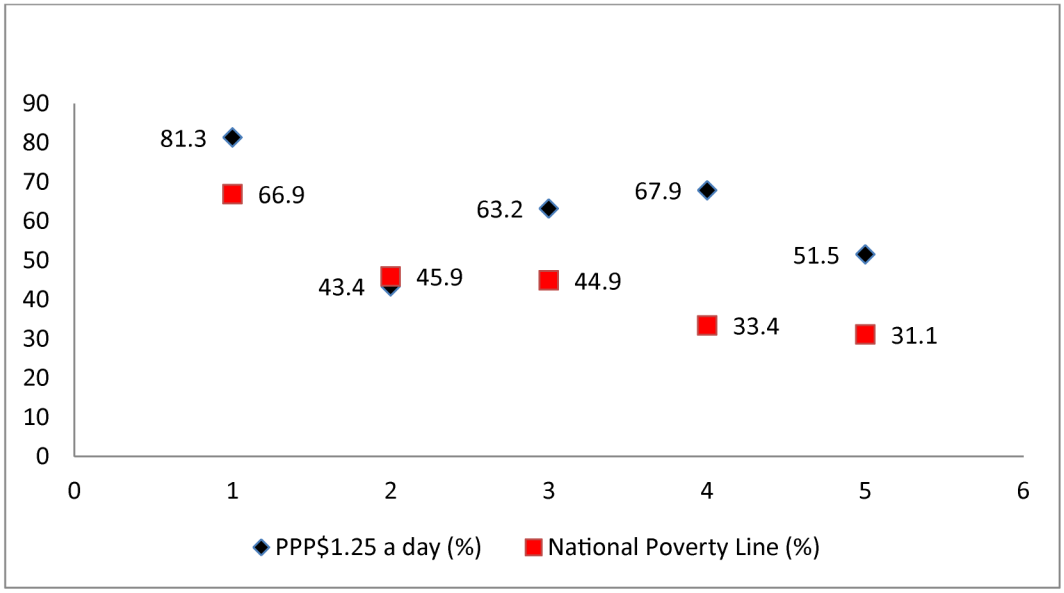
1. Halve, between 1990 and 2015, the proportion of people whose income is less than $1 a day;
2. Achieve full and productive employment and decent work for all, including women and young people;
3. Halve, between 1990 and 2015, the proportion of people who suffer from hunger.

The MDG goals have remained the overarching development framework for the world during the past 15 years. Current MDG's reports from global, regional, national and local efforts indicate that:

1. Extreme poverty has declined significantly over the last two decades. In 1990, nearly 50% of the population in the developing world lived on less than $1.25 a day; that proportion dropped to 14% in 2015. (United Nations, 2015b).
2. Globally, the number of people living in extreme poverty has declined by more than half, falling from 1.9 billion in 1990 to 836 million in 2015. Most progress occurred since 2000. (Extreme poverty is defined as average daily consumption of $1.25 or less and means living on the edge of subsistence).
3. The number of people in the working middle class—living on more than $4 a day—has almost tripled between 1991 and 2015. This group now makes up half the workforce in the developing regions, up from just 18 per cent in 1991.
4. The proportion of undernourished people in the developing regions has fallen by almost half since 1990, from 23.3 per cent in 1990–1992 to 12.9 per cent in 2014–2016 (United Nations, 2015b).

This report from International institutions' progress on poverty reduction contrasts with disappointing results in the real world. For example, the 2015 stark achievements as stated in in the 2015 UN report could hardly be said to reflect the lives of *Jitahidi* women in Tanzania. In 2001, poverty head count stood at 35.7% in Tanzania and declined marginally to 33.4% in 2007 (Hoogeveen and Ruhinduka, 2009). The situation in rural areas where the majority of the population lives is much worse as incidence of poverty has only decreased by 1.3%--from 38.7% to 37.4% (Mashindano, 2009). However, this small reduction of poverty reported in 2009 occurred during a period of impressive growth when GDP of Tanzania Mainland in 2007 was 51% higher in real terms than in 2001. Economists calculate that the growth currently

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



stands at 7 per cent (Agyei-Holmes, 2010; National Bureau of Statistics, 2009). The last development plan announced by president Kikwete before he left office, expects to raise the per capita income of Tanzanians from the current 350 to 650 US dollars by 2016 (Maijala, 2014).

Further, national reports pointed out that in developing regions, like Tanzania, children from the poorest 20 per cent of households are more than twice as likely to be stunted as those from the wealthiest 20 per cent. Children in the poorest households were four times as likely to be out of school as those in the richest households (Mashindano, 2009). Also, under-five mortality rates are almost twice as high for children in the poorest households as for children in the richest. In rural areas, only 56 per cent of births are attended by skilled health personnel, compared with 87 per cent in urban areas. About 16 per cent of the rural population do not use improved drinking water sources, compared to 4 per cent of the urban population. About 50 per cent of people living in rural areas lack improved sanitation facilities, compared to only 18 per cent of people in urban areas (World Bank, 2012).

Although life expectancy, school enrollment, and other indicators of social wellbeing have improved dramatically in Tanzania and across Africa and the developing world; and although the proportion of the poor has gradually declined in the last few decades, the absolute number of poor people in the world has actually increased. For example, about 1.3 billion people in less developed countries still subsist on less than $1 per day (UN, 2010). Figure 1 shows poverty levels in Tanzania compared to its neighbors: Burundi; Kenya; Rwanda; Uganda.

The common explanation for the discrepancy which is gaining credence among scholars is the proportionate contribution of the various sectors of the economy to growth, the weights given to various social and environmental parameters (which is subject to contestation) and the number of people engaged in those sectors (Mashindano, 2009; Kaplinsky, *et al*, 2009). Of the 80% of Tanzanians who live in rural

Figure 1. Populations in 2002-2011 below income poverty line (World Bank, 2011). 1. Burundi; 2. Kenya; 3. Rwanda; 4. Tanzania; 5. Uganda.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

areas, more than four fifths of them live in households where the main economic activity is agriculture. The economic boom in Tanzania today is being driven mainly by mining and tourism sectors, dominated by foreign investments with its associated capital flight (Mashindano, 2009; Atkinson and Lugo, 2010).

While relative progress was witnessed nationally, poverty continues nevertheless to be the fundamental theme and core of many development strategies. As a general observation, women in Tanzania as well as throughout Sub-Saharan Africa operate too often in the informal sector, in small farms, and in traditional sectors (e.g., agriculture and other miscellaneous domestic activities) as compared to their counterparts in the North countries (Agyei-Holmes, 2013). They are not fully able to realize their capabilities and potential (World Bank, 2009). Conversely, Tanzanian women, in particular, have invaluable knowledge in crop growing and management. They are also experts in environmental conservation whose beginnings or even impacts have not been solemnized, having been kept largely invisible in their society (Jagire, 2014; Wane, 2007).

Therefore, a persisting question is, 'Why do women lag behind in almost all sectors of the economy in Tanzania and elsewhere in Sub-Saharan Africa?' The women's invisibility must be "attributed to male privilege and power exercised over women as prevalent in Tanzanian society" like many other societies (Jagire, 2014, p. 165). From popular perspective, the widespread picture of the African rural woman is that of someone uneducated, under control of her spouse, resource-less and virtually powerless. Overcoming these inequalities and ensuring that women benefit from the current economic boom, requires that the needs and desires of women are not only taken into account, but are put front and center in policy statements.

Unfortunately, in other parts of Africa, with poverty that plagues the majority of rural women, comes the unspeakable misery that is inflicted on families and often aggravated by instances of catastrophic illness, war, national disasters (e.g., floods, drought, earthquakes, typhoons, hurricanes, or sandstorms) recession, or oppressive and corrupt government regimes. In recent years, since 2000, efforts of national governments, international organizations, humanitarian agencies, scores of non-governmental organizations (NGOs), and volunteers and most recently, the business community have mobilized and joined efforts to support the UN Millennium Development Goals to reduce the incidence of economic poverty.

Poverty Reduction and Microfinance Lending Institutions

The UN Millennium Development Goals spurred a flurry of financial institutions to engage women in poverty reduction. In Tanzania, for example, microfinance lending institutions (e.g., Savings and Credit Co-operative—SACCOS) have boosted women's economic enterprises in the country even though microfinance is still relatively new (Nkomolla, 2007). Established in 1995, mainly to link women and poverty alleviation, microfinance is widely recognized as a tool for poverty reduction (Sizya, 2001, Zeller & Manohar, 1998). With its increased use and publicity in Tanzania, following the 2001 implementation of the National Microfinance Policy, microfinance lending and borrowing has grown exponentially to involve four main microfinance institutions: (1) Foundation for International Community Assistance (FINCA), (2) Promotion of Rural Initiative & Development Enterprises (PRIDE), and (3) Small Enterprise Development Agency (SEDA) and (4) the Tanzania Postal Bank (ILO, 2005).

Also, Community Banks and small banks have taken interest in microfinancing, as well as many NGOs and non-profit organizations. Currently, Tanzania's national directory has at the service of poverty reduction a total of 8 banks, 45 Community Based Organizations (CBOs), 2 companies, 95 Government programs, 1,620 SACCOs, 48 Savings and Credit Associations (SACAs) and 62 NGOs (Agyei-Holmes,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2013; Dill, 2010). It turns out that in the past two decades, civil societies, social movements and more recently, microfinancing institutions have come to flourish, and in particular, through national governments, as they fulfilled their obligations in implementing the MDGs that ensure global human wellbeing.

In the confluence of the wide spread of financial institutions to assist poverty reduction, women entrepreneurs quickly became economically active. This phenomenon is not limited to Tanzania but it is a phenomenon in the Sub-Saharan Africa region where women have established income generating enterprises more than any other region (World Bank, 2011). Reports show that in most Sub-Saharan African countries, 80% of farming is done by African women with Indigenous knowledge passed from generation to generation also by women (Jagire, 2014). For example, women account for sustained increases in income, greater empowerment and social inclusion, health and caring for the elderly, education for children, mental health and happiness (Blattman, Green, Annan, and Jamison, 2013). In addition, women have a wealth of knowledge and expertise in farming and some status in social organization of families, where they have important roles as nutritionists, trainers and conservationists. "They (women) are the backbone of the agricultural economy in Tanzania" (Jagire, 2014: 165).

For these reasons, African women are reckoned as a great development resource of the community. Nearly 80% of food grown in African agricultural country, such as Tanzania, is done by women (Wane, 2007). The United Nations Development Program (UNDP) recognizes the roles women play in the community, and consequently, UNDP estimates that gender equality and women's empowerment are desirable byproducts of human development (UNDP, 2008). However, patriarchal and traditional practices with gender discrimination continue to hamper women's progress, and agricultural knowledge remains a "male" exclusive domain—men own the land, they make decisions about land use, determine what or when to grow on the land, and ultimately keep the money derived from the harvest, particularly proceeds from cash crops sales.

Attempts to Measure Incidents of Poverty by Key Indicators

Although Tanzania's policy-makers have been concerned with poverty and its eradication for many years, remarkably little is known about the nature, causes, incidence, and trajectory of poverty in the country. The micro case of *Jitahidi* women signifies gravity of the incidence of household poverty. The majority of Tanzanian women who live in rural areas spend an important fraction of their expenditures on staple food. They have little assets such as access to land, credit, high yield seeds, or pests control remedies. In their midst are farmers who lack education and face lots of interconnected, multidimensional obstacles that make it impossible to escape the poverty trap.

To provide an idea of the gravity of their plight, their expenses can be related to local currency. Though an imperfect example and using the December 2000 exchange rate of about Tsh. 1,000 to the US dollar, Tanzania's poverty line appears low: about 0.26 per adult equivalent. Such expressions can be deceptive; however, as the international poverty line is expressed in 1993 purchasing power parity (PPP) dollars. In sum, to express Tanzania's national poverty line of Tsh. 7,253 per adult equivalent per 28 days (December 2000 prices) in 1993 prices results in a poverty line of Tsh. 3,329 (Rahman, & Westley, 2001). Few empirical research studies have been conducted to chart out certain aspects of national patterns of poverty. For this reason, none of the recent major national studies attempt to locate poor people by region or district (See Bagachwa, 1994; REPOA, 2005). However, there is a general agreement that

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

poverty is more widespread in rural than in urban areas. Typically, income or expenditure comparisons between rural areas, Dar es Salaam and other urban areas show a greater incidence and depth of poverty in rural areas, with Da es Salaam showing the least.

Generally, the incidence of poverty is measured as a percentage of the population whose per capita consumption is below the poverty line, that is, the population that cannot afford the basic basket of goods—including all consumption that which is not bought on the market but produced for own consumption (Cooksey, 1994). The poverty gap is a measure of the amount relative to the poverty threshold. The severity of poverty is the total of the squared income shortfall (expressed in proportion to the poverty line) of families whose incomes are below the poverty threshold, divided by the total number of families. Severity of poverty happens to be a measure which is sensitive to the income distribution among poor—thus, the worse the distribution, the more severe is poverty. While the incidence of poverty is a key indicator, it is used to complement the depth and severity of poverty to see what happens to the poorest, especially if inequality is great.

Other attempts to measure poverty and deprivation in the broader sense have been undertaken but indices such as the Human Development Index (HDI), the Human Poverty Index (HPI) (UNDP, 1998), or the Physical Quality of Life Index—PQLI (Morris, 1979) have helped to advance the debate on "non-income" measures of well-being at the aggregate level (Srinivasan, 1994; Ravallion, 1997). Much of the short-comings of such efforts relate to the limited availability of reliable data on many non-income achievements, particularly for cross-country comparisons. See Table 1.

At the same time, a series of living standards measurement surveys have recently generated new, fairly reliable and comprehensive micro data for many developing countries (Ravallion, 2001). These surveys have been used in economic analyses and poverty studies, including efforts to compare levels of absolute expenditure poverty across countries (Ravallion, 2001; World Bank, 2012). Table 1 compares the multidimensional poverty index for countries in the East African community: Burundi, Kenya, Rwanda, Tanzania and Uganda.

Table 1 shows (a) multidimensional poverty Index, that is percentage of the population that is multidimensionally poor adjusted by the intensity of the deprivations; (b) population below ppp $1.25 a day, that is percentage of the population living below the international poverty line of $1.25 (in purchasing power parity terms) a day; (c) population below national poverty line, that is percentage of the population living below the national poverty line, which is the poverty line deemed appropriate for a country by its authorities.

Table 1. Multidimensional poverty index (mpi) and population below income poverty line

Country	Multidimensional Poverty Index Year	Multidimensional Poverty Index Value	2002-2011 Population Below Income Poverty Line	
			PPP$1.25 a Day (%)	National Poverty Line (%)
Burundi	2005 (M)	0.53	81.3	66.9
Kenya	2008/2009 (D)	0.229	43.4	45.9
Rwanda	2010 (D)	0.35	63.2	44.9
Tanzania	2010 (D)	0.332	67.9	33.4
Uganda	2011 (D)	0.367	51.5	31.1

These national estimates are based on population-weighted subgroup estimates from household surveys, including ICF Macro Demographic and Health Surveys, United Nations Children's Fund Multiple Indicator Cluster Surveys, and World Health Organization World Health Surveys conducted between 2000 and 2010 (World Bank, 2012). Generally, the Human Development Index (HDI) is a summary measure of key dimensions of human development (Barro & Lee, 2013). HDI measures the average achievements in a country in three basic dimensions of human development: a long and healthy life, access to knowledge and a decent standard of living. Klugman, Rodriguez and Choi (2011) emphasize that the HDI is the geometric mean of normalized indices that represents each of these three dimensions. In addition, the Multi-dimensional Poverty Index (MPI) identifies multiple deprivations at the individual level in education, health and standard of living (Alkire & Santos (2010; Alkire, Conconi, and Roche, 2012). (See Figure 2). MPI uses micro data from household surveys, and—unlike the Inequality-adjusted Human Development Index—all the indicators needed to construct the measure must come from the same survey.

However, few attempts have been made to use the data to generate broader measures of well-being and deprivation (Ravallion & Chen, 1997). Approximately, 1.2 billion people globally expend less than a standard; "dollar-a-day"; and are in "dollar poverty"; 44 percent in South Asia; about 24 percent each in Sub-Saharan Africa and East Asia and 32 percent in Latin America and the Caribbean. Almost 75 percent of people who live on a dollar a day worked in rural areas in 2001 (Rahman & Westley, 2001). For the rural population of Sub-Saharan Africa as a whole, the figure was over 200 million people (also 6%). Of the 66 developing countries with the highest levels of poverty, over half are in Africa (Rahman & Westley, 2001). Since by most definitions, a large proportion of Tanzanians are "poor" it makes some sense to focus the discussion on "absolute" (extreme) poverty rather than relative poverty.

THEORETICAL CONSIDERATIONS

The literature on poverty can be divided into theoretical and empirical approaches. First, theoretical approaches focus mostly on the types of poverty or different social aspects of poverty. Empirical literature investigates evidence of the relationship between underlying variables based on observed statistics. For example, Ellis (1984) took a theoretical approach to describe different types of poverty. The nature of poverty was examined in relation to a model of causes affecting the welfare of a community, suggesting that it is possible to operationally distinguish among four major dimensions of poverty: economic, social,

Figure 2. Multi-dimensional poverty index. source: human development report, 2013 (UNESCO, 2012).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

political, and legal. The study also discussed further aspects of poverty, stating that the classification of poverty into different types can help in understanding the problems faced by the community.

Ravallion (2003) describes the techniques used by the World Bank to measure poverty. The selected common poverty line (US$1 a day) typically prevails in low-income countries. This poverty line is converted into the local currency for consumption surveys by using purchasing power parity (PPP) exchange rates. Ravallion (2003) explains how different measures used for poverty or any other variable can lead to dissimilar results; if the approaches used are different, then their results cannot be considered legitimate.

Squire (1993) reviews efforts to reduce poverty in the developing world. The study uses country- and regional-level figures for poverty headcount, growth, and health measures to compare these efforts, concluding that (a) economic growth should be encouraged to induce the productive use of labor so that the poor can earn to escape poverty, (b) public spending is an important source of improving health and educational attainment among the poor, and (c) the provision of subsidized social services is better than direct cash transfers. The study does not use an estimation model to observe the effects of social indicators such as education and health on poverty.

Harper, Marcus, and Moore (2003) provide a comprehensive review of the literature on poverty reduction. Their discussion covers a number of key social processes that affect poverty. They also highlight the significance of education as a means of poverty reduction, and argue that a good-quality formal education widens horizons and increases future employment opportunities. They conclude that education can facilitate upward economic and social mobility, a better- paying and safer job, and general wellbeing. This finding confirms the importance of education in breaking different aspects of the poverty cycle, ranging from individual earning to parental and family effects.

The literature review leads us to some important conclusions. For example, education can increase an individual's earnings by enhancing productivity and thus can significantly help reduce poverty. Second, the impact of education on poverty does not work only via income or a productivity mechanism (direct impact) but also through a number of externalities (indirect impact), e.g., through reduced infant mortality, better decisions, improved health and parental education, etc. Third, the impact of determinants of poverty can vary across regions due to a number of factors including economic circumstances, labor market requirements and the level and quality of education.

As shown previously an increase in the illiteracy rate is expected to be positively correlated with poverty, whereas an improvement in health indicators should be inversely related to poverty. Table 2 compares literacy rates in the East African Community countries. As a result of national economic liberalization in Tanzania, rates seem to have risen in 2010 and beyond.

This phenomenon shows that both the level of GDP per capita and its rate of growth are expected to be negatively correlated with the poverty rate. However, the effect of real exchange rate depreciation

Table 2. Adult literacy rate, 1988-2010

Year \ Country	Burundi	Kenya	Rwanda	Tanzania	Uganda
2000-2002	59.30	82.23	64.89	69.43	68.14
2010	67.16	87.40	71.05	73.21	73.21

Source: World Bank Open Data, April 2014 at http://data.worldbank.org

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is in general ambiguous; it is likely to lead to a reduction in poverty if it benefits small farmers in the tradable sector, as is the case in many low-income developing countries.

A higher rate of urbanization also has in general an ambiguous effect on aggregate poverty; to the extent that rural-to-urban migration translates into greater access to public services in urban areas, it may lower poverty; but to the extent that inflows of workers in the urban sector lead to an excess supply of labor in the informal sector and lower wages there, it may increase poverty (Harper et al., 2003). An improvement in the terms of trade may reduce poverty if it represents an increase in the relative price of agricultural commodities (thereby benefiting small farmers in rural areas) or a fall in the price of imported consumption goods (benefiting mostly households in urban areas). According to the World Bank 92014, Urbanization has a positive sign and is significant in some regressions so we can say that inflows of workers in the urban sector lead to an excess supply of labor in the informal sector and lower wages there and as a result it increases poverty.

Women's Grassroots Initiatives Underscore Self-Reliance

The case of the *Jitahidi* women is not unique in Africa. In recent years, grassroots initiatives that empower women and marginalized groups to address poverty in Africa are found everywhere from literacy/numeracy to vocational training among rural women (Chucks, 2004). They are also actively pursued in adult education initiatives and the empowerment of civil society (Maruatona, 1999), and in social and political change movements (Lodge, 2013), or human rights (Gillespie & Melching, 2010). These initiatives reinforce the assumption that adult education and civil society are historically linked to the positive roles adult education plays in empowering men and women in emerging and middle income economies worldwide (Maruatona, 1999).

While many civil society organizations broadly support the global partnership that the U.N. Goals encapsulate, there are civil society organizations which have expressed reservations about the MDG strategies arguing that the Goals are 'top down', and imposed by the international community, rather than locally developed (Maruatona, 1999). There is uncertainty about the community's role in achieving the Goals. Skeptics seem to suggest that the U.N. Goals are too narrow and unambitious, especially in comparison to the U.N. Millennium Declaration, leaving out critical issues. For example, the Goal for gender equality falls short of the aims set in the Platform of Action at the U.N. Conference on Women (UN, 1996), to which governments around the world are committed (UN, 1996). In spite of such criticism, most of the NGOs that support women's empowerment have spent years dedicated to the broader objectives that the U.N. Goals represent, namely: promoting gender equality and fighting poverty, hunger, illiteracy, disease, and environmental degradation.

The Capability Approach

The *Jitahidi* Women's goal of promoting empowerment in grassroots organizations, and the insistence of key institutional policy and political interactions is rooted in the larger conception of development and empowerment. As such, it is framed in a particular understanding of the 'capability approach'. This approach has in recent decades emerged as a novel theoretical framework about well-being, development and justice. In fact, the capability approach is one of the foundational building blocks of Amartya Sen's paradigm of 'development as freedom' (Sen, 1999).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The capability approach is a theoretical framework that entails two core normative claims: first, the claim that freedom to achieve well-being is of primary moral importance, and second, that freedom to achieve well-being is to be understood in terms of people's capabilities. This refers to people's abilities and the opportunities they have to do or manage their own affairs. The case of *Jitahidi* Women aligns with some of the theories and understanding of human development that the philosophy of '*capability approaches*' embraces. By addressing poverty, inequality and wellbeing, the capability approach influences the human development language that is visible in the Millennium Development reports and has had a great influence on policy processes around the developing world.

The capability approach has been developed in a variety of more specific normative theories, such as (partial) theories of social justice or accounts of development ethics. It has also led to a new and highly interdisciplinary literature in the social sciences resulting in new statistics and social indicators, and to a new policy paradigm which is mainly used in development studies, the so-called 'human development approach'(Stanford University, 2011).

Habermas (2005) and Fultner, 2011 called this human development potential the constitutive capabilities individuals have that enable them to control the physical world, interact and relate with it, as well as gain autonomy over individual affairs. When individuals can exert such constitutive capabilities, they are said to be 'empowered.' However, over the decades, the term "empowerment" has been overused to the extent that it is reduced to a slogan that means little of substance. (Way, 2011). As explained in the *Pedagogy of the Oppressed*, Freire (2002) contended that the underlying tenet of this way of thinking about "empowerment" is that the "disempowered" already know a great deal about the sources of their oppression and what must be done to overcome it (p. 88). What they do not have is an organized approach to translating this knowledge into action. The appropriate educational response is therefore one that elicits participants' knowledge and responses. Freire calls this educational method "problem-posing" (p. 9).

Ensuring the necessary conditions for a transformative approach to capability enhancement also depends on providing the means to have a say in the process of policy-making and taking action to make changes (Dugan 2003). Freire's approach was aligned with "transformative" learning theory, which was developed over 20 years ago. Transformative learning involves participation in constructive discourse to use the experience of others to assess reasons justifying the assumptions people make, and taking action based on the resulting insights. In essence, transformative learning theory's focus is on how we learn to negotiate and act on our own purposes, values, feelings and meanings rather than on those meanings we have uncritically assimilated from others. Mezirow (2002) suggests that to be transformed is "to gain greater control over personal lives as socially responsible and clear-thinking decision makers" p. 11).

JITAHIDI WOMEN IN TANZANIA

The *Jitahidi* story chronicles events, motivations, and practical initiatives of women in development which represent a small entrepreneurial group, organized with shoe-string budgets. This micro case of the women signifies the majority of global poor who live in rural areas with an important fraction of their expenditures spent on staple food. They have little assets such as access to land, credit, high yield seeds, or pests control remedies. In their midst are farmers who lack education and face lots of interconnected, multidimensional obstacles that make it impossible to escape the poverty trap.

Mapping out the multi-dimensions of poverty that continually face the *Jitahidi* women is critical to understand the challenges they confront in their attempts to engage local women to alleviate household

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

poverty through grassroots initiatives. The women's goal was to organize women's collective strength that could unleashe their lives and strength from oppressive economic regimes, patriarchal traditions, gender inequality, gender discrimination, and socio-historical legacies (e.g., inheritance laws) that exploit women everywhere. To implement this vision, the women embarked on what is known in Tanzania as "self-reliance enterprises. In Tanzania, "Self-reliance," which is locally known as "*Kujitegemea",* was a movement of the late 1960s and early 1970s, at a time when the policy of 'Education for Self-Reliance' was at its peak (Nyerere, 1967). Nyerere emphasized:

What we do have is land in abundance and people who are willing to work hard for their own improvement. It is the use of these latter resources which will decide whether we reach our total goals or not. If we use these resources in a spirit of self-reliance as the basis for development, then we shall make progress slowly but surely. And it will then be real progress, affecting the lives of the masses, not just having spectacular show-pieces in the towns while the rest of the people of Tanzania live in their present poverty. . . . It is therefore the villages which must be made into places where people live a good life; it is in the rural areas that people must be able to find their material well-being and their satisfactions (p. 14)

This policy urged Tanzanians to reconsider the purpose of education and to rely on their own tangible and intangible resources at their disposal to bring about national development. In practice however, self-reliance fosters empowerment and is assumed to include the engagement of people of all ages in programs for economic development instead of relying on outsiders.

The background and context of *Jitahidi* women sum up a four-part agenda that provided women with incentives and abilities to run larger enterprises in higher value-added economy within the formal sector. The *Jitahidi* venture pulled together individual efforts of some women in Northern Tanzania who realized that most of the produce (including grains) they brought to the market-stalls to sell ended up getting spoiled because of short shelf life. They then would incur heavy losses. To reduce losses in the long term, the women established a cooperative venture under the leadership of the Director of Women in Development (WID) groups in Northern Tanzania.

INSIGHTS FROM THE 2009—2012 SURVEY

Table 3 gives a sense of the economic and social profile of the women who joined *Jitahidi.* The women came primarily from rural areas. As indicated, generally, the urban sector consists of only 26 percent of the overall population. Other demographic characteristics show low literacy rates and low incomes in terms of GDP (World Bank, 2011) and generally confirms the plight of the women in general.

Most of the women (81%) had completed seven years of schooling, 8% had completed nine years (Form 2; i.e., 2 years of secondary school) and 11% had completed twelve years (Form 4.) A majority (54%) of the women primarily used cell phones in their business communication, whereas somewhat fewer (46%) used face-to-face communication (including travel) as their primary means of business-related communication. Cell phones, while not the primary way of conducting all business communication, were, nevertheless considered important to carrying out business by a vast majority (96%) of these women agro-entrepreneur respondents. Somewhat less than half (44%) of the women's business relationships involved buying produce, 10% involved selling, bartering and lending money. Nearly half (48%) of the business relationships involved personal favors between the individuals involved (Semali, 2011).

JITAHIDI WOMEN'S ENTERPRISES TO ALLEVIATE HOUSEHOLD POVERTY

To develop the capability and to strengthen the potential and empowerment of *Jitahidi* women, an important addition to the structure and conduct of business among the Women was implemented, namely, the development of a safe, cohesive and empowering group climate which helped to promote the goals of the group. This structure however was not automatic but rather a conscious trial and error effort to encourage the members to talk, to tell their story of how to combat the many faces of poverty. This approach was introduced by the Director of Women in Development in the region. She insisted on allowing every individual to express oneself freely.

This practice set the tone of how the cooperative and its leaders must operate. In this case study, the *Jitahidi* example provides an instance of social change that embraces the capability approach to augment years of gender inequality and poverty. Consequently, the *Jitahidi* Cooperative took the capability approach seriously. Members felt that the cooperative movement gave women the opportunity to improve their conditions within a safe and supportive atmosphere. One of the basic principles of operation that was established early was the freedom to speak one's mind and to have one's ideas heard and valued. These creative ways to emphasize communication allowed the women to begin with ease the process of transformative empowerment. The aim was to recognize Tanzanian women as active custodians of Indigenous knowledge and active contributors to the economy and wellbeing of the family" (Jagire, 2014: 169).

Historically, women in Tanzania have been disempowered, disenfranchised and denied basic education. In addition, historical social structures have posed formidable barriers. For example, gender differences in legal status and capacity, particularly for married women, affect women's access to and control of assets and resources required for entrepreneurship. Education and business experience are important drivers of economic choice, opportunity and performance. Lack of access to finance was a formidable obstacle to business development. Women's limited opportunities for networking and exclusion from decision-making bodies and from policy dialogue, especially in the business environment, meant that business climate reforms rarely tackled issues for women entrepreneurs (Hallward-Driemeier, 2011, p. 8).

In Tanzania as well as some African countries, women continue to be excluded from schools and from higher education. Actually, not so long ago in some communities in Tanzania, women were denied schooling until recent years (Jagire, 2014). For example, a number of economic, social and cultural influences have contributed to the curtailment of women's capability and potential; and thus disempowering girls and women. As it seems to be the case in Tanzania, as well as other African countries with strong oral traditions, disempowering influences include many things.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Examples of disempowering practices abound, like separation of the sexes to privilege boys and men over girls and women, the perpetuation of cultural ideologies that promote or glorify traditional stories of gender inequality, myths about who can own land and receive inheritance wealth. In the public media, one finds songs that focus on women's beauty or other physical attributes but not their human rights or intelligence; and a proliferation of media stories or skits that have served to ensure male dominance in the home, office, and sexual relationships. These unequal exploitive gender practices remain unexplored and their contextual influences or impacts on the lives of girls and women are virtually unknown or simply covertly brushed aside (Hallward-Driemeier, 2011).

The indoctrination of girls into traditionally defined gender roles, particularly girls who are unable to pursue higher education, is both strong and persuasive, leaving young women with little awareness of the extent to which these external pressures, expectations, and restrictions limit their capability for self-reliance, career choices, social behaviors or overall women's horizons. Because these gender expectations and practices are widespread in Tanzania as well as in other parts of Africa, the *Jitahidi* Women's Cooperative intuitively realized that at the epicenter of these negative expectations and exploitation of women is *poverty* and *economic* dependency and a lack of *basic education* sufficient to confront oppressive encounters. Therefore, the capability approach was critical and central to the sustainability of *Jitahidi* women as an empowered collective.

Women's Business Ventures

The small steps the cooperative took and commitment made grew to several enterprises that included raising pigs, chickens, and new ventures to grow mushrooms, spinach, cabbage, tomatoes, carrots, and other household vegetables. The markets in the town of Moshi and big cities of Dar es Salaam, Arusha and Mwanza saw a surge of improved and steady supply of vegetables and fruits, some of which, like avocadoes had not been brought to the market before. Importation of spinach, apples, eggplants, lentils and fruits from South Africa has in recent months fizzled, and most of the products found in the market are grown locally. (See Figure 3).

Other women invested in the purchase of avocadoes from farmers and transport them to various cities in Tanzania or sell to small scale retail vendors. (See Figure 4 and Figure 5).

Other teams of women built storage tanks with large capacity to store two tons or more of maize between the growing seasons. As a result, they can sell maize in the off-season period with large profit margins. To date, they own two of such storage tanks. Reports indicate that last year the women were contracted to supply the United Nations High Commissioner for Refugees (UNHCR, 2011) with maize that was exported out of the country, thus fetching them the much needed revenues (Loewenberg, 2011).

Even though the *Jitahidi* women are modest when it comes to discussing their successes, a quick appraisal of their progress shows immense improvement. A recent report submitted to one of the funding agencies of *Jitahidi* projects, as explained by the Director, showed that the progress they made matches results from similar cooperatives in Northern Tanzania where monthly cash earnings doubled from 50,000Tanzania Shillings (Tsh.) to over 150,000 ($50 to $150 U.S. Dollars). In fact, cash savings tripled, and short-term expenditures and durable assets increased 30 to 50% relative to where they were at the beginning of the cooperative in 2008. In spite of these gains, there was no immediate effect on women's independence, status in the community, or freedom from intimate partner violence. This reality was explained further by the women saying: "Attitudes take time to change."

However, issues of domestic violence, teen-age marriages, and female circumcision are topics frequently broached and spoken out openly by *Jitahidi* women at public meetings. As a result, today teen-marriages have been listed as a nation's tragedy and discussions on concerns on underage marriage is regularly featured in the daily press (Makoye, 2013). However, we see little evidence that more inclusive role for males in the household leads to better empowerment or economic success, although promising improvement in partner support and relationships were observed and acknowledged by the women.

The fundamental role of grassroots organizations, like *Jitahidi*, lies in mutually reinforcing personal and collective capabilities. However, the opportunity to live a good life depends extensively on the social determinants of the relevant capabilities. It is in this context that policy and programming at the national and supra-national levels, along with the work done by civil society organizations (CSOs) at the local level can influence the social alternatives women have, and more broadly their quality of life and wellbeing.

The *Jitahidi* Cooperative organized regular meetings to utilize group dynamics approaches to social justice and empowerment with the purpose to raise women's awareness of social and cultural issues and contexts in which they live, and how these contexts influence or persist to impact their plight in poverty and diseases, HIV/AIDs in particular. The first step towards achieving the goals of the group was the development of an "empowering group climate" which included free expression and exchange of opinions and ideas, a strong sense of cohesion and support, and a collaborative, non-authoritarian relationship between group leaders and group members. These principles were brought to bear during seminars conducted by *Women-in-Development* (WID) Office. The WID seminars and regular visits to members' projects by *Jitahidi* leadership were not only additive to the function of the cooperative but also transformational. Transformation was explored through identifying interconnected practices: visioning, reframing, human rights in local discursive practices in problem-based contexts, and creat-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing critical capacity and consciousness through connecting participants to a larger discourse on human rights in Tanzania and beyond.

The reasoning behind interconnected practices was is quite simple: When household income is generated and managed by women, it is likely to be used for children's school fees, uniforms, books and school supplies as well as for medical care, better quality food for the family and improvements to the home environment. This quality of life improvements results in fewer children's missed days of school and more years of schooling for children (Commission, 2005). The good outcome of having a sustainable livelihood becomes to discourage early marriage and the resultant pregnancies that frequently result in poor maternal outcomes for young girls. As confirmed by many researchers, the education of girls is the best strategy for reducing infant and child mortality, a critical issue in most developing countries (Bloch & Beoku-Betts, 1998).

Even though these women entrepreneurs were not representative of the population of Tanzania, they represent a possibility for a "capability" and empowerment model for women in other parts of East Africa. Examination of their practices was important to define the possibilities for other women in developing nations seeking poverty reduction, or working to increase literacy rates, and desiring to master and apply post-literacy skills for social change. Thus, this case of *Jitahidi* women entrepreneurs provides a micro-analysis of financial market imperfections and it is just one episode from a larger social science networks study that is ongoing in Northern Tanzania since June 2008 (Semali, 2011). Empowerment was being realized by individuals as they regained their voice in the community and engaged other women in the business they conducted every day at the markets.

CONCLUSION

The main objective of this case study was to investigate the story of *Jitahidi* women in Tanzania to understand the dynamics of poverty reduction projects at the grassroots level. The study took note of the theoretical assumptions that inform the women's entrepreneurial enterprise that was deliberately undertaken by WID Tanzania with the *Jitahidi* leadership to overcome household poverty among individuals, particularly women with little or no basic education. The rationale was that the ability of women in Africa to sustain livelihoods of their households will occur largely through small, agriculture-related enterprises in which the optimal use of recent technological developments of mobile phones and social networks may result in increased income and quality of life for women (Semali & Asino, 2013).

Insights from this case study provide introspection to what is going on in women's development and their business relationships. The use of cell-phones was quite prevalent and the researchers suspected that perhaps it would not be possible to establish *Jitahidi* without the facility and easiness of access to mobile phone communication. It seems that these women have learned innovative ways of using ICTs to advantage their businesses as well as strengthening their networks. As new applications begin to rapidly emerge on the market, such as access the Internet, Google maps, and instant upgrades and multiple applications, cell-phone communication is almost taken for granted, since the women swap telephone numbers frequently.

Likewise, the emphasis of transformative practices aimed to strengthen visioning, and reframing human rights in local communities as well as problem-based contexts, increased the critical capacity and consciousness of the *Jitahidi* women judged by what they were able to accomplish. In practice, grassroots enterprises were aimed to assist new members during monthly seminars to overcome literacy barriers

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and to name barriers created by restrictive gender relations in the home and in social and civic engagements. The step by step approach helped the women to identify barriers that impact adolescent young women in general and *Jitahidi* cooperative members as individuals. In addition, the practices encouraged women to envision how the cooperative can mitigate against women's exploitation.

The case of the Jitahidi women informs the design of subsequent projects intended to assist women escape poverty trap of extreme household poverty in rural villages of Tanzania and beyond. The initial idea underlying this case that brought us in contact with the *Jitahidi* women was to gather information about the business climate among women who live in rural areas and to use that information to organize these women to form a cooperative. The questions that pave the way forward to future investigations are: What can policymakers and educators do to facilitate and improve the use of mobile phones as a tool to redress extreme poverty or to enhance women's knowledge of the environment they live in? What can women do to leverage the economic boom for their advantage to improve the agricultural sector? What is the nexus between having access to communication and poverty alleviation?

These issues call for research studies that expose further the potential of poverty alleviation. There is every chance that the dialogical way of thinking introduced by WID can create space for all women and empower Tanzanians to define their own economic, social and educational needs; and hopefully create political organizations within the local community that spearhead national development. And more importantly, women can become stronger partners in development as Tanzanians implement the next level of MDGs.

Chapter 67
Impact of Microfinance on Poverty in the Context of Global Financial Crisis:
A Cross Country Analysis in South Asia

Arindam Laha
The University of Burdwan, India

ABSTRACT

The microfinance programme in the South Asia region has proven to be resilient to the shocks of global financial crisis. In fact, cross country experiences in South Asia reveal little impact of the global financial crisis on the penetration of the microfinance programmes to poor households. To explore the impact of microfinance on poverty in the backdrop of global financial crisis, an attempt has been made in this present study to examine the relationship between MFI's gross portfolio per active borrower and the measures of poverty. Empirical evidences based on Pooled Regression Analysis suggest that gross portfolio per active borrower is negatively and significantly associated with the poverty head count ratio or poverty gap measure, which is consistent with the author's hypothesis that micro loans reduce poverty. The poverty alleviation role of microfinance in South Asian countries is not changing its dynamics even in post-crisis scenario.

INTRODUCTION

Microfinance, as an instrument of doorstep financial services, is considered as a well-designed institutional innovation to ensure a substantial flow of credit to collateral poor households. However, it is widely believed that microfinance programme is not a panacea to alleviate poverty from grass root level; rather it is considered only as a means to address the problem. Microfinance intervention expand the access to resources, increase self-employment opportunities and thereby, reduce poverty, provided a proper government initiatives are taken in the direction of social mobilization, capital formation, capacity building and pro-poor programme design (Burra, Murthy & Ranadive, 2005). Without an effective intervention in a

pro-poor macro policy environment, no such micro policy intervention can be successful in alleviating poverty (Islam, 2009). Microfinance programmes in Asia and Pacific countries are found to be successful in extending the services to the poorest sections of the population. Nearly 62 percent of the members covered under such programmes are poor women in this continent (Maes & Reed, 2012). Historically, Bangladesh dominates among the countries of South Asia in terms of microfinance outreach and share of total borrowers. The Grameen Bank of Bangladesh is a well known people's institution for the poor women promoting small scale production by extending microcredit. Taking the lessons from Bangladesh, micro finance programme has been emerging in a big way in other countries of South Asia. In particular, Sri Lanka and Nepal has achieved a considerable success recently in expanding the outreach of micro finance institutions to promote socio-economic development of the poor households.

The institution of microfinance in South Asia is proven much more resilient to absorb the stock of global financial crisis in the late 2007 than are often presumed. Micro finance institutions (MFIs) linked into the formal financial system, in fact, suffered more. Available empirical evidences in the literature suggest more robust correlations between microfinance's performance and economic conditions in domestic and international sectors after the emergence of crisis. In particular, MFIs in Central America and the Caribbean, Eastern Europe and the Middle East and Central Asia appear most sensitive to changes in the domestic and international economic environment (De Bella, 2011). Interestingly, the overall impact of crisis in South Asia has been limited due to the implications of proactive measurements of governments in those countries (Dohulilova, 2009). Under this backdrop, an attempt has been made in the study to explore the cross-country evidence of microfinance penetration among the poor across major South Asian countries over a period of time 2000-12. The plausible implications of global financial crisis on the relationship between MFI's gross loan portfolio per borrower and poverty indices is a particular interest in this paper. For convenience, the paper is divided into five sections. The next section survey the existing literature with an emphasis on the macro economic perspectives of the problem. A section is devoted to develop a conceptual framework to consider an association between microfinance outreach and poverty reduction in the perspective of global financial crisis. The section on data and methodology consider the selection of dependent and independent variables in the empirical specification of Pooled Regression Analysis. The section on results and discussion examines the outreach of microfinance programme to poor households in South Asian countries. In addition, an attempt has been made in this section to examine the implications of global financial crisis on the outreach of microfinance on poor. The concluding remarks and future direction of research appear in the last section.

SURVEY OF LITERATURE

In the existing literature, the impact of microfinance on poverty has relied on micro-level evidences on country specific household level data (Morduch, 1999; Mosley, 2001; Khandker, 2005; Imai, Arun & Annim, 2010). It has been argued that financial development disproportionately boosts the income growth of the poorest quintile, reduces income inequality and thus strongly associated with poverty alleviation (Beck, Demirguc-Kunt & Peria, 2006). This argument is further substantiated by the fact that the access to banking network is negatively associated with the level of poverty. Over the period 1961-2000, the expansion of rural branches significantly lowered the level of rural poverty in India (Burgess, Pande & Wong, 2004; Pande, 2004). However, the empirical findings of the studies remains mixed due to different outcome measure of microfinance and different methodologies adopted by these studies. While some of

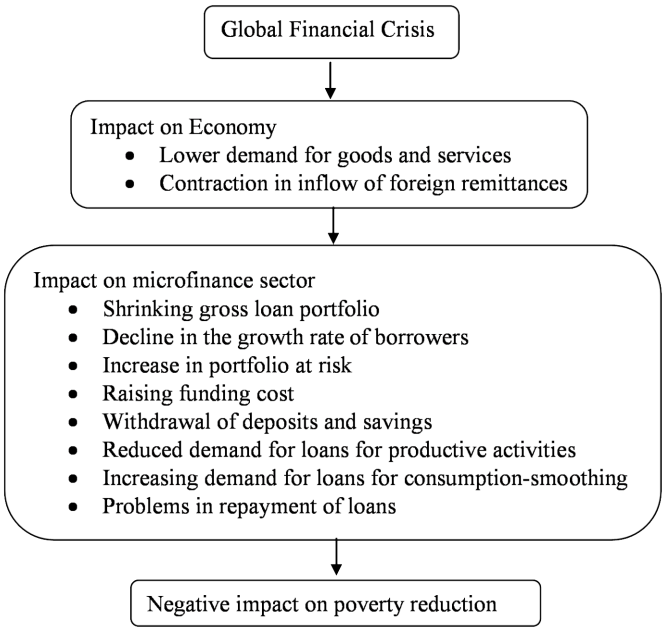
EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the studies establish the proposition of poverty reducing impact of microfinance through expanding the access of resources, enhancement of employment opportunities and alleviation of feminization of poverty (Khandkar, 2005; Burra et al, 2005; Imai et al, 2010; Devi, Prabakar, & Ponnarsi, 2011), the others argued the little impact of microfinance on poverty (Hulme & Mosley, 1996; Rosenberg, 2010). However, macro economic studies based on cross-country evidences on the poverty reducing role of microfinance are rather limited in the literature. Scarcity of reliable data often cited as the barrier in addressing the problem in macro perspective (Imai et al, 2012). A few notable contributions in this direction are Lapenu & Zeller, (2001); Weiss, Montgomery & Kurmanalieva, (2003); Shastri, (2009); and Imai et al, (2012). The macroeconomic perspective of the problem has helped us in understanding the likely implications of global financial crisis on the sustainability of microfinance in general and poverty alleviation role of microfinance in particular. In the literature, the financial stability aspects of microfinance in the face of financial turmoil are debatable. Some have argued that the microfinance is vulnerable to financial crisis as MFIs are now more closely linked to global financial markets than before (Magnoni & Powers, 2009; Di Bella, 2011; Wagner & Winkler, 2012). On the other, some of the optimistic opinion reveal that microfinance in some regions are largely immune to fluctuations in international financial markets (Littlefield & Kneiding, 2009; Dohulilova, Janda & Zetek, 2009).

MICROFINANCE OUTREACH AND POVERTY REDUCTION IN THE CONTEXT OF GLOBAL FINANCIAL CRISIS: A CONCEPTUAL FRAMEWORK

The differential impact of global financial crisis on financial institutions in developed and developing countries can be conditioned upon the level of integration of each domestic economy to the global financial system. MFIs are not so different from traditional financial institutions in many ways. This is why the financial crisis led to problems surfacing at MFIs that were quite similar to those faced by traditional financial institutions (IFC, 2013). The development of microfinance sector is crucially dependent on different sources of funding: domestic, foreign or savings (Gonzalez, 2011). Local sources of funding in Indian MFIs have protected them to the liquidity crunches owing to the contraction in inflow of foreign remittances in the economy. However, withdrawal of deposits and savings in the environment of financial risk may put a heavy pressure on domestic source of funding. In the pre-crisis situation, the rapid growth of micro credit was driven by the fostering financial inclusion without raising series sustainability and stability concerns (Gonzalez, 2010). Financial inclusion policy of the government was badly affected in the post crisis scenario by declining growth in borrowers (breadth of outreach) and loan size (depth of outreach). Lack of demand for goods and services in the real sector of the economy in the post crisis situation has resulted in reduced demand for loans for productive activities vis-à-vis increased demand for loans for consumption-smoothing purposes. Fear of repayment of loans by the poor borrowers often compelled the MFIs to adopt a policy of rationing of credit for consumption purposes, and even for productive purposes in agricultural sector. The complex process of interaction of the events ultimately worsens the profile of poor households in the economy.

However, in order to understand the potential impact of microfinance on poverty, the group of 'the poor' should be differentiated into long-term or 'chronic poor' and the 'transitory poor' or temporary poverty as a result of adverse shocks. Within the chronic poor category, one can further distinguish between the 'destitute' i.e., those who are physically or socially disadvantaged and the 'non-destitute" i.e., those who are poor because of lack of assets and opportunities. Further, within the 'non-destitute'



EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

category, there is a group of 'core poor' who has irregularity of income and thereby is considered to be most vulnerable according to the depth of poverty (Weiss et al, 2003). The microfinance programmes is expected to address the problems of chronic (non-destitute) poor and the transitory poor. Access to microfinance can serve the purpose of both 'promotional' or income creating role to the chronic poor and 'protectional' or consumption smoothing for transitory poor households. However, the distinction of the poor according to their needs is sometimes myopic in nature and thereby found practically infeasible. In practice, it has been empirically established that the poorest of the chronic poor (the core poor) generally borrow for protectional purposes due to their irregularity of income. These groups of people are observed to be so risk averse that it is not possible for them to borrow for promotional measures with an expectation of enhancement of income in future. However, the causal link among microfinance outreach and poverty alleviation in the context of global financial crisis is depicted in the Figure 1.

DATA SOURCE AND METHODOLOGY

The study is exclusively based on the available secondary data sources. Data on number of active borrowers, gross loan portfolio covering six countries of South Asia is collected from data generated by Microfinance Information Exchange (MIX). Also, the study uses the World Bank poverty estimates across countries of the world. These poverty estimates are based on the poverty line of US$1.25 and US$2 per day covering a period of 2000-12. World Development Indicators provides numerical estimates of head count ratio and poverty gap measures across countries based on these two stipulated poverty lines. Unavailability of poverty estimates for all the years is mainly because of the construction of international poverty estimates is relied on the national wide household expenditure or income surveys which are carried out once or twice in a decade for most of the developing countries (Imai et al, 2012).

Figure 1. Linkage between global financial crisis and poverty through microfinance outreach

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is held that microfinance does not necessarily reach the poorest of the poor (Morduch, 1999). In this context, the study attempts to examine the effects of gross loan portfolio per active borrower on incidence of poverty (measured by head count ratio) and the depth of poverty (measured by poverty gap). To examine the impact of microfinance on poverty, an attempt has been made in this present study to examine the relationship between MFI's gross portfolio per active borrower and the measures of poverty. The empirical specification is given as follows:

$$Pov_{it} = \beta_0 + \beta_1 GDP_PC_{it} + \beta_2 GLP_PB_{it} + \beta_3 Domestic_Credit_{it} + \beta_4 Year_{it} + u_{it}$$

where i is the ith country and t is the time period of the variable. The dependent variable, Pov indicates poverty head count ratio or poverty gap ratio of the country. The explanatory variables and hypothesis (as specified by expected sign) are presented in Table 1. Descriptive statistic of dependent and explanatory variables is presented in table 2 and the correlation matrix interpreting association between selected variables is represented in table 3.

The country specific economic factors those are expected to influence the impact of microfinance on poverty have been identified: economic status of the country measured in terms of gross domestic product of the country, average loan provided to active microfinance borrowers of the country and access of domestic credit of banks in the country. The impact of global financial crisis is captured by using an independent dummy variable. We have applied both Pooled Ordinary Least Squares and Random

Table 1. Expected sign of the determinants to examine the influence of microfinance on poverty

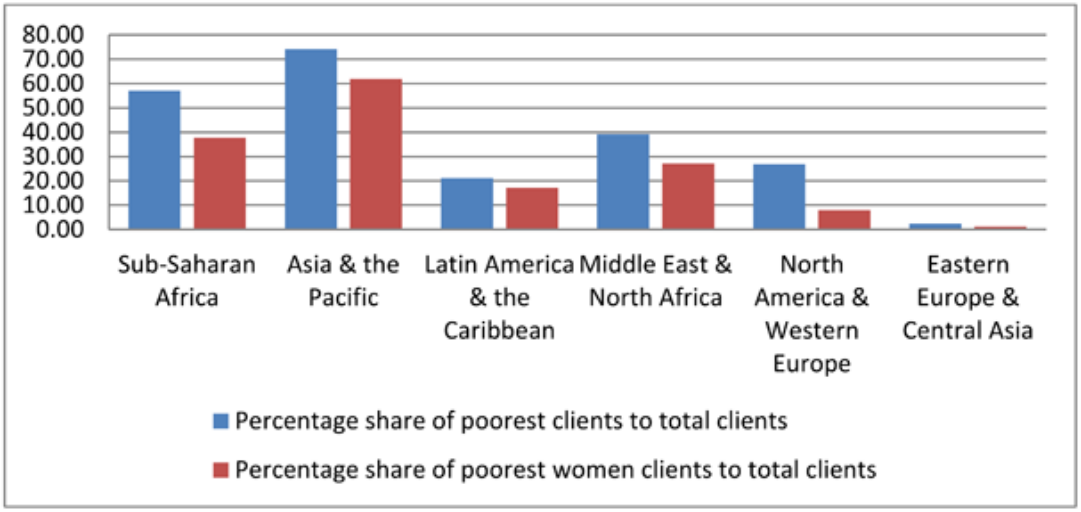
effect Panel Regression to estimate the effect of gross loan portfolio per borrower of MFIs on poverty. The choice of regression analysis is based on Breusch and Pagan Lagrange Multiplier Test under the hypothesis that there is no random effect. Accordingly, pooled regression is appropriate when we do not reject the null hypothesis.

RESULTS AND DISCUSSIONS

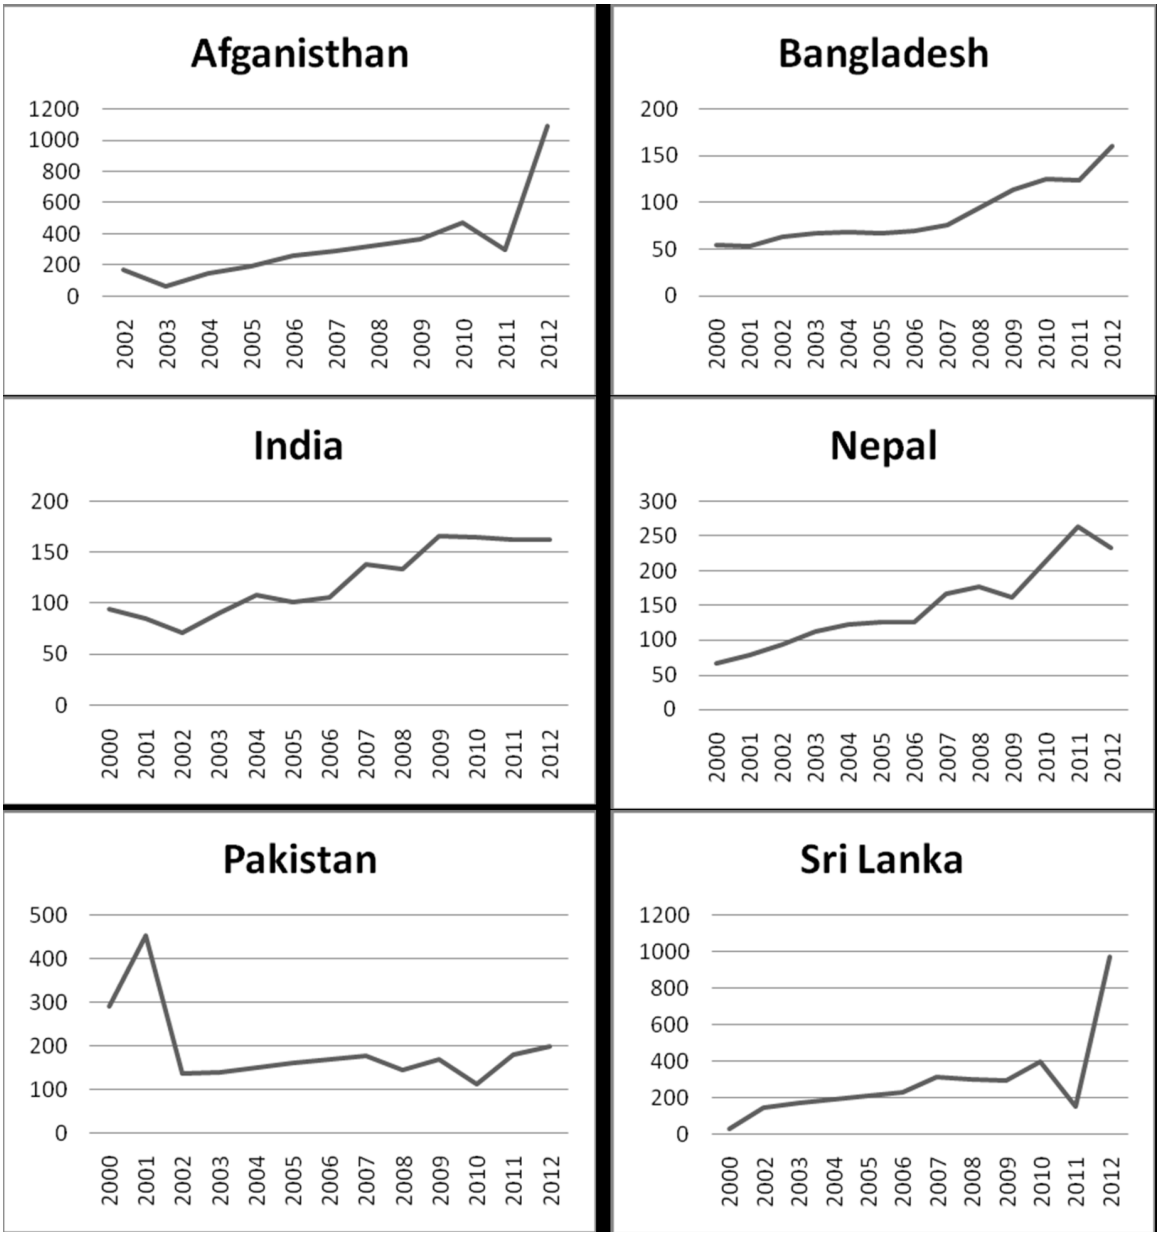
Microfinance Access and Poverty: South Asian Experience



The outreach of microfinance programme across regions of the world exhibits a strong growth in the outreach of the sector in Asia. According to Microfinance Summit Campaign Report, 2012, out of 3652 microfinance institutions, 1009 are found in operation in Sub-Saharan Africa, 1746 in Asia and the Pacific, and 647 in Latin America and the Caribbean. Thus microfinance as an institutional interven-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion is mainly widespread in developing world. In such economies, Asia and the Pacific predominantly occupied a large client share of 82 percent, followed by Latin America and the Caribbean countries (6.47 percent), Sub-Saharan African countries (5.67 percent). In fact, Asia accounted for the majority of microfinance institutions, retained the highest number of savings and credit[1] and served more members than any other continent (Lapenu & Zeller, 2001). Another distinguished characteristic suggests that a variety of alternative delivery mechanism – cooperatives, village loans, and lending to solidarity groups or individually are found operating in Asian countries (Weiss et al, 2003). Moreover, microfinance programmes in Asia and Pacific countries are successful in extending its services to the poorest and women sections of the population. It is evident that Asia and Pacific region retains more than 90 percent of the share in the number of poorest[2] clients and number of poorest women clients across regions (Figure 2). The coverage of poor households under the microfinance sector is highest in Asia and the Pacific region (68.8 percent) and it is followed by Africa and the Middle East (11.2 percent), Latin America and the Caribbean (32.4 percent) and Eastern Europe and Central Asia (3.7 percent). The coverage of poor women households under the microfinance sector is also highest in Asia and the Pacific region (61.94 percent) and it is followed by Sub-Saharan Africa (37.69 percent), Middle East and North Africa (27.16 percent), Latin America and the Caribbean (17.06 percent), North America & Western Europe (7.87 percent) and Eastern Europe and Central Asia (1.20 percent) in 2010.



In the backdrop of widespread prevalence of microfinance practice in the South Asia[3], an attempt has been made in this section to examine the trend of gross loan portfolio per active borrowers' over time (2000-12) across several countries in the region (Figure 3). Over the years, Bangladesh, India and Nepal have experience a steady upward movement in the average loan portfolio than other countries of the regions. Afghanistan and Sri Lanka also maintained a steady progress in the outreach of microcredit till 2009, with a slowdown in 2010 and thereafter the progress is again restored. Pakistan exhibits a sharp decelerating trend in 2001-02, but thereafter witnessed a steady upward movement in the average loan portfolio. An interpretation of the trend over this period can be summarized to draw the necessary conclusion of the potential implications of global financial crisis on the microfinance sector. In fact, the overall

impact of crisis in South Asian countries witnessed a limited impact on the microfinance movement in this region. It has been suggested that resilience of microfinance sector in the face of crisis is mainly due to the implications of proactive measurements of governments in those countries (Dohulilova, 2009). In this context, it should be noted that despite a satisfactory progress of microfinance sector across countries of the region there has been little cross-border operation in the transaction of microfinance services. However, some of the microfinance institution in Bangladesh made an inroad in the countries like Sri Lanka and Pakistan. Bangladesh Rural Advancement Committee (BRAC) of Bangladesh entered the Sri

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Lankan[4] market after the tsunami and has rapidly scaled up to become a significant player in providing microfinance services. Three notable microfinance institutions operating in Bangladesh, viz., Grameen, BRAC and ASA, have extended their network in Pakistan (Bedson, 2009).

However, the higher number of active borrowers of micro finance does not necessarily imply the greater penetration of micro finance among the poor households in a country. It is thus desirable to assess the number of active borrowers relative to the potential base of poor households. In order to examine penetration rates across countries of the South Asia, two indicators[5] are considered: the proportion of borrowers to total population and the proportion of borrowers to total poor population. While the first indicator indicates the penetration of microfinance programme to the total population, the second one actually evaluates how successful are the microfinance institutions in eradicating poverty. To represent the trend of these indicators across countries of South Asia, three distinct time period are considered purposively: 2000-2006 (time period preceding crisis), 2007-2008 (the period of shaping crisis) and 2009-2010 (time period after crisis). Interestingly, both the penetration indicators exhibit an upward trend for all the major South Asian countries during the time period. Cross country experiences, thus, suggested that global financial crisis has not shown any major impact on the penetration of the microfinance programme to the poor households. However, there is wider cross-country variation in the penetration of microfinance in the region, with Bangladesh and Sri Lanka achieved significant depth, but other countries lag far behind. If we consider total borrowers with respect to the potential client base of the total population living below the international poverty line of US$1.25 per day, then it reveals that microfinance institutions in Bangladesh and Sri Lanka cater to more or less one-third of potential clients in these countries. It is worth mentioning that Sri Lanka has experienced with a dramatic shift in microfinance penetration over the period 2007 to 2010. The scale of microfinance outreach has expanded to reach out to more poor households in a robust way. This is broadly due to the sharp reduction in rural poverty in Sri Lanka over the period. India, being the largest market in South Asia, still lags in outreaching microfinance services to the poor households. Despite the significant growth of microfinance institutions and its active borrowers, the penetration of microfinance lending services to the poor households in the country is limited to only 8 percent in 2010 vis-à-vis 33 per cent in Bangladesh and 91 per cent in Sri Lanka[6] (Table 4).

Microfinance Access and Poverty: A Pooled Regression Analysis

It is desirable to examine the relationship between MFI's gross loan portfolio per borrower and measures of poverty so as to undertake appropriate policy measures for bringing about a more inclusive society in terms of the access to microfinance services. To test the hypothesis of a relationship between gross loan portfolio per borrower and poverty (incidence and depth) a pooled regression analysis is carried out for each poverty measure. Four sets of regression are carried out in the analysis by considering poverty head count ratios (Pov_ 1 and Pov_2) and poverty gap ratios (Pov_Gap1 and Pov_Gap 2) on the basis of poverty line of US$1.25 and US$2 per day respectively, adjusted for purchasing power parity. Trend of poverty indices across South Asian countries on the basis of international poverty line of US$1.25 and US$2 per day, adjusted for purchasing power parity is presented in Table 5In the regression analysis, we have pooled country specific poverty estimates for five countries[7] of South Asia during the time period 2000-12. Choice of pooled regression is guided by the Breusch and Pagan Lagrange Multiplier test. In fact, Breusch and Pagan Lagrange Multiplier test produces a chi-square value of 0.38, which is found insignificant (Table 6). Therefore, we do not reject the null hypothesis, and hence the random effects

model is not appropriate. However, the result of Random effect panel regression is presented in Table 7. However, a cursory look suggests that the coefficients of both the regressions (pooled and panel regressions) are somehow similar with a negligible minor difference (Table 7 and 8).

The results of the Pooled Regression Model identified the relationship between MFI's gross loan portfolio per borrower and poverty indices (Table 8). Empirical results of all the four specifications using four different poverty indices are observed to be closely related to each other. It can be suggested that GLP per borrower is negatively and significantly associated with the poverty head count ratio or poverty gap measure, which is consistent with our hypothesis that micro loans reduces poverty. As expected, GDP per capita is observed to be negative and statistically significant irrespective of the poverty measures chosen. However, the coefficients of the share of domestic credit to GDP are not found consistent with the finance-poverty literature[8]. In the context of South Asian countries, the negative implications of global financial crisis on poverty are not statistically established.

CONCLUSION AND FUTURE RESEARCH DIRECTIONS

The chapter focuses the linkage between microfinance outreach and poverty alleviation in the context of global financial crisis. A wide cross-country variation in the outreach of microfinance programme

to the poor households is observed. Asia retained its supremacy over a long period of time in regard to microfinance institutions, volume of savings and credit, and thereby served more poor members than any other continents. Microfinance programme in the South Asia region survived the setbacks of global financial crisis and witnessed much more resilient in compared to other continents in the world. In fact cross country experiences in South Asia exhibits little impact of the global financial crisis on the penetration of the microfinance programme to the poor households. Empirical observations using Pooled Regression Analysis identified a significant positive relationship between MFI's gross loan portfolio per borrower and poverty indices in South Asian countries. It is thus predicted that an all-inclusive microfinance system would strengthen the process of financial inclusion and thereby helps in eradicating poverty. However, the regression analysis is based on limited observations on international poverty data of six South Asian countries for the period 2000-12. Construction of poverty estimates is conditioned upon the available nation-wide household expenditure or income surveys which are carried out once or twice in a decade for most of the developing countries. The paper can be further developed by simulating the likely implications of global recession on poverty reducing effect of microfinance programme. The experience of other countries of the world may be considered as the interesting future research agenda in this field of study.

KEY TERMS AND DEFINITIONS

Breusch and Pagan Lagrangian Multiplier Test: This test procedure gives a guideline to select the appropriate model – pooled regression or random effect panel regression. It starts with testing a

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

hypothesis that there is no random effect. In other words, if we do not reject the null hypothesis, then it is fair to argue that random effect model is not appropriate in this case.

Global Financial Crisis: The effect of global financial crisis has been realized in the middle of 2007 and into 2008. The symptoms of the crisis are in the form of exposure of Hedge funds known as the sub-prime mortgage crisis, bank failures, a credit crunch, private defaults and massive layoffs. Consequently, stock markets have fallen across the countries, large financial institutions have collapsed, and governments in the advanced capitalist economies have sanctioned relief packages to bail out their financial systems. In the new international economic order, the crisis affected more or less every part of the world.

Microfinance: Microfinance refers to a wide range of innovative financial services that are devised to cater the needs of income-producing activities, build assets, stabilize consumption, and protect against risks. These services include savings, credit, insurance, remittances, and payments, and others. The design of the financial services in the form of smaller monetary amounts focused on the target group of households having lower incomes and limited access to other financial services.

Pooled and Panel Data: Data sets that combine time-series and cross sections are known as pooled data. Panel (or longitudinal) data is a special type of pooled data in which the data on same cross sectional units is collected overtime. It is said that all pooled data are not panel, but all panel data are pooled.

Pooled Ordinary Least Squares: In pooled regression model, all the cross section and time series data are pooled to estimate a grand regression, neglecting the cross section and time series nature of the data. In the regression model, it is assumed that the regression coefficients are the same for each of the cross sectional units. Like other OLS assumptions, it is assumed that the explanatory variables are non-stochastic.

Poverty Measures: The generalized measure of poverty was first developed by Foster, Greer and Thorbecke. This measure comprises three individual poverty indicators: head count ratio, poverty gap measure and squared poverty gap index. The present study focuses on the first two measures of poverty indices.

Random Effect Panel Regression: Panel regression model may be two types depending on the nature of correlation between individual effects and regressors. Unlike fixed effect model, this random effect regression model is applied when the unobserved individual effects are strictly uncorrelated with the regressors. In other words, the model is appropriate when the individual specific constant terms are randomly distributed across cross sectional units. This model is alternatively known as error components model.

South Asia: South Asia is the southern region of the Asian continent, which comprises the sub-Himalayan countries like Bangladesh, India, Sri Lanka, Pakistan, Nepal, Bhutan, Maldives, Afghanistan and Myanmar. South Asia is comprised of over one fifth of the world's population, and thereby considered as the most populous and the most densely populated geographical region in the world. It is to be noted that the South Asian Association for Regional Cooperation (SAARC) is an economic cooperation organization in the region which was established in 1985 with the active cooperation of seven countries — Bangladesh, Bhutan, India, the Maldives, Nepal, Pakistan and Sri Lanka.

ENDNOTES

[1] The largest distribution of loans and mobilization of savings in terms of GNP are recorded in South East Asia (Thailand, Bangladesh, Viet Nam and Indonesia), Latin America (Bolvia, Honduras,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Panama, Jamaica and Colombia) and East and West Africa (Kenya, Togo, Benin, Mali and Burkina Faso) (Lapenu and Zeller, 2001).

2 For international comparison, the population below absolute international poverty line is considered as those living on less than $1.25 a day adjusted for purchasing power parity.

3 We have not included the country Bhutan since Mix data provides information on the number of active borrowers in the country for the period 2009-11. The number of active borrowers have increased from 1, 99, 23 in 2009 to 2, 44, 76 in 2010 and further reached to 2, 78, 74 in 2011.

4 In Sri Lanka, some corporate entities see microfinance as a Corporate Social Responsibility activity or an image building exercise (Bedson, 2009).

5 These two penetration rates were first appeared in Asia Microfinance Analysis and Benchmarking Report, 2008.

6 A brief profile on the development of microfinance sector in selected South Asian countries is carried out in Appendix.

7 The country, Afghanistan, is excluded in the analysis of South Asia due to non-availability of data on the poverty estimates in the stipulated time period of the study.

8 In the finance –poverty literature, a deepening of microfinance system (measured by the share of domestic credit to GDP of a country) is expected to have a favorable impact on the reduction of poverty. Excepting the regression result of poverty head count ratio at US $ 2 per day (Pov_2), the coefficients of domestic credit are not found statistically significant.

APPENDIX

A Brief Profile of Microfinance Programme in Selected South Asian Countries

Bangladesh: In Bangladesh, microfinance sector is dominated by a few pioneering microfinance institutions, viz., BRAC, Grameen bank, Association of Social Advancement (ASA) and Proshiksha. These microfinance institutions have a vast network throughout the country and enable to outreach its services to the rural poor. Some of the remote areas in north and southwest districts have experienced lower penetration of microfinance services in comparison to the rest of the country. In the provision of financial services to the poorer sections of the population, private microfinance institutions (NGO-MFIs) accounting for 86 percent of the 14.3 million active borrowers (World Bank, 2006).

Sri Lanka: House-hold Income and Expenditure Survey conducted by The Department of Census and Statistics in Sri Lanka witnessed a gradual decline of poverty estimates from 26.1 percent in 1990-91 to 22.7 percent in 2002. The latest calculation of poverty indices shows that poverty level of the country has further declined from 15.2% reported in 2006-07 to 8.9% in 2009-10. The gradual reduction in poverty can be explained by the successful implementation of a wide-ranging poverty alleviation programme of the government targeting youth, women and the disadvantaged. As a part of the National Samurdhi Programme, Samurdhi Bank Societies (SBSs) were established in 1996 to targets the poorest segment of the population has contributed to this. However, circumstantial evidence gives enough reason to believe that microfinance programme led by SBSs and other agencies has contributed to this decline (Atapattu, 2009).

India: In India, SHG-Bank Linkage Programme (SBLP) has emerged as the major microfinance programme, even if there are other different models for extending microfinance in the country. The programme is being implemented by the commercial bank, RRBs and cooperative banks. The performance of the programme in outreaching its services has significantly scaled up subsequently. However, a deceleration trend is observed in the formation of new SHGs financed by the bank from 2009-10 (Government of India, 2012). The programme of SBLP is specially designed to cater the needs of women section of the population. It has been seen that around 80 per cent of the SHGs linked were exclusive women SHGs and their share in the disbursement of loan is around 85.73 percent.

Nepal: The Microfinance Development Banks (MFDBs) are the predominant direct providers of microfinance services in Nepal. In an effort to expand the outreach of microfinance services to the poor, the government in Nepal has directed all commercial banks to allocate 3 percent to the "deprived sector" and all development banks and finance companies are required to disburse at least 1.5 percent and 1 percent of their loan portfolios respectively to the poor. However, on the implementation ground, little progress has been done, and thereby, the poor and lower income clients still have limited access to microfinance services (Bedson, 2009).

Pakistan: In Pakistan, the microfinance sector has three key categories of regulated microfinance providers (MFPs): microfinance banks, rural support programs and specialized MFIs. Policy makers in the country have played an instrumental role in implementing some of the promotional measure so as to develop the microfinance sector. The policy of the State Bank of Pakistan to promote branchless banking and Islamic banking have been successful in covering the target group of population those who are so far been excluded from the purview of the sector, either due to their living in remote places or to their religious belief (Bedson, 2009).

Chapter 68
Rational Asymmetric Development:
Transfer Mispricing and Sub-Saharan Africa's Extreme Poverty Tragedy

Simplice A. Asongu
African Governance and Development Institute, Cameroon

ABSTRACT

A recent publication by the World Bank on Millennium Development Goals (MDGs) has established that extreme poverty has been decreasing in all regions of the world with the exception of sub-Saharan Africa (SSA), in spite of over two decades of growth resurgence. This chapter explores the role of transfer mispricing in SSA's extreme poverty tragedy. The analytical structure entails: (1) emphasis of rational asymmetric development as the dark side of transfer pricing; (2) linkages between financial reporting, international financial reporting standards (IFRS), transfer pricing and poverty; (3) evidence that the recent growth resurgence in African countries has been driven substantially by resource-rich countries which are experiencing high levels of exclusive growth and extreme poverty; (4) the practice of transfer mispricing by multinationals operating in resource-rich countries of SSA and (5) a Zambian case study of extreme poverty and transfer mispricing schemes by Glencore in the copper industry. While transfer mispricing is contributing to diminishing African growth, available evidence shows that the component of growth that is not captured by transfer mispricing does not trickle down to the poor because the African elite is also animated by practices of rational asymmetric development. Policy implications for the fight against extreme poverty are discussed.

1. INTRODUCTION

A recent publication by the World Bank on Millennium Development Goals (MDGs) has established that extreme poverty has been decreasing in all regions of the world with the exception of sub-Saharan Africa (SSA) (Caulderwood, 2015; World Bank, 2015). Consistent with Asongu and Kodila-Tedika (2015), about 45% of nations in the sub-region are substantially off-track from attaining the MDGs extreme

poverty target. From the evidence provided by Figure 1, it can be noticed that, but for SSA, extreme poverty has been decreasing in all other regions of the world. This is an unfortunate tendency, despite about two decades of growth resurgence that began in the mid 1990s (Alan & Carlyn, 2015, p. 598). In the light of these observations optimistic narratives about African rising should be treated with extreme caution, notably: (i) Pinkivskiy & Sala-i-Martin (2014) on all African countries attaining the MDGs extreme poverty target by 2014, with the exception of the Democratic Republic of Congo; (ii) Leautier (2012) on Africa's growing leadership role in the World and (iii) the continent witnessing considerable poverty decline compared to other world regions (Fosu, 2015a). It should be noted that the cautious position of Fosu is much more articulated in Chapter 1 (Fosu, 2015b) of his recent book on 'growth and institutions in Africa'(Fosu, 2015c). Nonetheless, such overly optimistic positions may have been motivated by a stream of the literature on 'the African growth miracle' (Young, 2012): a motivational current in the literature which is likely to be more concerned about promoting the interest of neoliberal ideology and capital accumulation. Therefore, neglecting fundamental ethical concerns like: ecological crisis, inequality and sustainability in job creation (Obeng-Odoom, 2013, 2014).

Over the past decades, a lot of scholarly attention has focused on the causes of African poverty (Englebert, 2002; Jerven, 2011; Kodila-Tedika & Agbor, 2014; Asongu & Kodila-Tedika, 2015). The plethora of studies has either been based on the existence of an African dummy or the assumption that the continent is fundamentally different from other regions of the world. Some of the documented reasons for persisting poverty include: social barriers to economic growth and technological change (Amavilah, 2015); deinstitutionalization of Africa (Nunn, 2008, 2009; Nunn & Puga, 2012) and/or loss of traditional African institutions (Amavilah, 2014a, 2006; Lewis, 1955); inability to make a clear distinction between 'private property rights' and 'private use rights' (Amavilah, 2015); overvaluation of foreign knowledge and undervaluation of local knowledge (Brush & Stabinsky, 1996; Raseroka, 2008; Lwoga

Figure 1. Comparative regional poverty levels

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

et al., 2010; Asongu, 2014a; Tchamyou, 2014; Amavilah et al., 2014; Asongu et al., 2014); over-idleness of natural resources (Doftman, 1939; Lewis, 1955; Amavilah, 2014a); 'Ignoring art as an expression of technological knowledge' (Amavilah, 2014a); excessive consumption of luxury (Adewole & Osabuohien, 2007; Efobi et al., 2013); lack of capacity to acknowledge scarcity (Lewis, 1955; Dorfman, 1939; Lucas, 1993; America, 2013; Drine, 2013; Looney, 2013; Asongu, 2014ab); negative influences from colonialism and noecolonialsm (Ndlovu-Gatsheni, 2013); false economics of preconditions (Monga, 2014); lost decades of policy prescriptions from the Washington Consensus (Lin, 2015; Asongu and Ssozi, 2015); less self-reliance (Fofack, 2014) and over-dependence on development assistance (Moyo, 2009; Obeng-Odoom, 2013; Asongu, 2014c); absence of qualitative measurements in African paradigms of development (Obeng-Odoom, 2013); inability to effectively negotiate for foreign aid, absence of favourable local conditions and presence of fragile institutions (Kayizzi-Mugerwa, 2001); low levels of regional integration (Kayizzi-Mugerwa, et al., 2014); corruption in international trade (Musila & Sigué, 2010) and asymmetric globalisation-fuelled policies that are more favourable to developed countries (Asongu, 2015a), inter alia.

To the best of our knowledge, the role of 'transfer mispricing' (hence TM) has not been substantially explored as a fundamental cause of African poverty. It is important to position a TM-related line of inquiry on Africa because with the continent's growth resurgence, Multinational corporations (MNCs) are expected to increases their presence in the region (Curtis and Todorova, 2011, p. 2).

According to Sikka and Willmott (2010, p. 342), in the conventional literature on accounting, transfer pricing (TP) is a technique that is employed by multinationals to optimally allocate revenues and costs across joint ventures, subsidiaries and among divisions within a group of entities that are related. Consistent with the authors, these representations of TP illustrate how multinational companies are substantially involved in processes of wealth retentiveness which enable corporations to avoid taxes and ease capital flight. In essence, while a conception of purely technical nature of computing TP could abstract from the politico-economic contexts of their development and usage, the context much reflects contemporary business activities or an époque of globalised trade combined with interactions among tax authorities of the state, shareholders and other stakeholders of the business practicing TP. It is acknowledged that the practices determine economic opportunities in ways that are critical in augmenting private gains, hence, contributing to social impoverishment of developing countries through tax avoidance (Nkurunziza, 2012). It is also worthwhile to note that TP is a legitimate business practice as it is a necessary accounting entry needed to ascertain profit arising from different jurisdictions. Therefore, TP in itself is not bad but it is the abuse of TP or TM that is bad because it could be a cause of poverty in SSA. While the interested reader may find recurrent references to illicit capital flight, it is important to also note that illicit capital flight is only an aspect of TM, but has been documented to represent the most substantial consequence of TM (Nkurunziza, 2012).

In light of the above, to logically establish that TM may be a source of extreme poverty in SSA countries, at least five conditions are necessary: (i) evidence of rational asymmetric development as the dark-side of TP; (ii) linkages between financial reporting, international financial reporting standards (IFRS), TP and poverty, (iii) establishing that the recent growth resurgence in African countries has been driven substantially by resource-rich countries which are experiencing high levels of exclusive growth and extreme poverty, (iv) substantiating that TM is practiced by foreign multinational in resource-rich countries in SSA and (v) a case study of a resource-rich country for which we clearly articulate the first-four points. In what follows, one section is devoted to elucidating each of the five points, while the last section concludes.

2. FINANCIAL REPORTING, IFRS, TRANSFER PRICING, AND POVERTY IN AFRICA

We discuss this section in five strands, notably: (i) the reason TP is important in Africa, (ii) TP schemes/ regimes, (iii) challenges to TP, (iv) future of TP and (v) linkages between TM, tax evasion and poverty in the continent.

In the first strand, TP is important for African countries essentially because at the advent of globalisation, MNCs are increasingly playing an important role in the economic growth of most countries (Curtis and Todorova, 2011). According to the narrative, as of 2011, more than two-third of transactions in the world, were related to MNCs. The authors sustain that attaining the MDGs requires, inter alia: increasing domestic revenues and consolidating domestic tax bases. This entails, tailoring TP policies such that domestic tax revenue is protected without disincentivising foreign direct investment (FDI) and international trade.

The second strand engages TP regimes in Africa. Curtis and Todorova (2011) have outlined various stages in the adoption of TP reform, namely: Stage 1, Stage 2 and Stage 3 respectively 'Developing countries that do not have TP legislation in place', 'Developing countries that are on the verge of implementing TP legislation' and 'Countries with existing TP legislation'. Accordingly, stages of development are the basis for categorising a given TP regime corresponding to the specific country. In Africa, the picture is mixed at best. The perspective is the following for some countries, inter alia: well established referenced TP regimes (Kenya and South Africa); recently passed TP legislation (Uganda); expectations of enacting TP legislation (Nigeria and Zimbabwe); tax code provisions that mention TP (Mozambique and Algeria) and no TP regulation/legislation (Libya and Sudan). This heterogeneity among countries represents substantial challenges to harmonizing TP policies across the continent.

Challenges for African TP regimes in the third strand have inevitable consequences like tax evasion which has substantial poverty externalities (Nkurunziza, 2012). Documented challenges by Curtis and Todorova, (2011) include: lack of comparable transactions, lack of knowledge and resources, the intangible economy or intellectual property (IP) regimes which skew most taxable income to developed countries, concerns with location of savings and lack of comprehensive tax treaties.

The fourth strand relates to the future of TP in Africa. According to Curtis and Todorova, (2011), since more African countries engaging-in and/or speeding-up the adoption process of TP regimes, it is imperative for the underlying TP policies to be harmonized at some point in time. The integration process of the continent into the global economy would require, inter alia, the adoption of comprehensive and harmonized TP policies. To this end, strategic safeguard harbours with which to ease capacity and compliance concerns have been documented by Curtis and Todorova (p.11).

Harmonizing TP policies is very crucial because according to Donnelly (2015), the 2015 African Economic Outlook report has revealed that TM is substantially retarding the continent's development because of the absence of a monitoring capacity which focuses on tax avoidance. The report is jointly published by the Organisation for Economic Co-operation and Development (OECD), the African Development Bank (AfDB) and the United Nations Development Programme (UNDP). The authors sustain that 'illicit flows of tax revenue collection' is continuously falling short of the needs of countries. According to the narrative, there has been an extensive abuse of TP and only three African countries are currently in possession of TP units in their internal revenue services': "Lack of official monitoring capacity leaves African countries highly vulnerable to these tax avoidance practices".

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This leads us to the fifth strand on linkages between TM, tax evasion and poverty. Donnelly (2015) have recently reported on the abusive TP and tax evasion that are contributing to substantial losses of income that would have been invested on the poor in African countries, notably: more than 60 billion USD annually. We articulate the report by Donnelly (2015) with numbers to enhance clarity. The issues of illicit financial flows from the continent are in the neighbourhood of 4% of Gross Domestic Product (GDP): outstripping FDI and official development assistance (ODA). The unlawful money flows entail practices that build around tax evasion, via, inter alia: abusive transfer pricing, trade misinvoicing, bribery and money laundering by international companies. According to the report, in 2012, illicit flows from SSA stood at about 68.6 billion USD, compared to 35.4 billion USD and 41.1 billion in FDI and ODA respectively. Moreover, given that these unlawful transactions are surreptitious, there is a high likelihood that the actual scales of the illicit financial outflows are being substantially under-reported.

On the nexus with poverty, the corresponding research estimates that the stock of African capital would have increased by more than 60% had the underlying illicit funds been retained in the continent, whereas GDP would have been about 15% higher. Given that economic growth is needed for poverty reduction, the link between illicit capital flows and poverty cannot be denied. Donnelly (2015) further reports that commercial corporations account for a substantial portion (approximately 65% of illicit capital flows), followed by organised crime (about 30%) and corruption-related practices (5%). Moreover, trade misinvoicing or the deliberate under- and over-invoicing of trade transactions has been the most widely documented method of the illegal transfer of money across borders, representing about 67.4% of corresponding illegal outflows during the period 2003 to 2012.

The deplorable linkages between TP, tax losses in domestic economies and negative externalities on economic development have been articulated in a recent report by renowned economists who have qualified the international tax system as 'repulsive and inequitable' (Walsh, 2015). According to Nobel Prize laureate Joseph Stiglitz, the manner in which MNCs are taxed is 'repulsive, inequitable and inefficient'. Stiglitz emphasises that, whereas tax systems are national, MNCs and their capital are global; hence, they have "free rein to move their money around to the low-cost jurisdictions" (Walsh, 2015).

This tendency deprives developing countries (especially in Africa) of the capital needed for investments in education, health and development programs. According to Stiglitz, "it undermines the social and economic fiber of a country". Moreover, he articulates that endowing MNCs with tax breaks and implicitly allowing them to engage in schemes of TM makes domestic companies less willing to comply with their own tax obligations: "If multinational companies are escaping taxation, domestic firms are put in an unfair competitive position and it distorts the economy". For brevity and lack of space, we invite the interested reader to get more insights into country-specific consequences of TM in Ndikumana & Boyce (2012a). Diak (2014) posits that, had the tax revenues lost to TM been spent on healthcare since the year 2000, with incremental tax revenue from avoidance of capital flight, approximately 350 000 children could have been saved on a yearly basis.

Fofack and Ndikumana (2010) have estimated that if a quarter of capital flight was repatriated to Africa, the continent's domestic investment as a percentage of GDP would increase from about 19% to 35%. Channels via which capital flight increases poverty have been documented by Nkurunziza (2012) who has empirically examined linkages between capital flight and poverty in Africa. According to the author, TM (e.g illicit financial flows) increases uncertainty and risk in the domestic economy, thereby discouraging investment and its potential appealing impact on the mitigation of poverty. Moreover, countries with high corruption levels in which the governing elite have more opportunities of unlaw-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

fully appropriating resources and transferring them to save havens abroad, there are limited or decreased incentives to put in place socio-economic measures for poverty reduction. This is essentially because the corresponding elites may easily recourse abroad for services that are lacking domestically.

3. RATIONAL ASYMMETRIC DEVELOPMENT AND THE DARK SIDE OF TRANSFER PRICING

In this section, we: (i) clarify the concept of rational asymmetric development; (ii) elucidate the correlation between rational asymmetric development and TM and (iii) engage the dark side of TP.

Consistent with Asongu (2015a), rational asymmetric development "refers to unfair practices of globalisation adopted by advanced nations to the detriment and impoverishment of less developed countries" (p. 14). The author refers the interested reader to find more insights into the phenomenon in studies focused on capitalism-oriented rational asymmetry. Some examples include: 'Making Globalisation Work' by Stiglitz (2007) which documents that "The average European cow gets a subsidy of $2 a day; more than half of the people in the developing world live on less than that. It appears that it is better to be a cow in Europe than to be a poor person in a developing country" (p. 85). Additionally, "Without subsidies, it would not pay for the Unites States to produce cotton; with them, the United States is, as we have noted, the world's largest cotton exporter" (p.85). Moreover, the Chang (2008) 'Bad Samaritans: The Myth of Free Trade and the Secret History of Capitalism' also provides insights into the underlying concept. Mshomba (2011) has also provided an African specific-perspective with a systematic review of how the World Trade Organisation (WTO) policies are affecting Africa while Asongu (2015a) has extended the celebrated Piketty (2014) literature to elucidate the spirit of African poverty.

Drawing from the above, in the second strand there are grounds on which to sustain that capitalism-fuelled TM is fundamentally motivated by rational corporate policies from multinational companies which are primarily concerned about increasing shareholder value, with little regard over how such practices (like tax evasion) affect the livelihoods of the poor in the less developed world from which they operate. According to Osabuohien et al. (2013, 2014, 2015), multinational corporations in African countries have been increasingly employing very questionable accounting practises that enable them to declare minimum profits and therefore liable to low taxes to African governments. The dichotomy between less developed and more advanced countries comes-in when such rational corporate practices are destined to increase tax revenues in more advanced countries, to the detriment of their less developed counterparts. In this light, owing to accounting malpractices, a substantial chunk of wealth from African countries ends-up in offshore financial centres that are for the most part under the jurisdictions of the OECD nations (Boyce & Ndikumana, 2003, 2010; Fofack & Ndikumana, 2010). Given that, these offshore financial centres are economically and politically managed by OECD countries, it follows that advanced nations are the primary beneficiaries of these rational corporate practices. Hence, the term: 'rational asymmetric development'.

The European Network on Debt and Development (EURODAD, 2008) has provided an interesting literature on how the 'black hole' of asymmetric development can be tackled through capital flight regulation. It is important to note that more than 50% of illicit capital flight from developing countries involves questionable accounting practices by corporations (EURODAD, 2008, p. 7). Some characteristics of capitalism-driven illicit capital flight practices documented in the study include: (i) speculation and volatility, (ii) tax havens, tax concessions, investment and abusive TP, (iii) emergence of hedge funds

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and private equity, (iv) capital account liberalisation and its implications, (v) failure by the International Monetary Fund (IMF) to enhance financial surveillance and regulation and (vi) European nations easing conditions for regulatory inefficiencies in hedge funds and private equity, as well as facilitating capital flight from less developed countries. From the above narrative, asymmetric development between rich (high-income) and poor (low-income) countries is fundamentally driven by capitalism-oriented policies, with TM fundamentally motivating the flow of illicit capital flight from less developed to developed countries.

Borrowing from Sikka and Willmott (2010), we engage the dark side of TP in the third strand. According to the authors, TP is of growing relevance to companies in the globalised world where their operations are not limited to a single country, but extended to nations with differing regulation capacities and regimes of taxation. The narrative sustains that, in the pursuit of cash flows, marketing goals, joint ventures, profits, inter alia, corporations are obliged to recourse to rational measures of taxable profits and cost performance. Under such environmental conditions, multinational corporations develop processes of overhead- and cost-allocation as well as design strategies with which to transfer commodities. Given the subjective nature of overhead and cost allocation channels, companies enjoy some discretion in tailoring them towards specific geographical jurisdictions and commodities. Such discretion allows them to keep taxes at minimum, hence, increasing profits. The strategy consists of allocating most profits to low-risk and low-tax jurisdictions. While there is some consensus that TP can help companies mitigate the negative effects of double taxation, the practice is substantially abused as it is: (i) used to shift profits by virtually every multinational company in the world (Baker, 2005) and (ii) increasingly being employed to artificially shift profits to low- from high-tax jurisdictions, thereby maximizing income in the former and expenses in the latter. Ultimately, TP remains the most important issue of international taxation that Multinational Enterprises (MNEs) are increasingly being confronted with (Ernst & Young, 2006). This is essentially because it is very instrumental in tax avoidance (Ernst & Young, 2005), which has consequences in the distribution of public commodities and wealth in low-income countries.

Globalization has brought about new dimensions in the politics of TP (Sikka and Willmott, 2010). Extricated from the constraints of territorial jurisdictions, MNEs find it easier to establish joint ventures, trust, special purpose entities, affiliates and subsidiaries that enable them to take advantage of favorable subsidies and taxes in certain geographic locations. Hence, global production has brought new and extensive avenues for TP schemes that enable MNEs to avoid taxes in less desirable locations and shift profits to more desirable areas. The sheer complexity, power and scale of globalization represents a significant challenge to mainstream thinking on TP, essentially because owing to complex production and exchange networks: (i) domestic corporations now have transnational and multinational tendencies and (ii) foreign corporations either work with local companies through joint ventures or establish fresh businesses in new jurisdictions.

The overwhelming increases in corporate power and global trade has provided many avenues for crafting 'tax avoidance' TP strategies, especially with the tendency of MNEs exploiting natural resources in less developed countries. Hence, developing nations are substantially vulnerable to TP practices of illicit capital flight and/or tax avoidance (Borkowski, 1997). The evidence of manipulation by MNEs in developing countries has been documented in a broad stream of literature. First, the IMF's position that the globalization of trade has emerged in tandem with numerous issues for national tax authorities, accruing from the abuse and potential use of TP by MNEs, entailing, the allocation of fixed costs, loans, patents and trademark valuations (Sikka & Willmott, 2010). Second, a plethora of tax administrators are involved in TP practices (Tanzi, 2000).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The strength of MNEs is consolidated with the ideologies of capitalism, as nation-states are obliged to compete in order to attract the investment needed to boost domestic economies. This competition engenders avenues by which MNEs devise TP strategies, rationally needed to take advantage of differences in taxes across nation-states (Sikka & Willmott, 2010). In addition, the opportunities provided by TP are beginning to facilitate the birth of microstates, which are known as 'tax havens' or offshore financial centers. These microstates are instrumented by advanced nations with legislative powers to provide less tight regulation, preserve secrecy and impose no/low taxes which are attractive to MNEs seeking blur administrative structures. The secrecy represents a fertile ground for creative TP schemes that are being exploited for tax avoidance. No wonder approximately half of global trade transactions transit via offshore financial centers, despite these jurisdictions accounting only for about 3% of World GDP. While microstates represent only 1.2% of the global population, they account for 26% (31%) of assets (net profits from American MNEs) (Sikka & Willmott, 2010).

We end this section by providing some stylized facts on the increasing power of microstates and growing influence of MNEs vis-à-vis nation states. First, consistent with Sikka and Willmott (2010), every year about 200 000 new corporations are created in microstates, with a cumulative number of about 3000 000 after the turn of the millennium according to Baker (2005). Consistent with the narrative, some cases in point include: (i) a building in Caymans registering about 18, 857 corporations, including major global MNEs (US Government Accountability Office, 2008); (ii) the British Virgin Islands (Caymans) having 3389 (182) corporations by per 100 people and (iii) the 575 residents of Sark Island (part of the Channel Islands) having some 15,000 companies which are non-resident corporations for the most part (UK Home Office, 1998). A common denominator among these tax havens is that they do not impose taxes on the profits of corporations and hence, local tax authorities are not concerned about TM practices. Second, at the start of the third millennium, of the 100 largest economies, 51% were not nation states but MNEs with a considerable exercise of power (Anderson et al., 2005). We engage the narrative in five points. First, the 100 biggest companies controlled about $3400 billion worth of assets, of which about 40% are not located within domestic economies. Second, the top 200 companies represented about 28% of the world economy. Third, the top 500 controlled 70% of global trade, 80% of FDI, 30% of world GDP, about 33.3% of manufactured exports, 75% of trade in goods and services and approximately 80% of trade in technical and management services. Fourth, less developed countries which are dependent on agriculture are left to the whims and caprices of MNEs because, only 20 controlled the trade of coffee, 6 influenced 70% of trade in wheat, 1 controlled about 98% of packed tea production and 2 companies influenced about 80% of world grain which was distributed by two MNEs. Fifth, intellectual property rights (IPRs) were essentially monopolized at about 97% by OECD nations, of which 90% were held by powerful MNEs (Anderson et al., 2005).

4. AFRICA RISING, RESOURCE-RICH SSA COUNTRIES, EXCLUSIVE GROWTH, AND POVERTY

In this section, drawing from the evidence that most of Africa's growth has been driven by resource-wealthy countries with oil, mining and gas industries (Deaton, 1999; Veselinovic, 2015), we present evidence that underlying countries are characterised with exclusive growth and poverty. We have shown above that the growth resurgence in the sub-region has been fundamentally driven by resource-rich nations owing to increasing commodity prices (Boyce & Ndikumana, 2012ab; Asongu, 2014d). Unfortunately,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

these wealthy nations are also plagued by substantial extreme poverty, with comparatively lower social and health amenities. Putting the account into greater perspective (Ndikumana & Boyce, 2012b): the Republic of Congo, Gabon and Equatorial Guinea are among these countries with per capita incomes (wealth rank) of respectively $1,253 (15th), $4,176 (5th) and $8,649 (2nd) and oil reserve ranks of 8th (Congo), 7th (Gabon) and 10th (Equatorial Guinea). Consistent with the account, a great portion of the population in these nations still live in very abject poverty. Accordingly, the lack of basic social services, drinkable water, elementary schools and decent sanitation are eloquent testimonies. For example, Gabon and Equatorial Guinea both rank second- and third-to-the last with 55% and 51% respectively of immunization rates against measles. Moreover, the probability of a child reaching his/her fifth birthday in Equatorial Guinea is lower than the average of the SSA sub-region.

Evidence of exclusive growth is provided by a recent global ranking on 'quality of growth' provided by the IMF (Mlachila et al., 2014, p. 27)[1]. Drawing from time-dynamic assessments of the performance from 93 developing nations in terms of 'quality of growth', rankings of the highlighted oil-wealthy nations have been deteriorating substantially. In essence, evidence from 1990-1994, 1995-1999, 2000-2004 and 2005-2011 shows increasing exclusive growth: Congo Republic (59th, 70th, 74th & 84th), Gabon (58th, 61st, 67th & 69th) and Equatorial Guinea (76th, 73rd, 76th & 88th).

In light of the above, the position of SSA countries in Figure 1 is not surprising, given that the two decades of growth resurgence has been marred by inequality[2]. The stance can be elucidated on two counts: (i) the relationships among, growth, inequality and poverty and (ii) evidence that growth in the sub-region has been marred by inequality which justifies the growing extreme poverty.

First, inequality substantially affects the relationship of growth on poverty because the inequality elasticity of poverty is higher than the growth elasticity of poverty (Asongu & Kodila-Tedika, 2014). In more specific terms: "The study finds that the responsiveness of poverty to income is a decreasing function of inequality" (Fosu, 2010a, p. 818); "The responsiveness of poverty to income is a decreasing function of inequality, and the inequality elasticity of poverty is actually larger than the income elasticity of poverty" (Fosu, 2010b, p. 1432); and "In general, high initial levels of inequality limit the effectiveness of growth in reducing poverty while growing inequality increases poverty directly for a given level of growth" (Fosu, 2011, p. 11). This evidence is consistent with studies focusing on Africa (Fosu, 2010ac) and a broad sample of developing nations (Fosu, 2010b; Asongu et al., 2014).

Second, Africa's growth resurgence has been marred by inequality (Blas, 2014; Veselinovic, 2015). According to Veselinovic (2015), Africa's growth has been characterised by the rich getting richer and the poor getting poorer. According to the narrative, the continent is characterised with inter alia, (i) seven of the 10 fastest-growing economies in the world, (ii) the highest expected-increase in the number of multimillionaires over the next 10 years (59%) and (iii) 6 of the 10 countries with the highest inequalities, notably: South Africa (65), Namibia (61.3), Botswana (60.5), Zambia (57.5), Central African Republic (56.3) and Lesotho (54.2).

The facts on inequality substantially contrast with a recent strand of literature on Africa rising (Young, 2012; Leautier, 2012; Alan & Carlyn, 2015; Fosu, 2015a). The continent is becoming the destination for luxury commodities (e.g Nigeria being a top Champagne market) and about 45% of Africans are still living in extreme poverty (Asongu & Kodila-Tedika, 2015). It follows that, the fruits of economic prosperity gathered in recent decades have not rolled-down to the poor. Moreover, the resource-industries driving African growth (Bond et al., 2010), intuitively do not employ a substantial bulk of the population because they are capital-intensive for the most part. Hence, the growth is not broad-based as only a few elite are benefiting from the economic prosperity.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

5. RESOURCE-RICH COUNTRIES, TRANSFER MISPRICING (TM), AND CAPITAL FLIGHT

Consistent with the caution in the introduction, illicit capital flight is only an aspect of TM. We have seen above that TM contributes to more than 50% of illicit capital flight from developing countries. Consistent with Asongu (2014d), most of the illicit capital flight in Africa is driven by resource-rich nations (EURODAD, 2008, p.7). Hence, interactions among resource-wealth, TM and illicit capital flight are fundamental to the poverty tragedy or the spirit of poverty in SSA (Asongu, 2015a). But in order to fully understand these nexuses, it is important to engage how illicit capital flight is linked to poverty.

Drawing from Asiedu et al. (2012) and Asongu (2015a), one of the justifications put forward for Africa's underdevelopment is the shortage of investment capital. In line with the Harrod-Domar model, three arguments have been advanced: (i) Africa is confronted with a 'financing gap' issue because invested capital is substantially lower than the capital required for sustainable growth investment; (ii) long-run development is achievable with the bridging of the 'financing gap' and (iii) for the 'financing gap' to be filled, the continent would need external finance in the forms of development assistance and debts. It is in this light that calls for more development assistance have been increasing after unsuccessful attempts at attracting foreign direct investment (FDI) through domestic financial markets and liberalisation policies (Asiedu, 2004; Asongu, 2012). According to the authors, the relevance of external finance in Africa's development has been encapsulated in the New Partnership for African Development (NEPAD) and the Millennium Development Goals (MDGs).

In line with Asiedu et al. (2012), dependence on external finance by African countries to fight poverty is problematic for a threefold reason. First, development assistance and FDI are extremely volatile and such volatility has substantial adverse consequences on recipient economies, especially during global financial meltdowns (see Kangoye, 2013; Quartey & Afful-Mensah, 2014). Second, a bulk of recent literature has also shown that the impact of development assistance on economic growth is ambiguous. These includes, provocative narratives like 'foreign aid follies' (Rogoff, 2014), sceptical surveys from more than four decades of development assistance (Doucouliagos & Paldam, 2008, 2009), radical positions (Asongu, 2014c) and clarifications on the questionable economics of development assistance in Africa (Asongu, 2015b), and inter alia, the need to reinvent foreign aid for inclusive and sustainable development in light of Piketty's (2014) celebrated literature (Asongu, 2015c). Third, efforts at attracting FDI to the SSA sub-region have not been very successful (Asiedu & Lien, 2011; Anyanwu, 2012). This narrative is consistent with the bulk of African business literature (Rolfe & Woodward, 2004; Bartels et al., 2009; Asongu, 2013ab).

The current of literature above provides evidence to the fact that, the use of foreign aid to compensate for TM and/or illicit capital in SSA has several shortcomings. In essence, given that previous attempts at attracting other forms of external financial flows like FDI have not been successful and with the tendency unlikely to change in the near future, it would be unrealistic to suppose that overly reliance on development assistance would in the short- and medium-runs compensate for Africa's investment needs. While solutions to the issue have varied from self-reliance (Fofack, 2014) to the recommendation '*that sub-Saharan African nations establish effective strategies toward mitigating illicit capital flight within the framework of a broader agenda of resource mobilization for economic development*' (Asongu, 2015, p.19), the conjectures of Fosu presented in Section 3 clearly emphasise the need to improve inequality structures before the growth benefits in poverty eradication can be fully reaped. Hence, TM is as im-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

portant to existing inequality structures in policy priority. Therefore, the two policy syndromes should be tackled simultaneously, with greater emphasis on structural inequality. We illustrate narratives in the last-four sections with the case study of Zambia.

6. CASE STUDY: ZAMBIA, TRANSFER MISPRICING, GLENCORE, THE COPPER INDUSTRY, AND POVERTY

TM represents a rational asymmetric development issue of how much profit is fair? In other words how much should be rationally stolen from Africa by MNEs operating in resource-rich countries? As far as we have reviewed, a case study that can objectively illustrate the line of inquiry addressed by this chapter is Zambia, Glencore and the Copper industry. Glencore Plc is an Anglo-Swiss MNE, specialized in mining and commodity trading, headquartered in Baar-Switzerland, ranked 10th of the Fortune Global 500 of the world's largest corporations and third largest family business of the world (Why Poverty, 2013). Zambia as a nation has been blessed with abundant natural resources, especially in copper. However, the paradox is that the country is ranked among the bottom 20 in terms of poverty. Hence, the country is rich and at the same time poor, which translates the issues of inequality and asymmetric development (Why Poverty, 2013).

The overarching issue is why Zambia with its abundant natural resources is one of the world's poorest countries? In other words, why have booming copper prices not reduced her poverty? This has been widely debated in political and academic circles. In the former, some parliamentarians have even threatened to walk to the copper mines and request them to pay their taxes. On the latter, there is an evolving stream of literature on TP in the Zambian copper industry (Ping, 2007; Azémar & Corcos, 2009; Adam & Simpasa, 2010; Why Poverty, 2013). While copper represents averagely more than 70% of exports, the 'copper share of fiscal revenue' and 'copper revenue/GDP' have revolved respectively between 0.1% and 12.9% and between 0.0% and 2.8% for the period 1994-2008 (Meller & Simpasa, 2011, p.20). Despite the fact that the price of copper nearly quadrupled between 2001 and 2008, the shares of copper in fiscal revenue and 'revenue as a % of GDP' remained averagely unchanged. For instance in 2006, while Copper exports from Zambia stood approximately at 3 billion USD, corresponding tax revenue was just 50 million USD. And given that the Zambian government has an underlying contract of furnishing electricity, which stood at 150 million USD for that year, it was a loss to the Zambian economy (Why Poverty, 2013). The fact that tax revenues paid by mining industries to Zambia did not increase correspondingly with the burgeoning of world copper prices eloquently translates the concept of TM. In 2008, '*if Zambia had received for its copper exports the same price that Switzerland declared for its copper exports, in the same quite detailed commodity categories, Zambia's GDP would have nearly doubled that year*' (Why Poverty, 2013, 40:00mins to 40:15mins).

An audit of Mopani Copper Mines, initiated by the Zambian government has established evidence of TM. When the report was made public, the European Investment Bank suspended further loans to Glencore. The case has been reported to the OECD by one Zambian charity on charges that Glencore has been violating tax-related guidelines. Unfortunately, failure by Glencore to cooperate has led the OECD to admit it can do nothing about the case if one party refuses to cooperate (Why Poverty, 2013).

Glencore is the world's largest integrated commodity trader, with a yearly turnover of approximately 180 billion USD which is more than 8 times the GDP of Zambia. It controls Mopani Copper Mines in

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Zambia, with a 73% stake and all copper produced by Mopani is sold to Glencore. The copper from Zambia is sold among subsidiaries of Glencore such that the highest margins are obtained from those located in countries with low or no tax requirements (Why Poverty, 2013).

Environmental issues have also been raised, with some of Glencore's activities suspended because of diluted acids drifting from production plants to homes. There have been incidences in 2005 and 2008 in which contaminated water has sent hundreds of people in townships near the Mopani Copper Mines to hospitals. Sulfur dioxide emitted by the mines is causing severe respiratory problems. Some accounts even sustain that the emissions of impurities by the mines is about 1000 times higher than the limits tolerated by the World Health Organization (WHO) (Why Poverty, 2013). We resist the itch of engaging this dimension further because it may derail us from the TM focus of the study.

Today, with the copper boom, unemployment is not decreasing and about 64% of Zambians still live below the poverty line (Why Poverty, 2013). Moreover, it is the fourth country with the highest inequality rate in the world (Veselinovic, 2015). A logical implication here is that even in the absence of TM, the elite of the country would still exercise rational asymmetric development practices by preventing the juice of economic prosperity from trickling down to the poor. Hence, it is fundamental to deal with the inequality structures in the country, so that, if and when fair taxes are paid by MNEs, their externalities are broad-based and not captured by a few.

We now devote some space to engaging how financial reporting standards in Zambia are being improved to address discussed TM issues. According to Curtis & Todorova (2011, p.23), the following general and specific and considerations elucidate Zambia's response to TM. First, on the general consideration, the country has fully adopted OECD guidelines on the issue. But while, the Zambia Revenue Authority (ZRA) requires documentation to be provided to justify TP, no specific guidance is provided concerning the quantity and quality of sufficient documentation. TP issues are tackled under general anti-avoidance provisions because there are no specific TP penalties. The authors further articulate that the ZRA does not possess its own TP database and areas reviewed by the underlying authority include: purchase of trading goods, royalties and management of fees. While the ZRA is improving its human resources through trainings abroad, there is yet no move to establish a unit within the organisation that specifically addresses TP issues.

Second, on the specific considerations, authors of the report caution that taxpayers should exercise caution when planning to enter the domestic market. Whereas subsidiaries and branches are objects of the same statutory rates, there are inherent disparities in the manner in which transfer of funds by related parties are treated. In essence, while funds may be repatriated to a related party 'free-of-withholding tax' by a branch, a subsidiary (absent a treaty) is obliged to declare a dividend. Therefore the latter fund is subjected to a 15% tax withhold. It follows that it is advisable to locate a holding company in a treaty country (Curtis & Todorova, 2011).

7. CONCLUDING IMPLICATIONS

A recent publication by the World Bank on Millennium Development Goals (MDGs) has established that extreme poverty has been decreasing in all regions of the world with the exception of sub-Saharan Africa (SSA), in spite of over two decades of growth resurgence. This chapter has explored the role of transfer pricing in SSA's extreme poverty tragedy. The analytical structure entails: (i) emphasis of rational

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

asymmetric development as the dark side of transfer pricing; (ii) linkages between financial reporting, international financial reporting standards (IFRS), transfer pricing and poverty; (iii) evidence that the recent growth resurgence in African countries has been driven substantially by resource-rich countries which are experiencing high levels of exclusive growth and extreme poverty; (iv) the practice of transfer mispricing by multinationals operating in resource-rich countries of SSA and (v) a Zambian case study of extreme poverty and transfer mispricing by Glencore in the copper industry.

Two main policy implications are derived for the fight against extreme poverty. First, Africa needs to deal with its inequality structures, because the current tendency shows that even in the absence of transfer pricing, inequality is still worsening. Second, the concept of rational asymmetric development is not only limited to the relationship between developed nations and African countries by the bond of transfer mispricing or illicit capital flows. Such tax avoidance mechanisms also substantially exist between the rich and poor segments of African populations. Hence, the rich of poor countries also device all kinds of schemes to avoid declaring their full incomes and hence, limiting the tax paid for the ultimate delivery of collective or public commodities.

In essence, if the component of growth that survives transfer mispricing practices cannot trickle down to the poor, there is no guarantee that even with the absence of detrimental transfer pricing, the incremental growth would trickled-down to the poor. Dealing with the structures promoting inequality would entail, inter alia, understanding the role of inequality in poverty-growth transformations. Accordingly, inequality substantially affects the relationship of growth on poverty because the inequality elasticity of poverty is higher than the growth elasticity of poverty (Asongu & Kodila-Tedika, 2014). In more specific terms: "The study finds that the responsiveness of poverty to income is a decreasing function of inequality" (Fosu, 2010a, p. 818); "The responsiveness of poverty to income is a decreasing function of inequality, and the inequality elasticity of poverty is actually larger than the income elasticity of poverty" (Fosu, 2010b, p. 1432); and "In general, high initial levels of inequality limit the effectiveness of growth in reducing poverty while growing inequality increases poverty directly for a given level of growth" (Fosu, 2011, p. 11). This evidence is consistent with studies focusing on Africa (Fosu, 2010ac) and a broad sample of developing nations (Fosu, 2010b; Asongu et al., 2014).

ENDNOTES

1 It is important to note that Mlachila et al. (2014) have presented a comparatively more holistic measurement of inclusive development, termed 'quality of growth'.

2 This is broadly consistent with recent African development literature that has been focusing on, inter alia: unemployment (Anyanwu, 2013; Inekwe, 2013), pro-poor growth (Daouda, 2013), income-inequality (Caracciolo & Santeramo, 2013: Ncube et al., 2014), gender-inequality (Anyanwu & Augustine, 2013; Elu & Loubert, 2013) and poverty (Iwasaki & El-Laithy, 2013; Mkondiwa et al., 2013).

Chapter 69
Population Growth and Urbanization in Africa:
Implications for the Environment

Samuel Adams
Ghana Institute of Management and Public Administration, Ghana

Eric Evans Osei Opoku
City University of Hong Kong, Hong Kong

ABSTRACT

This study examined the effect of population growth and urbanization on the environment (carbon dioxide emissions) for 37 sub Saharan African countries based on 1980-2010 annual data. Using the Pooled Mean Group estimation technique, the findings of the study show that affluence and industrialization have negative effect on the environment (increases carbon dioxide emissions) while urbanization does not have a significant effect on carbon dioxide emissions. The population variable is significant only in the long run but insignificant in the short run. Also, after controlling for the different age groups, the results show that the more active age group (15-59) is positive and significantly related to carbon dioxide emissions.

INTRODUCTION

Recent reports indicate that though there have been significant changes in the demography of the world in the last 20 years, changes in the size of the population have been more significant (United Nations [UN], 2014a). For example, the population of the world increased from 5.7 billion in 1994 to 7 billion in 2011 and an estimated figure of 7.2 billion in the beginning of 2014 and is expected to reach a population of 8.1 billion in 2025 and Africa's population growth is expected to contribute significantly to this.

Considering the limited facilities to support population growth in Africa, it is surprising to note that the region contributes 33 percent of the 82 million people added to the world's population annually. It is also expected to account for more than 80 percent of the global increase in population by 2050 (UN,

2014a). These estimates are not farfetched considering the fact that Africa's population size has grown from an average of 297 million in 1960-1964; 383 million in 1970-1974, 503 million in 1980-1984, 660 million in 1990-1994, 747 million in 1995-1999, 841 million in 2000-2004 and 944 in 2005-2009[1] (see Table 1 in Appendix).

Like population growth, the rate of urbanization has increased rapidly around the world. In 2014, more than 54 percent of the world's population was urbanized compared with the 1950 rate of 30 percent (UN, 2014b). Urbanization in Africa is increasing at a very fast rate. For example, urban population increased from an average of about 59 million in 1960-1964 to 75 million in 1965-1969, 94 million in 1970-1974, 117 million in 1980-1984 to 178 million in 1985-1989 (see Table 1 in Appendix). The average rise in the average urban population has been more profound after the 1990s. For example, the period 1990-1994 saw average urban population size of 216 million. This figure increased to an average of about 259, 306 and 361 million for the periods 1995-1999, 200-2004 and 2005-2009 respectively. The rapid rate of urbanization is attributed mainly to the movement of people from the rural areas to urban centers to seek jobs in both the formal and informal sectors and a better standard of living (Todaro, 1997).

The rapid population growth and urbanization are associated with high rate of infrastructural development and huge energy demand, all of which pollute the environment and consequently detrimental to the environment and human health (Shahbaz et al., 2014). Increasing urbanization implies increasing formation of cities, and as Sadorsky (2014) notes, cities usually become wealthier by expanding their manufacturing which can adversely affect the environment. Temurshoev (2006) asserts that developing countries generally experience higher levels of environmental degradation because of their lax environmental regulations. This is consistent with the observation that carbon dioxide emissions have increased consistently over the years from 171 million metric tonnes in 1964 to 446 million metric tonnes in 1979 and over 1100 million tonnes by 2010 (see Table 1 in Appendix).

Environmental degradation, especially the emission of carbon dioxide is believed to be the main cause of climate change (Kessel, 2000; Pittock, 2003; Rehan and Nehdi, 2005), which has adverse effect on agriculture, particularly in the tropics (IPCC, 2001). The implication is that the poorest parts of the world are in danger of escalating hunger (IPCC, 2001). Besides, climate change is also believed to have adverse effect on human health (see, Kurane, 2010; Dhillon and von Wuehlisch, 2013). Though population growth and urbanization might be good for education, health care, housing and other essential services if well organized (UN 2014a), it can pose great danger to human development if not well planned. Sub-Sahara Africa (SSA) recorded the lowest human development index (HDI) of 0.502 in 2013 (United Nations Development Programme [UNDP], 2014) amidst increasing population and urbanization. Africa also remains the poorest continent in the world (Handley et al., 2009).

In view of the rapid population growth and urbanization, this chapter seeks to examine its effects, if any, on the environment in Africa. Studies of this sort are very relevant due to the devastating effect of environmental degradation to the health of people, agriculture and the environment as a whole. Despite the fact that the poorest (developing) countries contribute the least to carbon dioxide emissions, they are the hardest hit victims of the consequences of climate change (Tiwari, 2011). Though the relationship between population growth and the environment has been studied (see for example, Dietz and Rosa, 1994; York et al., 2003; Cole and Neumayer, 2004; Poumanyvong and Kaneko, 2010; Zhu and Peng, 2012), the focus has majorly been outside Africa. This study therefore fills the gap in literature on Africa. Further, we contribute to the literature by examining not only the population size but also its structure in terms of the demographic dynamics and how it affects the environment.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The chapter proceeds as follows; the next section provides a background of the chapter (this entails a theoretical concept and a review of some related empirical studies). The third section describes the main focus of the chapter (this highlights on the focus of the chapter, methodology and results). The fourth section contains solutions and recommendations of the chapter. This is followed by suggestions for future research and conclusion.

BACKGROUND

The literature on environmental degradation (emissions) can broadly be classified into four strands;

1. The first and the traditional one creates a link between emissions and economic growth in the quest to test the efficacy of the environmental Kuznets Curve (EKC)[2],
2. The second tests the pollution haven hypothesis (PHH)[3], by finding the impact of trade openness and foreign direct investment (FDI) on emissions,
3. The third examines the relation between population growth (and urbanization) and emissions,
4. The last looks at the link between energy consumption and emissions[4].

Considering the focus of the chapter, the literature on population growth (and urbanization) and emissions (the environment) is emphasized. The genesis of the impact of population growth on the environment can indirectly be traced to the Malthusian Theory of Population. It must however be stated that Malthus' take on the impact of population growth on the environment had to do with depletion of land resources (mainly food) for human subsistence and not necessarily environmental degradation. Malthus hypothesized that if population is not controlled it will grow in a geometric progression as the means of subsistence will grow in an arithmetic progression. With this he explained that population growth will always exceed the means of subsistence and the world will be characterized by famine, war, and diseases among other vices. It must however be emphasized that the Malthusian Population Theory has been criticized for being short-sighted as it does not take technological innovation into account (see, Boserup, 1981). Besides, to a large extent history has proven Malthus wrong as the production of food has far surpassed the growth in population (Urdal, 2005).

Despite the heavy criticisms of the Malthusian Population Theory, some neo-Malthusians still believe population growth can adversely affect agricultural (food) production and have gone further to emphasize that population growth could lead to environmental deterioration (degradation)(see MacDonald, 1989; Ehrlich and Ehrlich, 1990; Ehrlich and Ehrlich, 1996) hence resulting in global warming and acid rain among others.

The effect of rising population and urbanization on the environment is also seen in the demand for energy. Birdsall (1992) supports the population growth/urbanization-energy demand nexus by opining that; i) a greater population translates into rising demand for energy and transportation, ii) rapid population and urbanization promote deforestation and the burning of wood for fuel. Temurshoev (2006) claims that growth in developing countries increases the rate of urbanization because of the transition from an agrarian to an industrial energy based economy. The consumption of energy has, however, been identified as the major contributor to carbon dioxide emissions (Halicioglu, 2009; Akpan and Akpan, 2012, Olivier et al., 2012, Farhani and Rejeb, 2012).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Inferences can be drawn from the ecological modernization theory to explain the impact of urbanization on the environment (carbon dioxide emissions). The ecological modernization theory has widely been used by different scholars (sociologists, politicians and environmental activists) for different purposes. Within the context of modernization and environmental degradation, it is regarded as a social theory or environmental sociology that analyzes how changing social practices in production and consumption affect ecological changes (Mol, 1997). The theory upholds urbanization as a social change that is considered as a vital factor of modernization and shows a threshold effect of modernization on the environment (Poumanyvong and Kaneko, 2010). In this light, the ecological modernization theory can be likened to the EKC hypothesis which predicts that at higher levels of economic development, environmental degradation reduces.

Empirically, using the STIRPAT (Stochastic Impacts by Regression on Population, Affluence and Technology) model and various panel estimation techniques for 16 emerging economies for the period 1971-2009, Sadorsky (2014) finds technology (proxied by energy intensity), affluence and population to have positive impact on environmental degradation. In the United Arab Emirates, Shahbaz et al. (2014) using data from 1975-2011 and the autoregressive distributed lag estimation technique demonstrate that urbanization and economic growth are positively related to emissions of carbon dioxide. Zhu and Peng (2012) expanding the STIRPAT model and using the ridge regression method report urbanization to positively impact carbon dioxide emissions in China for the period 1978-2008. Martinez-Zarzoso and Maruotti (2011) also explore the STIRPAT and carbon dioxide emissions for 88 developing countries for the period 1975-2003 and report that the elasticity of emission-urbanization is higher than unity in lower income and lower-middle income countries. However, in upper and highly developed countries, the elasticity of emission-urbanization is negative. In light of their findings based on OLS and GMM estimates, the authors conclude that the urbanization/population growth–carbon emissions nexus is moderated by a country's level of development. York et al. (2003) use a cross-sectional data of 1999 for 146 countries and the OLS within the STIRPAT model and find population, urbanization, GDP per capita and share of industry in GDP to positively impact on carbon dioxide emissions.

Leitao and Shahbaz (2013) using data from 18 countries for the period 1990-2010 and the GMM estimator find that while income per capita impacts positively on carbon dioxide, urbanization has a negative effect on carbon dioxide emissions. Sharma (2011) controls for the level of development for a panel of 69 countries and reports that urbanization, trade openness, and per capita electric power consumption have negative effects on the CO_2 emissions.

Poumanyvong and Kaneko (2010), however, report that the share of industry in GDP to be insignificant while population density and urbanization are found to be significantly related to carbon dioxide emissions, while Cole and Neumayer (2004) show that population size and urbanization have insignificant impact on emissions.

MAIN FOCUS OF THE CHAPTER

The main focus of this chapter is to analyse the impact of population growth and the increase in urbanization on the environment in Africa. All over the world the issues of the environment particularly those relating to climate change have attracted much attention from governments, international bodies and scholars alike. This attention has keenly been drawn considering the adverse consequences of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

climate change on the environment. In addition to the campaigns and investments of governments and international bodies, scholars mainly in the fields of ecological economics (and also environmental and resources economics) have attempted to study the impact various economic and non-economic factors (variables) have on the environment, hence their likelihood to contribute to climate change. A number of these studies have found variables such as economic growth, trade openness, population, industrialization, energy consumption among others to explain changes in the environment (which is usually proxied with the emissions of carbon dioxide). Nevertheless, the outcomes of these studies do not move in the same direction, hence not conclusive. In following studies conducted in other countries and regions of the world, this chapter makes a case for Africa, which is believed to suffer the most from the consequences of the environment, thus the effect of climate change.

Assessing the effect of population growth, urbanization, human behavior and activities on the environment has widely been conducted within the premise of the famous IPAT ($I = PAT$) identity put forward by Ehrlish and Holdren (1971). The identity postulates that environmental impact (I) is determined by the combinations of three factors namely population (P), affluence (A) and technology (T). In essence the identity implies that changes in the environment (such as emissions) are caused or determined by the size of population, affluence or consumption, and technology.

Though the IPAT identity provided a model for analyzing environmental impact, the identity is usually criticized on two grounds (see Dietz and Rosa, 1994, 1997); i) the identity was upheld to be only a mathematical identity and therefore does not provide a stochastic model for testing hypothesis about the demographic and anthropogenic factors of environmental changes. That is, the impact (elasticity) of population, affluence and technology on environmental impact are assumed to be unitary. For example, a 10 percent rise in population size, affluence and technology cause environmental impact to also rise by 10 percent respectively. This is however contrary to the EKC which posits an inverted U-shaped relation between the environment (emissions) and economic growth.

Following the criticisms and limitations of the IPAT identity, Dietz and Rosa (1997) proposed modified stochastic version known as the STIRPAT (Stochastic Impacts by Regression on Population, Affluence and Technology) model. The specification of the STIRPAT model can be given as;

$$I_i = \propto P_i^{\beta_0} A_i^{\beta_1} T_i^{\beta_2} e_i \tag{1}$$

Where I represents environmental impact, P is population size, A is affluence and T is technology. i denotes the unit of analysis (usually a country), $\propto$ is the constant term to be estimated, and the β's are parameters of P, A and T to be estimated. e is the error term of the regression. Distinct from the IPAT identity, STIRPAT model has been defined to include other variables such as urbanization (see for example; Martinez-Zarzoso and Maruotti, 2011; Sharma, 2011; Zhu and Peng, 2012; Shahbaz, 2013).

In specifying our model, we adopt Equation (1) and include urbanization (U) .We write the model in an estimable econometric form as;

$$I_{it} = \propto + \beta_0 P_{it} + \beta_1 A_{it} + \beta_2 T_{it} + \beta_3 U_{it} + \varepsilon_{it} \tag{2}$$

$$i = 1, 2, 3, \ldots, 37 \quad t = 1, 2, 3 \ldots, T$$

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Where i represents each of the 37countries[5] used in the study and t is the time period considered. All other variables are as already defined. We measure I as environmental degradation proxied with the emissions of carbon dioxide (metric tonnes per capita) as used in several studies (see for example, Dietz and Rosa, 1997; Shi, 2003; Poumanyvong and Kaneko, 2010; Zhu and Peng, 2012; Shahbaz et al., 2014). P is measured by total population. We further disintegrate population into various age distributions:

1. Population ages 0-14 years ($P1$),
2. Population ages 15-64 years ($P2$),
3. Population ages 65 years and above ($P3$) - to find their different impact on the environment. The population age distributions are all expressed as a percentage of total population.

A is measured by real GDP per capita, constant 2005 US Dollars and T by the share of industry in GDP (see Shi, 2003; York et al., 2003; Poumanyvong and Kaneko, 2010; Sadorsky, 2014). U is measured by urban population as a percentage of total population.

All the variables in equation (2) are expressed annually and cover the period 1980-2010. All variables are expressed in the logarithm form and obtained from the World Development Indicators. See Table 2 in Appendix for descriptive statistics for the variables. In working with macroeconomic time series variables, one of the important requirements is to undertake stationarity test so as to determine the order of integration of these variables. Establishing the order of integration serves as a guide as to the choice of estimator to employ. As a result, we employ the use of Breitung (2000)[6] and Hadri (2000)[7] panel unit root tests. The Breitung test results (see Table 3 in Appendix) indicate that all the variables but total population and industry as a share in GDP variable are nonstationary. However, using the Hadri test which has a different null hypothesis of stationarity all the variables are found to be strongly nonstationary. These tests are conducted to make sure no series exceeds order one.

Having established the level of integration, we proceed with the estimation of equation (2). We employ the use of the Pooled Mean Group (PMG)[8] by Pesaran et al. (1999), which is an intermediate estimator between the Mean Group (MG)[9] and the traditional pooled estimators such as the fixed and random effects estimators[10] (Pesaran et al., 1999). The PMG estimator is analogous to the time series autoregressive distributed lag estimator (Pesaran et al., 1999) applied to panel data.

We present results from four models ([I], [II], [III] and [IV]), differentiated by the measure of population (i.e. total population, population ages 0-14 years, population ages 15-64 years and population ages 65 years and above) in Table 4 (see Appendix).

In all the models, the dependent variable is I (measured by carbon dioxide emissions, metric tonnes per capita) which is a proxy for environmental degradation. The error correction term (ec) is consistently correctly signed negative and statistically significant at the one percent error level in all the estimated models. This guarantees convergence to equilibrium in the long-run following a shock in the short-run.

Unexpectedly and inconsistent with many empirical studies (see for example; Shi, 2003; Cole and Neumayer, 2004; Martinez-Zarzoso and Maruotti, 2011), the population variables generally indicate negative relationship with environmental degradation in the long-run and statistically insignificant in the short-run. In Models [I], [III] and [IV] in which population is proxied by total population, population ages 15-64 years and population ages 65 years and above respectively, show statistically significant negative relationship between population and environmental degradation in the long-run. However,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

consistent with literature, in model [II) where population age group 0-14 years is used as a proxy, the results indicate a statistically significant positive coefficient in the long-run; implying that an increase in the population of this age distribution increases environmental degradation.

As expected, the results indicate a statistically significant (ranging between 1 and 5 percent) positive relationship between affluence (measured by real GDP per capita) (see for example Poumanyvong and Kaneko, 2010; Sharma, 2011; Leitao and Shahbaz, 2013; Sadorsky, 2014; Shahbaz, 2014). The long-run results corroborate that of the short-run, which implies that as economic growth increases or as the countries become richer they tend to harm the environment more by generating more carbon dioxide. This outcome is not surprising as Africa is a developing region and the governments have put in several measures and strategies to help boost growth to better the lots of its people.

Regarding the technology variable (measured by the percentage share of industry in GDP), the results consistently show statistically insignificant coefficients in models I through III in the long-run. However, in model IV the results show a statistically positive relationship between technology and environmental degradation in the long-run. This is evident in several previous studies (see for example, York et al., 2003; Poumanyvong and Kaneko, 2010; Martinez-Zarzoso and Maruotti, 2011; Sadorsky, 2014). In the short-run, the results indicate statistically significant positive relationship between technology and environmental degradation in all the estimated models. This implies that technology largely increases emissions in the short-run.

Another surprising outcome is that of the urbanization variable, which has statistically insignificant coefficients in the models. This implies that environmental degradation in Africa is not influenced by urbanization. This outcome is evident in other studies such as Martinez-Zarzoso and Maruotti (2011) and Sadorsky (2014) and Cole and Neumayer (2004). This might be explained by the fact that though urbanization is on the rise in the region, access to energy (particularly electricity) is limited. The region is noted to have the largest energy deficit among the developing world. The International Energy Agency (IEA) (2014), for example, notes that two-thirds of the population in sub-Saharan Africa is without access to electricity. One would expect the increase in urbanization to increase with emissions if energy consumption were high with this increase in urbanization. However, the lack of access to energy by many countries in the region might explain why the result do not indicate a positive relationship between urbanization and carbon dioxide emissions.

SOLUTIONS AND RECOMMENDATIONS

Considering the fact that the emission of carbon dioxide has detrimental effect on the environment, it is recommended that various measures to curb the emissions through, for example, improved technology and increased access to electricity as opposed to the use of traditional energy sources, and an effective regulatory regime could be important in reducing environmental degradation. One practical way to do this in many African countries is the policy of taxing or pricing of emissions. This could be achieved through the issuance of taxes on emissions levied mainly against industry players, which will cause industries to adopt less polluting technologies.

Though urbanization is found to have no effect on environmental degradation, it is recommended that government plans for urbanization so as to reduce slums as this can harm the environment. In Africa, growth in urbanization imply growth in slums as about 62 and 13 percent of the urban population in SSA and North Africa respectively live in slums (United Nations Human Settlements Programme [UN-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

HABITAT], 2012). Finally, because of the funding constraints in many African countries, a simple and less costly but effective means to reduce the adverse effects of carbon dioxide emissions is the policy to promote afforestation. The trees planted have the capacity to reduce the amount of carbon dioxide in the atmosphere as they absorb and use it for the production of their food. From this perspective then, it will also be appropriate to have in place policies that regulate the unnecessary and unauthorized cutting down of trees and promote agricultural practices that reduce the tendency towards bush burning.

FUTURE RESEARCH DIRECTIONS

Due to limited access to data, all the countries in Africa could not be covered in this study. It is suggested that future studies should include all countries in the region for a constructive conclusion as data becomes available. Future studies should also look at the actual impact urbanization and population growth are having on carbon dioxide emissions and in particular climate change more generally in specific countries to identify how these are impacting on the livelihoods of the people.

CONCLUSION

This chapter has investigated the effect of population growth and urbanization on the environment in Africa within the framework of the STIRPAT model using the PMG estimation method. The empirical findings reveal that the population and urbanization variables do not have detrimental effect on the environment. However, on controlling for age distribution, the results show the 0-14-year category is significantly correlated with environmental degradation. Overall, the results imply that affluence (economic growth) and technology (mainly in the short-run) are the main variables within the STIRPAT model which have detrimental implications on the environment. The chapter has contributed to the literature by showing that environmental degradation in Africa is enhanced by affluence and technology (industrialization) rather than population and urbanization.

KEY TERMS AND DEFINITIONS

Affluence: The wealth of the people or the economy, this is generally referred to as the gross domestic product.

Carbon Dioxide: A naturally occurring gas or by-product of burning fossil fuels and biomass, and the primary greenhouse gas that is contributing to climate change.

Climate Change: Long-term changes in the climatic conditions of a particular location or region that results in adverse environmental factors for human development.

Environmental Degradation: This is the deterioration of the environment through the misuse or depletion of factors such as air, water and the earth.

Population Growth: The rate at which the number of people increases over a given period of time.

Technology: This depicts industrialization or the potential and capacity of the economy to convert raw materials into semi-final or final outputs.

Urbanization: The increase in the number of people living in urban areas which is mainly as a result of people moving from rural areas to urban centers.

ENDNOTES

1 The data is sourced from the Africa Development Indicators. It ends in 2009 because data on carbon dioxide emissions in Africa as a whole which is also used in the study ends in 2009.

2 The EKC is the hypothesis that the relationship between environmental degradation and economic growth exhibits an inverted-U shape nature (Grossman & Krueger, 1991**;** Kijima et al., 2010). The inverted-U shape nature implies that at the initial stages of an economy's growth environmental degradation increases but as it achieves higher growth, the environmental degradation reduces and hence environmental quality sets in.

3 The PHH postulates that with trade liberalization, multinational firms from developed countries will relocate the production of their pollution intensive products to developing countries where there are lax environmental regulations (Eskeland and Harrison, 2003). This will result in increased environmental degradation in developing countries.

4 See for example, Soytas et al. (2007), Menyah and Wolde-Rufael (2010), Akpan and Akpan (2012), Arouri et al. (2012).

5 Algeria, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Cape Verde, Central African Republic, Chad, Comoros, Congo Republic, Cote d'Ivoire, Democratic Republic Congo, Egypt, Gabon, Ghana, Guinea Bissau, Kenya, Liberia, Madagascar, Malawi, Mali, Mauritania, Mauritius, Morocco, Mozambique, Niger, Nigeria, Rwanda, Senegal, Seychelles, Sierra Leone, South Africa, Swaziland, Togo, Tunisia and Zambia. The selection of countries and time period has been limited by data availability.

6 This test that does not employ a bias adjustment, and it power is significantly higher than that of other tests like the Levin et al. (2002) and the Im et al. (2003) tests.

7 This test exhibits robust results with small sample sizes.

8 The PMG imposes homogeneity in the long-run coefficients while at the same time permitting heterogeneity in the short-run coefficients and the error variances. Different from other estimators

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

such as the dynamic OLS and the fully modified OLS; (i) the error terms are serially uncorrelated and are independently distributed among the regressors, (ii) the long-run parameters are the same across cross-section, (iii) the PMG provides consistent and efficient long-run estimators when parameter homogeneity holds. However, all these estimators assume long-run relationship between the dependent and independent variables. See Pesaran et al. (1999) for more detail.

[9] It produces consistent estimates of the average of the parameters.

[10] They allow the intercepts to differ across groups while all other coefficients and error variances are constrained to be the same.

APPENDIX

In Table 1, population is total population, urban is the size of urban population and emissions are carbon dioxide emissions measured in metric tonnes. All figures are for Africa and expressed in millions.

Table 1. Population, urbanization and population

Year	Population	Urban	Emissions
1960-1964	297.39	58.82	171.37

Chapter 70
Women Entrepreneurs Address Poverty and Social Change Through Empowering Grassroots Initiatives in Tanzania

Ladislaus M. Semali
Pennsylvania State University, USA

ABSTRACT

This chapter investigates the story of Jitahidi women in Tanzania to understand the dynamics of empowerment at the grassroots level. The stories chronicled in this chapter present self-reliance events, motivations, and practical initiatives of a small entrepreneurial group of women, organized with shoestring budgets. Their goal was to establish a women's collective strength that could unleash women's lives from oppressive economic regimes, patriarchal traditions, gender inequality, gender discrimination, and socio-historical legacies that exploit women everywhere. The study revealed that dialogical way of thinking and underlying conventions wrapped-up in Women in Development activities in Tanzania were critical in providing the vision that guided the Jitahidi group to create a space for transformation and potential to empower women so as to define their own educational needs and create political organizations within the local community.

INTRODUCTION

This article presents the case of *Jitahidi* women entrepreneurs in Tanzania and explains how they addressed poverty and social change by establishing grassroots cooperative business activities. This case analyzes the invisible but vital roles African women play in feeding their families and contributing to development. There is a tacit but general agreement however that women's economic empowerment is critical for development and women entrepreneurs are a great resource in Sub-Saharan Africa region (Hallyward-Driemeir, 2013).

In recent years, microfinance lending institutions (e.g., Savings and Credit Co-operative—SACCOS) have boosted women's economic empowerment enterprises in Tanzania even though microfinance is still relatively new (Nkomolla, 2007). Established in 1995, mainly to link women and poverty alleviation, microfinance has widely and officially become recognized as a tool for poverty eradication (Sizya, 2001). With its increased use and exposure to Tanzania, following the 2001 implementation of the National Microfinance Policy, microfinance lending and borrowing has grown exponentially to involve four main microfinance institutions namely, Foundation for International Community Assistance (FINCA), Promotion of Rural Initiative & Development Enterprises (PRIDE), and Small Enterprise Development Agency (SEDA) as well as the Tanzania Postal Bank (ILO, 2005).

Also, Community banks and small banks have taken interest in microfinancing, as well as many Non-Governmental Organizations (NGOs) and non-profit organizations. Currently, the directory has at the service of poverty eradication a total of 8 banks, 45 Community Based Organizations (CBOs), 2 companies, 95 Government programs, 1,620 SACCOs, 48 Savings and Credit Associations (SACAs) and 62 NGOs (Agyei-Holmes, 2013; Dill, 2010). It turns out that in the past two decades and beyond, civil societies, social movements and more recently, microfinancing institution shave come to flourish in response to the void left by the departing colonial governments at the dawn of political independence in the 1960s and 1970s, and later, through national governments, as they fulfilled their obligations in implementing a world program initiated by the United Nations in 2005, namely, the U.N. Millennium Development Goals (MDGs) that ensure global human wellbeing.

In the confluence of these developments, women are economically more active in the Sub-Saharan Africa region than in any other region (World Bank, 2011). Reports indicate that in most Sub-Saharan African countries, 80% of farming is done by African women with Indigenous knowledge passed from generation to generation also by women (Jagire, 2014). For example, women account for sustained increases in income, greater empowerment and social inclusion, health and caring for the elderly, education for children, mental health and happiness (Blattman et. al., 2013). In addition, women have a wealth of knowledge and expertise in farming and some status in social organization of families, where they have important roles as nutritionists, trainers and conservationists. They (women) "are the backbone of the agricultural economy in Tanzania." (Jagire, 2014, p. 165).

For these reasons, African women are seen as a great development resource of the community. The United Nations Development Program (UNDP) goals recognize the roles women play in the community, and consequently UNDP reckons that gender equality and women's empowerment are desirable by-products of human development (UNDP, 2008). However, patriarchal traditional practices continue to hamper their progress and agricultural knowledge remains a "male" exclusive domain—men own the land, they make decisions about land use, determine what or when to grow on the land, and ultimately keep the money derived from the harvest, particularly proceeds from sales of cash crops.

As a general observation, women in Sub-Saharan Africa operate too often in the informal sector, in small farms, and in traditional sectors (e.g., agriculture and other miscellaneous domestic activities) as compared to their counterparts in the North countries (Agyei-Holmes, 2013). In this instance, they are not fully able to realize their capabilities and potential (World Bank, 2009). Conversely, Tanzanian women, in particular, have invaluable knowledge in crop growing and management. They are also experts in environmental conservation whose beginnings or even impacts have not been solemnized having been kept largely invisible in their society (Wane, 2007; Jagire, 2014). Therefore, a persisting question is, 'Why do women lag behind in almost all sectors of the economy in Tanzania and elsewhere in African countries?'

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Blattman et al., (2013) explicated the question of women's participation in the economy to include, for example, providing inputs like cash and business skills to build sustainable sources of income. Blattman, et al.'s considerations portend the conception of "empowerment" to reflect the causes of poverty and the constraints that hold back the poor, particularly African women. Furthermore, Blattman et al. suggest that a discussion of economic empowerment (like reduced poverty and sustainable businesses) needs to take into account the broader forms of empowerment (like increased independence and reduced risk of domestic violence, etc.).

To examine some of these problems in relation to issues of *Jitahidi* women's empowerment is a multifaceted task and perhaps beyond the scope of this chapter. Suffice it to say, however, that many studies in various disciplines such as women's studies (Namabira & Kamanzi, 2013), women's cooperatives (Kamanzi, 2010), women in agriculture (Longwe, 1990), gender studies (Malhotra et al., 2009), and sociology (Kamanzi, 2012), continue to strengthen whatever arguments are proffered in relation to these pertinent problems. Essentially, this chapter draws insights from a case study that captures the story of *Jitahidi* Women's Cooperative (JCW) in Northern Tanzania. The case study analyzes the story of their aspirations and efforts to address poverty and social change in order to overcome gender discrimination, socio-economic inequalities and disempowerment. The chapter provides tentative answers pertaining to the empowerment processes and challenges facing this group of women, collected through a survey conducted from June 2009 to August 2012.

Notably, *Jitahidi* is a Kiswahili word coined to represent women's efforts to support development and empowerment. It is an expression that signifies a local metaphor that reflects the 'pulling up oneself by the bootstraps' or 'to improve or succeed by one's own efforts'. This metaphor represents the story of grassroots initiatives taken by *Jitahidi* women entrepreneurs poised to empower all women in the region. Their determination was to implement and invest in self-help enterprises in order to address poverty and social change. While the experience of empowerment is complex and inevitably complicated by socio-cultural and historical legacies that threaten women in rural and urban settings, empowerment is broadly defined in this chapter, as "the ability to make choices" and to overcome equality and empowerment gaps in education, employment, and political participation (Kabeer, 2005, p. 15).

The establishment of *Jitahidi* was inspired by Freire's (2002) approach to empowerment. Freire's ideas on empowerment have been adopted by different groups all over the world. The Freirean approach suggests that direct participation of community members through active dialogue strengthens the beliefs in people's ability to change their own lives. It also promotes control and ownership of empowerment projects. In sum, it gives back to women their voice, their visibility trampled over by extant patriarchal practices and the colonial-era legacy with its Eurocentric culture that devalued indigenous women.

The Freirean approach resonates with Nyerere's (Tanzania president 1962-1985) philosophy of adult education and adult learning which is considered very progressive amongst the international adult education community and non-governmental organizations engaged in development work. Nyerere's philosophy of adult education and *'Self-reliance'* echoes much of the concepts of 'conscientization', empowerment and liberation, very akin to the ideas expressed in Paulo Freire's Pedagogy of the Oppressed.

The *Jitahidi* women implemented some aspects of the Freirean "empowerment" framework. The initial plan was to restore in individuals a sense of their own values and strength, and their own capacity to "handle life's problems" (Dugan, 2003, p. 23). Simply put:

To empower women means to make them visible and thus giving back to them a learning experience that necessitates showing appreciation about shared knowledge in their community. Visibility to Tanzanian

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

women recognizes them as active custodians of Indigenous knowledge and active contributors to the economy and wellbeing of the family (Jagire, 2014, p. 169)

The organization of *Jitahidi* as a cooperative was informally established in 2008 to address the Millennium Development Goals of eradicating poverty and redressing gender inequalities. The goal was to support women in adult education, entrepreneurial ventures, and to empower them to maximize their potential capabilities. It turns out that gender equality and women's empowerment is one of the eight United Nations Millennium Developments Goals. According to United Nations Secretary-General, women are not just the target of special measures to promote development, "they are also the driving force to overcome poverty, reduce hunger, fight illiteracy, heal the sick, prevent the spread of disease and promote stability" (UNDP, 2010, p. 3).

To situate the story of the *Jitahidi* women, first, this chapter opens with a theoretical discussion concerning the rethinking and re-evaluation of wellbeing and of the involvement of grassroots organizations. Second, the narrative explains how women through cooperative endeavors empower themselves to generate better living standards in communities in which they operate. Third, analysis of the survey data and focus group interviews conducted between 2009 and 2012 provided the support and basis for the stories of the women's business ventures and process of empowerment.

BACKGROUND AND CONTEXT OF THE CASE STUDY

The *Jitahidi* story chronicles events, motivations, and practical initiatives of a small entrepreneurial group, organized with shoe-string budgets. The aim was to establish a women's collective strength that could unleashed their lives from oppressive economic regimes, patriarchal traditions, gender inequality, gender discrimination, and socio-historical legacies (e.g., inheritance laws) that exploit women everywhere. In Tanzania, empowerment is often times perceived as if synonymous with 'self-reliance.' Locally referred to as "Kujitegemea", self-reliance was a movement of the late 1960s and early 1970s, at a time when the policy of 'Education for Self-Reliance' was at its peak (Nyerere, 1967). Nyerere emphasized:

What we do have is land in abundance and people who are willing to work hard for their own improvement. It is the use of these latter resources which will decide whether we reach our total goals or not. If we use these resources in a spirit of self-reliance as the basis for development, then we shall make progress slowly but surely. And it will then be real progress, affecting the lives of the masses, not just having spectacular show-pieces in the towns while the rest of the people of Tanzania live in their present poverty. . . . It is therefore the villages which must be made into places where people live a good life; it is in the rural areas that people must be able to find their material well-being and their satisfactions (p. 14)

This policy urged Tanzanians to reconsider the purpose of education and to rely on their own tangible and intangible resources at their disposal to bring about national development. In practice however, self-reliance fosters empowerment and is assumed to include the engagement of people of all ages in programs for economic development instead of relying on outsiders.

The background and context of *Jitahidi* women sum up a four-part agenda that provides women with incentives and abilities to run larger enterprises in higher value-added economy within the formal sec-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tor. The *Jitahidi* venture pulled together individual efforts of some women in Northern Tanzania who realized that most of the produce (including grains) they brought to the market-stalls to sell ended up getting spoiled because of short shelf life. They then would incur heavy losses. To reduce losses in the long term, the women established a cooperative venture under the leadership of the Director of Women in Development (WID) groups in Northern Tanzania.

Insights from the 2009-2012 Survey

Table 1 gives a sense of the economic and social profile of the women who joined Jitahidi. The women came primarily from rural areas. As indicated, generally, the urban sector consists of only 26 percent of the overall population. Other demographic characteristics show low literacy rates and low incomes in terms of GDP (World Bank, 2011) and generally confirms the plight of the women in general.

Most of the women (81%) had completed seven years of schooling, 8% had completed nine years (Form 2; i.e., 2 years of secondary school) and 11% had completed twelve years (Form 4.) A majority (54%) of the women primarily used cell phones in their business communication, whereas somewhat fewer (46%) used face-to-face communication (including travel) as their primary means of business-related communication. Cell phones, while not the primary way of conducting all business communication, were, nevertheless considered important to carrying out business by a vast majority (96%) of these women agro-entrepreneur respondents. Somewhat less than half (44%) of the women's business relationships involved buying produce, 10% involved selling, bartering and lending money. Nearly half (48%) of the business relationships involved personal favors between the individuals involved.

The most common individuals among the *Jitahidi* women were wholesalers, farmers and street restaurant vendors, but respondents also mentioned public transport operators, immediate family, security guard, stall setup person, cell phone vendor person, hired house-help, tour guide, district councillor, teacher and church leader. Over 70% of the business relationships described by the women had lasted for more than one year. Nearly all of their identified business contacts were trusted (96%) and respected (100%) by the survey participants.

The survey revealed that poverty (lack of income, access to venture capital and loans) was the main reason the women felt helpless. This observation confirms the persistent poverty widely observed in developing countries that characterizes to a large extent the poverty traps into which households may fall and have difficulty escaping. For example, when asked how to estimate the excess household income for the year, the results are as indicated in Table 2. They show that only 30% estimated they may earn more than 500, 000 (US$ 500) in contrast with 11.5% of the women who actually earned that amount

Table 1. Economic and social context of Tanzania, 2008

in the previous year. The fundamental features of most poverty trap models depend on the existence of financial market imperfections that impede investment in productive assets or technology, and thus prevent households with poor initial endowments from reaching higher-level equilibriums in systems characterized by multiple equilibriums (Smith, 2005).

Goals of *Jitahidi*

The overarching goal of *Jitahidi* women was to improve the prospects of existing businesses. They aimed first to establish storage facilities for the products they sell and second, to streamline delivery of such products to minimize losses. Furthermore, their efforts were directed to a long standing financial problem that impacted the financial wellbeing of women, the majority of whom were heads of single-parent households. The *Jitahidi* leadership comprised of a five-member team of women elected from the membership. Their responsibilities consist mainly of managerial roles but sometimes they also acted as advisors and recruiters of new members. In their early deliberations, this team appraised that addressing constraints in the investment climate that burden informal and smaller enterprises would in the long term advantageously benefit women.

Additionally, the other immediate and third task was to enable more women to shift the nature of what they do—moving them from traditional small scale enterprises to large but economically viable enterprises. The *Jitahidi* group was therefore formed to implement these goals. To achieve these goals, it was essential to close the gender equality and empowerment gaps in education, employment, and political participation (Kabeer, 2005). Activities included adult education seminars, meetings, advocacy on how to access micro financing (loans and grants) and visioning. A visioning exercise was embedded in all monthly seminars to create a discursive dialogue that introduced discussions on democracy and human rights (borrowed from the WID guidelines). Because women were eager to invest in enterprises that yielded profits, this cooperative movement spread throughout the region like wild brush fires.

Women's educational activities were designed to empower young women to overcome the gender inequality that subordinates women and often puts them at increased risk of HIV infection in the country. Group goals included heightening group members' awareness of the influence of the restrictive social messages that surround women and assist them in developing efficacy and skills to combat the social and structural barriers they faced every day.

To get started, a membership drive to register a women's cooperative with local authorities was launched in 2009 with 26 members, and to-date this membership, now at 80 members strong, continues

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

to grow. Incidentally, as it will be explained later, what seemed as humble beginnings grew to remarkable entrepreneurial ventures that currently defy not only economic difficulties previously experienced by the women, but also seem to overcome oppressive traditions frequently sustained by patriarchal beliefs and traditional practices that are known to exploit women. For example, women can join the Cooperative, raise pigs, and keep profits from sales freely without their husband's permission.

As a grassroots organization, *Jitahidi* was influenced by the Women in Development (WID) agenda in Tanzania (as proposed in the U. N. Millennium Development Goals). As an entrepreneurial endeavor, on the other hand, *Jitahidi* began its work by coordinating grassroots efforts of urban women who sell agricultural produce at a central market in town. Grassroots organizations like *Jitahidi* are defined as "self-organized groups of individuals pursuing common interests through volunteer-based non-profit organizations that usually have a low degree of formality but a broader purpose than issue-based self-help groups, community-based organizations or neighbourhood associations (Radu & Radisic, 2012). Women cooperatives are also well positioned to address the problem of moving perishable or shelf-stable food products quickly and cost-efficiently from rural processing facilities to urban markets.

Theoretical Underpinnings

The case of the *Jitahidi* women is not unique. In recent years, grassroots initiatives that empower women and marginalized groups to address poverty in Africa are found everywhere from literacy/numeracy to vocational training among rural women (Chucks, 2004). They are also actively pursued in adult education initiatives and the empowerment of civil society (Maruatona, 1999), and in social and political change movements (Lodge, 2013), or human rights (Gillespie & Melching, 2010). These initiatives reinforce the assumption that adult education and civil society are historically linked to the positive roles adult education plays in empowering men and women in emerging and middle income economies worldwide (Maruatona, 1999).

The first United Nations MDG goal of ending poverty and hunger illustrates the strategies adopted by *Jitahidi* women. In recent years, debates have raged around development issues particularly regarding poverty alleviation (Polak, 2008; Prahalad, 2006; Sachs, 2005). To a large extent, these debates have been fuelled by high visibility conferences that aimed to reduce poverty and consequently establish targets for poverty reduction worldwide. But at this stage, critics wonder what this rhetoric can yield to make a difference to rural populations who are often poor and in many other respects, underserved educationally (Way, 2011).

While many civil society organizations broadly support the global partnership that the U.N. Goals encapsulate, there are civil society organizations which have expressed reservations about the MDG strategies arguing that the Goals are top down', and imposed by the international community, rather than locally developed (Maruatona, 1999). There is uncertainty about the community's role in achieving the Goals. Skeptics seem to suggest that the U.N. Goals are too narrow and unambitious, especially in comparison to the U.N. Millennium Declaration, leaving out critical issues. For example, the Goal for gender equality falls short of the aims set in the Platform of Action at the U.N. Conference on Women (United Nations, 1996), to which governments around the world are committed (United Nations, 1996). In spite of such criticism, most of the NGOs that support women's empowerment have spent years dedicated to the broader objectives that the U.N. Goals represent, namely: promoting gender equality and fighting poverty, hunger, illiteracy, disease, and environmental degradation.

The Capability Approach

The *Jitahidi* Women's goal of promoting empowerment in grassroots organizations, and the insistence of key institutional policy and political interactions is rooted in the larger conception of development and empowerment. As such, it is framed in a particular understanding of the 'capability approach'. This approach has in recent decades emerged as a novel theoretical framework about well-being, development and justice. In fact, the capability approach is one of the foundational building blocks of Amartya Sen's paradigm of 'development as freedom' (Sen, 1999).

The capability approach is a theoretical framework that entails two core normative claims: first, the claim that freedom to achieve well-being is of primary moral importance, and second, that freedom to achieve well-being is to be understood in terms of people's capabilities. This refers to people's abilities and the opportunities they have to do or manage their own affairs. The case of *Jitahidi* Women aligns with some of the theories and understanding of human development that the philosophy of '*capability approaches*' embraces. By addressing poverty, inequality and wellbeing, the capability approach influences the human development language that is visible in the Millennium Development reports and has had a great influence on policy processes around the developing world.

The capability approach has been developed in a variety of more specific normative theories, such as (partial) theories of social justice or accounts of development ethics. It has also led to a new and highly interdisciplinary literature in the social sciences resulting in new statistics and social indicators, and to a new policy paradigm which is mainly used in development studies, the so-called 'human development approach'(Stanford University, 2011).

Habermas (1972; 2005; Fultner, 2011) called this human development potential the constitutive capabilities individuals have that enable them to control the physical world, interact and relate with it, as well as gain autonomy over individual affairs. When individuals can exert such constitutive capabilities, they are said to be 'empowered.' However, over the decades, the term "empowerment" has been overused to the extent that it is reduced to a slogan that means little of substance. (Way, 2011). Interestingly, therefore, the term 'empowerment' can be disempowering, when it is understood to mean the giving of power by the powerful to the powerless. However, that is not how the term is used in this essay. Empowerment in this chapter connotes what Dugan, (2003) implied when characterizing the efforts to restore in individuals a sense of their own values and strength, and their own capacity to "handle life's problems," to make them visible, and thus giving back to them a voice in their community. The appropriate role of the person or group with power is to share, not to convey or impose. The group must make and own its decisions, so that group members can develop and experience their own power.

As explained in the Pedagogy of the Oppressed, Freire (2002) contended that the underlying tenet of this way of thinking about "empowerment" is that the "disempowered" already know a great deal about the sources of their oppression and what must be done to overcome it (p. 88). What they do not have is an organized approach to translating this knowledge into action. The appropriate educational response is therefore one that elicits participants' knowledge and responses. Freire calls this educational method "problem-posing" (p. 9).

Ensuring the necessary conditions for a transformative approach to capability enhancement also depends on providing the means to have a say in the process of policy-making and taking action to make changes (Dugan 2003). Freire's approach was aligned with "transformative" learning theory, which was developed over 20 years ago. Transformative learning involves participation in constructive discourse to

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

use the experience of others to assess reasons justifying the assumptions people make, and taking action based on the resulting insights. In essence, transformative learning theory's focus is on how we learn to negotiate and act on our own purposes, values, feelings and meanings rather than on those meanings we have uncritically assimilated from others. Mezirow (2002) suggests that to be transformed is "to gain greater control over personal lives as socially responsible and clear-thinking decision makers" p. 11).

Community Organizing Through Citizen Participation

Saul Alinsky (1909-1972) was one of the 1960s radical thinkers about issues of community organizing. He believed that the key to organizing success was citizen participation, letting the people set the agenda, not setting it for them. Alinsky was famously known for his work as community organizer. He focused his attention on organizing communities against substandard living and working conditions in places including Chicago's depressed Back of the Yards neighborhood in the Woodlawn area of Chicago, USA (Williamson, 2012).

In his time, Alinsky was convinced that poor people have no voice because they have no organization, but argued very strongly that sometimes development agents or community organizers in fact serve to disorganize communities under the guise of organizing them. However, Alinsky believed that an organization gives people a way of expressing their group needs in a manner that cannot be ignored. His goal was nothing short of unleashing the power of the people to "create mass organizations to seize power and give it to the people. This way people can realize the democratic dream of equality, justice, peace, cooperation, equal and full opportunities for education, full and useful employment, health, and the creation of those circumstances in which men have the chance to live by the values that give meaning to life" (Sugrue, 2012). For these reasons, small groups are formally organized first, for example on a block-by-block or small neighborhood-by-small-neighborhood basis. Once the small groups have met and worked successfully together on some issues, next, they are brought together into a larger community-wide organization. The larger group thus has the infrastructure as well as experience to bring transformative change (Alinsky, 1989).

As a grassroots organization, *Jitahidi* Women followed this step-by-step approach even though they never heard of Alinsky before. Nevertheless, they faced challenges as soon as they took decision to establish an empowerment group, some of which problems were political as well as financial. The women had to deal with complex interactions as they relate to state regulations for establishing Cooperatives, local government bureaucracy, and donors—interactions which tend to constrain social action given the broad systems of political and social power relations. In this instance, *Jitahidi* was no exception as the members struggled through the early stages of establishing the cooperative with attempts to find start-up funds, plan new ventures, and on occasions, contend with failure of pledges made for grants but not honored.

In sum, when taken together, Sen's (1999) capability approach and development as freedom paradigm, Alinsky's notions of citizen participation, Habermas (2005) constitutive capabilities, Freire's (2002) conscientization and problem-posing approach, and Nyerere's education for self-reliance, we can affirm that "empowerment" is not about what actors do but rather how they think and translate what they know into action." The appropriate response to empowerment is therefore one that calls for participant's knowledge and responses in having a say in policy-making and taking action to make changes. I suppose the *Jitahidi* story reveals that once the women understood their situation in poverty they sprang into action to organize and to act. For the *Jitahidi* women, the grassroots initiatives developed in the past

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

several years represent a rare story of empowerment situated in their cooperative efforts and perhaps what seems to be a breakthrough to the hurdles that in the past conspired to trap rural women in poverty, disease and ignorance for decades.

The Case of *Jitahidi* Women Entrepreneurs and How They Addressed Poverty

To develop the capability and to strengthen the potential and empowerment of *Jitahidi* women, an important addition to the structure and conduct of business among the Women was implemented, namely, the development of a safe, cohesive and empowering group climate which helped to promote the goals of the group. This structure however was not automatic but rather a conscious trial and error effort to encourage the members to talk, to tell their story of how to combat the many faces of poverty. This approach was introduced by the Director of Women in Development in the region. She insisted on allowing every individual to express oneself freely.

This practice set the tone of how the cooperative and its leaders must operate. In this case study, the *Jitahidi* example provides an instance of social change that embraces the capability approach to augment years of gender inequality and poverty. Consequently, the *Jitahidi* Cooperative took the capability approach seriously. Members felt that the cooperative movement gave women the opportunity to improve their conditions within a safe and supportive atmosphere. One of the basic principles of operation that was established early was the freedom to speak one's mind and to have one's ideas heard and valued. These creative ways to emphasize communication allowed the women to begin with ease the process of transformative empowerment. The aim was to recognize Tanzanian women as active custodians of Indigenous knowledge and active contributors to the economy and wellbeing of the family" (Jagire, 2014, p. 169).

Historically, women in Tanzania have been disempowered, disenfranchised and denied basic education. In addition, historical social structures have posed formidable barriers. For example, gender differences in legal status and capacity, particularly for married women, affect women's access to and control of assets and resources required for entrepreneurship. Education and business experience are important drivers of economic choice, opportunity and performance. Lack of access to finance was a formidable obstacle to business development. Women's limited opportunities for networking and exclusion from decision-making bodies and from policy dialogue, especially in the business environment, meant that business climate reforms rarely tackled issues for women entrepreneurs (Hallward-Driemeier, 2011, p. 8).

In Tanzania as well as some African countries, women continue to be excluded from schools and from higher education. Actually, not so long ago in some communities in Tanzania, women were denied schooling until recent years (Jagire, 2014). For example, a number of economic, social and cultural influences have contributed to the curtailment of women's capability and potential; and thus disempowering girls and women. As it seems to be the case in Tanzania, as well as other African countries with strong oral traditions, disempowering influences include many things.

Examples of disempowering practices abound, like separation of the sexes to privilege boys and men over girls and women, the perpetuation of cultural ideologies that promote or glorify traditional stories of gender inequality, myths about who can own land and receive inheritance wealth. In the public media, one finds songs that focus on women's beauty or other physical attributes but not their human rights or intelligence; and a proliferation of media stories or skits that have served to ensure male dominance in the home, office, and sexual relationships. These unequal exploitive gender practices remain unexplored

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and their contextual influences or impacts on the lives of girls and women are virtually unknown or simply covertly brushed aside (Hallward-Driemeier, 2011).

The indoctrination of girls into traditionally defined gender roles, particularly girls who are unable to pursue higher education, is both strong and persuasive, leaving young women with little awareness of the extent to which these external pressures, expectations, and restrictions limit their capability for self-reliance, career choices, social behaviors or overall women's horizons. Because these gender expectations and practices are widespread in Tanzania as well as in other parts of Africa, the *Jitahidi* Women's Cooperative intuitively realized that at the epicenter of these negative expectations and exploitation of women is poverty and economic dependency and a lack of basic education sufficient to confront oppressive encounters. Therefore, the capability approach was critical and central to the sustainability of *Jitahidi* women as an empowered collective.

Women's Business Ventures

The small steps the cooperative took and commitment made grew to several enterprises that included raising pigs, chickens, and new ventures to grow mushrooms, spinach, cabbage, tomatoes, carrots, and other household vegetables. The markets in the town of Moshi and environs saw a surge of improved supply of vegetables and fruits, some of which had not been brought to the market before. Importation of spinach, apples, eggplants, lentils and fruits from South Africa has in recent months fizzled, and most of the products found in the market are grown locally (See Figure 1).

Figure 1. Some Jitahidi women selling fruits and vegetables

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Other women invested in the purchase of storage tanks with large capacity to store two tons or more of maize between the growing seasons (See Figure 2). As a result, they can sell maize in the off-season period with large profit margins. To date, they own two of such storage tanks. Reports indicate that last year the women were contracted to supply the United Nations High Commissioner for Refugees (UNHCR, 2011) with maize that was exported out of the country, thus fetching them the much needed revenues (Loewenberg, 2011).

Even though the *Jitahidi* women are modest when it comes to discussing their successes, a quick appraisal of their progress shows immense improvement. A recent reports submitted to one of the funding agencies of *Jitahidi* explained by the Director showed that the progress they made matches results from similar cooperatives in Northern Tanzania where monthly cash earnings doubled from 50,000Tanzania Shillings (Tsh.) to over 150,000 ($50 to $150 U.S. Dollars). In fact cash savings tripled, and short-term expenditures and durable assets increased 30 to 50% relative to where they were at the beginning of the cooperative in 2008. In spite of these gains, there was no immediate effect on women's independence, status in the community, or freedom from intimate partner violence. This reality was explained by the women saying: "Attitudes take a long time to change."

However, issues of domestic violence, teen-age marriages, and female circumcision are topics frequently broached and spoken out openly by *Jitahidi* women at public meetings. As a result, today teen-marriages have been listed as a nation's tragedy and discussions on concerns on underage marriage is regularly featured in the daily press (Makoye, 2013). However, we see little evidence that more inclusive role for males in the household leads to better empowerment or economic success, although promising improvement in partner support and relationships were observed and acknowledged by the women.

Figure 2. Example of a maize storage tank

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The fundamental role of grassroots organizations, like *Jitahidi*, lies in mutually reinforcing personal and collective capabilities. However, the opportunity to live a good life depends extensively on the social determinants of the relevant capabilities. It is in this context that policy and programming at the national and supra-national levels, along with the work done by civil society organizations (CSOs) at the local level can influence the social alternatives women have, and more broadly their quality of life and wellbeing.

The *Jitahidi* Cooperative organized regular meetings to utilize group dynamics approaches to social justice and empowerment with the purpose to raise women's awareness of social and cultural issues and contexts in which they live, and how these contexts influence or persist to impact their plight in poverty and diseases, HIV/AIDs in particular. The first step towards achieving the goals of the group was the development of an "empowering group climate" which included free expression and exchange of opinions and ideas, a strong sense of cohesion and support, and a collaborative, non-authoritarian relationship between group leaders and group members. These principles were brought to bear during seminars conducted by Women-in-Development (WID) Office. The WID seminars and regular visits to members' projects by Jitahidi leadership were not only additive to the function of the cooperative but also transformational. Transformation was explored through identifying interconnected practices: visioning, reframing, human rights in local discursive practices in problem-based contexts, and creating critical capacity and consciousness through connecting participants to a larger discourse on human rights in Tanzania and beyond.

The reasoning behind interconnected practices is quite simple: When household income is generated and managed by women, it is likely to be used for children's school fees, uniforms, books and school supplies as well as for medical care, better quality food for the family and improvements to the home environment. This quality of life improvements results in fewer children's missed days of school and more years of schooling for children (Commission, 2005). The good outcome of having a sustainable livelihood becomes to discourage early marriage and the resultant pregnancies that frequently result in poor maternal outcomes for young girls. As confirmed by many researchers, the education of girls is the best strategy for reducing infant and child mortality, a critical issue in most developing countries (Bloch & Beoku-Betts, 1998).

Even though these women entrepreneurs were not representative of the population of Tanzania, they represent a possibility for a "capability" and empowerment model for women in other parts of East Africa. Examination of their practices was important to define the possibilities for other women in developing nations seeking poverty reduction, or working to increase literacy rates, and desiring to master and apply post literacy skills for social change. Thus, this case of *Jitahidi* women entrepreneurs provides a micro-analysis of financial market imperfections and it is just one episode from a larger social science networks study that is on-going in Northern Tanzania since June 2008 (Semali, 2011). Empowerment was being realized by individuals as they regained their voice in the community and engaged other women in the business they conducted every day at the markets.

CONCLUSION

The main objective of this case study was to investigate the story of *Jitahidi* women in Tanzania to understand the dynamics of *empowerment* at the grassroots level. The story took note of the theoretical assumptions that inform the women's entrepreneurial enterprise that was deliberately undertaken by WID

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Tanzania with the *Jitahidi* leadership to overcome poverty among individuals, particularly women with little or no basic education. The rationale was that the ability of women in Africa to sustain livelihoods of their households will occur largely through small, agriculture-related enterprises in which the optimal use of recent technological developments of mobile phones and social networks may result in increased income and quality of life for women (Semali & Asino, 2013).

Insights from this case provided introspection to what is going on in women's development and their business relationships. The use of cell-phones was quite prevalent and the researchers suspected that perhaps it would not be possible to establish *Jitahidi* without the facility and easiness of access to mobile phone communication. It seems that these women have learned innovative ways of using ICTs to advantage their businesses as well as strengthening their networks. As new applications begin to rapidly emerge on the market, cell-phone communication is perhaps taken for granted, since the women swap telephone numbers frequently.

Likewise the emphasis of transformative practices aimed to strengthen visioning, and reframing human rights in local communities as well as problem-based contexts, increased the critical capacity and consciousness of the *Jitahidi* women judged by what they have been to accomplish. Practices were aimed to assist new members during monthly seminars to name barriers created by restrictive gender relations in the home and in social and civic engagements. The step by step approach helped the women to identify barriers that impact adolescent young women in general and *Jitahidi* members as individuals. In addition, the practices encouraged women to envision how the cooperative can mitigate against women's exploitation.

The case of the Jitahidi women informs the design of subsequent projects intended to assist women escape the poverty trap in rural villages of Tanzania and beyond. The initial idea underlying this case, that brought us in contact with the *Jitahidi* women, was to gather information about the business climate among women who live in rural areas and to use that information to organize these women to form a cooperative. The questions that pave the way forward to future investigations are: What can policymakers and educators do to facilitate and improve the use of mobile phones as a tool for advocacy or to enhance women's knowledge? What can be done to address the challenges and the ways to facilitate "full" empowerment? What is the nexus between having access to communication and personal or collective empowerment? These issues call for research studies that expose further the potential of empowerment. There is every chance that the dialogical way of thinking introduced by WID can create space for all women and empower Tanzanians to define their own educational needs and create political organizations within the local community. And more importantly, women can become stronger partners in development as Tanzanians implement the MDGs.

ACKNOWLEDGMENT

The project including a feasibility study of Jitahidi women was sponsored by Pennsylvania State University's Office of Global Programs and The Marjorie Grant Whiting Endowment for the Advancement of Indigenous Knowledge and the Inter-Institutional Consortium for Indigenous Knowledge (ICIK) at the Pennsylvania State University.

KEY TERMS AND DEFINITIONS

Capability Approach: A novel way of thinking about well-being, development and justice that gives abilities and the opportunities to people to do or manage their own affairs.

Community Organizing: To let grassroots people set the agenda and destiny of their affairs, not setting it for them.

Empowerment: The ability to make choices in one's life and to overcome equality and address resource gaps in education, employment, and political participation.

Poverty Trap: A situated cycle of limited access to resources that impedes investment in productive assets or technology, and thus prevents households with poor backgrounds or initial meagre endowments from reaching higher-levels of sufficiency to make a comfortable living.

Self-Reliance: A mindset to engage people of all ages in programs for economic development instead of relying on outsiders and to be willing to work hard for their own improvement.

Social Change: A process that aims to transform individuals and embraces the capability approach to augment years of gender discrimination, socio-economic inequalities, disempowerment, and poverty.

Transformative Learning: The effort to gain greater control over personal lives as socially responsible and decision makers and learning to negotiate and act on our own purposes, values, feelings and meanings rather than on those meanings we have uncritically assimilated from others.

Women Entrepreneurs: A group of social agents who engage other women in the business they conducted every day at the markets and through their practices endeavor to define the possibilities for other women in developing nations seeking poverty reduction, or working to increase literacy rates, and desiring to master and apply post-literacy skills for social change.

Chapter 71
Reflections From Inside the World of Empowered Women:
The Case of Thota-ea-Moli, Ha Luka Multi-Purpose Cooperative, in Lesotho

Bantu Lulu K Morolong
University of Botswana, Botswana

ABSTRACT

Poverty is one of the most critical problems facing developing regions. In Lesotho, poverty is more deeply entrenched in the rural areas and closely linked to severe degradation of land on which rural livelihoods depend. Landlessness affects Basotho women more adversely than men who have better employment opportunities as mine labour migrants in South Africa. This chapter therefore, presents the case of Thota-ea-Moli Multi-Purpose Cooperative as a response to further threats of poverty to a community that lost its land to a government project. The chapter maps the historical trends of Basotho women's empowerment and their pivotal role in development and poverty alleviation through cooperatives. Having outlined the project design and implementation processes, its achievements and challenges are highlighted and their impact on Thota-ea-Moli women's economic and socio cultural empowerment. Future trends that hold promise for women's further empowerment are also presented.

BACKGROUND HISTORY OF THE ORGANISATION: THOTA-EA- MOLI (HA LUKA MULTI-PURPOSE COOPERATIVE)

Presented in this chapter is a case of women of Thota ea- Moli in Lesotho. The place, Thota-ea-Moli is a former seat of the traditional Basotho parliament) and now hosts, Moshoeshoe I International Airport which is about 25 kilometres away from the Capital town of Lesotho, Maseru. In geographic historical terms, Thota-ea-Moli is no ordinary village in Lesotho as its background as provided below shows. Thota-ea-Moli is a peri-urban community in Lesotho which is of historic significance for Lesotho. Thota-ea-Moli, or Ha Luka, meaning the place of chief Luka, as communities are commonly called in

Lesotho, is a small community of about three hundred (300) households, the average household size being about six people. It is about twenty (20) kilometres away from Maseru, the Capital city of Lesotho.

Thota-ea-Moli is closely associated with the growth of a popular consciousness and national identity for Basotho which was a response to the threat of incorporation into South Africa during the first sixty years of the twentieth century. The primary source of identity and tradition for Basotho is their founder Moshoeshoe 1 during the (1800s, (1786-1870 to be exact. This identity emerged as the basis of resistance to incorporation throughout the period of which Moshoeshoe offered protection (around the mid (900s to people fleeing the ravages of the famous Lifiqane wars. He assimilated these refugees into one group and sought for them protection from Britain against the Boers and Basotholand as their territory became known, was declared a protectorate of Britain in 1868. Thota-ea-Moli, the place, is one of the two perhaps most cited symbols of National consciousness. The other symbol aside from Moshoeshoe, himself, is Thaba-Bosiu, the mountain fortress of Moshoeshoe the founder of Basotho during the Boer and Zulu wars.

Lesotho is a small Kingdom in Southern Africa with a land area of around 30,355 square kilometres and an estimated population of 2.2 million. The country is one of the few left kingdoms of Africa which is geographically wholly surrounded by the Republic of South Africa. Lesotho is, often aptly described as the land of many contrasts, vivid history with scenic natural attractions which are complemented by its rich culture, and fascinating heritage. Lesotho is the only country in the world where the entire territory is more than 1,000 metres above sea level and much of the population lives in rugged, mountainous terrain, accessible only on foot or horseback. Lesotho's total land area is 30,355 square kilometres and only a little over 10% of that land is arable. In 1868, Lesotho became a British colony through annexation in 1868. With regard to power for Basotho, Eldredge (1985) describes the self- conscious initiatives of Basotho through resistance to British and Boer invasions as they struggled to determine their own affairs at all levels of society (p.24). Eldredge argues that, contrary to the assumptions about hegemonic colonial rule disabling and disempowering the colonised people for Basotho there are transcripts even from oral traditions which reflect Basotho's history of rejection not only of political colonisation but also colonisation of their consciousness, culture and their daily lives (p.27). Eldredge further notes that women in Lesotho were affected in many and varied ways by the socio-economic and political changes that came with colonial rule.

The terrain of Lesotho is usually just described as picturesque as the above snapshot of exactly what that means shows. It is mostly highland with plateaus, hills, and mountains. Hence the fond reference to Lesotho, as the Mountain Kingdom, the Kingdom in the Sky or the Roof of Africa. The highest point in Lesotho is Thabana Ntlenyana (3,482 m). This is also the highest peak in southern Africa while the lowest point is 1,400 m at the junction of the Orange and Makhaleng Rivers. It is this terrain and the described elevations which also have a bearing on the climate of Lesotho which is known to be temperate with cool to cold, dry winters with frequent spells of snow and; hot, wet summers. Lesotho winters are generally long (April-September, dry and cold with, warm to moderate temperatures during the day, and sudden cold temperatures just after sunset. The lowlands often receive cold rainfalls while heavy snowfalls are usually experienced in the highlands.

During winter the snow covered Traditional huts are a common sight in the mountain areas of Lesotho. These climatic conditions have direct implications for agriculture, the major employment sector in Lesotho, (which accounts for about 10 percent of the country's gross domestic product (GDP) (Lesotho, Bureau of Statistics 2007b). Many Basotho (Lesotho's majority ethnic group) pursue rain fed agriculture and are thus highly vulnerable to climate change and variability (Turner et al. 2001; LVAC 2008 cited

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in Gwimbi, Thomas, Hachigonta, & Majele-Sibanda, 2013.) It is also reported that the contribution of agriculture to GDP has been declining steadily, from more than 50 percent in the 1960s to 25 percent in 1980 and then to 17 percent by 2005. Currently it is less than 10 percent (Owusu-Ampomah, Naysmith, & Rubincam 2009 cited in Gwimbi, Thomas, Hachigonta & Majele-Sibanda, 2013). This is outlined here as it would have direct implications for the Women of Thota-ea-Moli's mainly agricultural activities of their project

The Economy of Lesotho

In the world economy, Lesotho falls within the category of least developed countries (LDCs), and more than half of its population lives on less than $1 a day. This small southern African state has one of the highest HIV infection rates in the world. This situation and others can be regarded as both a cause and an effect for Lesotho's high level of poverty. The bulk of Lesotho's population lives on subsistence farming, producing barley, maize, pulses, sorghum and wheat and limited livestock farming. Disheartening however is the report that while Agriculture, is the backbone of the rural economy and the sector that employs most of the poor, this sector has been stagnant since the early 1990s due to unpredictable climatic conditions, including erratic rains and persistent droughts. This has resulted in the contribution of agriculture to gross domestic product (GDP) declining and it is said to have shrunk from 20 percent in 1983 to nearly 14 percent by 1999 and to 7 percent in 2011. The poor performance of the agriculture sector has compounded the country's already tenuous food security situation (African Development Bank Group Kingdom of Lesotho Country Strategy Paper 2013-2017).

Lesotho's economy is also described as a truly enclave economy that for many years has depended on the remittances from people working in the mines in South Africa. These remittances were an important source of revenue for the economy of Lesotho. However, this too has seen a dramatic decline from 127,000 Basotho men working in the South African mines 'the best choice for a livelihood a Mosotho could make but the worst for a human being' (Sechaba Consultants, 2000 p.30), to 56,000 in 1990. This had a major and devastating effect not only on the employment of Basotho men but also on the economy that thrived on remittances the miners used to send back to their families. According to the 2014 Index the following are Lesotho's economic facts: The GDP (PPP) stands at $4.1 billion and economic growth rate is 4.0% and the per Capita income is $2,138. The overall rate of unemployment is 25.0% and the Inflation (CPI) is 5.3%. http://www.heritage.org/index/country/lesotho. Of the many factors to which Lesotho's evidently weak economy is often attributed to chiefly, are the considerable challenges with regard to political instability which significantly contributes to weak in institutional frameworks (political, economic and maybe even social) which see the country grappling with high levels of corruption and limited protection of property rights, and marginal reforms in the effort to achieve sustained economic growth and development.

Lesotho's Natural Resources

While Lesotho is reported to be not so well endowed in natural resources, it has the following water, agricultural and grazing land, diamonds, sand, clay, which are used for both sustenance of livelihoods and for commercial purposes. Of these, diamonds and water are the most mentioned and for purposes of this case water resources (because this provides for the country most of the financial and other benefits and also for its close association with agricultural activities) will be elaborated on. Lesotho's most important

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

natural resource is water. Lesotho Highlands Water Project, supplies water to South Africa. Known as Lesotho's "white gold", water generates much needed revenue for Lesotho. Through this project, Lesotho sells water to South Africa and it aims to be self-sufficient for its electricity needs through hydro-electric schemes which are part of the outcomes of this project

The Lesotho Highlands Water Project is one of the pinnacles of Lesotho's development and the first deliverable of the Multi- million dollar Lesotho Highlands water project (1986- to date).

Lesotho Highlands Water Project raises millions of dollars each year mainly through the sale of water to its only neighbour, South Africa. The Lesotho Highlands Water Project was instituted as a bi-national project spanning the borders of South Africa and Lesotho in accordance with a treaty signed in 1986. This almost miraculous engineering feat diverts water from the Senqu River System in Lesotho to South Africa's economic hub, the water-stressed Gauteng region. The Lesotho Highlands Water Project is a multipurpose undertaking that transfers 780 000 million litres of water and generates 72 megawatt (MW) hydropower at the Muela Power Station. The water en route to South Africa is put to good use, powering an underground hydroelectric power station that generates electricity to meet the needs of Lesotho. Royalties paid to Lesotho for water transferred amounts to R438 million for the period covered in this report, bringing the total royalties paid to date to R3 430 million http://www.tcta.co.za.The Lesotho Highlands Water Project (LHWP) is the second largest water transfer and hydroelectric project in Africa today, the largest being the Chinese built Meroe Dam on the fourth cataract of the Nile in Sudan. Costing an estimated US$3 billion for the first two phases (1A-The Katse Dam, and 1B-the Mohale Dam), the project provides water from the Senqu River Basin in Lesotho, which is part of the much larger Gariep (Orange) River Basin, for the Gauteng region of South Africa (formerly Johannesburg and the Witwatersrand), and electricity for Maseru, the capital of Lesotho.

Poverty in Lesotho: A Focus on the Rural Areas

Today, poverty is one of the most critical problems facing many parts of the world, especially the developing regions. For most of these regions poverty is endemic in the rural areas with devastating consequences for the rural dwellers. In Lesotho, like in many countries of the developing world, Poverty is countrywide, with 62 percent of the population living on less than $2 per day (Wood et al. 2010 cited in Gwimbi, Thomas, Hachigonta, & Majele-Sibanda, 2013) Poverty in Lesotho, is deeply entrenched in the rural areas, where about 70 per cent of the people live. In fact, it is reported that more than half of the rural people in Lesotho are poor, while more than one quarter of the poor are classified as extremely poor. As demand for migrant labour into the South African mines declined and unemployed migrant workers returned to Lesotho, remittances shrank from about 60 per cent of gross domestic product (GDP) in the 1980s to about 20 per cent in 2005. This significantly dramatic drop in remittances from migrant labourers threw many rural households deeper into poverty and had the country experience an influx of those in search of wage employment from rural to urban and peri-urban areas within the country. These, especially younger women, have been able to find employment in the country's new industries, mainly the textile industry. However, the limited employment job opportunities cannot keep up with the demand for wage employment (BOS, 2006).

Poverty in Lesotho is closely linked to lack of income and unemployment, as well as to severe degradation of the natural resource base on which the livelihoods of many of the rural poor depend to a varying extent. Gross national income per capita in Lesotho is relatively low and there is a high level of inequality in income distribution. Poverty in rural Lesotho is attributed to a great extent, to increased

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

landlessness; poor production technologies; rampant stock theft; poor animal health, husbandry and nutrition; ineffective agricultural extension and research support services; and culturally embedded land-tenure practices that continue to inhibit sustainable natural resource use and management. The lack of investment in agriculture, the decline in agricultural production, the lack of income-generating activities and degradation of natural resources are among the principal causes of rural poverty in Lesotho. It is on record that about 30 per cent of rural people live in extreme poverty and these are mainly farmers who have less than 0.5 ha of land and also people who are landless and households which are headed by women. People who live in the rugged mountain areas are significantly poorer than others in the country (Lesotho, Bureau of Statistics (BOS), UNDP (United Nations Development Programme), 2007 and National Human Development Report, 2006**).**

Literature abounds with strategies that countries have used to alleviate poverty. In the case of Lesotho, Lesotho's National Strategic Development Plan (NSDP) 2012/13-2016/17 serves as an implementation strategy for the National Vision 2020. The NSDP serves as the Poverty Reduction Strategy Paper (PRSP) and is the second PRSP that the Government of Lesotho has produced (IDA & IMF, 2012). On the whole, the NSDP presents a coherent analysis and offers an appropriate path forward to sustained poverty reduction and sustainable economic growth (p.1). It is recognised that in order to achieve any level of reduction or alleviation of poverty, sustained and broad-based economic growth is a necessary and effective route to take. The key focus areas for Lesotho as this route is being followed have been identified as employment creation; infrastructure development; human capacity and skills development, technology adoption, and foundations for innovation; improved health especially to combat HIV and AIDS, reductions in (social)vulnerability; reversal of environmental degradation and adaptation to climate change; as well as to promote peace and democratic governance, through strengthened and effective institutions (IDA & IMF, 2012). The question of who participates in these processes aside from governments, points to women as key players in this regard. The case of Thota-Multi-Purpose Cooperative as here presented serves to demonstrate that role and to analyse the benefits of that within a women's empowerment perspective.

HISTORICAL TRENDS OF WOMEN'S EMPOWERMENT IN LESOTHO

Within the patriarchal society of Lesotho, women constitute a significant proportion of the population at 52 percent to 48percent of males (Bureau of Statistics, 2006). However, Basotho are a patriarchal society hence the recognised and accepted male dominance of ownership and control over resources and power which in turn operates and maintains a system of gender discrimination (Letuka, Matashane & Morolong, 1997). In spite of this as mentioned earlier, Basotho women have always been powerful in rural development projects. At 58%, Lesotho has the highest number of women in local government in the SADC region and this is viewed as an achievement and a starting point of women's empowerment in Lesotho (Genderlinks, 2010). Women in Lesotho also have a high status in society and a voice in local and national government. Aside from women being more present in the rural settings of this predominantly subsistence economy, Lesotho has one of the highest women's literacy rates in Africa. Girls in Lesotho have benefited from investments in education more than boys, who are often kept out of school to work as herders. With a solid education behind them, many women in Lesotho have achieved positions of influence in households and in the formal institutions. The gender in educational trend for Lesotho has for a long time been that when males went directly from herding to working in the mines,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

there was little incentive for them to attend school. This resulted in a significant gender difference in favour of females. The gender gap in education began to narrow when the government introduced free primary education in 2000 and school enrolment rose dramatically with a positive effect even for boys. As of 2009 this is what UNESCO reported for Lesotho:

This report acclaims this positive scenario from a gender equality perspective and notes that it permeates all levels of education, with statistics showing that a higher number of girls than boys are enrolled in school, a scenario that is different from most of the other Sub-Saharan countries. However, the report quickly points to the fact that the total enrolment for girls is still very low and the enrolment of girls decreases significantly as the grades increase, indicating a very high incidence of drop-outs and a larger number of out-of-school girls. It is also noted in the same report that, although Lesotho's education system has achieved progress in raising literacy levels, major issues in terms of drop-out, student flow, quality, and equity2 remain to be addressed. More than half of all households in Lesotho are headed by women. While education has benefited many women, there are large numbers of poor women, particularly in rural areas, who remain disadvantaged. Households headed by single mothers or women who are divorced, widowed or abandoned by their husbands are among the households with the highest incidence of poverty. Women who are heads of poor households are likely to have lost the assets they once possessed and are less likely to own agricultural assets such as livestock. They have difficulty securing the cash they need to feed and provide for their families. But households headed by women whose spouses have migrated in search of wage employment and stay away from home for considerable amounts of time, tend to be better off.

Lesotho Women's Role in Development and Poverty Alleviation

Women play a leading role in poverty alleviation through community initiatives and their activities in agriculture. This is especially so in Lesotho where men are migrant labourers in South Africa. In many instances, women are heads of households, yet they are discriminated against on access to land resources in their own right. In Lesotho, the role of women in poverty alleviation is especially realized through ventures of a similar nature as the case of Thota-ea Moli and this role has not been adequately mapped yet. Broadly speaking and on a comparative scale, perhaps Basotho women are the most present in development activity than it is the case with women in many countries of Southern Africa. Migration mainly to South Africa to seek employment is a fact of life in these countries and Lesotho is no exception. This is evidenced through the fact that nearly one in five male heads of households are at a given instance not present in the household but working/living away. This is not the case for female household heads where the vast majority are present in the household. And in the rural setting especially, women are less likely to be earning an income than men. Many studies of poverty in Lesotho have significantly made correlations between household headship, gender and levels of poverty. For example, a longitudinal study conducted by Wason & Hall (2002), noted that in terms of sex of head of the house Lesotho has three categories of headship. Male de jure head, female de jure head and female de facto where the man is a migrant worker).This study further found that being chronically poor is positively correlated with households who have de jure female heads. For example, 31% of the chronically poor households in 1993 had de jure female heads compared to 12% of the never poor. The never poor had a high proportion of de facto female heads. On the other hand 54% of the never poor households had male de jure heads in the mines which shows the critical importance of migrant working especially in the mining sector of South Africa as an anti-poverty strategy for the Basotho (p.28).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Women play a key role in household maintenance throughout the developing world. They collect water and fuel, and along with children are involved in agricultural production. In Lesotho, this role and the associated burden imposed on women are particularly acute given the large number of female headed households (27.6%) and the difficulties posed by a seriously degraded environment. Women undertake a substantial proportion of agricultural activities and are extensively involved in the informal business sector. This importance is not matched by control over most disadvantaged in terms of access to land having user rights only through their husbands although many women have found strategies to cope with this, such as share cropping or (illegal) leasing (http://www.fao.org/docrep/). It is against this background that the case below is being presented.

Thota-ea-Moli, Ha Luka Multi-Purpose as a Women's Empowerment Project

Empowerment projects take different forms. In the case of Thota-ea-Moli, the women embarked on a Cooperative project. According to the United Nations, a cooperative is an autonomous association of people united voluntarily to meet their common economic, social, and cultural needs and aspirations through a jointly-owned and democratically-controlled enterprise. Cooperatives are based on the values of self-help, self-responsibility, democracy, equality, equity and solidarity (UN, 2011, p.1). It is further noted that although the reliable figures Cooperatives tend to be scanty from context to context, cooperatives appear to operate on a significant scale in developing countries with studies showing that over seven per cent of the African population are affiliated to primary cooperatives, and this number is increasing (Delvetere, 2008; Pollet, Delvetere & Wanyama, 2008 cited in GRSD, 2011, p.1). Cooperatives are also said to have wide-reaching, direct and indirect impacts on socio-economic development (UN, 2009). I would not be farfetched to suggest that the fundamental premise on which this idea of addressing the issues that Thota-ea-Moli aimed to address cooperatively was socio- cultural. This is in spite of the fact that the cooperative movement as we know it today had already taken root by the time the community of Luka came together to form this venture. The socio cultural basis of cooperation in Lesotho like in many other parts of the world is historic. It is on record that cooperative efforts have occurred throughout history. Since the time when early man cooperated with others to kill large animals for survival, people have been cooperating to achieve objectives that they could not reach if they acted individually. In Africa like in other cultures language and proverbial expressions have been used to highlight and promote the spirit of cooperation and unity in order to achieve better results when families, communities and societies are confronted with challenges such as the challenge of to achieve development.

The cooperative case presented in this chapter is to be understood against the backdrop of the Cooperative movement in Lesotho which has a history that dates back to the late 1940s. Speaking at the official opening of an annual five-day students and youth cooperatives forum in July 2008, the Assistant Minister of Trade and Industry, Cooperatives and Marketing, Mr. Khotso Matla said that the cooperative movement in Lesotho has a long history of more than 50 years starting from the formation of the marketing cooperatives in 1948. He added that since then a number of primary societies were established around the country, which later affiliated to form the first Cooperative Bank, Basutoland Cooperative Banking Union (BCBU). Speaking at the same occasion The Chief Executive of United Kingdom Cooperatives College, Mr. Wilson Mervyn commended Lesotho for being a leader through its involvement in cooperatives, expressing his confidence that other countries will follow the Lesotho's example. He further said that all cooperatives struggle to become sustainable, but Lesotho has pulled through, and as a result has many cooperatives that are still operational. Thota-ea-Moli is one of those surviving cooperatives.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This is a case of a registered Multipurpose cooperative venture which was conceived in the early 1980s and has existed since then, to date 1983-2014 covering the areas of agriculture, (crops vegetable gardening, poultry, Piggery, for income Generation, household food security and improved livelihoods through sewing and knitting, early childhood education, household sanitation and employment creation. At inception, the envisaged economic empowerment was to be gained from an anticipated close to regular income from the sale of products from activities in the above mentioned areas. The decision to have a strong multipurpose orientation was based on the recognition very early in the initiative that diversity among community members (with regard to needs aside from the key issue of loss of agricultural land) and which was fully perceived and articulated by the community itself was going to be a real issue.

Ha Luka households (almost the whole community lost their farming land to a government development project- to site the International Airport (Moshoeshoe 1 International Airport. For the Basotho, like it would be for many agrarian societies of the world, loss of land is loss of a means of livelihood that can never be fully replaced as. In these societies, land is the primary productive asset (Mosaase, 2011) land tenure plays a fundamental role in economic and political power. As per one of the development policies, the Lesotho land Compensation and Resettlement Policy of 1980, if a site is identified by Government for National development purposes, and that land is fully or partially occupied by an individual, groups or even an entire community, the government reserves the right to effect existing compensatory mechanisms. The communities of Thota-ea-Moli had a good idea of the above mentioned policy, and they decided to act together to address their future plight by forming the cooperative. Unlike other development initiatives in the country, this was an initiative founded on a need for confrontation with Government.

PROJECT DESCRIPTION

Almost all the households in the community had lost their farming land to a government development project to build the Moshoeshoe I, an International Airport. According to a government policy if land is earmarked for national development purposes, the only solution to that loss is compensation in monetary terms. For The Basotho, like it would be for many agrarian societies of the world, loss of land is loss of a means for livelihood that can never be fully replaced. The community of Thota-ea-Moli had a good idea of the above mentioned policy, and they decided to act together to address their future plight by forming the cooperative. Unlike other development initiatives in the country, this was an initiative founded on a need for confrontation with Government mainly by women of this village.

The project drew its membership from several villages which were affected by the development. Initially there were about eighty members out of which, seventy eight were women and two men. One of the men was the principal of the primary school in the village and the other was a prominent member of the community who was known to have led many other development activities in the community. The main purpose of the project was employment creation in order to address the ensuing state of socio economic deprivation as a result of loss of farming and grazing land to the airport project. From the activities as described the community members of the project anticipated a close to regular income from the sale of project products such as vegetables, eggs, chicken and farm produce such as milk and pork etc. The benefits were to be gained by almost all households in the community, for the project members these would be direct benefits while for the rest of the community the benefits would be indirect in the form of goods and services. This case presents a rare community programme which brought together,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

all members of the community to solve a common but fundamental problem. Therefore, because of its nature, engagement with the project by all the stakeholders, almost always dictated involvement of all of the community members, thereby making it a very complex development venture.

Project Design

This was a registered multipurpose cooperative which was initiated by a group of women who in their words, "once the fields were taken over, they (as women) felt very stranded". They asked themselves what they would be doing if they are not working in the fields like other women and cannot go to work in the mines like men. They also asked themselves what they will feed their children from. They said they had to ask themselves these questions because in Sesotho, "when things get really bad, especially where children are adversely affected, it is the mother who is expected to take action and provide protection". The appropriate Sesotho saying is, *mangoana u tsoara thipa ka bohaleng* (portraying mothers as protectors even in times of difficulties or to a point of risking their own lives to save their children). They said they started knocking on many doors looking for advice and assistance. On one afternoon one of them had a friend visiting from town who also happened to be working for the university and they talked about her problem. The visitor gave her friend good ideas who immediately called several of them to come and share those ideas with. They followed up at the ministry of Agriculture where they negotiated to be included in the Government extension routine community training on Nutrition which is a typically women focused area. In the meantime they said since they knew that what they needed was much more than cooking lessons, they started to sell home brewed beer to men at the construction site of the airport. The money from those sales was to be part of the capital which they knew they needed in order to start a business venture that would create employment to help them sustain their families. The solution sought therefore, was to be long term as the community and the stakeholders agreed that trying to address a problem related to land cannot be a once off encounter. Therefore, the interactions internally and with external prospective networks were not only intensive but also extensive in the form of meetings, visits to offices participation in national activities such as Agricultural shows and community information for a etc. the visitor friend was incidentally also an extension educator working for the university who promised to also return to the community with more ideas and the relevant colleagues within the university framework of outreach and development, which she did and the association of the project with the university lasted since then to date.

The project had several components as mentioned above hence the designation of multipurpose. However the most predominant feature was employment creation for income generation. In other words while the bulk of the training was for skills that would enable the members to survive the day to day challenges such as small scale vegetable growing for home consumption, good nutrition and health education, the main aim was to find ways of compensating the loss of food security and income as a result of loss of land. Intensive training was provided under the auspices of the Lesotho Cooperatives and Credit Union League which resulted in the group being register two or three years later thereby acquiring legal status which enabled them to receive financial support from Government and international development agencies when and if they qualified for such support,.

The support provided was multidimensional with a diverse team of stakeholders which were and still are some of the following: African Development Foundation (ADF), Unitarian Service Committee of Canada (USCC), Ministry of Agriculture(Crops, Piggery, Poultry keeping, Nutrition, Cooperatives), World Vision International, The National University of Lesotho, Ministry of Interior and Chieftainship

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Affairs, Ministry of Transport and Telecommunications, Ministry of Education, Lesotho Council of Non- Governmental Organisations, World Vision, Lesotho etc. Ha Luka underwent a very Intensive and comprehensive programme of Capacity building with a strong bias to Cooperatives which has been a popular movement and community development approach in Lesotho. The programme was revised periodically to meet the evolving challenges. For most of the stakeholders, Thota-ea-Moli held promise for success and it became a laboratory for experimenting with different approaches to community development and engagement (Project records 1983 to date).

Project Implementation

As mentioned before, most of the project activities were in the areas of Poultry keeping, Dairy Production, Vegetable gardening, Knitting and sewing especially school uniforms piggery and home brewing and sale of outputs form these for income generation. All of these activities were implemented by clusters of cooperative members. Using the funds received as grants from the international development partners, as part of the design, members had agreed to borrow from those on a rotational basis. This means that those borrowing first had to use the borrowed money to generate income and return so that the other waiting members could do likewise. Therefore, the project concept was that of assets being held in trust by individuals to address their needs. This meant that what the project had was collectively owned but individually used to address household needs of members. The collective aspect was prominently employed in particulars aspects of the project such as in the marketing of products whereby when an order was received the treasurer had responsibility (working with the executive committee to have the order proportionately shared by members to supply the product so that all members had opportunity to take advantage of the available market. There was also a rule for collective purchasing of inputs by each project sector in order to share and offset the high costs of transport to town to buy inputs or for the sale of products.

The case also aimed to address the non-money aspects of the venture such as the loss of dignity from the status of landlessness, the conflicts that arose from divergence in interests and needs on the basis of gender, age, class and income, levels of education, employment status and from those who did not have land and were still expecting to be allocated land by the chief or to inherit it from their parents. In other words, it was clear right from the start of the problem that there were benefits to be derived by almost all households in the community and therefore there was an aim for inclusive empowerment. This is a case of a community programme which brought all members of the community together to solve a common problem. The solution sought was to be long term as the community and all those who eventually came on board to support the initiative were drawn by the community into using this principle of inclusiveness. All came to an understanding that trying to address a problem related to land cannot be a once off encounter and that it is also bound to be a complex matter. Therefore the interactions amongst all the parties were not only intensive but also extensive. The support provided to the group was also multidimensional with a diverse team of stakeholders. The community was also not homogeneous and their needs, interests, demographics, physical location within the community and extent of land loss, were also to somewhat varied. These and other factors posed as challenges which will be discussed later in the chapter. For now a focus is made on the project achievements.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ACHIEVEMENTS

Within the broad framework of empowerment as a core principle of community development which is also linked to sustainability, this case is serves to demonstrate achievement to a great extent with regard to empowerment of the women of Thota-ea-Moli and their community. Their empowerment is evidenced within several areas and the three picked to illustrate the point are; economic empowerment, social empowerment to include access to power, authority, control and decision making and conflict management,. Empowerment is one of the most elusive concepts that is also, applied across a wide spectrum of disciplines from economics to sociology, psychology, philosophy, political science, human rights, education and even in business and the sciences. Empowerment is sometimes perceived as a process, a methodology or a strategy. Sociological empowerment often addresses members of groups that social discrimination processes have excluded from decision-making processes through - for example - discrimination based on disability, class or economic status, race, ethnicity, religion, or gender. These groups are marginal to mainstream power and decision making structures and are generally excluded from processes of the wider society. As a result of that marginal status they are also excluded from enjoying the full benefits of what their societies are able to offer. Empowerment in these instances then becomes a means through which these groups obtain the basic opportunities and it often involves systematic skills acquisition improvements in the psychological factors such as self -confidence and self- esteem and increased economic gains or increased participation in power and decision making structures. While broadly speaking, empowerment conjures up ideas from a wide landscape of meanings, and interpretations, for purposes of this chapter the focus is on economic empowerment as both an achievement and a challenge which was and it still is faced by women of Thota-ea-Moli.

Economic Empowerment as an Achievement

Besides social security, there is a need for economic freedom by all persons. Economic freedom in this context refers to a condition which enables people to utilize their innovative and creative capacities in the development process; protects individual economic rights to have access to productive assets, including land rights; provides a right to control one's labour in terms of decisions to engage in economic activity of one's choice; and conveys a right to control the fruits of one's labour. It also implies a right to gainful employment (Meena, 2010). To a relatively large extent, the women in this case achieved this. It is a generally held view that economic empowerment has positive impacts on the lives of those who gain it and on the lives of their families as it gives them some degree of independence. There is also, empirical evidence to suggest that economic empowerment of women is central to their subsequent ability to survive poverty, exploitation, violence, discrimination and violations of many of their fundamental human right. Therefore, the women's economic empowerment framework which is closely associated with feminist thought has been used globally as a stepping stone to achieving some degree of equality between men and women. In the context of development and for groups of the type that this case is presenting, the community empowerment framework has been applied. This framework has been mediated through interventions that aim to change the lives of communities or community groups and facilitate their seeking solutions to defined community problems. This process often involves determining the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

causes or relationships amongst social factors, and to engage in effective individual and collective action to address those problems or their causes. The problem being addressed may be within a sector or several sectors such as education health, agriculture or in the broad area of economics such as land, environment, water or even access to ICTs.

In this particular case, the common problem was Ha Luka households (almost the whole community having lost its farming land to a government development project- site for the International Airport (Moshoeshoe 1 International Airport). The main purpose of the project was employment creation in order to address the ensuing state of socio economic deprivation as a result of loss of farming and grazing land to the airport project. From the activities as described the community members of the project anticipated a close to regular income from the sale of project products such as vegetables, eggs, chicken and farm produce such as milk and pork etc. The benefits were to be gained by almost all households in the community. For the project members these would be direct benefits while for the rest of the community the benefits would be indirect in the form of goods and services. The uniqueness of this case is that it was a rare community program which brought together, all members of the community to solve a common problem. Therefore, by its nature, engagement with the project by all the stakeholders, almost always dictated involvement of all of the community members, thereby making it a very complex development venture that also brought out a complex set of factors both enabling and some real challenges and barriers which will be further illuminated in the subsequent section of this chapter.

For the economic activities of this case to be viewed as processes of empowerment, it is necessary to reflect on the background part of this chapter on the economic situation in Lesotho which is intricately tied with migrant labour by Basotho men into South Africa. This more or less seems to point to the fact that interaction with money at a personal level and actually earning it was in this culture and presumably for women in Thota-ea-Moli, ha Luka had been a male prerogative until inception of this project. For the members also, the levels at which they had interacted with money differed because as it is women are not a homogeneous group much as they might have a common problem. The project members were diverse with regard to age, economic background, educational and literacy levels interests and needs and expectations, family size, or even whether in spite of lost land there was a family member who was bringing income from the mines. True, the cooperative experience enabled the women to borrow money and repay at a rate determined by them thereby not subjected to some of the inhibiting factors for women to take loans such as their legal status. Now in an environment where such barriers were removed without accompanying mechanisms to safeguard the loan, the extent to which failure to repay occurred seems to have been high. In discussing the challenges of this, the women said in their view, those with loans really wanted to repay the loans because they did not want to disgrace themselves and their families to the community and also to the funding support agencies who often received reports about the project In other words the community aspect served as a sanctioning tool for the members. In addition to this, they also articulated a fundamental cultural perception of a loan that they brought into the project. They said in Sesotho culture, a loan among or between people who live and know each other, is a long term investment and an expression of a relationship especially between neighbours. When this is considered in contrast with the concept of a loan within a strictly financial institution, such as a bank or with a foreigner where the pressure to repay would be even more, seems to confirm the empowering experience of this project by its members. The cultural conception adds a human touch to an otherwise economic development which is also one of the fundamental principles of human development.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Access to Power, Status, Authority, Control, and Decision Making as an Achievement

The whole project account provides evidence of increased access to power by women of Thota-ea-Moli to make decisions in their families and outside the family in formal project or group settings that also have an economic face. Decision making also involved patterns of communication that the members articulate well as they discuss their resources management processes. In their loan processes, for example, members report that they had to sign and one member said, "this thing of using books was new to us, but I like it because we all realise that what is written does not change." This realisation has to be appreciated within an otherwise anchored tradition of oralcy. Evidently, agreements on what was to be done and how, were also entered into through use of collective group skills within new institutional structures and a frameworks of distinct patterns of division of labour and responsibilities. There is the executive committee, sub committees, the chief as the overall overseer of development aided by the village development Committee, Extension staff of Government and the university as external stakeholders and programme officers of international development partners, etc.). This complex structure involves hierarchies and protocols that members of this project seem to have been able to operate in successfully. Most importantly an empowering aspect in this case was capacity of the project to move women out of the private domain of decision making and expose them to the public in a manner that is not common for most women particularly during those years (early eighties and in this part of the world). What emerges from the case is also the fact that the Women of Thota-ea-Moli seem to have realised early enough that implementation of the project required a lot of skill in areas where they saw some cultural contradictions and they demonstrated readiness to adapt in this transitionary environment. This realisation was even more evident in their discussion of Conflict and conflict management as another example of an achievement on their part.

CONFLICT MANAGEMENT

Sociologically speaking, in every unit of society conflict is eminent. In discussing project management processes in this case different experiences of conflict are alluded to, which arose from some of the following:

- Access to and control over resources;
- Accounting processes and systems with regard to project resources;
- Loan repayments and the eminent conflict that arose from this;
- Performance of roles and responsibilities especially leadership roles;
- Sharing of Project benefits, both long term and short term;
- Different perceptions about some aspects of the project(grants turned into revolving loans; collective ownership and individual use of assets.

In showing their empowerment with regard to resolving conflict this incident was used; one of their earlier committees had overstayed their term and was not prepared to relinquish power. They stalled the election process until at one general membership meeting the members say, they unanimously removed those members from the committee and elected a new one. In other words, they did not as members

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

only think and talk about what to do but they forcefully took charge to implement the plan that they had crafted and mobilised for prior to the meeting. However, they were quick to point out that in asserting and claiming this right from people with whom they live outside of the project they exercised restraint and continue to show due respect to the members. But at the same time they said what drove them to act in this instance was the realisation that if a source for conflict remains unresolved then that is a real problem. The ways in which conflict is perceived in this case seems to confirm the notion that conflict resolution or mediation is a creative process that requires full ownership of those involved. It also highlights the fact that conflict often features prominently in women's development activities which have a potential to empower them.

In summary, it can be noted from these achievements that some of the following principles of empowerment emerge from the case.

- People centeredness and broad based representation of those with a stake in the project;
- Hands on participation, engagement, and inclusion;
- Ownership of project plans, processes and outcomes which motivated members to develop individually and collectively;
- Community self-determination within the framework of shared values;
- Equal partnerships and building of networking with elements of equality;
- Collective strength and unity in diversity.

The women of Thota-ea-Moli were able to identify a community problem and the factors compounding it, develop strategic solutions and facilitated processes of independent change in their lives as individuals and as a community. They achieved this through identifiable economic and social gains in the form of income, power decision making and improved social status. They took the initiative to mobilise support for change, build their skills and capacities within a framework of enhanced ability to make choices that positively impact their lives and those of their families and community. All of this was a result of a project implementation strategy that comprised of structures such as those of leadership, power and authority and control capitalising on local resources, and a role sharing mechanisms which were anchored on effective systems of role assignment and role sharing. Evidently, the Thota-ea-Moli Project gave the women and the community a voice with the national decision making structures and gained them an international face. But of course like any other development initiative, this project was not without challenges, some of which are presented in the next section of this chapter

CHALLENGES

From the foregoing presentation, it can be noted that Thota-ea-Moli Multipurpose Cooperative is a unique and complex women's empowerment project. It can be expected therefore that it also had and still has a number of challenges which were also many, diverse and evolving. For all the stakeholders of the project, Thota-ea-Moli has served as a laboratory for experimenting with different approaches to community empowerment and engagement for own development. Among the many challenges from which lessons can be drawn the following are of particular interest in this case:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Lack of hands on experience in the public sphere by the women members (particularly from an economic perspective) within the context of an enclave economy) due to the entrenched socio-cultural belief that a woman's rightful place is in the home.
- The generally low status accorded women in Basotho society which culminated in the current policy and legal frameworks which are discriminatory to women and inadequate institutional mechanisms for advancing the status of women.
- The hostile economic development environment in which resources are acutely limited and women are also of a relatively low economic status as a result of higher rates of unemployment and low participation in the labour market, limited access to credit and overall lack of the financial means to effectively compete, in entrepreneurship and business.
- Limited capacity at the start of the project to effectively interact within the mostly patriarchal structures of local and central government.

FUTURE TRENDS

All in all the project has evidently been empowering as it has enabled the members to devise a lasting solution to their common concern within the framework of a range of options. Against the backdrop of scanty empirical evidence on the impact of cooperatives on women's empowerment in Lesotho, this case has been used to present the experiences of Women of Thota-ea-Moli, Ha Luka as empowering experiences. It is on record that generally, in spite of their patchy history, cooperatives are widely seen to have potential to make positive impacts on development and poverty reduction (Birchall, 2008 cited in GSDRC p.1 & DFID (2010). These authors further argue that, cooperatives make an important contribution to sustained economic growth and to making markets function better for poor people. Perhaps this is why the UN has acknowledged their important direct and indirect impacts on socio-economic development in terms of promoting and supporting entrepreneurial development, creating productive employment, raising incomes and helping to reduce poverty while enhancing social inclusion, social protection and community-building. On the social aspects it should be interesting to note that several studies argue that cooperatives do not only directly benefit their members, but also have positive effects for the rest of society (UN, 2009). In the case of Thota-ea-Moli, the solution sought was to be long term as the community and the stakeholders agreed that trying to address a problem related to land cannot be a once off encounter. Evidence for empowerment seems to be demonstrated by the Women of Thota-ea-Moli's independent decision making; persistence and determination to achieve a set goal; high levels of confidence; individually and collectively; adaptation within exigencies of contradictory traditional modes and ways of thought and modernity; a good grasp of the dynamics of group functioning; and a fair perception of the non- economic aspects of development experience such as this.

The unique experiences within a unique context include the exercise of power and control within a public sphere a trend of feminist thought that needs to be upheld, improved status by slightly circumventing the legal constraints around women's access to power, credit and status and authority. There is also evidence of an effective interface between traditional practices and ways of thinking, tolerance and accommodation of heterogeneity and a fair perception of gender dynamics in this specific cultural context. The case also supports the view that when we talk about women's empowerment, we mean the process of renegotiating accepted norms and expectations about female and male roles, relations, and responsibilities. This strategy serves to open up new opportunities for women within the household, the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

community, the country and beyond. The case further demonstrates, that despite the many and sometimes deep divides between women in terms of ethnicity, class, education, age, family background and religion, women still have the common interest and capacity within the framework of their social, legal and cultural identity, to act together for a common cause (UN, p.15). This chapter has also presented some of the strategies that women used to address some of the challenges they face. Some of the strategies were evidently creative, culturally anchored and very bold forming part of the lessons for future development and empowerment projects for women in this context. This seems to point to a trend in which there is realisation that indigenous approaches can be a useful foundation in the tackling of modern day problems such as the approach to conflict as described in the case.

Much as access to and control over land and or property is a generally gendered process, in Lesotho this is sanctioned by the dual legal system which inform policies and socio cultural practices uphold those. However, until 2006 when the Legal Capacity of Married Persons Act was introduced to eliminate inequality between married persons, women in Lesotho had always, individually or collectively, used alternative strategies to access land (Larsson, Mapetla & Schlyter (1998) such as collective access to resources through cooperatives within the framework of slowly changing gender relations. Until then, indirectly, women's empowerment was constrained by the women's legal minority status. This legal reform achievement holds promise for women in dealing with the factors of gender inequality which are embedded in the legal and cultural systems of Lesotho. Other areas which hold potential for Thota-a-Moli women include use of Technology, specifically information Communication Technologies (ICTs) to address some of the project challenges. Foundations for us of these had already been laid when in spite of the limitations of access, the women report to have been using the radio, for example, to listen to an Agricultural weekly Programme from which they learnt about developments in the different aspects of the project or to access information regarding markets for inputs and outputs, invitations to national activities such celebrations of National Cooperative day at which they had good opportunities to network and further empower themselves.. In this era of Cellular phones, computers and other tools, there is increased potential to exploit these. What would be needed is improved infrastructure to support use and capacity Building to facilitate that use in this information and communications technology age.

KEY TERMS AND DEFINITIONS

Cooperatives: These are autonomous associations of people who voluntarily come together to cooperatively address or solve an identified problem or need for their mutual social, economic, and cultural benefit.

Development: The act or process through which growth, progress, advancement or change is achieved; the state of being developed; There is socio economic development which refers to the sustained and concerted actions that promote or achieve improvements in the standards of living and wellbeing of people as individuals, communities or societies in specified locations.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Empowerment: The process of increasing the economic, political, social, educational, gender, or spiritual strength of an individual or group of individuals. It can also be used to mean the granting of power to someone, for them to perform certain functions, duties acts or responsibilities on behalf of others. Empowerment is the process of obtaining basic opportunities for marginalized groups of people, either directly by those people, or through the help of non-marginalized others.

Lesotho: Officially, the Kingdom of Lesotho, is a small democratic and sovereign country in Southern Africa which is completely surrounded and landlocked by South Africa. With its scenic mountains and valleys Lesotho is known as the Kingdom in the Sky because of its lofty altitude. It is the only country in the world that lies entirely above 1,000 metres (3,281 ft) in elevation.

Poverty: This means dearth; neediness, state of deprivation and scarcity. It implies a state of lack of necessities and poor state of existence as a result of limitations with regard to basic needs, income, health and other social services for individuals, households, and societies.

Rural: Geographic areas which are located outside cities and towns; Countryside; an open stretch of land that usually has fewer homesteads, limited sparsely populated and limited services and generally lacking in many of the development indicators.

Women: A plural of woman which means a person of a female sex identity; an adult human female, often referred to as a lady. The antonym of woman is man or adult male person.

Chapter 72
Agriculture, Trade Liberalization and Poverty in the ACP Countries

Theresa Ann Rajack-Talley
University of Louisville, USA

ABSTRACT

This chapter looks specifically at the impact of the ACP agriculture trade agreements on issues of food production, food security and poverty and how they relate in some ways to each other. It is divided into four distinct but inter-related sections. First, poverty in the ACP regions is briefly described. Secondly, the importance of agriculture, particularly the role of small farming systems to economic growth, employment, food production, food security and poverty reduction in the ACP countries is examined. Thirdly, the impact of the acceleration of trade liberalization and agriculture protectionism on ACP countries is reviewed and analyzed. Here, the trade arrangements and networks in the three ACP regions are described and include international, regional and local agricultural trade and market agreements. Further, the paradoxes and dilemmas that emerge are interrogated and their outcomes discussed. Particular attention is paid to small producers and women. The fourth and final section of the chapter concludes that while the impact of agriculture trade liberalization remains a mixed bag of positive and negative possibilities, one thing that is clear is that while trade liberalization is promoted as a cure for food security and world poverty, the jury is still out on whether it has helped or hindered this endeavour. Trade policies and arrangements do substantially change the lives of people in developing countries, but in very complex ways. Recommendations are made to support the South-South initiatives of the ACP and others as well as enhance regional and domestic agriculture production and trade policies. The author, however, warns that agriculture and trade policies must be linked closer to food security and the healthy diets of local populations.

Overcoming poverty is not a gesture of charity. It is an act of justice. – Nelson Mandela

INTRODUCTION

International trade and financial transactions are not new phenomena. From time immemorial, people across the globe have exchanged goods and services. Today, societies have become more specialized and no single country produces all that is needed to sustain itself. Thus, the exchange of goods and services is even more necessary than before. However, the formation of cooperative entities and marketing blocs have made trading more political and convoluted. No longer is the simple use of supply and demand economic principles applicable. Currently, the international movements of goods and services have more to do with decisions made by multinationals and groups of developed countries. According to Koroma and Ford (2006), the rapidly changing structure and patterns of trade are heavily influenced by private sector investment and standards. As a result, freedom to trade at all levels, from the farm gate to the stock market, is now much more complicated and is further removed from the power of producers and/or consumers, who are also finding it increasingly difficult to avoid slipping into the clutches of poverty.

The primary purpose of this chapter is to examine the links between agriculture production and trade, food security, small farmer production, and poverty reduction in developing countries. It specifically analyses the impact of agriculture trade policies and outcomes in select African, Caribbean and Pacific countries known as the ACP group. There are 79 African, Caribbean and Pacific states that form the ACP: 48 are in Sub-Saharan Africa, 16 in the Caribbean region, and 15 in the Pacific. The countries are demographically, geo-physically and economically diverse; 40 are considered less developed countries, 37 small island states (or both), and 15 landlocked developing countries (see table 1). The total ACP region population is approximately 727 million and represents 15% of the total population of all developing countries. Ninety-four percent live in Africa, close to 5% in the Caribbean and just over 1% in the Pacific islands. According to ACP Secretary General, Dr. Patrick Ignatius Gomes, in his address to the UN Summit on Sustainable Development at the 70th United Nations General Assembly (2015), **"**the domains of the ACP group include: rule of law and good governance; global justice and human security; intra-ACP trade, industrialization and regional integration; building sustainable, resilient and creative economies; as well as financing for development." Further South-South and Triangular Cooperation informs the group's approach to all these domains.

In reality marketing and trade arrangements can sometime result in uneven benefits and the extent to which they assist in poverty reduction remains contested. The chapter infers that agricultural trade policies are often bullied by international trade magnates and are not necessarily the answer to economic growth, food security and poverty reduction in most developing countries. Moreover, trade policies, although still important, do have negative impacts on developing countries including marketing preference erosion, decline of tariffs, and the demand for high level of competitiveness which requires a wide range of mitigating factors. Thus, many developing countries are often confronted with substantial disadvantages in implementing current trade policies that necessitate having substantial resources that they simply do not have (UNCTAD, 2013). Since most of these countries including those member states who belong to the ACP Group are agrarian-based, current agriculture trade policies have direct and indirect impacts on poverty, economic growth and the well-being of the people who live in these countries.

LDC= Less Developed Countries

OVERVIEW OF POVERTY AND AGRICULTURE IN THE ACP COUNTRIES

World Bank estimates indicate that on a global level, the first Millennium Development Goal of cutting the 1990 poverty rate by half in 2015 has already been attained. However, despite the progress made there are still large numbers of people whose standard of living fall at or below the poverty line. Close to 17% or 1 billion people in developing countries live on less than US $1.25 a day, that is, about one in seven of the world's population suffer from hunger (World Bank 2015). Similarly, the United Nations Food and Agriculture Organization (FAO) estimates for 2012-14, indicated that approximately 805 million people were chronically undernourished, i.e., one in every nine people in the world had insufficient food for an active, healthy and productive life.

Progress made towards meeting the Millennium Development Goals internationally has also been uneven. The gap between the wealthiest and poorest countries has widened and the level of hunger and poverty varies among developing regions. For example, although developing countries overall experienced

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

a reduction in poverty, a disproportionate amount (just over 80%) of the world's extremely poor live in South Asia (399 million) and in Sub-Saharan Africa (415 million). Fewer than 50 million of extremely poor people live in Latin America and the Caribbean (LAC), the Middle East, North Africa, Eastern Europe and Central Asia, combined. Furthermore, the vast majority (791 million) of people who live in dire poverty reside in developing countries (WorldBank, 2015). Thirty-nine of the 49 developing countries are members of the ACP groupings where approximately 214 million undernourished individuals can be found in Sub-Saharan Africa[1] and 37 million in Latin America and the Caribbean.

There is also the problem where increasingly larger numbers of families in some of the ACP countries are eating too much of the wrong types of food, resulting in overweight and obesity. For example, while hunger is a major problem in sub-Saharan Africa, the excess intake of calories seriously undermines the health of many in the Caribbean and Pacific regions. Chronic non-communicable diseases, several related to poor nutrition, now account for 57% of deaths in the Caribbean. Further, although undernutrition and iron-deficiency anaemia persists in the region, the increasing incidence of obesity is now the major source of nutrition-related problems. In addition, diseases related to obesity such as diabetes, hypertension and heart conditions are chronic and very expensive to manage placing financial burdens on poor families (PAHO 2014).

A similar story can be told for the Pacific region, where half of the adult population is overweight. Pacific Islanders tend to eat a lot of imported canned meats like spam and corned beef, which has a negative effect on their health. In 2007, eight of the 10 heaviest countries were located in the South Pacific. Nauru, the world's smallest republic with just over 9,000 inhabitants, earned the number one spot with over 90% of their adult population considered obese. At the same time, 38% of Papua New Guineans live below the National Basic Needs Poverty Line, which means 2.7 million people are unable to buy sufficient food and meet basic requirements for housing, clothing, transportation and school fees. Even more alarmingly, 61% of the populace does not have access to safe drinking water (Borgen Project Report 2015).

Ironically, the lack of adequate food, proper nutrition and the resulting high levels of diseases and deaths related to poor nutrition in many ACP countries occur in places where agriculture and food production have historically been core to people's livelihood and dietary needs. Currently, ACP countries need to produce increasing quantities of food to satisfy their growing populations. However, food security is not just about growing more food, but also about high quality items that have the nutritional value for healthy diets. Equally important therefore, is that healthy food items should be accessible and affordable to all sections of the population, including those responsible for producing them. It is therefore imperative that domestic agricultural policies and practices be oriented around these understandings and trade negotiations be sensitive to the needs, capabilities, health and well-being of people.

Role of Agriculture in Livelihoods, Employment, and Food Security

Taken as a whole, ACP countries average significantly lower rates of per capita Gross Domestic Product (GDP) growth than most developing countries. However, with the exception of the Caribbean subgroup, agriculture's share in the GDP of ACP countries is normally higher than in developing countries collectively, and in some ACP countries agricultural products form the larger portion of their total trade. In the case of sub-Saharan Africa, the processing of agricultural products also accounts for two-thirds of manufacturing value-added (CTA 2011). Moreover, agriculture still accounts for more than 60%of total employment in ACP countries compared to around 55% in developing countries jointly. Most of the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ACP countries have also sustained increases in per capita food production, but food production has not kept up with population growth nor the dietary needs of any of the three ACP sub-regions (FAO 2006). Specific to Africa, agricultural production has increased steadily, tripling in value and is almost identical to that of South America, but lower than that of Asia. However, the growth of the sector is uneven and the World Bank estimates that there is a wide spread in agriculture's contribution to GDPs across the various African countries. For example, in Libya, Guinea, Gabon, and others, agriculture accounts for over 45% of the GDPs while in Burundi, Republic of Congo, Liberia, and others, agriculture accounts for under 15% of these countries' GDPs. The average for the continent as a whole is approximately 30-40% (World Bank 2012). More importantly, this sector has always absorbed a large percentage of the adult work force. Agriculture creates most of the jobs in Africa, aside from the oil-producing African countries. Half or more of the working population, an estimated 530 million people or 48% of the total African population work in the agriculture sector. A large proportion of all new entrants to Africa's working population (approximately 330 million) have very little or no option but to turn to agriculture (NEPAD 2013).

The main farming system in Africa is quite similar to that of the Caribbean and the Pacific Islands. Africa's agricultural sector is dominated by small family farms that rely mainly on family labor and women's labor. As a whole, Africa has 33 million farms of less than 2 hectares, accounting for 80% of all farms. However, in the last decade large-scale investment contracts have crept, threatening not only the persistence and support to small farmers but also to the continent's natural resources and biodiversity. These large-scale farming systems are estimated to cover close to 20 million hectares, which represents more than the arable area of South Africa and Zimbabwe combined. While the small family farming systems are unable to expand and enhance their production due to the lack of their own investment capacity and secure land tenure, many African countries have bought into the concept of industrial farming as an avenue to meeting the demands of world trade agreements and the food security of their populations. As such, in many African countries it is easy for foreign groups and multinationals to acquire land and set up operations without adequate policies to protect local production by small producers and the countries' natural resources (NEPAD 2013).

In the last 30 years, Africa's population has doubled overall and tripled in urban areas. The most direct consequence of this exponential population growth is that the continent now has more mouths to feed. Yet, cereal production, one of the main staple for Africa, has been unable to keep pace with population growth, since it has only increased by a factor of 1.8. This gap is even wider for processed products and meat, which are increasingly called for by a larger and larger urban population. In fact, Africa has moved from being self-sufficient in cereal production and other traditional crops in the 1960s to becoming a net importer of basic food items that compete with its own production of meat, dairy products, cereals and oils. In 2011, African countries spent close to US $35 billion in food imports (excluding fish), which amounts to 1.7 times the value of its agriculture exports (Africa Progress Report 2014).

A very similar synopsis is found in the Caribbean Region where agriculture is important for the region's GDP, employment, food production and food security, with these varying from country to country. For example, the 2012 data from the World Bank shows that in the Caribbean, the GDP earned from agriculture ranged as high as 21-13%in some countries (e.g. Guyana, Dominica, Belize) to as low as 1-2%in others (e.g. Barbados, Antigua and Barbuda). As in Africa, the sector is an important source of employment where some 3.3 million individuals are employed as agricultural workers. In the past decade this approximated to 32% of the labor force in 15 countries across the region including Haiti (Bourne 2008).[2] In the last decade farmers made up about 8% of the labor force in the least agrarian country such

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

as Trinidad and Tobago, but comprised as much as 20-30% in countries, e.g. Belize, Guyana, Grenada, Dominica and Jamaica, which are more heavily dependent on agricultural production (Potter et al. 2004). Many others are often employed in jobs attached to the forward and backward linkages in the food sector, especially in agro processing and marketing businesses.

Although the agricultural sector in the Caribbean historically focused on wealth generated from the exportation of raw materials (sugar, cocoa, coffee, etc.) to metropolitan states (and some still do), it also benefitted from a fairly decent domestic food sector. According to Rajack-Talley (2015), the production of food items continue to be carried out primarily by small family farms scattered throughout the landscape of the Region. Although there are variations in size of operations, small producers in the Caribbean are mainly family operated enterprises co-existing alongside larger private and state-owned farms. They have limited access to land and their farms are either owned, rented/leased, shared with other family members, or illegally occupied. The size of farms can vary, but small operations range from ½ - 5 acres (.15-2.0 hectares). They practise mixed farming ; a combination of crop production, livestock husbandry, forestry, artisanal fishery and small scale aquaculture, producing food both for the home and the local markets as well as for the export market. Farmers devote a major part of their time to cultivation using mainly their own labor and that of family members, with little paid help from non-family laborers.

Over the years, agricultural development has suffered so much so, that the Region's food importation bill soars higher every year and was estimated at US $3-6 billion in 2012-2013.[3] With the exception of Belize and Guyana, most of the Caribbean countries are net importers of food, averaging 60% in some cases to as high as 80% in others. Such high levels of food importation compete with cost of local food production and food prices. Furthermore, not only have Caribbean people become more dependent on imported foods but the income needed to purchase these items has dwindled. Although the Region has over the years increased minimum wages, food price inflation has outstripped the minimum wage increases in most countries. According to the Director of the Caribbean Food and Nutrition Institute (CFNI), "soaring food prices present a crisis which has devastating consequences on nutrition, particularly in children" (CFNI Annual Report 2008: v).

Statistics on the agricultural earnings or GDP on the third region of the ACP group, the Pacific Island, are not readily available. What is known is that the agriculture and fisheries (forestry in some of the larger countries) sectors remain the economic mainstay of most Pacific ACP countries (PACPs). Commercialized agriculture does provide a substantial income to these countries based on medium, small and micro levels of production and the US dollar value of commercial market products (see table 2).

The agricultural sectors of the Pacific countries are made up primarily of subsistence or semi-subsistence farmers, producing both food crops and cash crop products in the larger countries (palm oil, cocoa, and coffee). Farming is still a family owned and operated system and many families rely on agriculture as

Table 2. Ranking of commercial agricultural production in PACP countries

Value of Top 5 Commercial Market Products	Country
Medium: Above US$100 million	Papua New Guinea; Fiji
Small: US$10 million-US$ 60 million	Solomon Islands, Vanuatu, Timor-Leste, Kiribati, Tonga.
Micro: Under US$7 million	Federates States of Micronesia, Marshall Islands, Cooks Island, Niue, Nauru, Palau, Tuvalu

their main source of income. Fisheries, especially tuna, remain an important resource in several of these countries but the processing of fish as an industry remains limiting because it is too capital intensive for most of the people in the Pacific Islands. Timber is another natural resource available to some countries but it is unsustainable and under constant threat, as many of the traditional owners of this resource are unable to protect their interests in commercial negotiations and cannot depend on strong support from their governments (CTA 2011; Malua 2003).

Farming remains a very traditional practice tightly linked to family values and culture. Family farms are considered multi-purpose enterprises whereby women and men have historically provided a self-sufficient food system for households and communities (Farming Matters 2013). However, today imported foods constitute a high percentage of household diets, much like the other two ACP Regions. For example, 90% of the diets in the Marshall Islands are dependent on imported foods and 95% of the diary requirements in Fiji are derived from imported foods, particularly powered milk and cheese (CTA 2011). To break this dependency, the PACPs are actively seeking to promote greater national food self-sufficiency. That is, to produce whatever basic foodstuff can be produced locally (e.g. fruits, vegetables, root crops and small livestock) while importing other food stuff. However, because of the small size, remoteness and geographical fragmentation, many Pacific communities are highly vulnerable and suffer disproportionately from external shocks, such as adverse climatic events or market failures.

Natural disasters, reef degradation and deforestation have caused extensive damage to lives and livelihoods. With the exception of Fiji, in the other islands (Papua New Guinea, Samoa, Solomon Islands, Tonga and Vanuatu), agricultural land is very limited and can do little more than support the local population. Traditional ownership patterns govern land use in the Pacific but are becoming increasingly constrained by the shortage of usable land. As a result, there will always be some dependency upon imported food in the Pacific region in spite of its many negative impacts on local economies (UN-Women 2012). A few Pacific island countries have developed tourism and industry but the lack of infrastructure, especially regular transport services and accommodation, prevent these enterprises from reaching full potential (Bulletin on Asia-Pacific Perspectives 2003/04).

Impact on Women Small Farmers

Throughout the discussions so far, the production of food for families and the domestic market has been discussed as an extremely important part of the agriculture sector. Rajack-Talley and Talley (2000) pointed out that any analysis of the domestic food sector in the Caribbean (as well as in Africa and the Pacific) is essentially an analysis of women's role in food crop production. Women farmers tend to concentrate on local food production for their households, communities, society and region primarily as small producers and/or family farms. Globally, women are responsible for 60-90% of total food production in their respective countries with smaller percentages for exports (FAO 2006). In many countries, women are also responsible for fishing in shallow waters and in coastal lagoons, producing secondary crops, gathering food and firewood, processing, storing and preparing family food, and fetching water for the family (UN-Women 2012).

In many African countries women comprise 70% of the agricultural workers and 60-80% of the labor that produces food for household consumption and sale. Women do all the processing for basic food stuffs and provide 80% of the labor for food storage and transport from farm to village, as well as 60% of the harvesting and marketing activities (NEPAD 2013). Although women play a major role in agriculture, their access to land and other resources is governed by customary laws that discriminate against them.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

During the last ten years, many African countries have adopted new land laws in order to strengthen women's land ownership rights. This has helped improve the situation of rural women (Mucavele 2015). According to Dr. Lindiwe Majele Sibanda, Chief Executive Officer and Head of Mission Food, Agriculture and Natural Resources Policy Analysis Network (FANRPAN), "women farmers are the pillars of African agriculture. Yet even as the guardians of food security, they are still marginalized in business relations and have minimal control over access to resources such as land, inputs such as improved seeds and fertilizer, credit and technology" (NEPAD 2011:1).

Women in the Caribbean are also highly visible in the production and marketing of food for domestic, household consumption as well as in the regional export food trade, buying directly at farm-gate and exporting to neighboring islands (FAO 2006; Rajack-Talley 2015). The majority of women are smallholders, with the average farm size being significantly smaller in area than that held by men. Rajack-Talley and Talley (2000) argued that production constraints related to land tenure and other resources impact more heavily on women than on men because women are predominantly in the domestic and/or in the regional sphere of agricultural production and marketing, while men typically are more actively engaged in the production and marketing of traditional agricultural commodities for the international markets (see also FAO 2006; Rajack-Talley 2015).

Similarly, women in the Pacific island countries continue to be prominent in traditional agriculture ensuring the absence of absolute poverty and associated hunger in many homes (Bulletin on Asia-Pacific Perspectives 2004/04). They engage in subsistence farming to feed their immediate families and/or grow cash crops to sell in the market. According to a United Nations study on Entity for Gender Equality and the Empowerment of Women in the Pacific Sub-Region (2012:7), "women's agricultural labor is an indispensable part of food production and consumption practices". Although the ways in which the women participate in agriculture vary by island and local cultural norms, they all contribute in planting, tending, and harvesting crops, as well as in marine activities that support the majority of families throughout the region. The important role of women in agriculture on the Pacific islands is similar to Africa and the Caribbean where women are the nurturers of the family and providers of food on land, while men have been providers from the sea. However, they are disadvantaged by their underrepresentation at all levels of society, especially in the decision-making processes. Customary law established centuries ago by colonial administrative systems prevents women from owning and gaining access to land, credit and other resources in many of the Pacific island countries (Balakrishnan and Fairbairn-Dunlap 2005).

In essence, despite the many discriminatory disadvantages, women across Africa, the Caribbean and the Pacific regions play crucial roles throughout the food chain; from food production to distribution and preparation in the homes. ACP countries have historically tailored their agricultural policies to focus on the export of primary 'raw' products, in response to international trade and domination. Current trade liberalization policies that are export-driven will therefore have gendered effects in production and consumption patterns.

AGRICULTURAL TRADE POLICIES AND AGREEMENTS

There is no doubt that the governments of the ACP countries have attempted to resolve the issue of trying to feed their populations, enhance the agricultural sectors and achieve economic growth. They have over the years attempted to take ownership of their economies by adopting the following strategies: (i) developing policies, structures and trading networks among themselves; (ii) reinvigorating the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

agricultural (and mineral production) systems and reorienting them towards export markets; and (iii) developing strategies and programs aimed at poverty reduction.

In terms of trade, each region has embarked on several unilateral, bi-lateral and regional agreements as well as extra-regional trade and restrictions, all of which affect food production and movement. In Africa, regional trade arrangements include the West African Economic and Monetary Union (WAEMU), the Regional Integration Facilitation Forum (RIFF) formerly the Cross-Border initiative (CBI), the Southern Africa Customs Union (SACU) and the Central Africa Economic and Monetary Community (CAEMC). Regional trade agreements have also been created under the Southern African Development Community (SAADC), the Common Market for eastern and southern Africa (COMESA), and the Commission for East African Cooperation (EAC), the Indian Ocean Commission (IOC) and the Economic Community of West African States (ECOWAS). With the exception of WAEMU, members of the other regional bodies also belong to one or two other trading blocs[4] From these various configurations, three broad patterns of agriculture reform can be discerned: (1) adherence to market reforms (e.g. maize and fertilizer marketing in East and South Africa); (2) countries that resisted reforms and/or re-imposed controls basically opposing trade liberalization (e.g. maize in Zimbabwe after 1998); and (3) states that maintained control while implementing liberalization (e.g. fertilizer market in Zambia and Ethiopia, coffee in Malawi) (FAO 2003).

Similar regional trading networks and blocs can be found in the Caribbean region. For example, the Community Single Market and Economy (CSME) was established by the Caribbean Community (CARICOM) in response to the evolving international environment in areas specifically trade liberalization and globalization. The idea behind the CSME is to create a safe economic space where goods and services along with the factors of production (labor, capital and in the case of land the right of access for establishment purposes) to move freely and be supported by appropriate institutions, and operate in a coordinated fashion. Similar other trade policies emerged in response to the World Trade Organization's (WTO) Agreement on Agriculture such as the Revised Treaty of Chaguaramus (2001), the Regional Transformation Programme for Agriculture (2002), and the Jagdeo Initiative (2004) to name a few. During the same period that some of the agreements were being promoted, the Caribbean reeled from the loss of privileged markets and tariffs which continued in the mid-2000 as the Doha Sanction Waiver[5] expired. In 2009 the Liliendal Declaration on Agriculture, Climate Change and Food Security, as well as the Regional Food and Nutritional Security (RFNSP) were created to focus on sustainable production, processing, preparation, and the commercialization of affordable, nutritious and high quality Caribbean foods, while preserving the region's natural resources. More recently (2011), the Caribbean like its African partners in the ACP group responded to the EU – CAP (Community Agriculture Policy) by establishing its own CAP that encourages the regional building of broad-based and balanced agricultural sectors that could be internationally competitive. The anticipation that these initiatives would address the Region's issues in the agriculture sectors, and by extension Caribbean countries' fiscal stability and sustainability, food security, hunger, poverty and the protection of the region's natural resources, is still doubtful (Rajack-Talley 2014).

Governments of the Pacific Island countries have also established regional trade agreements and processes. The Pacific Island Countries Trade Agreement (PICTA) is based on having free trade among the participating countries, initially for a 10 year period. However, level of trade between the countries has been low due to geographical and logistical constraints. In fact, a 2010 analysis suggested that intra-regional trade agreements could only make limited contributions to economic development (Scollay 2010). In addition to the intra-regional trade agreement, the Pacific group has had bi-lateral Interim

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Economic Partnership Agreements (IEPAs) with the EU and a South Pacific Regional Trade and Economic Cooperation Agreement (SPARTECA). Papua New Guinea has had its own free trade agreement with Australia (PATCRA), and Fiji also established an economic framework agreement with Australia (FATERA). In addition, as a group the PACP countries established free trade with Australia and New Zealand – the PACER Agreement. There are several other agreements negotiated as either individual states and/or as a group with the USA and some Asian countries.

Of all the various extra-regional trade arrangements agreed to by the ACP states, one of the largest is that between the African, Caribbean and Pacific countries and those of the European Union (ACP-EU). As far back as 2000 the ACP-EU agreement was signed into what is known as the Cotonou Agreement which entailed a comprehensive framework for ACP-EU relations. The intent was that the ACP-EU arrangement would help with economic development, regional integration, poverty reduction and the smooth and gradual transition of the ACP into the global economy. To achieve these objectives, the Agreement provided an approach for ending the WTO's compatible trading arrangements between the ACP States and the EU. This was to be accomplished through the conclusion of Economic Partnership Agreements (EPAs) that were bargained during 2002 and 2007. The ACP States negotiated the EPAs as regional groups: CEMAC (Economic and Monetary Community of Central Africa; ECOWAS (Economic Community of West Africa States; ESA (Eastern and Southern Africa); SADC (Southern Africa Development Community); CARIFORUM (Caribbean Forum); and the Pacific Forum.

According to Bilal, Dalleau and Lui (2012: ix), the African, Caribbean and Pacific (ACP) Economic Partnership Agreements (EPAs) with the European Union (EU) resulted in various degrees of progress across the three regions. For example, while in the Caribbean comprehensive agreements have been reached, most African and Pacific countries, particularly the least-developed countries (LDCs), are still negotiating comprehensive regional EPAs.[6] Under an EPA, the EU agreed to grant full and immediate market access to ACP/African countries, however, those ACP members who decide to enter an agreement must remove tariffs on "substantially all the trade" between themselves and the EU "within a reasonable length of time", to comply with Article XXIV of the General Agreement on Tariffs and Trade. However, because governments depend on revenues from trade taxes and custom duties, many ACP countries resisted, because the reduced revenues impacted negatively on social expenditures, meeting the Millennium Development Goals (MDGs) and poverty reduction. These concerns obstructed EPA negotiations and regional integration efforts.

Bertow and Schultheis (2007) argued that the opening of the ACP agricultural markets, following the principle of reciprocity, seems to be obligatory for the EU while causing a lot of difficulties for many of the ACP Group of States. For example, while European farmers are able to enter the world market without export subsidies, the farmers in the 'partner' Africa, Caribbean and Pacific countries are unable to do so especially within the timeframe allotted. This is because of underdeveloped infrastructures and little or no subsidies to the farmers in the ACP group. On the other hand, famers in the EU are supported by subsidies, have access to infrastructure, technologies and other resources, and both the negotiations and pace for implementation of trade is on the EU's terms with tenable outcomes for the 'partner' countries. Goodison (2007) explained that the economic partnership agreement (EPA) negotiations are based on a shift from the Lome Convention's non-reciprocity commitment to a basic regime of free trade between the EU and EPA regions. This involves the liberalization of trade in goods as trade-related areas and services. He further pointed out that while Europe has effectively integrated itself, few African (Caribbean and Pacific) countries have strong regional integration.

Impact of Agriculture Trade on Self-Reliance and Self-Sufficiency

It is difficult to decipher at first glance the advantages and disadvantages of extra-regional agriculture trade agreements and market arrangements for the ACP group and developing countries overall. Both governments and academics remain divided on whether or not agriculture trade liberalization contributes to slow economic growth, the demise of small farming households, and restrictions to achieving food security. Some researchers suggest that trade liberalization is good for growth (Dollar & Kraay 2004; Falvey, Foster, & Greenaway 2012; Sachs & Warner 1995; Summers & Heston 1991), and has generally supported agriculture development and food security (See FAO Report 2003 on Trade Reform and Food Security). Others challenge this perspective (Rodriuez & Rodrik 2000), and some believe that trade liberalization centered on comparative advantage is especially challenging for countries producing agricultural commodities, particularly raw materials and where diversification is difficult. For example, Connell and Soutar (2007) pointed out that while the Windward Islands of the Caribbean have reduced banana production and both Barbados and Fiji experienced contractions in the sugar industry, none have found effective substitutes.

Researchers also point out proposed market arrangements have not worked well for small countries. For example, in the Pacific new regional trade agreements have not been unsuccessful and as a whole international agreements have not recognized the disadvantages of small developing countries, "but continue to stress benefits that are nowhere apparent in the small island states" (Connel & Soutar 2007:41). Some see trade liberalization as having both a negative and positive impact on poverty. For instance, research on household income inequality and poverty using detailed microdata across Brazilian states from 1987 to 2005 found that trade liberalization contributes to growth in poverty and inequality in urban areas but reductions in inequality (possibly poverty) in rural areas (Abarche, Dickerson & Green 2004). It was also observed that both state poverty and inequality decrease with rising export exposure and increase with import penetration. Other researchers concluded that there is not enough data on the actual implementation of agriculture trade liberalization, or on reforms that are only partially implemented in some developing countries (e.g. Sub-Sahara), to reach any conclusive assessment (Milner & Morrissey 1999). What is less refuted, is that there are several direct links between trade liberalization and food production and poverty.

Over a decade ago, in an FAO Report (2003) on trade and food security it was suggested that there were two different approaches in addressing issues of agriculture trade and marketing and food importation and food security. First, there is the *self-reliance* approach whereby a country does not need to produce all the food it needs but to export enough goods and services to earn what is required to purchase all its food needs. The other approach, to be *self-sufficient*, is having the ability to produce all the food needs from domestic agriculture production. In this approach, it is necessary to protect and support local farmers. In reality, not all ACP countries can be self-reliant or self-sufficient, particularly if they have limited export opportunities and access to resources as well as high food needs for their populations. This is particularly true for some of the smaller Pacific and Caribbean territories. On the other hand, the World Bank suggested that with certain conditions in place, Africa's farmers can potentially grow enough food to feed the continent, that is, to become self-sufficient. According to the Bank's 2012 Vice President for Africa, Makhtar Diop:

Africa has the ability to grow and deliver good quality food to put on the dinner tables of the continent's families. However, this potential is not being realized because farmers face more trade barriers in getting

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

their food to market than anywhere else in the world. Too often borders get in the way of getting food to homes and communities which are struggling with too little to eat.

As a general rule, ACP member states should first identify the extent to which their agricultural sector has the potential to meet some, most or all of their food needs - and then develop appropriate agriculture reforms.

Interestingly, discussions about self-reliance and self-sufficiency have been held in the Caribbean for decades. Sir Arthur Lewis (1978a, 1978b) suggested that governments needed to support industrialization and revolutionize domestic agriculture, as well as secure better benefits from international trade. He envisioned that export-led growth could be either detrimental or supportive to the economic development of Caribbean societies, depending on the relationship between the export and domestic sectors. Lewis warned that international trade arrangements should be linked to the specific domestic sectors of a country, including agriculture. Other Caribbean scholars further explained that self-reliance is based on domestic food production as well as local industrial development, to meet the consumption needs of the masses (Beckford 1972; Girvan 1973; Rodney 1974; Thomas 1982). This was offered as an alternative to export-led growth and import substitution. Here, the idea is not to isolate Caribbean economies from the international market but to reduce the external diversion of resources and instead invest in domestic food production and link-industries. For example, Thomas (1982) proposed the re-orientation of agriculture from producing raw materials for the world market, to the production of foodstuffs and needed local industrial inputs. Industry, in its turn, should be required to produce basic consumption goods, in particular those needed to raise agricultural efficiency (see also Amin 1977; Mansour 1979).

Self-sufficiency in food involves the development of the domestic food sector and the ability of the region to produce an adequate amount of the region's most basic food items, such as rice, sugar, citrus, fruit and vegetables, milk, eggs, poultry, fish and meats from small animals. This requires that people have access to suitable agricultural lands and other resources to more than just subsist. Given the current high food importation bills and poor diets of the vast majority of people in the ACP Nation States it is imperative that countries grow more of what they can and promote a change in food culture. This will result in decreased dependency on high levels of imported processed foods and an addiction to fast foods, especially those with high fat, sugar and salt contents. However, a move in this direction necessitates increases in government involvement, greater participation by the people, and the buy-in from the private sector. The success of self-sufficiency is heavily reliant on building the capacity of the people so that they can take advantage of the knowledge, technology and the decision-making processes needed throughout the chain of events (Rajack-Talley 2014).

Both approaches, self-reliance and self-sufficient, are linked to policies that support domestic agriculture with the possibility of one of three outcomes. First, countries can become self-reliant as net food exporters where food security is not an issue. In this case, however, access to foreign market opportunities can be daunting because of the challenges of meeting new and emerging market requirements, especially the more stringent food safety and quality requirements for export products. Additionally, many of the new trade agreements have mandated the removal of guaranteed markets between some ACP countries and the EU. As a result, in reference to the sugar industry (as well as banana and others) in the Caribbean (and other ACP countries), the Chairman of the Sugar Industry Board in Jamaica commented that:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

We have moved from a situation of a guaranteed market, guaranteed price, and guaranteed access to one in which we still have guaranteed access but nothing else and we now have to be competitive because that guaranteed access has been expanded to include a number of other countries (Heaven 2010).

Second, countries can become self-sufficient in food meeting local food needs and even engaging in export of some food items. However, to do this requires minimal biases against domestic agriculture and small farm production as well as strong agricultural sector reforms. It is dependent upon the extent to which small producers and the network of family farms in ACP countries can easily access new technologies and other resources that are necessary to increase yields and profitability from food exports, and at the same time lower domestic food prices. If this were to take place, then both rural and urban poverty would be reduced. In the real world however, most foods produced from industrialized countries are sold at subsidized and therefore cheaper prices on the open markets. This common occurrence presents a disadvantage to ACP countries that are aiming for self-sufficiency but who are discouraged by the World Bank and the IMF from subsidizing their own farmers. This practice, along with the mandate of food importation that is tariff-free, creates unfair competition against the small (and some large) domestic producers in the ACP countries. The distortion of world food prices for these reasons is detrimental to the small producers and family farms of developing countries. Consequently, the less efficient farmers who do not have access to technology and other resources are eventually forced out of the domestic and international markets.

Third, some ACP countries may decide that because they are unable to be self-sufficient in local food production aim to generate enough earnings from other agricultural exports to meet food import bills. In this case, it is important to not be dependent on the export of primary commodities with low income elasticity and high price volatility. As Ambassador Derrick Heaven, the former executive chairman of the Sugar Industry Authority (SIA), pointed out in the Jamaica *Gleaner* newspaper, the 2010 divestment of the local sugar factories has not produced the desired result because the new players in the sector are now struggling to keep pace with what is unfolding on the wider global stage. According to Heaven:

We have been weaned on the situation, where for the past several hundred years, we have been making one product - raw sugar, particularly for the mother country (England) and Europe…the situation has changed, but I don't think we have changed as quickly as we should, even though we were aware of the implications.

SUMMARY AND CONCLUSION

There is no doubt that the agriculture sector is important to the 3 regions which comprise the ACP for the following reasons: economic development and employment; food production for domestic use; and foreign exchange earnings through agriculture export production. Nonetheless, most of the ACP countries are experiencing a decline in their agriculture sectors and worse yet are increasingly unable to feed their growing populations. As a result, food import bills in these countries continue to climb. Equally dangerous, is that high levels of food importation are usually accompanied by a fast food culture and the use of unhealthy, highly processed foods – both of which contribute to increases in obesity, hypertension, and other health-related conditions. Consequently, ACP governments are grappling with exorbitant food import bills, loss of employment in the agriculture sector, and a decline in the availability and ac-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

cessibility of nutritious food that can support healthy and productive populations. Many ACP countries are neither self-sufficient in food production nor self-reliant, that is, having the ability to grow and/or purchase what is required to feed their people. Faced with this situation, international trade policies and market arrangements are often touted as the life line for agriculture growth, food security and poverty reduction for developing countries.

The benefits of agriculture trade liberalization, however, are not straight forward. The impact of these trade policies on food production, food security and food dependency is different for ACP and most developing countries compared to the more developed, industrialized nations. Moreover, there is no 'typical' or 'model' ACP country within and across the three regions. The information and discussions presented in this chapter suggest that individual countries should exercise caution when dealing with trade liberalization policies as no 'one size fits all'. Nevertheless, there are some general concerns about the negative effects of agriculture trade liberalization on the well- being of low-resource households, rural families, small farmers and women farmers in all of the ACP member States.

One glaring feature is that the removal of guaranteed protected markets and subsidies for farmers, as well as the stringent market product mandates (sanitary and phytosanitary measures, standardization and labelling, etc.) has made it difficult for the ACP countries to compete for the same export products on the 'open' and 'free' market. As a result, the agriculture sectors in these countries that are dependent on international trade of 'cash' products find themselves on a downward tailspin as many small producers, farming, rural and working families can no longer generate adequate incomes to support their families. This includes the ability to adequately educate their children, purchase food and other imported items (regardless of cost), afford proper health care and improve their living conditions overall. In other words, the move towards a self-reliant way of life for certain groups in many ACP countries is arduous.

The situation is further compounded because the removal of farm subsidies combined with an increase dependency on imported agriculture inputs, makes it difficult for ACP farmers to grow food for themselves and the domestic markets, at affordable prices. The end result, is that, rather than becoming self-sufficient in food production many of the ACP countries are importing their food, including traditionally grown poultry and other meats, milk and dairy products, some fruit and vegetables, as well as traditionally grown staples (starches, grains, cereals, etc.). So not only do we see local farmers struggling with sales for export crops but also in the production of food for home, community and the domestic market. Currently, many small producers are forced to seek other forms of employment or migrate in search of non-agricultural work. The inability of small producers to maintain their farms also translates to loss of freedom and independence. As farm and rural families migrate, the physical, economic, social and cultural life of entire villages also diminishes.

Equally important, not only are more families unable to grow or purchase adequate food to feed themselves but they are also unable to maintain nutritious diets. Cheaper food does not necessarily mean healthier choices and diets. The quality of food items imported, in particular those that are offered at lower prices tend to have high fats, salt, sugars and carbohydrates. As a result, many ACP countries continue to become dependent on food imports "that contravene their health, nutritional, environmental and cultural norms, including Genetically Modified crops, but without the option of refusing it" (Hurungo 2006:21). Citizens have no control over the price of consumer items, what items should be subsidized by their governments and what foods are imported. Food cultures are changing, health concerns are increasing and the human capabilities of both children and adults are diminishing.

Current trade liberalization strategies are not altogether dissimilar from the old Plantation Model in that they are export production centered. Similarly, they pose serious competition for resources for

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

domestic food production and by extension small producers and women farmers in these countries. As many of the ACP countries adopt policies that support trade liberalization, small producers, especially women farmers are dislocated as land and the support services that should be directed towards local food production are diverted to larger farms producing for the export market. Since men tend to concentrate on cash crop production they are more likely to benefit. Even in cases, Uganda for instance, where the use of women in the production of agriculture goods for export did increase, their access to and control of agricultural resources did not. Neither did the increase in female labor in the export market sector resulted in increased incomes for farming families. Moreover, where some traditional export products (e.g. bananas, sugar, etc.) are 'in trouble' because of the removal of protected markets, there is a tendency for men to shift to growing the same crops as women and compete for limited resources.

There are not many studies on the impact of current agriculture trade liberalization on small farmers and women, but the little evidence that does exist show that there tends to be more harm than benefits. As market operations become more globalized and concentrated at the same time, small producers and women farmers overall are increasingly excluded from decision-making and the advantages of markets (ADB 2013; FAO 2006). International trade agreements, the EU-ACP arrangements in particular, need to be sensitive to the constraints faced by small producers and women farmers in Africa, the Caribbean and the Pacific. Longstanding limitations such as low levels of technical capacity, limited land allocations, credit, extension services, infrastructure and market support continue to inhibit the capacity of small producers and/or women farmers to engage with trade opportunities and switch to higher-return crop or animal production. Worse yet, as more productive resources are reallocated for 'cash crops', the production of food for the domestic market is stymied even though food security and poverty reduction remain top priorities for ACP countries.

On a global level, the ACP group, and developing countries as a whole, are more or less weak partners who are unable to take full advantage of the `intended' benefits from agriculture trade liberalization and 'open' market arrangements. Truth be told, trade policies including the use of tariffs and protectionism have not been very rewarding for African, Caribbean and Pacific countries. While these work for the benefit of developed countries, they do not have the same impact for developing countries and poor people across the globe. To simply follow or respond to the terms of agreement led by groups of select developed countries, multinationals and financial institutions can result in the ACP countries remaining food insecure and income generation from agriculture is stunted. Eventually, some ACP countries may shift from being food producers to becoming reliant on food aid from outside.

Because ACP preferences will continue to be eroded by the WTO, governments should be prepared to adjust to the changes as they expand their own trade. Stronger negotiations are critical so that the agriculture policies and strategies of ACP countries are better integrated into the globalized agriculture and economic trade agreements. According to Koroma and Deep Ford (2006), adjustment assistance should be an accepted dimension of ongoing negotiations by the ACP group on specific products such as rice, sugar, fish, and other items produced largely in these countries. Similarly, it would be advantageous if regional and sub-regional cooperation are strengthened in areas of management, control and surveillance, research and in overall development capabilities. Stepped-up regional economic integration and trade policies, revisiting those that already exist, and addressing issues of natural barriers and transactional costs are all important recommendations. In addition, similar benefits/privileges offered to farmers in developed countries should be given to those in developing countries.

Interestingly, although it is implied that agriculture trade liberalization will have a positive effect on economic growth and poverty, few studies actually examined the distributional effect on both the small

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

farmers and the poor in developing countries, including those of the ACP group. FAO's latest projections indicate that global food production will increase by 60% between 2005/07 and 2050 under its baseline scenario. This represents a downward revision, based on updated data and information, from the 70% increase projected for the same period in 2009 (ESA E Working Paper 2012, No. 12-03). A rise in food production is possible in developing countries, albeit not in all. For example, in Brazil, food production increased from 12.5% in 2003 to 48% in 2008. Likewise, malnutrition declined in Rwanda from 24.5% in 2000 to 15.8% in 2005 (CTA 2011). But this requires that the agriculture in ACP countries to not be driven by international trade liberalization policies, but of meeting the Sustainable Development Goals (SDGs),[7] specifically those related to poverty reduction, ensuring gender equality, economic growth and improving the health and well-being of people. Such gains are more likely to occur from regional cooperation and domestic reforms, rather than from international trade and market arrangements (IFAD 2007).

Nevertheless, it is not recommended or is it practical to simply reverse international trade policies and agreements. However, until the proverbial playing field is levelled, agriculture trade liberalization is not 'fair' nor 'free' and 'open'. The ACP Group of States have proposed South-South Programmes to support food security and nutrition through sustainable food systems and social protection. Governments from these States, while focusing on their local and regional efforts at self-sufficiency and/or self-reliance, must step up their support for this South-South initiative. This is key to the impact of current trade liberalization policies as history has shown us that both wealth and poverty can be derived from agriculture's relationship between the debtor (developing nations) and the creditor (groups of industrialized nations, multinationals and financial institutions).

On the domestic front more attention is required to produce food of high nutritional quality. This requires a range of interventions, including policies that empowers women's decision-making in the sector and providing them with greater access to land, credit, extension services, technology and other resources. Women farmers and small producers are key to both self-reliant and self-sufficient approaches to food production ad food security. They should be encouraged to produce a diversity of grains, roots and tubers, vegetables and fruits, fish and livestock. In doing so, they can provide themselves, and supply local markets, with a diverse diet containing the minerals, vitamins, proteins and calories essential for a healthy life. Raising smallholder productivity is one of the measures being advocated by the Pan-African Nutrition Initiative and the Africa Regional Nutrition Strategy developed by the New Partnership for African Development (NEPAD) and the African Union. Effective implementation of these initiatives in Africa as well as in the Caribbean and the Pacific should improve the nutritional security of the most vulnerable populations in many of the ACP countries. But this calls for a different vision, one that sees the urgent need to create stronger links between agriculture production, food security and health and nutrition. To build stronger partnerships with school feeding projects, local food establishments and cafeterias, with hospitals and other social programs. The end goal is to utilize the agriculture sectors to reduce poverty, hunger, and poor nutrition and to build the capacity, wealth and health of all groups in the ACP countries.

[3] CARICOM Workshop on Regional Policy for Food and Nutrition Security, Georgetown, Guyana, September 20, 2010.

[4] Not all of the African countries however, participate in the regional trade protocols and agreements.

[5] The Doha Round is the latest round of trade negotiations among the WTO membership. Its aim is to achieve major reform of the international trading system through the introduction of lower trade barriers and revised trade rules. The work programme covers about 20 areas of trade aimed to improve the trading prospects of developing countries. The Round was officially launched at the WTO's Fourth Ministerial Conference in Doha, Qatar, in November 2001. The *Doha Ministerial Declaration* provided the mandate for the negotiations, including on agriculture, services and an intellectual property topic, which began earlier. In Doha, ministers also approved a decision on how to address the problems developing countries face in implementing the current WTO agreements. The Doha Sanction Waiver expired in 2008 resulting in the loss of tariffs and privilege markets.

[6] EPAs represent a fundamental shift in the trading relations between the two parties, from a non-reciprocal preferential trading regime – under which ACP countries could export almost freely to the EU while maintaining their own restrictions on EU imports – to one requiring reciprocity in liberalization, albeit with a certain degree in asymmetry in commitments, in line with rules of the World Trade Organizations (Bilal, Dalleau and Lui, 2012).

[7] The Sustainable Development Goals, otherwise known as the Global Goals, build on the Millennium Development Goals (MDGs), eight anti-poverty targets that the world committed to achieving by 2015. The SDGs include a set of 17 Sustainable Development Goals (SDGs) to end poverty, fight inequality and injustice, and tackle climate change by 2030.

Chapter 73
The Social Impact of the Financial Crises in the Recent Past and Evidence Thereof:
With Special Reference to India

Asim Kumar Karmakar
Jadavpur University, India

Sebak Kumar Jana
Vidyasagar University, India

ABSTRACT

Financial crises have significant short-term and long-term social costs. As a result, economic and social indicators have dwindled significantly since 2007. The soar in the unemployment rate has been most marked in so called advanced economies, reaching alarming levels in the tangential Europe with more than half of the young labour force unemployed in Greece and Spain. What is more, the crises, one global and another Euro zone financial crisis, have inexplicably hurt the poor. The progress in poverty alleviation has been not smooth across regions, and the pace has slowed since 2007 across the board. The crisis has also created challenges to the achievement of other development targets, including reduction of the occurrence of malnutrition and mortality rates, and civilizing gender equality in education and access to hygienic water and sanitation. This also suggests a significant loss or a reversal of the progress in development. In the above background, this paper presents evidence on the extent to which the global financial crisis and other crises since 2007 has been associated with deteriorating economic and social well-being indicators with a special focus on India. The results clearly indicate that poverty levels have been falling before the pre-crisis period but the post-crisis period witnessed a jump in the poverty rates across India.

INTRODUCTION

I feel cheated as I wonder how economic problems somewhere in America can make my cash crops suffer here in Malawi. It's a shame that I cannot boil and eat it. A Malawian cotton farmer (in Green, King & Miller- Dawkins, 2010)

Financial crises are not a new phenomenon. They occur — occur enormously with knock-on-effects — in different countries under different garbs. Crises will occur again and the next one will be different in some dimension from the last — and it will also be unexpected. Of late, it occurred in USA in the subprime[1] mortgage market in 2007-08. The purpose of their sub-prime loans was to maintain the housing boom from 1995 to the mid-2000s. This entitled agreeing to high-risk loans to applicants with poor or without any credit records; however, investment banks (in the business of buying or selling securities on the stock market) were handed the task by government of delivering the mortgage lending policy. These financial institutions transformed the mortgage loan assets into investment bonds, and sold them on to other financial concerns, which proved problematic in that the borrowers who had taken out the loans in the first place were unable to keep up with payments when interest rates rose rapidly after 2004. The myriad financial speculations were simultaneously reinforced by a near absence of consistent regulation to protect vulnerable groups and the whole community. However, after crossing the Atlantic Ocean it hit the various nations of different varieties with different impacts. While OECD countries have resources and instruments to cope with it and mitigate its effects on displaced workers and vulnerable people, poor countries are still below their trend of output growth and lack the appropriate tools to deal with these multiple external shocks, thus the poorest people in the poorest countries, those who are less responsible for the crisis end up being the most exposed to the global recession; not only do they lack sufficient safety nets for immediate help but also, more importantly, they have been dramatically affected in the long run by the likely reduction in social spending. Crises have hard hit in all categories of social stratum, especially the poor, babe, young, elderly, young, women and the ill, even knocked at the kitchen. This is because the poor are bereft of savings and no tangible assets. They have lost their jobs and find no access to public services such as education, health care and social services.

What the United Nations (2009) stresses is the fact that even the Millennium Development Goals has been distorted and hampered. Poverty ratios, indicators of hunger, child malnutrition, gender equality and unemployment all worsened in 2008. The World Bank (2009) estimates suggested that lower growth rates in developing countries, due to the twin food/fuel financial crisis had trapped an additional 89 million people in poverty. Besides the economic and food crisis have increased the number of the undernourished worldwide to more than 1 billion people, the highest since 1970 (Presbitero & Zazzaro, 2010).

The United Nations (2009) stresses that the financial crisis has jeopardized the achievement of the Millennium Development Goals: poverty ratios, indicators of hunger, child malnutrition, gender equality and unemployment all worsened in 2008. The World Bank (2009) estimates suggested that lower growth rates in developing countries, due to the twin food/fuel financial crisis had trapped an additional 89 million people in poverty. Besides the economic and food crisis have increased the number of the undernourished worldwide to more than 1 billion people, the highest since 1970 (Presbitero & Zazzaro, 2010). The late 2007 tsunami was successful in transforming the lives beyond imagination of many individuals and families even in advanced countries such as those in the Euro Zone[2] and the United States.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

When all US financial sectors were in recession and the housing bubble burst in 2008, they made a devastating immediate effect on ordinary Americans' housing, and the consequential increase in homelessness.

The profound social impact was being felt even much more intense than the Great Depression when a severe credit crunch in 2008 turned into a worst financial crisis, following the bankruptcy of US investment bank, Lehman Brothers resulting in an unprecedented dislocation in financial markets and damaging stability and confidence in many of the most countries' financial systems, whether advanced or not- advanced. National governments and monetary authorities' response in this connection by injecting huge financial support rapidly affected many countries' fiscal balance. The result was: weakened economic activity causing huge job losses around the world, with unemployment rates climbed very high. Particularly hurt Countries were those with poor governance, weak institutional capacity and limited fiscal room.

Then another crisis goes by the name of Sovereign debt crisis had occurred in Greece in 2010-12 exposing the financial fragility of the banks and the government inability to service debt obligations and failure to keep a check on the financial sector of the economy, highlighting the important role that money, banking and finance play at the heart of the Greek economy. What has happened in banking is that a culture of caution has changed into a culture of risk taking. So, the saying made by politicians and economists "the era of boom, bust and boost" became highly optimistic. The worrisome fact is that they hadn't anticipated that so sudden will be its land for a horrifying impact on the economy and society.

OBJECTIVES OF THE STUDY

In the above background the objective of the paper is to show the impact of the global financial crisis of 2007-08 and Sovereign debt crisis 2010-12 on the economy and society in particular. How the various impacts are being associated with and social well-being indicators are also pointed out. The paper also discusses the key channels of transmission from financial to social crises, provides some major facts on the evolution of key social and economic indicators during the financial crises occurred since 2007.How does the financial crisis transform into social crisis through key channels is also discussed.

And, last of all, what be the policy implications of these crises would are also answered. In addition, one of the other objectives of the study is to understand the difference between the scenario in the trends of poverty in India in the pre-crisis and post-crisis stage. In this background, the paper empirically tries to verify the rise in poverty rates across India in the post crisis scenario.

METHODOLOGY

The model that has been fit to the following data for the Indian case is given below:

$$g_t = a_0 + a_1 t + a_2 d + e \tag{1}$$

where:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$g = FGT\left(\alpha = 2\right)$$

t = time variable;

d = dummy variable for pre-crisis and post-crisis period;

e = error term following standard white noise properties;

The data has been taken up from 2000 onwards and pre-crisis period means from 2000-08 and post-crisis period means from 2008-2016. The data has been compiled from the Planning Commission database and www. India stat.com. Defining the FGT $\left(\alpha = 2\right)$ measure, we have:

$$FGT_2 = \frac{1}{N}\sum_{i=1}^{H}\left(\frac{z - y_i}{z}\right)^2$$

where, z is the poverty line income and y_i is the income of the ith poor individual and N is the total number of individuals in the economy.

The FGT_2 can be rewritten as:

$$FGT_2 = H\mu^2 + \left(1 - \mu^2\right)C_v^{\,2}$$

where, C_v is the coefficient of variation among the incomes of the poor, H is the total number of the poor, and μ, the poverty gap index, is given by:

$$\mu = \frac{1}{H}\sum_{i=1}^{H}\left(\frac{z - y_i}{z}\right)$$

TRANSFORMATION OF THE FINANCIAL CRISIS TO SOCIAL CRISIS: HOW, WHEN?

Costly to the poor are the financial crises. Financial crises have serious implications both for economic and social well-being of the people and countries. Everyone is affected by financial turmoil, especially the poor—babe, young, old women and the ill. For the poor usually awaits the ill–effects of natural disasters, contagious diseases, or climate change. Along with if it is coupled with the ill-effects of global financial tsunami, then it is extremely difficult for the poor with their limited capacities and instruments to cope with this adverse circumstance and protect themselves from the sudden shock totally new to them and recover from its effect. Even they are incapable of gaining the opportunities —if there is.

Full many a channel in the globalized world becomes active during the crisis period through which a financial crisis transforms into a social crisis. For example, we may mention (1) labor and product market channel. This channel activates and makes its inroad by weakening economic activity, reducing

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

demands like consumption and investment. It results in sustained declines in economic growth, loss of jobs, reduced wages and benefits, and higher unemployment, (2) financial market channel: through this channel comes insufficient flows of financial flows across countries (in the form of foreign capital and remittances), Loss of remittances or private flows from the migrants which acts as a blessings to recipient countries as a protection to fight against poverty and malnutrition propels at last to savings erosion. During the 1997-98 contagion East Asian currency and banking crisis and the global crisis of the recent past, small and medium enterprises (SMEs) faced severe credit crunch, showing thereby that market channel has also been active in transforming the financial shocks to economic and social shocks. The same is true for Latin America, Europe and the Caribbean islands.

The state's endeavour is found when it expands spending to counter the adverse impacts of crises on people by providing essential public goods and services. This leads to fiscal deficits and countries face balance of payments difficulties. Tax revenues decline and fiscal deficits soars up. as economic activity weakens. States are forced to cut prudent social sector budgets. Expenditure on infrastructural and education development is to be reduced. Indonesia, Malaysia, and Thailand during the East Asian crisis and the 1994 Mexico are cases in point.

There is ample evidence that poverty [those who live in extreme poverty line which corresponds to $ 1 a day and the poverty line ($ 2 a day) as what the World Bank calls], rose in virtually all financial crises. The economic and societal status and well-being had been jeopardized as a result following from the intermixture of income and job losses, non–accessibility to goods and services by individual households and communities. Rising prices and falling asset values, and the associated costly coping strategies added fuel to the fire affecting again the economic and social well-being.

Overall poverty rates rose to 50 percent in Indonesia after the crisis in 1997, and urban poverty doubled to 18 percent in Korea. Ten years' earlier poverty rates in Mexico were ten times lower than in the year 2000.

Individuals' responses to crisis situations further deepen and enhance the deterioration of social well-being during and after financial crises. To be out from the quagmire of poverty traps becomes extremely difficult then as the financial crash has already been transmitted through negative wealth effects. Asset depreciation, no social government support induces the individuals and households to cut consumption. They at the same time refrain from the activity of sending their children to school and colleges. Coping strategies that long-term consequences for individuals and households in this case are highly costly; is no other but to sell their productive assets and to borrow at high rate of interest.

Social ties and cohesion deteriorate during the economic crisis. Ample evidence runs thus: suicide rates among males in Japan increased by 39 percent, in Hong Kong, China (44 percent), Korea and Thailand (45 per cent (Ötker-Robe, Podpiera, 2013).

Financial globalization, as cross- country evidence suggests, also leads to higher consumption and output volatility in low-income countries. History is the evidence to the fact that unrestricted capital flows are intertwined with a higher likelihood of poverty.

EUROPE'S SOUTH-WESTERN PERIPHERY EXPERIENCED A SOVEREIGN DEBT CRISIS

After passing through good times from 2002 to 2006 and an increase in the degree of convergence in the interest rates, the Euro zone (a currency union of 19 European countries for a single currency [the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

euro]) had faced a major crisis which started with Greece but spread rapidly to other Mediterranean economies as Spain, Italy, Portugal.

The crisis that engulfed the global economy in 2008 regained new momentum in Europe in 2012, triggering a sovereign debt[3] crisis in Europe's South-western periphery. This caught most experts and policy makers by surprise, bringing to light a number of hitherto unnoticed vulnerabilities. While these were chiefly found in the financial sectors of major advanced countries, troubles there quickly spread to the entire international monetary and financial system, in the form of sudden stop or reversal of capital flows and in liquidity shortages, as investors scrambled to reduce risk exposures and deleveraged. The crises made even more obvious how tightly the economies and financial markets of the world are tied together, with a shock in one major country rapidly propagating to the entire system (Karmakar and Jana, 2014). The crisis has made it clear that more prudence and liability is needed in the financial system, which requires a better, globally coordinated regulatory framework.

GLOBAL RECESSION, THE SOVEREIGN DEBT CRISIS (2012) IN EUROPE AND SOCIAL WELFARE

The Euro zone crisis originated in Greece, whose national sovereign debt had accumulated by 2009. Greece had entered the European Community in accord with the Maastricht Treaty in 1992, and was allowed to enter the Euro zone, evidently a political decision since its GDP was less than one percent of Europe as a whole. However, the profile of the Greek state was atypical in the Euro zone: powerful ship-owners were not subject to tax; nor were thousands of workers reliant upon the nation's tourist industry. Consequently, the private and public debt grew uncontrollably, a situation only revealed in 2009 by an incoming Papandreou government announcement that the state accounts had been consciously falsified. The crisis affected both the banks and the public sector. Interest rates began to rise in response to the clear unsustainability of the public debt. This set in train a snowball effect, as the Greek and European leaders countered the possibility of any default by Greece in paying its debt, in tandem with measures imposed by international fiscal bodies—the so-called *troika* —the European Commission, the European Central Bank and the IMF. In 2010, cutbacks of 25 percent were made to public sector wages, complementing huge public sector spending reductions, regressive tax increases, and pressure for privatization. By the end of 2011, the accumulation of austerity policies had pushed the national debt up to 160 percent of GDP. These policies led to sizeable demonstrations in the Greek capital, Athens. In early 2012, the Greek Government accepted a new 'bailout' plan of 174 billion Euros, on top of involvement from the private sector. The result was a further economic recession in the Euro zone, a culmination of its persistently poor economic growth over the decades (Bochel, & Daly, 2014).

Undoubtedly, the latest global economic recession (2008) and the sovereign debt crisis (2012) in Europe are the seminal event. While the crisis, 2012 hit hardest the developed countries and members of the European Union (EU the weakening of aggregate demand spilled over to developing and emerging countries through different channels— trade, financial and confidence linkages. The countries of Asia, emerging Europe and Central Asia, Latin America and the Caribbean, and Middle East and North Africa were affected. For example, the Government of India had reduced the GDP growth target for the year 2012-13 from 7.5 per cent to 6.5 per cent. This could be attributed to the slowdown caused by the Euro zone crisis.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Laour markets are also affected due to depressed aggregate demand and weak economic activity. About 28 million people have lost jobs. The rise in unemployment rates has been most severe and alarming in high- and upper-middle income countries of North America and western Europe or Central and South-Eastern Europe, Latin America and the Caribbean, and advanced countries in Asia.

Crisis affected the youth. An estimated 74 million of young people went out of jobs in 2012 around the world. The jump in the youth unemployment rate has been most pronounced again in advanced economies, rising from 12.5 percent in 2007 to an estimated average of 17.9 percent in 2012. The rate has reached alarming levels in the peripheral Euro Area countries, to 59 percent in Greece and 56 percent in Spain. Long-term unemployment affects social cohesion, with ill-effects for economic and social stability. About 49 percent of world workers were in vulnerable employment in 2012. The number of working poor earning less than US$2 a day has increased by 15 million in the Middle East North Africa and Sub-Saharan Africa.

The products and services of the Asian countries have been seriously affected. Stock markets suffered. The external value of the currency has shown downward movement. Job losses and its associated fallouts such as unrest in society showed an increasing trend (Karmakar & Jana, 2016).

EXPLANATIONS OF THE EUROZONE CRISIS

The BBC's 'online' explanation was that the earlier global financial crisis and the later, more specific Euro zone crisis were closely connected. In Spain and Italy there had been a sizeable accumulation of debt, but this was scarcely due to the government's actions. It was attributable to the activities of the private sector, namely financial companies and the mortgage borrower who were taking out loans. Interest rates had plummeted in southern European countries when they 'pinned' the euro, encouraging a boom driven by the cumulative debt. Germany had created the Euro zone in 1991 and acted as the EU's driving force from its abundant funds loaned to the southern Mediterranean economies. But this left Spanish and Italian employers with a huge competitive price disadvantage. Which is why, it became far more prohibitive for the southern Mediterranean nations to export to Germany. The outcome of the resultant cutbacks was to deepen the 2008 recession, so that wage levels declined, unemployment rose, and the debt were increasingly difficult to pay back (BBC News, 2012a). A critical interpretation of this scenario is that in 2007-08 they had spent hundreds of billions of Euros in rescuing banks (Callinicos, 2012).

GLOBAL SOCIAL POLICY RESPONSE TO CRISIS

One might have expected a powerful redirection of the IMF's and World Bank's social policies and practices in their response to the deepest financial crises of modern times, yet redirections were minimal: at the most, they have targeted poverty alleviation in the global South. From 2008, agreements were made with Eastern European nations, Pakistan, and E1 Salvador, entailing economy contractions, public sector wage freezes, and cutbacks in budgets, rather than growth and welfare protection. The global institutions' lending policies continued more or less undisturbed. A 'minimum social protection package' was agreed by the UN Chief Executive Board for Co-ordination. More directly, however, the G20 summit of 2009 made $1.1 trillion available for nations in crisis.

The European Union's Policies in Response to the Euro Crisis

The euro crisis has exerted a corrosive effect on the growth of the world economy, implicating China, Brazil, and India, resulting from the reduced trade to Western countries. In spite of a series of meetings held by the G20, recovery to date is inconspicuous. 'The crisis struck at the heart of the financial system – the banks – but it is systemic affecting every part of the economy: banks, firms, households, states' (Aglietta, 2012). While the large European banks became global operators, EU policy was only capable of delivering 'half-measures' thanks to a 'deep-seated conservatism' that may be constructed as 'disastrous in times of turbulence'. Added to which, suggests Aglietta, the Eurozone suffers from profound structural faults attributable to how it was initially constituted. For example, the French and German banks helped to pour funds into Spain's housing sector, fueling Spain's own housing bubble, which subsequently burst, leaving massive private debt (Karmakar and Jana,2014).

Euro Zone Crisis and Germany

Germany has been the dominant actor within the zone, with the zone itself modeled on Germany's own monetarist doctrine. Two-thirds of the country's trade surplus is derived at the cost of Germany's partners in the Euro zone. The nation's political rulers adopt an anti-market stance, and emphasize rules and regulations. Furthermore, German banks are 'loaded with toxic assets deriving from the American subprime mortgage crisis' (Aglietta, 2012). It was unsurprising, then, that tentative solutions were 'incremental, homeopathic', and ineffective, offering no real hope for European growth. What of the role of the Union's own bank? The Euro zone possessed a further barrier in its very institutional design, dominated by the European Central Bank. Aglietta (2012) concludes that this 'contradiction lies at the heart of the present crisis'. Until July 2012, the ECB appeared unable to act. In September 2012, the President of the ECB, Italian economist Mario Draghi, intervened in the crisis to enhance the status of the bank by buying bonds in the Euro zone countries (The Guardian, 2012b).

To recap, although the Euro zone crisis affected the global economy, including the financial and banking system, the European Union, a crucial institutional actor in global economic and social policy has not proactively countered the Euro zone crisis, unlike the big European banks. What is arguably apparent is first, the worrying disparities between the southern Mediterranean regimes and the Western European economies within both the Euro zone and the Union, and second, the immanent structural and constitutional weakness of the EU's central financial institutions. In these respects, the politics of the European Union remain as charged as ever.

THE SOCIAL IMPACT OF THE EURO ZONE CRISIS

The impact of the global 2008 crisis has been a powerful one in those member states categorized as the Mediterranean economies. The developing recession hit Portugal, Spain, Italy, Greece, and Ireland most severely, each experiencing vast national debt and bankruptcy. The European Union economies have been pressured by the wealthier Western EU economies, particularly Germany, to employ vast cutbacks in their economic and social infrastructures (now commonly termed 'austerity budgeting), not least in social welfare. This has resulted in a number of social problems bearing upon social policy, including mass unemployment, poverty, and reduced social benefits.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Pay restraint and reductions in workers' earnings even in 2012, notwithstanding various governmental measures such as increased flexible employment, which were scarcely activated (Eurofound, 2012). Greece's economy was close to financial collapse by 2012 in the wake of total uncertainty; unemployment was as high as 23 percent, and the health care system was suffering from lack of medical equipment (The Guardian, 2012a). The health service had already suffered from the global crisis cutbacks in 2010 (with a 40 percent reduction in its hospital budget), yet was faced with a rise in admissions to public hospitals from 2009. Health outcomes had worsened, particularly among vulnerable groups; suicides had risen by 17 percent. Yet Greece's membership of Euro zone made its debt crisis worse: the government had been unable to leave the euro, and thus could not devalue the Greek currency. Instead, Greece had been forced to borrow 110 billion Euros from the IMF (Lancet, 2011).

Spain was badly hit by the later Euro zone crisis, having already suffered from the demise of its massive property bubble in 2007-08. Its banking sector was hugely indebted, and one of its largest banks, Bankia, called for a 19 billion Euros bailout (Economist, 2012). By 2012, Spain's unemployment rate of 25 per cent was the highest European Union. The majority of young adults (21.5 percent of the population) were unemployed. Whereas the general unemployment rate of 8.5 per cent in 2006 had been close to the EU average, it was twice as high at 21.7 per cent by 2011. One in four Spaniards had become at risk from poverty or social exclusion since 2010. In addition, Spain's regional administrations were struggling financially, and approaching the central government for assistance (BBC News Europe, 2012; Eurostat, 2012).

Italy's austerity measures of 2010 in response to the global credit crisis and mass accumulated debt did put a brake on the country's economic growth. Italy fell into deeper recession because of its continued debt crisis (up to 2 trillion Euros). A farther contraction of the economy sent its GDP spiraling downwards by 2.5 per cent from only the previous year, leading to extra cutbacks of 4.5 billion Euros. The social policy repercussions were grave. Some 10.3 million Italians were living in poverty. Many poorly paid youths were leaving Italy (Der Spiegel, 2012). Families in the south were in basic poverty; 'scavenging and scraping by without gas or electricity' (Daily Beast, 2012). Ten of Italy's cities, responsible for the provision of domestic services, were almost deplete of funds by late 2012, yet the national government was planning to wipe another 500 million euros off its provincial budget (The Telegraph, 2012).

Like the Eurozone member states referred to above, Portugal was one of those most affected by global tsunami, and its population's hardships were exacerbated by the Eurozone crisis. Unemployment was at 15 per cent in 2012, and still rising. Its debt was predicted to grow to 124 per cent of GDP by 2015; its recession was expected to last until 2015 (IMF et al., 2012). The government's social policy response to hardship was to attempt to enlarge social contributions for workers from 11 per cent to 18 per cent and to lower them for companies from 25 per cent to 18 per cent (EUobserver.com, 2012). In October 2012, the government's proposed large tax increases for 2013 were received by warnings from the unions that they would lead to a drastic worsening of living conditions and life expectancy (The Telegraph, 2012b).

In 2013 Cyprus, a Euro zone member and ironic location of the European Council's new Presidency (while also an investment haven for Russian billionaires) ran into grave financial crisis, re-igniting the euro crisis. Following temporary closure of its banks, a last-minute bailout of 17 billion euros was sanctioned by the European Central Bank, IMF, and the European Commission.

To summarize, the Euro zone crisis is yet one more major financial crisis bearing upon the economic stability of EU member states, the viability of the social policies, and the social wellbeing of their populations. The crisis, originating in the sovereign debt of a member state, Greece, has produced unequal effects within the European Union, with the Mediterranean countries most extensively affected. In each

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

case, the euro crisis compounded the problems from the earlier global crisis. The resultant unemployment, family poverty, reduced social benefits, and general poverty conditions have persisted, contributing to rising inequality.

The Social and Economic Impact of the Eurozone Crisis on the EU

The developing recession hit Portugal, Spain, Italy, Greece and Ireland most relentlessly, each experiencing vast national debt and bankruptcy. The European Union economies have been pressured by the wealthier Western EU economics, particularly Germany, to employ vast cutbacks in their economic and social infrastructures (now commonly termed 'austerity budgeting'), not least in social welfare. This has resulted in a number of social problems bearing upon social policy, including mass unemployment, poverty, and reduced social benefits. But the problems were multiplied for the EU states (Karmakar & Jana, 2014).

WHAT HAS HAPPENED TO POVERTY AND DEVELOPMENT

The progress in respect of poverty alleviation in East Asia and Pacific has been slow and uneven. But China has been successful in poverty eradication so that every economic historian should remember.

Significant challenges apart from extreme poverty come from the crisis. The attainment of the other development goals for developing and developing developed countries, such as reduction in malnutrition, higher access to primary education, etc., becomes extremely difficult for the crisis.

Nay, the developed world has also been distorted by the ongoing crisis. Recent UNICEF Report, for example, articulates that there has been a big deterioration in child well-being in a number of advanced countries. Based on measures of material well-being, health and safety, education, behaviors and risks, and housing and environment the report exemplifies this.

Income Inequality

Financial crisis coupled with macroeconomic volatility also has worsened income equality, since lower income segments of the population are less protected from economic downturns. From the Gini index, we find that it has increased in the post-crisis period in a number of advanced countries such as Iceland, Sweden, Switzerland, Croatia, and Luxembourg. This suggests increased income inequality and a growing gap between rich and poor. Even in Germany, (Gini index being low than others countries of Europe) inequality seems to have increased, with the richest 10 percent of the population now controlling 60 percent of all wealth. The Gini index sharply has deteriorated after the crisis in several developing countries in Europe and Central Asia and Sub-Saharan Africa. This shows the worsening socio-economic conditions

SOCIAL IMPACT ON INDIA: AN EMPIRICAL RESULT

The GLS estimation results of Equation (1) can be found in Table 1.

The results clearly indicate that poverty levels have been falling before the pre-crisis period but the post-crisis period witnessed a jump in the poverty rates across the Indian subcontinent. The first case

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Pre-crisis vs. post-crisis period (GLS estimation)

Period	Dependent Variable: g	Coefficient	$\left\|P\right\| > t$
Pre-crisis	t	-1.30	00
Post-crisis	t	2.47	0.00

Source: Results compiled by the author; the constant terms have been ignored

corresponds to the pre-crisis period and the second case corresponds to the post-crisis period. The value of the coefficient indicates contrasting results across the two periods. With time, the value of the FGT index in India was going down in the years before the crisis from 2000 onwards but after 2008, the scenario changed and the data reflects that poverty has been on the rise ever since then. This result is very much consistent with the data we have on poverty in the post-crisis period.

Social and Political Cohesion

United Nations vociferously points to a sharp deterioration in social and family cohesion since the onset of the global crisis in a number of countries. The increase in rates of mental illness, abuse, and suicides incidents in Egypt, Japan, Latvia, South Africa, and the United States, labor migration in response to the crisis and reported increase in the incidence of child abandonment bear a clear testimony to the fact and signs of deterioration in social and family cohesion. Even there is prevalence of depression in India, Indonesia, Pakistan, South Africa, and Thailand.

The Economist magazine from result of economic indicators, viz. nominal GDP, real per capita GDP, and private consumption and income indicators viz.real wages and unemployment rate computed a measure of "lost time" and showed that advanced economies have lost more than a decade of wealth, income and employment: Greece lost more than 12 years, Ireland, Italy, Portugal and Spain by 7-9 years, the United Kingdom went back 8 years, and the United States a decade. The overall measure of lost time shows that the peripheral European countries that have been hardest hit by the global financial crisis.

POLICY IMPLICATIONS

The Euro zone crisis is a key moment for the European Union as a whole, coming immediately after the global financial crisis, given the ramifications for member states, and that the continued existence of the EU was thrown into doubt by media commentators at least until the beginning of 2013. The Euro zone crisis imposes yet a further social burden upon the Mediterranean economies (and the majority of their respective citizens) and renders visible the gap in economic and political power between them and the affluent Western European nation-states. Whereas the origins of the crisis resided in the sovereign debt of Greece, the accumulation of previously unthinkable Mediterranean debt was not only caused by private sector exhortations and the interests of an economically booming Germany, but also by having to pay for the earlier and indisputably related global financial crisis. Finally, the European Union's singular response to the Euro zone crisis is a disappointing one, compared with those of the member states' own banks. The European Central Bank (ECB) lacks 'weight', owing to its historical constitutional weakness, while the actual situation shows lack of an effective, centralized financial authority.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Bad social and economic outcomes from the crisis step in owing to the low provision of very essential goods and services. As a result the governments of the crisis- affected countries have undertaken measures to cut vigorous public spending. Labour market is so badly affected by the crisis that those job–seekers find it difficult to have jobs in the labour markets as austerity programs made by government that often involved direct cutbacks or freezes in employment and wages is in force.

A number of policy implications that follow the above discussions are the following:

- There is no denying the fact the crisis-ridden countries' social structure; also its well-being has been severely distorted. Individuals, societies, and governments should prepare for adverse potential consequences of financial shocks and fight for taming the shocks;
- Adverse effect of crisis on people should have to be minimized by the public sector taking into account that no social –harming policies are taken under no circumstances. Always social safety nets policies and programs are to be launched for the poor and vulnerable.

ENDNOTES

[1] Subprime mortgages are those made to borrowers with poor credit histories and financial profiles.

[2] Eurozone: (also known as 'Euro land'): The Euro zone consists of 19 member countries like Austria, Belgium, Finland, France, Germany, Ireland, Italy, Luxemburg, the Netherlands, Portugal, Spain, Greece, Cyprus, Malta, Slovenia, Slovakia, Lithuania, Estonia and Latvia. The other nine members of the European Union continue to use their own national currencies. The Euro zone crisis initially stated from Greece and spread to other member countries is identified with the closest proximity of sovereign debt crisis. A debt crisis even in small peripheral economies can affect the whole monetary system given that the euro's financial system is highly integrated.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

[3] Sovereign debt: It refers to the amount of money that country owes to the holders of its government bond. Debts defaulting make a tremendous pressure on banks and the banks become technically insolvent. Sovereign debt is so called because many of the loans were made to governments or guaranteed by governments. The sovereign debt crisis has exposed the limitation of the euro zone's governance and policy framework; it also has threatened the political fundamentals of the currency union.

Chapter 74
Perception of Corporate Social Responsibility by the Employees: Evidence from Slovenia

Zlatko Nedelko
University of Maribor, Slovenia

Vojko Potocan
University of Maribor, Slovenia

ABSTRACT

The main purpose of this chapter is to examine the relationships between three underlying aspects of Corporate Social Responsibility (CSR), namely economic, environmental, and societal aspects, and the level of CSR, as perceived by the employees. The strength and direction of the impact of a single underlying aspect of CSR, on the level of CSR in organizations, is examined through a sample of 288 employees in Slovenian organizations. Results from the empirical survey suggest that employees' higher concern for environmental and social issues increases the level of organizational CSR, while higher striving for solely economic outcomes lowers the level of organizational CSR. Findings in this chapter provide insight into the state of CSR in organizations as perceived by the employees, providing an important starting point for definition or re-thinking of strategies in relation to CSR, and as a starting point for other actions as well, like changes in academia.

INTRODUCTION

Over decades various initiatives to preserve the environment for future generations emerged (Dunlap & Mertig, 1990; Elkington, 2004). These initiatives have been used in different forms and shapes. In the literature are examined under different names, like triple bottom line (Elkington, 2004), CSR (Foote, Gaffney, & Evans, 2010), social responsibility (Blackburn, 2007; Potocan, Mulej, & Nedelko, 2013), Agenda 21 (Bullard, 1998), sustainable development (Beckerman, 1994), and sustainability (Clayton

& Radcliffe, 1996). Recently, and in the academic sphere increased attention has been directed towards the issues related to the sustainability (e.g., plethora of scholarly articles, books) as well as among practitioners (Baumgartner & Ebner, 2010; Foote et al., 2010; Ubius & Alas, 2012). This is reflected in the rising importance of CSR in business, since CSR has become an important part of everyday business, especially in well developed economies, where the striving seems to be more towards sustainability, rather than in catching up economies.

Sustainability refers to the balance among economic, social, and environmental sustainability (Dunphy, Benveniste, Griffiths, & Sutton, 2000; Elkington, 2004). It is a holistic concept, emphasizing that none of the development goals of economic growth, social well-being, and the wise use of natural resources can be reached without considering and affecting the other two (Beckerman, 1994; Clayton & Radcliffe, 1996). Organizations with their actions and behavior importantly influence on natural and social environment (e.g. depletion of the resources, pollution) or often cause (or at least trigger) different misconduct. In that framework, the focus of the literature is to study/examine sustainability issues at the organizational level (Beckerman, 1994). In last decades there has been several well-known examples of different kind of misconducts, in terms of natural and social environment, as well as financial abuses (Valentine & Fleischman, 2008).

The mainstream literature about CSR provides many theoretical and empirical investigations of sustainability aspects, mainly focusing on one or two out of three key underlying aspects of sustainability. In terms of focusing on one aspect primarily consider the environmental aspect (Karp, 1996; Schultz & Zelezny, 1999; Schultz, 2001; Dietz, Fitzgerald, & Shwom, 2005), while researching solely the economic or social aspect, in the context of sustainability, is rare. Considering the two-aspect studies, those dealing with both environmental and economic aspects of sustainability prevail (Munda, 1997), frequently discussing the justification of sustainability in terms of financial criterions, like return on investments, return on assets (Agle, Mitchell, & Sonnenfeld, 1999; Agle, Nagarajan, Sonnenfeld, & Srinivasan, 2006). Meanwhile, few studies research linkages between social and other aspects of sustainability or all aspects of sustainability (Ciegis, Ramanauskiene, & Martinkus, 2009; Udo & Jansson, 2009; Potocan et al., 2013).

Focusing on the single aspect of sustainability or linkages between two out of three building blocks of sustainability fails to capture more accurate and holistic picture about the impact of different sustainability aspects on the level of organizational sustainability. The lack of empirical evidences about the relationships between economic, environmental and social aspects of CSR and the level of organizational sustainability motivates us to examine these relations. Furthermore, these issues are especially underexamined in emerging economies in Central and East part of the Europe.

In terms of sustainability, management in organizations faces a trade-off between pursuing economical, environmental, and societal goals (Agle et al., 1999; Vitell & Hidalgo, 2006; Godos-Diez, Fernandez-Gago, & Martinez-Campillo, 2011). Due to the high importance of incorporation of sustainability principles in organizational practices, is in nowadays business environment main question related to the actual state or level of organizational sustainability as well as employee's perception of different sustainability aspects. Employee's perception of CSR is important, since employee's at higher managerial positions in organizations importantly influence on organizational directions, thorough developing and implementing different strategies (Ajzen & Fishbein, 1980; Kreitner, Kinicki, & Buelens, 2002; Roccas, Sagiv, Schwartz, & Knafo, 2002; Smith, Peterson, & Schwartz, 2002; Mullins, 2006). For the purpose of this chapter we presuppose that employee's perceptions reflects relatively well in their

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

behavior, since employees' behavior in organizations is driven by plethora of interrelated factors (e.g., stakeholder requirements, shareholders claims, economic conditions, organizational culture, personal values, perceptions, personal situation, etc.) (Hersey & Blanchard, 1977; Agle et al., 1999; Kreitner et al., 2002; Smith et al., 2002; Mullins, 2006).

According to the above outlined cognitions, we examine in this chapter the relations between different aspects of CSR and the level organizational sustainability, with the aim to empirically determine the strength and direction of the relations. With proposed approach, this paper upgrades in the literature partial theoretical and empirical discussions about the "isolated" impact of each dimension of the CSR, mainly discussed and/or considered on organizational level. Such approach enables more accurate prediction of the impact of three underlying aspects of CSR on the level of organizational sustainability, since the impact of thee aspects on the level of CSR is assessed simultaneously. This reveals how different underlying CSR aspects shape and influence sustainability of the organization.

Results of this study could serve as an important starting point for managers and policy makers in organizations, when developing future steps in terms of broader sustainability and different appearances forms, especially CSR. In that frame actual state of various aspects are outlined as well as their influence on the level of organizational sustainability. Accordingly, management in organizations can adjust their decisions, in order to strongly influence on desired aspects of CSR. These findings could be also useful for academia for "refreshing" their classes, containing sustainability and especially CSR content.

According to the above outlined starting points the chapter has following structure. In frame of literature review section we outline basic definitions for understanding CSR concept and linkages between three aspects of CSR and the level of CSR. This section ends with three postulated hypotheses. Empirical part of paper first introduces sample characteristics, used questionnaire and research procedure with used methods. Next we present results and decisions about hypotheses testing. Last paragraphs of this chapter are dedicated to the discussion of obtained results, emphasizing possible practical implications, while also addressing some limitations of this paper.

LITERATURE REVIEW

Organizations nowadays highly competitive and global economy needs to be highly competitive and hence innovative (Collins & Porras, 2002; Skarzynski & Gibson, 2008; Alas, Elenurm, & Tafel-Viia, 2010). Latest data and trends indicate that modern enterprises tend to holistically satisfy legal, market, stakeholder, and environmental requirements with their internal and external actions (Agle et al., 2006; Schermerhorn, 2008).

The existence and future development of organizations in severe business environment importantly depends on their ability to achieve important aims as well as better understand behaviors and the ways to meet environmental, ethical and social requirements, besides striving for satisfactory economic results (Furrer et al., 2010; Godos-Diez et al., 2011; Potocan et al., 2013).

There have been several discussions among academics and practitioners regarding the level of organizational involvement in CSR activities (Beckerman, 1994; Mitchell, Agle, & Wood, 1997; Agle et al., 2006; Dima, Vasilache, Ghinea, & Agoston, 2013). Major arguments for organizations to perform CSR activities are related to (Certo & Certo, 2009):

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. The fact that organizations have significant impact on such critical issues as environmental pollution, influencing quality of people in neighborhood of organizational premises,
2. The fact that organizations are open system, thus they should listen to what must be done to sustain or improve social welfare,
3. Severe depletion of natural resources, increased social problems, and greed for profits, in last decades, and
4. Increased role and importance of national legislation, European Union legislation, activist groups, non-governmental organizations, customers, etc., for sustainable development.

Based on above outlined theoretical cognitions and our own experiences in business practice, we argue that the modern enterprise develops as an entity consisting of economic, ecological, social, and ethical goals. In terms of goals, thus organization try to achieve profitability, reducing the impact on the environment (e.g. investing in modern or greener technology), improving corporate reputation (e.g. donations, sponsoring) and behave ethically (to the employees and outer environment), as well as an entity for all goals in synergy for its business.

Sustainability and CSR

Recently the topic about sustainability has become prevalent in literature as well as in business practice, where could be found under different names/appearances forms, like CSR, corporate sustainability (Baumgartner & Ebner, 2010). Sustainability is a holistic concept, but the vision that none of the development goals of economic growth, social wellbeing and a wise use of natural resources, can be reached without considering and effecting the other two, got widely accepted (Landrum & Edwards, 2009). John Elkington (2004) developed this notion into the 'triple bottom line' or 'Triple-P (People, Planet, Profit)' concept. Sustainability is about the balance or harmony between economic sustainability, social sustainability and environmental sustainability.

Sustainability encompasses much more than just balancing profit with people and planet aspects, based on the concepts and standards of sustainability, developed through last decades. According to the findings of different authors a number of key elements or principles of sustainability can be derived, namely (Beckerman, 1994; Clayton & Radcliffe, 1996; Munda, 1997; Dunphy et al., 2000; Hitcock & Willard, 2009; Baumgartner & Ebner, 2010):

1. Sustainability is about balancing or harmonizing the social environmental and economical interests. In order to contribute to sustainable development, a company should satisfy all 'three pillars' of sustainability: social, environmental, and economic;
2. Sustainability is about both short and long term orientation. A sustainable company should consider long-term consequences of their actions, and not only focus on short-term gains;
3. Sustainability is about local and global orientation. The increasing globalization of economies affects the geographical area that organizations influence. The behavior and actions of organizations therefore have an effect on economical, social and environmental aspects, both locally and globally; and
4. Sustainability is about consuming income, not capital. Sustainability implies that the natural capital remains intact.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This means that the extraction of renewable resources should not exceed the rate at which they are renewed, and the absorptive capacity of the environment to assimilate waste, should not be exceeded.

Furthermore, sustainability is about transparency and accountability (Cancer & Mulej, 2009). The principle of transparency implies that an organization is open about its policies, decisions and actions, including the environmental and social effects of those actions and policies, to stakeholders that could be interested in or affected by these actions. The principle of accountability implies that an organization accepts responsibility for its policies (e.g. dedication to support sport; commitment to contribute to the repairing local roads, due to the activities of organization), decisions and actions, and is willing to be held accountable for these.

Sustainability is also about personal values and ethics. Sustainable development is inevitably normative concept, reflecting values and ethical considerations of the society. Thus, importance of societal values could reflect national policies; while employees also in their sustainable behavior in organizations. For instance, for those employees, for which for preservation of natural environment is highly important, will give more attention to this issues also in terms of his/her behavior in organization (Potocan et al., 2013). Part of the change needed for a more sustainable development, will therefore also be the implicit or explicit set of values that project management professionals, business leaders or consumers have and that influence or lead their behavior.

The concept of sustainability has often slightly different meaning to different people (e.g., authors in environmental management, general management, organizational behavior). Authors in management literature often refer to concept of sustainability in terms of social responsibility or CSR. For instance, Certo and Certo (2009, p. 79) the managerial obligation to take actions that protects and improves both, the welfare of society as whole and the interests of organization. While Schermerhorn (2008, p. 44) defines CSR as the obligation of organization to serve its own interests and those of society. Based on these examples of understanding CSR, by management authors, it is evident that social and environmental issues are often treated in frame of society, e.g. external organizational environment as a whole. While on the other hand, mainstream of the literature about the sustainability, always emphasize three interrelated underlying aspect of sustainability (Clayton & Radcliffe, 1996; Cancer & Mulej, 2009).

Reviewing the management literature on CSR can show the following evidence:

- With CSR enterprises try to balance the economic, environmental, and social goals of their business (Peet & Hartwick, 2009; Kira & van Eijnatten, 2011).
- CSR helps enterprises match requirements related to: efficiency X technical and commercial quality X flexibility X innovativeness X holism and wholeness of business (Mullins, 2006; Waddock & Bodwell, 2007).
- CSR authors originate their work from environmental paradigm (Dunlap & Van Liere, 1978; Dunlap & Mertig, 1990), and CSR paradigm (Elkington, 2004).
- CSR covers areas of: governance, management and organization, human rights, labor relations, natural environment, fair business practices, consumer issues, and relations to community (Elkington, 2004; Ralston et al., 2011).
- CSR requires values of: accountability, transparency, ethical behavior, respect for stakeholder interests, respect for the rule of law, respect for international norms of behavior, and respect for human rights (Kira & van Eijnatten, 2011).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

An overview of acknowledged prior studies about different aspects of sustainability (Axelrod & Lehman, 1993; Stern, 2000; Schultz, 2001; Kemmelmeier, Krol, & Kim, 2002) reveals that the majority of previous examinations as well as the measures taken by businesses, focus primarily on the environmental dimension of sustainability and therefore fail to acknowledge the holistic principle of sustainable development (Clayton & Radcliffe, 1996; Ketola, 2008). Several authors (Clayton & Radcliffe, 1996; Elkington, 2004; Potocan et al., 2013) argued, that the socio-cultural, environmental and economic realms are interdependent and the aim of a sustainably managed business should be the optimization of all three.

Table 1 presents important levels for organizational working, the selected levels for the consideration, the selected aspects of consideration of organizations, and the basic criteria for the evaluation of working and the behavior of organizations in terms of three inter-related aspects of sustainability (Elkington, 2004; Cancer & Mulej, 2009; Potocan et al., 2013).

In literature prevails papers, researches, studies, and discussions dealing with environmental issues (Schultz & Zelezny, 1999; Kemmelmeier et al., 2002; Spash, 2006), while society and economic aspects are not in the centre of attention (Munda, 1997; Cirnu & Kuralt, 2013). Thus, environmental surveys identified important factors which influence pro-environmental behavior (Axelrod & Lehman, 1993; Kemmelmeier et al., 2002; Hemingway, 2005). Examinations of the linkage between economic aspects and sustainability were mainly disused in terms of justification of sustainability (Agle et al., 1999; Hammann, Habisch, & Pechlaner, 2009). While there is a shortage of studies researching linkages between social aspect and sustainability (Sarotar-Zizek, Strukelj, & Mulej, 2011; Cirnu & Kuralt, 2013).

Besides knowing the state regarding different sustainability aspects, in order to capture the holistic picture, also the relationships between different aspects of CSR and the level of organizational CSR should be addressed. An overview of the literature investigations and business practices, offers us different solutions for researching the relationships between organizations, employee's perceptions and different aspects of CSR.

Postulated Hypotheses

The literature provides some partial answers, about comprehensive consideration of all CSR aspects (Munda, 1997; Udo & Jansson, 2009). Looking from the viewpoint of relations between different aspects of CSR and the level of CSR in organizational environment, there are prevailing theoretical assumptions about the negative impact of striving for economics results on concerning for social and natural environ-

Table 1. The holistic consideration of working and the behavior of organizations

Criteria by Levels: Selected Aspects	Individual Performance Criterion	Corporate Performance Criterion	Societal Performance Criterion	Global Performance Criterion
Economic Imperative	Individual prosperity	Corporate profitability	Societal wealth	Global wealth
Ecological Imperative	Individual eco-efficiency	Corporate eco-efficiency	Societal eco-efficiency	Global eco-efficiency
Social Imperative	Individual quality of life/ well-being	Corporate reputation	Societal quality of life	Global quality of life
All aspects in synergy	Individual well-being and sustainable life index	Corporate sustainable working/behavior index	Societal sustainable development index	Global sustainable development index

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment (Friedman, 1962; Daft, 2000; Foote et al., 2010). Based on the findings of Friedman (1962), about negative association between economic results on one hand and achieving social and environmental goals on the other hand, management authors (Daft, 2000; Schermerhorn, 2008), and the underlying idea of CSR, it can be presupposed that the economic aspect is negatively associated with the other two aspects (i.e., environmental and societal) and vice versa. These relations reflect typical trade-off in management decision making between goals aimed to earning profits and dedicating money for reaching goals beyond economic results (Vroom & Yetton, 1973; Daft, 2000). For instance, in current economic conditions this means that management reconsiders expenses for social and environmental goals (e.g. cutting money for sponsorship), but they are often limited with regulation (e.g. environmental law).

Despite these, mainly theoretical findings, literature does not offer us abundant empirical evidences, especially in emerging economies in Central and East part of Europe. Furthermore, there is often also natural or self-evident understanding about relations between CSR aspects and the level of CSR, considered as a single entity. The lack of empirical evidences regarding the relationships between CSR aspects motivates us to examine the interplay between underlying aspects of CSR and the level of organizational CSR, based on employees' perception of ecological, environmental, and societal aspect (Stern & Dietz, 1994; Cirnu & Kuralt, 2013). We assume that giving priority to the economic aspect (over other two) lowers the level of organizational CSR, as perceived by employees, whereas giving more priority to environmental and societal (over economics) aspect increases the level of organizational CSR, as perceived by employees. Employee's perception of the CSR level represents a foundation for their behavior in organizations regarding issues tackling CSR and its underlying aspects (Ajzen & Fishbein, 1980).

Employee's orientation toward different issues is often examined using concept of people's attitudes. Also in frame of examining people's perception of different aspect of CSR, examination of employee's attitudes is very common and well accepted approach (Schultz & Zelezny, 1999; Kemmelmeier et al., 2002; Ralston et al., 2011; Dabic, Potocan, Nedelko, & Morgan, 2013).

For the purpose of this chapter we identified three underlying aspects of CSR as follows. We understand:

1. Concern for economic results, as employee's striving only for economic benefits, without taking into accounts other two aspects of sustainability. This may results in neglecting or ignoring other two aspects (Munda, 1997; Daft, 2000; Ralston et al., 2011);
2. Concern for environmental issues as actions aimed to prevent environmental degradation, depletion of resources, and minimization of human impact on the natural environment (Common, Blamey, & Norton, 1993; Sarre, 1995; Spash, 2006; Malheiros, Phlippi, & Coutinho, 2008), and
3. Concern for social environment as actions aimed to actively contribute to the solving society problems and enhancement of the community welfare (Dunphy et al., 2000; Ciegis et al., 2009; Ralston et al., 2011).

Based on above presented findings our main focus is to provide evidence about the relations between different aspects of CSR and the level of CSR, considered as a single entity. CSR is considered as one entity – that expresses the level of CSR. In that framework, the level of organizational CSR can be framed on a interval, ranging from the low level of CSR to the high level of CSR (Potocan et al., 2013).

According to the above proposed framework for understanding the relations between three aspects of CSR and the level of CSR, the main question is what are the strength and direction of the outlined relations. Thus, we are looking for the answer, how does single underlying aspect of CSR influence on

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

level of CSR, based on the employee's perception. In line with above outlined cognitions and assumptions, we formulated following hypotheses, to be tested, namely:

Hypothesis 1: A higher concern for the economic results lowers overall level of CSR in organizations, as perceived by employees.
Hypothesis 2: A higher concern for the environmental issues increases overall level of CSR in organizations, as perceived by employees.
Hypothesis 3: A higher concern for the social issues increases overall level of CSR in organizations, as perceived by employees.

Next we outline research design and methodology.

RESEARCH DESIGN AND METHODOLOGY

Sample and Data

The survey was done during winter semester of academic year 2012/2013, at University of Maribor, Faculty of Economics and Business, Slovenia. Participants in the survey were enrolled master students and their parents. A link to the online survey was given to the students, which forwarded the link to their parents. Approximately 90 percent of the targeted parent's population responded. All participants participated voluntarily. For this paper we used 288 answers from student's parents. Every selected adult in this survey was employed at the time of conducting the survey.

Main demographic characteristics of the sample are. The average age of participants is 48.64 years, and they have on average 25.54 years of working experiences. In terms of gender, 47.2% were males and 52.8% were female participants. In terms of highest achieved education, 9.7% participants did not finished primary school, 11.5% have finished primary school, 43.1% have finished high school, 33.3% have obtained bachelor degree, while only 2.1% obtained master degree and 0.3% have obtained doctorate degree. Regarding participants position in organization, 67.6% of participants are non-supervisory staff, while 32.4% participants hold managerial position at various levels (12.5% in low, 14.6% in middle and 5.3% in top management). In terms of organization size, 54.8% of participants is employed in organizations having less than 100 employees, 31.9% of organizations have between 100 and 1,000 employees, while 13.3% of employees work in organizations having more than 1,000 employees.

Instrument Used

Based on outlined cognitions it is evident that CSR is a multidimensional construct, consisting of three interrelated aspects (Singhapakdi, Vitell, Rallapalli, & Kraft, 1996; Elkington, 2004). For our research of employees' perceptions of three aspects of CSR and relations toward the level of CSR in organizations, we adopted validated questionnaire aimed to measure employee's personal values, attitudes toward promotion, and employee's attitudes towards CSR aspects (Ralston, Gustafson, Cheung, & Terpstra, 1993; Egri & Herman, 2000; Ralston et al., 2011; Potocan et al., 2013) in different cultural settings. In line with purpose of this chapter, we considered answers from third part of questionnaire, which deals with CSR aspects and includes 25 statements about CSR aspects. These statements express possible activities

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

that organizations can engage in. An example of statement is "I believe it is the duty of an organization to worry first and foremost about maximizing profits". In that framework respondents in survey express their views about 25 statements, regarding different duties of organizations, in terms of CSR. For each statement, a 9-point scale is used, ranging from 1 – strongly agree to 9 – strongly disagree.

In order to identify possible underlying aspects of CSR, e.g. concern for environment, concern for economic results, and concern for society, a factor analysis was utilized. Based on entering 25 items aimed to measure CSR (KMO = 0.870; sig. = .000), after varimax rotation, we built three factors, namely:

- Concern for environment,
- Concern for economic results, and
- Concern for society.

According to results of factorial analysis, that emphasized possible factors, and several conduced reliability analyses, we used following measurement of single aspect of CSR. From initial 25 items in questionnaire, we used for building constructs 12 items, which in reliable manner express three underlying aspects of CSR.

The items used to measure concern for the environment were:

- Prevent environmental degradation caused by the pollution and depletion of natural resources (EN 1);
- Adopt formal programs to minimize the harmful impacts that organizational activities have on the environment (EN 2); and
- Minimize the environmental impacts of all organizational activities (EN 3).

(Dunlap & Van Liere, 1978; Thomas & Griffin, 1996; Cordano, Welcomer, Scherer, Pradenas, & Parada, 2011) Cronbach's α for this scale was 0.732.

The items used to measure the primary concern for economic results (over other aspects of CSR; e.g., society and the environment) were:

- Worry first and foremost about maximizing profits (EC 1),
- Bring down labor costs to a strict minimum (EC 2),
- Taking into consideration environmental issues when jobs are at stake (EC 3); and
- Always be concerned fist about economic performance (EC 4).

(Kemmelmeier et al., 2002; Blackburn, 2007; Foote et al., 2010) Cronbach's α for this scale was 0.609.

The items used to measure concern for social environment were:

- Contribute actively to the welfare of the community (SO 1),
- Help solve social problems (SO 2), and
- Play a role in society that goes beyond the mere generation of the profits (SO 3).

(Blackburn, 2007; Shafer, Fukukawa, & Lee, 2007; Valentine & Fleischman, 2008) Cronbach's α for this scale was 0.669.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

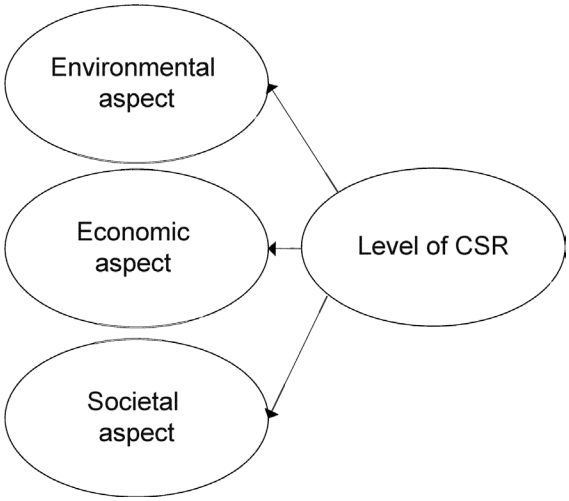
Comparable researches about the level of environmental concern (Alibeli & Johnson, 2009) illustrates Cronbach's α coefficient falling between 0.539 and 0.572 for considered constructs related to the concern for the environment. Schultz and Zelezny (1999) reported a Cronbach's α coefficient between 0.47 and 0.81; after modification, the reliability coefficient for all 14 nations in the sample was 0.70. In this field of research authors (see for example Nordlund & Garvill, 2002), reported similar values of Cronbach's α (the lowest $\alpha = 0.52$ and $\alpha = 0.50$, respectively).

In our research the concern for economic results yielded lowest reliability coefficient, in comparison to other two aspects in study. Due to the relatively low achieved reliability, we look at some papers and/or researches that include economic dimension of CSR. For instance, a survey that is also focused on issue regarding justification of CSR in organizations, does not report about reliability coefficients, since accounting-based measures are utilized (e.g. return on assets, return on equity) (Agle et al., 1999). There are also other studies, which do not report about reliability coefficients of economic aspect, due to the nature of the study (Common et al., 1993; Munda, 1997; Ciegis et al., 2009). In our study we examine economic aspect of CSR through the lenses of employee's attitudes towards economic orientation. This means that we asked participants about their attitudes regarding trade-off between concern for economic results and other tow aspects of CSR; e.g., society and the environment). In search for dimensions or constructs aimed to measure "economic orientation" (e.g. how much is important achieving economic profits, regarding to considering also environmental and societal aspect of CSR, we found a research about leadership orientation, where cronbach's α for performance goal orientation was 0.61 (Pastor & Mayo, 2008). According to outlined cognitions about economic dimension of CSR and its empirical measurement, we can conclude that reliability of our proposed dimension of concern for economic results is in acceptable range, according to the prevalent practice in this field.

According to the reliability coefficients in this stream of research we can conclude, that our Cronbach's α values are satisfactory given the exploratory nature of our research.

Research Procedure

As outlined in previous section, we utilized factorial analysis, coupled with reliability analysis in order to identify three underlying aspects of CSR. Both, attitudes towards CSR aspects and level of CSR at organizational level, are as employees perceive them. Our analysis procedures, for testing the relationships, are based on structural equation modeling in AMOS. We developed a research agenda encompassing the relationships between CSR aspects and the level of organizational CSR, as perceived by the employees. Research agenda is depicted in Figure 1.



According to proposed research agenda it is evident that CSR rests on three underlying aspects. With proposed research design we emphasize the role (i.e. the strength and the association) of single underlying aspect on the corporate social responsibly. Thus, CSR is considered as a construct, determined with three underlying aspects.

According to this, our research will reveal how different underlying aspects of CSR, determine CSR, which can be defined on a continuum, ranging from low to high level of CSR in the organization.

Proposed relationships between underlying aspects of CSR and the level of CSR, will be examined on the sample of employees in Slovenian organizations. In this scenario, employees will express their attitudes and/or preferences about three aspects of CSR, which according to the proposed research agenda show its influence (i.e., direction and strength) on the level of CSR. We can thus presuppose that the level of CSR could express organizational level of CSR, as perceived by the employees.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Research agenda for examining the relations between CSR aspects and the level of CSR in organizations

RESULTS AND DISCUSSION

In frame of presenting research results and their discussion, we first outline mean values, followed by the regression coefficients. Mean values for three aspects of CSR, as perceived by the employees, are outlined in Table 2.

From the results above it is evident following. In terms of mean values for three underlying aspects of CSR, it is evident that surveyed employees expressed highest concern for preservation of natural environment, followed by concern for social environment of organization. In comparison to social and

Table 2. Mean values for CSR aspects

CSR Aspect	Mean Value	Std. Deviation
Concern for Environment	**2.52**	**1.38**
Prevent environmental degradation caused by the pollution and depletion of natural resources	2.47	1.85
Adopt formal programs to minimize harmful impact of organizational activities on the environment	2.26	1.49
Minimize the environmental impact of all organizational activities	2.82	1.76
Concern for Economic Results	**5.07**	**1.57**
Worry first and foremost about maximizing profits	3.93	2.31
Bring down labour costs to a strict minimum	4.60	2.68
Taking into consideration environmental issues when jobs are at stake	7.22	2.12
Always be concerned first about economic performance	4.53	2.12
Concern for Social Environment	**3.06**	**1.45**
Contribute actively to the welfare of the community	3.30	1.81
Help solve social problems	2.85	1.92
Play a role in society that goes beyond the mere generation of profits	3.03	1.89

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

environment aspects of CSR, concern solely for economic results is not in the forefront. Looking more into details, i.e., focusing on items comprising three aspects of CSR, the most important item for employees is "adoption of formal programs to minimize harmful impact of organizational activities on the environment".

Among most important single items are also "prevent environmental degradation caused by the pollution and depletion of natural resources" and "minimize the environmental impact of all organizational activities", both belonging to the employee's concern for preservation of natural environment. While on the other hand, employees mostly disagree to take into consideration environmental issues, when jobs are in question.

Our findings about higher concern for preservation of natural environment, in comparison to concern for social environment, confirm the dominant role of "concern for natural environment" in frame of empirical researching the concept of sustainability, where environmental issues are most frequently studied (Axelrod & Lehman, 1993; Munda, 1997; Egri & Herman, 2000; Dietz et al., 2005; Spash, 2006; Potocan et al., 2013).

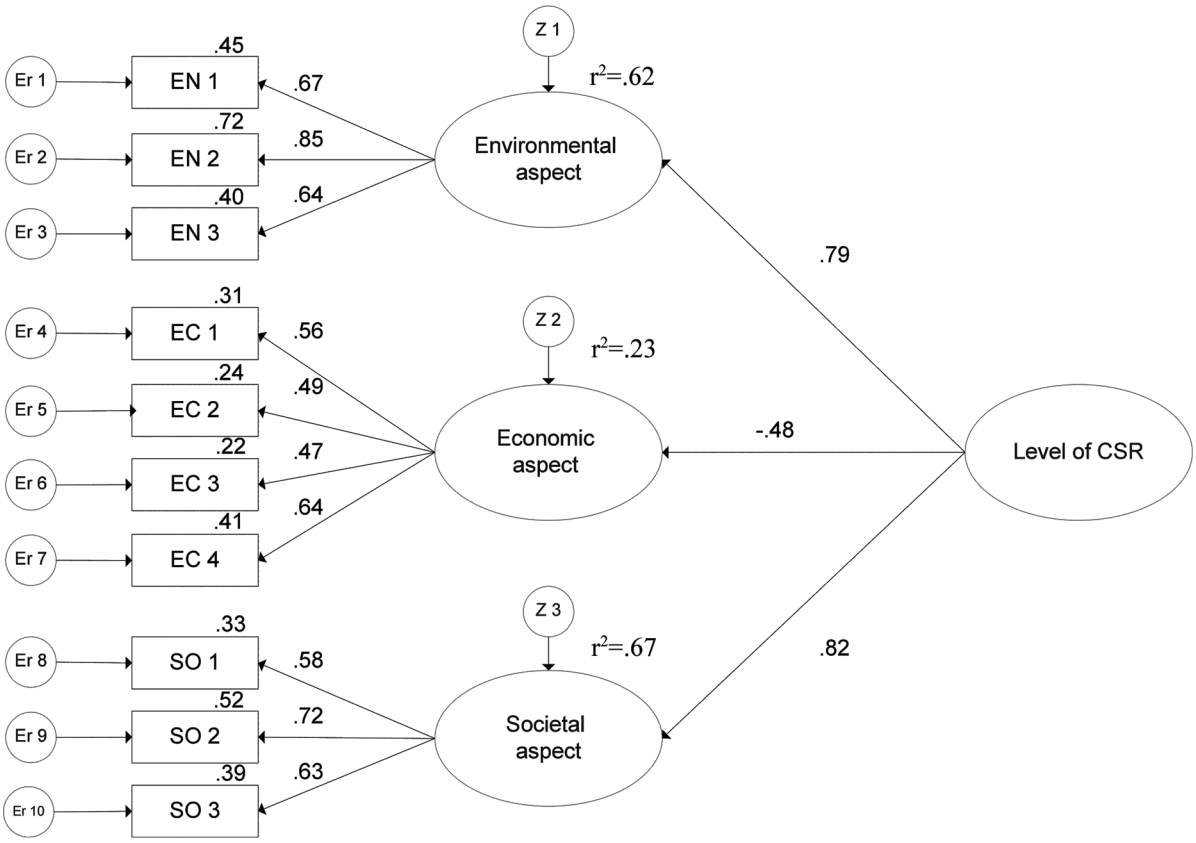
Next we present the regression coefficients concerning the associations between different aspects of CSR and the level of organizational CSR, as perceived by the employees.

According to proposed research design, after the modification of the initially proposed model in AMOS, we achieved satisfactory model fit, regarding to the accepted values in this field of research (Ho, 2006; Byrne, 2010);

χ^2 (N = 288, df = 33) = 96.462, p < 0.000; CFI = 0.911.

Detailed results regarding associations between CSR aspects and the level of CSR in organizations are outlined in Figure 2.

The outlined results in Figure 2 reveal that employee's concern solely for economic results is negatively, moderate and significantly associated with level of organizational CSR ($\beta = -0.48$, $p < .05$). This means, that that with higher employee's concern solely for economic results, the level of organizational CSR decreases. Based on these findings we can support hypothesis 1, which states that a higher concern for the economic results lowers overall level of CSR in organizations, as perceived by employees.



Next, the concern for environment is positively, strong and significantly associated with level of CSR. This mean, that with higher employee's concern for environment, the level of organizational CSR increases. These findings provide support for hypothesis 2 which states that a higher concern for the environmental issues increases overall level of CSR in organizations, as perceived by employees.

Looking at the third relationship, the concern for society ($\beta = 0.82$, $p < .001$) is positively, strong and significantly associated with level of CSR. This mean, that with higher employee's concern for society, the level of organizational CSR increases. These findings provide support for hypothesis 3 which states that a higher concern for the social issues increases overall level of CSR in organizations, as perceived by employees.

Obtained results, about the association between three underlying aspects of CSR and the level of CSR in organizations, reflect prior findings about these associations. First, our results are in line with cognitions about positive association between social and environmental aspect with level of organizational CSR (Common et al., 1993; Singhapakdi et al., 1996; Egri & Herman, 2000; Schultz, 2001; Spash, 2006; Hards, 2011). Second, prior theoretical and empirical evidences, confirm the negative impact of solely striving for economic results on lowering level of CSR (Friedman, 1962; Daft, 2000; Foote et

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Results about associations between CSR aspect and the level of CSR in organizations

al., 2010). Thus, we can generally as well as for our sample, conclude, that these relations reflect typical situation in management decision making process, where managers need to trade-off between goals aimed to earning profits and dedicating money for serving community and protecting the environment. This means, that managers have certain amount of money which they dedicate for different goals; in case no or less money is dedicated to the environmental and societal activities/goals, in turn also the level of organizational CSR is lower.

In terms of explanation power, we can significantly more precisely capture the environmental and social aspect of CSR, than the concern for economic results, with used approach. Studies, that incorporate economic aspect, either use accounting/financial based measures (see for instance Agle et al., 1999; Agle et al., 2006) or do not address this issue. As we outlined throughout the paper, the focus is frequently on environmental issues. Although with lower explanation power, our approach through the lenses of employees' attitudes towards economic orientation, provides reliable measurement.

We can assume that employees in examined sample of Slovenian organizations, understand CSR especially in terms of environmental and social responsibility. Economic concern seems to be "more isolated" from having an impact on the level of CSR, reflecting in lower explanation power and moderate impact, in comparison to relatively strong association of environmental and social aspect to the level of CSR, coupled with relatively good explanation power (i.e., 62 percent and 67 percent, respectively). For such state we can outline following reasons. First, due to the "several unsettled" issues having its roots

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the process of transitional transformation in organizations (Dyck & Mulej, 1998; Potocan & Mulej, 2007; Nedelko & Potocan, 2013). In such circumstances, there are in the forefront management practices aimed at business optimization (Rigby & Bilodeau, 2009; Rigby, 2011; Dabic et al., 2013). Second, the impact of severe economic conditions in last couple of years could reflects in lowering striving for CSR – especially in terms of environmental and social responsibility. In this scenario, thus primary goals of organizations are related to the survival and mitigation of the impact of economic crisis on organization. Thus, in centre of attention of organizations is concern for economic results, while environmental and social aspects may be neglected. Third, weakest association of economic aspect of CSR on its level, could be attributed to the lower explanation power (i.e. 23 percent) and adopted research approach – i.e. considering attitudes toward economic orientation/concern.

IMPLICATIONS AND RECOMMENDATIONS

In terms of practical implications obtained results can serve as an important guide for decisions and actions in terms of establishing or re-thinking CSR strategy in organizations. Knowing most important actions appreciated by employees, that can contribute to the increased level of organizational level of CSR, enable organizations to focus on those employee's attitudes. This is possible with incorporating actions that reflects favorable employee's actions into organizational policies and especially standardized operating procedures. In such way organizations can actively manage, contribute and strive towards higher level of CSR, since organizational policy execution is based on those attitudes that are highly appreciated by the employee's.

But, boosting and putting forward actions that reflect favorable employee's attitudes toward CSR, especially social and natural employee's attitudes are not enough. Since sustainability is in contemporary business environment is a holistic concept comprising of three underlying aspects, also viewpoint of economic results must be taken into consideration. Due to the perceived negative impact of striving for economics results on level of organizational CSR, managers in organizations also need to make decisions about how to eliminate or at least mitigate the impact of concern solely for economics results on the level of organizational CSR.

Issues about equally balancing between economic, environmental, and social goals in current economic conditions is very challenging issue for managers, since top priorities in organizations are related to their survival and/or assurance or boosting again a stable growth of business (e.g., increasing sale; reducing layoffs) (Smith & Langford, 2011). At first glance, in such scenario it would be reasonable that issues about environmental and social concern could be putted into the back, since in business practice is hard to justify for instance cutting the expenses for labor and laying off employees, but still giving organizational money for environmental and social actions. But this trade-off is in business practice much more complex, than just a simple trade of decision, since decisions about environmental and social actions (done by organizations) are often legally binding, e.g. obeying the legislation, obtained certificate.

In practice, managers can devote fewer amounts of organizational funds to the environmental and social issues, but their actions still needs to be in accordance with the legislation. From a practical viewpoint, if organization goes well beyond just minimally fulfilling environmental requirements, it has a lot of space to adjust their policy. But when organizations doing reactively, so doing only what is obliged by the law, they have limited space for changing decisions about spending money for environmental issues. Looking generally, organizational decisions or aims about devoting less money for preserving natural

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

environment in contemporary economy are not a real option, due the high pressure for preservation of natural environment for various sources (e.g. national legislation, European Union legislation, activist groups, non-governmental organizations, customers, etc.).

The possible variability of organizational expenses related to its CSR, can be higher for social issues than environmental issues. But also here can managers have some limitations, especially due to the organizational dedication for social actions, like supporting successful athletes and sport clubs, giving money to charity institutions, etc. Managers have even less space to change policy regarding social issues when organizations have certificates for defined social issue. For instance, such example can be obtained family friendly enterprise certificate, which represent one of the various possibilities of a socially responsible action of an organization. Obtained certificate certifies that organization more effectively balance professional and private life of employees, in areas of working time, service for families, dual-career couples, etc. Since the key importance is adherence to the standards (provided with the certificate), managers cannot, for instance, radically change these policies or reduce expenses for these issues if organizations still want to have a certificate (FFEC, 2013).

We can conclude, that given picture about positive contribution of environmental and social attitudes, and negative impact of striving solely for economics profits, on level of organizational level of CSR can be used broader.

In terms of using findings outside business organizations, our findings can be useful also for organizations in public administration. Those organizations also need to rethink or establish their policies regarding achieving higher levels of CSR. Thus, results about actual state of employee's attitudes about underlying aspects of CSR can be used for reshaping or establishing CSR policies (Fiorino, 2010; Rodic, Vukovic, Zavrsnik, & Miglic, 2012).

Results may be also useful for academia (McDonald, 2004; Khan, 2013). Knowing actual state of employee's attitudes toward CSR aspects can be used for making decisions about the content of classes related to the CSR, like classes about business ethics and CSR. The main idea can be to put more focus on raising student awareness about the importance of preserving natural environment and increased concern for social environment in modern society. Important issue to address is also related to the understanding of CSR, which is currently more understand as being comprised of environmental and social aspect. On the other hand, issues regarding balancing between economic, social, and environmental goals should be more intensively addressed due to the increased striving for economic benefits and greed (Potočan & Mulej, 2007; Potocan, Mulej, & Cancer, 2008). Giving more attention to these issues in education system could improve overall picture about perception and awareness about sustainability and/or CSR among citizens.

Findings in this contribution can also be useful for new investors, strategic partners, or multinationals which want to establish their business in Slovenia or just re-aligning their policies within local subsidiaries. Knowing actual state of employee's perception of CSR, thus enable them to identify gaps and obstacles for implementation of their policies in local subsidiaries.

LIMITATIONS AND FUTURE RESEARCH DIRECTION

In terms of limitations, we can emphasize following limitations. First, small sample size, but it is still enough for making relevant conclusions. Second, limited number of items used for studying underlying aspects of CSR used in the survey, since adopted well-known instrument encompasses only 25 possible

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

items for measuring CSR aspects. Third, a survey is done in time of economic downturn in Slovenia, which could have some impact of perception of CSR attitudes by employees as well as actions of managers. Fourth, in this paper, we do not empirically examine the level of CSR; rather the mentioned concept is considered as one general entity that expresses CSR. Thus, the level of CSR is considered as single second-order factor of CSR, based on the suggestion to build relations among variables in structural equation modeling (Byrne, 2010). In this case, the level of CSR is not empirically examined, rather assumptions are made on three underlying aspects. Our assumptions about level of CSR are based on the direction and strength of the three underlying aspects of defined level of CSR.

In terms of possible future research directions we can emphasize most probable ways. Due to the severe current economic conditions there should be an examination of the possible impact of economic downturn on the perception of different aspect of CSR by employees, as well as the level of organizational CSR. Next, the study can be expanded to the areas (e.g., regions, countries) having different economic, social, and cultural background, with aim of later comparison of the results.

CONCLUSION

In this paper we examined the association between three underlying aspects of CSR and the level of organizational CSR, as perceived by employees, on sample of Slovenian employees. The pattern of results suggest that employee's high concern for environmental and social issues reflect in higher level of organizational CSR, while higher striving solely for economic concern decreases organizational level of CSR, as perceived by the employee's. Knowing actual state of employee's attitudes toward CSR is important in nowadays business environment where there is increasing striving for enhancing CSR of different entities. Thus, our findings are useful for designing or re-thinking policies and actions related to the CSR issues in business organizations. Furthermore, these findings could also serve as crucial starting point for implementing of CSR concept into public administration organizations, where the striving for CSR is lower than in business sphere. Looking from the perspective of education sphere in emerging Central and East Europe country, academia could enhance holistic understanding of CSR concept, as a entity in which also economic concern plays an important role. These findings can be found useful also for other counties in this area, sharing common history and problems, but with critical rethinking.

KEY TERMS AND DEFINITIONS

Attitudes: Someone's perception regarding the objects and/or subject in his/her environment.

Corporate Social Responsibility (CSR): The balance and trade-off between achieving economic, natural and societal aims of an organization.

CSR Level: Defined on a interval, ranging from low to high level of CSR in the organization.

Economic Concern: Reflects employee's striving only for economic benefits, without taking into accounts other two aspects of sustainability. This may results in neglecting or ignoring other two aspects.

Employee's Attitudes: How employees perceive different issues or what their attitudes are toward different aspects, viewpoints, etc.

Environmental Concern: Encompasses actions aimed to prevent environmental degradation, depletion of resources, and minimization of human impact on the natural environment.

Social Concern: Actions aimed to actively contribute to the solving society problems and enhancement of the community welfare.

Sustainability: The balance or harmony between economic sustainability, social sustainability, and environmental sustainability.

Chapter 75
Impact of Local Self-Government Institutions on Creating a Business-Friendly Environment: Multi-Criteria Analysis

Jelena Stanković
University of Niš, Serbia

Igor Novaković
University in Pristina – Kosovska Mitrovica, Serbia

ABSTRACT

The chapter objective is to demonstrate application possibilities of Multi-Criteria Analysis (MCA) in the specific local economic development problem in Serbia that refers to assessment of Local Self-Government (LSG) institutions' capabilities to act in order to create business-friendly environments and increase entrepreneurial activities. The primary aim of the chapter is to formulate an adequate multi-criteria model for evaluation of institutional cooperation between business councils, as representatives of local authorities and the business community in observed LSG units. Results indicate inadequate quality and functionality of the business councils, although cooperation has been established between the business councils, as a local government institution, and representatives of business community. Data analysis is conducted using relevant statistical methods. For multi-criteria analysis of subjective preferences of Local Economic Development (LED) offices has been applied Analitic Hierarchy Process (AHP).

INTRODUCTION

Entrepreneurial activities are very important for inclusion of developing local self-government units into national economy. Therefore, increase of entrepreneurial activities is seen as an opportunity for providing growth in developing LSG. A country representative bodies and institutions have a great role in creating business environment. However, they are not the only ones that should be taking actions and

making positive environment for business activities. Local governments can also take part in encouraging entrepreneurship and business prosperity. They can create micro climate, which should make their communities recognizable and favourable for entrepreneurs. One of the first steps includes development of local economic strategies and plans with purpose of reducing risks for developing business and creating stable business environment. The chapter summarizes the problems and efforts concerning business environment improvements that local communities in Serbia were facing during the last two decades and the factors that influenced the reduction of business activities (Antic *et al.*, 2013). Local governments in some cities have already realized the importance of local actions and discovering of local comparative advantages for increasing business activities and making better position inside regionally unbalanced Serbian economy (Stankovic *et al*., in press).

Two of the most influential determinants on business activities are business environment and the state and local government bodies' ability to deal with specific problems in creating stable and favorable business environment. Especially in the period of the recent economic crisis these two factors have been analyzed from many different aspects (e.g. Grilli, 2011; Lavric, 2010; Bumgardner *et al.*, 2011; Nicolescu *et al*., 2011). Similar conclusions can be found in research conducted by Ciocarlan-Chitucea and Popescu (2010), Norwood (2011), Dunkelberg and Wade (2012) as well as Nicolescu and Nicolescu (2013). The main conclusions of all mentioned scientific papers and studies refer to the multiple influence of the business environment on the business activities and the crucial role of the state institutions in developing and enabling business environment.

Some other studies show that local governments are likely the primary policy makers and regulators that entrepreneurs and small businesses encounter (McFarland *et al.*, 2010). Unfortunately, many local governments do not know the impact of their efforts or what their most effective roles should be. Too often, local regulations can unknowingly create institutional and bureaucratic barriers that impede development and the speed to market for new businesses (Morris & Brennan, 2003; Roxas *et al*., 2008; Stankovic *et al*., 2013; Stankovic *et al*., 2014). Additionally, while most local governments have policies and programs designed to proactively support entrepreneurs and small businesses, these efforts are not necessarily well suited to meet the needs of the types of small businesses most likely to drive economic growth (McFarland & McConnell, 2011a).

Local self-governments are interacting with business activities via its regulations, policies and communicatory and governance processes, as an important factor in supporting new and small business growth. Regulations affect doing business in a community and good communication between local institutions and business comunity helps establish trust, build supportive policies and provide ways to solve problems (McFarland & McConnell, 2011b).

Governments can, given their powers, have considerable influence over the entrepreneurial process by stifling the efforts of those attempting to start a new business. This may be done through onerous bureaucratic requirements, complex regulations or merely slow reaction to requests for decisions required to form a new business. (Reynolds et al., pp. 447)

The speed, efficiency, and complexity of local regulatory processes are indicators of a local government's responsiveness to the needs of business community.

When it comes to Serbia, the competencies of state institutions and local government institutions vary even more drastically (Stankovic *et al.*, 2013). In fact, due to the high level of centralization, the operational capacity of local institutions in the area of creating a favorable business environment is small.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

On the other hand, previous studies have shown that the business communities are still not perceived by local governments as partners but there is still a distance relationship, where the local authorities are considered as the category of "power" (Stankovic *et al*., 2012). All jurisdictions of local institutions in the field of local economic development are relatively new and have not yet found the right model of action. In this context, this research aims to identify some key issues of operation (in)efficiency of local institutions and thus improve the relationship between the business community and local government.

Since stimulating local economic development is a relatively recent jurisdiction of towns and municipalities, introduced by the Law on local self-government, the towns and municipalities have for some time been practising activities aimed at stimulating local economic growth. These activities are carried out not only within the Offices for local economic development (or, more exactly, organizational authorities of the town or municipal government which in their area deal in businesses of local economic development) but are also practised by other bodies and departments within the framework of organizational structure of the self-government, such as member of the city or municipal council in charge of economy, the council/committee of Municipal Assembly for economy, the strategic planning committee, the committee for planning capital investment, employment council, socio-economic council, etc. Representatives of economy in local self-government bodies have the opportunity to make statements on certain aspects of the local economic development in some of these forums – for instance, local employment councils gather representatives of local self-governments, national employment service, private entrepreneurs, representatives of centres for social work, representative syndicates and non-governmental organizations. However, bearing in mind that these forums (councils, boards or committees) have been founded with the aim of establishing or better functioning of only one part of the local economic framework (employment, education, defining and following development strategies), the role of these economic representatives is limited only to formulating prepositions and initiatives and following already adopted measures referring to a single particular area. In that way, they do not always have motivation or a long term interest in participating and essentially contributing to activities of these bodies.

The chapter points out the main institutions of LSG units in creating business friendly environment and the effects of their actions, measured through quality rate of Business Councils operation. The respondents (LED offices) have been offered a set of functions of Local Business Council and they are asked to express an opinion on their significance for the improvement of the business environment and the level of compliance in the respective local self-government unit. Since this is a heterogeneous criteria, which include a variety of responsibilities of councils, it is possible to form an adequate multi-criteria model and to determinate relative importance of criteria using AHP method. The analysis in the chapter will quantify the subjective perception of LED offices about business council's functionality.

The result of this chapter is to provide statistically analysed data for determination of relevant criteria for evaluation of different functions of LSG bodies used and their functionality at local level for business climate improvement. In addition, as it is already pointed out, by using AHP methodology it is possible to quantify subjective perception of LED offices about importance of certain criterion for business friendly environment. In that context, AHP is used as methodology for weights derivation when the decision maker is a group. Finally, the chapter will present testing of significant differences between the results of the statistical analysis and the subjective perception of LED offices assessed by AHP method. In order to present these analyses and results the chapter contains the following headings:

1. Legal framework of institutional cooperation between local self-government and business community,
2. Research methodology and hypotheses,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. Statistical analysis of business council's functionality,
4. Impact of business council activities on business council quality and functionality rating, and
5. Future research directions.

The research presented in the chapter has practical value because it provides information about importance of institutional co-operation between LSG bodies and the business community and it can become valuable guideline for future actions of local self-government authorities in order to increase business friendly environment.

LEGAL FRAMEWORK OF INSTITUTIONAL COOPERATION BETWEEN LOCAL SELF-GOVERNMENT AND BUSINESS COMMUNITY

The Law on Local Self-Government (Official Gazette of Republic of Serbia, No. 129/2007) determines jurisdictions of local self-governments in the area of local economic development as well, which creates a legal basis for local self-governments to actively cooperate with business communities in order to carry out the jurisdictions given. However, this Law does not define obligations or ordered way of institutional cooperation, although other regulations predict establishment of different institutional mechanisms for cooperation between local self-government and business community. Namely, establishment, jurisdictions and functioning of different institutional forms of cooperation between local self-government and business community have been defined by the Law on Employment and Insurance in Case of Unemployment (Official Gazette of Republic of Serbia, No. 36/2009 and 88/2010) as well as the Law on Socio-Economic Council (Official Gazette of Republic of Serbia, No. 125/2004).

Also, several donor development programs and development institutions have promoted different models of institutional cooperation between local self-government authority and business community. Thus, *USAID*[1] through program *Municipal Economic Growth Activity - MEGA* promoted formation of Offices for local economic development within the authority of local self-government, as part of administration which will, among other things, cooperate with the local business community. Founding and functioning of Offices for local economic development in Serbia have been supported by *GTZ*[2], *UNDP*[3] and the like. The same programs proposed and promoted forming of economic (business) councils, representing advisory bodies with the task to establish dialogue and active participation of local business community in creating and carrying out local economic development policy. National Alliance for Local Economic Development (NALED) initiated the process of certifying local self-governments with favourable business environment, which, within the framework of defined criteria, made the existence of Offices for local economic development and economic (business) councils obligatory for local self-governments, which to a great extent, made local self-governments participating in the process create this mechanism of institutional cooperation as well (see Business Friendly Certification South East Europe, 2013 and NALED, Certification program business-friendly municipality, 2012).

In connection with the legal framework for establishing institutional mechanisms of cooperation between local self-government authorities and economy, we have to bear in mind the Law on Economic Chambers (Official Gazette of Republic of Serbia, No. 65/2001, 36/2009 and 99/2011), particularly taking into consideration changes in the "chamber system" in the Republic of Serbia, as well as annulment of obligatory membership of all business entities in economic chambers.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

From the foregoing, it can be concluded that there is a valid legal framework that enables the formation of bodies of local governments whose competences would be directly aimed at improving the business environment. Also, in addition to legal solutions, initiatives in this field have solid financial support of donor funds.

RESEARCH METHODOLOGY AND HYPOTHESES

Empirical research was conducted within the framework of cooperation with the Board for local economic development and Network for local economic development of Standing Conference of Towns and Municipalities in Serbia during April and May 2013. The research was carried out on the sample of 56 cities and municipalities in Serbia and consisted of two segments:

1. Research of existence of institutional capacities for local economic development within the government, that is, administration of towns and municipalities and
2. Research of various models and mechanisms of institutional cooperation with business community, where special attention is given to existence, structure and functionality of three possible forms: (1) Local Socio-Economic Council, (2) Local Employment Council and (3) Local Economic, i.e. Business Council.

Total number of questions included in the survey is 31. The questionnaire was sent to all local governments in Serbia (174 LSG units, according to Statistical Office of RS: 150 municipalities, 23 cities and the City of Belgrade as a capital) and 56 of them responded positively and joined the research. The research was conceived as a kind of self-evaluation of local self-government institutions and response to the questionnaire was the responsibility of LED offices. Out of total number of 56 cities and municipalities included in research sample, according to population, 23 belong to small municipalities (up to 20,000 inhabitants), 21 belong to medium-sized (from 20,000 to 80,000), and 12 of them belong to large municipalities (over 80,000 inhabitants), as shown in Table 1.

Within local self-governments surveyed, activities in the area of local economic development are organized in 12 cases through Department for local economic development, in 8 cases through Division for local economic development and in 26 cases through Office for local economic development. In only 5 towns and municipalities local economic development activities are done by Agencies for local economic development as separate legal entities (Table 2).

Table 1. The structure of the surveyed municipalities by size

The Size of Municipality	Number of Municipalities	%
Small (up to 20,000 inhabitants)	23	41.07%
Medium (from 20,000 to 80,000 inhabitants)	21	37.50%
Large (over 80,000 inhabitants)	12	21.43%
Total	56	100.00%

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Institutional forms on local level that carries the activities of economic development

Institutional Form	Number of Municipalities	%
Department for Local Economic Development	12	21.43%
Division for Local Economic Development	8	14.29%
Office for Local Economic Development	26	46.43%
Agency for Local Economic Development	5	8.93%
	51	91.08%
No local institutional form in the field of LED	5	8.93%
Total	56	100.00%

Based on the given data, it can be concluded that in 51 out of 56 municipalities surveyed (91.08%), exist special organizational authorities to perform activities in the area of local economic development, most commonly organized as Offices for local economic development (46.43%), which shows that local self-government authorities have become aware of their obligation to actively deal with local economic development.

Since there is currently a high level of centralization in Serbia, the authors of this paper have found it necessary to evaluate initially the existence of local self-government bodies in all municipalities that are within its jurisdiction that should deal with local economic development problems. First of all, this applies to small and underdeveloped municipalities in which the existence of these bodies is of great importance. Therefore, the null hypothesis is defined as:

H_0: There is no connection between the size of the municipality and existence of Business Council.

If there is adequate institutional infrastructure at the local level, the paper will also test the functionality of these institutions and their cooperation with the business community through involvement of business representatives in the work of these institutions. In this regard, the authors tested the following hypotheses:

H_1: There is no correlation between the size of the municipality and quality and functionality rating of Business Council, and

H_2: There is no correlation between the fact that the President of the Council is among the business representatives and quality and functionality rating of Business Council.

In order to test the hypothesis, the relevant statistical methods will be applied.

Furthermore, functionality analysis of business councils will be tested through the application of multi-criteria analysis. Namely, through the process of determining the weights, evaluation of all activities performed by the Business Council will be carried out. This part of research refers to following hypothesis:

H_3: Quality rating of Business Council dependent on activities performed by the Business Council in observed municipality and contribution of each activity can be expressed by weights in multi-criteria model.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to test the hypothesis H_3, the appropriate methods for determining weights will be applied. Since this is a quantification of the subjective preferences about quality of performance of Business Councils the applied method will be Analytic Hierarchy Process. Data analysis that precedes forming of the pairwise comparison matrix will be performed using the Chi-Square Test.

STATISTICAL ANALYSIS OF BUSINESS COUNCILS FUNCIONALITY[4]

In the observed sample of LSG units, 32 of them have established Economic i.e. The Business Council, which is 57.1 percent (Table 3). Also, one of the municipalities in the sample, Odžaci, had established Business Council in the period from 2010 to 2012 and those experiences will be taken into account in the analysis.

If the size of LSG units in the context of the population is considered, it can be concluded that 75.0% of large municipalities and 63.9% of medium municipalities have established the Business Councils (Table 4). When it comes to small municipalities, the percentage of those who have a Business Council is much smaller and amounts to only 43.5%, which is well below the sample average.

The fact that in small municipalities there is lower percentage that indicates the existence of the Business Council, makes null hypothesis justified. For purpose of testing H_0, Chi-Square Test is applied. Chi-Square Test is a well known statistical procedure that refers both to a statistical distribution and to a hypothesis testing procedure that produces a statistic that is approximately distributed as the

Table 3. Descriptive statistics: is the Business Council established?

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

chi-square distribution. For the purpose of research, Chi-Square Test is used in its second sense. The original procedure dates from Karl Pearson paper published in the 1900s which defined the chi-squared test of goodness of fit (Plackett, 1983).

However, the results of Chi-Square Test (Table 5) clearly show that municipality size does not influence the fact whether Business Council is established (Pearson Chi-Square equals 0.131). Regardless of the circumstances where small municipalities have a lower percentage of those who established Business Council, this difference is not statistically significant and cannot be correlated with the size of the municipality. The null hypothesis has been confirmed by this conclusion.

This finding is very important, in terms of decentralization, because it suggests that the process of establishment of the institutional framework of cooperation between local governments and the business community is taking place in all LSG units. The next issue to be analyzed is relating to the management of Business Council. The very idea and purpose of the establishment of the Business Council is in cooperation between institutions and businesses focused on business enabling environment. In this sense, it is very important to analyze the participation of businessmen in the work and management of the Business Council. Particular question contained in the questionnaire was whether the president of the Business Council from among the business representatives. The answer to this question was given by 33 LSG units, of which 23 or 69.7% have a president of the Business Council among business representatives (Table 6).

If one looks at management structure of the Business Council in relation to the size of the municipality, it can be concluded that the majority of representatives of business in the position of the president are in the medium-sized municipalities (56.5%), followed by large municipalities with 26.1%. Cross

tabulation results between municipality size and the fact that the president of the Business Council is among the business representatives is presented in Table 7.

That is not the case when it comes to small municipalities where the share of business representatives as president of the Business Council is lower.

The results of Chi Square Test indicates that there is a dependence between size of the municipality and this issue in the sense that in most medium and large municipalities have president of the Business Council from among businessmen (Table 8).

The following analysis is related to Business Council quality and functionality assessment. The quantification of perception of LED offices about quality and functionality of Business Council is achieved by applying the Likert scale (Likert, 1931), where the highest level is rated with 5, and the lowest level with 1. Assessment results are presented in Table 9.

Quality and functionality of Business Council were assessed in 30 municipalities. The average rate was 2.97, and the standard deviation is 1.33. Business counsels in medium-sized municipalities have best average rating 3.15, while both other groups are below average of the sample (Table 10).

However, despite the obvious difference in average scores, which can be seen from the cross tabulation analysis, Chi-Square Test shows that there is no statistically significant dependence between the size of the municipality and the average rating of the Business Council in it (Table 11). Therefore, the research hypothesis H_1 is proved.

Table 7. Cross tabulation analysis between municipality size and the fact that the President of the Council is among the business representatives

Finally, the relation of the average quality and functionality rates has been analyzed depending on whether the Business Council is managed by a business representative.

The results show that there is a higher quality and functionality rate in those business councils where the president is among business representatives (Table 12), but the difference is not statistically significant. Therefore, the research hypothesis H_2 is proved, as well.

IMPACT OF BUSINESS COUNCIL ACTIVITIES ON BUSINESS COUNCIL QUALITY AND FUNCTIONALITY RATING

The quality and functionality of the Business Council is reflected in the ability to efficiently and effectively implement activities that contribute to improving the business climate at the local level. Starting from the assumption that there is a finite set of activities carried out by Business Council and that the goal of its work is to create a favorable business environment, the whole problem can be regarded as multi-criteria model where it is necessary to determine the weights of criteria and thus assess the extent to which they contribute to the problem goal.

The problem of relative weights determination exists since the formulation of the first multi-criteria analysis methods. During that period several approaches have been proposed to determine weights (Hwang, 1987; Saaty, 1980). Most of them can be classified depending on the information provided for their assessment in two main groups: (1) subjective and (2) objective approaches. Subjective approaches determine weights that reflect subjective judgment, while objective approaches determine weights by making use of mathematical models and they do not consider subjective judgment (Liu, 2003).

The most popular subjective approaches are the Analytic Hierarchy Process (Saaty, 1977), least squares comparison (Chu *et al*., 1979), Delphi method (Hwang & Lin, 1987), etc. The objective approaches include methods such are LINMAP - Linear Programming Techniques for Multidimensional Analysis of Privileged (Srinivasan & Shocker, 1973), various computer-aided mathematical models (Pekelman & Sen, 1974), Data Envelopment Analysis (Charnes *et al*., 1978), the entropy method (Hwang & Yoon, 1981; Van Uden & Kwiesielewicz, 2003; Chen & Lili Qu, 2006), principal component analysis and multi-attribute programming methods (Fan *et al*., 1999), all statistical methods, etc. Usual application of those methods in the field of local economic development (Wong, 2002) or urban economy (Nel, 2001) is through creating composite indices. The subject of this chapter, in contrast to conventional application, relates to the implementation of multi-criteria analysis in local economic development problem where weight determination and ranking relevant criteria should be preformed, based on which would be possible, in some of the further research, to make comparison of business councils performance, through creating a composite indices of their quality and functionality.

Testing Dependence Between Activities and Quality and Functionality of Business Council

Suppose the Business Council performs n different activities with aim to improve business environment and it is necessary to determine the measure of relative importance of each activity, expressed through weights w_j (j=1,2,...,n). A way of quantifying the contribution of activities is the assessment of the quality and functionality of the Business Council. The higher the rating of quality and functionality, the greater

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the extent of contribution of the Business Council in creating a friendly business environment. The quality and functionality ratings are subjective estimations of the LED offices about degree of performance success of the Business Council.

According to research data, Business Council performs the following activities:

A1: Draws conclusions, recommendations and opinions, it is important to improve the business climate in the community;
A2: Submits the above documents to the Municipal/City Parliament, Municipal/City Council and Municipal President/Mayor with a proposal to take adequate measures;
A3: Prepares a proposal of the Strategic Plan;
A4: Prepares amendments to the Strategic or Action Plan;
A5: Prepares annual implementation plans;
A6: Monitors and evaluates the implementation of projects and tasks of the Strategic Plan;
A7: Provides support to the LED offices in the performance of all functions within their jurisdiction;
A8: Provides support to Municipal President/Mayor and Municipal/City Council in making decisions related to other economic and development programs; and
A9: Gives opinions and suggestions for improvement of the municipal/city government, public enterprises, institutions, organizations and agencies established by the municipality/city in order to enhance conditions for economic activities in the municipality/city.

Each of these activities is categorized as "performed" and labeled with 1, or "not performed" and labeled with 0. In order to connect the category "performed" of certain Business Council activities with its quality and functionality rating, Chi-Square Test was used as a suitable non-parametric test. The results of Chi-Square Test where the dependence between quality and functionality rates was tested and particular activities conducted by Business Council are presented in Table 13.

Table 13. Chi-Square Test results: testing dependence between quality and functionality rates and particular activities conducted by Business Council

Activity	Frequency of Quality and Functionality Rates in the Group of Business Counsels That Are Performing the Observed Activity					Total Number of Business Councils Which Perform the Observed Activity	P-Value
	1	2	3	4	5		
A1	4	3	6	10	3	26	0.115
A2	2	1	4	8	3	18	0.053

A9	3	1	3	8	3	18	0.063

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Based on results presented above, it can be concluded that there is only one activity that is statistically significant for achieving higher quality and functionality rate of Business Council (p-value for *A8* is 0.001). This suggests that the activity A_8 has the highest level of utility for achieving the goal and this information will be used in forming the decision matrix in the analysis that follows. Also, for all other activities analog estimation logic will be applied - lower p-values mean a stronger connection with the quality and functionality rate, which automatically means greater importance for achieving the goal. Based on this data objectification of preferences will be conducted. Simple additive normalization of expression (1 - p-value) in order to obtain weights assessment, will not give the desired result because utility arising from the perception of statistical significance would be ignored and all activities would be treated equally. By applying a subjective method of determining the weights, the desired goal is achieved - to objectively assessed dependence between activity and quality and functionality rate, has been added new information about the utility of that assessment for achieving the goal of the problem. This procedure will be carried out using the method of Analytic Hierarchy Process.

Analytic Hierarchy Process for Weights Assessment of Business Council Activities

Analytic Hierarchy Process (AHP) is a well-known method of multi-criteria analysis developed by Thomas Saaty in 1980s. The AHP algorithm is defined through set of principals and axioms that delimits the scope of the problem environment (Forman & Gass, 2001). Three basic principles of AHP are (1) decomposition, (2) comparative judgments and (3) hierarchic composition or synthesis of priorities (Saaty, 1994).

The purpose of decomposition is to structure a complex problem into clusters of different hierarchy: criteria, sub-criteria, sub-sub-criteria and so on. At the bottom level are alternatives that should be ranked according to higher levels of hierarchy. The principle of comparative judgments is applied to construct pairwise comparisons of all combinations of elements in a particular cluster with respect to the cluster of the higher level. First knowledge about pairwise comparison method was introduced by Fechner in 1860 and developed sixty years later by Thurstone in 1927. Based on this essential pairwise comparison method, Saaty developed the AHP as a method for multi-criteria decision-making.

These pairwise comparisons are used to assess "local" priorities of the elements in a particular cluster with respect to their higher level cluster. The principle of hierarchical composition or synthesis is applied to the priorities of the elements in each cluster level and creates a kind of "general" priority vector for all elements and all hierarchy levels in the problem.

The theory of AHP method is based on three axioms. The first axiom, the reciprocal axiom refers to forming decision matrix. Based on pairwise comparison reciprocal matrix A_{nxn} has been formed, for each cluster respecting their parent in hierarchy above. The reciprocal matrix has elements $a_{ii} = 1$, (the main diagonal elements are equal to one), while the elements below main diagonal are computed as the reciprocal of the elements above, i.e. $a_{ji} = 1 / a_{ij}$, i≠j, $i, j = 1, 2, ..., n$ (1):

$$\begin{bmatrix} 1 & \cdots & a_{1n} \\ \vdots & \ddots & \vdots \\ 1 / a_{1n} & \cdots & 1 \end{bmatrix} \tag{1}$$

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The second is homogeneity axiom which suggests that the elements being compared through pairwise comparison should not be too different or there will tend to be larger errors in judgment. On the basis of this axiom it is implied that AHP method is not suitable for problems where there is a large number of criteria or alternatives.

The third axiom states that judgments about, or the priorities of, the elements in a hierarchy do not depend on lower level elements. This axiom is required for the principle of hierarchic composition to be applied. While the first two axioms are, in our experience, completely consonant with real world applications, the third axiom requires careful examination, as it is not uncommon for it to be violated (Forman & Gass, 2001).

The mathematical background of AHP algorithm for calculating the priorities is theory of consistent matrices as well as Perron-Frobenius theory on non-negative matrix (Perron, 1907; Frobenius 1912). Simply, whole algorithm is based on ability of eigenvector to generate true or approximate weights (Saaty, 1987). The AHP algorithm makes a comparison of criteria or alternatives with respect to an observed criterion, in pairwise mode. As a tool for pairwise comparison, AHP uses a fundamental scale of absolute numbers (from 1 to 9) that has been widely accepted in practice and validated by many different experiments in the field of decision theory (Saaty, 1977). This scale has to be a scale that quantifies individual preferences with respect to quantitative and qualitative attributes just as well or better than other scales. The pairwise comparison matrix that refers to activities of Business Council whose relative importance is to be estimated is presented in Table 14.

According to the Perron-Frobenius Theorem, if A is an *nxn,* non-negative, primitive matrix, then one of its eigenvalues λ_{max} is positive and greater than or equal to (in absolute value) all other eigenvalues, and there is a positive eigenvector W corresponding to that eigenvalue, and that eigenvalue is a simple root (matrix Frobenius root) of the characteristic equation. (Alonso & Lamata, 2006, p. 447):

$$AW = \lambda_{max} W \text{ or } (A - \lambda_{max} I)W = 0 \tag{2}$$

According to eigenvector method, weights could be calculated based on eigenvector W by additive normalization. If the pairwise comparison matrix is perfectly consistent, following statements are valid: (1) for arbitrary *i, j* and *p*, $a_{ij} \cdot a_{jp} = a_{ip}$ (*i,j,p=1,..., n*), (2) the comparison matrix determinant is equal to 0 and (3) the matrix Frobenius root i.e. eigenvalue λ_{max} is equal to *n* and (4) the remaining eigenval-

Table 14. Pairwise comparison matrix

	A1	***A2***	***A3***	***A4***	***A5***	***A6***	***A7***	***A8***	***A9***

A3	1/4	1/5	1	4	1/4	1/3	1/4	1/5	1/5
A4	1/8	1/9	1/4	1	1/8	1/6	1/8	1/9	1/9
A5	1/2	1/2	4	8	1	2	1	1/3	1/2
A6	1/3	1/3	3	6	1/2	1	1/2	1/4	1/4
A7	1/2	1/2	4	8	1	2	1	1/4	0.5
A8	2	2	5	9	3	4	3	1	2
A9	1	1	5	9	2	3	2	1/2	1

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ues are equal 0 for any a_{ij}. Thus, the eigenvector corresponding to the λ_{max} is always non-negative and each element of the eigenvector standardized by additive normalization can be interpreted as relative importance of corresponding criterion (Alonso & Lamata, 2001). In situation of perfect consistency, the comparison matrix satisfies the transitivity property for all pairwise comparisons. However, ideal judgments that decision matrix makes consistent are rare and it is necessary to determine the acceptable level of inconsistency. In this case, Saaty defined the consistency index (*CI*) as follows:

$$CI = \frac{\ddot{e}_{max} - n}{n-1} \tag{3}$$

as well as consistency ratio:

$$CR = \frac{CI}{RI} \tag{4}$$

where *RI* is the average value of *CI* for random matrices using the Saaty scale. According to Saaty only acceptable inconsistency is if $CR < 0.1$.

For pairwise comparison matrix presented in Table 14, the calculated maximum eigenvalue was $\lambda_{max} = 9.304137$, as well as the corresponding consistency index $CI = 0.0380171$ and consistency ratio $CR = 0.0262187$. The random index value was the one provided by Saaty and Wharton where $RI_{(n=9)} = 1.45$ (data from Table 1. *RI*(n) values from various authors, Alonso & Lamata, 2001, p. 449). The application of eigenvector method determined weights presented in Table 15. Eigenvector solution is calculated by additive normalization procedure, i.e. each weight is calculated as ratio of corresponding coefficient of eigenvector and sum of all elements of eigenvector. The calculations were performed using the software package Mathematica 9.0.

According to results providing support to municipal government bodies (Municipal President/Mayor and Municipal/City Council) in making decisions related to economic and development programs is the activity which makes Business Council the most efficient and effective in creating a favorable business environment, i.e. achieving greater level of quality and functionality. Activities that follow in

Table 15. Weights assessment

significance are submitting proper documents with conclusions, recommendations and opinions, it is important to improve the business climate in the community to municipal government bodies, as well as giving opinions and suggestions for improvement of the municipal government, public enterprises, institutions, organizations and agencies established by the municipality in order to enhance conditions for economic activities.

FUTURE RESEARCH DIRECTIONS

Future research that would be complementary to the one presented in the chapter will focus on the analysis of other forms of institutional cooperation between local authorities and the business community. Special attention will be paid to the analysis of the work and results of the Socio-Economic Council and the Council for Employment. In this regard it is possible to perform an analog analysis of their activities in order to assess their quality and functionality.

In addition, research will focus on collecting data for the objectification quality and functionality evaluation of these local government bodies. Namely, authors intend to measure the effects of their actions through numbers of open and closed businesses, employment rates, unemployment rates and investments in the territory of the observed LSG unit. Finally, it is important to investigate and review the business community about the quality and functionality of LSG bodies involved in issues of local economic development. By fusion of all those research results, it is possible, by using multi-criteria analysis, to create a composite index which show the comparison and ranking of the business councils in different LSG units, which contained indicators of LED office self-evaluation, as well as attitudes of the business community about the quality and functionality of cooperation.

Nevertheless, further research will focus on global dimension of the local economic issues, considering the analysis of the business environment through international cooperation and relations with neighboring countries.

CONCLUSION

Research conducted for the purposes of this chapter clearly indicates that the LED offices are not largely satisfied with the quality and functionality of the business council (low average quality and functionality rate). On the other hand, if we take into account the response of LSG units, where only one-third of them participated in the survey it can be concluded that there is still no awareness of any local authorities to proactively participate in the improvement of its quality and functionality.

Positive conclusions are related to the fact that the most of LSG units (regardless of size) have formed bodies that would carry out institutional co-operation with the business community. Also, there are indications of good cooperation with representatives of business and the most of the business councils head are exactly business representatives.

When it comes to activities that are carried out by business councils, their effects are not assessed as significant, because there is a clear statistical correlation only between one activity and quality and functionality rate. The AHP method provided weights that suggest the same conclusion. This clearly indicates that the business councils in observed LSG units in Serbia do not carry out their activities in

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

an efficient and effective manner. Hence, it is necessary to improve the quality and functionality of the business councils in terms of the selection of activities according to the concrete needs and problems of the local economy in observed LSG unit, but also through a more efficient way of carrying out those activities.

KEY TERMS AND DEFINITIONS

Analytic Hierarchy Process: One of the most popular methods of multi-criteria analysis developed by Thomas Saaty in 1980.

Business Council: An advisory body which is aimed at encouraging economic activities at the local level.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Business Environment: An environment in which business operates.

Chi-Square Test: Well known statistical procedure that refers both to a statistical distribution and to a hypothesis testing procedure that produces a statistic that is approximately distributed as the chi-square distribution.

Institutional Cooperation: Official cooperation between local government bodies and the economy sector.

Local Self-Government Institutions: The authorities at the local level.

Multi-Criteria Analysis: A set of methods aimed at selection or ranking alternatives on the basis of two or more relevant criteria.

Statistical Analysis: A set of methods that are used for data analysis.

Weights Assessment: The procedure of determining the relative importance of criteria in the model.

Chapter 76
International Migration Through the Tourism Industry:
Implications, Challenges, and Contradictions in South Africa

Unathi Sonwabile Henama

Portia Pearl Siyanda Sifolo
Tshwane University of Technology, South Africa

ABSTRACT

The tourism industry has advantages and disadvantages that are evident in South Africa. One of the disadvantages in Cape Town is the growth of particularly urban tourism that has displaced domestic tourists due to the high prices charged. The development of the domestic tourism market is challenged by the dominant unemployment, poverty, and inequality that are affecting the South African economy. Yet, tourism consumption requires the availability of discretionary income as a necessary condition to afford to procure and consume tourism offerings. Government support is visible in the industry as it has the ability to create jobs and opportunities for entrepreneurs. Even though three cities in South Africa, Cape Town, Durban, and Johannesburg, dominate the urban tourism market, this can also be reflected in the flight frequencies via Johannesburg, which is the regional hub for Southern Africa.

INTRODUCTION

The tourism industry has established itself as one of the leading industries in the world economy as it is being promoted for its economic benefits across all countries. Some of the economic benefits include improving the balance of payments, attracting foreign exchange because tourism is an export industry, where the tourism product offering can be consumed at the destination area, meaning that the bulk of the value adding happens at the destination area. "Tourists usually consume a bundle of goods and services while travelling, the key elements of such a consumption bundle may be identified in five broad

commodity groups: accommodation, food, transportation, shopping and entertainment'' Divisekera (2010, p. 631). When tourism planning at the destination area seeks to achieve pro-poor outcomes, the destination area can benefit economically. Tourism gained widespread recognition as a major industry when it was integrated as one of the industries that could assist countries that were under the structural adjustment programmes initiated by the IMF and the World Bank. The tourism industry is appreciated by policy makers as it can create the opportunities for local employment, because of its labor intensive nature for local entrepreneurship. Therefore, it can be said that the entry level positions that tourism creates cannot be matched by any other industry because the labour intensive nature of tourism means any growth in the tourism industry, is matched by employment growth. Evidence of the linkages with others sectors of the economy is well documented in agriculture, and construction.

Tourism is one of the world's leading industries in the world economy and is mostly promoted for its economic benefits across all countries. Tourism economy is not an independent autonomous entity but is intricately woven with the social and political fabric of society (Bailey & Richardson; 2010). It is the industry that cuts across other sectors, which make it difficult to estimate (Harrison, 1992, p. 15). According to Visa (2013), the tourism industry is forecasted to grow at an average of four percent annually over the next 10 years. Although tourism is a piece token for all due to its nature of being a multiplier effect; regional unemployment continues to be a problem as a larger number of jobless people emigrate from distant places to the tourists' centres, thus increasing the unemployed population in the cities. This merely concurs with the statement made earlier that 'tourism in an export industry' because of the product offerings that are consumed at the destination area. Therefore strengthening regional integration, collaboration and partnership through bilateral and multilateral engagement to facilitate movement of people from one place to another is prudent; be it for migration or tourism purposes.

However, Pillay & Rogerson (2013) contend that there are poor linkages between tourism and other sectors as a result, something must be done by tourism planners to ensure that there is as little as possible leakage from the local community. Yet, Torres (2003, p. 547) indicates that "tourism development is also often associated with increased demand for imported food, resulting in foreign exchange leakage and competition with local production. This phenomenon leads to the tourism industry's failure to stimulate local agriculture and in some cases; it is associated with a relative decline in production. The potential for tourism to promote local agricultural production, nevertheless, is widely recognised''. The integration of local agriculture must be a concerted step as part of the tourism development master plan for a destination, to ensure that tourism benefits and improves the standard of living for locals. Hence, integrating the local economy with the tourism industry plays an important role to improve the developmental ability of the tourism industry, especially for small scale farmers. When locals benefit from the tourism industry, they will become better hosts for tourists, due to the value domain. Tourism has become a major economic sector in many countries (Cheng, 2012), as it is one of the four key industries in Hong Kong contributing 3% of gross domestic product.

The economic growth and wealth of the Middle East countries such as India and China, has stimulated a demand for outbound tourism from those countries, which has increased the pool of available tourists. Market diversification is imperative especially for South Africa which is overly dependent on Europe (mainly United Kingdom) and the United States for the majority of international tourist arrivals. According to Gauteng Tourism Authority (2013), 69.9% of arrivals in South Africa are from African land arrivals, comprising of shoppers and cross-border traders. Such pointers indicate that tourism has an ability to rejuvenate sections of a town or city through redevelopment and attracting tourists. One of the examples within the South African context is the case of Cape Town and Durban. The Depart-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ment of Environmental Affairs (2003) noted the boom in international tourism to South Africa during post-apartheid period that was accompanied by a growing influx of international visitors to the Western Cape. This is evident amongst domestic tourists, patterns of tourism growth that have been associated with the growth of tourism numbers within the previously disadvantage groups that includes Africans, Coloureds and Indians. As Pillay & Rogerson (2013) acknowledged that Durban (a city in KwaZulu Natal province) experienced a shift in the early 1990s as it experienced a decline in the white middle class clientele. This change in tourism migration patterns has been compensated by an increase in popularity of Durban amongst the Black South Africans. The redevelopment brings about the displacement of poor locals, whilst at the same time bringing in highly sought after direct foreign investment. Moreover, the top end of the tourism industry is dominated by large multinational companies that include principals such as major airlines, hotel groups and tour operating companies. Multinational companies and airlines bring new expertise to a destination which leads to the undesirable economic leakage and a decrease in the multiplier effects for the tourism industry. The involvement of multinational companies sometimes leads to leakage because of the exclusion of local ownership. For example, employing foreign staff that remit salaries, and the use inputs in the production of the tourism experience from outside of the destination country.

Nevertheless, not all is bad because tourism growth can occur at the destination without tourism benefit for the destination, sometimes this situation is undesirable. The effort to make tourism inclusive in the South African context is associated with the efforts of government to integrate the previously disadvantaged black South Africans to play an increasing role in the tourism industry as owners and tourists. According to Tangri & Southall (2008) when the African National Congress (ANC) in 1994, identified black economic empowerment (BEE) as one key instrument to break through the wall of whiteness around the South Africa's economy; the benefits of BEE and other policies increased the economic cloud of Black South Africans, through equity stakes in companies and better prospects in being hired due to affirmative action policies. The tourism industry has benefited from the increase in Black South Africa tourists, in as much as little is known about the special needs of this market. The emergence of Black South African tourists presents many opportunities for the greater dispersal of tourism expenditure geographically, especially when one is considering that the former homelands in South Africa that are not major tourism nodes.

Another breakthrough by South African government within the tourism industry is dealing with a challenge of retaining the tourism industry from pre-apartheid racial character of being predominantly white owned, and white controlled. Black Economic Empowerment has been promoted to try and address some of the issues of this nature, but the change is at a slow pace. Interestingly, the one sector of the tourism industry that has the highest black ownership is the gambling and gaming sector, where government grants licenses for operations that have significant black shareholding. The end of apartheid has ushered many policies such as the Employment Equity Act that legislated affirmative action for people of colour in South Africa and this has resulted in an increase in the number of black people in positions of power and authority and increased the black middle class. The tourism needs of the black middle class continue to escape academic gaze which is a missed opportunity. The same can be said of regional tourism from Lesotho, which constitute, by number of tourists, the biggest contributor of tourists to South Africa.

"The growth of tourism in South Africa during the past ten years resulted in the development of various types of tourism such as: eco-tourism, cultural tourism, adventure tourism, business tourism, sports tourism and event tourism" Strydomet al. (2006, p. 87). They desire by countries to attract more

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tourists has been shaped by the emergence of special interest tourism which has allowed for the attraction of tourists based on the strengths or jewels of a country. For example, a country such as Australia is an established educational tourism destination, whilst Dubai remains the most important transit destination and is known for its shopping holidays. The Southern Africa is known for the great wildlife. Medical tourism has also become a major differentiator for South Africa, from major hip operations to abortion, which is not allowed in many countries in Africa. The South African constitution which is one of the most progressive, has allowed for the same sex marriages to be recognised. This has stimulated the emergence and attraction of South Africa as a destination that attracts gay and lesbians.

Cape Town is basically Africa's urban Gay Capital where by gay tourism is one of the most urban of tourism market segments. For example, three major cities in South Africa are Cape Town, Durban and Johannesburg. They dominate the urban tourism market in South Africa, and this can be reflected in the flight frequencies. Moreover, when South Africa hosted a 2010 FIFA World Cup, different games took place in the Provinces of South Africa including three cities. Durban has already indicated its desire to bid to host the Olympic Games, after the failed attempt by the City of Cape Town in the early 2000s. This is an indication of tourism growth in South Africa.

The tourism industry allows peaceful movement of people in the world, and is a very important economic force for any destination that receives tourism. Africa's share of the tourism industry remains small; any change in tourist arrivals has an adverse impact on the tourism industry. Acts of terror, post-election violence and acts of crime against tourists deter tourists away from un-safe destination. For example, after disputed elections of 2007 in Kenya, they led to a dwindling in tourism numbers and (Modi&Shekhawat, 2008) led to citizens being internally displaced to safer areas within Kenya and in neighbouring countries. South Africa grappled with a violent past (during the apartheid). Unlike other countries, South Africa does not have a dedicated tourism police safeguarding tourists, hence crime affects the tourism industry negatively. A country has opened up its borders; opening up the country exposes the country to new risks such as reducing visa restrictions that are seen as a barriers especially by less developing countries, and this can proliferate the entry of unwanted tourists that stay beyond their allocated time period. The growth of particularly urban tourism in Cape Town has displaced domestic tourists due to the high prices charged. The development of the domestic tourism market is challenged by the dominant unemployment, poverty and inequality that are affecting the South African economy. After a period of jobless growth experienced by the country, major industries such as agriculture and mining are increasing mechanisation and retrenching workers. Ashley & Mitchell (2005) cautioned that tourism cannot be a panacea for all the challenges of a destination country. Much has been made of the positive benefits of tourism, which is usually well publicised, whilst the negative social, and environmental impacts are downplayed.

SUCCESSFUL MIGRATION LESSONS IN AFRICA

Much academic gaze on the tourism destination area has increased because it is the site of production and consumption of the tourism experience. The operation of the tourism industry would attract inward migration that would compete with locals for jobs in the tourism industry. This point is also eluded by Shaw & Williams (1994, p. 184), that "international migration is important in tourism because it fills critical labour shortage in many developed countries". Although the use of expatriates' labour in the tourism industry is problematic, it leads to leakage from the tourism destination, thus, limiting the ben-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

efit that the tourism industry has for the destination area. Apart from leakage, developing countries still struggle with socio-economic and operationalization issues (Sharpley & Telfer, 2004, p. 159). This makes it difficult for tourism to prosper in developing countries; for example some African countries hegemonic aspirations in the sense of seeking out a position of 'structural power' is evident through political and economic instability facing the continent (Alden & Soko, 2005, p. 383). These hegemonic aspirations leads to migration of people from one country to another, or from rural to urban areas, thereby causing terrorism, crime, illegal immigrants, etc. However, this does not mean that there are no success stories in the continent concerning movement of people from one place to another place. African countries do realise benefits of the tourism industry, however, for tourism to prosper in Africa there is dire need for cooperation among the African countries and for the migration to go smoothly.

One of the successful stories that affect tourism and migration is the African Union (AU) headquarters that was established on 25 May 1963 in Addis Ababa, Ethiopia. AU currently houses 53 country members with the aim of promoting the unity and solidarity of African States; co-ordinate and intensify their co-operation and efforts to achieve a better life for the peoples of Africa; defend their sovereignty, territorial integrity and independence; eradicate all forms of colonialism from Africa; promote international co-operation, giving due regard to the Charter of the United Nations and the Universal Declaration of Human Rights; and co-ordinate and harmonise members' political, diplomatic, economic, educational, cultural, health, welfare, scientific, technical and defense policies. As an African inter-governmental organisation operating in Ethiopia, the existence of the AU Specialised Agencies in different African countries plays part in tourism and migration in general. The Specialized Agencies includes the, African Accounting Council; African Bureau for Educational Sciences; African Civil Aviation Commission; Pan-African News Agency; Pan-African Postal Union; Pan-African Railways Union; Pan-African Telecommunications Union; and Supreme Council for Sports in Africa. Hence, Crush, Williams and Peberdy (2005, p. 29), underscores the fact that that understanding the role of migration across, through and from the continent could assist in the development of NEPAD policies, and in the stated intention to foster African cooperation, unity, interaction and development. Albeit, the success stories concerning the movement of people occur because of their affiliation with other organisations outside their own countries. This activity has exacerbated migration in the continent as a result of controls that have become a critical issue when it comes to the movement of illegal emigrants without an entry visa, work visa, residency, etc. Any illegal migration leads to socio-economic problems in the continent. Moreover, the continent is still facing a myriad of challenges which include, but are not limited to; food insecurity, slow pace of regional integration, unconstitutional changes of governments, lack of respect of the rule of law and absence of durable peace in some countries, corruption, bad governance and human rights violations.

Africa has been punching above its weight in global affairs and has managed to reposition itself as a relevant and key player in the global political economy, as demonstrated by its role in agitating for the UN reform and for Africa's important role in global governance institutions. The implementation of grand plans and initiatives like NEPAD and APRM are a good example of institutionalised migration. The response of African leaders, governments, AU and Regional Economic Communities (RECs) to the challenges today can have long term implications for Africa's future. It is important to work together with non-governmental, international organisations and domestic platforms like (AU, UNECA) to strengthen Africa's competitive advantage, control migration and to increase tourism opportunities. The development in the continent through the facilitation of visas may lead to economic growth, increased employment, FOREX, etc. A good example is that of the Southern African Development Community (SADC) region planning to introduce a Schengen type visa to control movement in the region. Such strategies

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

will benefit less developed countries of sub-Saharan Africa, especially those afflicted by debilitating rural poverty; tourism is perceived as one of the few feasible options for development (Briedenhhamn & Wickens, 2004, p. 71).

Moreover, other successful migration practices that involves people travelling from one place to another involves the African regional economic communities such as, Common Market for Eastern and South Africa (COMESA), East African Community (EAC), Economic community of Central African States (ECOWAS), Intergovernmental Authority on Development (IGAD). Tourism remains crucial to diversify the economic activities of the rural areas, which would most probably be associated with mining and agriculture.

TOURISM AND MIGRATION IN SOUTH AFRICA

South Africa's unique features in terms of landscape and its geographic positioning are phenomenon because the country is endowed with both natural and manmade attractions which stimulate growth in term of job creation, economic development, investment opportunities etc. Since 1994, South Africa has become an exciting, dynamic country for people wishing visit, study, work, conduct business, retire, volunteer and explore. The country provides future aspirations and opportunities for most people who want to reach their dreams. South Africa is one among the few countries in Africa that provides an investor-friendly environment, in which 100% foreign ownership is allowed. With its booming economy, South African tourism industry is prosperous and contributes towards boosting investors' confidence. The country possesses three large vibrant cities, Johannesburg, Cape Town and Durban and repatriation of profits is liberal as the country possesses a number of entry and exit points. South Africa's advantage of shaping new world order and maintaining its international influence through its alliances such as (G20, BRICS, etc) has manifested the country's capabilities. The development of diplomatic ties between South Africa and many countries that assisted the ANC and other liberation movements in the struggle against apartheid has also led to some migration, both temporary and permanent between countries. A good example is highlighted by Potgieter & Yang (2011) that Chinese community in South Africa (48.5%) that have been in a country for 6 years or longer. Pretoria is the administrative capital city of South Africa (the seat of the Executive). Furthermore, Pretoria is the most important diplomatic city in Africa, as it has the highest number of consulates and missions on the African continent.

Furthermore, successfully hosting major events has put South Africa on the map (Sifolo, 2010). According to the World Tourism Organization (WTO), (2002), South Africa is the premier destination, attracting about 50% of tourists to the SADC countries. This is not a surprise that South Africa has been doing well for almost two decades. Hence, an increase of immigrants in South Africa is sky rocketing (Crush, Williams and Perberdy, 2005, p. 7). Johannesburg has become more cosmopolitan with growing communities of Chinese, many African citizens setting up communities and diversifying the culinary experience especially in downtown Johannesburg. According to Cornelissen (2004, p. 1294), SA has emerged as a particularly virile events campaigner, coupling a more aggressive international self-projection based on the development of a particular image and the expansion of its tourism sector with a policy of actively pursuing the hosting of different sport (and other) mega-events. It may be argued that SA is already seen as the country that has possibilities and is an international hub that connects the rest of the continent to the world. Johannesburg's OR Tambo International Airport is the regional hub in South Africa and the city benefits from the transit tourists that will connect in the city.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In contrary, according to the synthesis report by Peberdy, South Africa has the greatest proportion of its population living in urban areas and is the richest country on the continent; it is also a country with one of the highest rates of inequality between rich and poor in the world http://www.gcro.ac.za/sites/default/files/News_items/Xeno_reports_July2010/synthesis/3_Setting_the_scene.pdf). History of migration in South Africa dates back from 1652 when the great settlers led by Jan Van Riebeck arrived, leading to other South African ethnic groups moving from one place to the other parts of Africa, especially in the SAD region. This was followed by the migration of Indians and Chinese in the late 1800s. The development of racially exclusionary immigration legislation (Immigrants Regulation Act of 1913) which allowed white migration and immigration started spreading from 1910. Such Africans from the region have entered as contract and seasonal workers on commercial farms since the late 1800s. In the synthesis report, Peberdy states that immigration to South Africa in the 20th century covers the long history of state sanctioned black African temporary migration from southern Africa to the mines and commercial farms of South Africa as well as the tacit sanctioning of other forms of migration from the region, including "clandestine", or illegal migration.

Due to the troubled past of apartheid, South Africa was an outcast in international politics due to its racist policies. The Overseas Development Institute (1986) notes that air links were important for South Africa's international trade and commercial life. However, in 1986, the Commonwealth leaders (except Britain) agreed to ban air links with South Africa. This had a negative impact on South Africa's economy due to a loss of revenue due to lack of air links to many countries. This meant that South Africa was excluded from the international community, limiting the developmental ability of the tourism industry. Regional and international tourism to South Africa was curtailed. Rogerson & Visser (2004, p. 3) purports that "during the apartheid period, the country witnessed the expansion of a significant domestic tourism sector.....apartheid legislation also circumscribed the potential for domestic tourism, as the majority of the country's black population could not enjoy access to a number of facilities, most notably certain beaches, which were deemed the exclusive preserve of South Africa's white population". It can therefore be deemed according to Rogerson & Visser (2004) that the tourism industry under apartheid was anti-developmental, due to structural obstacles to the growth of the tourism industry. However, since the end of the apartheid regime, South Africa has seen significant changes in patterns of internal and cross border migration.

Despite the issues of migration, South Africa still struggles with its own socio-economic issues on the ground. Some issues include the South African systems such as governmental challenges, leadership, political, technological, etc. Besides, immigration being a process on its own; it involves multiple stakeholders, stages, processes and stages are inevitable. Immigration is one of the most politicised problems in South Africa. According to Stats SA (2010, 17),legal movements across South African borders as well as legal immigration into South Africa fall under the jurisdiction of the Department and Home Affairs. The number of people or travellers passing through South African ports continues to increase. Stats SA recorded a total of 35 291 559 travellers that passed through South African ports of entry in 2012 from 19 185 135 recorded in 2000.

TOURISM AND MIGRATION CHALLENGES IN SOUTH AFRICA

Several studies contextualise tourism and migration based on the geographic area or the events taking place. Work by Williams and Hall (2010), identify tourism and migration as two social phenomenon that

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

overlap one another. They juxtapose the causal relationship of tourism and migration through definitions. Tourism and migration are intrinsically woven as tourism may generate migration flow in the process. It is therefore essential to identify common characteristics of tourism and migration which involves movement of people from one place to the other and economic opportunities such as labor migration and tourism job opportunities. Failure to identify illegal practices surrounding tourism and migration may negatively affect the beauty of tourism and migration. Following are some of the challenges.

Structural State of Affairs of South Africa

Negative economic condition that has affected developed countries, such as 'credit crunch' has had an effect on South African government decision to cost cutting. This has led to the government not being able to create job opportunities. The high rate of unemployment in South Africa is more profound in rural areas. Rural areas have less expertise due to the out-migration of skills, and less economic opportunities to provide employment and give residents a good standard of living due to (Briedenhhamn & Wickens, 2004, p. 71) dwindling rural industrialisation. The tourism industry has been identified as an opportunity to bring in highly sought after investments and money from tourists. This could address the rural-urban migration of poverty by providing local jobs in tourism for locals. Diversification of the economic base of the rural areas is important, as the tourists provide temporary migration to the rural areas. When tourism is developed with pro-poor principles, it can contribute to the diversification of the rural economy, especially for sectors such as agriculture. The adoption of tourism-led local economic development has seen tourism integrated into policy of the local governments. However, institutional challenges such as corruption, maladministration, poor financial controls, poor governance and lack of understanding of tourism, also contribute to the challenges of the tourism industry. These challenges limit the ability of local government to provide a conducive environment for tourism to flourish. South Africa needs to increase its share of the global tourism industry and it can only do that by ensuring that the aviation industry is supported to flourish.

The domestic and international aviation sector must be fully liberalised so that customers, and commerce alike, benefit from the increased competition, increased choice, lower prices, better connectivity, and increased frequency Aviation is threatened by threats for the introduction of carbon taxation on a transport network that does not benefit from government subsidies (excluding in cases of national flag carriers). In addition, the reduction in the growth of aviation, would only have a detrimental impact on tourism, destroy jobs. Carbon taxation, instead of being a solution, would rob airlines of the financial means to buy newer generation aircraft that would produce less noise, fly faster, for longer and produce lower emissions.

Safety and Security

Personal safety and security is one of the key challenges for the growth of the tourism industry in South Africa. As soon as potential tourists undertake holiday planning theyconsider increasing their personal safety and security as a determinant of the choice of destination, they will choose relative to other competing destinations. According to Hughes (1996, p. 172) "South Africa has the highest per capita rate of murder with a firearm in the world, the second highest for manslaughter, the second highest for rape rate, the fourth highest murder rate, the second highest assault rate, the fourth highest burglary rate and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the fourth highest robbery rate". Overall, according to the Global Competitiveness Report 2011-2012 (2011, p. 17), South Africa's challenge include crime, violence and the sense that the police are unable to provide protection as a result crime do not contribute to an environment that fosters competitiveness. This means that South Africa as a destination is crime ravaged, and therefore crime would limit, curtail and direct tourists to certain areas, both domestic and international tourism.

Tourism is associated with the temporary migration of people from their normal areas of stay and work for the purposes of engaging in tourism, and leisure activities. The threat of burglary would limit the length of stay of domestic tourists away from home; this limits the developmental ability of the tourism industry because of crime. The fact is that Gauteng which houses the metropolis of Johannesburg and Pretoria is the economic heartland of South Africa and the most populated province. The province is highly urbanised and the temporary migration by Gauteng tourists to visit other provinces, peri-rural surrounding areas and outer lying areas would become targets. Limited involvement of the state to manage crime has led to the emergence of vigilantism in most formerly Black only townships. According to Todaro and Smith (2003, p. 94), there is very little scope for reducing the pressures of overpopulation in developing countries today through massive international migration. Crime has a detrimental impact on the tourism industry, firstly for product owners and tourists. The product owners have to invest significant amounts of money on securing their premises and assets due to the high rate of crime. In addition, concerns for personal safety and security may constraint tourist movement, and therefore geographically restrict the movement of tourists (also restricting geographically the tourism multiplier effect). Perception is an important function in customer decision making and crime is one such factor. Township tourism suffers from a negative image from a product offering perspective and about personal safety and security. Much needs to be done to change this image, and any failure to do so, will limit the developmental ability of tourism in townships, the place where the developmental impacts of tourism are mostly required.

"Undocumented" or "Illegal" or "Unauthorized" Migration

Another contributing factor to the challenges of tourism in South Africa, is the issue of illegal or undocumented immigrants. According to Hoogendoorn & Marais (2008, p. 81) high rates of crime in South African cities has created 'fear based' spatial distribution. This in turn affects the tourism industry, negatively. Hoogendoorn & Marais (2008) reiterate that whites feared for their personal safety and security, shying away from the central business districts (CBD) of major South African towns. This phenomenon perpetuated spatial distribution in the country. South Africa is faced with a challenge of overcrowding due to illegal and undocumented migrants in major cities of South Africa. For example, informal boarder trade and xenophobia attacks that took place in 2008 were due to high levels of unemployment in the country affected the tourism industry. South Africa has a developed mass tourism culture, which exists with a growing special interest tourism niche market. Hindson et al. (2009) assert that'addressing red tape is an important building block of a local economic development initiative'. It is crucial to highlight that Shaw and Williams (1994, p. 183) recognize that inmigration happen when the labour demands of the tourism industry exceed those of the local supply. South Africa's economic success compared to other African countries has led to a steady migration both documented and undocumented for job-seeking within South Africa. Nevertheless, South Africa's economic success continues to draw attention to immigrants; hence there is more demand on the economic slice of the country.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

SOLUTIONS AND RECOMMENDATIONS

The tourism industry is supposed to increase the standard of living of locals. It is important that locals derive benefit to increase and sustain the support of the local community. South Africa has a huge mass of unemployed, poorly skilled labour that competes with illegal migrants for entry level jobs in the tourism industry. The Ministry of Tourism and other stakeholders from public and private sector need to ensure that the labour laws of South Africa are enforced with regard to the hiring of labour. Good governance must be promoted. According to the United Nations (2012), governance refers to the exercise of political and administrative authority at all levels to manage a country's affairs''. Hyden& Court (2002, p. 5) purports that governance is the act of 'getting politics right', if not a precondition, at least it's a requisite for development. To emphasise on governance, Rodick (2006, p. 978) reiterate that governance was one of the most important second generation of reforms to advance economic growth in a country.

Therefore, this means that the state must administer its laws. One may argue that every bureaucracy must function properly in the administration of entry and exit into the country's borders. Checks and action must be initiated to address each breach of law and arrest and deport illegal and undocumented migrants. One may argue that the lack of illegal migrant labour may increase the ability of the tourism industry to create local jobs and benefit the local community. Therefore, the tourism industry may benefit from increased money circulation as there would be no economic leakage from the repatriation of money to the countries, from which the illegal labour comes from. Skilled migrant labour must be encouraged in areas of special interest to tourism such as medical tourism as the country builds the capacity for those scarce skills. For example, the Department of Tourism Management at the Tshwane University of Technology responded to industry's need to offer the first Bachelors Degree in Airports Management on the African continent. This will have a positive impact on improving the tourism industry.

The recommendations from the G20 report for the 4th T20 Ministers meeting in Mexico included visa facilitation as central to economic growth and job creation. The report by the UNWTO and the WTTC (2012), further identified visa facilitation as an opportunity to control migration which includes improved delivery of information, facilitation of the process to obtain visas, differentiation of treatment to facilitate tourist travel, instituting e-Visa programmes and establishing regional agreements. Proper facilitation of visa may improve collaboration between different countries and increase aviation industry's' economic endeavour. Furthermore, aviation is linked with the growth of commerce and the tourism industry. The increase of the aviation sector will provide the means for a quick transport network for South Africa, and ease the access to destination by both domestic and international tourists. The growth of tourism to South Africa through primarily aviation, would also lead to an increase in greenhouse gas emissions from aviation. As Friend of the Earth (2005) noted, aviation is the fastest contributor to climate change. Furthermore, Henama (2013, p. 4) adds that global emissions from international aviation account for 1% of total anthropogenic CO2 emissions.

Therefore, there is still scope for the growth of the aviation market segments domestically as the cost of air travel remains high. The emerging black middle class represents an untapped market, which is demographically in majority to other racial groups in South Africa. Dolnicar et al. (2011) notes that price is most important determining factor for choice of airline for people that are not frequent fliers. The increase in competition in aviation will lead to a greater focus on trying to retain current customers, through loyalty programmes such as frequent flyer programmes, and a greater focus on service. More-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

over, South Africa is a long-haul destination that has one of its main draw cards as the great wildlife, the hospitality of the people, and the diverse cultures available in South Africa.

CONCLUSION

According to Wood (2005) tourism has been a central dimension of globalisation, as the desire for travel and to be a tourist is practically universal. Hence, migration has become a new ''normal'' life (O'Reilly, 2007). The aviation industry has been an important industry in providing ease of fast paced transportation. As a result, the global skills shortage has led to the transportation of skilled human resources from any corner of the world to the site where the skills are required, which could be temporary and/or permanent arrangement. Greater global mobility for leisure or business has opened up new areas to a global population that is more connected by means of communication and travel. High amenity areas are attractive for residential tourism.

The sustainability of the tourism industry in South Africa depends on a robustness of the domestic tourism market. Tourism consumption is a function of disposable income and disposable time. Disposable income is imperative for tourism consumption is linked to the savings behaviour of tourists in the destination area (and inbound tourists from foreign countries). Discretionary income that is used for tourism consumption is regarded as the domain of individuals that are members of households. Financial literacy in addition to measures linked to increasing banking and savings access for South Africa is important to instil a culture of savings.

South Africa is a constitutional democracy with good institutions of governance. The post-apartheid era has corruption as one of the key challenges that impact on state capacity to function properly, and to govern. Corruption leads to institutional and governance decline, and the Department of Home Affairs which administers the borders of the country, has an entrenched culture of corruption. Acts of maladministration, corruption and poor governance impact on all levels of the bureaucracy and its ability to operate efficiently and effectively. This is especially imperative for the tourism industry, as tourism is frequently justified on the basis of its potential contribution to economic development (Mihalic, 2004, p. 81). Locations need to develop strategies for local development to remain attractive to companies and residents (Pechlaner, Raich& Fischer, 2009, p. 28). Research by Jean-Maurice Thurot indicates that tourists create an economic dependence by the host county (EdgelSr, 2008, p. 157). In search of remedies for a persistent slow employment of the tourism industry, it is evident the tourism stakeholders from the provincial, district and to the local level should be pioneers towards steering tourism economic development initiatives for success in the county. The involvement of prominent tourism stakeholders can't be bypassed.

The growth of the tourism industry should be through an increase in domestic tourism expenditure (and the growth of Black South African tourists) and the growth of inbound international tourism. The growth of domestic tourism is a function of economic growth of the country, and the tourism industry can increase its contribution to gross domestic product (GDP), and therefore drive the economy. In order for this to happen, South Africa needs to remove the barriers that limit the ability of the tourism industry, specially visa access and aviation constraints. Research conducted by Cheng (2012) in Hong Kong indicates that when China relaxed visa requirements, mainland China became the major outbound tourism market for Hong Kong.

FUTURE RESEARCH DIRECTIONS

Future research must focus on the tourism industry's role in perpetuating low wages. This is related to the fact that the tourism industry is a supplier of jobs for the poorly skilled illegal migrant, in the context of South Africa having a high unemployment rate. According to Witz, et al. (2001) tourism is big business in South Africa and it is also about the repackaging of images that represent society and its past. The post apartheid era has presented immense opportunities for the packaging of many heritage linked tours that relate the story of more than 300 years of colonialism of a special type, and apartheid. The previously Black only townships are yet to fully exploit the tourism potential linked with dark tourism (and justice tourism). A model for be developed for township tourism for South Africa. The post-apartheid era has seen the emergence of many monuments that seen to preserve the history of apartheid and the struggle for liberation creating heritage sites. These heritage sites have been constructed as monuments that fail to communicate the unique story of each destination, as they have failed in packaging and communicating the detailed story of each site.

Considering that the significant migrant population that resides in South Africa, especially from the Southern African Development Community (SADC) much research is needed to find out their specific tourism needs so as to exploit the market potential. For the tourism industry in to succeed requires the collaboration between the private sector and the public sector. Much interest lies in the aviation industry, which provides the world's fastest logistic system, is important for tourism growth. All three major cities in South Africa play a huge role when it comes to realising collaborating with other airlines to exploit tourism potential. Johannesburg is the only South African city to be classified as a world city. Cape Town and Durban are port cities and are answers to South African trade when it comes to the economy of the country and the region.

The aviation industry needs to be liberalised. For example, there is a call for public ownership though a partial privatisation of South African Airways (SAA). SAA as the national flag carrier. Currently, SAA is under the political leadership of the Minister of Public Enterprises; therefore, partial privatization would enable SAA to become more efficient and effective in the delivery of services. It has been observed that SAA has become a perennial loss maker, due to inefficient practices. This is further compounded by the fact that the aviation operational environment is burdened by high operational costs, the unstable price of jet fuel, and consumer demand suppressed by a recession and low consumer demand due to rising cost of living. There is a need for the aviation industry to lobby for less government intervention through detailed research. The impact of the rising fuel price on aviation growth in the context of South Africa is a potential research area. Aviation laws in South Africa demand that domestic airlines be 75% owned by South Africa, which limits the ability of foreign competition.

A detailed study on the impact of altering aviation legislation to allow foreign airlines to compete domestically without the requirement for the 75% local ownership is paramount. Hence, there is a need for further research concerning tourism and migration within the aviation industry. There is a need for the study that connects crime, migration and tourism. It is without a doubt that tourism is an industry that is sensitive to changes in the environment and at the tourism destination. Any concerns whether real or perceived, about personal safety and security may depress tourism demand. Tourism may have increased in political esteem; however it does not enjoy the same esteem like agriculture, mining and textiles manufacturing in the psyche of decision makers and the media. Therefore, through the Ministry of Tourism, there is a dire need to launch detailed research projects on the relationship between tourism and crime in South Africa. This research project should involve each province in the country and one

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the main findings would be to investigate the benefit of a tourism police under the authority of the South African Police Service (SAPS). Tourism police will be assigned to the major tourism nodes in the country and help to achieve what the Tourism White Paper (1996, p. 28) sought to achieve, undertake actions and strategies to reduce crime and violence on tourists. The existence of a tourism police must be assisted by the bureaucracy with special measures for prosecution and special courts for the speedy prosecution of cases.

Terrorism is another issue that negatively affects the tourism industry in the world. However, South African government remains vigilant because the country has not been unlucky for the past years. For example, South African continues to see an increase on the international tourism source markets that are significant, which include United States and the United Kingdom .According to Gauteng Tourism Authority (2013) Gauteng is the most visited province by foreign tourists amounting to 46.3% of all foreign visitors, and it is vulnerable to downturns in arrivals from foreign countries when source markets have economic challenges. This means that the tourism revenue from foreign tourists is geographically concentrated in Gauteng, defying plans for greater geographically dispersal of tourists within South Africa. This further limits the development ability of tourism if it will be geographically concentrated in Gauteng. Much research must be undertaken to find out the reason that tourism remains geographically concentrated in Gauteng, and what can be done to make it geographically dispersed within the various provinces of South Africa. According to United Nations (1999), tourism is one of the external forces influencing the direction and options for local development. Tourism-led local economic development has been become standards practise in trying to bring development to localities as part of devolution of power to give local government more entrepreneurial. Research must be undertaken to assess the success of local economic development in South Africa in general, and specifically tourism-led local economic development. The failure of tourism-led local economic development can limit the abilities of localities to tap and exploit their key selling points, packaging them and selling them as product offerings for tourism consumption.

The sustenance of these markets is vital for the growth of the tourism industry. South Africa major cities have grown in stature as international destination for business, and leisure. Pretoria and Cape Town, which are the administrative capital, and the seat of Parliament respectively continues to attract politicians, dignitaries and very important people (VIPs). Johannesburg remains the economic hub and the gateway to Africa, whilst Durban remains an entertainment and a playground for tourism activities. 'South Africa is like Hong Kong' and has a low chance of terrorist attacks compared with Western countries, it remains a potential target for terrorist attacks (Chan & Lam, 2013, p. 202). The emergence of BRICS countries has diversified the tourism market for South Africa, which has heavily depended on the United Kingdom and the United States for international inbound tourism. The Peoples Republic of China which is a member of BRICS has surpassed France as the fourth most important international inbound market for South Africa. This has reduced the risk from market failure for South Africa whilst presenting new markets, which South Africa must tap into based on detailed market research and market intelligence. As Oxford Economic (2010) noted, there is little knowledge of the travel habits and needs of emerging nations. South Africa would need to engage in inter-disciplinary research to understand the travel needs of emerging tourism markets, whilst consolidating the 'cash cow' markets such as the United Kingdom and the United States. According to Visa (2013) the popularity of Asian countries is on the rise-China, Hong Kong, Singapore and Thailand also proving to be popular destinations.

The rise of Asian countries must be researched, along with constant market intelligence gathering. The success of destination South Africa in attracting greater levels of domestic tourism and inbound

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tourism is linked to the increased marketing outlays informed by detailed marketing research and market intelligence. According to Deloitte (2012) noted that the Africa is the second largest mobile phone market after Asia, presents many opportunities for marketing using especially social media. The future of South Africa tourism will remain dominated by wildlife as the key major selling point but cultural tourism, has much potential for growth, in enriching the tourist experience. As a continent, African countries can do more to promote tourism. According to Ashley & Mitchell (2005) '' whilst Africa contributes little to global tourism figures, tourism contributes significantly to African economies... tourism is disproportionally important to Africa compared to other continents''. The challenges that limit tourism growth in South Africa specifically and African generally must be researched, that limit tourism and potentially the migration of high end tourists. African land arrivals to South Africa remain substantial, and the continued lack of attention from policy markets is regrettable. Detailed research must be done to understand these markets and their potential for destination South Africa. The migration patterns from African land arrivals must be considered within the context that there is a legacy of migrant labour from neighbouring countries.

KEY TERMS AND DEFINITIONS

Border Management: Facilitation of authorized flows of business people, tourists, migrants and refugees and the detection and prevention of illegal entry of aliens into a given country. Measures to manage borders include the imposition by States of visa requirements, carrier sanctions against transportation companies bringing irregular aliens to the territory, and interdiction at sea. International standards require a balancing between facilitating the entry of legitimate travellers and preventing that of travellers entering for inappropriate reasons or with invalid documentation.

International Law: The legal principles governing the relationships between States. More modernly, the law of international relations, embracing not only States but also such participants as international organizations, and even individuals (such as those who invoke their human rights or commit war crimes). Also termed law of nations, public international law, *jus gentium*.

Irregular Migration: Movement that takes place outside the regulatory norms of the sending, transit and receiving countries. There is no clear or universally accepted definition of irregular migration. From the perspective of destination countries it is illegal entry, stay or work in a country, meaning that the migrant does not have the necessary authorization or documents required under immigration regulations to enter, reside or work in a given country. From the perspective of the sending country, the irregularity is for example seen in cases in which a person crosses an international boundary without a valid passport or travel document or does not fulfil the administrative requirements for leaving the country. There is, however, a tendency to restrict the use of the term illegal migration to cases of smuggling of migrants and trafficking in persons.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Long-Term Migrant: A person who moves to a country other than that of his or her usual residence for a period of at least a year, so that the country of destination effectively becomes his or her new country of usual residence. From the perspective of the country of departure, the person will be a long-term emigrant and from that of the country of arrival, the person will be a long-term immigrant.

Passenger: A person riding in a vehicle (boat, bus, car, plane, train, etc.) who is not operating it.

Passport: A government document identifying a person as a national of the issuing State, which is evidence of the holder's right to return to that State. In Western traditions, passports have been used for foreign travel purposes, not as domestic identity documents. The passport is the accepted international certificate or evidence of nationality, although its evidentiary value is *prima facie* only.

Sponsorship: The act of promising financial support for a nonnational seeking entry to the State. Some States require either sponsorship or proof of adequate income as a condition for certain categories of immigration status.

Transit Passengers: Persons who arrive in a State from another country while in transit to another (third) country destination; and throughout the whole period (up to a maximum of 24 hours from the time of arrival) during which they are in the State, remain on board the craft they arrived on, or in a port or airport secure area, or in the custody of the police.

Transit Visa: A visa, usually valid for three days or less, for passing through the country issuing the visa to a third destination.

Transit: A stopover of passage, of varying length, while travelling between two or more countries, either incidental to continuous transportation, or for the purposes of changing planes or joining an ongoing flight or other mode of transport.

Transportation: The movement of goods or persons from one place to another by a carrier.

Travel Documents: Generic term used to encompass all documents which are acceptable proof of identity for the purpose of entering another country. Passports and visas are the most widely used forms of travel documents. Some States also accept certain identity cards or other documents.

Traveller: A person who passes from place to place, for any reason.

Visa: An endorsement by a consular officer in a passport or a certificate of identity that indicates that the officer, at the time of issuance, believes the holder to fall within a category of non-nationals who can be admitted under the State's laws. A visa establishes the criteria of admission into a State. International practice is moving towards issuance of machine-readable visas which comply with ICAO (International Civil Aviation Organization) standards, printed on labels with security features.

APPENDIX

Ports of Entry/Exit in South Africa

The tourism industry in South Africa has transformed over the year is such that South African government identify tourism as one of the key industries to boost the economy and the key to economic development. According to the South African Migration (SAMI), different types of visa available for migrants coming to South Africa contribute to the number of people travelling to the country. The visas includes the retirement visa, corporate visa, work permit, study permit, citizenship, extensions of permit, temporary residence permit, permanent residence, spouse permit, medical permit, relatives permit, life partner residence permit, business permit, migration and investments, financially independent visa and migration. The above mentioned visas have both advantages and disadvantages concerning migration, regional tourism and urban development. For many, tourism is a cornerstone of a policy of urban development that combines a competitive supply able to meet visitors' expectations with a positive contribution to the development of towns and cities and the well-being of their residents (Cianga & Popescu; 2013, p. 35).The growth of tourism, especially international tourism has been added by the development of the aviation industry. According to Stanford (2000, p. 1) "air travel facilitates economic growth, world trade, international investment and tourism, and is therefore central to the globalisation taking place in many other industries''. Aviation has been at the forefront of making the world a truly global village, being the world's fastest transportation and logistics system. It is linking each corner of the world, through commercial aviation, playing an important role in migration. Moreover, the end of apartheid and policies such as affirmative action and preferential procurement has increased the participation of black people in tourism. A report prepared for the Department of Environmental Affairs (2003) highlights how tourism, specifically white shark tourists have changed the economic base of the town of Gansbaai from exclusively a fishing town. Moreover, the fascination about tourism by governments, policy makers and the private sector is motivated by the fact that tourism is a growth sector.

Chapter 77
Population Growth, Governance and Urban Social Conflicts in Africa

Shaibu Bala Garba
Qatar University, Qatar

ABSTRACT

Many African countries are witnessing an increase in social conflicts with negative impacts on their development. Most conflicts are urban centered, with causes rooted in social, economic and political issues and fatalities, property destruction and displacement as outcomes. This chapter asserts that issues of growth and governance are at the heart of conflict, with growth challenging the ability of most governments to deliver services. The chapter undertakes a broad examination of social conflict in the African context with focus on understanding their cause and effects and the role that population growth, urbanization and governance play in country conflict situation. The chapter examined conflict in three countries; Algeria, Kenya and Nigeria, from a macro and micro level, along with the role that population growth, urbanization and governance play. The chapter concludes with findings and recommendations on ways to mitigate conflicts.

INTRODUCTION

There appears to be a growing number of conflict incidence in many developing countries resulting in violence, death and displacement, and the stifling of development potential. African countries are witnessing a disproportionate increase in the number of these conflicts with countries such as South Africa, Zimbabwe, Nigeria, Liberia, Algeria, Sudan, Kenya, Burundi, and Congo having protracted conflicts of different types and forms with roots at the intersection of social, economic and political issues. While reports indicate that these conflicts occur over the national space of countries, the most severe and destructive conflicts usually occur in urban areas, and are associated with outcomes that include fatalities, destruction of property, displacement of large population, dislocation of social and economic life, and the exertion of stress on emergency infrastructure. The consequences of the conflicts and their negative impact creates the need to examine and find ways to reduce their incidence and effect. In many

societies, conflict is usually associated with diversity and difference which results in competition and friction, that ultimately leads to violence. In the African context, difference in ethnicity and values, along with competition for resources are generally advanced as the cause of most conflicts. There is, however, a growing perception suggesting deeper causative roots in patterns of community growth and state of governance. Many countries are witnessing a rapid process of growth that is challenging the ability of governments to effectively maintain social order, and deliver social opportunities and development goods. This has contributed to generating the frictions that has resulted in conflicts and points to the need for any meaningful examination of social conflict to be situated within the context of prevailing pattern of demographic change as well as the capacity and state of governance.

Available reports on social conflicts tend to focus on presenting particular episodes or country situation, along with their causes and suggestions for mitigation. There are few reports that examine conflict across national divides, particularly with focus on understanding how political context in terms of governance and its effectiveness impacts the state of conflict in different countries. This chapter seeks to fill this niche. The main thesis of the research is that cross country comparative examination of conflict will lead to a better understanding of their causes and to search for more effective ways of mitigation. Such examination would facilitate the understanding of local causes of conflicts, as well as the broad systemic cross country/community issues that generate conflicts. The focus of the research is on urban conflict in the African continent. The chapter's aim is to undertake a broad examination of urban conflict with a view to understanding the dynamics of the cause and effect of conflicts, and the particular role that population growth and state of governance play in country situation. The paper uses a case study approach, with focus on three countries; Algeria, Kenya, and Nigeria, reflecting differences in regional, social and national characteristics of the continent. The research adopts an empirical approach with focus on data collection, analysis and inference. Data for the research comes principally from the Social Conflict in Africa Dataset (SCAD), (Salehyan et al., 2012), and its follow up volume, the Social Conflict in analysis Database (Salehyan & Hendrix, 2014). The SCAD database identifies and reports on 10 different types of conflicts over a period from 1990 to 2013. Use of the SCAD database is complemented by other qualitative secondary sources. The next section of the chapter presents a review on urban social conflicts and an outline of the method of the study. This is followed by presentation of the state of social conflict in each country, along with an examination of population growth and state of governance. The third section present a comparatively analyses of the three countries. The chapter ends with a conclusion that summarizes the findings and proffers recommendations on ways to reduce and mitigate the effects of urban social conflicts.

Nature, Causes, and Dynamics of Urban Social Conflicts

Conflict, as Omenya & Lubaale (2012, p. 4) pointed out is generally associated with situations where individuals or groups have different and sometimes contradictory interest, creating potential for clash. Conflict is translated into violence when individuals or groups forcefully impose their wills on others. WHO (2002, p. 5) defines violence as the "intentional use of physical force or power, threatened or actual against oneself, another person, or against a group or community, that either results in, or has a high likelihood of resulting in injury, death, psychological harm, mal-development or deprivation." Conflict is general accepted as a natural attribute of societies and social systems, and action is always focused on looking for ways to prevent its degeneration into violence (Best & Rokodi, 2011, p. 5). Cities are generally recognized as fostering conflicts because of the concentration of people in them

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Omenya & Lubaale, 2012, p. 4; Stanisland, 2010). Best and Rakodi (2011, p. 48), in this respect, point out that "in cities, people with different identities live in close proximity to each other, competition over resources and opportunities can be intense, new ideas can reach people quickly, and it is relatively easy to organize and mobilize large number of people." They further point out that conflicts generally arise over differences in interests and goals and the unequal power positions of groups. There also appears to be an association between the level of group and inter-personal conflicts with the size of a community, which implies that larger cities or communities are more likely to have more conflicts than smaller ones (Knox and Pinch, 2008, p. 210; Best and Rakodi, 2011, p. 48). On the translation of conflict to violence, Best and Rokodi (2011, p. 19) note that while conflicts are an inevitable characteristic of societies and social life, its escalation into violence is not. Conflicts translate into violence, where sound institutional mechanisms do not exist to manage and mediate differences, bringing into fore the role of governance in conflict mitigation. Elaborating on the issue, Knox & Pinch (2008, p. 360-376) have highlight the fact that urban conflict is usually driven by need to have and protect access to the plethora of services and opportunities provided to urban residents, leading to the formation of coalitions that are the main protagonist in the fight for turf in cities. Sound public institutions and mechanisms are required to manage such 'Turf' fight to avoid conflict and violence

Based on an extensive examination of intra-state conflicts, Azhar (1990) has identified the dynamics in the development of conflicts as it translates into violence. The process is classified into three stages; preconditions or origin, dynamics of conflict development, and outcome. Factors identified as contributing to establishing conflict preconditions include communal content, human needs, governance and the role of the state, with communal content viewed as most significant in predicting conflict. Community refers to a group that has shared identities and values around ethnicity, religion, or language. The community groups have basic needs which they have to satisfy within a pluralistic setting, creating the framework for competition and conflict. Government mediation and action serves to address grievances and ensure equity, with failure in government performance of this role resulting in feelings of marginalization, domination and injustice, which fuels conflict and violence. The role of the preconditions as facilitators of conflict and violence has been reported in many studies (Asiyanbola, 2007; Adedeji, 1999; Bollens, 1999; Best & Rakodi, 2011). In this respect Bollens (1999) also suggests that cities are more likely to be the sites of protracted conflict and periodic violence when: they are characterized by ethnic differences but lacking legitimate political means of managing these differences; in polarized cities where governance structures are controlled by a dominant ethnic group that uses them to discriminate against competing and threatening groups; and in cities with weak or illegitimate governance and deep intergroup antagonisms.

The existence of preconditions in a city does not necessarily establish the stage for the evolution of conflicts and violence. Certain triggers usually create the dynamics that results in the translation of conflict into violence. Azhar (1990) has identified three of the common triggers: political action by communal groups, state response to such communal action, and built-in properties of the conflict. A number of recent research has been focused on understanding the 'tipping point', the moment when conflict translates into large scale violence. Omenya & Lubaale (2012) have associated it with increase in poverty, number of youths involved, and the level of political exclusion. Azar (1990) has identified four types of outcomes resulting from violent conflict: deterioration of security resulting in destruction of social and physical infrastructure; institutional weakness, including erosion of state capacity and social fabric; psychological stress resulting from fear and vicious circle of hostilities; and increased loss of control over communal groups which contributes to making conflicts protracted. Asiyanbola's (2007) study of two protracted warring communities of Modakeke (Ife, Nigeria) show that sustainable peace among

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

conflict communities can only be achieved by policies that encourage social integration, psycho-social healing and transformation. This review points to need to address underlying issues, including poverty, access to opportunities, social equity, along with strong public institutions and mediation mechanism as means to mitigate conflicts.

The focus of the chapter is on urban social conflict that tips to the point of violence. The research addresses three particular questions; what is the state of urban social conflict in each country in terms of incidence and causative factors? what are the outcomes and impact of conflicts? what role do population growth, urbanization and state of governance play in conflicts, and how can conflicts be mitigated? The research examined the incidence of conflict in each country separately, along with analysis of country population growth pattern and state of governance. The state of conflict in each country is examined from both a macro and micro level view. At the macro level, focus is in on examining country urban conflict data. Data has been source from the SCAD Database version 3.1covering the period from 1990 to 2013. The SCAD database is viewed as providing a significantly improved coverage of social conflicts compared to other databases (Thaler, 2013, p.3). The database monitors incidences of conflict, their causes, actors, location and description of events. The Database classifies conflicts into ten and identifies fourteen causes of conflicts. In examining country state of conflict, focus has been on five classes that are deemed civil or community related. These are organized violent riots, spontaneous violent riot, pro-government violence, anti-Government violence and extra-government violence. For each country summary statistics has been used to establish the state of conflict, along with calculation of proportions of different classes of conflict compared to totals to establish difference among countries. At the micro level, examination of country state of conflict focuses on prominent case episodes with a view to understanding preconditions, process dynamics and impact. To understand the pattern of population growth and urbanization, data used is from Population Reference Bureau database (PRB, 2015). Population and urbanization data for 2010, 2015, 2030 and 2050 were used. With regards to state of governance focus has been on acquiring qualitative information from published sources, with information complemented by the use of country GDP information and GINI index. The Gini index is a commonly used measure of inequality based on statistical dispersion of a country's income distribution. The paper in discussing the result qualitatively relates findings regarding state of conflict with information about state of population growth and urbanization, and that of governance to arrive at individual country conclusions and the comparative analysis of the three countries to establish commonalities and differences in conflict statistics, cause and effect and their association with dynamics of population growth, urbanization and state of governance.

URBAN CONFLICT IN CASE STUDY COUNTRIES

Urban Conflict in Algeria

Located in the Maghreb region of North Africa, Algeria is usually grouped as part of the North Africa and Middle East (MENA) region. It has a 2015 population of 39.9 million, composed of a majority Arab and, a minority Berber population located mainly in the Kabyle region, and is 99% Sunni Muslim. The country's current border was defined by France, which colonized it in 1830, and from whom it gained independence in 1962 after a protracted war of independence. Independence saw the rise a political structure dominated by the *Front de Liberation Nationale* (FLN) as the sole ruling party (Arief, 2013).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The country is a major exporter of oil, which is the bedrock of its national economy. The current GDP of the country is estimated at 187.2 billion US$ with a growth rate of 2.6%.

The preconditions for conflict in Algeria were established during the early phase of the country's development, with the evolution of a political structure dominated by a strong presidency and security apparatus following independence (Loyd, 2003, p. 5). Political life was dominated by a military elite network that Algerians refer to as *Le Pouvoir* (the powers-that-be). From the independence period, an unwritten social contract evolved between the state and people, whereby political rights and resources were abdicated by the people in favor of political despotism in exchange for social welfare and being looked after by the state (Lloyd, 2003, p. 5). The dominance of FLN and military elites in the political life of the country continued until the 1980s, when it was challenged as a result of the rise of an alternative political force in the form of an Islamic movement that evolved from university activism. The Islamic movement built its challenge on the inability of the government and FLN to deliver the social contract (Arief, 2013, p. 5). The challenge took the form of mass protest which started in 1988 and was violently suppressed. Suppression of the protest contributed to the loss of reputation by the ruling elites and, to a large measure, to the change in the political landscape. To arrest and correct the situation, a process of reform focused on political liberalization was initiated resulting in the introduction of a new constitution and multi-party democracy in 1989. The reform enabled the Islamic movements to galvanized together into a coalition that established a political party, the Islamic Salvation Front (FIS). FIS subsequently evolved as one of the major actors in the most protracted conflict that Algeria has witnessed.

Analysis of Algerian Conflict Data

The SCAD data base reports a total 305 incidence of conflicts that resulted in violence in Algeria between 1990 to 2013. Out of this, 109 or 31% is associated with civil or social conflicts. The five topmost issues accounting for violence are Human rights and democracy (24.6%), Economy and jobs (15.4%), Religious discrimination and issues (12.8%), Ethnic issues and discrimination (11.15%) and domestic war and terrorism. In terms of location, with location unspecific data discounted, the report indicates that 174 or 57.1% of incidences occurred in urban areas compared to 43 or 14% in rural areas. Figures 1 and 2 shows chart and map with location of cities with the highest conflict incidence. Figure 1 shows the capital city having the highest incidence of conflict. It is also possible that if nationwide location unspecific data is disaggregated to location, the incidence count in the capital city may increase reinforcing an indication that conflict is centered around it. Another interesting aspect of the chart is the high incidence of conflict in the Kabyle region. The kabyle region, which integrates cities that include Tizi Ouzou, Bejaia and Boumerdes, is the focus of conflict related to Berber Identity. The Region is characterized by industrial decline and unemployment which serves as a major precursor for violence and migration out of the country. This region along with Algiers accounts for most of the conflicts that was witnessed within the period of concern in Algeria.

Case of the Post 1991 Algerian Election Conflict

The most protracted and violent conflict in Algeria occurred in 1991 following an election. The dynamics of the conflict began with the broadening of political space for multi-party activities resulting in elections of 1991. The liberalization of political space, led to the emergence of FIS as a party with values rooted in Islamic and Arabic identity as a challenger to the ruling power elite. (Lloyd, 2003, p.

7). FIS participated in local elections that were held in June of 1990, winning the highest proportion of the popular vote and control of many local municipalities. The ruling party (FLN), while not contesting the results, initiated an adjustment exercise to redefine constituency boundaries and weaken the victory of FIS. Following victory in the election, FIS agitated for further change and elections, setting the stage for legislative elections that were scheduled for December 1991. More than 50 political parties took part in the first round of that election, which FIS won, though with a reduced margin compared to the previous election. FIS was however able to secure enough votes to garner two-thirds majority in the National Assembly, enabling the Party to have the power to change the constitution of the country. Just before the second round of the legislative election, the president of the country resigned and the military stepped in, cancelled the election and declared a state of emergency. Reaction was initially calm, but it gradually changed leading to sporadic outbreak of violence. The outbreak of violence led the military government to dissolve FIS and apprehend and imprison all its leaders. The vacuum created by the imprisonment of the leaders was filled by jihadist returning from the war with the Soviets in Afghanistan, who splintered FIS into different groups that engaged in violent conflict with the government for most of the period between 1992 and 1998.

The outcome of the conflict saw more than 200,000 people killed, many injured and whole communities traumatized. During the peak of the conflict, it is estimated that about 200 people were killed weekly, with most of the fatalities in the capital and its neighboring regions (Lloyd, 2003, p. 18). Particularly targeted were schools and intellectuals, who were seen as symbols of Francophone elitism. More than 700 schools were destroyed and over 200 teachers killed. The impact of the violence was exacerbated by factional competition within the security forces that influenced the conduct of counter insurgency measures leading to atrocities against many segments of the society. The armed insurgents, differentiated mostly by ideology, also engaged in brutal actions including terrorist attacks and the massacre of civilians. The conflict peaked in 1994 when the then President of the country Boudiaf was assassinated by his bodyguard while giving a speech in Annaba, in an attempt to render the government ineffective. This was complimented by a Fatwa issued by the insurgents for all foreigners to leave Algeria. An Air France Airbus plane was also hijacked at Algiers airport and flown to France, with threats to crash the plane into the center of Paris (Lloyd, 2003, p. 18). The conflict came to an end in 1998, following the initiation of talks by eight opposition parties that called for a return to peace based on the re-legislation of FIS and the freeing of imprisoned activist in return for a gradual end to violence and the rejection of violence as a means to attain power (Arief, 2013, p. 7).

Population Growth, Governance and Conflict in Algeria

From a population perspective, Algeria has experienced significant population growth that is projected to continue into the future. Estimates put the country's population at 25 million in 1990 and 39.9 million in 2015, and is project to increase to 49.9 and 60.4 million by 2030 and 2050 respectively. The demographic distribution is bottom heavy, with 28% of the 2015 population below the age of 15, with implication for future demand for services and opportunities. The country is also urbanizing, with current level estimated at 70% and a growth rate of 0.9%. Majority of the urban population are in 37 cities, having a population of hundred thousand or more. There is a prevalence of small cities of between 100,000 to 200,000 population in the urban system, with only four cities having population greater than half a million.

From a political perspective, there is a general perception of government in Algeria being dominated by an elite class that has maintained a strong grip on the political institutions of the state (Lloyd, 2003,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

p. 37). People also perceive governance as being characterized by bureaucracy and corruption and inability to foster a sense of inclusion, particularly across gender, language and religious divides (Arief, 2013; Lloyd, 2003, p. 37). As a result, many, Algerians feel disconnected from politics and tend to harbor a deep resentment for the government because of the difficulty of living conditions. The state is also accused of overlooking some regions and constituencies, creating a feeling of exclusion and fostering conditions for conflict (Arief, 2013, p. 6). Loyd (2003, p. 23) also points out that perceptions about the government has pushed inequality and social justice to the heart civil strife throughout the years of Islamist protest and of recent Kabylie uprisings. An examination of the country's indices of inequality show a rich 10% to poor 10% of the population ratio of 9.6, and A GINI index of 35.5 in 1995. The indices suggest the existence of a level of inequality, despite the lack of currency of some data. There also appears to be an acknowledgement in the academic literature of the poor management of the national economy by the ruling elite. Algeria has had economic problems since the 1980s following the imposition of structural adjustment by the International Monetary fund. Pertinent economic issues and problems identified include "slow job creation process, poor business climate, including rigid labor market and barriers to foreign investment that are among the most restrictive in the world, stagnant labor productivity, high level of social spending on subsidies and wages and an economy dependent on hydrocarbons and public expenditure (Arief, 2013, p.12)." The economic problems of the country have contributed to its mounting social problems that are compounded by population growth. Unemployment, for example, has been rising since 1985, with those in the 25 years and below cohort having consistent rate of about 60%. Lack of employment has forced many to migrate in search of opportunities outside the country (Mussete, 2000; Lloyd, 2003, p. 8). Other prominent social problems include housing shortages and poor state of educational resources and infrastructure (Loyd, 2003, p. 6; Arief 2013, p. 7). The economic and social problems contribute in a significant way to establishing the pre-conditions that have generated the conflicts witnessed in the country (Arief, 2013, p. 11).

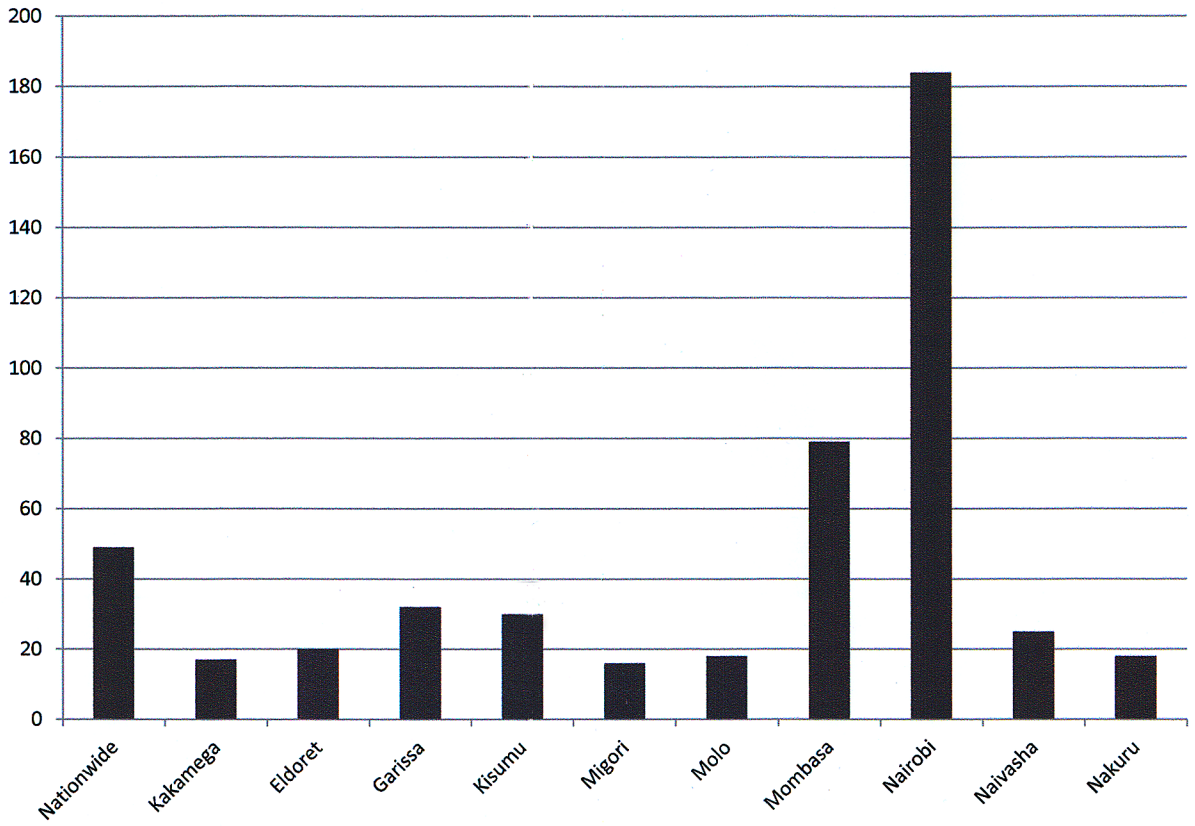
An overview of the state of conflict in Algeria from a population growth and governance perspective indicate a country with a fairly fast growing population, a high level of urbanization but poor political and economic management. The result is unemployment, lack of social opportunities, a growing perceptions of inequity in treatment, and disenchantment with the country's political state. These fundamental issues lay the framework for the level of conflict that has been reported in the SCAD data base as well as for explanations of the causes of conflicts reported. The SCAD data is, in this respect, in agreement with opinions expressed in the literature with regards to cause of conflicts. This agreement centers on the assertion that capacity in governance has not developed in ways that enable Algeria to effectively deal with development challenges resulting from population growth.

Urban Conflict in Kenya

Kenya is located in the Eastern part of Africa, sandwiched between five countries; Tanzania, Uganda, South Sudan, Ethiopia and Somalia. The 2015 population of the country is estimated at 44.3 million, with a GDP of 65.9 Billion US$. The country is multi-ethnic and multi-religious, with the dominant ethnic groups being the Kikuyu, Luo, Embu, Meru, Kamba and Somali tribes. The kikuyu and Luo are the largest of the ethnic groups. Most of Kenya's land is arid or semi-arid, with only 7% of the land arable and the focus of agriculture activities and settlements (APRM, 2006). The history of Kenya's territory is traceable to the Berlin conference when East Africa was partitioned. The British Government founded the East African Protectorate in 1895 and soon after, opened the fertile highlands to white settlers. Indians

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

were later brought to the country to work on building the Kenya-Uganda Railway Line, and subsequently settled, many also inviting their kins to join them. In 1942, some tribes of Kenya, including the Kikuyu, Embu, Meru and Kamba, took an oath to fight for freedom from colonial rule, leading to the formation of the Mau Mau Movement and a rebellion against British rule. The rebellion resulted in direct elections for Africans to a legislative council in 1957, and finally to independence in 1963, with Jomo Kenyatta, the leader of the Mau Mau Movement emerging as president. After independence, Kenya evolved as a de factor one party state, with the situation institutionalized in in 1982, when the country's constitution was amended. The situation was reversed in 1991, with annulment of the one party state and the introduction of multi-party democracy. The introduction of multi-party democracy resulted in the expansion of political rights and the number of registered political parties. The democratic space of the country witnessed further opening following elections in 2002, which saw Mwai Kibaki, who was leader of a coalition of opposition parties, emerging as the third president of the country.



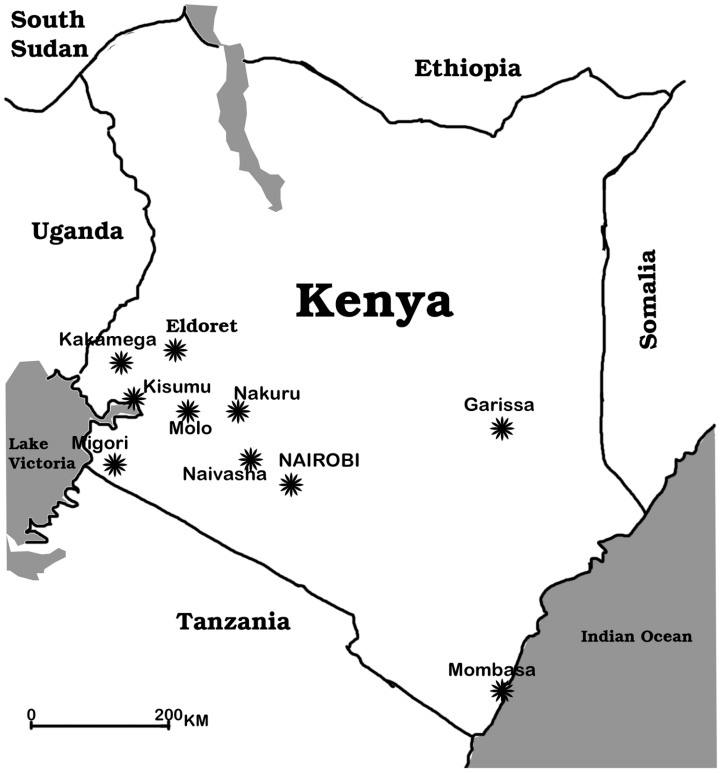
Kenya was generally viewed as a relatively peaceful, economically progressive and politically stable East African country before the 2007 election violence (Muzrui, 2008). Ethnicity and the competition for access to opportunities via the instrument of politics and political office were the principal preconditioning agents for conflict in the country. The preconditions have existed as fault lines since the colonial period following the expropriation of land from certain ethnic groups and the redistribution of the land to other ethnic groups (Onyango, 2011, p. 147). This was viewed as having resulted in lopsided economic growth and wealth among selected ethnic groups and a general rise in ethnic sensitivities. It also contributed to enhancing mistrust between the different ethnic groups, and also between the groups and the government. The situation was exacerbated following independence, as political office holding evolved as a means to facilitate access to resources and opportunities for the various ethnic groups. The Luo and the Kikuyu, who were aligned to the ruling KANU party at independence were, believed to have been favored in access in contrast to other ethnic groups. Thus, when the country's first president Kenyatta died and Arap Moi came to power in 1978, he found the government, military, police and intelligence along with most of the available fertile land, and private sector activities open to Africans were dominated and controlled by the Kikuyu. He acted by initiating reform aimed at changing the situation in favor of members of his tribe and allies. The actions contributed in furthering mistrust between the different tribal groups and, to a large extent, accounts for the worst urban conflict witnessed in Kenya, following the December 2007 elections.

Analysis of Kenyan Conflict Data

The SCAD data base reports a total 593 incidence of conflict that led to violence in Kenya. Out of the number, 433 or 81.3% is associated with civil conflicts that resulted in violence. The five topmost issues that accounted for conflicts are elections (12.5%), human rights and democracy (11.1%), Economy and jobs (7.5%), and religious discrimination and issue (4.9%), and ethnic issues and discrimination (3.9%). In terms of location and, discounting conflicts with lack of clarity in location, the data shows a total of 234 (39.5.1% total) incidences occurring in urban areas, compared to 202 (34.5%) incidences in rural areas. Figures 3 and 4 shows chart and map location of cities with the highest incidence of conflict. The data suggests that conflict is principally centered on and around the capital city. Another interesting aspect is the high incidence of conflict evident in other secondary large cities including Mombasa, Garissa and Kisumu.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Chart showing cities with the highest incidence of conflict in Kenya



Case of the Post 2007 Kenyan Election Conflict

Kenya witnessed its most violent conflict following general election held on the 27th of December 2007. The election saw an incumbent Mwai Kibaki and his Party of National Unity (PNU) running against Raila Odinga, the candidate of the Orange Democratic Movement (ODM). After an election and counting process that was viewed as flawed, Kibaki was declared the winner and hastily sworn in, amidst rumors of rigging and malpractice. Almost immediately, violence erupted across the country as ODM-affiliated communities targeted ethnic groups thought to have supported Kibaki, and the latter responded with retributive attacks. Over the next two months, the violence escalated into spirals of revenge attacks. The outcome included more than a thousand people dead and over 350,000 displaced, destruction of property and general disruption of social and economic life. By the time the violence ended, over 1133 lives were lost; 3561 people were injured, and about 600,000 Kenyans became Internally Displaced Persons (IDP). The violence also caused significant political and socio-economic losses, with over a billion US dollars or 3.25% of GDP and 400,000 jobs lost (Okumu, 2009).

The violence stopped when a group of eminent persons lead by the former United Nations Secretary General, Kofi Anan, intervened and brokered a reconciliation agreement between the candidates. The agreement provided for the formation of a grand alliance between the warring parties, changes to the structure of government, Synchronization of the manifesto of the two parties and the implementation of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Map of Kenya showing location of cities with the highest incidence of conflict

a reconciliation and building program that would cover the whole country. A National Accord Implementation committee was established to facilitate the synchronization and implementation of programs. In parallel to this, three additional bodies were formed to aid the reconciliation process; The Truth Justice and Reconciliation Commission, The Commission of Enquiry on Post-Election Violence, and Independent Review Committee on the 2007 Elections. Through these bodies truth, reconciliation and healing was to be brought to Kenya and its people. The parties also agreed on a process and roadmap for comprehensive constitutional reform, which will strengthen the institutions of Governance and address the long term differences that contributed to the violence.

Population Growth, Governance and Conflict in Kenya

Kenya has a population that is growing and is set to continue growing. Its population was estimated 20 million in 1990, 44.3 million by 2015, and is projected to increase to 60 million and 81.3 million by 2030 and 2050 respectively. Population trend points to a significant increase and to impending challenges in terms of expanding services and opportunities to cope with the demands of growth. The country's demographic distribution is also bottom heavy, with 41% of the population below the age of 15 years, pointing to the future continuity of expansion and associated challenges. The low urbanization level of the country currently estimated at 25% is indicative of potential for future urbanization with implications for both management and services provisions. The country's urban system has a total of 30 cities with a population of a 100,000 or more, with three of these having a population of more than half a million.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Most of Kenya's cities are in the 100,000 to 200,000 range pointing to prospective future urbanization and demand on the governance system.

Governance in Kenya, as earlier pointed out, is principally characterized by the politicization of ethnicity and its use as an instrument to acquire state power as a means to material accumulation (Lynch, 2006, p. 49; Oyugi, 2000, p. 13). Lynch (2006, p. 49) has observed that economic prosperity and development has evolved being understood by local-level actors as being directly linked to having members of one ethnic group in power, which in turn enable material benefit "in the form of employment opportunities, access to land, loans and localized development projects". Lynch (2006) goes on to point out that negotiation and renegotiation of ethnicity in Kenya has ultimately become linked to how political representation and redistribution works in the country. The situation has also engendered a discourse of belonging and exclusion based on "an understanding of ethnic others as 'immigrants' and 'guests'" (Jenkins, 2012, p. 576). This situation has also created the conditions for conflict, as bottom up processes of identification and violence interact with incitement from above in the quest for the political use of identity" (Jenkins, 2012, p. 576). The process has led to the evolution of elections as being as much about who would get power and control of state resources as it was about how to exclude other ethnicities from the control of state resources. Oyugi (2002, p. 13) also points out that the use of state power as an instrument of acquisition has meant that those who benefited over the years from access have used every trick available, including mobilizing ethnic support to sustain such power. Politicization of ethnicity has, therefore, evolved as the "single most intractable problem in Kenya (Onyugi, 2002, p. 3)" and has been associated with promoting a feeling of inequality, lack of access to opportunities by different groups, and fueling conflict and violence. This apparent inequality is also reflected in statistics about Kenya, which shows a relatively high social inequality, with an average Rich 10% to Poor 10% of the population income ratio of 13.6, and A 2003 GINI index of 58.5 in 1995.

The politicization of ethnicity and ethnic polarization in politics has also resulted in poor economic management and decline, as public policy becomes directed at parochial benefits rather than for social development of society. Thus by 1980, decades of policies to advance ethnic interest had significantly impacted the economy in a negative way, leading to the introduction of structural adjustment policies. This led to drastic increase in poverty by the 1990s with conflict implications, as social exclusion and marginalization widened and discontent spread over the country (Bujra, 2005).

In summary, examination of the state of conflict in Kenya from a population growth and governance perspective reveals a country that is growing fast and gradually urbanizing, but with a government that is characterized by ethnic polarization and interest, rather than focus on national development and interest. Access and opportunities are driven by kinship affiliations rather than by benevolent governance that takes care of the needs of all social groups in an equitable manner. This has engendered divisions that have evolved as the main driving force in urban social conflicts.

Urban Conflict in Nigeria

Nigeria is located in the West Coast of Africa, bordering the Atlantic Ocean and sharing borders with Benin Republic, Niger, Chad and Cameroun. The History of Nigeria started in 1914 with the Amalgamation of Northern and Southern Nigeria into one country by the British colonial administration. The country became independent 1960 with a political structure that had it organized into regions. This structure has transformed over time into a federal one with a powerful central government and 36 semi-independent states. Nigeria is multi-ethnic, with more than 250 ethnic groups as well as multi- religious. The Hausa,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Yoruba and Ibo are the largest groups located in the Northern, Western and Southern part of Nigeria respectively. The dominant religions are Islam and Christianity, even though both are characterized by a multitude of sects with different ideological leanings. Nigeria's population is currently estimated at 181.8 with a GDP of 515B US$. it is Africa's most populous country and the world's fifth largest oil producer

The preconditions for conflict in Nigeria arise from its population distribution and group value orientations with implication for access to opportunities, resource control and value conflicts. Hostilities became a feature of independent Nigeria because of an imbalance in regional population distribution. More than half the nation's population are in the Northern region, with implication in terms of access to political power. This has been a source of friction and was the reason for a rebellion and civil war in 1966. The reconciliation that took place after the civil war led to political stability and the emergence of the country as one of the wealthiest in Africa due to its petroleum reserves. The period also saw the dissolution of political organization based on regions centered on ethnic groups to a federal arrangement with states and a strong federal government. Additional states have been created over time to satisfy the yearnings of ethnic groups but this has always resulted in the demands for more.

Analysis of Nigerian Conflict Data

The SCAD data base reports a total 1492 incidences of conflict that led to violence in Nigeria. Out of this, 1034 or 69.3% is associated with civil conflicts that result in violence. The five topmost issues accounting for violence are domestic war, violence and terrorism (associated mostly with Boko Haram) (15.4%), Religious discrimination and issues (13.6%), Economy and jobs (11.3%), Human rights and democracy (8.77%) and Elections (7.2%). In terms of location of conflict, and discounting non –location specific data, analysis shows a total of 790 (52.9%) incidences in urban areas, compared to 322 (21.6%) incidences in rural areas. Figures 5 and 6 shows chart and map of location of cities with the highest incidence of conflict. The graph shows that the capital city has the highest incidence of conflict. It is also probable that if location unspecific incidences were distributed to particular locations, then the incidence in the capital city will likely increase, suggesting that conflict is principally centered on it. The graph also indicates a strong urban bias in the distribution of conflicts with the largest cities having the highest occurrence; thus cities like Kano and Lagos which are the largest cities in Nigerian have the highest count of conflict incidence.

Case of the Jos, Plateau State Conflict

Jos town in Plateau State and the areas around it is at the center of one of the most protracted conflicts in Nigeria. The Area was originally populated by indigenous groups including the Afizare, Anaguta and Berom. As a city, Jos was established during colonial period for tin mining activities. It attracted migrants from all over Nigeria to work in the mines and with the colonial administration (Krause, 2011, p. 10). The original layout saw Jos divided into three parts; a Government Residential Area for colonial administrators, a Native Township mainly for the Hausa from the North, and a Township for people from southern Nigeria. Since the establishment of Jos, there has been a long standing competition over land and political control between indigenous groups and the Hausa/Fulani community, who insists that they settled on virgin land that was not owned. In 1991, administrative restructuring led to Jos being divided into 3 local governments (Jos North, South and East). This action exacerbated the contentious issue of issue of land ownership, as the indigenous population alleged that the move was designed to enable the

Hausa Fulani take control over Jos North Local Government. An attempt to appoint a Hausa Fulani as administrator of the Jos North local government was resisted by the indigenous population. Protest by rival groups resulted in death of four people in April 1994. On September 7, 2001, another conflict was triggered by an allegation that a Christian woman pushed her way through a Muslim congregational prayer. By September 12th, the event had turned into a full fledge confrontation between Christians and Muslims that spread all over the city and claimed many lives. On November 29th 2008, another conflict started and turned violent following local government elections. The conflicts and associated violent confrontations has continued at a low level of intensity to the present moment in 2015, with occasional outburst resulting in death and destruction. Over the period of the conflict from 2001 to the present, between 4000 and 7000 people are estimated to have been killed. More than 220000 people have been internally displaced. Properties have been destroyed on a massive scale and all sides have suffered a considerable loss of means of livelihood. Violence has also reshaped the city as neighborhoods have become religiously segregated thereby altering the pattern of residency, business, transportation and trade (Krause, 2011, p. 9). This has served to increase poverty as spheres of activity become limited.

Population Growth, Governance and Conflict in Nigeria

Nigeria, the largest of the three examined, has a population of 84.9 million in 1990, which increased to 181.8 million (214%) by 2015 (PRB, 2015). The country's population is projected to increase to 261.7 and 396.5 million by 2030 and 2050 respectively. By 2050, Nigeria is anticipated to be the third largest country in the world after India and China. The country's demographic distribution is bottom heavy with 44% of the population below the age of 15 years. The country's urbanization level is at 67%, with an urban growth rate of 1.9%, the fastest of the three countries examined. The country has a total of 74 cities in its urban system with population above a 100,000. Twelve of these cities have a population of a million or more with Lagos, the commercial capital, having a population of 13million. About 13 cities have a population between half a million and one million with the remaining 52 cities having a population of 100,000 to half a million.

Governance in Nigeria has been shaped by its population distribution and multi-ethnic and multi-religious character. The diversity of ethnic groups and the distribution of population with a predominantly Muslim north, a predominantly Christian east and a mix Muslim- Christian west has elevated religion to an issue of social contention and conflict. Religion, both as an identity and as a value system, has evolved as the focus of rivalry between constituent parts of the country (Best & Rakodi, 2011, p. 11). Rivalry across religious and social identity lines is exacerbated by a population distribution that has the Muslim north having advantages in terms of access to political power because of its size. This dominance of the north generates fears of religious domination and contributes to generating conflict with ethnic "others" (Krause, 2011, pp. 9-10). The fear of domination appears to push both politicians and religious leaders to urge their followers to vote along religious lines in elections, further entrenching divisions. This rivalry, with its focus on access to resources and supremacy of identity or values (Krause, 2011, p. 10; Best & Rakodi, 2011, p. 11), is manifested in reality in competition for federal power and resources, in inequality in access to opportunities and in difference of views about legal regimes in the country (Best & Rakodi, 2011, p. 1). The political situation in Nigeria pushes Idowu (1999) to conclude that it suffers from a lack of democracy due to the structure of its federal system, which encourages ethnic loyalties and fails to develop a national consciousness. The failure of the state to also manage diversity and prevent violence has contributed in a large measure to the geography of violent clashes that are witnessed

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the country and their increase in frequency. Even where government organs are able to act, research reports suggest that intervention is usually characterized by ineptitude and partiality that contributes to undermining popular confidence in state institutions. The ineptitude of state institutions also translates into an inability to hold sponsors and perpetrators of conflict to account, contributing to increasing distrust about commitment to justice in governance (Best & Rakodi, 2011, p. 78).

Nigeria has not fared better that the other countries reviewed above in the management of its economic development. Following the oil crisis of 1973 and increase in the price of oil, Nigeria became a very wealthy country with per capital income jumping to over a $1000 dollars per year. Poor economic management led to a waste of the resources without the critical investment needed in vital infrastructure. By the 1980s when the price of oil slumped, Nigeria entered into an economic crisis and had to implement a Structural Adjustment Program at the prompting of the World Bank. Within a short period of implementation, the country witnessed a drop in average income by more than 75%, rapidly growing indebtedness, a general lack of industrialization, and growing poverty. This was unfortunately happening at a time when population was growing rapidly and the national physical and social infrastructure was collapsing and unemployment increasing. Parallel with this development was the growing issue of corruption in governance that has seen public funds diverted to private use rather than for social development, and recently by a religious insurgency that has devastated the North Eastern part of the country. Among the current economic problems that the country is facing include reduced investment, over dependence on oil as source of income, collapse of the agricultural sector, increasing reliance on imported goods, rising rural urban migration, increasing urban unemployment, a shrinking state sector, inflation, and increasing poverty. The impacts of the problems are not uniform across the country's social fabric in view of pronounced and increasing inequality. This inequality is evident in statistical reports which indicate a ratio of the wealth of the richest 10% to the poorest 10% at 17.8 times and a GINI index of 48.

The examination of state of conflict in Nigeria from a population and governance perspective show a rapidly growing and urbanizing country with diverse constituent social groups and a governance system that has not been able to socially manage society in a way that addresses sources of conflict, or manage the national economy in a way that expands opportunities and guarantees access to all social groups for harmonious existence. The governance systems also shows a lack of will to manage conflict and hold people accountrable for their actions. The situation has resulted in high youth unemployment and expanding poverty, both preconditions of conflict and triggers of violence.

Comparative Analysis of Conflict in the Three Countries

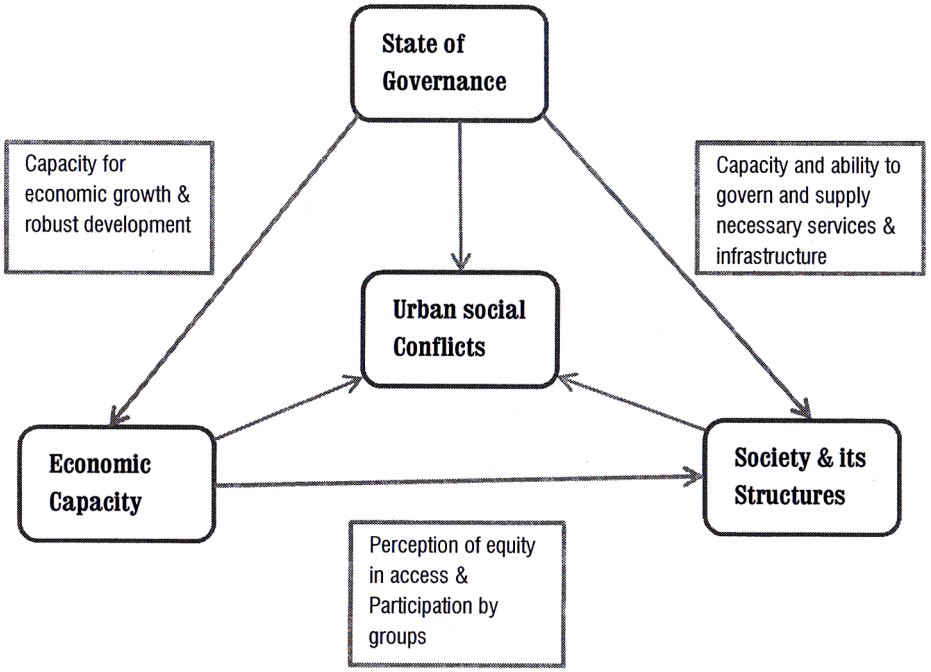
The examination of conflict in the three countries from the SCAD database suggest that they each have a significant incidence count that appears related to their population size. Nigeria with a 2013 population size of 173.6 million has a violent incidence count of 1034, While Kenya with a population of 44.3 has a total of 433 incidences, and Algeria with a population of 39.2 has a total incidence count of 305. A simple regression analysis of country population as predictor of conflict incidence returned a positive result with an r^2 0f 0.98 indicating a strong correlation. This is also supported by the examination of conflict location, which across the three countries shows conflict taking place more in urban areas than in rural areas, with cities having larger population generally being the location of a larger number of conflicts. An examination of the causes of conflict in the SCAD database also shows that the three countries have similar issues. A tabulation of the top five causes of conflict and their ranking leads to the identification of three prevalent issues that generate conflict; human rights and democracy, economy and jobs and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

religious discrimination. These could essentially be translated to mean a desire for political access and participation, social opportunities and respect for values and identity. Across the three countries, these issues are also important preconditioning factors in the case incident of violent conflicts examined.

An examination of trends also indicates that the three countries are witnessing a significant transformation with regards to population growth and urbanization. All the three countries have had tremendous population expansion in the period from 1990 to 2015 and are projected to further witness tremendous future population growth. Nigeria and Kenya are projected to have an increase of more than 300% between 1990 and 2030, while Algeria, with the least growth, is projected to increase by over 200%. The countries are also urbanization with Nigeria and Algeria having levels of 67% and 70% respectively, and Kenya having the least level at 25%, but with a growth rate of 1.7%.

A review of the literature and an analysis of the causes of conflicts also points to evident issues in governance in the three countries. There are indications in all the countries that the planning and management of growth and development has not been effective in anticipating needs and equitably expanding opportunities to all segments of the population. This has produced the competition by social groups across multiple-divides that accounts for most of the frictions that have translated into violent conflicts. Exclusion is sometimes complemented by security regimes that appears to target and persecute specific social groups contributing to social tensions. Corruption and economic mismanagement also feature prominently in discussions about the countries examined.



Based on the analysis of the three countries, it is possible to develop a model of the relationship of urban social conflicts to governance based on a concept of distributive justice. Figure 7 shows the model and its basic components. Social conflict is situated at the cross point of issues relating to governance, society and the economy. In governing, states manage both society and economy. They manage economies by ensuring that opportunities are being created to meet the needs of their society. They also manage society in ways that promote participation, protect rights, ensure accountability and mediate between different groups to ensure social cohesion. The management of a society also requires the promotion of equitable access to opportunities, both social and economic. Where governments are effective in anticipating needs arising from community change, and are able to manage both political and social processes and national economy in ways that supply needed development goods, expand opportunities and inclusiveness, ensure equity in access, as well as manage differences in ways that are just and equitable, then the probability of conflict will be significantly reduced. Where economic growth and opportunities are not expanding to cope with demand and the access to them is viewed as unequal, this leads to a competition among interest groups that lays the condition for conflict and violence. From the model's perspective, population growth and urbanization are not in any way generators of conflict. Rather, they lead to increase in demand for development goods and opportunities and also for effective governance. In doing so they contribute to exacerbating conflict pre-conditions.

CONCLUSION AND RECOMMENDATIONS

The chapter examined urban social conflicts in Algeria, Kenya and Nigeria with a view to understanding the dynamics of the cause and effects of conflicts and the particular role that population growth, urbanization, and the state and capacity of governance play in individual country situation. Results from the analysis of the three countries show that they all have a significant amount of social conflicts reported, with a higher proportion occurring in urban areas. Analysis also points to a strong relation-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Conceptual model of the relation of governance to social conflicts

ship between reported incidence and country population. The countries also share common causes for reported conflicts, with political access and participation, availability of social opportunities, particularly jobs, and values and identity as the major forces shaping conditions for conflict. The study also shows that the three countries have a fairly fast growing population, along with an urbanization process at different stages of development in terms of level. Evidence from the study leads to the conclusion that while population growth and urbanization contribute to exacerbating preconditions for conflict, they cannot be held accountable as causes of violent conflicts. Rather it is the manifest failure in governance to plan and meet the social aspirations of societies and ensure social equity, access and accountability that largely accounts for the conflicts witnessed. It also explains the inability of the countries to exploit opportunities from the population growth and urbanization trend for societal development. The failure of governance accounts for the reasons why elections, economy and jobs, human rights and discrimination are advanced as the main causes of urban conflicts.

From the examination of the three countries, it is apparent that any attempt at addressing general issues related to population growth and urbanization and particularly the issue of urban social conflicts in Africa and the developing world must start with efforts at improving governance. Effort must be exerted to promote good governance, and our concept of good governance must address pertinent issues including participation that must inclusive, equity in access to opportunities for social groups, protection of rights, good economic management, and establishment of public order and legal institutions that ensure accountability. It is only when such a concept of governance is promoted in the developing world would conflicts be minimized enabling societies to exploit opportunities from demographic change and advance in a more peaceful and stable way.

KEY TERMS AND DEFINITIONS

Conflict: A situation of disagreement between individuals or social groups with potential to lead to violence.

Ethnicity: Refers to the classification of people according to their tribal affiliation or identity.

Governance: Refers to structures for the management of the social affairs of people at different spatial scales including local, city, regional and national.

Religion: Systems of beliefs and values held by individuals.

Urban Area: In the context of the research refers to a place with a population of a 100,000 people or more.

Violence: Refers to a situation where conflict results in physical engagement that leads to injury or death.

This research was previously published in Population Growth and Rapid Urbanization in the Developing World edited by Umar G. Benna and Shaibu Bala Garba, pages 210-230, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

Chapter 78
Promoting Agricultural Productivity and Inclusive Growth in Uganda

William Amone
Gulu University, Uganda

University of Limpopo, South Africa

ABSTRACT

Although many countries in the world including Uganda witnessed high rates of economic growth in the last three decades, the strong growth has failed to holistically deliver the expected prosperity. Amidst Uganda's strong growth of about 7% per annum, of the recent decades, poverty, unemployment and inequality have remained pervasive especially in the rural areas; an indication that the growth process has not been pro-poor and inclusive of the deprived. Agriculture which is the sector employing majority of Uganda's poor has also not developed much; within the same period the sector grew at an average rate of 2% per annum and its productivity has remained considerably low. This chapter reviews the trending conception of inclusive economic growth, and its relevance to Uganda's development process. In its final section, the chapter assesses the factors that affect agricultural productivity and it discusses the most effective means of raising productivity in order to make the growth process of the country more broad-base, pro-poor and inclusive.

INTRODUCTION

Many countries in the world have achieved high rates of economic growth for nearly three decades since 1990, with a few witnessing slowdown in growth following the global financial crisis that began around 2008. As observed by the World Bank (2013), although it is believed that economic growth should generate virtuous circles of prosperity and opportunities, strong growth of the last three decades in many developing countries have not translated into the expected development outcomes.

The World Bank (2014) estimated that about 2.4 billion people lived on less than US $2 a day in 2014, and that even after 2015 more than 1 billion people will still live in extreme poverty. Worldwide, more than 200 million people are believed to be unemployed (ILO, 2014). OECD (2012) explains that in most countries, the growth of recent decades has been accompanied by widening inequality. Economic growth in the recent decades did not benefit all groups equally. Similarly, Oxfam (2014) estimates that the richest 85 people in the world own the same amount of wealth as the bottom half of the world's population (3.5 billion people). The record levels of growth seem to have failed to tackle three key global problems of poverty, unemployment, and inequality.

Rising living standards, not economic growth per se, is what societies expect their leaders to deliver. In many developing economies, fairly sustained strong growth has lifted many people out of absolute poverty but improvements in living standards have not kept pace with GDP growth. This experience is most apparent in Eastern Europe and fast-growing emerging Asian economies such as China, India, and Vietnam, and some African economies including Uganda, Zambia and Kenya. Worse still, some countries, including Chile and Mexico have witnessed widening inequality amidst stellar growth (World Economic Forum, 2015).

Literature shows that economic growth is often unequivocally tied to a correlating improvement in employment levels (Felipe & Hasan, 2006). However, over the recent three decades increases in growth have not resulted into expected comparable increases in the numbers of jobs. Felipe & Hasan (2006) estimated that in the 1980s it took 3% GDP growth to generate a 1% increase in employment, but in the 1990s this changed significantly and it then took an 8% percent increase in GDP to get the same result.

The International Labour Organization (ILO) estimates that over 1 billion people are employed in world agriculture, representing 1 in 3 of all workers (ILO, 2015). Agriculture is a significant source of food for citizens and a means of livelihood for the most vulnerable members in most developing countries. According to the World Bank (2014), about 70% of the world's poor live in rural areas, and agriculture is their main source of income and employment. In Africa, agriculture employs about 65% of the labor force and accounts for 32% of gross domestic product. Improvement in agriculture and its productivity is thus fundamental to achieving food security, poverty alleviation and overall sustainable economic development. Raising agricultural productivity must be an important policy goal for governments and development agencies.

Considering that the large share of the working poor is engaged in agriculture, targeting this sector in development may have major impacts on welfare throughout the world. Most literature seems to agree that investments in agriculture and rural development, both private and public, stimulate economic growth and development (World Bank, 2008; IFPRI, 2012). Similarly, good agricultural performance has been very significant in reducing poverty and hunger rates in the more successful countries. The World Bank (2008) also established that agricultural productivity growth has a high poverty reduction pay-off than non-agricultural growth or investments.

For the period from 1990 to 2010, the Ugandan economy achieved high GDP growth rates; real economic growth averaged 7%. However, the record growth has not been able to benefit all sections of the population; significant proportions of the country's population including smallholder farmers still remain impoverished, unemployed or marginalized (World Bank, 2013). Uganda Bureau of Statistics (UBOS, 2015) reported that the high performance of the Ugandan economy has been accompanied by structural changes, with a steadily declining share of agriculture and increasing shares of industry and services. Uganda's high growth process has therefore not been inclusive since the larger proportion of its

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

population (those engaged in agriculture) has been bypassed by the growth process. Most farmers have missed the benefits of growth as indicated by the entrenchment of poverty, unemployment and exclusion.

Recent statistics from the government indicate that Uganda's agriculture employs about 72% of all workers but contributes only about 23% of the GDP (UBOS, 2015). The farmers are primarily rural based, and have a lower standard of living than those working in other sectors. The majority of Uganda's poorest people are smallholder farmers living in remote areas. The country's agriculture is characterized by smallholder farming with hand hoes as the major production tool. The average farm size of the smallholders is 1.2 hectares. The farmers produce various commodities mostly for subsistence.

The major food crops include maize, rice, millet, bananas, sorghum, cassava, and potatoes. The farmers also produce pulses, fruits, and vegetables. Yields are low across all these commodities. Smallholders use traditional farming techniques; they lack capital for modernization, expansion and purchase of vital inputs. They also lack access to financial services to give them the most needed capital. The biggest challenge to Uganda's farmers seems to be low productivity.

Considering that the large share of Uganda's working poor are farmers and that agriculture is the main productive base of the economy, targeting this sector for development may have major impacts on welfare, economic growth and inclusion. This chapter assesses the factors that affect agricultural productivity and proposes some methods of raising productivity, in order to make the growth process of the country more pro-poor and inclusive.

STUDY AREA

Uganda is a landlocked country astride the Equator, about 800 kilometers inland from the Indian Ocean. It lies on the northwestern shores of Lake Victoria, extending from 1 degree south to 4 degrees north latitude and 30 to 35 degrees east longitude. As shown in figure 1, the country is bordered by Tanzania and Rwanda to the south, Democratic Republic of Congo (DRC) to the west, South Sudan to the north,

Figure 1. Map of Uganda showing the major towns and the neighboring countries
(World Atlas, 2015)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and Kenya to the east. With a land surface of 241,550.7 square kilometers, Uganda occupies most of the Lake Victoria Basin. It has a total population of about 37 million people (UBOS, 2015). The country is blessed with fertile soil and ample rainfall.

Uganda's rural areas account for 85% of the population and 94.4% of the poor, while the urban areas account for 15% of the population but only 5.6% of the poor (World Bank, 2015a). Despite the progress achieved to date in some areas such as security and education, there is little cause for complacency, as most development indicators still remain deficient. A few indicators are shown in table 1.

DEFINING AGRICULTURAL PRODUCTIVITY

Fulginiti and Perrin (1998) define agricultural productivity as the output produced by a given level of input(s) in the agricultural sector of an economy. Similarly, Olayide and Heady (1982) define it as the ratio of the value of total farm outputs to the value of total inputs used in farm production.

Productivity of agriculture is measured as the ratio of final output, in appropriate units, to some measure of inputs. Singh and Dhillion (2000) suggested that "yield per unit" should be considered to indicate agricultural productivity; many scholars have criticized this suggestion pointing out that it considered only land as a factor of production, disregarding other factors. Many scholars believe that agricultural productivity should contain all the factors of production such as labor, farming experiences, fertilizers, availability and management of water and other biological factors (Dharmasiri, 2009; Zepeda, 2001).

Measures of productivity are categorized as partial or total measures depending on the number of inputs considered as discussed below.

1. **Partial Measures of Productivity:** are the amounts of output per unit of a particular input. Commonly used partial measures are yield (output per unit of land) and labour productivity (output per economically active person or per agricultural person-hour). Yield is commonly used to assess the success of new production practices or technology. Labour productivity can also be used to indicate rural welfare or living standards since it reflects the ability to acquire income through sale of agricultural goods.

As emphasized by Dharmasiri (2009), productivity of land is very important because land is the most permanent and fixed factor among the three inputs of land, labour and capital. Land productivity may be raised by applying input packages consisting of improved seeds, fertilizers, agro-chemicals and labour intensive methods, or by applying crop diversification in a season on the same land.

Table 1. Basic information on Uganda

Total population	37 million (2015)
Gross Domestic Product (current US$)	$26.3 (2015)
GNI per capita (atlas method)	$660 (2014)
Agricultural households' population	4.2 million households
Percentage of workers employed in agriculture	72%
Agriculture contribution to total GDP	23.2 (2014)

(UBOS, 2014; UBOS, 2015; World Bank, 2015a)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Productivity of labour is a vital determinant of the income of the population engaged in agriculture. Labour productivity has two important aspects: i) it profoundly affects national prosperity; ii) it principally determines the standard of living of the famers. Agricultural labor productivity may be enhanced through training and increase of incentives or wages. Capital in terms of land purchase or development, drainage, irrigation equipment, livestock, feeds, seeds, agricultural implements and machineries, crop production chemicals should also be given priority as a factor for enhancing agricultural productivity.

Generally, the quality of the three major inputs: land, labour and capital is still very poor in Uganda, and they are not optimally utilized. As a result, both yields and labor productivity are very low. Although the partial measures are used to assess agricultural-production performance, often because they are easy to estimate, the measures normally show higher rates of growth than Total Factor Productivity (TFP).

Output is measured as a function of the conventional inputs (production factors): capital, labour, land and raw materials that are under the control of the farmers and for which markets exist. This is because growth in land and labor productivity may result from more intensive use of inputs including fertilizer and machinery rather than TFP increase. Using the partial measures can be misleading as they ignore the role of other inputs in any observed output changes. Due to this shortcoming, a total measure was developed.

2. **Total Measures of Productivity:** TFP is the ratio of total output (crop and livestock products) to total production inputs (land, labor, capital, and materials). It is the ratio of output value to the value of inputs (IFPRI, 2013). An increase in TFP implies that more output is being produced from a constant amount of resources used in the production process.

According to Zepeda (2001), TFP is also defined as the ratio of an index of agricultural output to an index of agricultural inputs. The index of agricultural output is a value-weighted sum of all agricultural production components. The index of agricultural inputs is the value-weighted sum of conventional agricultural inputs; including land, labour, physical capital, livestock, chemical fertilizers and pesticides. TFP measures are often preferred because they are generic.

As observed by the World Bank (2015b), improving agricultural productivity will play a key role in achieving food security and reducing poverty in Uganda. Achieving high agricultural productivity requires investment in education especially of women, improvement of rural infrastructure including roads, water sources, communication and markets. These must also be complemented by private investment in inputs such as fertilizers, farm machines, and vehicles.

The Inclusive Growth Concept

A key policy challenge preoccupying leaders around the world is expanding social participation and benefits of economic growth. Correspondingly emphasized in the Inclusive Growth and Development Report 2015 (WEF, 2015), major international organizations including the World Bank, IMF, WTO, WHO and OECD are calling upon policy makers to design appropriate policies to strengthen growth and make it more inclusive and sustainable over time based on the perception that strong growth is clearly compatible with social cohesion.

According to DFID (2012), inclusive and sustainable economic growth is crucial for long-term poverty reduction. Inclusive growth should be characterized by people's ability to participate in, benefit from, and create wealth and jobs from growth. Literature on inclusive growth unanimously concludes that for

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

growth to be inclusive equity must be a component of growth and at the same time growth must be pro poor (OECD, 2012; Anand, Mishra & Peiris, 2013; CAFOD, 2014).

The World Economic Forum (WEF) defines inclusive growth as output growth that is sustained over decades, is broad-based across economic sectors, creates productive employment opportunities for a great majority of the country's working age population, and reduces poverty. They reiterate that inclusive growth is about both the pace and pattern of economic growth (WEF, 2015).

Ianchovichina and Lundstrom (2009) stated that that: (i) for growth to be sustained in the long run, it should be *broad-based* across sectors. Issues of structural transformation for economic diversification therefore take a center stage; (ii) it should also be *inclusive* of the large part of the country's labor force, where inclusiveness refers to equality of opportunities in terms of access to markets, resources and unbiased regulatory environment for businesses and individuals. Given the widespread poverty and unemployment in Uganda, leaders and policy makers need to focus on redistributing the benefits of growth.

After witnessing average GDP growth of about 7% for about two decades, Uganda's economic growth has dipped. Beginning 2011 to date, GDP growth has averaged 4%, a rate considerably lower than those recorded by the neighbouring countries of Kenya, Tanzania, and Rwanda (World Bank, 2015b). Uganda's stellar economic growth is therefore not being sustainable in the long term. The record growth process has not been inclusive since a larger proportion of its population (especially farmers) continues to miss the benefits of growth as indicated by the entrenchment of poverty, unemployment and exclusion.

Why the Ugandan Government Should Urgently Embrace Inclusive Growth

1. **Economic Growth Sustainability:** When the poor farmers who have mostly been bypassed by growth and development get to benefit from the growth process, they will become more involved in it. Engaging the farmers will enhance their capacity to better educate their children and undertake investments that will ultimately lead to sustainability of economic growth.
2. **Poverty Reduction:** Inclusive growth is pro-poor, targeting those deprived, commonly based in rural areas. Empowering these segments of the population will significantly lead to poverty reduction. This has already been witnessed in Egypt, Burkina Faso, Ghana, and Zimbabwe (UNDP, 2013a).
3. **Equity:** Involving the disadvantaged sectors or segments of a population in productive economic activities will hopefully augment redistribution of income across the population. Achieving equity is a realistic way of fostering balanced development which can ultimately reduce rural urban migration with all its associated predicaments. Considering that Ugandan smallholder farmers are more unprivileged, targeting them in the process of development is a viable way of ensuring equity.
4. **Enhanced Employment:** By targeting the disadvantaged segments such as the underemployed smallholder farmers and empowering them, an economy is poised to reduce its unemployment level. Those empowered will further gain capacity to create own jobs/employments which can reduce the rate of crimes committed by those formerly unemployed.
5. **Food Security:** In most developing countries especially in sub-Saharan Africa, more than 65% of the populations are engaged in agriculture making the sector a home to more than 70% of the poor. In the same way, agriculture remains an important sector, employing about 72% of all workers in Uganda (World Bank, 2014). Targeting agriculture and enhancing its productivity will ensure food security for the whole nation.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

6. **Resource Utilization:** Just like many other developing countries, Uganda has a number of unutilized natural resources. By economically empowering the poor segment of the country's population, the government will eventually see a number of natural resources exploited. This will probably lead to improved people's income and welfare, and broaden the tax base or revenue of the country.

Literature indicates that growth is always more effective in reducing poverty in countries with low income inequality than in countries with high income inequality (UNDP, 2013b). When growth is inclusive people are more augmented to participate in, benefit from, and create wealth and jobs from the growth. Inclusive growth is inextricably linked with the contemporary definition of economic development. Therefore, to achieve economic development, developing countries should unanimously promote inclusive growth. In the case of Uganda this may be achieved through increasing agricultural productivity of the smallholder famers who are more disadvantaged. As reported by UBOS (2014), production by smallholders constitutes over 75% of both food crop and cash crop aggregates.

Major Constraints to Agricultural Productivity in Uganda

Despite several attempts to raise agricultural productivity in Uganda, success has been significantly low. The modest increases in productivity since 1990 are attributed to expansion of cultivated land rather than improvement in productivity per unit area of land (World Bank, 2008). Nabbumba and Bahiigwa (2003) observed that expansion of cultivated land is becoming unsustainable since access to land is increasingly constrained by the high population growth.

Growth of agricultural productivity in Uganda is constrained by several factors. In this chapter, the key factors were identified based growth accounting exercise. Based on the work of Barro (1998), growth accounting can be defined as a technique for explaining the factors that determine growth; it breaks down economic growth into components associated with changes in factor inputs and Solow residual. It provides an understanding on the sources of growth hinging on the Cobb-Douglas production function. Other determinants of productivity were ascertained by disaggregating the key variables captured in the main growth accounting equation (equation 1).

$$G_t^Y = G_t^A + \alpha G_t^K + (1-\alpha) G_t^L \tag{1}$$

Equation (1) implies that the growth rate of output equals the growth rate of the technology term, plus a weighted average of capital growth and labour growth; where the weight is determined by the parameter $\boldsymbol{\alpha}$**.** The equation provides estimates of how much agricultural productivity growth over a certain period comes from growth in the number of workers, how much comes from growth in the stock of capital and how much comes from improvements in TFP. The major factors identified in this chapter are discussed below.

- **Capital:** Since most smallholder farmers are poor, lack of capital prevents them from acquiring modern equipments, using hybrid seeds, or expansion of their farms. The farmers often fail to cultivate in time, cannot afford to buy fertilizers and cannot spray their crops or treat their livestock in case of diseases. In most cases, the farmers are forced to use family labour. They plough small areas and spend a lot of time doing worthless work.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Pests and Diseases:** Pests and diseases are serious problems to nearly all farmers in Uganda, causing yield losses of up to 50% sometimes. Maize, beans, bananas, simsim, cassava, millet and coffee are extremely susceptible to diseases and pests. The possibility of chemical control of pests and diseases by smallholder farmers is limited by finances and availability of quality pesticides. Most farmers resort to resistant varieties which are generally low yielding.
- **Farming Skills/Knowledge:** Over 70% of the Uganda's smallholders have never received formal training in farming or agriculture; most farmers lack the required technical skills in agriculture.
- **Land Problems:** Uganda's rapid population increase and the analogous increase in the number of agricultural households have increased land pressure. Average agricultural household land holding is as low as 2.4 hectares (6 acres). However, in the northern part of the country some households own more than 4 hectares of land, while their counterparts in the central and western Uganda own less than 1.6 hectares. Land limitation forces farmers to undertake small scale farming activities, and the repeated use of a farmland depletes its fertility making the land less productive. Since most smallholder farmers lack the technical farming skills, they do not know how to replenish soil nutrients. Recent economic update by the World Bank (2015b) shows that most land in Uganda is not registered; less than 20% of Uganda's arable and pastoral land is registered (having land titles), with over 90% of rural land being undocumented.
- **Variable Climate and Weather; Drought, Flood and Wind:** Due to reliance on natural climatic factors, Ugandan farmers have become more vulnerable to the impacts of climatic change. Further still, poverty cannot allow the farmers to undertake irrigation. Extreme weather events including drought, flood and wind are expected to severely affect farmers further due to climate change. Less than 2% of the farmers apply irrigation. Most farmers in the country have also failed to control flood and extreme wind, except in western Uganda where some farmers practice terracing.
- **Labour Problems:** Availability and the quality of labour are serious constraints to farm productivity in Uganda. The high cost of labour or their limited availability makes planting, weeding, and harvesting often a serious problem. Shortages of labour causes delay in planting, weeding or harvesting; bad timing in any of these activities leads to major losses to the farmers.
- **Limited Application of Modern Inputs:** The key intermediate inputs include fertilizers, pesticides, energy, feeds, seeds and parent/breeding livestock. The application of modern intermediate inputs is not widespread in Uganda and most smallholders do not use them. Due to limited knowledge, poverty and conventionality, most farmers grow their crops or keep their livestock without using modern inputs. Although some farmers lack the money to buy them, others believe that they can do without the inputs perhaps because their land is still fertile or because they prefer to practice organic farming.
- **Poor Infrastructure:** Uganda has the poorest infrastructure in the region; most roads are basic and they are hardly maintained. There are almost no functional irrigation facilities. The poor state of infrastructure has had long-term detrimental effects on productivity growth. Policy makers need to reconsider their budget priorities in order to mitigate the deleterious impact of budget cuts on future growth. Under funding of agriculture is now a big problem (UBOS, 2014).
- **Lack of Government Support in the Form of Subsidies, Loans and Extensions:** Over the last twenty years, the agricultural sector has been receiving less than 5% of Uganda government budget allocations. Based on Annual National Budgets (MFPED, 2015), the government allocates

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

more money to security (army), education, health and transport sectors. Under financing of the agricultural sector implies support to the smallholder farmers in form of subsidies, loans or extensions/trainings are limited.

Although the government has put in place the National Agricultural Advisory Program (NAADS) to support farmers, only about 11% of the farmers received support. The supports given are often too small to improve the living standard of the farmers. Supports extended included seeds, animals (goats and cows), fertilizers and specialized trainings. In most cases supports are given to farming groups.

- **Fluctuation in Prices:** Uganda experiences fluctuating food prices; prices increase during and after the long dry spell (between December and June) and are low during the rainy seasons. The main reason for this fluctuation is the reliance on natural factors. Immediately after harvest periods, prices for most food stuff are extremely low due to very high supply, and the prices will rise in times of scarcity. However, even during scarcity the smallholder farmers do not gain much from soaring prices since they do not store their products to sell later at higher prices.
- **Political Instability and Conflicts:** Uganda has witnessed several episodes of war over time that caused various atrocities and seriously ravaged the country. In the last fifteen years however, most parts of the country were peaceful. To some extent, the various episodes of wars and conflicts have destroyed or lessened the infrastructure and other systems needed for the development of agriculture, thereby limiting agricultural productivity.
- **Post-Harvest Losses:** According to Alliance for a Green Revolution in Africa (AGRA, 2013), crop post-harvest losses in Uganda have been estimated at 5-15% for cereals and legumes, 20-25% for root and tubers and over 35% for fruits and vegetables. These losses are mostly attributed to poor storage conditions, damp floors, inadequate sunshine and high humidity. Ugandan farmers' need additional training to enable them mitigate continuous post-harvest losses.

Ways of Improving Agricultural Productivity

For national development strategies to be successful, food security must be part of the national agenda, and the promotion of rural development should be a key component of such strategies. Achieving rural development requires sustainable strengthening of agricultural productivity and competitiveness (World Bank, 2008). Based on these views, for growth to be effective in reducing poverty, unemployment and income inequality, the poor must contribute to deliver growth and they must also benefit from the process. Enhancing agricultural productivity must be a prime target in any policy design for sustainable growth and development in any poor agriculture based country. The subsequent section presents the possible ways of raising agricultural productivity in Uganda:

- **Resource Support for Farmers:** Agricultural growth depends on whether Uganda's scarce resources, including farm land, labour, irrigation water, farm equipments and other capital, can move freely between farms to higher value uses. Efficient resource reallocation through structural adjustment or otherwise is an important productivity driver at industry level. As previously indicated, a major constraint limiting agricultural productivity is lack of capital for acquiring modern

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

equipments, buying hybrid seeds, or expanding the enterprise. Unfortunately, the unrelenting underfunding of the agricultural sector implies that the little public support extended to the farmers cannot adequately foster improvement in their livelihood. In case of natural hazards, assistance programs such as drought/flood assistance may also be introduced to provide farming incentives and to act as a safety-net to the victims.

- **Access to Assets:** There is need to improve access by the smallholders to various assets and also to involve them in decision making processes, especially on issues that influence their own lives. The government should provide low interest loans to farmers with minimum requirements since most smallholders do not have the required collaterals. Given that most farm land is not registered, the government should subsidize land registration and ensure faster processes of formal land documentation. Government should also invest in expensive farm equipment including tractors and avail them for hire at more affordable cost at every sub-county. These would enable timely land opening and will foster cheaper farm expansion by the smallholders.
- **Invest in Research, Development and Extension System:** Investing in rural R&D is critical to increasing productivity, sustainability and resilience of rural farm activities. Public investment in R &D, and effective and timely extension activities will foster adoption of such innovations on the latest technologies by farmers. Investments by the Ugandan governments in rural R&D and extension have not had a significant effect on agricultural productivity. Most rural farmers are not informed about new research findings from the National Agricultural Research Organization (NARO) because little extension services actually reach them. Since most farmers have had low level of education and less than 30% received formal training in agriculture, rural R&D and extension are significant in promoting productivity. Several studies which examined the return to public investments in R&D and extension in agriculture have shown high rates of return (Mullen, 2007; World Bank, 2008).

Although both domestic and international R&D findings should be used, domestic findings lead to more tailored and better suited policies to the local conditions. R &D should particularly focus on high yielding varieties, and pests and disease control. Generally, future agricultural productivity growth will depend on the capacity of rural RD&E systems to holistically supply innovations to a diverse section of rural Uganda.

- **Rigorous Use of Modern Inputs Including Hybrid Seeds, Fertilizers, Pesticides and Feeds:** Several scholars have recognized intermediate inputs as the major embodiment of modern scientific farming (Donovan, 2012). As outlined previously, smallholder farmers in Uganda still underutilize modern inputs despite their positive correlation with productivity. Addressing the low use of modern inputs may require an integrated approach. The government should subsidize inputs so as to make them more affordable to the farmers. Subsidies can help to overcome temporary market failures, reduce risks and offset fixed costs. Furthermore, the inputs should be made available in the rural areas and their benefits should be well communicated to the farmers.
- **Rural Infrastructural Development:** The magnitude of smallholder supply response to trade and price changes depends on, among other factors, rural infrastructure (irrigation, roads, transport, power, and telecommunications), markets, rural finance, and research. Rural infrastructure is

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

still very poor in Uganda. The significance of rural infrastructure and their unrelenting deficiency implies government must invest in them in order to reduce the cost of doing business and to take advantage of trade reforms.

Private sector competitiveness may be significantly constrained by infrastructure deficiencies such as unreliable electricity and inadequate rail or road networks. The Ugandan government has recognized this and it has increased public investment to finance infrastructure projects in energy and roads in the budget allocations of 2015/16 with the aim of reducing the cost of doing business (MFPED, 2015). Nevertheless, there is need to monitor the implementation of the projects. The government should open and maintain rural roads, install irrigation facilities, extend electricity, and improve communication services.

CONCLUSION AND RECOMMENDATIONS

Although the Ugandan government expects that economic growth should generate virtuous circles of prosperity and opportunities, strong growth of the recent decades has not translated into the expected development outcomes. As indicated in several reports (World Bank, 2011; World Bank, 2015a; MFPED, 2015), the distress of poverty, unemployment and inequality continue to acutely affect people, especially the rural farmers. Uganda's growth process has thus not been pro-poor and inclusive since the living standards of most farmers have not improved.

The biggest challenge of Uganda's agriculture seems to be low productivity (IFPRI, 2008; Nabbumba & Bahiigwa, 2003). The country's agricultural productivity is constrained by lack of capital, pests and diseases, and limited farming skills. Land limitation, bad climate and weather, and limited use of modern inputs also limit productivity. Other factors that constraint productivity include poor rural infrastructure, poor government support to farmers, price fluctuation, and post-harvest losses.

Augmenting agricultural productivity will require increasing resource support for farmers; increasing access to various assets; and investing in research, development and extension system. The government should also foster rigorous use of modern inputs including hybrid seeds, fertilizers, pesticides and feeds; and it should develop rural infrastructure. Further researches should consider careful decomposition of Uganda's economic growth (growth accounting) and also ascertain the country's binding constraints to inclusive growth in order to foster formulation of well-tailored policies that coherently offer generic solutions to poverty, unemployment, and inequality problems.

KEY TERMS AND DEFINITIONS

Agricultural Productivity: The ratio of the value of total farm outputs to the value of total inputs used in farm production. It is the output produced by a given level of input(s) in the agricultural sector of an economy.

Economic Development: The process of improving the quality of all human lives and capabilities by raising people's standards of living, self esteem and freedom.

Economic Growth: The continuous improvement in the capacity to satisfy the demand for goods and services, resulting from increased production scale, and improved productivity (innovations in products and processes). It is measured using GDP.

Inclusive Growth: Output growth that is sustained over decades, is broad-based across economic sectors, creates productive employment opportunities for a great majority of the country's working age population, and reduces poverty. It involves growth in both income and equity or income distribution.

Poverty: The lack of basic needs and services such as food, clothing, beddings, shelter, healthcare, education, information and communication.

Unemployment: All the individuals who are without work/jobs: they may either be in the process of moving to new jobs or actively seeking work.

Chapter 79
Exploring the Social Impact of Foreign Direct Investment on Institutional Change: The Case of Russia

Natalya Smith
Heelstone Consulting Ltd., UK

Ekaterina Thomas
Staffordshire University, UK

ABSTRACT

Despite the vast and growing literature on the economic impact of foreign direct investment (FDI), its social significance is somewhat a neglected issue. Focusing on Russia, this chapter examines the effect of FDI and (formal) institutions (proxied, alternatively, by the [1] accumulated stock of small and medium sized firms or SMEs and [2] number of economic crimes per 100,000 population or corruption) on (informal) institutional change (proxied by the change in the number of violent and property crimes per 100,000 population). The empirical findings provide robust support for a significantly positive direct impact of SMEs, whilst observing a significantly negative effect of corruption and either significantly positive impact of FDI or insignificant effect of multinational firms in this context.

INTRODUCTION

Evidenced by the research that has addressed locational choices of multinational enterprises (MNEs), foreign direct investment (FDI) has become a popular subject in the literature. This research has recently paid some specific attention to institutions as one of the key FDI determinants. Well-functioning institutions are critical to economic performance (North, 1989; 2005): they instil trust into firms and markets, helping firms to build innovation capabilities (Busenitz, Gomez, & Spencer 2000; Licht & Siegel, 2006; Lam & Lundvall, 2007; Mathews & Hu, 2007; Smith & Thomas, 2015a).

Empirical evidence confirm that MNEs tend to invest in countries with strong institutions, or in places with (among others) lower degree of government intervention in business operations, lower level of corruption, better contract enforcement and property rights protection (Du, Lu, & Tao, 2008). Although FDI can benefit host economies, countries seeking to attract foreign investment can have undesirable outcomes (Alexeev & Pyle, 2003; Robertson & Watson, 2004; Kwok & Tadesse, 2006; Halmos, 2011; Petrović & Ranđelović, 2012).

Indeed, the recent literature stresses the importance of bi-directional influence between firm's decisions and institutions and addresses how firms shape institutional framework (Carney, Gedajlovic, & Yang, 2009). In particular, MNEs can act as "institutional entrepreneurs", in that they may initiate change unintentionally by sharing business practices or by internalising their norms and professional standards (Kwok & Tadesse, 2006; Hardy & Maguire, 2008).

Whilst positive change in local institutions caused by MNEs is possible, MNEs can increase social inequality (Halmos, 2011; Petrović & Ranđelović, 2012) and damage institutional quality (Alexeev & Pyle, 2003). For example, competition by MNEs for natural resources can increase the total supply of money (bribery potential), resulting in higher level of corruption and crime in a host country (Robertson & Watson, 2004; Kwok & Tadesse, 2006).

This chapter makes a very first attempt to investigate these issues by contributing to the debate on the social impact of FDI. More specifically, its objective is to empirically examine the effect of FDI and (formal) institutions (measured by the (i) accumulated stock of small and medium sized firms (SMEs) and (ii) number of economic crimes registered per 100,000 population) on (informal) institutional change (measured by the change (to account for dynamism in the social environment) in the number of violent and property crimes) within a country.

Russia provides an interesting context to achieve this purpose, with evolving institutions, slow growth in entrepreneurship and an increasingly recognised importance of FDI in technological catch up of the local firms (Smith & Thomas, 2015a). It is a suitable environment for a cross-regional approach. Russia is the largest country by land, with regions comparable in size to entire countries. This makes this research similar to a cross-national study. The number of regions across Russia is large enough to ensure considerable variations among them, while providing reliable statistical findings.

Russia's regions are diverse (in terms of language, ethnicity, culture and economic performance), while retaining comparable status within the country. Russia is heterogeneous both ethnically and religiously. It displays large and persistent regional disparities in social and economic characteristics, in spite of common policies, institutions and laws. Therefore, changes in these factors are not responsible for socioeconomic differences across the country, and this, in turn, substantially reduce the omitted-variable problems affecting many cross-country studies.

This investigation is novel, thus the results should be viewed as preliminary. The study finds a significant effect of formal institutions on change in informal institutions across the country. Namely, the positive change is observed in the regions with stronger formal institutions (with a higher number of SMEs and a lower number of economic crimes registered), or in the regions with higher entrepreneurship activities and lower corruption. The findings support the premise that the local entrepreneurs along with foreign investors had a positively changing impact on the social environment within the country.

The chapter is structured as follows. The next section briefly discusses the relevant literature. It then describes the empirical specification and data, the model and methodology used. The following section presents results, pointing at policy and managerial implications and potential directions for further research.

LITERATURE REVIEW

Institutions

Appropriate formal institutions (laws and regulations) and informal structures (restrictions to structure human interactions) are the key determinants of a well-functioning society (North, 1989). The cost of information is fundamental for the existence of transaction costs (costs of negotiation, information, search, surveillance and enforcement) (Smith & Thomas, 2015b). Important parts of transaction costs are the costs for acquiring information about true characteristics of exchanging goods.

Institutions play a crucial role in reducing transaction costs (North, 1989): they put constraints on economic agents' behaviour and reduce the risk of opportunistic behaviour (North, 1989; 2005). Institutions that limit governments from 'praying on the market' (by restraining the discretion and authority of individual actors within a government) is a necessary condition for markets to function well (North, 2005). The vital role of institutions lies in defining and enforcing property rights and in providing incentives for firms to engage in productive activity (North 1989; 2005). By defining and enforcing laws, institutions reduce uncertainty of human interaction and, therefore, the costs of cooperation.

Formal institutions (government defined and enforced) play the key role in an economy, so do the informal institutions and social capital embedded in them (Williamson, 2009; Dixit, 2009). Formal rules interact with their informal surrounding shaped by the history of formal institutions (Tabellini, 2008). The relation between informal and formal institutions is dynamic: formal institutions (or rules) can shape the informal institutions, but formal institutions are also the long-run reflections of past values, beliefs and norms (Williamson, 2009).

For example, Johnson, Mcmillan, & Woodruff (2002) find that firms in European post-communist countries resorted to bilateral relationships due to courts' inefficiency. Lambert-Mogiliansky, Majumdar & Radner (2007) point to the fact that across Russia the variation in the outcome of enactment of the bankruptcy law depended on the popularity of governors and the quality of the relationship with the federal center. Steer & Sen (2010) provide evidence that, to compensate for the deficiency of the formal legal system, Vietnamese firms used relational contracts.

What has not been given sufficient attention in the literature is the ways in which MNEs strategy might shape the institutional framework (Carney, Gedajlovic & Yang, 2009). This is rather surprising, as MNEs coordinate their actions through associations of which they are a part and, as a result, can exert some strong influence over the environment, since the relational framework allows them to increase their powers (Smith & Thomas, 2015b) to become "institutional entrepreneurs" (Battilana, Leca & Boxenbaum, 2009).

The Social Impact of MNEs

The literature on the impact of MNEs is vast. In the case of transition economies along, there are over 450 studies that examine the effect of FDI on macroeconomic growth (Iwasaki & Tokunaga, 2014). Most of the studies that examine the economic impact of FDI focus on FDI-related technological spillovers (see Acemoglu, Johnson & Robinson, 2002; Aizenman & Marion, 2004, Driffield & Love, 2007).

However, there does not appear to be much of cumulative benefits, stemming from the presence of MNEs and there is a need for examining the broader impacts of FDI on host countries (Dunning, 2002; Meyer, 2004). As the intangible wealth, among other means, includes the provision of social services and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

reduction of crimes (which is a much broader definition than that contained in gross domestic product, see Dunning, 2002), considering the social role of FDI on the host economy is vital.

FDI can contribute to achieving the host country social goals (Lall, 2004; Petrović-Ranđelović, 2012; Lehnert, Benmamoun, & Zhao, 2013), by improving social welfare (health, education and standard of living, see Lehnert et al., 2013) or by generating employment, (see Lall, 2004). However, a negative relationship between FDI and income inequality is also found (as in Paus & Robinson, 1999; Goldberg & Pavcnik, 2007; Halmos, 2011; Rafsanjani, Zeinolabedini, Mir, & Far, 2014).

Literature argues that skill-based nature of technology (embodied in FDI) can amplify the inequality effect of FDI (Wang & Blomström, 1992) that also entails social dumping that may reduce socio-economic capabilities of a country and can affect its absorptive capability in terms of political institutions, social cohesion and technological opportunities (Lee & Vivarelli, 2006).

Empirical evidence points at the degree of relative deprivation in a society, the degree of cohesiveness in social relations among citizens and the level of crimes (Kawachi, Kennedy & Wilkinson, 1998; Kennedy, Kawachi, Prothrow-Stit, Lochner, & Gupta, 1999). In this context, social capital can be a precondition for efficient and successful economic activities (Putnam, 1995; Fukuyama, 2003). Indeed, economic and social development of countries may depend on the available stock of social capital (Knack & Keefer, 1997; Rose, 2000; Kaasa, 2009).

Furthermore, economic growth and social prosperity through FDI can be determined by the interaction between governments and MNEs (Spar, 1999). For example, MNEs can influence governments and provide for the social welfare of host-country citizens, by offering foreign aid to developing countries, by expanding international trade and investment and by influencing public policy (Rondinelli, 2002).

On the one hand, MNEs can hamper the economic integrity and sovereignty of the developing world (Hippert, 2002). On the other hand, MNEs can act as institutional entrepreneurs, by initiating and actively participating in the implementation of changes that diverge from existing institutions, 'independent of whether the initial intent was to change the institutional environment and whether the changes were successfully implemented' (Battilana, Leca, & Boxenbaum, 2009).

That said, the nexus between institutions and MNEs' agency (with the latter being purposeful action by MNEs to intentionally pursue their interests and exert some effect on their social environment, see Scott, 1995), remains rather underdeveloped. The current research is yet to answer some important questions regarding the conditions for change (Child, Rodrigues, & Tse, 2012), especially in a context of emerging economies (Smith & Thomas, 2015a,b).

Social Capital and Crime

The concept of social capital (see Putnam, 1995 among many others) is related to institutions: in a similar to institutions way, social capital reduces transaction costs and (in a form of trust and social norms) makes cooperation easier. The existence (or absence) of social capital in a country tends to be self-reinforcing: trust and networks, on the one hand, and distrust and isolation, on the other, seem to self-reinforce.

Higher levels of social capital help to coordinate and implement changes in formal institutions (Platteau, 1994). Countries with higher stock of social capital achieve higher levels of growth (Putnam, Leonardi & Nanetti, 1994; Knack & Keefer, 1997; Rose, 2000): social capital can increase economic efficiency through supporting cooperation and by lowering transaction costs (Knack & Keefer, 1997; Akçomak & Ter Weel, 2009).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

People in networks (or communities) with a higher level of social capital can work together more effectively and take chances on risky ideas, fuelling innovation as a result (Florida, 2002; Smith & Thomas, 2015b). In this process, social capital can promote business networking and information flows (Coleman & Coleman, 1994, Putnam et al., 1994; Fukuyama, 2001).

Individual choices of crime participation may be significantly affected by the presence of civic norms and networks. For example, there is an established link between civic engagements, social capital and social outcomes (the level of crimes) (see Rosenfeld, Baumer, & Messner, 2001). Whilst countries with higher levels of social capital may have lower crime rates (due to higher civic engagement), countries with higher crime rates may have weaker social capital (Taylor, Gottfredson & Brower, 1984, Rosenfeld et al., 2001).

That is, strong attachments among citizens may help to deal with crime, as exchange of information on criminal behaviour between them may facilitate responsive action to prevent such behaviour in the first place (Sampson, Morenoff, & Earls, 1999). Strong attachments and involvement in matters within a country leads to strong social bonds and can, as a result, reduce the cost of conflict resolution, since conflicts are resolved in peaceful ways (Hirschi, 2002).

Criminal behaviour not only depends on the individual incentives but also on the incentives of people surrounding the individual: an individual is less likely to commit a crime if peers and the community can punish their criminal behaviour. Informal social control (a response to unusual behaviour, that is not the same as formal regulation designed to prevent and punish crime) helps to achieve social order and increase the level of well being in a community and increase the level of trust among citizens and political involvement (such as voting) (Nie, Powell, & Prewitt, 1969).

According to Sampson & Groves (1988), communities are empowered by the trust in each other to take action against crime and to join with formal control (such as the police). Consistent with this theory, significantly lower crime levels and self-reports of victimisation in neighbourhoods, characterised by social or collective efficacy, are reported (Sampson, Raudenbush, & Earls, 1997).

Bursik & Grasmick (1993) argue that effectiveness of law enforcement and public control is higher in communities with extensive civic engagement (see also Rosenfeld, Messner, & Baumer, 2001; Lederman, Loayza, & Menendez, 2002; Messner, Baumer, & Rosenfeld, 2004). Hence, the cost of conflict resolution decreases and more conflicts can be solved.

Similarly, by being caught, an individual risks to loose the utility generating social capital (loss of reputation and job, divorce) (Williams & Sickles, 2002). This means that the more social capital an individual possesses the higher the expected cost of committing crime, which reduces the probability to engage in criminal activities. Therefore, given the probability of being caught and formal control, higher levels of social capital seem to reduce crime (Williams & Sickles, 2002).

Social capital is closely related to corruption, perceived as a failure of institutions and a lack of capacity to manage society, by means of a framework of social, judicial, political and economic checks and balances. Indeed, there is a strong association between higher levels of social capital and corruption (La Porta, Lopez-de-Silanes, Shleifer & Vishny, 1997).

Social capital can lead to low corruption (Uslaner, 2004) and the level of corruption might decrease because of generalised trust and monitoring (Bjørnskov, 2003). Environments with weak institutions can be the most corrupt and least entrepreneurial, since institutions are essential for business start-ups (Baumol, 1996). Legal quality can reduce corruption in high-trust countries, but might have no significant effect in low-trust countries (Bjørnskov, 2011).

METHODOLOGY

The study is based on the regional panel data collected from Rosstat (Russia's Federal State Bureau of Statistics). The data are available for 83 regions in 1997-2011. To construct dependent variable (*INF_INST*), the change in the number of violent and property crimes registered is used (with the rational that the crime is a mirror of the quality of the social environment, see Kawachi et al., 1999).

This variable is, therefore, binary: change above zero indicates the change is 'positive' and there is either no change or a negative change, otherwise. The model takes the following simple form:

$$INF_INSTit = \beta 0 + \beta 1 FORM_INSTit + \beta 2 FDIit + \varepsilon it$$

where *INF_INST* is informal institutions in a region *i* at time *t*. Formal institutions (*FORM_INST*) are proxied by two variables. *SMEST* (or entrepreneurship) is the accumulated number of SMEs. The rational here is that stronger institutional environments should be more conductive to the process of new business start-up, see Popov, 2001; Smith, Thomas & Antoniou, 2014; Smith & Thomas, 2015b). *CORR* (or corruption) is measured by the number of economic crimes registered per 100, 000 population (as in Smith et al., 2014).

FDI controls for FDI-related (social) spillovers (number of MNEs and the stock of MNEs are used to check robustness of the results); the error term is modelled as $\varepsilon it = \eta i + mt + \lambda it$, where η and m are time- and regional-invariant effects, respectively, and λ is a random disturbance. Variables' definitions are in Table 1. Descriptive statistics is in Table 2. Table 3 presents a correlation matrix.

Table 1. Definitions of the variables used

INF_INST: Change in the number of violent and property crimes registered (per 100,000 population)
SMEST: Accumulated stock of SMEs
CORR: The number of economic crimes registered (per 100,000 population)
FDI: Inflow of FDI
FDIST: Stock of FDI
MNE: Number of MNEs
MNEST: Accumulated stock of MNEs

Note: See Table 1 for abbreviations' definition.

Regions in Russia are very heterogeneous: they are diverse in historic and economic conditions, land mass, ethnic and religious composition and language. For example, in 2004 Vologda had the highest share of ethnic Russians (97 per cent), whilst Ingushetiya - the lowest (1.2 per cent). Many of Russia's ethnic republics (for example, Ingushetiya) have been relatively poor; they are located on the periphery of the country having to bear higher transportation costs in reaching country's main markets – Moscow city and Moscow region.

There is an uneven distribution of population across the country. Russia's average population density is 8.4 people per square kilometre, making it one of the most sparsely populated countries in the world. The population is most dense in the European part of the country, around Moscow city and St. Petersburg.

Just over 11 per cent of the population reside in East-Siberian and Far Eastern territories (combined, these represent over 60 per cent of Russia's landmass). By contrast, 20 per cent of the population reside in Central Russia (2.8 per cent of the area of the country). In 2004, for example, Evensk had a population of 20 people per square kilometre, whilst the population in Moscow city of 9,461 people (Rosstat).

Although (on average) 74 per cent of the population in Russia is urban, its regions differ in industrial development and natural resource endowment, which accounts for the variations in gross regional product (GRP) per capita. In 1995, for example, the difference between the highest GRP (in Moscow city) and the lowest (in Ingushetiya that has one of the largest deposits of oil and gas) was 247 fold; this difference almost doubled by 2009 (to 471 fold).

Taken per capita, the difference between the highest 1995's GRP (in Nenetsk) and the lowest (in Ingushetiya) was 77 fold (this diversity being reduced to 21 fold by 2009). The great majority of regions in Russia have been handicapped by low population density, barriers to labour mobility and poor infrastructure (OECD, 2013).

Therefore, to account for this heterogeneity in the analysis, the study begins by testing the sample for heteroschedasticity by using the Breusch-Pagan/Cook-Weisberg test with null hypothesis that the error variances are all equal versus the alternative that the error variances are a multiplicative function of one or more variables.

Heteroscedasticity is confirmed by the large chi-squares found and the Generalised Method of Moments (GMM) estimation is used as a result, as most efficient in this case (Baum, Schaffer, & Stillman, 2003). Since the basic model is limited to FDI and institutional determinants of social environment only, it may suffer from misspecification.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

To deal with the omitted variable bias, the GMM regression with fixed effects (to control for regional-specific characteristics not included in the model) is opted for. As it can be argued that individuals living in more corrupt locations have 'looser' standards for judging corrupt practices, regional-fixed effects that help to control for these (among others) differences are added to the model.

DISCUSSION OF RESULTS

The main results of GMM regression are presented in Table 4. To check the results for robustness, the basic model is re-estimated, using alternative FDI data. The results in Table 5 are with MNEs and their accumulated stocks. Models 1, 3, 5 and 7 are with FDI/MNEs and Models 2, 4, 6 and 8 are with their interactions (that essentially tests if regions with lower corruption can benefit more in terms of social change caused by FDI/MNEs). If this is the case indeed, the impact of these interactions should be positive.

Overall, just with a limited number of selected variables, the explanatory power of the model is satisfactory: the models explain (on average) over 50 per cent of the variance in the change of informal institutions across Russia. The results support the argument regarding the association between FDI and

formal institutions, on the one hand, and the informal institutions, on the other. More specifically, the stock of SMEs (at 1 per cent significance) and corruption (at 5 per cent significance) are significant in all eight models.

Hence, the higher stock of SMEs leads to a positive change in informal institutions (or lower crime rates) across the country, whilst such change is either zero or negative in the regions that register higher number of economic crimes (or corruption). That is, between 1997 and 2011 corruption has a damaging effect on the social environment across Russia. The results show regions with higher inflows and stocks of FDI (at 1 per cent significance) changed socially. Although the effect of MNEs per se is insignificant, their stocks have a significantly positive effect on the social change (at 1 per cent significance).

The interaction term between FDI/MNEs and corruption is significantly positive (at 5 per cent significance), confirming that foreign investors across Russia led to a positive change in the informal institutions through their impact on corruption (possibly by minimising its level by not accepting bribes). This confirms that MNEs acted as institutional entrepreneurs, possible due to the uncoupling between them and the unsuitable institutions in the country.

Indeed, early institutional theorists have emphasised that, to gain legitimacy within their organisational field, MNEs conform to institutional pressures (DiMaggio & Powell, 1983). However, a more recent

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

institutional perspective states that MNEs may become institutional entrepreneurs as they can mobilise resources to change the institutions for their own interest (Battilana et al., 2009). On the base of this, the study finds some preliminary but robust empirical arguments in support.

CONCLUSION

Using regional panel data for 1997-2011, the chapter estimated the direct and indirect effects of FDI and formal institutions on the change in informal institutions across Russia's regions. The main assumption of the study was that MNEs would have a significantly positive effect across the country. In other words, it was expected that MNEs would act as institutional entrepreneurs, leading to a positive (as in as in Kwok & Tadesse, 2006) social change across the country, by changing or improving the existing institutions (law and order). A significant link between social institutional environment and SME sector development was also assumed.

In line with the arguments in the literature, the preliminary evidence confirms that, during the period under investigation, both MNEs and domestic SMEs led to a positive change in the social environment in Russia. More specifically, a higher number of MNEs and SMEs are found in regions with positive social change (as characterised by a reduction in violent and property crimes).

That said, the effect of corruption on social change was adverse: regions that registered more economic crimes reported showed the least change (or improvement) in their social environments. The results suggestive of the fact that foreign investors in Russia led to a positive change through the change in institutions, possibly by minimising the levels of corruption, perhaps by not involving in corrupt deals with local business agents.

Policy Implications

The implications of this study for policy makers are straightforward. Firstly, the preliminary empirical evidence confirms that the development of social capital by attracting FDI and promoting the development of SME sector in Russia (as well as elsewhere in emerging world) is paramount, given the obsolete social capital, low capacity for self-organisation and low trust in institutions (Rose, 2000; Tabellini, 2008; Aghion, Cahuc, & Shleifer, 2010).

Indeed, in the context of emerging economies undergoing rapid and profound institutional change, it is vital that resources to finance investments are locally generated (Ghura & Goodwin, 2000). Thus, local policies directed at establishing the environment conducive to development of domestic private sector are necessary. Business environment with a sound domestic institutional framework is also a necessary condition for attracting FDI/MNEs (Smith & Thomas, 2015a).

Although SMEs make up around a quarter of Russia's economy, the proportion of SMEs in Russia remains comparatively small (the European Investment Bank). This study shows, however, the role of SMEs is important not only in driving economic growth (for example, through job generation) but also in building the social infrastructure, as employment is a major determinant of reduced conflict and social empowerment (the World Bank).

As MNEs may exert some strong economic and political influence on the environment in which operate, they should not be considered as 'passive players, submissively seeking legitimacy in their interactions with institutions' (Riaz, 2009, p. 28). Instead, they should be seen as institutional agents of change.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The change actions can be exerted by MNEs either in isolation or through combining efforts with SMEs (that face the same institutions in the host environment). Indeed, institutional change is usually the result of the collective and collaborative actions of many actors (Wright & Zammuto, 2013). Therefore, to help MNEs and SMEs to act as institutional entrepreneurs, policy makers should view them as resources to solve the coordination problems, or develop specific capacities (Jackson & Deeg, 2008).

For example, one way forward may be for managers of MNEs and SMEs to work together, by increasing their participation in the collaborative activities aiming at reducing the risks associated with weak institutions (for example, by targeting corruption and corruptors). By providing incentives (by policy makers) to positively influence the environment, MNEs should make marginal or relevant internal adjustments that take the form of new in-house institutions to which SMEs would also adjust.

In cases of uncertain business environments (when there is an urgent need for changing unsuitable institutions), the pioneering (in the institutional change) role of MNEs (due to their powers) and the role of their followers, or SMEs, should be diffused. On the one hand, MNEs and SMEs may jointly pilot new suitable institutions, for example. On the other hand, it is likely that the introduction and diffusion of new institutions will face some strong resistant forces (Child et al., 2012). Specifically, the attempts from MNEs can probably be in competition with the responses of embedded institutional actors (such as governments) and, as a result, fail. These failed attempts, therefore, should be taken into a consideration.

Managerial Implications

Managerial implications of this study are important. MNEs start interacting with host-country institutions as soon as they enter a country and institutions, indeed, have a significant effect on their continuous operations. For example, an MNE that contemplates FDI has to take into account the characteristics the institutional environment, including the degree of corruption.

Managers of MNEs often impose pressure for subsidiaries to adopt practices used in the home country operations elsewhere (Kostova & Roth, 2002). That is, MNEs' degree of legitimacy in their home environment can affect the degree of legitimacy in a host (Kostova & Roth, 2002). However, in the host corrupt countries MNEs may encounter significant pressure to engage in corruption (Smith & Thomas, 2015).

Possibly, the more MNEs engage in corruption, the greater will be the pressure to offer 'facilitation payments' in the course of their business operations (Smith & Thomas, 2015). Finally, when managers of MNEs recognise that corrupt practices are institutionalised in a host environment, they will be more likely to engage in corrupt practices, even if they personally view them negatively at home (Doh, Rodrigue, Uhlenbruck, Collins, & Eden, 2003).

In the last decade, governments, activists and media have become adept at holding firms accountable for the social consequences of their actions/activities (Porter & Kramer, 2006). Corporate success has, indeed, been largely dependent on corporate ethics practices. From this, therefore, it follows that MNEs should pay more attention to social issues and identify their effects have on host societies.

LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

The study is not without limitations. For example, what type of FDI is accounted for in the data on aggregated FDI inflows published by Rosstat is unknown. As a result, it was not possible to assess exactly why the effect of FDI varied between its aggregated (FDI inflows and stocks) and disaggregated (MNEs)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

levels. The reason for this could be, for example, a high proportion of FDI (reflected in the data by Rosstat) being the Russian capital returning to the country instead of 'foreign' in origin.

If that holds, one of the most important agendas for policy makers should be the facilitation of the return of this capital, given its positive impact on the social environment. Accelerating capital flight that Russia has suffered in recent years has negative consequences for the economy, as lack of capital may delay the development of the enterprise (or SME) sector. Therefore, strengthening policies and institutions to assist with SME start-ups should remain the precondition for enhancing the quantity and quality of domestic capital formation required for the development of SMEs.

It is important to point out that the study presented in this chapter is exploratory and its results are preliminary. However, it can be a good starting point for further research that should, indeed, consider the role of change agents in emerging economies. It is believed that the following proposed research areas will have some important policy implications, given the promotional efforts made by the governments in emerging economies to attract FDI.

Future research efforts may, for example, focus on examining the conditions under which the interaction effects of corruption and FDI are most prominent. Further papers should also examine the role of SMEs in institutional change. Finally, spatial correlation becomes a crucial issue when evaluating determinants of social change (as various forms of localised social interaction may give rise to a spatial multiplier, by which crime rates in a given region also depend on crime rates in neighbouring regions, see Anselin, Cohen, Cook, Gorr, & Tita, 2000). Therefore, further studies should make an effort to control for spatially lagged crime rates.

KEY TERMS AND DEFINITIONS

Corruption: Dishonest or fraudulent conduct by officials in power.

Foreign Direct Investment (FDI): Controlling ownership in a business enterprise in one country by an entity based in another country.

Formal institutions: Contracts, incentives, authority, laws and regulations.

Informal Institutions: Norms, routines, political processes and restrictions that economic agents put on their own behaviour.

Institutions: Formal and informal rules and norms that organise social, political and economic relations.

Multinational Enterprise: A firm that has its facilities and other assets in at least one country other than its home country.

Social Capital: Informal values or norms.

Chapter 80
Can Zakat Institutions Adopt Consumer-Centric Knowledge Management Successfully to Alleviate Poverty?

Abu baker Ramadan Mohamed Hussain
Taibah University, Saudi Arabia

ABSTRACT

Drawing upon Consumer-Centric Knowledge Management (CCKM) approach and poverty alleviation efforts, this chapter elaborates the adoption of these approaches in Zakat Institutions (ZI) in their search to alleviate poverty. It assesses the interrelationships of the two approaches in ZI considering the poor and needy as the main envisioned stakeholders. The investigation deliberates the landscape of poverty alleviation by key agents of knowledge change, reviewing their contributions to establish communities of practices in creating and sharing knowledge on poverty alleviation. Similarly, it relates major strategic focus of poverty alleviation to CCKM processes. It explores knowledge management gaps that could affect ZI outreach highlighting the main internal and external challenges. The substances of outreach stipulate the importance of poverty intelligence portfolio that utilizes key elements of CCKM, namely poor and needy intelligence, demand intelligence, situational intelligence, and networking intelligence. As a result, the effective engagement of ZI in the two approaches is valued with respect to knowledge on poverty alleviation.

INTRODUCTION

Existing research on the effect of consumer – centric knowledge management on poverty alleviation by Zakat Institutions (ZI) has not yielded definitive conclusions, in part because of differences in methods. Four issues distinguish recent literature based on assessing factors influencing poverty alleviation as strategic goal in economic development. First, knowledge and knowledge sharing is essential for development in general and alleviating poverty in particular (Shin and Kook, 2014; World Bank, 2011; KDI &

WBI, 2011; FAO, WFP & IFAD 2012; IFAD, 2011; Anand, & Lea, 2011; Anderson et al, 2013. Second, different perceptions caused by demand –led poverty alleviation approaches (Biard, 2013; Camacho & Conover, 2011). Third, all types of organizations can benefit from the essence of knowledge management (KM), customer relationship management (CRM) – customer-centric approach (Jirinova, 2013; Wang & Fen, 2012; Kopetz et al. 2012; Alhawari, 2013; Al-Shammari, 2011; Lee, 2014; Gebert, 2003). Fourth, globalization changed the nature of economic activities, which results in redefining poverty, and the poor. This process modifies the role of Zakat Institutions (ZI) as social safety net organizations (Al Baraka, 2011, 2012 & The Kuwaiti Zakat-House).

These four issues are interrelated: for instance the millennium declaration and the move towards knowledge economy places knowledge as a global strategic goal to alleviate poverty. However, many countries, international, national and organizations adopted Consumer Centric Knowledge Management approach to support collaboration oriented activities (Tsai *et al*; 2006). The effectiveness of these relations in organizations (i.e. ZI) depends on not only social capital and knowledge management processes but also on knowledge sharing and partnership (Barry & Tacneng, 2013; Abuo-Zeid; 2007).

Zakat as a third pillar of Islam is the proportion of a person's wealth designated for the poor and needy seeking purification and growth[1]. Legally, it means transfer of ownership of specific wealth to specific individual or individuals under specific conditions (Abdul-Rahman, 2007). It indicates that poor people have the right in the wealth of the rich. Zakat Institutions are legal entities aim to implement the divine objectives of Zakat including collection, distribution and management. Hussain (2001; 2011) showed that the theoretical framework of Zakat institutions comprises the scope (objectives), focus (rules, regulations, and policies) and processes (different methods and techniques). Accordingly, its stakeholders include Zakat payees (obligatory and voluntary payees), employees (admin staff, Sharia boards/committees etc), community, government, and Zakat receivers prescribed in the holy Quran. The focus on the poor and needy stems from the fact that they are the main envisioned stakeholders that all social policies and Zakat institutions' objectives revolve around.

The dynamics of identifying and reaching the poor and needy as the prime target of Zakat institutions overshadowed by recent developments in the literature, in particular the investigation aims to assess the following factors:

- How Zakat Institutions utilize the developments in knowledge sharing and knowledge exchange for more efficient and effective poverty alleviation practices.
- The strategic commitment of ZI to reduce poverty as a multifaceted phenomenon and to establish the necessary condition to promote change in a dynamic nature of poverty reduction processes as an Islamic obligation.
- The needs to promote and sustain knowledge creation (portfolios) and knowledge sharing in poverty alleviation depend on a rapid growth of information and the move towards knowledge management in Zakat activities and processes in collection and distribution. Given the unstable flow of collected funds, distribution is highly dependent on processes of creation and acquiring knowledge.
- While more Consumer Centric imputes came from inside these institutions, knowledge exchange with other stakeholders including community is a vital objective.

This chapter assesses the interrelationships of CCKM and poverty alleviation approaches in ZI considering the poor and needy as the main envisioned stakeholders. It tries to identify areas in which ZI

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

can contribute to the existing knowledge in alleviating poverty. It departs from deliberating the landscape of poverty alleviation reviewing the contribution of knowledge on poverty alleviation by key agents of knowledge. Similarly, the investigation relates major strategic focus of poverty alleviation to CCKM processes. Accordingly, the chapter explores the main gaps that led to identify internal and external outreach challenges. The latter stipulates the importance of poverty intelligence portfolio that focuses on the key elements of CCKM namely: poor and needy intelligence; demand intelligence; situational intelligence; and networking intelligence. The chapter is assertive stressing on examining these elements to improving consumer centric knowledge management approach as a mean to alleviate poverty.

In what follows, the chapter first begins with a general background discussing the recent development on the topic highlighting the importance of investigation. Then, it assesses the role of CCKM in Zakat institutions. The chapter scrutinizes the landscape of poverty alleviation defining the main contributions made by key knowledge agents. The role of poverty alleviation as strategic goals in ZI is then examined. This provides the study with the major KM gaps that could affect ZI outreach highlighting the main internal and external challenges. Poverty intelligence portfolio is discussed, assessing key CCKM elements including: poor and needy intelligence; demand intelligence; situational intelligence, and networking intelligence. To instill these elements institutionalization process is discussed. The study highlights future research themes.

BACKGROUND

Knowledge is considered one of the most valuable resources for growth and sustainability (Shin & Kook, 2014). In recent years, consumer centric knowledge management led to improving the quality of business management (Al-Shammari, 2011). Since 1980 customer - oriented models for public sector became popular (Chen, Yu, Yang & Chang, 2004). Over the past decades consumer – focused, consumer centered, consumer relationship management etc. dominated the literature suggesting the move towards consumers as a driving element in shaping business's success. There is an immense literature on CCKM dealing with businesses growth and the importance of customers as a focal success in satisfying all stakeholders' interests (Adebanjo & Kehoe 2001). The approach enhances organizations' practices to improve their effectiveness in dealing with the customers. This implies mobilization of all organizational resources; creating cultural shift that strengthens organizational capabilities and connection to view their consumers' needs. Classical knowledge sharing models suggest that knowledge transfer and / or sharing process involves the conversion of tacit knowledge into explicit and vice versa (Nonaka and Takeuchi, 1995; Nonaka & Krogh 2009). For them the conversion of knowledge from tacit to explicit and then tacit is the base of knowledge creation.

Recent advances in consumer research emphasized that poverty alleviation lacks a formal consumer behavior approach (Davis and Pechmann, 2013). However, the third Transformative Consumer Research Conference at Baylor University (2011) provided a new framework for alleviating poverty. The framework identified two important concepts to understand poverty: felt deprivation and power (Blocker et al, 2013). It proposes five streams to achieve its effectiveness including alleviating stress; productively engaging institutions; fulfilling aspiration; leveraging trust and social capital and facilitating creativity and adaptation. This will improve poor people consumption choices, capabilities, and capacity. Transformative consumer research, in this sense, seeks to inspire consumer researchers to improving lives

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the poor by providing significant insights on wellbeing agenda. Its impacts cover opportunities and challenges for consumer research, and opportunities and challenges for social and government entities.

Interestingly, Werhane Kelley, Hartman & Moberg (2010) argued that for-profit multinational enterprises have a role to play in poverty alleviation, introducing the concept of poverty alleviation through profitable partnerships with the poor for mutual gains. VanSandt and Sud (2012) extended this argument explaining how the power of business, inclusive growth, role of institutions and collaborative entrepreneurship work together to build a framework for alleviating poverty. The approach has the potential to alleviate poverty while, enhancing corporate profits through mutual benefits, transparency, and cohesive long-term vision.

Trends of developing a demand-driven approach to knowledge management had been elaborated by several scholars and organizations i.e. Koenig, (2002); Bennet and Bennet (2000). For Firestone (2003) the coexistence of supply – and demand – side Knowledge Management (KM) still dominating the field. However, growing concerns with innovation and intellectual capital can only be influenced by a wider embracement of demand-side approach. Peppers and Rogers (2006) developed the 360 degree of customer views that helped organizations to work together to deliver superior customer experience that maximizes benefits.

Research on poverty alleviation strategies traces the implementation of different countries' national poverty reduction strategies. A common goal of all strategies revolves around coordinating the efforts to produce an impact on the poor (IDB, 2006). Zakat institutions play a central role in this sense; however, Jelenic (2011) showed the importance of knowledge as a vital strategic resource for organization in the 21st century. Kaplan and Norton (2004) extended their original work on businesses' strategies; focusing on strategy maps that consists the four perspectives including learning and development, internal, customers and financial perspectives. Customer's perspective depends on how organizations value their views generating the necessary operational & cultural changes to manage their processes. In developing intangible assets into tangible outcomes, many scholars, among them Peterson, M., Ekici, A., & hunt, D. (2010) highlighted importance of the poor people perception and related business' activities. In general, the complexity and unpredictability generate serious challenges to knowledge creation, transfer, and capabilities. However, there are several shortcomings to knowledge transfer including knowledge barriers (Landaeta, 2008; Bengoa, and Kaufmann, 2014).

At times where resources are limited, organizations must focus on matching the management techniques to the desired knowledge outcomes and needs of different parts of their organization. Mc Laughlin (2007) indicated that certain parts of organization have different knowledge transfer profiles and as a result require different knowledge focus ensuring investments in knowledge management should be directed to the right projects.

Understanding the mechanisms of poverty and poverty alleviation issues have been the concern of local, national, and international organizations. The emphasis on knowledge as a key instrument for catalyzing change is evident by the development institutions, policy makers, academician, and practitioners (KDI & WBI 2011). The World Bank (2011) indicated that countries rate of acquisition of knowledge as more valuable than financial lending. Its literature suggested tripartite initiatives including standardization of governance and measurements of results; developing comprehensive framework for connectivity across the core knowledge product and the openness of knowledge. Equally, FAO, WFP and IFAD (2012); extended the focus to improve the overall environment and risk management capacity of the poor suggesting strengthening individual and collective capabilities of the poor.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Despite massive progress in reducing poverty, the World Bank, IFAD (2011) indicated that there are still about 1.4 billion people living on less than US$1.25 a day in East Asia, and close to 1 billion people suffering from hunger. Muslim countries constitute the bulk of poor people in East Asia and in North Africa (World Bank, 2009; Ali, 2003). The Organization of Islamic Congress (OIC) believes that more than 55% of its members were below the poverty line. Such statistics questioned the efficacy of Zakat Institutions to reduce poverty and expand its spatial outreach to distribute Zakat funds.

The prime functions of Zakat institutions are to collect and to distribute Zakat. Their processes require generating, acquiring and storing knowledge for both purposes. Zakat is often associated with prayer in the holy Quran (Quran: 98; 5). As an obligatory, all Muslims have to perform. While there is no huge differences in categorization of Zakat distribution, variation between scholars overshadowed different aspects of disbursement of Zakat distribution programs and projects. The strategic focus of poverty alleviation targeting the poor and needy is well documented in the holy Quran, where many verses indicated the importance of caring for the destitute and the poor (Quran: 51: 19; 70: 24 – 25; 9:60).

Zakat is for the poor, and the needy and those who are employed to Administer and collect it, and the new converts, and for those who are in Bondage, and in debt and service of the cause of Allah, and for the Wayfarers, a duty ordained by Allah, and Allah is the All-Knowing, the Wise (Quran; 9:60)

The processes of Zakat distribution focused on outreach explained mostly by Sunnah[2] encompassing identifying the poor, approaching them, deciding on the services / product etc. Since poverty is dynamic and multifaceted, there is a need for knowledge management to introduce sound methods that fit with Zakat strategic goals and contemporary operational tactics. Although, there is relatively sufficient tangible resources for Zakat institutions (originated from collection), intangible ones are questioned especially the availability of internal knowledge to improve poor and needy networks. Consumer Centric Knowledge Management in Zakat distribution's plans are now emerging as one of the possible solutions to the inappropriate use of Zakat funds collected by Zakat institutions.

Accordingly, the vision of Zakat institutions is to improving Zakat outreach; however, the nature and characters of Zakat institutions embodied the main areas of consumer centric knowledge management approach. Distribution processes start with defining the poor and needy; approaching them; processing their claims and giving them the product / services or support they deserve. As the mainstay of the studied approach, this process implies the exploration of the needed knowledge in defining who is the poor and why? Such knowledge is required to manage the processes of reaching the poor and needy.

Zakat institutions as learning organizations can create value for the poor and needy if they exploit their knowledge to the benefit their strategic objective. At this stage, the processes trace the breadth and depth suggesting exclusionary tendencies and their concerns. All processes, practices, and decision-making should rely on solid data mining "poverty intelligence". Institutionalization these processes is an essential factor in such change and development that creates competitive edge for Zakat institutions. El Salihi, (2006) emphasized that Zakat has the potential to play a pivotal in Islamic financial system, while others call for immediate incorporation of Zakat into the Islamic system to correct societal ills (Abdul Rahman, 2007)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

THE ROLE OF CCKM APPROACH IN ZAKAT INSTITUTIONS

The emphasis on customer centric knowledge management as a key instrument for catalyzing change is evident by the consumer centric approach. The literature on small firm (organization) networks stresses on collective action for local development Bassi, et al (2014). It argues, collective actions opens up new opportunities (resource access), network economies, reduce transactions cost, and coordinate poverty alleviation efforts. Zakat institutions are the foundation structures to form, and to implement poverty eradication policies including support, governance, and leadership. In Islam, Zakat Institutions are qualified to play a pivotal role as they work closely with local organizations networks to ensure that poverty alleviation efforts and systems work together to provide integrated, coordinated, and flawless services to the society (Hamad El-neeil, 2012; Hussain, 2001; El Magboul, 2010). They have unique characters that differentiated them from other poor and needy oriented organizations extending from rural, urban, national, regional, and international spectrum.

First, Zakat has a religious tie and societal benefits that generate cultural and behavioral advantages. It is an obligatory duty for Muslims to pay their alms according to payment conditions[3]. Second, it is a self-sustained organization depends on its two tiers Zakat collection and distribution. Wealthier Muslims give Zakat on an annual basis for their wealth and economic activities. Third, flexibility is maintained by ZI structures and decentralization approach. ZI are independent bodies serve to instill Zakat collection and distribution (setting policies, measures, procedures and managing processes). However, they accept donations and charity for the benefit of poverty alleviation processes as prescribed in the holy Quran. Forth, ZI act as knowledge agents to creating and sharing necessary understandings based on Islamic values to reduce poverty and other societal drawbacks. Accordingly, Zakat institutions encompass the following knowledge management activities:

- From strategic knowledge management points of view, the role of Zakat as a divine obligation seeks to purify and develop individual (and society's) wealth hence to please the Creator. The vision of Zakat institutions in this sense aims to purify individuals and societies from many socioeconomic problems including poverty and destitute. Knowledge and information are needed and constantly should be reviewed, evaluated and controlled against Islamic knowledge (*Sharia*).
- Tactical knowledge management informs Zakat institutions to establish of general rules, procedures, means and responsibilities to deal with processes of Zakat including both elements collection (giver's side) and distribution (receiver's side).
- Operational knowledge raises the concerns of efficiency and effectiveness of Zakat funds. Utilization should be made in-line with strategic and tactical knowledge management. This implies continuous improvement in developing systems of creating, storing, disseminating, and using of knowledge and information.

The adopted principles and methods of Knowledge Management in Zakat institutions cover the following areas:

- Zakat Institutions usually process modern information and its infrastructure on both collection and distribution of Zakat funds.
- Knowledge sharing with other governmental and NGOs and community-based organizations regarding sources of funds (collections) and outreach programs.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Tacit and explicit knowledge are required from both Zakat payees and receivers to perform their obligatory duties and to attain their rights respectively.
- Zakat Institutions have to live-up with expectations of the society objectives.
- Good practices can be emanating from adapting to and adoption of ICT and other technological methods.

Accordingly, Zakat institutional "organizational" knowledge had been generated differently in numerous ways including human minds, documents notes and reports and Islamic scholars' recommendations (Fatwa's). The emergence of computer – based communications technologies had not only complemented the traditional methods of acquiring, sharing, and utilization of knowledge and delivery methods; but also improved the efficiency and effectiveness of the overall knowledge at the collection front. Many researchers in Islamic world i.e. Bakheet (1998) and Awad (1993) in Sudan and Kahf (1997) Pakistan stressed on research and development in Zakat to strengthening its theoretical framework.

As defined by many scholars; consumer centric "is an approach in which company focuses on creating a positive consumer experience at the point of sale and post-sale. It adds value to a company by differentiating themselves from competitors who do not offer the same experience". The focus on distributional aspect of Zakat funds (collected by Zakat institutions) necessitated that all products and services activities and entitlements should be driven by needs / wants of the poor and needy. It entails the following elements of consumer centric approach:

- Knowledge for, the poor & needy (environment & entitlement),
- Knowledge about Zakat institutions' people, processes and structures (means),
- Knowledge about the required data / information (intelligence),
- Knowledge about outreach and its processes.

Zakat institutions have accumulated considerable experiences through which they developed and improved their performances. Transference of the knowledge they gained remains modest to the expectations of institutions, the needy, and the society. Employing consumer centric element depicts knowledge gap challenges to fulfill Zakat objectives including transferring, reusing of standard knowledge; how to identify, reach and manage the poor and needy? The landscape of these types enhances organizational knowledge culture; Abdul Rahman (2007) highlighted the need for integration Zakat processes into the mainstream of Malaysian Islamic Financial System. This needs to enforce fairness in Zakat processes (collection and distribution), standardize Zakat accounting and performance measure. Bias in Zakat theoretical framework (scope, focus, and process) hindered comprehensive integration and knowledge sharing in the Sudan (Hussain, 2001). Wirts and Tomlin (2000) generated varied generic steps of institutionalization process. It departs from solid preparation that describes institutional assessment including strategic review operational problems and challenges; information needed allocation of resources and capacity analysis. To accommodate CCKM approach the following challenges deem important.

First, standard distributional knowledge is the long-standing challenge for effective Zakat institutions. A number of scholars (i.e. Al Qaradawi, 2000; Bakheet, 1995 and El Magboul, 2010) identified that Zakat distributional knowledge lagged behind the collection one. The awareness of tacit and explicit distributional knowledge includes the knowledge locus and capability of interpreting the knowledge before applying it.

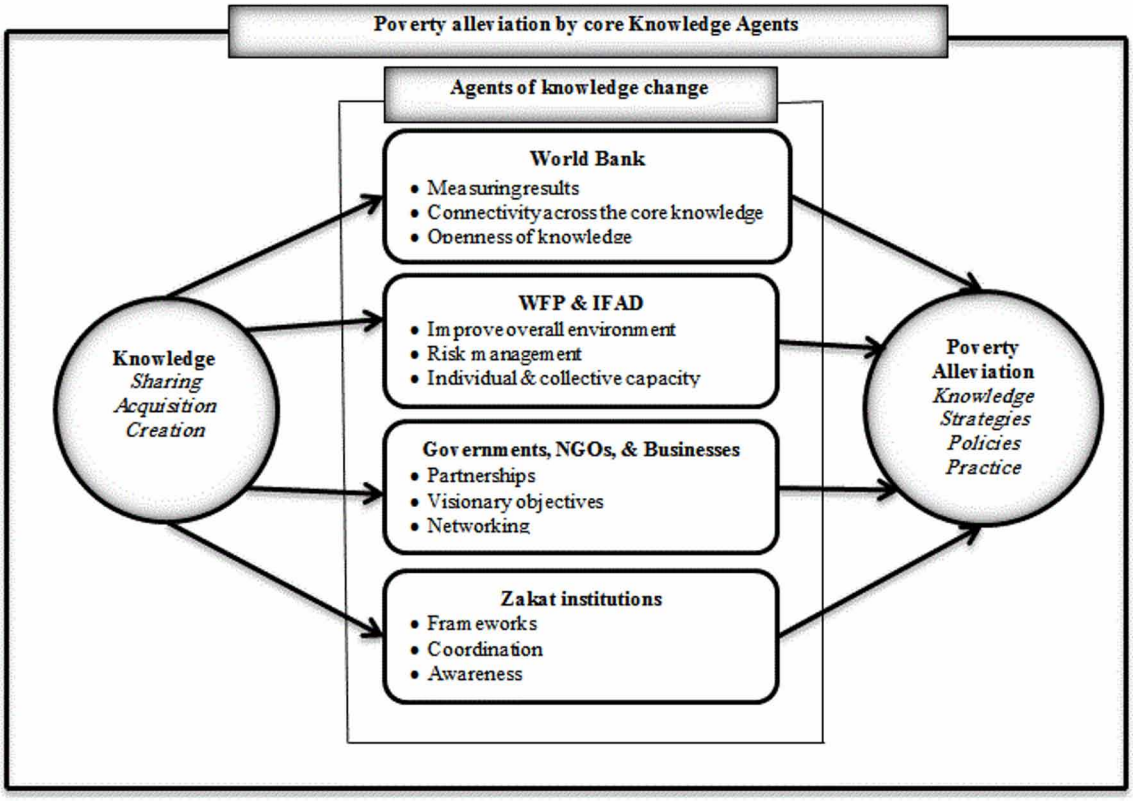
EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Second, the learning culture is the biggest concern for Zakat institutions to realize their potentials, not only on their socioeconomic potentials, and on internal processes, but also the potentials for the collective actions at different spheres. Zakat institutional "*organizational*" knowledge management processes are therefore to generate tacit and explicit knowledge identifying possible points of entry to collaboration and collective actions in order to create positive knowledge, encourage experiences and thus initiate a paradigm change among the poor and different local organizations (Hussain, 2001; El Salous, 1998).

Third, poverty intelligence visibility into poor and needy information is limited to eradicate poverty. The CCKM approach as a demand driven strategy requires "Poverty Intelligence" to manage poor and needy experiences to build fruitful relationships in the path of differentiation and growth. This enables Zakat Institutions to access individual information identifying the value and the need of each person and to deliver the best response.

DELIBERATING POVERTY ALLEVIATION

Changing the Landscape of Poverty Alleviation



The potential impact of knowledge on socioeconomics development processes and the possible use of knowledge management as an effective tool for poverty alleviation have led the global debate on the role of knowledge as enabler of poverty reduction. Despite a consensus that knowledge is positively relate to economic growth, the literature categorized various institutions as agents of knowledge to alleviate poverty into four groups including: international organizations consists the World Bank, UNDP, IMF, FAO, IFAD... etc.; governments and governmental bodies; NGOs and not for profit organizations; and entrepreneurs.

Developing countries and development partners are investing considerable resources in harnessing the promise of poverty reduction and economic growth. There are major differences between developed and developing countries in the effective use of knowledge and knowledge management. These differences implied sharing knowledge on all aspects of poverty calling for new approaches to reach the poor and the needy (destitute). These agents created, acquired, and shared knowledge on poverty alleviation including strategies, policies, and frameworks. In practice, operational and technological approaches focus on how to identify the poor and needy and to assess their levels of poverty and destitute and why? The development efforts in developing countries exacerbated by the complexity of challenges in adapting the global knowledge and technology to local conditions and needs Rezaian (2007).

The figure reflects the following: first, knowledge has increasingly become a vital strategic resource to alleviate poverty. Key development agents reflect the importance of knowledge and knowledge management on poverty reduction processes as a consumer centric approach. Globalization introduces a "knowledge economy" that signifies intangible resources changing the patterns of socioeconomics activities and organizational operations. Accordingly, most processes including poverty alleviation are viewed through knowledge management. Developmental institutions as knowledge agents added significant value to knowledge creation, acquisition, and sharing. Their operations and performances have resulted in differentiated outcomes. Gebert (2003) evidently emphasized that where client – focused (consumer – focused) is an integral part in organization process; high level of institutional performance is generally achieved increasing the benefits from these organizations to their clients (consumers).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Shows the contribution of key knowledge agents on poverty alleviation

Second, since the World Bank stresses on knowledge as a vital resource (not financial resource) for poverty alleviation, therefore, developing an adequate system of knowledge management is a necessity. Its framework relies on effective governance and standardization of measurements and results, knowledge creation, and sharing. The World Bank believes in the openness of knowledge and connectivity that utilizes different development models to promote growth, development and to reduce poverty. The consumer centric approach in this sense challenges organizations' special knowledge, managerial skills including technical and human capacities to improve their products and services for the poor.

A remarkable shift from product – focused to consumer - focused knowledge approach gains its stature as one of the most visible poverty alleviation methods. For instance, IFAD (2011) focuses on increasing poor people knowledge on basic skills, reducing risk, learn how to manage assets effectively, and to market their products, while interacting with others. The overall knowledge competences assumed to give poor people confidence, security, and power. This is supported the UNDP "Human Development Report," World Bank Annual Reports, and national countries poverty strategies. This shift overshadowed the effectiveness of tailored products for the poor and destitute that varied spatially and by the development agents.

Third, governments, governmental bodies, and NGOs implemented varied development approaches and models that aim to maximize benefits for the poor and needy, however, these efforts resulted in differentiated outcomes. In turn, it affects their sustainability creating new knowledge used to draw outlines, guidance, and practices on how to reach the poor effectively in order to improve their lives. Sharing

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

knowledge rests on building effective partnerships and networking. The majority of national poverty reduction strategies and policies promote economic growth, improving governance, public service delivery. However, Barry and Tacneng (2013) questioned the integration of the latter into action plans for poverty alleviation and their effectiveness.

Forth, approaching the poor and needy is not limited to international organizations, governments, and NGOs; private sector (entrepreneur) too shifted their strategies, policies, infrastructure, programs, and projects targeting the poor. This tendency enlarged the landscape of poverty alleviation, departing from community engagement, social responsibility, and participation. The gradual shift from product oriented towards client oriented prompts the changes in organizations' behaviors and internal operations increasing the effectiveness and efficiency of these organizations. With the adoption of consumerism approach, the type of the offered products for the poor and their satisfaction are changed raising mutual benefits between organization and the poor. VanSandt and Sud (2012) explored the philosophy of inclusive growth stresses on the patterns of economic growth including its social and cultural dimensions. Accordingly, development strategies and policies objectives were set to ensuring that multiple strata of the society must share the benefits of globalization.

Fifth, the nature of utilizing knowledge in ZI echoes the growing challenges on building reliable frameworks including legal and organizational, and coordination among different Zakat Institutions (nationally and internationally) in a knowledge-based economy. Knowledge about the poor and needy mirrors their focus; however, intelligence and data mining are key knowledge processes that influence the quality of ZI performances. International conferences on Zakat issues organized by Kuwait Zakat House, and OIC persistently recommend increase coordination between organizations and the awareness of Zakat processes (Kuwait Zakat House, 2010).

Poverty Alleviation Processes and Zakat Institutions

Poverty reduction efforts stems from different schools of thoughts using various approaches. Two complementary developments in economic analysis informed poverty alleviation processes encompassing behavioral economics and capabilities approach in economics. The former focuses on how effective policies can be designed to reduce poverty, while the latter on what poverty is (Anand, and Lea 2011).

Measuring poverty is, however, the most controversial issue. Several methods measure poverty determine the poor and needy and entitlement; few of them are featured prominently in the literature. The most commonly used measure is the World Bank US$1.25 and / or US$ 2 a day. In recent years Human Development indexes extended income measures to incorporate human development factors as a result many measures had been proposed and implemented including Human Misery Index, HDI, etc. poverty lines too were customized nationally to accommodate different factors.

The nature of Zakat institutions and its search for creating value, introduced flexible measures. Zakat institutions use 85 ounces of gold as an income line to differentiate between Zakat payees and receivers. The line depends on current prices of gold. Spatially at macro level, it employs rank-size distribution of states and cities. In Islam knowing the poor and needy is not an easy process and it is solely the responsibility of the head of the State (or Zakat institutions) to define who the poor is. Depending on *hadith* narrated by Abu Huraira (R A); the Prophet (PUH) said:

The poor is not the one who goes around the people and ask them for a mouthful or two (of meals) or a date or two; but the poor (Al- Miskeen) is that who has not enough money to satisfy his needs and whose

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

condition is not known to others; that others may give him something in charity and who does not beg of the people. (Al Bukhari; 2:55)

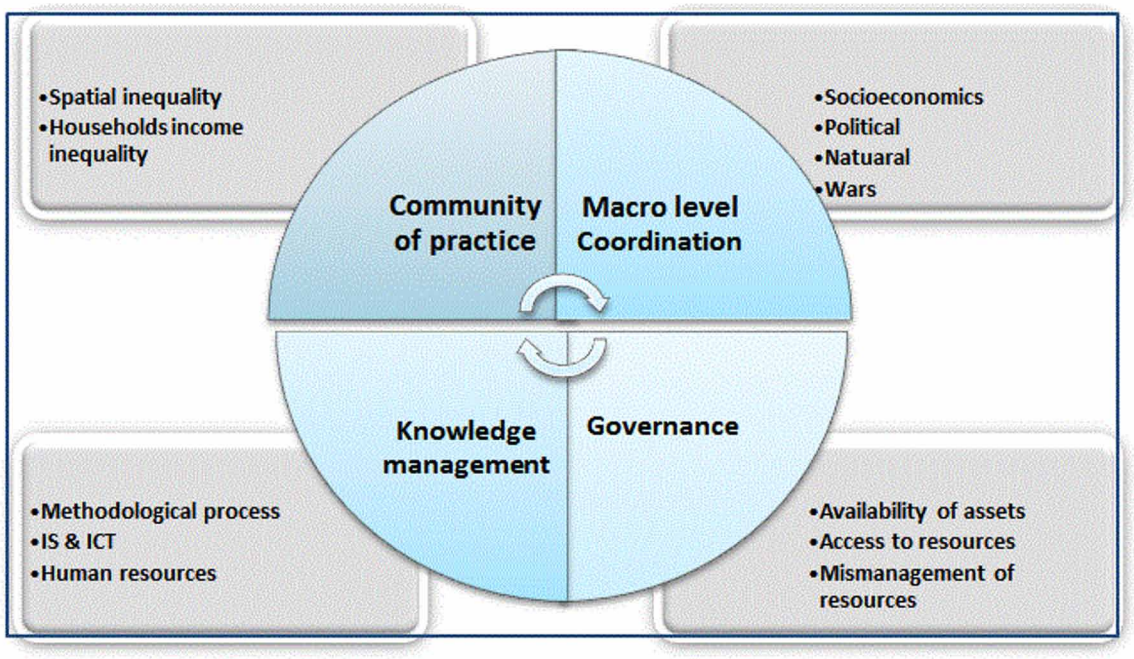
This hadith has added an invaluable contributes to knowledge including:

- Inclusion of behavioral issues in defining the poor,
- The importance of knowing the poor,
- Identification of the needs / wants line,
- The dignity of the poor and needy,
- Methods of identifying the poor.

Accordingly, the emerging knowledge about identifying the poor and needy accompanied these factors to the conventional knowledge including external forces "socioeconomics, political etc." and internal refers to one's capabilities and resources beside organizational knowledge. Anand and Lea (2011) suggesting that the poor are means-ends oriented, where, support this; behavioral approach is richer in explaining individual motivation and sociological limits.

Knowledge about the poor and needy sources that determine who is the poor? The increasing number of defined "poor and needy" by international organizations (World Bank, 2009) suggests that emerging approaches are yet to demark a definite conclusion on poverty outreach. The world community raises a growing concern on the number of poor people and socioeconomic situation in developing world and some Muslim countries. Despite these apprehensions, there seems to be little consensus on who are the poor and what constitutes poverty?

Poverty in Islam includes material, social, cultural, and spiritual poverty linking the notion of social protection to incentives. Sharia framework informs social systems that define structures, processes and most importantly the nature and intensity of individual needs (Hussain, 2001). Recent literature on poverty alleviation opens-up several opportunities for Zakat institutions to reduce poverty. To implement a healthier policies and programs ZI should focus on two strategic directions as Figure 2 shows. It summarizes the major strategic focus on poverty alleviation.



First, consolidate core knowledge processes concentrating on governance and knowledge management that leads to more transparent and effective poverty reduction policies and programs. Second, is to build the essence of communities of practice and macro level coordination. Establishing a healthier environment contributes to alleviation knowledge programs covering the causes of material and non-material factors linking them to socioeconomic, political, legal, and cultural environments. Strategic objectives nurture innovational knowledge creating a multidimensional, complex, and dynamic framework that accommodates changes, re-assessment of vulnerability and poverty causes, policies, and programs.

Internal factors comprises governance and knowledge management processes. First, governance, many scholars among them is Ali (2003) emphasized the importance of poverty alleviation that centered on the causes classifying them into two broad factors:

- Inter-temporal causes where poverty is perceived as a function of time. Cyclicality and marginality are considered the main drives of increasing the number of the poor especially in rural areas and suburbs. For the rural poor, cyclicality is rooted from the seasonality of agriculture and associated activities, where poor people in suburbs lack access to means of production and basic skills.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. The main strategic focus on poverty alleviation

- Cross–sectional reasons describe mainly variations of intergroup within the society. It depends, somehow on lack of participation in their affairs. These societal sections can be found in localities, states, regions. Access to resources, participation, and decision-making are among the main forces. Accordingly, distribution of wealth and power is a function of these forces. The dynamic nature of these processes makes it difficult to standardize what constitutes poverty and its space and time spheres.

Knowledge on these factors signifies the call for the breadth, depth, and impact of any poverty alleviation policies and programs prescribed by Zakat institutions and other organizations. Governance approach relates the causes (availability of assets - Zakat resources, access to resources and mismanagement) to the internal organizational processes namely knowledge management in ZI

Second, knowledge management processes would alter methods of creating, handling, storing and sharing information within ZI It includes knowledge about poor and needy captured by management teams where most processes were personalized based on user criteria. This type of knowledge must be transparent and accurate to identify required actions and capabilities. Similarly, knowledge from the poor and needy are collected. Poor and needy regarded as equal partners in discussing changes and improvements. To utilize knowledge from the poor, Zakat institutions must process knowledge into two ways to understand the perception of the poor with respect to the offered products and services.

Standard knowledge management underpins the basic functions behind the establishment of Zakat institutions and the rationale for their strategic aims. It implies breaking down strategic goals to categorized objectives spelling out different targets prescribed in the holy Quran. Understanding the eight categories (Quran; 9: 60) signifies specific knowledge on services' decisions including the complexity of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

behavior and ideas; the degree of involvement and the perception of received services (benefits) by the categorized beneficiaries. Distributional decisions, too, should be directed by the need and the availability of funds. Measuring success is another important factor to set performance indicator and communicated with targeted groups encompassing attitude, change, and beneficiaries' reactions.

External factors comprise macro-level coordination and establishing community of practice.

- Macro-level coordination tries to understand external socioeconomic environment and utilizes available opportunities and their spatial impacts. Understandings socioeconomics, political, and natural factors imply considerable knowledge on their dynamics in setting rural or suburbs poverty. In a Sevier manner, wars deplete natural and human resources causing human misery. It has portrayed as a cause and effect of socioeconomic, political, and social exclusions.
- Community of practice by ZI tries to furnish two types of relations: product (services) offered to the poor and information; and network related information. Lee (2014) explores acquiring and updating product knowledge is the prime concern for most local actors, not network related information. This self-interest reduces social power to eradicate poverty. Poor people and other organization without adequate knowledge and expertise they will be dependent on others. ZI are qualified to increase the awareness encouraging sharing knowledge and information not only in various product (service) offering, network information, but also in valuing information for the benefit of societal groups.

In practice, unequal distribution of income and wealth is main factor in capability approach to reduce poverty. Scholars differentiate between spatial inequality and households' income inequalities, Zakat institutions use the former as an indicator for strategic concern, while focusing on the latter as a practical means to reduce poverty. On balance households - income inequality may increase without substantial changes in spatial inequalities. In the contrary, income households are often contributes to spatial inequality. In this sense, Zakat institutions as developer of a community of practice, helps in the provision of knowledge and sharing understandings to identify and eliminate spatial and households' inequalities.

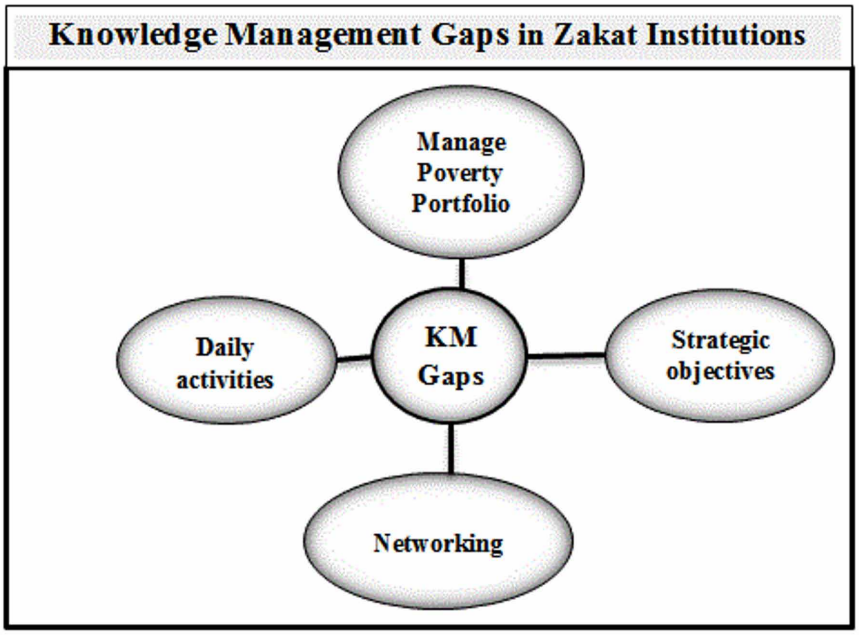
Various frameworks had been established to determine "who the poor is?" are resulted in different measures. The most striking patterns emerged from these frameworks is their varied nature in defining the main parameters and concepts. Different factors played disproportionate roles in shaping the scope of the emerging community of practices for poor and needy in international organizations (UNDP & the World Bank), national countries, NGOs, and Zakat institutions. These variations portray significant challenges in promoting sharing knowledge for poverty alleviation.

UNDERSTANDING ORGANIZATIONAL LEARNING IN ZAKAT INSTITUTIONS

Knowledge Management Gaps in ZI (Learning Environment)

Knowledge management moved to the forefront of all prevailing types of Zakat institutions in Muslim countries. First, the situation where there are no formal Zakat institutions, individual knowledge becomes crucial to account Zakat and to identify who are the poor and their entitlements. Second, in situations where governments are partially involved into Zakat, knowledge deems important to collect, and to distribute voluntary alms. Third, in the case of all Zakat processes are managed solely by the state as a

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



mandatory for all Muslims in a country (Zakat Bureaus, Zakat institutions, Zakat-Houses etc.), knowledge and knowledge management become vital to sustain Zakat objectives. This system is predominantly prevails in Saudi Arabia, Pakistan, Malaysia, Libya, Sudan and Yemen. All three types have resulted in differentiated knowledge management processes that had impacts and implications on the degree of poverty in the country and the magnitude of the need. However, the following gaps reflect the challenges to incorporate knowledge management in poverty alleviation in Zakat Institutions.

Figure 3 indicates knowledge management challenges (knowledge gaps) in Zakat institutions.

To promote healthier Zakat institutions the following factors arises as vital forces to lead Zakat institutions towards knowledge-based organizations.

- Most ZI established significant repositories comprising technologies designed to capture and store structured or written knowledge about the poor. Installing systems without addressing the related cultural and content management can result in host problems. Movements into and out of poverty arise from different changes including socioeconomic activities, time, and space. This needs knowledge to create and to share sustainable poverty portfolios.
- Failure to align ZI knowledge effort to poverty alleviation resulted in a minimal impact on the poor and needy. Internal governance is to focus on strategic vision of eradication of poverty and reaching the poor and needy. Both Zakat Board of Trustees and management teams at state and local levels should carefully assess their internal processes to accommodating the poor and needy views. Historically, this has been an area of knowledge debates between Sharia knowledge and professional knowledge to integrate new knowledge about the poor and vulnerable people and emerging socioeconomic activities to satisfy the societal goals. In most areas (localities), key needs are ill addressed or completely overlooked. These elements overshadowed the values of

Figure 3. Knowledge management gaps in ZI

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

reaching the poor and making positive impacts. Supervisory board oversight should combine new standardized measurement systems to determine entitlement requirements. National advisory – supervisory / consultative – committee is to oversee the overall entitlement approach and their suitability for each location.

- Persistently, the OIC reports on Zakat calls for improving coordination and networking between and within Zakat bodies (OIC, 2008). Most ZI focuses on internal knowledge management renouncing potential opportunities associated with sharing knowledge with other Zakat bodies. In normal cases, healthier institutions benefit from sound external knowledge. This comprises knowledge about surrounding environment including market, information, and characteristic; other providers of similar services and their management and leadership styles; prevailing technology and available infrastructure including financial rules and regulations.
- Applying knowledge management into ZI processes implies a careful understanding of unique needs of various users groups. Delivery knowledge denotes practical usage of standard knowledge by Zakat institutions with relevant technology. Daily processing of this knowledge entails how Zakat institutions identify, reach, and meet both beneficiaries and organizational expectations. Excellence in delivery refers to easiness to do business in terms of day-to-day management processes. Personal touches by staff in the provision of the services accumulate managerial knowledge on the best way to achieve stated goals and objectives involving the mechanisms of resolving problems. A call to strengthening employee's knowledge is crucial to achieving goals together with better understanding of supported means of delivery and communications. Organizational knowledge displays different types of knowledge about the processes, related technologies, and organizational culture. The latter is fundamental to Zakat institutions historic and future social and institutional performance. Senior managers take important steps to communicate and reshape desired culture to balance developmental and institutional objectives. Strengthening knowledge management processes aims to ensure the organizational values are central to every employee. It affirms the importance of mission and values on an ongoing basis via organization's means of communications. Latest technology acts as a vital role in enhancing efficient delivery.

As an important factor, prudent behavior of Zakat institutions is very important to envision the divine goals of correcting societal ills i.e. poverty, in-debt and for the sake of Allah. In this regard, transmitting values and believes into actionable behavior is a crucial element for successful performances. This necessitates the incorporation the values of knowledge, fairness, and justice into ZI processes, structures, and people. Equity, too, is a concern for Zakat distribution; it does not mean equality between the eight categories mentioned in the Holy Quran (9:60). Understanding the nature of above challenges require managerial knowledge to building ZI as an organizational learning.

Zakat Institutions Outreach Challenges

Knowledge on poverty outreach has reflected on institutional performance. Barry & Tacneng (2013) emphasized that NGOs and voluntary organization are successful than formal ones like banks, and local governments. Poverty outreach measures efforts to reduce poverty and considers two aspects depth and breadth. Depth of poverty outreach indicates how the net gain from ZI of a given financial assistance, service, and support are valued by the society in general and poor people in particular. Breadth of poverty outreach denotes the number of poor people benefited from ZI financial assistance, service, and support.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Within the setting of organizational learning, Zakat institutions need to consolidate their understandings on outreach processes and related knowledge. In practice, Zakat institutions outreaches processes rely on two basic methods claimants and informants. Claimants are poor and needy (individuals / groups) put their requests to Zakat offices justifying their need and destitute. Proves / support are necessary pre-requisite for accepting their claims before processing. The sequence includes local committee, local office, matching / mismatching entitlement's criteria and availability of funds at locality then the final recommendation. Visits to verify the claim might be included in the process. One of the biggest criticisms for this practice is that: direct measures are prone to bias, that the poor overstatement, understatement or withholding of information based on his perception that such action(s) will serve his interests.

In contrast, informants (individuals/organizations) who are legally responsible of identifying the poor among their localities are often the locality élites. They observe poverty and destitute in their areas notifying the most needed population reporting to the local Zakat office for assessment. Local Zakat officer prioritize all claims from different sources then report to local Zakat committee who reach a consensus on the rules, procedures against the allotted amounts. Key weaknesses in traditional approaches to Zakat outreach processes comprise lack of scientific utilization of knowledge management components, dependence on financial needs only; inability to handle huge number of claims; lack of efficient processes that links financial plans to actual distribution and inadequate timing. As a result in most cases, the committee prefers the breadth than depth which deepen poverty and destitute.

The main challenge faces ZI is the tradeoff between the depth and breadth of poverty outreach. The huge number of poor and needy within the domain of Muslim countries necessitates understanding of exclusion tendencies as a vital factor to reduce poverty. Poor and needy (consumers) have been informally and formally excluded by Zakat institutions.

Informal exclusion is the most significant areas in the shift towards consumer centric approach. Exclusion caused by various factors including: Lack of understanding poor and needy perceptions; kind of ZI product (service), policies or procedures that contributed more to informal exclusion; outreach processes; competencies; and lack of strategies to mitigate bias towards the poor. Zakat institutions processes also contributed to formal exclusion of poor and needy people. This includes the type of the product / services; discourage poor people to apply or reapply; matching poor people's need and organization's capacities. Lack of supporting documents, prove, and even field visits may result sometimes in formal exclusion. The most significant element in this regard is the limitation of the products; they were associated to financial products only, while some poor and needy requires capacity building and changing / redirecting their competencies and skills.

A self-exclusion referred to voluntary exclusion exercised by the poor and needy people themselves from Zakat institutions distributional activities. As noted in *Hadith* earlier, these types of people require close attention by Zakat institutions to contain their need and destitute. The role of Zakat institutions is to extend their outreach to identify them and to understand their perceptions for incorporation in the institutional strategies. Similarly, tracing back ex-beneficiaries of Zakat institutions' products to evaluate the change before and after to improving their products and the change in the poor and needy lives.

Given the selected learning environment factors and outreach processes, strengths include the following:

- Understanding Zakat institutional mission that envisage the complexity of environment,
- Sharing the value of continuous learning as a necessity to perform obligations and duties,
- Developing relevant learning style to accommodate exclusionary tendencies.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

International research (World Bank, 2012; UNDP, 2009) confirmed that countries with stronger local coordination systems and governance have better outcomes suggesting increased knowledge sharing reduces vulnerability and destitute. For instance in the Sudan and Pakistan, local authorities lack these efforts despite the existence of Zakat institutions and decentralized local governments systems (Hussain, 2001; Kahf, 1997).

Knowledge creation is embodied in all aspects of Zakat processes, a learning culture that governs its environment cover internal processes, external knowledge, and prudent behavior. Such framework is crucial to highlight the knowledge gaps and to improve outreach processes correcting exclusionary tendencies. Issues of time lags between knowledge creation and coordination and its uptake in practice remain the main challenge in Zakat Institutional learning. These require careful understandings to improve Zakat institutions' processes and capacities; and to concentrate on perfecting outreach methodologies and practices; and to consider knowledge management seriously in drawing entitlement criteria and the needed product or services.

POVERTY INTELLIGENCE PORTFOLIO

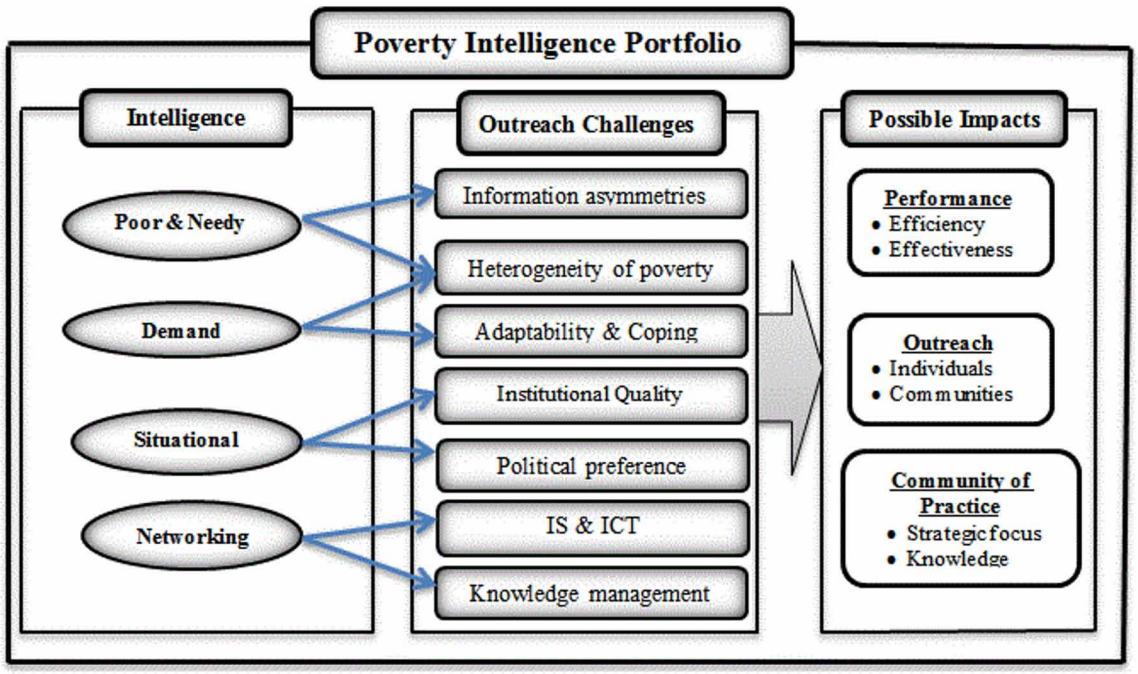
Poverty intelligence portfolio refers to a detailed knowledge (understanding) of the poor in terms of who they are, what they do, and what they do for living. Consumer centric knowledge management intelligence includes understanding of poor & needy intelligence, demand intelligence, situational intelligence and networking. The portfolio facilitates the following:

- Provide comparable knowledge to evaluate ZI performances.
- It supports decision-making process.
- It permits ZI to predict the outcomes of its own services and activities more accurately, and to learn when to anticipate response or coordinate.
- It provides networking enhancing communities of practice.

Poverty intelligence is an important element in applying consumer centric approach in Zakat institutions. It informs strategies, decision-making processes, and practices. It complements other elements of theoretical knowledge that identifies the poor people as a central stakeholder in organizational learning. The importance of poverty intelligence goes beyond understanding the poor; it is however, extended to consider factors that influences the existing poverty situation and possible future changes.

In this regard, its flow comprises knowledge for the poor to satisfy their needs and to disguise their destitute. Knowing the offered products and services by Zakat institutions are essential factors to the needy. Knowledge about the poor and needy is designed to understand the histories, economic activities, causes and the roots of poverty in personalized ways. For continuous improvement and feedback on the services offered by Zakat institutions, knowledge from the poor and needy is crucial. Ordóñez (2002) emphasized that such types of knowledge for customers and knowledge from customers are part of rational intellectual capital and their flow are critical in developing customer relation management. This entails standard elements in accruing knowledge "collect, store and distribute only the needed knowledge." To achieve successful CCKM approach; poverty intelligence is required to involve master database management, change management, rules, and procedures comprising the following:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



- Validating accuracy and availability of required data.
- Technical support in all aspects i.e. IT, communication and training.
- Defining intelligence processes, adapting best practices, internal requirement, and knowledge about, for, and from the poor & needy. This incorporates expectations from the system and from the poor and needy.

Figure 4 identifies poverty intelligence portfolio including types of required intelligence, outreach challenges, and possible impacts. . It is clear that the portfolio components reflect the essence of CCKM, it shows their possible impact on three different areas ZI performance, outreach, and community of practice. Achieving the ultimate goal will be accelerate by recognizing outreach challenges, capabilities, and developing a focused organizational culture evolved around the poor and needy.

Poor and Needy Intelligence

Poor and needy intelligence encompasses current poor & needy people, previous client, and vulnerable people. It refers to a detailed understanding of the three types of poor and needy including: First, basic database reflects necessary socioeconomic, demographic information comprising essential income and wealth assets and their source. This is the prime source to assess the entitlement. Second, storing, processing, analyzing, and sharing data to verify and to compare poor people status and progression. Normally, assessment procedures include field visits' reports on a regular basis to observe changes. Third, satisfaction data oversee the degree of satisfaction on Zakat institutions products / services. Internal and external surveys (interviews) used on regular basis to supply the necessary information. Forth, feedback

Figure 4. Poverty intelligence portfolio

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

database reflect the regular perception of the poor and needy (customers) on all ZI processes. Poor & needy intelligence used to enhance decision-making and to improving distributional processes.

Although, information asymmetries is the main challenge for current poor & needy; the intelligence should focus on the following:

- Identify the poor purpose for each services offered by ZI.
- Plan the process around the poor's requirements.
- Identify the support required by each poor people to deliver effective services. This will build ZI around effective delivery of these services.
- Provide access to services offerings using different means of communications.

These steps consolidate the essence of consumer centric knowledge management in ZI.

Demand Intelligence

Demand intelligence provides detailed insights into what items and in what quantities ZI provide in different circumstances. Zakat institutions deliver varied products and services ranged from financial, services support, means of production, assisting individuals and families, supporting education, health etc. Demand intelligence vary over time and between places involving the following offerings: first, direct financial support for both individual and collective poor people. Second, it enhances services including health and health insurance, education, water electricity etc. Third, ZI provide means of production for both individuals and communities. Forth, consultancy and knowledge sharing, in most cases this is not used satisfactorily.

Globalization generated diversified economic activities that resulted in heterogeneity of poverty. Accordingly, poverty perceptions had changed, hence ZI services that targeting the poor. In theory, the distribution of Zakat aims to convert Zakat receivers to Zakat payees suggesting the giving should be sufficient providing the necessary means for transformation. In practice, adaptability and coping with knowledge base economy entail scrutinizing the actual services offered, and the targeted services; and the desired services. Studies on drop out or ex-client are very rare in Zakat institutions. Ex-client information can be used as "key performance indicator" for the institute or as a reflection on the depth of institutions' products. External research in this matter is important to justify the validity of the service. Exit monitoring system offers useful insights about magnitude and reasons for dropout. Revisiting ex-client's database with new developments and changes is necessary to compare existing clients with previous ones. Interviews or surveys are utilized to gather these types of information. Current systems in Zakat institutions need to be revised to improve the objectivity of the information.

Situational Intelligence

As a basis for strategic decision-making, situational intelligence focuses to understand the broader environment in which poor people live and interact. It provides knowledge on external environments that shape poverty and vulnerability conditions. It depends on national and international socioeconomics information as key indicators in understanding poverty environmental factors. Local areas economic activities furnish the required components to mapping poverty and vulnerability. Institutional information compares the competitive status between similar services' providers. Competitors normally differ in

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

terms of targeted groups, strategies, systems, scope of work and communication. Existing infrastructure is however, helps identifying potential link between present policies and actions and future outcomes. Institutional quality and political preferences are the main challenges. Situational intelligence attempts to capture broadly based strategic thinking on long-range time horizon enhancing the following:

- Detection of possible threats and opportunities recognizing weak signals and their consequences in spreading poverty in the future.
- Develop contingency plans to avoid severe impacts.
- Becomes more effective in decision-making, good decisions normally rely on good information.

Zakat institutions should coordinate remote areas' database and their processes by identifying the need, observations, and self-assessment. Mapping the overall environment materializes certain criteria including scoring, ranking, and prioritization institutional involvement on poverty alleviation.

Networking Intelligence

Networking intelligence refers to develop community of practice in poverty alleviation within which situational learning develops, information exchanged, and knowledge shared to reduce poverty. It results in developing a set of relations among ZI, local institutions, individuals and the rest of the world. Intelligence networking highlights shared knowledge and activities where members:

- Possess and develop shared values and attitudes (dynamics) to reduce poverty.
- Members contribute in creating, storing, and sharing knowledge to alleviate poverty.

In particular, Zakat institutions, intelligence networking seeks to:

- Coordinate between Zakat institutions to exchange experiences and practices.
- Ways to upgrade Zakat sources and funds.
- Standardization of Zakat practices.
- Reach a consensus on legal frameworks.
- Increase awareness of Zakat issues.
- Exchange experiences with the poor and among the poor.
- Educate the poor.
- Offer training for vulnerable people.

Developing poverty portfolio as a foundation in implementing consumer centric knowledge management in ZI hindered by various challenges among them is capabilities, knowledge sharing, accessibility, IS and ICT. Successful poverty portfolio and intelligence networking enhance ZI to focus on knowledge and knowledge management, and to integrate internal processes to becoming a pro-poor focus. Other benefits include improving performance (efficiency and effectiveness), and improving outreach for both individuals and communities.

FUTURE RESEARCH DIRECTIONS

By assessing the interplay of CCKM and poverty alleviation knowledge in ZI the findings showed that, significant knowledge gaps remain unaccounted for. Future research is needed to improve Zakat institutions organizational quality and effectiveness to alleviate poverty. First, the discussion on CCKM processes in ZI opens up a need to further investigations on knowledge management processes. Investigations in these areas will increase the understandings of identified gaps in governance and knowledge management processes, and the type of products or services and related knowledge.

Second, analysis of outreach as means of improving poor people well-being and the effectiveness of ZI require intensive empirical research on outreach methodologies, and outreach practices. The third area of investigation should focus on poverty intelligence portfolio and its components. Theoretical and empirical insights on knowledge sharing and transfer are required to enhance the overall institutional quality.

CONCLUSION

Consumer Centric Knowledge Management approach in Zakat institutions is considered one of the most valuable resource for creating, organizing, sharing, and utilization of knowledge for effective poverty alleviation efforts. Poverty alleviation has gained centrality in development agenda in the last decade. A number of factors explain these heighten among them is the growing no. of poor people in the world in general and Muslim countries in particular. This chapter assesses the interplay of the two developments using ZI as a premise to appraise their engagement to alleviate poverty. It departs from a central consideration that the poor and needy are the main envisioned stakeholders presented as strategic goal for all organization. It extends literature on poverty alleviation and KM providing key summary points of current advanced and limitation (gaps) in relation to ZI

Knowledge creation is embodied into Zakat operations. However, its development was hampered by learning environment, internal processes and prudent behavior. This deters Zakat institutions to benefit from sharing and collaboration processes limiting their learning abilities especially in outreach. Learning from other NGOs, national, international organizations around the world had been overshadowed by measurement methods and some material definitions. In comparison different perceptions, offering and approaches exacerbated tacit and explicit knowledge on the poor and needy, scope, outcomes, and impacts.

Changing the landscape of poverty alleviation turned out to focus on knowledge driven processes portrayed by key knowledge agents including the World Bank and IFAD. In general, this result provides a better understanding of poverty alleviation among ZI as well as other organizations. It highlights poverty alleviation and outreach as the basis for any strategic development goals focusing on knowledge sharing and network approach.

Developing an adequate system of knowledge management is a necessity for effective ZI to achieve their strategic goals. Although, ZI are yet to realize their potentials in knowledge creation and sharing; consumer centric knowledge management approach and governance enables them to recognize their internal abilities; while socioeconomics knowledge and community of practice facilitate the comprehension of their external capacities. The identified gaps include failure to handle repositories effectively; alienation of poverty alleviation efforts to strategic goals; networking deficiencies; and knowledge management daily activities.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The study revealed the potential of Zakat institutions as an awareness tool, its institutional quality is yet to be materialized to favor poor and needy. Tradeoffs between depth and breadth of outreach necessitate the improvement of outreach methodologies and internal processing. The reliance on the poor to approach Zakat (social security) offices should be reversed to adhere to the methods noted in *Hadith*. These require careful understandings to improve Zakat institutions' processes and capacities; and to concentrate on perfecting outreach methodologies and practices; and to consider knowledge management seriously in drawing entitlement criteria and the needed product or services.

The proposed poverty intelligence portfolio illustrated in Figure 4, highlights poor and needy at the heart of poverty alleviation processes. It is clear that the portfolio components reflect the essence of CCKM, it shows their possible impact on three different areas ZI performance, outreach, and community of practice. Achieving the ultimate goal will be accelerate by recognizing outreach challenges, capabilities, and developing a focused organizational culture evolved around the poor and needy. The composition underlines poor and needy intelligence encompassing current, previous, and vulnerable people linking their diverse information to associated needs and products / services. Demand intelligence provides detailed insights of products and services to be offered, while situational intelligence complement with the understanding of the broader environment in which poor live and interact. Networking intelligence refers to develop community of practice in poverty alleviation within which situational learning develops, information exchanged, and knowledge shared to reduce poverty.

KEY TERMS AND DEFINITIONS

Formal and Informal Exclusions: Informal exclusion from Zakat distribution is the phenomenon characterized by lack of understanding, processes, strategies and low staff competences; where formal exclusion denotes inadequate Zakat institutions' methods, criteria and policies that deter the poor and needy from benefiting from the offered products by various means.

Institutionalization Process: Institutionalization process is the means of incorporating CCKM components into knowledge management practices in Zakat institutions.

Poor and Needy: Poor and needy are those sections in the society below the acceptable level poverty measures.

Poverty Intelligence: Poverty intelligence involves database management about the poor and needy and their environments.

Zakat Institutional Learning: Zakat institutional (organizational) learning is a prudent behavior of knowledge acquiring, sharing, storing, and dissemination of knowledge; processes; related technologies and Zakat institutions culture.

Zakat Institutions: Zakat institutions are religiously based organizations aim to match payees' obligations and receivers' rights on prescribed alms.

Zakat Outreach: Zakat outreach is the processes of distributing Zakat to its prescribed categories mentioned in the Holy Quran as end beneficiaries.

ENDNOTES

[1] The Arabic word of "Zakat" means purification and growth. Its dimensions extended to spiritual, economic, social, and developmental. For more elaboration, see Al Qaradawi, Y. (2000). Fiqh Al Zakat, English Translation by Kahf, M. Jeddah; King Abdul Aziz University: Centre for Research in Islamic Economics.

[2] Sunnah is considered as a path or method of what prophet Mohamed (PBUH) said, did and approved.

[3] Conditions include sufficient amount, duration, the type of wealth or economic activity etc. For detailed criteria, Al Qaradawi (2000) provides significant development in different categories.

This research was previously published in the Handbook of Research on Managing and Influencing Consumer Behavior edited by Hans-Ruediger Kaufmann, pages 507-532, copyright year 2015 by Business Science Reference (an imprint of IGI Global).

Chapter 81
Macroeconomic Reasons for International Migration Development

Lokota Oleg
Russia Academy of National Economy and Public Administration, Russia

Kozlova Elena
Rostov State Transport University, Russia

ABSTRACT

Fast-growing international migration as a factor of labor market globalization is an important trend of the world economy and a determinant of social-political transformations. The study of fundamental economical reasons for international migration is relevant due to their prognostic, predictable, and normative potential, which can be used in conditions of global economic non-stability. This chapter analyzes the role of natural resources, financial, and labor factors in economic growth of the modern states and studies relationships between stimulating the role of natural resources, finance, and labor with levels of modern countries' economy development. Based on achieved results findings about fundamental reasons of international migration, transformation of labor factor's role in providing an economical progress of the states, efficiency of positive impact of manufacturing factors (domestic and attracted from international markets) are offered.

INTRODUCTION

Factors for national economy development within the frames of complex global economic system, as well as conditions for long-term economic progress in turbulent market environment have always been prior areas of science research.

Analysis of factors affecting economic growth, consideration of economic cycles, studying of labor resources role in economic dynamic of modern states are a basis of social-economy forecasting and serve as a theoretical principle for national economic policy formation and development.

Economic growth as criteria of national economic and social system development is an original result of Governmental economic activity, indicator of National well-being and guarantor of economic independence. Stability of economic growth, it's dynamic and qualitative content can demonstrate a real economic health of society.

Today, economic growth is a central problem of macroeconomic policies of all nations and states. On the one hand, national states are intertwined by complex cross-border economic relationships with participation of MNCs and international economic regulators. On the other hand, even in the conditions of economic globalization dynamics of economic growth preserve asynchronous, dependence on external economic conditions and domestic resource potential.

ECONOMIC GROWTH AS CRITERIA OF NATIONAL DYNAMICS

Economic growth in its narrow sense - is an interaction of exogenous and endogenous factors that are forming at the stage of manufacturing, gaining sustained character on the other stages of economic reproduction, and finally lead to quantitative and qualitative changes of the productive forces (resources, labor, technologies, capital and so on), to increasing of gross product and national welfare (Marx, 1986, pp. 46-49).

In a broad sense: economic growth is a reflection of current economic and institutional conditions that determines a direction of social movement, establishes a nature of social development in general (progressive, regressive or slow).

As an object of study economic growth has qualitative and quantitative determination; its substance is revealed through analysis of qualitative and quantitative characteristics.

It's necessary to clearly distinguish concepts of "economic growth" and "economic development ". Firstly, the development takes place even when there is no any growth. Secondly, development can be expressed in different structural changes, in various innovations that do not lead directly to economic growth. Thirdly, development can be carried out by declining trend, without quantitative growth and even with a decay of product or services properties.

Being a result of social reproduction, economic growth is not only an attribute of manufacturing. Appeared at the stage of manufacturing economic growth passes through the stages of distribution and exchange and finally manifests in consumption. There is very complex relationship between production and consumption. Despite an importance of production, last one is useful only as supporting of consumption. So economic growth that was born in the depths of production process, finds a real essence and content only in the end of reproduction chain (when product is produced, sold and consumed).

Economic growth as a complex phenomenon can be presented not only as a criterion of economic development, but also as a process with number of quantitative and qualitative economical and social indicators. Among them we can primarily note the indicators of absolute increasing of gross national and domestic product (GNP and GDP), national income (ND) and changes of these parameters in "per capita" terms.

We can use both of these groups of indicators. For example, focusing on the problems of economic and political potential, it seems more appropriate to use first group of indicators. However, comparing living standards in different countries and regions, it seems more preferable to use second group.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

An economic growth analysis becomes really reasonable when it carries out in a historical retrospective, with a highlighting of different historical periods. These factors define particular types of economic growth.

As a main criterion of classification we can use a mention of the main factors of social production. Basing on them we can identify three types of economic growth. Every of them has own characteristics and differences:

- Pre-industrial growth. Leading factors of pre-industrial growth have natural origin. This economic growth is characterized by increment of wealth in its natural form;
- Industrial growth is differing by a dominance of material, tangible conditions of manufacturing. An important indicator of industrial growth is dynamics of the gross national product;
- Post-industrial growth is characterized by increasing of human factor importance. Human is moving from a category of "means for goals' achieving" to a system of management and (later) production objectives.

Ability of the economy to grow up depends on several factors. As growth factors we can consider phenomena and processes that determine pace and scale of long-term increasing of real outputs, opportunities to improve an efficiency and quality of growth.

By type of influence on economic growth direct and indirect factors can be distinguished.

Direct factors make economic growth physically possible. This group includes the factors of supply such as:

- Quantity and quality of human resources;
- Quantity and quality of natural resources;
- Amount of capital;
- Technology of production;
- Level of development of entrepreneurial skills in society.

Indirect factors are conditions that allow a practical realizing of society's capabilities (potential) to economic growth. Such conditions are creating by factors of demand and distribution:

- Decreasing of market monopolization;
- Local tax regime;
- Efficiency of finance and banking system;
- Increasing of consumer, investment and government spending;
- Expansion of exports ;
- Abilities of reallocation of productive resources in economy;
- Current system of income distribution.

The economical impact of these factors determines a type of economic growth. Economic science distinguishes two types of economic growth, firstly formulated by Marx (1986, pp. 116-119). They are differed by ratio of results and factors of production.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The first type is characterized by a quantitative increasing of economic resources (factors of production) usage: construction of new plants, power stations, roads, new land, labor and natural resources commercializing. This is extensive economic growth. With this type of economic growth a growth of GDP is achieving by expanding of scope of labor using with keeping condition when average productivity of labor in society does not change.

The second type is called "intensive economic growth". It occurs when GDP growth is higher than growth of economic resources' usage.

Extensive growth is a simple type of economic growth. Its main advantage is in providing an easiest way to increase the pace of economic development, making it relatively quickly and cheaply. Historically extensive growth transforms to intensive ones. Western countries, for example, completed their economic development by extensive way and moved to intensive one in the first half of the XX century.

Dutch economist Tinbergen, J considered relationships between factors of extensive and intensive growth in 1870-1914 (Table 1) (Timbergen, 1952, pp. 179-186).

Later, American economist Solow, R. (1974) found that in 1909-1949 more than 80% of growth of the U.S. GDP caused by technologies' progress (intensive factor) (not by usage of labor and capital).

One of famous researchers of economic growth factors - American economist Dennis, E. - divided factors of economic growth in two categories. First category includes physical factors of production (labor and capital), the second - factors of growth of labor productivity (Dennis, 1972).

For evaluation of labor factor's impact Dennison (1962, pp. 12-18) considered not only a size of the labor force, but also dependence of labor impact's on age, gender, level of education and training. For assessment of capital impact on economic growth he used indicators such as costs of housing, equipment, industrial buildings, inventories and foreign investment.

The growth of labor productivity, according to Denison (1962, pp. 15-18), is a result of following processes:

- Expansion of technological knowledge or improving of manufacture process' organization.
- "Catch-up" that occurs due the transmission of knowledge and technologies from highly developed countries.
- Improvement of physical productive factors' placement and their usage in industries and regions where greater economic efficiency can be achieved. When location of productive factors is close to optimum, productivity of their usage increases.

According to Denison (1962), there are some following possibilities for optimization:

Table 1. Ratio of factors for intensive and extensive growth in some countries of the world

Country	Factors for Extensive/ Intensive Economic Growth %
Great Britain	80/20
Germany	60/40
USA	73/27

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Absorption of surplus labor that formed as a result of agricultural production intensification;
2. Reduction of small independent producers' sector, that leads to similar consequences occurring in the agricultural sector;
3. Removal of world trade restrictions that improves an international division of labor.

Development of the world economy, following with a progress of manufacturing specialization and national consumption.

An analysis, conducted by Denison, E. allowed explaining differences in rates of economic growth of the USA, Western Europe and Japan in the postwar period. Thus, the economic growth in the U.S. was not only less significant (in 1948-1969 the average annual rate of economic growth in the U.S. was about 3.87%, 4.78% in Western Europe, and 8.8% in Japan), but also was stimulated by different factors (Dennison, 1962, pp. 12-18).

US economic growth more caused by increasing of labor and capital. Since the 1970s growth of labor productivity in the United States had only small impact on the country's economic development, because society sent more and more resources to devote an environmental protection and to develop a human habitat.

A situation in Western Europe and Japan was different. West European economies, according to the calculations of Denison, E. grown for 2/3 because of increasing of labor productivity.

50% of economic growth of Japan was due to increasing of labor and capital using, other 50% due to the growth of labor productivity. As a main factor of economic growth in Japan Denison (1962) considered an increasing of capital investment.

Denison analysis contained many interesting and unexpected conclusions. However soon it was subjected to serious scientific criticism. The main drawback of this approach appeared because of Denison, E. studied an efficiency of different factors of economic growth separately and ignored a process of their interaction and mutual influence.

In the 1970th economic growth in the U.S. and other developed countries slow down. A main reason for this trend was a decreasing of labor productivity.

In 1980 – 1990th a labor productivity slightly increased, but no-one leading countries came close to the rate of productivity growth of 1960th (this period Western literature is considered as the golden age of rapid economic growth).

Reducing of labor productivity growth, economists explain by influence of following reasons:

- Worsening of demographic structure of the labor force (increasing of the share of young people that born in the years of post-war "baby boom" and increasing of part-time employment);
- Increasing of spend for environmental protection and fight against crime;
- Sharp rising of the world oil prices in this period;
- Reduction of dynamic of innovations commercialization;
- Increasing of government regulation.

Some authors such as Acemoglu (1998), Amable (1994) and Kuznets (1968) have noted that the oil prices rising impacted on the rate of economic growth due to devaluation of existing capital. This process encourages new direct investments to replace existing capital and not to expand a production capacity. However, after replacement of energy-intensive technologies by energy saving ones other trend showed in the economy - acceleration of productivity growth (as evidenced by the 80- 90th).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The model of intensive economic growth has a number of own features, characteristics and advantages:

- It is more sophisticated type of economic growth due to crucial role of scientific and technological progress. Therefore, it requires a high level of development of productive forces, engineering, technologies, higher education and professional level of employees;
- This type of economic growth gives abilities to overcome a problem of resources' limitation.

However, a transition to intensive economic growth is not a simple matter. It requires a progressive restructuring of economy, an increasing of share of high-tech industries, a relevant training of workforce, and a mobility of productive factors in the economy. Therefore, a pursuit of market reforms is one of the conditions for economic growth intensification

LITERATURE AND APPROACHES' REVIEW

The formation of theory of economic growth at first stage was under the strong influence of researchers focused on theory of economic dynamics.

In the early twentieth century theories of economic growth and cycles formed in parallel. In particular, it is now well-known an attempt to create a model of economic growth (economic dynamics) by Kondratiev (1928) and to develop an aggregated conjuncture index.

The basic inputs for formation of the theory of economic growth have been carried out in the operation of National Bureau of Economic Research (NBER) in the United States under the heading of Mitchell, W. He focused on the analysis of economic cycles and market conditions. Formation of theory of conjuncture, that means an interrelated movement of cycles of different lengths also occurred in Russia, Germany, Switzerland, Sweden, and has been associated with the names of Ropke (1972) and Kondratiev (1928).

Note that all of these approaches are closely linked. The concept of the industrial cycles by Tugan-Baranovsky, M. (Michaelides et. al., 1996) had a major influence on the development of world economic thought in XX century. In this approach logic of economic cycles explained by:

- Mechanisms of fixed capital formation;
- Relationships between investment dynamic and loan interest rate.

Ideas of Mitchell (2006, 2008) and Tugan –Baranovsky affected formation of Kuznets and Hansen concept of economic growth.

It is obvious today that the theory of the investment cycle by Tugan –Baranovsky, M. was a basis of the theory of leading sector formation by Kuznets S. This facilitated a development of the theory of neoclassical growth (approaches of Blacksmith - Solow), nonaggregate theory of economical growth (approaches of Blacksmith - Rostow) and theory of technological structures.

If to consider development of the theory of economic growth through the prism of its relationship with problems of cycles and endogenous components of economic development, this progress can be represented in following steps:

1. Keynes (1936) model was under influence of cyclic paradigm and concept of economic multiplier. It should be noted that, historically earlier theory of the investment cycle by Tugan –Baranovsky,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

M. had a number of similarities with the later Keynesian theory of growth. Tugan- Baranovsky, M. and subsequently Keynes, J. considered multiplicative chains between investments, national income growth, increasing of demand and emergence of new sources for investment. Using a theory of over-accumulation by Marx, K., Tugan –Baranovsky, M. proved even a multiplicative effect of recession.

2. First Keynesians (Keynesian model of the Harrod - Domar) arguments contained reminiscences of industrial cycle and based on very strict technological assumptions (the constancy of the ratio between capital and labor that is independent on the quality of the labor and capital). So why this model was criticized by Solow, R. - founder of the neo-classical model.
3. An emergence of the neoclassical theory of economic growth of Solow R. with elastic production function and certain degree of freedom for the inclusion of additional factors of development (Solow residue) (Solow, 1974). Solow model is sufficiently well- known and focused on the analysis of alternative concepts.
4. Model of Tobin (1992) suggested that money is an asset equal to physical investment. Value of Tobin theory for development and practical usage of theory of growth is very high. This impact is indirect through the influence on the theory of economic cycles.

In general, a development of the theory of economic growth in the XX -XXI century shows that a business cycle can be explained by different effect of feedback and multipliers acting in the economic system. Factor structure of economic growth is sufficiently open, is not limited by interactions of labor and capital - or, for example, by the products of new technologies and effective demand.

In addition, economic growth as a macroeconomic phenomenon generates at different levels of the economy. In these terms a behavior of economic agents (for example, propensity of entrepreneurs to innovate, or consumer preferences changes) must be taken into account.

In this regard, an accumulated stock of economic science and research methods in the field of technological, industrial and macroeconomic dynamics provides a possibility to develop delicate instruments for regulating of growth processes.

Most of existing approaches identifies few factors for economic growth that are related with natural resources, finance, labor and technological capabilities of the country. In this study we evaluated a role of each factor (resources, finance and labor) in providing of economic growth of modern countries from 2004 to 2012.

It should be noted that proposed study is not leveling a value of factor of innovative and technological development for countries' economic growth. In the limited frameworks of this study we considered a factor of innovativeness of national economic system in conjunction with national labor potential.

This decision is explained, firstly, through the direct relationships between innovativeness potential of the country and skills of its labor force; and secondly, due to dependence of initial innovation capacity of the state, national innovative background (that is highly required for generation and commercialization of innovations) on the quality of labor relationships within national economic systems (for example, role of the human capital in production, level of investments in the human capital, degree of intellectualization of production and so on).

The purpose of the study is to determine (based on the analysis of countries' macroeconomic indicators) an importance of three factors (natural resources, human resources and financial resources) to ensure a dynamic of economic growth of the modern states in short term (2004 - 2012).

In connection with this purpose following research objectives were set:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- To analyze an impact of natural-resource potential on countries' economic growth based on calculation of economic efficiency of natural resources using by modern national economic systems;
- To define a role of financial resources of the country (based on financial macroeconomic indicators) to ensure countries' economic growth;
- To characterize an importance of countries labor potential in implementation of the world economic progress;
- To track a dynamics of factors for economic growth in modern states for last 8 years (from 2004 to 2012);
- To test an effect of "diminishing utility" for three factors of economic growth (resource, financial, and labor);
- To correlate dynamics of economic growth in the world with dynamics of economic efficiency of the using of natural, financial and labor factors in national economic systems;
- To conduct the study following hypotheses were identified:
  - **H1**: The dynamic of economic growth of the countries causes a disproportionate change of economic value of labor, natural and financial resources in economic progress.
  - **H2**: The financial aspect of economic growth is most susceptible for effect of diminishing utility, while the labor factor of economic growth is out of this pattern.
  - **H3**: Labor factor (including a factor of innovativeness) is the most important for economic growth of developed countries (with medium or low rate of economic growth).
  - **H4**: Financial resources are the most significant for economic growth of developing countries (with medium or high rate of economic growth).
  - **H5**: Natural resource potential is less important for economic growth of the countries with big natural resources potential (effect of diminishing utility).

METHODOLOGY OF THE STUDY

To conduct the study we used the secondary data - statistical data of World Bank (2004 – 2012) that is available on the World Bank official website (www.worldbank.org).

We used statistic data for 72 modern countries selected by their following characteristics:

- Demography and economic performance of the country (national GDP is higher than $1 billion, country has at least three national industries, population of the country is bigger than 1 million, country is relatively economic and social stable);
- Political situation in the country is stable (existence of a legitimate center of authority, country's involvement in the world trade, country's membership in international organizations);
- Required statistic data is available.

For evaluation of natural- resources role in providing of countries' economic growth we calculated a synthesizes index that aggregates following characteristics of the country:

- Estimated value of land and natural resources of the country;
- Share of mining in GDP;
- Energy capacity of the national economy;

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Degree of energy concentration in the country;
- Energetic efficiency of the country;
- Country's share in world export-import of natural resources;
- Internal and external competitiveness of the country's mining sectors.

To assess a stimulating role of financial factors we calculated index that aggregates:

- Level of capitalization of the national economy,
- National annual balance of payments,
- Level of capitalization of the country's leading stock exchanges,
- Level of liquidity of the national economic system,
- Level of investment in fixed assets.

Finally, for evaluation of labor factor impact on national economical growth we used following macroeconomic indicators:

- Capacity of country's labor market,
- Productivity of labor,
- GDP per employed person,
- Rate of unemployment,
- National structure of employment.

Further these indexes were estimated in dynamic (2004 -2012) and were correlated to rates of economic growth of the modern states.

THE MAIN FOCUS OF THE STUDY

The results of stimulating economic growth impact of natural resources, financial and labor factors are presented in Tables 2, 7 and 8.

Taking into account that balanced value of each analyzed factors in countries' economic progress should be about 33%, we can note that highest role of natural-resources in economic progress belongs to rapidly developing countries of the Asia-Pacific region, North Africa and Latin America.

At the same time, countries with developed economic systems, and modest dynamics of economic growth (such as European Union, the United States), as well as small countries that are geographically deprived of powerful natural-resource basis (such as Kyrgyzstan or Armenia) have small stimulate impact of this factor.

In order to test a hypothesis of diminishing economic efficiency of natural-resources for economic growth, we made a comparative analysis of groups of different countries.

The first compared groups present countries with largest and smallest (among the analyzed countries) territories (land is one of the most important natural resource). The comparison of these groups is shown in Table 3.

Results of comparative analysis show that stimuli role of natural resources in ensuring of countries' economic growth is not reducing together with growth of their natural resource potential. However ho-

Table 2. Stimulate impact of natural resources on economic growth of the modern countries (leaders and outsiders), 2012

Nº	Leaders	Index of Stimulating Impact of Natural Resources[1]	Nº	Outsiders	Index of Stimulating Impact of Natural Resources
1	Philippines	82.83	58	Sweden	24.84
2	Peru	77.28	59	Slovak Republic	24.66
3	Colombia	76.5	60	Belgium	24.61
4	India	75.83	61	United States	24.29
5	Morocco	73.22	62	Venezuela, RB	23.71
6	El Salvador	73.09	63	Latvia	22.8
7	Sri Lanka	72.51	64	Kazakhstan	22.53
8	Thailand	67.95	65	Finland	21.34
9	Panama	67.14	66	Canada	21.13
10	Montenegro	63.86	67	Saudi Arabia	20.92
11	Indonesia	62.4	68	Australia	19.86
12	Tunisia	61.05	69	Norway	18.32
13	Brazil	58.71	70	Kyrgyz Republic	12.27
14	Vietnam	58.35	71	Armenia	9.78
15	Bangladesh	58.21	72	Iceland	9.48
				Average Index	23.1

mogeneity of this group is very low. For example, the value of natural resource potential in economic growth of geographically large Peru and Saudi Arabia differs in 4 times!).

Tested impact of natural resources on economic growth of the countries - traditional exporters of natural resources (hydrocarbons and metals), we can also see a low correlation between degree of this impact and countries' resource potential. The results of correlation are shown in Table 4.

Finally, only testing of the correlation between stimulating impact of natural resource potential and level of countries' economic development (GDP per capita) confirms that the role of natural resources in economic growth of developed countries is significantly lower than in developing ones (Table 5).

Data in Table 5 shows that countries with the lowest GDP per capita remain extremely high role of natural resources in ensuring their economical growth. On the one hand, this can be explained by simply lack of other sources for economic progress (for example, financial resources or skilled labor) in the poorest countries. On the other hand, this fact proves an urgent need to find new, more efficient sources for economic growth in the poorest countries, deprived of own natural resources (eg, Jordan and Kyrgyzstan), that will be able to guarantee long-term and responsible strategy for national economic progress.

At the same time factor of natural resources impact has not a leading role in rich countries, even with high natural resource potential (eg, Norway, the U.S., and Australia). Therefore, we can conclude that economic progress of rich countries is providing by their natural resource potential for only 20%. At same time dynamic development of the world poorest countries bases on their natural wealth for more than half.

Separately we can consider BRICS countries (Table 6).

Table 3. Comparison of natural resources' stimulating impact in biggest and smallest countries of the world, 2012

Index of Stimulating Impact of Natural Resources	TOP-15 Countries with Smallest Territories[2]		TOP-15 Countries with Biggest Territories	Index of Stimulating Impact of Natural Resources
67.14	Panama	1	Peru	77.28
30.46	Ghana	2	Colombia	76.5
33.52	Singapore	3	India	75.83
33.24	Denmark	4	Indonesia	62.4
72.51	Sri Lanka	5	Brazil	58.71
31.75	Netherlands	6	Mexico	57.62
24.66	Slovak Republic	7	China	53.36
63.86	Montenegro	8	Bolivia	52.72
24.61	Belgium	9	South Africa	43.15
73.09	El Salvador	10	Russian Federation	31.2
61.05	Tunisia	11	United States	24.29
25.31	Estonia	12	Kazakhstan	22.53
36.56	Cyprus	13	Canada	21.13
35.63	Costa Rica	14	Saudi Arabia	20.92
30.94	Georgia	15	Australia	19.86
42.95	**Average**			46.5

Table 4. Index of stimulating impact of natural-resource factor in the countries - traditional exporters of natural resources

Nº	Country[3]	Index of Stimulating Impact of Natural Resources	Nº	Country	Index of Stimulating Impact of Natural Resources
1	Norway	18.32	8	Russia	31.2
2	Saudi Arabia	20.92	9	South Africa	43.15
3	Canada	21.13	10	Malaysia	55.29
4	Kazakhstan	22.53	11	Chile	55.49
5	Venezuela. RB	23.71	12	Mexico	57.62
6	United States	24.29	13	Brazil	58.71
7	UAE	25.9	14	Indonesia	62.4
				Average index	37.7

As can be seen from the Table 6, stimulating role of natural resources in economic development of Russia is minimal (even role of natural resources in Russian budget formation is huge), while in India it is more than in two times higher.

The values of financial resources impact on countries' economic growth are shown in Table 7.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Comparison of natural-resource factor's impact on economic growth of 15 richest and 15 poorest countries[4], 2012

1	Russian Federation	31.2	4	Brazil	58.71
2	South Africa	43.15	5	India	75.83
3	China	53.36		Average in group	52.45

The data in Table 7 proves that:

- Highest role of financial factor in economic growth of developing countries, both with huge natural-resource potential (such Ukraine, Venezuela, Kazakhstan) or without it (such Uruguay, Armenia, Kyrgyzstan);
- High inverse correlation between the value of stimulation impact of financial potential and capital's saturation of the countries. It is noticeable that countries with high financial saturation have extremely low capital's impact on their economic growth.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 7. Impact of financial factor on the stimulation of economic growth of the modern countries (leaders and outsiders), 2012

Nº	Leading Countries	Index of Stimulating Impact of Financial Factor[6]	Nº	Outsiders	Index of Stimulating Impact of Financial Factor
1	Uruguay	92.47	58	Belgium	4.44
2	Armenia	87.58	59	Japan	4.37
3	Kyrgyz Republic	86.19	60	Malaysia	4.21
4	Paraguay	69.07	61	Spain	4.08
5	Ghana	64.1	62	France	4
6	Georgia	61.96	63	Chile	4

13	Slovak Republic	50.86	70	United States	2.32
14	Kazakhstan	45.91	71	United Kingdom	2.23
15	Ecuador	45.84	72	Singapore	1.77
				Average	19

On the one hand, this obviously proves an effect of declining economic value of capital. On the other hand, significant differences of economic efficiency of capital stimulate its trans-boundary movement (stimulated mainly by rich states);

Despite of extremely high demand for capital from developing countries, within all analyzed countries an average stimulating impact of financial factor is much lower than stimulating impact of natural-resources. This can be explained by high capital mobility and by its high concentration in three global centers of capitalism.

Finally, Table 8 shows the performance of stimulating effect of labor factor.

Data in Table 8 shows a highest stimulate role of labor factor mainly in Western developed countries with high labor productivity, high technological structure of national economies, contributing a further growth of labor efficiency.

At the same time, economically under developed countries, including agrarian states of Africa, Asia and Latin America, are motly growing not due to their labor force potential.

Correlation between labor factor's stimulating role and national labor force potential (a number of employees in the national economic system[7]) confirm an independence of stimulate role of the labor factor on the countries' saturation by workforce.

So, China (country with largest labor potential) and Montenegro has almost similar criteria of stimulating economic value of labor. Consequently, an economic efficiency of labor does not reduce in countries with rich labor resources. An effect of declining economic efficiency of the labor factor does not demonstrate.

MACROECONOMIC FACTORS OF INTERNATIONAL MIGRATION DYNAMIC AND COUNTRIES' MIGRATION ATTRACTIVENESS

Modern scientific approaches to labor migration are often based on studies of Lewis, E. on economic development in the conditions of unlimited labor supply, for examples, studies of Gavrilova (2009), Ivakhnyuk (2005) and Maevsky (2003). According to these approaches economic system of the modern states consists of two sectors - capitalist and non- capitalist. The first one is based on manufacturing; is concentrated on profitable activity and capital increasing, and acts as a labor force employer. The second sector is initially saturated by manpower, but is not a highly profitable form of commercial activity.

Growth of capitalist sector of national economic system, logically leads to the pumping of labor force from non- capitalist spheres. A specificity of geographical concentration of capitalist and non- capitalist sectors determines directions and intensity of domestic or international migrants' flows.

Later, neoclassicists – Adelman & Taylor (1991), Fields (1975), Fix & Passel (1994), Jorgenson (1967), Perloff, Lynch & Gabbard (1998) - have continued to analyze the international (and domestic) labor migration, based on the ideals of the market and market equilibrium. Another approach founded by Todaro considered problems of market functioning (failures and imperfections of market mechanisms, such as unemployment), which are (according to the author approach (Todaro & Maruszko, 1987) the main causes of international and internal migration flows formation and development.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 9. Factors affecting on directions and dynamic of international labor migration

Dynamic of International Labor Migration 100%		
Economical factors of group A (can be objectively estimated) *– share in a total index - 60%*	Socio-economical factors of group B (can be estimated) *– share in a total index - 40%*	Social factors of group C (can't be estimated) *– not considered*
- average salary in the country of origin - average salary in the country of destination - living cost in the country of destination - migration cost	- growth of population - economic growth - rate of unemployment - national debt - foreign investments - refinance rates - equality of material values distribution	-impact of relatives, -migration traditions, -diasporas, -special bilateral programs and agreements

Problems of migrants' selectivity, well represented in scientific literature, became a basis for formation of approaches to labor migration, based on the theory of human capital and formed in early studies of Mincer (1974) and Becker (1975).

Development of human capital theory become a new vector in international labor migration theorizing from macroeconomic determinants of current socio- economic process to the set of its micro-factors related with human nature.

Basing on results of scientific researches factors stimulating an international labor migration can be classified into two types – economical, that can be objectively evaluated and analyzed (eg, differences in wages in the place of migrants origin and destination, cost of migration and so on); socio-economical, that are weakly objectively measurable (eg, country's attractiveness for labor migration in terms of socio-economic criteria - dynamics of economic growth, unemployment, domestic and external debt of the country, number of migrants in the national economic system, equality of social benefits distribution and so on), and social, not amenable for objective evaluation (families' impact, migratory traditions, existence of migrants' diasporas, special programs, bilateral agreements between countries of origin and destination, and so on) (Table 9).

Further study of international migration trends will be conducted only on the basis of modern states' macroeconomic indicators (excluding any social and political relations between the pair of states). Furthermore, the study considers only the problems of mass international migration, because an evaluation of highly qualified personnel international migration within the neoclassical model is not possible.

As the main objective factors of international labor migration (group A) in the study were highlighted:

1. Average wages in the country of destination (as a main factor attracting foreign migrants). It should be noted that this study is based on equality of migrants' and locals' labor;
2. Average cost of living in the destination country (study is based on the assumption that foreign migrant workers are fully socialized in the host country; and have living costs similar with locals).

A difference between wage and living cost in the country of employment determines an amount that migrants can save (or send home). Essentially, this amount is an economic reason of migration. If the difference between wage and living cost in the country of employment is less or similar with average salary in the country of migrant's origin, international labor migration loses any economic meaning.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

For example, an average salary in Japan by World Bank statistics is less than in the U.S.A. (2522 USD per month compared to 3236 USD per month[9]).

However, the minimum living cost, for example, in California is 1258 USD per month, and, consequently, a Japanese worker can save/send home less than can earn at home. Obviously, there are no any economic reasons of mass labor migration from Japan to the U.S.

Comparing with previous studies of international migration by Clark, Freeman & Soete (1981), Kolosnitsyna (2005), Ravenstein (1985), Redford (1968) and Skeldon (2008) this study considers level of purchasing power in different countries and significant differences of local prices.

Correction of value of wages, remitted by migrant to relatives was made considering differences in the level of nominal national GDP and national GDP by purchasing power parity (PPP) of every state.

For example, basing on the nominal GDP and GDP (PPP) of Turkey (0.8 trillion USD and 1.36 trillion USD in 2013) 1,000 USD remitted by Turk from Berlin to his family, will be equivalent to 1720 USD in Istanbul (taking into account the differences between German and Turkish prices).

A similar multiplier for India (in 2013 India's nominal GDP is 1.8 trillion USD and GDP (PPP) is 5 trillion USD) is equivalent to 3.1. It means that 1000 USD earned by Hindu, for example, in the United States is equivalent to 3100 USD in India.

Similarly (depending on the place of expected salary's spending) the consumer attitudes to the same amount of money change in various countries around the world and that directly affect on structure and dynamics of international labor migration.

Statistical studies of international migration, widely known in the scientific community - Adams (2009), De Hass (2009), Rosenzweig, Mark & Stark (1989) and Rumyantceva (2004) - consider wages in the countries participating in migration exchanges in their absolute terms. This in our opinion does not fully reflect a real situation in international flows of workers.

3. Average cost of migration is also important factor of international labor movement.

On the one hand, value of the average cost of migration can be objectively evaluated on individual basis (each personal worker knows how much he or his family spent on the necessary procedures, documentation, ticketing and so on).

Table 10. Estimating of probability of migration flows to Belgium[10]

№	**Countries of Origin**	**Belgium – Average Wages – 3035 $ Living Cost – 1610 $ Multiplier PPP – 0,98**			
		Average Salary[11], $	**Multiplier PPP[12]**	**Migration cost[13]**	**Total Index[14]**
1	Philippines	227	1.7	420	4.4
2	Thailand	471	1.65	290	4.29
3	Turkey	1731	1.72	400	9.5
4	Ukraine	659	1.92	113	35.6
5	India	255	3.1	313	21.4

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

On the other hand, a consideration of the value of this factor in relation to the whole country (mass migration) is significantly hampered, firstly, by purely individuality of migration decision-making process; secondly, by personalization of job search process in the destination country; and thirdly, by absence of required information.

In this connection and in context of the present study the migration costs were estimated based on complexity of visa requirements for citizens of the country of origin in the destination - country and on minimum price of air ticket to the country of destination[15].

The proposed technique can be used to estimate a probability of migration from one country to another (based on their macroeconomic indicators) as well as to predict migration flows in one specific country.

For example, as we can see from Table 10 a probability of migrant flow from Ukraine to Belgium is much higher than flows from Asia Pacific region or Turkey (even the average salary in Ukraine is bigger than Thai or Indian).

Table 11. Estimating of probability of migration flows to California (USA)

Nº	**Countries of Origin**	**California (USA) – Average Wage – 3263 $ Living Cost – 1258 $ Multiplier PPP – 1**

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Similar findings can be made for California (USA) in Table 11. They show meaningless of labor migration from Japan to the USA.

As we can see from Table 12 migration flows from Ukraine, Belarus, Kyrgyzstan and Moldova will be mostly probable for Russia.

Offered methodology can be modernized by evaluation of Group B factors that are reflecting a country's migration attractiveness.

Socio-economic factors of group B are poorly amenable for objective evaluation. Meanwhile, an aggregation of well-known macroeconomic indicators and further inter-comparison of the resulting indexes, for example, with the Russia' ones (that are equal to 1, 00 in our research) can allow us to make a ranking of the countries - potential destinations of international labor migration.

It has to be noted that unlike previous evaluation (Tab. 10, 11 and 12) characterizing a migration's interactions inside a pair of certain countries here we analyze (based on macroeconomic indicators) the countries' attractiveness for abstract migrants, not for particular nationality or original.

In assessing countries' attractiveness for migration macroeconomic indicators and World Bank statistics were used (Table 13). The maximum value of every criterion is equal to 100% and a minimum value is equal to 1%. According to this scale results of modern states' macroeconomic indicators evaluation were distributed (as shown in Table 14).

As seen from the Table 14 and 15, most popular among migrant workers states have not high rates of migration attractiveness (only Russia – one of the global leader by number of coming migrants – is in the top-10 of migration attractive countries).

This criterion characterizes dynamics of economic development of the state, likelihood of the country's demand for foreign labor force (for example, due to the disproportional growth of national productivity and natural growth of local population).

Table 13. Macroeconomic indexes forming a country's migration attractiveness

№	Index	Methods of Calculation	Impact on Migration Attractiveness of the Country
1	Population growth	Dynamic of population growth (2002-2012).	Identifies quantity of national labor resource and dynamics of its change
2	Economy growth	Dynamic of economy growth (2002-2012).	Determines the prospects of national economy development and likelihood of lack of national labor resource and requirements for labor force's import
3	Unemployment	Average unemployment rate in the country, dynamic of unemployment rate (2002 – 2012).	Determines the national economic system demands for foreign workers
4	Migrants in-flow	Dynamics of foreign workers arrivals (2002-2012).	Determines a popularity and attractiveness of the country for foreign workers
5	Foreign investments	Dynamics of foreign investments flows (2002-2012).	Determines a country's attractiveness for business; a possibility of new businesses opening and new industries formation in the national economic system.
6	Refinance rate	Dynamic of refinance rate changing (2002-2012).	Characterizes an availability of credit in the national economic system, a probability of new enterprises opening and new industries formation in the country (and, consequently, demands for foreign workers)
7	Equity of National wealth distribution	The ration between national wage fund and national GDP (2002-2012).	Determines the level of equity of compensation for workers, impacts on attractiveness of the country for foreign migrants also

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

An implementation of the modern countries' migration attractiveness is advisable for more correct prediction of international migration flows formation in today's globalizing economy (Tables 16, 17 and 18).

Thus, considering factor of migration attractiveness of modern states we can correct a probability of international migration flows formation in the states studied above - Belgium, the USA and Russia.

As seen from the Table 16, after consideration of countries' migration attractiveness the probabilities of labor migration from Thailand and India to Belgium significantly decreased. At the same time indicators of possible migration of Filipinos and Turkish to Belgium rose.

An inclusion of modern states migration attractiveness in the case of California doesn't slightly change the overall statistics of the migration flows probability (only the likelihood of migration from Brazil increases).

Finally, in the case of Russia, consideration of countries' migration attractiveness within the analyzing of possibilities of migration flows formation, determines a sharp increasing of probability of the labor migration from Moldova and Kyrgyzstan, while the probability of migration from Kazakhstan, Ukraine, Azerbaijan and China slightly adjusts.

Table 14. Macroeconomic indexes, characterizing migration attractiveness of the countries, 2013-1

Nº	Country	Population Growth	Nº	Country	Econ. Growth	Nº	Country	Unemploy-ment

SOLUTIONS AND RECOMMENDATIONS

Thus, analyzed three main factors for economic growth of the countries (natural-resource, capital and labor resources), we can conclude that modern states are greatly differ by degree of importance of each factor in their economic progress. It is interesting to note that a catalytic role of capital significantly reduces together with growth of capital-saturation of the states. At the same time, labor and natural resources potentials retain their high stimulating role even with increasing of countries' saturation by them.

An analysis of macroeconomic indicators of the modern states also allows making several conclusions:

- Extremely high positive correlation (0.88) between stimulating role of labor factor with GDP per capita in the modern states. At the same time there are almost identical negative correlations

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

between the stimulating role of natural resources and financial factors with GDP per capita in the modern states (-0.47 and -0.49 respectively).

This statistical finding directly confirms an important economic transformation – an economic growth of the country has increasingly provided not by natural and financial resources (including borrowed ones) but by productivity and quality of the labor force (both own and borrowed from abroad).

Allowing a possibility of feedback (a reducing of the role of high-skilled labor in economic growth determines simplification of national economy and its further impoverishment) we can make an extremely important finding for countries that actively attract low-skilled labor (including Russia, UAE, and Thailand).

Qualitative economic progress of the country due to involvement of unskilled workers is impossible in the long term! With a growth of number of arriving migrants national economic progress continues to be provided only by financial and natural resources of the countries. In conditions of rapidly decreasing of stimulating effectiveness of capital, as well as limited natural resources potential of the country, this strategy has a dead end, is enable to change country's positioning in the structure of international division of labor, can't guaranty discovery and development of new resources for economic growth.

- Taking in account a specific of macroeconomic indicators of the countries of global avant-garde, a negative correlation between stimulating role of the labor factor and dynamics of economic growth of modern states (-0.42) seems logic. Meanwhile a correlation between economic role of natural potential and financial resources and dynamics of economic growth in the world is a positive (0.31 and 0.19 respectively). It can be concluded that states are growing fastest due to their natural resource potential (high economic dynamics is traditionally peculiar for developing countries). While an importance of the labor factor is more typical for countries with low dynamics of economic progress (usually developed ones).
- Finally, analyzed a correlation between indicators of stimulating roles of three factors for economic development and indexes of international migration in the modern countries, we can determine that the maximum positive correlation is between a stimulating role of the labor factor and dynamics of international migration (0.51). At the same time relationships between economic role of natural-resources and financial factor and dynamics of international migration is negative and relatively low (-0.33 and -0.18 respectively).

These results suggest that countries developing mostly due to natural or financial resources now practically do not attract foreign workers, or even supply workers on the global labor market. At the same time, countries with high labor productivity, with a great stimulating effect of labor on their own economic growth are the main global migrants' receptors.

This result leads to the definition of main problems of the contemporary world labor market functioning.

Global migrant workers' receptors traditionally have limited capacity for own economic growth (often dynamics of their economic growth is timely less than dynamics of migration flows' increasing). In these conditions, the national systems of these countries are required to increase labor productivity as the most important factor and stimulator of economic growth (as was proved a stimulating effect of natural-resource and financial potentials in economic growth in these countries is insignificant).

In this connection, economic success of these countries will depend on the performance of two important conditions:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The effectiveness of measures to ensure an influx of highly skilled professionals that are capable to positively impact on growth of labor productivity in the country later (for example, carriers of education, skills, abilities, technologies, and so on);
- The effectiveness of tools to ensure a greater concentration of local population on increasing of their own educational and professional level (with the further application of these skills in productive activities) by providing unskilled jobs to foreign migrants.

A presence of two directions of National migration policy of modern developed countries permits a presence of international migration both of high-skilled and unskilled workers. And it requires defining of differentiated effective migration policies within offered model from every state.

The proposed method to determine probability of international labor migration basing on comparative analysis of modern states' macroeconomic indicators allows to:

- Forecast the migration flows from different countries and territories worldwide;
- Compare the national economical systems by a probability of their converting into the countries of origin or destination of migrants in conditions of world economic progress;
- Create national migration policy (both in the countries receiving and sending migrants); strengthen its flexibility and differentiation; adapt the national migration policy to requirements of current migration relations, monitor its the dynamics and so on.

Finally, the proposed model of estimation a probability of international migration flows formation as a complex system, aggregating objective indicators of modern states economic and social development, costs of migration decision - making, is interesting from a scientific point of view as an attempt to study a phenomenon of international labor migration, to define causes and effects of migration dynamics changes in the global and national economic conditions.

KEY TERMS AND DEFINITIONS

Diminishing Returns: Is the decrease in the marginal (incremental) output of a production process as the amount of a single factor of production is incrementally increased, while the amounts of all other factors of production stay constant. The law of diminishing returns states that in all productive processes, adding more of one factor of production, while holding all others constant, will at some point yield lower incremental per-unit returns. The law of diminishing returns does not imply that adding more of a factor will decrease the total production, a condition known as negative returns, though in fact this is common (Saiduzzaman, S. (2014). The theory of diminishing return. Academia.edu. Retrieved 12 August 2014).

Economic Effects of Migration: The economic effects of migration vary widely. Sending countries may experience both gains and losses in the short term but may stand to gain over the longer term. For receiving countries temporary worker programs help to address skills shortages but may decrease domestic wages and add to public welfare burden. The economic effects of migration for both sending and receiving countries may also vary depending on who is moving, specifically with respect to migrant workers' skill levels. A Swedish Professor notes, "the problem is not immigration; it is integration, especially in the labour market. If there are no jobs, the consequences are segregation, housing problems and divided cities" (Traynor, 2010). For sending countries, the short-term economic benefit of emigration is found in remittances. Remittances are funds that emigrants earn abroad and send back to their home countries, mainly in order to support families left behind.

Economic Growth: 1. Firstly, and most commonly, growth is defined as an increase in the output that an economy produces over a period of time, the minimum being two consecutive quarters. 2.The second meaning of economic growth is an increase in what an economy can produce if it is using all its scarce resources. An increase in an economy's productive potential can be shown by an outward shift in the economy's production possibility frontier (PPF). The simplest way to show economic growth is to bundle all goods into two basic categories, consumer and capital goods. An outward shift of a PPF means that an economy has increased its capacity to produce.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Extensive Growth: Is based on the expansion of the quantity of inputs in order to increase the quantity of outputs, opposite to that of intensive growth. For example, GDP growth caused only by increases in population or territory would be extensive growth. Thus, extensive growth is likely to be subject to diminishing returns. It is therefore often viewed as having no effect on per-capita magnitudes in the long-run (Bjork, Gordon J. (1999). The Way It Worked and Why It Won't: Structural Change and the Slowdown of U.S. Economic Growth. Westport, CT; London: Praeger. pp. 2, 67).

Factors Affecting Economic Growth: Industries experience cycles of economic growth and contraction based on many factors. These include the overall health of the markets, consumer preferences and even seemingly unrelated world news and events. Although some companies perform better than others in their industry, the global factors that affect the industry as a whole must be contemplated when planning to start or grow a business (Galor, Oded (2005). "From Stagnation to Growth: Unified Growth Theory". Handbook of Economic Growth 1. Elsevier. pp. 171–293).

Governance of Migration: System of institutions, legal frameworks, mechanisms and practices aimed at regulating migration and protecting migrants. Used almost synonymously with the term "migration management", although migration management is also sometimes used to refer to the narrow act of regulating cross-border movement at the state level.

Pull Factors for International Migration: Whereas push factors drive migrants out of their countries of origin, pull factors are responsible for dictating where these travelers end up. The positive aspects of some countries serve to attract more immigrants than others. Below are three examples of pull factors that draw migrants to receiving countries: higher standards of living/higher wages, labor demand, political and religious freedom.

Push Factors for International Migration: Sometimes these factors leave people with no choice but to leave their country of origin. Below are three examples of push factors that drive people to emigrate from their home countries: lack of jobs/poverty, civil strife/war/political and religious persecution, environmental problems.

Chapter 82
Finding Inner Strength in the Face of Adversity Kgopolano GROW Group Empowerment Journey: Botswana

Keitseope Nthomang
University of Botswana, Botswana

ABSTRACT

This article describes how numerous studies in Botswana have found high levels of poverty among women, in particular, those in female-headed households. Extreme poverty among women continues despite government programme interventions designed to end poverty. This article reports the findings of an initially donor-funded women's empowerment project in an urban village, Molepolole, Botswana. At the center of this project are 14 women who are experimenting with the GROW model to transform their lives. Through in-depth interviews and focus group discussions the women's views on the past, present, and future of the project were solicited. Content and thematic analysis were utilized on the data. The results confirm the potential of the GROW model in transforming the lives of women facing insurmountable hardships. The Grow model inspired women to gather inner strength and break the cycle of poverty by continuing the project beyond donor funding.

INTRODUCTION

Globally, women's empowerment is anchored on various national and international instruments. At the international level, such instruments include: The United Nations Decade for Women (1975-1985); United Nations Convention on the Elimination of All Forms of Discrimination against Women (1979); the Beijing Declaration and Platform of Action (1995); Millennium Development Goals (2000-2015); In Botswana, a legal and policy environment exists to promote and advance women's empowerment.

This includes, inter alia, the National Policy on Women and Development (1998); the National Gender Programme Framework (1998); the Advocacy and Social Mobilization Strategy for the National Gender Programme (1999). In recent times, the National Policy on Gender and Development (2015) and Vision 2036 are the most important policy instruments highlighting critical issues that affect women and require urgent attention. Examples include; women and poverty, education and training*;* women and health; decision-making and violence against women (Vision 2036; National Policy on Gender and Development, 2015). In addition, the Government of Botswana has, over the years, initiated legislative reforms such as the Abolition of Marital Power (2004); the Domestic Violence Act of 2008 and associated guidelines, amended Citizenship Act of 1995 and Deeds Registry Act of 1996. These initiatives sought to advance and achieve gender equality in Botswana (Quansah, 2005). Women's empowerment initiatives have placed women at the centre of development, affording them the right to make decisions and determine their own destiny. Further, these initiatives are meant to empower women and protect them from any form of oppression and discrimination.

The above notwithstanding, significant challenges remain, revolving around the official definition and application of the concept of "empowerment". Evidence on the ground with respect to the application of the concept of empowerment in the implementation of the various government projects suggests a flawed definition of empowerment. It would appear from the perspective of the government of Botswana, to empower essentially means providing hand-outs in the form of grants or food hampers. Government programmes meant to empower women have deliberately and continuously ignored the critical aspects of the verb "to empower". As a result, the government approach has attracted sustained criticism, in that it is contrary to the true definition and application of term empowerment, which means to "enable" people to be self-empowered and to depend on their own efforts rather than depending on government for sustenance.

The women studied are poor rural women from Borakalalo Ward, Molepolole – Botswana. The Kgopolano GROW Group came into existence in 2011 with support from one of the local NGO's Hope Worldwide Botswana (HwwB), and an international development organization – Project Concern International (PCI). The women deserve attention because they represent the poor who have tirelessly worked together to reach goals of transforming their lives from poverty to improved socio-economic wellbeing. Most of them are single mothers or widows with few or no formal work experience, no background in running an empowerment self-help group and limited resources to take care of their children and families. Despite their background, they took the opportunity presented to them and mobilized themselves into a self-help group known as *Kgopolano* GROW group. The group's overarching goal is self\empowerment using the GROW model. Since its inception in 2011, the Kgopolano GROW group has provided a common touch, physical energy, local knowledge, and skills in attempting to achieve its objectives of transforming the lives of women. Their hope and confidence in the ability to change their lives for the better continues to be the source of inspiration for group members.

This article shares the empowerment journey of the women through active participation in the Kgopolano GROW group implementing the GROW model. The article tells the story of how the women have worked against all odds to create their own source of wealth and livelihood. It is important to point out that this article is not a critique of the empowerment journey in terms of achievement, rather, it articulates the GROW model's ability to empower and transform lives in marginalized contexts. It reports on progress (or the lack thereof) made by the GROW group since its inception in 2011. In particular, the article focuses on progress made since the end of donor funding and technical support in March 2016.

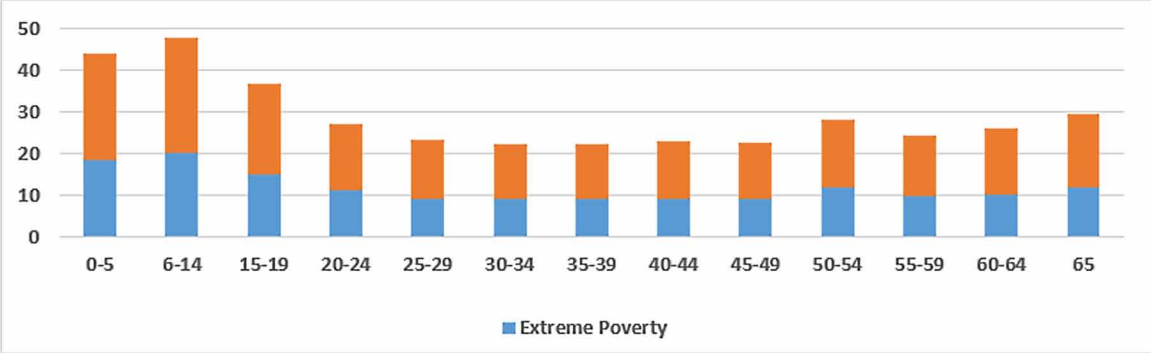
EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is an enhanced version of a journal article entitled: *Inspiring Poor Women to Empower Themselves: Insights and Lessons from Botswana*, which was published in the *International Journal of Civic Engagement and Social Change,* Volume 3 Issue 2, 2016. The most recent findings are shared in this article.

The article is structured thus: first is the introduction, followed by the background that comprises, the Botswana context, a brief review of the literature on empowerment, and the conceptual frameworks underpinning arguments advanced. Next is the methodology and the findings of the study. Pertinent issues emanating from the literature and women's narratives (findings) are consolidated and presented in the discussion section. Finally, a conclusion is drawn.

Background: The Botswana Context

For many years Botswana's economy was among the world's fastest growing, with real GDP growth averaging 8 percent per annum. As a result of this growth, Botswana has transformed from being one of the poorest countries in the world at the time it attained independence in 1966 to becoming an upper middle-income country with a Gross National Income (GNI) per capita of US$ 7,240 in 2014. Despite sustained levels of economic growth and physical development over the past five decades, abject poverty, unemployment, and inequalities persist and remain high (IMF, 2012; Government of Botswana, 2016). An estimated 19.3 percent of the population (approximately 362 112 Batswana out of a total population of slightly over 2 million) are poor. This rate is among the highest in the world and human development outcomes are below the norm for an upper middle-income country. Even with its relatively good social infrastructure and significant investments in social development, Botswana still confronts several challenges, including:



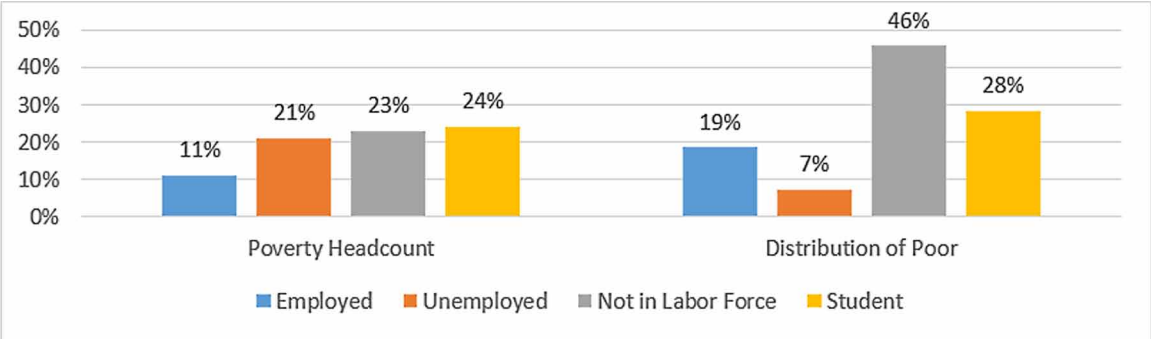
- Eradicating absolute poverty in a budget neutral manner
- Reducing malnutrition in young children
- Ensuring that all children have access to early childhood development programmes and attend school
- Creating jobs for youth and other groups with high unemployment rates
- Increasing access to social insurance and reducing new cases of HIV infection and treating those affected by HIV and AIDS
  (See, World Bank, 2015; Statistics Botswana, 2011; 2013. BCWIS, 2009/10).

Poverty and Inequality

Available evidence shows that poverty and inequality have declined but remain high. For example, in 2009/10 the incidence of poverty (using the national poverty line) was 19.3 percent (this translates to 362, 112 poor people or approximately 84,000 poor families living in extreme poverty in Botswana) while extreme or food poverty stood at 13.8 percent (Statistics Botswana, 2013). Children and the elderly emerged as groups with the highest incidence of poverty (see Figure 1 below). Data shows that poverty in Botswana has a young face, with children below 15 years of age representing almost half (46.2%) of the poor. It was found that poverty is higher in rural and remote areas among female-headed households and those with low levels of education. At the same time, there exists a large number of people who are marginally above the poverty line and therefore at risk of falling back into poverty (World Bank, 2015).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Extreme and total poverty rates by age group, 2010. Source: World Bank (2015). Botswana Poverty Assessment, Washington, D.C.



A recent assessment by the IMF concludes that, while there is a sharp decline in the poverty headcount ratio from 30.6 percent in 2002/03 to 19.3 percent in 2009/10, quality of life for the majority of the people has not improved because social welfare and public works programmes have been relatively less effective in terms of targeting the poorest of the poor (IMF, 2012).

Employment and Unemployment

It is important to point out that employment is a buffer but not a guarantee against poverty. The Botswana Core Welfare Indicator Survey (2009/10) estimated the unemployment rate at 17.8 percent, although, if discouraged workers were taken into account, the rate would be closer to 30 percent (BCWIS, 2009/10). The same survey indicated that youth unemployment (15-19 years) was highest at 36 percent followed by a female unemployment rate at 21 percent. More than half of all poor Botswana households (and almost two-thirds of poor households in cities) are headed by unemployed individuals.

Figure 2 shows that, in 2009/10, the poverty rate was 21 percent for unemployed workers and 11 percent for the employed. Nineteen percent of the poor were employed, 7 percent unemployed, and 46 percent outside the labour market. A majority of the unemployed are women, with serious implications

Figure 2. Poverty and employment source: World Bank (2015). Botswana Poverty Assessment, Washington, D.C.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

for their socio-economic wellbeing. Lack of economic opportunities for poor women who are, in most cases, heads of households and lack support from their families' communities, government, and NGOs, have led to a debilitating sense of powerlessness and hopelessness in communities.

PCI and the GROW Development Initiatives

Against the above background, PCI Botswana partnered with the Botswana Government to address poverty and unemployment among poor women in Borakalalo ward, Molepolole. PCI recognizes the fact that poverty among women is relentless and a powerful negative force that affects a significant number of women across the globe. While some developed countries, such as the United States of America, have made substantial strides in gender equality, many developing countries, are still lagging behind. To this end, it is imperative that the battle for empowerment of women should continue, particularly in countries where poverty, oppression and violence against women is a daily occurrence. PCI aim at promoting economic and social empowerment of women through the formation of self-managed and self-sustaining savings groups. In Botswana, PCI success in introducing and implementing the GROW model was made possible with funding support from the President's Plan for AIDS Relief (PEPFAR). Kgopolano became the first group in Botswana to experiment with the GROW model. Through this model PCI-Botswana sought to achieve economic strengthening of the entire community through transforming their own lives and empowering themselves socially and economically by promoting people participation in self-development.

PCI provides training in governance, record keeping, savings, lending, and entrepreneurship to Kgopolano Grow Group. Regularly held group meetings provide a platform for social support and individual leadership development, thus enabling women to become powerful agents of economic and societal transformation within their communities. PCI believes that women who are empowered become solutions to poverty, poor health, and vulnerability for their families and within their communities. Some of the benefits that have been realized include increased food and economic security for women and their families, decreased use of exploitive money lenders, as well as improved relations between female participants and their husbands.

LITERATURE REVIEW IN BRIEF

The situation of women, mainly as an underserved population group, has attracted much attention over the years. Numerous studies have been conducted on the marginalization of women (feminization of poverty) on a wide range of social and economic issues. History books, academic journal articles, and documentaries on their lives have been written, published, and widely distributed by professional researchers, including anthropologists; sociologists; human rights activists, and development practitioners. The researchers generally came to the conclusion that most women in Botswana are poor and marginalized (MDGs, 2000-2015; SDGs 2016 – 2030; National Policy on Gender and Development 2015; Vision 2036; & BALA, (2014). They have, over the years, suffered extreme poverty, marginalization, gender-based violence, and discrimination and are dependent on government welfare programmes.

Against this background, concerted efforts have been made over the years to empower women because of their disadvantaged position in society. To this end, the concept "empowerment" has gained prominence in development discourse that seeks to find solutions to many challenges faced by women

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and other marginalized groups. The notion of empowerment means different things to different people. In the New Webster's Dictionary, the verb "to empower" is defined as "to give power to", or "to enable" someone. According to Rappaport (1987), "…empowerment conveys both a psychological sense of personal control or influence and a concern with actual social influence, political power and legal rights…" McArdle (1989, p. 99) defines empowerment as "the process whereby decisions are made by people who have to bear the consequences of those decisions". The emphasis is on achievement of set goals through self-help and not dependency. Thus, empowered people are those that have, through self-help and through pooling their knowledge, skills and other resources, achieved their goals without recourse to an external dependent relationship.

To this end, Shragge (1993, p. iii) defined empowerment as:

a process that occurs both at a personal and political level. It is a process that involves changing power relations between individuals and groups and social institutions. At the same time, it is a process of personal change as individuals take action on their own behalf and then redefine their understanding of the world in which they live.

At an individual level, empowerment focuses on promoting participatory behaviour, skills acquisition and differing forms of self-efficacy, and self-esteem leading to an increased sense of personal control (Dunst, 1992). Further Dunst (1992, pp. 169-170) sees empowerment as requiring cohesiveness, collective problem-solving skills, and a joint feeling of efficacy and control.

While the notion of empowerment has acquired a considerable aura of "respectability", even "social status" within the vocabulary of development, it has not yet acquired a socially agreed content. It is also one of those concepts whose full implications people do not realize when they use it. Within the development community, empowerment has been used to refer to the following; popular participation; promotion of community development through self-help with emphasis on the process, rather than on the outcome of particular development projects. Empowerment results in transformation of economies into self-reliant and endogenously developed communities.

Most perspectives on empowerment emphasize the need to build capacity in people to participate in and respond to the changing economic and political environment. Thus, empowerment seeks to ensure broader and more meaningful citizen participation in the development process with a view to achieving sustainable development, growth, and prosperity for all. To empower therefore means either to strengthen one's belief in his (her) self-efficacy or to weaken one's belief in personal powerlessness. Therefore, any real empowerment must be "self-empowerment". There must be an internal urge to influence and control (Conger and Kanungo, 1988). People are empowered when they feel an enhancement of their abilities to control, influence or cope with their social or economic roles.

Women's Empowerment in Botswana

The 21st century has seen the greatest push for women's empowerment across the globe. In Botswana, women's empowerment is generally taken seriously as a method of achieving promotion of gender equality. This is demonstrated by current efforts to promote gender equality and empowerment of women in all spheres of social, economic and political development (MDGs Botswana Status Report, 2010). There are no deliberate institutionalized structures to disadvantage, marginalize, and discriminate against women in Botswana.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, despite concerted efforts undertaken by the Government of Botswana and other stakeholders to promote women's empowerment and gender equality, gains made over the years are under threat of being reversed due to persistent and debilitating poverty and unemployment among this population group. For example, it is estimated that 47% of female headed households are living in extreme poverty compared to only 27% of male headed households. In addition to high poverty rates, women experience higher unemployment and lower pay for similar work than men, and they are increasingly victims of gender-based violence (Gender-based Violence Indicators Survey, 2012; UNCEF, 2011). Further, cultural attitudes that hinder women's progress are still entrenched in some communities. Available literature on the empowerment of poor women in Botswana shows that they are seldom provided with a platform to express their views. Their voices thus remain marginalized under the pretext of culture. Too often, menfolk or other powerful groups and government speak and think on their behalf leading to improper misunderstanding and misinterpretation of their experiences and aspirations for development.

In the context of this article, the fundamental goal of empowerment is to help Kgopolano GROW Group transform the lives of women from poverty to sustainable livelihoods. Empowerment is intended to help the women unleash their creative and productive energies in order to achieve continuous improvement in their living standards. It involves engaging poor women and other relevant stakeholders in a transformative process that seeks to enable and help them to understand the challenges and/or reality of their environment (social, economic, political, ecological and cultural) and to help them learn how to solve those challenges themselves. This notion is against current approaches to development that promote dependency on government and donor handouts. Current government approaches to empowerment are viewed by independent social policy analysts as counter-productive and inherently unsustainable (Nthomang and Tlagae, 2015).

CONCEPTUAL FRAMEWORK: THE GROW MODEL

For the purpose of this article, PCI (2006) GROW model, predicated on the notion of social change and transformation in marginalized contexts is applied. The GROW concept was first developed by PCI in Ethiopia in 2006 with the intension of transforming the lives of the poor by building social capital, improving economic status, and increasing community participation. The GROW model was found appropriate because of its emphasis on enabling poor women in their own communities to transform their lives from poverty to improved socio-economic wellbeing. It is a conceptually coherent and practically relevant framework to address some of Botswana's deep-rooted development challenges that affect mainly women including; poverty, unemployment, inequality, welfare dependency, gender-based violence, HIV and AIDS, and other vulnerabilities. The GROW model mission is to promote universal social justice of marginalized, underprivileged, and vulnerable people in society. It advocates for the rights of people without a "voice" who have been side-lined and disempowered by structural forces in the process of development. This is particularly important in a country like Botswana which prefers top-down approaches to development where poor people are often not consulted on development issues that directly affect them (Vision 2016 Evaluation Report, 2016). The GROW model currently implemented by Kgopolano focuses on building the capacities of women for self-empowerment as well as to promote a culture of self-reliance rather than dependency on their government.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Methodology

A brief review of the literature on empowerment across the world, data collected using focus group discussions, in-depth interviews, informal conversations, observations and programme data allowed for a detailed examination of the women empowerment narratives as a result of their interaction or experimentation with the GROW model. Over the course of fieldwork, the researcher was able to immerse himself in the lives of the Kgopolano Group and develop a broader understanding of the women's views on the GROW model and its objectives, in particular its impact on their lives and overall socio-economic wellbeing. This process enabled the researcher to draw evidence-based conclusions on the impact of the GROW model on the socio-economic wellbeing of the beneficiaries. Qualitative data obtained from fieldwork narratives, that is, women's stories, were analyzed and key results are presented and discussed in the findings below.

Findings

Evidence from fieldwork data collected in April and May 2017 identified some positive outcomes from the GROW model as reflected by some group members:

This is life, it is better than most of the things I have tried to make a living before on my own. We are now working as a group to share experiences, support and help each other. I have benefitted, and I know that my colleagues with whom we started the journey together have also benefitted. My life is far much better off than was the case before I joined and became a member of the GROW group. If I do not have money … I am now able to borrow money from the group to pay for my children's school fees, buy uniform and other basic household items. I am able to take items on credit from the kiosk (semausu) because they know I am part of the GROW group that is well respected for raising money to sustain members of the group.

The success or failure of any self-help voluntary group is often determined by the level of commitment to meet set objectives. One of the objectives of the Kgopolano GROW Group is to hold regular meetings with a view to discussing challenges faced by the group and develop solutions to address them. Meeting this objective requires holding regular meetings for discussion and decision making. The focus is on meeting poverty needs, opening a bank account, and saving money raised through income generating activities. Some of the major achievements of the GROW model identified by the group include: staying as an active member of the group, ownership of assets, sustained income, and financial security and self-empowerment. These achievements are illustrated in the narratives below.

Staying as an Active Member of the GROW Group

Members of the Kgopolano GROW reported a sense of "we" feeling and belongingness. Under the grow group they have become a family unit. Even some who have left the group to participate in government sponsored poverty eradication projects visit the remaining members of the group for guidance derived from the principles of the GROW model. In a way, their positive experiences illuminated perceived benefits of staying together. Staying together in a group has the advantages such as being able to come together think together, and share ideas on how best they can transform their lives from poverty to improved and sustainable ivelihoods.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

One group member shared the sentiments of other members when she expressed her willingness to stay as a member of the group:

I will stay because now I know from experience that the GROW group has great future potential. It is a cow and we shall benefit from both its milk and calves. Since joining this group about three years ago my life has changed for the better. I am now very positive. In the past I used to be very negative about life. I had completely given up hope and was even contemplating to end my life. Today, I am a changed woman. I am no longer that poor and a frustrated soul. I have developed confidence and can now mix freely with other people, including my siblings because I believed they no longer look down on me. Now because of the training I received, the little income I get and some savings, I have regained my confidence. I am a better person now.

Skills Development

One of the major objectives of the GROW model is to provide skills training in entrepreneurship, governance, record keeping, saving and lending. In-depth interviews with GROW group members revealed that there has been positive transformation in the lives of the people. Members have learned livelihood skills such as saving and lending money to other members and, in the process, allowing their money to grow. Some said that they have developed business skills, for example in record keeping and ability to track all money coming into the business and going out. The most rewarding experiences repeated in almost all the interviews are captured by the quotes below:

I have acquired business skills that I can use to make a living. I used to work for Ipelegeng here on a rotational basis but have since stopped. I spend all my time here because I can see the benefits.

Another respondent said:

I say thank you to PCI and Hope World Wide for opening my eyes and giving me this lifetime opportunity. If it was not of their good gesture, I do not know where I will be right now. Possibly dead, killed by HIV and AIDS because I did not have the skills on how to run a small business and save money for the future. You have given us the opportunity to learn skills on bookkeeping, stock taking and banking. As a result, we are able to survive on our own with little or no dependency on the government like many people in Borakalalo ward who live on food hand-outs from the government.

Listening to the women's narratives two years later, after my first encounter with them, I observed growth and maturity. In the past. most of the women in the group were a little shy and bashful and displayed low self-esteem. They have since gained confidence and are able to articulate their experiences freely and without fear. Clearly, they have developed good communication skills, and this is a very important ingredient for a successful self-help group. This is clear evidence that the GROW model has made a considerable contribution towards transforming the lives of women for the better. The women were happy with the outcome and would like to continue their membership and share with others their experiences and the benefits accrued. They appreciated the knowledge and skills acquired which transformed their lives for the better. They feel empowered, confident, and ready to engage in small businesses to improve their socio-economic wellbeing.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ownership and Sustainability

Ownership in community based organizations is critical in order to ensure continued survival of the self-help group. Ownership resides in the group members who are driving social change from within by implementing the GROW model rather than depending on donor agencies. This has been clearly demonstrated following the departure of PCI in March 2016. The GROW Group has continued to date in the absence of donor funding and technical support. This is confirmation that PCI has built capacity and the Group is self-empowered and able to continue beyond donor funding. Fundamental to the GROW group is the strength and experience of its members more than the knowledge of outside experts. Ownership is demonstrated by group cohesion and ability to deliver on set objectives. Group accomplishments include developing the Constitution, bye laws and allocating responsibilities.

To articulate issues of ownership, one group member had this to say:

I joined this group in 2011. It is now 2017 and this means that I have been a member for five years. That is why I feel I own the group ... it has become an important part of my life. I have committed all my time and energy and I am part of the group. My family has given me all the support I need because of the benefits accrued from membership.

Underscoring the sentiments expressed above, an older member of the group said:

I am the oldest member of this group and as the oldest I have earned so much respect that I feel so comfortable and at home in this group. It is my family and I belong all the time. In this group we think and plan together on how to meet our needs. In all the meetings, we speak the same language to help each other to improve our lives and those of our children and family. We think about the future, we discuss opportunities that members can engage in to transform their lives.

Another group member agreed:

I am still a member of the GROW group because of the support I get from the group. We are like family; during weddings and funerals we support each other. I had an emergency and needed money immediately and was offered a loan by the group.

From my interaction with the group, I observed that a strong sense of ownership and commitment exists in the group. Members keep coming back because they feel the group helps them at individual level to meet their needs for food, education and money. If a member has personal challenges to attend to and needs support such as obtaining a small loan, other members assist. The group, it would appear, is driven by a strong sense of meeting unmet needs of each member such as supporting one another during bereavement and weddings and how to run a small business in a profitable manner. Members support each other by encouraging them to contribute at least P2.00 (an equivalent of $ USD 20 cents) every week. Group savings provide small loans during times of need.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Financial Independence

One central objective of the GROW model is to create financial independence among its members through small weekly savings. Contributions are collected from members, saved, and ultimately loaned to members as and when the need arises. The sentiments expressed by all the group members interviewed is that this aspect has been achieved resulting in a positive impact on their lives. They are now inspired to continue running small businesses and saving the proceeds. Most are involved in small projects, including selling traditional foods harvested from the farm; making watermelon jam, floor polish, and the sale of goats and chickens. Women continue to engage in other income generating projects such as bead work and running tuck shops to sell basic household commodities like sugar bread, sweets, and paraffin. Most members talked about personal aspirations as a strong push to engage in income generating projects. One of the women was emphatic that:

It is important to manage our own businesses. This has generated income for ourselves, our children and families. We have used the money to transform our lives for the better. GROW has given us skills on how to raise funds and sustain ourselves.

Interestingly, some members who had left the group after acquiring the skills through the GROW model are now running their own businesses independently. For example, one of the women I spoke to has approached social workers in Molepolole to assist her to process an application to acquire goats through the Botswana Government Poverty Eradication Programme. This was confirmed by the programmes officer for Hope Worldwide Botswana (HwwB) who has been working with the women to ensure that they utilize skills learned through the GROW model. This is yet another affirmation that the GROW model has positive, long lasting benefits.

From the foregoing discussion, it may not be unreasonable to conclude that the major advantage of the GROW model is that it has provided much needed skills that were employed to relieve group members from hunger and destitution, thus instilling a sense of dignity and pride. Women in Borakalalo Ward who were jobless, idle, desolate, and poor are now engaged in self-help, income generating projects that have enabled them to transform their lives for the better. Local NGOs (HwwB), social workers and community leaders who were interviewed also underscored the women's achievements with respect to employment creation leading to transformed socio-economic wellbeing. By engaging in income generating activities, it is anticipated that the women will generate sufficient funds to buy the basic necessities of life such as food and clothing and to pay school fees and buy uniforms for their children as well as to build houses for their families. Financial independence brings dignity into the home and a good relationship between husband and wife and thus peace in the household.

Challenges Faced by the Kgopolano Group

Implementing the GROW model by the Kgopolano women's group has not been without challenges. Thus, despite positive results, research evidence suggests numerous challenges, including; slow return on investment or rates of return; inadequate entrepreneurial skills; and difficulty attracting youth.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Slow Return on Investment

As indicated throughout this article, Kgopolano GROW Group comprises of very poor women who are eager to change their life situation for the better. Engaging in income generating activities such as *Dimausu* (a tuckshop or Kiosk) and selling traditional wares, have taken time to produce the desired results such as liberating them from poverty as was originally envisaged. This had negative implications on loans to members. As a result, some members became frustrated, lost patience and left the group.

A key informant noted with respect to the above:

Slow rate of return is often a challenge to poor people with limited or no alternative sources of income. Failure by the group's income generating projects to yield immediate results can result in frustration and helplessness. I have observed this among some group members, who have become frustrated because it has taken a long time for the group to meet their needs and expectations. They have been forced by circumstances to look for better opportunities to change their poverty situation. They have been forced to look for projects that provide immediate gratification.

Another member of the group observed that:

You know … all members of the group are poor and have, for a long time experienced many challenges in their lives. Kgopolano is our hope in that it has provided us with skills to help improve our lives. But given where we started and our socio-economic realities, it has taken a long time to bear fruit. I have remained patient, but my family is complaining and putting a lot of pressure on me. The family complain that it is taking too long and they want to see some changes otherwise it will be a waste of time [o kare ke go dia nako hela ka maduo a bonya e bile ga a bonale] … it's like a waste of time since the results are slow.

Inadequate Entrepreneurial Skills

Kgopolano GROW Group members are generally illiterate. Many of them can barely read and write having only primary level education. Modern businesses require complex entrepreneurial skills to grow and remain competitive in a rigorous business environment. This is true for all businesses regardless of their size. Although most women are talented and possess traditional skills in such trades as weaving, basketry and pot making, they lack entrepreneurial skills. In particular, they are deficient in basic marketing and bookkeeping skills. Some group members have admitted that they have been taught skills by PCI and HwwB on how to run a small individual business, but they still feel inadequate and hence are afraid to start due to fear of failure.

One member noted the challenges thus:

Yes, we have been taught skills on how to run a business, but it is not always easy to start. This is because before one could start they should gain the confidence to start and be willing to take risks associated with the business. The difficulty stem from the fact that many of us are afraid of take risks. Some member are even reluctant to take a loan from the group to meet their needs. They are always concerned about the consequences in the event they fail to service the loan.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The above quote underscores the fear that women have that undermine self-empowerment. The reality is that, although the group has received requisite training in running a small business, they still lack the confidence to start their own. This is not surprising because most poor people without entrepreneurial skills lack the zeal and confidence to start a business because they believe it is very risky. Instead, they would rather go back to their "comfort zone" dependency on support and 'baby-sitting' provided by government or donor agencies. As such there is a tendency to resist taking a loan because of fear of failure and its consequences.

Building the capacity of poor women to manage businesses requires constant mentoring and support through skills building. It is, therefore, important for development partners, NGOs, and relevant government ministries and departments to provide special skills on confidence building, mentoring and running small sustainable businesses.

Difficulty Attracting and Retaining Youth

The prevailing concern that has plagued the group since its inception is failure to attract the young people to become members. Youth participation is very important to ensure sustainability and continuity. This is even more critical for a country like Botswana with more than two thirds of its population aged below 35 years (National Youth Policy, 2010; Statistics Botswana, 2011). Most importantly, young people are over-represented in poverty and unemployment. As such, it is important to attract the youth to participate in initiatives geared towards addressing the challenges of poverty and unemployment.

Most women interviewed repeatedly expressed the concern regarding the absence of youth participation by noting that:

Young people are not coming forward to join the group. I do not know why. Maybe they think this is for elderly women with children and those who stay at the lands.

Another interviewee expressed similar sentiments and concerns about the youth:

Young people do not like engaging in traditional projects that bring in money slowly. Some do not want to be seen at the bank depositing small amounts of money. Many of them want fast cash for immediate gratification.

Against the above background, it is therefore important to reach out to young people and educate them about the benefits of the GROW model. The aim is to create employment opportunities and to get young people out of poverty. This is done by teaching them business skills which they could use to transform their lives.

In summary, the challenges presented above must be addressed urgently with a view to strengthening the capacity of group members to transform their lives in a sustainable manner. Failure to respond in a timely fashion may undermine Kgopolano's efforts to improve the group's socio-economic wellbeing. Fundamentally, its survival is dependent on group cohesion, member's commitment and a focus on the broader goals of skills building, employment creation and poverty reduction in order to meet member's needs for self-empowerment. This is possible when group members are willing and motivated to work hard to overcome the challenges they are facing.

DISCUSSION

The factors that motivated the formation of Kgopolano GROW Group are clear. It was formed for purposes of addressing the challenges of poverty, unemployment and the creation of income generating opportunities for the poor rural women with a view to improving their quality of life. These objectives remain valid today. The Kgopolano GROW Group has, since its formation made concerted efforts to deliver on this transformational agenda with mixed results. Available evidence suggests that the Group has been able to achieve some of its objectives notwithstanding some challenges (Nthomang & Tlagae, 2015). The analysis showed that the group's successes exceeded expectations. Thus, more achievements than challenges were recorded. In terms of achievements, Kgopolano GROW group members have acquired training, skills and self-empowerment and this has resulted in increased self-esteem and dignity leading to independence from government welfare provision upon which they have relied in the past. The Group's contribution to poverty reduction through income generating activities and savings has hitherto been very encouraging and generally a success. Kgopolano Group members have affirmed an improvement in their socio-economic wellbeing and linked that to the successful implementation of the GROW model.

Kgopolano group achievement referred to above is a clear demonstration of the potential of the GROW model in achieving self-empowerment. To be effective, the most basic principles of empowerment should be implemented. These include, inter alia, the following:

1. **Commitment to Self-Empowerment:** The most fundamental factor determining effectiveness of voluntary self-help group is commitment of its members. An empowered woman from GROW is confident and not afraid to seek help to pursue set goals.
2. Confidence and belief in self-promote group cohesion which is central to its sustainability. Solidarity based on shared values and mutual interests is fundamental to the attainment of group objectives.
3. Confidence building, patience, and perseverance captured in metaphors like *"le tsema le thata ka mong wa lone'* [independent living is a virtue] are central to Kgopolano group sustenance and continuity. There is need for continuous mentoring and support in order to gain confidence and produce results which in turn will motivate members. This promote the zeal for hard work and design solutions to problems of poverty and unemployment.

The above notwithstanding, it has been demonstrated that although the GROW model has great potential to transform lives in marginalized contexts through building resilience, self-confidence and economic empowerment, this potential is often undermined by some factors beyond the group's control. These include a general lack of group cohesion, insufficient entrepreneurial skills and the group's failure to renew itself. These factors conspire to undermine future sustainability of the group (Nthomang & Tlagae, 2015). These could be addressed through embracing the values of social capital, including; norms of reciprocity, mutual trust, collective efficacy, participation and joint community activities and actions. Taken together, these values reinforce the need to work together as partners and collaborators for self-empowerment.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

The article assessed the contribution of the GROW model in transforming the lives of the poor women in Borakalalo Ward, Molepolole Botswana. Its main objective was to assess efficacy of the GROW model in achieving self-empowerment by stimulating poor women's inner strength to confront endemic problems of poverty and unemployment that has become part of their lives. Overall, evidence obtained from the in-depth interviews with women and author's observations and other data sources suggests that, although Kgopolano has not "fully" accomplished its empowerment journey, in terms of realizing its goals of self-help, building resilience, confidence, group cohesion, entrepreneurial skills that will enable the group members to exit from poverty, the group has made tremendous progress in achieving some of its objectives – transforming lives from poverty to sustainable livelihoods. Two major conclusions are reached (i) poor women have acquired basic skills on group cohesion independence from donors and entrepreneurship e.g. how to run small businesses and manage loans given to group members (ii) Self-help partnership environment has been cultivated and now exists, what is lacking is effective nurturing of such an environment so that it is sustainable and directed towards meeting the groups goals of transforming lives which has hitherto been undermined by the challenges relating to; slow return on investment, lack of entrepreneurial skills, lack of youth participation and an uncertain future and general lack of community support and participation in the various activities of the group.

The above notwithstanding, this article conclude that poverty and unemployment are a reality in Botswana which affect mostly women. That numerous interventions have been put in place to address poverty and unemployment in marginalized context, but the results have been very disappointing. The GROW model has great potential to "fix" the problems of poverty and unemployment in a sustainable manner and this has been amply demonstrated by the women's narratives reported in this article. The broad consensus gleaned from women's stories is that the GROW model is working and has made, and continues to make, a positive impact on the lives of the group members. Self-empowerment promoted by the GROW model is manifest in increased levels of confidence and a decline in the dependency syndrome among group members as well as the development of capabilities to engage in income generating activities. This is a clear demonstration that the GROW model strength far outweighs its weaknesses or challenges.

Recommendations

Going forward the following key *Recommendations* are made:

- The Government of Botswana should work in collaboration with Kgopolano GROW group to ensure that the GROW model is integrated in all poverty eradication programmes such that it becomes part of the national agenda on eradicating poverty
- Kgopolano GROW group should develop formal partnerships with government departments (Department of Social and Community Development); NGOs (Hope World Wide Botswana and PCI) and other community-based organizations to promote the GROW model as an intervention with potential to contribute to poverty eradication, self-employment and empowerment in poor communities

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Kgopolano GROW group should reach out to the community and other stakeholders to sensitize them on the GROW model and its potential to transform the lives of the poor (best practice example)
- Kgopolano GROW group should in collaboration with government and NGOs conduct regular workshops and seminars to upskill its members and the general community on laws, policies and programs that seeks to address poverty by promoting income generating activities
- Kgopolano GROW group should promote youth participation in planning and decision-making processes with a view to generate youth interest in the use of the GROW model for self-empowerment and a break from the shackles of poverty and unemployment
- Information and training on the GROW model should be communicated in the local language that the community understand, and the benefits of such model should be clearly demonstrated
- Ministry of Local Government and Rural Development should provide both financial and human resources to support growth and sustainability of the Kgopolano GROW group
- Local and International NGOs should provide resources to support on-going training of Kgopolano group members as well as monitoring and evaluation of GROW model activities.

Chapter 83
Global Economy Urbanization and Urban Economy Globalization: Forms, Factors, Results

Denis Ushakov
International College Suan Sunandha Rajabhat University, Thailand & Russian Academy of National Economy and Public Administration–South Branch, Russia

Shieh Chich-Jen
Chang Jung Christian University, Taiwan

ABSTRACT

World economy globalization fundamentally changes the role of urban business systems. Now, they are the main actors of global production and trade. A dominant share of international business activity is now concentrated within a frame of global urban net. This trend transforms mechanisms and patterns of market economy institutes' functioning and stimulates the appearance of new economical, social, and political problems. This chapter includes statistical and comparative analysis of modern cities, their economical performance, and position in global economic affairs, and also an original methodology for urban business structure evaluation. It allows setting some theoretical findings about internal and external sources of urban business system competitiveness and effectiveness in a globalizing economy and the formation of an original approach to modern cities' global hierarchy evaluation.

INTRODUCTION

In twentieth century globalization became an objective condition of world economy evolution due to rapid development of multinational corporations, liberalization of cross-border movement of productive factors (capital, technology and skilled labor), fast flourishing of information and communication technologies, transformation of international and national regulating of economical and social processes.

The dynamics of globalization identified a number of fundamental transformations that are changing a basis of world economic relations, balance of power in the global production and distribution.

Firstly, feature of economy globalization is a combination of processes of autonomy and integration (Naisbitt, 1994, p. 43-48). This is broadly well-known as a «paradox of Naisbitt»: higher level of economy globalization makes its smallest agents stronger.

Consequently, in the context of globalization small and well-managed agents of the world economy have got competitive advantages of global scale, have started to extend their own economic impact on the world market (due to the usage of transnational productive - distributive systems and opportunities of international markets).

Secondly, globalization requires a maximum involvement of every subject (agent) into the world economical processes, its maximum integration in common economic space. This increases a competitiveness of the small agents of the world economy that are capable to develop own infrastructure for rapid development of foreign affairs and trade.

Thirdly, globalization dynamics of technological progress has highlighted innovative and infrastructural factors of competitiveness (legal, economic environment, innovative potential of society, level of intellectualization of production, and so on), that can be effectively concentrated in frames of smaller (in comparison with the states) business systems.

These patterns of the modern globalization determine a theoretical basis of transformation of urban business systems' economic importance and development of the global cities as new world economic agents.

During five-six thousand years of own evolution the cities developed from relatively small, simply organized and structured settlements to complex and large economic, social, political, cultural, religious, scientific, military and strategic centers and agglomerations.

As a business system city can also be characterized by number of features. Firstly, cities have certain limits and boards that allow their existence independently from the other units. The urban business systems' boundaries are defined by territory, name, organizational structure, etc.

Secondly, every urban business system is characterized by a combination of local resources, by their quality and capacity.

Thus, the dynamics of globalization processes, giving a global competitive advantage to the small business systems, allows them to gain competitive advantages of a global scale, to encourage some transformations of the world economy structure. Due to these transformations urban business systems with their strong internal links, internal unity, and high potential of own economic progress, are more comfortable than national states for international integration and are coming to the forefront of the world economy.

PROBLEM, PURPOSE, AND OBJECTIVES OF THE STUDY

Development of the world economy demonstrates a significant growth of global economic role of urban business systems. Cities concentrate production, innovations, commercial potential and any international business activity. Today a share of hundred of the world major cities in a global GDP is bigger than 30%.

It is caused, firstly, by internal features of urban business systems' organization, such as locality, better management, high domestic consumption, innovative and cultural potential, investment attractiveness

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and transport infrastructure, possibility for formation of new areas for business activity. And, secondly, by current trends of globalizing world (such as growing urbanization, capital and labor mobilization, post-industrialization, expansion of multinational corporations, development of information and communication technologies). Needs to consider causes, factors and consequences of formation and development of the global cities system identified a relevance of this study.

The purpose of the study: based on the theoretical analysis of factors of global cities' formation and development, on the role of urban business systems in modern world economy to determine features and patterns of urban business systems' globalization and positioning within a frame of global cities' net.

Objectives of the study:

- To identify globalization and world economy transnationalization as the factors for changing of economic role of the cities, for creation of new kinds of urban business competitive advantages, for formation of network of the global cities and for a concentration of international economic affairs within this net;
- To consider a role of urban business systems in dynamic of economic integration, to evaluate world biggest urban business systems by criteria of their economic, demographic, legislative and financial performances, by their innovative, investment and tourism potential and environment;
- To identify the role of global cities in world economy networking; conditions of formation, principles of functioning of the global cities' network and possible consequences of its development;
- To analyze interactions between the cities within a global system of urban economies, to assess its dynamics and intensity;
- To identify types of urban economies depending on city's positioning in the global hierarchy, and abilities of this hierarchy transformation in the dynamic of world economy;
- To study dependence between a quality of urban governance and local business global economy performance; to offer conclusions about global hierarchy of the global cities and features of inter-cities relationships within this structure

Following hypotheses of the study were set:

H1: Globalization as a trend of world economy development is also a process of increasing of cities' economical role, supports a movement of urban business systems' competitive advantages to the global level, and stimulates concentration of world economical activity within a frame of global cities' net.

H2: There is a high positive correlation between global economic role of the city and its economic role within national economical system.

H3: There is a high positive correlation between quality of local (urban) governance and global economical role of the city.

H4: There is a high positive correlation between quality of local (urban) governance and economical role of the city in the national economical system.

H5: There are few kinds of the cities, differing by their economical role, forms and intensity of their relationships with national industries and world market, dynamics of economical growth in the global net of urban business systems.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

LITERATURE REVIEW

Formation of theory of global cities and urban business systems functioning has a long history. As a founder of modern research in this area we can name Geddes, P. who in "Cities in Evolution" started to use a category "global city".

Naturally, at the beginning of the twentieth century a combination of three criteria - political significance, economic strength and population size - was a main reason for any city to become "a world center" (Geddes, 1915).

In 1966 Peter Hall published "World City". He defined world cities as the national and international centers of political power; centers of national and international trade; centers of professional activity; consumption, information and diffusion of technology through means of mass communication, culture, entertainment and services industry (Hall, 1966).

One of the first researches considered global economic role of the cities and their financial importance was conducted by Reed, H. He analyzed financial indexes in conjunction with geographical, political, economical and socio-cultural characteristics of 76 cities in 40 countries (dynamic of their development in period 1900 – 1980). Achieved findings allowed to establish a five-level hierarchy of international financial centers (with London on the top) (Reed, 1989).

In authoritative study "The Global City: New York, London, Tokyo" S. Sassen focused on new aspect of the world economy - intense transition of management, coordination and financing functions to high-end and high-tech companies.

As Sassen, S. pointed, there are four key groups of high-tech activity in the service sector: financial and business services, power and influence, creative activities and tourism.

Thus, a term "global city" currently means the city, where disproportionately high share of the economic and political institutions focused. It gives to global cities opportunities to make significant solutions for all regions of the world. Consequently, a global city has to have an infrastructure for making and realizing global solutions (headquarters of multinational and global corporations, international political and financial institutions, world stock exchanges, largest international trade fairs and so on).

MAIN FOCUS OF THE CHAPTER

Statistical Analyze of the Modern Economic Role of Urban Business Systems

Comparing the economic systems of different cities and national countries, we can highlight main advantages of the cities as world economy agents. First of all, cities have a greater mobility of people and capital. They are much more predisposed to commercialize and generate new knowledge and innovations (Velikhov, 1996, p.145-152).

Moreover, cities can be easier connected to the international trade; they have abilities to reduce transport costs, to increase own investment attractiveness, and to form new types of business activities.

An average share of the cities in national GDP of India, Russia, Brazil and some countries in the Middle East and Latin America, is on 5-10% higher than their proportion in the population of these States. It indicates a higher efficiency of the urban business systems comparing with rural areas. Modern cities are also distinguished by high rate of gross regional product's (GRP) growth.

10	London	Paris	1,070

Global Cities' Economic Integration: Dynamic and Intensity

Attempts to consider a world economy as a network of interacting cities have been made since the 1990's.

An approach of GaWC expert group is one of the most prominent (Taylor, 2004, 2011). This group analyzes interdependence between global cities networking and world economy transnationalization.

Manufacturers of high-end services form a core of global service industry, offer possibilities of "global service" for MNC's and aggressively develop an international network of the own offices. In this network system the cities are considering as points, where interests of the global companies intersect. For identifying inter-urban linkages GaWC uses information about location of offices of TOP-100 largest multinational companies.

According to GaWC research mostly integrated into transnational network cities are concentrated in North America, Western Europe and East Asia (Hymer, 1972, p.181-194; Clark, 1996, p.41-48).

An original approach of Viltox F. and Verekken L. (Wiltox & Verecken, 2005) to determine characteristics of the global cities' network based on the analysis of air passengers flows between them. Using statistic data from largest airports and airlines of the world, they identified world busiest air-routs and structure of inter-regional passenger traffic (Table 1).

Obtained data was visualized as a variant of global urban network that also demonstrates a leadership of U.S. and European cities and rapid increasing of global impact of Asia -Pacific agglomerations.

However, existing methods for determining patterns of the global urban network functioning are based on a comparison of selected urban indicators without taking into account regional features of the cities and their relationships with own states.

As noted before, a definition of global cities network should be based on assessment of regional significance and importance of the city (Meteleva, 2012). Further, analyzing a quality of interactions between the cities, we can identify the city's opportunities to impact on the world economy progress and to be integrated in the forming global urban network.

Within a study economic relationships between 33 world largest cities were analyzed and evaluated by following indicators:

- Number of headquarters / branches of MNCs (data from "Forbes-2012" / www.forbes.com/researches.html);
- Number of national companies branches in partner city (data from "Forbes-2012"/ www.forbes.com/researches.html);
- Number of national financial MNCs based in the city, and number of their branches in a partner-city (data from "Forbes-2012" (TOP-500 companies in the world, 2012);
- Urban export to partner city (data from web sites of the cities (urban commercial departments), 2012);
- Urban import from partner-city (Data from web sites of the cities (urban commercial departments), 2012);
- Investments from / to partner city;
- Number of flights between a pair of cities per day;
- Number and amount of money transfers to / from partner city per year (data from web sites of the cities (urban commercial departments), 2012);
- Number of students from partner city in largest local universities (Data from Pricewaterhouse Coopers, 2012);
- Number of applications for extension working / migration visas by residents of the partner city per year (Data from Pricewaterhouse Coopers, 2012);
- Daily Internet traffic between the pair of cities (Data from annual report by Microsoft, 2012);
- Number of tourists' arrivals from the partner city per year *(Annual report by World Tourism Organization*, 2012);
- Existing preferences and special regimes for the development of business relations with the partner - city (*Mapping the global network economy on the basis of air passenger transport flows*, 2012);
- State of information environment of economic relations between the partner cities (number of partner-city's references at city official web-site (calculated by authors).

An assessment of interdependence of world major cities was made by 12- points' scale (12 points were given to the maximum value of each indicator). The results are shown in Table 3.

As can be seen from the Table 3, maximum intensity of correlations is observed in pairs London and New-York (absolute maximum), Hong- Kong and New-York, Hong-Kong and London, New-York and Los-Angeles.

Minimum intensity is typical for relationships between geographically dispersed regional centers (such as Berlin and Shanghai, Osaka and Barcelona). Based on this data we can show five most important economic partners for modern cities (Table 2).

It is obvious that the most important economic partners of all analyzed cities are London, New-York, Hong-Kong, Tokyo, Paris and Singapore. Due to maintaining of own intensive connections with the capitals of Latin America we also can see Madrid in this Global Ranking and also Toronto, Sydney, Shanghai, Frankfurt that have high economic impact in different regions.

Based on the data from Table 3 we can rank cities of the world by diversification of their international relations (Table 4, 5).

It's obvious that cities playing a less significant role in the global economy in general have more diversified foreign economic relations and maintain relationships with major urban economies of the world at approximately similar level of intensity.

At the same time cities with high global economic impact (such as Hong-Kong, Paris, London, Tokyo, Singapore, and New-York) are increasingly specialized in internal(within own group) relationships.

This phenomenon, called glocalization (concentration of international economic interactions within the countries - economic leaders) is well studied now (Zinoviev, 2003); its economic causes and patterns are identified. This study confirms that a similar trend is relevant for the global cities.

Current Network of Global Cities: Structure and Potential to Transform

Based on results and conclusions about cities' world hierarchy, we can describe a network of cities that are currently concentrating most of the world production and distribution.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Global cities (New-York, Hong-Kong-Tokyo, and London-Paris) are more closing on interactions with each other and provide a global range of the productive factors (including innovations and information, labor and capital) movement. These are three historic centers of world capitalism with currently prevailing and dominating economic role in the world.

Five global cities using instruments for global control and regulation will obviously retain their dominant position in the world economy in context of current trends and patterns of international economic integration.

In our view, changes within a round of global cities are possible only in paired centers (such as Hong-Kong - Tokyo, Paris-London), where one city will displace another.

In Europe, London will remain a leadership due to financial and innovative role of British capital.

Actually, modern leadership of Paris is not based on its global economic role, but rather, on the opposition to British economic policy (Berg & van der Braun, 1999). Existing differences in trajectories of the European Union development required a continental European counterweight with London. Frankfurt or Milan could not play of these counterweights primarily due to their small size (they are essentially smaller than London by population and economic power). Paris, as one of the oldest and third (after Moscow and London) populated capital of Europe, recognized world cultural and economic center is much better suited for the role of continental European trends' consolidator.

Currently, there are two possible scenarios for the European Union, and both of them show a decreasing of Paris' economic role.

The first scenario is a final (deepest) integration of the European Union. In this case, need of counterbalance with London will disappear and politic and economic role of Brussels will significantly increase.

The second scenario is preservation and escalating of European integration problems. In this case Paris will lose its economic impact due to the increasing of economic role of largest cities in disintegrating Europe (such as Madrid, Milan, and Frankfurt).

In Asia, the situation will also change. In our opinion, the only one Asian city will remain a global leadership and this city is Hong-Kong.

Hong-Kong is a unique project of global city that maintains a maximum integration into the world economy and has a strong support from the Mainland China, largest economy in the world.

Hong-Kong is an independent player of the world economy that has all attributes of global economic entity (national financial and monetary system, political sovereignty).

As a city-state, deprived of rural population and any problems related with economic integration, Hong-Kong can be fully oriented to the global world and build own global power.

Tokyo, being a capital of other large Asian country, cannot develop, fully focusing on the globality, especially in the conditions of relevant structural problems of Japanese economy.

From this perspective, Hong-Kong has enormous competitive advantage. Hong-Kong can be maximum focused on the world economy, can conduct an active global economic activity and form an infrastructure of global finance and economic regulation. At the same time, in case of global or regional crises, Hong-Kong can always be supported by the powerful Chinese economy. For example, in 1998 Chinese government implemented complex financial investments "saved" Hong-Kong in the midst of the Asian crisis.

Tokyo or Singapore has not abilities to conduct a really global economic activity and at the same time to be in zone of responsibility and supporting of the world's largest economic system.

In addition to 5 global cities, we also can define two other types.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The first type includes cities of global orbit that provide a transfer of political and economic impact of the global centers, are also highly integrated into the world economy; however, are not capable to impact on its dynamics.

In the language of management, these cities belong to middle level and transfer trends, from level of global cities to the level of national economies. These cities are regional leaders and have very high impact on regional economic development.

Geographical location of the global cities provides uninterrupted operation of channels for information and production factors' transfer for functioning of the global productive and distributive systems.

Finally, the third type of cities is so called "cities - gates", that provide connections of national economies to the cities of global orbit. These cities are deprived of the world economy impact and keep intensive relationships with national economies. Moreover, only national economy, its dynamics and indicators of development are the key reasons of cities presence in the list of global "gates".

If country loses its attractiveness for the world economy, an economic importance of "city-gate" rapidly shrinks. For example, in the early twentieth century, Rangoon (Yangon) was a major "gateway" of Southeast Asia. Nowadays, in a situation of political conflict in the Union of Myanmar Yangon has no any value as a global city.

According to our findings there is only one global city in Asia-Europe part of the global orbit - Singapore. Taking into account a geographical specific of localization of largest cities in South Asia, Middle East and Russia, this chain of global urban orbit will be under a high competition for leadership between three cities whose place in the global urban network is not clear defined now. These cities are Mumbai, Dubai and Moscow.

Mumbai is now a stronghold of economic development of second populated country in the world, largest and dynamic economic system. India is interested in the presence of own cities within the orbit of global economic power (along with Singapore or Frankfurt).

Mumbai already plays a role of "gate" to Indian economy, has a huge potential to transit on higher level of global urban hierarchy.

This potential is defined by increasing financial, cultural and innovative abilities of Mumbai, rapidly modernizing urban business, transport and social infrastructure.

If India has no other cities competing for the leadership (such as Delhi, Kolkata or Chennai), Mumbai already might be regarded as a real player of global orbit. In the same existing conditions, Mumbai needs a qualitative improvement of local living conditions, enhancing of international relations (not only within Asia), building of effective institutions of global finance, transformation to not only world cultural (for example, due to success of Bollywood) but innovative and technological centre.

Mumbai authorities understand this and already implement a program of urban development "To overtake Shanghai in 2020!" (The urban poverty: Global analysis, 2009. p.9-11).

Experience of Dubai is also unique. In fact, this city now is not even a "gate" due to relatively low global economic importance of the United Arab Emirates economic system.

This country has excellent living conditions for the local residents. But their quantity (about 1 million) does not allow considering Emirates as a promising market. There is no large-scale industry and any potential for industrial growth in the nearest future. Meanwhile, the city's authorities have implemented an unprecedented program of artificial (not based on economic realities) transition of Dubai to the rank of global cities.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Municipal authorities have set up super modern logistics, transport, services (including banking, international finance institutions, insurance, trade and tourism) infrastructure.

Since 2005, the city of Dubai has implemented large-scale programs to attract highly qualified specialists in every field of science, research and development (projects of Internet City, Education Village, Health City, and Silicon Oasis). Dubai now is a world recognized center of tourism, conventions and business trips. Before 2008 Dubai was the world leader in sales of real estate to foreign owners (due to local odious development projects).

Thus, Dubai has an infrastructure of global city, but its real economic impact is insufficient for the city's transition to the top of global pyramid. In order to overcome this limiting fact, in terms of lack of time to develop own production and distribution networks, Dubai businesses are actively investing every attractive projects, regardless of geography and undustry spheres - from retailers of South Africa to London Stock Exchange.

In economic sense Dubai has significantly less global impact than metropolises of China, Europe or India. However, taking in account ambitions of the city leadership, Dubai's fast recovering afer financial crisis - 2008, and already announced plans to diversify foreign investments and to attract foreign MNCs (by creating most favorable business conditions), as well as urban strategy of innovative modernization (that should turn Dubai into a city of high technology and cultural capital of the world in 2030), opportunities of this Arab city to enter into a global urban orbit are very real.

The third competitor for entrance into the global urban orbit (in Asia-Europe chain) is Moscow. However, a presence of Moscow in list of possible candidates is just based on the Russian capital's geographical location and its historical role as a center of state between Europe and Asia, not on the real economic strength.

Certainly Moscow is one of the most famous cities in the world, has an authority and power to impact (also due to the Soviet legacy) (Zanadvorov & Zanadvorova, 2003, p. 51-54). But modern Moscow's economy role in the global network is just a "city - gate" to Russia economy, way to huge natural resources.

And even this function Moscow doesn't realize well (Moscow's position in a global cities' rank is lower than position of Jakarta or Buenos - Aires). Moscow has the best Russia' infrastructure to develop international contacts (transport, communications, exhibition activities, financial institutions, consumer market). Moreover Moscow is a federal capital and this is an extremely important competitive advantage within current structure of Russian economy. No-one Russia city has same advantage, even some of them have more favorable geo-economic position (for example, Vladivostok, Kaliningrad and St. Petersburg).

Moscow has no any socio-economic indicator similar to the global cities. Moreover, an increasing of concentration of Russia international economic initiatives in Moscow, year by year reduces an efficiency of Moscow's business functions (due to rising of living cost, price of real estate, indicators of city's corruption, deteriorating of business conditions, increasing of urban transport problems, crime and so on).

This negatively affects investment attractiveness of the city, and desire of transnational business to include Moscow in the list of prior and favorable locations; reduces financial performance of domestic corporations.

Of course, Moscow already has some attributes of global economic center. City is actively trying to improve own image, to attract tourists and businessmen, to implement pretentious infrastructural projects. But speed and cost of this upgrade can't be compared with growing of mega-cities of the Middle East and Asia Pacific. In this problem situation, a development of Moscow is seen simultaneously in two directions:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Improving of Russian capital efficiency to connect national economy with global flows of goods/ services and productive factors. It will help to overcome problems of regional differentiation (at least in the European part of Russia), will provide opportunities for increasing of Moscow global competencies;
- Inclusion of Moscow in global cities orbit (in the chain Asia – Europe), turning Moscow in a world-class financial center, performs the broadcasting role between Hong- Kong and London in long term. This will require a number of infrastructure and institutional measures to level a substantial loss of Moscow to its closest competitors - Dubai and Mumbai.

Urban Business Systems' Efficiency as a Factor of Cities' Global Positioning

Studying of historical phases and modern dynamic of urban business systems' globalization allows identifying main reasons of world economy transformation to a global cities' net.

First reason is a rapid growth of urban business systems' economic importance. Cities' economical impact increased in context of world economy globalization and business transnationalization; spread out of urban or national boards, allowed them to get functions of global economic regulators.

The second reason is a structure of urban economical systems. This structure in the age of post-industrialization is increasingly focused on so-called tertiary and quaternary sectors. Post-industrialization' trend is most clearly stated in the cities, where population prefers to consume tech goods and services and to participate in information and innovation production.

For example, in Mumbai, India technological and service sectors create 64% of GRP. At the same time share of these sectors in Indian GDP is less than 28%. Same indexes for Istanbul and Turkey are 69% and 38%, Jakarta and Indonesia - 29% and 21%, Mexico City and Mexico - 25.3% and 21%, Buenos Aires and Argentina - 79% and 38%, New York and the U.S. - 84% and 58%[3].

In contrast to traditional industry and agriculture, information and service economy highly depends on space. Information is global in origin (due to its mobility), while most of services (such as business, medical, tourism) is immobile and directly related to the place of provision.

Immobility of services contributes to their localization and development of "invisible" export (when consumers have to go to the places of services' purchasing).

Finally, a third condition of global urban hierarchy formation is activities of multinational corporations. According to Global-500 list, more than 30% of all headquarters of TOP-500 MNCs is concentrated within a global cities network. Traditional geography of world largest MNCs headquarters location (mostly in Tokyo, London, New York, Frankfurt) is changing now by invasion of developing Asian and Eastern European centers.

For evaluation of business urban system efficiency impact on cities positioning withing a global hierarchy we evaluated 48 world largest (in terms of population and economic role) urban business systems. Every city was evaluated by 6 groups of criteria. Evaluation assigned a number of points - from 0 to 12 (Table 6).

Results of evaluations of these six criteria translated into 12 - points scale of assessment and are presented in the Table 7.

According to survey a leadership of New York, Tokyo and London is clear. Meanwhile, there are many cities of Asia-Pacific region, BRICS countries with a great potential for the further development.

Based on data from Table 7 we can divide explored cities on global and local leaders (as global we will consider cities from TOP-24 of this ranking).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Structure and criteria of urban business systems evaluation

Nº	Index	Methods of Calculating
1	City's position in a global hierarchy	Results of GaWC study were used. Alpha++ cities got 12 points. Gamma cities – 2 points. Cities out of GaWC ranking got 0 points.
2	City's role in national economy	City share in national GDP, national export and import, foreign investments flows, local stock exchange capitalization were used
3	Demographic potential of the city	Share of the city in national population, comparison of urban and national unemployment and wages
4	Conditions for running a business in the city	
4.1	Law and political conditions for running a business (10% share in final evaluation)	Based on cities rankings (Moody's Global Rank, 2012 and Ex-Im Bank-2012), process of license obtaining (number of required documents for construction, time required for obtaining a license for construction), process of property registration (number of required documents, of registering officials, time required for obtaining a property rights).
4.2	Economical stability of the city (10% share in final evaluation)	Calculating based on GRP dynamics, inflation dynamics, realty (business and residence) prices dynamics in 2012
4.3	Regime of commerce and manufacture (20% share in final evaluation)	Calculating based on process of new business registration, liberality of labor law, custom regime. Results of 'Doing Business/ Global Cities Report - 2012" were used
4.4	Financial stability of the city (22% share in final evaluation)	Calculating used - number of offices and headquarters of financial institutions and banks in the city (data of Forbs), capitalization of city stock-exchange
4.5	City's function as a business center (12% share in final evaluation)	Calculating used – process of obtaining a credit, cities credit ranking (Mastercard Worldwide, 2012), process of closing a business (Doing Business, 2012), transport infrastructure of the city, passenger and freight traffic, number of international flights in local airport per day, number of 5 stars hotel rooms per capita, share of population living in high-rise buildings (over 10 floors).
4.5	Index of innovativeness of the city (16% share in final evaluation)	Calculating used – number of universities, MBA programs, issued patents, Internet traffic per capita, number of publishing science magazines, local population access to Internet and mobile nets
4.7	Living standards in the city (10% share in final evaluation)	Calculation used results of UN-Habitat research in 2012 (Livability Indexes)
5	City attractiveness for tourism and business	Calculation used – number of arrived tourists in 2012, city popularity as a tourist and business tourism center[4].
6	Political power of the city	Results of research - Global Power City Index, 2012 by Institute for Urban strategies

Next part of research includes a comparison of roles of the local (urban) administrations in development of business environment and in deepening of urban business systems' integration in a global economy.

Role and effectiveness of municipal administration were estimated by three indicators:

- Level of corruption in city administration,
- Quality of municipal decisions and acts,
- Transparency of local government.

The index of corruption of local authorities (by 100 - point rating system) is determined annually by World Bank international experts. Assessment of the quality of municipal decision and acts were taken from the study of Lafen (2011) "The role of global cities" (original results were transformed to 100 - point rating system).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Local government transparency was evaluated by analysis of urban e-government performance (official web portals of local authorities, quality and quantity of on-line services). Here we used 100 - point rating system:

- 10 points, when city does not have any official representation on the Internet;
- 20 points, when official portal of the city authorities just contains a basic information;
- 30 points, when official portal of the city authorities provides information about the conditions of doing business, living, real estate purchase, and so on;
- 40 points, when official portal of the city authorities has relevant information and analysis;
- 50 points, when official portal of the city authorities gives abilities for on-line consulting by municipal officials;

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- 60 points, when official portal of the city authorities offers a possibility of filling / downloading official forms and legal documents;
- 70 points, when official portal of the city authorities has information about official activities in the city with coordinates and contact details;
- 80 points, when official portal of the city authorities contains information about main projects of municipality, discussions and relevant reports;
- 90 points, when official portal of the city authorities provides information about the state / city procurements;
- 100 points, when official portal of the city authorities allows obtaining of certain government services in remote access (registration of insurance, grants, pensions, health care, educational services, and so on).

Examples of this evaluation (for 9 global cities) are demonstrated in Table 8.

Obtained data allows evaluating of the correlation between quality of urban governance and local business system global economic role.

For clear demonstration of findings we can divide the global cities for 4 categories, depending on urban business system's positioning in a global economy and quality of the local governance (Table 9).

As we can see on Table 9 an economic role of effective-managed global cities in their own countries, in general, is the lowest among all analyzed categories. The business systems of these cities are not main drivers of National economics' development; are not significantly outstanding within the frames of national economic system. High quality of the urban governance in these cities forms their ability to regulate a global economy, not only to serve as a "gateway" to the National economic systems.

On the other hand, a share of non-effective-managed local cities in the national economies is maximal. Differences between the city's share in national GDP and in national population show a high productivity of urban labor force comparing with rest of the country (the average labor productivity in non-effective-managed local cities is in 2.8 times higher than in surrounding provinces).

This suggests that these local cities received their status in a global economy only due to concentration of big productive and trade potential of countries within them (Brazil, Egypt, Philippines, Indonesia, and

so on). In the global economy, these cities serve as coordinators of regional production and distribution systems; as portals of National economies connection with systems of transnational goods, services and productive factors transfer. However, these cities do not have any impact on the functioning of transnational economic interactions, and just keep a function of "entrance gate" for multinational business.

Cities of the third category have a global status and abilities to impact on the world economy progress. However, taking in account a low quality of their urban governance, we can suggest that global impact of these cities is only based on potential of the countries (where these cities are located), including capital, natural and human resources.

Relatively a high share of these cities in the structure of national economies can multiply (due to the concentration of all national resources within urban economy) their influence on transnational economic relations. Such cities (for example, in the case of Russia, Thailand, Argentina, Mexico) are often only one ability for national economy to be connected with existing transnational production and distribution structures; monopolize a foreign trade and multinational entrepreneurship.

Four different types of cities in the global economy significantly vary from each other by type of their relationships with national economies, institutions and global markets.

Ineffective managed local cities take a lowest position, performing mostly as coordinators for National industries development. These cities are under influence of the global economy trends but have no abilities to provide any feedback effect.

Non-effective managed global cities retain high connection and inter-dependence with the national economies; serve as the locomotive of National economic development and connect it with transnational productive and distributive chains. Meanwhile, the ability of these cities to impact on the world economy is ensured only by potential of countries of their location (raw materials, labor, innovation, and so on).

Cities of the second type with effective city management, but local in their economic role are much less dependent on business environment in own countries and are under bigger impact of global cities and world economy.

Finally, cities of 1 type are operating in transnational system of production and distribution and retain a small dependence on their own states, attract international resources and productive factors (capital, information, labor), acquire opportunity to influence on the world economy functioning.

The analysis of four types of the cities also confirms findings that well-managed global cities are growing slower than the others (Bramezza, 1996; Jensen-Butler, 1997; Kresl, 1995).

Discussion

The methodology of urban business systems evaluation, presented in this paper bases only on a comparison of objective criteria of their economical, social, innovative, technological development (Table 6).

From one hand, it gives abilities for identifying patterns of cities' positioning within a global system of division of labor.

From the other hand, this research doesn't take in account real forms of economical interactions between the modern urban business systems, their intensity and dynamic (such as inter-cities trade, passenger or internet traffic). Interactions between urban business systems within a frame of global cities' net can be considered as a prospective direction for further research and studies, which are able to clear a modern global hierarchy of the cities and patterns of urban business systems globalization.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moreover, for testing economic efficiency of local (urban) governance only three aggregated indexes (local government's transparency, local government corruption and efficiency of local government's decisions and acts) were taken in account. It is sufficient for consideration of world urban business systems' hierarchy consisting of 4 kinds of global cities (as was proved in a study). But importance of increasing the number of local governance criteria for further research is also obvious.

CONCLUSION

Globalization as a process of world economy transformation, increasing of integration between national economical systems, formation and fast development of transnational manufacture and distribution chains transferred local advantages of effectively managed urban business system (small size, high level of infrastructural development, innovative and consumption potential and so on) to the global level, gives abilities of global economical stimulation and regulation, opportunities to concentrate productive and consumption potential of whole world within a frame of global cities chain. Additional reasons for cities transformation to the main actors of global economy are traditional structure of urban business systems (that are maximally proper for globalizing economy requirements), their easy access to the world financial and technological markets, their high innovative potential, and abilities of urban consumption markets and so on.

Existing methods of determining the patterns of global cities' network functioning based on a comparison of urban development indicators (Beaverstock & Smith, 1999; Begg, 1999; Duffy, 1995; Knox, 1995) without taking into account regional features of the cities and relations with own countries. Thus, based on proposed classification, global cities hierarchy and evaluation of 15 criteria (number of head offices / branches of national TNC, value of inter-cities export-import operations; inter-cities investment flows, passenger traffic, Internet traffic, number of tourist exchanges, state of information environment development and so on) paper analyzes an intensity of economic interactions between cities, determines their potential impact on the global economic progress, value of their integration into the global network.

Maximum intensity of economic relationships was observed between pairs of cities - London-New-York, Hong-Kong-New-York, Hong-Kong-London, and New-York-Los-Angeles. Less intensive relationships are built between geographically dispersed regional centers, for example, Berlin-Shanghai or Osaka-Barcelona.

Cities with less significant role in the global economy, however, have more diversified foreign economic relations; maintain connections with major urban economies in the world at approximately the same level of intensity. While cities with a global impact (Hong-Kong, Paris, London, Tokyo, Singapore, New-York) are specializing in internal links (within a group). This trend (glocalization) is legitimate in a growing global influence of these cities; they form a framework of current world economy.

Municipal infrastructure assessment of allows selecting tools of conservation a global leadership of few cities associated with the functioning of global finance institutions, transnational movement of highly skilled labor force, innovative development and inner (urban) consumption.

High capitalization of stock exchanges of the global cities, provided mostly by foreign capital, demonstrates their ability to concentrate of global financial flows within its own network. Global cities also act as leaders in the field of innovations, creating a necessary infrastructure for new knowledge generation, opportunities to commercialize innovations by expense of venture investment programs and public funding.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Global cities that have a maximum variety of economic, social, cultural, recreational, service infrastructure, headed the ratings of most attractive places to live, ensure a constant supply of highly qualified labor from around the world. The major advantage of a global city also is capacious and diversified consumer market that develops through growth of urban population income. Quantity and quality of consumer demand is also a condition for financial, innovative and political progress of the urban economy.

Global cities (New-York, Hong-Kong-Tokyo, and London-Paris) are closing more on interaction with each other, providing a range of major global movement of factors of production, including innovation and information, labor and capital. These five global cities representing three world centers of capital will retain their dominant position in the global economy while modern trends of international economic integration continue.

Changes in circle of the global players are only possible in the pair centers (Hong-Kong - Tokyo, Paris-London), where one city will displace other.

In Europe where the position of Paris is not based on its global economic role, but rather, on the opposition to the British continental economic policy (both by optimistic and pessimistic scenarios for European integration development), London will be only one global leader.

Hong-Kong will be the only global city in the Asia-Pacific region. Now Hong-Kong is slightly inferior to the Japanese capital in its socio-economic development and economic role, however, Hong-Kong is a unique project of global city that, maintaining a maximum integration into the world economy, has a strong support from the Chinese mainland.

In addition to the global cities in proposed version of world urban network we identified cities of global orbit and "cities-gates". Cities of global orbit provide a transfer of political and economic influence from global centers and are highly integrated into the world economy.

Their geographical location ensures a smooth functioning of communication channels and transfer of productive factors required for global production and distribution system.

"Cities – gates" allow connection of national economies to the cities of global orbit. They are deprived of impact on the global economy and keep relationships with economy of the country and conditions of its functioning.

Currently there is only one city in the second part of the global orbit - Asia-Europe - Singapore. Taking in account geographical specific of localization of the largest cities in South Asia, the Middle East and Russia we can suggest that this place in the global orbit will be a place of strong competition between three cities, whose place in urban global network at the present time is not defined - Mumbai, Dubai and Moscow.

As was proved in the study effectively managed global cities normally have not high economical importance in national economical system – they are globally competitive, attractive for multinationals, and are mostly concentrated to operate in transnational system for goods and services production and distribution.

At the same time ineffective managed global cities have strong relationships with own national economical systems, prove its access to the world markets (of capital, high skilled labor force, innovations and technologies, or consumer markets) and traditionally have determining economic impact on national economical system's development.

Due to its impact on the cities' global competitiveness and business attractiveness quality of local governance (transparency, corruption, tactical and strategy efficiency) is a reasons for identifying 4 kinds of the cities within a global urban net. They are effectively managed global and local cities and ineffectively managed local and global cities.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This allows identifying a hierarchy of world cities, to predict interactions between urban business systems and international economic institutions, national economies. In any case, the presence of cities hierarchy implies an existence of certain patterns of forming of economic interactions between modern urban business systems, a formation of global cities network that is more and more concentrating almost all world economy.

KEY TERMS AND DEFINTIONS

Characteristics of Global Cities: Standard characteristics of world cities are: variety of international financial services, notably in finance, insurance, real estate, banking, accountancy, and marketing; headquarters of several multinational corporations; the existence of financial headquarters, a stock exchange and major financial institutions; domination of the trade and economy of a large surrounding area; major manufacturing centers with port and container facilities; considerable decision-making power on a daily basis and at a global level; centers of new ideas and innovation in business, economics, culture and politics; centers of media and communications for global networks; dominance of the national region with great international significance; high percentage of residents employed in the services sector and information sector; high-quality educational institutions, including renowned universities, international student attendance and research facilities; multi-functional infrastructure offering some of the best legal, medical and entertainment facilities in the country (Florida, R. (2012). What Is the World's Most Economically Powerful City? The Atlantic Monthly Group. Retrieved 19 June 2013).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Economies of Agglomeration: Is used in urban economics to describe the benefits that firms obtain by locating near each other ('agglomerating'). This concept relates to the idea of economies of scale and network effects. Simply put, as more firms in related fields of business cluster together, their costs of production may decline significantly (firms have competing multiple suppliers, greater specialization and division of labor result). Even when competing firms in the same sector cluster, there may be advantages because the cluster attracts more suppliers and customers than a single firm could achieve alone. Cities form and grow to exploit economies of agglomeration.

Global City (World City): Is a city generally considered to be an important node in the global economic system. The concept comes from geography and urban studies and rests on the idea that globalization can be understood as largely created, facilitated, and enacted in strategic geographic locales according to a hierarchy of importance to the operation of the global system of finance and trade (The Global City Competitiveness Index. Managementthinking.eiu.com. 12 March 2012).

Glocalization: Serves as a means of combining the idea of globalization with that of local considerations. Thus, initially developing an understanding of globalization offers a great deal of assistance in beginning to understand the function and meaning of glocalization. As explained by Phillip Hong and In Han Song, glocalization corresponds to the integration of local markets into world capitalism (Sharma, C. (2009). Emerging Dimensions of Decentralization Debate in the Age of Globalization, Indian Journal of Federal Studies Vol.19, No. 1: 47-65). Manifested by global changes in structures of the economy, globalization entails a restructuring of the world economy and a spatial reorganization of production and consumption processes across political states (Hong, P. & Song, I. (2010). "Glocalization of social work practice: Global and local responses to globalization". International Social Work 53 (5): 656–670).

The Ranally City Rating System: Is a tool developed by Rand McNally & Co. to classify U.S. cities based on their economic function. The system is designed to reflect an underlying hierarchy whereby consumers and businesses go to a city of a certain size for a certain function; some functions are widely available and others are only available in the largest cities. The system consists of a number and a letter. The number reflects a city's importance in the national hierarchy. Nationally important business centers are ranked 1. Regional business centers are ranked 2. Significant local business centers are ranked 3 and business centers whose importance is purely local are ranked 4. the letter reflects its importance in its own area. Doubled letters serve to distinguish centers within a class. The most important center in a market (trading area) is given some kind of A. Other business centers in the same market area will be given B or C depending on their importance.

Urban Economics: Is broadly the economic study of urban areas; as such, it involves using the tools of economics to analyze urban issues such as crime, education, public transit, housing, and local government finance. More narrowly, it is a branch of microeconomics that studies urban spatial structure and the location of households and firms (Quigley, 2008).

Urban Planning (Urban, Merged Urban Regions, Regional, City, and Town Planning): Is a technical and political process concerned with the use of land and design of the urban environment, including air and water and infrastructure passing into and out of urban areas such as transportation and distribution networks. Urban planning guides and ensures the orderly development of settlements and satellite communities which commute into and out of urban areas or share resources with it. It concerns itself with research and analysis, strategic thinking, architecture, urban design, public consultation, policy recommendations, implementation and management (Taylor, Nigel (2007). Urban Planning Theory since 1945, London, Sage).

Chapter 84
Correlates of Political Consumption in Africa

Emmanuel Adugu
University of West Indies – Cave Hill, Barbados

ABSTRACT

Using the marketplace as a site for political action with social change motives is referred as political consumption. Boycott, as a form of political consumption is an innovative way being used by citizens to directly express their attitudes, interests and concerns with the ultimate goal of influencing public affairs. This book chapter specifically examines the correlates of boycott as a form of political consumption in Africa using Wave 6 of the World Values Survey. Based on binary logistic regression, the correlates of boycott action are: level of education, gender, social class, media usage, gender equality, institutional confidence, social network, interest in politics, life satisfaction, seeing oneself as being part of world citizenship, seeing oneself as being embedded in local community, importance of doing something for the good of society, importance of traditions, and importance of riches or expensive things. These findings have implications for reaching out to boycotters.

INTRODUCTION

The use of the marketplace to influence social policy changes is referred to as political consumption. The growing tendency by citizens to use political consumption has been widely linked to the inability of conventional forms of political participation to deal effectively with public issues (Goodman & DuPuis, 2002; Halkier & Holm; 2004; Stolle, & Micheletti, 2013). Boycotts—punishing businesses for unfavorable behavior (Neilson, 2010, p. 214) and buycotts—the deliberate act of purchasing a product to support specific ethical, moral, or political concerns (Sandovici & Davis, 2010, p. 329) are considered as forms of political consumption. The phenomenon of political consumption has been widely studied in post-industrialized nations but not much has been written about such social change-oriented actions in developing countries (Adugu & Ampadu-Ameyaw, 2014). The objective of this book chapter is to explore the relationship between engagement in boycott action and attitudinal variables (such as life satisfaction,

political interest, embeddedness in social network, etc.), Schwartz values and socio-demographics in the context of representative national survey data from Africa using Wave 6 of the World Values Survey.

CONSUMERS AS MARKET ACTORS

In general, consumption includes activities of buying goods, social relations connected to the provision, allocation and use of goods and services and can also be viewed as part of the social space in which people participate in creating and reproducing meanings about the occurrences of everyday life (Luckmann, 1989). Some scholars view consumption as a meaningful form of civic engagement (Scammell, 2000; Hertz, 2001). In an overview of consumption, Humphrey (1998, p. 7-8) identifies consumption as:

… a potential arena of personal empowerment, cultural subversion, and even political resistance…The 'consumer' was positioned as active, rather than passive, as the 'producer' of usages and meanings that the marketplace may not have assigned to a particular commodity or consumer space, and which potentially undermined or evaded consumerist ideologies.

Another comment which aptly illustrates the growing recognition of the potential power and agency of consumers is from Fiske's summation of 'cathedrals of consumption.' Fiske (1991, p.31) asserts:

… [t]he values of commodities can be transformed by the practices of their users, as can those of language, for as language can have no fixed reference point in a universal reality, neither can commodities have final values fixed in their materiality. The practices of the users of a system not only can exploit its potential, but can modify the system itself. In the practices of consumption the commodity system is exposed to the power of the consumer, for the power of the system is not just top-down, or center-outward, but always two-way, always a flux of conflicting power and resistances.

The above quotations convey a picture that consumers are market actors who have a wealth of power that they can use to demand changes. As market actors, they can force the market to respond to their concerns such as labor practices of companies, production and environmental practices. The role of consumption in shaping market change has led to an understanding of consumer values and concerns and how that might be motivating enlightened consumers to take responsibility to change the dynamics of the system from "what is" to what it "ought to be." In that regard, Halkier and Holm (2008, p.667) note that in the area of food policies, the individual consumer is increasingly called to take responsibility for various types of food issues, such as safety, environmental improvements and ethics—such concerns about food system risks may be prominent in motivating consumer engagement in consumption behavior to influence desired changes. By engaging in consumption as a means to seek changes, consumers take issue with "the means of production"—"those things that make it possible for people to acquire goods and services and for …people to be controlled and exploited as consumers" (Ritzer 2001, p.110 in Neilson & Paxton, 2010, p. 7). In sum, the conscientious consumer can be considered as an actor with the power to change things (Bossy, 2014, p.188), through his/her consumptive decisions.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONSUMERS WITH CONSCIENCE

Indeed there is growing evidence from survey research that individual consumers who are conscious of their power can effectively use it to demand desirable changes associated with labor conditions, fair trade global warming, etc.(Adugu, 2014; Stolle & Micheletti, 2013). These conscious consumers apparently have the power and control to change the dynamics of society from perceived "unacceptable and objectionable" practices to "desirable" ones. In that respect, they are motivated to make their consumptive decisions based on ethical values to promote change. This behavior, which is referred to as reflexive or political consumption, suggests the notion of individual responsibility-taking and agency necessary to bring about the desired change in any sphere of society.

In order to promote change in their respective societies, conscientious or political consumers use the marketplace to address social and economic issues by urging others (consumers) to exercise self-reflexivity based on knowledge about the consequences of their consumptive decisions. For example, the online advocacy network, BehindTheLabel.com, put on the following appeal against The Gap, a large clothing chain with stores in several nations: "The Gap uses sweatshop labor, if you buy Gap you do too. Make a difference. Be the generation that stops sweatshops. Tell your family and friends: Don't buy me Gap this holiday season" (Micheletti & Stolle, 2005, p.1). Available survey evidence suggests that a majority of consumers are willing to pay more for products made under good labor standards. According to a study by the Marymount University Center for Ethical Concerns (1999 in Hiscox & Smyth 2007, p. 8), 86% of surveyed individuals in a 1999 US poll said they would be willing to pay $1 more for a $20 garment if it was made under good conditions. Similarly, a survey administered by the Program in International Policy Attitudes (PIPA) at the University of Maryland in 1999 found 76% of respondents indicated that they were willing to pay $25 for a $20 garment that was certified as not being made in a sweatshop (PIPA, 2000 in Hiscox & Smyth 2007).

The above consumer behaviors fit into the conceptualizations of political consumption over the years. In the view of Webster (1975), a political consumer is an individual who takes into account the public consequences of his or her private consumption or who attempts to use his or her purchasing power to bring about change. Political consumers use their knowledge, buying and organizing power to demand certain changes (Dixon, 2003). For Micheletti, Follesdal and Stolle (2006), political consumption is buying or boycotting of products or services based on political or ethical values and with a motive for change. It is normally an individualized form of consumption (Baumann, Engman & Johnston, 2015).

Consequently, political consumption can be considered as a distinct form of market behavior with change motives, which is undertaken by consumers to reflect their attitudes toward pertinent social, economic and political issues such as fair business practices and environmentally sustainable methods of production. Most scholarship on political consumption is primarily focused on post-industrialized consumers and corresponding organizational settings; and even where scholars turned their attention to the phenomenon in the developing world, they did so with respect to how the later is affected by environmental and human rights generated from consumption activities of post-industrialized nations (Stolle & Micheletti, 2013). Even though there is a growing literature on political consumption, it lacks a more nuanced examination of specific forms of the phenomenon (Neilson, 2010); and also understanding the phenomenon in the context of developing countries using survey data is virtually non-existent. There is therefore the need to direct attention at examining the phenomenon in developing nations, especially those in Africa. This book chapter specifically examines the correlates of boycott as a form of political consumption in Africa.

IMPORTANCE OF UNDERSTANDING CONSUMER BOYCOTT AS A FORM OF INFLUENCING PUBLIC POLICY

The emergence of political consumption manifests in the growing recognition, potential power and agency of consumers to influence a fair and moral marketplace and ultimately stimulating desirable change. Dickson (2000) found that societal values influenced consumers' concerns about responsible business practices. He further noted that consumers who had socially centered values are more likely to have positive attitudes towards socially responsible business practices. Using the Schwartz value system, this book chapter examines the personal values of consumers in relation to their engagement in the behavior of boycott in the developing world. The values of consumers are useful in explaining and understanding their behavior because they (values) are stable over time and play a central role their cognitive structures (Brangule-Vlagsma, Pieters, & Wedel, 2002). Consumers' values further influence and shape their attitude and behavior toward issues (Homer & Kahle, 1998). In the context of African countries, there are virtually no studies that explore the relationship between engagement in boycott behavior and an individual's value systems such as conformity, universalism, power, self-direction, tradition and related variables. The chapter also investigates the role of attitudinal variables such as: media use, gender equality, institutional confidence, social network, interest in politics, life satisfaction, autonomy, generalized trust, world citizenship, local community embeddedness. An inquiry into consumer agency will help understand how Schwartz values, attitudinal and socio-demographic correlates shape consumer engagement in the specific political consumption behavior of boycott, specifically in Africa. Knowing the correlates of boycott will be useful in crafting effective media strategies in reaching out to consumers with certain values, attitudes and socio-demographics who engage in boycott action.

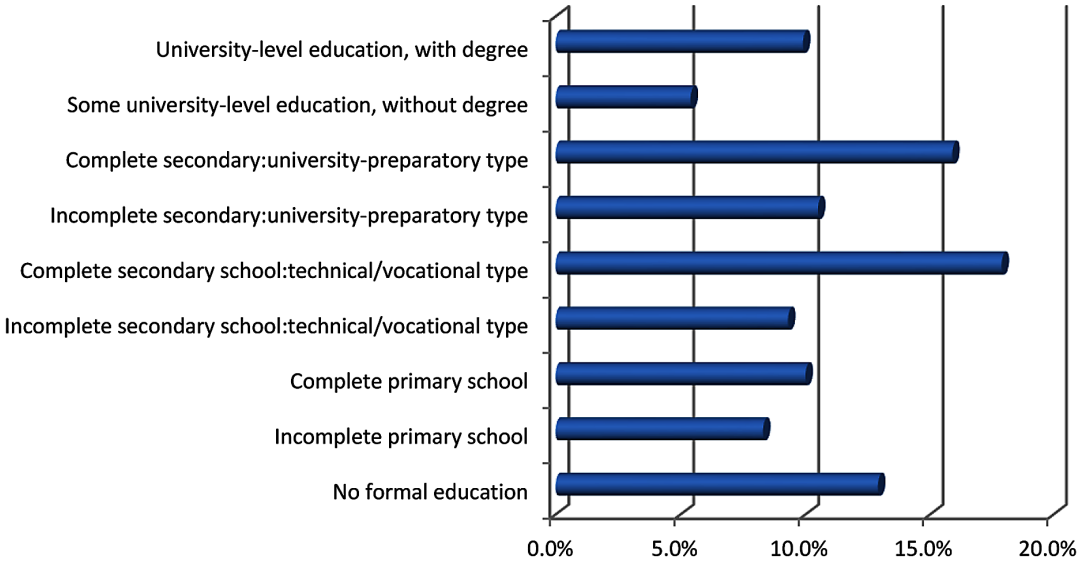
DATA AND MEASUREMENT OF VARIABLES

This book chapter proposal fills the gap in the literature by focusing on boycott as a form of political consumption utilized in developing countries using Wave 6 of the World Values Survey. The World Values Survey is a global research that explores individuals' values and beliefs over time with respect social, economic and political issues based on representative national surveys, conducted in almost 100 countries. This chapter is based on World Values Survey data from the following African countries: South Africa, Nigeria, Ghana, Rwanda, Zimbabwe, Libya, Egypt, Morocco and Tunisia. The independent variables measured are categorized as follows: socio-demographics, media use, gender equality, institutional confidence, social network membership, interest in politics, autonomy, generalized trust, life-satisfaction, world citizenship, local community perception; and Schwartz value systems. The dependent variable is engagement in boycott action/behavior.

Socio-Demographics

Socio-demographics variables collected include gender, age, level of education and income. Research suggests that women are more inclined to engage in political consumption than men and this idea has become a well-integrated part of women's political action repertoire (Inglehart & Norris, 2003; Lowndes, 2004; Stolle, Hooghe, & Micheletti, 2005). In order to investigate this claim, gender was treated as a

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



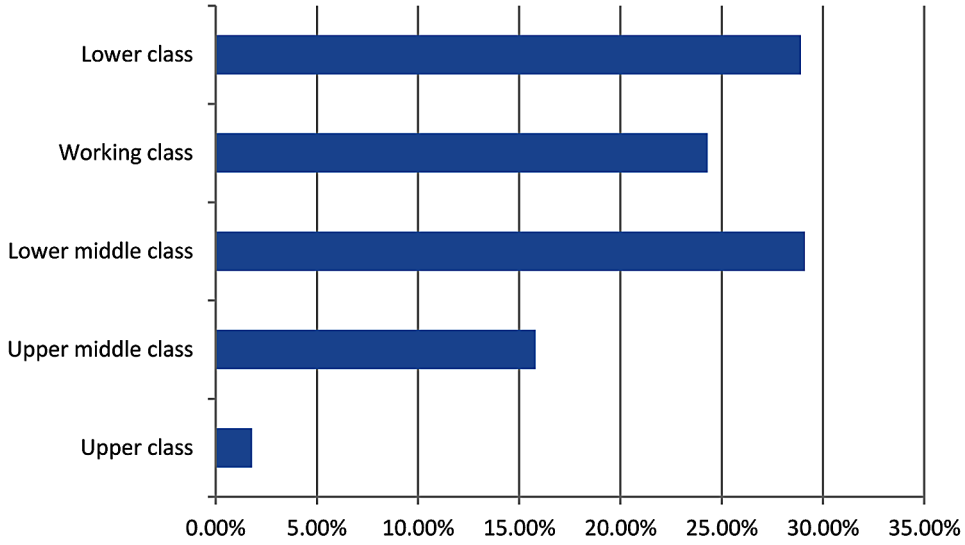
dichotomous variable (female coded 1 and male coded zero). In the sample of about 15928, 49.1% were male (coded 1 and recoded 0), and 50.1% female (coded 2 and recoded 1).

There are generational differences regarding those who engage in political behavior. Younger people are anticipated to be more engaged in political consumption while conventional political behavior may be favored by older people (Stolle & Micheletti, 2013). Majority (34.3%) of the respondents were X-generation (26-37 years) followed by dot-com generation (15-25 years) with 29.4%.

Education is the prime factor in most analysis of political behavior because it fosters political engagement (Verba, Schlozman, & Brady, 1995). Both conventional political behavior and political consumption have been found to be strongly determined by the level of education (Goul & Tobiasen in Micheletti et al., 2006; Verba et al, 1995, Peterson, 1990). For example, education may impart the knowledge that is necessary for the assessment of product labels or political events which may trigger boycotts, petition drives, etc. (Stolle, Hooghe, & Micheletti, 2005). Education may influence people's cultural capital. People with high cultural capital may have increased critical thinking skills and access to information, which makes them better critical thinkers in a post-industrial society (Eckersley, 1989). In effect, educated people are more likely to be informed and interested in political engagement. Figure 1 shows the levels of education of respondents. More than 50% of them have at least secondary school or technical/vocational level of education.

Similar to education, those with high incomes are anticipated to engage in political action (Verba et al., 1995)—in this context, boycott. This may not always be the case since people do not necessarily need money to engage in political behavior. However, there is a notion that engagement in political consumption may be within the reach of those who are relatively well off (Stolle, Hooghe, & Micheletti, 2005). In that regard, a scale of 1 to 10 (1 coded lowest group and 10 coded highest group) representing income brackets as measured in the country was provided for respondents to specify what was appropriate to them (Median=5, M=4.9, SD=2.2). With respect to social class, respondents were asked to describe the social

Figure 1. Level of education of respondents



EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

class they belong, with upper class (coded 5), upper middle class (coded 2), lower middle class (coded 3), working class (coded 4) and lower class (coded 5). The response options were then reverse coded such that greater values relate to upper class and lower values are associated with the lower class. The distribution is shown in Figure 2. About 56% of respondents were in the lower and lower middle classes.

Media Use

People use different media sources to learn about what is going on in society. Exposure to the news media will facilitate stronger levels of civic knowledge (Norris, 2012). In that regard, the media is thought to shape people's beliefs about appropriate behavior and practices in the public sphere. For example, through the media, people may become enlightened in relation to income inequality, attitudes towards appropriate division of sex roles for men and women in the home, government responsibility, etc. and further urge them to take responsibility in order to seek improvements. In order to determine the communication behavior of respondents, they were asked a series of questions regarding sources of information on what is going on in the country and the world. The media sources are: daily newspaper, printed magazines, TV news, radio news, mobile phone, e-mail, Internet, talk with friends or colleagues. The results are presented in Table 1, summarizing respondents' media usage. Response categories were: daily, weekly, monthly, less than monthly and never coded as 1, 2, 3, 4 and 5 respectively. These responses were reverse coded so that higher values reflect higher frequency of use of a particular information source. Following Norris (2011), an eight item summated scale (alpha reliability=0.76) of media use was constructed for purposes of bi-variate and multivariate analyses. The results are presented in Table 1. Radio news and television are used quite frequently (daily/weekly) whereas for new media, mobile phone is used quite frequently (daily/weekly). Talk with friends and colleagues is also relatively high apparently due to the general connectedness of communities in developing countries.

Social Network Membership

Membership in social associations/organizations or movements may equip people with the knowledge and needed skills to effectively address their discontent about social issues and public policy (Adugu & Ampadu-Ameyaw, 2014, p. 42). Embeddedness (membership) in social organizations or movements may help citizens learn how to take action in order to address their discontents in society. In addition to that, embeddedness in social networks may also teach people how to frame social issues in order to recruit others into their cause to influence social change. A measure of group membership may offer some insight into its role in engagement in boycott as a form of political consumption with motives for social change. In that context, social network membership is expected to have significant effects on engagement in boycott behavior. The membership of social organization variable is a respondent's total participation in various types of associations: church or religious organization; sport or recreational organization; art, music or educational organization; labor union; political party; environmental organization; professional association; humanitarian or charitable organization; consumer organization; and self-help/mutual aid group. Respondents were asked whether they are an active member (coded 2), an inactive member (coded 1) or not a member (coded 0) of the afore-mentioned organizations. For logistic regression purposes, active member and inactive member were recoded as 1, and not a member remains coded as 0. Following Norris and Inglehart (2009), a ten item summated scale (alpha reliability=0.96) of social network embeddedness was constructed for purposes of bi- and multivariate analyses. The results are presented in Table 2.

Gender Equality

Historical studies reveal that women have used the market to express their dissatisfaction with the price and quality of foods in the United States and Europe and organized consumer groups in their communities to fight high food prices and other economic injustices (Orleck, 1993; Young, 1994). As a result of socialization, the higher involvement of women with consumer goods relative to men influences them to be much more engaged in political consumption. The socialization perspective predicts that the gender gap will disappear once men assume responsibility for day-to-day family life (Micheletti et al., 2006).

Extraction Method: Maximum Likelihood.

Another perspective on gender and engagement in political consumption behavior is known as situational perspective. The situational perspective says that more women participate in political consumption because they are concerned about the effects of consumer goods on their families and mankind (Deveaux, 1995). In that regard Davidson and Freudenburg (1996, p. 328) note that "women appear to care more about the potentially serious and often empirically underdetermined threats to the health and safety of their communities and families." This view is supported by the grape boycott in the 1960s as a result of women's perceived risks associated with the product. There was a boycott of grapes when consumers learned that pesticides used in grapes were hazardous to families and the farm workers (Micheletti et al., 2006). In that context and following Norris and Inglehart (2009), scale of gender equality (alpha reliability=.73) was constructed based on the following 5 items: When mother works for pay, the children suffer; on the whole, men make better political; university education is more important for a boy than for a girl; on the whole, men make better business executives than women do; being a housewife is just as fulfilling as working for a pay. The response options were strongly agree (coded 1), agree (coded 2), disagree (coded 3), and strongly disagree (coded 4). The results are shown in Table 3.

Table 3. Gender equality scale

Scale/Indicators (Alpha Reliability=.73)	Factor Loading

Institutional Confidence (External Efficacy)

Peterson (1990, p.20) defines political efficacy as the belief by a person that he or she is capable of affecting politics (internal efficacy) and that the political system is responsive to him or her (external efficacy). External efficacy is concerned with political institutions' responsiveness to citizens' actions (Sullivan & Riedel, 2001). Citizens' trust in government institutions (external efficacy) is a reflection of government's responsiveness to the demands that citizens make through conventional political action. Rosenstone and Hansen (1993, p. 143) asserted that social networks and trust "help to overcome the constant suspicion that participation is hopeless" and thereby are measures of external efficacy. In their discussion of why Danish citizens engage in political consumption, Halkier and Holm (2004, p. 19) note that lack of trust has led to individual strategies for securing what is believed to be safe food stuff, with the two most favored consumer strategies being to buy organic and to buy Danish products. Engagement in political consumption behavior of boycott may be a manifestation of distrust of conventional political action in addressing the concerns of citizens in post-industrialized societies (Micheletti, 2003; Stolle et al., 2005; Norris, 2002). Consistent with Norris, 2011), a ten item summated scale of institutional confidence was constructed (Alpha reliability=. 87). Respondents were asked to indicate how much confidence they have in a number of institutions. The response options were: a great deal (coded 1), quite a lot (coded 2), not very much (coded 3), none at all (coded 4). The responses were then reverse coded so that greater values are associated with greater levels of confidence in institutions. The final scale ranges from 10 to 40. The individual descriptive statistics are shown in Table 4. The average response pattern to the individual items tended towards the midpoint of each item. Armed forces, police and the courts had greater levels of confidence.

Generalized trust was measured by asking respondents "Do you think that most people would try to take advantage of you if they got the chance, or would they try to be fair? (0=most people would try to take advantage of me, 10=most people would try to be fair). The mean is 5.5, indicating that average individuals thought that people would be moderately fair to them and not take advantage of them.

Schwartz Values

Schwartz (1992, 1994) developed a theory of human values and different instruments for measuring these values. The theory identifies ten basic personal values that are recognized across cultures. Schwartz's theory enables the systematic study of relationships between human values and constructs such as self-reported behavior, which can be related to consumer engagement in boycott action. The theory has been empirically validated in at least 65 countries across the globe (Schwartz, 2003). Table 5 shows the items that represent each of the Schwartz value types—ten value items and the corresponding indicators and categories. The main categories/dimensions are: conservation, openness to change, self-enhancement and self-transcendence. According to Schwartz, self-enhancement and self-transcendence describe the tension between self-improvement or pursuit for self-interest even at the expense of others and promoting the welfare of others or society. As shown in Table 5, power, achievement and hedonism value types align with the self-enhancement categories whereas benevolence and universalism align with self-transcendence. Similarly, the value types pertaining to conservatism are security, tradition and conformity.

Five items from Schwartz value system which are of much relevance to consumer motivations were used in order to explore the relationship between consumers' personal values and engagement in boycott. These items were: 1. It is important to this person to think up new ideas; to do things one's own way, 2. It is important to this person to be rich; to have a lot of money and expensive things, 3. It is important to this person to do something for the good of society, 4. Adventure and taking risks are important to this person; to have an exciting life, and 5. Tradition is important to this person; to follow customs handed down by one's religion or family. For each of the descriptions, respondents were asked to indicate whether that person is very much like you (coded 1), like you (coded 2), somewhat like you (coded 3), a little like you (coded 4), not like you (coded 5), or not at all like you (coded 6). The descriptive statistics of the individual Schwartz value items are shown in Table 6. Most of the respondents indicated that the descriptions fit in between a "person like them and somewhat like them."

Table 5. Schwartz value items and indicators

Indicators	Values	Categories
Living in secure surroundings is important to this person; to avoid anything that might be dangerous	Security	Conservation
Tradition is important to this person; to follow the customs handed down by one's religion or family	Tradition	
It is important to this person to behave properly, to avoid doing anything people would say is wrong	Conformity	
It is important to this person to think up new ideas and be creative; to do things one's own way	Self-direction	Openness to change
Adventure and taking risks are important to this person; to have an exciting life	Stimulation	
It is important to this person to have a good time, to "spoil" oneself	Hedonism	Self-enhancement
It is important to this person to be rich; to have lots of money and expensive things	Power	
Being successful is important to this person; to have people recognize one's achievements	Achievement	
It is important to this person to help the people nearby; to care for their well-being	Benevolence	Self-transcendence
Looking after the environment is important to this person; to care for nature	Universalism

Interest in Politics, Life-Satisfaction, Autonomy, World Citizenship, and Local Community Embeddedness

Campbell, Gurin and Miller (1954, p. 187) define political efficacy "as the feeling that an individual political action does have, or can have an impact on the political process. It is the feeling that political and social change is possible and that the individual citizen can play a part in bringing about this change." This conceptualization of political efficacy focuses only on internal efficacy. Political interest may influence engagement in boycott due to the fact that the decision to boycott or not requires knowledge and interest in the issue or cause to which the product is associated (Adugu, 2014; Sandovici & Davis, 2010). Using Campbell and colleagues' conceptualization, respondents were asked questions in relation to interest in politics. Interest in politics was measured on a 4-point scale with 4 coded as not interested and 1 coded as very interested. The responses were then reverse coded so that higher values were associated with greater interest in politics. Descriptive statistics associated with respondents' political activity is presented in Table 7. Apparently, the sample average with respect to interest in politics tended toward "middle of the road."

Measures of satisfaction/dissatisfaction with life have been linked to political participation such as boycott. Barnes and Kaase (1979) showed that satisfaction/dissatisfaction with life may shape increased protest potential. Boycotting can be considered as a form of protest. It is in that connection that Sandovici and Davis (2010) found out that people who are dissatisfied with the economy are more likely to boycott products than those who are satisfied. Measurement for satisfaction consisted of the following question: "All things considered, how satisfied are you with your life as whole these days?" The answers were coded 0 to 10, with 0 indicating completely dissatisfied and 10 indicating completely satisfied. The responses were standardized to 100 points. The mean is 62.3, indicating that average individuals are moderately satisfied with their lives.

Consumers' global and national identities may influence their engagement in political consumption, specifically in this case, boycott. There are notable examples where purchasing decisions are used to advance changes in the market and/or society. For example, in Sweden, political consumers have acted out of concern about human rights, labor rights, environmental protection, issues of globalization and gender equality. It is interesting to note that the political consumption movement has generated such awareness that Sweden require labels on groceries, paper for school, shoes, soaps, etc. to ensure that companies' mode of production and the source are adequately communicated to concerned consumers (Micheletti, 2003, p.121-122). Such developments have successfully pressured governments and mul-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tinational corporations (with markets in Sweden) to adopt ethical business practices and other values consistent with those demanded by Swedish civil society.

Consumers global and national identities were measured by three variables: autonomy, world citizenship and local community embeddedness. Respondents were asked the following questions to measure autonomy, world citizenship and local community embeddedness respectively: I see myself as an autonomous individual, I see myself as a world citizen, and I see myself as a member of my local community. The response options ranged from strongly agree (coded 1) and strongly disagree (coded 4). They were reverse coded so that higher values were associated with greater levels of global and national identities. The results are shown in Table 7. The means for being world citizen and local community embeddedness were more than 3, indicating that average individuals agreed that they were world citizens, and also embedded in local community.

Engagement in Boycott

In this book chapter, political consumption is conceptualized as an individualized action with the goal of directly influencing public affairs based on the belief that such an action may lead to desirable changes. Boycott, as a form of political consumption is an innovative way being used by citizens to directly express their attitudes, interests and concerns with the ultimate goal of influencing public affairs. Boycott is a deliberate consumer choice not to purchase (Stolle et al., 2005). Boycotting is punishing businesses for unfavorable behavior (Neilson, 2010). Boycotts are often favored by activist groups as a protest strategy, often targeting single businesses (Friedman, 1996). Thus consistent with the political efficacy perspective, citizens may engage in boycott due to the belief that their actions will influence public affairs. Engagement in boycott was used as the dependent variable in this book chapter. Boycott was measured by asking respondents whether they have done it (coded 1), might do it (coded 2), or would never do it (coded 3) under any circumstances. The response options "have done and might do" were both recoded as 1, whereas "would never do" was recoded as 0 for analytical purposes. Based on an effective sample size of 14851, 27% fell into the category comprising those "have done and might do" (engagement in boycott), and 73% into the category of "would never do."

ANALYSES

The results of bi-variate and multivariate analyses of correlates of boycott action as a form of consumption are reported as follows: The first part of the analysis reports the bi-variate relationships (correlations)

Table 7. Descriptive statistics associated with interest in politics, life-satisfaction, autonomy, world citizenship, and local community embeddedness

	Mean	Minimum	Maximum	SD
Interest in politics	2.5	1	4	1.0
Life-satisfaction	62.3	10	100	24.8
Autonomy	2.0	1	4	.99
World citizenship	3.1	1	4	.94
Local community embeddedness	3.4	1	4	.66

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

between the dependent and independent variables. Spearman's rho correlation was used. Spearman's rho correlation is the appropriate statistic to use in cases where one variable is categorical or dichotomous and the other is an ordinal, interval or ratio scale and also where both variables are categorical (Chen & Popovich, 2002); Cohen & Cohen, 2003). The second part presents binary logistic regression analyses.

Bi-Variate Analyses

The following bi-variate analyses are reported: relationship between engagement in boycott and level of education, age, income, gender and social class; relationship between engagement in boycott and media use, gender equality, institutional confidence, and social network membership scales; relationship between engagement in boycott and interest in politics, life satisfaction, self-autonomy, generalized trust, seeing oneself as world citizen, and seeing oneself as part of the local community; relationship between engagement in boycott and Schwartz values.

Relationship Between Engagement in Boycott, Socio-Demographics, Media Use, Institutional Confidence, Social Network, Interest in Politics, Schwartz Values and Other Variables

Table 8 shows the correlation between engagement in boycott, socio-demographic variables, media use, gender equality, institutional confidence, social network, interest in politics, life satisfaction, autonomy, generalized trust, world citizenship, local community embeddedness and Schwartz values. Findings show a positive correlation between engagement in boycott and level of education and income. On the other hand, being young and female are negatively associated with engagement in boycott. Media use, institutional confidence and social network membership have positive correlation with engagement in boycott. Similarly, interest in politics, life satisfaction and seeing oneself as a world citizen are also positively correlated with engagement in boycott. With respect to Schwartz values, importance of tradition and doing something for the good of society are positively correlated with boycotting.

It is worthy of note that even though all the above correlations between boycott and the variables are significant, the coefficients are weak. This means that the degrees of association between the variables are weak. It is important to go beyond simple correlations and examine how the relationships hold when relevant measures that shape boycott action are included simultaneously—using binary logistic regression.

Multivariate Analyses

In order to examine the characteristics of individuals who engage in boycott, a binary logistic regression model was performed. The results assessing relationships between engagement in boycott (dependent variable) and the independent variables—socio-demographics, media use, gender equality, institutional confidence, social network, interest in politics, life satisfaction, autonomy, generalized trust, world citizenship, local community embeddedness and Schwartz values are shown in Table 9. Based on the Hosmer and Lemeshow Goodness of Fit Test for binary logistic regression, the model is well-fitting. Models that are well-fitting show non-significance ($p>.05$) on the Hosmer and Lemeshow Goodness-of-Fit Test, indicating model prediction is not significantly different from observed values (Hosmer & Lemeshow, 2000; Menard, 2002; Norusis, 2008).

	Engagement in Boycott		**Engagement in Boycott**		**Engagement in Boycott**		**Engagement in Boycott**
Level of education	.16**	Media use scale	.17**	Interest in politics	.17**	It is important to this person to think up new ideas; to do things one's own way	-.04**
Income	.09**	Gender equality scale	-.00	Life satisfaction	.04**	It is important to this person to be rich; to have a lot of money and expensive things	-.06**
Social class	-.00	Institutional confidence scale	.10**	Seeing oneself as autonomous individual	-.01	It is important to this person to do something for the good of society	.04**
Gender	-.08**	Social network membership scale	.21**	Generalized trust	.02**	Adventure and taking risks are important to this person; to have an exciting life	-.06**
Age	-.06**			Seeing oneself as world citizen	.02*	Tradition is important to this person; to follow customs handed down by one's religion or family	.09**
				Seeing oneself as part of local community	-.05**		

** Correlation significant at the 0.01 level (2-tailed).

*Correlation significant at the 0.05 level (2-tailed).

The coefficient of education is .089. This means that when level of education changes from 0 to 1, and the values of other independent variables are held constant, the log odds of engagement in boycott increase by .089. The corresponding odd ratio of 1.093 suggests that for a unit increase in level of education, the odds of engagement in boycott are 1.093 times higher. On the other hand, engagement in boycott is negatively associated with social class. For a unit increase in social class, the odds of engagement on boycott are .89 less likely. Similarly, the odds of engagement in boycott are less likely for women (reference category female=1 in model).

For a unit increase in political interest and social network, the odds of engagement in boycott are 1.4 and 1.3 times respectively. Media usage, seeing oneself as a world citizen, seeing oneself as embedded in local community, perception of gender equality and institutional confidence are all positively associated with engagement in boycott. With respect to Schwartz values, importance of doing something for the good of society, and importance of traditions are positively associated with engagement in boycott. On the other hand, importance of riches is negatively associated with engagement in boycott.

DISCUSSION OF FINDINGS/EVIDENCE

Based on the logistic regression analyses, the following variables are significantly associated with engagement in boycott action: level of education, gender, social class, media usage, gender equality, institutional confidence, social network, interest in politics, life satisfaction, seeing oneself as being part of world citizenship, seeing oneself as being embedded in local community, importance of doing something for the good of society, importance of traditions, and importance of riches. Such findings suggest that engagement in boycott action is shaped by socio-demographics, attitudinal measures and Schwartz values.

Education is the prime factor in most analysis of political consumption behavior. Both conventional and political action and political consumption are strongly determined by level of education (Verba et. al, 1995; Peterson, 1990; Micheletti et. al, 2006). Evidence from the data shows that the higher the level of education of an individual, the more likely s/he will engage in boycott action. This is due to the fact that education facilitates enlightenment. In that context, education is a cultural resource that deeply af-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

fects people's world view (Waal, Achterberg & Houtman, 2007). It can be argued that people with high cultural capital acquired through education may have increased critical thinking skills and access to information—which would ultimately promote individual responsibility-taking by engaging in boycott action. As Sandovic & Davis (2010, p.349) aptly noted: "educated individuals will know more about politics and its connection to the market. Likewise, they will be more resourceful in finding alternatives to companies they wish to avoid. And efficacious individuals will believe their choice to boycott will actually make a difference." In other words, through boycott action, educated individuals are demanding changes. This notion is consistent with the conceptualization of political consumption by most scholars who view it as buying or boycotting of products or services based on political or ethical values with change motives (Micheletti & Follesda, 2006; Neilson, 2010; Stromsnes, 2009; Neilson & Paxton, 2010; Stolle & Micheletti, 2013).

Individuals in low social classes are more likely to engage in boycott action. This may be due to their concerns about the effects of consumer goods on their families. This claim is due to the fact that people tend to engage in boycott in order to address issues that hit home. This is contrary to what pertains in post-industrialized nations where the phenomenon is associated with people of high income and social class. It means that in Africa, engagement in boycott action is not limited to people with greater levels of education. Thus consistent with the conceptualization of political consumption, people in the lower social class are also concerned about affairs in society, prompting them to engage in boycott action to bring about social and economic change.

The odds of engagement in boycott are less likely for women. In other words, based on the data set, men are more likely to engage in boycott action. This finding is inconsistent with the literature on boycott in post-industrialized countries such as the United States and most European countries, where women are more likely to engage in boycott as a form of civic engagement (Abramson, 1999; Stolle & Micheletti, 2013). In that context, women may be considered to be more interested in boycott than men. In Africa, even though women are socialized to be much more involved with consumer goods relative to men, they are less likely to engage in boycott probably due to the fact that in most households, men also assume responsibility for day-to-day family life. This claim merits further investigation.

Evidence from the data shows that individuals' media usage is positively associated with engagement in boycott. This may be due to the fact that exposure to the media facilitates stronger levels of civic engagement (Norris, 2012); and brings enlightenment to people regarding pertinent issues such as businesses' use of sweatshops in the process of production. Thus similar to education, exposure to the media enhances enlightenment and fosters engagement in boycott action.

The odds of engagement in boycott increases with membership in social networks. This is probably due to the learning function with respect to membership of social networks. Embeddedness in social network may teach people how to frame pertinent public issues in order to be able to gain and motivate sympathizers into their cause to influence desirable change. In that regard Holzer (2006) noted that social networks can mobilize people to boycott products. This suggests that social networks are capable of providing signals targeted at companies or products at the market place with the ultimate goal of influencing changes.

Similar to membership to social networks, the odds of engagement in boycott action are more likely with individuals who have political interest. When people feel that their individual political actions do have or can have an impact on the political process, they may take interest in politics. This interest may be a manifestation of individuals' beliefs about the impact that they can have on public affairs. Therefore political interest influences engagement in boycott due to the fact that the decision to boycott requires

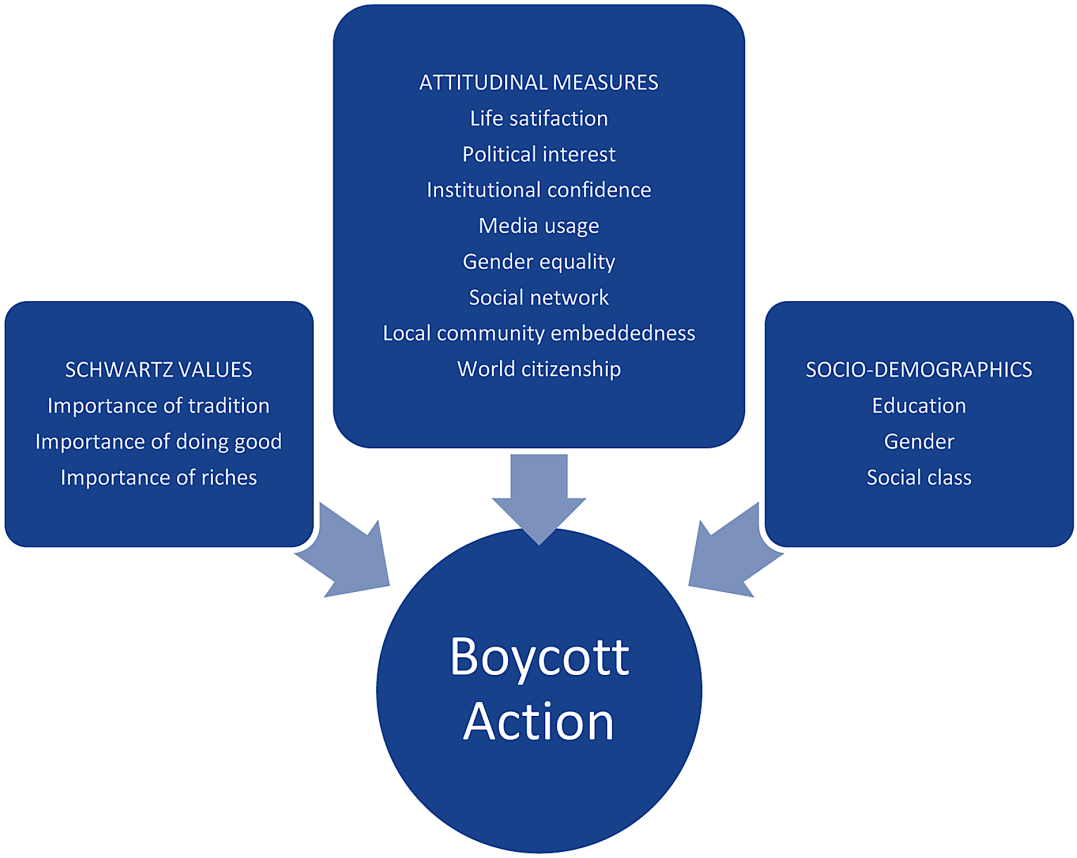
EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

interest in the issue or cause motivating the action. In that respect, Sandovici and Davis (2010) noted that people must take interest in political issues in order to avoid products or companies for political reasons. In essence, people who engage in boycott are those who have political interest and the belief that they have the power to change things (through boycott action).

Institutional confidence (external efficacy) relates to the responsiveness of political institutions to citizens' actions and a reflection of government's responsiveness to citizens. Evidence from the data shows that institutional confidence is positively associated with engagement in boycott action. This suggests people have the belief that political institutions are capable of changing the dynamics of the system from "what is" to "what it ought to be." This finding is contrary to the literature in post-industrialized countries where engagement in boycott is associated with lack of confidence in institutions (Stolle & Micheletti, 2013). In such cases, boycotts are alternative means of setting new agenda for public policy. In the case of Africa, its people currently have trust in institutions and their engagement in boycott could be a demonstration of long-held notion that government institutions are a panacea to all their challenges—and would therefore appropriately respond via boycott actions. This claim needs further investigation since data used is limited.

Engagement in boycott is negatively associated with life-satisfaction. In other words, those who are dissatisfied with their lives as a whole are more likely to engage in boycott action as a form of protest. In essence, dissatisfied people are more likely to engage in boycott.

People's perception of gender equality is positively associated with boycott action. It follows that people are more likely to engage in boycott when they have an attitude that men and women roles are complementary. This finding is interesting given the fact that in most traditional African communities, the notion of gender equality is not encouraged especially among the less educated. Examining the data used, about 50% of the sample had at least technical/vocational type of education. This might have enhanced their understanding of and appreciation of gender roles.



When people see themselves as being world citizens and embedded in local community, they are more likely to engage in boycott. For that matter, engagement in boycott may be done with the intention to preserve the local community and promote the well-being of others that people consider to be part and parcel of them. In essence, people who are "other-centered" are more likely to engage in boycott action. With respect to Schwartz values, importance of tradition or following customs handed down by one's religion; and doing something for the good of society are positively associated with boycotting. On the other hand, importance of riches or expensive things is negatively associated with engagement in boycott. Thus people who have socially centered values are likely to engage in boycott action. This further reinforces the comment that people who are "other-centered" are likely to engage in boycott.

CONCLUSION

Based on the above discussion, the following typology was developed to show the correlates boycott action in Africa. In that context, engagement in boycott action in Africa is determined by socio-demographics, attitudinal measure and three of Schwartz's values. The typology is depicted in Figure 3. It follows that engagement in boycott action in Africa is shaped by attitudinal variables (such as life satisfaction, political interest, embeddedness in social network, etc.), Schwartz values (specifically, importance of tradition, riches, and doing good), and socio-demographics (education, gender and social class). Thus engagement in boycott action in Africa is a complicated phenomenon that cannot be clearly understood

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. A typology of boycott action in Africa

from a single perspective. In order to theorize about consumer boycott behavior at least in the case of Africa, scholars need to approach it from a multidimensional perspective. Good business and policy decisions must be informed by an understanding of the nature of consumers. This multidimensional nature of consumer behavior provides and important insight for businesses and policy makers to be able to effectively respond to their (consumers) needs.

In essence, this book chapter has demonstrated that the correlates of engaging in boycott action in Africa are: level of education, gender, social class, media usage, gender equality, institutional confidence, social network, interest in politics, life satisfaction, seeing oneself as being part of world citizenship, seeing oneself as being embedded in local community, importance of doing something for the good of society, importance of traditions, and importance of riches.

Policy Implications

Consumption is a form of civic engagement being used in the marketplace to elicit desirable changes. Engagement in boycott action in Africa is shaped by attitudinal variables, Schwartz values, and socio-demographics. Policy makers and businesses can tap into consumer attitudes, values and socio-demographics to design relevant policies and products. Knowing these correlates of boycott are useful

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in crafting effective media strategies in reaching out to consumers with certain values, attitudes and socio-demographics. For example, an effective media campaign for the promotion of particular "product brands" that are being boycotted could be targeted at those with the following demographics and attitudes and values: educated, male, interest in politics, embedded in social network, and "other-oriented."

KEY TERMS AND DEFINITIONS

Boycott: Punishing businesses for unfavorable behavior or a deliberate consumer choice not to purchase.

Political Consumption: An individualized action with the goal of directly influencing public affairs based on the belief that such an action may lead to desirable changes.

Political Efficacy: The feeling that political and social change is possible and that the individual citizen can play a part in bringing about this change.

Schwartz Values: Basic personal standards of behavior that are recognized across cultures, comprising the following main categories/dimensions: conservation, openness to change, self-enhancement and self-transcendence.

Social Change: A substantive alteration in structures, institutions, values and behaviors of society over a period of time.

This research was previously published in the Handbook of Research on Consumerism and Buying Behavior in Developing Nations edited by Ayantunji Gbadamosi, pages 452-473, copyright year 2016 by Business Science Reference (an imprint of IGI Global).

Chapter 85
E-Government for Rural Development in Tanzania: As Reviewed

R. W. Kisusu
Tarime Institute of Business Management, Tanzania

D. M. Bahati
Local Government Training Institute, Tanzania

G. R. Kisusu
Rural Solutions and Consultancy, Tanzania

ABSTRACT

This chapter presents the importance of developing rural areas with an emphasis on good governance and poverty alleviation through the use of electronic government in Tanzania. With such concern, the authors show that rural areas are as significant as the economy of most of the developing countries, including Tanzania. As such, putting sufficient efforts on rural development is unavoidable for rapid development. Further, the authors note how Tanzania improves its rural areas through the use of e-government, but efforts are constrained by the existence of poor Information Communication Technology service providers, ineffective policy, and unreliability of rural electricity. In order to address such shortfalls, the authors propose several solutions that could motivate the increase in the use of rural e-government and revise rural development policy.

THEORETICAL BACKGROUND

Most of the populations' livelihoods in African countries including Tanzania depend heavily on the rural economy. In Tanzania, for example, about 85% of its population lives in rural areas and the economy of the nation mostly derived from rural comes with the proportions of 85%, 25% and 65% as employing active labor force, foreign earnings and source of industrial inputs respectively (Hella, Haug, and Kamile, 2011; Kisusu, Turuka, Mdoe, and Mlambiti, 1999; Kisusu, Mlowosa, and Mathias, 2010; URT, 2010).

Such proportions justify how rural development would contribute significantly in reducing poverty if given a priority. However, the experience shows that good governance is the predominant condition which could influence the possibility of reducing poverty (Kisusu, 2008). This is a possible expression as poverty reduction cannot be attained easily when the country experience bad governance and this implies that addressing poverty is possible when good governance is well maintained favorably.

Although the economy of Tanzania relies on rural economy which is heavily based on small scale agriculture, strategies on how to develop rural areas is an issue which needs comprehensive outlook. Based on the trend, the rural gets insignificant weight even by many governments worldwide (Cooksey, 2013, Policy Forum, 2012a). As a result, life in rural is as miserable such that poverty is so rampant and in some cases even annoying. In this country, the situation is worse. For example, per capital income, per capital expenditure, mortality rates, morbidity rates, shelter, environment and illiterate rate are worse as compared to urban areas (URT, 2013). This could also be associated with the governance which experiences an alarming situation in rural areas. This is based on several indicators; among them is the existence of high corruption level, poor services delivery and human rights violation which humiliate a lot of smallholder farmers and pastoralists. In most cases, conflicts between farmers and pastoralists occur due to bad governance in rural areas, associated with biasness involving civil servants in rural areas (Cooksey, 2012a; United Republic of Tanzania, 1999a, Policy Forum, 2012b).

In an attempt to improve rural areas, the government of Tanzania managed to put a lot of financial resources with an assumption that it would help to reduce poverty through improvement of good governance in rural areas (URT, 2011, 2013). But, the result was not as expected. Consequently, the government of Tanzania realized that the successes were very minimal due to an ineffective communication between rural people and the government itself. As a result, citizens felt that they were abandoned by the governments. This is based on the fact that communication between the government and people in village and vice versa was not that much effective, thus creating a gap and consequently ended up expanding the gap.

In order to overcome such a gap of poor communication or informing citizens with needed information on time, the government of Tanzania was forced to adopt the use of electronic government popularly known as e-government in 2003 (URT, 2013). E-government was thought to be feasible and effective in the strategy to increase the development which involves the citizens, either in rural or urban centers. As a result of that, it was necessary for the government through Information Communication Technology (ICT) to dialogue with the people using electronic government (e-G). Others, including Mwachang'a (2013), define e-G as a utilization of online services to deliver government information and services to citizens. UN Publications (2005) also defined e-government as a transformation of public sector internal and external relationship through use of ICT. This means e-government is defined as a system where the government delivers services to its people electronically through ICT.

Due to the importance of ICT, many governments thought the livelihood of their people either in either rural or urban areas could reach optimal level when the required information reaches their people in time and vice versa. It is important, however, to ensure that the positive results of e-government spread worldwide. For instance, Backus (2001) reported that e-governance in developing countries efficiently increased the services delivery, reduced cost of delay, speeded up development, saved time and improved good governance in general. Again, in India, the use of e-government has substantially improved the livelihood of rural areas through the provision of good governance.

The impact of e-governance is also noted by several studies, as it was further reported by Raina (2011) that, e-government strongly supported the rural poor in Gyandoot-India through increasing benefit of strategies initiated to alleviate poverty. However, it was illustrated that the number of the poor who par-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ticipated was very minimal. This could be due to the fact that the level of adoption of new technology was carried poorly. On the other hand, it was marked how such reduction of poverty through the use of e-government correlated with the increase of economic growth. For example, the increase of economic growth reported by various studies empirically by Chandra and Malaya (2011) on World Bank study shows that, at least 10% increase in mobile phones subscribers was associated with 0.8% increase in economic growth while, 10% increase in high speed internet connections was related with 1.3% increase in economic growth.

Although, the economic growth is related to effective communication as noted above, generally that growth could be associated with the level of good governance in the country and among the targeted group of the population could be those who reside in rural areas. With that relation, the level of good governance in various countries especially in Africa is not much attracting. Basing on http://www.moibrahimfoundation.org/interact/, by percentages on good governance in the list of African countries, Mauritius leads (83%) while Somalia is the least (7.2%). In East African countries, Tanzania leads (58.8%), in Central Africa Rwanda leads (53.5%), in Sub Saharan Africa, Mauritius leads (82.8%), Southern African Development Countries is Mauritius again (82.8%) followed by Botswana (77.2%). Those with poor rural development as indicated by the level of good governance includes, Zimbabwe (34.4%), Central Africa Republic (33.7%), Eritrea (33.0%), Chad (32.8%) and Democratic Republic of Congo (32.8%). In West African countries, Ghana leads (66.3%) while Tunisia leads (62.7%) in North African countries.

The same source ranks Tanzania number 10 out of 52 countries, however, efforts on e-government in rural areas in Tanzania is again unpersuasive. On the other hand, the mode is 58.5% involving Tanzania, Sao Tome and Principe and Zambia. With the countries proportions, several countries scored highly while the same countries had high increase of good governance. Countries like Angola, Sierra Leone and Liberia perform very well in the increase of good governance. The median level country was Swaziland.

Some of the mentioned constraints by several studies are due to poor economic power. Mostly involving; unreliable power distribution in a country, high cost of ICT infrastructure which is not affordable by rural communities due to rural poverty and a shortage of service providers. Although, poor economic situation is mentioned as the hindering factor, it is possible that ineffective development policy could be the most causative reason.

This paper reviews how e-government could improve rural development with an emphasis on good governance which supports rural poverty alleviation in the country. The paper is divided into four subsections namely theoretical background, methodology, and review on good governance and poverty alleviation, conclusion and recommendations.

METHODOLOGY

Study Area

The study is based on Tanzania mainland composing an area of 945,087 square kilometers (378,000 square miles). This area is slightly twice larger than the size of California (One World – Nations on line, 2014). It contains 25 administrative regions with 135 local government authorities. But due to poor infrastructure especially in rural areas, e-government is also less documented. This implies that large part of country population estimated at 46.2 million by 2013 are not benefiting sufficiently on e- government.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Such population which is based on One World – Nations Online (2014), reported that Tanzania median age is 18.7 years, with male 18.5 years and female 19.0 years are minimally benefiting. However, this indicates how a female lives longer than male and one of the reasons being the effect of HIV/AIDS on a male. Despite the variations, e-government could have done a major role through sensitizing the population variable on the HIV/AIDS epidemic, an issue which has less been done. Although, literacy rate is reported at 85.9% on males and 70.7% on females, the impact of this is not seen by rural community and therefore reflecting untrue results. Another controversial observation is that, males are more literate than females but how comes that males fail to utilize their knowledge to combat HIV/AIDS as compared to females? The review was not able to come up with the scientific answer. However, 85% of total area is rural based and about 85% of total population lives in rural areas. Despite the fact, e-government in rural areas is less seen and therefore, indicating a horrible situation.

Data Collection and Review Technique

Data collection based on secondary sources which extracted from official documents such as government libraries, e-government agency, publications and internet. The review is based on qualitative and quantitative techniques and mostly involving the use of percentages, mean, mode and median.

REVIEW ON RURAL DEVELOPMENT INDICATED BY GOOD GOVERNANCE AND POVERTY ALLEVIATION

E-Government on Good Governance in the Rural

Among the key indicators of rural development is good governance. Association of that kind is well elaborated and therefore Tanzania with population reaching 42.6 million (2012, Census) considers good governance too as a milestone of national development. But the review noted that, the strategies to attain e-government for good governance in rural development are less implemented. This is based on the fact that, Tanzania ranks high in corruption practices, with minimal transparency. For instance, World Bank Institute Indicators (2013) found that Tanzania ranked 100th out of 182 countries based on Corruption Perception Index (CPI) by international transparency (http://www.corruptiontracker.or.tz/dev/index.php). This implies that majority of the rural citizens lack information on how government put efforts to combat corruption and other indicators of good governance such as rule of law, integrity, democracy and good ethics. Again, this evidences how the e-governance is highly demanded in rural areas something which is missing. However, for African states, Tanzania ranks on the top ten on the best position.

The same evil of bad governance has ever again been reported by several diplomats. For instance, due to corruption, the Embassy of Finland in Tanzania (2013) noted through Human Development Report (2011) that, in Tanzania, basic service delivery is generally low. Almost all children go to school, but the quality of learning is relatively low and only a third of all continue to secondary schools studies. Approximately, 50% of the mothers do give birth without professional health assistance while a third of all children are under-malnourished. The review noted that the coverage is very disappointing. As Simomen (2011) also noted, gender equality in local governments in Tanzania remains low. This correlates to the fact that the number of female who are local government councilors is still very small, which varies between 25% and 33% (United Republic of Tanzania, 2012; http://www.google.co.tz).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Basing on such consequences, e-government could be more feasible as it may cover a large number of populations who reside in rural areas. This also was appealed by the United Nations in Tanzania (2011) concluding that, weakness remains in ensuring government transparency and accountability. This includes effective oversight of the national poverty reductions strategies implementation (http://www.tz.one.un.org/index.php). As such it is appealing to apply e-government so that every person who resides in rural areas at least knows the initiated efforts of maintaining good governance.

E-Government on Rural Poverty Alleviation

Tanzania experiences high levels of poverty as the majority of the citizens live below poverty line. By review, it was estimated that 65% of Tanzanians live below poverty line which is equivalent to US $ 1.25 a day (http://www.allafrica.com/stories/2013). Moreover, USA (2013) reported that 42% of Tanzanian children below 5 years suffer from stunting and 16% are underweight (www.feedfeature.gov/country/Tanzania). With these anomalies, it is proper to engage e-government so that those who are unable to obtain the required health standard could be able to look for other alternative means. For example, the use of e-government may educate and give more awareness for those who have been experiencing stunting and underweight to consume other available food nutrients which are not necessarily from urban centers. It is also reported by several studies that, most of the poor population are those living in rural area. They possess low per capital income; they consume calories below the required amount per day, living on poor environment and drink unhygienic and unsafe water and experience gender imbalance (Kisusu, 2003). The review noted that such horrible life conditions could be eliminated through application of e-governance.

CONCLUSION AND RECOMMENDATIONS

Conclusion

The review observed that e-governance is an effective means of improving rural development through focusing on good governance which could end up with poverty alleviation. This can be affective as e-governance realizes the required services on time and it is easy to get feedback on an agreed time. Moreover, it helps to save time and eliminates time delay. As such, fast rural development would only be attained through the use of e-governance. But likely, the constraint remains to be poor electricity supply in rural areas, the salvage which needs comprehensive efforts.

Recommendations

In order to achieve e-governance for rural development at specified time schedule, the review suggests that obstacles hindering the use of e-governance should be addressed with sufficient efforts. These efforts may include encouraging energy agencies to find reliable electricity sources such as solar systems in rural areas and to create agencies in rural areas for provision of ICT related services. Similarly, policies to encourage e-governance through motivation processes should be reformulated and implemented to get a positive result; including the revision of rural development policy.

KEY TERMS AND DEFINITIONS

Good Governance: A process for creating and executing decisions in order to achieve a positive effect on various aspects, mostly in central and in local government. Such implementation may also involve consultation policies, practices, meeting procedures, service quality protocols as well observing conduct of elected representatives and office bearers, role clarification and good working relationships.

Governance: In most cases is a process undertaken by either mostly a government, market, or network on whether over a family, tribe, formal or informal organization or territory. So that laws, norms, power or language are maintained throughout.

Information and Communication Technology (ICT): A large umbrella term that covers all technical equipment to process and communicate information to customers. In this case, any communication device or application such as radio, television, cellular phones, computer and network hardware and software, satellite systems as well as the various services and applications associated with them are recognized as ICT process. ICTs are often spoken of in a particular context, such as ICTs in education, health care, or libraries. The term is more common in Tanzania and outside the country.

Policy: In a normal circumstance, the policy is a principle or protocol used to guide decisions in order to achieve rational results. Policy may also refer to the process of making important organizational decisions following identification of different alternatives such as programs or spending priorities. In Tanzania, it is understood as economic, technical, political, management, financial, and administrative mechanisms arranged to reach explicit goals which ultimate results is desired developments.

Poverty: The state of one who lacks a certain amount of material possessions or money inability of getting choices, opportunities, violation of human dignity and lack of basic capacity to participate effectively in society. It means insecurity, powerlessness and exclusion of individuals, households and communities. In Tanzania, poverty is condition where a person unable to acquire basic needs such as food, shelter, good environment, education, health and lacks democracy.

Poverty Alleviation: It describes strategies to eradicate poverty. It is any process which seeks to reduce the level of poverty in a community, or amongst a group of people in the country which involve improving the living conditions of people who are already poor. Poverty alleviation efforts may also be aimed at removing social and legal barriers to income growth among the poor which mostly in Tanzania is those living in rural areas.

Rural: A geographic area that is located outside cities and towns but in Tanzania context rural means village areas. Rural as encircling all population, housing, and territory not included within an urban area. Characteristic of rural is low population density and small settlements and majority are poor thus living below poverty line.

Rural Development: Refers to the process of improving the quality of life and economic well-being of people living in relatively isolated and sparsely populated areas. It is also characterized by its emphasis on locally produced economic development strategies.

Chapter 86
Historical and Methodological Approaches to the Analysis of International Labor Migration in a Globalizing World Economy

Eteri Rubinskaya
The Russian Presidential Academy of National Economy and Public Administration, Russia

ABSTRACT

International labor migration is a multi-level, multi-dimensional, social phenomenon studied by specialists of different branches of science. The scientific views on the content of the concept, causes and factors, consequences, etc. have been developing together with the progress of the phenomenon and are developing until now. The chapter is devoted to the influence of the world economic trends (globalization, integration, transnationalization) on the international labor movement and change of theoretical approaches to its analysis in the historical development of society on the example of modern concepts.

The contemporary world economy is a collection of national economies an associated system of international economic relations, an organic unity of interconnected and interdependent parts that is generating a process of human society development. The global economy and the system of international economic relations in process of historical development passed through different stages with distinctions both in quantitative and qualitative characteristics. Historical approach to analysis of socio-economic phenomena requires knowledge of objective historical laws process and study of the phenomenon in the development: how it appeared? what stages were passed? what results were found?

Under this approach an international migration process against the background of the historical development of late twentieth and early twenty-first centuries were analyzed. Period boundaries are defined by qualitative changes in the productive forces, caused by scientific and technological revolution as well as by major socio-political phenomena: collapse of colonial system, collapse of socialist system, disintegration of the Soviet Union.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Since World War II, a complex structured system of international economic relations has been formed by several interconnected and continually developing forms of entities, both long ago involved (States and intergovernmental organizations) and new (international governmental and non-governmental organizations, multinational corporations, firms, associations, unions, etc.).

Qualitative changes in the world economy is basis for development of international division of labor and internationalization of production, under the influence of scientific and technological revolution, in the second half of the twentieth century led to regional economic integration and transnationalization. In the last quarter of the twentieth century developed countries have begun their transition from industrial to post-industrial society, which is based on productive forces, combined global information technology systems, transition to the global economy.

Deep analysis of the global economy was made by Manuel Castells. For Castells, M. globalization is associated, first of all, with economy. He started using a term "global/the informational economy". Processes of globalization in the world are new and highly significant factor in contemporary migration, but migration itself is increasingly playing role of tool for globalization development.

According to this scientist, a global network which is the result of revolution in information technology has created a material basis for economic globalization. And this stage is new and differs from pre-existing economic systems. Economy is global, because the main economic activities and production factors are organized globally, either directly or with the use of an extensive network linking economic agents; economy is informational because productivity and competitiveness depend primarily on the ability to generate, process and use the information based on knowledge effectively (Castells, 2000, 80-81).

According to Castells, M., a principal difference between information technology revolution compared with its historical antecedents is that the new information technology almost immediately covers space around the world. However, the scientist recognizes that international economy is not global in general, it only goes on the path of globalization; large share of GDP and employment in most countries continues to be depended on activity of the domestic economy, but not from the global market.

However, there are significant areas that are not included in the modern technological system in the world. Castells (2000) makes a major conclusion: different levels of people, regions' and countries' access to technologies are the reasons of inequality in the modern world.

Edge of this process is the threat of exclusion of all national and even continental economies (for example, African) from the global information system and, consequently, from the global division of labor (Castells, 2000, 53).

Consequences of globalization trends on migration are also analyzed by Massey, D. Scholar writes (2002): "In the context of economic globalization, market transition and capital-intensive production practices .... lead to a large-scale displacement of people from their traditional way of life .... Research shows that international migrants do not come from poor isolated places that are cut off from world markets. Migrants arrive from those regions and countries that are undergoing rapid changes as a result of their inclusion in the global trade, information and production network. .... International migration is not the result of insufficient market development, but just development of markets themselves" (Massey, 2002. 162).

Eppleyard, R. highlights another important aspect of globalization - a higher level of organization, where national identity is blurred and all major political and economic decisions eventually spread to the whole world.

International labor migration is the relocation of the working population movement from one state to another, due to economic and other reasons.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The basic notion of international labor migration highlights its main features:

1. Sale of labor power;
2. Crossing the state border;
3. Entry to work legally;
4. Limited period of work in the country of entry.

According to the majority of scholars, one of the main causes of international labor migration is inequality of economic development of countries. In modern conditions, migration gets truly global scales, which cover almost all countries of the world.

According to the International Organization for Migration, in 2012 there were 232 million international migrants (almost 3% of the world population) totally in the world; half of them were accounted in 10 countries ("World migration report", 2013):

1. United States (45.8 million migrants),
2. Russian Federation (11 million),
3. Germany (9.8 million),
4. Saudi Arabia (9.1 million),
5. United Arab Emirates (7.8 million),
6. United Kingdom (7.8 million),
7. France (7.4 million),
8. Canada (7.3 million),
9. Australia (6.5 million),
10. Spain (6.5 million).

A distinct vector of migration doesn't change - from South to North, from less developed countries to highly developed. Since 1990 a rapid growth of international migrants in the absolute number has been registered in North America (25 million people). In the United States, an average annual growth rate of migrants was about 2.8%. Position of Western Europe as one of the centers of attraction of migrants has also strengthened: at the beginning of the 90th there were more than 20 million of international migrants, and in 2012 - 72 million people ("World migration report", 2013).

We shall note another trend in the development of modern international migration - the growth of migration flows in North-South direction. According to World migration report, there are 7 - 13 million, or 3.6% of all international migrants. The first reason for this flow - skills shortages in countries with rapidly developing economy (BRICS and others). For instance, a number of work permits issued in Brazil between 2009 and 2011 has increased by 64%, with a substantial proportion of foreign workers - migrants from the United States.This trend is also relevant for China, where rapid economic growth and labor market requirements stimulate demand for foreign professionals (especially highskilled ones). The second reason for migration from North to South is associated with the activities of multinational companies, because the companies are increasingly establishing themselves in the South.

Thus, "as opposed to the view that economic growth itself will eliminate the need for migration - says Richmond, A. - we should recognize that in the emerging global economic and social system migration will likely continue to increase, rather than shrink" (Kritts, 2002, 113-114). We share this statement

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

because an increasing of international labor migration as a factor of world production caused by the growth of global production.

According to the UN, one of the main features of contemporary international migration is a significant change of migrants' destinations (table 1).

As shown in table 1, despite the quantitative growth of migration (from 74 million in 1960 to almost 190 million in 2010) the percentage of its population remained unchanged, and the proportion of migrants in the population in developed countries more than doubled, from 5 to 12%. Data of international organizations shows a significant effect on migration flows direction of geographical proximity of countries of origin and destination, such as Mexico and the United States, Eastern and Western Europe, North Africa and Southern Europe ("Trends in International Migration", 2005).

According to International Organization for Migration, 40% of migrants are moving to the neighboring countries. It should be noted that factor of geographical proximity largely explains the fact that majority of refugees from developing countries (over 80%) moves not to developed countries but to neighboring ones for waiting out unfavorable situation.

A greater role of longstanding relationships between countries of origin and destination has emerged during the colonial era. Such historical relations between states largely determine the intensity of particular emigrant flows from Latin America to Spain and Portugal, from countries of sub-Saharan Africa to Belgium, France, Portugal, from India to the UK, etc.

One of the factors influencing migration processes is change in the territorial world population (Table 2).

As can be seen from the Table 2, the Earth's population between 1960 and 2012 more than doubled to 7.1 billion people. Total growth of the world population in analyzed period is largely due to increasing of Asia, Africa and Latin America population (their share in total population now is about 84%).

Table 1. Regional distribution of international migrants, 1960-2010

	1960			2010		
	The Total Number of Migrants (in Millions)	**Share in the Global Migrant Stock (%)**	**Percentage of Population (%)**	**The Total Number of Migrants (in Millions)**	**Share in the Global Migrant Stock (%)**	**Percentage of Population (%)**
The world (except the former Soviet Union and Czechoslovakia)	74,1		2,7%	188,0		2,8%
By region:

Compiled by the author based on the analysis of Eurostat data (http://ec.europa.eu/eurostat)

According to UN predictions the rate of world population growth will slow down in the next few decades. However, the total number of residents will comprise more than 9.6 billion people in 2060. Fast increasing of population will be typical only for developing countries. In developed regions (especially in Europe) the population growth will be changed to declining. The reasons for these changes are slowdown of population demographic growth, falling of birth rates, aging of population, increasing of problem with labor market supply and demand. Migration of population is becoming most relevant for these countries. Rapid population growth in developing countries leads to increasing of gap between supply and demand on the domestic labor market and thereby induces a significant part of population in working age to migrate. Thus, the number of migrants from the South (according to various sources) estimates from 70 to 80% of all migrants (Table 3).

One of the most important patterns of contemporary international migration development is its impact on the total population dynamics in countries and regions.

Thus, in the last decades a scale of international migration increased. Number of countries involved in the processes of migration is growing; directions of migration flows are becoming more and more differentiated. Sometimes, situation with the countries positioning in migration processes has also changed: almost all of modern states has become ones simultaneously sending and receiving migrants. This trend is typical for developed and developing countries, moreover, some countries even encourage an export of labor within an overall strategy of socio-economic development acceleration.

The most important factors, influencing development trends of whole world economy system are scientific, technical, technological and information revolutions. All these factors predetermine needs

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

for national economies restructuring, resulting in increasing of migration of skilled and highly skilled professionals.

Migration of highskilled workforce is considered in science literature in different ways. The loss of professionals in developing countries undoubtedly slows the rates of their development. For instance, Ghana has lost 60% of physicians trained in the 1980s.; in the second half of the 80s more than 600 thousand of highly skilled professionals emigrated from African countries; in the 1960s, thousands of students from Japan, South Korea, Taiwan and Hong Kong went to study in more developed countries.

Skeldon, R. says that the negative effects of the "brain drain" has not been confirmed in East Asia. Scientist concludes that impact of highly educated migrants' departure should be assessed for each individual country. In this context a factor of migrants' return/non-return to the country of origin gets a fundamental importance.

Since the beginning of the 21st century labor migration flows has increased a proportion of migrants with high level of education and professional qualifications. According to the IOM report, in 2012, 44% of migrants had low qualifications, 33% - had an average level of qualification and 22% of all migrant workers belonged to the highskilled.

Another factor influencing changes in migration system is integration processes. Formation of international economic integration organizations (EU, CIS, etc.) and so-called "transparent borders" has generated an "external" migration as a part of international migration within a single integrated space. As can be seen from Table 3, 13.6 million of people (40% of all migrants in the EU) permanently living in the European Union, are citizens of another EU countries. Such countries as Germany, Spain, Italy, Britain and France attract the largest number of migrants. These five EU member states account for 77.1% of all migrants in the EU-27 (Table 4).

Massey, D. (2007) wrote that "immigration is a consequence of wider processes of social, political, and economic integration, stepping over international borders".

Since the middle of the XX century multinational companies have become a leading force in world economic development. In 2012, 100 largest MNCs based in developing countries and countries with transition economies, have increased their foreign assets for 22%. According to UNCTAD, in 2012 MNCs employed 72 million people (by 5.7% more than in 2011).

Table 4. Movement of populations within the EU and in the EU from other countries in 2012 for some countries

	Total Number of Migrants		**Migrants the EU Citizens**		**Migrants Citizens of Countries Outside the EU**	
	Thousand People	**% of Population**	**Thousand People**	**% of Population**	**Thousand People**	**% of Population**

MNCs influence on dynamic of migration processes is ambiguously. On the one hand, their direct and indirect assistance to new jobs creation restrains an emigration process. But, on the other hand, contributing modernization of economy and social relations, improving branches staff' professional skills, establishing closer ties between the countries they are operating, MNCs facilitates a migration mobility. Also transnational companies play an important role in circulation of highly qualified specialists. In general, MNCs use migrant workers from all countries, as well as other factors of production, guided by decreasing of their costs and willings to maximize profits.

Analyzing the processes of international labor migration, it is necessary to take into account a fundamental transformational change of political map of the world. These changes occurred after World War II has largely determined the nature of new international labor migration, the scale of migration flows, their directions, structure and problems. Successful struggle of colonies for independence (60-70th of XX century), and the adoption of UN documents about establishment of new world order caused deep changes in world economy and migration situation in the world. Ambiguity of the consequences of globalization for different countries has not settled contradictions between developed and developing countries, but rather created new problems. Even today, 40 years later gap between levels of countries socio-economic development does not only persists, but also continues to deepen. Another number of transformational changes in the socio-political system in Central and Eastern Europe as well as the collapse of the USSR caused large-scale migration flows of refugees and migrant workers

However, a significant limiting factor of labor migration is a usage of protectionist measures towards migrants. Migrants' flow rates in developed countries are largely depends on decisions of their governments to regard quantity and quality of migrants, to regulate border control effectiveness and migrants' employment. One of famous migration processes' researchers - Agotsino, B. writes: "Freedom of migrant ends where prerogative of the State begins" (Agozino, 2000, p.30).

Due to increasing of armed conflicts around the world, forced migration has become a strongly marked tendency. Another factor strengthening migration flows are unstable political regimes, which generate flows of refugees and migrants. The impact of political and socio-economic changes in the world should be taken into account in analyzing of international migration processes.

An example is the socio-political shocks in North Africa and the Arabian Peninsula in early 2011, which caused significant negative consequences for a number of Western countries by generating huge migration flows. Thus, the Italian island of Lampedusa has become a place for Tunisian refugees arrivals: within 5 days 5,000 people arrived there caused a humanitarian catastrophe.

Educated people, who speak foreign languages, expecting to get a job in the "quiet" and developed countries will be leaving their own states due to political, social and economic reasons.

So under influence of globalization several trends that have an enormous and complex impact on international migration in general (especially labor flows) are appearing. Globalization becomes a major factor in the development of world labor market, formed by global demand and supply of workforce. The increasing scale of labor migration generates many new challenges for States and the international community.

For deeper understanding of the nature of transnational movement of population we shall focus on the analysis of the transformation of theoretical approaches to international labor migration.

One of the first researchers of migration process was Ravenstein, E. who drew attention to the link between migration and economical development, and proved that economic development is the main cause of migration (Ravenstein, 1985, 167-227).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Migration is essentially a response to the changing conditions of the population development, and it should be read as an integral part of the development process (Skeldon, 2007, 243).

Economically reasoned confirmation of migration role was developed by Simon (2005), author of the theory of "prosperity" or "technological development".

More than one century an international migration is a subject of numerous studies.

From a scientific point of view, as well as in practical terms, international labor migration is a sphere characterized by a variety of approaches and concepts. Moreover, opinions of scientists on the causes and factors of international migration, its importance, role and consequences are often opposite.

There are several approaches to the study of international labor migration.

The most universal, combining a significant amount of theories (from Smith, A. to Keynes, J.) is an economic approach. In this approach, migration appears as one of the most important regulators of the working population, catalyst of labor reallocation depending on skill level, labor market competition, needs of society. Thus, the economic approach combines demographic, sociological (choice of migrant destination is largely dependent on interpersonal relationships, presence of migrant communities, etc.) and other approaches. A distinctive feature of the economic approach is that most of the migrations flows caused by economic necessity.

In the scientific world a neoclassical paradigm of international migration understanding has been developed by Harris, J. & Todaro, M. According to this paradigm causes of international migration in contemporary conditions are economic imbalances and inequalities between the countries, including wage level. It estimates rising of labor movement from countries with low-wage levels to countries with high wages and ensures an implementation of self-regulatory functions of the global labor market. According to Harris, J. & Todaro, M. (1970) sustainable economic development of the less developed regions can only reduce migration.

However, some scientists, for example, Stark (1972) believed that, from the viewpoint of neoclassical macroeconomic theory, we cannot explain the return migration, the influx of migrants to the countries with similar wages.

In contrast to classical theories, supporters of historical structuralism (Castles et al., 1976, 24-32) in the 70-90th of the last century considered migration as a dynamic process caused by structural changes in economy, economic and political inequality of countries and regions. It should be noted, that one of the most important factors for international migration development is state regulation of migration relations. Kastlz (1998) emphasized the importance of a massive labor recruitment in the context of globalization.

One of the first scholars pointed out the factors influencing migration processes was an American scientist Lee (1966) whose theory of "push & pull" factors gains recognition. "Push" factors may include some economic factors (unemployment, low income, high taxes); social and political (poverty, discrimination, restrictions on freedom of conscience and religion, war); unfavorable natural and climatic conditions, etc. "Pull" factors may include a high level of economic development, higher incomes, security, opportunity to gain access to the labor market (including informal sector, which is particularly important for illegal immigrants) and others. Together with the pull and push factors some mediating factors may have an effect on migration. The intermediate factors increase with the growth of distance between territories and can act as limiters of migration flows. These include transport costs, legislative regulation movements, availability of information about the region of arrival, etc. (Lee, 1966, 47-57). Lee (1966) mostly focuses on economic factors of migration, but we cannot ignore the impact on increasing migration of the global tendencies of transportation, communication, access to international information (that helps migrants to solve several problems on the first stage of migration process).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Systematic approach to analysis of international economic relations implies their research in terms of system integrity. This objective reality is reflected in the theories of international labor migration.

Authors of the "international migration systems" concept (Kritts, M., Zlotnik, N. etc.) within a system combined different approaches to explain migration and proved that migration flows between countries of origin and countries of destination are significantly interrelated. For understanding migration dynamics, scientists believed that it is necessary to consider the whole migration space (migration system).

An intensive process of globalization of labor markets has been attracting attention of researchers more than one decade.

In the global labor market theory such researchers as Pletnev, A., Petras, E., Tsvylev, E. exploring international labor market, have got conclusions that global labor market has no clear territorial boundaries. It's forms and functions is a result of labor export-import development. Scientists determine the movement of foreign labor not only by supply and demand in different countries, but also by political, social, demographic and ecological processes.

In the late 70th a segmented labor market theory (or theory of "dual labor market") appeared and was further developed in the 80th in the works of Portes (1978), Bach (1979), etc. On the basis of multiple labor markets theory, markets are divided into segments — individual parts that do not intersect with each other and act according to their own rules and are characterized by different conditions. Supporters of the segmented labor market theory divide labor market in developed countries into three sectors: primary (highly skilled and well-paid jobs where mostly national citizens are employed), secondary (low earnings, bad working conditions, that are mainly used by foreign workers), and enclaves (work on host-immigrant fellow) (Iontsev, 2001, 92-93). Critics of this theory think that it does not allow to fully predict the macro level changes. Labor market factors in host countries rather than in the countries of origin, impact on migration processes.

Analyzing the causes, trends and consequences of international labor migration in the 50-70s Lewis, Sjaastad, Harris and others noted that international labor movement leads to the welfare of the host country. This is explained by fact that the growth of labor supply in the host country reduces wages that proves being advantageous for entrepreneurs.

Eppleyard (2002), with reference to some scientists, raises the issue about "the impact of globalization on migration policy, as well as on the amount, direction and structure of migration flows" and concludes that "the main task of studying globalization and migration is the understanding of international labor system in this new economy".

Several scientists in their conceptions convincingly prove the role of migration as a development factor. In the 1970s-1980s South Asian countries actively exported labor to maintain the highest rates of economic growth, including remittances. In addition, "... part of migrants are traders and entrepreneurs who transfer economic experience to their country not only creating wealth for themselves, but also jobs for locals, as well as in countries of origin and countries of destination" (Skeldon, 2006, 95).

Causes of migration based on the processes of globalization are investigated by supporters of world-system theory. The main thesis of this theory is that migration flows are directly related to the development scale of foreign economic relations and primarily with the volume of exports. Kritts (2002) proved this conclusion by empirical data analysis of migration flows between the eight countries.

Professor Sassen in her book "The Global City: London, New York, Tokyo" (2001) proves that immigration processes should be regarded as central aspect of globalization together with the internationalization of capital. In her opinion, the model of postindustrial society involves the increased proportion

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of highly educated workforce in the labor market and development of high areas should lead to growth of living standards as well as reduce social tension.

Synthetic theory developed by American sociologist Massey (2007) in the end of the 20th century has also gained popularity. The scientist explained large-scale growth of labor migration flows with the direct dependence on economic globalization and the development of the global market.

Views of supporters of the theory of migration ties or human capital also gained a wide popularity (Hugo, G., Taylor, A., Massey, D., Gyurak, D., Coleman, J.). This theory considers transnational social networks as one of the most important mechanisms determining migration ("Synthetic Theory of International Migration", 2002, pp.161-162). It should be noted that the existence of social networks helps migrants find a job faster and adapt to the country easier. In turn, social networks of migrants form the largest migration corridors. (table 5). A significant part of migrants chooses a specific destination country where relatives or diaspora based. Thus personal factors play a significant role in making a migration decision.

Formation of interstate social ties gives one more new specific feature to contemporary migration. It loses a unilateral movement and increasingly acquire features of a transnational process, called transmigration. Several scientists analyzed the impact of migration networks on different groups of migrants. Low-skilled workers rely more on migration networks based on family relations. Highly qualified specialists, vice versa, are less likely to rely on migration networks, and more focused on communication with colleagues and former classmates.

Changes in the international labor migration in globalization context and new character of migration processes are determined not only by economic factors, but also by social, political, demographic, environmental. This is reflected in the development of theories within the demographic, sociological and other approaches.

In the middle of the 90s of the last century transnationalism concept proposed by Shiller, N. became popular. The authors identified phenomenon of transnationalism as a process where immigrants - transmigrants cross national borders and form a social field, linking the country of origin and the host country. Immigrants included in such social fields, develop and maintain a diverse family, economic, social, religious, political, etc. connections (Schiller et al., 1979, pp 1-24).

In our view, a significant breakthrough in the study of migration is a demographic approach, that explains how demographic situation defines migration processes in the world, and inverse effects of migration on global demography. Interactions between these two processes in the 90s years of the twentieth century in Western Europe was investigated by Sluka, A. He argued that, high economic growth

Table 5. The main migration corridors in 2012

Countries Sending Migrants	Countries Receiving Migrants	Number of of Migrants
Mexico	United States of America	12 189 158
Ukraine	Russian Federation	3 662 722
Russian Federation	Ukraine	3 524 669
Bangladesh	Buthan	3 190 769
Turkey	Germany	2 819 326

Compiled by the author based on the analysis of Eurostat data (http://ec.europa.eu/eurostat)

maintaining, GDP increasing, living standards improving in European countries caused sharp deterioration of demographic dynamics (Sluka, 2001).

Professor Iontsev, V. noted that general population theory carries out a comprehensive, interdisciplinary approach: migration was determined as demographic processes affecting only human reproduction, as well as a multifaceted phenomenon, with economic, political, geographical and other aspects having an indirect impact on the demographic development (Iontsev, 2001, p 34).

The development of international migration concepts have been impacted by qualitative changes both in the world economy and non-economic processes: instability of political regimes, increasing of intranational conflicts, rising of unemployment and poverty, and also formation of interstate social communities. The volume of migration is controversially influenced by fluctuations of economic conditions . The impact of these fluctuations was most fully considered by Brinley, T., who identified common patterns of fluctuation migration between Europe and the United States. Brinley, T. in his book "Migration and economic growth: a study of the UK economy and the Atlantic region countries" (1954), in contrast to the generally accepted views, explained periodic inflows of immigrants and capital in the U.S. not only due to the U.S. aggregate demand fluctuations, but also opposite character of British economic cycles.

Under the influence of contemporary trends in the global economy scientists reviewing the methodological approaches to the analysis of migration processes. From the second third of the twentieth century, most scientists use an integrated approach to the study of the migration process, the impact on not only economic, demographic, etc. factors, but also their combinations. Ronald Skeldon argues that inability to explain dynamism of contemporary migration flows has led to departure from the narrowly focused models (Skeldon, 2006, 95).

The second aspect of international labor migration theories development under influence of the global economy - is the integration of different approaches. During the twentieth century a problem of different approaches synthesizing in single concept was repeatedly solved by scientists from different countries. English economist Marshall, A., founder of the neoclassical school in economic science, has applied synthesis approaches trying to combine approaches of marginalism, classical political economy and the historical school in his work (Marshall, 1993).

In order to overcome contradictions and shortcomings of neoclassical and Keynesian theories, and adapt them to the reality of the 60th "neoclassical synthesis" was initiated by the American economist Samuelson, P.

In Russia in the mid 70th a problem of synthesis of different approaches to the migration relations was suggested by Valentey, D. (1976). By necessity to synthesize the results of scientists' research from different science fields, Valentey (1976) explained significance of patterns development and population reproduction for the "internal-external" relations.

Team of scientists provided an overview of the neoclassical economics theory (Todaro, 1976), a new economic theory of labor migration (Stark, 1991), the segmented labor market theory (Piore, 1979), world-system theory (Sassen, 1988); theory of social capital (Massey, Goldring & Durand, 1994) and the cumulative causation theory (Massey, 1990). The purpose of the review was to determine the field of contradictions, complementarities and partial matches, the establishment of value of different theoretical approaches and empirical research literature ("Synthetic Theory of International Migration", 161-162). "There is no simple model of international migration - writes Massey (2007) - which could explain past trends or to predict the future, so the recent research aims to develop integration models that combine different levels and disciplines". Based on systematic approach Massey, D. analyzes complex mechanisms

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

determining migration processes, among which defining transnational social networks which support sustainability of international migration movements.

One of the most powerful concepts of the last third of the XX century is the world-system analysis theory initiated by american sociologist and culturalogist Wallerstein, I. World-system approach was developed in the 1970th. The main feature of this approach is that the subject (object) of the study is not separated national states of the world, but world-system in general. Authors and proponents of the world-system proceed from the fact that migration usually occurs between former colonial empires and their colonies, facilitated by historical, linguistic and other ties between countries (Wallerstein, 2001). This theory is based on a systematic approach, intended to prove that migration flows between countries of origin and destination countries are determined by different factors: since the formation of stable migration flows creates a migration system; understanding of these dynamics requires an analysis of the whole system.

The study of international labor migration is interdisciplinary and stay at the intersection of disciplines including demography, sociology, political science and law. This position determines different approaches to the study: demographic, economic, sociological, etc. However, due to the extreme complexity and diversity of the research object, it is extremely difficult and controversial to highlight theories that would correspond to any single approach. In reality, all these approaches and explanations complement each other.

Thus, consideration of the basic concepts of international labor migration has revealed the impact of global economic trends (globalization, integration, transnationalization, etc.), the growing interdependence of countries, manifested in the globalization of international economic relations; the emergence of new approaches in economic elements reflecting non-economic processes (the instability of political regimes, increased intra-national conflicts, rising unemployment, poverty, the formation of interstate social communities, etc.) contributes to understanding of the conditions for synthesizing of modern scientific approaches to the analysis of international migration.

KEY TERMS AND DEFINITIONS

Concept: An abstraction or generalization from experience or the result of a transformation of existing concepts.

Global Economy: A collection of national economies and non-state actors, which united international relations.

Globalization: The process of international integration arising from the interchange of world views, products, ideas and other aspects of culture.

International Economic Relations: The economic relations between states, regional groups, transnational corporations and other entities of the world economy. Include monetary, financial, trade, manufacturing, labor, and other relationships.

International Labor Migration: A movement of people from one country to another for the purpose of employment.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Labor Market: A sphere of demand and supply for labor.

Systematic Approach: A direction methodology of scientific knowledge, which is based on the consideration of the object as a system: integral complex interrelated elements.

Theory: A contemplative and rational type of abstract or generalizing thinking, or the results of such thinking.

This research was previously published in Urbanization and Migration as Factors Affecting Global Economic Development edited by Denis Ushakov, pages 1-13, copyright year 2015 by Information Science Reference (an imprint of IGI Global).
