Table of Contents

Preface xix

Volume I

Section 1
Fundamental Concepts and Theories

Chapter 1
Global Market Trends 1
William Amone, Mbarara University of Science and Technology, Uganda

Chapter 2
Social Exclusion and Poverty: EU 2020 Objectives and Turkey 23
Davuthan Günaydin, Namık Kemal University, Turkey
Hakan Cavlak, Namık Kemal University, Turkey
Neslihan Cavlak, Namık Kemal University, Turkey

Chapter 3
A General View of Poverty in Turkey as an Issue for Social Work in the Light of Behavioral Finance and Game Theory 41
Seher Cesur-Kiliçaslan, İstanbul Arel University, Turkey
Toprak Işik, Independent Scholar, Turkey

Chapter 4
Recursive Inter-Ethnic Violence and the Failure of Development Communication in Africa 55
Charles Chiedu Okigbo, North Dakota State University, USA

Chapter 5
Theoretical Aspects on Bottom of the Pyramid in Emerging Economies: An Overview of Microfinance in Latin America 67
Milo Paviera, University of Edinburgh, UK
Mahmoud Khalik, University of St. Andrews, UK

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 6
Youth Engagement in the Era of New Media 90
Yoshitaka Iwasaki, University of Alberta, Canada

Chapter 7
National Ethical Institutions and Social Entrepreneurship 106
Etayankara Muralidharan, MacEwan University, Canada
Saurav Pathak, Kansas State University, USA

Chapter 8
Towards a New Definition of Social Innovation 130
Donatella Ettorre, Politecnico di Bari, Italy
Nicola Bellantuono, Politecnico di Bari, Italy
Barbara Scozzi, Politecnico di Bari, Italy
Pierpaolo Pontrandolfo, Politecnico di Bari, Italy

Chapter 9
Women's Economic Empowerment in the Developing Countries: Reengineering Patriarchy? 155
Ummu Atiyah Ahmad Zakuan, Universiti Utara Malaysia, Malaysia
Kalthum Hassan, Universiti Utara Malaysia, Malaysia

Chapter 10
A Study of Two Microfinance Models and Their Suitability for Egypt 171
Ahmed Youssry, Coleman University, USA
Brett Winklehake, San Diego Mesa College, USA
Jaime A. Lobera, Coleman University, USA

Chapter 11
The Making of the Information Society: Taxonomy of Concepts, Determinants, and Implications..... 196
P.E. Thomas, Bharathiar University, India

Section 2
Development and Design Methodologies

Chapter 12
Picking the People up From Poverty: Urban Labour Market Deregulation vs. Encouraging the Development of Micro-Enterprises..... 222
Abu Saleh Mohammad Sowad, University of Dhaka, Bangladesh

Chapter 13
A National Crisis and a Call to Action: Preparing Teachers to Teach Children From Poverty..... 232
H. Carol Greene, East Carolina University, USA
Jane C Manner, East Carolina University, USA

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 14
Measuring the Poverty of Elderly People With Needs Analysis in Turkey 256
Emine Özmete, Ankara University, Turkey

Chapter 15
National Migration Policy as a Principle for Economic System Structuring in the Modern States: The Case of Russia..... 277
Ekaterina Andreeva, Rostov State Transport University, Russia

Chapter 16
An Endogenous Switching Model to Poverty Dynamic Assessment in Tunisia: A New Proposal 303
Amal Jmaii, Institut Supérieur de Gestion, Tunisia

Chapter 17
FDI, Urbanization, and Economic Growth Linkages in India and China..... 313
Sudhakar Patra, Ravenshaw University, India

Chapter 18
Corporate Governance: The Catalyst for Economic Growth and Social Change 328
Sandeep Goel, Management Development Institute, India

Chapter 19
Key Aspects to Develop Long-Term Microfinance and Financial Inclusion for Social Development 340
Omar Alonso Patiño Castro, Universidad Ean, Colombia

Chapter 20
Political Consumption as Supplement to Conventional Political Participation in Promoting Social Change 362
Emmanuel Adugu, University of West Indies, Barbados

Chapter 21
Universities' Contributions to Sustainable Development's Social Challenge: A Case Study of a Social Innovation Practice 379
Douglas Paulesky Juliani, Instituto Federal de Santa Catarina, Brazil
Ania Silva, Instituto Federal de Santa Catarina, Brazil
Jorge Cunha, University of Minho, Portugal
Paul Benneworth, University of Twente, The Netherlands

Chapter 22
A Qualitative Analysis of Social Entrepreneurship Involving Social Innovation and Intervention ... 400
Vera Fernandes, University of Aveiro, Portugal
António Carrizo Moreira, University of Aveiro, Portugal
Ana Isabel Daniel, University of Aveiro, Portugal

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 23
Locational Determinants of Foreign Direct Investment in the Vietnamese Economy 422
Ngoc Le, Northumbria University, UK
Xiaoqing Li, Brunel University London, UK
Andrey Yukhanaev, Northumbria University, UK

Chapter 24
Multinational Corporations: A Boon or Bane for a Developing Economy – A Study in Indian Context 460
Leena Ajit Kaushal, Management Development Institute (MDI) Gurgaon, India

Chapter 25
On the Road to SME Sector Development in Bangladesh: A Guideline Based on Current Challenges and Opportunities 480
Syed Abidur Rahman, Universiti Utara Malaysia, Malaysia
Noor Hazlina Ahmad, Universiti Sains Malaysia, Malaysia
Seyedeh Khadijeh Taghizadeh, Universiti Tecknolgi PETRONAS, Malaysia

Chapter 26
Zakat and Its Socio-Economic Merits: A Holistic View towards Eradication of Poverty 500
Mohammed Abdul Karim Al-Banna, Heriot Watt University, UK
Ian Michael, Zayed University, UAE

Chapter 27
A Crowd-Funder Value (CFV) Framework for Crowd-Investment: A Roadmap for Entrepreneurial Success in the Contemporary Society 515
Payal Jain, University of Northampton, UK

Section 3
Tools and Technologies

Chapter 28
Hunger Hurts: The Politicization of an Austerity Food Blog 538
Anita Howarth, Brunel University London, UK

Volume II

Chapter 29
Lorenz Curve, Gini Coefficient, and the Income Inequality in Turkey in the Last 13 Years 554
Sema Bölükbaş, Yıldırım Beyazıt University, Turkey

Chapter 30
The Effect of Microfinance on Poverty Reduction in Developing Economies 575
Christopher Boachie, Central University College, Ghana

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 31
Children and Youth Making Digital Media for the Social Good 592
Jill Denner, Education, Training, Research, USA
Jacob Martinez, Digital NEST, USA

Chapter 32
Is the EU Moving Towards Sustainable Development? Changes in the Social Exclusion Area in Some European Countries 612
Irina Gabriela Radulescu, Petroleum-Gas University of Ploiesti, Romania
Mirela Clementina Panait, Petroleum-Gas University of Ploiesti, Romania
Madalina Albu, Petroleum-Gas University of Ploiesti, Romania
Mihaela Ciopi Oprea, Petroleum-Gas University of Ploiesti, Romania

Chapter 33
Mobile Learning for Social Change: Democratizing Education and Civic Engagement 623
Tseday Alehegn, Columbia University, USA
Dominic Mentor, Columbia University, USA

Chapter 34
Deploying ICT to Enhance Small Businesses and Achieving Sustainable Development: A Paradigm to Reducing Poverty and Unemployment and Enhancing a Sustainable National Development in Nigeria 638
Ojinga Gideon Omiunu, University of Ibadan, Nigeria

Chapter 35
Corruption, Business Climate, and Economic Growth 663
Harish C. Chandan, Argosy University, USA

Chapter 36
Grassroots Innovation for Human Development: Exploring the Potential of Participatory Video 687
Alejandra Boni, Universitat Politècnica de València, Spain
Monique Leivas, Universitat Politècnica de València, Spain
Teresa De La Fuente, Universitat Politècnica de València, Spain
Sergio Belda-Miquel, Universitat Politècnica de València, Spain

Chapter 37
The Arts, Civic Engagement, and Urban Youth 703
Amy M. Grebe, ACPPA Community Art Center, USA

Chapter 38
Meaningful Youth Engagement Through Media Usage 729
Yoshitaka Iwasaki, University of Alberta, Canada

Chapter 39
Opportunities and Challenges of Visualization and Open Data in Food Security Analysis 748
Thida Chaw Hlaing, University of New England, Australia
Julian Prior, University of New England, Australia

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 40
Reducing Poverty and Sustaining Growth: A Microfinance Approach 773
Nabila Nisha, North South University, Bangladesh
Afrin Rifat, North South University, Bangladesh

Chapter 41
Real-Time Monitoring of Intercity Passenger Flows Based on Big Data: A Decision Support Tool for Urban Sustainability 793
Zheng Li, Xi'an Eurasia University, China
Yan Wang, Xi'an Eurasia University, China
Qin Chen, Business Big Data (BBD), China

Chapter 42
Tourism Marketing in Developing Countries 802
Nermeen Atef Ahmed Hegazy, Cairo University, Egypt

Chapter 43
Utopia, Labor, and Informational Capitalism: Lights and Shadows of Social Media 817
Marco Briziarelli, University of New Mexico, USA

Section 4
Utilization and Applications

Chapter 44
The Inter-Linkage Between Governance and Poverty: Evidences from SAARC Countries 838
Maniklal Adhikary, The University of Burdwan, India
Dyuti Sinha, The Bhawanipur Education Society College, India

Chapter 45
Games for Social Change: Review of the Potential for Multi Player Online Gaming to Facilitate the Emergence and Growth of Progressive Movements for Social Change Within Youth and Community Work 866
Paul Keating, Limerick Institute of Technology Tipperary, Ireland

Chapter 46
Holistic, Evolving Aspects of Nonviolence for Bringing About Needed Social-Political Change and Important Practitioners of Nonviolence 882
Linda Groff, California State University – Dominguez Hills, USA

Chapter 47
Poverty Reduction, Wealth Creation, and Tourism in Ethnic Minority Communities in Mainland Southeast Asia 904
Scott Hipsher, Webster University, Thailand

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 48
Digital Entrepreneurial Charity, Solidarity, and Social Change 921
José Manuel Saiz-Alvarez, Tecnologico de Monterrey, Mexico
Jorge Colvin-Díez, Schiller International University, Spain
Jorge Hernando Cuñado, Nebrija University, Spain

Chapter 49
The Social Economy and Role of Government in South Africa 943
O. E. Okeke-Uzodike, University of KwaZulu-Natal, South Africa
Mogie Subban, University of KwaZulu-Natal, South Africa

Chapter 50
Shrinkage of Rural Areas as a Result of Urbanization and Migration Processes in Mexico 956
José G. Vargas-Hernández, University of Guadalajara, Mexico

Chapter 51
Using Creativity and Social Innovation to Create Social Value and Change 975
Ziska Fields, University of KwaZulu-Natal, South Africa

Chapter 52
The Role of Entrepreneurial Spirit in Indonesian Youths and Housewives to Reduce Unemployment and Poverty Rate 991
Ati Cahayani, Atma Jaya Catholic University, Indonesia

Chapter 53
The Crossroads That Were Never Meant to Be: An Account of Promises and Challenges in an Orphan's Empowerment Journey 1009
Oitshepile MmaB Modise, University of Botswana, Botswana
Rebecca Nthogo Lekoko, University of Botswana, Botswana

Chapter 54
Functional Effectiveness and Modern Mechanisms for National Urban Systems Globalization: The Case of Russia 1022
Alexey Arkhipov, South Federal University, Russia
Denis Ushakov, International College Suan Sunandha Rajabhat University, Thailand & Russian Academy of National Economy and Public Administration–South Branch, Russia

Chapter 55
Sustainable Rural Development in the Conditions of Trade Integration: From Challenges to Opportunities 1041
Anna Ivolga, Stavropol State Agrarian University, Russia

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 56
Effective Urban Infrastructure Governance in Africa: Resolving the Wealth-Poverty Paradox 1060
Peter Elias, University of Lagos, Nigeria
Olatunji Babatola, University of Lagos, Nigeria
Ademola Omojola, University of Lagos, Nigeria

Chapter 57
Poverty as a Tourism Attraction: Travelling on the Web 1084
Donatella Privitera, University of Catania, Italy

Chapter 58
Integrating Spatial Technologies in Urban Environments for Food Security: A Vision for Economic, Environmental, and Social Responsibility in South Bend, Indiana 1102
Edwin Joseph, Indiana University – South Bend, USA
Elizabeth O'Dea, Indiana University – South Bend, USA

Volume III

Chapter 59
Operation Sukuma-Sakhe: A New Social Contract for Decentralized Service Delivery and Responsive Governance in KwaZulu-Natal 1139
Ndwakhulu Tshishonga, University of KwaZulu-Natal, South Africa

Chapter 60
Foreign Land Acquisitions: Household Livelihood With Some Evidence on Nigeria 1159
Ben E. Aigbokhan, Samuel Adegboyega University, Nigeria
Kehinde O. Ola, Samuel Adegboyega University, Nigeria

Chapter 61
ICT: A Magic Wand for Social Change in Rural India 1179
Orance Mahaldar, Ghent University, Belgium
Kinkini Bhadra, Jadavpur University, India

Chapter 62
Foreign Direct Investment in Land Acquisitions in India: Evidence and Challenges 1205
Falendra Kumar Sudan, University of Jammu, India & University of South Australia, Australia

Chapter 63
Urban Economy and Sources of Its Efficiency as Factors Addressing the Challenges Faced by Urban Economy: The Case Study of Southern African Region 1227
Evelyn Chiloane-Tsoka, University of South Africa, South Africa
Junior Mabiza-ma Mabiza, University of Johannesburg, South Africa

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 5
Organizational and Social Implications

Chapter 64
Social Media for Promoting Grassroots Political Movements and Social Change 1249
Amir Manzoor, Bahria University, Pakistan

Chapter 65
Current Trends of Education and Social Change in Balochistan: A Sociological Analysis 1279
Naveeda Erum, University of Balochistan, Pakistan
Naima Saeed, University of Karachi, Pakistan
Tansif Ur Rehman, University of Karachi, Pakistan

Chapter 66
Women in Development Mobilize Grassroots Enterprises to Reduce Household Poverty 1292
Ladislaus M. Semali, Pennsylvania State University, USA

Chapter 67
Impact of Microfinance on Poverty in the Context of Global Financial Crisis: A Cross Country Analysis in South Asia 1317
Arindam Laha, The University of Burdwan, India

Chapter 68
Rational Asymmetric Development: Transfer Mispricing and Sub-Saharan Africa's Extreme Poverty Tragedy 1334
Simplice A. Asongu, African Governance and Development Institute, Cameroon

Chapter 69
Population Growth and Urbanization in Africa: Implications for the Environment 1355
Samuel Adams, Ghana Institute of Management and Public Administration, Ghana

Preface

The constantly changing landscape of Socio-Economic Development makes it challenging for experts and practitioners to stay informed of the field's most up-to-date research. That is why Business Science Reference is pleased to offer this three-volume reference collection that will present students, researchers, and academicians with a strong understanding of critical issues within Socio-Economic Development by providing both broad and detailed perspectives on cutting-edge theories and developments. This reference is designed to act as a single reference source on conceptual, methodological, technical, and managerial issues, as well as to provide insight into emerging trends and future opportunities within the discipline.

Socio-Economic Development: Concepts, Methodologies, Tools, and Applications is organized into six distinct sections that provide comprehensive coverage of important topics. The sections are:

1. Fundamental Concepts and Theories;
2. Development and Design Methodologies;
3. Tools and Technologies;
4. Utilization and Applications;
5. Organizational and Social Implications; and
6. Critical Issues and Challenges.

The following paragraphs provide a summary of what to expect from this invaluable reference tool.

Section 1, "Fundamental Concepts and Theories," serves as a foundation for this extensive reference tool by addressing crucial theories essential to the understanding of Socio-Economic Development. Introducing the book is "Global Market Trends" by William Amone: a great foundation laying the groundwork for the basic concepts and theories that will be discussed throughout the rest of the book. Section 1 concludes and leads into the following portion of the book with a nice segue chapter, "The Making of the Information Society: Taxonomy of Concepts, Determinants, and Implications" by P.E. Thomas.

Section 2, "Development and Design Methodologies," presents in-depth coverage of the conceptual design and architecture of Socio-Economic Development. Opening the section is "Picking the People Up From Poverty: Urban Labour Market Deregulation vs. Encouraging the Development of Micro-Enterprises" by Abu Saleh Mohammad. Through case studies, this section lays excellent groundwork for later sections that will get into present and future applications for Socio-Economic Development. The section concludes with an excellent work by Payal Jain, "A Crowd-Funder Value (CFV) Framework for Crowd-Investment: A Roadmap for Entrepreneurial Success in the Contemporary Society."

Section 3, "Tools and Technologies," presents extensive coverage of the various tools and technologies used in the implementation of Socio-Economic Development. The first chapter, "Hunger Hurts: The

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Politicization of an Austerity Food Blog" by Anita Howarth, lays a framework for the types of works that can be found in this section. The section concludes with "Utopia, Labor, and Informational Capitalism: Lights and Shadows of Social Media" by Marco Briziarelli. Where Section 3 described specific tools and technologies at the disposal of practitioners, Section 4 describes the use and applications of the tools and frameworks discussed in previous sections.

Section 4, "Utilization and Applications," describes how the broad range of Socio-Economic Development efforts has been utilized and offers insight on and important lessons for their applications and impact. The first chapter in the section is "The Inter-Linkage between Governance and Poverty: Evidences From SAARC Countries" written by Maniklal Adhikary and Dyuti Sinha. This section includes the widest range of topics because it describes case studies, research, methodologies, frameworks, architectures, theory, analysis, and guides for implementation. The breadth of topics covered in the section is also reflected in the diversity of its authors, from countries all over the globe. The section concludes with "Urban Economy and Sources of Its Efficiency as Factors Addressing the Challenges Faced by Urban Economy: The Case Study of Southern African Region" by Evelyn Chiloane-Tsoka and Junior Mabiza-ma Mabiza, a great transition chapter into the next section.

Section 5, "Organizational and Social Implications," includes chapters discussing the organizational and social impact of Socio-Economic Development. The section opens with "Social Media for Promoting Grassroots Political Movements and Social Change" by Amir Manzoor. This section focuses exclusively on how these technologies affect human lives, either through the way they interact with each other or through how they affect behavioral/workplace situations. The section concludes with "Exploring the Social Impact of Foreign Direct Investment on Institutional Change" by Natalya Smith.

Section 6, "Critical Issues and Challenges," presents coverage of academic and research perspectives on Socio-Economic Development tools and applications. The section begins with "Can Zakat Institutions Adopt Consumer-Centric Knowledge Management Successfully to Alleviate Poverty?" by Abu baker Ramadan Mohamed Hussain. Chapters in this section will look into theoretical approaches and offer alternatives to crucial questions on the subject of Socio-Economic Development. The final chapter of this book looks at "Historical and Methodological Approaches to the Analysis of International Labor Migration in a Globalizing World Economy" by Eteri Rubinskaya.

Although the primary organization of the contents in this multi-volume work is based on its six sections, offering a progression of coverage of the important concepts, methodologies, technologies, applications, social issues, and emerging trends, the reader can also identify specific contents by utilizing the extensive indexing system listed at the end of each volume. As a comprehensive collection of research on the latest findings related to using technology to providing various services, *Socio-Economic Development: Concepts, Methodologies, Tools and Applications* provides researchers, administrators, and all audiences with a complete understanding of the development of applications and concepts in Socio-Economic Development. Given the vast number of issues concerning usage, failure, success, policies, strategies, and applications of Socio-Economic Development in countries around the world, *Socio-Economic Development: Concepts, Methodologies, Tools, and Applications* addresses the demand for a resource that encompasses the most pertinent research in technologies being employed to globally bolster the knowledge and applications of Socio-Economic Development.

Chapter 1
Global Market Trends

William Amone
Mbarara University of Science and Technology, Uganda

ABSTRACT

This chapter provides a discussion of competitiveness, globalization, and trade, including their recent transformations. The global market has witnessed several changes including reductions in trade costs, increased global trade, growth of industrialization in developing countries, and a complete change in the nature of goods traded. The drivers of global market changes include shifts in production and consumption patterns, technological innovations, new ways of conducting business, and policy changes. Many governments have lately opened their economies to international trade, enabling them to reap several benefits. Openness to trade is believed to have supported the growth of many countries and has greatly contributed to the success of most Asian countries, especially China and India. Although the global market offers numerous benefits, many developing countries still face serous limitations to fully access it; they are constrained by factors such as quality inferiority, distance, quantitative restrictions, poor technical skills, bad governance, and border controls.

INTRODUCTION

As the global market is changing so rapidly, the key drivers underpinning global market changes include shifts in production and consumption patterns, new technological innovations, new ways of conducting business, and policy changes. Technology is a key driver of these changes; new technology has tremendously improved transport and communications anchoring the fast integration of the world into a single market. Trade and foreign direct investment (FDI), together with a greater geographical spread of income growth and opportunity, will further integrate a growing number of countries into more extensive international exchange.

According to the World Trade Organization (WTO) (2008), trade and globalization have generally brought enormous benefits to many countries and citizens. Trade has allowed nations to benefit from specialization and economies to produce at a more efficient scale. It has raised productivity and incomes, stimulated economic growth, supported the spread of knowledge and new technologies, and it has enriched the range of choices available to consumers.

Global trade and the flows of goods and services are crucial for achieving sustained growth in developing countries. Alongside trade, growing flows of capital across national borders significantly contribute to economic growth and poverty reduction. The international mobility and division of labor also generates important distributional changes across countries (UNCTAD, 2012).

Many governments in developing countries have lately opened their economies to international trade through the multilateral trading system, increased regional cooperation or as part of domestic reform programs. However, the benefits of trade and globalization have not necessarily reached all sections of society. Furthermore, although international trade is an integral part of the process of globalization, trade skepticism continues to rise in certain sections of society (Jacks, Meissner, & Novy, 2011).

Despite the current global economic crisis, world trade has increased dramatically over the past decade, rising almost threefold since 2002 to reach about US$18 trillion in 2011. Developed countries continue to constitute the main players in international trade, while developing countries account for an increasing share. As of 2011, nearly half of world trade has originated from developing countries (up from about one-third in 2002). Although well performing as a group, developing countries' integration into the global economy has been rather varied. East Asia continues to dominate developing countries trade flows, while other regions lag far behind. China has become an increasingly important trading partner for many other developing countries, not only in the East Asian region, but also in Sub-Saharan Africa and Latin America (UNCTAD, 2013). According to the WTO (2008), the dominant share of the United States in world trade in the early 1950s has eroded in subsequent decades. Although the automotive agreement between the United States and Canada in 1965 strengthened intra-North American trade, their combined share in world trade shrank by 10 percent between 1953 and 1973.

During the following two decades, the share of regions in world merchandise exports varied largely due to the fluctuations of commodity prices and exchange rates. The oil-exporting developing countries (especially those in the Middle East) increased their share between 1973 and 1983, but lost significantly when oil prices decreased thereafter. In 1993, after the disintegration of the Soviet Union and the demise of the Council of Mutual Economic Assistance (CMEA) industrial countries (i.e., Western Europe, North America, and Japan), the share of world merchandise exports reached a peak. Together with the Asian Newly Industrialized Economies (NIEs), they accounted for more than 80 percent of world trade in 1993 (WTO, 2008).

In the 1990s, Japan's share in world exports began falling due to the competitive pressures exerted by the NIEs and China. The stimulus provided by the creation of the North American Free Trade Agreement (NAFTA) in 1994 was not even sufficient to reverse the downward trend in the share of Canada and the United States in global trade. Similarly, the European integration process which continued to deepen and expand to cover the central European countries and the Baltic States could not halt the relative decline of European exports (WTO, 2008).

World trade share drop of the industrial countries can be attributed to the rise of China, the recovery of the Commonwealth of Independent States (CIS), and in more recent years to the boom in commodity prices which boosted the trade shares of Middle East and Central/South America regions which export mostly minerals and other primary products. China initially concentrated on the manufacture and trade of textiles and other labour-intensive goods such as footwear and toys, but swiftly later its export basket diversified to include sophisticated electronics and data processing equipments. More recently, China's biggest gains in market share have been in iron and steel products. China more than tripled its share in world exports between 1990 and 2007, and apparently China is the world's most competitive exporter of merchandise (Nataraj & Tandon, 2011).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to the United Nations Economic Commission for Africa (2013), the share of Africa's world trade has been steadily declining. Africa mainly exports commodities like coffee, copper, and diamonds, but these products have fallen in value relative to manufactured exports like clothing and computers in which many Asian countries have specialized; therefore, their share of world trade has risen dramatically. Across Africa, most countries produce and export mainly unprocessed crops or minerals, even though such raw materials attract lower prices on world markets. However, some are changing to consciously develop their manufacturing industries.

Africa's trade performance improved slightly in line with global trends in 2010, although its share in world trade remained constant at 3.2 percent. The persistent prevalence of lack of value addition in Africa's predominantly raw material based export portfolio means the continent's export fortunes are contingent on commodity price movements, exacerbating the continent's susceptibility to external shocks (UNECA, 2013).

Rich, economically advanced countries pledged to open their markets to the poor, but progress has been painfully slow in world trade talks. Special pledges have been made to assist Africa's producers and manufacturers as they are offered duty free access to developed markets, but more must be done to improve Africa's ports, roads, and airports, and to increase manufacturing exports. For instance, the European Union and United States have been providing massive agricultural subsidies by making large payouts to their biggest farmers. This has caused overproduction and export dumping, undermining poor producers overseas (Oxfam, 2005). By dodging their commitments to reduce the subsidies that harm poor farmers overseas, while at the same time forcing poor countries to open their markets to unfairly subsidized produce, the rich countries are likely to frustrate the developing world's efforts in trade and ultimately these duplicities could undermine global trade.

MAJOR TRENDS IN GLOBAL MARKETS

- Decreases in international trade costs has anchored a mass increase in the volume of trade in the global market and is a key driving force behind today's global trading system. Besides improvements in transports and communications, the progressive reduction in Tariffs since the establishment of the General Agreement on Tariffs and Trade (GATT) in 1948, and the removal of many Non-tariff barriers (NTBs) that represent a large category of import restrictions have contributed significantly to the falling international trade costs (WTO, 2014).
- In the last 30 years, world merchandise and commercial services trade have increased by about seven percent per year, reaching a peak in 2011 of US$18 trillion and US$4 trillion, respectively. In 2008, services accounted for about 20 percent of world exports if considered in gross terms, while the value-added measure reveals that the contribution of services is twice as high (WTO, 2013).
- Between 1980 and 2011, the share of exports of developing economies increased from 34 percent to 47 percent and their share in world imports from 29 percent to 42 percent (see World Trade Report, 2013). Asia is playing an increasing role in world trade. Japan and China are two major growing forces in world trade, supplying the global market with a wide variety of finished products.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- For a number of decades, world trade has grown on average nearly twice as fast as world production. This reflects the increasing prominence of international supply chains and hence the importance of measuring trade in value-added terms.
- According to the World Trade Report (2013), in a dynamic economic and open trade environment, developing countries are likely to outpace developed countries in terms of both export and GDP growth by a factor of two to three in future decades. By contrast, their GDP would grow by less than half this rate in a pessimistic economic and protectionist scenario, and export growth would be lower than in developed countries.
- With as a number of African countries now attempting to establish credible industrial policies as well as upholding structural transformation for industrialization, Africa is expected to emerge as a central region for global growth in the next few years (UNECA, 2014).
- According to the International Monetary Fund (2014), global activity and world trade augmented in the second half of 2013. Global economic growth during this period was stronger than anticipated in the October 2013 World Economic Outlook. Final demand in advanced economies expanded broadly as expected: much of the surprise in growth is due to higher inventory demand. In emerging market economies, an export rebound was the main driver behind better activity, while domestic demand generally remained subdued except in China.
- Considering projections, global growth is projected to be slightly higher in 2014 at approximately 3.7 percent, rising to 3.9 percent in 2015. Economic growth in the United States is expected to be 2.8 percent in 2014, an increase from 1.9 percent in 2013. Overall, growth in emerging market and developing economies is expected to increase to 5.1 percent in 2014 and to 5.4 percent in 2015. Growth in China rebounded strongly in the second half of 2013 largely due to acceleration in investment. This surge is expected to be temporary, partly because of policy measures aimed at slowing credit growth and raising the cost of capital. Growth in India picked up after a favorable monsoon season and higher export growth and is expected to firm further on stronger structural policies supporting investment. Many other emerging market and developing economies are now benefiting from stronger external demand in advanced economies and China (International Monetary Fund, 2014).

Global Competitiveness

According to the Global Competiveness Report 2012-13, competitiveness refers to the set of institutions, policies, and factors that determine the level of productivity of a country. In turn, the level of productivity sets the level of prosperity that can be reached by an economy. Productivity level also determines the rates of return obtained by investments in an economy, which are the fundamental drivers of its growth rates. Therefore, a more competitive economy is one that is likely to grow faster over time. The concept of competitiveness thus involves static and dynamic components. Although the productivity of a country determines its ability to sustain a high level of income, it is also one of the central determinants of its returns on investment, which is one of the key factors explaining an economy's growth potential (World Economic Forum, 2013).

However, Michael Porter (1990) believes national prosperity is created and not inherited. Porter states a nation's competitiveness depends on the capacity of its industry to innovate and upgrade; therefore, companies gain advantage against global competitors because of pressure and challenges, and that the companies benefit from having strong domestic rivals, aggressive home based suppliers, and constantly

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

demanding local customers. Companies achieve competitive advantage through acts of innovations, and the only way to sustain a competitive advantage is to constantly upgrade (i.e., move to more sophisticated types). Companies approach innovation in its broadest sense including both new technologies and new ways of doing things. The Japanese auto makers practice this by initially penetrating foreign markets with small, inexpensive cars of adequate quality, but still continue to enhance their features. Private businesses and the government must work together to achieve national competitiveness (Porter, 1990).

The Global Competitiveness Reports state that Switzerland with its outstanding competitiveness performs consistently well across the many areas that make a country productive and economically resilient. Compared to the challenges being faced by many advanced economies in Europe and elsewhere, and despite being surrounded by countries struggling with managing the euro's difficulties, Switzerland has maintained an impressive growth performance and enviably low unemployment of only about 4%. While many qualities drive this exceptional performance, three of the most important drivers can be singled out: the excellence of its institutions, the dynamism of its markets and its strong capacity for innovation (World Economic Forum, 2013).

Public institutions in Switzerland are among the most effective and transparent in the world. The country is unique in its governance structure. With seven members of the Federal Council acting more or less as a collective Head of State, the country is governed under a highly decentralized form of federalism which is able to achieve high degrees of engagement among voters. Its political system fosters the well formulating and implementing of long-term economic agendas. Switzerland's enduring competitiveness is further explained by its highly sophisticated business environment which is supported by well-functioning labour and financial markets that help Swiss companies to offer high-quality products and compete across a very sophisticated product range (World Economic Forum, 2013).

However, Many African countries continue to feature among the least competitive economies in the world. Africa's problems include barriers to increased trade, worsened by the poor states of infrastructure and legal and regulatory environment, limited innovations, and poor public-private partnerships. Both public and private institutions in most African countries are characterized by widespread corruption, and inefficient government spending that cast doubt on the countries' ability to spend resources intended for fundamental projects. Furthermore, the countries' infrastructures are the least developed globally, and the educational and health systems still need a lot of improvements (World Economic Forum, 2014).

BENEFITS OF ACCESSING THE GLOBAL MARKET

Accessing the global market widens producers' market opportunities and promotes further investments and growth. Trade also creates jobs, attracts new investments, attracts new technology and materials, and offers people of a country wider choice in products and services. A number of business persons in developing countries still lack the key skills that are necessary for conducting international businesses. Access to the global market anchors all the above benefits and provides a good learning ground for premium global businesses.

As people earn money from trade, they spend, save, or pay taxes with the money. The government uses taxes to provide services which create more jobs. When people save, the capital markets lend money to others, who will spend it on consumer goods, or open/ expand a business, therefore creating new jobs. People's expenditures and demands create jobs. Trade raises incomes; it provides more choice of products and qualities and stimulates economic growth (World Trade Organization, 2008).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The specific benefits of accessing the global market include the following:

- **Investments and Economic Growth:** Increased exports generate foreign exchange which can be used to purchase foreign goods and services such as tractors, computers, milling machine, grinding machines. These goods (machines) may be used in other production processes that finally end up stimulating investments in the country. By competing with foreign firms, increased exportation also exposes domestic firms/business-persons to the latest product and process innovations in their particular sector.
- **Market Access and Poverty Reduction:** The global market offers local producers greater market opportunities for their goods and services, and it also increases domestic returns to factors of production, and expands exporters' market horizons. The universal effect in this regard is that the local producers earn and learn more. The producers including farmers are therefore capable of moving out of poverty faster.
- **Meeting Needs:** Trade is always balanced if it is fair. Many businesses can create a surplus inventory of goods and services. For example, Rwandan farms produce more food than Rwandans can eat, and their service providers can provide services to other countries However, Rwandans cannot produce well-manufactured products like computers and televisions, so these products are mainly imported from Japan, China, the USA, or Europe. Both trading partners obtain something they need by trading something they do not require. Therefore, trade leads to specialization and exploitation of comparative advantage.
- **Job Creation:** Unlike the barter system of the past, businesses now receive money from selling their products or services to foreign markets. Exports are very important to a country as they create jobs for the people. Some foreign businesses that open their branches in a country also employ many of the local people.
- **Attracting Investment:** Investment follows trade. Many foreign companies will invest in an office, factory, or distribution warehouse to simplify their trade and reduce cost. While these investments create employment, they also attract more other international investors. Related businesses will also develop alongside to supply inputs or purchase the outputs.
- **New Technology and Materials:** New technology promotes competitiveness and profitability. If a business could create a machine that works better, faster, or cheaper (or all three), the business will have produced a more competitive product for national and international markets. Efficient production means more products, lower production costs and better quality products.
- **Diverse Products and Services:** For instance, in most African countries people can use various forms of electronics imported from the USA, Japan, Germany, or China such as computers, phones, televisions, and radios of various qualities. Foreign trade turns the world into a giant market, delivering food, fashions, etc. New services such as banking, travel, and consultation are also available now. Business competition is no longer on a city scale; instead, businesses compete against worldwide businesses. The result is better quality goods, lower prices, and higher functional design.
- *Improvement in infrastructure* such as roads, railways, schools, and hospitals. Good roads and railways are required for delivery of goods in the markets. The families engaged in trade will also require hospital and schools services. All these will ultimately lead to the development of societies.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Government obtains revenues from various taxes and fees. The government uses the money to provide public goods and services like security, and build required infrastructures such as shopping malls or markets.
- Trade enables sale/disposal of surplus products of a particular country.
- Trade builds good relations between the trading partners, thereby reducing conflicts.

COSTS OF ACCESSING THE GLOBAL MARKET

The global market has made it easy to buy and sell international goods; however, this situation presents both benefits and challenges. Such trade can cause countries to be prosperous for a short time, but leads to economic exploitation, loss of cultural identity, and even physical harm over the long-term. Understanding trade costs is essential for formulating policy interventions designed to reduce such costs (Moïsé & Le Bris, 2013)

- **Fulfillment of Minority Interest:** Great hardship can be caused when people make poor decisions about land use or surplus production for export, and do not take the general population's welfare into consideration. For instance, in East Africa the Chinese and Indians are acquiring and owning many resources including minerals and land. Therefore, they can influence a number of decisions in the countries; however, many times their interests conflict with those of the local populace since they mainly value their businesses and profits and not public interests. In many circumstances, the wishes of the majority aboriginal peasants are ignored because they do not actually own the land or minerals.
- **Specialization Leads to Over Dependency:** When focusing on the production of the goods in which a company possesses a comparative advantage and relying on supply of other goods from another country, the firm is at risk in case of a supply shortage or stoppage.
- **Cultural Identity Issues:** Culture is a major global export as it displays and promotes values and lifestyles worldwide. With global market access and contemporary globalization, many people have become overwhelmed by US-based ideas, especially youth around the world. People tend to copy/adopt the American ways of life including dressing, hairstyles, and accent: in the process they lose their own culture. Trade leads to diffusion of culture; others get lost while some people adopt new ones.
- **Social Welfare Issues:** Maintaining safety standards, minimum wages, worker's compensation and health benefits are all social welfare issues that cost business money. Through trade, a number of products that can cause health defects get exported /imported. Dangerous goods like explosives, chemicals, and guns are also traded. The challenge here is that such trade causes death and injury to people. Similarly, some exported consumer goods that are of poor quality may undermine health standards of the consumers.
- **Environmental Issues:** In many developed countries, businesses are urged by the government and environmental groups through strict laws and regulations to keep air, land, and clean water. This is a costly process, so businesses decide to move their operations to poorer countries where it is less regulated, thus posing great damage to the environment.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Political Issues:** Precious commodities such as gold, diamond, oil or farmland are increasingly important for over which to retain control; poor management of these resources often leads to wars. Trade of these items has caused political alliances which do not assist people in the trading nations; instead, only powerful corporations control the commodities or resources.
- **Depletion of Natural Resources:** When the international demand for a given natural resource is high, it may be over-exploited and depleted in the attempt to meet world demand. This may even go against the will of the local people.
- **Seizure of Power and Loss of Control:** With trade, rich foreign investors will eventually controlling a number of local resources and possess more power and authority in a country than the natives of the land.

THE CHANGING PATTERN OF GLOBAL TRADE

The composition (nature of products) of world trade has changed significantly; it is totally different from what it used to be about 50 years ago. What could have happened? Are people's needs changing? Today communication and technological improvements have considerably shortened distances between countries, and nations are increasingly integrated economically (Jacks, Meissner, & Novy, 2011). The contemporary phenomenon of globalization seems to have gained speed, changing history daily, and is turning the entire globe into a single village. While some countries consider this matter a big problem, and therefore are missing the opportunities the situation offers, others have embraced it as a movement offering development potential to advance their growth and development. While some nations believe contemporary globalism is a dangerous process of exploitation where rich countries and big international corporations become larger and richer at the expense of poor ones, other nations see the situation as the final pin in the process of positive socioeconomic, mutually beneficial, global integration.

The entire process of globalization has actually changed the face of consumption and global trade; people fictitiously believe modem transportation and communications have abolished distance and that the world has become a small place. There is clearly some truth to these statements: the Internet makes instant and almost free communication possible between people thousands of miles distant while jet transport allows quick physical access to all parts of the globe. Generally, global market access has become easier and faster, and even the nature of items traded has significantly changed.

WHAT PRODUCTS DO COUNTRIES TRADE IN THE GLOBAL MARKET?

When countries trade globally, they deal in products ranging from agricultural outputs such as coffee, maize, wheat, soya beans, and plantains to mineral products such as silver, copper, coal, or oil. They also trade manufactured products such as vehicles, computers, and finished garments. Finally, trade in various services has also developed. The industrial economies played a central role in world merchandise exports until the 1990s due to their very large share in exports of manufactured goods, the product category most in demand. The long-term shifts in the composition of world merchandise trade show a strong rise in the share of manufactured goods and a marked decline in agricultural products and non-fuels minerals.

The share of agricultural products (including processed food) has declined from more than 40 percent in 1950 to less than 10 percent since 1999. The share of fuels in world merchandise exports has fluctu-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ated sharply due to a marked variation in prices, with highest shares recorded in 1974, 1981, and 2007 (a total of 20 percent of world trade on each occasion) (WTO, 2008).

Manufactured goods, iron, steel, and textiles have witnessed massive decline in their relative importance over the years. The share of clothing, however, increased in the first two decades after World War II and exceeded that of textiles after 1980. Road motor vehicles also increased their share in world trade between 1950 and 1973, while office and telecommunications equipment were the most dynamic products in the 1990s. However, due to falling prices and less buoyant demand, by 2001 office and telecom products could no longer expand their share in world exports of manufactured goods.

According to the World Trade Report (2008), the industrial countries accounted for 85 percent of world exports of manufactured goods in 1955; however, their share declined to about two-thirds in 2006. The share of industrial countries in exports of agricultural products (including processed food) rose strongly from 40 percent in 1955 to roughly 60 percent in 2006. However, their share in world exports of fuels and other mining products was already low in 1955 (less than 40 percent) and further decreased to around 30 percent in 2006. Industrial countries' share of world exports of clothing, textiles and office and telecommunications equipment decreased steadily after 1955. For iron, steel, and chemicals, the decline began in 1973. Generally, between 1955 and 2006, a decline occurred in the share of the industrial countries in world manufactured exports.

On the opposite end of the relative decline of the industrial countries' exports is the rise of a highly diverse group of developing economies that now account for more than two-thirds of world clothing exports and more than one-half of world exports of textiles and office and telecom equipment. A big increase in the share of developing countries was in office and telecom equipment, a sector in which the fragmentation of production has been the most visible. These developing countries (including China and India) have doubled their export shares over the past 25 years, exporting more than a third for all manufactured goods (Nataraj & Tandon, 2011).

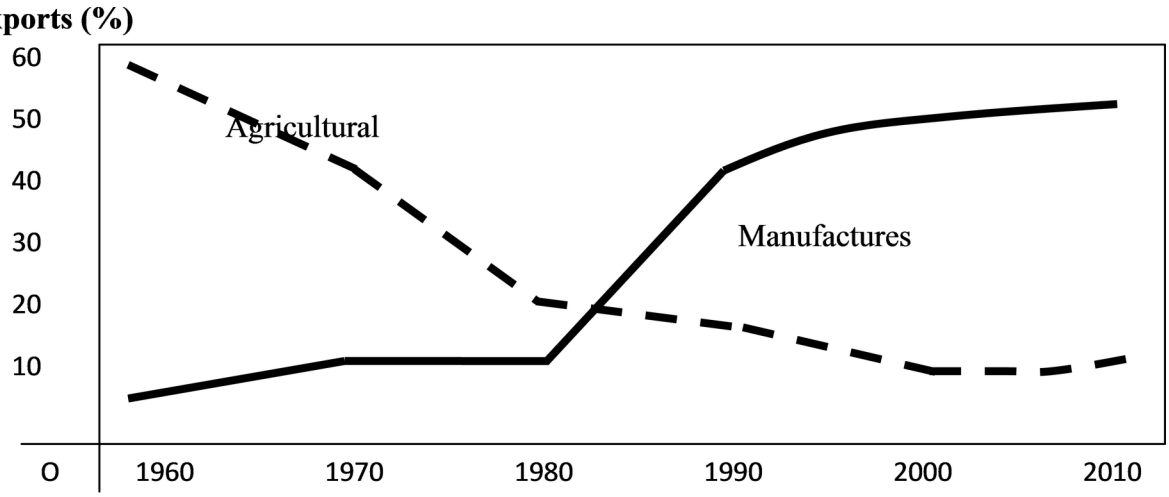
PRODUCT COMPOSITION AND TRENDS OF DEVELOPING COUNTRIES' EXPORTS

In the past, primary products-agricultural and mining goods constituted a bigger proportion of world trade. In early 20th century Britain when it overwhelmingly exported manufactured goods and mainly imported primary products, today the United Kingdom manufactures dominate both sides of the trade scene. Meanwhile, the USA has transitioned from a trade pattern in which primary products were more important than manufactures on both sides to one in which manufactured goods dominate on both sides (Krugman & Obstfeld, 2009).

According to the United Nations Environment Programme (2013), although gross agricultural trade has been growing in the recent decades, its growth rates have been significantly lower than those recorded in the manufacturing sector. The share of agricultural trade proportion to total global merchandise trade has declined. Today, agricultural trade accounts for approximately 10 per cent of total merchandise trade, compared to 30 percent 40 years ago (see Cheong et al., 2013). Nevertheless, agricultural trade remains particularly significant for developing countries, given the links between agricultural production, rural development, and poverty alleviation (UNEP, 2011a).

In 2010, developing countries held a share of 37 percent in world exports of agricultural products, an increase from 30 percent in 1995. Most of the growth in agricultural trade is attributable to an increase

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



in trade in processed agricultural products. This shift is observed in both developed and developing countries. It implies there has been greater specialization in the process of value addition. Countries with a very low share of processed products in their agricultural exports tend to be low-income countries (Cheong et al., 2013).

The current situation in which manufactured goods dominate world trade is relatively new. A more recent transformation has been the rise of "Third World" manufacturing exports by developing countries. As recently as the 1970s, these countries in the so-called "Third World" mainly exported primary products. Since then, however, they have moved rapidly into exports of manufactured goods. Figure 1 shows the shares of agricultural products and manufactured goods in developing country exports since 1960. There has been an almost complete reversal of relative importance. More than 90 percent of the exports of China, the largest developing economy and a rapidly growing force in world trade, consist of manufactured goods. Generally over the last 40 years, the exports of developing countries have shifted toward manufacturing (UNCTAD, 2012).

Over the years, trade openness has contributed considerably to enhancing developing countries' participation in the global economy. The WTO (2014) states that between 1990 and 2008, the volume and value of exports from developing countries rose faster than exports from developed countries or the world as a whole. For example, between 2000 and 2008 the volume of developing countries' exports almost doubled while world exports increased by only 50 percent. Even after the recent global economic crisis, the decline in the value of developing country exports was smaller than developed country exports. The countries which have experienced strong export growth have lower levels of import protection than countries with stagnant or declining exports.

It should be noted that not all developing countries participate equally in international trade. Asia is by far the most important exporting region in the developing country group, with a 10 percent share of world exports in 1990 (US$335 million) which increased to 21 percent (US$2.603 billion) in 2009. In contrast, Africa had the smallest share of world exports at three percent in both 1990 and 2009. Along with Africa, Latin America and the Middle East did not experience a notable increase in the share of world

Figure 1. The changing composition of developing country exports

Sources: UN Council on Trade and Development, 2012; Cheong et al., 2013

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

exports between 1990 and 2009. Simultaneously, the value of these three regions' exports did increase over the period: African exports, for example, increased from US$106 million in 1990 to US$379 million in 2009. In addition, LDCs accounted for only 2.8 percent of the value of exports of the developing country group in 2009. This share has not changed much since 1990, although LDCs' exports increased in value, from US$18 million in 1990 to US$125 million in 2009 (WTO, 2014).

IS THE GLOBAL MARKET RIGGED AGAINST NEW ENTRANTS?

The rather obsolete view that the world market is rigged against new entrants, preventing poor countries from accessing the global markets and hence becoming rich, has surprisingly turned out to be incorrect: A few Asian countries have proved to the world that any serious developing country can access the global market, generate wealth and expand its economy's Gross Domestic Product (GDP) to any level. Today Japan, China, and India are among the world's biggest economies. Just like any developing country, these three nations were equally poor. According to the International Monetary Fund (2013), China and Japan are the other world's largest (richest) economies after the USA. Other economies with very high GDP include Germany and France. Table 1 shows the list of the top biggest economies in the world.

In the 1950s and 1960s, it was widely believed that developing countries could create industrial bases only by substituting domestic manufactured goods for imports. However, from the mid-1960s it became increasingly clear there was another possible path to industrialization: via *exports* of manufactured goods primarily to advanced nations. The World Bank now refers to the group of countries that developed in this manner as the High Performance Asian Economies (HPAEs): they achieved spectacular economic growth, in some cases at more than 10 percent per year (Krugman & Obstfeld, 2009).

The Facts of East Asian Growth

From 1965 to 1990, the 23 economies of East Asia grew faster than all other regions. Most of this achievement is attributable to seemingly miraculous growth in just eight economies: Japan; the "Four Tigers" of Hong Kong, the Republic of Korea, Singapore, and Taiwan, China; and the three newly industrializing economies (NIEs) of Southeast Asia – Indonesia, Malaysia, and Thailand. Amazingly, these eight economies have been unusually successful at sharing the gains of growth. Compared to other developing economies, they have had declining levels of inequality. Rapid growth and improving equity are the defining characteristics of the East Asian miracle and the eight high-performing East Asian Economies (HPAES) (World Bank, 1993).

Kim and Lau (1994a) found that the postwar economic growth of the East Asian newly industrialized economies (NIEs)—Hong Kong, South Korea, Singapore, and Taiwan was mostly the result of the growth of tangible inputs: tangible capital and labor and not technical progress or equivalently the

Table 1. Biggest economies in the world

Source: International Monetary Fund, 2013

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

increase in total factor productivity. By contrast, the economic growth of the developed Group-of-Five (G-5) countries—France, West Germany, Japan, the United Kingdom, and the United States was mostly attributable to technical progress (Lau & Park, 2003).

The World Bank's definition of HPAEs contains three groups of countries whose "miracles" began at different times.

1. First is Japan which began rapid economic growth soon after World War II and now has per-capita income comparable to the United States and Western Europe.
2. In the 1960s, rapid economic growth began in four smaller Asian economies, often known as the "Four Tigers": Hong Kong, Taiwan, South Korea, and Singapore.
3. Finally, in the late 1970s and the 1980s rapid growth began in Malaysia, Thailand, Indonesia, and, most spectacularly, in China.

Each group achieved very high growth rates. Real gross domestic product in the "Tiger economies" grew at an average of 8-9 percent from the mid-1960s until the 1997 Asian financial crisis, compared to 2-3 percent in the USA and Western Europe. Recent growth rates in the other Asian economies have been comparable, and China has reported growth rates of more than 10 percent. The common fundamentals within the economic miracle were a commitment to education by the governments, sound fiscal policies, high domestic savings rates and a global outlook (Neelankavil, 2009).

In addition to their very high growth rates, the HPAEs have another distinguishing feature: they are very open to global trade and they are establishing their bases in every corner of the world. Agreeably, economists have concluded that East Asia's experience supports the proposition that liberalized markets are the best way to organize economies, developed or developing. The state should protect property rights and ensure the supply of public goods, but not impart directional thrust. More specifically, the state should create and sustain: (a) efficient, rent-free markets; (b) efficient, corruption-free public sectors able to supervise the delivery of a narrow set of inherently public services; and (c) decentralized arrangements of participatory democracy. The more these conditions are in place the more development and prosperity will follow (Wade, 2003).

According to the World Bank (1993), the miraculous eight Asian economies used very different combinations of policies from hands-off to highly interventionist. Thus, there is no single "East Asian model" of development. This diversity of experience reinforces the view that economic policies and policy advice must be country specific if they are to be effective. However, there are also some common threads among the high-performing East Asian economies. Rapid growth in each economy was primarily due to the application of a set of common, market-friendly economic policies, leading to both higher accumulation and better allocation of resources.

While there is a correlation between rapid growth in exports and rapid overall economic growth, the correlation does not necessarily demonstrate that free trade policies have been the main reason for the high growth in the HPAEs. Instead, most economists who have studied the issue now believe that while the relatively low rates of protection in the HPAEs helped them to develop, they are only a partial explanation of the "miracle." (Krugman & Obstfeld, 2009).

The Washington Consensus and East Asian Growth

Coined in 1989 by English economist John Williamson, the *Washington Consensus* contains a set of 10 relatively specific economic policy prescriptions that were considered to constitute the "standard" reform package promoted for crisis-wracked developing countries by Washington, D.C.–based institutions such as the International Monetary Fund (IMF), the World Bank, and the US Treasury Department. The prescriptions encompassed policies in such areas as macroeconomic stabilization, economic opening with respect to both trade and investment, and the expansion of market forces within the domestic economy (IMF, 2013).

The policies include:

- Fiscal discipline.
- A redirection of public expenditure priorities toward fields offering both high economic returns and the potential to improve income distribution, such as primary health care, primary education, and infrastructure.
- Tax reform (to lower marginal rates and broaden the tax base).
- Interest rate liberalization.
- A competitive exchange rate.
- Trade liberalization.
- Liberalization of inflows of foreign direct investment.
- Privatization.
- Deregulation (to abolish barriers to entry and exit).
- Secure property rights.

The phrase "Washington Consensus" has become a lightning rod for dissatisfaction among anti-globalization protestors, developing country politicians and officials, trade negotiators, and numerous others. It is often used interchangeably with the phrase "neoliberal policies." Today, it is quite outstanding that although the Washington Consensus package was confidently disseminated, there is virtually no good evidence that the creation of efficient, rent-free markets coupled with efficient, corruption-free public sectors is even close to being a necessary or sufficient condition for a dynamic capitalist economy.

According to Wade (2003), almost all currently developed countries experienced different stages of industrial assistance policy before the capabilities of their firms reached the point where a policy of (more or less) free trade was declared to be in the national interest. Britain was protectionist when it attempted to be on par with the Netherlands. Germany was protectionist when trying to catch up with Britain. The United States was protectionist when trying to compete on par with Britain and Germany right up to the end of the World War II. Japan was protectionist for most of the 20th century until the 1970s, and Korea and Taiwan was the same until the 1990s. Hong Kong and Singapore are the great exceptions in international trade in that they did have free trade and they did eventually develop on par with other developed nations.

Today's fast and populous economic entities include mainly China, India, and Vietnam which have certainly benefited from the more open markets and international investment of the past two decades. However, they began their fast economic growth well before their fast trade growth and even longer before their trade liberalizations. They have constrained their trade liberalizations by considerations of the capacities of domestic firms to compete against imports, in just the manner List recommended (Wade, 2003).

India's Boom

With a population of more than 1.2 billion people, India is the world's second-most populous country after China with a population of about 1.4 billion (World Bank, 2014). A generation ago, India was a very minor player in world trade and its sluggish economy had little participation in world trade. After the country achieved independence in 1948, its leaders adopted a particularly extreme form of import-substituting industrialization as their development strategy. India imported almost nothing that it could produce domestically, even if the domestic product was far more expensive and of lower quality than what could be bought abroad. High costs, in turn, crimped exports, so India was a very "closed" economy. In the 1970s, imports and exports averaged only about five percent of GDP, close to the lowest levels of any major nation. (Sharma, 2000).

Until about 1980, India endured very low rate of economic growth of about 3% per annum which was sometimes mocked as the "Hindu rate of growth". After 1980, India's growth accelerated dramatically: GDP per capita, which rose at an annual rate of only 1.3 percent from 1960 to 1980, grew at close to four percent annually since 1980. And India's participation in world trade surged as tariffs were lowered and import quotas were removed. By 2005, exports and imports were 20.3 and 23.3 percent of GDP, respectively (Virmani, 2004).

India is a growing force in world trade, especially in new forms of trade that involve trade in information rather than in physical goods, thus apparently permitting it to become a high-performance economy. Although it remains a rather poor country, it is rapidly growing richer and has begun to compete with China as a focus of world attention. India is also aggressively pushing for a more liberal global trade regime, especially in services. It has assumed a leadership role among developing nations in global trade negotiations, and played a critical part in the Doha negotiations (World Bank, 2013). Today India is the 10th world's largest economy with a GDP of US$2.0 trillion, per-capita income of US$1,500, and life expectancy at birth at 65 years (World Bank, 2013; IMF 2013).

Chinese Economic Growth

Two hundred years ago, China was the world's greatest power in terms of both economic muscle and geographical territory. Although the concept of GDP did not exist at that time, Angus Maddison estimated that China in 1820 accounted for about one-third of the world's GDP. However, such economic dominance did not last as the Chinese economy suffered greatly under colonial exploitation and Mao's extreme economic policies. In the 19th century, China suffered from complacency that the historian David Landes has called an "ineffable stillness of immobility." (Malkiel, 2009).

The World Bank (2014) states that since initiating market reforms in 1978, China has shifted from a centrally planned to a market based economy and experienced rapid economic and social development. The country's GDP growth, averaging about 10 percent each year, has lifted more than 500 million people out of poverty. All Millennium Development Goals have been reached or are within reach. With a population of 1.4 billion, China recently became the second largest economy and is increasingly playing an important and influential role in the global economy. China remains a developing country since its per capita income is still a fraction of that in advanced countries and its market reforms are incomplete. Official data shows that about 98.99 million people still lived below the national poverty line of RMB 2,300 per year at the end of 2012. With the second largest number of poor in the world after India, poverty reduction remains a fundamental challenge (World Bank, 2014).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, amidst the country's economic success there is also skepticism about the future as not everyone is convinced China will continue on its rapid growth path. Indeed, many China experts see a plethora of serious problems, and some have even forecast a meltdown. Rapid economic ascendance has brought on many challenges as well, including high inequality; rapid urbanization; challenges to environmental sustainability; and external imbalances. China also faces demographic pressures related to an aging population and the internal migration of labor (Malkiel, 2009).

Significant policy adjustments are required in order for China's growth to be sustainable. Experience shows that transitioning from middle-income to high-income status can be more difficult than moving up from low to middle income. China's 12th Five-Year Plan (2011-2015) attempts to addresses these issues. It highlights the development of services and measures to address environmental and social imbalances, setting targets to reduce pollution, to increase energy efficiency, to improve access to education and healthcare, and to expand social protection. Its annual growth target of seven percent signals the intention to focus on quality of life rather than on pace of growth (World Bank, 2014).

The East Asian growth and trade experience seems to challenge some key beliefs regarding economic development that are widely accepted:

1. First, the presumption that industrialization and development must be based on an inward-looking strategy of import substitution is clearly false. On the contrary, the success stories of development have all involved an outward-looking industrialization based on exports of manufactured goods.
2. Second, the pessimistic view that the world market is rigged against new entrants, preventing poor countries from becoming rich, has turned out to be incorrect. With correct policies and suitable investments by governments, economies can get transformed, become prosperous, and change the living standards of its populace.

WHICH COUNTRIES TRADE MORE AND WHY? A DISCUSSION BEYOND THE GRAVITY MODEL

The Gravity Model of World Trade

According to the Gravity Model of World Trade, the value of trade between any two countries is proportional, other things equal, to the *product* of the two countries' respective GDPs, and diminishes with the distance between the two countries. The model implies a country with a big economy such as that of the USA would trade more with another giant economy such as Germany or Japan, and trade less with a smaller economy like Sweden. It also means the USA is likely to trade more with its neighbors: Canada and Mexico than even big European countries even though the neighbors may be smaller economies. In fact, Canada, whose economy is roughly the same size as Spain's, trades as much with the USA as does all of Europe (Krugman & Obstfeld, 2009).

Considering global trade as a whole, economists use an equation of the following form to predict the volume of trade between any two countries fairly accurately,

$$T_{ij} = \frac{k \times Y_i \times Y_j}{D_{ij}} \tag{1}$$

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

where k is a constant term, T_{ij} is the value of trade between country i and country j, Y_i is country *i's* GDP, Y_j is country *j's* GDP, and D_{ij} is the distance between the two countries. Therefore, ceteris paribus, the value of trade between any two countries is proportional, to the *product* of the two countries' GDPs, and diminishes with the distance between the two countries.

The equation (1) above is known as a *Gravity Model* of world trade. The reason for the name is the analogy to Newton's law of gravity: Just as the gravitational attraction between any two objects is proportional to the product of their masses and diminishes with distance, trade between any two countries is, other things equal, proportional to the product of their GDPs and diminishes with distance (Krugman & Obstfeld, 2009).

Economists often estimate a somewhat more general gravity model of the following form:

$$T_{ij} = \frac{k \times Y_i^a \times Y_j^b}{D_{ij}^c} \tag{2}$$

This equation states the three things that determine the volume of trade between two countries are the size of the two countries' GDPs and the physical distance between the countries, without specifically assuming that trade is proportional to the product of the two countries' GDPs and inversely proportional to distance. Instead, *a, b,* and c are chosen to fit the actual data as closely as possible. If *a, b,* and c were all equal to 1, this would be the same as equation (1). In fact, estimates often find that equation (1) is a rather solid approximation.

Does the gravity model really hold? Generally, large economies tend to spend large amounts of money on imports because they have large incomes. They also tend to attract large shares of other countries' spending because they produce a wide range of products. Therefore, trade between any two economies is larger with the larger being *either* economy. For instance, the USA trade and investment relationship with European countries is the largest in the world and this should not be complex. These countries have big economies, large incomes and they have various needs in common. Similarly, USA goods and services trade with Japan totaled US$267 billion in 2011. Exports totaled US$113 billion while Imports totaled US$154 billion. The USA trade deficit with Japan was US$40 billion in 2011. Japan was the USA's fourth largest goods trading partner with US$195 billion in total (two ways) during 2011. Therefore, the Gravity Model justifies this trade trend (USTR, 2014). Although the Gravity Model fits the data on USA trade with European countries fairly well, it may not work perfectly well for other counties. Often trade between two countries may be either much more or much less than what the gravity model predicts.

Why should this be the case? The answer to the above question is that there are many factors affecting trade between two countries and are not captured by the Gravity Model. Some of these factors include the following:

1. **Investment in Physical Infrastructure:** This can facilitate the integration of new players into international supply chains. The accumulation of capital and the build-up of knowledge and technology associated with investment, particularly foreign direct investment, can also enable countries to climb the value chain by altering their comparative advantage. Well-built and efficient physical infrastructures reduce the cost of doing business, and anchors larger volume of trade.
2. **Demographic Composition and Change:** This affects trade through its impact on a nation's comparative advantage and on import demand. An ageing population, migration, educational im-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

provements and women's participation in the labor force will all play a role in the future, as will the continuing emergence of a global middle-class. Very youthful or very elderly populations may not favor trade.

3. **Research and Development (Technological Progress):** Countries representing 20 percent of the world's total population accounted for about 70 per cent of research and development (R&D) expenditure in 1999, but only about 40 percent in 2010 (see World Trade Report, 2013). Technology spillovers are largely regional and stronger among countries connected by production networks. In addition to the traditionally R&D intensive manufacturing sectors, knowledge-intensive business services are emerging as key drivers of knowledge accumulation.
4. **Transport Costs:** Ample opportunities exist for policy actions at the national and multilateral level to reduce transportation costs and offset the effect of higher fuel costs in the future – thus improving the quantity and quality of transportation infrastructure, and introducing more competition on transport routes, and supporting innovation are likely to foster more trade.
5. **Institutional Operational Quality:** Notably in relation to contract enforcement, clearance and legal support can reduce the costs of trade. Institutions are also a source of comparative advantage, and trade and institutions strongly influence each other.

WHICH COUNTRIES ARE TRADING MORE TODAY AND WHY?

According to the *Economist* (2014), China is currently leading in global trade. The weekly publication reports China's export value at more than US$2.21 trillion, thus leading the world in international trade in goods in 2013. Its combined imports and exports amounted to almost US$4.2 trillion, exceeding that of the USA for the first time. However, some skeptics of China's trade highlight that many of its seemingly sophisticated exports include valuable imported components. According to the WTO and the OECD, China itself adds only 67% of the value of its exports while the USA adds 89%. Indeed, if one considers only the value that a country adds to its exports, then export figures for the USA are roughly equal to those of China's (Economist, 2014).

India and China, which are now powerful in global trade, share a number of key common elements. First, they share the same continent. Next, demographically they both possess populations exceeding one billion. Third, the two countries have a rich and long history, making them world leaders until the 19th century. Last, they are also similar in economic development trends with just a few differences. The main difference between the two giants is probably their differing political systems as democracy is much more rooted in India than in China (Malkiel, 2009).

It is clear the increasing degree of trade openness, especially regarding exports, and the liberalization of imports, has favored a surge in trade in both China and India. In addition, huge foreign direct investment inflows, mainly attracted by much lower labor costs, probably engendered spillover effects and contributed to transformation of the production specialization in both countries. The hypothesis that "openness" of the economy plays a positive role in economic growth has been largely analyzed in the theoretical and empirical literature (see Frankel & Romer, 1999; Bensidoun et al., 2009). Most empirical studies confirm the positive effects of "openness" on trade and growth.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

WHAT FACTORS HAVE LIMITED MOST DEVELOPING FROM ACCESSING AND BENEFITING FROM THE GLOBAL MARKET?

Although global market offers numerous benefits to the potential trading nations, most developing countries cannot have ample access to it. According to the WTO (2014), poor nations have limited access to the global market due to factors such as quality inferiority, distance, quantitative restrictions, limited technical skills, bad governance, terrorism threats, and border controls.

Specific limitations include the following:

- **Quality:** Most developing countries export primarily agricultural unprocessed products such as coffee, cotton, and wheat. They also export unprocessed minerals such as copper ore, silver, and crude oil. These types of products provide these countries with low foreign exchange and yet the cost of transporting and delivering them to the destined markets are very high. For the few processed products coming from the developing countries, their quality is usually so low that they are hardly accepted into many developed countries.
- **Distance:** A larger volume of world trade takes place outside Africa where the majority of developing countries are housed. This makes it more difficult for them to participate in the global market trade, as long distance increases the cost of trade for these countries. If they must travel there to engage in trade, they are affected by transportation costs.
- **Quantitative Restrictions:** Many developed countries impose quantitative restrictions on imports entering their countries. These restrictions limit the volume of trade that can be conducted, especially by developing countries that must strive to search for markets.
- **Technical Skills:** Most traders in developing countries including farmers and miners lack international exposure, and are often caught unprepared by new trade policies that sometimes do not favor their businesses. As such, they are often not as strategic in business as their counterparts in developed counties. This limitation in technical skills undermines the volume of potential trade they can effectively conduct.
- **Bad Governance:** Traders in most developing countries are normally subjected to unhealthy trade policies, unacceptable beaurocratic processes, baseless political interference, and tainted images abroad. All these factors combined downplay their trade potential.

WAYS OF INCREASING GLOBAL MARKET ACCESS TO DEVELOPING COUNTRIES

As discussed earlier, accessing the global market improves a county's terms of trade. Improvement in the terms of trade raises the profitability of exporters, creating more incentives for investments. Labor and other factors of production switch from other sectors to their most productive sectors. In turn, all of these lead to economic growth and development.

We have also seen that most developing countries do not yet benefit much from global trade due to bottlenecks that restrain their full access to the global markets. To tap into trade-growth opportunities and global trade benefits, developing counties must diversify in several ways: they need to become less dependent on the stagnating markets of their traditional trading partners in the developed world, and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

simultaneously they must lower their dependence on the export of commodities vulnerable to price shocks (International Trade Centre, 2012).

This section provides a discussion on how developing counties should be supported in order to enable them gain full access to the global market. The key supports include the following:

- **Reduction in Export Tariffs:** If possible, developed countries should reduce the level of tariffs on developing countries' exports to levels below (or further below) those faced by other exporting countries. This difficult action may require a lot of negotiations and lobbying. More potential markets for developing countries' exports exist in the developed countries since most developing countries produce products of similar nature.
- **Most-Favored Nation (MFN) Tariff Reduction:** Developed countries should not discriminate against developing countries using tariffs. Under the MFN treatment/rule, countries agree not to discriminate against other WTO member countries. Thus, if a country offers low tariffs on, for example, computer imports (e.g., 5%), then it must charge 5% on computer imports from all other WTO members. Discrimination or preferential treatment for some countries is not allowed. However, the country is free to charge a higher tariff on imports from non-WTO members. The MFN rule is the first article of the General Agreement on Tariffs and Trade (GATT), which governs trade in goods and is also priority in the General Agreement on Trade in Services (GATS) (Article 2) (WTO, 2009). Non-discrimination will encourage increased volume of exports, and it will also indirectly improve the terms of trade of those developing countries exporting their commodities
- **Higher Export Quotas:** Another factor to consider for increasing global market access to developing countries is an increase in (i.e., a relaxation of) the level of quotas set by some (or all) developed countries on a particular developing country's exports. In most cases, the effect of a higher export quota is a higher volume of exports, and increased domestic relative price of the exported commodity.
- **Improvement in Infrastructures:** Governments of developing countries should invest in all sorts of exports enabling infrastructures. Existence of first class airports or seaports, with good local roads and railways networks, will foster fast and reliable shipment of exports to the international markets. This will make trade easier and faster for developing counties.
- **Export Subsidies:** Provision or granting an export subsidy usually raises the domestic relative price of the export commodity. Export subsidies can take various forms, including subsidized credit and/or intermediate inputs, fiscal incentives, support with technological upgrade and/or quality control in order to meet product health and/or safety standards.
- **Export Favorable Policies and Procedures:** Governments in developing countries should institute local policies/laws that favor exporters and simultaneously they should negotiate for favorable international policies for the traders. Good policies should encourage and protect traders, and also ease the process of trade clearance. Restraining policies with lengthy and bureaucratic processes will constrict traders, hence limiting their global market access.
- **Peace and Democracy:** All governments are concerned about the health, safety and peace of their people. Most governments in developed countries feel more comfortable to trade with people who do not pose health and safety risk in their country. Traders and goods from a non-peaceful and undemocratic country may suffer skepticism or even sanctions in many markets.

CONCLUSION

The global market has witnessed various changes especially in the last four decades. There has been a complete change in the nature of goods traded in the global market from mostly agricultural products to manufactured products. Most countries have also heeded to the changing demand in the global marketplace, and are therefore supplying fully finished/processed products. Accessing the global market could potentially help to alleviate poverty as the long-term benefits from improved resource allocation and efficiency resulting from trade liberalization are well documented. Openness to trade is believed to have been central to the remarkable growth of developed countries since the mid-20th century and an important factor in economic growth and poverty alleviation, as demonstrated by the experience of some Asian countries, especially China and India.

The global market appears to be open for access to all countries including developing countries without any form of rigging or bias. Developing countries are slowly improving the quality of their products to satisfy international demand, thereby gaining access to the global market, and gradually contributing to global economic growth. A number of developing countries are already reaping the benefits of accessing the global marketplace.

KEY TERMS AND DEFINITIONS

Competitiveness: The set of institutions, policies, and factors that determine the level of productivity of a country; a more competitive economy is one that is likely to grow faster over time.

Developing Country (Less-Developed Country): A nation with a lower living standard, underdeveloped industrial base, and low Human Development Index (HDI) relative to other countries.

Economic Development: A multidimensional process that involves major changes in social structures, popular attitudes, and national institutions as well the acceleration of economic growth, the reduction of inequality and the eradication of poverty.

Economic Growth: The increase in the market value of the goods and services produced by an economy within a given time period; it is measured as the percentage rate of increase in real gross domestic product.

Global Market: The market in which goods and services of one country are traded (purchased or sold) to people of other counties.

Globalization: The increasing integration of national economies into expanding international markets, involving the process of advancement and increase in interaction among the world's countries and people.

Gross Domestic Product (GDP): The total final output of goods and services (in monetary terms) produced by a country within its territory by the residents and non-residents, regardless of its allocation between domestic and foreign claims.

Poverty: The lack of basic needs and services such as food, clothing, beddings, shelter, paraffin, basic health care, roads, markets, education, information and communication.

Trade Liberalization: The removal or reduction of restrictions or barriers on the free exchange of goods between nations; may involve dismantling of tariff as well as non-tariff barriers.

Chapter 2
Social Exclusion and Poverty:
EU 2020 Objectives and Turkey

ABSTRACT

In this chapter The EU's 2020 Objectives concerning social exclusion and poverty and Turkey's vision on social exclusion and poverty based on tenth development plan and Justice and Development Party's 2023 vision is dealt. The EU has developed a growth strategy named "EU 2020" in 2010. The objective concerning social exclusion and poverty of this strategy is to rescue as much EU citizens as possible from social exclusion and poverty and decreasing the number of EU citizens who live under poverty line by 20%. Although Turkey is not officially obliged to follow goals stated in EU 2020 objectives, it is integral for Turkey to pursue those principles in order to be harmony with the EU and reach her final aim of being a member of the EU.

INTRODUCTION

Poverty, which can be summarized as an individual's struggle with meeting the basic needs resulting from being a human, is a notion as old as the history of humanity. On the other hand, poverty, as a social phenomenon, is evaluated as a product of the industrial revolution. Oppressive wage policies brought by the industrialization process pushed the laborers, who have no income but their labor, and their families into poverty. Individuals became dependent on the "affection" granted by the capitalist system in this period where the social solidarity weakened and alienation process got faster. This also brought about a new type of poverty, social exclusion, which causes class conflicts and causes the social order to be disturbed as it has never been before.

Issues of poverty and social exclusion in European Union are matters evaluated within the framework of European Social Charter. All the citizens have the right to be protected against social exclusion and poverty. This right is not only evaluated on the basis of employment but also on the basis of citizenship. Within this framework, many decisions have been made towards prevention of social exclusion and poverty in European Union since the beginning of 1990s. In 2000, major advancements were aimed within ten years in the issues of poverty and social exclusion in the Lisbon Council. However the evaluation made in 2010 showed that the objectives were not met as a result of the economic crises. In light of these developments, EU decided to bring the EU 2020 Strategy into action to solve negativities to be seen within the next ten years with sensible, sustainable and inclusive growth strategies. This strategy, bringing new developments in the issues of poverty and social exclusion, tacitly imposes responsibilities to candidate countries like Turkey.

Turkey has worse indicators in the issues of poverty and social exclusion than EU member countries. It is inextricable that Turkey which is on course of full membership to EU primarily catches on similar objectives with member countries to go through a smooth integration process The opposite would cause Turkey's membership to either be delayed or problematical. Justice and Development Party's 2023 vision and particularly 10th Five-Year Development Plan come to the forefront as the most concrete objectives put forward in the issues of poverty and social exclusion in Turkey where the anticipation that economic growth will eliminate poverty is dominant.

POVERTY AS A SOCIAL PHENOMENON

It is possible to mention about poverty in every period of the history. Poverty which is caused by individual or social circumstances can be evaluated as the inadequacies or difficulties faced in meeting the needs of an individual stemming from being a human. But poverty, as a social phenomenon, can be accepted as a product of the industrial revolution. It characterizes the struggles of masses in factories flooding to cities from rural areas with the thought of a better life and more freedom. Individuals earning their keep as agricultural laborers have become unsuccessful in meeting their basic needs against the competitive wage systems of the factories. This situation not only causes absolute poverty for individuals but also makes social life change as it has never changed before. Loss of the culture of solidarity and support of traditional society created the need to take institutional precautions and caused poverty to become more structural.

In modern world, however, the causes of poverty are based on many economic and social reasons. Even if the short income is always a leading reason among these, the poverty of the modern world together with the weakness sensation against the state and the society has become a social issue containing the insufficiency in dealing with these and the vulnerability for negative situations.

The first studies towards understanding the poverty are seen in the sixteenth century. Vives's "The Relief of the Poor" published in 1526, Paine's "Agrarian Justice" published in 1796 and Mill's studies in which he foresaw relief to the poor draw attention as the first studies to try to explain the notion of poverty (Bugra, 2007, p. 77). Many studies were made in the following days towards evaluating the poverty. Poverty was attempted to be evaluated within the frame of different definitions in these studies. However in present day, it is generally researched in three groups as relative and human poverty, approximation poverty and absolute poverty.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Absolute poverty is the case in which an individual can only meet his basic needs simply to go on living. It can be compared between countries and people with global standards. Per capita income is the most useful measure for this comparison. Individuals who have an income below one Dollar per day are accepted as an absolute poor. In the definition of the United Nations, absolute poverty is defined as the severe poverty in meeting the basic human needs like food, safe drinking water, sanitation, health, shelter and education. This definition evaluates poverty not only in terms of income but also access to other services (Ingstad & Eide, 2011, p. 1). Relative poverty is an approach which evaluates the individual as a social asset and conceptualizes in that whether the individual has the minimum level of living within the society he belongs to. It is related to the division of income and welfare (Gundogan, 2008, p. 43). Human Poverty is focused on income poverty and more extensive human values like education, health and access to safe drinking water. It estimates poverty within the frame of "Human Poverty Index". According to this, while evaluating the data of lifetime, education and a fair living standard for developing countries, social exclusion is added to these parameters for the developed countries (UNDP, 1997, p. 18).

A NEW ASPECT IN POVERTY: SOCIAL EXCLUSION

The industrial society that emerged as a result of the industrial revolution in the nineteenth century brought together a new type of poverty which includes interclass conflicts of interest and causes the social order to be disturbed. This new type of poverty even got worse with the problems resulting from the inability of the proletariat to be represented in the politic institutions and to access full citizenship rights. And with this, it caused the revenue gap between those on top of the scale and those on the bottom to rise and thus starting the social polarization.

Social exclusion is the opposite of the social integration that reflects the importance of being a part of the society. It is an economic, politic, social and a multi-dimensional notion focusing on the mechanisms related to the processes that excludes people. Social exclusion is the situation in which an individual has less chance in accessing financial resources, dwelling, employment, education, health services that rise the level of welfare and accessing social institutions when compared to the rest of the population and the long continuation of this disadvantageous situation (Robilac, 2006, p. 87).

The term of social exclusion started to be used by French sociologists to define social problems emerging in relation with the socio-economic transformation in the 1970s. The term defines the lack of social adaptation caused by the increasing inequalities and massive, social and economic security gap for an increasing part of the population. In this period, an increasing number of individuals were not able to access a proper job and the masses with disadvantages in income, shelter, health and education were growing. This situation caused the social exclusion to be not only about the lack of materialistic wealth but also the formation of deprivation (Bhalla & Frederic, 2004, p. 2).

In fact, social pressures and struggles were reduced in particularly the industrialized countries with the welfare state practices that reached up to the end of 1960s after the Second World War. The social integration was increased with the rising full employment conditions and improvements in the living conditions of the laborers in the welfare atmosphere created by the economic growth achieved in this period. But the crises that started in the late 1970s caused the socio-economic structure in the industrialized countries to transform. New supra-national strategies, new types of social and economic regulations came along with reorganization in the labor market and globalization. This process started to harm the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

growth and social justice mechanisms that were harmonizing in the Fordist production organization. At the same time, sweeping ideological changes in this period like privatization, liberalization, reduction of public services and deregulation of labor market caused this process to speed up. These circumstances revealed poverty problems of individuals that were integrated well in the society once. This situation not only affected the poor, the handicapped and the marginal groups outside the social norms but it also caused the population to be exposed to an increasing long-term unemployment, loss of the social status and weakening of family and non-family bonds. Thus the notion of social exclusion is more related to the socio-economic structural changes than individual behaviors or characteristics (Bhalla & Frederic, 2004, pp. 3-4).

The notion of social exclusion brings poverty into minds first. In fact, poverty is not the sole determinant of the social exclusion while it is an important element of it. To understand the social exclusion, one must study democratic participation processes, labor market, welfare state practices supporting economic and social integration and domestic and social sub-systems (Kaya, 2009, p. 16). Poverty aspect of the social exclusion is generally a result of the exclusion from labor market, from opportunities of welfare state and from family and society. The faults resulting from wrong fictionalizing in democratic and legal systems reflect the situation of exclusion from citizenship integration (Martin, 1998, p. 43). We can say that there are two basic determinants of the notion of social exclusion. These are economic exclusion meaning the exclusion of people from employment, earnings, property, shelter and education and social exclusion preventing social integration (Haan, 2000, p. 26). Groups that are prone to exclusion are generally ethnic or religious minorities. These groups are perceived as "the others" by the rest of the society because of their different cultural practices (WB, 2011, pp. 2-3).

THE NOTION OF POVERTY AND SOCIAL EXCLUSION IN THE EU

Poverty in EU is a notion mention together with the notions of social exclusion and social inclusion. The notion of social inclusion are the public regulations to make individuals who have less income than most of the society, different ethnicities and religions and whose gender, education and abilities are lower take advantage of equal civil rights in the social level. The content of these regulations is not employment activities towards eliminating absolute poverty but all the practices towards being an equal citizen (Bugra, 2007, p. 77). Poverty, in this sense, is perceived differently by EU than many developing regions of the world. Absolute poverty is an issue that is not accepted in the Union and comes up less for the member states than the developing countries. This is because the main goal of the Union is not only providing basic needs of the citizens as opposed to other countries but also aiming to provide a high level of welfare and the opinion that the acceptable minimum living standard is, as a necessity of the socio-economic development, is enough to keep up living in a developed country (EAPN, 2009, p. 8).

The first definitions in the UN for poverty are based on the studies on the report for fighting the poverty made in 1975. In the report, the poverty is defined as the inability of the country to provide the acceptable living standards that are cash income, property, access to public and private services in family and individual life (European Communities, 1975, p. 2). Based on this definition, it was estimated that there were nearly 10 million poor families in the mid-1970s which corresponds to 11, 4 percent of the population. Being unemployed for various reasons, having only one income in the family, belonging to various ethnic groups like immigrants and Romans are seen as the main reasons for poverty (European Communities, 1982, p. 7).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

However in the report published in 2004, the notion of poverty became very different than the notion of poverty that was accepted in many regions of the world and a wider definition of poverty was made in parallel with European Social Model. Hereunder, the poverty is defined as the lack of income and sources of an individual as to levels preventing him from accessing the living standards of the society he lives in, unemployment resulting from poverty, low income, poor sheltering, inadequate health services, obstacles in front of the lifelong education, cultural and sportive activities, isolation from social, economic and cultural activities and limitation of basic rights that are standard for other individuals (Council of the European Union, 2004, p. 8).

It is seen that the notion of social exclusion is evaluated together with the notion of isolation mentioned together with the poverty and the notion of poverty of the EU in the report. Social exclusion is defined as the process which drifts some individuals out of the society as a result of the discrimination and keeps them back from the advantages of lifelong education and basic abilities and prevents them from taking part in social activities. As a result of this whole process, individuals are getting away from having a job, education, income and social network and activities and power and a decision mechanism (Council of the European Union, 2004, p. 8).

The individuals who live in European Union countries have a different perception of poverty. In a study made in 2010, 26 percent of the people define poverty as the resources being as limited as to prevent them from participating in the social and economic activities of the society they live in. 17 percent of them define poverty as not having the basic materials needed to keep living. 24 percent define poverty as charity or dependence on the public relief. Nearly 75 percent of the people who participated in the same study state that the poverty is common in their countries. Unemployment (%56) and old age (%42) are seen as the most important reasons of the poverty. These are followed by low education and skill level, disability and long-termed illnesses. Financial and social exclusion are seen as results of the poverty (European Commission, 2010, pp. 9-35).

EU POLICIES FOR POVERTY AND SOCIAL EXCLUSION

Issues of poverty and social exclusion in the EU which predicts an integration founded on economic basics are not among Union's primary and common issues but were seen among social politics practices. Thus particularly in the first days of the Union, the anticipation that a successful economic growth and integration would bring the solution to many social problems like social exclusion and poverty was prevalence. Although a common policy was not determined, the understanding to implement independent practices in the national level was prevalence. However, increasing unemployment and the problems it brought together caused to understand that the practices implemented in the national level on the issues of social exclusion and poverty which were important fields of social policy would not be enough (Sapancali, 2005, p. 60). It is seen in the Treaty of Rome with which the foundation of the Union was formed that social policy arrangements towards adaptation of immigrant laborers and laborer movements that could only evaluate social policy practices as a tool of economic integration were made. Poverty and social exclusion only came up in the European Union with the European Social Charter published in 1961. The article stating that all the individuals have the right to be protected against poverty and social exclusion was added to the European Social Charter which was republished with some amendments in 1996. With this, the aim was to take precautions for individuals and their families who live in the condition of social

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

exclusion and poverty against particularly sheltering, vocational training, education, access to social and cultural activities and health services (Council of Europe, 1996, p. 17).

But the precautions were evaluated within the frame of primarily the issue of unemployment as a product of the welfare understanding based on employment rather than social relief that would directly eliminate the negativities the individual experience. Within this scope, the importance of struggling with social exclusion was emphasized in the Community Charter of Fundamental Social Rights of Workers published in 1989 pursuant to European Social Model (Community Charter of Fundamental, 1989, p. 1).

European Commission started to take an important part in spreading the notion of social exclusion and poverty after late 1980s. Struggling with poverty and social exclusion has become a fundamental goal in national policies and European Social Policy. Social exclusion and poverty started to be evaluated as one of the important issues among the research programs of Europe in this period. "Combating Social Exclusion" report was published in 1989-1994 as a result of the researches made in this context. With this report, it was emphasized that poverty was not only materialistic neediness but also exclusion from rights, benefits and opportunities accepted as a standard for modern society (Harveys, 1994, p. 6).

However major practices were not put into use during 1980s. The issues of poverty and social exclusion started to have an important priority among social policy practices after early 1990s in the EU. It was emphasized with the Maastricht Treaty signed in 1992 that member countries needed to determine their objectives to struggle with social exclusion and social exclusion took place in the official documents of the Union (Maastricht Treaty, 1992, p. 37). Within this scope, the importance of the phenomenon of social exclusion in the social policy was presented in the Green Paper published by European Commission in 1993. It is emphasized in this paper that an individual can isolate himself from the society as a result of the condition he is in because of the injustices in terms of sharing the welfare by touching on social injustice and that this situation could lead to racist ideologies, ethnocentrism and politic and social extremism. The reduction of inequalities in struggling with social exclusion and encouraging participation in labor market were touched on in the White Paper named "Growth, Competitiveness and Employment" which was published at the same period (Bildirici, 2011, p. 30). The struggle against social exclusion and poverty took place as one of the main objectives of the EU in the Amsterdam Treaty which was signed on 1997. In order to struggle with social exclusion, modernist approaches, information exchange, taking advantage of good examples and for encouraging the policies of member states, the tasks of EU institutions were extended (Treaty of Amsterdam, 1997, p. 35).

It is possible to say that after 2000s there has been a turning point in the social policies of the EU. It was emphasized in the Lisbon European Council organized in 2000 that it was inevitable to compromise on new objectives and programs for the Union to experience a healthy transformation in the direction of improvements in information technologies and globalization. One of the most important problems to emerge at this point was reconstruction of European Social Model within the frame of this transformation in a way to react to problems that emerge at this point and moreover the social exclusion (Cakar, 2007, p. 90). It was emphasized within this scope that it was unacceptable for many people in the Union to live below the poverty line and in social exclusion conditions and that the most important protection against Social exclusion was employment. In was decided in the Lisbon European Council to take measures to make welfare state practices applicable in order to improve social exclusion and poverty understanding in the context of Europe, to modernize the European Social Model within the next decade by struggling social exclusion and investing in humans (European Council, 2000).

The struggle with social exclusion was determined as one of the six objectives of the social agenda of EU in the Nice European Council organized in 2000. It was decided that the advantages of the active

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

welfare state practices accepted in Lisbon to struggle with poverty and social exclusion would continue to be taken. It was decided that National Action Plan on Social Exclusion be presented to be implemented in order to struggle with social exclusion and poverty by setting specific objectives out and having regard to local, regional and national differences in the Council (www.consilium.europa.eu).

Despite all these improvements, one of the most substantial practices put forth in the struggle with social exclusion and poverty in the EU is the European Anti-Poverty Network (EAPN). EAPN was put into practice as a reflection of the sensitiveness shown in social rapprochement by non-governmental organizations (NGOs) in early 1990s when issues of poverty and social exclusion started to be on the agenda of EU. It was established in 1990 with the decision taken in Anti-Poverty Conference in 1989. This network created by 200 NGOs gathering together included anti-poverty networks of 11 countries. Today, it is the biggest organization of Europe that struggles against poverty and social exclusion and covers 29 national networks and 18 European Organizations. The mission of the organization is to encourage and support practices towards eliminating poverty and social exclusion, to create awareness about poverty and social exclusion, to support individuals who live in poverty and social exclusion and to carry out lobby activities (www.eapn.eu).

EU 2020 OBJECTIVES AND SOCIAL EXCLUSION

EU 2020 Strategy was shaped under the shadow of failure of the objectives to healthily transform the Union in the direction of improvements in information technologies and globalization set forth for the next decade in the Treaty of Lisbon as a result of the economic crisis recently experienced. It was hoped that the damage the crisis made on the social and economic life would be repaired by setting forth a new decade and that it would be an opportunity for a strong economy.

Despite many decisions on the issues of poverty and social exclusion, it was revealed in the Evaluation Document in the Lisbon Treaty published in 2010 that the EU could not reach the desired level. It is emphasized that increasing employment rate is not successful enough in preventing poverty, and it is stated that some groups are devoid of services that provide opportunities of equality and in some member countries women and children poverty rate is too high (European Commission, 2010b, pp. 3-6) The fact that over 80 million people living in this rich geography live below the poverty line and they cannot access to employment, education, shelter, social and economic services creates an opposite image to principles of solidarity and integration among member nations, gender equality, high living standards which are regarded as basic responsibilities of the Union by the European Social Charter (Parlak & Aykac, 2004, p. 2).

It is seen in 2010, with the effects of the economic crisis that nearly 80 million people, %16,5 percent of the total population in the EU, are living below the poverty line in 2010. More than half of these comprise of women and children. On the other hand, the young, immigrants and those who have low skill levels generally work in temporary and low-wage jobs, thus they are the most affected one from an increase in unemployment. In particular 1 in 5 young is unemployed. The unemployment rate in the Union is more than %11. Also, 10 percent of the working young is living in poverty and 8 percent of all workers are materially poor. This rate is rising up to 30 percent in relatively poorer countries. The risk of poverty for the unemployed multiplied by eight by rising to 44 percent from 33 in proportion to employed since the 2005. This also triggers social exclusion, and poverty and social exclusion go head to head (European Commission, 2010c, pp. 2-4).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This major unemployment and poverty resulting from the economic crisis was accepted as a turning point in that they set forth the important problems within the Union. In this direction, EU 2020 Objectives were explained under topics of "European Strategy for Smart, Sustainable and Inclusive Growth" in the opening speech in March 3rd, by the President of the European Commission in 2010. In this report, it was stated that the economic crisis reversed the positive improvements achieved in the previous years in employment and growth with its results. In this scope, it is stated that GDP decreased by 4 percent averagely within the Union countries, that debt ratio increased to 80 percent of the GDP from 60 percent, that nearly 23 million people are unemployed and unemployment rate increased from 7,1 percent to 10 percent, that a major decline was seen in industrial production and it reached to levels of 1990s. On the other hand, it is assessed that this situation affects the growth potential of the Union adversely and budget deficit reached to 6,5 percent in EU overall (European Commission, 2014, pp. 5-7).

These objectives were set out in the EU 2020 Strategy in order to eliminate all these negativities within the next decade,

- Increasing employment rate to 75 percent from 69 in the active population of 20-64 age range,
- Sparing 3 percent of GDP for R&D,
- Reducing greenhouse gas emission by 20 percent based on 1990, increasing the rate of renewable energy in the total energy consumption to 20 percent, saving 20 percent energy,
- Reducing the rate of dropping out early from 15 percent to 10, increasing 30-34 age college graduate rate in the total population from 31 to 40 percent,
- Reducing the rate of those living below the poverty line in EU by 25 percent by saving 20 million people from social exclusion and poverty.

In fact, the objectives aimed by the report on social exclusion, poverty and employment issues are problems that were aimed since the Lisbon Strategy but not solved and got even worse after the economic crisis. Approximately 116 million individuals representing 23 percent of the total population in the EU are known to be facing the risk of social exclusion. Most of these compose of children, old persons, lonely women, lonely parents, low-skilled persons, the unemployed, inactive individuals of working age, those living in rural areas, immigrants and some ethnic minorities like Romans. The report aims to save 20 million citizens within the Union from the risk of poverty and social exclusion within ten years (European Commission, 2013, p. 5).

In order to achieve this objective, five practices are foreseen to be implemented. These are, ensuring that practices in such issues as labor market, minimum income support, health, education and sheltering spread to all politic practices, utilizing Union funds in a better way to support social inclusion, basing new practices in social policy on strong evidences as to whether they will be useful or not before bringing them into action, increasing cooperation with non-governmental organizations and politic coordination among member nations of the Union. (http://ec.europa.eu).

In order to reach the unemployment target, increasing reliability and flexibility of the labor market (covered flexibility), equipping individuals with accurate skills for the job and ensuring that this is continuous, providing better working conditions and increasing business quality and improving employment conditions are anticipated (http://ec.europa.eu).

It is actually known that individuals who are reckoned to be in the risk of poverty and social exclusion are also facing the risk of unemployment. For this reason, the most concrete steps in objectives of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

eliminating poverty and social exclusion of the EU 2020 Strategy are the objectives towards reducing unemployment. Approximately 26 million of the population that is in the working age and lives in EU countries is unemployed. Targeted practices to struggle with unemployment in the direction of EU 2020 objectives are supporting the free movement of workers and their families in EU countries, prevention of gender discrimination, increasing measures of occupational health and safety in the workplaces and ensuring that workers are well informed and counseled by their employers (European Commission, 2013, p. 3).

A target was determined for each one of the member states with the EU 2020 Strategy and member countries are expected to report the progress they make in policy priorities. Thus, it is targeted that EU has information about the overall situation and decides on necessary actions to be taken. (Table 1)

THE NOTION OF POVERTY AND SOCIAL EXCLUSION IN TURKEY

Poverty was not seen as a responsibility of the state in Turkey for many years and was evaluated as a phenomenon that could be overcome by being in traditional solidarity. Nominal social aids were made via various institutions in a limited way and social solidarity was brought into the forefront rather than an institutional understanding of struggling with poverty. In this context, it is hard to talk about a policy to struggle with poverty stipulated by governments until 1980s. Social damages resulting from economic crises experienced after the late 1980s made poverty more apparent to governments and non-governmental organizations. However the effect of mass communication should not be ignored in the improvement of appearance (Gundogan, 2008, p. 52).

The issue of social exclusion is a matter for Turkey which was only recognized within the context of EU adaptation process. In this context, in the Ninth Five-Year Development Plan, the notion of social inclusion is mentioned, it is stated that the preparations started for Social Inclusion Document within the scope of Community Action Plan to Combat Social Exclusion within the EU adaptation process and it is targeted that measures which will contribute to the participation of risk groups to economic and social life for struggling with social exclusion are taken.

Poverty estimations in Turkey are based on studies made by Turkish Statistical Institute. Turkish Statistical Institute studies poverty under two categories as "absolute" and "relative" poverty. Absolute poverty is defined as *"the minimum consumption level needed by an individual or a family to keep on living physically"*. Absolute poverty estimation is made by dividing the monthly consumption expenditures by the equivalent adults living inside the family. If the consumption expenditure per capita in the family is lower than the hunger limit, that family and its individuals are reckoned as "too poor". Households that have lower consumption expenditure per capita than the poverty line which composes of components other than food are reckoned as "poor". Relative poverty is defined as the situation in which the individuals are below the average welfare level of the society. 50 percent of the median household consumption expenditure per capita forms the relative poverty line. Turkish Statistical Institute, to be used in international comparisons, defines those who have lower consumption expenditure per capita than 1 Dollar, 2,15 Dollars and 4 Dollars daily per person according to the purchasing power parity as poor (TUIK, 2008: 34-38). Within this framework, as of 2011, relative poverty rate in Turkey is 22,6 percent and 2,8 percent has lower income than 4,3 Dollar per day.

The notion of struggling with poverty and social exclusion in Turkey was patronized by an understanding that an economic development process which will increase employment will eliminate this problem

by itself. However it did not take long to understand that poverty could not be eliminated with this just like economic development alone would not solve the unemployment problem that special regulations had to be made in order to struggle with poverty just like the employment policies.

TENTH FIVE-YEAR DEVELOPMENT PLAN AND 2023 VISION IN THE CONTEXT OF EU 2020 STRATEGY

Turkey's determination to be a full member of the EU has been going on for many years. It is known that many adjustment policies in the perspective of being a full member were brought into action with this in mind. This situation is a result of the fact that full membership is only possible with substantial similitude to member states in politic, social and legal aspects. It is assessed that if this similitude is not achieved Turkey could not be a full member of the Union, or even if it becomes one, the membership would be a painful one within the Union. Thus, it is inevitable that the improvements anticipated by the Union for member states within the context of EU 2020 strategy would apply to Turkey, too. Adaptation to the determined objectives is one of the major milestones of the membership process for Turkey.

In this context, the determination of how similar Turkey is to the member states of the Union is crucial in determining the measures to be taken. The first important data in the self-evaluation of Turkey's own condition of poverty and social exclusion are Laeken Indicators which were set down in 2001 with the decision of Stockholm European Council with the aim of watching objectives determined as part of Lisbon 2010 Strategy.

In order to make comparisons between Turkey and member states, it is primarily needed to determine to which member states Turkey has similarities. It was established in the studies made in this direction that Turkey has similar socio-economic characteristics with member states like Greece, Portugal, Spain, Hungary, Romania, Poland and Czech Republic. (Aykin & Korkmaz, 2014, p. 8; Cakar, 2007, p. 90).

When Turkey's poverty and social exclusion risks are evaluated within the scope of Laeken Indicators, first of all it is seen that the poverty average of Turkey is 26 percent which is 16 percent in the Union. This rate is 21 percent in Greece, 20 percent in Portugal and Italy. While in member states 42 percent of the unemployed are under the risk of poverty, this rate is 31 percent in Turkey. When examined from a point of working poverty, Turkey, with its 23 percent, is far more above 8 percent which is the EU average. This rate is 14 percent in Greece and Romania and 12 percent in Portugal. On the other hand, social protection systems within the scope of the European Social Model need to be protective for individuals against the risks they are under. When considered from this point of view, poverty rate which was 30 percent before the social transfers scales down, almost by not changing at all, to 26 percent after the social transfers. This rate scales down from 40 percent in EU overall to 18 percent, from 41 percent to 21 percent in Greece, from 37 percent to 13 percent in Bulgaria and from 41 percent to 18 percent in Romania. It can be said that the most important cause of this is the fact that the social protection system is largely dependent on employment and that there is no systematical structure. When the data related to the income distribution is reviewed, it is seen that the situation is not so bright for Turkey. While the rate of total income of the population's 20 percent who have the highest income to the total income of the population's 20 percent who have the least income is 4,5 times in EU, it is 10 times in Turkey (Cakar, 2007, pp. 93-94).

Another study showing the adaptation status of Turkey to member states is the study that aims to determine the situation of Turkey and member states, as part of clustering analysis, in reaching EU 2020 Strategy (Aykin & Korkmaz, 2014, p. 8). In this study, Turkey, Malta, Cyprus, Portugal and Spain are in the same cluster. As a result of the analysis made, it was determined that Turkey is mostly similar to Malta in regard to the EU 2020 objectives and it is also close to the other members in the cluster. Therefore, it is evaluated that the recommended resolutions of the Council for Malta could shed light for Turkey.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

EU 2020 objectives are crucial for Turkey to achieve Although it is not in the scope of membership negotiations, it is inevitable to achieve these objectives for Turkey to be a full member. In this context, political will set forth by Turkey in the last decade is crucial for achieving these objectives. The most important objectives set forth in this direction are present in Tenth Five-Year Development Plan (TFDP) and 2023 Vision of Justice and Development Party.

Crucial objectives are set forth in the TFDP in the issues of poverty and social exclusion. Resolution of absolute poverty problem is the most important goal among these objectives. Economic growth and increasing employment are put forth as the resolution method. Thus, it is aimed to focus solely on relative poverty just like in the developed countries. On the other hand, it is aimed to boost the living standards of those living under the risk of poverty and social exclusion by removing the barriers in front of their participation in social and economic life, to enhance income distribution and thus reducing poverty. In order to do this, it is aimed to support the families receiving social services and aid with an understanding focused on employment. In this context, it is aimed to reduce relative poverty to 19 percent, reduce population who have income below 4,3 Dollars per day per capita to 1 percent and reduce Gini coefficient to 0,36 percent until 2018. In order to achieve all these objectives, the policy implementations were determined to increase the effect of social transfers and taxes in reducing poverty and inequality of income distribution, to increase opportunity equality in accessing public resources like education, ad hoc to increase the participation of civil society and local government and to increase employment of the poor (Ministry of Development, 2013, pp. 46-48).

It is aimed, in the plan, to achieve 5,5 percent annual growth, to reduce unemployment to 7,2 percent by providing employment to 4 million people and 16 thousand dollars income per capita with the anticipation that poverty and social exclusion will be eliminated with economic growth.

The other crucial goal set forth in struggling with poverty and social exclusion is the 2020 Vision by Justice and Development purporting the objectives which are wanted to be achieved in economic and social life by 100th anniversary of the foundation of Turkish Republic. This strategy is concurrently one of the most prolonged and assertive projects of development set forth so far in Turkey. It is aimed for Turkey to be one of the most improved economies with this project. Main goal of 2023 Vision project in struggling with poverty and social exclusion is solving this problem by means of increasing employment depending on economic growth. When objectives set forth with this aim are examined, it is aimed to reduce the unemployment rate to 5 percent by increasing employment of women and participation of them into workforce. In order to achieve this, it is aimed to strengthen the relation of employment and education, to support policies towards starting a business, to make career plans towards acquiring a profession by favor of vocational and job counselors and to elasticated labor market (Table 2).

It is also seen that objectives that can be reckoned as other than to increase employment in struggling with social exclusion and poverty were determined. The most important one of these objectives is to reduce the population rate below poverty line to 10 percent. It is also aimed to not have any individual who has income below 2,5 Dollars per day until 2015 and 4,3 Dollars until 2019. It is also aimed to provide minimum income support to poor families, to provide employment to the disabled who can work, to take measures in reducing social exclusion and poverty in issues of sheltering and education.

However both the TFDP and 2023 Vision are criticized for the feasibility of their objectives. These criticisms intersect at whether the growth will bring development as well as the feasibility of the economic growth figures targeted. According to those who criticize, economy policies alone will not be enough to put Turkey in the league of developed economies. *"The individuals need to improve their welfare,*

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. 2023 Vision objectives towards eliminating poverty and social exclusion

Re-determining vocational schools and vocational education centers according to the needs of the industry to prevent unemployment.
Providing employment to every disabled person who is able to work.
Not taking the social security support contribution for three years in first employments to increase employment.
Promoting policies for the young to start a business to increase youth employment.
Not having any individual who has income below 2,5 Dollars per day until 2015 and below 4,3 Dollars per day until 2019.
Making career studies for the unemployed to provide them with a profession by favor of vocational and job counselors.
Reducing population who are below poverty line which includes food and non-food expenditures to 10 percent until 2023.
Supporting poor families enough to save them from poverty .
Reducing unemployment rate to 5 percent and increasing employment rate to 50 percent.
Achieving an economic growth of 2 trillion Dollars.
Providing 25 thousand Dollars income per capita.
Increasing woman workforce to 40 percent and employment of them to 38 percent.
Encouraging girls' attendance to schools to provide equality of opportunities in education.
To combat unemployment, strengthening the relation between education and employment, elasticizing the labor market, strengthening the relation between employment and social protection.
Providing employment for 200 thousand people annually for five years.
Providing minimum income support to every family having regard to criteria such as population, poverty state, old age and disabled state and number of children.
Building 100.000 dwelling houses for the poor and disadvantageous groups.

References: Prepared by writer from Justice and Development Party's 2023 Vision, Politics, Society, World.

freedom, health, education, to provide equality of opportunities and for these, to make social and politic reforms required (Aydinonat, 2012, p. 1). From this aspect, it is claimed that economic growth will not occur without averting social exclusion and poverty.

Therefore, the issue which is as important as economic reforms is the need to make reforms in issues of education and employment, especially employment of women. As a matter of fact, it is claimed that the goal to increase women employment to 38 percent until 2023 need to be revised to 50 percent, otherwise the expected growth will not occur (ISO, 2014, p. 2). What's more important is the fact that educated workforce is playing a key role for economic growth, that the developed countries have advanced technologies in manufacturing industry and thus that the developing countries need to have a well-educated workforce to adapt these technologies. It is claimed that economic growth achieved by shifting the employment from agriculture to manufacturing like in most of the developing countries could only be achieved by investing in human capital from now on (Aydinonat, 2012, p. 1).

On the other hand, the fact that TFDP and 2023 Vision set forth parallel and inter compatible objectives is evaluated as a positive politic improvement in contradistinction to other plans in terms of feasibility of the objectives (Caglar & Acar, 2013, p. 6).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

It is seen that Turkey achieved a major economic growth particularly in the last ten years. However it is hard to say that this growth increased social welfare evenly. This, being a result of the inequality of the income distribution, is also one of the main reasons of poverty and social exclusion. It is also important in that it shows that the notion that economic growth will reduce poverty is groundless. Struggling with social exclusion and poverty requires policies to be implemented in this direction. Turkey needs to carry into effect much more substantial practices towards bringing individuals and communities who are exposed to social exclusion in social and economic life and especially policies towards improving income distribution.

It is also a requirement of social and economic integration to struggle with social exclusion and poverty in the perspective of full membership of Turkey to EU. When compared to member states of the EU in this context, it is seen that Turkey needs to move much more forward. It is seen that Turkey falls much behind in especially poverty, inequality of income distribution and effects of the social transfers to reduce poverty than member states of the EU which have similar socio-economic indicators. In this context, although achieving EU 2020 Strategy objectives does not bring obligations for Turkey, it is important in providing the welfare its citizens deserve from the economic growth and in smooth integration of Turkey. At this point, Turkey needs to carry out policy practices towards achieving EU 2020 Strategy objectives which were determined for countries which have similar socio-economic development level like Malta, Greece and Spain.

In this context, TFDP and Vision 2023 are important in that they are the most important political objectives set forth so far by Turkey. However it should not be ignored that these plans alone cannot achieve the economic growth anticipated to reduce poverty and social exclusion. Therefore, substantial practices towards reducing inequalities of income distribution and social aids and increasing the employment foremost need to be put into practice. In this context, EU 2020 Strategy is evaluated to be a good guiding light.

KEY TERMS AND DEFINITIONS

Absolute Poverty: The case in which an individual can only meet his basic needs simply to go on living.

European Social Charter: The European Social Charter is a Council of Europe treaty which guarantees social and economic human rights. It was adopted in 1961 and revised in 1996.

Gender: Refers to the socially constructed roles, behaviors, activities, and attributes that a given society considers appropriate for men and women.

Poverty Line: A level of personal or family income below which one is classified as poor according to governmental standards.

Social Inclusion: The provision of certain rights to all individuals and groups in society, such as employment, adequate housing, health care, education and training, etc.

Social Integration: The set of arrangements adopted by the society and the group to accept a new member among them, and to facilitate this acceptance process.

Welfare State: A concept of government in which the state plays a key role in the protection and promotion of the economic and social well-being of its citizens.

Chapter 3
A General View of Poverty in Turkey as an Issue for Social Work in the Light of Behavioral Finance and Game Theory

Seher Cesur-Kiliçaslan
İstanbul Arel University, Turkey

Toprak Işik
Independent Scholar, Turkey

ABSTRACT

In this chapter, the authors define poverty in general terms before including statistics for a detailed, Turkey-specific discussion. Once the authors elaborate on the causes of poverty, they introduce behavioural economics and game theory, the fundamental aim of the chapter being to examine how these two theories affect perceptions of poverty and the struggle against poverty. Another issue that enters into the scope of this chapter is to what extent the poor themselves are responsible for their own poverty. On this question, game theory and behavioural economics can potentially be marshalled against the poor. However, we also argue that, by using a different approach, both theories can be interpreted in the poor's favour. We examine the double-sided nature of these two theories in detail and stress how important it is in the study of poverty to consider the disadvantageous position in which the poor find themselves.

INTRODUCTION

Unfortunately, at the present time, poverty is no less widespread than the two extremely up-to-date scientific theories that we shall be using in this study. Poverty is no longer a problem experienced only in the less developed regions of the world. Today, in many developed countries, poverty rates have started to reach alarming levels. For example, although the EU is—generally speaking—a prosperous region, there too poverty is still at a relatively high level: approximately one out of every seven people (seventy-two

million people in total) is at risk of poverty or relatively poor, and the poverty rate among disadvantaged groups such as the elderly, the disabled and children is particularly high (Gündoğan, 2008, p. 45).

Poverty has an influence on almost everyone, not only through its actual presence, but also through its prevalence in the world of human emotion. Indeed, those who have never had a direct encounter with poverty in their own life or environment are nonetheless aware of it from portrayals in different media, ranging from stories to films.

According to the calculations of the Turkish Statistical Institute (TÜİK), in Turkey in 2007, approximately 0.54% of the population was living below the starvation line, which only includes food expenses, while 18.56% was living below the poverty line, which includes both food and non-food expenses. When we take the figure of 70 586 000, obtained in the 2007 census, to be the population of Turkey, then according to TÜİK's most recent study on poverty, there are 380 000 people in Turkey living below the starvation line (T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, pp. 3-4).

Although they shall be dealt with in more detail below, suffice it to say that both behavioral finance and game theory examine people's decision-making processes. While behavioral finance considers the psychological factors that influence decisions, game theory tries to determine the correct strategies from a logical angle. Based on the assumption that both theories complement each other, they can be dealt with together. At the same time, like all people, the poor, in their roles of making the decisions that influence their own situation, also come within the scope of this joint assessment.

BACKGROUND

Poverty

The first difficulty encountered in a scientific treatment of poverty is that there is no agreed-upon definition. Briefly, it can be described as a state of deprivation wherein the basic needs necessary for survival are not met. If we flesh out the idea of poverty, paying attention to the emotional intensity it contains, then poverty is hunger, poverty is not having a place to shelter, poverty is being ill and not being able to go to the doctor. Poverty is not being able to go to school and not knowing how to read or write. Poverty is not having a job; poverty is looking at the future in fear and living from day to day. Poverty is children dying because there is no clean drinking water. Poverty is weakness; poverty is not having a voice; poverty is not being able to take part in decision-making processes; poverty is not having a representative or having nobody to represent you. It is for these reasons that poverty really does pose a serious threat and a major risk to survival (T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, p. 233).

The prevailing theory in the definition and measurement of poverty is the absolute poverty line (threshold) theory, which has roots in studies carried out in England towards the end of the nineteenth century and is based on income/expenditure criteria. According to this theory, poverty is generally defined as "not possessing sufficient resources to meet one's needs" or very similarly, "remaining below the absolute minimum welfare level" and "not being able to meet the need for goods and services necessary in order to stay alive" (Alagh 1992, p. 109).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Causes of Poverty

We can suggest some very basic explanations for the causes of poverty or about why some people come to need the help of others in order to survive. Just as these causes can be related to personal characteristics, such as skills and abilities, concepts of discipline and responsibility, or levels of frugality, they can also depend on structural factors outside of the individual's own direct control (T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, p. 234).

Overpopulation, the unfair distribution of economic resources, inability to afford high standards of living, lack of education and employment possibilities, rapid destruction of the environment, certain economic and demographic trends etc. are among the primary factors that can lead to poverty. In these circumstances, can we blame the poor for their own poverty? Could their poverty not be caused by the development programs that governments follow? Can we gloss over the role of globalization as one of the causes of poverty and inequality? For instance, we certainly cannot ignore that behind the interdependency that, in tandem with globalization, is steadily increasing throughout the world, there are global decisions, policies and practices, generally determined by the rich and powerful. It seems very difficult to bring under control and eradicate the basic factors, such as these, that can be numbered among the causes of poverty. In most cases, the causes of poverty interact with each other and with the consequences of poverty as well. As a result, factors that push people into poverty at the same time also, generally speaking, produce conditions whereby the same people are unable to escape from poverty (T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, pp. 1-2).

The Culture of Poverty

Another important concept related to poverty is the "culture of poverty", first formulated in the 1960s by Oscar Lewis(as cited in Theories of Poverty: The culture of poverty, n.d.). Lewis claimed that the culture of poverty was "a way of life handed on from generation to generation along family lines." The people in this culture are marginalized; they consider themselves helpless, powerless and lower class; they live only with an understanding of living from day to day, with no thought of the future. They are fatalistic; there are high divorce rates in their families; women and children are abandoned; the heads of the family are generally women. People who internalize the culture of poverty do not participate in social or political life; they do not join political parties; they have only limited contact with institutions such as banks and hospitals. According to Lewis, the culture of poverty, inasmuch as it affects children, perpetuates poverty. Children in slum areas internalize these behavioral codes when they are six or seven years old and for the rest of their lives do not make the effort to change them (Theories of Poverty: The culture of poverty, n.d.).

Lewis' concept can be summed up as "a subculture of people living in poverty who respond to their lack of resources with a distinct set of negative beliefs, attitudes, and behaviors" (Hill&Gaines, 2007).. As for the other basic characteristics of the culture of poverty, they are (Lewis as cited in Erdem, 2003):

- Those living in the culture of poverty do not have a particularly healthy relationship with social institutions.
- The poor are not members of trades unions or political parties. In other words, their cooperative and organizational skills are very weak. Because they are not very familiar with politics, they can-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

not be used in movements that oppose the system. They have low literacy rates and a low demand for education. They rarely frequent banks, hospitals, department stores, museums or art galleries.

- They live in unhealthy dwellings in slum neighborhoods. Many houses only have one bedroom.
- Their families tend to be large. There is no period of childhood in the family. Children tend to be initiated into sex at an early age. There is a high incidence of cohabitation. Husbands very often abandon their children and spouses.
- On the individual level, there is a high incidence of feelings of exclusion from society, feelings of helplessness, feelings of inferiority, weak ego structure, no impulse control, living for today and not really thinking about tomorrow, resignation and fatalism, and widespread belief in male superiority.

Lewis blamed poverty for creating a subculture within itself and accused the poor of being scathing, reproachful and scornful (Erdoğan, 2011a). However, the attempt to define poverty as a culture or subculture with its own specific psychopathology actually has a result that is tantamount to concealing the structural causes that underlie it (Bilen&Şan as cited in T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, p. 14).

Poverty in Turkey

Examining income distribution and the dimensions of poverty in Turkey, we cannot speak of the existence of a balanced income distribution. For 2004-2005, the top 20% of the population received close to half of the total income in the country, while the bottom 20% received only 6%. The top 40% of the population received more than two thirds of total income (T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, p. 18).

According to the United Nations Development Programme (UNDP) Human Development Index, considered as one of the indicators of a country's poverty, while Turkey was 69th out of 174 countries in 1995, it had fallen to 86th in 1999 and 84th in 2005 (UNDP, 2007). The concept of human poverty set forth in the UNDP's 1997 Human Development Report is based on the thesis that, in order to meet basic needs, as well as financial opportunities, some economic, social and cultural opportunities are also required. In other words, it takes as its starting point the fact that poverty is multi-dimensional, encompassing more than mere financial needs (T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, pp. 18-19). Devised with this idea in mind, the human poverty index measures deprivation arising in human development, such as low life expectancy and lack of educational services or limited access to private and public resources (Aktan&Vural as cited in T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, p. 19). According to this, in terms of the indicators measured, we can say that over a ten-year period, Turkey has witnessed a change below the world average and more limited development compared to other countries (T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, p. 19). Based the 2012 data and method, Turkey was 90th out of 187 countries on the 2011 Human Development Index (2013 İnsani gelişme raporu. Güney'in yükselişi: Farklılıklar dünyasında insani gelişme. 2013 İnsani gelişme raporu'ndaki muhtelif göstergelerle ilgili açıklama notu, n.d.).

In 2005, there were 623 000 people living below the food poverty line in Turkey. Approximately 20% of the population eked out a living below the food and non-food poverty lines. When we take a poverty line of $2.15 per person per day, the number of poor rises to over one million, while at $4.30,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the figure specified for the group of countries that includes Turkey, it is approximately twelve million (T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, p. 20).

The latest data used to calculate the Multidimensional Poverty Index (MPI) for Turkey were collected in 2003. While 6.6% of the population lives in multidimensional poverty, a further 7.7% (by the MPI 'reckoning') are at risk of multidimensional poverty. The intensity of deprivation in Turkey, in other words the proportion of indicators in which people living in multidimensional poverty are deprived, is 42% (2013 İnsani gelişme raporu. Güney'in yükselişi: Farklılıklar dünyasında insani gelişme. 2013 İnsani gelişme raporu'ndaki muhtelif göstergelerle ilgili açıklama notu, n.d.).

Taken from a historical perspective, in Turkey, the poor have been helped to a large extent by religious institutions and waqfs and/or by private philanthropy. Until the mid-1980s and even today, successive Turkish governments have tended to deal with the field of welfare, or rather the way in which those in need are cared for, within traditional solidarity mechanisms (Abay as cited in T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, p. 20).

Study on the evolution of poverty has intensified in Turkey; this was especially so in the 1990s. One of the most salient reasons for this is that while national income has increased, the income gap between the middle and upper classes, on the one hand, and the lower class, on the other, has broadened in parallel with it. This has made poverty visible in the city. Another reason is that migration from the countryside to the city has increased and the urban poor are losing their organic bonds with their village. While this process induces families to settle in the city, where they can no longer grow their own food, it also results in absolute poverty when the family experiences a loss of income due to unemployment or similar reasons (T.C. Başbakanlık Aile ve Sosyal Araştırmalar Genel Müdürlüğü, 2010, p. 26).

As the result of the evolution in poverty, poor people lack the protective mechanisms that they used to have within the traditional social order. Charity for the poor and the struggle against poverty cannot be sustained on the natural reflexes of present society. The fact that people become grouped according to their incomes in residential areas in big cities has resulted in the poor having social networks, from whom they could have received support in times of need, being composed of people who, like them, are also poor and in need of help. For this reason, there is more need than before for overarching organizations that will identify poverty and make the necessary interventions.

Behavioral Finance

In 1979, in opposition to Expected Utility Theory, Daniel Kahneman and Amos Tversky developed Prospect Theory, which asserts that, due to psychological factors, people assign different probability values to gains and losses. Thus, they made a breakthrough not only in psychology but also in finance. In the same paper, they argue that when studying investment decisions, perceived risk, not expected risk, should be taken into account. Thanks to these findings, traditional finance theories that propose systematic approaches to investor decisions started to be questioned and the groundwork for studies in behavioral finance was laid (Sefil&Çilingiroğlu, 2011, p.253).

Behavioral finance was born as a discipline that points to human psychology as a potential source of the steps in the decision-making process and of market anomalies that cannot be explained by traditional finance theories. Unlike traditional finance theories, the models proposed by behavioral finance methodology make as much use as possible of parameters that feature human behaviors. This incorporates anomalies, representing economic actors' deviations from rational behavior, into the models. Research

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the field of behavioral finance is structured around cognitive and emotional tendencies that prevent individuals from behaving rationally. Emotional tendencies are basically guided by desires to avoid loss and regret. Cognitive tendencies are formed as a result of investors seeking to create shortcuts in their decision-making processes (Sefil&Çilingiroğlu, 2011, pp. 252-255).

Among other things, the psychological carriers of value appear to be gains and losses, rather than final wealth, and diminishing sensitivity yields conflicting risk attitudes for losses and gains. People are loss averse (the loss associated with giving up a good is greater than the utility associated with obtaining it), which yields "endowment effects" and a reluctance to depart from the status quo (Kahneman&Tversky, 2000).

Also, contrary to standard fungibility assumptions, people compartmentalize wealth and spending into distinct budget categories, such as savings, rent, and -entertainment, and into separate mental accounts, such as current income, assets, and future income (Thaler, 1999). People typically show different propensities to consume from their current income (where marginal propensity to consume [MPC] is high), current assets (where it is intermediate), and future income (where it is low). In addition, people often fail to ignore sunk costs or to consider opportunity costs and have trouble predicting their future moods and tastes or learning from past experience (Kahneman&Tversky, 2000).

Standard economic-policy thinking attributes to people preferences and motivations that they often lack and ignores psychological factors that can be highly consequential. Deterrence, for example, plays a key role in the legal determination of punishment but appears to be relatively ineffective because those who violate the law often tend not to engage in the presumed cost-benefit analyses. Similarly, policies geared toward the poor are often driven by normative assumptions, rather than empirical facts, in ways that may miss the intended beneficiaries. Standard thinking naturally assumes that big effects are due to big causes and, thus, merit major intervention. If the poor are deeply hurt by their failure to have a bank account, then there must be compelling reasons for that failure. Behavioral research, on the other hand, has shown that highly consequential behaviors often are triggered by what are deemed to be minor causes (Bertrand, Mullainathan&Shafir, 2004, pp. 422-423).

To explain investor irrationality and their decision-making process, behavioral finance uses empirical evidence from cognitive psychology and the types of decision making and prejudices that appear when people form beliefs and preferences (Barberis&Thaler, 2003).

Game Theory

Game theory, which appeared slightly earlier than behavioral finance, has also been crowned with a Nobel Prize, and has received broad acceptance in the academic and intellectual fields. Game theory is based on examining the opposing tactics used by rational actors in "games" and predicting the result.

Game theory is rampant in economics. Having long ago invaded industrial organization, game-theoretic modeling is now commonplace in international, labor, macro and public finance, and it is gathering steam in development and economic history. Nor is economics alone: accounting, finance, law, marketing, political science and sociology are beginning similar experiences. Many modelers use game theory because it allows them to think like an economist when price theory does not apply. That is, game-theoretic models allow economists to study the implications of rationality, self-interest and equilibrium, both in market interactions that are modeled as games (such as where small numbers, hidden information, hidden actions or incomplete contracts are present) and in nonmarket interactions (such as between a regulator and a firm, a boss and a worker, and so on) (Gibbons,1997, p.127). Zhao

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and Zhang (n.d., p.4) state that game theory can be used in interactions where both sides select profit-maximizing strategies.

Sociologists study games on occasion (e.g., Avery; Puddephatt), but they liken social life to games with abandon. Usually such allusions serve to highlight some property or properties of the setting under study that the author can expect the average reader to already associate with games. Those properties include: that, like games, some areas of social life are rule-governed (Geertz), goal-oriented (Long), and possibly competitive in that there is some coveted reward that not everyone can possess (Bourdieu &Wacquant); that action involves discrete moves (Goffman) and perhaps something approximating alternating turns (Elias); that skilled "play" involves the use of strategies (Bourdieu; Finlay &Coverdill); that with extended play one develops an instinctive "feel for the game" (Lamaison& Bourdieu); that earlier actions constrain subsequent options for oneself and others (Slez& Martin); that a setting may demand that participants ignore external distractions (Goffman); that play is engrossing (Burawoy; Goffman); that roles are differentiated and knowingly coordinated (Mead); that rules are arbitrary, in the sense that they are based on convention rather than physical laws (Kaminski); and that, as a consequence of rules' arbitrariness, many different games are possible (Burawoy) (as cited in DiCicco-Bloom & Gibson, 2010, p. 248).

POVERTY IN THE CONTEXT OF BEHAVIORAL FINANCE AND GAME THEORY

The fact that behavioral finance explains negative situations as incorrect decisions taken by individuals may suggest that also poverty, qua negative situation, can be explained as incorrect behaviorson the part of the poor. As a typical academic example of this approach, Beaulier and Caplan (2007), in their article "Behavioral Economics and Perverse Effects of the Welfare State", have interpreted behavioral economics as a theory showing that we should not help the poor for their own good:

Yes, giving money to the poor reduces their incentive to enter the workforce, acquire experience, and eventually join the middle class through their own efforts. But this hardly shows that it makes the poor worse off! All the transfer program does is make the non-work option more attractive. If it remains less attractive than work, the poor will still opt for work. If, on the other hand, the poor decide to take the government's money and remain idle, it must be because—all things considered—it maximizes their expected lifetime utility. In otherwords, if you were to remindwelfare recipients that they are hurting their future job prospects, they could curtly respond: 'I am well-aware of that, but my welfare checks more than compensate for my loss of future income.'(Beaulier&Caplan, 2007).

The perverse effects frequently attributed to the welfare state are easy to interpret from a behavioral perspective. If people overestimate the magnitude of immediate benefits relative to more distant ones, you can actually—on net—harm them by offering them additional immediate benefits (Beaulier&Caplan, 2007).

One poor family will be better off if it takes government assistance. But its members can be worse off on balance because other families in their area participate in the same program. Their neighborhood becomes a worse place to live as the mix of local activity shifts from productive work to drug use or crime. There could also be intra-family externalities. A father willing to support his family might abandon it if the government will assume his responsibilities. The father is better off as a result of the government program, but his wife and family are worse off if they prefer the presence of a working father to a stream of government checks (Beaulier&Caplan, 2007).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

To ascribe the cause of poverty, or—according to the principles of behavioral economics—the mistakes of the poor, to the overt behaviors of individuals contains the error of seeing a social problem as the sum of the independent actions of the individuals that figure within it. Social phenomena are definitely related to the behaviors of individuals, but they are not the sum total of these behaviors. If that were so, it would be possible to solve the problem of poverty by enabling each poor person to act correctly according to the principles of behavioral economics or game theory. Studies on the struggle against poverty clearly show that this is not possible. Even if sometimes the individual mistakes of the poor are enough to explain why they are poor, the number of poor people produced by national conditions would have remained unchanged if these mistakes had not been made. In Turkey, unemployment is one of the major causes of poverty. Individual failings can be posited as the reason why an unemployed person loses his or her job or cannot find work; if the unemployed person in question is freed of these negative qualities and finds work, the employment potential of the country will not be changed: someone else will become unemployed and poor instead.

Moreover, to advocate that the poor forgo benefits because the balance of intra-familial relations will be disrupted is similar to recommending that no medicines be used because of side effects. As in all social work aimed at families, while helping the poor, experts in the field already stress the necessity of paying attention to current family relationships.

The eradication of poverty is not something that will be achieved through individual endeavors alone. It requires an economic and social crusade. For this reason, a multiple-intervention system should be used. For example, while intervening on an individual level in a poor family in areas such as helping a father or mother find work or education, it is also necessary to work with the family as a whole on the mezzo level to improve intra-familial roles and functions that have broken down because of the problem of poverty. Macro interventions can even be planned, for instance,to enable poor individuals and families to participate in social life and make use of their rights, and to bring about the equal distribution of services in society (İçağasıoğlu-Çoban, 2003, p. 201).

Miley, O'Melia, Dubois (as cited in İçağasıoğlu-Çoban, 2003, pp. 202-203) state that generalist social work is carried out in the framework of three interrelated functions: counseling, education and resource management.

As a behavioral economist, Mullainathan (2009), after noting that he is optimistic that behavioral economics can be used in the struggle against poverty, cited the poor in the south of India as an example of what behavioral economics calls "shortsightedness". This example is illuminating about how the principles of behavioral economics can be used in the course satisfying the three functions of social work.

Sugarcane is harvested once a year and paid for in one lump sum. Planting sugarcane, although it's more profitable monetarily, raises an unappealing psychological challenge. Imagine receiving your entire annual salary all at once, at the beginning of the year, and having to dole it out carefully over the course of 12 months. Meanwhile, many who own cows cite the daily income that milk provides as a primary benefit, even though cows are not as profitable as other investments. This is the far more consequential equivalent of someone purchasing the more expensive (per unit) but smaller bag of cookies to avoid the temptation of eating all of them at once. Uncertainty figures in as well: A small-business owner who does not know what she'll earn must have the willpower to save in good weeks to ride out the lean weeks, while a salaried worker knows exactly what is coming, and when(Mullainathan,2009).

Many households seek advice from financial planners and other experts, yet some households make decisions that are hard to reconcile with this advice or with any standard model. One response to this observation is to maintain the assumption that actual and ideal behavior coincide, but to consider non-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

standard behavioral models of preferences that incorporate phenomena such as loss aversion and mental accounting. An alternative response is to abandon the framework of revealed preference and to consider the possibility that households may not express their preferences optimally. This response leads to the view that behavioral finance theory describes the choices households currently make, whereas standard finance theory describes the choices that maximize household welfare, and that households can be educated to make (Campbell, 2006, p.1554).

As can be seen, behavioral economics approaches are important in the development of advice designed to help the poor use their scarce resources more efficiently. The poor, as a rule, do not have savings to invest; they can only be steeredtowards being conscious consumers if they are enabledto make effective use of their daily/weekly/monthly earnings in line with the suggestions of behavioral economics. In Turkey, as in many places in the world, the instruments of consumer-culture propaganda, primarily adverts, drive consumption beyond needs. Even fairly poor homes have televisions. One of the most widespread leisure activities in Turkish households is watching television series, which are interrupted by long commercial breaks, after the evening meal. There is no doubt that the adverts watched along with the series also act on consumer behaviors in the household. This should be taken into account in social work to stop the poor from sinking into the unreasonable consumer behaviorsidentified by behavioral economics.

The fact that the psychological interpretation used in the behavioral finance approach can be readily grasped and that the gains can be seen with simple cost-benefit calculations facilitates the use of behavioral finance in the struggle against poverty. Game theory, in contrast, has a relatively more technical structure and requires a grasp of mathematics; however, there are also approaches aimed at reducing the mathematics contained in the theory. Bernard(as cited in Swedberg, 2001, pp. 304-305), according to Swedberg, has introduced an approach that does limit the mathematical content of game theory,thus enabling it to be widely used: It is of great importance, Bernard stresses, that sociologists learn to translate sociological problems into games. Bernard's treatment is non-mathematical, and she reassures the reader that one can use game theory, just like statistics, without a full understanding of the underlying theorems. Game theory is mainly of help for making predictions, and nothing is said about the problem of verifying the results of game-theoretical analyses with the help of data (Swedberg, 2001, pp. 304-305).

When we look at poverty specifically in Turkey and in the context of game theory, we can see that the game that is the subject of the theory is playedbetween poor people and the government. In the interviews carried out in the study Cases of Poverty in Turkey (Erdoğan, 2011b), a great number of the poor said that they expected the government to help them out of their current situation. This makes it clear that in Turkey, contrary to Lewis'findings, the poor do take an interest in politics, even if this does not amount to an active role. Moreover, due to their voting potential, there is no doubt that political parties do court them.

In Turkey, the current ruling party makes effective use in its political propaganda of the work that it has done to help the poor. In the context of game theory, in such a relationship, the gain to be had by a political party is the votes that it will receive from the poor, while the poor expect their lives to get easier thanks to help that they will receive. The ruling party widely distributes food and fuel aid to the poor. Thus, one of the poor player's constant needsis metas and whenit arises. Should the ruling party lose office, there is a high possibility that this aid will be stopped. In the current state of the game, voting for the ruling party is one profitable strategy for the poor.

According to data from TÜİK's Household Budget Survey Consumption Expenditures 2009 (2011, p. 1), at 28.2%, housing and rent constitutes the biggest slice of household consumer spending. Becoming a homeowner is a major achievement for a poor person and,once acquired, his or her home remains

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

his or hers forever, independently of the existence of a helping hand. The fact that in interviews, poor people who do not own their own homes indicated their wish to do so shows that they thought it more profitable to be a homeowner than to have their other needs met. However, it is understandable that a body that offers help in return for votes will not follow strategies aimed at making homeowners of the poor.After acquiring a home, a poor person is not obliged to take the position that the ruling party should remain in power perpetually.He or she will be able to use his or her power as a voter to make new gains. Nevertheless, to achieve results, it is not possible for players crushed by the pressure of their momentary needs to follow this strategy independently of each other. If the poor act together to ensure that their joint needs, such as housing, are met, it will allow them to take the initiative against a strong player in future games.

CONCLUSION

Game theory recommends that each and every situation be approached like a game and claims that it shows the most sensible strategy in such games; in moves falling under the scope of finance, behavioral finance claims to prove that players do not always behave rationally. When both theories are taken together, it is also possible to assert that when the correct behavioris clear, negative results stem from people not behaving rationally. This approach, if it interprets every bad situation that occurs to be the result of individuals' incorrect behaviors, must not lead to the error of not seeing the distortions created by the economic structure. Game theory and behavioral finance must not acquire the role of absolving the system, especially not with regard to poverty. Otherwise, we might be tempted to see the poor as responsible for, rather than as victims of, the inhuman conditions in which they find themselves, and under the influence of this thought, we might be less willing, or even unwilling, to help them. Yet above all, the children of the poor are also poor and it is certain that they at least are not living in poverty because of their own mistakes. They will have deficiencies in many areas, from the education that they receive to food, and they will make them felt in every game that they will one dayplay as adult individuals. There is a high probability that,as players under the influence not only of the physical but also of the psychological burden of the harsh conditions in which they find themselves,they will make bad moves in life. The poor should definitely be helped to make their living conditions easier and alongside this, strategies in the struggle against poverty should also be formulated in the light of theories such as game theory or behavioral finance.

Close to two thirds of the steel and more than two thirds of the aluminum, copper, lead, nickel and zinc, and three quarters of the energy used in the world is used by industrialized countries and, for example, the demand in developed countries is also behind the destruction of the rainforests (Şenses, 2013, p. 157). These facts also unmask the injustice of seeing the poor as a group that needs help from others while consuming more. The planet that we live on is a joint resource to which future generations are also entitled. The poor have received a much smaller share of this joint resource than the rich have. As the natural result of this, they consume less of the planet. Therefore, it is also possible to think that the rich are indebted to the poor because they consume more natural resources, which are the joint property of humanity.

KEY TERMS AND DEFINITIONS

Behavioral Finance: A theory, which claims to prove that human does not behave rationally in the financial decision-making process.

Game Theory: A theory, which recommends that each and every situation be approached like a game and claims that it shows the most sensible strategy in such games.

Poverty: A state of deprivation wherein the basic needs necessary for survival are not met.

Poverty Line: The minimum level of income deemed adequate in a given country.

Poverty in Turkey: The situation of poor people in Turkey.

Social Work: A practice-based discipline, which try to improve the quality of life and wellbeing of an individual, group, or community.

Struggle Against Poverty: Fight against poverty.

Chapter 4
Recursive Inter-Ethnic Violence and the Failure of Development Communication in Africa

Charles Chiedu Okigbo
North Dakota State University, USA

ABSTRACT

This chapter traces the evolution of development communication and examines how it has helped or hindered peaceful coexistence in Africa. Starting with the dominant paradigm of the 1950s and 1960s, it explains the critical and dependency model of the 1970s as well as the participatory paradigm of the 1980s before concluding with the most recent iteration which is the social entrepreneurship model of McAnany (2012). These provide a backdrop for examining the place of communication in the recent developments in the six African countries which are among the 10 fastest growing economies of the world today. The final picture to emerge is one that underlines the importance of strategic communication in planned social change, especially in promoting peace and curbing inter-ethnic violence.

INTRODUCTION

Africa, the origin of human existence, has been bedeviled with numerous recursive violent confrontations from ancient times, long before the earliest contact with explorers and colonialists. With a landmass of approximately 11.7 million square miles, it covers 20.4% of the world's total land area. The population stands at about 1.2 billion now but will reach up to 2.4 billion by 2050. Although Africa is reputed to have no less than 835 ethnic regions (Murdock 1959), this is likely to be an undercounting and it is widely believed that if African national borders were based on ethnic or linguistic identification as in Europe, the resultant countries would be more than the sum of all the countries in the world today. With so many ethnic groups many of which are in very close proximity to each other, and further challenged with limited resources, inter-ethnic rivalry and conflicts seem to be inevitable.

In this chapter, we highlight some of the historical and recent inter-ethnic violent incidents against the backdrop of ineffectual development communication strategies and practices that could have prevented

or at least ameliorated some of the violence. The best solution to inter-ethnic conflicts is prevention, which is best built on effective communication, congenial meeting of minds, and common understanding. Violence and conflicts are evidence of communication failure first at the interpersonal level and then at the mass society level. Development communication is one of the ways to promote peace and conviviality within and between ethnicities. This appears to not have worked in Africa yet.

In the front part of this chapter, we trace the course of development communication paying attention to the distinct phases which are now referred to as the paradigms, starting with the original first phase or dominant paradigm of Daniel Lerner and Wilbur Schramm through to the current phase which McAnany (2012) has referred to as the entrepreneurial stage. Interspersed between these two phases are a potpourri of six or so variegated models which are conveniently labelled dependency, participation, communalism, oramedia, "RIOC", cultural warrants, and triple heritage. Explaining these approaches to development communication sets the stage for an analysis of the environment for recursive violence in five selected African countries which are Sudan, Egypt, Kenya, Nigeria, and South Africa. At the backend of the chapter, we conclude that development communication in Africa is still largely misunderstood, unappreciated, under-utilized, and consequently has not served Africa very well, in spite of the reality that the continent is culturally communication-rich. The much touted African renaissance will require more strategic uses of traditional and modern communication, without which significant development will continue to elude large sections of the continent.

DEVELOPMENT COMMUNICATION: WHAT IT IS

The term 'development communication' is still not fully understood and it is far from clear how communication contributes to development despite more than half a century of continual scholarly and practical attention to the salient issues of the subject in all the regions of the world. Regardless of whether it is called development communication or communication for development or development-support communication or social change communication, it is taken to refer to the understanding that the state of socio-economic growth and social change in a community is a function of the extant communication processes that include interpersonal and mass media contexts. Development communication, as a term, came into greater use in the 1970s, following the coinage by Quebral (1972, 1973) who defined it as the art and science of human communication used in planning for and bringing about strategic transformations of a society to alleviate poverty and achieve better and more equitable socio-economic growth that involves the larger unfolding of the potentials of individual peoples.

Properly conceived, development communication is the practice of purposively and systematically applying communication principles, processes, products, and methods to promote positive and desirable change in a community. In this sense, it is necessarily continually evolving and applicable in all human societies, regardless of their levels of economic and technological development as it is primarily aimed at addressing and redressing social problems. Since there are no countries without social problems that can be addressed through communication, it follows that no countries are outside the ambit of development communication. As Moemeka (2000, p. x) explained, "there is no nation in the world that has no development or social change problems … problems whose solutions are strongly dependent upon intelligent exchange of ideas, cooperation and building of understanding." The building of understanding and the creating a feeling of social togetherness and community unity are some of the essential functions of communication in society. Pervasive social tension and inter/intra-group violence are indicative

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of communication failure and a low level of development communication, although communication in itself cannot be the panacea for disagreement between and within groups.

As a field of study, development communication started in rural sociology with early interests in the diffusion and adoption of innovations and the processes for making new ideas more widely accepted by people (Rogers, 1962). It was also a focal concept in political science and international development studies, with particular attention addressed to mechanisms for improving political participation and living conditions among less-developed peoples, particularly in the Middle East (Lerner, 1958; Pye, 1962). From such early beginnings, development communication has now become an interdisciplinary subject for scholars and practitioners in social psychology, social marketing, public journalism, economics, global and area studies, cultural communication, and media studies, among others. Interest in development communication as a field of study and practice waxes and wanes, depending on the potency of individual promoters or academic departments and supporting organizations such as The World Bank and United Nations organizations. Credit is deservedly given to the pioneers whose efforts are still today acknowledged as the dominant paradigm.

The Dominant Paradigm

Among the pioneers in this area are Daniel Lerner, Wilbur Schramm, and Everett Rogers, who are associated with the dominant or originating paradigm which held sway in the 1950s and 1960s. The main points of development communication at this stage were best expressed by Lerner (1957) as "the parable of Balgat" which is the story of how an ancient village in Turkey passed into a modern suburb with retail stores, a bus service, electricity, tarred roads, movies, and other symbols of the new civilization. Within Balgat and all through the region, there pervaded a sense that the old ways had to go because they no longer satisfied the people.

Schramm (1967) added to the understanding of development communication by explaining how communication is an integral part of the most widespread and spectacular patterns of social change and modernization in developing societies, where "communication is asked to help survey a new environment, raise people's aspirations, guide and control a dynamic process, teach new skills, and socialize citizens to a new and different society that is still in the process of becoming" (p. 5).

Rogers and Svenning (1969, p. 14) elaborated on the link between modernization and development in these words: "Modernization is the process by which individuals change from a traditional way of life to a more complex, technologically advanced and rapidly changing style of life." Rogers (1974, p. 45) would later add that modernization at the individual level corresponds to development at the societal level and "so, development is a kind of aggregated modernization" (was not to be conceived as Americanization, Europeanization or Westernization, but should be domesticated. The scholars were comfortable explicating the concepts and processes of modernization and did not call their efforts 'dominant paradigm' (Rogers & Svenning, 1969).

An overburden by technology and new ideas existed – even at the cost of reducing ethnic tension and violence – which at the time was noticeably minimal or perpetrated at foreign dominators. These were all the right sentiments regarding the power of communication to bring about change, but they were not sufficient to keep at bay rising disenchantment with the main tenets of the dominant paradigm, which culminated in the evolution of the successor paradigm of the dependency model (the second paradigm).

Dependency Model

Criticisms of the main tenets of the dominant paradigm were in tandem with the views of Latin American economists who disagreed with modernization principles of adopting Western economic systems that benefited compradors and foreign interests at the expense of the local population. Modernization was seen as a cloak for continued dependency in the economic realm, and this political economy side of dependency easily transferred to communication. The reverberations of the dependency paradigm had started with attacks on modernization which was the thesis of the dominant paradigm (Frank, 1967) but soon morphed into more pointed criticisms against the expectations that expectations of media impact/determinism – see Peter Golding (1974). The mass media are not neutral purveyors of information but often reflect ideologies of the ruling class or imperialists in the case of foreign programs. Beginning with Latin American writers, who were soon joined by Asian and African voices, it became acceptable to "consider mass media as tools of imperialism rather than magic multipliers for social change, as Lerner and Schramm had promoted" in the phase of the dominant paradigm (McAnany, 2012, p. 71). Communication and media do matter in social change, not only in the techniques and technology but also in the content and messages. These ideas would reverberate more strongly later in arguments in support of the new world information and communication order to redress the imbalance in global news flow. If dependency was a criticism of modernization and the dominant paradigm, participation and the involvement of the people at the peripheral, economic, and social structures was proposed as a solution to addressing the inadequacies of imperial domination.

The Participatory Paradigm

If dependency is the riverside of the dominant paradigm, then participation is on the same side with dependency. The introduction of new ideas could best be done by involving the people who are the beneficiaries of change and development. One of the most ardent promoters of grassroots and citizen involvement was Freire (1970) who developed the method of "critical consciousness" from his experience of teaching peasants and students to read. Development beneficiaries should not be passive recipients of instruction and new knowledge, but rather like literacy students, should be active participants, who are engaged in the critical examination of their extant situations of oppression with their eyes focusing on the target goals of empowerment instead of just learning new tools. Learning by active engagement and full participation provides motivation, empowerment, and a sense of ownership, which are important concepts that leverage social change and development.

Unlike modernization and dependency, the participatory model underscores the importance of empowering local people and development beneficiaries to be active participants in development projects instead of waiting passively to be directed. Servaes, Jacobson, and White (1996) explain participatory development as encouraging the empowerment of ordinary people in developing countries to promote positive social change and development of their communities. Whereas participation has obvious benefits, it is not flawless. It has its drawbacks, which include over glorification and idealization of local capacities for knowledge and engagement, and the misplaced belief that participation is unassailable and always desirable for its own sake. Participation reposes great confidence in the people's capacity to know what is best for them and to be able to eschew negative inclinations such as selfish self-interests and dangerous cultural practices or beliefs. Although participation is desirable and can be put to good use in development social change communication, it is not a magic bullet. How could it have been gain-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

fully deployed in such situations as the Rwandan genocide of 1974 where the Hutus massacred the Tutsis and lots of lives were lost from both groups? Or in the post-election violence that wracked Kenya in 2007 and 2008? No one paradigm is sufficient to explain and guide the use of communication in social change management. Social change can be conceived as a set of ideas or products or services which are amenable to social marketing techniques of persuasive communication and entertainment education. In a post-participatory phase of development communication, McAnany (2012) proposed social entrepreneurship as a new paradigm.

The Social Entrepreneurship Paradigm

The new emerging discourse of development communication is focusing on entrepreneurship, local settings, small scales, and gradual scaling up. Calling this the "paradigm for a new millennium" McAnany (2012, p. 106) observed that "much of the thinking about development over the past fifty years or more has been promoted by national governments, large foundations, and the UN system" and recommended that the development communication community adapt from the work of two pioneers, who are operating outside the communication field. The first person is Muhammad Yunus who created the Grameen Bank for poor women in Bangladesh and the second person is Bill Drayton, who created Ashoka, a social change NGO designed to seek out promising change agents worldwide and sponsor their ideas with private funding. Although social entrepreneurship has been defined differently, it is acknowledged that the common goal is the creation of value that is social and the consequence is the provision of benefits for people whose urgent and reasonable needs are not being fulfilled by other means. Thus, as McAnany (2012, p. 108) explains, it is "an approach that looks at social problems that are not otherwise being solved and finds a local solution to them." Applying this paradigm to the problems of recursive social conflicts in African communities, Grameen Bank's principles of helping local poor women to build trust and become more economically self-reliant can help promote peace and inter-group harmony, as can Ashok's principles of promoting positive change and innovation within a peaceful social culture. How popular and widely accepted the social entrepreneurship model will be among development communication scholars and practitioners remains to be seen. What is easy to see is that like the other preceding paradigms, aspects of it will not easily go away and will find applications in some areas of development communication and social change practices.

Other Development Communication Paradigms

If it appears that successor paradigms in the field completely displace their predecessors, this is not exactly true as every model has some kernels of truth that survive critical onslaughts. Thus technological determinism might be criticized in the dominant paradigm of modernism only for us today to see that the new social media are assuming very powerful stances that could not have been imagined in earlier generations. Dependency and participation are taking on new meanings in the new phenomena of globalized digital communication where the distinctions between sources and audiences are becoming less clear. In the circumstances, it is best to see these paradigms as explanatory concepts rather than historical phenomena that marked certain periods in the life of development communication. In this sense, there are many other explanatory concepts that help to illuminate development communication principles and practices, and they all have implications for explaining Africa's predicament of inter-ethnic violence. A prime example is Frank Ugboajah's oramedia, which is the notion that African communication must

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

be patently African, if we accept that human communication is an extension of the particular peoples engaging in the creation and exchange of the communication content through their accepted channels, which can be unique to them, as in the case of some aspects of African traditional communication.

The Oramedia Model

The concept of oramedia is neither fully explained nor is its theoretical and practical import expressly developed. The term could be taken to be a derivative of oral (spoken) media as prevalent in traditional African settings, but that would be only part of the story as there is much traditional African communication that is not spoken. Frank Ugboajah, who created the term equated oramedia with folk media and characterized them as based on indigenous African culture with rich symbolic significance. As he explained it, "oramedia or folk media are grounded on indigenous culture produced and consumed by members of a group. They reinforce the values of the group. They are visible cultural features, often strictly conventional, by which social relationships and a word view are maintained and defined. They take on many forms and are rich in symbolism" (Ugboajah, 1985, p. 166). Challenge is for scholars to further explore and "to identify systematically the symbols that exist in traditional media channels and how these symbols can be manipulated for effectiveness in communication" (p. 176). His challenge for scholars to explore "the potentials and relevance of oramedia in the process of development." and for managing inter-ethnic social tension. More communication technology (tool or medium) than communication content (the message) – without much attention on communicators (receivers/senders), which is the focus of another African communication paradigm which was originated by Onuorah Nwuneli in his work propagating social change through government-sponsored rural communication.

The Rural Information Officers Corps (RIOC)

This is an approach to development communication and social change which places more emphasis on people as active agents than technology qua technology. With as much as 65% of African peoples living in the rural areas, Nwuneli argued that sustainable national development must incorporate rural information management aimed at engaging with rural dwellers as active participants.

GOAL OF THIS CHAPTER

In this chapter, we plan to examine how the four phases of development communication played out in Africa and helped or hindered inter-ethnic harmony. Our emphasis will be on the current paradigm of social entrepreneurship and its application in the six African countries which are among the 10 fastest developing economies of the world at this time. While we are stridently objective in our analysis, we shall not hesitate to be cautionary even if this runs in the face of the prevailing exuberant optimism about rising Africa. Our emphasis shall be on the promise of communication as a means of promoting inter-personal and inter-group harmony and thus while recognizing there is a role for communication technology, our focus will be more on the human, social, emotional, and personal aspects of messages. The final picture we hope to create is one which will show that even though development communication has failed in African peaceful development, there are important roles for strategic communication in the evolving social climate of change on the continent.

INTER-ETHNIC CONFLICT IN AFRICA

The post-independence era did not bring about the much anticipated peace and security that many Africans had hoped for. Post-colonial societies in Africa while autonomous from their colonial masters, have had to contend with the established neo-colonial bourgeoisie. A lot of ethnic conflict arises between indigenous classes and neo-colonial ethnic authorities. Control over state power is never fully with one or the other and cultural dominance becomes the bases of class supremacy and state rule. The inherent problem is that whichever group finds themselves in charge of the state tends to engage in similar behaviors of altering the law in their favor, partiality, corruption as a means of achieving their objectives, and collusions among politicians and civil servants (Mou, 2014).

We can find examples of such behavior in the major ethnic conflicts that have plagued/ and is still challenging African nations, post-colonial era. Take for example Egypt. The Nubians were forced by other groups to leave the south of Egypt that they believe belonged to their ancestors. The Banu Hilal Arabs were stigmatized by other Arab groups on the justification of bad morals. Ethnic conflicts can also be racially motivated for example in the case of South Africa. Even with the rate of modernization that the country has achieved, certain groups like the Zulus, Xhosas, and other ethnic concentrations do not fully enjoy the yields of their countries development. The early twentieth century witnessed executive mandates against Black South Africans such as their evacuation from major cities and even withholding some of their rights to produce their own food through agriculture. In addition to having a right-wing ruling government, the apartheid in South Africa led to the promulgation of beliefs that Black South Africans were not only culturally inferior, but biologically inferior as well. Black South Africans grew contentious towards the ruling authority (Irobi, 2005).

South Africa is the regional giant of the south of Africa. The country has approximately 40 million people and is familiar with the complications of racial polarization. The notable racial divisions are indigenous (or Black) Africans (about 30 million), Whites (about 5 million), and Colereds and Indians (about 3 million). There are a total of eleven linguistically different groups but English is the official language. South Africa is plagued with ethnic separatism in identity, language, and ethnic symbolism that was heavily influenced by colonial rule. Establishing ethnic harmony has been quite a challenge for the country (Irobi, 2005).

Nigeria is the epitome of pluralism with over 250 ethnic groups. The country contains a conducive atmosphere for the most challenging ethnic conflicts possible. Before her independence in 1960, Nigeria was divided into three regions, the north, east, and west. These divisions exist today as classifications for the major ethnic groups of Hausa in the north, Igbo in the East, and Yoruba in the West. Several sub-groups make up these three regional categorizations. The Hausa-Fulani people are the largest ethnic concentration in the country and their defining factors for ethnic ties are language and religion. The Yoruba's on the other hand are united language and ancestral legends. The Igbo's existed in social units of segmented village groups. The different groups were united in trans-village relations through the Aro Chukwu trading community. Not having a central ruling state system like the Hausa-Fulani or a unifying myth of origin like the Yorubas made the Igbos a difficult group to be subdued during colonial rule (Young, 1976).

In 1945, an incident occurred in Jos city of northern Nigeria that involved an Igbo settler in the state. What started out as a minor altercation escalated into a riot that led to the loss of many lives. More events such as this began to occur in other parts of northern Nigeria that led to the loss of lives with Igbo's as the primary victims. There were ethnic insecurities, growing fear, and anxiety among the Igbo's. This

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

was also a time of great suspicion over the forth coming elections and the motives of the different ethnic leaders. One hand was the Hausa-Fulani people preaching Africanization and on the other hand was the Igbo's with their intelligent and enthusiastic rhetorician Nnamdi Azikiwe calling for Nationalization. Nigeria was becoming a chaotic battleground for ethnic and regional tensions. The progression led to a coup of Igbo military majors in 1966 followed by a deadly northern backlash. The bloody civil war had begun in earnest and it was a battle between the Hausa-north and the Igbo-east (Young, 1976).

The case in Sudan was quite different. The southern part of Sudan had three major provinces – Upper Nile, Equatoria, and Bahr al Ghazal. The major thing they had in common was their opposition to northern Sudan. In terms of development, south Sudan seemed to be in stark contrast to the north. Young (1976) pointed out that in 1955, a year because Sudan became an independent state there were only three schools in the whole of south Sudan compared to sixty-five schools in the north. Even within the grossly underdeveloped south, the distribution of development among the provinces were significantly different.

South Sudan also witnessed a devastating civil war with north Sudan. The year was 1955 and it was just months before Sudan became independent. Tension rose in the south as 300 southern workers got laid off from working in the mills. Angry southerners accumulated in the north to demonstrate their grievances and the north retaliated. Things got deadly for the southerners with many of them losing their lives and fear mounting. A few years prior, in 1947 to be precise a conference was held in Juba and the northern leaders invited representatives from the south for a meeting. They all reached an agreement that Sudan would be developed as a single country. The first national elections were held with three parties emerging – the Southern Party, the National Unionists Party, and the Umma. The latter two were northern parties. In campaigning, the northern parties capitalized on the fear in the south to gain their support. Each party accused their northern opponent of seeking to dominate the southerners.

Soon after that, a list was published with the names of people that had been given civil service appointment. Out of the 500 names, only our four were from South Sudan. This elevated the fears and suspicion of the southerners. They changed their parties name from the Southern Party to the Liberal Party and held a conference where they decided that they did not want to be a part of one Sudan anymore. Following this new development were numerous massacres of southern troops and fearing for their lives, many of them sort escape. There was complete distrust between the south and the north. Many southerners who fled started reemerging as guerilla soldiers.

When Kenya got her independence, the ordering of tribal units established by the colonial rule in 1925 were still in place. By inevitability, the political parties that emerged were based on ethnicity and the stakes for control over the region were very high (Wopp, 2013). Natives often harbored resentment towards new settlers. There always seemed to be a perceived threat that was accompanied with violent actions and repercussions. It did not help matters that many regional leaders were tribalists in some respect and favored members of their tribes above others (Nwakikagile, 2007).

Kenya saw some of its bloodiest conflicts in the late 20th century. The Coast and Rift Valley provinces carried out stringent actions to expel Kenyan settlers from other regions of the country (usually the interior), from their territory. In 1992, at least 3000 people were killed or severely wounded in the Rift Valley province. In the Coast province, attacks were constantly carried out on the Kikuyu, Luo, Luhya, and Kamba people among others (Nwakikagile, 2007).

APPLYING DEVELOPMENT COMMUNICATION TO CONFLICT RESOLUTION

The inter/intra-ethnic clashes explored above are in no way representative of the all the conflicts across Africa. However, they portray the common themes at the center of conflict issues within the continent. The specific cases point to social issues such as corruption and favoritism in Egypt, discrimination in South Africa, Nigeria, and Kenya, and underdevelopment in Sudan. Unfortunately, there is an observable overlap of all these problems in both past and present inter/intra-ethnic conflicts in African countries. Other emergent themes that are motivations for indignation are discontent, fear (for safety, future, and maintaining power), greed, threatened value systems among others. It is not unreasonable to think of resolving ethnic conflict in terms of assuring offended people, things of perceived value – their safety, assurance of their position etc.

The social entrepreneurship paradigm of development communication as stated earlier, focuses on providing small-scale entrepreneurial opportunities for those in local settings as a means of abating conflict. McAnany (2012) identifies the processes involved for social entrepreneurship. First, an identifiable goal should be created for inter/intra-ethnic conflict. The second step is to employ innovative techniques for addressing the issue. Third, expand the organization in a way that serves a large number of people, and finally, use empirical analysis to evaluate the performance of the program. McAnany encourages research efforts to be directed at social and economic bottom line participants of the initiative in order to effectively evaluate the true impact of the program.

Although the technique of social entrepreneurship has not been fully taken advantage of in abating inter/intra-ethnic conflicts in Africa, there are some emergent cases for example the National Poverty Eradication Program (NAPEP) in Nigeria (Ugoh & Ukpere, 2009). One of the main challenges encountered by such programs is the capacity to empirically measure its impact. The nature of ethnic conflicts is not such that a one-size-fits-all solution can be applied. Even if we put all ethnic upheavals into categories, in order to address them, they must be understood on a case by case basis.

Africa is lacking in development communication researchers who focus their studies on the nature of conflict situations. Some aspects to consider for conducting the needed research are the kinds of insecurities that are present and the difficulties posed by such threats. According to Ikelegbe (2015) the current state of social change research in Africa is plagued with high costs of research, lack of corporation between researchers, practitioners, and government, difficulty in empirical data collection, and safety issues. Ikelegbe offers solutions to the problem of development communication research by suggesting the use of native's involvement, those well known in localities, avoiding localities prone to high risks, seeking cooperation of critical stakeholders, and seeking support of traditional leaders/community leaders, as well as security agencies.

Dada (2015) believes the focus of development communication research should be on ways to effectively promote the concept of human security. He argues that this responsibility is that of development communication researchers and policy implementers. Dada states that most existing institutes for conflict resolution in Africa has focused on the security dimension rather than ways to actually resolve conflict. He agrees with Ikelegbe (2015) in stating that the cost of peacebuilding is very high. Moreover, ensuring that peace is sustained after the war is fought is a complex but important challenge. The picture of change that is presented ought to take into cognizance the picture of peace held by the conflicting parties otherwise, they would continue to pursue through violence, what they perceive to beneficial end for

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

themselves. Oshita (2015) highlights the importance of Africans being the ones to carry out research about Africa. While he encouraged that foreign anecdotes be adopted, he advises the careful interrogations of foreign approaches to African conflicts. Oshita (2015) stresses the building of necessary infrastructure and effective conflict mediation as keys to addressing interethnic conflict

THE NEW AFRICA

Recently, there has been a new awakening as the fortunes of the continent appear to be looking up. This has been given different names ranging from African Renaissance to Africa Rising, and Emerging Africa. Six of the 10 fastest growing economies in the world today are in Africa. Both the academic literature and the popular mass media are agog with recent products chronicling the continent's new economic development fortunes. However the challenges of inter-ethnic violence are ever present, and will continue to pose a serious constraint, unless the good works of communication are deployed to realize some of the visions of the pioneers of development communication.

KEY TERMS AND DEFINITIONS

Dependency Model: The belief that mass media are not neutral purveyors of information but often reflect ideologies of the ruling class or imperialists in the case of foreign programs.

Development Communication: A communication strategy used to promote peace and conviviality within and between ethnicities.

Dominant Paradigm: The belief that old and traditional ways of doing things are no longer sufficient and modernization is the way forward.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Inter/Intra-Ethnic Conflict: A dispute that occurs between or within ethnic groups.

Oramedia Model: Visible cultural features, often strictly conventional, by which social relationships and worldview are maintained and defined.

Participatory Paradigm: Involvement of the masses in new ideas for change and development.

Rural Information Officers Corps (RIOC): This is an approach to development communication and social change which places more emphasis on people as active agents than technology qua technology.

Social Entrepreneurship Paradigm: A focus on entrepreneurship, local settings, small scales, and gradual scaling up as the answer to modern-day problems.

Chapter 5
Theoretical Aspects on Bottom of the Pyramid in Emerging Economies:
An Overview of Microfinance in Latin America

Milo Paviera
University of Edinburgh, UK

Mahmoud Khalik
University of St. Andrews, UK

ABSTRACT

Despite the growing body of literature on the Bottom of the Pyramid (BoP), much remains unclear and more research is needed in a number of areas as this chapter will highlight. Firstly, the broad literature is reviewed which includes looking at definitions and different strands of research undertaken in the field. The chapter then presents three key sectors that the authors believe have the most potential to aid poverty alleviation, while proposing that other types of studies can be conducted for other sectors that are more likely to lead to consumer satisfaction. Points of departure are offered, before discussing microfinance and then latterly in the context of Latin America. The chapter uses secondary data to show key countries and institutions serving the BoP, and to highlight important aspects that merit further attention. Implications for policy makers and practitioners are offered, and this is followed by a number of directions for future research.

INTRODUCTION

The concept of the Bottom of the pyramid (BoP) first introduced by C.K. Prahalad has led many scholars to undertake research on the low-income consumers and underserved communities, and this has become a promising area of study. This chapter aims to uncover two important objectives: firstly, to review the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

concept of BoP, and secondly to map out a number of microfinance institutions that serve this segment in the region of Latin America. We begin this chapter with a review of BoP from its inception, and the controversy surrounding the definition, before delving into the literature on the BoP, including Prahalad's work and the main theoretical developments. Attention then turns to microfinance and the BoP in emerging markets, before focusing more specifically on Latin America as an important region of study. The chapter then using secondary data maps out the microfinance companies serving the BoP, and the Latin American countries in which they operate. This will allow scholars undertaking research on this area to more easily identify which companies and countries merit further and more narrow research at different levels, including a firm and individual level. Finally, we conclude with policy implications and future research directions.

BOTTOM OF THE PYRAMID: PRAHALAD AND BEYOND

The Peruvian economist Hernando de Soto (2000) calculated that up to half of the total economic activity undertaken in emerging markets takes place outside the formal economy. The scholar further states that the total unregistered assets among the world's poor accounts for US$9 trillion, a point acknowledged by Prahalad (2010). London and Hart (2004) have consequently suggested that within such an informal context, governments and firms should primarily build relationships based on social, rather than legal contracts. The work of these scholars has set the foundations and contributed significantly to research on how firms in emerging economies should look in a constructive manner at the people living at the bottom of the socio-economic pyramid.

There are different ways to define the bottom of the pyramid, and initially Prahalad and Hart (2002) in their seminal paper outlined the BoP as people living with an annual income of less than US$1,500 measured on purchasing power parity (PPP) basis. However, much debate has centred on this PPP threshold and this is due to the lack of rigour. The World Bank and other scholars use different thresholds and so there is clearly a lack of consistency, which is neatly pointed out by Karnani (2007). The World Resource Institute (WRI) and its partners have proposed a new definition and this threshold is based on an annual income of US$ 3,000 PPP in 2002 U.S. dollars, which is $3,260 when adjusted to 2005 U.S. dollars (London, 2007). According to the WRI threshold, the total amount of people living at the BoP across Africa, Asia, Eastern Europe, Latin America and the Caribbean accounts for nearly 4 billion people (Hammond, Kramer, Katz, Tran, & Walker, 2007).

Nevertheless, it remains very opaque, and it is complex to establish a consistent BoP definition when purely based on an income basis. An important issue to point out is that the national context in various emerging economies is different, with certain regions of the world exposed to higher levels of extreme poverty (people living on less than US$1.25 per day). At the same time there are studies that apply a rather general definition of BoP that is well above the US$ 3,000 annual income (Hart, 2005). Furthermore, there are important differences when we take into account rural poverty contexts (often the case with African countries), and urban poverty (often the case with the Latin America region). This distinction is fundamental, and well explained by Kolk, Rivera-Santos, and Rufin (2013) who point out that "the spending power on consumer goods in the shantytown of the three largest cities in Venezuela is between 5 and 10 times higher than that of the whole Indian rural BoP population" (p.15). It is the case also that some studies tend to segment the BoP and just focus on one specific tier (either taking the lowest or highest). These limitations illustrate how difficult it is to arrive at a universal definition for the BoP.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is due to this complexity we feel that the definition proposed by London (2007/2010) that views the Base of the pyramid as the poor at the base of the global socio-economic ladder, who primarily transact in an informal market economy as the most effective and reliable one.

One of the specific topics surrounding the base of the pyramid is how firms build businesses that target the BoP. Kolk, Rivera-Santos, and Rufin (2013) show that research views the BoP from two dimensions; the first refers to the role or position of the poor in the value network, meaning the extent to which the poor are viewed as customers. The second is the mode of engagement, which examines the extent to which targeting the BOP is based on existing or the 'co-invention' of products.

The opportunities at the BoP and the low-income segments are an intriguing proposition. However, what is less clear is how companies and particularly MNEs can effectively serve this large mass of informal workers and consumers. Prahalad (2005) suggested that there is an untapped purchasing power at the BoP, and that private firms can attain profits by selling to the poor. The underlying argument is based on the assumption that by selling to the low-income segments, companies can bring prosperity to the poor and this can contribute to alleviating poverty. From this perspective, it is suggested that MNEs should play a key role in this process. However, it is noteworthy that some authors like Karnani (2009a) view this with scepticism.

Other scholars, such as London and Hart (2004) have emphasised that strategies in emerging economies have to reinvent the transnational model if they want to target the BoP. The aforementioned authors suggest that MNEs that successfully devise strategies that rely "on leveraging the strengths of the existing market environment outperform those that focus on overcoming weakness" (London & Hart, 2004, p. 350). The same authors advocate three important strategies for the BoP, which include developing relationships with non-traditional partners, such as (NGO's, the local government, suppliers), co-inventing custom solutions, and building local capacity. The BoP approach suggests implicitly a market solution to poverty; however, since its inception the BoP has considered the poor mainly as consumers. More recently, it has been advocated that poor people should also be considered as producers (Karnani, 2007/2009a), self-employed poor people, otherwise known as micro-entrepreneurs (Gibson, 2007), or even looking at the poor in different points of value chains (UNDP, 2008).

Simanis and Hart (2009) formalized the idea that the poor should not be regarded just as consumers, but also as co-inventors of BoP initiatives. Karnani (2007/2009a) suggests that to alleviate poverty, it is necessary to raise the income of the poor and points out that buying from the poor is far more relevant than selling to them. He emphasizes that the majority of examples of BoP are based on the poor as consumers. The author goes further to suggest that the effective way to reduce poverty is through employment, and that the most effective organizational form to achieve this is small and medium enterprises (SMEs) in labour- intensive sectors. Karnani (2007/2009a) offers the example of China as one of the countries that have implemented the most effective poverty reduction strategy, where poor people have been given the chance to work in labour-intensive rather than in capital-intensive industries. This approach has been effective yielding strong results in China. Other emerging economies, such as India opted for different strategies (generating jobs through larger businesses), which has not achieved the same result. In his more recent work, Karnani (2009b) brings to light the example of Technoserve, an NGO that is able to generate thousands of jobs through specific investments in human capital to boost the creation of local SMEs in different developing countries, such as Asia, Africa and Latin America. However, the downsides are that it assumes a certain level of government involvement in the creation of a business environment for SMEs to grow, and the examples presented in the literature are scarce.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

A small group of scholars have pointed out the relevance of microfranchising as an approach to alleviate poverty. Gibson (2007) explains that microfranchising brings two parties together and brings mutual benefits to each party. It pairs talented microentrepreneurs who want to expand their business, but may lack managerial skills and capital to achieve this; with people who lack entrepreneurial skills, but desire self-employment. Kistruck, Webb, Sutter, and Duane Ireland (2011) advocate that microfranchising might provide a number of social benefits to microfranchisees and underserved communities.

Banerjee and Duflo (2007) show that the poor can be entrepreneurial, and show BOP consumers as being able to undertake several different types of jobs. However, it is a result of the lack of specialization and training that prevents them from obtaining higher incomes. An interesting finding in the literature is that the large majority of entrepreneurship examples at the BoP are not initiatives introduced by the poor (Anderson & Billou, 2007; Dolan & Scott, 2009), but examples showing the poor as producers (Altman, Rego, & Ross, 2009). Kolk, Rivera-Santos, and Rufin (2013) suggest that while there is a call for MNEs to collaborate and co-create with the poor, very little examples of this can be found in the current literature.

The review so far illustrates that there are different perspectives with respect to understanding the poor at the BoP, and how to alleviate poverty through different approaches. However, they all recognise to different degrees the potential or relevance of the BoP (Nghia, 2010). The majority of the studies conducted have viewed the poor as consumers, and much less have focused on the poor generating income, or the poor as key actors along the value chain, such as distributors, suppliers or employees (Kolk, Rivera-Santos, & Rufin, 2013).

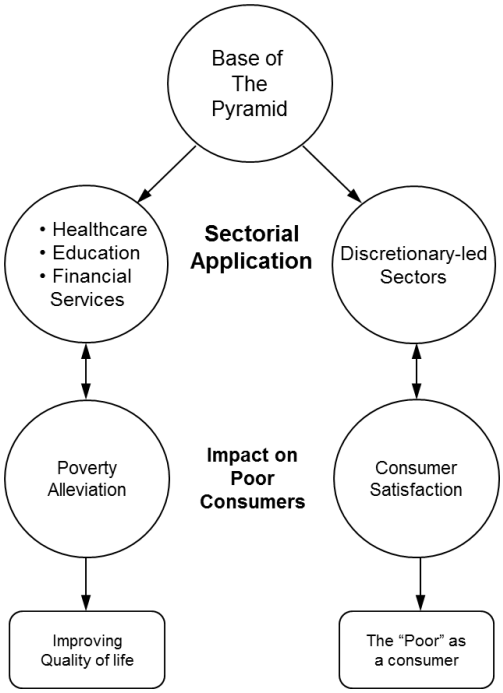
Another strand of literature within the BoP is linked with the initiators of BoP activities. In the initial work, Prahalad and Hart (2002) called for the active role of MNEs, and during the last decade few examples have appeared alongside those well known in the literature, such as Avon in South Africa, Cemex in Mexico, Hindustan Lever Ltd in India (Unilever in India). Despite these cases being MNEs, the majority of initiatives at the base of the pyramid seem to be developed by small and local firms. Cases have been studied, particularly in Asia and Africa showing how small companies have developed innovative solutions to alleviate poverty, particularly in the case of communication technology and mobile phone services (Anderson & Markides, 2007; Arnould & Mohr, 2005; Brinkerhoff, 2008). Another group of studies instead have shown initiatives that have been developed by not-for-profit organizations, and this is quite remarkable given that this goes against the initial idea of BoP. One thing that is clearly shown in the literature is that much more work is needed, in order to enhance our understanding with respect to the roles each of the following can play in BoP projects: MNEs, SMEs or NGOs, social entrepreneurs.

Finally, there is literature associated with the type of outcome related to the initiatives at the base of the pyramid. This is an extremely important section within the BoP literature since an ample of definitions or lens might be used to understand the BoP outcomes. The issue of the assessment and impact measurement of BoP initiatives is relevant and it has been raised by scholars as an important way to legitimize the market approaches to the BoP (London, 2009). Kolk, Rivera-Santos, and Rufin (2013) analyzed a comprehensive number of articles containing explicit measures of the economic impact of BoP initiatives, and they found that half of them did not actually measure the economic impact on the firm. Out of 34 articles that reported the economic impact on the firm, 25 reported a positive outcome for the company. The companies range from a microfinance company reporting positive profit margins (but without showing the actual profit margin) to a renewable energy firm in India reporting positive profit, but without any substantive data (Akula, 2008; Hart, 2005).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The social impact of BoP ventures was found in 48 out of a total of 104 initiatives, and this has been measured in terms of the impact on the local populations (Kolk, Rivera-Santos, & Rufin, 2013). The literature shows that different assessment criteria has been used from healthcare output to education, access to water and sanitation, to employment and income generation, and empowerment. However, only 28 of these articles were able to fully provide measurable results. One of the issues that need further attention in this research area is objective assessments of BoP initiatives, since the BoP concept deals fundamentally with poverty reduction. A minority of studies have focused on the environmental impact of BoP initiatives, and this may partially be explained by the main structural challenges often poor people have to face in their everyday life, which is linked with basic needs rather than with sustainable aspects of their life. The findings in this area show that empirical evidence of the economic, social, and environmental impact of BoP ventures is rather weak, and more work is needed here to better capture both impact assessment and trade-offs that firms must confront (Kolk, Rivera-Santos, & Rufin, 2013).

SECTORIAL PATHS AND THE BASE OF THE PYRAMID



It is clear to the authors that the most relevant and pending issues related to research on the base of the pyramid have been the sectorial application. We believe that doing business at the base of the pyramid in different sectors has different impacts on the poor, for example, the healthcare sector is not the same as the consumer retail sector. The reason for this is that when a sector provides poor people with access to a business solution (either a product or a service) that improves one's life then that specific venture is having an impact at the base of pyramid while conducting business. On the other hand, when a poor person has access to either a product or service related to discretionary spending (such as tobacco or alcohol) this will not improve their life, and can cause more harm (Karnani 2009b). For this reason, we believe that the key sectors that are better linked with the philosophy of the base of pyramid are: healthcare, education, and financial services. Retailing and consumer products still merit attention, but with the objective of better understanding how firms devise strategies to serve low-income segments. We believe that this is more relevant to the field of marketing, and such studies could adopt psychology perspectives which could be fruitful.

Figure 1 demonstrates the type of impact in terms of sector, with two different types of outcomes (Poverty alleviation vs. Consumer satisfaction), the latter relates to improving the purchasing experience of the poor). Applying this to the BoP would have a series of implications: on the one hand it may potentially and effectively improve the quality of life for the poor in terms of health, access to education, access to basic literacy, and knowledge with respect to the use of finance. On the other hand this embraces a more consumption based perspective (which we would argue resembles a 'pure free market ideology' applied to poor consumers), with the argument that the poor also need to have a decent customer experience. Given this dual approach to the BoP, we propose a simple framework that shows the likely approaches and the possible outcomes resulting from sectorial applications. In summary, figure 1 demonstrates that there are opportunities to alleviate poverty and improve the quality of life, or to provide a better purchasing experience for poor people.

We believe that the sectors previously mentioned, which are ones whereby poor people have more difficulty in finding good custom solutions at effective prices can realistically alleviate poverty. In the case of the healthcare, the case of Aravind Eye care system, pointed out by Prahalad (2005/2010) shows

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Sectorial paths and the base of the pyramid
(Source: Authors elaboration).

how radical business models may effectively improve the life for thousands of poor people, while being a viable business. Without these types of business solutions, many poor people would eventually die earlier than they should simply because for them it is not feasible to have access to certain healthcare services, which can be regarded as basic for Western standards. Education is intriguing and appears to be an untapped potential for the base of the pyramid (Stanfield, 2010). While for some readers the association of the terms 'business' and 'education' may seem overstated, there are a number of examples in rural India of private solutions in the education sector. The authors have found private schools serving low-income communities in developing countries (India in particular), which outperform public counterparts. This offers interesting insights with respect to how private sector education may contribute to the development of people living in low-income communities. This offers the poor learning opportunities that are affordable, compared with public schools and this is having a tremendous impact (Stanfield 2010).

Similarly, the financial service industry and in particular microfinance has a lot to offer. When using the term microfinance we are referring to financial services for micro-entrepreneurs, small businesses, and poor people that do not have access to formal banking channels and related services. The case of Grameen Bank has been well documented, and has become a popular case that has shown not only how microfinance in Bangladesh has helped thousands of micro-entrepreneurs to grow their business, but also how to start a culture of saving.

The following section of this chapter discusses microfinance, but before delving into this we summarise some important points from the BoP literature, and these are as follows:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Prahalad deserves merit for bringing the attention with respect to how businesses and particularly MNEs may find untapped opportunities at the base of the pyramid; meaning the low-income based socio-economic groups in society.
- BoP casts light on the large amount of people living below the poverty line or barely above it, and that have commercial needs.
- Early perspectives on BoP have failed to build a more constructive and sustainable approach for this segment as it considers engaging with the poor, mainly as customers (Karnani, 2007/2009a).
- Later approaches i.e. (Karnani, 2007; London and Hart, 2004/2011), have demonstrated that the base of the pyramid requires either co-building solutions with poor people or generating real employment opportunities for the poor, in order to raise their income level.
- We question the extent to which industries can aid poverty alleviation with respect to wants (discretionary spending). We believe that some sectors may require more marketing and psychology perspectives to better understand how companies can sell to the poor. Other sectors, such as financial services and more specifically microfinance offer more potential to tackle the issue of poverty.
- Important sectors to study include: education, financial services, healthcare. Further research is needed on the role of SMEs, microfranchising, and microfinance which have strong potential to alleviate poverty.

MICROFINANCE AND BOP

With the term microfinance, we are referring to the source of financial services for microentrepreneurs, small businesses, and poor people that cannot obtain access to formal banking channels and related services. In certain countries, such as Bangladesh or Bolivia microfinance has been extremely successful, and today represents an important segment with respect to bringing financial services to microentrepreneurs and poor people. Advocates of microfinance believe that access to financial services may contribute to poverty alleviation and improve financial inclusion. The microfinance business model is based on providing loans to people who do not have collateral to guarantee banks repayment of a loan. Microfinance can contribute significantly to the lives of poor people, for example weddings, emergencies, and even more long term investment opportunities such as improving a business or buying a land. Furthermore, microfinance is vital to poor people due to their lack of income stability, whereby they may not have money or sufficient funds when they face a specific need, and therefore need to borrow.

One of the best cases that resonates the importance of microfinance is the success of Muhammad Yunus and his Grameen Bank. Microfinance has often been linked with poverty alleviation and has received strong support from governments, NGOs, development agencies, economic and financial institutions. There is a general belief that microfinance represents a method that can aid with alleviating poverty and boost entrepreneurship, and a number of successes have been well documented. The microfinance concept was essentially designed in developing nations for developing nations, essentially to provide financial services to those that are left behind by the formal and mainstream channels and it has worked as a mechanism to fight poverty and achieve social inclusion. According to the Consultative Group to Assist the Poor (CGAP, 2011) 2.7 billion adults do not have full access to formal financial services. This view that providing financial services to people who do not own any assets as collateral is believed to contribute to poverty alleviation, for a number of reasons.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Carruthers and Kim (2011) believe that access to credit is sensible for the long-term prosperity of a business, and gives people the chance to plan for the future. Furthermore, it may also contribute to the accumulation of equipment and tools to improve business productivity and so there are opportunities for a rise in income (CGAP, 2014). Authors, such as Hermes, Lensink, and Meesters (2011) also link microfinance services with an improvement in terms of access to healthcare services and housing. The logic of microfinance challenges mainstream finance, and sets the foundation for low-income individuals to access credit for different purposes. The rise of microfinance in developing nations also has been accompanied by a certain degree of failure. It could be argued that state owned banks have neglected delivering services and products that target low-income individuals, and instead have increasingly served more the middle and high income classes. Microfinance is probably the most prominent tool that can aid with poverty reduction and business development. According to Berger, Goldmark, and Miller-Sanabria (2006) microfinance has enabled poor microentrepreneurs to access financial services to support the growth of their businesses and increase productivity.

Roodman (2012) points out that microfinance serves at least 150 million clients around the globe. The mechanism of microfinance is based on small loans to poor people that often do not have the formal assets or guarantees to obtain credit through formal channels (banks but also other credit vehicles). In this sense, microfinance is able to provide a small amount of money that can allow microentrepreneurs to grow their business until they move out of poverty. While this concept looks attractive the reality is more complex, as different authors have shown that microfinance outcomes are not fully clear. Banerjee and Duflo (2011) show that in different cases and certain regions, microfinance loans are taken for consumption purposes rather than for productive purpose (i.e. increasing the productivity of a business). Karnani (2007/2009a) also pointed out that the outcome of microfinance is not clear and while in some cases it has proved to be successful, in other cases there was no evidence of poverty reduction at all.

Microfinance has grown remarkably since its foundation in the 1970s. By the end of 2009, more than 3,500 Microfinance institutions (MFIs) reached around 190 million households and 640 million poor people according to the microcredit Summit Campaign Report (Reed, 2011). In 2009, Wharton Business school published a list of the top 30 innovations over the past 30 years and microfinance made this list, with an entry at number 17 (Wharton, 2009). It is quite fascinating how the industry has evolved tremendously since the initial concept can be viewed negatively by both parties involved: institutions offering loans to poor people with no credit history or collateral and poor people wary of accumulating debt. However, organizations that provide such a service to the poor are known as microfinance institutions, which can vary in size. The positive results from expanding portfolio of microloans accessed by the poor have remedied the perception of the poor as a risky segment (Helms, 2006; Pantelić, 2013). Overall, we believe that this sector has much to offer in terms of alleviating poverty and improving the lives of the poor; whether it is the poor accessing capital for business development or emergency needs.

MICROFINANCE AND BOP: THE LATIN AMERICAN CASE

Latin America represents one of the most dynamic regions within the emerging economies, and this due to its unique business environment. Latin America is characterized by institutional voids, corruption, lack of rules of the game, high microeconomic volatility, arbitrage opportunities, large natural resource availability, and numerous low-income consumers (Vassolo et al, 2011). Interestingly, other business research strands such as entrepreneurship and family business which have started to dedicate research

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

toward Latin America, share this view. For instance, authors such as Nordqvist et al (2011) explain that Latin America needs to overcome many obstacles as industry environments are uncertain and hostile. Problems in Latin America include weak property rights and business networks, lack of access to financing, rigid regulations and security issues among others. Despite this, the aforementioned authors argue that there is potential for research and cite a report by Ernst and Young (2010) which argues that it may be the best time to start or grow a business in the region as trade relationships have increased and economic institutions have become stronger.

As it has been emphasized in other studies, Latin America is characterized by an overall large informal economy (UN, 2009), and a large number of informal microenterprises (de Soto, 2000). The GDP estimates of the informal economy account for around 51% of employment in Latin America (Webb, Bruton, Tihanyi, & Duane Ireland, 2012). Informality is defined as the entrepreneurial activities that cover certain market-based initiatives that take place within informal boundaries and outside formal institutional ones (Bruton, Khavul, & Chavez, 2011). Therefore, Latin America represents an appropriate environment for research where the informal economy is widely accepted and acknowledged as a norm among the poor. In the literature, a large proportion of the BoP initiatives studied have centred on India, and much less attention is given to Latin America (Kolk, Rivera-Santos, & Rufin, 2013).

The 2013 edition of *Microscope, a* comprehensive report on the world's microfinance business environment produced by the Economist Intelligence Unit (EIU) demonstrates that Peru and Bolivia are the top two countries among the 55 countries in the world. Peru has held the top spot for six consecutive years, while Colombia, El Salvador, and the Dominican Republic all occupy places in the top ten (IDB, 2013).

Microfinance institutions in Latin America have had much success in expanding financial services to underserved communities. Latin America and South East Asia are the two regions whereby microfinance has expanded the most, and since the 1980s the number of clients has grown gradually (Navajas & Tejerina, 2006). Brazil was the country that pioneered and developed microfinance in Latin America during the 70s. However, due to difficult social conditions, microfinance only expanded throughout the region from the 80s (LAB, 2012). By 2009, microfinance institutions in Latin America had served around 10.5 million people and reached a loan volume that exceeded US$12.3 billion. This is a result of the expansion in the number of institutions offering microfinance, and the number of customers or clients that are served (Cotler & Aguilar, 2013). However, as the aforementioned authors point out that there are many differences between countries, and explain that Peru performs well in terms of the institutional development and rank highly in terms of the regulatory framework. Mexico, meanwhile ranks significantly lower in terms of the regulatory framework for microfinance, and even more poorly compared with Peru with respect to the institutional development of the sector. This is an interesting observation as Mexico is a much larger market, and likely has a greater need for microfinance services, yet it is underdeveloped when compared with Peru.

Despite the hype around microfinance and authors advocating its importance, it is unclear to what extent it can alleviate poverty. This remains unclear as most evaluations are based on the financial performance of MFIs, rather than evaluating the level or effect on poverty alleviation (Pantelić, 2013). There are those who are more sceptical with respect to the effect of the industry's potential to alleviate poverty, and advocate that microfinance may not be a sufficient way to establish economic and social development in a manner that can be sustained (Bateman, 2010; Bateman & Chang 2009). Although the same authors acknowledge that microfinance plays an important role in Latin American economies with respect to boosting business activities, at least in the short term. We believe that microfinance is one of the three key industries that have the potential to alleviate poverty, but agree that more comprehensive

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and longitudinal studies are needed that measure and focus on the impact of the industry with respect to reducing poverty.

In the following section the authors provide factors that entrepreneurs need to be aware of when engaging with the microfinance industry in Latin America.

MICROFINANCE AND ENTREPRENEURSHIP IN LATIN AMERICA

In the majority of emerging economies in Asia, Africa and Latin America, a large number of the employment comes from the informal economy, and a large number of these people work as microentrepreneurs. Another feature of many emerging economies is that important segments of the population live below the poverty line or slightly above it. This represents an important challenge as the economic and demographic profile is different when compared to developed nations. However, these are potential business opportunities that result from large segments of the population who are willing to increase their level of consumption.

The presence of institutional voids in emerging economies often leads to ineffective and/or inefficient goods and financial markets, which generate unproductive mechanisms that connect supply and demand. Entrepreneurs often have to face challenges to successfully fill these voids. However, these gaps in the functioning of markets and institutions provide opportunities to entrepreneurs. One of these opportunities is precisely the ability to provide access to capital for micro-entrepreneurs and poor consumers. From a business perspective, entrepreneurs potentially have the chance to fill this 'gap' on the lack of access to capital for people without collateral or assets, and who normally would not have access to capital through commercial banks by putting in place a profitable business model. This implies that entrepreneurs working and providing microfinance services can potentially act as social entrepreneurs, or agents of social change that improve the life of poor people, and at the same time build successful and profitable business models. Entrepreneurs interested in filling business opportunities in the microfinance sector should take into account the following factors:

1. **Microfinance in Different Contexts:** There is a need to understand the different ways in which microfinance is implemented in different countries within Latin America. It is important to stress that income per capita is not the only variable for entrepreneurs looking at microfinance as a business opportunity. For example, Bolivia is a country where people are very familiar to the solidarity-based mechanisms behind microfinance through systems such as the 'pasanaku'. Local communities in rural areas are used to obtaining loans where the community guarantees the repayment of the person who took out the loan. This type of deeply rooted mechanisms, while they do not represent the success of microfinance in Bolivia per se, they still provide a more complex picture of why microfinance institutions can work well in certain countries. On the other hand, evidence from Argentina (and specifically from the province of Buenos Aires) where a number of poor people used to be middle class, shows that this specific type of social composition often does not fit with the profile of potential microfinance customers (Curat, Lupano & Adúriz, 2006). This explains the partial failure of microfinance in Argentina compared to many other countries in Latin America, such as Ecuador, Bolivia, or Peru. Therefore, it is important to understand the type of poverty within each context and the specific mechanisms of social organization within communities.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. **Methods of Scaling-Up Microfinance Institutions:** One of the biggest challenges in Latin America is to gain access to enough capital to allow microfinance institutions to obtain long term growth. This is due to the limited size of the financial markets within the region and the number of requirements needed to secure this capital. This represents a potential a major barrier for entrepreneurs and can be overcome by forming strategic alliances with key market players in industries such as food processing and retail.
3. **Product Diversification and Promotional Methods:** While in Latin America microfinance often means providing credits to individuals (or group credit), it is more difficult to identify microfinance institutions with a large and sophisticated portfolio of loans dedicated to microentrepreneurs and micro firms. Entrepreneurs should make a strategic choice about the type of offering to their clients depending on the risk appetite. Entrepreneurs should increase their offering to include other services such as savings or investment, while minimizing losses on their loans and applying customised based solutions to local needs. Entrepreneurs need to promote their products beyond the mainstream outlets (television and radio advertisements). Instead they should promote the services in places that are truly relevant to the local community, for example promoting services in local schools, churches, or other venues that has a strong relevance to that community.
4. **Leveraging Social Reputation:** Latin American entrepreneurs' reputation is not usually perceived highly among local populations. However, social leaders' reputation within the region is often regarded more favourably. Therefore, it is advised that entrepreneurs should establish ties with social leaders in order to have a greater impact on the society. This could be achieved by working with local NGOs and other social leaders.

The following section of this chapter turns to the secondary analysis with the main objective of identifying the state of microfinance in various countries within Latin America. At the same time the authors aim to identify important companies and some of their characteristics that can be used in future studies, particularly those focusing more on a firm level.

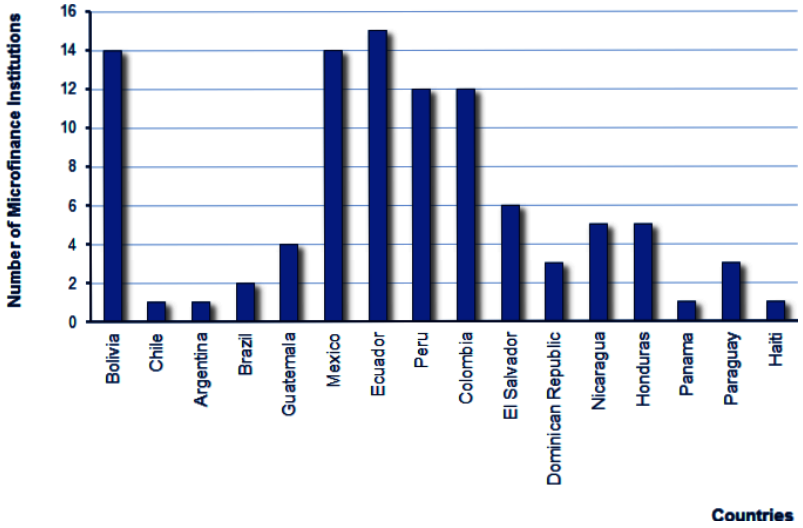
MAPPING OUT COUNTRIES AND MICROFINANCE INSTITUTIONS

In this section we set to map out the main microfinance institutions in Latin America. Figure 2 shows the number of microfinance institutions ranked by the Multilateral Investment Fund of the Inter-American Development Bank in Latin America. The data compiled and presented shows that there are a group of countries in Latin America that are clearly represented (see Figure 2). The most standout countries include Ecuador, Bolivia, Mexico, Colombia and Peru, whereby the number of microfinance institutions is relatively high. There is a second group of countries with a smaller number of institutions, but with a significant representation, and these are El Salvador, Nicaragua, Honduras, Paraguay, Guatemala and the Dominican Republic. Finally, there is a group of countries with a more limited number of successful and large microfinance institutions, and these are Chile, Argentina, Brazil, Panama and Haiti.

There are a number of reasons why microfinance is more developed in some countries compared with others, and here we will offer a possible source of analysis to understand these differences. Using secondary data offered by different organizations, such as the Inter-American Development Bank, the World Bank, or the World Economic Forum, Figure 3 shows on one axis the number of microfinance institutions in each country and on the other the rank of each country in 'starting a business' according

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. The number of microfinance institutions by country
(Source: Authors based on MIF-IDB data, 2013).



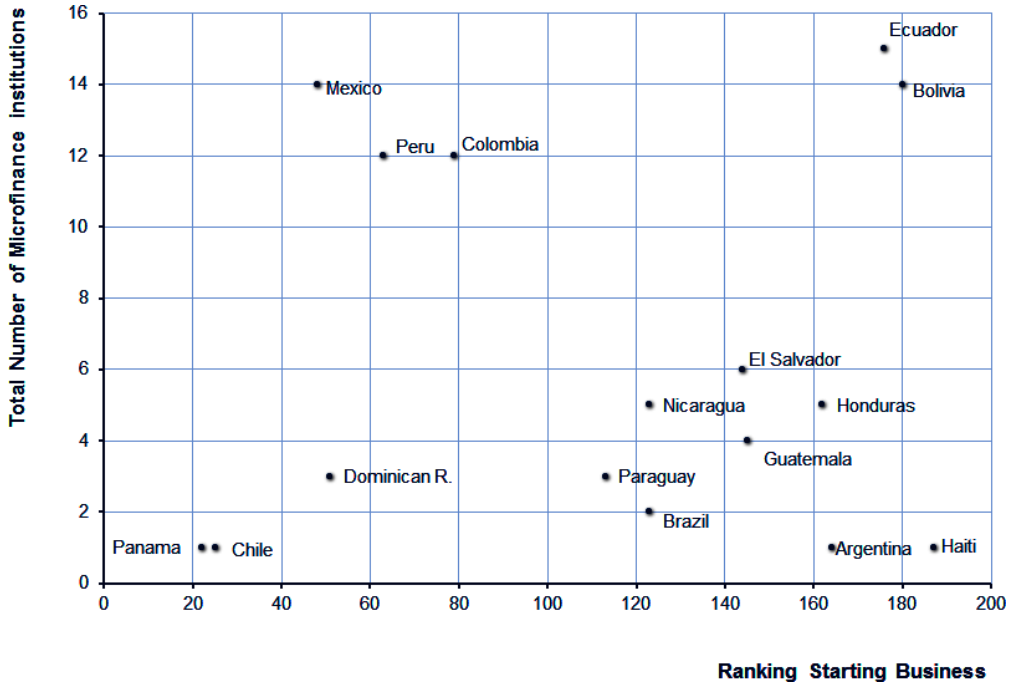


Figure 3. Number of microfinance institutions and ease of starting a business
Source: Authors analysis based on MIF-IDB data, 2013 and World Bank Data Ease of Doing Business, 2013.

to the World Bank. Starting a business which is related to entrepreneurship represents one of the main sources of growth and development in countries around the world, and this becomes even more important in the case of developing countries. For entrepreneurs, the access to capital is a critical aspect for their activity, and therefore we aim to understand how in terms of 'ease' it is to start a business in different

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

developing countries within Latin America. This allows us to understand possible links with the presence of a strong or weak microfinance industry in a given country.

The data shows no potential link between the number of microfinance institutions and the ease of starting a business in a country. Microfinance seems to prosper both in Bolivia, which ranks 180th in the world for starting a business, and in Mexico, a country that ranks pretty well in terms of 'starting a business'. In a similar fashion Peru and Colombia show an important number of microfinance institutions and a positive performance in starting business procedures. The data however does not support the perspective that there could be a link between the number of procedures and days required to start a business and the number of microfinance institutions. Countries, such as Chile and Panama that rank very well in starting a business have a low and similar number of institutions, while Argentina and Haiti, which have a low ranking in terms of ease of starting a new business, rank very poorly.

An element that may be linked with the development of microfinance institutions in Latin America is the financial market development of a given country. To measure the financial market development, we used the indicator offered by the WEF Ranking on Competitiveness 2013-14, and this includes the following variables:

- Availability of financial services
- Affordability of financial services
- Financing through local equity market
- Ease of access to loans
- Venture capital availability
- Soundness of banks
- Regulation of securities exchanges
- Legal rights

Figure 4 shows that in the countries where microfinance is more developed there is a medium level of financial market development, and these countries include Ecuador, Mexico, Colombia, Peru and to some extent Bolivia. A number of countries, such as Argentina, Chile, Haiti, and Panama all rank poorly. The Central American countries, such as El Salvador, Nicaragua, Honduras and Guatemala have a decent number of microfinance institutions and show a medium level of development with respect to their financial markets.

The data analysed could support the idea that further empirical studies are needed to test the effect of the relationship between the level of financial development in a given country and the development of the microfinance institutions there. Figure 4 may offer different interpretations about the impact of financial development on the microfinance industry. However, clearly there are also other factors to take into account, such as the rule of law, corruption levels, the number of micro-entrepreneurs, SMEs, and MNEs in a given country, the overall levels of poverty, and type of poverty (rural/urban). These issues could be part of a larger empirical study that could be conducted to further assess the impact of the financial market development.

The analysis undertaken based on the Inter-American Development Bank data interestingly demonstrates that in Latin America the main microfinance institutions offer loans targeting micro-enterprises rather than individual consumers. It appears to be that only in a few countries, including Mexico, Ecuador, Peru, Colombia and Paraguay there is a growing presence of microfinance institutions that focus their portfolios toward the pure consumption side, rather than microenterprises (see Figure 5).

Our view is that government should bring more incentives to further expand microenterprise led MIFs as they can further contribute to the development and growth of entrepreneurs who will be responsible for generating more prosperity and jobs in a country.

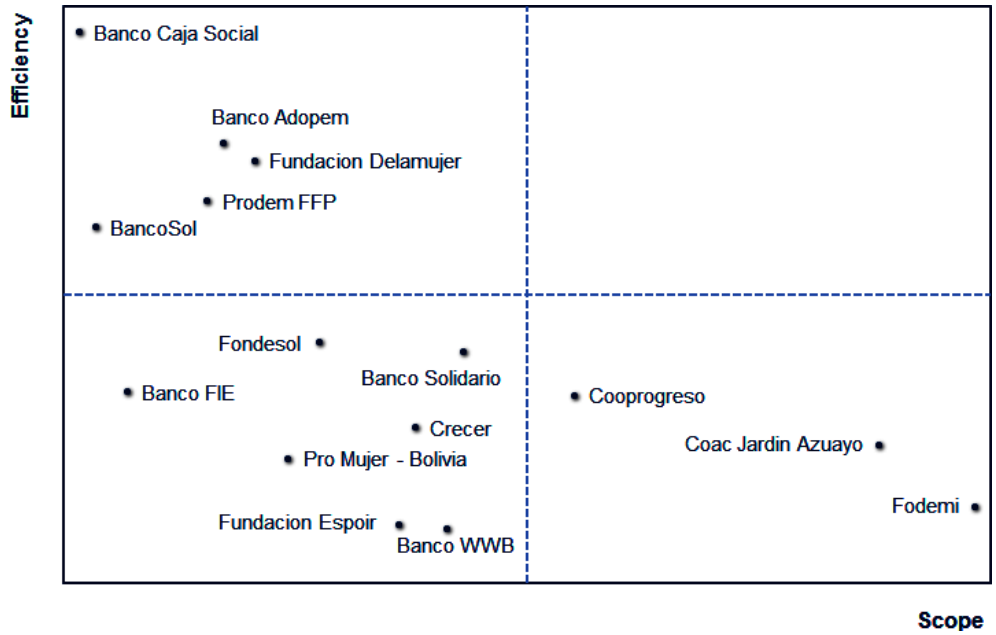

Figure 6 is company based and shows the top 20 companies ranked by the Inter-American Development Bank in terms of scope and efficiency. One of the most interesting insights from the data is that there is a polarization between the microfinance institutions in Latin America. There are insitutions that tend to be very efficient and those which tend to expand their scope; however, none of them seem to be capable of combining these two aspects (see Figure 6). Furthermore, we introduce Figures 7 and 8, which go further by mapping out the microfinance institutions according to the loans provided by the gross portfolio of loans (Figure 7 illustrates this for microenterprise loans, while Figure 8 illustrates this for consumption loans).

We conclude this section with a case study on BancoSol (Box 1). This briefly illustrates that despite the difficult institutional environment and the number of economic problems the country has faced, BancoSol has emerged as one of the best microfinance institutions in the world. Following this, we move on to implications and future directions before concluding this chapter.

IMPLICATIONS FOR POLICYMAKERS AND PRACTITIONERS

Policymakers in Latin America need to devote attention to the creation of more microfinance institutions, and this can be accomplished by offering tax incentives for entrepreneurs. There is a need to devise and implement strategies that allow local financial markets to be more transparent and improve the access to capital.

Box 1. BancoSol in Bolivia

Bolivia used to be considered as one of the least developed countries in Latin America. With a population of 9.5 million inhabitants made of members belonging to different ethnic groups in the country, Bolivia represents a unique nation with different geographical, economic and social challenges. In 1985, the country suffered one of the worst economic crises in its history. The country experienced hyper-inflation, and between 1982 and 1986 the GDP showed a negative rate of -3.4% and public debt reached 25% of the GDP. During the years 1993-1998, the country experienced a strong period of growth, only to fall again in 1998 into an economic crisis driven by different external and internal shocks. The political side like the economy also showed a similar instability

With this historical events and a mix of poor policies, the country generated a large mass of unemployment and people who did not have any access to credit. During the 80s the first NGOs offered microfinance services, while later several of them transformed into "Fondos Financieros Privados" (FFP), a small financial entity specialized in offering micro-loans and financial services. These institutions were able to serve these consumers through a mix of methodologies, including: solidarity-based groups, individual loans, and city-banks. The three approaches used different guaranty systems for the bank.

BancoSol was initially funded through the funding of PRODEM, the USAID, and other NGOs. Banco Sol initially offered only 3 types of products: medium-term deposits, solidarity-based loans, and short-term deposits. The typical loan was on average US$100 with a return period of 2 months. The banks employees undertook long periods of fieldwork sessions in order to better know and understand the local community, who were their clients. 75% of the people working for BancoSol were women with social science backgrounds. The group proved to be successful until the end of the 90s when Banco Sol started to face serious problems.

During 2000-2004 BancoSol developed a new strategy to regain competitiveness once again. Among the measures taken that allowed the company to grow again was the methodology known as "CAMEL", which was based on a more complex approach to evaluating clients, but also changes in the commercial areas with a new portfolio of products, and a strong innovation with respect to the bank's information system. It can be argued that BancoSol is one of the most successful microfinance institutions in the world.

Source: based on Caballero, and Melgarejo (2005). Banco Solidario S.A. La estrategia de recuperación, 2000 – 2004. INCAE Business School.

It is recommended that governments actively create financial markets designed specifically for microfinance institutions. As commercial banks have access to capital at low interest rates, this is not available or specifically designed for smaller microfinance companies. It is suggested that governments implement policies to create such an environment whereby microfinance institutions can access capital from a wider range of sources, including people from the general public. The authors believe this to be a possible avenue that governments can explore further as it allows benefits to both parties involved in the exchange process. The general public are given opportunities to invest with the aim of making a return on their investment (different to no-profit organisations), and can do so with a conscience and a feel good effect. At the same time this provides microfinance companies with capital from a wider range of sources.

Programmes are needed that allow people at the BoP to understand the procedures and benefits of using formal lenders to access capital. There should be nationwide programmes that are included in schools so that those at the BoP can understand microfinance at an early age and become more familiar with this channel for accessing credit.

It is important that new policies implemented take into account the successful companies that are profitable and have a proven track record. Studying these cases will offer much on two fronts; firstly, it allows policymakers to understand how successful strategies were devised and how these can be replicated and contribute to frameworks and guidelines for other firms to follow. Particular attention needs to be paid to innovative non-profit organisations, such as Kiva which connects people by leveraging the internet and a worldwide network of microfinance institutions to reduce poverty. People can help create opportunities around the world by lending as little as US$25 (Kiva, 2014). This idea of utilizing the web and building networks with microfinance institutions are a model to be studied with objective of contributing to policies that can aid access to credit. Secondly, it will allow policymakers to understand what aspects of microfinance models needs to be addressed so that existing barriers can be tackled and removed.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

For practitioners, the importance of business scope and efficiency merits significant attention. More is needed in terms of understanding and studying microfinance business models and the way they operate. In our chapter we pointed out that existing firms in Latin America are only able to focus on efficiency or scope but not both, and what is needed is a deeper understanding as to why this appears to be the case. Is there a way that existing models can be adapted or changed in such a way that both are achieved? Practitioners working with microfinance institutions need to devote more effort to understanding this issue. Understanding polar cases would yield interesting perspectives, for example, the microfinance company Banco Caja social in Colombia ranks high in terms of efficiency, but poorly in terms of scope, and this is in sharp contrast with the Ecuadorian firm FODEMI.

FUTURE RESEARCH: MOVING FORWARD

It is clear that a deeper understanding of strategic segmentation of the microfinance institutions is needed, according to their portfolio orientation. The field would highly benefit from a firm and individual level or unit of analysis. For example, it would be interesting for research to investigate and compare at a firm level the successful and unsuccessful firm strategies devised and implemented. In addition to this, formal lending institutions could be compared with informal lenders, as this will allow the field to better understand the practices of both types (Ayyagari, Demirguc-Kunt, & Maksimovic, 2007; Tsai, 2004). Longitudinal studies are needed that study firms serving the BoP over time, in order to uncover if strategies implemented are not only successful, but are ethical and sustainable. Therefore, we encourage firms to serve the BoP, and to do so in such a way that corporate social responsibility is at the heart of their ethos. Measuring the impact of microfinance institutions in terms of reducing poverty requires further attention, as some scholars believe this has been exaggerated and remains unclear. There needs to be a shift away from measuring success based on the growing number of loans and institutions, and a move toward measuring poverty reduction.

Research on SMEs and the decision making process at an individual level would be insightful. More research is needed that uncovers the way managers evaluate opportunities and perceive risk. Studies are needed that investigate those at the BoP as producers, rather than viewing poor people only as consumers. Research needs to be undertaken in many regions, not only Latin America, but Africa and the Middle East so that the best practices adopted by successful firms can be identified and possibly tested in other parts of the world. Although it can be argued that every emerging market is unique with its own institutional and cultural environment, it is still possible that some universal themes or principles that are relevant to other contexts can emerge.

An increasing number of scholars within the field of International Business (IB) have emphasised the need to move research forward. Buckley (2002) explained that the IB research agenda had stalled due to the lack of 'big questions' to guide future research. In addition to this, Buckley and Ghauri (2004) suggested that the big question could indeed be globalisation and its driving forces. Indeed a number of IB scholars have undertaken research and shown interest on MNEs and global poverty reduction (Ghauri and Buckley, 2006; Jain and Vachani, 2006; O'Brien and Beamish, 2006), and this has potential to offer exciting and fruitful research opportunities. MNEs and SMEs targeting the BoP and contributing to poverty alleviation in a sustainable and ethical manner should be another big IB research strand. For example, there is plenty of scope for international business scholars to be involved, particularly those researching firm behaviour. Future research could investigate the paths of internationalization pursued

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

by microfinance companies, and how they adjust their strategies and organisational structures in foreign markets to serve BoP consumers. It is here we argue that there is a potential for a strong intersection of two fields: strategy and IB. If again we turn our attention to the example of Kiva, we can see opportunities with respect to understanding the internationalisation process of lending institutions that make use of the web for people at the BoP.

CONCLUSION: A FINAL THOUGHT

The purpose of this chapter was to review literature on the BoP, and we began broadly before specifically focusing on microfinance. Using secondary sources, we mapped out microfinance companies operating in Latin America that serve the BoP. We strongly believe that a number of sectors can help alleviate poverty, while other sectors are not deemed as effective or are better understood from marketing perspectives, such as discretionary led sectors. There are still plenty of research opportunities as stated in the future research section of this chapter. We advocate that scholars continue to explore concepts and approaches to BoP that enlighten the field with a better understanding of e.g. the role of SMEs, and how firms devise and implement successful, responsible, and ethical strategies, to name a few.

Trust is an important underlying theme and is central to microfinance and the BoP, and this is supported by Sriram (2005). From the lenders perspective, they need to trust that the poor can repay their loans, while in turn the poor need to trust companies if they are to engage with them and move away from informal lenders, which have been prevalent in some countries. Trust is the foundation, and this is why we advocate that firms adopt long term visions and adopt strategies in an ethical and responsible manner. We strongly recommend that more exploratory research on the BoP is conducted with strong policy implications. Only then can we offer pragmatic solutions to tackle poverty, and move one step closer towards alleviating it.

Chapter 6
Youth Engagement in the Era of New Media

Yoshitaka Iwasaki
University of Alberta, Canada

ABSTRACT

Contextualized within the popularity of new media, youth engagement is a very important concept in the practice of public involvement. Guided by the current literature on youth engagement and media studies, this chapter examines the key engagement-related notions involving youth and media usage. Being informed by a variety of case studies on youth engagement through the use of media within various contexts globally, the chapter discusses the opportunities and challenges of engaging youth through media usage. The specific notions covered in this chapter include: 1) the role of "hybrid" media in youth engagement; 2) "intersectionality" illustrating the diversity of youth populations and their media usage; 3) meaning-making through media usage among youth; and 4) building global social relationships and social and cultural capital through youth's media usage. Importantly, the use of new media can be seen as a means of reclaiming and reshaping the ways in which youth are engaged, as key meaning-making processes, to address personal, social, and cultural issues.

INTRODUCTION

Occasioned by the rise of new media, engaging youth in the practice of public involvement presents both opportunities and challenges in our increasingly global society. Guided by the current literature on youth engagement and media studies, this chapter will examine the key engagement-related concepts involving youth and media usage. By combining practice-based accounts with theoretical insights, the chapter will provide critical analyses and interpretations of empirical data from local/regional, national, and international case studies on youth engagement through the use of media. Specifically, attention will be given to how new and traditional media is being applied to youth engagement in international socio-political contexts. Broadly, the chapter will discuss the opportunities and challenges of engaging youth through media usage.

A key argument emphasized in this chapter is that hybrid forms of communications through digital and social media, face-to-face interactions, and traditional media can promote youth engagement, in which relationship-building (both within youth and between youth and adults) is a critical concept. Another main argument is that appreciation of the diversity of youth populations and their media usage from an intersectional perspective is essential to better understand the ways in which youth are engaged via media that can provide meaning-making, for example, on identity and cultural issues. Briefly, an intersectional framework addresses the complex ways in which the *key axes of power* in society (e.g., gender, race/ethnicity, class, ability, sexual orientation) intersect with each other (Crenshaw, 1995; Garnets, 2002; Iglesias & Cormier, 2002). In addition, the chapter suggests that youth engagement through media usage can help build global social relationships and social capital and can facilitate a youth-led transformation of our society to address social justice issues. Importantly, such multi-media usage can provide youth with creative outlets for civic engagement, community connections, and meaning-making within their lives.

In particular, this chapter posits that meaningful youth engagement is a key concept for both positive youth development (PYD; Alicea et al., 2012; Delgado, 2002; Lind, 2008) and social justice youth development (SJYD; Cammarota, 2011; Gharabaghi & Anderson-Nathe, 2012; Ross, 2011) and facilitates social/system change to more effectively support youth (Blanchet-Cohen & Salazar, 2009; Davidson et al., 2010; Yohalem & Martin, 2007; Wexler et al., 2009). Indeed, the integration of PYD and SJYD is proposed applicable to the use of hybrid forms of communications to promote youth engagement and development by appreciating the diversity of youth populations and their media usage (from an intersectional perspective), and by promoting meaning-making and social capital, and to facilitate a youth-led/guided transformation of our society to address social justice issues. Importantly, the power of youth in social change should not be underestimated, and this role can be effectively promoted by the use of hybrid forms of communications for youth engagement.

Accordingly, the chapter will address such concepts as "intersectionality," "meaning-making," and "global social relationships and social and cultural capital" to appreciate the diversity in the types and forms of youth engagement through media usage. Before describing each of these key concepts, the chapter will begin with summarizing a framework of PYD and SJYD and then providing insights into the role of various forms of media in youth engagement broadly.

POSITIVE YOUTH DEVELOPMENT (PYD) AND SOCIAL JUSTICE YOUTH DEVELOPMENT (SJYD)

Youth's media usage is seen as a key youth-engagement activity, which has significant implications for youth development (Conner & Slattery, 2014; Dedman, 2011; Garcia et al., 2015; Kahne et al., 2012). Two of the most popular concepts concerning youth development include positive youth development (PYD; Alicea et al., 2012; Delgado, 2002; Lind, 2008) and social justice youth development (SJYD; Cammarota, 2011; Gharabaghi & Anderson-Nathe, 2012; Ross, 2011). First, PYD seeks to promote a variety of developmental competencies that young people need at individual, social, and system levels to become productive, contributing members of society (Alicea et al., 2012; Ersing, 2009; Lind, 2008; Yohalem & Martin, 2007). Rather than a pathological focus, PYD adopts a holistic view of development, giving attention to youth's physical, personal, social, emotional, intellectual, and spiritual development, and emphasizes the strengths, resources, and potentials of youth (Alicea et al., 2012; Ersing, 2009; Lind, 2008; Yohalem & Martin, 2007).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Second, SJYD involves youth's awareness of their personal potential, community responsibility, and broader humanity, and the engagement in social justice activities that counter oppressive conditions (Cammarota, 2011; Gharabaghi & Anderson-Nathe, 2012; Ginwright & James, 2002; Ross, 2011). Specifically, SJYD involves a critical analysis of social, economic, and political factors including race, gender, class, and culture, and addresses the systemic root causes of community problems (Suleiman, Soleimanpour, & London, 2006; Wilson et al., 2006). Importantly, the integration of PYD and SJYD conceptually supports the vital role of youth as a proactive agent for changes at personal (e.g., self-identity; constructive behaviours), social (e.g., advocacy for social change), and community (e.g., policy and practice change from social justice perspectives) levels (Ross, 2011). Accordingly, these two concepts will be considered as a key framework throughout the chapter.

The Role of "Hybrid" Media in Youth Engagement

Research has shown that the optimal use of digital and social media can complement and strengthen face-to-face interactions and traditional media, supporting the role of hybrid forms of communications in promoting youth engagement. Specifically, hybrid communication methods including various forms of politically driven, nonpolitical interest-driven, and friendship-driven online participation have been shown to promote youth engagement and youth activism (e.g., Chan & Guo, 2013; Kahne et al., 2011; Xenos et al., 2014). For example, Conner and Slattery (2014) reported the efforts of the Philadelphia Student Union, using the youth-led hybridization principle of social movements that combine online/new/informal and real-world/traditional/formal activism. In particular, their study showed how "youth organizing" through the use of new media offers a bridge across the three divines (the academic achievement gap, the digital participation gap, and the civic engagement gap) and facilitates the digital literacy, civic engagement, and academic achievement of low-income youth of color who might otherwise experience limited opportunities in these domains. Youth organizing refers to "a strategy that trains young people to engage in collective action to improve the institutions in their communities that directly affect them" (Conner & Slattery, 2014; p. 18). Youth organizing has implications for youth engagement and public involvement through hybrid forms of communications and activism.

The importance of hybrid media systems and public spaces is further demonstrated through the use of different media platforms and online and offline spaces that reinforce one another and promote youth engagement and youth-led social and political movements. Sloam's (2014) paper reported such importance using four case studies to examine the role that the Internet and new media have played in the political mobilization of young Europeans. Specifically, four case studies (in Germany, Italy, Portugal, and Spain) highlighted the stories of young, highly educated 'stand-by citizens' who have become activated by crises of youth unemployment, frustration with politics and public policy, and anger with corporate greed into 'digitally networked action' utilizing new technology platforms. The new media also provided a central tool to directly appeal to citizens (particularly, the young and highly educated) and facilitate youth-oriented movements in the digital age without having to play by the rules of the old media or channel their energies through established political institutions (Sloam, 2014).

Also, the use of digital media has been shown to mobilize young people into more active engagement with civic and political life through deliberative activities in schools, democratic peer norms, news consumption, and citizen communication. For example, Lee et al.'s (2013) examination of the national panel survey of parent-child pairs — the Future Voters Study — emphasized the centrality of communication, whether at schools, among peers, or through the media, to youth engagement in civic and political life.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Results indicate that information consumption through hybrid forms of traditional and digital media works through citizen communication to encourage civic engagement, including influences stemming from peers and schools onto civic engagement. Specifically, the results show strong online pathways to youth participation and engagement especially through news consumption and political expression via digital media technologies (Lee et al., 2013).

Using data from Dutch grade-eight students, van Kruistum et al. (2014) examined youth media lifestyles that encompass new media, traditional print-based media, and face-to-face (offline) interaction as "hybrid" forms. This examination was completed by exploring both interest-driven media engagement (e.g., for entertainment, to gain knowledge) and friendship-driven media engagement. They found four distinct media lifestyles defined in terms of:

1. The medium through which a particular media activity took place,
2. The social distance involved between sender and receiver, and
3. The function of the particular activity.

These youth-media lifestyles were named as:

1. ***Omnivores:*** *Appropriating all media for multiple functions in diverse social contexts,*
2. ***Networkers:*** *Staying connected with known others across offline and online,*
3. ***Gamers:*** *Specializing in a medium of entertainment within a distant social context, and*
4. ***Low-Frequency Users:*** *Not bringing offline interests and relationship online (van Kruistum et al., 2014).*

Such study is useful to better understand the diversity in youth media lifestyles.

Drawing on international survey data from mentoring program staff and volunteer mentors primarily in US and Canada, Schwartz et al. (2014) examined the use of digital and social media in youth mentoring relationships. Their findings show that this media use does not seem to detract from the closeness and quality of face-to-face mentoring relationships, but may actually supplement and strengthen them. The findings also highlight the importance of creating an environment of reciprocity and mutuality, and reducing the chance of shaming and patronizing youth. Relationship-building (both within youth and between youth and adults) is a critical concept in youth engagement, which can be facilitated by the optimal use of new media that can complement face-to-face interactions and traditional media, again, supporting the effective use of hybrid forms of communications (Schwartz et al., 2014).

Also focusing on the use of hybrid forms of media, Skoric and Poor's (2013) study with young people in Singapore examined how youth navigate between the traditional and new media for civic and political participation. They found that social media use is positively related to traditional political participation (because new media are a means for political mobilization and organization of citizens due to their low barriers to entry and quick diffusion of information), while also providing evidence of the continued importance of traditional media for political engagement. Keipi and Oksanen (2014) explored youth narratives of the interaction of both opportunities and risks in the use of social media by youth in Finland. Their findings illuminated the role of new media in youth need-fulfillment toward self-exploration/expression, self-determination, identity development, and relationship-building, as well as the social risks that youth's new media use involves (e.g., cyberbullying, harassment).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Not surprisingly, the rapid dispersion of digital communication technologies in the last decade has spurred interest in how changes in communication technology might be reshaping and possibly reinvigorating youth's opportunities and inclinations for engagement. Research has been particularly focused on the engagement of young citizens, a population historically under-engaged and among the most active users of digital media. Existing literature suggests that recently created, online organizations will be most likely to embrace a newer, more youth-friendly communication style; those organizations working within the formal political realm may be most reticent (Bimber et al., 2012; Castells, 2009; Karpf, 2012). Wells' (2014) study of 60 organizations' (including government, interest groups, and community groups) communications through Facebook mainly confirms these expectations, but low levels of youth-friendly communications across the sample raise doubts about the likelihood of a civil society resurgence through social media.

In summary, research supports the role of hybrid forms of communications in promoting youth engagement by showing that the optimal use of digital/online and social media can complement face-to-face interactions and traditional media. Specifically, hybrid communication methods including various forms of politically driven, nonpolitical interest-driven, and friendship-driven online participation have been shown to promote youth engagement and youth activism. In particular, the youth-led hybridization principle of social movements combine online/new/informal and real-world/traditional/formal activism. The use of digital media has been shown to mobilize young people into more active engagement with civic and political life through activities in schools, democratic peer norms, news consumption, and citizen communication for the development of active citizens. Importantly, relationship-building (both within youth and between youth and adults) is a critical concept in youth engagement, which can be effectively facilitated by hybrid forms of communications. Furthermore, it is important to recognize the role of new media in youth need-fulfillment toward self-exploration/expression, self-determination, identity development, and relationship-building, as well as the social risks that youth's new media use involves (e.g., cyberbullying, harassment).

INTERSECTIONALITY: DIVERSITY OF YOUTH POPULATIONS AND THEIR MEDIA USAGE

Apparently, youth populations are diverse based on socio-demographic factors including: gender, race/ethnicity, age, social class, disability/ability, and sexual orientation. The framework of intersectionality is helpful to better understand influences of these diverse human characteristics on youth engagement via media. In particular, an intersectional framework addresses the complex ways in which the *key axes of power* in society (e.g., gender, race/ethnicity, class, ability, sexual orientation) intersect with each other (Crenshaw, 1995; Garnets, 2002; Iglesias & Cormier, 2002). Indeed, most people in our society have more than one identity in terms of gender roles, racial or ethnic identities, and identities related to social class, age, ability, and sexual orientation. These identities are linked to different experiences of social power, privilege, and oppression as related to the dominant culture. Intersectionality is a framework being used in various different disciplines (e.g., women's studies, cultural studies) to help recognize and analyze the multiple nature of identities and the interlocking systems of privilege and oppression in a non-additive sense within specific life contexts (Iwasaki et al., 2006; Razack, 1998; Ristock, 2002).

In addition to looking at such human characteristics separately, this section of the chapter will explore how young women and men with different races/ethnicities are engaged through various types of media.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Besides the intersection of gender with race/ethnicity, I will give attention to the other dimensions of human diversity including sexual orientation, disability/ability, and social class. Through the lens of intersectionality, I will address in what ways and how the diversity among youth populations should be acknowledged to better understand opportunities and challenges of youth engagement through media.

One such community group characterizing the diversity of youth populations represents sexual minority youth. Research has shown that their engagement with online technology is a critical feature of their daily lives and development because this offers them with significantly safer spaces and vital community support and connectedness (e.g., Craig et al., 2014). For example, using a feminist, intersectional framework, Singh's (2013) qualitative study found a key theme for the use of social media to affirm one's identity as a transgendered youth of color and promote sense of connectedness. Also, Asakura and Craig (2014) explored resilience development in the accounts of lesbian, gay, bisexual, transgender, and queer (LGBTQ) youth, by analyzing videos posted for the *It Gets Better* social media campaign. The findings offer a nuanced look at the pathways to resilience development, which are described by four major themes emerged from the data:

1. Leaving hostile social environments,
2. Experiencing "coming out" in meaningful ways,
3. Re-membering the social environment, and
4. Turning challenges into opportunities and strengths.

For instance, "by re-membering, many participants have developed their own clubs of life with selective members who have supported them through difficult times and valued their beings" (p. 261), whereas "the difficulties they experienced as youths also prepared them well to manage their adult lives" (p. 262).

Another instance of the diversity in youth populations and their media usage involves everyday use of digital technology and online social media by adolescents and young adults with physical disabilities and complex communication needs. To exemplify this notion, those youths in Hynan et al.'s (2014) study showed a desire to use the Internet and online social media as it is perceived to increase opportunities for self-determination and self-representation, while enriching friendships. The wide diversity of literacy and communication skills among youth with disabilities, as well as accessibility challenges, mean that the use of a collaborative approach is vital, for example, through receiving technical and social support from educational settings, families, and friends (Hynan et al., 2014).

Along with the growth of research on young women, we have seen the emergence of research on ethnic youth, implying the intersection of gender with ethnicity contextualized within the notion of youth subculture (e.g., Clark, 2012; Dedman, 2011; Gunter, 2010). Originally, Blackman (1995) advanced the idea of "youth cultural forms" and Thornton (1995) adapted Bourdieu's theory of cultural capital to speak about "subcultural capital." As emphasized by Blackman (2014), subcultures attract attention in culture, society, and the media because these have been theorized as not merely distinct from, but also in opposition to, the dominant culture. The new forms of subcultural communication through social media are considered as a key domain to promote knowledge, flexibility, participation, and collectivity transmitted through a subcultural network (Hodkinson & Lincoln, 2008; Williams, 2011). Blackman (2014) argues that youth cultural identities based on consumption, in which communications through social media play a key role, are structured by both material and social conditions of inequality (e.g., various forms of "isms"), while engagement with youth subcultures at a social and political level is critical by looking at, for example, deviant behaviour, connectedness, and social change to address social justice issues.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Importantly, the intersection of gender with ethnicity contextualized within the notion of youth subculture has implications for the broad topics of culture, society, and the media. Specifically, communications through social media play a key role in developing youth cultural identities. In this way, the use of media provides a key cultural sphere to create youth activist subcultures, which seek to contest a range of global injustices through collective means consistent with a SJYD framework described earlier.

For example, youth activist involvement includes the use of media, contextualized within the raced, classed, and gendered challenges of youth activist cultures from an intersectional perspective. To illustrate this notion, Kennelly's (2011) book, entitled "Citizen Youth: Culture, Activism, and Agency in a Neoliberal Era" explores youth activist subcultures undertaken as part of a year-long multi-sited ethnography in Canada's three largest urban centres: Toronto, Montreal and Vancouver. Specifically, the book examines the dilemmas and cultural dynamics of being young and politically engaged, including the use of media as a key cultural sphere. The book interrogates both macro-structural forces such as education, media, and politics, and micro-sociological factors shaping youth activists' lived realities, resulting in a portrayal of the day-to-day experiences of young people who seek to contest a range of global injustices through collective means. The major issues shaping youth activist engagement described include the use of media as a key resource to sustain activist involvement, and the development of raced, classed, and gendered activist cultures from an interactional perspective (Kennelly, 2011).

Contextualizing mobile media in teens' lives, Vickey's (2015) paper examines how ethnically diverse low-income, non-dominant teens mitigate reduced privacy levels in and through mobile technologies and social media, and with what consequences. Teens in the study utilized a variety of social media platforms (e.g., Facebook, Twitter, Tumblr, Instagram, YouTube) to reach different audiences, explore different identities, and form different communities. They deliberately used these multiple platforms as a way to cope with evolving privacy settings, social norms, and technological affordances — this was a deliberate strategy intended to resist social convergence (Vickey, 2015). As such, the boundaries of sharing and privacy are constantly renegotiated at the intersection of localized social norms, economic and social capital, and the technical affordances of particular platforms and devices. As shown in Vickey's study, mobile media provide youth with a sense of autonomy, independence, and privacy from adults (Ling, 2010) and facilitate more personalized forms of communication (Campbell & Park, 2008).

As an emerging form of culture, digital culture can be broadly defined as the multiple ways in which people engage with digital media and technologies in their daily lives (Livingstone, 2009). As a unique domain of digital culture, non-urban areas of a developing country would generate a distinct set of experiences. As shown by Pathak-Shelat and DeShano (2014), youth digital cultures in rural and small town India are influenced by and negotiate local, regional, national, and global discourses, for example, through homes, peers, schools, and official public messages. Youth in their study treat new media and technologies as one limited component of otherwise rich lives and social experiences. For example, financial interests that drive commercial aspects of digital culture obscure its layered power differentials through contradictory media experiences and end results (Pathak-Shelat & DeShano, 2014). Obviously, power dynamics play a role in the construction of digital culture among youth, which is contextualized both locally and globally.

As exemplified in this section, an intersectional perspective addresses the complex ways in which the *key axes of power* in society (e.g., gender, race/ethnicity, class, ability, sexual orientation) intersect with each other (Crenshaw, 1995; Garnets, 2002; Iglesias & Cormier, 2002). A variety of media forms, through which youth are engaged, address these power issues such as the intersection of various identities including gender roles, racial or ethnic identities, and identities related to social class, disability/

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ability, and sexual orientation. Indeed, these identities represent key factors for personal and collective experiences within the systems of social power, privilege, and oppression (Iwasaki et al., 2006; Razack, 1998; Ristock, 2002). In particular, the new forms of subcultural communication through new media promote knowledge, flexibility, participation, and collectivity transmitted through a subcultural network. Specifically, communications through new media play a major role in developing youth's cultural identities. Accordingly, the use of media provides a key cultural milieu to create youth activist subcultures, as a collective space to address social justice issues, in line with a SJYD framework. For example, youth activism includes the use of media, contextualized within the raced, classed, and gendered youth activist cultures from an intersectional perspective. Importantly, the use of new media can be seen as a means of reclaiming and reshaping the ways in which youth are engaged to address these power issues.

Meaning-Making Through Media Usage Among Youth

Another important idea is that the use of media in youth engagement is considered as an effective means of promoting *meaning-making* that can provide a variety of personal and collective benefits for youth. Meaning-making refers to the ways in which and how people gain meanings within life that are important for personal, social, cultural, spiritual, and community reasons (Markman, Proulx, & Lindberg, 2013; Park, 2010). Relevant to this chapter, the use of new media is seen as a key meaning-making process or activity to address identity, social/cultural, and power-related issues. For example, Halverson (2010) explored youth film-making as a medium for meaning-making, by seeing youth as producers of digital media. Her analysis demonstrated how films such as *Rules of Engagement* display the construction of a viable social identity where youth actively insert their understanding of:

1. How to represent complex portraits of how they see themselves,
2. How others see them, and
3. How they fit into their communities.

The study showed how youth (in particular, youth living within marginalized conditions) engage with and make sense of identity issues as a critical meaning-making process through the media they create (Halverson, 2010).

Mutere et al. (2014) examined the roles of popular culture, media, and the arts in the health-seeking concerns and behaviours of 54 homeless youth in California, USA, with a focus on what they saw as barriers and aids. Their findings highlighted the importance of a creative arts-media intervention (e.g., graffiti as a multi-media platform) for homeless youth to promote a sense of life-meaning, civic engagement, and positive community connections and health outcomes in an age-appropriate and culturally-sensitive way. Specifically, multi-media usage (e.g., poetry, screenplays, stories, and web-logs) provided homeless youth with creative outlets for civic engagement, community connections, and meaning-making within their lives (Mutere et al., 2014). In particular, a peer-to-peer mentorship has been found to be beneficial for "marginalized" youth to meet their desire for a sense of meaning as demonstrated through a quote from a street-involved youth in Mutere et al.'s (2014) study:

I like to write raps. I like to draw. I'm really talented at it. Marijuana doesn't stop me from that. Those are things that I know I have a gift in. It's like everyone else… electronics, computers, whatever the case may be… A mentor can help them get past that problem and help them go somewhere in life… 'Cause

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

that's what most people feel like they don't have… no life-meaning. You can't just directly say "no". You have to explain to them and encourage them to do better now. (p. 282)

By focusing on the construction of meaning and identity, Zemmels' (2012) study with American teens (13-17 years of age) in New Orleans documented those participants' engagement with new media in networked spaces and the everyday practices that surround their participation. The findings showed a complex pattern of relationships between interpersonal communication channels, the relative immediacy and intimacy of the channel, and the social relationship between participants. This pattern appeared to have a structuring influence on everyday communication practices of youth in networked publics, as they negotiate and construct meaning (e.g., aesthetic and social meaning through visual media) and identity in these networked publics (Zemmels, 2012).

In addition, it is useful to consider the digital media creation, distribution, and consumption process as "storytelling" in a shared space, in which a variety of perspectives and meanings are presented (Lambert et al, 2007). Accordingly, the space in which stories are shared and collaborated on becomes an entity with a life of its own. As mobile communication media and the internet become more pervasive, young people from different cultures and communities are afforded more opportunities for sharing and collaboration across previously unbridgeable distances (Botha et al., 2009). Botha et al.'s (2009) study with five teenagers from USA and five teenagers from South Africa demonstrated the role of mobile phones and the web as mediating technologies in the development of intercultural competencies and communication skills. Specifically, their study has shown that mobile phones have a place in the creation of meaningful user-generated content for improved cross-cultural awareness and communication — as communication devices, they have progressed "from text to context" (Botha et al., 2009). Increasingly, technology facilitates the ways in which the youth around the world communicate, consume content, and create meaning (e.g., South African teens mindful of explaining local slang and the meaning of Afrikaans words to American teens) across diverse cultural contexts.

For another example, with 35 young people in Philippine between the ages of thirteen and twenty-six in four focus groups, Portus (2008) explored how the urban poor acquire, use, and ascribe meaning to the mobile phone. This study found that the mobile phone allows the urban poor to pursue their gender-defined functions more effectively, being a source of desire and envy, most apparently among the women, as a highly sought-after and increasingly vital, meaningful part of their lives (e.g., social role fulfillment), despite grinding poverty (Portus, 2008).

A recent special issue of *Educational Studies* on "Youth, New Media, and Education" featured several papers that examined youth as both consumers and producers of popular culture, which lies at the intersections of traditional media and new digital media. As the issue editors, Luschen and Bogad (2010) commented that "youth representations of themselves have the capacity to shape the cultural landscape, interrupt and collude with existing discourses of youth, and teach what it means to be a youth in all its complexity, within and across difference… Reaching across boundaries between conventional and new media, these texts illustrate the complexities that a newly constituted popular culture provides" (p. 454-455). Through the process of youth's negotiations using various media forms, they produce, consume, and learn about popular culture as ways of meaning-making in their daily lives. Importantly, the use of new media can be seen as a means of reclaiming and reshaping the ways in which youth are engaged, as key meaning-making processes, to address significant social and cultural issues.

BUILDING GLOBAL SOCIAL RELATIONSHIPS AND SOCIAL AND CULTURAL CAPITAL THROUGH YOUTH'S MEDIA USAGE

Given the resurgence of digital and social media, youth engagement has become more globalized across cultural boundaries. One obvious outcome from this global process represents building cross-border social relationships and social and cultural capital facilitated by youth engagement through the use of media. For example, drawing from a comparative case study of the digital literacy practices of immigrant youth of Chinese descent, Lam (2014) examined the cross-border social relationships that are fostered between the youth and their peers in China. She showed how these cross-border relationships create unique social, linguistic, and cultural capital. The findings suggest that youth's online literacy practices need to be understood within the particular social fields/networks in which they are situated and how they allow the youth to navigate and take up a position within social fields across national boundaries. Importantly, media usage is considered as one of the significant and meaningful daily human activities within structured social spaces. Consequently, relationships built from using communication technologies can promote social capital (e.g., affiliations and networks) and cultural capital (e.g., cultural knowledge, skills such as bilingual or multilingual skills, and cultural dispositions/customs) (Bourdieu, 1991). Specifically described in Lam's study include "bridging capital" to connect with the monolingual majority population in society, and "bonding capital" to connect with the minority population, as well as transnational engagement and resource development in digital art.

For another example, de Haan et al. (2014) examined the networked configurations for learning of migrant youth in the Netherlands, in relation to particular offline and online connections, their historical geographies, the development of learning 'places,' and particular learning affinities. Specifically, they described three ethnically different groups:

1. Dutch youth as 'unrooted' learners (who are networked according to individually expressed interests for exploration),
2. Moroccan-Dutch youth as 'routed' learners (who form collective affinities and interests within same generation ethnically informed spaces), and
3. Turkish-Dutch youth as 'rooted' learners (defined by more collectively formed interests embedded in family and ethnically based networks).

This grouping shows examples of the diversity in globally dispersed, highly individualized yet collective networks within migrant youth to pursue tailored knowledge. Even within a single country at a local level, the development of global social relationships and social and cultural capital is a reality as increasingly facilitated by the use of media within youth populations internationally.

Furthermore, Garcia et al.'s (2015) study focused on civic engagement enacted through digital media participation by exploring the relationships between critical literacy practice, digital media production, and civic agency in the Council of Youth Research, a youth participatory action research program in Los Angeles, USA. In particular, their study articulates a vision of literacy that is tied to societal power structures as a way of building personal and social capital for the purpose of personal and social transformation. Specifically, the study highlights the ways in which student digital literacy production manifested powerful civic agency. The authors argue, "Academic and critical literacy development are crucial to beginning the process of empowerment for students to become critical consumers of information. When youth are empowered with the ability to make sense of the unjust conditions in their community and the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

skills to act, they become powerful agents of transformation" (p. 165). Importantly, meaning-making and mobilization of actions to address social justice issues are key empowerment and transformation processes, again, consistent with a SJYD framework described earlier.

Attractive to young people, modern music festivals have become sites of mediated brand management where commodified hyper-experiences are considered as new forms of contested cultural capital. As described by Flinna and Frewb (2014), the realm of music festivity has grown into a global circuit that responds to the demand for emotive experiential products and taps into postmodern themes that celebrate a lifestyle attitude of extended youth. Their study explored the phenomenon of festival culture through a case study of Glastonbury Festival of Contemporary Performing Arts in England. The study presented an innovative interpretation of festivity through multi and social media, showing that identity is a hybrid construct where the localised ephemeral and embodied experiences of festivity demand a simultaneously mediated and socially globalised reflection. The study portrayed that festivity is moving beyond management as it is increasingly dependent on the co-creative social media activity of consumers to perpetuate the fantasy and capital of festivity. This study depicted how festivity works in an age of ubiquitous social media where lifestyles are increasingly digitised and networked. Undoubtedly, the power of technology is a driving, transformational force in festivity as a form of building cultural capital.

As shown in this section of the chapter, youth engagement has become a more hybrid concept ranging from localized to globalized experiences across cultural boundaries prompted by the resurgence of digital and social media. Indeed, one key consequence of this emerging process includes building cross-border social relationships and social and cultural capital facilitated by meaningful youth engagement through the use of media.

SUMMARY AND CONCLUSION

Contextualized within the popularity of new media, youth engagement is a very important concept in the practice of public involvement. Guided by the current literature on youth engagement and media studies, this chapter examined the key engagement-related notions involving youth and media usage. Being informed by a variety of case studies on youth engagement through the use of media within various contexts globally, the chapter discussed the opportunities and challenges of engaging youth through media usage. Better understanding the ways in which youth use media for their engagement has significant implications for practice and policy on youth and public involvement at all system levels globally. The specific notions covered in this chapter include:

1. The role of "hybrid" media in youth engagement;
2. "Intersectionality" illustrating the diversity of youth populations and their media usage;
3. Meaning-making through media usage among youth; and
4. Building global social relationships and social and cultural capital through youth's media usage.

In summary, hybrid forms of communications through digital and social media, face-to-face interactions, and traditional media can promote meaningful youth engagement and youth activism, in which relationship-building (both within youth and between youth and adults) is a critical concept. Appreciation of the diversity of youth populations and their media usage from an intersectional perspective is helpful to better understand the ways of youth engagement and activism via media that can promote

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

meaning-making, for example, on identity and cultural issues. In addition, youth engagement through media usage can help build global social relationships and social, linguistic, and cultural capital and can facilitate a youth-led transformation of our society to address social justice issues. Importantly, multimedia usage provides youth with creative outlets for civic engagement, community connections, and meaning-making within their lives.

As described earlier, meaningful youth engagement is a key concept for both positive youth development (PYD; Alicea et al., 2012; Delgado, 2002; Lind, 2008) and social justice youth development (SJYD; Cammarota, 2011; Gharabaghi & Anderson-Nathe, 2012; Ross, 2011) and facilitates social/system change to more effectively support youth and their families (Blanchet-Cohen & Salazar, 2009; Davidson et al., 2010; Yohalem & Martin, 2007; Wexler et al., 2009). Importantly, the integration of PYD and SJYD conceptually supports the vital role of youth as a proactive agent for changes at personal (e.g., self-identity, constructive behaviours), social (e.g., collective identity, advocacy for social change), and community (e.g., policy and practice change from social justice perspectives) levels (Ross, 2011).

Indeed, this notion (i.e., the integration of PYD and SJYD) is highly applicable to the use of hybrid forms of communications to promote youth engagement and development by appreciating the diversity of youth populations and their media usage (from an intersectional perspective), and by promoting meaning-making and social and cultural capital, as well as to facilitate a youth-led/guided transformation of our society to address social justice issues. The power of youth in leading/guiding social change should not be underestimated, and this role can be effectively promoted by the use of hybrid forms of communications for youth engagement. Importantly, the use of new media provides youth with opportunities to re-define and re-create the ways in which youth are engaged, as key meaning-making processes, to address identity, social, and cultural issues.

Chapter 7
National Ethical Institutions and Social Entrepreneurship

Etayankara Muralidharan
MacEwan University, Canada

Saurav Pathak
Kansas State University, USA

ABSTRACT

Using insights from institutional theory, the chapter proposes understanding ethics as national institutions that deeply influence social entrepreneurship. Moreover, the chapter proposes that low behavioral ethical standards (normative ethical institutions) provide opportunities for individuals to establish social enterprises. Furthermore, it proposes that high public-sector ethical standards (regulatory ethical institutions) and values of unselfishness (cognitive ethical institutions) facilitate and motivate individuals to establish social enterprises. The chapter also explores the combined effects of public-sector ethical standards and low behavioral ethics, public-sector ethical standards and societal unselfishness, and low behavioral ethics and unselfishness, on the creation of social enterprises. The chapter contributes to cross-cultural comparative entrepreneurship by suggesting, through a multilevel framework, the effects of societal-level ethical institutions on the creation of social enterprises.

BACKGROUND

Although the study of entrepreneurship and the study of business ethics have become important lines of inquiry, study of the intersection of entrepreneurship and ethics remains relatively new (Harris, Sapienza, & Bowie, 2009). In particular, examining what ethical factors drive socially responsible behaviors is a burgeoning area of interest among research scholars (Bacq, Hartog, & Hoogendoorn, 2014). Extant scholarship has examined ethical standards primarily at the individual level. Similarly, at the firm level, few studies have examined conceptually the mechanisms through which variation in societal-level institutions may specifically influence corporate social performance among firms (Jackson & Apostolakou, 2010). Some studies have empirically examined the role and effect of societal-level institutions across large datasets of countries (Habisch, Jonker, Wegner, & Schmidpeter, 2004; Ioannou & Serafeim, 2012; Jackson & Apostolakou, 2010; Jamali, Sidani, & El-Asmar, 2009).

In the case of social entrepreneurship (SE), a growing line of inquiry among scholars investigating the intersection of entrepreneurship and ethics is the ethical or moral factors that drive social enterprises (Bacq et al., 2014). Scholarly discourses on SE appear to dwell on discussions that demand more ethical and socially inclusive capitalistic behaviors (Dacin, Dacin, & Tracey, 2011). Some examples include consumers increasingly looking for more ethically sourced and manufactured goods (Nicholls & Opal, 2005); increasing expectations for multinational organizations to behave in ethically and socially responsible ways (Friedman & Miles, 2001); and politicians under increasing obligation to pursue and implement policies that promote social equality, and reduce the harmful effects of business activities on the environment (Bernauer & Caduff, 2004). Extant research on entrepreneurship and ethics adopts the perspective of either entrepreneurship and ethics or entrepreneurship and society. The former perspective deals with the ethics of individual entrepreneurs, and the latter concerns questions related to social and economic implications of entrepreneurship (Hannafey, 2003).

Some of the key constructs scholars use to understand the influence of ethics on social entrepreneurship are ethical attitudes reflected in the responses to questions about right and wrong (Bucar, Glas, & Hisrich, 2003); a system of value principles or practices and the ability to determine right from wrong (Payne & Joyner, 2006); perceived importance of ethics, measured by obligations to stockholders and stakeholders (Shafer, Fukukawa, & Lee, 2007); and ethical attitudes in response to issues, concerns, and activities involving standards in society for what is morally right and virtuous (Franke & Nadler, 2008). Further, the Global Entrepreneurship Monitor's (GEM) research report on SE reports an average of 3.2% of new social entrepreneurial activity (or new social enterprises established or under establishment) across the 58 GEM economies (Bosma, Schøtt, Terjesen, & Kew, 2016). The report suggests this activity ranges from 0.3% in South Korea, to 10.1% in Peru. The reported cross-country variance suggests possible societal-level differences in countries, which have resulted in differences in the establishment rates of social enterprises.

These items imply the following observations. First, extant scholarship that has attempted to link ethics with social entrepreneurship has been using constructs interchangeably; therefore, the measures of ethics described above are similar, and capture all aspects of ethics. Second, national or societal-level differences may contribute to the differences in the establishment rates of social enterprises. This chapter addresses the identified gaps by proposing that ethics be viewed through different lenses, by developing an understanding of national or societal-level ethical institutions, and attempting to predict their influence on the creation of social enterprises. Further, the chapter uses the institutional configuration perspective (Stephan, Uhlaner, & Stride, 2014) to understand the joint effects of societal-level institutions. It suggests a multilevel theoretical framework to understand the effects of societal-level ethical antecedents, and to predict the creation of social enterprises. In so doing, the chapter distinguishes one form of ethics from the other, and provides a framework for understanding the effects of ethical institutions at the societal level on the creation of social enterprises. The chapter further contributes to the calls for research to examine the effects of context on entrepreneurship (Welter, 2011).

The chapter is organized as follows. In the next section, a brief discussion of SE precedes discussions on context and its relevance to entrepreneurial research. Then, societal institutions (or institutions at the national level) and research on the interface between ethics and social entrepreneurship are discussed. There follows a discussion of the suggested conceptual framework, and development of propositions related to the effect of societal-level ethical institutions on the creation of social enterprises. Finally, discussion of and elaboration on the propositions leads to suggestions for future avenues of research.

SOCIAL ENTREPRENEURSHIP

Entrepreneurship involves the identification, evaluation, and exploitation of opportunities that are present in society (Shane & Venkataraman, 2000). Typically, such situations represent opportunities to bring new products or services into existence in society, such that individuals or firms can sell their outputs at prices higher than their cost of production (for a detailed review on opportunities and entrepreneurship, please refer to Eckhardt and Shane, 2003). However, the understanding in this definition is that the fundamental objectives of such entrepreneurial activities involve profit generation, and these profits help entrepreneurs to build their personal wealth (Certo & Miller, 2008). In the recent past, SE, a subdiscipline in the area of entrepreneurship, has been gaining attention among both academics and practitioners working in the area of entrepreneurship, due to its potential to address societal problems such as poverty and illiteracy (Certo & Miller, 2008; DeLeon, 1996; Estrin, Mickiewicz, & Stephan, 2013a).

As defined in the literature, SE involves the recognition, evaluation, and exploitation of opportunities presented in society that result in social value. SE creates value by bringing about catalytic changes in society (Waddock & Post, 1991). Organizations that have a particular social, environmental or community objective create such value (Bosma et al., 2016). This social value essentially addresses the basic and long-standing needs and concerns of society, in contrast to personal or shareholder wealth (Austin, Stevenson, & Wei-Skillern, 2006). Social value has little to do with profits, but instead involves the fulfillment of basic and long-standing needs such as food, water, shelter, education, and medical services, to those members of society who are in need. In order to better understand SE, Austin et al. (2006) distinguished between two types of entrepreneurship: commercial entrepreneurship (CE) and SE. In their framework, CE represents the identification, evaluation, and exploitation of opportunities in societies that result in profits; whereas SE refers to the identification, evaluation, and exploitation of opportunities in societies that result in social value. Opportunity awareness and recognition is an important ability of an entrepreneur running any form of enterprise (social or commercial) to exercise when either supply or demand for a value-creating product or service exists in society (Kirzner, 1973).

SE has gained both academic and practitioner interest due to its potential for addressing societal problems such as poverty and illiteracy (Estrin et al., 2013a; Seelos & Mair, 2005). A social entrepreneur is an individual running an enterprise, working for his or her own account, while primarily pursuing prosocial goals—that is, goals that are set to benefit individuals in society other than the entrepreneur (Bierhoff, 2002). The occupational definition of entrepreneurship explains the first part of the definition above: working for one's own account (Hébert & Link, 1988). This definition, however, does not specify the types of goals that entrepreneurs can pursue, such as economic wealth versus social value, and hence the definition applies to both commercial and social entrepreneurs (Stephan et al., 2014). The focus on prosocial goals and social value creation, over economic wealth creation, differentiates social from commercial entrepreneurs and their respective enterprises, and is consistent with recent definitions of SE (Mair & Marti, 2006; Zahra, Gedajlovic, Neubaum, & Shulman, 2009).

In summary, through an acute understanding of social needs, social entrepreneurs fulfill these needs creatively through their enterprises. This focus on social value is consistent across the various definitions of SE (Peredo & McLean, 2006), as opposed to the focus on private or economic wealth that differentiates them from CE. The study of SE spreads through politics and the media (Dey, 2006), and it legitimizes and gives identity to social entrepreneurs and their enterprises, those individuals who run enterprises concerned with a variety of issues including poverty, concerns about the natural environment, and social inequality (Dacin et al., 2011). Therefore, it is important to understand social entrepreneurial behavior in the context in which such entrepreneurs operate.

CONTEXT AND ENTREPRENEURSHIP RESEARCH

While in Latin, "context" means to weave together or to make a connection (Rousseau & Fried, 2001), in management research it refers to the conditions external to a phenomenon that facilitate it or constrain it (Welter, 2011). Some examples that define context refer to surroundings associated with specific phenomena that help illustrate them (Capelli & Sherer, 1991) and stimuli that exist in the surrounding external environment (Mowday & Sutton, 1993). Context also includes situational opportunities and constraints that influence or affect behavior (Johns, 2006). Consideration of context in entrepreneurship is not new (Welter, 2011). Any economic behavior can be understood better within the context in which it is observed (Low & MacMillan, 1988). Contexts may be social (Granovetter, 1985), spatial (Katz & Steyaert, 2004), or institutional (Polanyi, 1957). Scholars studying entrepreneurial phenomena have therefore suggested recognizing the importance of the context in which entrepreneurship occurs. Researchers "have a tendency to underestimate the influence of external factors and overestimate the influence of internal or personal factors when making judgements about the behavior of other individuals" (Gartner, 1995, p. 70). This chapter examines societal institutions or dimensions of institutional context for their influence on SE.

Societal Institutions

A society's institutional context consists of stable rules, social norms, and cognitive structures (Scott, 1995). It sets the framework for market transactions by defining the ''rules of the game'' (North, 1990, p. 1) and by specifying the conditions under which firms are legitimate (Meyer & Rowan, 1977; Spencer & Gomez, 2004). Extant research reveals that institutional contexts influence a firm's strategic activities, the growth of foreign partnerships (Steensma, Tihanyi, Lyles, & Dhanaraj, 2005), and differences in entrepreneurial activities (Bruton, Fried, & Manigart, 2005; Busenitz, Gomez, & Spencer, 2000; Casson, 1992).

Institutions are therefore key aspects of social structure, which provide strong guidelines and constraints for behavior (North, 1991, 2005; Scott, 2005, 2008). They are taken-for-granted rules that are either explicit and perceived by individuals, or acting as implicit guidelines for individual behavior and actions (Powell & DiMaggio, 1991). Institutions are further divided into formal and informal institutions (North, 1990). Formal institutions are explicit, objective incentives and constraints, the consequence of government regulation of individual and organizational actions (Bruton, Ahlstrom, & Li, 2010; Scott, 1995, 2005, 2008). Formal institutions are more related to the political and economic environment that creates or restricts opportunities for entrepreneurship (Welter, 2011).

Some examples include laws and regulations for market entry and exit, or private property regulations (Welter, 2011). Informal institutions are more implicit, culturally transmitted, and socially constructed (Stephan et al., 2014). These institutions include the norms and attitudes of individuals in a society, and influence opportunity recognition, opportunity exploitation, and access to resources (Welter, 2011). Some examples include the values of trust, in-group collectivism, and the value society generally accords to entrepreneurship (Pathak & Muralidharan, 2014; Welter & Smallbone, 2008).

Scott's (1995, 2005) work further divides institutions into a three-pillar framework that considers formal institutions regulatory, and further differentiates informal institutions into cognitive and normative. Cognitive and normative arguably correspond to the concepts of cultural values and practices in cross-cultural research (Javidan, House, Dorfman, Hanges, & De Luque, 2006). Regulatory institutions

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

include laws, regulations, and government policies that facilitate certain behaviors and constrain others (Busenitz et al., 2000). Normative institutions essentially define the various behaviors and values expected of individuals or organizations (Scott, 1995). These are often visible through shared norms about the appropriate behaviors in a particular profession (Bruton et al., 2005).

These institutions basically describe social obligations and expectations for appropriate actions, modeled on existing dominant practices or norms in a given society (Bruton et al., 2010; Javidan et al., 2006; Scott, 2005; Stephan & Uhlaner, 2010). Finally, cognitive institutions reflect how certain knowledge sets have become institutionalized and form part of a shared social understanding or shared values (Zucker, 1991). Specifically, these institutions include the culturally shared understandings in society closely associated with cultural values (Bruton et al., 2010; Javidan et al., 2006; Scott, 2005; Stephan & Uhlaner, 2010, Stephan et al., 2014). In summary, institutions can be described as widely diffused practices, regulations, or rules of social interaction, which have become entrenched in society, in the sense that it is difficult to choose alternative practices, technologies, or rules (Lawrence, Hardy, & Phillips, 2002). Ethics are now examined as societal or national-level institutions, in order to understand ethical antecedents of social entrepreneurship.

Ethics

A survey of literature by Harris et al. (2009) reveals that existing academic literature connecting ethics and entrepreneurship falls into one of three areas: entrepreneurial ethics, entrepreneurship and society, and social venturing (or SE). While the literature covering entrepreneurial ethics is primarily concerned with the ethical dilemmas involved in setting up new enterprises, the literature on ethics and entrepreneurship adopts a broader view of entrepreneurship, exploring the role of new enterprises in the relationship between business and society (Harris et al., 2009). Social venturing, or SE, is considered an important topic at the intersection of ethics and entrepreneurship, and covers six broad areas of research (Harris et al., 2009): defining SE, discussing ethical concerns in setting up a social venture, covering the measurement of the performance of a social enterprise, examining disenfranchised entrepreneurs, discussing the differences between social ventures and traditional ventures, and discussing the role of purpose in a social venture. This research has paid scant attention to societal-level ethical attitudes (Franke & Nadler, 2008).

Societal-level ethical attitudes comprise people's cognitive, affective, and behavioral predispositions to respond to issues, concerns, and activities involving standards in society for what is morally right and virtuous (Franke & Nadler, 2008). While various frameworks of ethical decision-making (see Ferrell, Gresham, & Fraedrich, 1989; Hunt & Vitell, 2006; Srnka, 2004) suggest that ethical judgements depend on the nature of the consequences of the issue and personal traits of the decision maker, national culture is also an important influencer (Franke & Nadler, 2008). Extant literature has examined various aspects of ethical attitudes, such as sensitivity to the presence of ethical concerns (Sparks & Hunt, 1998), process of moral development in discussions on ethical concerns (Goolsby & Hunt, 1992), and the correctness of particular behaviors in situations involving dilemmas (Volkema, 2004).

Besides discussions on societal-level attitudes, extant research has also examined the influence of ethics as antecedents of different variations of social responsibility. In understanding the corporate ethical values of managers, Singhapakdi, Kraft, Vitell, and Rallapalli (1995) suggest that for managers to act ethically and socially responsibly, they should believe that ethics and social responsibility are important aspects of organizational effectiveness. Questions of what is right and wrong reflect ethical attitudes of managers (Bucar et al., 2003).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

At the firm level, actions of firms reflect attitudes concerning ethical concerns (Longenecker, Moore, Petty, Palich, & McKinney, 2006). Ethical frameworks are also considered to be systems of value principles or practices, and the ability to distinguish between right and wrong (Joyner & Payne, 2002; Payne & Joyner, 2006). Researchers have also examined the perceived importance of ethics in terms of the obligations that firms have toward various stockholders and stakeholders (Shafer et al., 2007). The high ethical standards that drive several professions, such as advertising, marketing, and medical services, also reflect their emphasis on ethics (Valentine & Fleischman, 2008). Finally, respect and concern for the environment are also the measure of ethical standards (Cambra-Fierro, Hart, & Polo-Redondo, 2008). Extant research also refers to the various traits or characteristics that comprise or define ethical leadership (Resick et al., 2011).

While all extant research has merit in associating ethical attitudes or drivers of ethics with performing socially responsible behaviors, the understanding of all types of ethics assumes ethics to be universal. The above discussion focuses on the individual level. In regard to ethical attitudes at the societal level, research is limited to the understanding of national culture as a driver of societal-level ethical attitudes. While ethical attitudes at the firm or individual level have been considered as drivers of ethically or socially responsible behaviors, this chapter attempts first to establish societal-level ethical attitudes as societal or national-level institutions, and then to predict their influence on SE. The understanding gained from this study of societal-level ethical institutions in the establishment of social enterprises can also extend to predicting socially responsible behaviors by commercial enterprises.

Societal Ethical Institutions and Social Entrepreneurship

Insights drawn from institutional theory and institutional configuration perspective establish ethical attitudes as societal-level institutions, in order to discuss the mechanism by which these institutions jointly influence SE (Stephan et al., 2014). The influence of formal institutions on entrepreneurship has been well researched, with several studies analyzing the effects of the formal and regulatory frameworks (e.g., Acs & Karlsson, 2002; Davidsson, Hunter, & Klofsten, 2006; Karlsson & Acs, 2002; Klapper, Lewin, & Delgado, 2009). For example, changes in technology policies, political factors or forces, and various regulations, can have decisive impacts on the occurrence and creation of new opportunities (Shane, 2003). A typical example of new opportunities being created for entrepreneurs is changes in the regulations in Eastern and Central European countries that permitted private organizations to lawfully exist (Smallbone & Welter, 2009).

The other area of research examines the influence of informal institutions on entrepreneurship. This group of studies specifically examines the role of informal institutions across countries. Some of the research that falls into this category includes studies comparing different institutional profiles (Busenitz et al., 2000; Manolova, Eunni, & Gyoshev, 2008); study of entrepreneurial cognitions across different national cultures (Busenitz & Lau, 1996; Mitchell, Smith, Seawright, & Morse, 2000; Mitchell et al., 2002); the impact of national cultures on entrepreneurship (Hayton, George, & Zahra, 2002; Tan, 2002); and cross-country study of the impact of postmaterialism on entrepreneurship (Uhlaner, Thurik, & Hutjes, 2002).

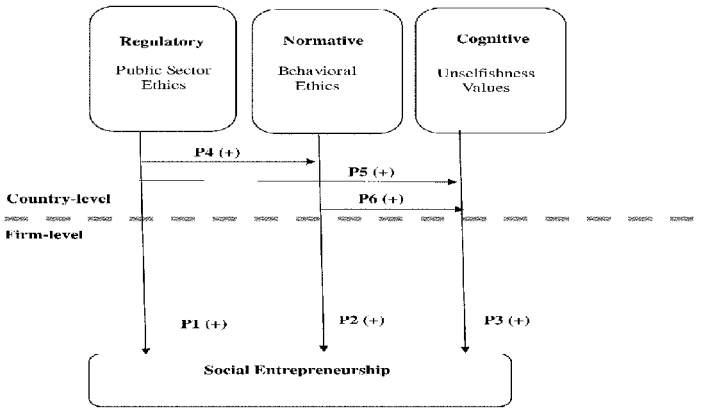
Like the case of commercial entrepreneurship, SE needs to be studied in the social context in which it is embedded (Mair & Marti, 2006). Drawing from institutional theory suggests that individuals in society are embedded within larger social structures, which comprise different institutions that strongly influence individual decision-making (Campbell, 2007). As discussed in the section on societal institu-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions, Scott (1995) classified North's formal and informal dimensions of institutions into three pillars: regulative, normative, and cognitive. So far, scholarly research has mainly examined the influence of formal institutions on SE (Dacin, Dacin, & Matear, 2010; Estrin et al., 2013a; Mair & Marti, 2009; Zahra et al., 2009).

Different disciplines define comparative entrepreneurship research differently, depending on whether they use formal or informal institutions to predict the existence of entrepreneurship (Bruton et al., 2010; Jones, Coviello, & Tang, 2011). For example, cross-national comparative entrepreneurship research, based on institutional economics, examines formal institutions (Autio & Acs, 2010; Estrin, Korosteleva, & Mickiewicz, 2013b); cross-cultural psychology and sociology entrepreneurship research examines informal institutions (Autio, Pathak, & Wennberg, 2013; Stephan et al., 2014). While scholars in other research areas have suggested the possibility of joint influences (formal and informal institutions to predict phenomena) (Carney, Gedajlovic, & Yang, 2009; North, 2005), scholarly studies integrating and using both formal institutions and informal institutions in comparative entrepreneurship research are limited (Stephan & Uhlaner, 2010; Stephan et al., 2014).

Inputs from institutional theory (North, 2005; Scott, 1995) are used to develop societal-level ethical antecedents of the creation of social enterprise. In the process, the institutional configuration perspective is used to develop the conceptual framework. From the institutional configuration perspective, incentives and constraints provided by both informal and formal institutions jointly influence behavior of an individual or a firm (Stephan et al., 2014). Furthermore, individual mental models of entrepreneurs influence the type of firm; extant research suggests that the firm is an extension of the individual entrepreneur's ego (Muralidharan & Pathak, 2016; Zahra, Korri, & Yu, 2005). Researchers in the area of strategy equate a firm's objectives to the goals and vision of the founding individuals (Katz & Gartner, 1988). Therefore, the exploration in this chapter occurs at the firm level, given the intricate link between individual entrepreneurs' personal objectives and the goals of the firms they establish (Zahra et al., 2005).



In summary, both formal and informal institutions are integrated into a framework to propose the impact of societal-level public-sector ethical attitudes (as a formal-regulatory institution), societal-level behavioral ethical attitudes (as an informal-normative institution), and societal-level unselfishness values (as an informal-cognitive institution), and their interplay in the creation of social enterprises. These societal or national-level institutions are considered opportunities and facilitators of SE in the proposed framework, as demonstrated in Figure 1. The subsequent sections discuss each of the predictors and their interplay, to predict the creation of social enterprises.

Public-Sector Ethics (Regulatory Institution) and Social Entrepreneurship

Public-sector ethics relate to integrity, bribery, and favoritism in the public sector (Kaufmann, 2004). The Global Competitiveness Report of the World Economic Forum measures the following factors that could potentially define public-sector ethics: honesty of politicians, government favoritism in procurement, diversion of public funds, trust in the postal service, extent of bribing in issuing permits, siphoning utilities, and cheating on or avoiding taxes. Public-sector ethics is posited as a societal-level regulatory institution. The institutional support perspective (Stephan et al., 2014) is used to understand the effect of public-sector ethics, and suggests that societies with more active governments, bureaucracy, and public-sector institutions will support, and thus enhance, SE (Evans, 1996; Korosec & Berman, 2006; Zahra & Wright, 2011).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1.

Extant research suggests that national governments, through their bureaucracy and public-sector institutions, participate in addressing social concerns in society by providing both tangible and intangible resources, thereby providing support to social entrepreneurs (Evans, 1996; Korosec & Berman, 2006; Zahra & Wright, 2011). Tangible support arrives through funding and easy access to information, and intangible support through all forms of assistance in performing transactions related to setting up and running a social enterprise in a sustainable manner. Some examples of tangible resource support include donations, grants, and subsidies. Intangible resource support may include assistance with accessing and completion of grant and funding applications, obtaining necessary permits to obtain resources, and providing a networking platform for managing operations in a smooth and uninterrupted manner (Korosec & Berman, 2006; Meyskens, Carsrud, & Cardozo, 2010).

The ethical standards of the government bureaucracy and public-sector institutions are formal societal-level institutions that can facilitate or constrain social entrepreneurial activities. Low ethical standards in these institutions in society could create barriers to entry or operational barriers to obtaining clearances and permits to start social ventures for individuals with social objectives. Such contexts may also delay access to resources required to start and operate their enterprises. Barriers could increase the transaction costs involved for social entrepreneurs to start and manage their ventures in a sustainable manner (Nicholls, 2006), and hence these barriers would constitute institutional constraints for such activities.

In summary, an important role of the government and its constituencies is to provide public resources, and also to take care of the welfare of its citizens. As discussed earlier in this chapter, social entrepreneurs create enterprises that address societal concerns and needs. This implies that social entrepreneurs, the government, and public institutions are natural partners in addressing societal concerns and needs (Zahra & Wright, 2011). Extant research has found a positive association between government support and the creation of non-profit enterprises (Saxton & Benson, 2005). The established bureaucracy and public-sector bodies translate government objectives into action. Higher ethical standards of the government and the public sector may enhance social entrepreneurs' resources, and reduce transaction costs in commencing and managing their social enterprises in a sustainable manner (Nicholls, 2006; Stephan et al., 2014). A culture of high ethical standards in the government and its constituencies is a reflection of a society's regulatory institution, an indication of the government support for social entrepreneurs in the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

creation and management of their enterprises. Since entrepreneurs' personal objectives and the goals of the enterprises they form are intricately linked (Zahra et al., 2005), it is proposed:

Proposition 1: Public-sector ethics in society is positively associated with the creation of social enterprises.

Behavioral Ethics (Normative Institution) and Social Entrepreneurship

Justifiable behaviors are the accepted norms or practices of behavior of individuals in society. Behavioral ethics encompass morally justifiable actions, norms, or practices in society. The World Values Survey, using the following parameters that could potentially reflect behavioral ethical norms in society, measures the extent to which individuals consider the following as normal: claiming benefits to which they are not entitled; avoiding paying for public transportation; cheating on taxes; and accepting bribes in the course of duty. Since these are norms and practices that occur in daily life, they may qualify behavioral ethics as societal or national-level normative institutions.

Extant research considers entrepreneurship a function of available opportunity and motivated individuals (Aldrich & Zimmer, 1986). Entrepreneurial activity is therefore a product of the individual entrepreneur and the opportunity provided by the environment (Shane & Venkataraman, 2000). Scholars agree that opportunities exist when there are imperfections in the market, or in conditions of imperfect competition (Alvarez & Barney, 2010). While market imperfections could present opportunities for commercial entrepreneurs, opportunities for social entrepreneurs are different (Corner & Ho, 2010). Opportunities for social entrepreneurs stem from activities that create social value for society. Examples of such opportunities for SE include philanthropic activities, facilitating fair-trade importing, and self-help systems such as the microfinance movement (Hockerts, 2006).

Opportunities for social entrepreneurs are therefore embedded in society (Robinson, 2006). Lack of a favorable context could also provide opportunities of which firms can take advantage, such as institutional voids in developing economies (Mair & Marti, 2009; Puffer, McCarthy, & Boisot, 2010). In particular, a low behavioral ethical standard in society may be an opportunity for motivated social entrepreneurs, through their social enterprises, to pursue change and create social value. The presence of low behavioral standards in society is an opportunity for prosocial entrepreneurs, just as demographical, technological, and regulatory changes in society can result in opportunities for commercial enterprises (Drucker, 1985; Hall & Rosson, 2006). Examples of low ethical standards discussed earlier reflect unethical norms and practices, such as bribing at all levels in the administration, tax evasion by individuals, excessive levels of pollution, or not adhering to civic or regulatory standards in society. These societal concerns or opportunities act as motivational stimulants for entrepreneurs ranking high for prosocial motivations (Stephan et al., 2014). Existing scholarship linking entrepreneurship and society suggests that social entrepreneurs, through their social enterprises, can stimulate positive change in society by helping to discard existing social norms (i.e., low behavioral ethical standards in this study), and helping to create new ones (Harris et al., 2009).

In summary, entrepreneurship is a combined product of the individual and the context that provides an opportunity to act entrepreneurially (Shane & Venkataraman, 2000). As mentioned earlier in the chapter, SE is the recognition and exploitation of opportunities that stem from the long-standing needs or concerns of society, which may warrant change (Austin et al., 2006). Societal norms can create incen-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tives for entrepreneurial activities (Baumol, 1990). Behavioral ethics are morally justifiable actions in society, and low behavioral ethics in society are norms that provide opportunities for change in society for prosocial entrepreneurs, through their agency. Again, based on the intricate link between entrepreneurs' personal objectives and the goals of the enterprises they form (Zahra et al., 2005), it is proposed:

Proposition 2: Unethical behavior in society is positively associated with the creation of social enterprises.

Unselfishness (Cognitive Institution) and Social Entrepreneurship

Unselfishness is a cultural value in society, whereby individuals attach importance to others, and therefore actively value doing good for society, as opposed to private gain (Dacin et al., 2010; Kanungo, 2001; Zahra et al., 2009). The World Values Survey reports the percentage of respondents in a country who believe that unselfishness is an important value that they encourage their children to learn at home. Since these are values that are shared and cultural-cognitive, unselfishness is a societal-level cognitive institution. Unselfishness as a societal value plays an important role in motivating individuals to pursue socially important goals through their agency. Motivation, as established in the literature, is an important driver of entrepreneurship (Shane, Locke, & Collins, 2003).

Furthermore, research suggests that an individual's values play an important role in career decision-making (Knafo & Sagiv, 2004; Noseleit, 2010). This insight can extend to understanding the drivers of career decision-making by individuals pursuing a career in SE (Roccas, Sagiv, Schwartz, & Knafo, 2002). Scholars have used insights from aggregate trait theory to understand the drivers of cross-cultural differences in individual career choices to engage in commercial entrepreneurship (Davidsson & Wiklund, 1997; Uhlaner & Thurik, 2007). Applying this insight from aggregate trait theory suggests that societal values reflect the importance of certain values for a society's inhabitants—that is, the aggregate of goals which are personally important to those inhabitants (Schwartz, 2006). When applied to SE, aggregate trait perspective maintains that the greater the number of individuals in a society who hold values consistent with SE, the greater the number will be of individuals in that society motivated to engage in social entrepreneurial activities (Stephan et al., 2014).

Extant research has also established that SE is based on ethical motives and moral responsibility considerations (Mair & Martí, 2006). Therefore, individuals who score high for prosocial values will be more inclined to become social entrepreneurs (Stephan et al., 2014). Unselfishness is a key ethical value that motivates such individuals to become social entrepreneurs, as this value differentiates them from commercial entrepreneurs, by virtue of their objective of actively doing good for members of the society, as opposed to pursuing initiatives solely to generate personal profits (Dacin et al., 2010; Grant & Berry, 2011; Grant & Sumanth, 2009; Zahra et al., 2009). This argument is also in line with extant research that suggests that social entrepreneurs create value for the benefit of the collective, as opposed to individual monetary gain (Bacq et al., 2014).

In summary, societal cultural values reflect the importance of certain values for individuals in a society—that is, the aggregate of personally important goals that those individuals hold (Schwartz, 2006). The aggregate trait perspective (Davidsson & Wiklund, 1997; Uhlaner & Thurik, 2007) has been used to understand why differences in values across cultures predict differences in individual career choices for commercial entrepreneurship. This insight extends to understanding the drivers of career choices of social entrepreneurs. SE is primarily based on ethical motives and moral responsibility (Mair & Marti, 2006). Unselfishness is a moral value that distinguishes social entrepreneurs from commercial entrepreneurs,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

by the importance they attach to actively doing good for society, as opposed to individual gain (Dacin et al., 2010). The societal value of unselfishness drives the prosocial motivation of such individuals to help or contribute to other people through their enterprises (Grant & Berry, 2011). Finally, given the intricate link between an entrepreneurs' personal objectives and the goals of the enterprises they form (Zahra et al., 2005), it is proposed:

Proposition 3: Unselfishness in society is positively associated with the creation of social enterprises.

Behavioral Ethics and Public-Sector Ethics

As discussed earlier in the chapter, entrepreneurial activities are a function of "*opportunity* structures and *motivated* entrepreneurs" (Aldrich & Zimmer, 1986, p. 3). The activity is an outcome of the fit between the individual and the opportunity (Shane & Venkataraman, 2000). Davidsson's (2015) review, which shows limited progress in understanding the role of opportunities and individuals, suggests the connection between "external enablers" and "actors" for new venture creation. High public-sector ethics in the environment would be an external enabler that would act as a strong motivational stimulant (Stephan et al., 2014) for individuals with high prosocial motivations (Grant & Berry, 2011; Grant & Sumanth, 2009) to engage in activities or form organizations that lead to social change.

While low behavioral ethics in the environment would elicit entrepreneurial responses from individuals who want to create social change, high public-sector ethical standards in the environment may serve to enhance or support the responses that such prosocial entrepreneurs may have to create social value. High public-sector ethical standards tend to alleviate the challenges that such entrepreneurs face, due to high transaction costs they may have to incur to establish and manage their social enterprises in contexts where public-sector ethical standards are low. This insight of a synergy between public enterprises and private agency appears in political science and development economics literature (Skocpol, 2008; Woolcock & Narayan, 2000). It is therefore suggested that high regulatory public-sector ethical standards reinforce the positive effects of the normative low behavioral ethical standards in society, and consequently enable SE. Hence it is proposed:

Proposition 4: Public-sector ethics moderate the relationship between unethical behavior in society and the creation of social enterprises; the relationship is stronger when both unethical behavior and public-sector ethical standards in society are high.

Unselfishness and Public-Sector Ethics

As discussed in relation to Proposition 4, entrepreneurial action has often been considered a product of the individual and a situation that provides an opportunity to act entrepreneurially (Shane & Venkataraman, 2000). Again, Davidsson's (2015) review, in understanding the role of opportunities and individuals, suggests the strong linkage between "external enablers" and "entrepreneurs" for new venture creation. Thus, widespread unselfishness values in a society, based on the aggregate trait hypothesis (Davidsson & Wiklund, 1997; Uhlaner & Thurik, 2007), may not be sufficient to stimulate a large number of individuals to become social entrepreneurs (Stephan et al., 2014), unless there are external enablers for these individuals to act upon those values.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Using the same arguments leading to Proposition 4, high public-sector ethical standards may serve to act as external enablers. High public-sector ethical standards tend to act as motivational stimulants (Stephan et al., 2014) for individuals with high unselfishness values, and hence a prosocial bent, to set up social enterprises with social objectives. High public-sector ethical standards help reduce transaction costs that prosocial entrepreneurs incur in setting up and managing their social enterprises. Hence it is proposed:

Proposition 5: Public-sector ethics moderate the relationship between unselfishness in society and the creation of social enterprises; the relationship is stronger when both unselfishness in society and public-sector ethical standards are high.

Behavioral Ethics and Unselfishness

Propositions 4 and 5 illustrate that entrepreneurial action is a product of the individual and his or her context (Shane & Venkataraman, 2000). Widespread unselfishness as a moral value in society may not be sufficient to motivate a large number of individuals in society to become social entrepreneurs, unless there is sufficient opportunity in society for them to create social change through their enterprises (Stephan et al., 2014). Bornstein's (2004) series of biographies of social entrepreneurs highlights how moral values of social entrepreneurs motivated them to act after they were sufficiently exposed to human suffering. Low behavioral ethical standards in society would be an opportunity that triggers individuals who score high for unselfishness values to pursue social change. Individuals in society are more likely to establish social enterprises in such situations. Individuals are more likely to engage in SE in societies where there is greater social need and demand for SE (when behavioral ethical standards in society are low), and a high proportion of prosocial individuals (those with high unselfishness values). Hence it is proposed:

Proposition 6: Unethical behavior moderates the relationship between unselfishness in society and the creation of social enterprises; the relationship is stronger when both unselfishness and unethical behavior in society are high.

DISCUSSION

Extant reviews by scholars suggest that entrepreneurship and ethics have generally been treated as separate fields of study. This conceptual study contributes to the intersection of entrepreneurship and business ethics, which remains in relatively early stages (Harris et al., 2009). There is limited research that examines how the ethical context of a society influences entrepreneurial actions. This study has attempted to address that gap, specifically by defining the ethical context of a society along the three dimensions of institutional theory: regulatory, normative, and cognitive; then by examining the influence of these ethical dimensions on the creation or establishment of social enterprises.

Insights from institutional theory are used to establish public-sector ethical standards of a society, behavioral ethical standards of a society, and unselfishness values of a society, as regulatory, normative, and cognitive institutions, respectively. Thereafter, the discussion establishes that behavioral ethical practices (or low behavioral ethical standards) provide opportunities for social entrepreneurs, through their enterprises, to bring about social change in society. Unselfishness is established as a societal value

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and a key driver of the prosocial motivations of social entrepreneurs setting up social enterprises. Then, it is suggested that for successful entry and establishment of their social enterprises, such prosocial individuals would require easy accessibility and the support of public-sector institutions to facilitate transactions in establishing and running their enterprises. Therefore, presence of high ethical standards in such public institutions would help reduce the transaction costs associated with social entrepreneurs starting and managing enterprises.

A mixed-determinant, multilevel model (presented in Figure 1) (Kozlowski & Klein, 2000; Stephan et al., 2014) is proposed, in which the three societal-level institutions (regulatory, normative, and cognitive) are represented. The proposed model represents the effects of public-sector ethical standards (the regulatory dimension), behavioral ethical norms and practices (the normative dimension), and societal unselfishness value (the cognitive dimension), alone and in combination, in relation to the probability of establishment of a social enterprise. While the presence of post materialist cultural values of unselfishness increases the supply of potential social entrepreneurs (Stephan et al., 2014), and low behavioral ethical standards in society provide the opportunity for such individuals to create social change, government support through high public-sector ethical standards serves as a strong enabler for lowering transaction costs and providing access to resources that social entrepreneurs need to establish and manage social enterprises in a sustainable manner (Nicholls, 2006). Given that entrepreneurs' personal objectives and the goals of the enterprises they form are intricately linked (Zahra et al., 2005), the probability determination is explored at the firm level.

The propositions in this chapter suggest joint institutional configurations of formal and informal institutions. Propositions using the institutional configuration perspective enable better integration of research on formal and informal institutions, and go beyond the debate on whether formal or informal institutions are more important for outcomes (Stephan et al., 2014). While theorizing the effect of configuration is a common practice in strategic management and psychology research (Short, Payne, & Ketchen, 2008; Tett & Burnett, 2003), it is limited in institutional theory research (Scott, 2005) and in comparative entrepreneurship research (Bruton et al., 2010; Jones et al., 2011; Stephan et al., 2014). The propositions offer a wider perspective by suggesting that formal and informal institutions can also have additive and mutually reinforcing influences on the creation of social enterprises (Stephan et al., 2014), as proposed between public-sector ethics and behavioral ethical standards, between public-sector ethics and unselfishness values, and between behavioral ethical standards and unselfishness values.

The chapter makes the following contributions to extant literature on entrepreneurship and societal institutions. First, the use of institutional theory as a framework is growing in all areas of management research, as the framework captures issues that the concept of culture cannot (Busenitz et al., 2000; Hoskisson, Eden, Lau, & Wright, 2000). Further, inconsistencies in research that uses Hofstede's measures of culture have prompted scholars to incorporate institutional arguments in their studies (Mueller & Thomas, 2001). Kostova (1997), for example, proposed the concept of a country institutional profile to explain how a society's institutional context influences its domestic business activity. Many entrepreneurship scholars use this concept to explore why levels of entrepreneurship vary by country (Busenitz et al., 2000). The institutional framework has been used to understand the effects of societal ethical context on social entrepreneurship. Classifying societal ethics along the three dimensions of institutional theory provides a benchmark to identify societal-level ethics as either regulatory, normative, or cognitive institutions.

Second, the institutional framework for ethics suggests a more contextualized understanding of the effect of societal-level ethics on SE at the individual level. While practitioners acknowledge the influence of context, academic research on the influence of context on SE is limited (Bacq & Janssen 2011; Estrin,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

et al., 2013b; Nicholls, 2010). Scholars have observed that socially responsible behaviors, represented by the rates of SE, vary significantly across countries (Lepoutre, Justo, Terjesen, & Bosma, 2013). The proposed framework in this chapter suggests that this variance may also be due to differences in a country's ethical attitudes. These societal-level ethical attitudes may also influence and contribute to discussions of the national entrepreneurship framework conditions, assumed to be resource-allocation mechanisms driven by opportunity discovery and pursuits at the individual or firm level, the results or outcomes of which are regulated by societal-level institutions (Ács, Autio, & Szerb, 2014).

Third, this conceptual study uses a multilevel theoretical framework to understand and propose how societal ethical attitudes influence SE at the firm level, given the intricate link between entrepreneurs' personal goals and the goals of the enterprises they form (Zahra et al., 2005). While societal culture is basically a collective-level construct, entrepreneurship is fundamentally an individual or team-level construct (Baumol, 1990). Using a multilevel theoretical design helps to avoid ecological and individualistic fallacies (Autio et al., 2013). The proposed framework in this chapter therefore contributes to multicountry comparative entrepreneurship research. This study is also in line with the recent calls by academic scholars for greater examination of the impact of context on entrepreneurial behavior (Welter, 2011; Zahra & Wright, 2011). The chapter specifically suggests that societal ethical contexts can serve as opportunities for individual social change agents to establish social enterprises, and addresses how these ethical contexts can enable or facilitate entry into social entrepreneurial activity.

FUTURE RESEARCH DIRECTIONS

The proposed framework is multilevel in design and conceptual in nature, to examine the influence of societal-level ethical institutions on SE. Future research may need to empirically test the framework proposed in this chapter, using advanced quantitative methods. Doing so will also respond to the call by scholars for the advancement of SE research through quantitative methods (Dacin et al., 2011; Short, Moss, & Lumpkin, 2009). Only three types of ethics have been conceptualized in this chapter. Future research may identify more ethical institutions at the societal level, and examine their influences on SE, as well as on socially responsible behaviors (Jones, 1999). Zahra et al. (2009), building on the research by Hayek (1945), Kirzner (1973), and Schumpeter (1934), identified three types of social entrepreneurs: social bricoleurs, social constructionists, and social engineers. Future research may examine the effect of the societal ethical institutions on these social entrepreneurial types.

CONCLUSION

Extant research has largely examined ethics in terms of the extent to which context influences ethical attitudes of entrepreneurs, or how entrepreneurs react to ethical dilemmas. The activities of social entrepreneurs have been examined from the point of view of individual motivation of such entrepreneurs. This chapter attempts to establish how societal ethical contexts can serve as an opportunity for social entrepreneurs, and how such contexts can facilitate establishment of social enterprises by such individuals. It suggests that societal-level ethical institutions, along the regulatory, normative, and cognitive dimensions, influence the probability of establishing social enterprises. Low behavioral ethical standards in society—a normative institution—serve as an opportunity for social entrepreneurs to establish social

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

enterprises. Societal unselfishness values provide the supply of social entrepreneurs. High public-sector ethical standards in society enable or facilitate individual success in social entrepreneurial endeavors. The chapter also proposes additive or reinforcing effects of public-sector ethics and behavioral ethical standards, public-sector ethics and unselfishness values, and behavioral ethical standards and unselfishness values, on the creation of social enterprises. In clearly identifying different types of societal-level ethical institutions, the chapter contributes to the sought-after literature that examines the effect of context on entrepreneurial behavior.

Chapter 8
Towards a New Definition of Social Innovation

Pierpaolo Pontrandolfo
Politecnico di Bari, Italy

ABSTRACT

This chapter focuses on social innovation, a topic that the literature has been increasingly discussing in the last decade. The authors revise the many available (and, to some extent, too general) definitions as well as identify the main features that have been claimed as relevant for social innovation (e.g. Mumford, 2002), which concur in providing its definition. By doing so, they pursue the assessment of a less fuzzy definition of social innovation and make a first attempt to focus on the role that companies play in developing as well as scaling social innovations. The adopted approach exploits the literature review and is based on an in-depth analysis of the definitions of social innovation: the authors collected and catalogued them, so identifying the main dimensions of analysis. Clarifying what social innovation is and the role that companies play in social innovation initiatives can increase companies' awareness of what they (can) do with respect to social innovation, possibly taking advantage of this in terms of business objectives.

INTRODUCTION

The literature on innovation analyzes the features, the needed resources, the processes, the effects and the implications associated to the development of different typologies of innovation. Organizational innovation (Wolfe, 1994), technological innovation (Utterback, 1971), architectural innovation (Henderson and

Clark, 1990), disruptive innovation (Christensen, 1997) and, more lately, open innovation (Chesbrough, 2003) exemplify just some of them.

In the last years, an increasing attention has been devoted to social innovation. As observed by Moulaert and Nussbaumer (2006), the social implications of innovation have been deeply discussed in the literature since the seminal work of Schumpeter (1942). However, according to Barroso (2011),the increased attention is partly due to the financial and economic crisis, which makes creativity and innovation in general, and social innovation in particular, crucial to foster sustainable growth, secure jobs, and boost competitiveness.

Social innovation indeed plays a crucial role in several sectors, and especially in those wherein the existing models of innovation are failing or stagnant or new possibilities are not being adequately exploited (Mulgan *et al.,* 2007). Such sectors range from manufacturing to economy, from education to health, from environmental protection to finance, from public service provision to strategic planning.

The diversification of the sectors wherein social innovations develop as well as the diverse backgrounds and perspectives of the scholars that, so far, investigated social innovation lead to several different definitions and to a notion of social innovation quite vague, no more than a buzzword (Bock, 2012; Pol and Ville, 2009; Neumeier, 2012). The paucity of systematic analyses on the topic is also hindering the practice of social innovation itself (Serrat, 2012).

This paper aims at investigating the nature of social innovation. In particular, we review the existing definitions of social innovation and, by the means of a quali-quantitative approach, we identify the dimensions of analysis and the variables that the literature considers as peculiar to social innovation. Based on them we provide a new definition of social innovation. Our work expands and updates the analysis carried out by Pol and Ville (2009). In addition we use three well-known cases of social innovation, i.e. fair-trade movement, microcredit and the open source software to test our conclusions and to question about the their real specificity and usefulness.

The paper is organized as follows. First a review of the literature is presented. Then, the goal of the paper and the methodology adopted to achieve it are discussed. Successively, we discuss the analysis carried out and the findings. Finally, we draw some conclusions and future research directions.

LITERATURE REVIEW

In the last two decades, a growing number of scholars has investigated the nature of social innovation. Literature reviews as well as pamphlets and general guides have been published (e.g. Young Foundation and NESTA, 2010; SIX, 2010). Such works use different approaches and methodologies, ranging from case studies (e.g. Mumford, 2002) to action research (e.g. Trifilova *et al.*, 2012). The novelty and importance of social innovation is also revealed by the number of centres all over the word (Canada, Australia, USA, UK, Germany, Austria, France, New Zealand) which are studying it and by the proliferation of social innovation 'hubs', incubators, and networks (such as the Social Innovation Exchange – SIX).

The literature provides different definitions which, in turn, discuss social innovation based on diverse dimensions of analysis and variables, For example, Flew *et al.* (2008) define social innovation as "the application of a new idea, or a new application of an existing idea, that delivers lasting social value", whereas Heiscala (2007) emphasizes its "changes in the cultural, normative or regulative structures of the society which enhance its collective power resources and improve its economic and social performance". Tafel-Viia *et al.* (2012) stresses that the phases of implementation, adoption and adaptation

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

(modification and customization) are part of social practice. Besides, according to Mulgan *et al.* (2007) and to Trifilova *et al.* (2012), social innovation can be identified according to two perspectives, namely the nature of the innovation (e.g. open source software) or its purpose (e.g. microcredit).

The possible applications and implications of social innovation in several fields have also been deeply studied. For example, in the educational field, Raufflet (2009) shows that social innovation can be adopted to generate new knowledge and to adapt existing knowledge to social needs. Trifilova *et al.* (2012) illustrate the use of social innovation to improve student's excellence and capabilities as well as organizational performance in companies the graduates would be part of; Medvedeva (2011) describes how social innovation may be exploited to develop the innovative competencies of people, and Tafel-Viia*et al.* (2012) scrutinize the mechanisms that facilitate educational reform and examine, among the rest, how networking among teachers influences the effective implementation of new teaching methodologies. In the environmental field, Maruyama *et al.* (2007) examine how an active citizenship can affect the people's acceptance of renewable energy and the adoption of the specific technology; from a different perspective. Rodima-Taylor (2012) investigates the linkages between organizational features of local institutions and their ability to enhance local adaptive capacity to reduce environmental vulnerability. Fink *et al.* (2013) identify practices that are crucial for a sustainable development of local communities and find that disruptive technologies should be accompanied by social innovations to be more easily adopted by the communities to whom the technologies are addressed; Doi and Yamada (2010) deepen symbiotic technology as one of the promising technologies for achieving social innovation.

Also, the role of governments and, in general, of politics and their potential in improving lives act as basis for another stream of research which investigates on social innovation, digging into the aspects related to the governance, defined in terms of collective action and common vision needed to produce social value or to solve societal problems (Kooiman, 2003).

Finally, numerous papers deal with the use of social innovation to promote social change, e.g. to reduce violence against women (Sullivan 2003), to assist homeless individuals with severe mental illness (Calsyn, 2003) or to develop a company's corporate social responsibility strategy (Hanke and Stark, 2009).

Social Innovation Actors

Different actors are involved in the process of developing and adopting social innovation . More specifically, the beneficiary of a social innovation is usually the more vulnerable part of the population (Cahill, 2010), e.g categories of people that, because of their gender or age, are marginalized by the existing power hierarchies (Rodima-Taylor, 2012), mentally ill, homeless, poor, disabled or some other identified user groups (Antadze and Westley, 2010a). Besides, the literature stresses a specific character of the social innovation: it refers to an unmet need (or every need met only partially or unsatisfactorily, or unserved). Indeed, according to Mulgan *et al.* (2007), the standing point for innovation is the awareness of a need that is not being met or some ideas of how it could be met.

Beneficiaries are usually interested to new services, but also have a limited purchasing power. This aspect probably explains why most social innovations involve developing countries, like India and Bangladesh.

In other cases, e.g. open source software, people are grouped according to their competencies in order to develop something jointly, using their own abilities. So, the beneficiaries of social innovation usually collaborate substantially to individuate the solution and develop the social innovation. The idea itself is usually generated from the bottom.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another important actor is represented by governments, which are often in the position to "purchase" the innovative social program or products on behalf of the populations to which it is addressed to. «Governments are generally constituted as the "guardians" of the public good (Westley and Antadze, 2010)», leaving the private sector to respond to the demand for product and process innovation (Fontana and Guerzoni, 2008). They are also prone to more stringent requirements for accountability and are uncomfortable with the uncertainty associated with radically innovative ideas (Antadze and Westley, 2010a).

Antadze and Westley (2010a) also discuss the important role of media in favouring the match between demand and offer of social innovation. Often, media are crucial in broadcasting the needs of disadvantaged peoples, which otherwise lack means to spread them. In doing so, to increase the effectiveness of the eventual social innovation, media should not distort those needs, should sustain only the most logic and sympathetic ones (Mulgan *et al.*, 2007) and should ripple the concept through different networks and communities (Dees, 2012).It is noteworthy that social innovation is not driven by the same incentives as in commercial markets. The pressure absence usually does not encourage the development of many promising idea. Mulgan *et al.* (2007) argue that the main difference with business innovation is the absence of the purpose of profit maximization. Unlike business innovation, social innovation is not diffused by organizations that are 'profit seeking' (Pol and Ville, 2009). According to Moulaert and Nussbaumer (2005), social innovation can give rise to community development that is alternative to market- or state-led development. Therefore, the market for social innovations does not exist, rather the innovations create their own market.

The recognition of the actors involved in social innovation can also be led from another point of view: many of the most successful innovators have learned to operate across sector boundaries, and innovation thrives best when there are effective alliances between small organisations and entrepreneurs (the 'bees' who are mobile, fast, and cross-pollinate) and big organisations (the 'trees' with roots, resilience and size) which grow ideas to scale (Mulgan *et al.*, 2007). For instance, Danone and Grameen Bank in 2006 constituted an alliance and launched Grameen Danone Foods, a social business enterprise designed to provide children with many of the key nutrients that are typically missing from their diet in rural Bangladesh, and run on "no loss, no dividend" basis (Yunus, 2010).

Nonetheless, Mulgan *et al.* (2007) stress that social innovations are usually implemented by governments, big companies or non-governmental organizations, which typically have a limited amount of creativity in the generation of ideas: often such organizations have the means to innovate socially and design effective social innovation, but they lack of the right ideas for doing that. On the other side, single individuals or small companies, which may have the right ideas, can hardly afford the investments needed to implement social innovation, which is characterize by quite long phases with negative revenues (Mulgan *et al.*, 2007). Despite this uncertainty related to the innovation investment, according to Pol and Ville (2009), it would be a blunder for governments not to encourage innovation without a profit motive. Lemieux (2004) claims that the dichotomy between the no-profit and the for-profit sectors should not be the central issue.

For all these reasons, social innovations are often committed to non-profit organizations and/or foundations. For instance, Martin Burt's Fundaciòn Paraguaya (Maak and Stoetter, 2012) promotes education and agriculture in Paraguay by making and extensive use of microfinance initiatives.

METHODOLOGY

The goal of the paper is to investigate the nature of social innovation by identifying the key features (dimensions of analysis and variables) that characterize it. To achieve such a goal, we collected the definitions provided by the literature. In particular, we examined three electronic databases (i.e. Sciverse, Google Scholar, and CASPUR[1]) and selected all the publications containing the string "social innovation" in the title and/or in the keywords, published in English and by October 2012. The covered resulting covered publishing period was 1982-2012 . Sciverse included 12 publications, Google scholar 20 and CASPUR 16, which gave us a dataset of 48 papers, published in peer-reviewed journals (37), book chapters (1), conference proceedings (3), and trade-publications (2). The dataset includes different typologies of papers, such as literature reviews, action research papers, model-based papers and case studies. Scanning the papers dataset, we collected 44 definitions of social innovations (a few papers reported more than one definition, some other related to definitions already cited in other papers, other paper did not mention a specific definition at all), listed in Appendix A. The definitions differ as to the features mentioned and/or stressed. Different features (e.g. the resource, the object, the goal, the beneficiary, etc.), hereafter referred to as dimensions of analysis, have been inductively identified. In the definitions, the same dimension is often reported stressing a diverse aspect (hereafter referred to as value assumed by the dimension). For example, the subject who develops social innovation is identified in some definitions with individuals, in other with organizations, and so on. We also identified the values for each dimension of analysis.

Appendix B shows all the values that the dimensions of analysis assume in the collected definitions.

Next Sections illustrate and discuss the results of the analysis that has been carried out. Specifically, first the emerging dimensions of analysis and the attending values are presented. Then, a new definition of social innovation, built on the analysis of the definitions, is proposed. Such a new definition is articulated so as to take into account only the dimensions of analysis that are most frequent (we chose the average of the frequencies of the dimensions of analysis as threshold value) and include for each dimension only the value(s) also based on average of the frequency of all the dimension values Tables reporting the matching between definitions and values are available on request asking to the corresponding author.

Finally the new definition is tested by three cases presented in the literature.

ANALYSIS AND RESULTS

Table 1 reports the dimensions of analysis and the frequency of their appearance in the definitions derived from the literature. The dimensions of analysis more cited are the innovation deliverable, the effect of innovation, the challenge it addresses, as well as the beneficiary of the innovation. Other dimensions (i.e. the developer of the innovation, the resource adopted to create it, its performance, and the persistence) are included only in few definitions.

Dimensions of Analysis

In this Section each dimension of analysis encompassed in the collected definitions and their attendant values are discussed.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Dimensions of analysis for social innovation and their frequency of appearance in the definitions

D4. Adopted resources	2
D5. Effect	25
D6. Field of need	22
D7. Performance	7
D8. Persistence	2

Deliverable

The deliverable is the output of the social innovation development process. The existing definitions of social innovation stress that the deliverable of social innovation can be any new program or initiative (Antadze and Westley, 2010b), product (Phills *et al*., 2008), process (Tafel-Viia *et al.*, 2012), way (Forum on Social Innovation, 2000), solution or technology (Phills *et al.,* 2008), dynamics (Maruyama *et al.*, 2007), change (Heiscala, 2007), practice (Moulaert *et al.*, 2005), model, activity or service (Mulgan *et al.*, 2007).

The terms used to describe the deliverable stress two distinct perspectives. In some definitions, the deliverable refers to the new object developed, i.e. the final product or service. In that case, terms such as product, model, solution, technology, or program are used. The latter perspective is associated to the use of other terms (e.g. process, activity, dynamics or change), which, in some cases, still refer to the output of the innovation development process (i.e. so meaning that a social innovation can be a process innovation). Yet, in other cases, the terms adopted in the definitions rather refer to the way the social innovation development process is carried out. Exactly that process is emphasized in some definitions rather than its output. To take into account both perspectives, we assume that the dimension of analysis "deliverable" can assume two values, namely object or process. Table 2 summarizes the frequencies for both values. The definitions which discuss both values are counted twice.

The adjective *new* stresses that a social innovation is indeed an innovation.

Table 2. Frequency of the dimension of analysis "deliverable" (D1) and its values

Value	Frequency

V1.2. New process	11
Total	**37**

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Developer

Another dimension of analysis relates to the subjects involved in social innovations. One of them is the developer, namely the actors (actor) who make(s) decisions and implement(s) activities to develop the social innovation. The developer can be an organization whose primary purposes are social, a company, an individual or an unstructured group of them, i.e. actors working in concert or separately (Antadze and Westley, 2010b).

Mulgan *et al.* (2007) identify various kinds of subjects who promote and develop social innovations. They can be individuals, especially when they are "heroic, energetic and important" (see for example Maak and Stoetter, 2012). Movements (e.g. feminism, or environmentalism) can also promote social innovation, as well as foundations (not as the end users) and organizations. As to the latter, they can be both existing or ad hoc established ones to promote the social innovation.

Mulgan *et al.* (2007) state that the idea to implement a social innovation can arise from angry individuals or groups, campaigns and political movements.

Indeed, on the birth of the idea of social innovation, Ramalingam *et al*. (2010) assert that social innovation is also built on the inherent capacities of individuals and communities, which makes the notion of open innovation especially relevant.

Table 3 shows the frequency the dimension of analysis reported in the examined definitions and the relative frequencies per value. In our opinion, it would be interesting to further investigate this dimension so as to clarify the roles involved in the development process. However, as such dimension is rarely mentioned in the literature, as explained in the previous Section, we assume that (at least according to the existing literature) it is not relevant and hence is neglected in the rest of the paper.

Beneficiary

The beneficiary is the subject to whom social innovation is addressed. i.e. an individual, a group of individuals who share some needs or personal conditions (e.g. poor health, or the will to map their professional network), a company or a network of companies, the whole society, or the planet. More specifically, the literature stresses that the beneficiary may be the vulnerable population (Cahill, 2010), gender or age categories which are marginalized by the existing power hierarchies (Rodima-Taylor, 2012), e.g. mentally ill persons, homeless, poor, disabled, or some other well identified user group (Antadze and Westley, 2010a). It is noteworthy that vulnerable people are discussed as potential beneficiary of social innovation in several papers but it is not explicitly mentioned in any of the definitions (included those reported in those papers).

Table 3. Frequency of the dimension of analysis "developer" (D2) and its values

Value	Frequency
V2.1. Organization	2
V2.2. Individual	1
Total	**3**

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The literature suggests also that sometimes the developer and the beneficiary of a social innovation are the same person. For instance, vulnerable people may also develop (or contribute to the development of) social innovations, in addition to be supported by them (Antadze and Westley, 2010b).

Table 4 indicates the frequency the dimension of analysis reports in the examined definitions and the relative frequencies per value. However, as such dimension is rarely mentioned in the literature, as explained in the previous Section, we assume that (at least according to the existing literature) it is not relevant and hence is neglected in the rest of the paper.

Adopted Resources

The dimensions adopted resources refers to what is used by the developer to develop the social innovation. Resources involve skills, competencies, technologies totally new (e.g. Mulgan*et al.*, 2007; Ramalingam*et al.*, 2010; Bessant*et al.*, 2012) or already existing and conveniently recombined. Social innovation brings together old elements in new - sometimes radically new-ways (Antadze and Westley, 2010a; Arthur 2009). Although both values are discussed in the literature, only one of them is cited in the definition, i.e. the fact that social innovation uses only something existing.

Table 5 shows the frequency such a dimension of analysis is cited in the examined definitions and the relative frequency. As the dichotomy between what discussed in the papers and what reported in the definitions suggests to further investigate this dimension of analysis. However, consistently with the methodology adopted in the paper, as the dimension is rarely mentioned, we decided to assume that (at least according to the existing literature) it is not relevant and hence is neglected in the rest of the paper.

Effect

Several definitions emphasize the effect of social innovation. In particular, scholars distinguish among two kinds of effects. The former pertains to people's quality of life, which results enhanced after social innovation is adopted (Mulgan, 2007; Pol and Ville, 2009). The latter relates to the system-level social change (Munshi, 2010). In that case, social innovation is considered a driver of the change of the social

structure (e.g. Tuomi, 2006). Antadze and Westley (2010a) mention that social innovations strive to change the way a social system operates, as they usually result in a change at the systemic level. That means that social innovation creates new social relationships, or rather it structures existing ones in a new and different way, so redefining the roles to address the equity concerns of various parties (Mumford, 2002). Indeed, social innovations can be considered as the actions that aim at transforming the social relationships that are at the roots of the social problems (Bouchard, 2011). Also, a social innovation may occur when people build structured institutions to preserve informal, naturally occurring relationship of value (Policastro and Gardner, 1999).

These considerations open up another aspect stressed by the literature, namely the critical role played by the relationships between the actors involved; in fact, according to Mulgan *et al*. (2007) it is the lack of certain social relationships that explains why many social innovations are still born.

Within the system-level social change we include also the effects on the economic system (Gershuny, 1982) and the strengthening of the labour market (Forum on social innovation, 2000).

Table 6 shows the frequency the dimension of analysis "effect" is reported in the examined definitions as well as the relative frequencies per value. As such dimension is often mentioned in the literature, as explained in the previous Section, we assume that (at least according to the existing literature) it is relevant and hence is preserved in the rest of the paper.

Field of Need

The field of need refers to the domain social innovation is intended to be addressed. Definitions of social innovation suggest that such a dimension may assume several values, ranging from the financial to the environmental and cultural milieu, as well as social one. The last one is the most frequently cited in definition: Leadbeater (2007b) talks social issues like education and health. Phills (2008) emphasizes that a social innovation is truly social only if the balance is tilted toward social value.

Table 7 shows the frequency the dimension of analysis "field of need" is reported in the examined definitions and the relative frequencies per value. As such dimension is often mentioned in the literature,

Table 6. Frequency of the dimension of analysis "effect" (D5) and its values

so collecting an high frequency, as explained in the previous Section, we assume that (at least according to the existing literature) it is relevant and hence is preserved in the rest of the paper. The most cited field of need is associated to the social milieu.

Performance

The dimension "performance" is related to the kind of improvement produced by the social innovation . The improvement may be associated to the efficiency, the sustainability, the effectiveness, or to the overall satisfaction of the beneficiary of the social innovation. It is noteworthy that the term sustainability is used to refer to the way the financial resources are marshalled and effective managed to make social innovation develop and animate over time (Mumford, 2002).

Table 8 shows the frequency this dimension of analysis is reported in the examined definitions and the relative frequencies per value. As such dimension (performance) is rarely mentioned in the literature, as explained in the previous Section, we assume that (at least according to the existing literature) it is not relevant and hence is neglected in the rest of the paper.

Time Horizon

The persistence refers to the duration of effects due to the adoption of social innovation.

Mulgan *et al.* (2007) clarify that social innovation has a long term effect, whereas Mumford (2002) states that it may not require complete solutions, but rather timely solutions laying an organizational foundation for long-term solutions.

Table 9 reports the frequency such a dimension of analysis is cited in the examined definitions and the relative frequencies per value. As such dimension (performance) is rarely mentioned in the literature, as explained in the previous Section, we assume that (at least according to the existing literature) it is not relevant and hence is neglected in the rest of the paper.

A New Definition of "Social Innovation"

In this section, we formulate a new definition of social innovation. To do so, we use the findings of this chapter and gather the dimensions of analysis whose frequency of occurrence is higher than the average. For each of those dimensions, we take into account only the values that are cited most frequently.

Based on what discussed in the previous section, we define social innovation as:

…any new object or process able to address a social need which change the socio-economic structure and/or improve the people's quality of life.

As summarized in Table 10, such a definition includes three dimensions of analysis, i.e. the deliverable, the effect and the domain of social innovation.

After developing the new definition, we checked if any other definition among those we examined, mentioned those (and only those) dimensions and value reported in Table 10. We found only one correspondence, i.e. the definition provided by the Forum on Social Innovation (2000), according to which "social innovation seeks new answers to social problems by: identifying and delivering new services that improve the quality of life of individuals and communities; identifying and implementing new labour market integration processes, new competencies, new jobs, and new forms of participation, as diverse elements that each contribute to improving the position of individuals in the workforce".

Indeed, our new definition underlines the same main features of social innovation: the need which creates it and the effect it produces. It is also consistent with the one formulated by Pol and Ville (2008): "an innovation is termed social innovation if the implied new idea has the potential to improve either the quality and the quantity of life; or new ideas with the potential to improve either the macro-quality of life or quantity of life". Nonetheless, our definition is at one time, more concise and sufficiently narrow, which in our opinion is a remarkable value.

CASES OF SOCIAL INNOVATION

In this Section we use some cases of social innovation to test the robustness of our definition. The literature indeed mentions several cases of social innovation in fields which cover human rights, boy scouts, song and dance methods, open source software, neighbourhoods nurseries, and wardens. We decided to analyse three of the most cited ones, namely the fair trade movement (e.g. Trifilova *et al.*, 2012; Hazelkorn, 2009), the microcredit (e.g. Bessant *et al.*, 2012; Cahill, 2010), and the open source software (e.g. Mulgan *et al.*, 2007; Hazelkorn, 2009).

Table 10. Dimensions and values for the new definition of social innovation

D1	V.1.1 and V.1.2	D5	V.5.1 and V.5.2	D6	V.6.1
Deliverable	Object	Effect	changing socio-economic structure	Field of need	Social
	Process		improving quality of life		

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

We use the cases also to investigate the role of companies within the social innovation development process; in particular, we are interested in assessing whether they are profit-seeking or not, and whether they are positioned upstream or downstream with respect to the development of the deliverable.

The Fair Trade Movement

Fair trade is a trading partnership, based on dialogue, transparency, and respect, which seeks greater equity in international trade. It contributes to sustainable development by offering better trading conditions to, and securing the rights of, marginalized producers and workers – especially in the developing countries. Fair trade organizations (backed by consumers) are actively engaged in supporting producers, raising the consumers' awareness, and campaigning for changing rules and practices of conventional international trade (FINE, 2001).

Pioneered in the UK and USA in the 1950s, and formerly limited to the importation of handicrafts from poor communities, the fair trade movement has grown globally especially since 1990s and extended to food and agricultural products, which now account for the bulk of the fair trade product range in the consumer markets of the developed countries (Ebong, 2008). In the economy of developing countries, the primary sector is still the largest one in terms of number of workers and most of the rural communities, when embodied in the network of international trade, have experienced a severe worsening of their standard of living.

To cope with such phenomena, fair trade aims at improving the livelihoods and well-being of producers, promoting development opportunities for disadvantaged producers, setting an example of partnership in trade, protecting human rights by promoting social justice, sounding environmental practices and economic security (Redfern and Snedker, 2002). Some of the drivers for fair trade are the settlement of fair prices (i.e. prices which cover the production costs and enable the improvement of workers' quality of life as well as preserve natural resources from depletion), the refusal of child labour, the pay equality between women and men, risk sharing agreements between farmers (or craftsmen) and buyers, prompt payment and, whenever possible, pre-harvest or pre-production financing.

The movement has grown exponentially from a moral rebuke of free trade into a world-wide movement and organization certifying, labelling, distributing, and selling a wide range of products, among which the most important are coffee, chocolate, bananas, and cotton (Hazelkorn, 2009; Ebong, 2008). There are about one million of fair trade producers worldwide, grouped in 3000 organizations that operate in more than 150 countries (CRC, 2006).

Although organizations involved in the fair trade typically are small companies, cooperatives, or consortia of them, several networks have been established to coordinate and support their activities. These networks – in shape of foundations (e.g. Fair-trade Foundation, established in 1992 in UK), informal no-profit associations (e.g.the European Fair Trade Association, established in the Netherlands in 1997), non-governmental organization (e.g. the Alternative Trading Organization), or meta-networks (e.g. the World Fair Trade Organization, which has been established in 1989 among fair trade producer cooperatives and associations, export marketing companies, importers, retailers, national, and regional fair trade networks and fair trade support organizations) – define standards to which one must conform to be acknowledged as a fair trade organization, and certify products and organizations by giving them marks and labels. In some cases (e.g. Fair-trade Labelling Organizations International), they also assists producers in gaining and maintaining certification and in capitalizing market opportunities on the fairtrade market.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to Hazelkorn (2009), the real success of fair trade has been to transform it from a fringe activity to a brand that cities and towns themselves have sought to embrace and highlight as a demonstration of ethical values – in the belief/realization that this is important for its own and tourists.

Microcredit

Microcredit is the (small) amount of money or, more generally, the provision of financial services that a bank or another institution loans to clients, usually low-income people who traditionally lack access to banking and related services (Cahill, 2010).

The origins of microcredit, as it is currently known, go back to several experiences conducted a few decades ago in Bangladesh. The Grameen Bank, which is generally considered the first modern microcredit institution, was founded in 1983 by Muhammad Yunus, who pioneered microfinance as a way of bringing banking services to an unserved part of the population. Microfinance refers to loans, savings, insurance, transfer services, microcredit loans and other financial products targeted at low-income customers: its ultimate goal is to build a society wherein people, irrespective of their financial conditions, have permanent access to an appropriate range of high quality financial services, useful to support entrepreneurship and alleviate poverty. Microfinance is designed also to empower women and uplift entire communities by extension. In many communities worldwide, in developed and developing countries alike, women lack a highly stable employment histories that traditional lenders require (Microfinance Information Exchange, 2009).

The model of microfinance pursued by the Grameen Bank is successful, serving some eight million people in Bangladesh and being profitable since 1993; it was widely replicated and now support over 200 million families worldwide, even if the original idea was rejected by the Bangladeshi government, the banks, the international relief agencies, and local business entrepreneurs (Bessant *et al*. 2012). As Schopenhauer (1942) observed: "every truth passes through three stages. First, it is ridiculed. Second, it is violently opposed. Third, it is accepted as being self-evident".

Microcredit is widely adopted in developing countries and is recognized as having "enormous potential as a tool for poverty alleviation" (Cons and Paprocki, 2008).

Open Source Software

Open source software is a software whose source code is made available (often, but not always, freely) to everyone (Bessen, 2002). The software is developed by developers who voluntarily interact, typically within web-based communities, and collaborate in designing and developing a software which they, or their organizations, need or desire (von Hippel and von Krogh, 2003).

Open source software may permit users to meet specialized needs more efficiently. It not only permits free customization, but relies on it: individual modifications that are contributed back into the shared source code allow open source programs to grow into highly featured, high quality products (Bessen, 2002). Open source principles and methods enable large numbers of people from different disciplines to work together and solve the myriad unexpected problems that surface in large scale projects (Huddart, 2008).

Sometimes, the network of open source software developer encompasses thousands of people worldwide; these are, for example, the cases of the communities that have originally developed, and still maintain, the Linux operating system and the Apache web server (a program for delivering web pages over the Internet). It is noteworthy that, even if the source code is usually distributed for free, it may

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

require customization and support to be used (the software is created by developers for other developers so usually it lacks manuals and supporting guides). Therefore, there exist a plenty of for-profit companies who support (not specialized) customers in using open source software.

Testing the New Definition

We use the three above-mentioned cases of social innovation to test the robustness of the definition provided above, and to highlight the role of companies within the social innovation development process.

Our definition of social innovation involves three dimensions of analysis, i.e. deliverable, effect and domain.

The social innovation deliverable is a service (e.g. microcredit) or a process (e.g. fair trade). Both kinds of deliverables can be identified, to some extent, in all the cases. For instance, open source software, while providing a service (the software itself), provides also a collaborative process and improved software development approach.

The social need is also clearly expressed in the cases. In the case of microcredit, such a need is a more respectful trading system or the access to financial resources for people otherwise excluded from the financial market. In the case of open source software, it is the provision of dedicated and high quality software for companies and/or individuals.

As to the effect of such social innovations, the fair trade movement improves the quality of life of large categories of people (e.g. poor workers in developing countries, mostly women), and has a crucial collateral effect on social (in particular, economic) structure. Microcredit, whose goal is to improve the welfare of poor households through better access to small loans (Navajas *et al.*, 2000), enhances social capital, improves quality of life and changes social structures as it also affects female control (Zaman, 1999). Finally, open source software modifies the socio-economic structure: it makes everyone access to software, usually for free; the development teams develop software that often, even if not always, has better performance that those provided by traditional software companies and satisfy specific and in some cases not addressed needs; it also created a meritocratic community, the open source community, emerged and, to a less extent, improves quality of life, as it allows skilled people to transform existing software by themselves, based on the freely accessible source code.

The examined cases thus confirm the validity and robustness of the definition we proposed.

As to the role of companies within the social innovation development process, the three cases provide support for the following considerations. Fair trade movement promotes the mushrooming of small companies, not necessarily profit seeking, which manage the trade from the developing to the developed countries; on the other side, it allows independent farmers or craftsmen in the developing countries to keep their activities independent from mainstream business actors (e.g. corporations, manufacturing plants, or large-scale producers) and, at the same time, allow them to build local networks with other farmers and craftsmen. Moreover, the need to certify products and organizations by giving them marks and labels urges the emergence of new companies and organization, whose aims may range from providing those certification to support companies interested in obtaining them.

Also microcredit allows new business actors to emerge, both at the provider's side and at the buyer's one. The former includes business actors, such as banks and financial institutions, which design, promote, and sell financial products for low-income customers. Such actors are often ad-hoc established for

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

microcredit. Nonetheless, as the model of microfinance is getting a foothold, even traditional financial companies have established their subsidiaries to provide microfinance services. The largest number of companies that benefit from microcredit, however, are the ones that grow out of the loans given to poor people.

Finally, as to open source, as it lessens the cost to provide software, it reduces the barriers of entrance in new markets for new and existing companies. Moreover, there exists a plenty of consultant companies and software houses which provide open source software users with customization and customer support. Such a service creates a new market and reveals the existence of substantial business opportunities.

CONCLUSION

The chapter investigates the nature of social innovation. Although social innovation is not a new topic (it emerged in the eighties), its importance has been lately dramatically increased due to the concurrence of several factors, which include the outbreak of the financial crisis. The paper contributes to the academic debate on social innovation by integrating the fragmented and dispersed literature on social innovation - and the numerous, and somehow dissonant, definitions of it. The final end is to assess a less fuzzy definition of social innovation. To achieve it, we propose a quali-quantitative approach by which three main dimensions of analysis, namely the deliverable, the effect and the field of social innovation, are emphasized. Based on them, we formulated a new definition of social innovation and test its validity and robustness on three remarkable cases of social innovation: namely the fair trade, the microcredit, and the open source software.

Our study contributes to clarify the nature of social innovation by providing a new definition and a first attempt to identify actors involved in social innovation. We are also aware of some of the limitations of the study.

Despite the review of the literature we carried out is extensive, it cannot be considered as exhaustive. Furthermore, as discussed in the paper, we neglected some dimensions of social innovation (those that were rarely cited), i.e. the beneficiary, the developer, the adopted resources, the performance, and the persistence, even if the last two are somehow included in the nature itself of innovation. We recognize that some of them could be relevant to describe the nature of social innovation. Similarly, according to the deliverable, it would be required a further investigation following a different path: social innovation as process which creates the innovation itself.

A further analysis, also by the study of more cases of social innovation, is needed. Finally, to test the robustness of the definition, more cases should be discussed.

A possible extension of our research will be to validate the definition on a larger sample of cases.

The cases and the definitions which have been analysed do not discuss some aspects such as the role of developers (who they are? do they usually operate according to specific schema?) and beneficiaries (are they active or passive? Are they involved, and eventually when?). We intend to investigate those aspects in future research.

APPENDIX A

Table 11. Definitions of "social innovation"

#	Definition	Author(s)
1	New ideas that work to meet pressing unmet needs and improve peoples' lives.	Mulgan, 2007
2	Innovative activities and services that are motivated by the goal of meeting a social need and that are predominantly developed and diffused through organizations whose primary purposes are social.	Mulgan, 2007
3	An innovation is termed social innovation if the implied new idea has the potential to improve either the quality and the quantity of life; or new ideas with the potential to improve either the macro-quality of life or quantity of life.	Pol and Ville, 2009
4	New ideas that resolve existing social, cultural and environmental challenges for the benefit of people and planet.	Centre for social innovation, 2008
5	Conceptual, process or product change, organization change and changes in financing, and can deal with new relationships with stakeholders and territories	Forum on social innovation, 2000
6	Social innovation seeks new answers to social problems by: identifying and delivering new services that improve the quality of life of individuals and communities; identifying and implementing new labour market integration processes, new competencies, new jobs, and new forms of participation, as diverse elements that each contribute to improving the position of individuals in the workforce.	Forum on social innovation, 2000
7	Satisfying new needs not provided by the market or creating new more satisfactory ways of insertion in term of giving people a place and a role in production	Forum on social innovation, 2000
8	Production of new ideas and new kinds of social structures	Scott, 2007
9	Changes in the cultural, normative or regulative structures [or classes] of the society which enhance its collective power resources and improve its economic and social performance	Heiscala, 2007
10	Dynamics which change the rules of risk-benefit distribution and the role of social actors	Maruyama *et al.*, 2007
11	Social innovation involves acting on and manipulating functional role relationships, restructuring these relationships to achieve new goals or to allow old goals to be met more efficiently.	Mumford, 2002
12	The generation and implementation of new ideas about how people should organize interpersonal activities, or social interactions, to meet one or more common goals	Mumford, 2002
13	New ideas that successfully meet social goals through mission-related impacts	Serrat, 2010
14	Any product, process, design, initiative, or program that is created to address a social problem or need and that ultimately profoundly changes the flow of resources, authority, and meaning of the social system in which it is created	Antadze and Westley, 2010b
15	New strategies, concepts, ideas and organizations that meet social needs of all kinds and that extend and strengthen civil society	Wikipedia
16	Social innovations are not a result only of brilliant idea or of hard work by individuals but, rather, are achieved through the interplay of "effective demand" (the 'pull' factor) and "effective supply" (the 'push' factor). "The combination of the 'effective supply' and 'effective demand' results in innovations that achieve social impact and, at the same time, prove to be financially sustainable"	Mulgan *et al.*, 2011
17	Social innovation is how cities, national governments and businesses solve compelling challenges facing society by designing and developing new and more effective approaches	www.britishcounci.org
18	Innovations that on top of creating value for the individual or a specific organization or firm, also create value for stakeholders and for society at large.	Krull, 2008
19	Innovation for the greater good	Bessant *et al.*, 2012
20	New ideas that resolve existing social, cultural, economic, and environmental challenges for the benefit of people and planet. A true social innovation is systems changing – it permanently alters the perceptions, behaviours, and structures that previously gave rise to these challenges	Centre for Social Innovation: Toronto
21	New ideas (products, services, and models) that simultaneously meet social needs (more effectively than alternatives) and create new social relationships or collaborations. In other words they are innovations that are both good for society and enhance society's capacity to act.	Mulgan *et al.*, 2010
22	The design and implementation of better ways of meeting social needs	Centre for Social Innovation: New Zeland

Table 11. Continued

#	Definition	Author(s)
23	Social innovation seeks to improve the well-being of people, communities and society.	Dawson and Daniel, 2008
24	An innovation in its insight and assimilation of existing knowledge and extrapolation of understanding to produce something new.	Dawson and Daniel, 2008
25	New ideas that work in meeting social goals in conjunction with other organizational, technical or scientific goals.	Dawson and Daniel, 2008
26	If you only concentrate on technology research then you invariably get technology innovation, but if you also research the social and the cultural, then you get social innovation.	Dawson and Daniel, 2008
27	The development of new concepts, strategies and tools that support individuals and groups to achieve improved well-being.	Dawson and Daniel, 2008
28	Processes of invention, diffusion and adoption of new services or organisational models, whether in the non-profit, public or private sector. It also describes the outcome – the service or model being developed	SIX et al, 2010
29	Innovations that are social both in their ends and in their means.	SIX *et al.*, 2010
30	It can be a product, production process, or technology (much like innovation in general), but it can also be a principle, an idea, a piece of legislation, a social movement, an intervention, or some combination of them.	Phills *et al.*, 2008
31	Social innovation is innovation that is explicitly for the social and public good. It is innovation inspired by the desire to meet social needs which can be neglected by traditional forms of private market provision and which have often been poorly served or unresolved by services organised by the state.	Harris and Albury, 2008
32	A novel solution to a social problem that is more effective, efficient, sustainable, or just better than existing solutions and for which the value created accrues primarily to society as a whole rather than to private individuals	Phills, Deiglmeier, & Miller, 2008: 36
33	New behaviours ... that leads to improved health and well-being, and arguably, quality of life.	van den Hove et al., 2012
34	New needs and new aspirations arising within society	Lévesque, 2007
35	Processes and mechanisms that facilitate the process of adopting change	Tafel-Viia *et al.*, 2012
36	Social innovation as an important 'enabler', facilitating the implementation and adoption of the 'main' innovation	Gopalakrishnan and Damanpour 1997; Moulaert *et al.*, 2005
37	Social innovation is explained as change in multilevel social institutions that encompasses regulative, normative and cultural elements of institutional change	Heiskala, 2007
38	The compound of collective practices aimed at satisfying material and immaterial human needs through the transformation of social relations.	Moulaert *et al.*, 2007
39	Typically diffuse events involving interactions among multiple parties over rather long periods	Mumford, 2002
40	Social innovation is a major influence in the process of economic development, an important explanatory variable for the pattern of development of both economic and social structure	Gershuny, 1982
41	The application of a new idea, or a new application of an existing idea, that delivers lasting social value.	Flew *et al.*, 2008
42	The process of implementing and adopting change	Tafel-Viia *et al.*, 2012
43	Social stands for: social needs and problems, social value and balance in creation and capture of value favours the public; innovation stands for: novelty, performance improvement, magnitude and implementation/adoption	Phills, 2009
44	Social innovation has four fundamental elements by which it can be understood: people, challenge (which may be a problem or an opportunity), the process (by which that challenge is negotiated and understood) and the goal (resolution of the challenge and increased social well-being).	Dawson and Daniel, 2008

Chapter 9
Women's Economic Empowerment in the Developing Countries: Reengineering Patriarchy?

Ummu Atiyah Ahmad Zakuan
Universiti Utara Malaysia, Malaysia

Kalthum Hassan
Universiti Utara Malaysia, Malaysia

ABSTRACT

It is an established fact that women's empowerment is primary to the socio-economic and political development of a nation. It will be meaningless, if women that constitute half of the population of the globe do not have access to education, healthcare, employment and political decision making bodies. A nation benefits fully when both men and women contribute rigorously in social cohesion, economic growth, peace and prosperity. Findings from countries and reputable institutions such as World Bank and the United Nations revealed that greater gender equality correlates positively with national economic growth. The World Economic Forum recently reported that across the 135 countries examined, greater gender equality correlates positively with per capita gross national product. Countries with greater equality between women and men have economies that are more competitive and fast growing. Hence, removing barriers on empowering women stimulates economic development. This chapter commences with the meaning of women empowerment followed by the identification of various barriers on women empowerment, and investigation on women economic empowerment in the developing countries. The patriarchal system is also introduced to explain how it influences women empowerment. Finally, this chapter argues that women empowerment in general can only be achieved if the patriarchal system is transformed or reengineered to foster more equality between both groups.

INTRODUCTION

Women are unequal to men in all aspects in the developing world and gender disparity is more prevalent among poor people (World Bank, 2001). International attention on the discrimination of women was raised in the 1970s, when the United Nations (UN) convened its first World Conference on the Status of Women, in Mexico City in 1975. It marked a new era at the international level when it opened a worldwide dialogue on gender equality. It also marked a sharp difference among the women gathered there reflecting the politics and economic realities at that time. While women from the Eastern Block were more concerned with peace issues, women in the West pressed more for equality while those in the developing countries prioritised issues relating to development. The UN, as an international organization, continued to promote gender equality through its track records in organizing the second world women conference in Copenhagen, Denmark, in 1980, the third one in Nairobi, Kenya, in 1985 and the fourth in Beijing, China, in 1995 (UN Women, 2000).

The Beijing Conference was significant because it marked the beginning of the struggle for gender equality. It also called for total restructuring of the entire society in order to re-evaluate the relationship between men and women. It was argued that through these practices, women could be truly empowered to take their rightful place as equal partners of men in all aspects of life. Women's rights are human rights and gender equality has become a universal concern. Twelve critical areas were identified namely; women in environment, women in power and decision-making, the girl child, human rights, women and education and training, violence against women, women and poverty, institutional mechanisms for the advancement of women, women and health, women in armed conflict, women and media as well as women and the economy. They also identified the obstacles to women's advancement in the respective areas. It required strong commitment from the respective national governments to remove the identified barriers (UN Women, 2000). In the post-Beijing era, in the context of women and poverty, although overall poverty had declined, many women were still trapped in poverty. Over 60% of the women in the developing countries engaged in various types of informal employment, meaning unstable earnings and high risks of poverty (UNIFEM, 2005).

The economic participation of women is vital not only in reducing poverty among the women, but also an important step towards raising household income and encouraging economic development in the country as a whole. However, it shows that there are several barriers impeding economic empowerment and patriarchy is the most prevalent one (World Economic Forum, 2005).

WOMEN'S ECONOMIC EMPOWERMENT

Women's economic empowerment is an achievement of women to be able to choose and control their economic activities and incomes. It is also an enhancement of women's rights to enable them to have control over their lives and also contribute to the society at large. The main objective of women's economic empowerment is to create just and equitable societies (OECD, 2011). In order to provide sufficient knowledge and understanding about women's economic empowerment, this section starts with broad definitions of relevant terms and concepts related to women's economic empowerment before exploring the context of economic empowerment for women in the developing countries

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Empowerment

The term empowerment was first used in the 17th century. Literarily, it connotes "authorize", "delegate" or "enable". It implies transfer of power over a period of time. It helps people to gain control over their own lives. It also refers to a process that fosters power in people for use in their own lives and their communities on issues which they think are more important to them (Mandal, 2013).

Rowlands (1997, pp.9-13) explained the conception of power in the context of empowerment. According to her, power is the root of empowerment and it can be seen in operation at many levels, from the household to national or even at the international setting. Power can be used to understand the process of empowerment which the former takes many different forms: First "power-over" shows that there is a controlling power, hence, resulting in a domination and insubordination. As a result of this, some people will have more while others will have less. The relationship between the two involves intimidation, threats of violence and resistance. Second, "power to" refers to the generative or productive power which prevent domination. It enables individual empowerment. Third, "power with" is a sense of the whole being greater than the sum of the individuals, especially when a group come together collectively for a common purpose or understanding. Lastly, "power from within" is the spiritual strength and uniqueness in any individual which make him or her truly human. A person in this situation possesses self-respect and self-acceptance, hence, he or she tends to recognize, respect and accept others equally.

In the context of women empowerment in the developing countries, the concept of "power over" emerges as the major hurdle. To empower the women, they have to be brought into the decision-making process. The "power to" and the "power with" mark that the women are aware of their rights and needs, and acquire necessary skills and abilities to improve and upgrade their lives. The women will relate with others and form a collective front to ensure the full realization of their needs and interests in various endeavours.

Economic Development

Economic development has a broader interpretation and implication than economic growth. Therefore, to understand economic development, it is essential to know the meaning of development. In general, development can be defined as achieving human fulfilment. Crewe & Harrison (1998) suggest that development should be an ideal objective and outcome towards which institutions and individuals aim for. Similarly, Hulme & Turner (1990) view development as a conscious action to bring about a desired transformation in a society. Both definitions suggest that development policies and plans are designed to ensure a society with better economic and social achievements. In a similar vein, Mabogunje (1980) sees development in various positive perspectives; as economic growth, as modernization, as distributive justice and as socio-economic transformation. Thirlwall (1994,) refers to development as a change and adds that development as a term is used to describe "the process of economic and transformation within countries" (p.9). Goulet (1971), classifies development in three ways; life-sustenance, self-esteem and freedom. This includes the fulfilment of basic needs, the feeling of not being exploited and independent and also the freedom to choose and to determine your own destiny.

According to Tadaro and Smith (2012, pp.22-23), development should provide at least the following conditions:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Increase the availability and widen the distribution of basic life-sustaining goods such as food, shelter, health, and protection.
2. Raise levels of living, including, in addition to higher incomes, the provision of more jobs, better education, and greater attention to cultural and human values, all of which will serve not only to enhance material well-being but also generate greater individual and national self-esteem.
3. Expand the range of economic and social choices available to individuals and nations by freeing them from servitude and dependence not only in relation to other people and nation-states but also to the forces of ignorance and human misery.

In a nutshell, the most suitable definition for economic development for this case is as described by Berg (2012), "the full range of changes in humanity's economic, social, and natural environments that are perceived by people as making life more pleasant and satisfying" (p. 28). This means that economic development should contribute positively to socio-economic condition of the overall population which also includes women and other disadvantaged groups. However, emphasis is placed on women's economic empowerment in achieving a better household in the society.

Women's Empowerment and Economic Development

Women's empowerment aims to provide equal distribution of power between the sexes. Both men and women should be provided equal economic, social, legal, and political opportunities for developmental society. To empower women requires self-esteem and self-confidence as well as understanding their potentials, appreciate them in order to develop their knowledge and skills. Women deserve equal distribution of power and involvement in decision-making at home, in society, in economy and politics (Panigraphy & Bhyuan, 2006).

Women's economic empowerment is a prerequisite for sustainable development, pro-poor growth and the achievement of all the Millennium Development Goals (MDGs). That is why a platform for increasing donor investments in the women's economic empowerment (United Nations, 2013) is necessary. Achieving women's economic empowerment is not a "quick fix", it will take sound public policies, holistic approach and long-term commitments from all development actors. This is achievable through integrating gender-perspectives at the design stage of policy and programme. In addition, more equitable access to assets and services such as land, water, technology, innovation and credit, banking and financial services will strengthen women's rights, increase agricultural productivity, reduce hunger and promote economic growth.

Empowerment of women is not only significant in the developing societies, but also to the world and that is why it becomes a focus of the international organizations like the United Nations and the World Bank. This is based on the belief that investment in women's skills and giving them power to make their own selection is not only important but also leads to economic growth and development (UN, 1995).

Long-term studies and observation prove that investments in women's economic activities and gender equality yield the highest returns of all development investments. A higher proportion of incomes generated by women are often spent for their families and communities than that of men (OECD, 2011). A study in Brazil showed that when the mother controls her household income the likelihood of a child's survival increases by 20 per cent (OECD, 2011). Therefore, women's economic empowerment is very vital to developing countries because of its huge contribution to the nation's future socio-economic development.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Gender equality and women empowerment have been moving hand-in-hand in most parts of the world. The movement involves women from various levels, from single mothers to housewives to women at professional levels. The progress has acknowledged women's participation in economic activities as employers, employees, and entrepreneurs, and their contributions to national economic growth. It also recognizes equality between men and women in health and well-being, educational attainment and political empowerment (World Economic Forum, 2005).

The United Nations, the World Bank, USAID, UNDP, WHO, IMF and many other international development agencies have initiated and sponsored various socio-economic development programmes and formulated various development policies with the aim to empower women socially and economically. In addition, policies, programmes and activities have been progressively formulated, planned and implemented by many developing countries that have empowered many women to improve their socio-economic status.

In this case, women's economic empowerment would contribute to economic development of the households, societies and nations. At present, among the objectives of women's economic empowerment is to increase women's access to economic resources and opportunities to enable them to participate and contribute to the nation's economic growth (OECD, 2011).This will contribute and enhance the ability of women to have control over their lives and improve their decision making ability within household. Invariably, this fosters women's property rights, equitable and just societies.

Not only that, gender equality promotes economic growth because literate women stand better chance of securing employment. With this, reduction of poverty in household is guaranteed. As rightly observed by (Kabeer, 2012), giving women the access to economic resources strengthens economic growth of a society. By empowering women, it enhances a balanced society where both men and women constitute a unit. The voices of both groups should not be treated differently, but equally listened to. When a woman is empowered, it means she is aware of her rights, possesses self-confidence, and has the ability to control her life and make changes in the society (Sohail, 2014).

Similarly, the nexus between women empowerment and economic development can be viewed via two directions. First, as women are empowered, economic development also increases. Second, as the economy develops, women get empowered. Sohail (2014) argues that gender equality promotes economic growth. When women are given better health care, education and public safety at work, it increases productivity level which subsequently promotes economic growth. Aid (2010) also shares a similar argument that women's economic empowerment will increase as women health improves. A study on socio-economic changes among women in Kerala State, India, discovered that economic empowerment among women leads to sustainable social development (Kenneth & Seena, 2012).

Although economic empowerment has been accepted as one of the approaches to including women among the players that contribute to the socio-economic and political development, implementing programmes in sustaining this faces set back in developing societies. This means that there are gaps between policy development and the actual implementation (Upadhyay, 2010). These issues and challenges are more apparent in the rural environments rather than in the urban areas as far as developing countries are concerned.

Issues such as plurality, constraints and restriction confronted by many women in the developing world are the fundamental challenges that need to be recognized by the policy makers and this is also consistent with a statement made by Gutmann (1985) that, the women empowerment projects were not successful due to their failures to take into consideration the plurality issues among women. In addition, some groups of women may face multiple constraints and restrictions to participate in the economic

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

development programmes due to the dynamism of groups among women (Duflo, 2012). However, whatever programmes or policies for implementations should take into consideration the dynamic of women groups which make their demands to vary. For example, in a study in Ahmedabad, Gujarat, India, self-employed women were offered business training to boost their incomes. Upper caste women benefitted from it, but not the lower caste women. Perhaps, the upper caste women had more business experience. Hence, the programme only benefitted a relatively a small proportion of women (Duflo, 2012).

Therefore, the underpinning drawback in promoting a strong relationship between women empowerment and economic development is the failure to confront issues and factors impeding a large number of women in developing countries from the benefits provided by various development agencies. Several studies have suggested solutions to tackle this state of affairs. Among the solutions are, to improve women's rights to access to services and facilities available in the communities, to improve their quality of life and enhance their ability to control their future and to improve their family well-being. To enable women to be economically empowered, they should be provided with free or affordable and accessible childcare.

Any direction one may choose, it could be strongly argued that by not empowering the women, the economy of a country will not develop and the tendency of poverty to reign in such society is very high. The World Economic Forum's First Report on 58 countries, examining to what extend the women have achieved equality with men in five critical areas (economic participation, economic opportunity, political empowerment, educational attainment, and health and well-being) concludes that, countries that do not capitalize on the full potential of women in their societies are misallocating their human resources and undermining their competitive potential (WEF, 2015).

WOMEN IN THE DEVELOPING COUNTRIES

The term "developing world" is often associated with poverty and inequality. Many literatures have discussed the incidence of poverty and hardship experienced by women in the developing countries. International agencies such as the United Nations, the World Bank, UNHCR, WHO and others, have also become the key-players in providing financial support, services, infrastructure and training to alleviate poverty.

In the past, more than 70 per cent of the poor in this world were women. A United Nations report demonstrated that in the early 90s, the number of rural women living in poverty in the developing countries had increased by over 50%. Poverty among the rural men had increased by 30% in the same period (United Nations, 1996; UNDP, 1995). This trend was characterized as feminization of poverty and had become a key concern of the World Summit on Social Development (United Nations, 1996). Even though the percentage of poverty in the developing world has decreased, feminization of poverty remains as a prominent issue that needs further scrutinization.

Feminization of poverty applies to a situation where the existing social and economic practices have made women to be vulnerable to poverty. Therefore, women are more susceptible to poverty and the degree of poverty experienced by most women is worse than that of men. Feminization of poverty is also a situation where girls and women are given less access to education, health care and food than boys and men. In addition, women's traditional and cultural practices have caused unequal inheritance rights (Bhat, 2002). In certain cases, women do not have property rights, the rights for inheritance and lacked the rights to control goods such as land and housing (Vicente, 2005).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Many development experts have emphasized that previously, in general, the division of work between genders was more obvious in the developing countries and in most cases women had been technically excluded from the rural development programmes (Robertson, 1984; Bernstein, Gosh & Bharadwaj, 1995; Crow & Johnson, 1995). Mabogunje (1980) pointed out that in rural societies in some South African countries, the women usually did farm work to help their husbands and relatives but did not have any power in managing and organizing this farm work. Mabogunje (1980) added that the development programmes were usually focused on men as land managers even though in some cases women had been doing the work. In certain land division cases, women got a smaller fraction of land than men. These inequalities caused higher percentages of women to work as casual workers. The unemployment rates were also high among the casual workers (Gosh & Bharadwaj, 1995). In many developing countries, women were overburdened with their own work and household work such as carrying out income-generating activities and accommodating their husbands' needs for more labour in their cash crop fields (Boer, 2001).

Various international government and non-governmental agencies have implemented various types of economic development activities to surmount feminization of poverty and to empower women. Numerous programmes focus on providing education to girls. Among the programme is the Food for Girl's Education Programme in Yemen to encourage girls to attend schools. Since 2010, 200,000 girls have benefitted from the programme (United Nations, 2013). Also a UNICEF-supported programme offers scholarships to encourage Somalian girls to enroll and stay in school. Currently 453 primary, secondary and university girls/women are beneficiary of the scholarship scheme. To help addressing sexual violence in Rio de Janeiro, Brazil, an online website was launched by the UN Women and UN-Habitat. The website contains important and valuable information such as abuse hotline numbers and information about the rights of women as well as the responsibilities and locations of Specialized Women's Attention Centres (United Nations, 2013).

Among the well-known economic development programmes is the micro-finance or credit facility that has been employed by most government and non-governmental agencies throughout the world to empower women in their economic activities. Bangladesh, as a leading country in micro-credit, has empowered thousands of poor women. This approach is followed by many micro-credit agencies like Amanah Ikhtiar Malaysia (AIM) in Malaysia, the Center for the Development of Women's Resources in Indonesia, Pro Mujer in Latin, Fonkoze in Haiti (Philanthropedia, 2012). The United Nations Entity for Gender Equality and the Empowerment of Women (UN Women) has also become partner in microfinance or credit programmes with several developing countries including Vietnam.

Besides the above programmes, USAID formulated a Policy Paper on Women and Development in 1982 focusing on Gender Equality and Female Empowerment (USAID, 2012). The aim of the policy was to promote gender equality, promote women empowerment and hence improved the lives of women around the world. At the country level, Gambia has introduced a Gender Policy for 2010-2020 focusing on priority areas such as education, health, sustainable livelihoods development, governance, human rights, poverty reduction and economic empowerment (African Development Bank Group, 2011). In addition, India introduced the Gender Budget Statement for the 2005- 2006 financial year.

WOMEN EMPOWERMENT: ISSUES AND CHALLENGES

As mentioned earlier, women faced various limitations and rules and regulations that restricted them from being actively involved in the economic development programmes organized by various agencies. According to the literature, several factors have posed barriers to women's economic empowerment in the developing countries. Discriminatory gender is still prevalent in the developing country which is primarily due to cultural norms and traditional practices. These have reinforced women's subordination in the families as well as the communities. Even though the practices deprived women, they do not constitute discrimination because they are acceptable norms. Dinne and V.Le (2015) explain that women in Vietnam are expected to care for the children and the elderly in the family. The culture rules that the women should be tolerant and passive whenever a crisis arises with their spouses to maintain family unity.

The occurrence of domestic violence is prevalent, but people are not aware of it or conceal it due to the social stigma. If it does not result in serious injury, then, domestic violence is seen as "normal" until the woman suffers from serious injury or the marriage is at stake. Lama (2013) who reviewed the literature on women's economic empowerment in India mentioned that due to traditional norms, the women's right places are at home and taking care of the families. This has resulted in the women working from 10 to 12 hours catering for familial responsibilities, such as childcare and cooking, besides helping their husbands in the agricultural sector. They are also perceived as being inferior to men. Similar expressions can be also found in Upadhay (2010, pp.1) that "women and girls have restricted mobility, access to education, access to health facilities and lower decision making power, and experience higher rates of violence". This discrimination is derived from the social and religious construct of women's role and their status in India. Similar scenario can be seen in Nigeria, where the women are under stress due to overwhelming responsibilities at work and home (Lesiele, 1999). Women in Iran are hindered from experiencing economic empowerment due to their familial responsibilities (Sarban & Hassanzadeh, 2014).

Illiteracy and lack of access to education also appear to be one of the main barriers to women's economic empowerment. Developing countries marked a low literacy rate as compared to the developed countries (OECD, 2011). Female children in Nigeria are often given less priority for education compared to their male counterparts (Lasiele, 1999), and often the former are entrusted with the role of "second mother", assuming responsibilities of the household such as looking after the younger siblings (Lama, 2014). Due to low educational backgrounds, women in India have limited economic opportunities compared to women with better education (Upadhay, 2010). In Vietnam, although there is a small disparity between Vietnamese boys and girls attending school, 72% and 70% respectively, there is a huge disparity between boys and girls in the ethnic minority groups in Vietnam. At the national level in 2010, adult literacy rates for men and women were 94% and 88% respectively (Dineen & V.Le, 2015). Rural women in Iran constitute a major portion of the labour force, and their participation is not considered vital in the social decision-making processes due to their limited access to formal education (Sarban & Hassanzadeh, 2014).

The right to property is often ignored. Women's land rights are crucial issues in the developing countries because women constitute 43% of the agricultural labour force and this percentage increases to 50% in the Eastern Asia and Sub-Saharan Africa. Given the fact that 40% of the total population in rural developing countries depend on land, land has become an important asset for security, nutrition, income and status. However, women's rights relating to land ownership are often ignored or lost. And in India for instance, the loss of land ownership is due to customary practices of family law rather than the formal law (Prosterman, 2013).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

A study conducted in the rural areas in Vietnam revealed that even though 74% of women entered the labour force as compared to men, (82%) in 2010, the participation of women in the formal sector has declined. In addition, they earned approximately 70% of the income that earned by men. Like as it is obtainable in other developing countries, more than half (64%) of the women concentrated in the agricultural sectors. They worked more hours than the men in aquaculture, artisanal fisheries, small livestock production management, and agricultural-product marketing. In addition, women contributed actively to household incomes through petty trades, food processing, and handicrafts (Dineen & V.Le, 2015).

Studies by the Poverty and Inequality Institute (SPII) in South Africa narrated the experiences of two participants of SPII's 'Social Protection and Local Economic Development (LED): Graduation Pilot Project', The following illustrations illuminate the limitations and restrictions faced by women in the process of empowering themselves in South Africa:

Participant 1: She had to withdraw from the programme due to the husband's refusal at the expense of her willingness to acquire education through participation in the programme. Her husband argued that he was able to provide everything she needed as a married woman. Therefore she did not have to acquire any new skills. She decided to obey her husband's instructions because as a wife she could not defy her husband.

Participant 2: She was selling traditional fast food outside a tavern every weekend. After attending the Basic Business Management Skill training component of the above programme, she was able to reduce the price of her products compared to other fast food businesses in the area. This caused a male fast food seller to verbally abuse her to the point that made her considering moving to another location.

The above scenario coupled with the aforementioned challenges testifies to the influence of patriarchal values and system which has been imbedded and accepted by the population of developing countries.

THE PATRIACHAL SYSTEM

The issues and challenges can be surmounted if the fundamental phenomenon, the patriarchal system is handled systematically. Though it may not be an easy task to adjust the system which has been so embedded, practiced and harmonized in the majority of households, community and national systems, scholars on women empowerment directly or indirectly, lamented that patriarchy emerges as the main barrier in empowering women (see Rawat, 2014; Lama, 2014; Dineen & V.Le, 2015; Sarban & Hassanzadeh, 2014; Mandal, 2013, Schutte, 2013). Rawat (2014, p.43) mentions that:

…depowerment of women is linked to the belief and practice of patriarchy which subjugates women at various levels-political, economic, social and cultural…deep social transformations will take place only when the concept of patriarchy is shaken …

Living in patriarchy influences the way and the form of gender relations. It varies from place to place depending on the degree of social and cultural definition of the roles of men and women. The big question however is; can patriarchy be altered in order to enable women empowerment? But first, it becomes imperative to understand the concept of patriarchy.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

What Is Patriarchy?

Patriarchy can be defined literally as the rule of the father or fathers. Patriarchy sometimes refers to the rule or power of adult men over others. Hearn (1992, p.48) explains that this notion sometimes is reflected as "viriarchy", "androcracy", "andrarchy" or "phallocracy". However, "patriarchy" is perceived as the most suitable term because it is more meaningful since it refers to hierarchy, even outside its literal sense. It also reflects a social construction of fatherhood and its derivatives. In contrast, Hearn states that the former terms are ambiguous in referring to both "men" and "males".

Patriarchy is the highest operating system, invisible, yet visible through family, community and state, in formal or informal settings. It has been embedded in human lives for so many years. Patriarchy refers to a social and ideological construct which considers men as superior to women. As defined by Walby, it is a social system in which the role of the male as the primary authority figure is central to the social organization and where males hold authority over women, children and property (cited in Rawat, 2014, pp. 44-45),

For the structural functionalist, the social system is composed of interrelated parts which operate together to keep the balance in the society. Each element of the society functions in some way to maintain the social order. Any change, if rapid, will be disrupted; hence, it should be slow and evolutionary in nature. In terms of gender, structural functionalists accept that men and women are physically different; hence, men are stronger and bigger than women. Due to these differences, they have different gender roles. Since women's primary roles are bearing and caring for families, hence, they are restricted at homes. In contrast, men are perceived as economic providers and the protectors of the families.

However, this perspective is criticized by the feminist sociologists. They argued that portraying masculinity and femininity based on human biology is natural. The former is claimed to be mistaken between gender and sex. Although feminist sociologists argue biological differences do play some role in gender differences, they are actually a product of social creation. Both masculinity and femininity happened to be the product of social interaction and process (Renzetti & Curban, 2003). Evelyn & Adedayo (2014) share a similar perspective that, biological differences do not necessarily determine the roles of men and women in society. Instances were drawn from some societies which reflect that certain tasks are not always performed by men and others by women. For example, the Mbuti pygmies in Congo, Africa, do not segregate men or women to do the hunting. Similarly, among the Aborigines in Australia, women are responsible for seal hunting, fishing and catching opossums (tree dwelling mammals). Women also participate in the armed forces in Israel, China and Cuba. Some women work in men's associated industries such as women in India work on building sites, while some women in Latin America work in mines.

Edley & Wetherell (1995) explain that the reproduction of masculinity is predominantly a family affair. The gender identity that every male embraces is shaped primarily by the relationship that he experiences at the early stage of his life. By the time he is ready to lead his own life independently, his gender "personality" is already established. At the same time, society around him reinforces the development of the personality and socialization as a male individual. It can be seen in the division of labour, whereby the father joins paid employment while the mother stays at home caring for the family. Lee & Newbye define socialization as "the business of learning the normative standards of society" (cited in Edley & Wetherell, 1995, p.70). Although it can be argued that through socialization at the level of society has made males manly, there must be practices that mold and define the meaning of masculinity at the sub- set level such as the family. These normative standards would inform us, such as, how a man should dress, how he should behave in public and the things he should and should not think. It is

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

termed as "male-sex role" (Edley & Wetherell, 1995, p.70). This process has eventually brought about patriarchy or patriarchal culture in a society or a place. The patriarchal cultural core value is controlled and dominated in almost every area of human existence. Gaining and exercising control is a continuing goal of great importance. It reflects the "power over"- the ability to control others, events, resources, or oneself in spite of resistance, rather than alternatives such as the ability to cooperate with others, or to act in harmony with nature (Johnson,1997).

Structure of Patriarchy

Male dominance can be seen in various levels. Wald (1990) explains that there are six forms of patriarchal structures namely; mode of production, paid work, state, male violence, sexuality and cultural institutions. From these structures, it can be argued that there are two main forms of patriarchy, private and public. Private patriarchy takes place when individual males exploit women's labour in the household and exclude women from public life. This form of patriarchy mainly took place in the 19th century Europe. The form persisted until the early 20th century, when the feminist movement intervened. They agitated for a space for women in the public spheres. Thus, the notion of public patriarchy emerged when the state and employment affairs permit less number of women in the state and organization. Moreover, women are designated to lower paid jobs respectively (Evelyn & Adedayo, 2014).

Hence looking at the structures of patriarchy, women face male dominance at the level of the family and the community (private), and as well at the institution and the state level (public). For instance, at the private level women may have to work at their husbands farms but do not have any power to manage or organize the farm work (see Mabogunje, 1980). Sometimes the husbands overburden them with farm work and household work (see Boer, 2001) and women are expected to care for the children and the elderly in the family. The women are expected to be tolerant and passive even when a crisis emerges to the extent that domestic violence is prevalent (Dinne & V.Le, 2015).

In terms of public patriarchy, the state translates it through policies or regulations. It can be seen in the practices of some countries and Singapore is taken as an example in this context. According to Chan (2000), the state has improved many areas to treat women as equal to men; among others, equal ownership rights to property, equal rights to divorce, to be equally responsible for their children, and have equal rights to social and economic participation. This has been spelled out in the Women's Charter which was passed in 1961. And other laws also came into place to protect women and the family as the fundamental unit in the society. However, in spite of these developments, the state overtly displays the defense of patriarchal system as a desired and desirable form of governance (Chan, 2000, p.46). In the 80s, it was observed that the state defined the roles of women in the family as to care for their children. Through its education system, secondary one and two female students were not allowed to take any Technical subjects and Home Economics was the compulsory subject for girls. Male students were prohibited from taking the Home Economics subjects. However, this policy was revoked in 1994. The state also imposed patriarchal practice in its medical treatment. Only male employees could claim medical benefits for their families while the female family members did not have that access. However, those women who were widowed or divorced or whose husbands were seriously ill would be eligible for the benefits. While defending this practice, the respective Ministry argued it was due to economic difficulties. However, after the economic boost, the Ministry maintained the policy on the ground that, it preserved the structures of the society. The Minister was reported to have said that "it is the husband's responsibility to look after the family's needs, including the medical needs. This is how our society is

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

structured. It would be unwise to tamper with this structure" (Chan, 2000, p.48). This statement dismisses the fact that there are female headed household in Singapore. Goh Chock Tong, the then Prime Minister, had once said that "(in) a largely patriarchal society, minor areas where women are not accorded the same treatment should be expected so long as the welfare of women and of the family is protected. I would not regard them as "pockets of discrimination" or "blemishes" but as traditional areas of differential treatment" (Chan, 2000, pp. 40-41). As a result of the state patriarchal policies, Chan added that, it yields the effect of relocating women back to homes, making them responsible for child rearing and other household duties, in spite of making calls for women to contribute to the economy.

Hence, it can be seen that, women have gained less and encountered discrimination in a patriarchal system which is embedded in the family, society as well as the state level. If the system persists, then, women would continue to be "depowered" as Rawat (2014) rightly mentions that, depowerment of women is associated closely with the belief and practices of patriarchy. "…deep social transformation will take place only when the concept of patriarchy is shaken…"(p. 43).

Reengineering Patriarchy?

How can women be empowered economically, socially and politically? In terms of economic empowerment, as discussed mainly in this chapter, it is through the gendered approach that would design good economic and developmental policies and programmes which cater for the needs of the women. Evidence has shown that women benefited in terms of higher incomes, property creation, reduced poverty among women (OECD, 2011), receiving better health care, education and public safety at work (Sohail, 2014; Aid, 2010).

As it can be observed from the previous instances, women found themselves deprived due to the extra workload of taking care of the children and other family members. Some of the women worked outside homes to cater for the needs of their respective families. The majority of them, who are employed, receive low incomes with working long hours. Some of them also endured domestic violence; hardly expose the sufferings due to social stigma. Some of them were also being denied access to education. This subjugation of women was also certainly endorsed by the government or the authority. However, it is only by reengineering the existing practices and perception related to patriarchy, that the whole problem of women empowerment, including that of economic empowerment can actually be solved.

Although it is difficult to alter the system of patriarchy as it is embedded in the society irrespective of the location, the substance of the system can be gradually changed through the new construction of gender relations. There is a need for gender education and awareness among men of all age groups irrespective of social class. This approach is championed by the UN Women and was recently launched at Tsinghua University Beijing in China. The "HeForShe" campaign is a solidarity movement designed to engage men and boys around the world in gender equality discourses. It calls for men's support for women's right and give women more opportunities to develop their potentials. The Regional Director of UN Women Asia and the Pacific and Representative in Thailand, Roberta Clarke, during the opening of the event said "We ask for awareness, we ask for social change" (UN Women, 2015).

It is already a global call made by the UN Women, and it is now left for the states, organizations and individuals to make it happen. Through this exercise, gender awareness can be done not only among men but also women. With this state of knowledge, acknowledging the differences in terms the roles and the relationship of men and women is guaranteed. In addition, it will also enlighten the people, the women in particular, that they have great potentials that can be fulfilled. At the end, with this state of knowledge,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the diversity and variation between men and women will result in differences to be observed in power relations, statuses, privileges, and needs. (Women's Resources Center Armenia, n.d). Therefore, this understanding about the relationship between men and women will subsequently promote equitability and improve the general well-being of both, particularly women. With this state of affairs, the patriarchal system will gradually dilute to accommodate women's rights and needs and can be reengineered. Hence, women empowerment initiatives can be fully realized and the nation will experience efficient economic development as well as other aspect of development.

CONCLUSION

Women economic empowerment is vital in reducing poverty among women, enhancing gender equality, improving social well-being of the women and also improving the lives of the communities at large. Evidences have proven that by empowering women economically, the social well-being of the communities would definitely improves and vice versa. Even though the benefits of empowering women are known, gender inequality in all aspects, particularly in the developing countries is prevalent. Various discriminations faced by women are due to cultural norms and traditional practices which are visible at the personal level (family) and public level (government). To some, though the practice deprives women, it does not constitute discrimination because it is an acceptable norm in the communities.

Patriarchal system has often been perceived as the main contributing factor to gender inequality. This is because in general, men rule the world. Therefore, men are likely to exert their power in any setting to their advantages. Since it is too embedded in the society, it is difficult to alter (absolutely) the system of patriarchy. However, the system can be gradually improved through the new innovation on gender relations. This process requires the introduction of gender education and foster gender awareness among men of all age groups irrespective of social class. These initiatives constitute re-engineering patriarchy and it is only can be realized if every social entity is willing to embrace the measures.

KEY TERMS AND DEFINITIONS

Developing Country: Refers to a country with the following characteristics: low levels of human capital, high levels of poverty and under-nutrition, higher population growth rates; predominance of agriculture activities and dominance of informal sector.

Economic Development: Is a process of restructuring of an economy to enhance the economic well-being of a community/ country.

Gender Awareness: Is an awareness of the differences in roles and relations between women and men. It recognizes that the life experiences, expectations, and needs of women and men are different.

Gender Equality: Refers to the equal rights, responsibilities and opportunities of women and men and there should not be any discrimination based on gender.

Patriarchal System: Is a system which differentiates and stratifies human being based on sex, and it favours men. It defines women's roles and functions in the society which normally put barriers to many women's right such as right to education and the right to work.

Patriarchy: Is a social system where men are in authority over women in all aspects of society. It is invisible, yet visible through family, community and state, in formal or informal settings. It has been embedded in human lives for so many years.

Reengineering: Refers to a process of a system in restructuring or redesigning as to optimize the outcomes. In this context, it is a process of transforming the patriarchal system to be gender sensitive.

Women Empowerment: Is an enhancement of women's rights and privileges to enable them to have control over their lives and to contribute to the societal wellbeing.

Chapter 10
A Study of Two Microfinance Models and Their Suitability for Egypt

Ahmed Youssry
Coleman University, USA

Brett Winklehake
San Diego Mesa College, USA

Jaime A. Lobera
Coleman University, USA

ABSTRACT

Developing countries around the world strive to implement one of the several current models of microfinance. This study focuses on two models: Grameen Bank, which is considered the change factor for the microfinance field, and Kiva.org, an organization that understood the importance of the Internet and crowdfunding to create a different model of microfinance. The purpose of the study is to analyze these two models and determine which would be more suitable for application in Egypt. This study provides a strengths, weaknesses, opportunities, and threats (SWOT analysis), a financial analysis, and a structural analysis, as well as historical background for both organizations along with a scan for the political, economic, social, and technological infrastructure in Egypt to determine the most suitable microfinance model.

INTRODUCTION

Currently, poverty and unemployment are the two main obstacles facing developing countries. According to Giugale and Mubarak (1996), more than 23% of Egyptians live below the poverty line, and unemployment is almost 30%. The country is trying to get through the bottleneck of the political situation that has existed since the 2011 revolution, and efforts are ongoing to solve the problem of employment.

One of the most effective solutions other countries have undertaken to deal with employment issues is implementing microfinance.

Microfinance institutions around the world and specifically in developing countries have helped thousands of people to cross the poverty line. These institutions help the poor through different financial services including microloans, microinsurance, and microsaving. Given the current economic conditions and the number of microenterprises that exist in Egypt that might need support, the country should view microfinance as a major economic tool. Many African countries and others in similar situations have tried different microfinance solutions.

Statement of the Problem

Poverty and unemployment in Egypt are among the main issues facing the country after the revolution in 2011 (Giugale & Mubarak, 1996). Microfinance institutions are one of the solutions for these issues, yet in Egypt, microfinance institutions are still underdeveloped and have dependency on external fund sources which has led to a very slight impact on the society. Small projects that help the poor and unemployed segment of the society usually require limited amount of fund that can be supplied through microfinance institutions.

Purpose of the Study and Thesis Questions

Microfinance has become a solution in several countries in the help of elevating poverty and decrease unemployment. The purpose of this study is to analyze two microfinance models that were implemented successfully in other locations. Study the current environment in Egypt based on four aspects; political, economic, social and technological, and recommend one of these two models to be implemented in Egypt.

RQ1: "How did Grameen Bank achieve success in Bangladesh?"
RQ2: "How did Kiva.org manage to use online microfinance and crowdfunding concepts so successfully?"
RQ3: "Which microfinance model out of Grameen Bank and Kiva would be more successful in Egypt?"

Significance of the Study

The results of this research would help social entrepreneurs in Egypt identifying the most appropriate model of microfinance between the two models studied to be implemented in Egypt. The study would also help researchers and students that are welling to investigate more in microfinance and crowdfunding. Arab spring revolutions have given hope to all young generations that they could make their countries a better place and they can elevate poverty and fight unemployment. This study could be a base for starting these battles with a national project.

Methodology

The method followed in this paper to answer the research questions is based on the findings from scholarly references, dissertations, academic research and articles. The conceptual framework of the study is explained on the first section of the paper in order to engage the audience on the main concepts behind

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the two models of microfinance selected for comparison. The ground work in this paper includes a study of Egypt's context and current practices in microfinance and non-profit organizations. Furthermore the ground work includes the study of Grameen Bank and Kiva.org. The research questions are answered based on the research done in the ground work section.

CONCEPTUAL FRAMEWORK

The conceptual framework in this paper includes an overview of the concepts related to thesis topic and research questions. The first part in this section is highlighting the concepts related to microfinance. These concepts include the explanation of microfinance and the different sub concepts developed through it; microcredit, micro insurance, and micro saving. Moreover the history of microfinance, the profitability of microfinance organization, and the key principles of microfinance are presented.

The second part of the conceptual framework is a focus on crowdfunding and its related concepts. A brief about the history of crowdunding and the misconceptions that several people get deceived by is also discussed in this section. An elaboration of the mechanisms of crowdfunding is presented in this section as well. Lastly, the pros and cons of crowdfunding based on the research conducted will be the last concept in this section.

Microfinance

Microfinance is considered to be one of the most efficient approaches in providing different financial services to the poor (Akram & Hussain, 2011). These services include microcredit, microinsurance, microsavings, transactional services, and financial consultations. Many microfinance institutions limit their role to microcredit, assuming that it is the only benefit they can provide to micro entrepreneurs (Akram & Hussain, 2011). The microfinance industry includes a wide range of organizations that includes nonprofit organizations, credit unions, cooperative societies, some commercial banks, and some non-banking financial institutions (Akram & Hussain, 2011). Microfinance is the a smaller scale concept of banking as it includes most of the services that banks offer to people, yet on a much smaller scale for people that usually doesn't possess collaterals. The main service of microfinance is the micro loans offered without collateral to cover it.

In certain developing countries, such as Egypt, governments have tried to use microfinance as an alternative to solve infrastructure problems such as poverty, lack of education, unemployment, and victims of natural disasters (Marinescu, 2009). The governments in these countries consider microfinance to be a new solution, yet it usually fails because the main objective in the above-mentioned cases is giving credit to people who are incapable financially, which usually requires a 98% performance rate (Marinescu, 2009). In order to achieve this rate, the government needs to ensure that each transaction performed is monitored, followed up on, and checked case-by-case. The Monitoring of case by case would cost the government more money than the low interest that they would usually announce they can offer. In other words to monitor the performance rate it would cost more money than the return from the interest (Marinescu, 2009).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Microcredit

The Microcredit Summit Campaign (2005) described microcredit as tool or program that provides poor, unemployed people who are looking to improve their financial status the opportunity of starting small projects or becoming micro entrepreneurs. This happens by facilitating microloans without the proven financial records or credit history that most regular financial institutions require. These loans are usually much smaller than the regular loans given to businesses and to people that have collateral to cover the loan they are asking for. Microcredit is the main service that the microfinance institutions offer to assist the poor segment of the society, as it's the concept of loaning money for starting micro projects.

Microinsurance

This is the protection of low-income people from possible risks and hazards in exchange for a specific regular payment amount that suits the type of risk and likelihood of occurrence (Churchill, 2006). The difference between regular insurance and microinsurance services is that the latter are aimed at the poor (Churchill, 2006). A larger difference is that with regular insurance a person usually has a stable or predictable income, whereas microinsurance is targeted to the low-income population that does not have a stable income (Churchill, 2006).

Microsaving

This can be defined as the usual concept of saving, but on a micro scale, meaning that the same concepts that apply to household savings apply to microsaving (Browning & Lusardi, 1996). Saving is keeping an amount of income in order to use it at another time (Browning & Lusardi, 1996). The reasons for saving could be building a reservoir against unexpected events, anticipating a future relationship between needs and withholding, increasing financial safety with interest and appreciation, enjoying slowly increasing purchasing power, increasing the ability to take a risk on a project, and accumulating enough income to satisfy other needs. The difference between regular saving and microsaving is the amount and predictability of income that might be saved (Browning & Lusardi, 1996).

Profitability of Microfinance Institutions

In 2005, a microbanking report showed that microfinance institutions always consider their priority to be profitability, which sometimes makes the decision-making process more biased toward turning a profit than helping the poor (Marinescu, 2009). The initial efforts of the first 63 microfinance organizations around the world have resulted in profitability after regulation of inflation rates and help received from governments or international organizations (Marinescu, 2009). This profit can be up to 2.5% of the organization's total income (Marinescu, 2009).

The main sources for financial revenue for microfinance institutions are; interest charges, and fees and commissions (Guntz, 2011). Other profits that the micro finance institutions make are generated form; the net gain on financial assets, and the revenue from insurance of micro projects (Guntz, 2011). The fact that microfinance institutions are profitable or in other words, generate revenues doesn't hide the important role they play in helping small and micro projects.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

History of Microfinance

Although not referred to as such, the concept of microfinance has existed since early civilization, due to differences in wealth between societal classes (Helms, 2006). In early times, microfinance took the form of informal credit practices and savings between individuals and groups. In the middle Ages, specifically in 1462, an Italian monk made the first formal attempt at microfinance in the form of a pawnshop that offered moneylending (Helms, 2006). In the 16th century, Pope Leon X allowed pawn shops to request a certain amount of money in return for their services to cover expenses (Helms, 2006). In the 18th century, the writer Jonathan Swift founded the Irish Loan Fund System to give microloans to farmers who were below the poverty line and had no guarantees or assets. The system was successful to the extent that at some point this type of lending was almost 20% of the household income in Ireland (Helms, 2006).

Friedrich Raiffeisen and his supporters from Germany developed the concept of a financial cooperative in the 19th century, which expanded rapidly throughout the developed world. In the 20th century, specifically between 1950 and 1970, a great effort was made to increase access to agricultural loans and credit using farmers' cooperatives at lower interest rates than the market (Helms, 2006). Those efforts failed due to the high expense of operations that exceeded the rates. It was not until the early 1970s when alternative-banking efforts became part of experimental programs to give small loans to poor women to start modest businesses that microcredit succeeded. Grameen Bank in Bangladesh, ACCION International in Latin America, and the Self-Employed Women's Association Bank in India were the pioneers of the microcredit movement (Helms, 2006).

In the 1980s, microcredit developed through institutions. The concept of cost-recovery interest rates and high repayment was introduced by Bank Rakayat in Indonesia in order to help micro lenders achieve long-term sustainability and increase the number of their clients (History, 2013). Since the 1990s, when the term "microfinance" began to replace the term "microcredit," most of the microfinance institutions tried to adopt a commercialization strategy that would turn them into profitable organizations to appeal more to clients. As the World Bank became aware of microfinance as a solution for poverty, they initiated the Consultative Group to Assist the Poor (CGAP) in 1995 (History, 2013). In the early 2000s with the rise of Internet technology, online transactions became an essential component of microfinance. Some organizations started to apply the model of online crowdfunding to microfinance to help poor people, and Kiva.org became prominent (History, 2013).

Consultative Group to Assist the Poor

The main idea of CGAP was to help any person access a financial service needed to improve his or her situation. CGAP created groundbreaking solutions for all the possible financial problems faced in poor communities through intensive and continual research, the group's active involvement with service providers on all levels, and funders and policy makers. CGAP was founded in 1995 by the World Bank as a response to the rising microfinance movement of the 1970s and 1980s (About CGAP, 2013). Currently, the organization acts as a reference source providing solutions and research for old and new microfinance institutions. CGAP's research database is considered one of the largest and most reliable sources for microfinance information (About CGAP, 2013).

Key Principles of Microfinance

In their 30th summit, June 10, 2004, G8, the group of the largest eight economies worldwide, recognized the effort done by CGAP to develop microfinance and came up with a statement by the end of the summit to formalize the key principles of microfinance. One of the principles was that people under the poverty line not only need loans in terms of financial services but also other financial tools such as savings, money transfers, and insurance. Microfinance is a very effective tool in the fight against poverty as poor households use microfinance services to support their families. Microfinance is about building a financial system that does not just offer a temporary solution and the concept should be included in countries' financial planning (G8 Summit Final Report, 2004).

The statement included other principles such as that microfinance institutions must support their operations through adequate fees that are not a burden on the poor. Microcredit is always a better solution in the guarantee of the looping of funds. The job of government is to facilitate financial services but not directly provide the services. Donor funds are a method of enhancing a microfinance institution but should not compete with it. Microfinance institutions should focus on management as means of success and finally, institutions that offer microfinance should always be able to measure their own performances in order to advance (G8 Summit Final Report, 2004).

Crowdfunding

Crowdfunding is one of the most effective methods of fund raising. Some experts prefer to say that it is a collective effort by an individual or a group of people to gather the support and the capital required to implement, improve, and enhance an idea or project through explaining and presenting a project to the public, which is usually done online (Prive, 2012). Crowdfunding depends on the support and funds of regular people, not traditional banking types such as bankers, venture capitalists, or angel capitalists.

History of Crowdfunding

The rise of crowdfunding in the last decade did not just happen to be a sudden phenomenon without previous indicators that there was something huge coming up, there were indicators and milestones that the crowdfunding concept went through (History of Crowdfunding, 2013). Crowdfunding began in 1996 when Andy Klein, the founder and owner of Spring Street Brewery, posted his company's public offering online Web to allow people to own stock directly (History of Crowdfunding, 2013) It wasn't until that year when, Mark Perlmutter lunched the first direct IPO platform to allow the public to put investments in small public offerings. Later, in 1998, Silicon Valley venture capitalist Tim Draper built on that success and founded a venture capital company based on public investing in early technology deals (History of Crowdfunding, 2013).

Michael Sullivan first used the term "crowdfunding" eight years later on his blog, fundavlog. The real watershed for small business investment in general, including crowdfunding, was when the Nobel Prize was awarded to Muhammad Yunus, the founder of Grameen Bank in 2007, for raising $6.8 billion through microloans to aid the poor. Following that, the crowdfunding platform started to branch out to different fields. In 2008, IndieGoGo began as a crowdfunding platform for independent films. Kickstarter, the famous crowdfunding platform, was formed in 2009 to provide an opportunity for all types

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of entrepreneurs and business seekers. That same year, crowdfunding grew by 74%, which brought the practice to the attention of politicians and economists (History of Crowdfunding, 2014).

Crowdfunding is currently in its early stages, yet it is growing enormously with the rise of the Internet over the last decade (Prive, 2012). There are different fields and projects that utilize the idea of crowdfunding including the music business, start-up businesses, charities, political campaigns, and software development, among others. The main idea is the concept of "it is not what you do, but why you do it." (Prive, 2012).The success of crowdfunding is due to the idea that people support a certain project because they believe in the cause or because they think that the creator is authentic and that his or her contribution might make a significant difference in bringing this idea to reality (Prive, 2012).

Misconceptions About Crowdfunding

There are several myths and misconceptions about crowdfunding among user platforms, which started at the beginning of the 1990s with the rise of the Internet (Howes, 2013). Some examples of these misconceptions include the idea that crowdfunding is only useful for start-ups and small business, which is not necessarily true (Howes, 2013). Crowdfunding can be a great tool for large, established companies and some people launch crowdfunding campaigns on their own Websites although exposure will not be as widespread as when an already-established platform is used. Another misconception is that some small business owners think that crowdfunding can maximize exposure by launching the same campaign on different platforms, which is not effective because the audience is essentially the same (Howes, 2013).

Crowdfunding for Non-Profits

The same concept that applies to for-profit start-ups or businesses also applies to nonprofit organizations (Howes, 2013). Crowdfunding for nonprofits is concerned with a project's cause and the story behind the cause drives the investors or, in this case, the loaners. The idea has also been used to create awareness campaigns and even to fund an election. In the U.S. in particular, politicians have used the concept to support their campaigns. The most famous example was the last presidential race, in which Barak Obama managed to raise almost $214 million from small donors, which changed the history of political campaigns (Crowdfunding for Nonprofits, 2011). There are several known nonprofit organizations that use the concept of crowdfunding to support their causes and raise funds (Crowdfunding for Nonprofits, 2011).

Crowdfunding Mechanisms

There are several mechanisms for crowdfunding through the use of an online platform or other kinds of platforms. According to Gueyie, Manos, and Yaron (2013), crowdfunding mechanisms can be split into three main categories: through donations, which is the concept of giving up a certain amount of material, whether money or some other valuable entity, to another person without the expectation of any return. The second category consists of an active investor, in which the crowd funder usually makes the decision or at least gives advice to the person or the project he is funding. The third and last type consists of a passive investor, who usually invests or loans money without trying to get involved. (Gueyie, Manos, & Yaron, 2013).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Pros and Cons of Crowdfunding

There are several advantages and disadvantages for using a crowdfunding platform to fund a project regardless of the scale of the project. An entrepreneur needs to take various factors into consideration when considering funding his project through a crowdfunding platform. Out of these factors are the pros and cons of crowdfunding.

Pros

- Crowdfunding helps in reducing the amount of time spent on the fundraising process and gives the entrepreneur more time to focus on other aspects of his future business (Dupree, 2012)
- Any person could be part of the funding process since there is no minimum level for the contribution to a certain project. This helps in expanding the outreach and the base of funders which also help the entrepreneur in getting more reviews on his project (Dupree, 2012).
- Investors can track the progress of the project they have chosen to fund, which make the business more transparent (Rogers, 2012)
- Crowdfunding platform are usually an online tool which make it easier for both entrepreneurs and investors to stay connected (Rogers, 2012)

Cons

- The exposure of ideas through the crowdfunding platforms makes the process of copying ideas easier and effortless
- Crowdfunding platforms mostly are online which means that there are a large portion of possible entrepreneurs with ideas that can't use it as they don't have access to the internet specially in some of the developing countries (Rogers,2012).
- Some project could be a fraud due to the lack of filtration process on the existing crowdfunding platforms (Dupree, 2012).

GROUND WORK

The main research in this thesis paper is done in this ground work section. The ground work consist of three main parts; Egypt context, Grameen Bank, and Kiva.org. The first part is Egypt context, which is a general overview of Egypt with an analysis of the political, economic, social, and technological environment. Additionally, a review of the current microfinance institutions in Egypt with the problems facing them is also presented in this part.

The second part of the ground work summarizes Grameen Bank as an organization. In addition to that it shows the socio-economic environment that lead to formation of Grameen Bank and highlights the relationship between the Bank and its employees. This part concludes with a SWOT analysis for Grameen Bank. The third and final part of the ground work is the synopsis of Kiva.org and their core principles. This part also concludes with a SWOT analysis for Kiva.org

Egypt Context

Egypt is considered the heart of the Middle East in terms of geography, as it is in the northeast of Africa, with Sinai situated in northwest Asia (Country Profile, 2014). Egypt shares borders with Libya, Sudan, Jordan, and Palestine. To the north of Egypt is the Mediterranean Sea, and to the east is the Red Sea. The Nile River, which is considered the source of water and agriculture, runs through the country from south to north. The surface area of Egypt is approximately 1 million square kilometers, of which less than only 5% is populated and more than 95% is desert (Country Profile, 2014).

Egypt is currently the largest populated Arab country, with 83,667 million people and continues to grow at a rate of 2.17% according to the Central Agency for Public Mobilization and Statistics (2013). Almost more than 98% percent of the population lives on the Nile strip, which runs from the south to the north. According to Brown (2004), life expectancy, which is the amount of years people expect life to be better after, in Egypt has increased from 55.3 years in 1980 to 67 years in the year 2001. In the same period, population density has increased from 44 people per km^2 to 69, which explains the previous increase. (Brown, 2004)

PEST Analysis for Egypt

Political

Because the political environment in Egypt has been very unstable since 2011, this section will be divided into two parts. In the first section, the political situation before the revolution in 2011 will be discussed and then the situation after 2011. Before the revolution, most Egyptians did not take part in the political process, as Hosni Mubarak's regime stayed in power for over 30 years (Osman, 2010). During this time, Mubarak made sure that his was the only party in power.

Egyptians in this era had a lack of awareness of rights and responsibilities, and there was little or no hope of change (Osman, 2010). Politics was not a part of the country's education and it was forbidden to practice any sort of politics in schools and universities (Osman, 2010). The country was ruled by the police state, in which everyone lived in fear. Starting in 2006, the return of Mohamed El Baradi raised hopes and initiated some constitutional changes; however, there was no active or effective movement in the streets (Osman, 2010).

On January 25, 2011, a few weeks after demonstrations had begun in Tunisia, a demonstration started in Egypt's Tahrir Square (Gamel, 2013). Many events happened during the first 18 days of the revolution, and eventually Mubarak had to resign his position and the Egyptian army took control of the country for a transitional period. Shortly after the fall of the old regime, the situation changed and an internal fight for power caused a period of political instability (Gamel, 2013). Currently, the situation is complicated because the army has remained in power after a short period of rule by the Muslim Brotherhood, which is considered by many people to be a terrorist organization (Gamel, 2013).

A new election for the presidency has been announced to take place in few months and there are two potential candidates that are running up (Gamel, 2013). The first candidate is the former head of the Egyptian army, and the second candidate has been in the civic society for 40 years (Gamel, 2013). To sum up, the political situation is extremely unstable, with the government changing every few months, and this has led to fear within the public, increasing prices for basic goods and services, and no real solutions for the country's long-term problems (Gamel, 2013).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

One other aspect of the current political situation in Egypt that affects nonprofit organizations in Egypt is the recent shutdown of several nonprofit organizations and a halt to funding others under the claim that they were receiving money from foreign entities. Egyptian media has focused on this incident only from the government point of view as if these organizations were in Egypt to spy or to fund vandalism. This action caused many international nonprofit organizations to be reluctant to operate in Egypt (Kirkpatrick & Myers, 2011).

Economic

In this section, several ways will be discussed to assess the economy of countries. After the revolution in Egypt, the economy was hit hard due to the street demonstrations and a lack of tourism. The Egyptian economy is built on several components—returns from the Suez Canal, tourism, oil, and some agricultural and industrial production—which were all affected after the revolution. According to the United Nations Situation Analysis for Egypt (Handoussa, 2010), the country was making great progress until the year 2009, when inflation reached almost 16%.

One of the main economic and social issues facing Egypt is poverty. Poverty rates are different, based on geographical areas, with poverty in rural areas being 67% higher than in the urban areas. More than 23% of Egyptians live below the poverty line, and 7% live in absolute poverty (Guigale & Mubarak, 1996). Approximately six million people are trying to survive on a quarter of a dollar per day or less (Guigale & Mubarak, 1996). The unemployment rate is estimated to be around 21%, and 85% of that is composed of young people, aged 19 to 29 (Guigale & Mubarak, 1996).

The informal economy in Egypt is a very important factor in employing people, as almost 60% of the workforce either work for a private company or operate a small business in a local market. This informal economy provides a large variety of goods and services. The government tried to support this movement so that the private sector could help solve the problem, but because there are no formal rules yet it could not moderate and aid the process (Drolet, 2005).

Social

Egypt has a very unique social composition, in which there is a clear distinction between different social levels. According to Amin (2001), the social mobility in Egypt since the 1950s has progressed for different reasons and along different pathways, starting from the social era in the 1950s and 1960s, passing through the era of capitalism, and ending with globalization in the new millennium (Amin, 2001). In Egypt, two important cultural aspects are a large and lively social network and the fact that it is a religious society. These social aspects need to be taken into consideration when initiating a new project as they could be the difference between success and failure.

There are several longstanding social problems such as late marriage, illiteracy, unemployment, and sexual harassment, among others. Illiteracy represents a fundamental problem in Egypt, as approximately 39% of the population cannot read or write (El-Baz, 1997). One of the main reasons behind this is the lower social value of women's education, which leads to a high dropout rate, especially in the rural areas (El-Baz, 1997).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Technological

According to Hafheinz (2007), Egypt has the largest and fastest-growing population of Internet users around the Arab world, yet this is dependent on individuals' social level and gender. Egypt has infrastructure for technology in general and for the Internet in particular, yet this infrastructure is not sufficient in rural areas, just in the main cities. In the 2011 revolution, social media played a very important role and it was considered the catalyst for motivating people to take to the streets after they shared news of the demonstrations online (Iskander, 2011).

Recently in Egypt, young entrepreneurs have developed many companies that depend on social media and the Internet (Iskander, 2011). Venture capitalists in Egypt support the movement toward building Websites, mobile applications, and Internet-based services, yet these small businesses and entrepreneurs focus on a small segment of the society who have continuous online access and can actually benefit from these services. Technology and the Internet could be used more than at present to help all Egyptians (Iskander, 2011).

Microfinance Institutions in Egypt

According to Waly (n.a) the first attempt to start microfinancing in Egypt was by the Alexandria Business Association and the National Bank of Development in the form of microloans to small enterprises with the support of the U.S. Agency for International Development (USAID). In 1997, the Principle Bank of Development and Agricultural Credit developed an initiative called "The Productive Families Project," which was supported by the Ministry of Social Solidarity (Planet Finance, 2008).Currently there are 15 different microfinance institutions in Egypt, although only eight are fully operational. These organizations receive funding from USAID, but other external sources of funding include the Ford Foundation, the United Nations Development Program (UNDP), Save the Children, and others (Planet Finance, 2008).

All of the microfinance institutions in Egypt are currently operating under law number 141, which was introduced in 2004 and regulates microfinance activities in the country. Waly (n.a) claims that currently there are more than 1.13 million active clients who are borrowing around 1.8 billion EGP (equivalent to 266 million USD). The average loan size is estimated to be 1600 EGP (230 USD) and the penetration rate is 6%.

Problems that Microfinance Institutions Face in Egypt

According to research and the survey done by Blackwood (2012), the creation of social entrepreneurship and microfinance institutions in Egypt has not been easy. There are several issues that confront most of the current organizations and that will affect any future organizations. At the top of the list are problems of funding and government restrictions. Other organizations that Blackwood surveyed indicated that a lack of partnership was also a major problem, and 100% of the organizations surveyed responded that their start-up funds came through external funding sources. Any nonprofit organization would face these problems when starting up, but there are always ways to solve these problems, as this research is trying to point out (Blackwood, 2012)

Grameen Bank

In 1983, microfinance institutions took a leap forward with the founding of Grameen Bank, a rural banking institution that was based on a microfinance model to aid the poor in Bangladesh. Grameen Bank was different in that it was aimed at women who owned less than half an acre of land or who owned assets of less than one acre of land (Khanker, Khalily, & Khan, 1995). The loans did not need collateral, which was phenomenal at that time.

The idea, started by Dr. Muhammad Yunus, was initially against all the rules that he had been teaching as an economics professor at Chittagong University. It took a great deal of research for Dr. Yunus to decide that he wanted to be teaching about the real economy in Bangladesh and then try to fix what he saw around him. During his study, Dr. Yunus came up with a list of 42 people that needed a small amount of money (not exceeding $27 each), to improve their financial situation (Yunus, 1999).The main motive behind Dr. Yunus' idea was that banks would not give poor people loans without collateral. In the beginning, he started loaning to the people on his list from his own money, and from funds contributed by his research group colleagues who believed in his ideas (Yunus, 1999).

However, Dr. Yunus was still concerned with the rest of the poor population, so he tried to convince the local university bank to loan to the poor with no collateral, but they refused. He then took a loan under his name and started loaning to the poor women in the village close to the university, and after they repaid their loans, he tried to put together a case study and resubmit his request to the bank, but the bank still refused (Yunus, 1999). Dr. Yunus did not give up at this point but instead moved to another village and tried to approach the local bank—but this bank also refused (Yunus, 1999).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Although Dr. Yunus eventually expanded to over 100 villages, he still couldn't convince any bank to lend money to the poor. He then decided to create his own bank. He went through several negotiations with the government, and in 1983 he reached an agreement to establish Grameen Bank or, as it is translated from Bangali, "Village Bank." The main concept was to lend to the poorest of the poor who did not have any sort of collateral (Yunus, 1999).

Grameen Bank's Credit Delivery Model

Grameen Bank operates with a different business model than other banks, similar to its different types of customers (Khandker, 1996). The Grameen model was based on a concept of groups of five, with different groups for men and women. The initial focus was on the women's groups, to help unemployed, low-income women in Bangladesh. The loans were received by individuals within a group, yet the entire group was accountable for repaying the loan.

If one member of the group failed to repay, then the entire group was affected and no other group member could qualify for more credit. This group pressure guaranteed discipline between members. On the other hand, in order for Grameen to protect the groups against anti-group actions that might affect one individual, the bank organized every six to eight groups into a larger community called "The Center" (Khandker, 1996).

Today, all of the lending and repaying transactions are made within the Center meetings. The two- tier structure helps to relieve the social pressure created by the Grameen Bank credit model. Each center is assisted by a bank representative to facilitate transactions, and each group of five elects a representative who acts as chairperson for a year to conduct meetings and take care of the paperwork (Khandker, 1996). The amounts that the bank usually lends to an individual are small, less than $100 per year, and he or she must repay the loan in 50 installments during the year. The loans are given to the individual to support the activity that the group of five has agreed upon (Khandker, 1996).

Power of Context

In his book *The Tipping Point*, Malcolm Gladwell discusses the concept of Grameen Bank's credit-delivery model. He examined similar projects that were dependent on peer pressure and group decision-making, and he demonstrated the importance of how groups change the decisions of individuals. Indecisive individuals within a group usually follow the logic of the group in order for them to reach a decision. Group numbers could differ from one application to the other, yet the effect of the group and peer pressure remains the same. (Gladwell, 2000)

Gladwell also discussed another decisive factor in any social epidemic, which is the power of context. The facts that Bangladesh was undergoing a tough economic period and that Dr. Yunus had just returned in 1974 were key factors in the success of Grameen Bank. Other factors include the place, timing, and the people involved in developing the idea of Grameen Bank, which are all considered part of the context. Gladwell claims that in order for any phenomena to become a social epidemic, it has to pass three laws—the third being the power of context (Gladwell, 2000).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Socio-Economic Environment

Grameen Bank was established in Bangladesh in 1983. Bangladesh is a country of almost 60,000 mi^2 that borders India and was formerly a part of Pakistan until it achieved independence in 1971(Grunewald, & Baron, 2011). The country's population is 162,221,000 people, which is considered the seventh-largest populated country in the world (Grunewald, & Baron, 2011). The GDP in Bangladesh is $624 per person, which is relatively low in comparison with other countries. The currency is Taka and as of September 2010, the exchange rate was 69.64 Takas to one U.S. dollar. The major issues in Bangladesh are health and education. The literacy rate in the country is very low: 54.7% of the population is illiterate, and out of that, 81.9% are women (Grunewald, & Baron, 2011).

Relationship Between Grameen Bank and Its Employees

Grameen Bank's employees are its main assets. The bank hires highly motivated individuals who are loyal to the cause of the bank and committed to helping bring the poor to a higher level of self-sufficiency. It has a very selective hiring process for potential employees, and applicants must go through several interviews in order to be recognized for a position (Dowla, 2006).

The recruited applicants must undergo an intensive training program. According to Woolcock (1998), this training program is very difficult, and almost half of the trainees leave before the end. The bank maintains a high level of trust and confidence in its employees, who have a deep sense of pride and compassion for the poor after finishing the training program. This trust can be felt and seen in the different branches of the bank, where employees' make decisions without checking with their supervisors (Dowla, 2006).

Grameen Bank also has a very unique system of evaluation to motivate employees and push them to achieve more success in helping the poor. This system is known as the Five-Star System, in which the bank ranks the different branches according to colored stars. A green star, which is the lowest-ranked

Table 2. Distribution Pattern of Rural Landownership in Bangladesh from 1979 to 1983/84 (Grunewald, & Baron, 2011, Table 2)

Size of Land Owned	1979 Land Occupancy Survey		1983/84 Agricultural Census		Annual Rate of Growth 1979-84
	Number of Households	Share of Households	Number of Households	Share of Households	
{Acres}	{Thousands}	{Percent}	{Thousands}	{Percent}	{Percent}
None	1,979	15.4	1,198	8.7	-10.5
Less Than 0.50	4,286	33.3	5,201	37.6	4.4
0.50-0.99	1,516	11.8	1,660	12.0	2.0

7.50-14.99	374	2.9	415	3	2.4
15.00 or more	114	.9	117	.8	.6
Total	12,866	100	13,818	100	1.6

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

star, is given to a branch if it achieves a 100% repayment rate (Mainsah, Heuer, Karla, and Zhang, 2004). The blue star, second in ranking from below, is awarded to the branches that manage to achieve a profit for the organization.

The violet star, middle-star rank, is given to the branches in which the amount of the deposits exceeds the loans. The brown star, the second-highest star, is given to the branches where the children in a borrower's family attend school. Finally, the red star, the highest- ranking star, is given to the branches that (1) have borrowers who are no longer considered to be in the poorest segment of society, and (2) have managed to fulfill Grameen Bank's ten requirements (Mainsah, Heuer, Karla, & Zhang, 2004).

To summarize, Grameen Bank enhances and builds relationships with employees' three different methods:

1. A rigorous recruiting system in order to acquire the most talented and loyal people to the organization and to the cause (Mainsah, Heuer, Karla, & Zhang, 2004).
2. Empowering the employees who are selected by giving them the power to make decisions without going back to their supervisors (Mainsah, Heuer, Karla, & Zhang, 2004).
3. Creating a unique system for evaluation—the Five-Star System—that promotes a healthy, competitive environment and keeps employees motivated and challenged (Mainsah, Heuer, Karla, & Zhang, 2004).

Thus, Grameen bank is keen to build relationships with employees through the ways mentioned above, which in turn benefits the organization and creates a sense of loyalty among the staff (Hossain, 2013).

Grameen Bank's Early Sources of Funds

Since its establishment in 1983, Grameen Bank has secured financing through domestic and international sources of funds at concessionary rates. Those sources have included the Central Bank of Bangladesh and the International Fund for Agricultural Development, among others. A portion from the bank's funds were secured through grants from organizations. In the early years, Grameen Bank had a total of 1532.7 million TK between 1983 and 1993 from the International Fund for Agricultural Development (Khandker, Khalily, & Khan, 1995). The bank also received approximately 200 million TK per year from the Bank of Bangladesh (Khandker, Khalily, & Khan, 1995). Starting in 1994, in order to sustain itself, the bank had to borrow 3250 million TK from commercial banks, which represented almost 46% of its resources (Khandker, Khalily, & Khan, 1995).

SWOT Analysis for Grameen Bank

Strengths

- Grameen Bank helps local communities alleviate poverty by providing small loans to individuals without collateral (Khandker, Khalily, & Khan, 1995).
- The idea of lending to groups of five helps in securing a social environment for the borrowers that helps them to achieve success (Khandker, 1996).
- The relationship between the bank and its employees enhances their ability and empowers them to make the right decision in aiding the poor (Dowla, 2006).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Weaknesses

- Grameen Bank focuses on women in different societies, which might lead to a higher poverty level among men (Khandker, 1996).
- According to Bornstien (2011), it may be questionable whether the concepts of Grameen Bank help the poor to save money for the future and thus alleviate poverty.
- Funding of a similar foundation like Grameen Bank would require government support as well as external-funding support (Khandker, Khalily, & Khan, 1995).
- There are supply and demand constraints because Grameen Bank depends on its different branches (Khandker, 1996).

Opportunities

- After Grameen Bank reached the point of self-sufficiency, it is easier to branch out to different countries around the world (Khandker, 1996).
- The Arab spring revolutions might encourage new governments to accept organizations such as Grameen Bank to operate within their countries (Osman, 2010).
- Public acceptance of the concept of microfinance might lead to more opportunities of funding of necessary (Dowla, 2006).
- Social media and technology represent an opportunity for Grameen Bank to expand and explore new ideas to help the poor (Dowla, 2006).

Threats

- The concept of the group of five might lead to conflict within the groups if one person fails to make a payment (Bornstien, 2011).
- New technology has made entry to microfinance much easier, which has created competitors to Grameen Bank. (Chang, Huang, & Wang, 2009).
- Peer-to-peer lending is an appealing concept that could be considered competition for the credit delivery model that Grameen Bank depends upon (Bornstien, 2011).

In order for a social entrepreneur to successfully implement the model of Grameen Bank, he needs to capitalize on strengths like the power of the idea itself and the lending group idea. In the same time avoiding weakness like the focus on women only or depending on the government support, would help the social entrepreneur in making the model successful.

Kiva.org

Kiva.org is an online platform that operates as a nonprofit organization that gives individuals the opportunity to participate in microfinance activity using small amounts of money directed to a small business or a micro entrepreneur (Chang, Huang, & Wang, 2009). In other words, Kiva.org tries to connect people who are looking to help other people in developing countries through micro lending. The process is done through an intermediary, a local microfinance institution, or an MFI, which identifies

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

micro entrepreneurs and small businesses that need help to grow and inputs their data on the Website and facilitates communication between the lender and the borrower (Chang, Huang, & Wang, 2009).

The lending cycle starts when the lender chooses the entrepreneur or small business they want to fund. After the lenders make their decision, Kiva collects the loan amounts from all of the different lenders around the world and distributes the sums to each local MFI partner based on the projects that were selected in their areas (How Kiva Works, 2014).Then the local MFI partner distributes the total amount of money funded from each entrepreneur. The entrepreneur gives monthly payments back to the local partner that collected the money and transfers them to Kiva.org, which repays the lenders and completes the lending cycle. At this point, the lender can chose to take back his money from Kiva.org or relend the money to a different entrepreneur (How Kiva Works, 2014).

The idea for Kiva.org, an online microfinance platform, was initiated by an American couple, Matt and Jessica Flannery, during a visit to East Africa in 2004 and was founded a year later. Matt and Jessica met at business school at Stanford University while he was studying and she was a staff member in the public Management Program (Flannery, 2007). In 2004, Jessica had an opportunity to consult for a nonprofit organization that specialized in microfinance in East Africa.

She took the opportunity and few months later, Matt went on a month-long vacation from his work at TiVo. They came up with the idea for Kiva.org when they were visiting Uganda. According to Matt, when they were asked about their career goals, Matt replied that he wanted "to live in the San Francisco Bay Area and be an entrepreneur," while Jessica's answer was "to go to Africa and do microfinance." They combined their career goals by founding Kiva.org (Flannery, 2007).

Core Principles of Kiva

Matthew and Jessica's idea went through different phases before they arrived at their main concept for Kiva in 2005. Currently, Kiva's vision is: "Everyone connected, everyone empowered" (Flannery, & Shah, 2009). The organization's current mission is "to connect people through lending for the sake of alleviating poverty." In his study, Carlman identified seven core beliefs of Kiva.org, which include the power of microfinance, partner relationships, transparency, the spread of technology, lending as connecting, sustainability, and industry inclusion. The organization's employees and partners make sure to take these principles and guidelines into consideration before making any decision in the operation cycle (Carlman, 2010).

Kiva and Web 2.0

Kiva is considered to be a Web 2.0 application in microfinance. O'Reilly (2005) defines the Web 2.0 "network as a platform…making the most out of intrinsic advantage of that platform." Kiva is creating an atmosphere and a platform to connect people around the world for a bigger cause. In Web 2.0, the key to success is being user driven, and Kiva, according to Flannery (2007), the organization depends on lenders to bring in more lenders by word of mouth and reviews as the main tool for growth. Collaboration of different online tools, which is the essence of Web 2.0, is one of the elements that Kiva.org considers primary in operations whether it is PayPal, YouTube, Amazon, or another online tool (Carlman, 2010).

In their study, Ashta and Assadi (2008) claim that Kiva is not yet a perfect Web 2.0 model because the features and the technology are not the same for all types of users. The borrower end of the Website

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is limited since there is almost no interaction between the borrower and the lender except through the local partner. On the other hand, the lender side of the Website has many different technological features that enable the lender to make better choices and to select the entrepreneur or small business to which he wishes to lend money. Kiva is even planning to partner with existing Internet and Web 2.0 gurus such as Facebook in order to further enrich the lender experience (McCarthy, 2009).

Statistical Facts About Kiva.org

Kiva currently operates in over 73 countries around the world, although with limited access in some countries due to governmental regulations and a lack of local institutional support. (Statistics, 2014). There are over 1,083,984 lenders using the Kiva online platform to lend small or large amounts of money to people in other countries (Statistics, 2014). Kiva currently has 242 local field partners in the countries in which it operates and over 450 volunteers. The amount that has already been loaned is nearly $537,703,175, and Kiva stands as one of the most successful online platforms for microfinance (Statistics, 2014).

Not only are the amounts of loans and lenders astonishing but the repayment rate, which stands at 98.97%, is also amazing. The lenders at Kiva often lend more than once, and the average lending on the online platform is 10.15 times per lender, which shows how fast a lending cycle can occur. On the borrower side, Kiva has more than 1,256,171 borrowers who have been funded (Statistics, 2014).

Lending Teams

Using the Kiva.org online platform, users can choose to lend money individually and directly to particular entrepreneurs or they can choose to join a lending team (Kiva.org, 2014). Lending teams are self-organized groups that form a community of lenders who share lending goals and connect with one another. There are two types of teams—open teams and closed teams, and each type has its own advantages (Hartley, 2010).

For example, an open team does not usually have accountability, and any person or lender can join the group based on his interest. There could be a lending team composed of Egyptian natives with none of them born in Egypt, yet they share a common interest that enhances the in-group solidarity and usually has a big impact on the group lending in general. On the other hand, the closed-lending groups are usually very moderated and organized; members of closed teams are more cohesive and they share the same interests (Hartley, 2010).

There are many books and studies that discuss the effects of human cooperation individually and within a team or a group as well as studies that delve into the effects that similarities between members of a team might have on the lending behavior and solidarity of the members. Chen and Li (2008) have indicated that a group identity results from the mix of group members with similar interests and thoughts, which result in a 47% increase in charity concerns, and around a 93% decrease in envy because of a lower payoff (Chen, & Li, 2008)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

SWOT Analysis for Kiva.org

Strengths

- Connecting lenders directly to borrowers in remote places, specifically in developing countries, has helped Kiva to raise the transparency level. Investors or lenders can choose the projects to which they would like to contribute and view the entire lending cycle through the platform. This transparency inspires trust between Kiva and the lenders and enhances opportunities for helping developing countries reduce poverty (Chen, & Li, 2008)
- The idea of loaning instead of donating money through the platform helps entrepreneurs in the long term to become independent and makes them appreciate the value of the money that they are borrowing (Chang, Huang, & Wang, 2009).
- Kiva serves as an alternative funding method for micro entrepreneurs in developing countries, which allows them to avoid local money lenders who may charge interest rates of up to 300% (Chang, Huang, & Wang, 2009).
- The marketing strategy for Kiva is based on cooperation with large online platforms, marketing, and advertising Websites such as Google, Facebook, Yahoo, etc. This strategy has enabled them to promote the awareness of poverty around the world.

Weaknesses

- Kiva only supports poverty in developing countries and does not create job opportunities for those who do not have entrepreneurial skills.
- Not controlling the field partners—the local microfinance institutions—leads to some of these local partners charging up to 21% interest rates on the loans provided by Kiva lenders (Chang, Huang, & Wang, 2009).
- Kiva depends solely on the local partners to provide business support to the micro- entrepreneurs, although they could provide other tools for them (Chang, Huang, & Wang, 2009).
- Kiva does not provide enough tools for borrowers as they do for lenders, as the organization's main focus is the lenders (Ashta, & Assadi, 2008).

Opportunities

- Kiva's platform is mainly online, so it is scalable and can reach countries in the developing world that do not have sufficient infrastructure.
- Kiva's media attention and its story have provided the opportunity to attract more lenders and investors, for which, for some time, there were not enough borrowers—in other words, the supply exceeded the demand (Uganda: A Little Goes All the Way, 2009).
- The uprising events around the world since 2011 have led developing nations to believe that different sources of funding for the poor may help economies get back on track.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Threats

- The growth in Kiva's operation and lender base may lead to an increased risk of scamming local microfinance institutions and scamming local entrepreneurs. This situation may occur if Kiva does not increase the amount of time and effort devoted to choosing local partners as well as the criteria for local projects and entrepreneurs (Chang, Huang, & Wang, 2009).
- Currently, lenders and lending teams are essential for Kiva and more research should be done to retain these lenders and convince them to continue their efforts.
- Resistant regimes in some developing countries could be a threat to the expansion of Kiva into new countries.
- The competition of new online platforms that offer the same services as Kiva might cause some lenders to go to competitors, which would provide local entrepreneurs with more options to demonstrate their projects.

For a social entrepreneur to successfully implement Kiva's model in Egypt, he needs to focus on solving the current issue that Kiva has like controlling the local partners by having certain criteria for selecting them and performing audits. Also the social entrepreneur would need to think of new tools for the borrowers in order to engage them more and in the same time avoid depending solely on local partners. Furthermore, the social entrepreneur will need to exploit the current strengths of Kiva like their marketing strategy and their concept of lending rather than donating.

DISCUSSION

In response to the first thesis question, "How did Grameen Bank achieve success in Bangladesh?" many factors led to the bank's success in Bangladesh in 1983. The first factor was the persistence by its founder Dr. Yunus and his group. When he was rejected multiple times by different banks in Bangladesh that refused to provide credit without collateral, he loaned his own money to groups. The second factor was the credit delivery model created by Grameen Bank, which depends on the creation of groups of five and starts lending to each of them on an alternating basis (Hartley, 2010). For instance, the second person in the group would not receive a loan until the first person made a first repayment (Hartley, 2010).

The credit delivery model also helped the bank to control repayments using peer and group pressure—if one individual within the group failed to make a repayment, the whole group would be suspended from further loans. The third reason behind the success of Grameen Bank is within the context of the country of Bangladesh: poverty rates were very high, particularly among women; Illiteracy rates reached almost 81% among women; and the government failed to fulfill the needs of the increasing population.

The fourth reason is the relationship created between Grameen Bank and its employees that enables an employee to make decisions without going back to their supervisors, and the trust created in making decisions that will help alleviate poverty. The fifth and final reason for Grameen Bank's success was the internal and external funds the bank received in the early days of operations, which almost closed the gap between the supply and the demand at that time. To sum up, Grameen Bank's success has been based on several factors, which have brought the concept of microfinance to a new level.

In response to the second research question, "How did Kiva.org manage to use online microfinance and crowdfunding concepts so successfully?," Kiva.org has managed to put together the concepts of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

microfinance and crowdfunding to come up with an online platform that aims to connect people and alleviate poverty around the world. Kiva made use of the Internet revolution and the Web 2.0 movement to attract lenders to their cause. They introduced peer-to-peer lending, which is based on an individual project or idea that the lender would like to support. The lending cycle that Kiva created makes the operation very transparent, which has also attracted more lenders.

Kiva.org has used social media and Internet tools to the fullest extent to market their platform and help people in developing countries. Using local partners to select local entrepreneurs reduced the amount of staff that Kiva needed to operate because it depends solely on input from local partners. Finally, the concept of lending teams has made it easier for lenders to find a community of people who share the same ideas and beliefs to invest in the same projects.

n response to the third research question, "Which microfinance model out of Grameen Bank and Kiva would be more successful in Egypt?" which is based on the research done on both models and also on Egypt's current political situation, it would be easier and more effective to implement the Kiva model. There are many factors behind the selection of Kiva: the first factor is the increased use of the Internet in Egypt and the increased use of social media and other components of Web 2.0.

The second reason is the limitations that the government creates for the startup of any nonprofit or microfinance organization. The third reason is the limited funds required for Kiva to start and to operate in Egypt's current economic situation. The fourth factor is the current microfinance institutions that exist in Egypt, could be potential partners for any created platform; and finally, the fifth factor is the advantages that any online platform would provide—flexibility, ease of use, quick access to funds, and the creation of communities.

CONCLUSION AND RECOMMENDATIONS

Microfinance and crowdfunding have become tools that could be used to alleviate poverty within societies. While microfinance has always been a way to provide different financial services to the poor, crowdfunding has recently become popular for the same reason. Both Grameen Bank and Kiva have managed through the years to become successful organizations through different strategies and different business models. Grameen Bank has developed the credit-delivery model that has proved to be a huge success in Bangladesh, while Kiva has used the concept of crowdfunding to create an online platform for microfinance to emphasis the concept of peer-to-peer lending.

The political, economic, social, and technical analysis of Egypt has shown that the use of microfinance would help the country's major problems such as poverty and unemployment. The fact that there are currently restrictions and limitations for the start-up of new microfinance organizations and that Egyptians are using the Internet in their everyday lives has led to the recommendation of using the model of Kiva.org for developing a microfinance presence in Egypt.

This conclusion was based on the current research and the concepts that are included in this paper. Future researchers may want to investigate the different steps needed to initiate the Kiva model in Egypt. Researchers could also investigate possible government support for an Internet-based microfinance organization. This future research will be important in supporting a social entrepreneur to take the initiative and use the results to implement the model. Other future research could include a study of the negative impact of microfinance and crowdfunding for social entrepreneurs in order to avoid these impacts.

KEY TERMS AND DEFINITIONS

Consultative Group to Assist the Poor: A group that was founded to aid the poor accessing financial services to elevate their poverty.

Credit Delivery Model: It's a model that is based on lending to groups of five either Men or Women and it was initiated by Grameen Bank in Bangladesh to assist the poor.

Crowdfunding: It's a combined effort by an individual or a group of people to collect the support and the fund needed to carry out an idea through explaining it to the public.

Lending Teams: Lending teams are self-organized groups through Kiva.org platform that share similar interests and lending goals.

Microfinance Institutions: Organizations that provide different financial services to the poor for little or no return.

Microfinance: Microfinance is an approach to provide different financial services to the poor.

Socio-Economic Environment: The social and economic environment for a certain country at a certain period of time.

Chapter 11
The Making of the Information Society:
Taxonomy of Concepts, Determinants, and Implications

P.E. Thomas
Bharathiar University, India

ABSTRACT

Unlike the decisive occupations which facilitated the unambiguous naming of the agricultural and industrial societies, the present one which is tagged with an array of groupings—Post-Industrial, Service, Knowledge, Post-modern, Wired/Networked, Artificial, so on and so forth—can hardly ever be viewed from the perspective of a single occupation. With technology in the forefront working as the driver of information and knowledge, it supports and causes the rampant changes in the provinces of economy, occupation, spatial relations, and culture. And, together they signify the arrival of the 'Information Society'. The obvious shift of a considerable population from the landed labour to industrial labour to knowledge workers marks the transitional phase of the society from agriculture to manufacturing to knowledge society. Hence, this chapter proposes that the dominant phase of a society is not to be visualised as an independent system that is divorced from the other two, but to be understood as an extension of its past.

INTRODUCTION

The explosion of information, spawned by the communication revolution, is today a stark reality and its consequences are profound though the causes are less certain. The direction in which the consequences ply is one of progression in the 'modern' sense. Indications of a progressive society are commonly visible in the form of tangibles like the rising economic status of its people or an encouraging increase in the Gross National Product (GNP). An advancing society reflects not only its economic strength but also a change of people's lifestyle into a more sophisticated one. Economic advancements were precedents in the earlier two societies as well; nevertheless, the pace of change that distinguishes the new society leverages the assumption that it is a fast advancing economy triggered by information. More to the

point, when there existed distinct occupations which described the agricultural and industrial societies, the same is not attributed to the present society, for manifold professions continue to take roots on the impulsive imagination of the 'informed' and the 'enterprising'.

The multiplicity of careers that are available today results in an overabundance of classifications—Post-Industrial, Service, Knowledge, Post-modern, Wired/Networked, Artificial, so on and so forth—prefixed to the term 'Society'. These orderings tend to pre-empt the attempts by social scientists to evolving a definitive and unambiguous name for the new society. Since information underscores most activities of this new economic culture, it is not inappropriate to call it the 'Information Society', at least for the sake of expediency.

The three revolutions, the agricultural (1000 BC to the 1800), the industrial (1800 to 1950), and the information (1960 to the present), according to Bell (1976), are discussed as the major stages in technological history and each period is marked by significant changes in the definition of property and work. Earlier, farming underscored the agricultural society, and later on manufacturing, the industrial society, and now, information and knowledge processing has become the backbone of the 'Information Society' (IS). Like-minded scholars like Peter Drucker (2001) explain the characteristics of the new age as a revolution of 'concepts', and that it is the 'information revolution' preceded by the invention of writing in Mesopotamia about 5000 to 6000 years ago, the invention of the written book in China as early as 1300 BC and Gutenberg's invention of the printing press between 1450 and 1455.

THE INFORMATION SOCIETY (IS)

The last century saw a dramatic shift in the fundamentals of the world of information, which in turn, yielded mass concepts of literacy, education, and communication and all of them were spurred by technologies. Technological inventions not only affected dramatic changes in lifestyle, but also intensified interdependence with the exchange of information and, as Low (2000) perceives, technological inventions run parallel to the evolution of the knowledge and information based economy.

The 'IS' paradigm is presented as the realisation of society that brings about a general flourishing state of human intellectual creativity (Mowlana, 1996) instead of affluent material consumption. The superior intellect of the human being stems from the production, process, and distribution of information. In his attempt at characterising the changed work culture, Rogers (1986) identified the US and several West European countries, which became information societies quite early, and whose citizens reflected visible dramatic changes such as fast life, expanded horizons, increased efficiency, and empowerment of a majority of the communities.

The individual in the new era who is also addressed as the 'information man', is perceived to be educated, affluent, and well-travelled (Wresch, 1996). The *nouveau riche* enjoyed expanded leisure, shifts from achievement to enjoyment and from rational work goals to pleasurable play goals. The well-heeled citizen of the 'IS' tends to experience unimaginable number of opportunities made available to him in diverse forms. The one who alone negotiates for himself a comfortable life in the Information Society is the skilled user of the Information Technologies (IT).

A society that embraces the 'doctrine of technological primacy' undergoes changes at a speed proportionate to the form and sophistication of those technologies used. The rapid changes experienced in the global scenario have stemmed from the accelerated growth of international communication whose

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

origin is ascribed to the explosion of technologies, such as TV, satellite, computers, video, fax, Integrated Services Digital Networks (ISDN) and the convergence of computers, television and telephone (Mowlana, 1996). According to Trivedi and Thaker (2001), 'convergence' is perceived as an enabler of the 'Information Society' which drives different technologies towards a common destination. A single channel allows the transmission of information technology, communication technology, and broadcasting services. However, at the base of the new ICTs is telecommunications, the bloodline of the new society, which fuse all other technologies together allowing nations to leapfrog over previous stages of development (Quon, 2001). Things, which were once unimaginable, have been made possible with the advanced technologies.

TECHNOLOGICAL DETERMINISM

Developments in communications technologies are shaping up a second industrial revolution but the forerunners are information, computers, and Internet and not iron and coal. These technologies of the Post-Industrial Society (Bell, 1976) have already begun their impact journey redefining the routine of the people they pass by. The 'technological informational revolution' is propounded as the backbone of all major structural transformations and depicts an 'informational society' which replaces the industrial society as the framework of 'social institutions' (Castells, 1994). When the potential (the amount of information preserved) of the information technology increases, the ability of human beings to process matter and information is enhanced (Low, 1997).

With the emergence of information processing as the basic activity, the new socio-technical paradigm is an information mode of development, conditioning the effectiveness of all processes of production, distribution, consumption, and management (Castells, 1989). The driving force of the new ICTs, discerned to be superior to those in the other societies, acts as a cue for scholars to pronounce that the new Information, Communication and Entertainment (ICE) economy's value is higher than that of the old one.

Theories propounded to define the IS have been doing their rounds without concreteness. Scholars speak out their minds based on their perception of the IS. Mowlana (1996) defines the IS as a mere data society but the other scholars term it as one whose centrality is division of labour and services and a society in which pluralism and secularism exist.

Whether viewed at its surface or in-depth psychological or philosophical levels, the technology is the cause and the way people live, the consequence. A fashionable and popular enthusiasm emerged following the admiration for the new ICT, which in turn sophisticated the domestic and routine lives of people in a dramatic and radical way (Hoffman et al., 2001; Preston, 2001; Maule, 2000; Heeks, 1999).

In his ritual view of communication, Dogra (2002) pointed out that communication via new media also engenders sharing, participation, and possession of common faith. And the shift to a highly technical planetary economy (Kelly, 1988) is sinewy to the idea of McLuhan's 'Global Village' with the 'death of distance' and enables individuals, business firms, and governments to reach around the world faster, farther, and even cheaper than ever before in human history (Lee, 2001; Cairncross, 1997). Admittedly, the ICTs continue to change the way one works, shops, learns and communicates (Brown, 2001). The implication is that there is a need to adopt (Chandler, 2002) technologies to keep pace with changes.

To embrace technology is not just a need alone but also a way of life. The American sociologist and economist Thorstein Veblen, who lived during 1857-1929 propagated "Technological Determinism," which

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

holds relevance even now, for it emphasises that in a technology-led theory of social change, technology is perceived as a 'prime mover' in history (Chandler, 2001). The technological determinists observe that those technologies such as writing or print or television or the computer changed society at every level. Any surmise that outlines the presence of the new ICTs to be the core of the 'IS' needs no shunning.

TOWARDS DEFINING 'INFORMATION SOCIETY'

That the distinctions among the agricultural, industrial and information ages engendered from the dominant occupations, which prevailed in the respective periods, are not disputed. For, it is a maxim that a society's lifestyle is shaped by those occupations whose benefits attract a majority of the populace.

When the farm hand and the industrial worker identify themselves with the agricultural and industrial ages respectively, the 'Information Age' is not represented by any single occupation. To address one as the 'information worker' is not devoid of ambiguity. The attempts of scholars to categorise the occupations of the 'Information Society' were less than emphatic and varied. Jonscher (as cited in Webster, 2007) identified two sectors—information and production—as dominant occupations of the 'Information Age'. Similarly, Machlup (1984) evolved five broad information groups—education, media of communication, information machines (computer, musical instruments), information services (insurance, law, medicine) and other information activities (R&D, nonprofit activities).

Conversely, Marc Porat (1977) offered a three-fold scheme, classifying 400 occupational types into three categories—production, processing and distribution of information. The first category, comprising the occupational types like scientists, inventors, teachers, etc., produces and sells knowledge, the second category, which gathers and disseminates information comprise managers, secretaries, clerks, etc., and the third, operating information machines and technologies that support the other two categories, consists of occupational types such as computer operators, telephone installers, TV technicians, etc.

The surmise that the 'Information Age' is identified as a result of more people taking to information-based occupations is not contended with. Unlike the 'agricultural' and 'industrial' ages, the 'Information Age' has given way to a numerous variety of white-collar occupations. The 'new age' results in not only diversified occupations, but also spawns a visible growth in many parts of the society. Information Society scholars have been merciless in describing the 'new society' from the point of view of culture. "Pseudo-sophistication" and "artificiality" is the sort of intangibles that have crept up into the society. If this is homogenisation of a global culture, the 'Information Age' could have a setback. Nevertheless, a new facade of the social system has begun to shape up following the increasing use of the ICTs. The socio-economic 'happenings' in the present society are multidimensional, whose causes are even more multiple. There is a sudden explosion of the newfound freedom—social and economic. The rise in literacy is of late, quite visible. The middle-class in the developing nations is capable of accessing its once-dreamed-about lifestyles. Above all, the enterprising are forever on a 'search' realising the potency of the world.

"The information superhighway may be mostly hype today, but it is an understatement about tomorrow. It will exist beyond people's wildest predictions. The digital planet will look and feel like the head of a pin."— Negroponte (as cited in Preston, 2001). Negroponte's observation that the information superhighway is hype continues to hold relevance as the process of initiation into the information revolution has not yet been experienced by a major segment of the world population. It was found that more than 80% of the people in the world have never heard a dial tone, let alone sent an email or downloaded

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

information from the WWW (Black, 1999). The impediment that glares is socio-economic in nature. Most of the Third World Nations and Latin American countries experience obstacles aplenty. Even in India, illiteracy is one of the foremost deterrents for development.

If illiteracy is the concern on the one side, negative economic factors form another one on the other, particularly in the Third World Nations. In his analysis of the rural-urban digital divide Hindman (2000) observed that the era of Information technology was bound to create users and non-users of technologies. In the long run, those who keep the information technologies at a distance or those who do not access them will be ultimately isolated from the forward-looking society. In the digital era, if one were to be classified under the 'non-use' and 'non-access' of information technology categories, it may lead to perceived nonexistence and those who joined the revolution group would be economically forward. Ruet (2002) added that the budget-based development on the traditional public model would be overshadowed by the new economy's valuation of networks. At its base, the Information Society's strength lay in the changes generated in different spheres driven by information, whose spread is the result of technology. Nevertheless, the changes that swept the pre-industrial and post-industrial societies are accredited to the dominant occupations that spearheaded those economies (Rose, 1991). But the social, economic, and cultural changes in the new economy are purported by the 'changes in the role and organisation of information', the key to defining the contemporary society.

CHANGE IS THE KEY

The 'Information Society' experiences explosive changes in many a field, especially education. Both formal and non-formal educations are poised for stupendous growth wherein interactive education, instruction, and distance education will gain mileage from the new technologies (Trivedi & Thaker, 2001). The apparent and inevitable changes now experienced by the society are imminent rather than willed. While imbibing new technologies, social upheavals take place, either spontaneously or force them upon ourselves, for we welcome change at least sub-consciously. Mowlana (1997) propagated four change dimensions—Centralisation of decision-making and control, Homogeneity, Hegemony, and Global system of nation states—that resulted from the ingress of the new ICTs. They point towards a trust-mistrust combination that precipitated in the space between technology and society. While realising the need for existing alongside the advancing technology, man took a fancy to uplifting himself socially by becoming a link in the electronic society and he not only made online courtesy calls but also passed on information to others both, relevant and otherwise.

INFORMATION VS. CHANGE

In his elaborate reviews of the 'Information Society' Frank Webster (1997) observed, "Post Industrialism is widely regarded as an 'Information Society'. The best known characterisation of the 'information society' is Daniel Bell's theory of Post-industrialism." Daniel Bell had projected the pivotal role of information/knowledge as the centrality of the emerging Information society. Bell (as cited in Webster, 1997) contended, "We are entering a new system, a post-industrial society, which, while it has several distinguishing features, is characterised throughout by a heightened presence and significance of information." Daniel Bell also argued that information and knowledge are crucial for Post Information Society,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

both 'quantitatively and qualitatively.' The "heightened presence" of information as a characteristic of the post-industrial age notwithstanding, one experiences a visible qualitative change, which Bell (1976) called 'theoretical knowledge'. That Bell's theorising pointed towards the increase in information in the social, economic and political fields is neither disputed nor found incorrect, whereas his premise that the 'presence of heightened information' signalling a new kind of society may not be saleable.

Post-Industrial Society stemmed from structural changes in society and not from changes in politics or culture. Bell (1976) asserted that change could seldom originate from any one sector and influence other dimensions of society. He opined that the developed societies were 'radically disjunctive' (Bell, 1980). "That is, there are independent realms—social structure, polity and culture—which have an autonomy one from another such that an occurrence in one realm cannot be presumed to shape another," (Webster, 1997).

The convergence of communications technologies, a cause for structural changes, is likely to have some significant impact on society in terms of change in life-style, viewing pattern, market strategies, employment, formal and non-formal education, etc. The convergence services provide access to information and interactivity leading to a better-informed society. It opens up an opportunity for reaching out to the inaccessible sections of the society (Trivedi & Thakar, 2001). In his interview with Herbert Schiller, Lovink (1997) observed, "Everything you will discover in the areas of television and film will come back in the Net. The patterns are going to be very similar. We are nowhere near to what they like to call an Information Society. This term serves to camouflage the current reality".

All sincere attempts at defining the 'IS' though yielded results, an emphatic bird's-eye view is yet to be achieved. But, the term 'information' largely influences the idea of the new society. From technological angle, that the Internet is second to none in the overwhelming quantum of information available at any given point of time at any single location is a cliché. In his scrutiny of the information industries in Asia, Kyung (2001) pointed out the superiority of the Net in the developed nations. In the US the Internet dominates in terms of contents and traffic of information and the U.S. is more or less the 'hub' of World Wide Web in every respect.

The new media of communications technologies, particularly Internet has a firm footing in the developed nations. Nevertheless, much to the chagrin of the users, these technologies infringe mercilessly upon the privacy of others. Taking cognizance of the danger ahead, the Universal Declaration of Human Rights stepped in. The need to fence the privacy of individuals is as quintessential as the dire need to put the technology to use, for, a society gains impetus when new know-how becomes the means of a more sophisticated life. At the same time, technology alone is insufficient for a society to move into the information mould.

IMPORTANCE OF TECHNOLOGY

The primacy of technologies in creating a society is neither remote nor indiscernible and their dominance is visible quite rampantly in the present. India is not an exception to this condition despite the reality that the advent of the new communications technologies such as Internet and mobile are as recent as the middle nineteen nineties. The growth of the communications industry was not a mere happening but followed a better money inflow into the country in the wake of liberalisation. That the embracing of technology became a reality only when backed up by resources is indisputable and the sidelining of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the 'have-nots', an inevitable feature of the IS. Those Americans who revel in the greatest connectivity today are typically high-income households. At the same time, the new ICT can be termed to be the most absorbing for the user. In his study "Uses and Gratifications of the Web Among Students" Ebersole (2000) found that television involves only one's leisure time, whereas the PC/Internet affect work, school and play—personal, family and business relationships. He concedes that the chances of the users of ICT to turn into addicts were rather inevitable or one's attraction for the medium could hamper one's routine.

THE SUPPORT OF ECONOMY

The adoption of a technology gains precedence when the potential user is economically comfortable to own it. Many studies of technology adoption have found that the income of the user was a priority as against education and occupation (Dutton et al, 1989). This leads to the inference that technologies are first tested out by the potential user irrespective of realising their usefulness. Yet, the fact that the new technologies are convenient and reliable as information sources has come to stay. Chung and Rodriguez (as cited in AEJMC, 2012) who explored the patterns of use of information sources such as 'traditional', 'on-line', and 'mixed' among investors, found that on-line investors were more certain about the investing environment. It implies that the credibility of the new technologies as information providers is rated high.

OCCUPATIONAL SUPPORT

The visible changes, which pervade the new society, are in the realm of occupation, especially the notable growth of the information industry. The emergence of the information workers has become a reality with the new-found need for information to manoeuvre the industry successfully. Kuo and Low (2001) pointed out that the long-term growing trend in information-related occupations has been in tandem with and supportive of industrial changes in a developed nation like Singapore. When information becomes the pivot of the post-industrial society, the efficiency of the employee is measured by way of his being a user of the ICT. The Luntz (1997) survey found that as much as 29% of the respondents worked for a "large company", which comprised 51, 47, 30, and 22 percents of the "Super-connected", "Connected", "Semi-connected", and "Not connected" categories respectively. On the contrary, a substantial 27% of the respondents who were "unemployed", "self-employed" (16%), "work for small business" (13%), and "work for medium-sized business" (14%) comprised the other categories. The statistics reveal that the new technologies pave way for the efficient and skilled people who can find placements in large firms. Here, the adverse impact of new technologies is also revealed in the form of the "unemployed". The adoption of technologies results in new ways of performing intellectual tasks and infusing new processes into the daily agenda of individuals and groups. One such is the preference of American government workers to work from home via computer but only a 14% had the opportunity (Temin, 1992).

The new technologies found their footing in India too. The citizenry began to adopt the new technologies at a great pace as (Ruet, 2002) there was a forecast that India's information technology workers would grow from 70,000 a year to 3,50,000 a year by 2008. Taking this cue, the U.S. IT companies decided that along with flying down professionals from India, they could relocate part of the work in India through networking.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

VALUE OF 'TIME' AND 'SPACE'

The foremost strength, contraction of space, of the new technologies notwithstanding, the potential user is located in the cities rather than in the suburbs. Hindman's (2000) study reflects that residents in metropolitan cities adopt and use various information technologies than residents of non-metropolitan cities. This is a fact, not only in the case of the West, but also that of the developing nations. The nullifying of the unimaginable distances involves mostly cities due to the dominant presence of users of the new technologies in them. The inference that 'income' was the central reason for technology adoption was also supported by the research finding that the demographics 'occupation' and 'education' equally supported adoption of technologies. Cities, which overwhelm in higher levels of occupational and educational status, would invariably figure among networked places.

CULTURAL HOMOGENEITY

The 'IS' is one in which the general value of life undergoes categorical improvements in the modern sense, wherein the lives of the younger generations are "Much better" than those of their parents (Luntz, 1997). The survey also reveals that the users of the technologies alone do not benefit but also the non-users, thereby the advent of the new communication technologies improves the lifestyle of a society in general.

The positive effects of the ICT are not economic alone, but social too. Technology users are quick to expand their horizons of friends and business partners. In a study of 'dependents' and 'non-dependents' of Internet (Young, 1996), 'Dependents' show a keen interest in creating new on-line relationships by "increasing their immediate circle of friends among a culturally diverse set of world-wide users." They reflect more affinity for on-line relationships as their personal identity could be concealed urging them to build strong bonds. The widening of the social circle, though a positive effect of the new ICT, is often dented by the users' attitude of concealing identities, a peculiarity of the information age.

The technology-driven changes became apparent in the people's lifestyles, in the form of a greatly augmented consumerism with on-line shopping becoming a part of the domestic routine. With satellite technology and the Internet rapidly improving, Internet and cable TV shopping emerge as new types of non-store shopping and is expected to impose a great deal of influence on the traditional store shopping. On the contrary, the online shopper is always wary of the confidentiality online. The groups that express more serious concerns are the same groups that use the Internet more frequently. These concerns could reach great proportions in the future especially when the reported cases of cyber crimes are on the rise.

When sophistication and improved economic value of life as characteristics of the 'IS' are placed on one side of the scale, like in any other form of society, other neutralising concerns might surface on the other. The problem of white collar crimes goes hand-in-hand with pornography, sexual discrimination, and male dominance. Heider and Harp (2000), using textual analysis and a feminist theoretical framework, while examining pornography sites on the WWW, found the Internet to be reifying existing power structures, i.e., male dominance and the exploitation of women. When industrialisation forced replacement of agriculture as an occupation, the repercussions of modernisation of the society did have telling impacts, socially and economically, and continue to do so.

A concrete classification of this new society continuing to be elusive to scholars notwithstanding, the philosophers of the 'IS' have ascertained the determinants that are responsible for its creation. Having acknowledged the deductions of many an author on the 'Information Society', Webster (1997) constricts

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

to five specifics— 'Technological', 'Economic', 'Occupational', 'Spatial', and 'Cultural'—that shape and characterize the new civilisation. He posits that the resultant changes in the 'post-industrial society' are visible in many realms particularly the five aspects, the core areas that together mirror the making of the 'Information Society'.

TECHNOLOGICAL

With the presence of technology in the society being realised in the 'post-industrial' era, the overwhelming presence of technology in information storage and dissemination coupled with cheap modes of processing, has begun to redefine the routine and lifestyle of people.

While regarding the new Information and Communications Technologies (ICT) as distinguishing features of a new society, Webster (1997) predicted the formulation of a "techno-economic paradigm" with the rampant spread of the Integrated Services Digital Network (ISDN) at the foundation of the Information Society'. He perceived a 'flexible specialisation' on the work front, as a result of constituting the ICT to spur a new way of administration. All perspectives lead to a point of view that describes the 'Information Society' as one that is technology-driven, as Gates (1995) contends, "I'm optimistic about the impact of the new technology. It will enhance leisure time and enrich culture by expanding the distribution of information. It will give us more control over our lives and allow experiences and products to be custom-tailored to our interests".

The boisterous technological changes that churned the developed societies in the latter half of the 1970s gelled with the emerging 'post-industrial society' as surmised by Bell (as cited in Webster, 1997) in his 'The Coming of Post-Industrial Society'. Castells (1989) also agreed emphatically, "Restructuring could never have been accomplished without the unleashing of the technological and organisational potential of the 'informational'."

According to the Commission of European Communities (Mowlana, 1996), "Telecommunications is the most critical area for influencing the "nerves system" of modern society and it must be viewed as the major component of a conglomerate global sector comprising the management and transportation of information." As rightly positioned, telecommunications, the bloodline of the new Information and Communications Technologies (ICT), creates a social metamorphosis by strengthening the interdependence in society through the mediated form of communication. Preston (2001), while exploring the three-corner relationship involving technology, information, and social change, wrote eloquently about telecommunications that, the explosion of the highly mobile character of telephony and the transition of the personal computer from isolated office automation equipment to a highly flexible form of communication and networking gadget, is noteworthy.

TECHNOLOGY AND SOCIAL CHANGE

The point that there exists an unshaken trust between technological innovations and social changes is not easily contested. The third-wave theorists postulate that the new technologies create many a fundamental change in the social fabric of the advanced societies. It made stronger sense to infer that the developing societies were close on the heels of the advanced ones. Speculations about the winner at the end of the race are meaningless, because only the stronger nations can withstand the inevitable social upheavals

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

that could create dislocations or fractures in the existing system. Toffler (1980) contended that 'a new critical transition' landed the society ushering in 'a third civilisational rupture' creating transformation in the social, economic and political forms.

The theories behind technology-created social change are not new to the new economy but as old as Cohen (as cited in Dogra, 2001) who observed, "the hand mill gives you society with the feudal lord, the steam mill, society with the industrial capitalist." Every society is the result of technological changes. Today, the new media are seen as the crossbreed of communication technologies fetching for itself a social status that runs parallel to the potency of the medium. Yet, the users of the online medium do not see it any different from the older media such as the electronic and print (Lin, 2000). As the purpose of all technologies were to empower the user in some way or other, the ultimate impact of the new technologies was to give end-users greater power to shape their computing systems and to manage their information needs.

The encouraging social and economic changes that trigger the new facade of the society are weighed down by the user's receding trust in the new media. Hoffman et al, (1999) opined that consumers are withdrawn when the electronic network does not safeguard their privacy and security. Conversely, the Indian scenario reflects a more optimistic reaction to using the new media, which helps the society realise for itself the need for easy adaptability to the new technology.

In his analysis of the new media, Paniyil (2001), while mentioning the relief that the ICT brought about for Indian consumers, pointed out that the railway ticketing information is available without the help of touts and examination results, without mobbing in front of notice boards. Indians' easy adaptability to technologies, particularly the Information Technologies (IT), perhaps help in the nation's rating as a topper among 53 nations in terms of IT expertise (Devraj, 2000). At the same time, he placed India at the bottom in terms of telecommunication infrastructure. Though the observation was relevant some years ago, it is otherwise now. The telecommunication technology that runs across the length and breadth of the country is one of futuristic generation. It is rather more pertinent to point out the socio-economic aspects as deterrents that normally plague technology diffusion in India.

While dilating upon the setbacks that impede technology diffusion in India, Shastri (2001) observed that the elite prospered with the private education system, whereas the rural populace (forming more than 60 per cent of the country's population) solely depend upon the public education system, which was faced with a fast-decreasing support from the government resulting in the creation of information haves and have-nots. The distinctions between the two are bound to reflect in intangibles such as upbringing, culture and education. While thinking on similar lines, Trivedi and Thaker (2001) also predicted that the new society would be faced with a new divide—computer literates and illiterates. The computer savvy people would leave behind a large mass of the older (35-50 years) generation in the race for technology adoption.

MEDIA CONVERGENCE

Convergence of different ICT is an intrinsic creation of the Information Society. Though branded as a revolution, Trivedi and Thakar (2001) argued that different perceptions emerged with regard to media convergence. Two schools of thought hold diametrically opposite premises. One thinks that technological convergence leads to media convergence and the other that though convergence is technically possible, divergence of media was bound to continue. When seen from the point of view of countries like India,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

media convergence could be unaffordable by a major segment of the population. The authors' premise further that the consumers would seek more value for money and simplicity in operation and that if it failed, the reasons were three: cost, complexity and consumer needs.

The issue of affordability is not exclusive to the developing or Third World Nations alone, but also to the developed nations. The former US Asst. Secretary of Commerce, Irving (as cited in Black, 1999) remarked, "Think how powerful the Internet is. Then remind yourself that fewer than 2% of people are actually connected". Lee (2001) also observed that the spread of the Net was rather dramatic and that it had taken only four years for the Internet to reach 50 million users. The amount of traffic carried over the Internet is said to be doubling every 100 days. The power of the medium permeated every nook and corner of the globe but did not touch its entire populace. According to Nua Internet Surveys (as cited in Lee, 2001) the Internet users had skyrocketed since 1998 and it was estimated that some 407 million people were connected to the Internet in 2000, and this reached almost 700 million in 2001. This reflected that the Internet was the fastest growing communication technology in human history. Region-wise, the Internet showed heavy concentration in the North America (40.8%) and Europe (27.8%), claiming 68.6% of the world's Internet users. As of 2014, with a penetration of 40.8% of the world population, the Internet covers nearly 3 billion users (ITU, & UNPD, 2014). It is inferred that among the ICT the Internet is apparently viewed as the foremost technology with one of the fastest growth rates. Though undisputedly, a revolution among technologies, it is improper to expect the medium to find its way into the hands of different economic strata of the society. This expectation never arose when either the television or even the radio made their entry.

ECONOMIC

The trend in the 'new age' is to ascribe an economic value to every piece of information that goes to contribute to the Gross National Produce (GNP). Peter Drucker (2001) deduced that 'knowledge' became the basis of modern economy, shifting from economy of goods to economy of knowledge. Information Society theoreticians argue that the society has evolved into one in which the distinguishing feature is that knowledge and organisation are the prime creators of wealth.

The premise can seldom be refuted, for, the strength of an economic activity is determined by the acceptable use of a piece of information in such a way that it can be converted into 'knowledge' for a congenial output from that activity. The essence of a strong database of information can "homogenise disparate economic activities" (Webster, 1997) and thereby leverage the society economically.

To experience the benefits of a technology by appropriately manoeuvring its potential, means that the objective (to enhance one's life economically) of its user is well-focused. Invariably the educated and the economically forward are likely to be regular participants of the electronic network game. This has the support of Peter Drucker (2001) who opined that the 'next information revolution' would involve all major firms of the present day society. The resultant will be the imperative need to redefine business enterprise as the "CREATION OF VALUE AND WEALTH". He also observed that the computer would be a watershed at the workplace impacting the top management deliberations in business policy, strategy and decisions. It is discerned that all business houses used the ICT not only to expand their business horizons but also to institute value-added services for the customers. This in turn provided the society at large, with an opportunity to enter new realms of consumer activities and trigger the need to address quality in a product and life. The focuses of the Post-Industrial Society are the service sector,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

which paved way for new opportunities that were non-existent in other societies, and self-employment ventures. Toffler (in Preston, 2001) identified the growth of a new sector that comprises "prosumers", whereby people produce more goods and services, not for sale, or even barter, but for their own use.

The major pitfall that can emerge in the long run would be the economic differences between people with the wherewithal and others without. Patterson and Wilson (2000) referred to the new ICT as 'engines of inequality', that contribute to an ever-widening gap between the rich and the poor, which has now reached 'grotesque' proportions. Irving (in Black, 1999) vouchsafed, "Low-income persons, the less educated are among the groups that lack access to information resources." Contrarily, there are others who contend that ICT has a tremendous equalising potential.

INFORMATION AND ECONOMY

The economic value of the 'IS' is spurred by the informational value developed and information would be the basis of the informational economy, which would cater to all economic needs of the society. Both the economy and the society would grow and develop around the core of production and use of information values (Low, 1997). Information as an economic product will exceed goods, energy and services in importance (Masuda, 1990). The 'intangible' information gains value proportionate to the degree of use it is put to. Those who convert the information into knowledge are slated to ascend higher up and others could be left behind. The power to control information is bound to create income disparities amongst young professionals, which will in turn have a telling impact on the educational system. Similarly, the relatively disadvantaged rural and non-metropolitan economies are likely to suffer from lack of newspapers and contemporary courses in schools and colleges. Hindman (2000) mentioned that if these communities were to be wired residents would read online newspapers and students take up those futuristic courses available in the metropolitan cities. Equipped with telecommunication infrastructure, the 'isolated' societies could evolve themselves into diversified economies and provide jobs for displaced farmers. But in a country like India mere information could be futile. Deb (2001) argued that unless power, water, roads, and other infra-structure improved, reforms might never touch Indians and that a decade of reforms and lowering of import tariff had only ushered in a consumer boom for the strong Indian middle class.

OCCUPATIONAL

Rampant changes in the distribution of occupations are at the core of the most influential theory of the 'Information Society'. Bell's (1976) propagation of the emerging "white collar society', the receding industrial labour, the rising communal consciousness, and the developing of an equality between the sexes, provide a lucid sketch of the Information Society.

The arrival of the 'Information Society' is realised with the domination of the labour market by 'information operatives', which brings together the occupational features and the 'economic measures.' The fundamental premise of the information society's scholars about its evolution points towards the predominance of occupations in the information sector where clerks, teachers, lawyers, and entertainers outnumber coalminers, steel-workers, dockers, and builders. The occupational trends in the 'Informa-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion Society' do not signify the fading importance of the agricultural or industrial occupation, rather it emphasises upon the shift in the nature of work, i.e. from hard physical labour to mental deliberations.

In order to define a type of society, it is almost certain that the predominantly prevalent employment is spontaneously used. The most common occupation became a "defining feature" (Bell, 1976) of particular societies. When the agricultural labour pervaded the agricultural society and the factory worker dominated the industrial society, the service specialist surfaced in the post-industrial society. The critical factor in moving from one society to another is that it becomes possible to get "more for less" (Webster, 1997) from work because of the principle of efficiency. In the pre-industrial epoch everyone had to work the land just to eke out a living. However, as it became feasible to feed an entire population without everyone working on the land it was possible to release a portion of the people from farms so that they may do other things while still being assured of an adequate food supply. Accordingly they drifted to the towns and villages to supply factories with labour while buying their food from the excess produced in the country.

To mention that the surpluses in agriculture indirectly led to the proliferation of the other sectors is not incorrect. The 'unthinkable luxuries: e.g., teachers, hospitals, entertainment, and holidays' (Webster, 1997), take roots when the surplus-producing work force of the agricultural sector move to the towns to create industrial wealth, which in turn created new opportunities in 'services'. The process (the automation of industry leading to robotic factories, continuous release of people from industry, and creation of new vistas in services in order to fulfill the new needs) is continuous as the society entered the Information Age. For Bell, (in Webster, 1997) a 'service society' is a post-industrial one. The 'Service sector' transfers employment from one sector to another. The ethos of "more for less" impels automation of first agriculture, and later on industry, thereby getting rid of the farmhand and the industrial working class while simultaneously ensuring increased wealth.

SERVICE SOCIETY

Bell (1976) deduced that the Post-Industrial Society is an Information Society and a service economy reflected the coming of post industrialism. However, Gershuny and Miles (1983) contended that the service occupations, defined as those outputs of which are non-material or ephemeral, are not limited to the service sector. The underscore of the agricultural society is the dependence on raw muscle power (Bell, 1976), the strength of the industrial period was the domination of the machine. Conversely, the pivot of the post-industrial society is based on services—'a game between persons'—where information was the tool. Even history brands as important the presence of the erudite and the skilled for the advancement of any society. The surmise concurs with Perkin's (1990) theory that Britain reflected the resourcefulness of professionals who ruled by the wealth created by the educated and sustained by the exclusion of the unqualified.

In contrast, research and theory has it that the fundamental development of a society became tangible only with the constructive 'inclusion' of the unqualified and the weak. In *The Coming of Post-Industrial Society,* Bell (in Webster 1997) highlighted trends, such as the increased presence of professionals, which have important consequences for politics (Will professionals rule?). Here one could discern not the isolation of realms, but their interdependence as opposed to the view of Bell. In a job-centred society, work represented not only income and sustenance but also self-respect and self-worth. If the 'workers' of capitalist industrialism and informational society are juxtaposed, the distribution of 'social position',

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

'power', and 'status' would weigh heavier in favour of the latter group. For, the 'information worker' prevails over his counterpart as a 'white-collar worker' (Low, 1997; Rose, 1991).

Popular theories of the information society reflected three types of occupations, 'extractive', 'fabrication', and 'information activities' that pervaded different societies. The dominant group in the post-industrial society is the third in which an overwhelming number of information workers existed. The growing presence of professionals not only meant perennial flow of information but also quality orientation. Here the information worker is the white-collared professional (Bell, 1989). More than the individual, the promotion of the community through valued relationships began to be realised.

The effect of using the IT reflects on the work front and culture or lifestyle, which accompanied work. Private companies, by adopting IT, create professionalism by providing new attire to the roles of information workers. The one new facet of the 'IS' seems to be the importance of education as a "new form of security". In effect, being in possession of a job in the 'IS' is akin to owning a property in another. Because, IT caused the losing of jobs except for those of the skilled. Moreover, the positive effect on the society is that jobs require high levels of creativity for sustenance (Trivedi and Thakar, 2001; Low, 2000).

SPATIAL

The most effective outcome, following the advent of the new ICT is the irreversible "death of distance", resulting in a dramatic effect on time and space. In his thematic analysis of the 'Information Society' Thomas (2001) observed, "the essence of this society is one of 'wired' where networks play the role of bringing together people and organisations that are separated by continents".

Manufacturing industries, which never looked beyond their own geographical boundaries for transactions, have explosively reached out to unthinkable corners of the world, putting the constraints of space asunder. After scrutinising the possibility of the global strategies of companies made possible by the ICT, Goddard (1992) deducted four elements—l. co-ordination of globally distributed manufacture, 2.computer and communication technologies to enable information processing and distribution, 3.explosive growth of information sector, and 4. integration of national and regional economies—in the transition to an Information Society.

That the New Information and Communications Technologies (ICT) have redefined the geographical space cannot be termed as a vague surmise. The distinct effects of the re-creation of space in the IS are tangible in some forms and intangible in others, besides being both positive and less-than-acceptable intrinsically. What used to be a move towards decentralisation of working is now reverting to a centralised working due to the speed with which governance has become a possibility and that too without too many impediments. With the development of modern science, the universally accepted 'global village' has begun to be realised on the one hand, and the nature of this global space becoming abstract, passive and uniform on the other. The abstract space could be open to exploitation as it is interchangeable with any other space. Radovan (2001), who envisioned the positive aspects of this new 'global culture of the present, predicted a more global human solidarity but cautions that the flattening and shrinking of the space of human experience is liable to have negative effects.

ICT has increased the speed with which economic transactions can be conducted over geographically disparate areas. The reach and extent of speedily activated patterns via computer networks might change the geopolitical influence of states and other organisations, rearrange the time and space of the society and also create a 'symbolic environment' (Mowlana, 1997; Harvey, 1989).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

INFORMATION AND SPACE

Although the potential of the new technologies in stringing places on the globe like beads is likely, theyimmobilise people and physically separate them from the society. The primary experience of people when using computers and the Internet is largely immobile and alone, movement is provided on the screen, which may be thought of as a window through which the person looks (Geocities.com, 2002) and as many services will be made available at home on a single device (Trivedi & Thaker, 2001).

At the same time the new ICT networks are propagandist technologies that promote the importance of information transportation around the sphere in order to help in the realisation of economic and social wants while they concurrently reduce the import of places. The flow of information may emerge as the principal aspect of the 'informational society' (Castells, 1994) and the reliance on networks reduces the restrictions of place on contemporary activities (Webster, 1997). The networks ought to have nodal centres through which the information does not merely flow, but where it is collated, analysed and acted upon. While viewing nodal cities like New York, London, and Tokyo as 'highly concentrated command posts of world economy', Sassen (1991) concurred with Castells on branding these cities as 'informational cities', which are spatially dispersed over a wide area and yet interlocked places of economic activity. The rapidity of the expansion of these cities went along proportionately with the equally paced increase in information workers who dealt with the management of the networks, thereby paving way for the 'global control capability'.

The 'global cities' become all the more central functionaries for the world economy as globalisation proliferates. The information producers who form a numerical minority dominate a place in terms of lifestyle. Castells (1989) calls them a "hegemonic social class" that might "not necessarily rule the state but fundamentally shapes civil society".

Though a minuscule minority, the cities that pivot the flow of economic deliberations around the world determine the shaping up of the new society. In Castells' (1994) parlance, this new society is informational and global and makes a vital point that 'informational' refers to more than 'information based' and 'global economy' signifies more than 'a world economy' The 'informational' societies are likely to have an upper hand vis-a-vis those that aren't. The race for a control of the global 'hegemonic social class' could be the near future consequences of the shrinking globe. In a contextual analysis of the changing face of the world, a new form of imperialism is visualised. He observed that the 'global net workers' built overseas hegemony by borrowing from the US its 'comprador' approach for overseas domination, in which local allies (compradors) are assisted to set up new 'independent' countries. These 'comprador' hegemonies administered 'their' spaces in accordance with the needs of their allies in the global centre.

INEQUALITY AND SPACE

The feeling of a shrunken globe due to information technologies notwithstanding, theoreticians do contend that the tedium of distance cannot be eliminated but is but to evolve new types of inequality by making the rural areas more accessible to the dominations of alien corporations. This is quite a truism in the Indian scenario wherein multi-national corporations have made forays into rural India by systematically instituting marketing strategies that deter its lifestyle.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

At the same time, contradictions surface from the point of view of other scholars who think that with the neutralising of distance, as a result of networking, jobs will be made available equally to people of both the urban and rural areas. Consequently, the mere knowledge of jobs without adequate skill can make one a misfit, where the rural man continues to be at the receiving end. The inequality, though a bane to society, is inevitable. Nonetheless, the disadvantages posed by geographic isolation would not hinder the "non-metropolitan businesses, which stand much to gain through the adoption of productivity-enhancing technologies" (Gillespie & Robbins, 1989).

Yet, they are also faced with the "rural penalties" of greater distances from markets and a lack of economic diversification (Hudson & Parker, 1990). Barring the inequalities the 'shrinking globe' can create, scholars forecast a major threat, the making of another world. While national boundaries and, in general, space is becoming irrelevant due to the increasing globalisation, scholars conceive of a 'fourth world' that comprises parts of Africa, S. America and Asia that will be excluded as futile to the global network economy. When the strategists advocate the need for uplifting the Third World nations, so as to help even the developed nations enjoy the benefits of the new ICT and the 'shrunken globe', it would be inconsequential if a 'Fourth World' emerged. In effect, the exploitative act of the first two worlds in enhancing their range of possible social networks by controlling the versatility of a medium like the Internet will not only help them reap dividends but also forestall progression of the Third World nations.

CULTURAL

Viewing through the "cultural' microscope Webster (1997) perceived more confusion prevalent in the 'Information Society' and described it as 'wayward' rather than 'organised'. His observation that the "extraordinary increase in information" attributes itself to drastic changes in lifestyle is not an incorrect inference.

The simultaneous access to abundant information from a variety of mass media, ICT, telephone, etc., has redefined social interaction with a sea change. 'Socialising' is preceded by a conscious effort of storage and analysis of global information, which, to a larger extent, controls the lifestyle. If the IS prides itself in evolving a new culture, the chances of 'culture' being considered a determinant of the new society is rather remote. According to the suppositions of scholars, the presence of a unique form of culture determines the emergence of the 'IS'. Contrarily, if the new culture is seen as the consequence of IS, the tools that shape the 'new culture' gain visibility and importance. The machinations of the agricultural and industrial societies are overwhelmingly responsible for the shift in the lifestyle of their peoples.

Today, the change in lifestyle is so abrupt and directionless that the much-valued cultural ethos is threatened leading to both, a shift in lifestyle and a cultural denigration. A state of confusion prevails upon any analyst who tries to define the 'new culture', for a highly complex paradigm has set upon the society. McQuail's (2000) observation that the communication technology has an effect on culture, as communication and culture are intertwined, aligns with the idea that the tools of communication shape the lifestyle of a society. Moreover the "common value system" (Bell, 1976) which was highly regarded throughout a system is now faced with the imminent death.

Irrespective of the nature of changes, Mowlana (1997) agreed that the fundamental form of culture and methods of communication of the industrialised nations are on the decline to give way to a new and different form altogether. The immense opportunities that aid people to form networks, irrespective of distance, open up newer reflections of the society. While examining the potential new marketplace of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ideas that exists in cyberspace, Brown (2000) expressed that citizens are provided with universal access opportunities to new media, thereby increasing the diversity of expression and discourse in society.

The high levels of discourse point towards the increasing educational strength of the participants, who eventually become information professionals. As a result of increasing their earning power, the 'IS' professionals are naturally drawn to the luxurious lifestyles offered in large urban centres rather than in the suburbs (Sassen, 1991). The participation of the well-to-do professionals alone is insufficient to promote a collective culture, and ignoring the voice and vision of underserved communities will greatly limit the ability of the Internet to function as a tool that strengthens local communities.

CULTURE AND DEVELOPMENT

If the marginalised are to be supported, they ought to be helped in experiencing the new technologies through applied educational methods. As social scientists have predicted, the non-users of information technologies may find themselves misplaced and incapable of keeping pace with the rest. Hindman (2000) went a step further and reasoned that the perpetuation of status and power in the information society depended on the patterns of use and adoption of the information technologies among the population. Implied, the people who rein in a new lifestyle in the Information Society would be the ones who apply the technologies in the most diverse manner. The benefits of the speed of adoption of technologies might be rocked by certain threats to society, if the speed became uncontrollable and lacks direction.

The profundity of the consequences of the new ICT is proportionate to the uncertainty of their nature and causes (Low, 2000; Mowlana, 1997). The GVU survey (2001) also reflected that users are wary of providing financial information on the Web. To add, the more convenient the technology became, the more the problems to encounter (Trivedi & Thaker, 2001). Nevertheless, despite the prediction that convergence would influence the life-style of people, experts do opine that for a single device to replace the television, computer, and telephone, it would take some years before it permeates very deep into a social system. For each of the technologies has its intrinsic use and importance.

PLAUSIBLE IMPLICATIONS OF THE INFORMATION SOCIETY

The breakdown of the traditional way of 'discriminating' women socially is becoming a reality. Women are geared to be a part of, and contribute to the new culture in equal vigour as that of men. The prominence of women in the social and political fronts has come to stay with the thinning down of the status of inequality between men and women.

Although the uncomplicated purpose of use of the new technologies is mutual to all to 'cover distance' and achieve 'speed and convenience', users belonging to various age groups think independently of each other when it relates to their own 'spaces'. The prominent presence of the teenagers or youth in their domination of the networking culture cannot be disregarded even though their objective of occupying the virtual spaces is a debatable one.

The youth, in general, reflect a capability for faster adaptability to the changing environment as opposed to the 'cautious' approach of the older age groups. They are, more often than not, prepared to conceptualise a new structuring of the social relations, and interact across indefinite spans of' 'time' and 'space', which Giddens (1990) calls 'disembedding'. .

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The reality of the environment of the present youngsters is that they were born into a digital world and are strapped to a mobility that is faster than the eye can follow. Although the Information Society' holds plenty of promises for the 'Netizens', their lack of experience of conventions and social life, can alienate them physically from their own surroundings.

The threat of digital divide looms large which results from the increase in the income of one segment which is techno-savvy. In addition to their high educational standing, the users of the Information Technologies can acquire more comforts in life because they are 'information rich'. For those in the 'very low' income bracket, it's extremely tedious to keep pace with the rest and is bound to be relegated to the background, socially and economically.

The deterrent of the Third World nations' progress is lack of adequate governmental support for the educational sector, besides population explosion and poverty. When elementary aspects are neglected, no amount of valiant efforts made in networking the society can result in the genuine form of development, for, the 'ignorant' would always remain dependent on assistance in order to use the new technologies. The sustenance of the government institutions must become a commitment so as to be on a par with the private ones.

As a personal communication technology, the mobile phone which has outpaced the landline is instrumental in the mushrooming of the service industry which is devoid of a 'permanent address'. However, the opportunity for low-investment self-employment seen in the present society is a resultant of the mobile technology.

The new communications technologies have begun to phase out other technologies which were the pivotal forces in office automation. The attempt to create 'paperless office' may see success even in the developing nations, but 'administrative security' never comes with an affordable price tag and even the most advanced nations fear the shelving of hard copies of documents.

With the often slashing of excise duty on personal computers from the government's budget, the markets get buoyed with buyers, due to affordability. India has also gone to the extent of inventing the 'simputer', the common man's computer, to make it affordable for all. The ardent computer user upgrades his system to meet with the equipment of the future, but how would the common man or the illiterate even get to feel the machine when his basic needs are not met and his right to education denied.

Networking has become a reality and is proliferating at an encouraging pace. The aim of achieving efficiency brought in 'decentralisation' of work. But networking has reintroduced the centralised working with a recreated version 'centralised-decentralisation'. The head office keeps a close watch on the working of its branch using the 'wired network' and continues to give directions by the minute.

The perception of the Internet users especially the youth, on the causal factors of the Information Society, run parallel. The future will show an increase in the users' dependence on the medium, making it a part of their lives. Singh's (2001) reservation that all individual media would shed their separate identities and converge on a single platform to provide "more for less" is the premise that cannot be ignored.

The composition of Webster's (1997) 'techno-economic paradigm' is today a realisation that few can rebut. Though the theory of social change engineered by technology is as old as Marxism, the change being felt in totality in the new age was unheard of in the previous societies. The 'third-wave' theorist Toffler (1980) called this change 'a new critical transition which has landed the society in 'a third civilisational rupture'.

The benefits of the new technologies, though numerous, can tend to be weighed down by the burden of the ills they are liable to cause. If the society does not 'stray and instead view the new technologies in

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the right perspective, the outcome of Preston's (2001) 'three-cornered' relationship involving technology, information, and social change may benefit mankind.

The role of the 'economic' determinant of the 'IS' is a watershed, which can be exploited by the skillful use of the new technologies and a mature analysis of the information disseminated through them. An ingenious handling of the new technologies would help reap better niceties of life. This is seen as a parallel to Drucker's (2001) observation that knowledge has become the basis of the modern economy, which ratifies the theory that "knowledge and organization are the prime creators of wealth."

To comprehend the worth of a piece of information that can be converted to knowledge lies in its intensity to produce a proportionate homogenisation of an economic activity. But, the one major setback that can befall a society, particularly a developing one, is the widening gap of inequality that can forestall any progression with equal strength.

That a major 'occupational' shift has come about in the new society is uncontested, which also confirms the propagations of Bell (1976) that 'white collar society' with a growing number of professionals is emerging and that now it is possible to get 'more for less'(Webster, 1997) the principle of increasing efficiency.

On the other side of the coin, the pull-back could be alarming, when the unskilled and unqualified would neutralise the efficiency of the 'professionals.' In the long run it's imperative that the skilled and the qualified professionals push up the 'weak' in order to stabilise the growth of the society.

The benefits of the 'spatial' aspects of the Information Society are attributable to the new technologies. This characteristic of the society is a long dreamed of phenomenon, helping the world inch closer to McLuhan's "Global Village." Moreover, the making of a new form of 'centralisation' ('centralized-decentralisation') cannot be ignored. Additionally, a networked society could run the danger of making its realities abstract. The swapping of 'abstract' places may take place leading to an insecure feeling of 'invasion of privacy'.

Having gratified their users, the new technologies, when viewed through the 'cultural' microscope, tend to threaten their users' values. The fear is all about an abrupt change that can create a loss of direction, leading to a state of confusion. This could be the 'beginning' of the loss of the local culture. A cultural homogenisation is a proposition that may not sink into the minds of people, especially those of the developing nations. The 'common value system' deduced by Bell (1976), which was regarded for long, could soon cease to exist.

CONCLUSION

In anticipation of the impact of technologies, the observation of one of the pioneers of studies in the province of technology and society deduced that all technologies brought about a social change (Pichandy, 1994), which suits not only the past, but also the future.

Irrespective of being a developed nation, changes accentuated by technologies could demonstrably strengthen and also abruptly pre-empt economic development and healthy progression. The outcome of the nature of developments will engender from the means of channelising the use of technologies. To visualize technological use, strictly on the basis of the realised needs of a society, would be a safe ground to tread on. The co-existence of opposing schools of thought in any given period of time is justified, as changes can be both productive and destructive to any society.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The adversities of the new age, if any, can be borne with equal vigour by neither a developed nor a developing nation like India. The shocks from an onslaught may be absorbed unperturbed by any economically strong nation, but the same might leave the pain unabated for generations in a developing one. The policy-makers of the latter nations need to address the cause of ills, before launching any developmental effort.

No development is sustainable when a major segment of the society is living in wretched conditions as in the Third World nations. The divide between the 'haves' and 'have-nots' will widen further leading to inconsequential effects even on the 'haves'. The government efforts on encouraging privatisation could turn out to be the ill of a developing country. For, there is bound to be a prohibitive hike in the cost of education, further distancing the 'have-nots'. A balanced approach to the policy is most warranted. Similarly, the same goes with the developed nations. Their sustenance will depend on their assistance to the needy nations. To realise the effects of globalisation, sincere attempts to chalk out plans for concerted contributions is the need of the hour.

The new society witnesses the emergence of skilled people, leading to professionalism and a scientific approach to issues. The use of skilled workers could become extremely expensive in the future, forcing the introduction of 'do-it-yourself' kits in the Third World markets. Besides, the notion of 'survival of the fittest' has already found its footing, resulting in downscaling of the work force, and retaining only the skilled. This accepted norm could possibly remove the fangs of the trade union movement in democratic countries, in particular, and eventually cause its extinction. The increasing demand for skilled persons in the new age will create the increase in part-time occupations, wherein those talented would tend to make more money to meet the needs of an 'expensive' future.

One principal outcome of the theories of the contemporary society is the need to use technologies to the hilt. For, the more they are put to use, the better will the economic benefits be. The hierarchies of the workplace are flattened, leading to the easy two-way links between the top management personnel and the floor workers. The traditional hand-me-down businesses in the family are faced with cessation, as the new generations have diverse thinking about novel ventures. The use of English language on the Net are heightened and the diminution of the regional languages is probably not far away. However, to achieve the dream of 'wiring' a developing non-English speaking nation such as India, a multi-lingual approach is crucial.

The strength of occupation in the 'Information Society' is the axiom in this context. The outlook of every kind of job has a changed facade. The change is the transition from the hard labour to the sophisticated mind manager. The information worker has become a reality only due to the machines that are available to help realise his vision. Had there been no industrial society, there wouldn't have been the 'Information Worker'.

The making of the 'Information Society' is discerned to be the extension of the toiling farmer and the industrial labour. It's the transition of one era into another, with changes in its basics. The sophistication and modernity embedded in the 'Information Society' is not actually divorced from the traditions of the yesteryears, but just seemingly discarded. The portrayal of the IS is more or less artificial in nature, which can't dislocate the cultural ethos of any nation. With the dramatic upsurge in the flow of information, its credibility is drowned in distrust, as tens of thousands of individual websites are bursting at the seams, suffocated with 'information'. The increase in cyber and white-collar crimes results in the inevitable rise in the invasion into people's privacy. A much-transparent approach, among peoples and nations, to the use of the new ICTs is undoubtedly commanding and anything opposed to it can brand the 'new society' a myth rather than a reality.

KEY TERMS AND DEFINITIONS

Centralised-Decentralisation: With the decentralising of power came decentralising of work and decision-making. Conversely, the advent of the networking technologies in the workplace tends to diminish the culture of decentralised working since the 'boss' can oversee the employee's work instantly causing sudden interventions.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Convergence: Primarily the term coincides with the combination of different technologies—telephone, computer, broadcasting, and Internet—on a single platform. However, it is pertinent to understand the term from the point of view of multiple activities being performed within a moment using the advances of the new communications technologies.

Cultural: The drastic changes in lifestyles can be experienced with the overwhelming flow of information. The concept of 'cultural shock' may be obliterated from even the conservative societies.

Determinants: If agriculture and manufacturing determined the making of the earlier two societies, a composition of different spheres of activities—technological, economic, occupational, spatial, and cultural—determined the creation of the Information Society.

Economic: Every nature of human activity has a price tag today and hence every piece of information has an economic value.

Information Society: Unlike the predominance of occupations of the agricultural and industrial societies which defined them unambiguously, the Information Society has numerous definitions. However, since information and knowledge is considered to underscore the new age, the term 'Information Society' has a universal applicability.

Occupational: It signifies the transformation from the landed workforce to a sophisticated 'white collar society', the pivot of the Information Society.

Spatial: The advances in communications technologies have resulted in the redefinition of distance and may end up with the creation of 'virtual citizens'.

Technological: The ever-increasing spread of interdependence on technology coupled with mediated form of communication, which replaces interpersonal face-to-face interactions, marks the importance of technology in today's world.

Chapter 12
Picking the People up From Poverty:
Urban Labour Market Deregulation vs. Encouraging the Development of Micro-Enterprises

Abu Saleh Mohammad Sowad
University of Dhaka, Bangladesh

ABSTRACT

Being a multidimensional phenomenon, it is hard to confine poverty within any definitive parameters and even harder to send the word poverty back to dictionary. Poverty eradication needs both short and long term strategic interventions; policies regarding employment opportunities should also be planned in such way. As an economic strategy, deregulation targets to eliminate the regulating authorities of labour market and decrease the interference of legal aspects within the relationship between companies and individuals to a minimum level with a great decline in the cases of collective bargaining. Labour market deregulation creates ample employment opportunities for poor people especially women. This paper looks for an effective and efficient way to alleviate poverty between Urban Labour Market Deregulation and the development of micro-enterprises with a sketch of possibilities and vulnerabilities of both approaches and a comparative approach to find the best possible way within these two to remove poverty's shadow from humankind.

INTRODUCTION

Poverty, historically being seen as an economic phenomenon, is much more a socio-cultural entity rather than solely financial. Though the economic side of poverty seems to be the major area of concern of today's development practitioners, poverty also includes lack of access to proper health care, education, information and so on. That's why, when poverty exists in certain area, it cohabits with social instability, increased mortality, petty to hefty crimes, poor health etc. Creating employment opportunities for poor is

certainly one of the best options to reduce poverty but if we really tend to send the word poverty back to dictionary it will take more than that. Creating and maintaining income sustainability, providing social protection and structural change; a proper synchronization of all of these actions is needed to take out the poor people from the jaws of poverty.

According to International Labour organization (1996-2012), decent job is a bunch of virtues including prospects to productive work with handsome remuneration, physical and social security for workers and their families, freedom of expression and integration, equality of opportunities regardless gender, participation in decision making process regarding the work or organization related matters. With the increasing instances or globalization, modernization and urbanization, every day a massive number of people are migrating from rural to urban areas to search for a decent job, better income earning opportunities, better living condition and moreover to find a better future. Cities are the hub of all major economic activities in most of the countries that combine business, service providers and consumers under one roof. For most of the residents of urban sphere, a well-paid job and income generated from urban labour market determines their financial successes (Eberts, 1995). The urban labour market is not a level playing field and that's why, almost every city in the world creates blatant dichotomies between successful and unsuccessful people; and generates not only a huge share of national fortune but also a massive share of poverty and destituteness among the nation's financially deprived low income workers (Eberts, 1995).

When it comes about creating employment opportunities for poor, there are many ways to do so; from decent job creations and encouraging labour migration to promoting small and medium enterprises. The main focus of this study is about debating the ideas of alleviating poverty through two major instruments of income generations, namely decent job creation through urban labour market deregulation and encouraging the development of micro-enterprise. I will try to jumble with both ideas to find a more suitable option to snatch poor people back from the claws of extreme poverty to an esteemed life.

POVERTY FROM A GLOBAL PERSPECTIVE

Poverty always equals with the words like inequality, discrimination and deprivation. If we follow the definition of poverty by United Nations (1998) we see poverty as:

…a denial of choices and opportunities; it is a violation of human dignity. It means lack of basic capacity to participate effectively in society. It means not having enough to feed and clothe a family, not having a school or a clinic to go to, not having the land on which to grow one's food or a job to earn one's living, nor having access to credit. It means insecurity, powerlessness and exclusion of individuals, households and communities. It means susceptibility to violence and it often implies living on marginal and fragile environments, not having access to clean water and sanitation.

As a multidimensional phenomenon it's not easy to confine poverty within any definitive parameters. As Mencher (1967) stated the problem of measuring poverty comprises with instituting a comprehensive structure of theory to address poverty, and then applying effective and consistent methods to attain appropriate information. According to Sen (1976, 1979), two different problems to be faced while

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

measuring poverty; first is tracing out the people who are actually poor within certain population and second is to combine poverty characteristics of different people into a universal index. Identifying poor people is really a complex issue because poverty isn't only prevalent in households rather it exists in individual levels. Changing in poverty status of a household doesn't imply similar changes in poverty status of individuals cohabiting in that, as distribution of resources in every household happens between 'dominant' and 'dominated' individuals depending on sex, age or family structures (Peluso & Trannoy, 2009, p. 2). When we tend to alleviate poverty, we should focus on individuals rather than households; because of existing inequalities and gender discriminations within households, raising income level or financial status of the family is not well enough to remove the vicious shadow of poverty over people.

SEARCHING FOR A DECENT JOB IN URBAN LABOR MARKET

As the amount of cultivatable land in rural areas around the world is on decrease because of increasing population and industrialization, migrants are now moving into urban areas in more numbers. As the employment opportunity in high productivity industrial areas are inadequate, lot of these migrant populations join urban informal sector and become engaged with low productivity works. Involving in such low income works doesn't help them to alleviate themselves up from low income group (Mitra, 2006). These poor people try to be involved in urban economic sector and to change their economic condition through participating in labour markets but not everyone becomes able to do that and lot of them ends up still being in low income groups as creating demand for untrained and semi-trained labour force in urban labour market is really difficult (Grant, 2008). Meanwhile, urban labour markets are being characterized by the longitudinal closeness of households and businesses that offers 'firms and workers advantages that lead to more efficient markets, enhanced productivity, and greater economic success' (Eberts, 1996, p. 52). Urban labour markets in developing world are mostly populated by semi-skilled or unskilled labour force, who for supporting them and their families is willing to participate in any kind of jobs that are available to them. As a consequence of such desperateness to get a job, they end up with some low paid informal work sector.

Decent work opportunities enable poor people to earn more to meet their basic needs and to ensure a better living standard, at the same time with this increasing accumulation of wealth the instances of tax and revenues grow up which help government to provide more social services to poor people but it needs a combination of social, economic and political policies to create more decent works (Vandenberg, 2006). Poor people cannot ignore any opportunities to earn some money and that's make them more vulnerable to employers who don't ensure safety of working environment or future security of workers rather exploit their cheap labour and desperateness of finding works and put them in some low-end jobs that doesn't has any future prospects to bring them out of poverty situation (Jennings, 2011). If we consider about the working age of 15 to 64, almost half of the world's poor population belongs to this working poor population group (Somavia, 2003). So, when we think about increasing job opportunities to alleviate poverty, we should target to create some decent jobs that will help poor people to fight and come out of poverty. Creating decent jobs are like social upgrading of work environment that tends to lead to workers as an enthusiastic workforce.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

DEFINING MICRO-ENTERPRISES

The widespread concept of micro-enterprises for poverty alleviation was introduced when the world of development policies faced a paradigm shift right after Second World War, basically in early 80's (Taylor, 2009, p. 1). Michael Pretes (2002, 1342) defines micro-enterprises as, 'firms with fewer than five employees; they are typically unregistered and do not pay taxes. To be successful, micro-enterprise entrepreneurs must possess managerial skills, knowledge of markets and prices, and the technical ability to create their product'. Micro-enterprises could be one of the viable options to eradicate poverty in developing countries because of its inherent potential to create employment opportunities; the basic problems one faces while establishing micro-enterprise are financial and structural. Vandenberg (2006) locates that there is an anticipated relationship between small enterprise development activities and poverty reduction. Still, being engaged with any kind of micro-enterprise is a source of employment to many poor people. While financial barriers of starting micro-enterprise includes the lack of credit and capital; structural barriers imply the hardship to enter to the existing markets and compete there successfully.

POVERTY ALLEVIATION THROUGH ECONOMIC MEANS: THE DEBATE BETWEEN DECENT JOB VS. MICRO-ENTERPRISE

Poverty is a multidimensional widespread global phenomenon and the process of alleviate poverty even only in economic sense will need a strategic multilateral approach. Neither decent job creation nor development of micro-enterprises will be able to eradicate poverty alone but when there is a comparison between these two; one will somehow be more effective than the other. Though poverty has to be seen in individual level and intra-household inequalities prevails in the society; creating employment opportunities could be the starting point to fight against poverty. From the history of countries that has succeeded to eradicate poverty effectively we can see that economic growth, which is an important factor in poverty eradication, has to be equality based while its benefits should be distributed equally and that's why employment plays a vital role in between poverty eradication and economic growth (Islam, 2004). Employment opportunities enable people to take part in income generating mechanisms and uplift their existing situation from sheer poverty. Though Zepeda, Alarcón, Soares & Osório (2007) believe that effective poverty eradication can be ensured with creating productive employment opportunities and such process will lead to quick decrease in overall poverty situation; Islam (2004) argues employment can't solely create an operative way out from poverty rather it will need the proper assistance from other development strategies as well. Still, employment is the major approach to poverty eradication just because poor people basically depend on use of their labour to earn their daily livings (United Nations, 2005). As creating jobs for poor people is important besides it's also important to empower people so that they can create job opportunities for themselves and for others as well.

Poverty eradication needs both short and long term strategic interventions; policies regarding employment opportunities should also be planned in such way. Here while I will search for an effective and efficient way to alleviate poverty between decent job creation and the development of micro-enterprises. First I will sketch down possibilities and vulnerabilities of both approaches and in the later part of my analysis I will materialize the best possible way within these two to remove poverty's shadow from humankind.

Alleviating Poverty Through Decent Jobs

Creating decent job opportunities needs severe efforts because creating jobs in large scale without thinking about basic opportunities for workers could lead to underemployment with sharp increase in unsecured and risky job environment. According to United Nations (2005, pp. 5-9), though there have been a large number of created jobs in recent times, most of those job holders are still snared in poverty because of the low qualities of such jobs. Among these working poor people three characteristics are predominantly visible and needs attention: 'feminization of poverty', majority of poor workers in agricultural sector and increased numbers of workers in informal sectors. If we look towards readymade garments factories in Bangladesh, who are one of the largest suppliers of world textile market, we see there are lots of new job opportunities especially for women but still most of them remains entangled in poverty after being engaged in income earning opportunity just because their jobs don't provide them the basic services that they were obliged to. The same thing is also true for agricultural wage workers in rural Bangladesh, where there is a bulk supply of permanent and seasonal workers. They work in large and small farms for low payment with lack other basic facilities.

The Possibilities of Decent Jobs to Alleviate Poverty

In his address in a joint session of congress, US president Barack Obama (2011) stated, 'we have to start building an economy that creates good, middle-class jobs that pay well, offer security and lasts into the future'. Creating decent jobs are one of the best options to fight against poverty but for developing countries the process of creating decent jobs is not that easy because of their quickly increasing population growth and feeble economic situations. Still with some strategic interventions it might be the best possible way to start the fight against poverty.

Decent job will empower poor people to use their full capabilities which will convert them to more effective human resources. It will provide poor women a strong fall back mechanism, they will be abler to use their agencies and to come out from an individual level of poverty and intra-household inequalities. Decent job creation will also ensure the quality and security of jobs that will help poor people to invest more one their consumption and future security like having nutritious food, attaining better health care and sending their children to school will that end up the 'intergenerational cycle of poverty' (Rose & Dyer, 2008, p. 7). It will also contribute to a rapid decrease in child mortality because of developed health and education system which will eventually lead to a lower fertility situation that will lead to a lower 'dependency ratio' and lessen the surplus supply of workers over time (Khan, 2007, p. 14).

The Dark Sides of Decent Job Creation Approach

Creating decent jobs will undoubtedly shift the economic momentum of poor people to a better life standard but at the same time this approach has some drawbacks as well. If government fails to monitor the farms those are supposed to create decent job opportunities for poor, they might start acting autocratic as in developing countries there are bulk supply of workers; for more benefit they might decrease the facilities enjoyed by workers. As we know poverty is much more individual than communal, the existing social contexts play a vital role to determine the access to jobs for individuals. Restriction of mobility for women in some societies, physical security, meeting reproductive obligations and more over glass ceiling effect could made it harder for women to enjoy full benefit of decent jobs.

Alleviating Poverty Through Micro-Enterprise

In this era of neoliberalism and globalization, state initiatives on poverty reduction are being squeezed and more market oriented initiatives are coming out to draw poor people out from the vicious cycle of poverty. To establish micro-enterprises in developing countries, people are generally dependent on loans from moneylenders or mainly on various non-government organizations, as they have comparatively least interest rate. On the other hand, these NGOs are creating new social vocabularies but subjecting people by including them in various socio-economic endeavours (Karim, 2008). Yet, micro-enterprises play important role in rotation of capital in the market and besides they create some job opportunities as well.

The Possibilities of Alleviating Poverty Through Micro-Enterprise

If implemented efficiently, micro-enterprises can play effective roles to help people fighting sheer poverty. An established micro-enterprise can create several additional job opportunities. As micro-enterprises needs less labour and are structurally less complicated, poor women can play a great role in micro-enterprises to reduce their individual as well as family poverty. Poor women can get loans from different NGOs or government organizations to start on their own. As Vandenberg (2006) argues if they create employment, maintain certain job quality and provide cheap goods and services to poor than micro-enterprises can play a great role to alleviate poverty. Besides if governments help them by creating new market opportunities, duty free quotas to export products, control the influences of middlemen, provide easy loans with capacity building trainings and ensure proper monitoring then micro-enterprises will have a great possibility to flourish and help to alleviate poverty.

The Dark Sides of Micro-Enterprise Approach

Though micro-enterprises have great potentialities to eradicate poverty it needs certain criteria's to be fulfilled which sometimes linger the process of poverty alleviation. Developing micro-enterprises depends on access to some vital resources like capital, loan, market, training etc. Sometimes access to credit and market becomes too hard for poor people, especially for women because of existing capitalist and patriarchal societal structure that solely focused on rapid profit maximization and women's subjugation. In many of self-help groups for microcredit it is seen that poor women are left out from groups by other members as they have least chances to repay the loans in time (Selinger, 2008). Besides for women, having control over profits and decision making power regarding use of loans and reinvesting profit are also major area of concern. According to available data on microcredit based NGOs, women are the major beneficiaries of such loans but in practice '95 per cent of these loans' are handled by the male members of the recipient women's families (Karim, 2008, p. 15). Concise and congested loan repayment time, and unstable market condition makes people vulnerable to these NGOs so that it increases instances of insufficient economic returns to micro-enterprise owners and leads to poor job condition, lack of physical and job security, increasing risks and lacks negotiation and collaboration among workers (Vandenberg, 2006).

IS DECENT JOB CREATION THROUGH URBAN LABOR MARKET DEREGULATION THE RIGHT CHOICE?

Deregulation is an economic strategy that targets to eliminate the regulating authorities of labour market like state, labour organizations, trade unions etc. and decrease the interference of legal aspects within the relationship between companies and individual personnel to a minimum level with a massive decline in the instances of collective bargaining (Eurofound, 2007). Urban labour market deregulation has been one of the most noteworthy financial policy changes in recent past, especially the removal of government regulations and principles (Peoples, 1998). Specifically most of the organizations supporting deregulation propose steps like eliminating or moderating legal restrictions enacted on setting up tough conditions in labour contracts; moderating legal restrictions on discharges and layoff; decentralizing or abolishing collective bargaining over wages, and/or to reach consent with trade unions, workers councils or other organizations of workers; withdrawal of the governmental decision of statutory minimum remuneration or keeping it on very low level; moderating legal protection of trade unions etc. (Dymarski, 2008).

The positive sides of labour market deregulations according to Chant (2013) are like: unrestrictive guidelines can encourage entrepreneurial initiatives; deregulation can possibly inspire increasing investment and increase in employment opportunities; poor people are expected to be benefitted because deregulated job market will not encourage credentialism as age-fixing in regulated labour markets do; moderate limitations and out-sourcing opportunities may lead to more income earning opportunities for women i.e. in work intensive export processing zones, as industrial homeworkers etc. On the other hand Chant (2013) also points outs some negative sides of urban labour market deregulations like: in global competitive markets deregulation allows companies to impose lower remuneration and poor working environment on workers; urban labour market deregulation sometimes can't help to offset market failures and increase productivity; deregulation most of the times end-up favouring rich rather than poor; empirical evidence show that deregulation in Mexico led to fewer employment opportunities and poor wage structures.

It's true that labour market deregulation makes it easy for different firms to enter into market and creates ample employment opportunities for poor people especially women. Moreover, because these newly created work opportunities women become able to come out of domestic sphere, join work force and for the first time in their life become able to earn on their own but most of those jobs are low and and/or in an informal sector. Besides as these is no government regulation on minimum wage and even any central body for collective bargaining on wage is absent most of these jobs are severely ill paid. In last few years the presumed positive influence of labour market deregulations on jobs and economic performances has come to face various questions. The major problem is when the main goal of deregulation is to remove all types of control over the employers, how do one decide whether or not various employers are using such deregulations for the wellbeing of the deprived people. The answer totally depends on the conscious actions taken by employers for welfare of workers.

CONCLUSION

The comparison between the characteristics of decent job creation and developing micro-enterprise denotes decent job creation as more feasible and rapid way to alleviate existing poverty situation that needs to be supported by urban labour market deregulation. Deregulating urban labour market have some unique effects but the question is who will enjoy its privileges and who will face the adversities. Starting fresh or developing any existing micro-enterprise needs time and increasing access to capitals, while encouraging micro-enterprises through microcredit interventions are too slow to grow and are unable to create many jobs (Eberhart, 2012). So creating decent job opportunities by deregulating urban labour market and through capacity building initiatives for poor people, attracting private investors to start their operations and creating monitoring cells in order to ensure workers' rights at work, productive and remunerative employment, social protection and social dialogue (Vandenberg, 2006) will be easier for governments, will ensure decent jobs for poor and help them to better their lifestyles while alleviating themselves from poverty.

Chapter 13
A National Crisis and a Call to Action:
Preparing Teachers to Teach Children From Poverty

H. Carol Greene
East Carolina University, USA

Jane C Manner
East Carolina University, USA

ABSTRACT

Well over 16,000,000 children live in poverty in the United States. One of the widest achievement gaps in education today exists between children from lower and upper income families. Our nation's teachers are woefully unprepared to work with children from poverty and the current soaring poverty rate is serving to exacerbate an already bad situation into a major educational crisis. Considerable dispute exists between and among differing approaches related to identifying an optimum way of perceiving and working with children of poverty, but the literature is clear that high quality professional development programs are critical for preparing teachers to work with these students. This chapter describes a program for preparing teachers to work with children of poverty that could be adapted for use in both preservice programs and also as professional development.

INTRODUCTION

Emphasis on student achievement and accountability measures for teachers and schools have both been under intense scrutiny since the No Child Left Behind Legislation of 2001 was enacted, and this emphasis continues to grow as calls for even stricter standards and accountability mount. Coupled with the demands for improved student achievement, there has been a concurrent rise in the number of children living in poverty in America. The national economic decline that began in 2008 has increased the number of public school children who are struggling to survive in poor economic conditions while, simultaneously,

more is being expected of them academically. This has created an almost unbearable level of stress for the students, their parents, and the teachers in our schools.

The numbers are staggering. Well over 16,000,000 children live in poverty in the United States and this number is continually rising. There were an estimated 16.1 million children living in poverty in 2012. That number rose to 16.7 million in 2013. Accurate numbers for 2014 are not yet available, but the number is expected to rise. Nationally, this represents approximately 23% of all school-aged children from 5-17 years old who struggle to survive in poverty; this is an amount higher than any other industrialized nation in the world. Much higher rates of poverty can be found in local areas or counties across the country. It is not uncommon to find counties with poverty rates over 30% and some even approaching 50%. When these numbers are drilled down even further to a school level, there are some schools across our country that are faced with a nearly 100% poverty rate. This poses incredible difficulties for the children, obviously, but it also poses significant challenges for the teachers who are charged with educating them.

Adding to the problem, research has shown that schools and teachers have not historically worked well with children from poverty (Barr & Parrett, 2007). This could be due in large part to the fact that institutions of teacher education have not prepared them to do so. Training on working with children of poverty is largely absent in most teacher training programs (Jennings, 2007). Jennings found most teacher preparation programs focus on diversity in terms of race/ethnicity (46%), special needs (34%), and language (18%). Social class received a mere 2% of the overall emphasis. Future teachers are not being prepared to work with these children. Professional development for in-service teachers is also sorely lacking in this area. Therefore, our nation's teachers, as a whole, are woefully unprepared to work with children from poverty and the current soaring poverty rate is serving to exacerbate an already bad situation into a major educational crisis.

Not only is very little time devoted in teacher preparation programs across the country to understanding the unique needs of children in poverty, even less time is devoted on teaching future teachers how to teach children of poverty. While understanding and empathy of the needs and struggles of students are an important piece of the puzzle, it is only the first piece, yet this is where what little training teachers get ends. Teachers need concrete methods and strategies that will work for reaching these students and supporting them in their enterprise of learning. They need to understand their situation and how to support them, not merely feel empathy for them. There is no magic bullet, but our teacher preparation programs could do more to prepare future teachers for educating these children that will likely make up at least a quarter of their future teachers' classrooms. We know more than ever before about the needs of these children and ways in which they could be encouraged and supported, but that information is not making it into the field of practice. Teachers should not have to be on the front line trying to figure out on their own how to help these students. Our country's schools need a plan of action to address this crisis. It is a moral, professional, and educational imperative that both universities and teacher professional development programs do a better job of preparing our future teachers to meet this demand and prepare teachers who can help these children succeed and break through the struggles of poverty. It is possible for children to overcome the odds and rise out of poverty; but it is far too uncommon that this actually becomes a reality. Research has demonstrated that students from high poverty schools can perform well if their unique educational needs are addressed (Kannapel & Clements, 2005; Pogrow, 2009). The literature is clear that high quality professional development programs are critical for preparing teachers to work with these students and that students from even the most difficult of circumstances can achieve academically if given the proper supports (Simon & Izuni, 2003).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The intent of this chapter is twofold. First, the authors aim to offer a new perspective on how we understand children of poverty. This perspective is offered as a framework for teacher preparation programs and for professional development opportunities. The literature is largely opposing in its views of children and families of poverty, advocating either a deficit perspective or an asset perspective. The authors share a more inclusive and realistic, yet complex, view that incorporates the challenges, as well as the strengths, that children of poverty may experience. This model seeks to capture the complexities of what poverty really means and the different ways in which it may be experienced, thus creating unique needs, challenges, and assets depending on each child's unique situation. The second goal of this chapter is to synthesize and share what is known about the academic effects of poverty and the ways research has shown that children of poverty may be supported and encouraged to achieve academically. To those ends, this chapter culminates in a description of an educational and informational program for teachers that could be adapted for use in both pre-service programs and in professional development opportunities for practicing teachers already struggling to meet the needs of their students. Finally, it is also hoped that this chapter sparks a national discussion on the importance of preparing teachers to work with children of poverty and encourages universities to make this a priority in their respective teacher education programs.

Defining Poverty

According to the U.S. Department of Health and Human Services, the poverty threshold for a family of four is $23,550, the number deemed as less than half the amount required to adequately cover basic expenses. This figure represents almost 25% of school-aged children. Of the nearly 25% of school aged children living in poverty, 10% of them live in deep poverty meaning their family lives on less than half of the figure determined to meet the poverty threshold for their family size (Annie Casey Foundation, 2015). Since the poverty threshold is defined as half the amount of income needed to meet adequate living expenses, this means that an even higher number of families are living in significantly difficult financial situations in which they do not have the resources to provide an adequate living for their family, and, although they may not meet the federal definition of poverty, they are in fact living without adequate resources, food, health care, and income. Therefore, astonishingly, the number of children living in dire financial situations in the United States of America is actually approaching 50% nationally (Addy, Englehardt, & Skinner, 2013), nearly half of all our nation's public school children!

Poverty's Effect on Academic Achievement

The effects of poverty on academic achievement have been widely researched and duly noted. There is no disagreement on the fact that high poverty rates drastically impact school achievement, which, in turn, perpetuates the problem of persistent poverty. In fact, poverty accounts for one of the widest achievement gaps in education today. Students from low-income homes consistently score far below average regardless of their race or ethnicity (Bergeson, 2006). Children from poor homes come to school already behind in skills and these gaps persist, and sometimes even grow, as the children move through school (Fryer & Levitt, 2004).

In 2001, the United States Department of Education reported on a study they had conducted with 71 high poverty schools and found that low income students in third through fifth grade scored below norms

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

on achievement tests every year in every grade. Additionally, according to the National Assessment of Educational Progress (NAEP), the achievement gap in reading between eighth grade students from low socioeconomic levels vs. children from middle or upper class families is typically around 34 points on a 500 point scale, and the achievement gap in math is around 38 points. This lack of achievement makes higher education difficult, if not impossible, for some. Since the lack of a higher education is one of the strongest predictors for living a life of poverty, our schools and universities are sadly failing our poorest students in helping them break the bonds of poverty.

Given this lack of academic achievement, not surprisingly, only about 28% of high school graduates from high-poverty schools attend four-year colleges after graduation, compared with 52% of high school graduates from low-poverty schools. Ratcliffe and McKernan (2012) found that parents' educational attainment at the time of their child's birth had the strongest influence on whether or not their child would experience persistent childhood poverty. This supports earlier research conducted by Peters and Mullis (1997) where they found that the parents' educational attainment had a significant effect on academic achievement while other studies have shown that a mother's education level has a more significant impact on children's academic achievement than income (Lacour & Tissington, 2011). It behooves our nation then, as a whole, to find a way to help these children stay in school and get an education if there is ever a hope of alleviating this crushing crisis of poverty.

As stated earlier, the research on the deleterious effects of poverty on academic achievement have been widely published and are well understood. What is less understood is the reason why poverty has this effect. Researchers have tried over the years to uncover the challenges faced by children living in poverty and to suggest ways in which to mediate their harmful influence. It has been posited that a lack of resources plays a major role, such as less funding for poor schools and lower teacher salaries (Carey, 2005; Karoly, 2001). Lack of access to high quality teachers and adequate school grounds and buildings have been noted (Barton, 2004). Lack of parental education, parental support, less reading aloud by parents, fewer cultural and extracurricular experiences, and larger class sizes have all been found to be contributing factors to poor children's lack of academic achievement (Halpern-Felscher et al., 1997; Peters & Mullis, 1997; Zill et al, 1995).

What has received less attention is the role of trauma and/or chronic stress often experienced by poor children and the effect it has on a child's brain. Children growing up in poverty are often exposed to a host of traumatic events such domestic violence, neglect or abuse, insecurities in maintaining housing and availability of food, or poor health. Poverty, especially when experienced early in life, has long been known to be indicative of behavioral and academic problems, but a burgeoning in the field of neuroscience is giving us ways to help us understand why this is the case.

Chronic stress in young children causes actual changes in the structure and function of the brain creating a "weak foundation for later learning, behavior, and health" (Shonkoff et al, 2012) as these changes are permanent. These structural and functional changes occur in the amygdala of the brain, which is the area of the brain that controls an individual's use of executive functions. Executive functions include such things as our ability to pay attention, to control impulsivity, to be in control of our emotional reactions, and to plan and organize. Children with deficits in these areas are often identified as having Attention Deficit Hyperactivity Disorder (ADHD). There has been much discussion in recent years about the rising number of children being identified as having ADHD. It is possible that this increase in the number of children with ADHD may be due at least in part to the rising number of children living through the stressors and traumas brought on by growing up in poverty.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Neuroscientists are working to learn more about the connection between poverty and chronic stress and their impact on executive function. Evans and Schamberg (2009) found that chronic stress is a factor in the relationship of childhood poverty and lower levels of working memory. Farrah, Noble, and Hurt (2005) similarly found that chronic stress impacts working memory and also found negative impacts on language development. Research conducted by Evans and Fuller-Rowell (2013) took these earlier research studies a step further by studying the self-regulatory abilities of children from poverty. They found that the greater a child's ability is to self-regulate, the less harmful the effects of chronic stress caused by poverty are on the child, thereby limiting the negative impact on working memory. When a child is able to self regulate, he is able to "maintain emotional and behavioral self-control necessary for goal-directed behavior in the face of competing social or physical demands" (Evans & Fuller-Rowell, 2013). The ability to self regulate may explain why some children can "overcome" their difficult station in life while others seem to struggle or even succumb.

Although growing up in poverty has extremely debilitating and potentially life-long effects, a life of continued poverty and hardships does not have to be a child's destiny. Decades of research, theoretical underpinnings, and professional practice experiences have led us to where we are in our understanding today of teaching children of poverty. Newer technological advances used in neuroscientific studies are allowing us to advance even further our understandings of the struggles and challenges poor children face daily, but they are also giving us new ways to think about helping them. The next section of this chapter looks at some of the current approaches, both theoretical and practical, to understanding and working with children of poverty. The authors provide a critical analysis of those approaches.

Theoretical and Practical Considerations

A challenge associated with examining current views about children in poverty is that of distilling elements from a very diverse matrix. Much of the classic and contemporary literature on this subject relates to what is commonly known as the deficit theory in which those in poverty are appraised with what Dudley-Marling (2007) refers to as a deficit gaze. In short, this orientation considers low-income students as suffering from a lack of experience resulting in a problematic position for school success. Dudley-Marling (2007) points out that the deficit view was strengthened by such concepts as the "War on Poverty" waged by Lyndon Johnson in the sixties, as well as by the work in the late 1960s of investigators such as Bereiter and Engelmann who held the belief that the lives of poor children were deficient in opportunities that support school success. From the deficit perspective, the experiential dearth of children in poverty needs to be fixed, so that they can accede to a position from which they can achieve in school settings.

In large measure, the examination of conceptions of low-income circumstances reveals a somewhat binary situation, as the principal positions are at opposite ends of a continuum. The deficit position, as described, views those in poverty as being debilitated by negatives, or lacks, that place them at a predictable disadvantage when compared with students from middle class backgrounds. At the opposite and more positive end of that scale is a position that describes poor children as having experiences that are different, but not deficient. Referred to as the "funds of knowledge" position (Moll, Amanti, Neff, & Gonzalez, 1992), this view asserts that there is richness in the experiences of poor children that can be used to educational advantage if curriculum, instruction and assessment are designed to engage rather than ignore them. In this view, the challenge for educators is to acknowledge and integrate the cultural

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

knowledge and experience of poor children, so that classroom learning can be supported by associations that are familiar and understood by the children.

Between the polar orientations of deficit theories and the funds of knowledge positions are a number of additional theories that espouse more intermediate interpretations and positions on the continuum. Beegle (2012) has enumerated and described several principle theories that address the conceptualization of poverty and potential ameliorative strategies. One such theory shares the central emphasis of discovering and acknowledging strengths. The *Strengths Perspective Approach* encourages teachers to find the strengths and skills that students possess and voice appreciation of these qualities. In addition, teachers are to find ways to have students make helpful contributions to the collective work, so that they can feel connected, important, and wanted. In a related conceptualization, *Resiliency Theory* asserts that when people receive praise for their strengths, they develop resilience. Also related is *Asset Theory* in which teachers assess the strengths of students, but go beyond this step by deducing what services they need to move forward. By building associations with community resources, teachers assist in finding needed services as well as the navigation of necessary steps and paperwork to make the connection work.

Additionally, Beegle (2012) considers *Social Capital Theory.* A principal tenet of this theory asserts that poor people increase their chances for success if they know and trust people who are in a position to help them. In particular, people who have escaped poverty through education are seen as very valuable support systems. *Faulty Attribution Theory,* on the other hand, describes the need for avoiding the assessment of the motives of others without knowing the reasons for their behavior, and for recognizing that one's own experience and perspective may be dissimilar from those of others.

Other theoretical orientations take a more comprehensive view of how experiences interact with development, including Bronfenbrenner's Ecological Systems Theory (1994) in which a series of nested spheres describe various influences on a child's development. Bronfenbrenner argued that accounting for the entire context of a child was necessary in order to understand development, and that economic deprivation could hold a prominent place in affecting socio-emotional development in a negative way. Recent research in neuroscience is proving him correct. Poverty is not a disease that affects the brain, but it is a situation that causes environmental influences that may impact the brain and the ensuing development. Researchers have studied the concept of cumulative risk and the impact it has on a child's development. Cumulative risk means simply the additive nature of multiple risk factors over a length of time (Gassman-Pines & Yoshikawa, 2006). The more risk factors present, the higher the likelihood for negative impacts on behavior and cognitive development up to and including psychiatric disorders (Ackerman, Izard, Schoff, Youngstron, & Koggs, J.,1999; Sameroff, Bartko, Baldwin, Baldwin, & Siefer, 1998; Rutter & Quinton, 1977).

It is not difficult to recognize the divergence of beliefs associated with multiple conceptualizations of poverty and their educational concomitants. Educators must anticipate that this divergence will continue to engender considerable debate about the merits of various positions, as well as the appropriateness of assorted approaches to improving student outcomes. Confusion is exacerbated by the potential of misunderstandings at various levels. Even more problematic, Beegle (2012) points out that the most prominent teacher about poverty in America is the media, and that institutions of higher learning produce graduates who operate on false concepts about it. In particular, there is no consensus or consistence in teacher education programs about how poverty is understood or how teachers can help.

The dissatisfaction with current conceptions for understanding poverty and for supporting low-income learners is obvious in the literature. Irizarry (2009) argues that the deficit model that is disseminated so widely in educational research does nothing more than to perpetuate negative stereotypes. Others, such as

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Dudley-Marling (2007), assert that some influential studies are flawed with respect to ethnographic bias and can suggest that poverty is only a black problem. Although blacks and Latinos are disproportionately poor, the U.S. Census of 2012 showed that only 25.4% of Americans in poverty were black while 41.5% were white (not Hispanic). And still other researchers have gone further and asserted that teachers are being miseducated by the media and even some of the research literature. Bomer et al. (2008) made such a claim by implicating the contribution of Ruby Payne, *A Framework for Understanding Poverty*, in just such a way.

In the landscape of all the varying conceptualizations and approaches to understanding the needs of children of poverty, some models, or frameworks, have drawn more attention than others. One such example is the offering of Ruby Payne who espoused a view of poverty that has influenced many in school practice. As a former middle school principal, Ms. Payne is the author of a popular self-published book. In addition, she offers workshops and conducts speaking engagements in which her framework is described for the consideration of teachers and administrators. Her work has had a wide reach within the educational arena, and since her work promotes a deficit view of children of poverty, her work has also served to support negative stereotypes and to promote the idea that children of poverty all experience poverty in the same way with the same deleterious effects and have little to no positive supports in place.

Dudley-Marling (2007) characterizes Payne's body of information as representing a strong deficit perspective surrounding a central tenet known as the culture of poverty. Payne asserts that low-income children must deal with a dearth of experiences, and that they must learn to function within the "hidden rules" that society imposes. Gorski (2008) points out that actual researchers agree that there is no culture of poverty, as posed by Oscar Lewis in 1961, and embraced by Ms. Payne. In fact, he emphasizes, differences in values and behaviors among the poor are just as numerous as they are between the poor and the wealthy. He continues on to support a concept similar to one from the *Faulty Attribution Theory* by cautioning that educators must examine how their own class biases affect their expectations for their students.

While some may see the deficit position of Payne's offerings as problematic with its deficit point of view, a more compelling argument derives from a scholarly scrutiny of her framework by Bomer et al (2008). In this analysis, the authors contend that Payne's assertions are both flawed and contradictory in a number of significant aspects. At the forefront of their concerns are Payne's citations about research that are incorrect, erroneous, and even contradictory. The fact that the ongoing popularity of her training is doing a disservice both to the educators who are influenced by it, and to the children whom they will, and do work, is of utmost concern.

This extreme deficit view of children and families of poverty such as what Ms. Payne espouses not only does them a great disservice, but it is factually incorrect in many areas. It overlooks any strengths or positives that are experienced by families in poverty and perpetuates these negative stereotypes in the wider culture. As Valladares and Moore (2009) reported in their work on the strengths of poor families, many of the beliefs that are held about the values and experiences of lower income homes are merely stereotypes and are fundamentally untrue. For example, they found not only that children from low-income homes attend religious services as often as those from higher income homes, but that children in poor families are actually more likely than children from higher income homes to eat a family dinner together. Family meal time has been shown to be very important to the well being of a child so, in this area, low income families and their children actually have an advantage over higher income families.

Furthermore, low-income parents reported very close relationships with their children and affirmed their belief in the true value of an education as well as their belief in the importance of being involved in

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

their children's learning (Valladares & Moore, 2009). These are not often the ways in which we think of a low-income family due to the proliferation of the deficit views in the media, the research literature, and within the practice of teaching. The past few decades' worth of discussions of cultures of poverty have done much to perpetuate the negative stereotypes and not enough to focus on these children's strengths and potentials and the ways in which teachers can work with them to help them succeed.

Practical Considerations. While theoretical positions on poverty provide a broad context for educational consideration, there is also substantial merit in examining the practical successes of classroom customs on the lives of low-income students. Johnson (2013) describes six principles of effective work with children of poverty by deriving essentials from her own escape from that status through education. She notes that poor children still have hopes and dreams of succeeding. In particular she stresses that relationships at school are at the forefront of success, and that making connections with, and validating each child, is essential. In addition, she recommends having high standards for all students combined with culturally responsive lessons that keep students actively engaged. Interestingly, Beegle's (2012) research agrees with Johnson's emphasis on the central significance of developing relationships with students. He cites mentoring as the overarching element for success with children in poverty. Deriving practical suggestions from a group of theories, she recommends emphasizing student strengths, connecting students to people who have benefitted from education, and helping to navigate systems so that connections can be made with needed resources.

Calls for active learning are not new in the literature and are also found in suggestions for supporting children of poverty. Decades ago, Haberman (1991) argued that the typical teaching strategies with low-income students in American schools were a failure and represented a pedagogy of poverty. He recommended a different approach that not only used inquiry to promote active learning, but that also provided opportunities for students to assist in planning educational activities and reflecting about them. Many of his suggestions appear akin to Montessorian notions about employing student interests and student assistance in creating plans of study with elements of journaling for reflection.

While not all practical examples derive directly from a theoretical perspective, they beg the question of whether or not any single orientation is complete and correct, or whether a constellation of considerations might provide a more comprehensive and flexible approach to working with children in poverty. One issue that seems to make flexibility a requirement is the fact that poverty is not a single condition. Beegle (2012) identifies four types of poverty; generational, situational, working class, and immigrant, all of which share the condition of low income, but which differ in other salient characteristics. For example, generational poverty is characterized by families with high illiteracy rates who don't know many others who have benefitted from education or who have moved up in employment. Working-class poverty includes those who are employed, but live from one paycheck to the next with no money for extras. Immigrant poverty is described as creating language and culture barriers, but is also characterized by members with a stronger sense of self than is present among those born into poverty in the United States Situational poverty arises from a critical situation such as job or income loss; however, the poverty is often abated when the situation resolves. It would seem that an educational approach that considers this variability makes sense and is needed to better inform teachers, principals, researchers, future teachers, and policy makers.

A New Paradigm for Understanding and Instruction

Paradigms, theories, or conceptual understandings are an important piece of any practical problem. The ways in which we understand things have a direct impact on our actions. The authors of this chapter are concerned with the current polar extremes described in the research literature concerning the needs of children of poverty. Buying into a culture of poverty at the least smacks of stereotyping and deficit thinking; at the worst it may unwittingly create a destiny for poor children. As we know, high expectations are important to students' success. Can we have high expectations if we truly believe our students live in a culture that will not allow them to be educated? That does not support education? That does not value education? Is this an easy way out to say that we can't make a difference because this is "just the way it is" because it is their culture?

On the other hand, while the authors do believe that all children can learn and that there is no singular "culture" of poverty, it would be irresponsible not to realize that children from low-income homes do face challenges and difficulties that middle and higher-level income children do not have to face. It would, furthermore, be unethical to ignore those challenges and not attempt to support those students who need the most support of all. The authors of this work concur with Moll et. al (1992) concerning the concept of funds of knowledge, but must also assert that there are challenges that also need to be addressed. No child is without strengths and potential and capabilities; and no child is without a struggle. However, children of poverty do have additional hurdles and challenges to address which teachers must take into consideration and accommodate. The next section of this chapter situates the authors' perspective on understanding the needs and strengths of children in poverty within the landscape of the current literature and also describes a model for classroom instruction to enhance the education of children from low-income homes.

A Fresh Look at Teaching Children in Poverty

The model described here supports the funds of knowledge position in recognizing that all children have learning experiences that can provide the foundation for further education and academic achievement. Truncating that foundation is what puts learners at a disadvantage since an important part of accessing and internalizing new knowledge requires linking it to that which is already known. At the same time, this model recognizes that children in poverty often have limited experience with the behaviors and language that align with success in school. It is not ethical or equitable to ignore the need to work toward developing those proficiencies, since they need to be able to operate successfully both at school and in their communities.

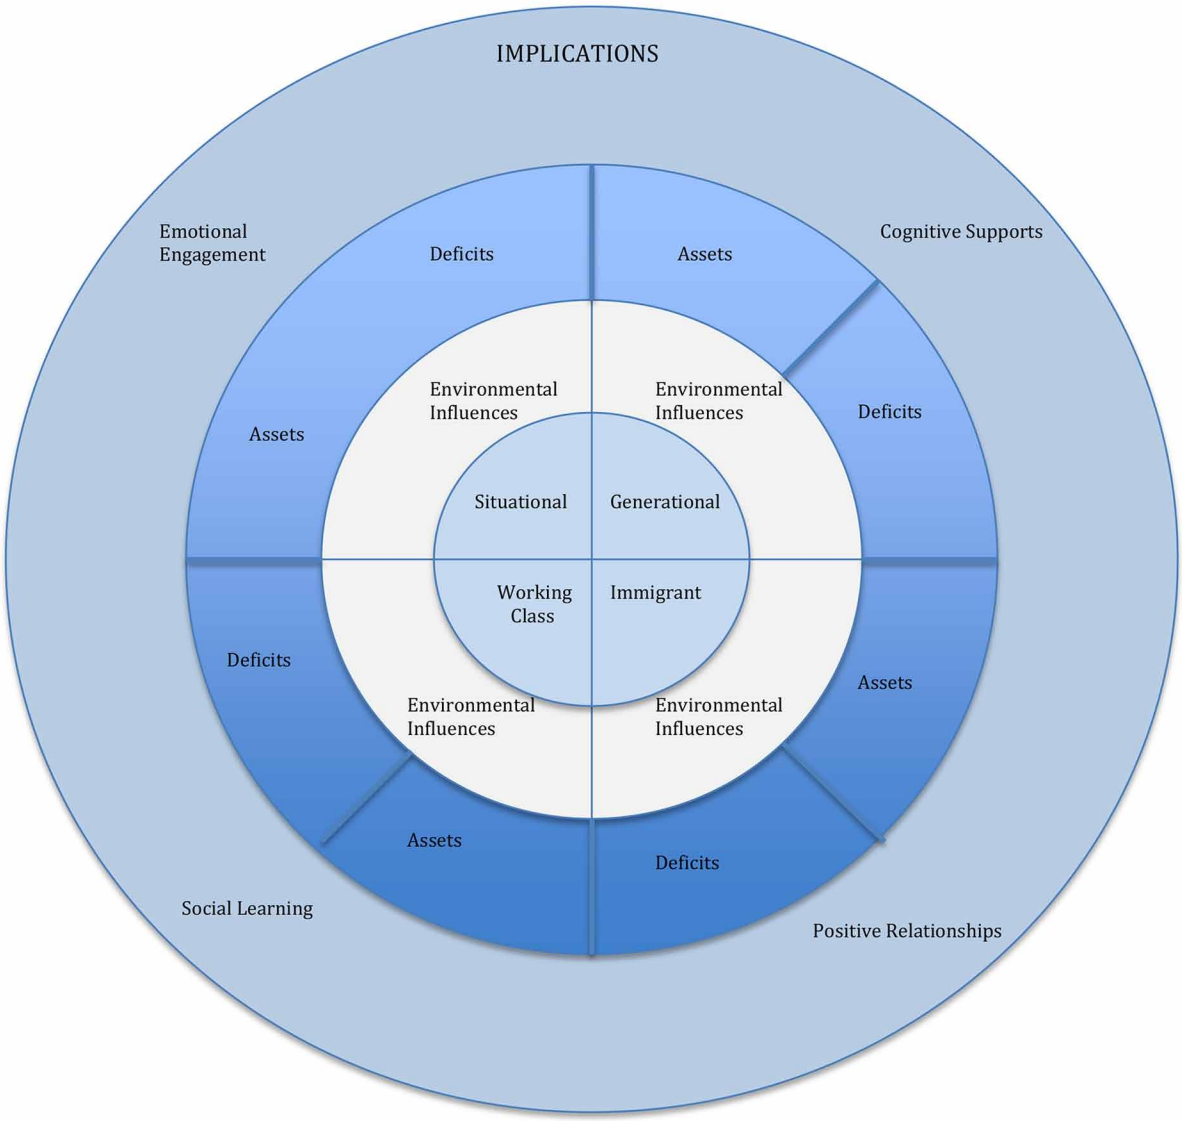
To put it simply, the school must adjust its strategies to include and build on the existing knowledge and culture of poor children; at the same time, they must help those children become conversant in the language, knowledge and culture of a wider world. This does not represent a value judgment about which cultures have greater merit. For example, Gee (2004) has argued that dialectic English is rich and complex. However, it is also asserted that it is irresponsible to fail in teaching all children what they need as the tools of success in a widening world. Standard English is expected in professional fields and it is educational malpractice not to prepare students for those opportunities.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Gorski (2008) noted that teachers likely feel overwhelmed by the ills he described in the schools of low-income children, such as outdated materials and faculty who are not qualified. They may feel powerless to make a difference in the broad arena of school policy and educational legislation. However, teachers are much more likely to assume a leadership role in changing what they *can* change in their own classrooms. As Haberman (1991) has noted, effective teachers do not expect to change schools very much, but they are decent, non-judgmental people who do expect to win in their interactions with their students. It is to this end, that our work proposes a multi-pronged model that acknowledges the contributions of multiple positions on the continuum between deficit and asset, and then describes an integrated framework that can be employed both by schools and colleges of teacher education for the benefit of the low-income learner.

The CESPR Model for a New Generation of Teachers and Students

The remaining sections describe a model of professional development and teacher education, the CESPR Model, which can be replicated nationally to equip teachers to serve public school students living in poverty. See Figure 1. CESPR is an acronym which reflects the four basic components which this model asserts is necessary to effectively teach and support children from poverty. Those components are Cognitive Support, Emotional Engagement, Social Learning, and Positive Relationships. These will be described in more detail later. The CESPR model builds on known recommendations for working with children from poverty and also offers new insights.



Two major concerns were noted in the literature on educating children of poverty: 1) the very polarizing views of the asset/deficit models, and, 2) the lack of a perspective or conceptualization that acknowledges the varying situational experiences of poverty. To that end, this model brings together what is depicted in the literature concerning both assets and deficiencies of children and families living in poverty with a more complex acknowledgment that the lived experience of poverty is not comprised of one "culture" applicable to all children in all classrooms and is, in fact, impacted by each child's specific situation that led them into poverty, along with such things as the child's environment, support systems, and educational needs.

At the center of this model are the four types of poverty children may be experiencing: a) situational, b) generational, c) working class, and, d) immigrant. Different kinds of poverty lead to different kinds of lived experiences, as depicted by the second ring of the model, environmental influences. However, it should be noted that these environmental influences are not specific to a particular type of poverty. This is where the authors' model veers from the culture of poverty myth. This model is presented as a ring to depict that situations, influences, environment, resources, etc. are not static and they are not limited to one type or group of people in poverty. If this model were moveable on this page, one could simply rotate the various rings of the model much like a knob to show that situations, environment, and resources are changeable and are as varied for people living in poverty as they are for those living in higher income homes.

For example, in general, children experiencing situational poverty have far fewer long-term and negative impacts from their poverty experience than children from generational poverty. Children experiencing situational poverty due to a parent's job loss or other loss of income experience temporary hardships from which they often rebound, whereas children from generational poverty are born into a life of poverty and experience the stressors and traumas that come with that in their very early years. This early exposure to poverty has been shown to have the most serious long-term effects on children

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The CESPR model of understanding and teaching children of poverty: cognitive supports, emotional engagement, social learning, and positive relationships

(Duncan & Brooks-Gunn, 1997). This type of poverty is also where one is most likely to find a child who has experienced the neurocognitive ramifications discussed earlier. However, might a child born into a middle class home, but who is experiencing situational poverty, be the victim of child abuse or an alcoholic father or some other trauma related to the stress of poverty that elevates her risk of long-term effects of poverty to that similar of a child born into generational poverty? Or, could a young mom from a family who has experienced generational poverty be raising her children differently from what she may have experienced growing up? Could she recognize the cycle and be determined to find a way to break it? The number of scenarios of lived experiences of children from poverty, as one can deduce from this very brief discussion here, is endless. There is no singular culture of poverty.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The third ring of the model depicts the notion that every child and every family has certain assets and also experiences deficits. The authors would prefer the term 'challenges' to 'deficits,' but have chosen to use the term most widely found in the literature for the sake of clarity. These assets and deficits interact with environmental influences and the type of poverty to create the unique environment and culture that each child experiences.

Finally, the outermost ring represents the implications that the interaction of the first three rings of the model bear witness to in regards to classroom practices. In distilling the most salient and effective practices of working with children of poverty from the literature, there were four main categories of educational practices that offer the highest potential of support for children of poverty. They are: a) cognitive supports, b) emotional engagement, c) social learning opportunities, and, d) positive relationships.

Cognitive supports include the awareness that some children of poverty who have experienced either cumulative risk factors and/or stress and trauma related to poverty may have neurocognitive impairments that require support and accommodations in the classroom. As discussed earlier, children exposed to poverty early in life have a higher incidence of experiencing problems with working memory and self-regulation. Working memory is simply the amount of new material a learner can remember and think about at one time in a short-term period in order to learn, reason, and/or comprehend. It is a necessary first step toward moving information to long-term memory resulting in retention of learned material. Without an effective working memory, moving new information to long-term memory is much more difficult. Such instructional strategies as graphic organizers that aid chunking, prompting, cueing, support with note-taking, etc. may reduce the cognitive load and support a child who has challenges with working memory.

Another area in which children of poverty may need cognitive supports is in their ability to self-regulate. Self-regulation means a child has the ability to control his thoughts, emotions, and behaviors (Blair & Diamond, 2008). The development of self-regulation skills is a developmental process so awareness of developmental appropriateness needs to be maintained; however, these skills can be taught and they can be learned. Some research has shown that a child's ability to self-regulate in their early years is even more indicative of academic success than IQ (Blair, 2002; Blair & Razza, 2007). Better self regulation skills not only offer the child the potential to achieve more academically, research has also found that the ability to self-regulate has a modulating influence on the negative effects of poverty itself (Evans & Fuller-Rowell, 2013).

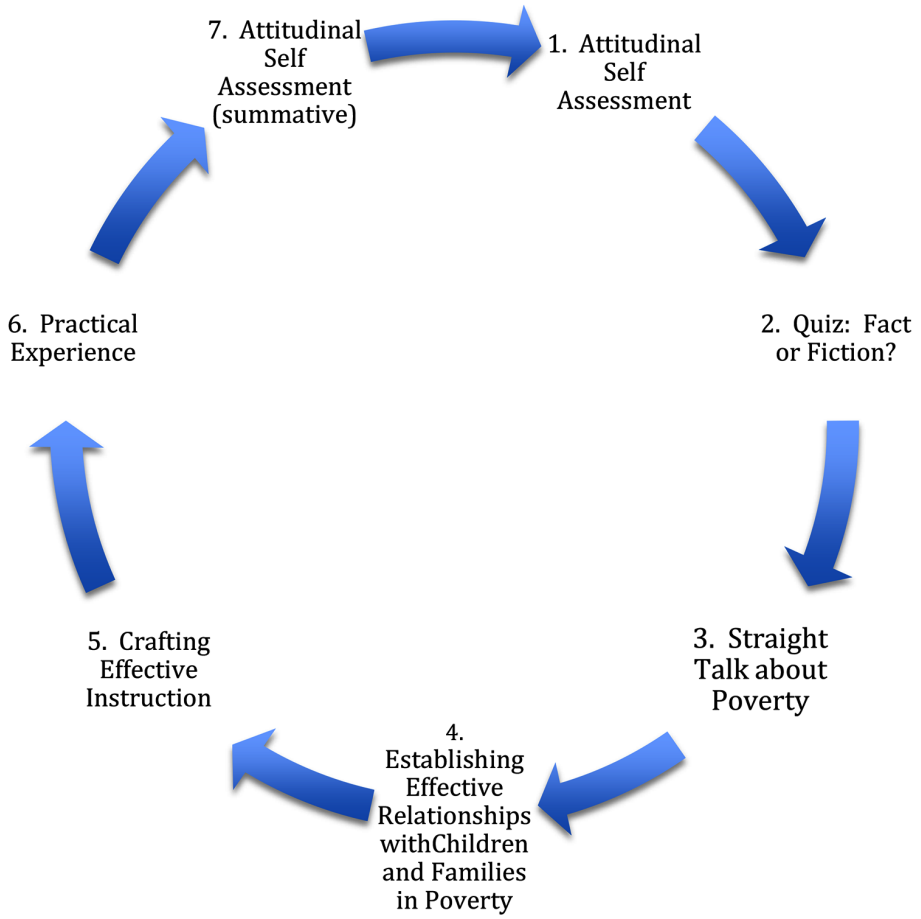
The second major implication for classroom practice included in this model of educating poor children is for emotional engagement. This component is somewhat related to the need for cognitive supports because research has shown that children from poverty often have lived experiences that change the structure and function of their brain, as well as the way they may attend to information. Lower SES children tend to pay as much attention to irrelevant information as they do to pertinent information (D'Angiulli, Herdman, Stapells, and Hertzman, 2008). Additionally, the chronic stress in their lives tends to make their emotional memories more salient than content knowledge learned in school (Schibli & D'Angiulli, 2011). In much the same way as the structure and function of the brain are impacted in regard to working memory and executive function, chronic stress from poverty can also cause "changes in the emotional centers and circuitry of the brain which may result in higher emotional reactivity" (Schibli & D'Angiulli, 2011). All of this can be competing information for a child trying to learn in school. One way a teacher may attempt to command the benefits of emotional engagement in a classroom is to make instruction meaningful, engaging, and fun for the students. Opportunities for choices, reflection, inclusion of the arts

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the curriculum, and highly engaging performance or authentic assessments are all ways to emotionally engage a child in the learning process. These are good instructional strategies for all students, but they are especially helpful for a child who may benefit from an attention to the emotional aspect of learning. Turning the high propensity for emotion from a chronically stressed child from a negative situation into a positive learning experience can only benefit the child.

The third implication for classroom practice in this model is the use of social learning opportunities. The concept of a theory of social learning was first espoused by Albert Bandura in 1977. His Social Learning Theory later became known as Social Cognitive Theory as he began to emphasize the role of cognitive factors such as attention and memory in his theory. Bandura's theory posits that much of what we learn is learned through observation and modeling. We observe others' behaviors and attitudes and then model those same behaviors, particularly if we see the person who is being observed rewarded in some way for their particular behavior. Social learning opportunities for students then, would include opportunities not only for observation and modeling, but for hands-on and creative ways of engaging the students in instructional opportunities such as cooperative learning groups, teams, and even mentors or buddies.

Finally, the fourth implication of this model for classroom practice is the need for positive relationships in teacher-student interactions as well as student-student interactions. The classroom climate and the establishment of a positive learning environment is perhaps the single most important piece to the foundation of a classroom. For children of poverty, this is even more important for them to have both positive self-expectations as well as positive affirmations from both teachers and peers. The quality of the teacher has been shown to be the most important factor in students' academic success. Teacher behaviors and attitudes are a large part of that.



The next and final section of this chapter discusses a suggestion for a program of professional development that can be used in public schools as well as in teacher preparation programs to prepare teachers to work with children of poverty. This professional development program: a) helps the teacher determine their own personal lens through which they view children of poverty, b) describes the specific academic, social, and emotional needs of low-income children; c) helps increase the academic gains it is possible for low-income children to achieve by describing tangible ways to address these needs in the classroom; and, d) focuses on the importance of practical experiences to solidify the learning experienced in the program.

A Program of Professional Development and Teacher Education for a New Generation of Teachers Working With Children of Poverty

This professional development program for those who will serve children in poverty involves a cyclic approach with self-assessment as the initiation point, and a reprise of self-assessment as the termination point. As much of the literature cited here has pointed out, it is essential for educators to examine their own experiences, beliefs and potential biases in an honest and meaningful way as the foundation for designing effective relationships with, and instruction for, low-income students. The starting and ending points are the same irrespective of career position. It is identical for those who are teacher candidates and for those who are veteran teachers. Since the deficit perspective that we have described may play a role in teacher beliefs about the poor, particularly in the case of widely disseminated training such as that of Ruby Payne, it is critical to begin with a self assessment of already-held beliefs and perspectives. Consequently, this cycle of professional development places considerable emphasis on a self-assessment exercise as it works participants through the program. See Figure 2.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Cycle of professional development

This model of professional development is a seven-phase process in which teacher attitudes and beliefs are examined, commonly believed myths about poverty are exposed, factual information is shared, types of poverty are analyzed, socio-emotional aspects of effective teaching are considered, effective teaching strategies are studied, and participants are given an opportunity to practice new attitudes and methods in a virtual practicum. Finally, the self-assessment is repeated as a means of measuring attitudinal changes and as a basis for professional reflection. Through a series of guiding documents, participants create a mini-portfolio they can refer to in future practice.

Phase One: Attitudinal Self-Assessment. Phase One involves taking a critical look at one's personal belief system with respect to children and families in poverty, and examining how those belief systems evolved. With growing numbers of poor children entering public schools, many teachers have had experiences with low income students, and many teachers have been influenced by media reports, their own environments, professional discourse, and informal ways in which attitudes about the poor can develop. While teacher candidates may not have direct experiences as yet with these students, they are just as likely to be persuaded to adopt unfounded beliefs from other sources.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

We recommend Beegle's (2012) thought-provoking questions that delve into the heart of these beliefs and their origins. Giving each participant an opportunity to consider these questions, answer them and then share perceptions with others can be a powerful beginning for changing the ways in which teachers perceive low-income children and families. We invite them to jot down answers to each and then share them with others in small groups. Specifically Beegle poses the following:

- What do you believe causes poverty?
- Where do your beliefs come from?
- Were they passed down from your parents?
- Did you learn them from your community?
- Do you have your own experience with poverty?
- How are your experiences and exposure to opportunities, while growing up, different than the students and families in poverty?
- Are you armed with relevant facts about poverty?
- Are you able to suspend judgment and understand people are making the best decisions possible from their perspective?
- Are you willing to assist students and families who may believe and respond differently than you?

Phase Two: Quiz – Fact or Fiction? In Phase Two, we move from inviting participants to examine their current beliefs and the origins of those beliefs, to assessing how much information and misinformation they currently possess about poverty. Beegle (2012) alleges that most people get their information from television and newspapers, and that colleges confer degrees on teacher candidates who do not understand how our current understanding of poverty has developed. Dudley-Marling (2007) points out that even those who have studied poverty are likely to be misled by studies such as that of Hart and Risley (1995) who examined a group of only six black welfare families, and, therefore suffered from ethnographic bias and insufficient data. Further, he notes that Payne's offerings reflect the worst stereotypes about the poor that have existed for generations.

In the quiz (Appendix A), we ask participants to respond to eight true/false items that characterize conditions a teacher might encounter in work with low-income students and families. Each quiz item reflects an accurate or inaccurate statement, derived from actual data and from teacher practices that have been effective with students in poverty. In addition to evaluating each item for veracity, participants are asked to provide a rationale or evidence for why they answered as they did. As a final open-ended feature, we ask those who got some of the answers wrong to express their reaction to being disabused of a misperception. On those occasions that someone gets the answers all correct, we ask them to provide information on how they learned what they needed to get them right.

Phase 3: Straight Talk about Poverty. In this stage, we present the participants with accurate factual information about the challenges children from poverty experience as well as the assets or strengths they may possess. We discuss the types of poverty experienced and how these types of poverty may impact learners in their classroom. Additionally, we divide participants into small groups with the assignment to read one of several articles relating to myths associated with poverty, including Gorski (2008), Irizzary (2009), and Beegle (2012). We have chosen these because they are both succinct and comprehensive in their purpose of debunking misinformation about poverty; however, many other existing and emerging

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

resources would prove equally appropriate and could easily be substituted. Conversation ensues regarding the substance of the articles, and then each group shares their findings with the larger audience, with an emphasis on what beliefs they may have held at the outset of the exercise versus what they have learned from their reading. A personal reflection follows (Appendix C) in which teachers and candidates are encouraged to consider how new information will shape their beliefs and behaviors.

Phase 4: Establishing Effective Relationships with Children and Families in Poverty. In Phase 4, we redistribute the membership of the groups established in Phase 3, and ask participants to read and consider the Johnson (2013) article in which six effective practices for working with low-income children and families are showcased. Again, teachers and candidates are asked to discuss what they have learned in the reading, and then consider how they can connect with, and validate, low-income children and families. They follow this discussion with sharing ideas about agencies and services that can benefit poor children and families, and create an action plan to learn more about how to access needed services through an exercise guided by the document in Appendix D.

Phase 5: Crafting Effective Instruction. In this section, we share the CESPR model and discuss the four components that form its framework. The participants learn how to address the unique cognitive, social, and emotional, needs of their students as well as the importance of establishing positive relationships. We ask participants to build on this new knowledge as well as information from prior phases to develop some general strategies that they believe could make their professional practice with children in poverty more effective. In particular, they are asked to compare and contrast their current instructional strategies with new ones that could be more effective with low-income students by remaining in their groups, but completing the guided exercise in Appendix E personally. Following the recording of their ideas and plans, they are asked to share with group members, and then distill a list of changes that the group endorses.

Phase 6: Practical Experience. This phase may be implemented differently depending on the audience of participants. For preservice teachers, it will be of critical importance that a partnership between the public schools and universities be established so that pre-service teachers may have sustained involvement in a classroom or school of high poverty students. These practical experiences in the classroom ideally should be supervised by the professor and supported by university coursework with time and structured opportunities for reflection to allow the pre-service teachers to process what they are learning.

If this program is being offered as professional development for practicing teachers, participants may be asked to privately consider students in their own classrooms as they move through the program. In this last phase, they are also asked to consider several student biographies, and then develop specific instructional strategies for the low-income students identified. These student biographies can take the form of video presentations or written narratives, depending on the format and available facilities of the gathering. Once again, group membership is rotated, and teachers and candidates complete a guided exercise in which they record what they have learned from a student biography, how they would analyze the needs of that student, and how they believe they could respond by building effective relationships and instruction (Appendix F). Following completion, group members are asked to share their ideas.

Phase 7: Attitudinal Self-Assessment. The conclusion of this professional development cycle encourages participants to summarize and process the content and experience provided, and to synthesize how these elements can work together to impact future beliefs and practice. Finally, teachers and candidates are asked to develop a concise statement they might share with other educators whose belief systems appear to include those common myths exposed during the training.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This chapter has focused on what is known and has been shared to date about teaching children from poverty with the intent of describing a professional development program that may potentially accomplish three main goals; a) begin to undo the decades of harm done by deficit views of children and families of poverty, 2) offer teachers accurate factual information about poverty and its effects on students, and, 3) offer teachers concrete, tangible ways of increasing the academic achievement of their students living in poverty. It is time for a perspective that offers a realistic view of the challenges children in poverty face, yet also breaks down deficit view stereotypes. The authors believe this new model offers such a perspective.

APPENDIX

Phase 1 Quiz©

Table 1.

Statement	True or False? (T or F)	What Evidence Supports This View?
1. Teachers must modify standards for students in poverty, so that they can work at a lower, more appropriate level.		
2. Teachers need to maintain a business like attitude with low-income students so that order in the classroom can be preserved.		
3. Poor students' families do not value education as much as middle class families do.		
4. Children in poverty can come from all races, but the majority of them are black.		
5. Poor children are more likely to go to schools that are poorly equipped and have fewer qualified teachers.		
6. There is a "culture of poverty" that defines the shortcomings poor people share.		
7. Poor people are more likely to abuse drugs than other socioeconomic groups.		
8. People are in poverty because they don't want to work.

Phase 2 Answer Key©

Did you get any quiz items wrong? What is your reaction to that?

If you got them all right, please share how you came to possess the knowledge that helped you.

Phase 3: Straight Talk about Poverty©

See Table 3.

Table 3.

Prompt: In this section, you have been asked to consider your own beliefs versus some compelling information about common myths associated with poverty. Select one aspect of this consideration in which you feel your ideas were unfounded. Reflect about how this concept may have impacted your professional practice, and what you can as a teacher to respond to the new information.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4.

Prompt: In this section we have considered how to connect with poor children and families as well as how to assist in locating and accessing appropriate services. What are the agencies and/or services you know about, or have learned about in our discussion that could be of help in your practice? What more do you need to find out in order to help families to get the services they need? 1. Agency or Service Name & Location: What more do you need to know in order to make the connection for families? 2. Agency or Service Name & Location: What more do you need to know in order to make the connection for families? 3. Agency or Service Name & Location: What more do you need to know in order to make the connection for families? 4. What other ideas did your group generate that you can add to this list?

Phase 4: Establishing Effective Relationships with Children and Families in Poverty©

See Table 4.

Phase 5: Crafting Effective Instruction©

In this professional development, we have been asked to consider what many have found to be effective strategies for working with low-income students. In this section, consider what you currently do as well as modifications you might make to improve your practice.

Table 5.

How do you currently make connections with and validate students?	How might you modify current practices to be more effective?
How do you currently learn about a student's "fund of knowledge", and incorporate this in instruction?	How might you modify current practices to be more effective?
How do you currently involve social learning into instruction?	How might you modify current practices to be more effective?
How do you currently assess the strengths and challenges a student possesses?	How might you modify current practices to build more effectively on this assessment?

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6.

Student's Name: Grade Level: What have you learned about the student's environment that will help you plan effective instruction? (Environmental Influences) What will you need to do to forge a trusting relationship with this student/family? (Emotional Engagement) What kind of poverty would apply in this case? What strengths does this student possess? How can you use those strengths to plan effective instruction? What challenges does this student face? What cognitive supports will this student need? How can you use this knowledge to plan effective instruction? What have you been able to learn about the student's interests? How can you use this knowledge to plan effective instruction, or, if your knowledge is insufficient, how can you expand it? How can you incorporate social learning into your plans for this student? What assessment techniques would be appropriate for this student? How can you reach out to this family with information about appropriate services? What would these services be? What would you want other professionals to know about working effectively with this student/family?

Phase 6: A Virtual Practicum

You have seen or read a student biography in which you learned about a low-income child's background and history. Take the information you have gathered to develop an action plan for this student's instruction, drawing on the perspectives you have encountered during this professional development.

Phase 7: Concluding Self-Assessment©

Table 7.

In this section we will put together a reflection that addresses how our views and ideas about students and families in poverty may have changed over the course of this professional development event. If you feel as though your views have changed, describe those changes here, and reflect upon how they may impact your future practice. What do you believe is the single biggest change in your way of thinking? What do you feel you still need to know about poverty and effective teaching? What can you say to other educators who espouse a strictly deficit view of children in poverty?

Chapter 14
Measuring the Poverty of Elderly People With Needs Analysis in Turkey

Emine Özmete
Ankara University, Turkey

ABSTRACT

This study aimed to analyze the economic, social, and cultural needs of elderly people to determine the poverty thereof in Ankara (the capital city of Turkey). The economic, social, and cultural needs of individuals, which are among the indicators taken into consideration by United Nations Development Programme (UNDP) in measurement of human poverty index, were subject to research in measurement of poverty of elderly people. Face-to-face surveys were conducted with individuals over 65 years of age in the study, with 2.522 surveys qualified for evaluation. It was seen that the majority of elderly people were covered by social security. The elderly people reported their health to be good. They stated satisfaction regarding interindividual relationships with regard to social needs. However, it was concluded that the income of elderly people was not sufficient, and that they could not sufficiently afford electrical power and water invoices, medicine, food, and clothing expenses.

INTRODUCTION

In the old age, retirement results in a decrease in income, loss of usual social status, and an alteration in the relations and interactions. Besides, overlapping of losses that are manifest with such original problems as cognitive and physical recession, decline in productive role, change in social position, decrease in interpersonal support, and loss of health that emerge in this period results in poverty. As a notion, which is difficult to define and to determine the limits thereof, poverty has various aspects. Poverty is reflected to the lives of elderly people primarily "in the form of lack of income and productive resources sufficient to ensure sustainable livelihoods," along with "hunger and malnutrition; ill health; limited or lack of access to education and other basic services; increased morbidity and mortality from illness; homelessness and inadequate housing; unsafe environments; and social discrimination and exclusion. It is also characterized by a lack of participation in decision-making and in civil, social and cultural life"

(World Summit for Social Development Programme of Action, UN). This study was inspired by both the limited number of scientific studies on poverty of elderly people, and by the fact that having foreseen the number of individuals over 65 years of age, who constitute the dependent population, would also increase in Turkey as it was the case throughout the world, the national and international institutions and organizations focused on initiatives to ensure healthy and successful aging by determining economic, social, and cultural needs of elderly people.

According to the Address Based Population Registration System (ADNKS) by the Turkish Statistical Institute (TUIK), the total population of Turkey is 76 million 667 thousand people (2013), composed of 50.2% (n=38.473.360) male, and 49.8% (n=38.194.504) female citizens. The median age in Turkey, which was 30.1 in 2012, increased to 30.4 in 2013. The median age of men and women were 29.8, and 31 respectively. The ratio of elderly people aging65 years and over was 7.3% in 2011 (n=5.490.715). The same ratio was 7.5%in 2012, and increased to 7.7% in 2013. Pursuant to the population projections, it is predicted that this ratio will increase to 10.2% in 2023, 20.8% in 2050, and 27.7% in 2075. In line with these ratios it can be asserted that Turkey has completed the mature population period and passed to elderly population period.

In this section, the level of ability of elderly people to meet economic, social, and cultural needs, which is among the indicators taken into consideration by United Nations Development Programme (UNDP) in measurement of human poverty index, will be analyzed. The scope of economic, social, and cultural needs can be explained as follows:

In the scope of the *economic needs*, the level of ability of elderly people to meet basic needs and life standards thereof will be determined so as to obtain information and measure awareness with regard to having economic/material resources along with their use and control.

In the scope of the *social needs*, data will be collected concerning the quality of relations and communication of elderly individuals with other family members, their permanent network of relations, also including friends, neighbors, and relatives, their interaction with this network of relations, intergeneration solidarity, social support systems, and confidence.

Finally, educational background, cultural values, habits, and whether the totality of the foregoing reflected concretely and objectively in the form of such documentation as diplomas etc., certain indicators regarding their lives in connection with the culture inherited from the family (age of marriage, last school of graduation etc.), social participation, and the ways of recreation will be determined in the scope of the *cultural needs*.

BACKGROUND

Having existed since the day human beings started to live together, poverty has been subject to a more intense debate especially after growth stalled in developed countries, people steered by the market, and increase underemployment during the foregoing process. Poverty at global and international level has macro reasons along with micro reasons specific to individual, family, and society (Oktik, 2008). The most important society-specific reason is inequality due to income distribution in a given country. Income differences between individuals, regions, and families living in the same city are considered the most important reason of poverty. Economic crises, inflation, and accordingly decrease in the purchasing power of individuals, difficulty or failure in meeting basic needs results in the fact that low-income individuals and families feel poverty deeply (Jehoel-Gijsbers & Vrooman, 2007). However, meeting

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

basic needs at a sufficient level in accordance with the geographical location, the current conditions, and the standards of the social environment based on one's own opportunities are considered the purpose and a condition to subsist for each social individual. Meeting basic needs in accordance with the current condition and the standard of the society is a must for individuals to sustain a humane life (Yunus, 1999). At this point, in its simplest form, poverty is defined as the status of the inability to meet one's basic needs for a humane life by one's own means. Nevertheless, it is argued that having focused only on meeting basic needs, this definition is not sufficient to explain poverty. This is because of the fact that poverty also brings deprivation (Devicienti & Poggi, 2007; Özmete, 2011). Therefore there emerge two different approaches with regard to the definition of poverty adopted especially by social scientists: Absolute poverty and relative poverty.

"Absolute poverty is a condition characterized by severe deprivation of basic human needs, including food, safe drinking water, sanitation facilities, health, shelter, education and information" (World Summit for Social Development Programme of Action, UN). Absolute poverty definition is based on the basic conditions that should be sustained in order to subsist, i.e. to reinforce a physically healthy existence. In other words absolute poverty is defined as having little or no income in kind or in cash necessary for individual or household members to meet minimum basic needs to survive. In most developing countries, caloric intake and minimum calorie thresholds are used to assess hunger and nutrition and to construct poverty lines.

Relative poverty; each household's income, adjusted for family size, is compared to median income (The median is the "middle" income: half of people have more than the median and half have less). Those with less than 60 per cent of median income are classified as poor. This 'poverty line' is the agreed international measure used throughout the European Union (Zastrow, 2008). Absolute poverty is the complete lack of resources to sustain life, while relative poverty refers to the inadequate lack of income when compared to the average standards living. As such, relative poverty implies that the individual has the ability to sustain his or her basic needs, but may lack the resources to engage in various social activities. The World Development Report on Poverty by the World Bank, published in 1990, defined poverty as "the inability to attain a minimal standard of living" and considered poverty as the relation of a part of individuals in the society with life standard (World Bank, 1990, pp. 24-39). World Bank defines poverty as the inability of individuals and households to attain even the lowest life standards (World Bank, 2000).

In Turkey, Article 4 of the Regulation on Assistance in Cash and in Kind, by the Ministry of Family and Social Policies defined poverty as "the status of deprivation of insufficiency of income, riches, or revenue necessary to sustain one's own life, one's spouse and children, and parents, which the individual is obliged to look after, at a minimum level according to the current life conditions" (Ministry of Family and Social Policies). There are difficulties with explaining both the absolute and relative poverty. This is because of the fact that there are determinants especially of relative poverty, which varies from one individual to another, one family to another and one society to another. Standard considered necessary needs in a society may be perceived as luxury in another society. For instance, city water supply (usable clean water), regular vegetable and fruit consumption are considered basic need for a healthy life and those who cannot access the foregoing are defined as impoverished in the developed countries. However in many underdeveloped or developing countries, these details are not considered standards and poverty is not determined with respect to the existence or non-existence thereof. This is because of the fact that, while the societies develop and their life standards rise, the relative poverty understanding is also subject to change. Despite at the beginning of the industrialization process such items as refrigerators, washing

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

machines, and telephones were perceived as luxury goods, today they are seen as necessities to actively engage with the life especially in the developed societies (Maxwell, 1999; Soyak, 2004; Şahin, 2010).

The increasing life expectancy phenomenon forces the people to have enough money to meet their needs in old age. Therefore the finance matter is vital for the elderly. With increasing life expectancy, people have to seek continuing wealth throughout their extended old age (DeVaney, 1995; Hogarth, 1991). This is because living longer will increase the chances of experiencing poverty and outliving available income and assets. Changes in work, health status, independence to dependence, and all these changes cannot be carried out without money. Thus, finance is vital for this group of older persons. The term "finance" refers to, how an individual manage his/her personal resources. It does mean that one knows what his financial resources are, and understand how the resources can best manage for him now and in the future. As elderly, individuals seek to improve the management of their economic resources and develop plans for strengthening their financial position in the future; a logical first step is to determine their present financial position. Financial status of elderly is able to picture the financial situations of an individual, how wealthy are they? How much money do they make? How much are their spending? What are their spending it on? To survive financially, they have to know whole of financial pictures. Financial behavior refers to the process people use in managing their financial resources to achieve financial success in the areas of retirement plans, financial planning, credit, and money management. Older persons are unable to sustain themselves and keep up with inflationary costs without depending on children and other family members. At the same time in older age some cultural, social and economic factors affect financial behavior of elderly people (Parsa, 2008).

The following items provide an overview of the different types of vulnerabilities faced by individuals at different points in older age, focusing on employment-related risks and vulnerabilities in terms of financial behavior (Bird, 2007).

- Loss of income when work is lost due to age discrimination frailty/illness etc.
- Work in informal sector throughout life means that there is no contributory pension provision.
- Poor health in later life due to poor nutrition, multiple childbirth, poor working environment and lack of health care.
- Continuing to work to support self and dependents in low-income earning and often physically disabled jobs.
- Widow's loss of access to late husband's family resources.
- Increased childcare responsibilities where middle age adults have been lost to HIV and AIDS leaving dependent children in the care of grandparents.
- Increased likelihood of age-related disability and chronic illness.

The argumentation above suggest that absolute poverty is not sufficient to define poverty, that relative deprivation should also be explained, and that poverty should be measured by more comprehensive components thereof. The generally used components of poverty are:

1. Income and consumption-based measures.

These could be any one or all of the following variables: Household or individual incomes and/or consumption; in total and/or per capita terms; unweighted and/or normalized for household demographics (equivalence scale adjusted)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. 'Human development' linked measures: The more commonly used indicators in this class relate to:
   a. **Health:** Life Expectancy; other mortality based indicators (age-specific mortality such as infant and child mortality, maternal mortality etc.); morbidity based indicators (such as Disability Adjusted Life Expectancy, incidence of chronic ailments etc.); health infrastructure based indicators (doctors/hospitals per 100,000 populations by location etc.).
   b. **Education:** Literacy rates, school enrolment ratio, and related indicators
   c. **Wages and Income-Earning Opportunities:** Household and individual incomes, nature and extent of labour market participation etc.
   d. **Infrastructure:** Community and household based; Physical (road, waterways, telecommunication networks per capita or per unit of land area); environmental (air and water pollution levels, availability of safe drinking water and sanitation, forest cover etc.); social (social capital, kinship network etc.), institutional (legal system, governance structures etc.) (Mukhopadyay & Shambhu, 2011).

Numerous studies analyzed poverty among the elderly (see Engelhardt & Gruber, 2004, Weir, Willis, & Sevak, 2004, McGarry & Schoeni, 2005, and Zaidi et al., 2006, for only a few recent examples). Most of these studies make use of income or expenditure data at the household level to count the number of individuals in poverty. As Deaton and Paxson (1998) indicate, this transition from households to individuals requires assumptions about the intra-household allocation of resources, about differences in needs and about the importance of economies of scale. Most of the analyses of elderly poverty ignore the issue of the intra-household distribution of resources by assuming that all individuals in a household are equally well off. The literature on intra-household allocation, though, convincingly demonstrated that resources are not equally shared within households (Cherchye, De Rock, & Vermeulen, 2008).

Taking into consideration measurements by income and consumption, one of the indicators to explain poverty in a society is without a doubt the income distribution. The issue of how to share the created values is related to distribution of equality, social justice, and freedom in society (Soyak, 2004). Despite it is observed that income distribution is more equitable and the range of inequality is narrower in governing processes, which put importance on social welfare and social justice, such factors as the unfair income distribution, decrease in national product per capita, consecutive economic crises, and failure of social and economic policies made poverty one of the prioritized issues both in the world and in Turkey (Buğra et al., 2003). The Human Development Report 2010 underlines the gap between women and men and the multidimensional poverty in South Asia and Africa based on long-term human development index. UNDP Coordinator Helen Clark stated on the basis of human development reports having been prepared each year since 1970 that; "There is much that countries can do to improve the quality of people's lives even under adverse circumstances. Many countries have made great gains in health and education despite only modest growth in income. Improvements are never automatic—they require political will, courageous leadership and the continuing commitment of the international community." (UNDP, 2010) Despite the improvements above, the report emphasized that about 1.75 billion people in the 104 countries were living in multidimensional poverty and that 1.44 billion people had to live on $1.25 a day or less (UNDP, 2010).

In Turkey the poverty rate was found to be 18.08% based on the poverty survey by TUIK in 2009. According to 2009 data, 0.48% of individuals, i.e. 339 thousand people, live under the hunger threshold based only on food expenses, and 18.8%, i.e. 12 million 751 thousand, live under poverty threshold based

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

on food and non-food expenses. It was estimated that the rate of individuals living under the poverty threshold as defined to be $2.15 a day was 0.22%, and the rate of impoverished individuals is 4.35%, provided that the poverty threshold was defined to be $4.3. While the poverty rate in rural population increased from 34.62% in 2008 to 38.69% in 2009, the same rate in urban population decreased from 9.38% to 8.86% in the same period (TUIK, 2011a).

Here an important emphasis should be placed on the deprivations arising from poverty. Most commentators consider that it is when material and social deprivation arise from lack of financial resources that we observe poverty. 'Deprivation' implies that people have unmet needs. 'Needs' must be defined and agreed upon in some way, and as will be seen throughout this report, this is an element of poverty measurement that is controversial and often overlooked. 'Deprivation' too must be defined and measured – to what extent must a need remain unfulfilled to comprise 'deprivation'? For example we may all agree that food is a basic human need, but would a person living in the country on a diet of only bread and water, or just chick peas and rice, be deprived? Deprivation is a continuum it is the combination of all resources that determines whether a person's needs are fulfilled or whether they are deprived. One type of resource (eg help from adult children, or excellent money management skills) may substitute for lack of another (eg low income). Two people might have the same amount of money (income, assets and access to credit), and the same amount of money over time, but through differences in for example personal histories, knowledge and skills, family support, social or charitable support networks, ability to access help from the state, housing conditions or local costs of living, one might be materially and socially deprived and the other not (Price, 2008).

Taking into consideration the measurements regarding the human development, the report published by the General Directorate on the Status of Women (2008) provide significant data. Accordingly it was stated that UNDP measured human poverty in developing countries based on three criteria: Life expectancy at birth, depriving of a long life, is considered the first indication of poverty. In UNDP measurements, the reference life expectancy at birth value is 40 years, and a value below that is considered an element of human poverty. Illiteracy, or depriving of educational opportunities, constitutes the second indicator of human poverty index. The illiteracy rate among adults is another criterion of human poverty in measurements. Economic and social opportunities, i.e. deprivation of individual of economic and social means are other indicators of human poverty index (General Directorate on the Status of Women /KSGM, 2008). UNDP explains the level of having economic and social means in terms of the percentage of population without access to healthy drinking water, percentage of population without access to basic healthcare, and percentage of undernourished population under 5 years of age. "Human poverty index value" is calculated by an average of life expectancy, education, and economic and social means. In accordance therewith, In Turkey the life expectancy of citizens less than 40 years is 5.7% (2005-2010), percentage of illiterate population over 15 years of age is 11.3% (1999-2007), percentage of population without access to clean water supply is 3% (2006), and the percentage of children under 5 years of age, who are below normal weight is 4% (2000-2006) (Human Development Report/HDR, 2009). According to a research by the World Bank in 2001, especially the rural single parent families, with the spouse, on whose income the family relied to live on, was dead, multi-child families (especially those having girl children) with disabled or dead (during military service) spouse were under threat of extreme poverty. Other groups under risk or fit to category of in need of care included those recently migrated to cities and lived in squatter settlements and the elderly people without any social security (World Bank, 2000).

On the other hand, poverty affects women more than men, and aggravates the already existed gender problems. Despite legal and institutional protection, sexual inequality cannot be overcome and that

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

women have gradually become the face of the poverty in the world. The reason for the foregoing is that women are employed in low status and low-wage jobs and that the free work they conduct at home as family labor is not included in the national income calculations (Daly, 1992; Fukuda-Parr, 1999; Bora, 2007). In order to measure the sexual inequality in terms of human development, UNDP developed the Gender Related Development Index based on three basic criteria: (i) average life expectancy, (ii) education (literacy in men and women, schooling rates in men and women), and (iii) average income level (share of women and men in the income). The aim of this index is primarily to reveal the sexual inequality in terms of human poverty along with human development. According to the said index, such countries as Canada, Norway, Australia, USA, Iceland, Switzerland, and Belgium rank the top among 143 countries in terms of sexual inequality. In these countries the sexual inequality is far lower compared to others in terms of human development. The countries with the worse sexual inequality rates are listed as Niger, Burkina Faso, and Ethiopia. Turkey ranks 68th in the list comprised of 143 countries (UNDP, 2011).

It is known that poverty is a result of income inequality. The fact that a large portion of the added value goes to a few people as a result of unequal distribution of income both in domestic and international scale, accounts for the inevitable poverty of those who can have only a quite low portion of the said value added. In fact, welfare in terms of abundance, development, and freedom, and extreme poverty and the phenomena of deprivation as a result thereof coexist today (Maxwell, 1999). The United Nations National Security Strategy Statement emphasized the prevention of poverty and that wealth was a right that should be accessed by everyone, through the statement that "a world, in which some live in comfort and prosperity, while others have to live on less than $2 a day is neither fair, nor balanced. It is an ethical responsibility to have the impoverished people in the world benefited from the developments and opportunities' (UNDP, 2011).

Elderly people constitute a group, which is closely affected by economic developments at micro and macro levels. Changes in money/income resources of elderly people also result in changes in their life styles (Hablemitoğlu & Özmete, 2010; Turaman, 2007). Economic aging underscores these changes in the life of the individual. Especially retirement results in a decrease in income, loss of usual social status, and change in relations and interactions (Gönen & Hablemitoğlu, 1997). On the other hand, overlapping of losses that are manifest with such original problems as cognitive and physical recession, decline in productive role, change in social position, decrease in interpersonal support, and loss of health that emerge in this period results in poverty (Turaman, 2007). As a notion, which is difficult to define and to determine the limits thereof, poverty has various aspects. Poverty is reflected to the lives of elderly people primarily "in the form of lack of income and productive resources sufficient to ensure sustainable livelihoods," along with "hunger and malnutrition; ill health; limited or lack of access to education and other basic services; increased morbidity and mortality from illness; homelessness and inadequate housing; unsafe environments; and social discrimination and exclusion. It is also characterized by a lack of participation in decision-making and in civil, social and cultural life" (World Summit for Social Development Programme of Action, UN). This leads the way for massive poverty in many developing countries, and as poverty compared to the prosperous part of the society in developed countries. Income poverty is measured by the minimum income necessary to sustain one's life and means the lack of purchasing power. Income needed to buy a certain amount of food is defined as "poverty threshold." UNDP developed a new criterion of poverty, namely human poverty. Human poverty means that some individuals lack the opportunities to survive a humane life (UNDP, 2011). At this point, the need for measuring the poverty of elderly people becomes more prominent in order to make plans and conduct programs aiming prevention of elderly people.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The poverty report by the World Bank (2005) examined the rates of poverty by age in Turkey, where the percentage of elderly people aging 65 years and above was 7% (World Bank, 2005). While the dependency rate of elderly people was 6.8% in 1990, it increased to 8.8% in 2010 (European Commission, 2012). The elderly people think that they have become burdens for others due to their retirement, sufficient economic conditions, and decrease in productivity, which translates into a major psychological pressure for them. Especially the old men would describe themselves as "the old and tired workers" of life (Gratton, 1996). Furthermore, for those elderly people, who are not covered with any social security and live alone, this situation results in their isolation from the society, or even "dying silently" without being noticed by anybody.

"To revise the absolute poverty indicators, based on consumption expenditures published since 2002, Turkish Statistical Institution has started evaluation studies in collaboration with local and international experts in order to reveal the socio-economic situation of Turkey and enable the international comparisons. Within this scope; studies on feasible data sources and new estimation methods and works on calculation of new indicators are ongoing. Until the end up these studies, poverty rates in terms of dollars per day according to personal purchasing parity" (TurkStat Poverty Study, 2010). The TUIK poverty study 2012 results indicated that the poverty lines in terms of dollars per person/day according to personal purchasing parity were decreased. "Based on the $2.15-a-day poverty lines in current personal purchasing parity, percentage of poor in 2009 is 0.22% while it is 0.21% in 2010. Based on the $4.3-a-day poverty lines in current personal purchasing parity, percentage of poor in 2009 is 4.35% and it decreased to 3.66% in 2010." "Based on the $4.3-a-day poverty lines in current PPPs, percentage of poor in rural areas in 2009 is 11.92% and it decreases to 9.61% in 2010. Based on the $4.3-a-day poverty lines in current PPPs, percentage of poor in urban areas in 2009 is 0.96% while it is 0.97% in 2010" (TurkStat Poverty Study, 2010).

METHOD

The study was conducted in Ankara. According to the Address Based Population Registration System (ADNKS) by the Turkish Statistical Institute, the total population of Ankara is 4,550,662, with 2,268,598 male and 2,282,064 female residents.4,762,116 persons live in the Centrum, whereas 128,777 live in town and villages. According to TUIK (2011b) data 191,864 persons migrated to Ankara, and 137,385 migrated out of Ankara. The median age in Ankara is 34.2, and the same is 33.3 for men, and 35.2 for women. The numbers of married men and women in Ankara is 1,229,058 and 1,228,492 respectively (TUIK, 2011b).

Three-fourth of Ankara population is employed in the service sector, which has the largest share in the gross product of the city. The fact that service sector developed to such an extent can be attributed to the lack industry large enough to employ migrated population. Ankara holds 9% of the gross national product of Turkey. 12% of the tax income of the country and 12.3% of budget income is collected in Ankara; whereas the share of the city in the country budget is only 6.4%. In general, 60% of land in Ankara is used for agricultural purposes. Livestock sector gradually lose its previously important place in the city economy.

The study population is comprised of a total of 276,608 elderly individual aging between 65 and 89, living in the central districts of Ankara (Altındağ, Çankaya, Etimesgut, Keçiören, Mamak, Sincan, and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Yenimahalle). In this process, the number of elderly individuals to be enrolled in the study in the scope of the central districts of Ankara was forecasted to be 2380, taking into consideration a confidence level of 95%, and a confidence interval of 2%.

The data collection tool enabling to determine the poverty of elderly people in terms of social, economic, and cultural needs was prepared in the form of a questionnaire based on open-ended and multiple-choice items. The questionnaire form was comprised of three basic sections. The first section included items introduced with an aim to obtain data on the household, where the elderly people lived in. The second section included questions to obtain information about the elderly individuals, such as sex, age, and marital status etc., and questions regarding the residence. The third section is consisted of open-ended and multiple-choice items to determine to what degree the economic, social and cultural needs of the elderly people were met/not met. Therefore the third section was analyzed under three titles of:

1. Economic Needs
2. Social Needs
3. Cultural Needs.

The first subsection included open-ended and multiple-choice questions regarding the economic needs of the elderly people in relation to money and income. The second subsection included open-ended and multiple-choice questions to reveal the social needs in the context of relations and communications such as the level of elderly people's contentedness about their relations with household members, the frequency to meet with children, grandchildren, friends, and neighbors. The third subsection was designed with open-ended and multiple-choice questions that enable measurement of cultural needs such as reading books and newspapers, daily average TV watching duration, and level of interest in actual events and social issues.

Having been developed as a data collection tool for the study, the questionnaire was tested before its application to elderly individuals in order to determine probable mistakes, and be sure about its reliability and validity. In the scope of the tests the questionnaire was applied to 50 voluntary elderly individuals, within the scope of study population, picked up by simple random sampling method. Serving also as a preliminary application, the approximate time needed to fill in the form was also determined in the course thereof, and the questionnaire was revised upon the opinions of the elderly individuals.

Despite the fact that the study population was determined to include 2,380 elderly individuals at the onset of the study, in practice the questionnaire was applied on one-to-one basis to 2,527 elderly individuals, and 5 questionnaires were excluded due to incomplete and inaccurate filling of the forms. Therefore, a total of 2,522 elderly individuals were included in the scope of the study. The study data were transferred to computer environment via statistical package software (SPSS 20), where filtering and control of the data conducted in electronic media.

RESULTS

In the study hereof, which focused on the elderly poverty, and the analysis of economic, social, and cultural needs, the finding were categorized under below titles:

1. General Information on Elderly People

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. Information on the Residence of Elderly People
3. Self-perception of the Elderly People regarding Aging
4. Poverty Analysis by the Economic, Social, and Cultural Needs of Elderly People

General Information on Elderly People

The percentages of elderly men and women participated in the study were 69.9%, and 30.1%, respectively. The percentage of elderly people in 65-74, 75-84, and 85-94 age groups were 63%, 31.4%, and 5.6%, respectively. 64.5% of the elderly people were married, where 32.0% lost their spouses, and 1.8% was divorced. 68.5% of the elderly people were married for 26-51 years. It was seen that 87.6% had both civil and religious marriage, 97.1% had children, and 93% had grandchildren. It was observed that nearly half (49%) of the elderly people were graduated from a primary education institution, and 20.7% were illiterate. 95.2% of the elderly people were retired and currently not employed in any job. 91% of the elderly people were covered by Social Security. 90.9% of the elderly people considered their health "good."

Information on the Residence of Elderly People and the Inventory of Durables Therein

The majority (75.9%) of elderly people resided at apartment houses. 90.9% of elderly people held the property of their residence. The residences mostly (91.7%) had three-four rooms, and the elderly people had their won room (90.9%). The inventory of durables in the residences of elderly people was listed as below:

- 79.5% had a telephone in the residence;
- 99.2% had a television in the residence;
- 99.0% had a refrigerator in the residence;
- 95% had a washing machine in the residence;
- 71.9% had a computer in the residence;
- 94.9% had an air-conditioner in the residence;
- 65.6% had cell phones in the residence;
- 87.9% did not have a digital camera/camera in the residence;
- 86.9% did not have a video/DVD player in the residence;
- 78% were contented with the comfort of their residence in general.

Self-Perception of Elderly People Regarding Aging

For 63.8% of the elderly people, aging started at below 65 years of age. 57.6% of the elderly people enrolled in the scope of the study felt themselves aged. 79.9% were contented with their physical look. 74.9% of the elderly people did not consider staying at nursing homes. 96.4% of the elderly people consider education of girls as important. 84.6% of the elderly people did not think then that they could make money based on their skills. A great majority (97.1%) of the elderly people consider themselves as religiously faithful-.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Poverty Analysis by the Economic, Social, and Cultural Needs of Elderly People

This section below provides the findings regarding the poverty of elderly people in terms of economic, social, and cultural needs, respectively.

Results of Poverty Analysis by Economic Needs of Elderly People

- The rental price charged for 35.5% of the elderly people in the scope of the study was TL250 ($120) or less. Where the same was TL351-450 ($150-220) for 24%, TL251-350 ($120-150) for 19.2%, TL451-550 ($225-250) for 12.5%, TL551-650 ($275-320) for 3.1%, and TL651-750 ($320-375) for 2.2%.
- It was seen that 85.1% of the elderly people did not possess a car, where 14.6% had their own automobiles.
- It was examined whether the income of the elderly people was sufficient to readily afford necessary food needs for balanced nutrition. In accordance therewith, 51.9% of the elderly people had sufficient income, whereas 47.7% did not.
- It was seen that 52.3% of the elderly people had sufficient income to cover health expenses, such as for medical doctors and medicine, however 46.4% did not have sufficient income to meet health needs including doctors and medicine etc.
- Approximately half of the elderly people (49.8%) stated that their income was not sufficient to afford such needs as clothing, shoes etc., whereas the other half (49.4%) declared that their income was sufficient for the purpose thereof.
- Approximately half of the elderly people (53.5%) had sufficient income to readily pay the water, electricity, and telephone bills etc. However, 45.7% of the elderly people did not have sufficient income to pay water, electricity, and telephone bills etc.
- It was seen that 79.1% of the elderly people could not allocate sufficient budget for such activities as excursions and travels; however 17.6% of the elderly people could have allocated sufficient budget for such activities as excursions and travels. 3.3% of the elderly people declined to answer this question.
- Upon examination of whether the elderly people enrolled in the study ever lent assistance to any person or institution during the previous year, it was seen that 59.3% of the elderly people did not lend any assistance to any person or institution, whereas 39.7% lent assistance to some persons or institutions.
- The elderly people enrolled in the study were asked to evaluate their economic status. Accordingly, 51.7% evaluated the same as “fair,” 27.0% found their economic conditions as “poor,” and that only 20.8% of the elderly people evaluated their economic status as “good.”

Poverty Analysis by Social Needs of Elderly People

- It was found that 93.6% of the elderly people were contented with their relations with the household members residing with them. 2.7% were uncertain, 2% did not reply this question, and 1.7% was not contented with their relations with the household members.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- It was seen that 68.1% of the elderly people stated that their children consulted them while making a decision, whereas 30.9% said they were not consulted by their children, when they made decisions.
- In the context the satisfaction of social needs, the frequency of meeting of elderly people with children was examined. Accordingly, 77.8% of the elderly people stated they were meeting their children frequently, every day to once a week, where 20.7% said they were meeting with their children occasionally, once a month, or at festivals and holidays.
- The level of contentedness of elderly people of their relation with their children was assessed in the scope of social needs. It was seen that 99.3% of the elderly people living in Ankara were contented with their relations with their children, where 5.5% were not pleased thereof.
- In the scope of the study the whether the elderly people enrolled in the study lent social and economic assistance to their children was assessed. It was seen that slightly higher than half of the elderly people (54.1%) lent social and economic assistance to their children, where 44.3% did not /could not lend social and economic assistance to their children.
- It was seen that 68.4% of the elderly people frequently met their grandchildren (every day to one a week), where 29% met occasionally.
- In the scope of the study, whether the elderly people enrolled in the study take the care of their grandchildren for any reason was assessed in the context of satisfaction of social needs. It was understood that more than half of the elderly people (52.9%) did not have to take care of their grandchildren for any reason, and that 46.5% took care of their grandchildren.
- In the scope of the social needs, it was examined whether the children or grandchildren provided economic or social support to the elderly people. It was understood that 59.9% of the elderly people were provided with economic or social support by their children or grandchildren, where 38.7% did not receive any economic or social support from their children or grandchildren.
- It was found that 82.8% of the elderly people frequently met with their friends or neighbors, every day to once a week, where 12.5% of the elderly people occasionally met with their friends or neighbors.
- It was seen that 91.4% of the elderly people were contented with their relations with friends or neighbors, and that 5.5% were not contented with their relation with friends or neighbors, and that 3.1% did not reply the question.
- It was seen that majority of the elderly people (74.7%) paid occasional visits to their relatives. It was observed that the percentage of those elderly people paid frequent visits (every day to once a week) to their relatives (11.1%) was higher than that of those, who did not pay any visits to relatives (7.6%) and those, who did not have any relatives (5.1%).
- The status of greenery areas in the districts, where the elderly people enrolled in the study, was examined. Accordingly, the majority of elderly people (80.4%) stated they had parks/greenery areas in their districts, where 19.6% said there was no parks/greenery areas in their districts. 81.7% of the elderly people were benefited from the greenery areas in their districts.
- It was seen that 76% of the elderly people had parks in their district, where 23.4% had no park in their district. It was observed that more than a half of the elderly people (55.1%) were benefited from the park in their district, where 44.9% did not benefit from the park in their district.
- As for the available social facilities in the districts of the elderly people, it was found that more than a half of the elderly people (56.3%) stated there was no social facility in their district, where 43.7% said that they had social facilities in their districts.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- As for the available sports facilities in the districts of the elderly people, it was found that more than a half of the elderly people (55.7%) stated that there was no sports facility in their district, where 44.3% said they had. However, it was also seen that 62.8% of the elderly people did not benefit from the social facility in their districts, where only 37.2% were benefited there from.
- As for the available markets in the districts of the elderly people, it was found that the majority of the elderly people (87.8%) stated they had a market in their district, where 12.2% stated they had no market in their district.78.4% of the elderly people were benefited from the markets in their district.
- As for the available coffeehouses in the districts of the elderly people, it was found that 78.2% of the elderly people stated that there were coffeehouses in their district, where 21.8% said they had no coffeehouses in their district. 67.3% of those, who had a coffeehouse in their district, were found not to have benefited from these coffeehouses.
- As for the available parking lots in the districts of the elderly people, it was found that 64.6% of the elderly people stated they had no parking lot in their district, where 35.4% said they had parking lots in their district. 77.6% of the elderly people were not benefited from the parking lots in their district. The main reason for the foregoing is that the percentage of elderly people possessing a car was low.
- As for the available primary healthcare centers in the districts of the elderly people, it was found that 96.6% of the elderly people stated that they had a primary healthcare center in their district, where 3.4% did not have any. It was seen that 93.6% of the elderly people were benefited from the primary healthcare center in their district, where 6.4% did not.

Poverty Analysis by Cultural Needs of Elderly People

- As for the status of reading newspapers or magazines, it was seen that 59.6% of the elderly people read newspapers or magazines, and that 43.4% did not read newspapers or magazines.
- It was examined whether the elderly people share newly acquired information with their friends or relatives. It was seen that 80.5% of the elderly people shared newly acquired information with their friends or relatives, where 19.5% did not share newly acquired information with their friends or relative.
- The daily average TV watching durations of the elderly people were assessed. It was found that 79.1% of the elderly people watched TV for an average period of 0-5 hours, 18% for 6-10 hours, and 2.6% for 1o hours and more.
- 78.9% of the elderly people thought that the TV programs they watched were helpful for their lives. Whereas, 19.3% believed these programs were not helpful, and 1.8% did not provide a reply.
- It was observed that 79.7% of the elderly people were interested in actual events and social issues, where 18.8% were not interested in actual events and social issues.
- It was seen that 86.2% of the elderly people were not members of any foundation, association, club, chamber, union, or political party, where 13.2% were members of a foundation, association, club, chamber, union, or political party, and that 0.6% did not provide a reply.
- In the scope of the cultural needs, it was examined whether the elderly people went for a domestic travel for sightseeing. Accordingly, 65.3% of the elderly people stated they did not go for a domestic travel for sightseeing, where 34.2% said they went for a domestic travel, and that 0.5% did not provide a reply.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- It was observed that the majority of the elderly people did not go for an international travel for sightseeing, where 9.2% went for an international travel, and that 0.8% did not reply this item.
- It was examined whether the elderly people could go wherever and whenever they want to in their city. It was seen that 62.6% of the elderly people could go wherever and whenever they want to, that 37.1% could not go wherever and whenever they want to, and that 0.2% did not reply this question.
- The elderly people were asked if there was a place in the country they wanted to see. Accordingly 51.7% of the elderly people said that there was a place they wanted to see, and 48.3% stated there was no place in the country that they wanted to see.
- It was examined, whether the elderly wanted to see a place outside the country. It was found that 72.6% of the elderly people said that there was no place they wanted to see outside the country, and 27.4% stated there was a place outside the country that they wanted to see.

FUTURE RESEARCH DIRECTIONS

In pointing to key future research directions we can identify two separate sets of issues. Firstly a set of thematic concerns which are likely to need particular attention over the coming decade (the what) – and secondly two major priorities in taking forward these concerns in the commissioning and execution of elderly poverty research (the how).

The what: some of these things are already on the radar (for example, politics, or gender) and have been for a long time. However, all are connected with how elderly poverty distribution and dynamics are likely to change over the coming decade. Politics about redistribution, poverty measurement methods for elderly, social differentiation, exclusion and poverty will be important issues for next research.

The how: in order to generate policy relevant elderly poverty diagnostics in parallel to the innovations in 'growth diagnostics', and opportunities for stronger policy evaluation. There are two sets of issues which won't happen automatically, and where long-term investment needs to be made. Firstly longitudinal quantitative and qualitative research is an important new basis for improved poverty diagnostics. Secondly in-country capacity building, stronger in-country networks including not only research institutes but research users, research analysts, statistical offices and citizens are needed. There should be a particular focus on the capacity to do longitudinal mixed methods, policy relevant, research; and an active effort to identify opportunities that information and communications technology provides to leapfrog conventional approaches to data collection, checking and analysis, with potential for gains in cost, speed, frequency and granularity of elderly poverty research.

CONCLUSION

Today the aged population of the world has increased and continues to increase as a result of the social, economic, medical, scientific, and technological changes. It is estimated that the number individual aging over 60 years will be 1.2 billion in 2025, 1.3 billion in 2040, and 2 billion in 2050, with 80% of the developed countries. As of 2002, the number of individuals aging 60 years and over in the developing countries were approximately 400 million. It is forecasted that the same figure will rise to an approximate

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

amount of 840 million as from 2025. Therefore almost all developed countries will be witnessing the aging of their population in the forthcoming decades.

Old age is not a new notion in the globalized world. However, day by day this phenomenon manifests itself through new problematic and the need for new service models. All countries had to face with increased economic and social demands during the aging process. Old age and issues related to old age have become to determine the agenda of the services together with the changing world conditions, developing healthcare system, and cultural and social changes. The elderly people are no more living in the extended family model, but in a world where nucleus family model has become widespread. On the other hand the advancements in technology and healthcare services increase average life expectancy. Due to the changes in needs and consumption habits during the old age period, difficulties in meeting economic and social needs, and prevalence of such conditions as dementia and Alzheimer's disease, this period may become quite challenging for relevant individuals.

The US Population Institute emphasized in its report published in September 2011, that the world population increased from 6 billion to 7 billion since 1999, and that one billion people were added to the global population in the said 12-year period. At this point, the report questions the implications of population increase for the future of the world and for ensuring the welfare of the entire humanity, and especially of disadvantaged, vulnerable groups such as children, elderly people, and women. In the context thereof, the report underscores the importance of such issues as the exhaustion of resources, fight against poverty, reinforcing disadvantaged groups such as children, elderly people, and women, and restructuring of population policies (Population Institute, 2011).

While percentage of employed population decreases in the aging societies the number of retired people increases. As with the increase in the number of retired people, the burden on the social security system and public finance increases. Moreover it seen, due to aging, that the healthcare expenses of the elderly people increase, that the elderly people need to benefit from healthcare services more frequently and for longer periods due to chronic diseases, and that the number of medicines and the administration period thereof is higher in the elderly people. One of the most important issues with regard to the economic cost of aging is the poverty of elderly people.

This study examined the poverty of elderly people upon analysis of economic, social, and cultural needs. Therefore, it was aimed to determine the deprivations accompanying the poverty. In this study, which researched the poverty of elderly people in Ankara, it was found that 64.5% of the elderly people were married, nearly half (49%) were graduated from a primary education institution, and 20.7% were illiterate. 95.2% of the elderly people were retired and were not employed in any job. 91% of the elderly people were covered by social security. 90.9% of the elderly people considered their health status to be "good."

Despite the fact that the residences of the majority of the elderly people were their own property, the percentage of possessing one's own residence and a car was lower in elderly people at low-income level. The percentage of having such durables as TV, air-conditioner, refrigerator, washing machine, telephone, and cell phone at home were lower in low-income elderly people. Therefore the level of dissatisfaction with their residence was higher in low-income elderly people.

It was found that the elderly people were in general not contented with the level of their income, that they found it insufficient, and that they could not sufficiently afford such expenses as food, clothing, electricity and water bills, and medicine. They could not make travel and excursion plans and allocate budget for such activities. Furthermore, the elderly people were economically supported by their children

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

or grandchildren due to the insufficiency of their income. Due to poverty, the elderly people experienced deprivations deeper as well. For instance, it was understood that impoverished elderly people used telephone less frequently due to its cost and visited their children less frequently. It was seen in the scope of the social needs that the elderly people were generally contented with the interpersonal relations and relations with their children, yet the low-income elderly people stated that they were not consulted by their children, when a decision to be made in the family. Moreover, the frequency of meeting with children and grandchildren was lower in such individuals. This suggests the fact that poverty is transferred to next generations. In a metropolitan city long distances increase the transportation cost and that usually the children, also poor themselves, experience difficulty in paying a visit to their poor elderly parents. On the other hand it was found that the elderly people mostly watched TV to meet their cultural needs, and met their need to read newspapers and books at lower degrees. Also despite available urban facilities as parks, sports facilities etc. the level of benefiting from these opportunities was low. Most elderly people did not make plans to see a place inside or outside the country due to poverty and inability to allocate budget there for. Although the level of meeting the cultural needs is associated with poverty, educational status and intellectual capital also influence the motivation and expectations to meet the cultural needs. Taking into consideration that approximately one-fifth of the elderly people enrolled in this study were illiterate, it was concluded that the motivation to meet cultural needs was low.

While on the one hand the income decreases with old age, the prevalence of diseases rises and the healthcare expenses such as medicine and doctor increases. There are ongoing social assistance programs in cash and in kind for poor elderly people in Turkey, in the scope of social warfare state practices, such as home care giving fee, old age pension for 65 and over age group, and free or discounted transportation opportunity. However it is seen that alleviating poverty is one of the most important issues for the elderly people, as it is with the generality of the population. Therefore it is obvious that effective social policies and intervention methods are required to implement in micro and macro levels.

KEY TERMS AND DEFINITIONS

Absolute Poverty: This is a term used in various different ways to denote a poverty level that does not change over time, in terms of the living standard that it refers to. It stays the same even if society is becoming more prosperous. An absolute poverty line thus represents a certain basic level of goods and services, and only rises with inflation to show how much it would cost to buy that package.

Deprivation: Deprivation is the consequence of a lack of income and other resources, which cumulatively can be seen as living in poverty. The relative deprivation approach to poverty examines the indicators of deprivation, which are then related back to income levels and resources.

Elderly People: Most developed world countries have accepted the chronological age of 65 years as a definition of 'elderly' or older person, but like many westernized concepts, this does not adapt well to the situation in Africa. While this definition is somewhat arbitrary, it is many times associated with the age at which one can begin to receive pension benefits. At the moment, there is no United Nations standard numerical criterion, but the UN agreed cutoff is 60+ years to refer to the older population.

Financial Behavior: It can be defined as any human behavior that is relevant to money management. Common financial behaviors include cash, credit and saving behavior.

Life Expectancy: Life expectancy is the expected (in the statistical sense) number of years of life remaining at a given age.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Need Analysis: Requirements analysis focuses on the elements needed to be represented in the system, needs analysis focuses on the requirements related to the goals, aspirations and needs of the users and/or the user community and feeds them into the system requirement analysis process. The main purpose of needs analysis is the user's satisfaction.

Poverty: Poverty is general scarcity or dearth, or the state of one who lacks a certain amount of material possessions or money.

Relative Poverty: Poverty can be defined and measured in various ways. The most commonly used approach is relative income poverty. Each household's income, adjusted for family size, is compared to median income. (The median is the "middle" income: half of people have more than the median and half have less.). Those with less than 60 per cent of median income are classified as poor. This 'poverty line' is the agreed international measure used throughout the European Union.

Chapter 15
National Migration Policy as a Principle for Economic System Structuring in the Modern States: The Case of Russia

Ekaterina Andreeva
Rostov State Transport University, Russia

ABSTRACT

This chapter covers three actual problems of the modern economy: immigration processes in developed countries and their "economic effect," current migration problems of Russian regions, as well as the specifics of economic space structuring considering the overall impact of migration processes on the territorial economy and the labour market. In the chapter, the assessment of the economic role of immigration in developed countries is justified, economic effects of migration processes are established, the analysis of the structure of the economic space of the modern state is conducted, regions of the Russian Federation in line with migration problems and conceptual substantiation of formation mechanisms of the Russian economic space are classified. The recommendations on the modernization of the Russian migration policy related to the use of positive foreign experience are suggested as conclusions. The given problem seems to be especially actual in the light of the strengthening of the latest migration processes, connected with the crisis in the Ukraine.

INTRODUCTION

International migration of the population refers to the number of large-scale, global and increasingly developing social processes of modernity. According to assessments of the International Organization for Migration (IOM), five years ago the number and in recent years they are reaching the double level. In recent decades, at the general background of intensification of cross-country human flows the

concentration of migrants to developed countries has increased. For the last fifty years, the share of these countries in the world number of migrants has increased from 40 up to 48%, while the share of foreign origin residents in their population has increased from 3,4 up to 10,3% (Andrienko & Guriev, 2004). Developed states, "giving" to other countries only a small part of their population, are the largest recipients of migrants. Therefore, immigration, understood in the broad sense of this word as the inflow and "accumulation" of the population of foreign origin, has a much more important significance for developed countries as compared to other migration flows: emigration of their citizens, return and secondary migration of people from other countries.

The scale and sustainability of immigration determine the importance and the structural nature of its role in the economy of the host societies. However, the economic consequences of immigration in developed countries are mixed. One can see in it a factor contributing both to employment and unemployment increase of local population, the replenishment of the state Treasury and its overloading by additional social expenditures, etc. On the one hand emphasizing the migration contribution to the increase in labor resources and strengthening of innovative capacity, required for dynamic economic development, and, on the other hand, its connection with strengthening of terrorist threats and ethnic conflicts, creating social and political risks of economic agents' activity, give to the discussion a particular acuteness. In the world crisis conditions, when xenophobia is increasing, which is the subject of speculation for extremist and other anti-immigration minded political forces, public opinion towards immigrants is extremely contradictory. According to the data of Eurobarometer, last year only 44% of respondents, residents of EU, believed that immigration contributes to the development of their countries significantly, while 47% of people rejected this fact categorically. The significance and diversity of the modern role of immigration in economies of developed countries, the presence of different, occasionally diametrically opposite assessments determine the relevance of its comprehensive and balanced analysis, and the need for research to identify the positive experience, different approaches and activities of these states, aimed at strengthening of the positive consequences of immigration and weakening of the negative ones.

Modern demographic situation in Russia is ambiguous and is characterized by the severity and intensity, caused by preceding the development challenges of the age and sex structure, complexity of movement types and the mode of reproduction of the country's population. In recent years there has been a significant increase in the number of supporters of the extreme pessimism theory concerning the demographic processes in Russia. In the public consciousness the idea about the hopelessness of the situation and the inability of the country's transition to optimal demographic development is actively being formed. Some scientists consider that, on the one hand, it is necessary to accept the fact of demographic degradation as something inevitable and unchangeable and, on the other hand, they rely not on the growth and development of the internal demographic resources, but only on immigration. Today Russia needs to take into account the positive "immigration experience" of developed countries in order to build an intelligent policy of economic development of its subjects, considering the scale of the country, population, ethnic peculiarities of its regions.

Lately the situation in southern regions of Russia, experiencing a huge influx of immigrants and refugees from the South-East of the Ukraine, aggravated considerably. According to the Russian migration service, in Russia the number of refugees from the Ukraine is almost half a million. The United Nations Organization names a smaller, but, in any case, a very impressive figure - 110 thousand. In the Conception of long-term socio-economic development of the Russian Federation for the period up to 2020 an important role is given to the international migration of the population in reducing of labor shortages and in the innovative development of the national economy. As the national studies show, mi-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

gration becomes "crucial for Russia", and in the nearest time the dynamics of economic growth, living standards, social climate, regional proportions of development, the size of the country and its integrity will depend on it. In recent decades, Russia took an active part in the international exchange of people and has become one of the world's largest recipients of migrants (according to the UNO, - 12,1 million people), conceding in this indicator only to the USA (38,4 million).

Despite the specificity of the development trends of migration processes in Russia, there is a considerable similarity of the goals and objectives of the migration policy of our country to that of developed countries. Therefore, when developing and implementing effective migration policy of the Russian state it is timely to study approaches and practical measures, used by these countries. At the same time, it should be noted that Russia should rely not only on immigration, but on the use of its own (internal) demographic resources. Depopulation processes aggravate the situation of regions with a different level of development. The reproduction of the Russian population has its own specifics. A number of steps, which are closely related to the socio-economic development of the society, have taken place. And all this gradually developed from the biologically-adjustable process (only the strong survives) to that, determined by social values and the attitude to human life and the person.

These processes cannot but affect the specifics of the economic space of Russian regions. The concept "economic space", the "united economic space" can be found in the economic literature more often in recent years, however, in general, as a special subject of scientific understanding, the notion of "economic space" remains outside the scientific research and cannot be properly defined. However, the major developed countries used the spatial factor actively for ensuring the goals of the transformation of the world economy, which was reflected in changing global patterns of production of goods and services, the distribution of foreign investment, loans, debt, patents and licenses, migration, transport flows, etc. Now we may say with a sufficient degree of confidence that this influence had a determining nature and determined the further course of global economic evolution considerably. Processes in the world economy, correlation changes of the power balance of their major participants, a shift in the priorities of their activities have a direct impact on the economic space in the world scale. Unresolved tasks, which separate countries and the world economy face, stand out more clearly. Not the autonomy of action of free market relations stands out more clearly, but the phase of the aggravating crisis, first of all, in relations between civilizations, cultures, people and nature.

The complexity of the impact of economic space on the potential of geographic and economic transformations can be seen not only in the regions of huge Russia, but throughout the whole world economy, and is determined by the fact that not only economy is in the transformation but also economic space, initiating these processes. The ideology of "economic openness" has become an important moment of transformation processes, which unfolded in the majority of states in the modern world (especially in developing countries and countries with transition economy), determined by a complexity of internal and external factors. All these tendencies were manifested in Russia. "Economic openness" revealed in the revision of views on the rights of the state, when the privatization was carried out; the financial system was changing, more serious importance was given to market processes. State intervention into the economy was reduced to a minimum, but at the same time the obligations of the state, connected with social security issues of citizens were greatly reduced. At the same time, the liberalization of the management systems of all types of international economic relations was realized, the active participation of states in international organizations activities expanded, there was a formation of new alliances and coalitions, the aspiration to take full advantage of new opportunities arising from the international division of labor strengthened. Migration processes in this system also played an important role.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In developed countries, the economic consequences of immigration, despite their ambiguity, in general, have a positive nature. Immigration is an important social source of economic development of countries - recipients of the population. The inflow of highly qualified specialists plays an especially important economic role. The contribution of immigration to the economy will grow significantly in the long term. Russia, which gave in the 90s and early 2000s highly qualified specialists to the West, took a huge number of residents of the former Soviet republics to its regions. Central regions and capital cities experienced extended influence: Moscow and Saint-Petersburg. The experience of developed countries in similar situations is positive. Selecting and attracting migrants which are in demand, promoting their integration in the host society, creating conditions for the adaptation, development and effective use of their economic potential, counteracting factors that generate flows of forced migrants, and favoring voluntary repatriation of refugees and some other categories of immigrants living on their territory, the developed countries increase the size of the win, obtained from immigration, and ease the burden of its costs.

Foreign labor migration is becoming an integral part of regional development in the conditions of globalization, the expansion of international economic relations, the internationalization of production, innovation development of economy. Foreign workers act as one of the sources of staffing in the regions of the Russian Federation. The role of foreign labor migration is becoming stronger in connection with demographic processes, taking place in the regions of Russia and related to the depopulation and aging of the population, which are reflected in the shrinking of labor force. Foreign migrant workers have a significant impact on peopleware, and, consequently, on the economic development of the regions and Russia as a whole. Over the last two decades in the economy of subjects of the Russian Federation profound transformation took place affecting all aspects of social and economic development of the regions. The country's transition to market principles of economic management has caused a major shift in the sectoral and occupational structure of the regional economy, changes in the spatial configuration of industries with partial closure or profile conversion of existing enterprises, the emergence of zones of surplus labor and, in contrast, areas with an acute shortage of specialists, the change in general parameters of economic activity of the population throughout the regions of the country.

A constant imbalance between the demand of enterprises for personnel and the availability of free labor force has become the result of these transformations for the regional economy. As a result, business entities in need for staffing have started to resort to borrowing of labor force from other regions of the country, from near and far abroad countries. Social and economic difficulties in these countries have become additional stimulus for foreign labor migration, which takes the nature of the unmanaged flow in some regions of Russia. At the same time an effective and balanced regional policy of regulation of labor migration practically was not worked out, which, in some cases, led to the emergence of hotbeds of social tension and conflicts on ethnic grounds.

Today we must accept that for the regional economy, its peopleware at the expense of attracted labor force has become an integral and important condition for the territorial development and one of the factors that determine the dynamics of social and economic processes, including the stable development of the region as a complex social and economic system. The process of foreign labor migration has an impact on the demographic situation, the functioning of the labor market, the crime situation, sanitary, epidemiological and ecological situation of the host region. Russia, as it is known, is entering a period of large-scale reduction of working age population, which will have a negative impact on the peopleware of the regional economy. According to forecasts annually during 2009-2018, the reduction of the working-age population will be more than 700 thousand people, and in 7 regions of Russia, the total

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

decline in the working age population will exceed 200 thousand people (Topilin, 2004). One of the ways to solve this problem, as it is noted in the Conception of long-term socio-economic development of the Russian Federation for the period up to 2020, is the attraction of foreign labor force in accordance with the needs of the demographic and socio-economic development. In this connection the study of positive experience of developed countries and working out of models of effective formation of economic space, considering the regulation of labor migration processes are very important. It will let to appreciate the current and perspective need of the economy of regions in staffing, including that one, which is formed at the expense of foreign labor migration.

Purpose of the study in an evaluating the economic role of immigration in developed countries, the establishment of logical relationships between factors, characteristics and economic effects of migration processes as a basis for migration policy and principles of economic space structuring of the modern state, as well as in the conceptual substantiation of formation mechanisms of the economic space of the Russian Federation according to the current migration situation.

In order to achieve this purpose it is necessary to solve the following objectives:

- To identify the main factors, influencing the economic effect of immigration, in the context of analysis of the driving forces and modern trends of population migration to developed countries;
- To generalize the conceptual approaches to the definition of "economic space", to clarify the nature of its structural mechanisms;
- To substantiate the nature of the impact of immigration on the economy of developed countries, to show the importance of immigration for the development of the modern economy;
- To systemize the effects of immigration at the labor market, to investigate the "barriers", hindering the effective use of economic potential of migrants;
- To examine the measures of developed countries for the raising of economic benefit from immigration and the reduction of burden of associated costs.
- To classify the Russian regions by the number and intensity of flows of foreign labor migration, to identify its driving forces;
- To substantiate conclusions on optimization of migration policy in Russia in the correlation of the development of migration processes in the developed countries and Russia, as well as to identify the series of processes of migration policy of developed countries, representing a practical interest for the Russian authorities.

MAIN HYPOTHESES OF THE STUDY

1. Modern Russia has the tasks to increase the efficiency of the national economic space. Problems of transformation of the economic space in Russia have a more than one century long history and are characterized by the accelerated changes in its spatial organization, caused by revolutions, world wars, and after it – by the confrontation of the two systems. In this connection, the economic space of the Russian Federation involves a complex structure, with a large proportion of social, cultural and demographic characteristics. In the structure of economic space the provision with resources is important, so the problems of the working population come to the forefront.
2. Migration is one of the most important mechanisms in the structure of economic space. Immigration is a powerful social source of the economic development of recipient countries. The inflow of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

highly qualified specialists plays an especially important role in the economy of these countries. The contribution of immigration to the economy grows significantly in the long term perspective. The economic consequences of immigration in developed countries, despite their ambiguity, in general, have a positive nature.

3. Selecting and attracting migrants in demand, thus facilitating their integration into the Russian society, creating conditions for the adaptation, development and effective use of their economic potential, as well as confronting the factors that generate flows of forced migrants, developed countries increase the positive effect of immigration. Russia, adapting positive foreign experience, could use its potential for the benefit of the whole society, facilitating the costs of immigration.

PRIMARY RESEARCH

A large number of scientific works is published on questions of international migration, both abroad and in Russia. Profound research of many economic problems of population migration to developed countries is carried out. Nevertheless, there is a range of quite unexplored issues, including, in particular, the macroeconomic consequences of economic externality of immigration and also foreign economic mechanisms of influence on migration processes.

Foreign economic science has started to study seriously the problems of the impact of immigration on the macroeconomic aggregates of the host countries only in recent years. First steps to assess the economic effects of immigration are taken. Analysis of migration policy focuses mainly on immigration policy; quite recently researches on integration issues have started to appear. However, use of assistance and development measures to influence the reasons of migration and managing its flows remains a little studied subject. In Russian works on the economic analysis of the immigration effects in developed countries, the main attention is paid to its socio-economic effects, mainly to labor flows. Attempts of a broader consideration of the economic impact of immigration are mainly focused on the analysis of the impact of labor migration on the development of global systems of transport, communications, foreign trade and remittances of migrants; not enough attention is paid to a number of other, first of all macro-economic impacts in host countries. Connection of foreign workers movements with the movements of the united family members and other categories of migrants, the population mobility of foreign origin (immigration status, condition of economic activity and so on), the importance of the influence on the economy of the host countries of the population as a whole, and not only of its employed part, create the need to consider a wide range of economic consequences of the whole immigration flows, including migration of the labor force, but not limited to it.

There are certain regularities both in the development and appearing of migration processes. The main modern trends of migration allocated by Iontsev, V., include: globalization of international migration, expansion of labor migration and the growth of the share of highly qualified personnel in its flows, intensification of illegal and forced population movements. But we can see a deviation from some previously identified trends in connection with decay of a number of hotbeds of refugees, and also under the influence of the financial crisis. Migration has a phasic nature, involving, in accordance with the scheme of Rybakovskiy, L., the existence of three main stages: taking the decision to migrate, the arrival in another country and adaptation to a new place. Taking into account the repayment of a part of migration flows and orientation of immigration policies of developed countries on it, staginess is understood wider, covering also the stages for the repatriation and reintegration.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The complexity and the mobility of migration flows structure and composition of the foreign origin population, multiplicity of channels of their interaction with the host society determine the multidimensionality of the immigration impact on different spheres. The main spheres of immigration influence on the economy of host countries traditionally include the labor market and the state budget. Justifying the ambiguity of the consequences of immigration in these areas, it is advisable to rely on the approaches and ideas of foreign scientists as: limited "portability" of human capital; differentiation of short-term and long-term effects of immigration on the conditions of work and employment of the local population; long-term life cycle of consumption of public services by the foreign origin population and its tax payments (Bentolila, Dolado & Jimeno, 2007).

In the absence of a unified theory of migration policy one should highlight the conceptions of its concrete directions: "realistic" (etatist) theory of migration of Waltz, K. and Mearshimer, J., governing the admission of foreigners by the national interests of the recipient country, including its workforce needs; the concept of socio-cultural and socio-economic integration of migrants by Kymlichka, V., and Collette, E., connecting the integration with economic and social development of the host country; modern interpretations of the classical theory of foreign trade by Tapinos, J. and Conjo, D., from which it follows that foreign economic measures of developed countries, helping to reduce the gap at the development level between countries, are able to eventually weaken the driving forces of migration. Combination of these theories in one theoretical block allows you to build up the logic and show the integrity of the migration policy of the developed countries.

MAIN FOCUS OF THE STUDY

Determinants of Migration Flows in Developed Countries and their Economic Effect

To the economically developed countries we refer the countries in Western Europe, the USA, Canada, Australia, New Zealand and Japan, which constitute the bulk of the OECD countries (Organization for Economic Cooperation and Development) with a high level of income. Modern migration to developed countries is caused by a complex of driving forces. The main determinants of migration flows are differences in the level of economic and social development, condition of the political environment and demographic resources in different groups of states. The main reasons, contributing to the objectives of the move, the degree of preparation to it, adaptation and integration opportunities of migrants, - are economic, which can be considered as a factor favoring the increase of the immigration contribution to the national economy of the host countries. Although, emigration from developing to developed countries is often explained by poverty. Statistics show that the majority of modern international migrants refer to the middle social strata and come from middle-income countries. This circumstance allows making a conclusion that the main motive for moving to developed countries is not an escape from poverty, but better employment opportunities and increase of revenues. Taking into account the "self-choice" of foreign workers, better prepared in the professional sphere and purposeful involvement of certain categories by developed countries, a rather common association of immigration mainly with the import of poverty is not fully justified.

Despite the forecasts of rapid development of a number of developing countries, the prospect of an enduring lagging behind from developed countries promises the prolongation of intensive migration

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

flows in the coming decades. As the emigration processes have a certain life cycle and develop along the spiral trajectory, we may expect their strengthening in accordance with the economic development in the countries, which are considered to be the most poor now, and, on the contrary, their attenuation in the countries, which are the donors of the population at present, and the transformation of the latter into its recipients.

Globalization acts as a certain accelerator of migration processes, gives them a chain, cumulative character and an internal dynamics, and enhances commonness of their trends and consequences. Together with the formation of the world labor market and the expansion of foreign trade (including the connections with the implementation of GATS (General Agreement on Trade in Services), globalization trends in the field of business, education, science, transport and communications, social relations, criminal activity on the organization of illegal entry of foreigners have the most noticeable influence on migration. However, some of the globalization processes, connected with the establishment of foreign affiliates of TNCs (Transnational Corporations), the development of outsourcing and formation of information networks can also facilitate the widening of employment opportunities in the countries of origin of migrants, including remote labor for foreign customers, and thus to weaken the potential of physical emigration of separate groups of the population. At the same time, migration contributes to the globalization of development of countries and regions.

Movement routes of the population are influenced considerably by historical connections, geographical, cultural and linguistic closeness of the countries of origin and reception of migrants, residence of relatives or Diasporas of compatriots in the last ones. Presence of such conditions contributes to a more rapid integration of migrants into the economy and a more complete realization of their human capital.

In recent decades migration to developed countries was distinguished by large scale and progressive dynamics, showing the weak dependence of the autonomy of its constituent flows, primarily humanitarian ones, on the state of economic conditions and determining the intensity and stability of its impact on the economy of the host countries. Since 1960, the number of international migrants in the developed countries more than tripled, reaching to the mid-2000s 91 million. The main feature of the last decade is the emergence of a large wave of economic migration, initiated by developed countries. At the same time there was a tendency towards the narrowing of flows of refugees. However, the main part of the settlers was still accepted because of humanitarian reasons (family reunification, asylum), what conditioned the ambiguous nature of the impact of immigration for permanent residence on the functioning of the economy.

A significant proportion of foreigners arriving to developed countries is approximately 1/4-1/6 of the total number – is coming illegally, feeding the shadow economy, creating threat for the national security of the countries of destination. In the USA, as well as in Russia, the number of the army of illegal immigrants is estimated at about 12 million people. Modern migration to developed countries is diverse ethnicities in composition in comparison with the long-established indigenous or ethnic groups. This tendency is more typical for the labor migration to Russia. With the transformation of the host societies into multi-ethnic, multicultural and multi-religious ones, the problems of their social cohesion and stability aggravate, which have the essential significance for the functioning of their economies.

The composition of the newly arrived residents by the level of education is polarized. As a rule, the number of people who do not have a diploma of secondary education among foreigners is higher than among the native population, what is especially characteristic of labor migration to Russia (preserving the outdated production base of the use of foreign labor). At the same time, in the conditions of the rapid intensification of intellectual migration in most OECD countries, the proportion of foreigners with the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

third level of education, exceeds the corresponding figure among local population and is growing rapidly. The vast majority of developed countries have a positive balance of intellectual migration, the greatest gains from which receive the USA, Canada, Australia and Switzerland.

The size of the contribution of immigration to the economy, and the degree of urgency of problems, generated by it varies considerably across countries. At the same time one can trace common features and trends in its impact on the functioning and economic development of the host societies.

In conditions of reducing and aging population in developed countries, the changes in the proportions between able-bodied and disabled parts in favor of the second one, immigration has become a significant factor of the demographic situation. Migrants make up a tenth of the population of developed states, including about fourth-fifth - in Australia, Switzerland, New Zealand and Canada (and the twelfth part in Russia). In the first decade of the 2000s, the contribution of net migration to population growth of OECD countries was estimated at an average of 40-50%. (In Russia, where there is a natural decrease of population, migration is partial - by the end of the first decade of the 2000s - by 50% - refunds.) At the same time, immigration has an ambiguous effect on the ratio of economically active and inactive population.

From the right to the left there are countries: Australia, Switzerland, the USA, Sweden, Spain, the Netherlands, France, Great Britain, Italy, Portugal, Finland. Blue column – the whole population, red column – economically active population, green column – working population

As a result immigration forms a special segment of the labor market of foreign origin workers with a high level of unemployment, widespread unstable and illegal employment of low-skilled and unskilled types of occupation, works, which do not correspond to the specialty and educational level, with lower wages (on average by 5-25% lower than that of indigenous population). Among the main factors hindering the effective use of economic potential of migrants are ignorance of the language of the country of residence, the incompatibility of education/qualification to national standards and the needs of the labor market, and also discrimination.

Problems, arising at the labor market, from which newly arriving cohorts of migrants suffer to the greatest extent, cause widespread poverty in their environment. However, in the USA and Great Britain, at least in recent years, there was no obvious link between immigration and the growth of social inequality in the society. Moreover, migrants, integrated in employment successfully (at the background of outflow of visitors, who could not enter the economic life of the host countries), often showed even higher rates of upward social mobility than the native population. At the same time, they also stimulated this process among the local workers.

The inflow of foreign population plays an important role both in smoothing the structural, professional, sectorial and territorial imbalances at the labor market, caused by the acute lack of both low - and unskilled personnel (for example, in construction, trade and public catering in Russia), and professionals, primarily in high-tech industries, in the system of health care and education. By the mid-2000s in American universities the share of teachers of foreign origin among those who got an academic degree in the USA in the field of technical Sciences was 40%, by the end of the decade in this country the share of immigrants - scientists in the field of Medical Sciences was 46%. Supporting traditional industries and nourishing the knowledge economy, immigration contributes to the balanced functioning of the national economy complexes and dynamic economic growth.

Higher territorial and sectorial mobility of recent migrants contributes to the mobility of labor from areas and sectors with a high level of tension on the labor market to more prosperous ones, to strengthening of flexibility and efficiency of its functioning. Together with it, reducing the economic incentives

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

for solving short-term challenges of labor shortage, immigration can create preconditions for their transformation in the long-term ones.

According to the majority of studies, conducted in developed countries, the immigration impact on the level of employment and wages of the local population is ambiguous. In the short term shocks of labor supply, caused by immigration, could have a destabilizing influence on local labor markets and facilitate the redistribution of incomes in favor of the owners of the capital. However, this effect is unimportant and depends on the composition of flows of immigrants and the nature of their presence at the labor market (complementary or competitive in relation to local residents) and manifests differently among the diverse groups of local people. In the long term during the adaptation of production to the changes in number and composition of the workforce, increase in investment, production and demand for labor - consequences of migration are becoming positive.

In the conditions of financial crisis, despite the growth of unemployment in some sectors, in particular in the sphere of R & D, education, health, agriculture, the demand for foreign workers remains and their use flattens the imbalance at the labor market. At the same time immigrants due to the nature of their position at the labor market have bigger losses in jobs, especially in construction, service sector, retail trade and tourism than the local population, thus damping the impact of the crisis on employment. This tendency is reinforced with the introduction by a number of countries, in particular the USA, as well as by Russia, restrictions on the use of migrant labor. However, because of evasion from return to the homeland of unemployed temporary migrants and, moreover, the unattractiveness of the prospects of repatriation for permanent foreign residents, immigration is no longer able to perform countercyclical functions effectively, as it was in Western Europe in the years of the recession of the 1960s. It strengthens tension at the labor market and, probably, will lead to the growth of the shadow economy.

Immigration affects such economic macro parameters of developed countries, as aggregate demand and aggregate supply, including the supply of labor and capital, and also technologies of their use in the production process, influencing the dynamics of economic growth. According to the results of studies for individual countries, the role of migrants in the production of GDP is conditioned to a considerable extent by their share among the employed: in Great Britain in the mid-2000s, the corresponding figures constituted 10,9% and 11%. If we compare the share of migrants among the employed with a median level of their wages (indirect indicator of productivity), the contribution of migrants to GDP production in 2005-2006 can be evaluated in Portugal at 7,3%, the Netherlands - 8,8%, France - 10,1%, Sweden - 11,6%, the USA - 12,5%, Germany - 13,9%, Canada - 20%, Switzerland - 21,7%, Australia - 27,4% . According to experts' estimates, in Russia the share of migrants accounts for 8 - 9% of GDP production ("Why Russia needs an immigration policy", 2013).

Providing a significant part of the employment increase immigration makes a significant contribution to the output growth. In Great Britain its share makes 1/5-1/6 part of the increased production for the period of 2001-2006. According to the estimates of the expert of the ILO (International Labor Organization) P. Stoker, the increasing population of West European countries due to immigration by 1% leads to an increase in GDP by 1,25-1,5%. We can assume that in the conditions of financial crisis without the use of labor of migrants in demand, GDP decline would be even stronger.

The contribution of migration flows different in the level of qualification to the economy varies considerably. If under the influence of immigration the population with a high level of qualification in developed countries of Europe increases by 10%, the gain from immigration increases by 5,5%; in case of a similar increase in the unskilled part of the population, the corresponding figure will be only 0,85%.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Among the channels of influence of migration on the capital accumulation one can highlight the growth of investments, coming from the countries of origin of migrants, including those made by immigrants. In 2000 the capital imported by the so-called investment immigrants to Canada amounted $5,76 billion, that is (12% of the total volume of foreign investment). Cost savings for foreign labor and the increase of entrepreneurs' incomes, connected with it, can also be a factor, contributing to the growth of investment activity.

In contrast to the positive impact of immigration on the total production, its influence on the dynamics of per capita GDP is ambiguous and depends to a considerable extent on the correlation of employment rate among migrants and the local population, as well as their productivity. At the same time immigration can contribute both to deceleration and acceleration of productivity growth. In addition, it can cause the effect of economies of scale and encourage more efficient use of resources.

Attraction of large contingents of scientists, engineers, and students from abroad stimulates the inventive activity and the spread of innovation in the economy, accelerating the rate of its growth (according to macro models by 0,5% a year). Thanks to it, the leadership of the USA is guaranteed in key high-tech areas. The increase in the share of foreigners among the American University graduates by 10% causes the increase in the number of patents on inventions, granted by commercial firms, by 6,8%. The fact that between 1901 and 2005, one third of Nobel laureates in medicine and physiology, and in 1985-1999, in chemistry were natives of other countries shows the extremely high productivity of arriving scientists, their contribution to scientific and technical development of the United States.

Thanks to the economic activity of immigrants-entrepreneurs and wage workers employed at their enterprises, and also independent workers, belonging to the same ethno-cultural group, a special segment of the host economy is being formed - the so-called ethnic economy. In ethnic enclaves, unattractive for local businesses due to their increased criminality, small capacity and low market returns, ethnic business develops types of economic activity in demand, ensures the satisfaction of the demand for specific ethnic goods and services. Although, ethnic business in the nationwide scale occupies quite a peripheral position, its contribution to the "common pot" is rather noticeable. Thus, over the last decade in the USA firms, owned by immigrants from Asia, created 2,2 million of jobs and made a profit of $ 326,4 billion. Business activity of migrants often contributes to the revival and economy development of former depressive areas.

The impact of migration on aggregate demand is realized primarily due to its contribution to population growth and expansion of its consumer demand. At the same time, the arrival of new foreign customers at the market, different from the local population by the level of income and wealth, preferences, and so on, has a different effect on the scale and structure of demand, than a similar increase in the number of consumers among the local residents.

As a rule, the reduced level of wages of foreign origin workers, particularly newcomers, lower accessibility of social payments for them, transfer to the homeland of the part of their earnings, their lower demand in the acquisition of durables, a bigger orientation on the products of the lowest price groups, etc. restrict the scopes of short-term expansion of consumer demand as a result of immigration. It should be noted that by the middle of the past decade in Germany the level of savings among the local population was 8,6%, among temporary migrants (including remittances to their Homelands) reached 11,8%, decreasing up to 7,2% among the settlers. Short-term pressure of immigration on the wages of local workers even affects the temporary reduction in consumer expenditures. At the same time, specific segments of the consumer demand for specific goods and services, typical for countries of origin of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

migrants (which may stimulate the growth of imports and the expansion of local production) are formed due to immigration.

In the long term, the migrants' consumer demand increases with the growing in the period of their stay increase of their earnings and other income, the acquisition by them of consumption standards of the local population, and also the growth among them of the number of highly skilled layers of population. In addition, immigration facilitates the increase of the purchasing power of the local population, contributing to the increase of its incomes.

Immigration influences various factors of inflation. It is mainly connected with the arrival of new cohorts of immigrants and, as a rule, it becomes stronger with their growing share in the economy, but it becomes weaker with their integration, usually having a short-term nature. Disinflationary influence of immigration is primarily determined by the difference of its contribution to the expansion of aggregate demand and supply. As the studies of IMF (International Monetary Fund) show in the countries of Western Europe, the growth of output, resulting from the involvement of additional resources and reduction of the marginal costs due to immigration, is more significant than the growth of consumption, caused by it. Such "scissors" prevent the formation of excess demand, or inflation rupture, causing inflation of demand. In addition, as immigrants are represented by trade unions less than local workers, and show a greater readiness for low-paid work, the marginal cost of production is reduced with the growth of immigration. Increasing the threat of substitution of local workers, immigrants weaken their position in collective bargaining. Thus, the growth of labor supply, resulting in short-term lowering of wages, reduces wage inflation. In Spain, for example, during the period of 1995-2006 at the background of the absence of immigration the average annual inflation rate would be by 2,2% higher. While at the markets of various goods and services there are opposite effects of immigration on inflation. Increasing the demand for housing, immigration stimulates a little bit the growth of prices for it. High concentration of low-paid workers of foreign origin in certain types of economic activity contributes to lower prices, especially on their labor-intensive services.

The main channels of influence of immigration on the balance of payments in current operations are foreign trade and remittances of migrants. The identified by foreign scientists statistical connections show that migration contributes to the expansion of foreign economic relations between the countries (regions) of residence and origin of migrants. Short-term effects of immigration on foreign trade is caused primarily by the increase in aggregate demand (including "ethnic" goods, customary in their native countries), which is partially satisfied by the growing volume of imports, which may result in the short term to the deterioration of the trade balance. However, long-term effects of immigration on foreign trade, including export, taking into account its impact on the efficiency and competitiveness of the economy, often become positive.

The export of educational services, connected with the reception of foreign students, has become a significant external source of revenues to many developed countries. By the beginning of the 2000s, the share of the indicated income in the export of services reached 13% in Australia, 8,1% - in New Zealand, 4,2% - in the USA, 2,1% - in Italy and 2% - in Canada (Ivakhnyuk, 2005).

At the same time, through the channels of remittances of migrants there is an outflow of funds from developed countries, what does not facilitate the stabilization of their economies in the conditions of the financial crisis. However, taking into account the relatively small sizes of this flow (0,4% of GDP of developed countries), its partial compensation by counter remittances, as well as its weakening in the conditions of crisis, the impact of this factor on the balance of payments is relatively small.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to multiple studies, in most developed countries, the average immigrant pays more taxes and fees and receives less social payments than the average representative of the indigenous population. Therefore, in the national scale there is a positive balance of the budget income and expenses, related to the stay of migrants in the country. Even forced and illegal migrants may replenish the national treasury, if they become taxpayers. Favorable fiscal impacts of immigration, growing with the increasing period of stay of migrants in the host country and improvement of the level of their qualifications, are especially noticeable in the long term. However, with its help we cannot solve the budget problems, connected with the population ageing. Thus, the impact of immigration on the sphere of public finances and social infrastructure (social security, education and health) has a contradictory character, arising from the dual role of migrants as producers of services and payments and, at the same time, their consumers. The arrival of medical and teaching employees and students creates impulses to the development of the relevant branches of social infrastructure and replenishment of the state treasury. However, the new settlers, unemployed members of families of migrants and geographically concentrated communities of immigrants create an additional burden on the budget and the field of free social services, especially at the local level, and this burden is growing in conditions of the crisis.

Among the external effects of immigration one can clearly see its influence on the national security and legal order of the developed states, affecting the living conditions and economic activity in the host countries. It is established that international terrorism is closely connected to migration, especially illegal one: the executors of the terrorist acts in the USA, the UK and Spain as well as in Russia were immigrants included in networks of al Qaeda. According to the estimates of the IMF (the International Monetary Fund), the direct losses from the terrorist act in the USA in 2001 exceeded $ 21 billion, that was equivalent to 0,2% of the GDP of this country. The British government allocated approximately £ 2 billion (0,12% of GDP) for the fight against international terrorism, including strengthening of border and immigration control in 2008. Connection of crime, as well as of unconventional political actions, and migration are also clearly seen. In the early 2000s in Great Britain the additional costs of the judicial and penitentiary systems, associated with the increased share of ethnic minorities and immigrants among prisoners, were estimated at £ 3,08 billion (0,3% of GDP). Maintenance of tolerant inter-ethnic relations in the society also requires public funds. In Great Britain their volume, including the budget of the Equal Opportunities Commission, was estimated at least at £ 600 million (0,03% of GDP). Such expenses of host countries weaken the positive fiscal effect of immigration. However, their sizes are usually relatively small in scale of the national economy and do not affect the balance of the positive economic consequences of immigration in general.

Socio-economic and political importance and the multidimensional character of immigration effects in developed countries make it an important object of the state regulation, determining the necessity of its multi-purpose nature. The spontaneity of the development of some migration processes, their ability to generate unpredictable and hardly controlled consequences give a special importance to the introduction of human flows into an organized way. The similarity of problems, solved by immigration policy of developed countries, contributes to its convergence, the enhancement of integration tendencies in it. The ruling circles of the developed countries are becoming more aware of the need for a balanced, complex, multilevel and multilateral management by migration processes, including immigration policy, integration of immigrants and their descendants and external economic impact on migration processes.

The Role of Migrations in Structuring of Economic Space

Currently, the migration is the subject of study of such sciences as Geography, Sociology, Economics, Demography, Statistics, Law, and many others. Migration is a socio-economic process related to the labor market, living standards of the population and other socio-economic indicators. Migration forms the demographic structure of the population of the country, determines the state of regional and local labor markets. Before determining of the role of migration in the structure of the economic space of Russian regions, it is necessary to note that the processes, affecting the specifics of the territorial structure of regional economies of such a big country as Russia, have problems similar to global aspects of the organization of world economic space. The study of the global aspects of structuring of world economic space lies outside the field of this study, but understanding of its basic mechanisms is necessary to clarify the role of migration processes in the General structure of territorial economic system (Gluschenko, 2006).

The transformation of the world economy began not with the collapse of the socialist economic system and the USSR, but from the end of the 19th century and was characterized by the accelerated changes in its spatial organization, caused by revolutions, world wars, and further by confrontation of the two systems. Now not only economic space changes radically, but also the organization of the world economy, subjected to destructive crises, which have assumed a global character. The need for a new theoretical understanding of the problems of the world economy, the development of principally new methods of research is dictated by the transition to a new level - the volume organization of economic space. In this connection it is possible to allocate three groups of interrelated problems.

The first one concerns the identification of the theoretical and methodological approaches of economic space learning, corresponding to the level of its structure, which are the basis of the world economy study; the establishing of the adequacy of an integral, really existing space, in which separate economic subjects act; to peculiarities of its abstract display in scientific and economic concepts.

The second one reveals a series of issues, connected, firstly, with the essence of the ongoing transformation of the world economy, its mechanisms, stages, patterns and driving forces; and secondly, with the peculiarities of the coming world order, the place and the role of Russia in it (the formation of a long-term strategy of economic development).

The third one – touches upon inconsistencies between the most important planetary needs and the possibility of their satisfying with joint efforts of mankind in the foreseeable future.

The whole inconsistency of the results of Russian modernization is explained by the specific development of Russian economic space, complex and ambiguous economic, political and cultural position of Russia in the world. As the historical experience of Russian modernization shows it is not so important what allies Russia acquires during this or that period of time, but it is important that it was always open for both European and world economy. Extensive way of development of Russia, which led to the expansion of the territories, was an original reply in relation to any geopolitical shifts in Eurasia. As a result of which Russia had to spend huge resources to create a centralized and militarized state, confronting threats from the East and the West. The problem also consists in the fact that developed countries consider natural resources of the whole world to be their property, as they, in the end, are influenced by their commodity-money relations (the volume of economic space). According to them, Russia is a raw materials appendage of not only European countries and the USA, but also of actively developing countries of South-East Asia and China (Zayonchkovskaya, 2007).

All kinds of economic space can be represented in the form of a formalized, dynamic model, which allows getting an effective mechanism for "tracking" the development of the economy. The main purpose

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of using of the potential of economic space formation is the achievement of the balance between the fundamental and market factors where migration processes are present and play their role. A distinctive feature of the proposed scheme is its consideration not only from the standpoint of the contribution of the fundamental factors in the process of economic space creating and the impact on these factors, but also from the point of view of the economic space building, taking into account the use of various factors potential.

Provision with resources is important in the structure of the economic space. Here the quality of the working population comes out at the forefront. Also the growth of population density, migration of workers (movement of entrepreneurs) with the aim of reducing of distances to markets, decrease of disunity, caused by inter-state differences in currencies and normative base are of great importance for the successful economic development. Space changes which occurred in these three dimensions - density, distance and disunity - are especially noticeable in Japan, North America and Western Europe. Thanks to the fast and frequent movements of people and goods, the share of North America, Western Europe and North-East Asia, where less than one-sixth of the world's population lives, is about three quarters of the world's GDP. In short, productivity, profit, quality of life is in the direct dependence on the proximity to the centers of economic activity.

Demographic studies with the use of spatial characteristics aim at analyzing and developing of the probable prognosis of changes in the state of population of countries, regions and the world economy as a whole. If we consider the share of countries in the world population, the greatest decrease in population is expected in developed countries from 17,13% in 1980 to 12,75% in 2020 (see table 1). The indicators of Western Europe and the Transition Countries are comparable. In the group of Developing countries the greatest increase in the share of the world population can be noted for the group as a whole from 74,21% in 1980 up to 81,67% in 2020, and in regions of Sub - Saharan Africa - from 8,93% to 12,83%, correspondingly. By the share in the world population Africa was already ahead of Western Europe in late 70s of the 20th century and in the long term, this gap will only increase (not less than 2 times).

Table 1. The share of the world population of the groups of countries, separate countries and regions, % (The World Economy: Forecast till 2020, 2007)

	1980 Year	1990 Year	2000 Year	2005 Year	2010 Year	2020 Year
The Whole World	100.0	100.0	100.0	100.0	100.0	100.0

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

During the observed period, only indicators of Russia and Japan are comparable in value. Brazil since the mid-90s of the 20th century begins to outstrip Russia and Japan significantly. If in some regions of developing countries one can notice a rapid increase in the population ("population explosion"), developed countries and Transition Countries are subject to sharp deterioration of population reproduction ("demographic crisis"), which is expressed in a rapid slowdown in population growth and in some cases of its natural losses (Russia), and also in the demographic ageing of the population.

Most developed countries have reached the stage of demographic maturity, characterized, on the one hand, by a low mortality level, and, on the other hand, by the low level of birth. The transition of industrially developed countries to the volume of economic space is directly linked to the tendency of the "population ageing", because people face so many needs (temptations) that, in some cases, the desire to have children is not different from any other utilitarian need, therefore the possibility to possess this or that thing becomes an obstacle for the increase of the family.

Taking into account the increasing role of the innovation component of the modern stage of scientific-technical progress, priority attention should be given to the migration of intellectuals-scientists, teachers and specialists of high and the highest qualification. The work of scientists and research workers is becoming the most important resource and the factor of development, first of all of innovation one, without which no country can achieve high socio-economic indicators. Therefore, the movement and consolidation of intellectuals are connected with the problems of creation of the corresponding infrastructure and mechanisms of adaptation in the host country. From the second half of the XX century one can notice the growing processes of purposeful attraction of intellectuals to developed countries to obtain economic benefits.

In the volume of the economic space the resources are directed to the place, where the costs are lower and efficiency is bigger. Russia, possessing the intellectual potential, created throughout many generations, and still having the possibility of reproduction of intellectual resources (concentrated in the academic institutions and establishments of higher education), with the existing system of motivation of scientific activity, is not able to use them properly and provide the necessary conditions for work and life.

In the context of the essential approaches to the definition of the economic space we should note that migration is a reliable source of economic well-being of the territorial units of any country and the region in general. For successful socio-economic policy we need to be able to predict the magnitude and direction of migration flows, to determine the factors of migration, to estimate its consequences, what is possible by means of constructing of corresponding models? In the 2000s the share of registered internal migrants of Russia's population was only 1,4% of the population. For comparison, in the USA this indicator constituted 13,7% of the population on average for the period of 2000-2006, in Canada 14,6%, in Japan 4,6% (Tyuryukanova, 2007).

However, it is necessary to note that international comparisons are difficult to make because of the existing differences in accounting methods. At present there are not many works devoted to the modeling of internal migration in Russia. Most of the research works have a descriptive and qualitative character. There is an urgent need for quantitative measurements of the links between internal migration and the economy of the country. One of the most comprehensive works in this area was published by Andrienko and Guriev in 2004 (Andrienko & Guriev, 2004) and dedicated to the analysis of interregional migration in the 90s. The authors describe one of the main barriers of migration – the poverty trap. In the 90s the poor population of the one third of Russian regions was in the traps, i.e. people had no opportunity to leave the region because they did not have sufficient funding for the move. There are almost no research works on modelling of migration in Russia on less aggregated data.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

But migrants go not to a particular region, but first of all to in a city, town, rural settlement. For example, conditions of employment not only in the region but at a specific local labor market are important for people. At the regional level (territorial, republican) the local labor market may not be formed, whereas in a certain city it is possible. Therefore the analysis of migration flows and the identification of factors of migration are necessary not only at the regional level, but also at the level of municipal units and cities. It requires the development and evaluation of models, taking into account the statistical information, existing in Russia. Migration may affect the interregional differentiation in labor market indicators and per capita income.

But, despite the fact, that in Russia the significant inter-regional differences in many socio-economic indicators are substantial, the volumes of registered migration of the population are considerably lower than in other countries of the world. In the 90s the trend of the volume of internal migration was decreasing, while, on the contrary, the differences between the regions were increasing. In the 2000s, in Russia the processes of convergence of per capita income and wages were observed. In these processes the role of internal migration of the population is great, especially in the current Russian situation. Impact of migration on wages, average income and unemployment rate in the regions is evident. One of the consequences of internal migration is the redistribution of labor resources, which leads to a change in the balance at the labor market, and as a result, to changes of interregional differentiation of these indicators.

There are two basic theories, suggesting various effects of migration on interregional differentiation in labor market indicators: neoclassical theory and the approach of the new economic geography. The existence of two conflicting theories is explained by two effects that are generated by migration of population: from the point of view of labor demand and labor supply. From the viewpoint of labor supply, migrant workers can reduce interregional differentiation, moving to a more perspective regions. Thus, the supply of labor in the departure region is decreasing and labor supply in the region of arrival is growing, as a result of which the salary in the departure region is growing and in the region of arrival it is reducing. From the point of view of the labor demand migration, on the contrary, results in the growth of regional differences. Since migrants lead to the growth of demand for goods and services in the region of arrival, it leads to increased demand for labor and, as a result, to the increase of salaries.

Thus, wages in the region of arrival continue to grow and interregional differences do not reduce. Neoclassical theory assumes that the effect of labor supply is dominant in comparison with the effect on labor demand. The approach of the new economic geography has the opposite position. Different preconditions are the basis of these theories, what leads to different results. There are not only the channels of the labor market when discussing the effects of migration on interregional differentiation, but remittances of migrants, investments, diffusion of technologies and others. In the works of Borjas, G., Fratesi, U., Riggi, M. separate flows of skilled and unskilled workers are investigated. The main factors of migration are economic factors, in particular per capita income. The most important directions of budget expenditures for migrants are expenditures on education and health. The presence of the problem of poverty traps is characterized by a positive coefficient between the migratory flow and the average per capita income in the region of departure.

If to present a theoretical model of migration, implying a non-monotonous connection between a migratory flow and per capita incomes in the region of departure, you can trace that there is some threshold value of per capita incomes, up to which the migration flow increases with the income growth, and after it the migration flow either does not change or decreases with the income growth in the region (Barrell, FitzGerald & Riley, 2007).

Cluster Analysis of Migration Processes in the Subjects of the Russian Federation

In the complex of economic problems in Russia the migration policy acquires a special importance. At the Federal level it is necessary; firstly, to determine the priorities and objectives of the migration policy, secondly, the differentiation of the federal and regional migration policies is necessary. In the Concept of the state migration policy, the migration policy is linked to the capacity of the labor market and socio-economic position of the subjects of the Russian Federation only in a streamlined liberal form. The implementation of such liberal migration policy may cause a deep crisis in employment sphere, especially in labor-abundant regions of the South of the country. Therefore, we need a more strict coordination of the migration policy with the situation at the labor market.

In General, because of incomplete information about the socio-economic development of the subjects of the Russian Federation, we can make a conclusion that migration processes in Russia have a spontaneous character. Migration flows are mostly to the regions with the largest population, and the lowest level of socio-economic development. The solution of the problem, revealed in several Northern clusters of the general problem can become a powerful tool for efficient practical solutions of the migration policy of the country.

CONCLUSION

Immigration has become a very important and in fact an integral factor of the modern life and long-term economic development of the host societies due to its range, stability and forwarding dynamics. Its national economic role is tend to increase. Most significant economic consequences of immigration and respectively their overall balance have positive character. Substantial and positive contribution of immigration to the economy of developed countries, confirmed by statistical data and research results stated in official documents of the governments of developed countries is clearly operated in a number of areas. Immigration is a very important source of workforce, the solution of structural problems of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the labor market, the resource ensuring the traditional sectors' operation, the dynamic growth of the knowledge economy's branches and overall balanced development of economic complexes of the host countries as well. It has a positive impact on the economic dynamics of the developed countries and plays an essential role in the production of their GDP. Admission of foreign experts and students contributes to the activation of innovative activity. The arrival of new cohorts of migrants promotes the decrease in inflation.

Apart from the obvious positive effects of immigration, there are its ambiguous consequences at which the possibility of temporary negative tendencies is admitted. Immigration can contribute to both improvement and deterioration of the indigenous population's welfare. It might have differential effects on employment rate and earnings of various groups of the local population. Being favourable to GDP growth, immigration in some cases ties up the dynamics of per capita index. Widespread use of cheap foreign and mostly low-skilled labor may lead to the reduction of capital-labor ratio, decelerating its productivity and production modernization. With the general positive impact of immigration on the scale of population's consumer demand there is a probability of their limitations in case of its downward pressure on aboriginals' incomes. If foreign students' training is a significant source of the export revenue, the increase in transfer of foreign workers and the expansion of imports, caused by immigration negatively affect the balance of payments on current accounts. Although nationwide state budget revenues related to immigration as a rule exceed the social expenses caused by it, yet at the local level inverse trends are often observed.

External economic effects of immigration, mediated by its political consequences have mainly negative character. Terrorist, criminogenic and ethno-political risks of economic agents' activity caused by immigration quite often entail additional revenues of receiving societies. However, their significance for the economy is generally relatively small.

Intensity and nature of immigration impact on the economy of the developed countries, being closely connected with the scales of the migration processes differ significantly in long-term and short-term plan. With the adaptation of production to the changed conditions of economic activity under the influence of foreigners' influx observing in the long-term plan, immigration promotes the growth of investments, output, labor demand, employment and earnings of the local population, the formation of the state budget surplus and a positive balance of payments on current transactions. Moreover, within a long period after the migration wave, with the outflow of foreigners who could not manage to adapt to the new environment, the proportion of integrated and more productive workers-immigrants increases. However, in the short-term plan immigration may negatively affect a number of indicators. Nevertheless, this influence is insignificant as a rule.

Economic effects of immigration show dependence on the structure of migration flows and the structure of the population of foreign origin. The integration of highly sought skilled foreign professionals who become a highly profitable asset of host societies and their arrival for quite a long period meet the long-term economic interests of developed countries.

Although the role of immigration in times of unfavourable economic conditions is little studied the trends found in the environment of economic recession provide a glimpse of some cyclic differences in the effects of immigration. In terms of a crisis, inconsistency of the economic role of immigration appears to be sharper, its positive contribution is weakened and the negative impact becomes more intense than in periods of positive economic dynamics.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Though the economy of the developed countries still needs labor force of foreign origin, the latter having significantly increased during the period of economic recovery in crisis times is excessive in relation to the reduced needs for it. This appears in strengthening its destabilizing impact on the labor market, the state budget and interethnic relations. At the same time the stability of demand for foreign experts and the continuous stimulation of their inflow confirm that immigration preserves important functions in the innovative development of the receiving countries.

Taking into account the demographic problems and structural disproportions of the developed countries' labor market and at the same time the migrants' quick reaction to open vacancies, their lower pretention and quite often high efficiency, in case of improvement of economic environment immigration may speed up the recovery.

Powerful driving forces of international migration of population determine a very significant potential for its further growth. Economic growth recovering in developed countries as well as in Russia will result in activating of the international labor exchange and increase of the national economic importance of immigration in the host countries.

The developed countries undertake considerable efforts to increase economic benefits from immigration and reduce the burden of revenues connected with it which are clearly traced in the logic of their migration policies. In immigration policy the accented economic interests of developed countries appear firstly in the selecting and attracting of demanded categories of economic migrants, primarily highly skilled ones; secondly, in reception rationalization of reunite family members and refugees; thirdly, in entry banning of undesirable foreigners including illegal penetration. The integration policy creates conditions for the active involvement of migrants in the host society to adapt, develop and make full use of their economic potential.

This policy is aimed at solving the problems of increasing of economic efficiency and social cohesion in society. Implementing measures in this sphere, host countries actually invest into the development of their economies. Foreign economic measures prevent the appearance of migration flows, being forced by political reasons, unemployment and poverty, and promote the voluntary repatriation of refugees and other categories of migrants who failed to integrate into the new environment, partially unloading the developed countries from the burden of the supporting of unemployed members of society. The most problematic and least efficient link of migration policy is the fight against illegal immigration. Failures of the authorities in the integration of Muslim communities and young migrants of the second and third generations are also obvious.

However the developed countries are in a constant search for more effective approaches to migration policy and the mechanisms of its implementation, responding flexibly to the changing situation allowing them to counteract inevitable negative consequences of migration processes and strengthen the positive ones.

The research of economic consequences of immigration in developed countries allows to make a number of conclusions that can be important for Russia. Experience of the developed countries indicates the multidimensionality of immigration consequences, existence of specific patterns and their specific expression in specific circumstances, delayed in time and cumulative nature of their parts being a considerable potential for developing both their constructive and destructive tendencies. Thus, special measures are necessary to guide these processes which are important to be considered in terms of large-scale immigration.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

As migration processes in Russia are comparatively young, their long-term positive consequences haven't fully appeared yet. This makes some negative short-term effects visible. The analysis of migration policies of developed countries indicates a number of its advantages, such as branching and flexibility of the institutional system, wide development of standard and legal frameworks, integrated approach and the diversity of practical tools that promote the development of corresponding measures and increase the efficiency of their implementation. The following seems to deserve a serious attention:

- System-based fight against illegal immigration, including cooperation with the countries of migrants' origin and transit;
- Coordination of measures of active migration policy aimed at attraction of foreign and migrated earlier local experts with innovative measures and general economic policy;
- Assistance in starting small business by migrants;
- Complex and massive support of migrants at the first stage of their stay in the country after moving;
- Ensuring arrival of the demanded categories of temporary low-skilled employees on a returnable basis;
- Creation of a special infrastructure for expansion of inflow of foreign students; - implementation of measures aimed at maintaining tolerant interethnic relations in society.

Under the conditions of the financial crisis narrowing of flows of foreign workers is planned. Revenue decline of the middle strata feeding student's migration is likely to lead to its weakening. However, as foreign experts believe, the circulation mobility of highly skilled professionals will be still high. Forecasts predict both the intensification of illegal migration due to more rigid restriction of legal entry and its weakening due to unfavorable market conditions. The crisis may deepen the socio-political instability in the world and provoke new flows of shelter seekers. As family reunion immigration is less subjected to economic factors it is likely to preserve its scales. In the context of worsening of the economic situation in migrants' countries - donors the returning movement of the latters is weakening. Due to divergent trends of development of individual migration flows, their common vector is not likely to change essentially in the short-term plan.

Foreign labor migration is a complex socio-economic phenomenon, which affects the development of regional economy, especially its staffing. At the same time foreign labor migration serves as a condition for balanced economic development of the region being supplementing resource of staffing in the region, but not substituting. The accounting of interregional differences in economic and social development is an essential condition in developing managerial decisions on the regulation of foreign labor migration processes for the balanced economic development of the region.

Differentiation of regions according to the number and intensity of flows of foreign labor migration is caused by differences of socio-economic parameters of the development of subjects of the Russian Federation. All subjects of the Russian Federation should be divided into three types: regions with high, medium and low potential migration load. Each one is identified by specific determinants of socio-economic development which affect the intensity of migration flows.

Foreign labor migration processes are characterized by dual impact on staffing of the regional economy. On the one hand, foreign workers are able to compensate the reduction in the labor force caused by

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the demographic crisis and supply staffing in case of insufficient domestic sources. On the other hand, expansion of foreign labor migration affects the increase of stringency on the regional labor market. Thus, for taking managerial decisions on regulation of migration processes, their scope and intensity for ensuring effective regional economic development, a quantitative assessment of the impact of foreign labor migration on the economic development of the region and its staffing is required.

Attracting of foreign labor migrants should be considered as a tool for regulating the efficient functioning of the economy of the region. Consequently, the migration policy should meet the changing needs of the regional economy in staffing in time. The analysis of migration legislation of the Russian Federation showed that labor migration processes begin with an assessment of the region's needs for foreign labor, which is mainly based on only one source of information – applications of business subjects for attraction of foreign workers. The research of both the structure of economy's staffing needs and the structure of the existing workforce in the region in the context of economic activities and levels of professional education should serve as basis to identify opportunity of staffing by internal sources and the regional economy's demand for foreign workers. The mechanism of regulation of staffing of the regional economy along with the resources of foreign labor migration can be used in management decision making for staffing optimization, increasing the balanced development of the regional economy for the current and prospective periods on the basis of the planned rates of regional economic development and changes in number of its resident population.

It is reasonable to distinguish subjects of the Russian Federation on the basis of an assessment of potential intensity of foreign labor flows to the region with the use of a system of indicators to characterize economic development, demographic situation, a standard of living, social tension and the development of the regional infrastructure, in particular: fixed capital investments per capita, a share of employed in the informal sector in the total employment, average prices on the primary housing market and others. Formation of the mechanism of foreign labor migration regulation becomes an element of the staffing of the regional economy.

To model interregional migration in Russia it is necessary:

- To analyze the changes of statistical methodology of migrants' accounting;
- To take into account the heterogeneity of regions, to define "special" regions, to build up models for couples of regions at different distances;
- To structure factors of migration and build integrated indices characterizing each of groups of factors;
- To develop econometric models that take into account the nonlinearity of interrelation of migration with income rates.

While classifying migration and socio-economic development of the subjects of the Russian Federation a negative relationship between the rate of migration growth and investments in fixed capital per capita and per capita incomes, on the one hand, and the direct relationship between migration flows and population was revealed. Migration flows are directed mostly to the regions with the largest population, and the lowest level of socio-economic development. The latter again confirms the spontaneous nature of migration processes, insufficient information on the socio-economic development of the subjects of the Russian Federation. According to the results of cluster analysis it is recommended to divide subjects of the Federation into districts on the basis of intensity of possible migration flows based on indicators of population density threshold, labor market saturation and the level of socio-economic development. It is

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

recommended to zone subjects of the Russian Federation on possible migration flows intensity: districts with the greatest maximum possibility of intensity; districts with average intensity; districts with weak intensity; districts with limited migration flows. According to the results of the cluster analysis it makes sense to divide subjects of the Russian Federation into districts on intensity of possible migration flows:

1. Regions with the greatest possible intensity;
2. Regions with an average intensity;
3. Regions with weak intensity;
4. Regions with limited migration flows.

Carrying out a balanced migration policy aimed at positive territorial movement of the population according to the capacity of the labor market and strategy of socio-economic development of each region will contribute to solving many social problems, in particular the problems of settling depopulated villages, the development of northern and eastern regions of Russia, restoring and development of infrastructure of these regions. The policy of distribution of state investments and stimulation of private ones as well as programs of development of road and housing construction should also facilitate this problem.

It is important to use "synthesizing" approach to the analysis of driving forces of migration where multiplicity of migration conditions are integrated. The three-block scheme of migration driving forces include: essential reasons of migration, global processes, intensifying migration, and the factors influencing the choice of country-destination. In this context it is possible to evaluate the potential of migration processes development and their influence on host societies.

The main tendencies in international migration at the turn of the XX-XXI centuries are the following: the rise of a new strong wave of economic migration and broad involvement highly qualified specialists into it, including scientists; rapid growth of illegal migrants' number; forced migration weakening, though it is nonlinear; stabilization and even some reduction in the proportion of immigrants from countries, ethnically and culturally distant from the receiving countries, and the intensification of migration between developed countries. The restriction of legal labor flows to developed countries and return flows from them are marked. An effect of immigration on the dynamics of poverty and social mobility is obvious. Immigration considerably influences the supply of resources necessary for economic growth, technologies of their use in the production process, aggregate demand, inflation and balance of payments on current transactions. The role of immigration in ensuring continuous and balanced functioning and growth of economy, which is not burden by accelerating inflation, is great. There are also differences in the effect of immigration on GDP, its per capita index and labor productivity. In strengthening the innovative capacity of host countries the role of intellectual flows is significant. It should be noted that in the economy of urban neighborhoods "ethnic business" carries out important functions. The impact of immigration on the functioning of the social infrastructure has contradictory character. Immigration is resulted in strengthening of terrorist and criminogenic threats, interethnic tensions that influence social and political conditions of economy's functioning, increasing budgetary expenses caused by increase of such socio-political risks. Thus taking into account the specified external effects of immigration it is necessary to calculate its fiscal consequences.

It is appropriate to use the three-level system-based characteristic of modern migration processes management, which along with the analysis of immigration and integration policy includes an assessment of the role of foreign economic mechanisms in voluntary repatriation of migrants, in reducing emigration, being forced by political reasons, poverty and unemployment, in closer coordination of migration

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and development issue. Migration policies should be focused on different terms and stages of migration processes, with the aim not only at present-day problems, but also at future; be guided not only by economic needs, but also political interests and humanitarian concerns. The development of integration trends within the EU can serve as an example of various directions of migration policy.

The creative accounting of foreign experience coordinated for the Russian national identity would facilitate immigration expenses and allow maximizing its potential for the benefit of the Russian society.

KEY TERMS AND DEFINITIONS

Economic Openness: 1. Economic openness is the recognition of the standards and laws of the world market. Assumes reasonable availability of the domestic market to foreign capital, goods, technology, information, labor force (Avdokushin E. F. (1999). International economic relations: M: ITC Marketing). 2. Economic openness, free trade is the most favorable rule of the game for leading economy (Pebro, M. (1994). International economic, monetary and financial relations, 1994). 3. The degree of openness of the national economy is determined by the lack of country "excessively large" export and import duties, the existence of a "reasonable" level of conversion of the national currency (Sachs, J.D., Warner, A.M. (1995). Natural resource abundance and economic growth // NBER Working paper series. Working paper 5398).

Economic Space: 1. this is a rich area containing many objects and relationships between them: human settlements, industrial enterprises, economically developed and recreation areas, transportation, and utilities etc. (Granberg A.G. (2000). Fundamentals of the regional economy). 2. Economic space is an abstract economic landscape dynamic resource allocation depending on market conditions and their location (Krugman, P. (1994). Rethinking International Trade).

Immigration: 1. (from lat. Immigro - dwell), entry (check) in the country on a permanent or temporary (usually long) stay of nationals of another country. Immigration is determined by a number of reasons (economic, political, religious, and other). Immigration has played a crucial role in settling some parts of the world and in the formation of the population of many countries. Has a significant. impact on the dynamics of the population. Immigration leads to the mixing of different ethnic groups, resulting in evolving a new nation (Rakovsky, S. Demographic encyclopedic dictionary). 2. Is the resettlement of citizens of one state in another country for permanent residence or for a long time. Immigration is not considered short-term business or tourist trip. The reason for immigration are the push factors and pull. The push factors can be poverty or persecution in the country where migrants leave; pull factors can be economic opportunities or freedom in the country to which they are directed (Economy. Explanatory dictionary. (2000). M.: INFRA-M"Publishing house "the Whole World"). 3. enter the country for temporary or permanent residence of citizens of other countries (Raizberg B.A., Lozovsky L.S. & Starodubtseva.E.B. (1999). The dictionary of Modern Economics. - 2nd ed., Corr. M.: INFRA-M).

International Labour Migration: 1. Is associated with moving to a permanent place of residence from one country to another (Demographic conceptual dictionary. (2003). Ed. by Rybak, A. the Center for social forecasting. M., 2003). 2. Is regulated by the Convention on the protection of the rights of all migrant workers, adopted by the UN General Assembly in resolution 45/158 of 18 April 1990, which

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

defines the term "migrant worker" as a person who is to be engaged, is engaged or has been engaged in a remunerated activity in the state of which he or she is not (Yudina, T. (2005). Sociology of migration). 3. Is a process cross-country movements of the labour force and specialists, acting as one of the sources of staffing of the economy (Parikova N. V. (2012). Foreign labour migration as a factor of regional economic development). 4. Migration represents a set of movements of people crossing the state border associated with employment and job search. Labour migration may be motivated by the desire to change the parameters of their own workplace and external to the residence conditions: socio-cultural, housing, environmental, climatic and other (Ivakhnyuk I. V. (2005). International labour migration, Moscow).

Labour Migration: 1. A set of displacements of the various social groups to implement their economic activities, the limited duration of the contract, agreement, resolution (Prudnikova T. A.(2007). International legal regulation of labour migration / Moscow). 2. Represents one of the conditions for the normal functioning of society, which can be achieved optimal allocation of labor resources in the country, which contributes to the equalization of the levels of economic development of the regions, overcoming socio-economic and cultural differences between urban village (Perevedentsev V.I. (1990). Methods study population migration. Moscow: Nauka). 3. Is an objective process of moving frames, which is inextricably linked with the development of the productive forces and production relations (Maslova I.S., 1976. Economic issues the reallocation of labour under socialism, Moscow).

Migration: 1. Is the process of spatial movement of the population, leading to its territorial redistribution. The actual migration from one area to another (in some countries registration in the new place of residence), the connection of a new residence with the sphere of employment, or study, or other activity) (Migrationology / Modern approaches to defining the essence of the concept "migration" //http://isfic.info/migran/). 2. Migration can be considered in a broad sense as the totality of any movement of people in space and in a more narrow sense, as a set of migrations of people connected with the change of their place of residence for a relatively long period of time (Perevedentsev V.I. (1975). Methods of studying the migration of the population. Moscow).

Chapter 16
An Endogenous Switching Model to Poverty Dynamic Assessment in Tunisia: A New Proposal

Amal Jmaii
Institut Supérieur de Gestion, Tunisia

ABSTRACT

This paper focus on the determinants of poverty dynamics in Tunisia by performing a two-stage endogenous model using a Bayesian algorithm to avoid missing data. Based on this approach author show that panel data analysis can be performed through potential variables such presented by the work of Donald B. Rubin. This contribution is rather empirical; researcher propose a method based on the concept of causal inference that enable to execute a panel data model using independent surveys. As the author assert the dependence between poverty status over time, they choose to use an endogenous switching model take into consideration the form of endogeneity caused by initial condition.

1. INTRODUCTION

Reducing poverty is a serious challenge for all countries. Over the last decade, the dynamics of poverty has been the subject of many empirical researches (Bane and Ellwood, 1986).

Generally, those who are experienced poverty cannot escape from his trap. Many economists have tried to find the origin of persistent poverty (Azariadis, 1996; Barrett & Swallow, 2006; Cappellari & Jenkins 2004), and wondered if we are poor because we are born poor or we are become poor over time. The literature present several explanations. Mainly, the failure of the economic systems, the weakness of the education programs, that may limit the opportunities to have a decent job and causes a higher unemployment rates, and exogenous shocks (Aliber, 2003). In the development countries, the weakness of infrastructure such as roads and communication, may limit poor people to have access to information or to the labor markets.

In particular, in Tunisia, government has implemented public policies to improve economic growth and to fight against poverty. As a consequence, the real consumption per capita has increased to hit 3.31 percent at 2005 and 2.5 at 2010 (2005 as base). The INS[1] report argue that poverty has increased face to a stable Gini index (36%) but considered very higher relative to other emerging countries. Despite this progress, poverty and inequalities between regions is one among the causes of the Tunisian revolution. A better identification of poverty leads to a better policies of fighting against poverty. Unfortunately, in Tunisia like the most developing countries, the knowledge of the group that belong to the poor class in developing countries is not entirely clear task. Lack of survey data necessary to analyze the patterns of income in the long term is a key reason to adopt a new methodology. For these reasons, studies on poverty dynamics in Tunisia are scarce. Among the few searches on Tunisia, we cite the work of Ben Rejeb (2008) who used pseudo-panel approach to estimate the permanent expenditures. In addition, Jmaii and Belhadj (2016) used fuzzy approach to run a dynamic analysis based on the Jalan-Ravallion framework.

In this paper, author propose a new approach based on multiple imputation and causal inference (Rubin, 2004). The methodology enable to compute a poverty rates that can reflect the real situation of poverty in Tunisia. Following the work of Rubin (2004) and based on Bayesian statistics, each variable was imputed from the observed data, taking into account the uncertainty associated with each step in the imputation process. Each complete base, thus generated, provides an estimate of the parameter of interest, and then a single estimator is obtained by calculating the mean of these estimates. Concretely, this paper study the determinants of poverty dynamics by individual socio-demographic characteristics considered stable over time.

The rest of the paper is structured as follows. Section 2 exposes methodology of the proposed approach. Section 3 presents the chosen model. In section 4, we detailed the data and the variables. Results are presented in the fifth section. Finally, section 6 concludes.

2. METHODOLOGY OF THE PROPOSED APPROACH

2.1. Potential Variable With Missing Data

Missing data is an unavoidable problem in the practice of statistics. Donald Rubin has formalized a causal model that allows to identify the assumptions that are necessary to support an observational study is similar to an experimental study (Rubin, 1987; Imbens & Rubin, 2009).

Rubin counterfactual model is based on two basic concepts: the causal statements and potential responses. Causal statements are also called treatment in the tradition of the counterfactual causal analysis. Each unit of analysis of a study should potentially be found in any of the examined causative states. In practice, this approach is close to the matching method in which researchers apply a treatment to a group in order to compare it with another group that did not receive the treatment. In fact, random assignment of an experiment ensures that each unit of analysis will be potentially found in a causal statement (Little and Rubin, 2014). Conceptually, fifty percent of the information are not observable to be able to estimate the causal effect. This is a missing data problem. This inability to observe two causal statements, simultaneously, for the same unit of analysis was named the fundamental problem of causal inference (Holland, 1986). According to this approach, and in the context of our analysis, panel data can be treated as a causal inference problem and a particularly case of missing data problem.

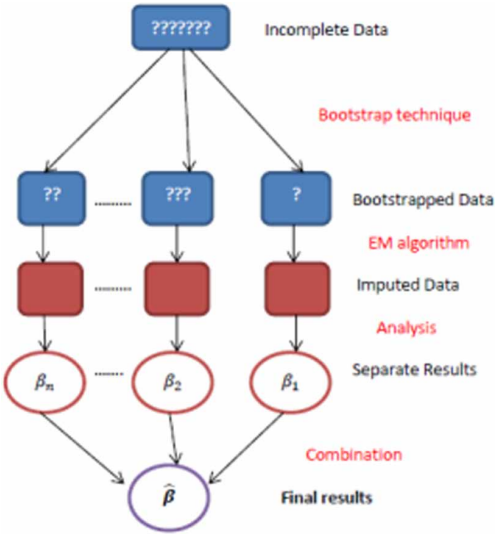
2.2. Pretreatment Step With Amelia Multiple Imputation Algorithm

Many alternative methods of missing data have been proposed and applied for the imputation of database. The first one is the Fully Conditionally Specified Models (FCS). This method is based on a modified version proposed by Gibbs sampler (White, Royston and Wood, 2011). Than a Bayesian algorithm was implemented in the package MI of the software R (Su, Yajima, Gelman and Hill, 2011). However, according to Van Buuren, Brand, Groothuis-Oudshoorn, and Rubin (2006) this approach has some theoretical weakness. Essentially, the incompatibility of the conditional densities. Hence, the appearance of the AMELIA package which is implemented in R. This algorithm represents a modified multivariate normal version, which takes into consideration the specified clustering of observations (Honaker and King, 2010).



Recently, James Honaker et al. (2011) have developed a more complete algorithm AMELIA II of multiple imputation program. The model is based on an assumption of normality $I \sim N_k\left(\mu,\Sigma\right)$, and therefore it requires some preliminary transformations of data. The EMB2 algorithm of Amelia II combines the classic EM algorithm with a bootstrap approach. For each draw, the data are estimated by bootstrap in order to simulate the uncertainty, and then the EM algorithm is executed to find the posterior estimate $\hat{\gamma}_{MAP}$ for bootstrapping data (see Figure 1).

3. THE SWITCHING ENDOGENOUS MODEL

3.1. Choice and Modeling

The main idea of our paper is that present poverty status depends from the past poverty. However the expected correlation over time between unobservable will then cause a sample selection bias created by the called "initial conditions problem" (Heckman, 1978). Among many solutions to solve, the problem

Figure 1. AMELIA II of multiple imputation program

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is the use of a recursive bivariate probit model (Roodman, 2011) that assume the existence of a correlation between the two-probit equations distribution of poverty (Newman and Canagarajah, 2000). Moreover, an alternative solution is to use an endogenous switching model (Miranda and Rabe-Hesketh, 2006; Wilde, 2000) which takes into account the endogeneity and dynamic (Azar, 2012) of the dummy explanatory variable. In fact, sample selection problem and endogenous switching are among the most known problems in the economics and statistics literature. This problem exists because the standard estimation techniques enable to correct the bias caused by the correlation of unobserved factors with the unobserved factors caused by the switch process (Heckman, 1978).

In the endogenous problem, the response p_{it} linked to the ith individual at time t is observed. We assume that the present poverty status p_{it} depend on the past poverty $p_{i-1,t}$, which is an endogenous dummy variable, and a vector (K × 1) of other explanatory variables, Xi (we include the constant term). We define $p_{i-1,t}$ similar to p_{it} with S × 1 vector of explanatory variables, Zi. author assume that the two vectors Zi and Xi could contain the same elements.

We were inspired from the works of [15] to formulate our model as an equation system for two unobserved (i.e., latent) responses. Following the reasoning of [5] and using a bivariate probit model, we assume that p_{it} is distributed as follow:

$$p_{it}^{*} = X'_{it}\beta + \alpha p_{i,t-1} + \varepsilon_{it} \tag{1}$$

where p_{it}^{*} is unobserved continuous variable, β represent the parameters of the model (to be estimated), α represents the associated coefficient of our endogenous dummy variable $p_{i-1,t}$, ε_{it} the error term, and p_{it} is a dummy variable that can take e value 1 if $p_{it}^{*} \succ 0$ and 0 otherwise.

Similarly, the switching equation is specified as:

$$p_{i,t-1}^{*} = Z'_{i,t-1}\theta + v_{i,t-1} \tag{2}$$

Same as Equation (1), $p_{i,t-1}^{*}$ is unobserved continuous variable, θ is the vector of parameters, and $v_{i,t-1}$ represent the residual term. To deal with the suspected endogenous of the variable, author use endogenous switching model to avoid the sample bias.

Moreover, this model enable to calculate an auto-correlation term (ρ) to test the robustness of the proposed model. $p_{i-1,t}$ is considered as exogenous (in Equation 1), if and only if $\rho = 0$. In this case, a sample probit regression can gives consistent estimators for the parameters of the model. However, if $\rho = 0$, this ordinary regression gives inconsistent estimators, evidently, because $p_{i-1,t}$ is correlated to ε_{it}.

In fact, the model describes two status of poverty: the "basis poverty" and the "poverty transition." Then we can rewrite the model as follow:

$$\text{Basis poverty } p_r\left(p_{i,t-1}\right) = \varphi\left(z_{i,t-1}, \theta\right)' \tag{3}$$

$$\text{Transition poverty } p_r\left(p_{it} = 1 / p_{i,t-1} = 1\right) = \varphi\left(\left[p_{i,t-1}\beta_1 + \left(1 - p_{i,t-1}\right)\beta_2\right]X'_{it}\right) \tag{4}$$

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

3.2. State Dependence

This study follows the works of Cappellari and Jenkins (2004) to distinguish between Aggregate State Dependence (ASD) and True State Dependence (TSD). The first one (ASD) does not take into account the individual heterogeneity. It represents the difference between the conditional probability of being poor at time t given that it was poor at t-1, and the conditional probability of being poor at time t given that it was not poor at t-1. Actually, it represents the difference between poverty persistence and poverty transitory (entry):

$$ASD = \frac{\sum_{s\in(p_{st-1}=1)} p_r\left(p_{st}=1 \setminus p_{s,t\text{-}1}=1\right)}{\sum_s p_{s,t\text{-}1}} - \frac{\sum_{s\in(p_{st-1}=0)} p_r\left(p_{st}=1 \setminus p_{s,t\text{-}1}=0\right)}{\sum_s \left(1 - p_{s,t\text{-}1}\right)} \quad (5)$$

On other hand, we measure the TSD as the rising probability of being poor on t caused by the poverty on t-1, with control to the individual heterogeneity. The chosen model assume that each component of X_{it}' (in the transition equation) may present a various impact on the status of poverty on "t" conditionally to poverty status on "t-1":

$$GSD = N^{-1} \sum_{i=1,\ldots n} \left[\hat{p}_r\left(p_{it}=1 \setminus p_{i,t-1}=1\right) - \hat{p}_r\left(p_{it}=1 \setminus p_{i,t-1}=0\right)\right] \quad (6)$$

4. DATA SOURCE AND VARIABLES DEFINITION

To analyze poverty dynamics in Tunisia, we chose households consumption surveys, INS for 2005 and 2010 as the source of the used databases. In the two period, individuals who were born in specific years (for example, 1984-1975, or who are 21 to 30 years old in 2005), and had some observed household characteristics were selected. Within our methodology, household's heads as well as their partners, their children and other dependents and relatives have been considered. The main idea of the proposed methodology is that we impute potential variables to panelized the used database through a Bayesian algorithm. Evidently, to impute these variables, researcher need some characteristics linked to the individuals:

- **Generation (4):** People who were born between 1984 and 1975, between 1974 and 1965, between 1964 and 1955, or between 1954 and 1945;
- **Sex (2):** Man or Woman;
- **Education (4):** Illiterate, Primary level, Secondary level and High level;
- **Areas (6):** Urban Greater Tunis, Rural Greater Tunis, Urban East, Rural East, Urban West, Rural West;
- **Employment [4] (4):** Inactive, Salaried, Independent, and Unemployed.

Proceeding from the current literatures, we assume that individuals who were poor in 2005 and remain poor in 2010, after five years, are chronically poor.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Descriptive statistics show that woman dominate the sample with a percentage of 53.8%. Those individuals who were born between 1984 and 1975 represents 31.5% of total sample, following by those who were born between 1974 and 1965 by 27.4%, those who were born between 1964 and 1955 represents 24.9% and finally those who were born between 1954 and 1945 represents 16.1% (see Table 1).

Illiterate Individuals represent 21% of total sample and those who have a primary educational level represents 38.6%. Individuals who have secondary educational level represents 29.4% and those who have a higher educational level represents 10.7%.

Our statistics highlight the large size of urban East, at the two years, compared to other regions (27.8% at 2005 and 28.9% at 2010), followed by the great Tunis at 2005 by 18.9% but at 2010 it is the urban west by 19.5% than the other regions. In this paper, total expenditure is taken as a standard of living indicator. Indeed, consumption expenditure are further characterize by their stability over time compared to income fluctuations. They provide information about the degree of satisfaction that comes from the consumption of good and services.

Table 1. Statistic descriptive of the imputed data

Parameters	Mean	Parameters	Mean
sex		Employment2010	
men	0.461	Inactive	0.434

5. RESULTS AND INTERPRETATIONS

According to the Student test, the auto-correlation coefficient ρ is statistically significant with a p-value different of zero. This is mean that an individual how was poor in 2005 has a higher probability to be poor in 2010.

With regard to the generation variables, we found that all coefficients are statistically significant and negative for the older generation. This sign indicates that the probability of being poor is greater for younger individuals. These individuals are less likely to be initially poor than the other generation. This find might be explained by the fact that this generation was more formed in terms of education system compared to others. As a result, they had more chance of having an employment than others.

Regarding to the educational level effects, we point the similar probabilities for both chronic and transient poverty for individuals whose educational level is primary or illiterate. These groups might suffer from periodical changes in their status.

Results show also that Genuine State Dependence (GSD) explains 11 per cent of poverty during the analyzed period. This prove that observed poverty depends on the past of poverty state after controlling individuals heterogeneities.

Finally, our study shows that around 61 per cent of total observed poverty (0.49) is due to the origin of a stationary propension of poverty (i.e. Chronic condition) while 39 per cent coming from transient poverty. When we compare different poverty lines, we highlight similar results (see Table 2).

Table 2. Switching model results

6. CONCLUSION

Most works on poverty dynamics, in developing country, consisted in measuring and identifying correlated variables to chronic and transient poverty. To execute such analysis panel data are recommended. However, in most developing countries, lack of survey data necessary to analyze the patterns of consumption in the long term is the reason for the scarcity of work on poverty dynamics. As a result, researchers are not able to conduct an ex-post dynamic analysis of poverty. In this paper author, propose a new approach enable to panelized the database through Rubin causal model. We use a Bayesian algorithm enable us to impute potential variables and then to run a switching endogenous probit model. The importance of this model is that it takes into account the endogenous nature of poverty.

Based on consumer household surveys for the two year 2005 and 2010, in Tunisia, this work has yielded several results that would help to better understand the phenomenon of poverty dynamics, its contours and its determinants. Poverty in Tunisia is mostly chronic (62%). Individuals how live in rural west are the most vulnerable. Results show also that, ceteris paribus, a higher level of education increases the probability of escaping from poverty.

In sum, the importance of this paper is the estimate of the poverty dynamics components through a new approach, which allow executing a panel data analysis even when we have independent surveys. With regard to results, it appears that causal inference may be a good tool of measuring poverty. All these finds are encouraging in terms of public policy since it suggests a new approach to poverty dynamics analysis in the case of non-panelized data, but they still insufficient and requires deepening.

Chapter 17
FDI, Urbanization, and Economic Growth Linkages in India and China

Sudhakar Patra
Ravenshaw University, India

ABSTRACT

The rapid urbanization and economic growth during new round of globalization is largely due to the flows of Foreign Direct Investment (FDI). In this context the objectives of this chapter is to analyze the causality and linkage among urbanization, GDP and foreign direct investment in China and India with the help of secondary data from 1979 to 2012. It focuses on determinants and pattern of FDI flow in China and India. The study observes a significant positive correlation between urbanization and flow of FDI to a particular region both in China and India. The rate of growth of FDI is significantly influenced by rate of growth of urban population at 10 per cent level of significance and by rate of growth of per capita GDP at 1 percent level of significance. The study also highlights the causality and linkage between urbanization and FDI inflow with evidences from China and India.

INTRODUCTION

Foreign direct investment is a direct investment into production or business in a country by an individual or company of another country, either by buying a company in the target country. It has strong linkages with economic growth and urbanization of a country. Urbanization plays a huge role in stimulating growth of a country. China has developed tremendously after the country launched its reforms and adopted its open door policy in 1978. For three decades, China has gained a two-digit annual growth rate on average when it gradually deviated away from the traditional doctrines of a central-planned economy and put into practice the market oriented economy. With the rapid economic development, cities, as centers for economic activities, have been expanding at an unprecedented speed. Urbanization in China has taken on new dimensions as a result of increasing globalization since introduction of economic reforms. The urban growth and other economic activities during new round of globalization can be measured largely

by the inflows and outflows of Foreign Direct Investment (FDI) which has become one of the driving forces binding countries into closer economic interdependence, and it continues to expand. The rapid increase in FDI flows has generated considerable impact on industrialization and urbanization in China. The role of foreign direct investments in the growth and urbanization of China and India has captured the attention of many researchers and analysts. China has historically attracted more FDI than India as a share of GDP, particularly in the early stage of its economic transformation. China achieved a significant growth rate of over 9 percent per year during 1990 to 2010 which was highest in the world during that period. This achievement was mainly due to adoption of radical changes and huge inflow of FDI to Chinese cities. China used to be one of the most closed economies in terms of policy toward foreign investment and external debt. Starting from virtually no foreign-owned firms on Chinese soil before 1979, China has now become one of the largest developing host countries for foreign investment. The coastal region enjoys more growth than inland region and most of the FDI (84 per cent) in China is invested in coastal region due to higher urbanization (Heid & Ries, 1996). China's need for FDI was related to its export oriented industrial structure – for example, it created special economic zones to attract foreign investment by exempting investors from regulations applicable elsewhere in China. There exist significant positive correlation between urbanization and flow of FDI to a particular region both in china and India. In this context, the objective of the present study is to analyze the causality and linkage between urbanization and FDI inflow with evidences from China and India.

REVIEW OF LITERATURE

There is plethora of literature and research studies on relationship among urbanization, inflow of FDI and GDP growth rates. Henderson (2000) in his study mentioned that cities are becoming the focal points of global and national economies. The evolution of the economic geography of developing countries in the process of urbanization has followed an urban growth pattern that differs from that of earlier industrializing countries, which urbanized much slowly. Yusuf, Altaf, and Nabeshima (2000) stated that the prominent contributors to successful urbanization include specialization in innovative or income elastic economic sectors, favorable national government policies in such areas as investment and infrastructure, economic development leadership from local public or private sectors, flexibility and openness toward new and emerging industrial ensembles. China's urban policy has shifted with the economic boom since 1979. Georgieva (1998) mentioned that the efforts to integrate investment and environmental policies are helped by the growing realization that the environmental and financial crises in developing countries have shared roots and responses. Gentry are an optimistic promoter for FDI; in his conclusion he shows that only FDI can meet the need for environmental infrastructure (Graham, 2000). Chen, Chang and Zhang (1995) study the effect of FDI on China's output and found that the FDI has a positive impact on the output growth between 1978 and 1990. Using cross-country data, Wei (1995b) found that despite the large amount of FDI China has received in recent years, the country still appears to host too little FDI compared to an 'average' host country. Heid and Ries (1996) study 931 joint ventures in 54 cities from 1984 to 1991. They intentionally exclude investments by overseas Chinese (Hong Kong, Macau, Singapore) which probably have a different set of location determinants due to familial, linguistic, and cultural ties. Their conditional logit regression shows that cities with good infrastructure, established industrial base and foreign investment presence are more attractive to investors. Wei (1995a) also looked

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

at individual cities. He found clear evidence that in the late 1980s, FDIs contribute to higher growth of the cities.

Kinoshita (1998) examined the data from a special survey conducted by the World Bank in 1992 on 468 firms in eight cities in China (six located in coastal provinces and two in inland cities). She investigates the possible effects of FDI on improving a firm's total factor productivity during the 1990–1992 periods. She finds no evidence that foreign investment helps increase the productivity growth of local firms via foreign joint ventures, foreign linkages, and the mere presence of foreign firms in the industry. Hence, she concludes that opening up to foreign investments is not sufficient for a country to benefit from foreign technology spillovers. Branstetter and Feenstra (1999) have an interesting working paper, which does look at FDI in China at the provincial level. However, their focus is different. They use 29 provincial data over the period 1984–1995 to estimate the structural parameters of government's welfare function. They want to examine the tradeoff between the benefits of increased trade and FDI against the losses incurred by state-owned enterprises as a result of such liberalization. Indeed, they observe that the government places much heavier weights on the output of the state-owned enterprises than on consumer welfare, although such preference has declined somewhat over time. They hence post skepticism on China's entering into the WTO. Similar to the study is a paper by Cheng and Kwan (1999). They look at data from 29 provinces from 1986 to 1995 and observe agglomeration effects of foreign capital stock. However, there is an important fact that none of these studies has taken into account the scale of FDI and that is the big differences in the scale and nature of FDIs in the 1980s and the 1990s. In his important paper, Naughton (1996) points out the critical role that Hong Kong and Taiwan has played on the FDI in Guangdong and Fujian provinces, especially in the 1980s and early 1990s.

OBJECTIVE OF THE STUDY, DATA SOURCES AND METHODOLOGY

The objective of the study is to analyze the trend of FDI in China and India and linkage with urbanization and GDP. It also investigates the determinants of flow of FDI and compares policy related to foreign direct Investment in India and China. The study is based on secondary data collected from Chinese statistical Year Book, Economic Survey, India, Reserve Bank Database and various websites. The statistical methods like mean, t test, regression and econometric methods like Vector auto regression, and graphical methods of bar diagram and line graphs are used for analysis.

URBANIZATION, FDI AND GROWTH IN CHINA FROM 1979 TO 2010

China was one of the most closed economies in terms of policy toward foreign investment and external debt till 1978. Before 1979, virtually no foreign-owned firms were operating in China, nor did China have many external loans. Chinese leaders used to take pride in this fact. The foreign aid volunteered by foreign governments or international organizations was viewed with suspicion. For example, after the great 1976 earthquake in Tangshang, the Chinese government refused an aid offer from the International Red Cross. This attitude toward foreign money took a dramatic turn in 1979 when Deng Xiaoping introduced economic reform and initiated the "open door policy." Several factors contributed to this change. Two primary ones are (1) the disastrous economic performance under rigid central planning before 1979 and (2) the glittering examples of Japan and the four Asian "tigers," particularly Hong Kong and Taiwan.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Foreign capital going into China mainly takes the form of loans. In 1991, the value of FDI was slightly more than 60 percent of that of loans. Over the period 1990-91, the single fastest growing item in non-FDI foreign capital inflow was, in fact, portfolio investment in the form of Chinese bonds and equities purchased by foreigners. The urban population, FDI and per capita GDP growth are given in Table 1.

Table 1. Urban population, FDI and GDP in China from 1979 to 2011

Year	Urban Population (Million)	Urban Residents as Percent of Total	Growth Rate of Urban Population (Percent)	Actual FDI (In Million USD)	FDI Growth Rate (Percent)	Per Capita GDP Growth

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

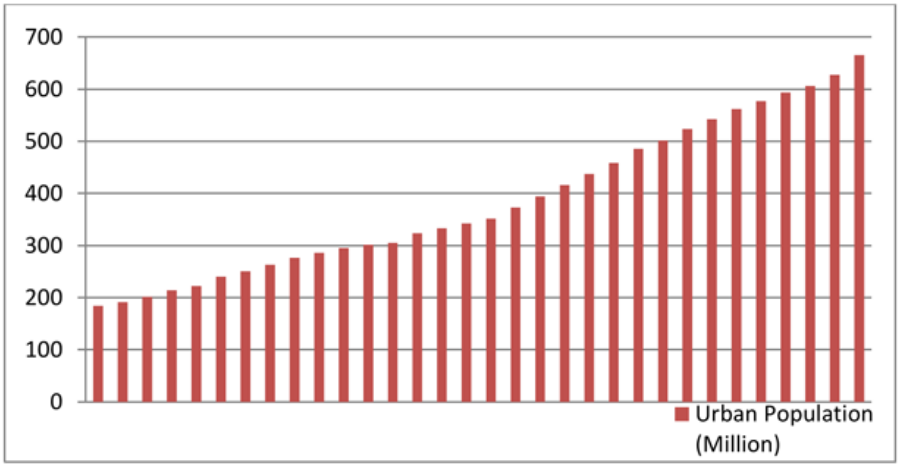
The urban population was only 184.98 million in 1979 which increased to 665.57 million in 2010 with average growth rate of urban population of 4.32 per cent per year. The total FDI in China was only 109 million USD in 1979 which increased significantly to 114734 million USD in 2010. The average FDI growth rate was 45.25 per cent which contributed significantly to industrialization and urbanization. FDI had negative growth in 1999 and 2009. The average real per capita growth rate was 9.64 per cent which is highest compared to all countries of the world during the same period.

Granger Causality Wald test was conducted to test the causality among rate of growth of FDI, rate of growth of urban population and rate of growth of per capita GDP. It was found that the rate of growth of FDI is significantly influenced by rate of growth of urban population at 10 per cent level of significance and by rate of growth of per capita GDP at 1 per cent level of significance.

The bar diagram shows the trend of urban population from 1979 to 2010. The Figure-1 indicates that there was rapid increase in urban population in recent years.

The bar diagram (Figure 2) of FDI inflow to China indicates that there was less growth of FDI during 1994 to 2000 but it increased significantly in recent years reaching 114734 million USD in 2010.

Figure 1. Urban population (million) from 1979 to 2010



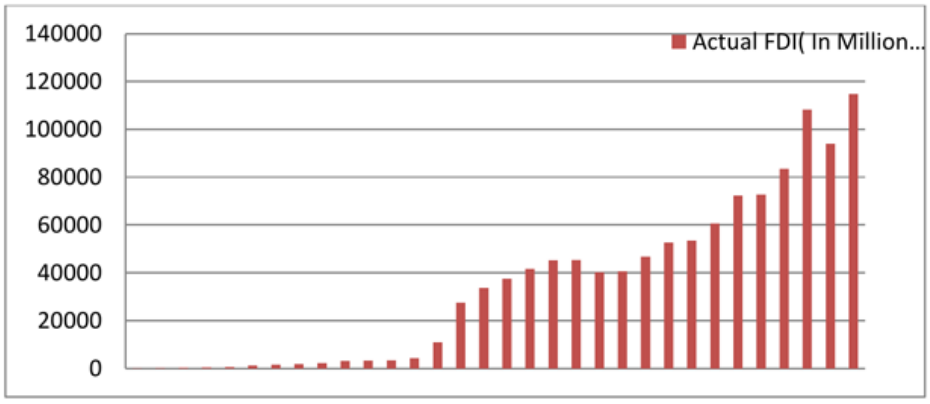


Figure 2. Actual FDI inflow to China (in million USD)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Least Square Trend of Urban Population

The trend of urban population and FDI in China was calculated through least square equation as stated below.

$U_t = a + b\ t + €$

$U_t = 131.61 + 15.56\ t$ where U_t = Urban Population in China at time t

(t = 35.24, SE= 0.44 and $R^2 = 0.98$)

There is significant positive slope and coefficient and urban population increases at high rate every year.

Least Square Trend of FDI to China from 1979 to 2010

$F_t = a + b\ t + €$ Where F_t = Foreign Direct Investment at time t

The trend equation with help of data is stated below

$F_t = -22855.99 + 3480.07\ t$

FDI has also positive and significant trend with large coefficient of 3480.07.

URBANIZATION AND FDI LINKAGE

Urbanization and FDI are closely interlinked. In China FDI was initially invested in four cities having special economic zones which promoted urbanization there. The proportion of the population in urban centers increased with development driven by investment of FDI (The World Bank, 1999). Hence a linear regression was done with secondary data as shown below.

Urban population = F (FDI)

$U_t = a + b\ F_t + €$

The result from time series data is as follows

$U_t = 247.38 + 0.004\ F_t$

(t = 19.09, SE = 0.0002, $R^2 = 0.92$)

The regression coefficient 0.004 is positive and highly significant as t value is obtained as very high, 19.09.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Since there are two way relations between urbanization and FDI, a linear regression was conducted with FDI as a function of urbanization. The coefficient (230.15) is positive and significant.

$F_t = a + b\ U_t$

The results from data from 1979 to 2010 are as follows

$F_t = -54305.75 + 230.15\ U_t$

$(t = 19.23, SE = 12.06, R^2 = 0.92)$

The FDI and per capita GDP are two significant determinants of urbanization. Urban Population was considered as a function of both FDI and Per capita GDP.

The function is as follows

Urban Population = F (FDI and GDP)

The result of regression is as follows

$U_t = 119.26 - 0.0016\ F_t + 0.11\ G_t$ Where G_t = Per Capita real GDP

Mackinnon P value Z (t) = 0.99

The regression coefficients are also significant.

Vector auto Regression (BASIC VAR) was also conducted to include lagged variables in the regression equation. It was observed that growth rate of urban population in the previous year has significant influence on growth rate of FDI in the current year. (P value=0.037). The coefficient is significant at 5 percent level of significance.

FOREIGN DIRECT INVESTMENT IN INDIA

Economic reforms by Indian government in 1991 makes the country as one of the prominent performer of global economies by placing the country as the 4th largest and the 2nd fastest growing economy in the world. India also ranks as the 11th largest economy in terms of industrial output and has the 3rd largest pool of scientific and technical manpower. Continued economic liberalization since 1991 and its overall direction remained the same over the years. Hence FDI in India has increased manifold since 1991 irrespective of the ruling party over the years, as there is a growing consensus and commitments among political parties to follow liberal foreign investment policy so that sustained economic growth can be achieved. Further, in order to study the impact of economic reforms and FDI policy on the magnitude of FDI inflows, quantitative information is needed on broad dimensions of FDI and its distribution across sectors and regions. The IT industry is one of the booming sectors in India. At present India is the leading country pertaining to the IT industry in the Asia -Pacific region. With more international companies entering the industry, the Foreign Direct Investments in India has been phenomenon over the year. The

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

rapid development of the telecommunication sector was due to the FDI inflows in form of international players entering the market and transfer of advanced technologies.

FDI inflows to India remained sluggish, when global FDI flows to emerging market economies (EMEs) had recovered in 2010-11, despite sound domestic economic performance ahead of global recovery. FDI inflows to India witnessed significant moderation in 2010-11 while other EMEs in Asia and Latin America received large inflows. This had raised concerns in the wake of widening current account deficit in India beyond the perceived sustainable level of 3.0 per cent of GDP during April-December 2010. This also assumes significance as FDI is generally known to be the most stable component of capital flows needed to finance the current account deficit. Moreover, it adds to investible resources, provides access to advanced technologies, assists in gaining production know-how and promotes exports. A perusal of India's FDI policy vis-à-vis other major (EMEs) reveals that though India's approach towards foreign investment has been relatively conservative to begin with, it progressively started catching up with the more liberalized policy stance of other EMEs from the early 1990s onwards, inter alia in terms of wider access to different sectors of the economy, ease of starting business, repatriation of dividend and profits and relaxations regarding norms for owning equity. This progressive liberalization, coupled with considerable improvement in terms of macroeconomic fundamentals, reflected in growing size of FDI flows to the country that increased nearly 5 fold during first decade of the present millennium.

Though the liberal policy stance and strong economic fundamentals appear to have driven the steep rise in FDI flows in India over past one decade and sustained their momentum even during the period of global economic crisis (2008-09 and 2009-10), the subsequent moderation in investment flows despite faster recovery from the crisis period appears somewhat inexplicable. With the tripling of the FDI flows to emerging economies during the pre-crisis period of the 2000s, India also received large FDI inflows with its robust domestic economic performance. The attractiveness of India as a preferred investment destination could be ascertained from the large increase in FDI inflows to India, which rose from around US$ 6 billion in 2001-02 to almost US$ 38 billion in 2008-09. The significant increase in FDI inflows to India reflected the impact of liberalization of the economy since the early 1990s as well as gradual opening up of the capital account. As part of the capital account liberalization, FDI was gradually allowed in almost all sectors, except a few on grounds of strategic importance, subject to compliance of sector specific rules and regulations. The large and stable FDI flows also increasingly financed the current account deficit over the period. Due global recession in 2008, when there was a significant deceleration in global FDI flows during 2009-10, the decline in FDI flows to India was relatively moderate reflecting robust equity flows on the back of strong rebound in domestic growth ahead of global recovery and steady reinvested earnings (with a share of almost 25 per cent) reflecting better profitability of foreign companies in India. However, when there had been some recovery in global FDI flows, especially driven by flows to Asian EMEs, during 2010-11, gross FDI equity inflows to India witnessed significant moderation. Gross equity FDI flows to India moderated to US$ 20.3 billion during 2010-11 from US$ 27.1 billion in the preceding year. FDI in India mainly flowed into services sector (with an average share of 41 per cent in the past five years) followed by manufacturing (around 23 per cent) and mainly routed through Mauritius (with an average share of 43 per cent in the past five years) followed by Singapore (around 11 per cent). However, the share of services declined over the years from almost 57 per cent in 2006-07 to about 30 per cent in 2010-11, while the shares of manufacturing, and 'others' largely comprising 'electricity and other power generation' increased over the same period. Sectoral information on the recent trends in FDI flows to India show that the moderation in gross equity FDI flows during

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2010-11 has been mainly driven by sectors such as 'construction, real estate and mining' and services such as 'business and financial services'.

There are number of measures announced by the Government of India on April 1, 2011 to further liberalize the FDI policy to promote FDI inflows to India. These measures, inter alia included (i) allowing issuance of equity shares against non-cash transactions such as import of capital goods under the approval route, (ii) removal of the condition of prior approval in case of existing joint ventures/technical collaborations in the 'same field', (iii) providing the flexibility to companies to prescribe a conversion formula subject to FEMA/SEBI guidelines instead of specifying the price of convertible instruments upfront, (iv) simplifying the procedures for classification of companies into two categories – 'companies owned or controlled by foreign investors' and 'companies owned and controlled by Indian residents' and (v) allowing FDI in the development and production of seeds and planting material without the stipulation of 'under controlled conditions'. These measures are expected to boost India's image as a preferred investment destination and attract FDI inflows to India in the near future.

The average growth of FDI in India is 48.57 per cent during last 14 years. There is high fluctuation in FDI inflow to India over the years as standard deviation of FDI is 677.53.

Linear Trend of FDI in India

$$FDI = - 108.04 + 144.87\ t$$

There is positive trend of FDI over time.

Regression results is as follows

$$GPCGDP = 4.51 + 0.0081\ GFDI$$

where GPCGDP = Growth of Per Capita GDP, GFDI = Growth of FDI)

There is positive effect of growth of FDI on growth of GDP in India but coefficient is not significant.

Comparison of FDI and Urbanization Between India and China

China and India are two emerging economies who have vast population. Both countries have long fascinated Western policy makers and analysts, but, at least until recently, they were fairly small players in the world economy. The emergence of China as a big economic power has been accompanied by a more relaxed, albeit still important, economic transformation in India. China focused on industrial production while India focused on services. China's rise has been simply extraordinary – in 2010, its economy was 47 times larger than it was in 1980. China and India had similar levels of per capita GDP (at market exchange rates) in 1980, but China grew much faster and had overtaken India by the early 1990s. Since then growth in China has been so fast that its per capita income is now more than three and a half times that of India. China launched its economic transformation by using abundant, low-wage labour to establish manufacturing for export industries. In contrast, India developed a service export sector focused on IT and BPO. As a consequence India had a much lower rate of investment than China and therefore 'capital deepening' was less prevalent. The basic differences between two countries with regard to urbanization and FDI are as stated below.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. China derived substantial benefits from foreign direct investment – China encouraged FDI by multinationals looking to set up export-oriented manufacturing operations, and was able to benefit from foreign intellectual property and know-how. In contrast, India followed an import-substitution policy and relied on domestic resource mobilization and domestic firms.
2. China reformed earlier and more aggressively than India - China began reforming its closed, centrally planned, non-market economy in 1978. In contrast, India always had a large private sector, but its product, input and labor markets were subject to rigid state controls until the hesitant and piecemeal reforms of the 1980s. Only after experiencing a serious macroeconomic crisis in 1991, did the reform effort become more determined and the reforms broader. The FDI in India and China are shown below in Table 2.

The trend of FDI in India and China is shown in Figure 3. There is significant increasing trend of FDI in china from 1990 to 2010 but FDI trend is India is not encouraging.

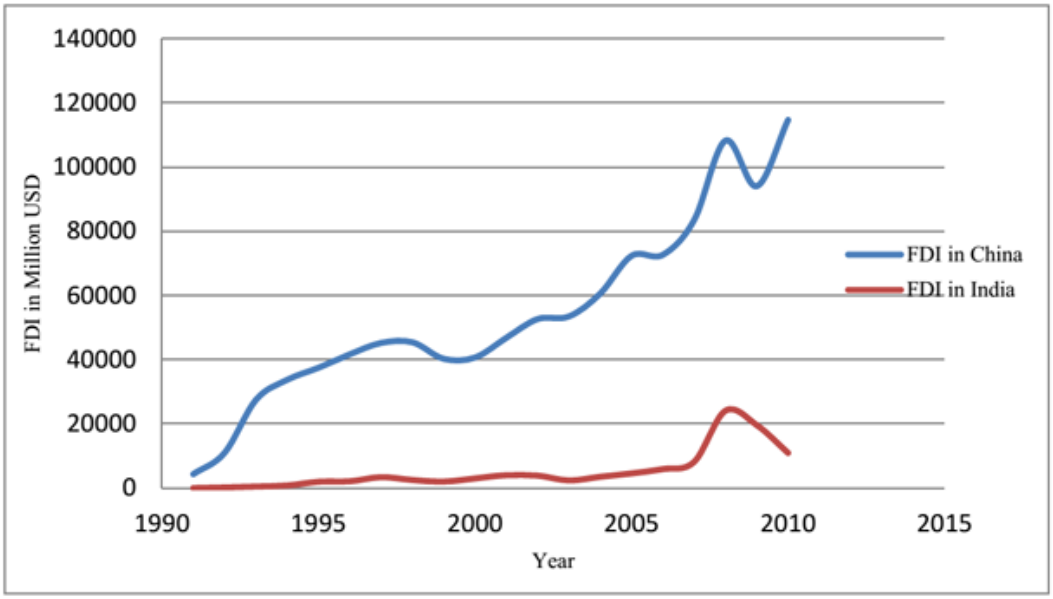

Table 2. Foreign direct investment in China and India (in million USD)

Year	FDI in China (In Million USD)	FDI in India (In Million USD)	FDI in India as Percent of FDI in China
1991	4366	74	1.69

Figure 3. Trends of FDI in China and India

CRITICAL REVIEW OF FDI POLICY IN INDIA AND CHINA

Due to sustained reforms in China from the early 1980s and from the early 1990s in India, both economies pursued liberalization of quantitative restrictions, trade and foreign investment policies, industry and tax reforms, among other sectoral reforms. These reforms fuelled the astonishingly strong growth of the inward bound Foreign Direct Investment (FDI) in these two economies in different magnitudes over the last three decades. Also, the contribution of FDI to their sustained economic growth in the last decades is commendable. China's performance in attracting FDI over the past three decades considerably outpaced that of India. Now, the interesting question is as to how China is attracting relatively more FDI inflows compared to India. After economic reforms and liberalization, both China and India have made substantial improvements in the structural transformation of their economies by allowing foreign firms to compete in their domestic markets which were previously restricted. The socio economic conditions of both countries were similar, and both were under the influence of the Soviet model, pursuing similar development strategies involving central planning and rapid industrialization. In China, foreign investments were prohibited and the mechanism for foreign trade was monopolized by the Ministry of Foreign Trade. In India, the Foreign Exchange Regulatory Act (1974) reduced foreign equity participation from 51 to 40 percent which led to the exit of companies like IBM, Shell and Coca-Cola. Since that time, both governments have significantly liberalized their FDI regimes, however, China has been able to attract a much higher level of foreign investment because it initiated the reform process much earlier than India and both countries are far more "FDI-led" than other developing countries have been in the past.

The divergence of attitudes toward FDI can be easily reviewed by the two countries' different political and economic systems. China has an authoritarian regime where policy-making is generally regarded as a top-down process. Additionally, the Chinese leadership has a clear focus on economic growth. On the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

other hand, the formation of policy in democratic India is much slower. Even the Indian diaspora was perceived as hostile, whereas in China more than half of FDI comes from overseas Chinese. In China, decentralization of economic responsibility and establishment of special economic zones (SEZs) was a key feature in foreign sector reform. Local authorities, responsible for the economic growth of their province, undertook many initiatives to ensure that SEZs would attract foreign investors. In India, decentralization was less 'economic' and more 'political'. It began in the early 1990s only because central government lacked sufficient political power and was not able to create an efficient coalition without depending on the state governments support. Thus, local officials have no direct incentives to promote FDI and state governments heavily rely on centrally-led strategies. Hitec City- a special economic zone in Hyderabad, designed to attract investments in the IT sector, is a case in point. Every significant aspect of the project, from negotiations with investors to the design of the regulatory framework was conducted centrally with no local participation. Seen broadly, local bureaucracy in India- epitomized in this case by the license-quota-permit raj- do not perceive themselves as independent actors in terms of economic reform and oblige central government to be responsible for the implementation of development programs.

In China local governments have far greater control over local revenues than in India. Under the new fiscal system that resulted from economic decentralization, Chinese provinces entered into negotiated revenue sharing contracts with the central government. This means that local governments are allowed to keep a share of revenue that they collected before handing over a negotiated amount to the central government. The ability to extract these revenues provides them with the financial resources to build a strong infrastructural base to foreign investors and maintaining a reputation for the rapid completion of infrastructure projects. Unlike in China, the tax assignment system in India is imbalanced: most broad-based taxes have been assigned to the center, while taxes narrow in scope are assigned to the states. The impact is that central government has a greater income and less expenditure whereas state governments are collecting less and spending more. This deficit in local state budgets needs to be balanced by central funds, which in turn means greater central control of the allocation of financial resources to state governments while simultaneously laying responsibility for infrastructure development on them. Since the central government itself is running on the deficit, transfers to state governments must take second place to central consideration. This has resulted in their decline in recent years, throttling state-level infrastructure investments. If state governments are not able to quickly and effectively implement FDI related projects, it decreases the flow of FDI.

CONCLUSION

Foreign direct investment is arguably an important source of employment opportunities, urbanization and growth for developing countries. China is an example of a country that has created this favorable business climate, attracted FDI over last twenty five years, and grown from $163.6 billion economy to being a $2.2 trillion dollar economy, the third largest economy in the world, and the fastest growing economy in the world. On purchase power parity basis, Chinese economy is the second largest economy of the world with $9.412 trillion in 2005 just behind USA. China has been growing at the rate of 9.5percent for last ten years. In 2006 china grew at the rate of 10percent. At this rate China will double its economy in every eight years and in 2040 will be largest economy of the world surpassing the US. In 2006 FDI inflow to China was $ 62.0 billion as opposed to $6.0 billion for India. AT Kearney FDI Confidence Index 2006 ranked China the most attractive FDI destination ahead of the United States for the fourth

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

consecutive year. China has been undergoing rapid rural-urban transition and transformation in the last two or three decades—although a precise measurement of the momentum is not straightforward, owing to China's complex system of urban boundaries and changing urban definitions. In any event, many expect China to continue on the path of high-speed urbanization for another one to two decades, a process which will entail massive population redistribution. The flow of FDI is much higher in China compared to India. The rapid urbanization and large flow of FDI are major challenges that China will have to face in the next two decades. Contemporary urbanization is induced by industrialization and technological change, and that it comes as labor shifts out of land-intensive agriculture into urban industrial production. Manufacturing, and later services, take advantage of economies of scale and some urban centers grow to large population sizes, often of several million or more. Urbanization requires developing countries to uproot most of their traditional rural population, to invest heavily in urban infrastructure and to create the institutions for cities to support and finance those investments, and to develop formal market institutions and a legal framework to replace the social mechanisms of traditional rural societies that are not workable in the anonymity of urban exchange.

Chapter 18
Corporate Governance: The Catalyst for Economic Growth and Social Change

Sandeep Goel
Management Development Institute, India

ABSTRACT

In light of the increasing number of corporate frauds worldwide, there is a growing emphasis on corporate governance. These corporate misappropriations not only destroy shareholder value but also act as a detriment to economic growth and social change. Therefore, investors look for companies with better corporate governance to maximize their returns. Still, this aspect of corporate governance has been largely neglected in the existing studies. This chapter is therefore an attempt to address corporate governance and its effect on business performance in the context of economic growth and social transformation at the global level. It goes inside the black box of the financial matrix. The central issue that emerges is the criticality of key parameters in the corporate governance process for organisational performance. It is hoped that it will provide a new dimension to the existing body of corporate governance for global development with policy implications for the required growth and social change.

INTRODUCTION

The concept of corporate governance has become popular globally, particularly over the last decade in regard to economic growth and social transformation. Undoubtedly, bodies of literature in law and social sciences have always considered political and social factors necessary to firms' and economic growth (Fligstein & Choo, 2005). But, of late good corporate governance has become a priority for policymakers and investors for better overall performance. The empirical research on the subject also verifies the fact. "Better corporate governance is associated with better business performance and thereby higher stock market performance, (Claessens, 2006)." Claessens highlights how the financial crises in the Russia, Asia and Brazil in 1998 demonstrated the deficiencies in corporate governance which might endanger the stability of the global economic system. A few years later, corporate governance scandals in the US and Europe added to this and shattered the confidence of a common man in the corporate sector. This

realization for better corporate governance has highlighted its importance as a key element for reaching economic performance and growth, increasing the investors' trust.

The corporate governance system across the countries varies according to the degree of ownership and control and the identity of controlling shareholders. On one hand, there are systems which are characterised by wide dispersed ownership (outsider systems), like US and UK. The basic conflict of interest here is between strong managers and widely-dispersed weak shareholders. On the other hand, there are systems which are characterised by concentrated ownership or control (insider systems), such as Germany and Japan, where the basic conflict is between controlling shareholders and weak minority shareholders.

To grow, an economy requires sound resource base, including natural resources and other resources. But, this is possible only when the country has congenial and fair environment which features sustainable scale, fair distribution of wealth, efficient allocation of resources, and high quality of life. Here, sound corporate governance becomes crucial as corporate sector is the real creator of wealth and the most important contributor to economic growth of any country. *Economic growth* is an increase in the production and consumption of goods and services. It is indicated by increasing gross domestic product (GDP). Economic growth of any country is linked with not only an increase in its productive capacity but also as an improvement in the quality of life of the people.

Any growth is meaningless if it is not is not backed by the society and is not instrumental in social change. The reason being is the economies changing for the betterment of society only last. *Social change is* a broad umbrella to encompass a range of typical social and civic outcomes from increased awareness and understanding, to attitudinal change, to increased civic participation, the building of public will, to policy change that corrects injustice.

Every economy calls for sustainable development. The concept of sustainable development is based on corporate governance which integrates the balance of key pillars of *economic and social pillars.* The economic pillar is based on the necessary retaining of ordinary capital with all the business activities performed, and use of only the generated profit. The social pillar involves people as individuals as well as the community. So, a company with sound corporate governance will adopt these two pillars as its strategic goal which in turn grows the company in the long run. The quality environment strongly impacts the quality of life of the population, which already bears upon the social sphere (Moldan, 2001).

This paper extends the above rationale of necessity of corporate governance for economic growth and social change, in particular to Indian perspective. It discusses how the corporate governance framework impacts the firm's overall performance including in the financial market, implied thereby leading to economic growth and social change.

BACKGROUND

Corporate governance has been associated with the "Agency conflict", i.e. principal-agent problem. As principal, shareholders expect the agents (managers) of the company to act in their best interest but in practice the situation is opposite. This gap leads to mis-governance (Berle & Means, 1932). For the last two decades, corporate governance has been an area of focus for all the economies globally on account of its increasing importance for economic growth and social transformation. Corporate are giving due importance to it regardless of whether they are involved in global operations or not.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

What Is Corporate Governance?

'Corporate governance' is the way corporations are being managed and most importantly how they communicate with shareholders and the rest of the world. *Corporate governance* as widely used is "the system by which companies are directed and controlled" (Cadbury Committee, 1992). It is the framework by which the various stakeholder interests are balanced. The OECD takes a broad view of corporate governance and defines it as the full set of relationships among a company's management, its board, its shareholders and other stakeholders. It provides the structure through which the objectives of the company are set, and the means of attaining those objectives and monitoring performance determined. (1999a) The *OECD Principles of Corporate Governance* universally applicable to all types of corporate governance systems in countries at all levels of economic development.

Corporate governance addresses issues of board appointment, their roles and responsibilities, the shareholders' rights, and others. These issues are important because they promote good business practices and create a good business environment for all the stakeholders and ensure better economic development. With the recent financial crisis, it has become all the relevant for corporate worldwide. Therefore, both companies and policy-makers globally are interested in ensuring that good corporate governance is adopted and is effectively institutionalized throughout the firm.

Why Corporate Governance Matters?

Good corporate governance helps companies operate more efficiently, improve access to capital, mitigate risk and safeguard against mismanagement. It makes companies more accountable and transparent to investors and promotes sustainable environmental and social development. Increased access to capital encourages new investments, boosts economic growth, and provides employment opportunities.

- **Improved Performance:** Good corporate governance brings better performance for corporate and economies worldwide. Improved governance structures and processes ensure quality decision-making, encourage effective succession planning for senior management and enhance the long-term prosperity of companies.
- **Value Addition:** Corporate governance helps in managing risks and adding value to the society. It reduces the risk of investments by improving the governance of investee companies and thereby promotes sustainable investment in countries. *So, it adds both 'economic and social value' to the economy.*
- **Developing Capital Markets:** Improving corporate governance contributes to the development of the capital markets. Poor standards of governance, particularly in the area of transparency and disclosure have been a major factor behind instability in the financial markets across the globe as evident in the case of the East Asian financial crisis of 1997, and corporate failures in United States and Western Europe.
- **Higher Access to Capital:** Better governance improves access for emerging market companies to global funds. Empirical evidence indicates that well-governed companies receive higher market valuations.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

CORPORATE GOVERNANCE: THE COMPETITIVE ADVANTAGE!

Corporate governance is an essential element of improving microeconomic efficiency. It affects the behaviour and performance of firms, and thereby impacts on the development and functioning of capital markets and exerts a strong influence on resource allocation, leading to sustainable growth and social development. Better corporate governance increases the likelihood that the enterprise will satisfy the stakeholders and fulfill its environmental and social responsibilities. Poor corporate governance mechanism is a major impediment to improving the competitiveness of firms.

It has been found out that companies with better governance perform better. They always have a competitive advantage over others. Across countries, there is evidence that operational performance is higher in better corporate governance countries. Corporate governance adds value by improving the performance of firms through more efficient management, better asset allocation, and similar efficiency improvements (Gompers, Ishii, & Metrick 2003). (Joh, 2003) strongly suggests that better corporate governance leads not only to improved rates of return on equity and higher valuation, but also to higher profits and sales growth.

Gugler (1999) provides a comprehensive survey of empirical studies of the effects of ownership concentration on corporate performance from the US and UK and finds that "owner-controlled" firms significantly outperform "manager-controlled" firms.

The McKinsey 2002 Survey, commissioned by the Global Corporate Governance Forum, surveyed institutional investors managing $2 trillion of capital. It found out that:

- Institutional investors would be willing to pay more for shares in companies with high governance standards. The average premium ranged from 12-14% in North America and Western Europe to 20-25% in Asia and Latin America to over 30% in Eastern Europe and Africa.
- 1/3rd of investors stated they would avoid countries with poor corporate governance.

A recent study conducted by the Treasury entitled *Corporate Governance and Financial Performance in an Australian Context* examines the relationship between a company's adoption of the Australian Securities Exchange (ASX) Corporate Governance Council's Principles of Good Corporate Governance and Best Practice Recommendations and its financial performance for the top 300 Australian listed companies. It found out that companies with better corporate governance outperformed the companies with less compliance.

Bad Governance

In practice shareholders usually don't get to use their votes to directly influence the decisions of the management of the company, as in a restructuring decision either its Vodafone-Hutch deal or Reliance Demerger and others. Board of Directors is supposed to be the representatives of the shareholders. But, they are often ineffective in discharging their responsibilities. This lack of management oversight and supremacy of personal interest by corporate Boards is illustrated by a long list of corporate scandals such as Enron, WorldCom and Paramalat.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Promoter shareholders tend to take minority shareholders for a ride. A promoter shareholder typically holds a large number of shares – through which he can easily influence the management of the firm. Minority shareholders, on the other hand, hold only a small fraction of the company's shares and have very little influence. For example, majority of the listed companies in BSE Sensex are family owned businesses with family members often holding senior management positions, such as CEO and CFO. They are mostly guided by their self- interest, like the recent case of Kingfisher Airlines and Sahara Investments.

This also leads to 'earnings manipulative' practices as evident in the case of Satyam in 2008. These are examples of bad corporate governance where managers are basically destroying shareholder value.

Good Governance Model?

What is good corporate governance? In most countries an official "Code of Best Practices" has been introduced, describing what good corporate governance is and how companies can implement it. In India, there is Clause 49 under SEBI Act, 1992 which describes code of corporate governance. It emphasizes that a public company should provide accurate and timely information to all stakeholders. Further, it also tries to strengthen the Board of Directors' role by introducing Independent directors. It is a mandate for listed companies to have ½ as independent in case of executive chairmanship and 1/3 in case of non-executive chairmanship. SEBI also stresses on the Audit Committee. At international level, we have SOX (US) and OECD Code.

Here, we will examine the common parameters of good corporate governance as prescribed by the international regulators, mentioned above. They are: CEO duality, Non-executive Independent Directors, Audit Committee, and Management Compensation.

1. CEO Duality

CEO Duality implies there should be a separation of chairmanship and CEO for better transparency in decision-making. The reason being is when the CEO plays the dual role, owner interests are, to some extent, "sacrificed" for managerial interest (Donaldson & David, 1991). (Heracleous, 2001) provides a literature review of evidence of the impact of executive chairmanship on the performance. (Ehikioya, B. I., 2009) in their study said CEO duality influences the overall performance of the firm.

2. Independent Directors

Non-executive independent directors were introduced as a guardian of the interests of minority shareholders in the company. Since, they are unrelated with the company they act objectively for the betterment of the corporate. Mak & Kusnadi (2005) reveal that proportion of independent directors on the board helps in enhancing firms' value.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. Audit Committee

Audit committee is the most important committee of the company as it is responsible for the internal control and the appointment of outside auditors. This is the reason why audit committee should contain independent board of directors. Siagian & Tresnaningsih (2011) state, "Independent directors and audit committees should improve the firms' reporting system and the quality of reported earnings because they do not have any potential conflicts of interest that reduce their monitoring capacity".

4. CEO Remuneration

CEO remuneration should be linked to organisational financial performance on account of agency principle. Management will always act in order to maximise self-interest. Research also does not find CEO remuneration to be important to performance. (Andjelkobic et al., 2000), (Collins, 2001) and (Coles, 2001) found no evidence of a positive relationship.

Scally (2011) selected top 10 companies from the Fortune 500, which demonstrated the highest total shareholder return (TSR) over a five-year period. Seven key board characteristics associated with good governance were compiled for the analysis, as mentioned in the table 1 (Top 10 Fortune 500 Companies by 5 yr. total return to shareholders).

It shows 6 of the 10 boards have separate CEOs and chairmen; 6 of the 10 boards have staggered board elections; 5 of the 10 have adopted majority voting. The percentage of independent directors per board ranges from 92% to 67%, and the average age of directors ranges from 52 to 63, with a mode of 62. Finally with regard to board diversity as defined by the companies themselves, 2 boards have as many as 4 diverse members and one board has none—the others have between 1 and 3 diverse directors.

Table 1. Top 10 Fortune 500 Companies by 5 yr. total return to shareholders

	5 yr. return%	Board size	Indep. Dir.	Add/l BD Seats	Separate CEO/Chair	Separate Risk Comm.	Staggered Board Seats	Majority voting	Diversity	Average age
1. Apple	45.6	7	6	8	Yes	No	No	No	1	62
2.Express Scripts	35.2	12	11	14	No	No	No	Yes	3	62
3.Western Digital	32.4	11	10	15	Yes	No	No	Yes	2	62
4.FMC Technologies	30.5	12	10	27	No	No	Yes	Yes	3	63
5. Mosaic	30.4	12	8	9	Yes	Yes	Yes	No	1	61
6. Flowserve	28.8	11	10	9	Yes	No	Yes		1	59
7.Precision Castparts	27.6	9	8	8	No	No	Yes	No	0	60
8. Google	26.3	9	6	6	Yes	No	No	No	4	52
9.Cameron Int'l	25.5	9	7	8	Yes	No	Yes	Yes	1	62
10. Monsanto	25.4	10	9	8	No	No	Yes	Yes	4	59

So, there is a correlation between the governance attributes selected and their appearance among these top-performing companies, in particular the mode of 62 for average age of directors and 60 percent board with separate CEO and chairman.

Emerging Markets Are Different

In emerging markets, means of enforcing shareholder rights are less developed. *First,* in emerging stock markets trading is still dominated by individual investors, rather than large investors. Individuals with small shareholdings usually have limited knowledge about the company, and are not well organized. They are unable to exert much influence on the company.

Second, there is strong presence of large controlling shareholders in these economies. Also, there are laws preventing foreigners from buying local companies. *Third,* low level of effectiveness of the legal system often makes it difficult to successfully prosecute and convict managers who abuse the company for their own benefit.

So, these factors make governance in these economies a little difficult. The key means by which corporate oversight is maintained in developed markets is lacking in many emerging markets. Even so, one problem remains: how to make sure that minority shareholders are treated fairly by the large controlling shareholders? *Probably, the answer lies in 'Indian Companies Act, 2013 in the form of Class Action suit.'*

Despite the above constraints, India is one nation which has shown a fairly better performance in terms of governance practices worldwide. That is the reason why it got least affected on account of global recession. Table 2 (Corporate Governance Practices Ranking for 2010) of IR global rankings for 2010 verify the fact where two Indian companies (Infosys and Kotak Mahindra) figure out in top five best governed international companies.

Corporate Governance in India

There are various reforms which have been channeled by Indian regulatory forces, viz. Security and Exchange Board of India (SEBI) and the Ministry of Corporate Affairs, Government of India (MCA). The first of this chain was the *Companies Act, 1956.* It did not directly talk about corporate governance but set the stage by providing notable restrictive measures for the board.

Then *Clause 49* came out under listing agreement of SEBI Act, 1992 which is considered as a milestone in the evolution of corporate governance practices in India. It is similar in spirit and in scope to

the Sarbanes-Oxley Act in the United States. Clause 49 of the Listing Agreement to the Indian stock exchange came into effect from 31 December 2005, for improving corporate governance in all listed companies. Its key features are: (i) composition of the board of directors; (ii) the composition and functioning of the audit committee; (iii) subsidiary companies; (iv) disclosures by the company; (vi) CEO/CFO certification of financial results; (vi) reporting on corporate governance as part of the annual report; and (vii) certification of compliance of a company with the provisions of Clause 49.

Companies Act, 2013 received the assent of the President on the29th August, 2013. The new Companies Act, 2013 is a proposition to improve corporate governance system in India on account of recent corporate scams. Significant corporate governance reforms have been recommended primarily to improve the 'board process.' Following key corporate governance reforms are put forward:

- Companies with turnover of Rs. 1000 cr. or more, net profit of Rs. 5 cr. or more, with net worth of Rs. 500 cr. have to spend at least two per cent of their net profit on 'corporate social responsibility.'
- The limit of the maximum number of companies in which a person may be appointed as auditor is 20.
- Auditors' appointment for 5 years shall be subject to confirmation at every annual general meeting.
- Director to vacate office on remaining absent from all the meetings of the board of directors held during 12 months with or without obtaining leave of absence.
- Financial year of every company has to be March 31. The only exception is for companies which are a holding/subsidiary of a foreign entity requiring consolidation outside India.
- Listed and prescribed class of companies to have *at least 1 woman director.* Existing companies have to comply with this provision within 1 year from the date of commencement of the 2013 act.
- Following committees of the board are made mandatory for listed and prescribed classes of companies: audit committee, stakeholder relationship committee, nomination and remuneration committee, and corporate social responsibility committee
- *For investor protection*, it provides for 'class action suit', which is key weapon in the hands of individual shareholders.
- There is *Prohibition on forward dealings in securities* of company by key managerial personnel. Insider trading rules have been made more stringent.

RECOMMENDATIONS

An effective corporate governance framework can avoid the conflict between shareholders and managers and minimise the agency costs. There are broadly two types of mechanisms that can be used to align the interests and objectives of managers with those of shareholders and overcome this problem of separation of ownership and control:

1. **Adequate Compensation:** By compensating managers adequately, there interests can be very well aligned with those of shareholders in the form of executive compensation plans, stock options, etc.
2. **Shareholders' Activism:** It implies the strengthening of shareholders' rights so they have a greater incentive and ability to monitor management. This involves legal protection to shareholders in the form of enforcement of shareholder rights, prohibitions against insider-dealing, etc. To quote again '*Class Action suit' under Indian Companies Act, 2013.*

FUTURE DIRECTIONS

Corporate governance is becoming more sophisticated and is providing greater opportunities for businesses. Following are the ideas that are critical for businesses for good corporate governance.

- Companies should not only implement general corporate governance practice but must focus on best practices.
- A key element of good corporate governance is good risk management.
- Corporate governance and CSR go hand in hand.
- Greater concern for the measurement of board performance.

CONCLUSION

Corporate governance affects the development and functioning of capital markets and exerts a strong influence on resource allocation in an economy. In an era of increasing capital mobility and globalisation, it has also become an important framework condition affecting the industrial growth and social change. There is no single model of good corporate governance, and both insider and outsider systems have their strengths, weaknesses, and different economic implications. Furthermore, the effectiveness of different corporate governance systems is influenced by differences in countries' legal and regulatory frameworks, and historical and cultural factors, in addition to the structure of markets. The challenge, therefore, is not only to identify the strengths and weaknesses in each individual system or group of systems, but also to identify what are the underlying conditions upon which these strengths and weaknesses depend.

KEY TERMS AND DEFINITIONS

CEO Duality: The separation of chairmanship and Chief Executive Officer for better transparency in decision-making.

Corporate Governance: The way corporations are being managed and most importantly how they communicate with shareholders and the rest of the world.

Economic Growth: An increase in the production and consumption of goods and indicated by increasing gross domestic product (GDP).

Independent Directors: The directors which are non-executive and unrelated to the company management.

Social Change: A process which encompasses a range of typical social and civic outcomes from increased awareness and understanding, to attitudinal change, to increased civic participation, the building of public will, to policy change that corrects injustice.

Chapter 19
Key Aspects to Develop Long-Term Microfinance and Financial Inclusion for Social Development

Omar Alonso Patiño Castro
Universidad Ean, Colombia

ABSTRACT

This chapter presents the main guidelines for microfinance to be a successful financial model, mainly for who do not have any access to the traditional financial market. The model can be active for reaching one of its main objectives (to reach poverty eradication worldwide). This will be achieved only if the microcredit institutions do not consider the operating conditions that may oblige them to be part of the traditional financial system. Nowadays, governments, financial sectors, and multilateral agencies have focused their efforts on financial inclusion, as a first experience before using a broad portfolio of microcredit services.

INTRODUCTION

From its very beginning, microfinance has had as its main basis the fact of giving credit to those whose economic condition does not match with the traditional financial market requirements.

Despite the existence of multiple experiences that can be characterized as microfinance, such as the Montes de Pio in the Spanish middle age or the creation of cooperatives, it is only by the 1970's when the concept becomes stronger and the model has the first successful experiences throughout the placing of microcredits (Yunus, 1998).

Experiences such as the Grameen Bank in Bangladesh, International Action and FINCA in Latin America demonstrated the relevance of the model and its applicability in the poorest sectors of the population in these regions (Guillamón, 2002).

Global awareness of the benefits and scope of micro-finance is one of its key advantages as a development model to aid in eradicating poverty. Following the emergence of micro-finance in the 1970s, actors have appeared and relevant events occurred which have facilitated substantial worldwide growth of microcredit. These include consolidation of the Consultative Group to Assist the Poor, CGAP, as an entity that promotes strengthening microcredit, the statement by the Group of 8 recognizing microfinance as a key element for development of the poor, the declaration of 2005 as the International Year of Microcredit and the formulation of the United Nations Millennium Development Goals (Resolution 55/2 United Nations, 2000).

One of the most influential entities in developing microcredit at the global level is the Consultative Group to Assist the Poor, a consortium of 34 public and private financing or micro-financing organizations. These include bilateral and multilateral development agencies, private foundations and international finance institutions that work together to increase people's access to financial services and thereby improve the living conditions of the poorest populations. The group was created in 1995 by nine microfinance organizations to support development of the sector. It currently works to generate services provision solutions through research and advisory services in the global and regional microfinance field, to which a large number of people and entities have access through its global resource center (Consultative Group to Assist the Poor, 2015).

Consultative Group to Assist the Poor is important because its studies and statistics have become global reference points when undertaking microfinance initiatives and its consulting services are sought by organizations that implement this type of projects. It specializes in developing local microcredit initiatives around the world, focusing on knowledge of microfinance and its contexts and providing consulting services for already-established microfinance entities to enable them to become more efficient in their goals and sustainable over the long term.

Then there is the G8, consisting of the world's 8 most developed economies. In 2005, the International Year of Microcredit, the G8 at its annual meeting in Gleneagles, Scotland, received a report from the 'Advisors Group to the United Nations International Year of Microcredit'[1] stressing the importance to its leaders of access to financing for the world's poorest populations (United Nations, 2006). According to the report of United Nations High Commissioner for Refugees, the objective is "…to widen the scope of the financial information available to them for developing and incorporating indicators regarding access to and use of micro-financing…", (United Nations, 2007), with active participation by the World Bank, and the International Monetary Fund, Micro-Finance Institutions. As a result of such efforts, the final report by the G8 Summit included a reference to the importance of financing, micro-financing and remittances, placing emphasis on the situation of microfinance in Africa. The final document, in addition to supporting these three topics, stresses the need to work to improve financial inclusion levels (less than 10% in Africa, as of the date of the report), and that both the United Nations and World Bank must continue their commitment to work and develop indicators for access to financing and to support national governments in creating public policies to facilitate the use of financial services by the population (European Parliament, 2006).

The G8 thus helped to generate momentum for the subject of microfinance, recognizing it as a key element for development of the world's poorest populations while directly linking it as an agent that could help to achieve the Millennium Development Goals.

Even though this model has been consolidated and developed and has had great impact on the poorest populations, its sustainability and growth can only be maintained over the long term if the difference between microfinance institutions and traditional banks can be clearly established and conditions created

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

to foster the continuity of microfinance institutions, strengthening their permanence as Non-Governmental Organizations or cooperatives, among other forms. Alternatively, conditions could be established to facilitate their entry into the traditional financial market while conserving their essence and making it possible for them to do so on a level playing field with the banks. While microfinance institutions must ensure their financial sustainability, their fundamental objectives must nevertheless continue to include poverty eradication and attention to the poor, improving levels of coverage and satisfying this population's needs.

This chapter seeks to contribute in identifying the actions -from different sectors- that can be performed in order to make microfinance be the instrument with which the conditions of poverty in the world can be mitigated.

For this purpose, the chapter begins with a description of the characteristics of microfinance, its relation with poverty and the various levels of impact it has had from the time of its emergence as a financing alternative. In this section some criteria are stated to be taken into account for ensuring the sustainability of microfinance institutions (MFI) and the way they should articulate with the needs of population.

At the end of this section, the impact of the interest rates on the operation of the MFI are stated as well as the role of other existing parties in this market such as the government and cooperatives.

The chapter also addresses the financial inclusion, its ongoing progress, obstacles and challenges that has as a phenomenon whose main goal is about economic development and it ends by considering the participation of key actors and the measures to be implemented, so that microfinance will guarantee a significant development in the coming years.

1. ANALYSIS OF THE CHARACTERISTICS OF MICROFINANCE AS AN INSTRUMENT FOR SOCIAL DEVELOPMENT

The key principles of microfinance consist of a set of guidelines created by the Consultative Group to Assist the Poor and its 34 members in 2004 and subsequently ratified at the G8 Summit of heads of state on June 10, 2008, intended as a guide for planning governmental and private policies at the global level. These principles are as follows:

- People of scarce resources need a variety of financial services in addition to loans, such as for savings and mobility of funds.
- Microfinance is a powerful tool in the fight against poverty.
- Microfinance refers to the creation of financial systems that address the needs of the poor, which is the fundamental objective.
- Microfinance can and must be sustainable if the goal is to reach a large number of the poor. This is what guarantees its long-term permanence.
- Microfinance requires the building of local and permanent financial institutions. That is the only way to obtain in-depth knowledge of the true needs and conditions of the poor.
- Microcredit is not always the solution.
- Ceilings on interest rates can jeopardize access by the poor to credit, because they discourage the providers of such rates when the limits are too low to compensate for risk.
- The government's role is that of a facilitator, not a direct provider of financial services. If it tries to assume the latter function, government can distort the market and discourage private efforts.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Funds provided by aid agencies must supplement rather than compete with private-sector capital, because they normally do not have the opportunity to compete against capital from the traditional banking sector.
- The crucial limitation is the lack of solid institutions and qualified managers.
- Microfinance works better when its performance is revealed and measured, which in turn helps MFIs to generate corrective measures for its errors in a timely manner. (Consultative Group to Assist the Poor, 2004)

In this context, microfinance acquires particular characteristics and a social function of significant value. These characteristics include:

1.1 A Tool to Fight Poverty

When the Millennium Development Goals were established, one of the most important was to reduce poverty levels by half by 2015. When the United Nations began to see the possibilities and alternatives for fulfilling this objective, it found that one of the greatest difficulties facing the poorest populations in overcoming poverty is the lack of access to credit, because they are not part of the target market for the traditional financial system. It also saw that possibilities for formal employment in these communities were almost nonexistent and that most people lived on agricultural or commercial activities – subsistence businesses. In many cases, the reason such businesses are unable to grow and generate better living conditions for their owners, along with dignified employment for others, was not due to the lack of a market but rather because their precarious profits were used to cover the basic needs of the owners and their families. They therefore never had funds to reinvest in their businesses, with the result that these businesses could not grow even when they had access to the market in order to do so.

Analysis of the situation also showed that the need for funds in many poor communities for operating their small businesses led them to resort to informal lenders. These lenders, as is still the case, charged interest rates much higher than those of the traditional financial system, thus adding a new difficulty for improving people's living standards. The obligation to pay such interest rates denied them funds for themselves and for their businesses. Thus the conclusion that, in order to modify the situation, there is a need for a system to provide credits in small amounts for the poorest people, with low interest rates, the capacity to loan such funds on a large scale and, beyond providing people with credit, give them the possibility of generating a savings culture to improve their levels of income and living standards in the future.

Microfinance had proven to be the model that would address all of the above-mentioned conditions, because it had already been developed over a number of years and demonstrated its effectiveness in various success cases around the world. It should become one of the most useful tools in attaining this objective and in the fight against poverty in general. This having become clear, in February of 1997, the first Microcredit Summit was held in Washington, D.C., bringing together more than 2,900 delegates from 137 countries. At this event, a global campaign was launched, which aimed to provide credit for self-employment to 100 million families by 2005, including the world's poorest, in addition to other financial services such as opening savings accounts and remittance services, at the personal level as micro-businesses (Daley-Harris, 2006). This program was called the 'Microcredit Summit Campaign' and seeks to extend and boost the use of microfinance for poverty reduction. It is directly managed by

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

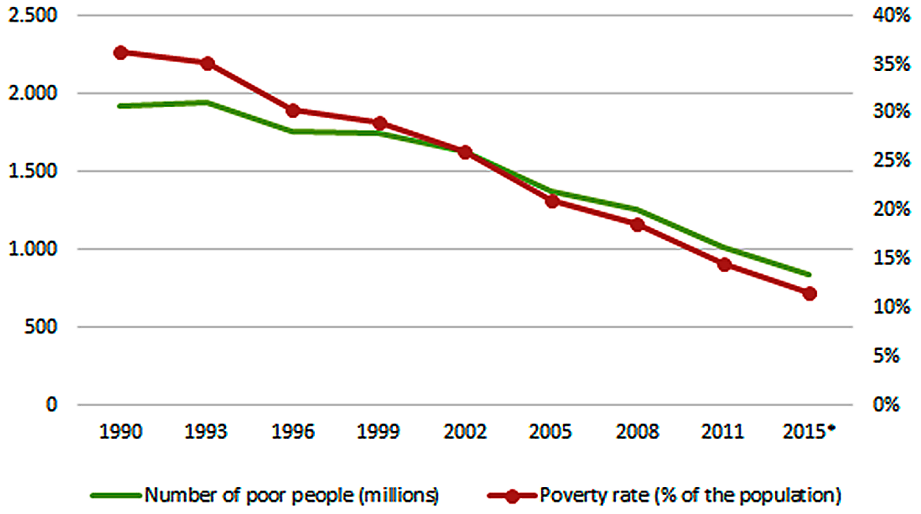
the UN, strengthening the principal role of microfinance in the global struggle against poverty and in the achievement of the Millennium Development Goals, as expressed by Kofi Annan, Secretary General of this organization, at the first meeting: "MICROCREDIT is a critical tool to fight poverty and a wise investment in human capital, now that the nations of the world have committed themselves to reducing the number of people who live on less than $1 dollar per day by half by 2015, so that we must view with even greater seriousness the fundamental role that sustainable microfinance can play and is playing in achieving this Millennium Development Goal" (Annan, 1997).

This campaign includes annual meetings at which reports are presented on the progress and growth of microfinance in the world's poorest populations and its impact on poverty reduction. Based on news reports, the results obtained are assessed and strategies and annual objectives are delineated or corrected with the aim of achieving the Millennium Development Goals through the four fundamental principles of the campaign, namely:

- Reaching the poorest.
- Reaching and empowering women.
- Creating financially self-sufficient institutions.
- Ensuring a positive and measurable impact on the lives of the clients and their families.

That is how the "Microcredit Summit campaign" has been established as the main effort on a global scale to focus upon microfinance as a tool to combat poverty. But it is not the only effort because there are cases of important microfinance entities such as the Grameen Bank, Bancosol, Bank Rakyat, Self Employed Women's Association and many others that operate in markets with a large percentage of poor communities. These entities have a large-scale impact on improving living conditions and reducing one of the greatest obstacles to overcoming backwardness in terms of income inequality, namely the poorest population's lack of access to financial services (Cano, 2006).

In seeking to achieve the Millennium Development Goals, and specifically poverty reduction, the United Nations (2015) presents the following two results:



- "The goal of reducing extreme poverty rates by one half was achieved five years before the deadline that had been fixed for 2015.
- The worldwide poverty rate for people who live on less than $1.25 per day in 2010 was less than half the rate recorded in 1990. While in 2010, 700 million people were no longer living in conditions of extreme poverty as compared to 1990, 1.2 billion people throughout the world remain in that situation".

Figure 1 shows the evolution of poverty levels.

According to these figures and in response to new realities, the United Nations has formulated the Sustainable Development Goals (SDGs) to provide continuity for some of the Millennium Development Goals while incorporating others that are part of its agenda for the next 15 years. In that sense, the first such goal formulated by the United Nations is "To end poverty in all its forms everywhere," from which significant progress is expected in the indicators along with strengthening of the diverse tools used, including microcredit.

1.2 Coverage

Because of participation by all of the previously-mentioned actors in developing strategies and programs, by 2005 approximately 82 million microcredits had been granted to the poorest population. Despite the high impact of this figure, it was nonetheless below the goal of 100 million such credits set for that year, which was finally achieved in 2007. Growth in recent years has remained stable, reaching 203 million microcredits by 2010, of which 135 million were granted to the poorest population (Maes, J. & Reed, L., 2012)

Figures on the granting of microcredit are given in Figure 2.

While the figure shows that the number of the poorest people served is constantly growing, in the early years there was an oscillation in the percentage of poor compared to the total number of clients, which then stabilized at around 70% starting in 2003.

This shows that there is sustained growth of microcredit among the poorest population as a whole, because when their share of total microcredits is analyzed, it demonstrates variable behavior, mainly because many beneficiaries have been able to rise above the poverty line but continue to use microcredit services.

This circumstance is consistent with the reality of microfinance; despite efforts aimed at consolidation of sustained growth in the number of poor served, the percentage has remained stable or has decreased, partly due to the reduction in the total number of poor people in the world. In this sense, it is important to permanently follow up on entities that grant microcredit in order to prevent them from avoid losing the proper focus, when, pressured by the need for good financial results, they may redirect their objectives and not necessarily concentrate on the poorest population.

In terms of the coverage reached by Micro-Finance Institutions at the global level, according to data compiled by the Microcredit Summit Campaign in December of 2014, 3718 Micro-Finance Institutions that reported that year were able to grant microcredits to more than 203 million people, 115 million of whom belong to the poorest population. Table 1 shows microcredit coverage as of the end of 2014 and women's share as users of this credit system (Reed, 2013).

1.3 Financial Sustainability

This subject has been widely debated in relation to microcredit because of the dilemma faced by Micro-Finance Institutions when having to decide between financial sustainability versus the option for social impact on poverty. Extreme positions have been expressed along with others that seek a middle ground.

One opinion is that the goal of Micro-Finance Institutions must not be to achieve financial sustainability and that their operations must be financed through donations from companies or the governments of wealthy countries. Another opinion is that the survival and growth of MFIs can only be achieved to the extent that they ensure their own financial sustainability.

An alternative has been set forth by Berezo (2005), who cites Hulme and Mosley (1996), to the effect that Micro-Finance Institutions must take greater risks when granting credits, with the resulting decrease

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

in the rate of recovery, if they seek to generate impact on poverty reduction through the awarding of microcredits, the end result of which would not ensure financial sustainability.

Much of the debate thus focuses on profitability and one of its fundamental elements, the interest rates applied to microcredit, which essentially requires higher rates than normal credits given the operational conditions of Micro-Finance Institutions, to enable them to deal with their own costs and expenditures while generating surpluses for investors or for reinvestment in their operations.

Berezo (2005) proposes that financial sustainability must be one of the mechanisms taken into account to achieve the objective of reducing poverty, giving it the status of a means, rather than an end in itself for MFIs, and thereby ensuring their durability along with fulfillment of their objective. That same author considers that, initially, an MFI must be subsidized because it does not have a sufficient volume of operations to permit self-sustainability, but with the passing of time, it must improve its management to achieve financial autonomy.

Due to these new conditions imposed by the market, many entities engaging in microcredit have increased the costs of their products and services and changed their focus so that they have ended up operating like traditional banking entities and abandoned microfinance. At the same time, those who have stayed in the field of microfinance have raised their microcredit interest rates to levels above those of other types of credits provided by the traditional banking sector.

Micro-financing entities have gradually become more efficient in handling resources and have been able to increase their operations to the point where they can fulfill their objective while being financially profitable. This situation has been more evident in regions of the world where microfinance has had its greatest development and most successful cases, such as in Latin America and Asia. In Latin America, nearly 80% of microfinance entities were financially sustainable in 2000 and in Asia the corresponding percentage was around 60% for that same year. By way of contrast, sustainability levels in Africa are still very low. Such sustainability levels in these regions came about because microfinance initiatives have entered significant markets, creating and fostering a microfinance culture among populations in which it is present, receiving state support for its projects and improving the growth and development of the economies of these regions. This situation has not yet arisen in Africa, where the level of economically sustainable micro-financing entities is barely 30%. That is because in many cases, microfinance has not received state support and poverty and misery levels in the region are so high that even microcredit requirements conditions are very difficult to fulfill for much of the population. The problem has been made worse by the failure to disseminate the advantages of microcredit among the population. That is why, since 2001, the "Microcredit Summit," at its annual meetings, has paid special attention to the situation in Africa and emphasized the need to disseminate and replicate success cases in this region, such as those in Zambia or South Africa.

1.4 Financial Cluster

With the development of microfinance starting at the end of the past century and its worldwide expansion, there has been an increasing trend towards specialization in that field. Micro-Finance Institutions currently work to specifically serve a particular population sector, such as women, micro-businessmen, farmers, exporters and many others.

This specialization among the different microcredit actors has led to the organization of microfinance productive chains or clusters around diverse economic activities. These include second-tier banks, first-tier Micro-Finance Institutions, Non-Governmental Organizations, cooperatives, entities that grant bank

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

guarantees, others that provide consulting or training associated with microcredit recipients, entities specializing in research and consulting and finally the provision of another set of financial services associated with sectors such as insurance among others.

In this sense, the next step is to organize the clusters into centralized and truly coordinated entities, because while in many cases there is complementarity of products and services and even partnerships among entities that provide microcredit, their objectives are different or the cluster is not visible to people.

1.5 Needs vs. Microcredit

When comparing the situation of the needs of the poorest population with what is offered by the Micro-Finance Institutions, it is clear that their main need is for access to funds, whether to enable them to generate a source of alternative income or to ensure the functioning of an already-existing one, so as to fulfill their basic needs. This is clear in the situation of Doris Iwhiwhu, a Nigerian woman whose case was heard at the 2007 Microcredit Summit, where she said that "Things were difficult, it was hard for us to deal with this and satisfy our families' basic needs; my children were hungry and my frustration increased every day" (Daley-Harris, 2007).

That was because her family's only income was her husband's salary, who worked as a government employee. Needing to find a solution, she decided to open her own business to sell fruit in order to generate additional income for her family. However, while she and her husband were able to put together enough money to set up the business, at first it produced only enough to maintain it and the profits were insufficient to cover her family's needs. She therefore decided to enlarge her business. Lacking the funds to do so, she chose to seek a loan. She consulted with some of her lady friends from the community and decided to turn to a Micro-Finance Institution in her region called Lift Above Poverty Organization, or LAPO. There, after attending a six-week training program on how to handle this type of credits and other tools for administering small businesses, she gained access to an initial credit of US $64 that enabled her to acquire products in larger quantities and thus make her business grow. After paying back her credit satisfactorily, she was able to obtain increasingly larger credits for as much as US $240, which she considers to have been decisive for the success of her business and the well-being of her family: "The regular loans from Lift Above Poverty Organization have really helped me with my fruit store and therefore my entire family, because we do not depend solely on my husband's insufficient salary. One positive aspect of the loans is that they are not difficult to repay because they have reasonable terms. There is no other financial institution around here that could provide that type of aid to people such as me, without guarantees."

Examination of this case and the words of Mrs. Iwhiwhu clearly show the difference that access to credit resources makes for such individuals, who normally lack the economic capacity to finance enterprises with their own means. If they do not have access to credit, it becomes very difficult to gain access to additional or better income and improve their living conditions. It also involves another situation typical of the second most important need of the poorest populations. Beyond access to funds, they also need this access to be under reasonable conditions within the reach of their possibilities, which is not always possible.

As mentioned by Mrs. Iwhiwhu, Lift Above Poverty Organization was the only Micro-Finance Institutions present in her region. While the funds and scope of microcredit have increased considerably in recent years, their scope in the poorest zones continues to be limited or lacking. People who do not have access to only Micro-Finance Institutions frequently resort to informal lenders, who, while they provide

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the funds, do so in conditions that reduce the benefit that the borrowers could hope to obtain from this type of credit, because the time frames are very short and the interest rates are too high.

These exorbitant interest rates mean that a large part of the benefits from the activities in which such credits are used end up with the lenders in the form of interest rather than the beneficiaries of the credits. There is thus the need for greater presence by only Micro-Finance Institutions in the poorest and most remote zones so that those who need funds can have access at reasonable interest rates that enable them to derive greater benefit for themselves and their families than what they could obtain by resorting to informal lenders.

Finally, there are the needs that go hand-in-hand with microcredit services and give rise to the concept of microfinance. When people have access to funds and are able to increase their incomes along with their living standards, the need arises for a system to enable them to generate savings and mobility of their funds. In response to that situation, the entities are in a process of modernization, making the transition from organizations focused exclusively on microcredit to becoming comprehensive ones that provide additional possibilities for their beneficiaries.

1.6 Flexibility of Interest Rates

Due to the kinds of needs that microcredit aims to satisfy, its social function and the type of population affected, along with the additional risk that this entails, the act of charging interest and the interest rates themselves are the subject of frequent debates at the global level. That is because market conditions and regulations mean that microcredit interest rates are normally higher than those for other types of credit, as mentioned by Avendaño (2006): "…apparently there is a contradiction between the goal of poverty reduction and the reality that places the financial costs of microcredit on the same level as the highest costs of the formal market. For the ordinary citizen, it is not clear why many governments approve those levels with regulations that permit the financial sector to charge additional costs on top of those charged for other types of credit."

At the same time, microfinance entities justify the high rates citing the additional risk that they must assume, because their clients' profiles are much riskier. That is because in most cases the clients lack stable income, do not have properties to effectively support their debt, have no credit history or one that is less than optimum, and finally lack advanced education levels. Additionally, there are higher administrative costs for these entities because they frequently must attend to their clients at their places of residence or employment, particularly in the case of farmers and micro-businessmen, instead of at their own offices, or they must establish offices at remote locations that imply greater expense and risks.

All of this must be compensated by the interest rates charged for their credits. So that if government regulations force these entities to charge interest rates that are insufficient for covering such expenses, many prefer to withdraw from the most costly and riskiest markets, which in most cases are the poorest and most vulnerable, such as occurred in Nicaragua: "There was evidence of a market contraction in Nicaragua after the national parliament in 2001 placed a ceiling on interest rates for specific types of lenders, including micro-financing Non-Governmental Organizations. Annual growth of the portfolios of such micro-financing entities has decreased by 30%, to less than 2% annually. Imposition of a ceiling on interest rates also led to the withdrawal of various micro-financing entities from rural areas where operational risks and costs are highest" (Helms and Reille, 2004).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Thus the dilemma that while controlling interest rates results in a decrease in the offering of microcredit, allowing complete freedom in the flexibility of interest rates causes interest rates for microcredits to rise to levels that are harmful for their beneficiaries, particularly when clients are poor. In this manner, some countries have tried to find a balance between these two situations, permitting flexible rates but with a ceiling for usury, which has in turn led to controversies among the diverse sectors of the financial system. These rates continue and pose one of the greatest challenges for the future of microfinance despite government efforts to lower the risk for micro-financiers.

1.7 The Government: A Facilitator

Over the years, the role of public institutions in representation of governments in the microcredit market has been of fundamental importance for its development. That is because microcredit and microfinance are aimed at a population segment that represents the base of the social pyramid. Microfinance thus acquires a greater capacity than any other type of credit and/or aid in terms of impact on poverty reduction. This factor takes on greater relevancy in the context of Micro, Small and Medium Enterprises, which, being business units that mostly involve personal or family subsistence businesses or whose impact focuses on zones with high poverty rates, are particularly important in terms of the contribution that they can make in raising the quality of life for the poorest people. In the words of Foshiatto and Stumpo (1996): "Despite the numerous problems that affect small-scale productive units —which include lack of technological knowledge and scarcity of material, human and financial resources— there is no longer any doubt about the relevance of that productive segment in terms of its capacity to generate employment and improve people's incomes."

This capacity, and in response to the problem of lack of access to credit resources for developing Micro, Small and Medium Enterprise, was what led different governments to view microcredit and subsequently microfinance, as a solution to this problem and a tool to support the Micro, Small and Medium Enterprise sector, while contributing towards raising the living standards of the poorest populations, as confirmed by Foshiatto and Stumpo (1996): "Microcredit is a particularly interesting instrument for supporting small productive units, which are a potentially effective tool, above all because of their capacity to penetrate different activity sectors and constantly adapt their methodology, which enables them to provide financial support to socioeconomic strata that are generally excluded from traditional banking circuits."

In this way, governments began to support microcredit initiatives, initially directly through credit entities targeting the agricultural sectors, as was the case of the Caja Agraria in Colombia. With the appearance of Non-Governmental Organizations engaged in microfinance in the late 1970s and greater interest in microcredit at multilateral credit entities (such as the Inter-American Development Bank or World Bank) in the early 1980s, due to successful cases of various such Non-Governmental Organizations, such as the Grameen Bank, governments changed their focus and began to combine their own initiatives with others, particularly Non-Governmental Organizations. Coordination was thus established with the Non-Governmental Organizations and advice and support was provided on obtaining credit from the multilateral entities. This led to a significant change, in which governments went from being an active part of the microcredit market to become more of a facilitator that guarantees the best conditions for the development of private participants in this market.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This trend became accentuated in the 1990s, initially because of the entry of entities other than Non-Governmental Organizations in the microcredit market, such as cooperatives and certain banks. Another factor was the boom in the concept of microfinance at the century's end, as a more complete system than microcredit. Additionally, governments in many places began to focus on the definition of regulation of the microfinance markets and to support supplementary services beyond microcredit in microfinance programs, such as training, health and others.

However, in the early 2000s, a flaw in the system became apparent, in which the initiative was completely left to the private sector. Because of the need to be financially sustainable and, in certain cases, generate positive results to be able to respond to their shareholders or creditors, the Micro-Finance Institutions were not reaching the neediest with their services nor the most remote populations. Thus in recent years, certain governments have decided to supplement the private microcredit offering with initiatives of an official nature.

1.8 The Cooperators: Hand-in-Hand with the Private Sector

The providers of capital for use in microcredit programs constitute a key element of microfinance. These cooperators, who can be of a public, private or multilateral nature or even a combination of these characteristics, must in particular be able to satisfactorily adapt to the nature of microcredit: they must be willing to reallocate part or all of their possible investment credits (compared with yields that would be produced if they were invested in another type of loans) and to grant longer terms for repayment then those provided by the traditional banking sector for other types of credit. Microcredit clients, who normally have low incomes, require special conditions with respect to terms for repayment and interest rates in order to gain access to credit.

In this sense, the large microfinance cooperators have evolved. In the 1980s, microcredit initiatives were entities from the public sector that undertook programs to strengthen the agricultural and livestock-raising sector. In the 90s, multilateral agencies such as the Inter-American Development Bank or World Bank began to view microcredit as an effective way to combat poverty. They therefore began to finance microcredit programs led by both public and private institutions. This gave rise to the appearance of various Non-Governmental Organizations in the early 1980s, along with collaboration between them to enable joint access to large-scale credits provided by these multilateral agencies. In the 90s, the cooperative sector became an important factor in the microcredit market. The cooperators were large groups of people who provided funds as members and savers at these entities.

Finally, at the end of that decade, another system began to operate in which the share of private capital was relevant. On the one hand, the traditional banking sector began to look with interest at the microcredit market, encouraged by examples of various successful Micro-Finance Institutions. Options for microcredit beneficiaries thus increased to a great extent, along with available capital. However, given the need to generate results and yields, traditional banking has only been able to cover the wealthier segment of these beneficiaries while failing to reach the poorest. Additionally, there is the system of guarantees, in which these entities, mostly governmental, while they do not directly loan funds, do act to provide support or to guarantee the beneficiaries before the Micro-Finance Institutions. This in turn enables them to more easily fulfill the requirements imposed by the Micro-Finance Institutions and thus gain access to funds, whereas for the entities this represents a very significant decrease in the level of risk from such credits.

2. FINANCIAL INCLUSION: A TASK UNDER WAY

For the United Nations Capital Development Fund (UNCDF) (2015), financial inclusion is defined as "Access at a reasonable cost for all households and businesses to the full range of products that could be "bankable", including savings, short and long-term credit, leasing and factoring, mortgages, insurance, pensions, payments, transferences in local currency and international remittances;…"

Financial inclusion has become an element of development about which diverse bodies, both regulators as well as cooperation agencies, have spoken and formulated policies and strategies for its worldwide dissemination. Diverse institutional initiatives promoted by international entities now exist, along with efforts by governments that in general have established inclusion as one of their objectives while including it on their development agendas for future years. In doing so, they seek to expand financial services coverage and thereby generate more and better opportunities for micro and small businesses, an important aspect in improving the quality of life for the population in general.

Previous studies have established that financial inclusion also facilitates business formalization, increases access to formal credit in the financial system, whether through traditional banking or microfinancing institutions, reduces income disparities, increases investment in education, aids the growth of local business initiatives, has positive effects on savings, improves handling of cash by users, controls consumption and facilitates the accumulation of working capital, according to Attanasio, Augsburg, De Haas, Fitzsimons, and Harmgart (2011), and Augsburg, de Haas, Harmgart, and Meghir (2012).

At the macroeconomic level, Levine (2005) established that increasing the coverage of financial services has a positive impact on job creation and a country's economic growth.

2.1 Criteria for Measuring Financial Inclusion

To determine progress in financial services coverage, the Alliance for Financial Inclusion (AFI)(López, 2013) has proposed measurement systems focusing on four fundamental elements:

- **Access:** The aim is to determine countries' capacities for providing opportunities for access to the financial system for the general population. Aspects such as costs and distances between users and the points of attention of financial institutions are considered.
- **Quality:** The objective is to establish the relevance of services offered compared to the real needs and expectations of the population, taking into consideration such aspects as lifestyle, variety of products and available alternatives for use of financial services.
- **Use:** The goal is for users to be more than just customers of the financial entities while consolidating their permanence in the system and their regular use of financial services. This takes into account the combination of financial products by individuals or family groups and their diversity, including savings and credit products for example.
- **Well-Being:** Refers to the impact of the use of financial services on people's living standards. Among other aspects, it takes into account growth or change in business activities, modification of patterns of consumption and improvements in activities involving education, recreation, health and in general all those associated with well-being.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.2 Progress and Obstacles

Development of the markets has led financial institutions to broaden their offering of services and in this sense, insurance, payments and mobile money have been part of the strategy to facilitate access by more people to the financial market. This has fostered a reduction in transaction costs, an acceleration of economic activity and better quality in the provision of social benefits (Jack and Suri, 2014).

The strategies and efforts made have had good results. Between 2011 and 2014, financial services coverage has risen considerably; whereas in 2011 just 51% of adults reported having a bank account, in 2014 the figure had reached 62% of the global population, with huge disparities. 91% had accounts in high income economies, 54% in developing countries and just 14% in the Middle East.

At the same time, the Consultative Group to Assist the Poor (2014) has found evidence of the impact that financial inclusion has had on people's quality of life, compiling diverse macro and microeconomic studies in different countries. Despite the heterogeneity of the research and the dissimilar conditions among the countries where these studies were made, financial inclusion and the use of microfinance, particularly microcredit, have had beneficial consequences for countries where such programs have been implemented.

The positive effects of financial inclusion on living conditions include the following:

- **Mongolia:** Group loans resulted in increased food consumption, in both quantity and quality. According to the authors' hypothesis (Attanasio, Augsburg, De Haas, Fitzsimons, and Harmgart 2011), joint responsibility fostered discipline in the selection and execution of projects, leading to long-term improvement in people's food consumption patterns.
- **Philippines and Mexico:** Access to microcredit improved the ability of micro-businessmen to take on risk, particularly in agricultural and cattle-ranching activities (Augsburg, De Haas, Harmgart, and Meghir, 2012).
- **South Africa:** Improved conditions for obtaining credit led to greater food consumption in the households of credit beneficiaries, improved their health conditions and decision-making processes as well as their life goals and future perspectives (Karlan and Zinman, 2010).
- **India, Morocco, and Mongolia:** Access to credit has had significant impacts on decreasing depression and on the self-confidence and powers of decision of women in the home, along with greater control over the consumption of non-programmed "temptations" (for example, tobacco).
- **Kenya:** Access to the programmed savings modality, with the stipulation of no withdrawals until the goal is reached, enabled beneficiary women street vendors to improve their health conditions and those of their families, and to increase their food consumption and investment in their own businesses, in contrast to others who lacked access to programmed savings accounts.
- **Malawi:** Programmed savings improved the volume of investment in businesses, and increased their expenditures and agricultural activities (Brune et al., 2013).
- **Mexico:** A strategy to increase coverage by opening bank branches in retail shops resulted in an increase of around 7% in the incomes of the inhabitants of the sector of influence of the branches, compared with people in similar sectors that lack access to a bank branch (Bruhn and Love, 2013).
- **India:** Government requirements between 1977 and 1990 promoted the opening of bank branches, which, according to a study carried out by Burgess and Pande (2005), caused a significant decrease in poverty rates in the rural zones of the country.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

At the level of business, microcredit has led to a considerable decrease in preventive savings accompanied by an increase in consumption due to the perceived security of having access to funds in cases of immediate need. The diversification of alternatives for obtaining credit, such as granting grace periods, has fostered an increase in the acquisition of durable goods and the existence of increasingly diversified inventories. After three years, a sustained and considerable increase in profits had been achieved by entrepreneurs.

However, despite great efforts that have been made to increase the use of financial services, the percentage of the global population that are users remains low. According to figures provided by the World Bank (2015), around half the world's adult population (approximately 2.5 billion people) are not users of formal financial establishments, 75% of the poor do not have bank accounts and one third of them have never made use of the services of these institutions.

The reasons are diverse: In some countries, there is a high degree of mistrust of the traditional financial system, which limits financial inclusion, particularly at entities that handle a low level of risk. This leads people to search for other savings mechanisms, most of which are informal.

By nature, the poorest populations seek financial services in which risk is minimized, even at the risk of losing possible profits, which translates into disincentives to handing over their scarce funds to a third-party who does not inspire their complete trust. In that sense, the crises of the financial system have been one of the factors that generate greater distrust for financial inclusion.

Very few countries over the last four decades have not experienced at least one financial crisis; these exceptions do not include any European country, just one in the Americas, namely Canada, two in Oceania, Australia and New Zealand, and 14 between Africa and Asia, with 7 from each continent (World Bank, 2015).

The Global Findex proposes additional reasons that restrict the growth of financial inclusion. These include, in addition to conditions of poverty, other reasons for not having financial products, such as the high cost of belonging to the system, excessive paperwork and the impossibility for many people to fit traditional banking profiles, the existence of informal financing markets and long distances to points of attention (World Bank, 2014).

Informality in the offering of financial services exists as an alternative in order to eliminate many of the obstacles of the formal market, including regulated entities and those which, despite being unregulated, have adapted to the legal conditions of the market. In developing economies, it has been found that 55% of those who apply for loans use informal credit sources, encouraged by easy access to savings as well as credit products, despite the fact that, in the latter cases, interest rates tend to be much higher than those charged in the formal market.

2.3 The Challenge of Improving Financial Inclusion Levels

One of the most important conditions for financial inclusion is the responsibility with which it must be undertaken. Clarity in the dissemination of information, the costs involved, the obligations acquired by users and the impacts that financial services have on people's financial culture are aspects that must be taken into account when designing policies and products for access to financial products. Also, the offering of financial services must be in accordance with the needs of the context, because each population has different social, cultural, economic and financial conditions, which means that the products offered must address those conditions. Even in similar contexts, there can be differences among social

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

groups with different characteristics and needs, so that efforts for inclusion are supported by specific and relevant products for each circumstance.

That being the case, the formulation of financial inclusion programs must aim to close currently existing gaps. In terms of gender, the challenge is to increase the use of financial products by women. In 2014, whereas 55% of men had bank accounts, only 47% of women did. In terms of age groups, the number of young people able to gain access to financial products is 33% less than that of older people and the difference between the two groups in terms of having the possibility for saving is 40%. In low income economies, around 35% of city dwellers have bank accounts, compared to just 22% of those who live in rural areas (World Bank, 2014).

On the other hand, in high-income economies, the most significant gaps involve levels of education; those who have attended a university are 20% more likely to have a bank account than those without such training. At the same time, the wealthiest 20% of the population has three times the possibility of having a bank account than the poorest 20%.

It is thus clear that great efforts for financial inclusion must be made with respect to women, young people just beginning their financial lives and who are normally younger than 25, people in the rural sector, those with low incomes and those who have lower levels of education.

Given the growing technological development, increased coverage in mobile communications services and changing habits of consumption among the new generations, methods for achieving participation by a greater number of users need to be in accordance with this new reality. The design of electronic means of payment and the provision of mobile banking services and other innovations in products as well as technology are a valid alternative to reach this objective. However, there must be guarantees so that, beyond access to services, frequency of use is promoted, thus consolidating behaviors that enable users to remain in the financial market, with the above-mentioned consequences that this poses for improvement in living conditions and the economies of countries that achieve inclusion.

One of the big obstacles to financial inclusion is the low level of financial education, in response to which programs have been designed with the fundamental goal of making users aware of their possibilities for access to products and the improvement of consumer protection conditions in the financial markets (European Economic and Social Committee, 2011). Since 2007, the European Commission has promoted financial education, promulgating its eight basic principles that same year, namely:

- Financial education must be actively promoted and continuously made available during all phases of life;
- Financial education plans have to be carefully crafted to satisfy citizens' specific needs and be easily accessible and opportunely available;
- Consumers must receive education about financial and economic matters as soon as possible, beginning in school, and, preferably, such education should be included in the general curricula of the schools;
- Financial education plans must include general instruments for sensitization about the need to improve understanding of financial problems and risks;
- Financial education made available by financial service providers must be fair, transparent and impartial; efforts must be made so that this education will always benefit the interests of consumers;
- Educators in this field must have adequate training and resources;

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- National coordination among stakeholders must be promoted and must increase international cooperation among financial education providers, with the aim of facilitating the sharing of good practices;
- Financial education plans should be periodically evaluated and, where necessary, updated (European Economic and Social Committee, 2007).

According to these principles, financial education must also address variables such as age, needs, and the social, family and employment situation and must become a joint effort by the public and private sectors to include the design of policies as well as relevant products adapted to the needs of the population.

3. NECESSARY ACTORS AND MEANS FOR DEVELOPING MICROFINANCE

Microfinance as a tool for poverty eradication has fulfilled its role. However, possibilities still exist for increasing its impacts on the social and economic conditions of the poor. In that sense, solutions must include participation by diverse actors from the governmental and private spheres.

Development of the market has enabled participants other than those from the traditional financial market to take part. With the aim of achieving financial inclusion, such financial service providers include Non-Governmental Organizations; cooperatives; community development institutions; commercial and state banks; insurance and credit card companies; telecommunications and telegraph services; post offices, and other businesses that offer access to point-of-sale (POS)" (World Bank, 2015).

With the proliferation of participants in the market, it has become possible to bring financial services to the places of residence of potential users, thus surmounting one of the most important obstacles, namely, distance to points of attention.

In this enlargement of the market, banking correspondents, networks for attention for financial services that decentralize the location of branch offices and use diverse mass-market networks such as neighborhood grocery stores or courier service providers, lotteries or others have taken on significant importance, thus improving geographical coverage. Clear examples of the efficiency of this system exist in Argentina, Bolivia, Brazil, Colombia, Ecuador, Mexico, Peru and Venezuela, as well as in other nations in Asia and Africa (Alliance for Inclusion, 2010).

Despite great progress, microfinance faces a much broader challenge than mere financial inclusion. This involves the possibility of generating venues in which micro-businessmen could develop and grow their businesses, which are normally subsistence initiatives, consolidate them and convert them into a backbone for economic growth.

This effort does not exclusively depend on the offering of financial products through the above-mentioned channels; it instead requires decided action by supplementary actors who, from their own vision, help to build favorable scenarios for business development.

According to studies by Avendaño, Daude, and Perea (2013), the number of micro, small and medium-sized enterprises account for around 90% of the world's entrepreneurial fabric, and a very high percentage of these, which significantly varies from country to country, lack possibilities for access to credit in the formal financial system, among other reasons because they do not fulfill legal requirements for receiving credit or because they lack sufficient guarantees to support the amount of the credit.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

On the other hand, the Institute for Study of Argentina and Latin American Reality (IERAL, for its acronym in Spanish) (Cohen, 2010), in research on access to credit in Latin American countries, found that, whereas in Argentina, 72.5% of small enterprises have had or have credit with duly established credit establishments, this proportion drops to 25.6% in Venezuela, showing the existence of huge differences between the possibilities for access to credit among these two countries, to cite only the most extreme examples.

Facts such as these show that mechanisms must be established to provide financing options to the smallest entrepreneurs. In this sense, there is a need to determine common problems and propose alternatives adaptable to each specific situation. Some of the common problems of entrepreneurs, at the global level, are as follows:

- Lack of access to the financial market, due to the conditions they require for granting credit, such as having co-signers, collateral to support the debt, etc., along with high interest rates for microcredit, which in most countries are higher than the rates for ordinary or consumer credit.
- Technological backwardness and a shortage of qualified labor available in the market for certain specific tasks.
- The fear of small entrepreneurs that submitting financial statements will cause them to reveal information that will force them to pay higher taxes.
- The search for tax evasion (Organization for Economic Cooperation and Development, 2013).

In this manner and in accordance with the customer profile for microcredit programs, such customers mainly have four needs:

- Capital at low interest rates.
- Lenient conditions and terms.
- Training in how to handle these funds.
- Personal self-realization.

In order to satisfy these needs and with the possibility that microfinance can be strengthened as a valid financing alternative for micro and small entrepreneurs, the financial markets already have certain lessons learned:

- Microcredit can be financially sustainable.
- Regulation of Micro-Finance Institutions must be as strict and effective as that applied to traditional banking entities.
- Microcredit is a very efficient tool in the fight against poverty.
- State participation is fundamental for the development of microfinance.
- It is necessary to build a competitive market for microfinance in the country, which would generate products with lower interest rates and better services for the population.
- Microfinance must conserve its fundamental goal of helping to decrease poverty to avoid what is currently happening, namely that the fundamental objective of some Micro-Finance Institutions has become the pursuit of profit, so that they no longer benefit “the poorest of the poor”.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

With the understanding that access for micro-entrepreneurs to financing is one of their fundamental needs, microcredit can become consolidated as a fundamental tool in a process for insertion of micro-entrepreneurs into formal economies. However, to do so it will be necessary for government policies to aim to create conditions in which micro-entrepreneurs would understand the advantages of the financing scheme offered to them, the requirements and demands involved and would progressively comply with such conditions.

Despite ignorance of many existing norms and difficulties in their application, entrepreneurs show no fear of entering the formal credit market as long as this does not lead to increased costs for their business activities.

In that context, providing financial resources alone is insufficient to achieve entrepreneurial development. It is of fundamental importance that, along with facilities implemented for this purpose, conditions be created to encourage beginning the process of access to microcredit, and therefore its insertion into the formal financial market, by means of duly authorized institutions. Some involve government decisions such as the elimination of interest-rate ceilings for microcredit or an increase in them, along with a policy to eliminate premiums as one of the financing mechanisms for entrepreneurs or micro-entrepreneurs. Others would commit financial intermediaries, who must have goals for the provision of funds but with terms in which the coverage target is set. In other words, benefiting those least favored while providing the possibility for access to working capital for those who require minimal amounts, in accordance with international standards for startup or continuity of their entrepreneurial initiatives and not in the framework of national conditions expressed above.

However, creation of this environment, using these and other measures, is insufficient. As a general condition, the starting point must be that of the original microcredit; in other words, besides providing funds, there must be entrepreneurial accompaniment for businessmen with respect to the necessary tools for effectively carrying out their work. It has been proven that in the current framework of laws and regulations in many countries, it is impossible to provide quality accompaniment. That is because of the costs involved and the great demands that should be placed on those who currently fulfill this role, and during whose working hours they can barely carry out superficial follow-up on the investment of funds, without being able to explore the comprehensive functioning of a business.

CONCLUSION

Although its eradication has acquired its own dynamic and have achieved very important results, poverty is still a social problem that afflicts about one million people worldwide.

Among several causes of poverty, it has been concluded that the lack of access to financial services is one of the aspects that affects the most, for people to remain in that condition and therefore governments, multilateral agencies and non-profit organizations, are committed to implement financial inclusion programs that allow easy access of poor people into the formal financial market.

Financial inclusion is achieved that people use more efficient savings mechanisms away from traditional savings in cash or through communal systems that blend with credit, consequently resulting in a greater awareness of the importance for the future personal and business initiatives.

The main challenge is to ensure access to financial products, however, this task is more difficult when it doesn't exist a system that allows people to have a minimum level of financial education, so the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

first task is to reach a level of financial education from an early age, but without neglecting the adult population, with which the knowledge of financial products gets strong and the benefits they bring in the long term to the poor person.

So, the responsibility involves governments to through public policies generate the favorable scenarios for financial inclusion and thus the scope that microfinance can play in improving the living conditions of the population.

Microfinance, in essence, are part of the solution given the market they must address, but this gap that currently exists between microfinance institutions should be closed, including those preserving its social sense assume financial sustainability problems and those that searching have taken the plunge and is much more like traditional banks.

In order to continue to identify opportunities for overcoming poverty, it's suitable studying the specific conditions they have in different environments, regions or countries, and from it can be designed microfinance products tailored to the needs of each market and serve as an instrument for social mobility.

Chapter 20
Political Consumption as Supplement to Conventional Political Participation in Promoting Social Change

Emmanuel Adugu
University of West Indies, Barbados

ABSTRACT

Research indicates that individual consumers with food safety, environmental and ethical concerns regarding the provisioning of food may be motivated to use the marketplace as a site for political action to promote social change—a phenomenon known as political consumption (PC). Using data from Ohio 2007 Survey of Food, Farming and Environment, this research examined individual level attributes shaping engagement in PC and conventional political action. Findings based on logistic regression analyses, reveal that engagement in conventional political behavior is positively related to the likelihood of engagement in political consumption. This suggests that engagement in conventional political action and political consumption are not mutually exclusive. The main factors associated with engagement in political consumption are: knowledge about food production, environmental and food safety concerns. These findings suggest that consumers with concerns about the organization and character of food production believe they can create social changes via their consumptive decisions.

INTRODUCTION

Evidence from survey research indicates that individual consumers with food safety, environmental and ethical concerns regarding the provisioning of food may be motivated to use the marketplace as a site for political action to promote social change (Goodman & DuPuis, 2002; Stolle & Micheletti, 2013). The use of the marketplace as a site for political action is a less studied form of political participation (Giddens, 1991; Galston 1991; Micheletti, Follesdal, & Stolle, 2006) and reflects a recognition of material products as embedded in a complex social and normative context (Micheletti, 2003).

New forms of political participation such as buying or boycotting products based on political or ethical values may reflect consumer perception that existing political institutions are inadequate to address citizen concerns; and reveal that traditional forms of participation are increasingly inefficient and less suitable to the nature of political problems in post-industrial societies (Inglehart & Baker, 2000; Norris, 2002). In that regard, buying certain products to support their sales, boycotts, the forwarding of political e-mails about the labor practices of companies, are emerging political action repertoires through which citizens circumvent traditional (conventional) channels for political participation to directly confront the companies and the market (Baek, 2010). This sort of politically motivated pattern of consumption is consistent with assertions by Inglehart (1997) and Norris (2002) that engagement in conventional forms of political behavior (contacting public officials, signing petitions etc) is declining whereas unconventional political behavior such as boycotting a product is on the rise.

The engagement in new forms of political participation such as boycotts and buying certain products to support their sale in order to address public concerns can be labeled as political consumption, which Micheletti (2003) defines as buying or boycotting of products or services based on political or ethical values and with a motive for change. Baek (2010, p.1066) defines political consumption as a consumer's decision to punish (i.e. boycott) or reward (i.e. buycott) private companies by making selective choices of products or brands, based on social, political or ethical considerations. Webster (1975) describes a political consumer as someone who takes into account the public consequences of his or her private consumption or who attempts to use his or her purchasing power to bring about social change. Political consumers use their knowledge, buying power and organizing power to demand certain changes (Dixon, 2003). Such changes could be with respect to food safety, environmental, labor and production practices.

Togeby (1993) offers another perspective regarding new forms of political participation. According to him, new kinds of political participation differ from conventional forms in terms of how they mobilize new social groups into politics. This view is called *the mobilization theory*. He also formulated the *supplement theory* which states that those who employ new modes of participation are already involved in traditional forms of political participation. In that regard, new forms of political participation are an extension of the conventional participation repertoire.

RESEARCH PURPOSE

While most researches focus on understanding the factors associated with conventional political behavior (Verba, Schlozman, & Brady, 1995; Peterson, 1990), few studies have examined engagement in political consumption compared with conventional political behavior (Barnes & Kaase, 1979; Norris, 2002; Micheletti et al., 2006; Stromsnes, 2009; Sandovici & Davis, 2010). Similarly, although political consumers engage in conventional participation acts just as often as others, they are skeptical about the effectiveness of these methods, and this corresponds to the fact that, in general, they have less trust in established institutions (Stolle et al 2005, p.260). They noted further that these citizens (political consumers) are not alienated; they continue to engage in conventional forms of participation, although they are aware of their limitations (p. 263). In addition to that, Peterson (1990); Barnes and Kaase (1979); Stromsnes (2009); Sandovici and Davis (2010) reported that conventional and unconventional forms of political participation are combined by politically active citizens; and Tarrow (2000) argues that those engaging in political consumption are the same people who participate in conventional forms of political behavior. There are virtually no studies that explore the relationship between an individual's views of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

food safety, environmental concerns, characteristics for purchasing food, etc. and engagement in political consumption in the Unites States. This research seeks to fill such gaps in the literature focusing on food and environmentally related data to examine individual level attributes shaping engagement in political consumption and conventional political action and how political consumption supplements engagement in conventional political participation in promoting social change.

DATA SOURCE AND SAMPLING PROCEDURE

The data for this research are from Ohio 2007 Survey of Food, Farming, and the Environment. The primary foci of the survey included food activism and the environment, food consumption and political views on national affairs. This survey was conducted in summer 2007 by Faculty of the College of Food, Agriculture and Environmental Sciences, in collaboration with the Ohio Agricultural Research and Development Center.

Experian HS, a private firm, was contracted to generate a random sample of Ohio Households in May, 2007. A proportionate stratified random sampling procedure was used. Two equal sized strata were sampled, with 1500 sampled from households in each of the core metro and fringe strata. A mail survey was administered using Dillman's Tailored Design Method (Dillman, 2000). Up to four mail contacts were made with each of the selected households. The mailings included: a pre-notification letter; a cover letter and survey instrument; a reminder postcard; and a replacement survey if necessary. The overall survey response rate was 34.7%. The final data set was weighted to ensure that each stratum is proportionately represented.

MEASUREMENT OF DEPENDENT VARIABLE

Conventional Political Behavior

Conventional political behavior was measured by asking about engagement in the following types of political action: talked to, emailed or written to a politician or government official; signed a petition; attended a political meeting or rally; contributed money to an organization. Respondents were asked to indicate whether they engaged in any of the above behaviors in the last 3-4 years. Response categories were dichotomous, with Yes=1, and No=2. These responses were recoded into Yes=1, and No=0 for data reduction purposes and logistic regression analysis. A scale of conventional political behavior was created. The total number of cases where a conventional political behavior was reported was counted for each of the types of the behavior. The range of conventional political behaviors engaged in ranged from 0 to 4, as shown in the descriptive statistics in Table 1. Forty-five percent of respondents engaged in none of the four forms of conventional political behavior; 15.4 percent engaged in only one of the four forms of political behavior and 8.5 percent engaged in all four forms of political behavior.

With 45 percent of respondents not engaged in any of the four behaviors and the rest (55 percent) engaged in at least one of them, the conventional political behavior variable is skewed. In order to identify the factors that are associated with engagement in at least one form of conventional political behavior, the distribution was transformed, with those who have not engaged in any behavior coded (0) and those who have engaged in at least one form of the behavior coded (1). This will allow binary logistic regression analyses.

Political Consumption

Political consumption was measured by asking about engagement in the following types of political action: boycotted any food types or brands in protest about food issues; bought particular foods or brands in order to support their sale; complained to a retailer (supermarket) about the food they sell; protested about food issues, either in person, by phone, by letter or e-mail; spoken to colleagues, family members, or friends to express support for any aspect of livestock farming.

The response categories for political consumption were dichotomous, with Yes=1, and No=2. Respondents were asked whether they engaged in any of the above political consumption repertoires during the last 12 months. These responses were also recoded into Yes=1, and No=0 for data reduction purposes and binary logistic regression analysis.

Similar to the conventional political behavior scale, a political consumption scale was created. The number of occurrences of engagement (Yes) in political consumption was counted for each case. The range of engagement in these types of behavior was between 0 and 5 as shown in Table 2. Forty-five percent of respondents were not engaged in any of the five forms of political consumption; 25.4 percent were engaged in just one of the five forms of political consumption and 1.5 percent engaged in all the five forms of the behavior.

Thus with 45 percent of respondents not engaged in any of the five political consumption behaviors and the rest (55 percent) engaged in at least one of them, the political consumption variable is skewed. In order to identify the factors that are associated with engagement in at least one form of political con-

Table 2. Count of occurrences of political consumption

Count Occurrence of Political Consumption	Frequency	%
0	439	45.0
1	248	25.4
2	151	15.5

sumption, the distribution was transformed, with those who have not engaged in any behavior coded (0) and those who have engaged in at least one form of the behavior coded (1). This will allow binary logistic regression analyses.

MEASUREMENT OF INDEPENDENT VARIABLES

Based on the diverse literature, it is anticipated that consumers' knowledge (being informed) and concern about food safety, organic and local product labels, animal treatment, and environmental issues may influence their engagement in political consumption and conventional political action. Other predictors of political behavior identified are: political efficacy, political ideology, post-materialist value orientations, education, income, age and rural/urban residence. The technique for measuring these various independent variables is described below.

Knowledge About Food, Agricultural and Environmental Issues and Food Production

Consumers who are informed about pertinent public issues in society may be motivated to engage in political action. For example, political consumers use their knowledge about issues such as food safety and environmental degradation to demand change (Dixon, 2003). It is in that context that Weber (1978) in Goodman and DuPuis (2002) refer to the enlightenment notion of politics where individuals act by virtue of empowerment through knowledge. The notion is that knowledge about pertinent public issues may be important in motivating consumers to engage in political behavior in order to change the state of affairs from "what is" to a desirable one. To measure how knowledgeable respondents were about how food is grown, they were asked to respond to the following question, "How knowledgeable are you about how your food is grown"? Response options ranged from not at all knowledgeable (1), somewhat knowledgeable (4) to very knowledgeable (7). The average (4.57) shows that survey respondents can be considered somewhat knowledgeable about how food is grown.

Food Safety Concerns

Food safety concerns are legitimate responses of consumers to the threats and insecurities that the food system is exposed in a "risk society." Consequently, individuals counter the risks (contamination, health hazards, etc.) and uncertainties associated with the food system through political consumption. In that regard, Morbak et al. (2011) showed that Danish consumers were willing to pay a premium for food safety when introduced to products having additional food safety characteristics. It is anticipated that consumers having high food safety concerns will be more likely to engage in political consumption. Respondents were also asked to indicate their concern regarding food safety issues, with response options ranging from not concerned (1) to very concerned (7). The average response was 5.95—meaning that many respondents were very concerned about food safety issues.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Important Characteristics for Purchasing Food

The use of labels which indicate that food products are organic and locally grown may satisfy consumers that the product is at least beneficial to small farmers, the environment and farming communities (Torjusten et al., 2001; Hinrichs, 2000). Consumers who place a high importance on acquiring locally grown products will be more likely to engage in political consumption. Similarly, consumers who place a high importance on organic products will be more likely to engage in political consumption due to their awareness of the relevance of moral considerations in food consumption (Giovanni, Peluso, & Guido, 2012). Consumer concern about food, agricultural and environmental issues might influence purchasing decisions. In order to investigate this, respondents were asked to rate on a scale of 1 to 7, with 1 coded as not important and 7 coded as very important, the importance of organic and locally labeled products in their purchasing decisions. Locally grown (mean 4.42) and organic (mean 3.05) labels are somewhat important influences on consumer purchasing decisions.

Animal Treatment

Following Kendal, Lobao, and Sharp (2006) and also based on the results of maximum likelihood factor analysis, a three item summated scale (Alpha reliability=.76) was created from a series of questions related to animal treatment. Respondents were asked to indicate their level of agreement with the following statements: humans have little respect for the quality of life of animals; animal agriculture raises serious ethical questions about treatment of animals; increased regulation of the treatment of animals is needed. The response categories were: strongly agree (coded 1), agree undecided, disagree and strongly disagree (coded 5). Cases were coded so that higher values reflect greater concern with animal well-being. The scale ranged from 3 to 15.

Environmental Concern/New Ecological Paradigm (NEP)

Berlin (2011) aptly noted that dissatisfaction with governmental performance on issues of environment, human rights and attempts to eradicate poverty mobilize people to practice political consumption. Similarly, individualized collective action as a form of responsibility taking to work against environmental also constitutes political consumption (Micheletti & McFarland, 2009). It is therefore anticipated that people with strong ecological concerns will be more likely to engage in political consumption. Dunlap's New Ecological Paradigm (NEP) set of items is a widely used measure of pro-environmental orientation (Dunlap et al., 2000). In that regard, a ten item summated scale (Alpha reliability=.73) was created from Dunlap's NEP set of items. Respondents were asked to indicate their level of agreement with the following statements: the so-called "ecological crisis" facing humankind has been greatly exaggerated; human ingenuity will ensure that we do NOT make the earth unlivable; the earth has plenty of natural resources if we just learn how to develop them; humans are meant to rule over the rest of nature; the balance of nature is strong enough to cope with the impact of modern industrial nations; we are approaching the limit of the number of people the earth can support; when humans interfere with nature, it often produces disastrous consequences; plants and animals have as much right as humans to exist; despite our special abilities, humans are still subject to the laws of nature just like any other species; and if things continue on their present course, we will soon experience a major ecological disaster. The response categories were: strongly agree (coded 1), mildly agree, unsure, mildly disagree and strongly

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

disagree (coded 5). In view of the fact that some questions were positively and others negatively phrased, reverse coding was done as necessary so that higher values reflected greater ecological concerns. The final scale ranges from 10 to 50.

Materialist and Post-Materialist Value Orientations

Inglehart (1981; 1997) argues that individuals with post-materialist value orientations are more likely to engage in political action compared with their materialist counterparts. Four sets of questions were used to measure materialist and post-materialist value orientations. Respondents were asked: of the following goals, which are the two most important to you? Protecting freedom of speech; maintaining order in the nation; giving people more say in important political decisions; maintain a high rate of economic growth. The response options to the above four questions were Yes/No (Yes=1 and No=0). Individuals who chose options 1 & 3 are classified as post-materialists and those who opted for 2 & 4 are materialists (Inglehart, 1997; 1981). There are no "labels" for the other possible combinations. Various combinations of goals 1, 2, 3 & 4 were obtained by extracting the response combinations that respondents mentioned each of the two goals as important to them. Protecting freedom of speech was favored by 55.4% of respondents compared with 40.4% who favored maintaining high rate of economic growth. About nineteen and 16 percent of the survey respondents had post-materialist and post-materialist value orientations respectively. This means 65% of survey respondents had different worldviews which did not fit Inglehart's materialist and post-materialist framework.

Political Ideology

Liberals may be more likely to engage in political consumption compared with their conservative counterparts. This is due to the fact that liberals are social change oriented, and ready to engage in any form of unconventional political action (Inglehart, 1997). Respondents were asked to describe their political views on a scale of 1 to 7 (1=extremely liberal and 7=extremely conservative). The sample average (4.33) tended toward "middle of the road."

Political Efficacy

Peterson (1990, p. 20) defines political efficacy as the belief by a person that he or she is capable of affecting politics, known as internal efficacy. It represents an individual's beliefs about the impact he or she may have on the political process due to his or her skills and confidence. Internal efficacy is linked to political interest or knowledge about public issues; and external efficacy is linked with trust in government institutions (Niemi, Craig, & Mattei, 1991).

Campbell, Gurin, and Warren (1954, p.187) define political efficacy "as the feeling that an individual political action does have, or can have an impact on the political process. It is the feeling that political and social change is possible and that the individual citizen can play a part in bringing about this change." Campbell and colleagues' conceptualization of political efficacy focuses on the dimension of internal efficacy, which is most appropriate to this research—the data set used for this research is limited to citizens' view about internal efficacy.

Political efficacy is investigated with respect to engagement in political consumption and conventional political action. Respondents were asked the following question: how much influence do you think

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

someone like you can have over government decisions? The response categories were: a lot of influence (coded 1), some influence (coded 2), very little influence (coded 3), and no influence at all (coded 4). These responses were reverse coded so that higher values reflected greater influence over government decisions. About 3% of respondents think that they have a lot of influence over government decisions. Half (51.4%) of respondents think that they have very little influence over government decisions.

Gender and Education

Political consumption is a form of civic engagement that is disproportionately utilized by women. In that respect, women are inclined to engage in political consumption; and political consumption is also viewed as a woman-friendly way of participating in political life (Sandovici & Davis, 2010; Inglehart & Norris 2003; Stolle & Micheletti, 2003). Gender was treated as a dichotomous variable (female coded 1 and male coded zero). Out of a total of 967 responses, 50.5% were women and the rest were male.

Education is the prime factor in most analysis of political behavior because it fosters political engagement (Verba et al., 1995). Both conventional political behavior and political consumption have been found to be strongly determined by the level of education (Goul and Tobiasen in Michilletti et al. 2006; Verba et al., 1995; Peterson, 1990). For example, education may impart the knowledge that is necessary for the assessment of product labels or political events which may trigger boycotts, petition drives, etc. (Stolle & Micheletti, 2013). In effect, educated people are more likely to be informed and interested in political engagement. Higher level of education is likely to be associated with engagement in political action. Respondents were asked to indicate the highest level of education they have completed. The response categories were: some high school (coded 1), high school graduate/GED (coded 2), some college/associate degree (coded 3), bachelor's degree (coded 4), some post-graduate work (coded 5) and graduate or professional degree (coded 6). The survey sample in general can be considered as well-educated. About 32% of the survey respondents had some college/associate degree and 12% had graduate or professional degree.

Income and Age

Individuals with greater incomes are anticipated to engage in political action. This is due to the fact that those with greater incomes tend to have resources such as time, money and civic skills (Verba et al., 1995; Stolle et al., 2005). Survey respondents were asked to indicate their approximate gross household income from all sources, before taxes, for 2006. The response categories include: less than $10,000 (coded 1), $10,000-19,000 (coded 2), $20,000-29,000 (coded 3), $30,000-39,000 (coded 4), $40,000-49,000 (coded 5), $50,000-59,000 (coded 6), $60,000-74,999 (coded 7), $75,000-99,999 (coded 8), $100,000-149,000 (coded 9) and $150,000 or more (coded 10).

Young people find lifestyle politics to be an option for more individualized and reflexive engagements in politics and citizen practice (Ward, 2008; Sandovici & Davis, 2010). Younger people are anticipated to be more engaged in political consumption while conventional political behavior may be favored by older people. The minimum age and maximum ages were 18 and 98 respectively. The average age was 52.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Rural and Urban Residence

Rural residents also have a higher awareness and concern about food system issues than their urban counterparts coupled with a higher likelihood of purchasing local foods than their urban counterparts (Weatherell, Tregear, & Allinson, 2003). Irrespective of place of residence, the behavior of purchasing local foods may be carried out with intentions of preserving the local economy, small scale producers, and the environment (Hinrichs, 2000). In that regard, consumers in both rural and urban areas are identifying themselves as being socially and environmentally conscious through political consumption (Raynolds, 2002). It is therefore anticipated that both rural and urban residents will engage in political consumption.

Respondents were asked to indicate the kind of place in which they currently live. The response categories were: city=1, suburb=2, small town=3, countryside (but not on a farm=4, farm (with livestock) =5 and farm (no livestock) =6. The first three response categories were combined to represent urban place of residence and the last three represent rural residence. The rural residents are then coded (1) and the urban ones coded (0) as reference category for binary logistic regression analyses.

RESULTS

Cross Tabulations Between Conventional Political Behavior and Political Consumption

Table 3 is a cross tabulation of count occurrences of conventional political behavior and political consumption. It shows that 263 (27%) respondents did not engage in conventional political behavior and political consumption. One hundred and seventy nine (18%) people engaged in political consumption behavior but not conventional political action. Similarly, 175 (18%) engaged in conventional political action only. A good number of respondents were engaged in both types of political activity. These are

Table 3. Cross tabulations of count occurrences of conventional political behavior and political consumption

represented in bold fonts (i.e. 46, 24, 25 and 8) across the diagonal in Table 3. It means that a total of 103 (11%) people were engaged in both types of political activity. A good number of people are engaged in one or more types of conventional political action but few are engaged in the corresponding political consumption behaviors. For example, 53 people are engaged in two forms of conventional political action and one type of political consumption; 40 people are engaged in three forms of conventional political action and one type of political consumption. The general pattern is that less people engage in many types of political consumption compared with the conventional political types of action. In Table 3, the areas shown in rectangular boxes represent people who have engaged in at least one form of each type of behavior in combination with the other type. A total of 359 (37%) people have engaged in at least one type of each behavior in combination with the other.

Multivariate Analyses

In order to examine how the characteristics of individuals who engage in conventional political behavior differ from those who engage in political consumption and how political consumption supplements engagement in conventional political participation in promoting social change, binary logistic regression models were performed. The results assessing relationships between conventional political behavior, political consumption repertoires and the independent variables are presented with respect to two models. Model 1 (Table 4) assesses the relationship between engagement in at least one form of

Table 4. Model 1: Logistic Regression for Engagement in at Least One Form of Conventional Political Behavior

Independent Variable	B (S.E.)	Odds Ratio
Knowledge of food production	.101(.050)	1.107*

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

conventional political behavior and independent variables (background characteristics and attitudinal correlates). Model 2 (Table 5) assesses engagement in at least one form of political consumption and the independent variables (see Tables 1 & 2 on count occurrences of conventional political behavior and political consumption; and the corresponding transformations into dichotomous variables for purposes of binary logistic regression).

Based on the Hosmer & Lemeshow Goodness of Fit Test for binary logistic regression, Models 1&2 (Tables 4&5) below are well-fitting. Models that are well-fitting show non-significance ($p>.05$) on the Hosmer & Lemeshow Goodness-of-Fit Test, indicating model prediction is not significantly different from observed values (Hosmer & Lemeshow, 2000; Menard, 2002; Norusis, 2008). Tables 4 & 5 summarize the results of the factors associated with engagement in at least one form of conventional political participation and political consumption. It is worthy of note that engagement in at least one form of political consumption is influenced by engagement in at least one form of conventional political action. Engagement in at least one form of conventional political participation and political consumption are all shaped by knowledge of food production, age (being young) and political efficacy. Pro-environmental concerns, political ideology and the importance of organic labels in purchasing decisions are positively associated with engagement in at least one form of political consumption. Income is only positively associated with engagement in at least one form of conventional political participation.

DISCUSSION

Given the fact that 263(27%) of respondents did not engage in conventional political behavior and political consumption; 179 were engaged in political consumption only; 175 were engaged in conventional political action only; and the rest (37%) have engaged in at least one type of each behavior in combination with the other, it implies that in general, a good number of people still engage conventional political action in addition to political consumption (see Table 3). This provides "compelling" evidence that a good number of people are engaged in both types of political activity. In that context, those who engage in conventional political action are more likely to be the same people who engage in political consumption. It is possible that people engage in political consumption in addition to conventional political action when they realize the ineffectiveness of the latter (conventional action). In that regard, conventional political action may be an antecedent of political consumption. This provides some support for Stromsnes (2009, p. 303) view that rather than being a "new" or post-conventional kind of political participation, political consumerism should be seen as an extension to the conventional, or "old" participation repertoire.

Based on the multivariate analysis, engagement in conventional political action emerges as a strong factor that shapes participation in political consumption. This further supports the consistent pattern where those who engage in conventional political action also participate in political consumption. This suggests that engagement in conventional political action and political consumption are not mutually exclusive behaviors. This relationship between engagement in political consumption and conventional political action is in line with some of the available literature on political action. Consistent with Togeby's (1993) supplement theory, those who are active in conventional political action also engage in political consumption. In that context, citizens (political consumers) are not alienated from conventional political actions; they continue to engage in conventional forms of participation although they are aware of their limitations (Stolle, Hooghe, & Micheletti, 2005, p. 263). In addition to that, Peterson (1990); Barnes and Kaase (1979) report that conventional and unconventional forms of political participation are combined by politically active citizens. As Stromsnes (2009, p. 312) puts it, political consumerism represents a broadening of the conventional or "old" participation repertoire. Consistent with the political efficacy perspective, citizens may engage in both types of political action if they believe that their actions will influence public affairs. Thus it can be argued that an individual's likelihood of engagement in political consumption is influenced by his or her conventional political behavior. It is also likely that people engage in political consumption in addition to conventional political action when they realize the limitations of the latter (conventional political action) in addressing certain public issues such as food safety and environmental degradation. This strengthens the earlier argument that conventional political action may be an antecedent of political consumption.

The fact that knowledge about food production is positively associated with engagement in both conventional political behavior and political consumption suggests that when people are made aware of affairs in their societies coupled with the realization of the difference they can make through their decisions, they are motivated to act. In this context, having the knowledge about food production promoted individual responsibility to engage in political actions for desirable change. Political behaviors with change motives in relation to food products and services have been credited to enlightened consumers (Klintman & Bostrom, 2006; Micheletti et al., 2006; Dixon, 2003). Those who have knowledge about food production are more enlightened about their capacity to act, and use "agency" to influence change.

The association of political efficacy with conventional political action and political consumption implies that citizens who engage in these behaviors believe that they can have some influence over gov-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ernment decisions. Multivariate analysis suggest that those who engage in conventional political action are more likely to have a relatively stronger feeling of being able to have influence over government decisions compared with political consumers. This raises the question of whether political consumers are distrusting of political institutions as suggested by scholars such as Norris (1999; 2002); Stolle and Micheletti (2013). For Norris (1999), political consumers are critical of conventional political institutions but are not alienated from conventional political institutions and still have a feeling of political efficacy. At this point, one can only speculate that the relatively lower level of political efficacy shown by political consumers may be due to their critical attitude and lack of trust in conventional political institutions. It is possible that the relative difference in perception regarding having influence over government decisions by those who engage in conventional political action and political consumers may be a motivation for engagement in political consumption.

The importance of organic labels in purchasing decisions emerged as a factor that differentiates engagement in political consumption from conventional political behavior. Consumers who place a greater importance for foods labeled organic are more likely to engage in political consumption. In the United States, consumer demand for organic foods has been growing. This is an indication of continued consumer interest in how food is produced. Consumers are becoming increasingly aware and concerned about practices that may pose health hazards, damage the ecosystem, etc. It is in that respect that the use of organic labels in purchasing decisions becomes important. Purchasing labeled organic food is one way for consumers to get information about the non-observable aspects of food such as no use of genetically modified organisms, no use of pesticides, and sustainable environmental practices (Torjusen et al., 2001). The positive association of engagement in political consumption with the importance of organic labels in purchasing decisions demonstrates that people may engage in political consumption behaviors to express their lifestyles and ethical values. According to Giddens (1991), consumers who consciously engage in political consumption practices are engaging in life politics. These reflexive (political) decisions not only shape identities, but also increasingly have political implications because they challenge the existing interrelationship between society, nature and individual responsibility (p.81).

The importance of locally grown labels in purchasing decisions also emerges as a factor that differentiates engagement political consumption from the conventional form of political behavior. Consumers who have greater importance for locally grown food are more likely to engage in political consumption. This finding may be explained in terms of the growing trend of increasing consumer interest in local foods. As a result of the high awareness and concern among consumers about conventional industrial food production systems and their impact on the environment, small scale producers, etc. an increasing number of them (consumers) are choosing to purchase locally grown foods (Hinrichs, 2000). Other scholars argue that the reasons for the growing consumer interest in local foods is due to the widely publicized food safety incidents, growing mistrust in mass production, ethical and environmental concerns regarding how food is produced and transported (Ilbery & Maye, 2006). The positive association of engagement in political consumption with the importance of locally grown labels in purchasing decisions demonstrates that people may engage in political consumption behaviors to express their lifestyles and ethical values. Further, it is a manifestation of how citizens can make a difference to food system problems through their purchasing decisions.

A number of studies link ecological concerns with political consumption behaviors (Gulbrandsen, 2006; Dhavan et al., 2007). The association of political consumption with strong ecological concerns can be explained in terms of the reflexive construction of identity. This is based on the acknowledgment of the fact that consumptive behaviors such as political consumption serve a dual purpose of fulfilling

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

material needs and also signaling identity (Pederson, 2000). These reflexive (political) decisions do not only shape identities, but they also challenge the existing relationship between society, nature, and individual responsibility.

Liberal political ideology also emerges as a factor that differentiates engagement in political consumption from the conventional form. This is theoretically sound due to the fact that individuals with liberal political ideologies share similar values with post-materialists such as, propensity for social change, readiness to engage in protest and boycotts (Waal, Achterberg, & Houtman, 2007; Inglehart, 1997). This finding is a manifestation of the changing nature of political engagement, where individuals who are dissatisfied with public affairs and are passionate for change, get motivated to take the necessary action.

Age also emerges as a common factor associated with engagement in both conventional political behavior and political consumption. Being young is positively associated with engagement in conventional political behavior and political consumption. It was anticipated that young people will be more likely to engage in political consumption due to Inglehart's intergenerational value change thesis, where younger generations tend to have post-materialist value orientations and engage in political consumption.

CONCLUSION

The findings of this research show the uniqueness of engagement in political consumption in setting the agenda for policy change regarding practices in the provisioning of food. Consumers' knowledge and concerns about food safety, environment, organic and local product labels, and animal treatment may influence engagement in political consumption. In that context, enlightened consumers are using their consumptive decisions to influence desirable changes reflective of their attitudes and values regarding the provisioning of food.

Engagement in conventional political behavior is consistently related to the likelihood of engagement in political consumption. This suggests that engagement in conventional political action and political consumption are not mutually exclusive behaviors. Thus political consumption is a supplement to conventional political participation in promoting social change.

As a result of consumer insight, consumer distrust is developed thanks to the understanding that traditional (conventional) forms of political participation are ineffective and unsuitable to deal with consumers' problems in post-industrialized societies. Similarly, as a consequence of being enlightened about food system issues, consumers seek alternative ways and policy options that will address their interests and concerns. This apparently motivates individual responsibility-taking to influence desirable change in public affairs. The risks and uncertainties of the US food system can be considered as motivations for enlightened individuals to take responsibility for social change. Thus political consumption is instrumental in addressing the perceived risks and uncertainties of the food system. In essence, engagement in political consumption is a mechanism being used by informed consumers to express their needs and promote their interests, with the ultimate goal of inducing public policy changes. These findings suggest that consumers with some concerns about the organization and character of food production believe that they can create some changes via their consumptive decisions.

Chapter 21
Universities' Contributions to Sustainable Development's Social Challenge:
A Case Study of a Social Innovation Practice

Douglas Paulesky Juliani

Ania Silva
Instituto Federal de Santa Catarina, Brazil

Jorge Cunha
University of Minho, Portugal

Paul Benneworth
University of Twente, The Netherlands

ABSTRACT

There is an increasing recognition that dealing with sustainable development need to address the social structures that encourage unsustainable economic and environmental practices. Universities represent important sources of knowledge for addressing sustainable development, but there has been relatively limited consideration of their contributions to these social elements. Drawing on recent interest in social innovation as to conceptualise social change and community development, this paper aims to understand universities' involvement in the process of social innovation, for the particular case of a Brazilian higher education institution. By exploring how universities can contribute to the different stages of the social innovation process, it highlights the capacities that universities have to address the social sustainable development challenge. The paper identifies five characteristics of universities contributions to social innovation and sets out an agenda for future research necessary to understand universities' wider contributions to sustainable development.

1. INTRODUCTION

One of the most urgent contemporary debates concerns the achievement of the sustainable development goals (Moore, 2015), covering economic growth, environmental protection and social progress. However, the social dimension is often overlooked in favour of the more urgent economic dimensions or the more visible environmental dimension. Understanding the social dimension is vital to achieving true sustainable development given an increasing sense of crisis in many areas of contemporary social development at the moment where after decades of progress, there are starting to be growing intractable problems around urban sustainability, climate change, food security, energy security and poverty/inequality (Cunha & Benneworth, 2013). The social dimension of sustainability concerns protecting society's vulnerable groups, respecting social diversity and ensuring social capital formation (Cunha & Benneworth, 2013; Rinkinen, Oikarinen & Melkas, 2016). Delivering sustainability's social dimension demands extensive innovation to reshape society in ways that deliver these protections and potentials (Schmidpeter, 2013). Socially innovative practices offer a response to the unfulfilled needs of communities to improve social relations and foster socio-political emancipation (Mehmood, 2016). This paper therefore considers this process of social innovation as a driver of sustainable development, here defined as innovation primarily driven by the intent of benefiting the society (Bhattacharya, 2013).

This paper seeks to consider the roles played by universities in driving these social innovations necessary to deliver sustain sustainable development, and specifically the gap that has arisen in contemporary understandings of university contributions to social innovation. To date the discussion has mainly focused on two kinds of university contribution (OECD, 2007), firstly universities as sources of technologies that can solve the particular environmental problems that become evident during unsustainable development practices, and secondly in universities' own practices as large institutions. This paper seeks to extend this discussion to where we identify a potential gap, proposing a third role that universities can play, namely in developing new kinds of social practices and organisations. These new social practices and organisations can potentially address the social exclusion problems that are increasingly evident in the challenges of sustainable development. But at the same time, we acknowledge that universities do not have specifically social innovation missions, and this can create barriers for universities in seeking to create these new social practices and organisations. To address this issue, the paper asks the specific research question of how can universities contribute to wider processes of social transformation that are necessary to deliver coherent and integrated sustainable development?

Any consideration of the roles of universities in social innovation need be mindful of the shortcomings of universities as drivers of institutional change. Benneworth (2013) concluded that university contributions to dealing with social exclusion is hindered by the wider institutional environments for higher education emphasising research excellence and teaching quality over place based contributions. Belyaeva & Kazakov (2014) claim that sustainability is not strongly integrated in majority business practices in firms in least developed (or emerging) countries, contrary to Europe countries (Crets & Celer, 2013), and similar claims might be expected for universities. However, in many of these countries, notably South America, universities are expected to make strong societal contributions (Tapia, 2008; Ramirez, 2011). This places practical expectations on universities to support and facilitate social innovation initiatives and therefore, contributing to social development. This in turn requires the effective integration of social innovation focus on their strategic planning and everyday practices, to drive forward social development and contribute to social sustainable development. We see for example that universities in various countries have begun creating learning environment that both allows "regular" students to

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

acquire knowledge and skills needed in their particular subject area whilst also allowing students from disadvantaged social groups to acquire the knowledge and skills necessary to overcome their practical social exclusion (Russo & Muller, 2013).

The paper adopts the process model for universities' involvement in the process of social innovation proposed by Benneworth and Cunha (2015) and applies it to an example from a Brazilian university. The paper provides insights into the practicalities of how universities may contribute to different stages of social innovation processes and what precisely are the various universities' inputs that may become involved in social innovation process, and thereby contribute to wider processes of social change and development. The paper highlights the great potential that exists for universities to contribute to solving the Grand Challenges of the 21st century, particularly through collaboration between sectors and different stakeholders and focusing on social sustainability (Rinkinen et al., 2016). At the same time, universities operate within wider political-economic contexts, and the capacities that universities have to realise this potential are constrained by these wider contextual factors.

2. SOCIAL INNOVATION CONTRIBUTING TO SUSTAINABLE DEVELOPMENT

The most common definition of sustainable development is provided in the Brundtland Report: "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (WCED, 1987). Definitions of sustainable development have focused on three main dimensions (Hopwood et al., 2005): economic, environmental and social. As the World Bank's (2003) report states "Improving human well-being over time is a broader goal than increasing economic growth … social and environmental assets also affect human well-being directly" and achieving a balanced long-term development includes the three dimensions. Until recently, sustainable development was perceived as essentially integrating environmental concerns into economic decision-making (Lehtonen, 2004). Yet, sustainable progress implies parallel improvement in three dimensions, economic, environmental and social (Rinkinen et al., 2016): if any one dimension is weak then the system as a whole is unsustainable (Millard, Weerakkody, Missi, Kapoor, & Fernando, 2016). This challenge has been reflected in the broadening of the Sustainable Development Goals (SDG) (2015-30) to include such primarily social activities (Moore, 2015) as (a) promoting peaceful and inclusive societies, (b) the participation and inclusion of people, (c) partnerships amongst all actors, (d) gender responsiveness, (e) improvements to risk and disaster management, (f) strong leadership across the public sector, and (g) rethinking the scope of basic public

Issues of sustainable development must also be understood in the context of growing concern for the so-called Grand Challenges of the 21st century. These are the problems which humanity must address in this century to survive into the next: these include climate change, uneven income distribution; high rates of unemployment; ageing of population; and mass urbanisation and social exclusion problems, among others (BEPA, 2010; Engelke, Mauksch, Darkow, & Gracht, 2015, Westley & Laban, 2011). According to Nicholls and Dees (2015), these problems are characterised by divergent analyses and diagnoses highlighting the failure of conventional solutions and established paradigms across private, public and societal sectors. They are quintessential problems of sustainable development solving those Grand Challenges demands new forms of social organisation facilitating human welfare whilst respecting the earth's ecological limits, creating collective action and co-ordination providing resilience against these new challenges (Damme, 2009; Urry, 2011).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

There is growing recognition of the need to go beyond simplistic considerations of national development in terms of per capita GDP (Oganisjana & Surikova, 2015) and instead consider 'prosperity' (Moore, 2015):

Prosperity is … about flourishing, the health of society, inclusive political institutions, a guarantee of human capital development and civil liberties … an educated and healthy citizenry who are actively involved in co-designing and co-producing their own futures within the limits of the sustainability of the planet's resources (p. 803).

Although technological innovations were important for economic growth historically, social innovation is increasingly recognized as the driver of future change towards sustainability (Moore, 2015) explicitly targeting socially excluded groups (Millard et al., 2016). Social innovation involves creating new social networks and capacities that evolve into new social structures and systems that therefore change existing social paradigms (Mieg & Töpfer, 2013; Garud & Karnoe, 2013; Cajaiba-Santana, 2014).

As Bruin emphasises (2016),

…building momentum for change, and unravelling how to strengthen elements to stimulate, sustain and grow social action, holds clues to transitioning to a socially sustainable future (p. 18).

This 'social innovation' is most resilient where embedded in a broader social change movement (Mehmood, 2016) enabling novel stakeholder collaborations and collective benefits (Ling & Dale, 2013; Dobele, Grinberga-Zalite, & Kelle, 2015). Social innovation, which emerges from the collective and is more likely to be a bottom-up process and driven by civil society, can foster the empowerment of actors, transforming social, cultural, economic, and power relations. Hence, promoting social innovations can represent an important way to deliver the social dimension of sustainable development, and hence to address the Grand Challenges of the 21st century.

3. SOCIAL INNOVATION: CONCEPTS AND PROCESSES

There has recently been increasing interest in social innovation in several academic disciplinary fields, most notably in innovation studies, territorial development, social economics, and public governance (Benneworth & Cunha, 2015; Evers & Ewert, 2015; Martins & Bermejo, 2015). Nicholls, Simon, and Gabriel (2015) noted that growing interest in social innovation at least partly reflects the failure of established systems (e.g. technology, markets, policy, governance) to deliver well-being and economic prosperity. The idea of social innovation has emerged as an attempt to capture and describe "bottom-up phenomena where new ideas, approaches, techniques and organisational forms grew from humble roots into substantive new social capacities" (Benneworth & Cunha, 2015, p. 510). As Nicholls and Dees (2015) state:

…social innovation has been recognized as a new wave of innovation that gives primacy to systems and processes of change in social relations… [and] may represent a step change compared with previous waves of innovation in that it often attempts to disrupt and reconfigure systems themselves rather than simply providing disruption within existing systems (p. 355).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

A broader review of definitions of social innovation is beyond the scope of this paper[1] and this paper adopts Benneworth and Cunha's (2015) definition:

A social innovation is a socially innovative practice that delivers socially just outcomes by developing novel solutions in border spanning learning communities thereby creating social value by promoting community development, hence forming wider collaborative networks, and challenging existing social institutions through this collaborative action (p. 512).

Social innovation involves creating new ideas manifested in social actions leading to social change and proposing new alternatives and new social practices for social groups (Cajaiba-Santana, 2014). Social innovation has an "immaterial structure" where new social practices (e.g. changes of attitudes, behaviour, or perceptions) become institutionalised through social engagement and cooperation among different social groups (Cajaiba-Santana, 2014). Social innovation cuts across all sectors of society – private, public and the third sector action (Nicholls & Dees, 2015), involving a "creative collaboration between public actors or market agents and civil society organisations contributing for the empowerment of citizens" (Garcia, Eizaguirre, & Pradel, 2015, p. 96).

Following Garud, Tuertscher, and Van de Ven (2013) it is possible to identify some patterns in the linkages, alignments and networks within social innovation processes, acknowledging contingencies and tensions inherent within social innovation (Rip & Schot, 2002).

Benneworth & Cunha stylise social innovation as a six-stage model. Firstly, idea generation involves inventing a solution to a previously-identified social problem (Voorberg, Bekkers, and Tummers, 2013). Secondly, implementation needs to be planned and immediate stakeholders need to be enrolled to support the promising and potentially risky new idea. The third stage is developing a demonstrator which helps convince stakeholders of the idea's validity (Rip & Schot, 2002; Evers & Ewert; 2014). If viability van be demonstrated then the expansion of the solution can begin, finding ways to upscale the innovative solution and deliver wider societal benefits (Phills, Deiglmeier, & Miller, 2008). The fifth stage is mobilising a support coalition for this upscaling, using networks to bring together institutions to assist with this (e.g. government departments, foundations, corporations, non-profit organisation or social capital investors). In the final stage (transforming and codifying) the social innovation becomes a product that can easily be implemented in many new settings, places or circumstances, allowing its upscaling. By stylising social innovation as a six-stage process, it is therefore possible to separate out the distinct roles of partners in each process stage, and therefore to consider the roles played by universities in these processes.

This model provides a means to explore this paper's analytical research question, concerning the roles of universities in stimulating social innovation in each of these stages. The paper therefore uses this six-stage model as a lens through which to view university contribution to social innovation via a case study approach.

4. RESEARCH METHODOLOGY

This paper adopts a case study research methodology to address its research question, because of its exploratory nature, seeking to understand existing dynamics across multiple analytic levels (from national higher education systems to socially excluded individuals). A case study approach seeks to understand the problem being investigated, providing the opportunity to ask in-depth questions and to capture the rich-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ness of the object under analysis (Gable, 1994). Although the case study approach encompasses several distinct research methodologies, they are all hallmarked by using various kinds of data use, qualitative and quantitative, and collection methods, such as document analysis, interviews, questionnaires and direct observation (Eisenhardt, 1989; Yin, 2003).

This paper is rooted in a tradition of critical realist research, which believes that reality is potentially knowable, but that in practice it is only ever possible to produce an insightful observation of a fragment of that reality (Sayer, 2000; O'Neill & Whatm, 2000). The skill in good case study research comes in producing a 'fragment of reality' that reveals the underlying topology of a situation from which understandings can be inferred about the way that the sub-elements of that system interrelate in that individual context (Eisenhardt, 1989). A case study research approach fits well for situations addressing 'how' or 'why' questions about a contemporary set of events with little or no control over the object of analysis (Ferraris & Grieco, 2015). However, the conclusions drawn may be specific to that object of analysis and may not be generalizable (Gable, 1994).

In this paper, the study design includes a single, exploratory, in-depth case study adopting an interpretative approach (Yin, 2003), using a case study based on the Eisenhardt (1989) framework. The case study HEI is the *Instituto Federal de Santa Catarina* (IFSC), which hosts a very interesting project dealing with women in vulnerable situations (social risk) called *Mulheres Mil* (Thousand Women) Program (see section 5). This case study drew data two separate sources. Firstly, was the documents and archives of the Dean of Extension and External Relations of the IFSC, which contained information about the *Mulheres Mil* Program. Secondly, two researchers (co-authors of this paper) were general coordinators of the program in the IFSC, and participated actively during all process, from conception to evaluation of the activities of the program. Data collection occurred from visits to campuses offering the courses, class participation as listeners and as speakers, interviews with local coordinators, follow-up meetings and sharing practices among campuses, documentary analysis of reports and other materials related to the *Mulheres Mil* Program.

The case study explores how universities can contribute to foster social innovation and, thus, contributing to building systemic theory about social innovation (Herrera, 2015). The specific case study presented represents innovation in educational services, addressing users' needs by investing in capacity-building, avoiding stigmatisation, improving peoples' skills, and bridging the gap between professional services and peoples' lives (Evers & Ewert, 2015).

5. CASE STUDY

The paper presents a case study from *Instituto Federal de Santa Catarina* (IFSC) a Brazilian federal public higher education institution, headquartered in Florianópolis, Santa Catarina state, with administrative, cultural, financial, educational and pedagogical autonomy. The IFSC was established in 1909 and after several restructuring processes, most notably following 2008, expanded from 6 to 22 campuses in all regions of Santa Catarina, southern Brazil. IFSC specializes in offering vocational and technological with a simultaneous strong profile in research and extension activities. IFSC seeks to promote inclusion and to educate citizens through the professional, scientific and technological education, generating, disseminating and applying knowledge and innovation, contributing to the socio-economic and cultural development (IFSC, 2016).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The social problem that IFSC sought to address concerned access to higher education for women with low education levels and social vulnerability simultaneously lacking income and professional skills. In recent years, Brazil has seen important improvements in education levels, falling illiteracy rates and increased school attendance (Ferraro & Kreidlow, 2009), a slow process marked by significant social, and particularly, regional differences. In urban areas, the average schooling of women is 7.4 years (total population) and 8.9 years (employed population). In rural Brazil, these averages are low and distance themselves considerably from urban areas: 4.5 and 4.7 years respectively (IBGE, 2014). The National Programme *Mulheres Mil* (Thousand Women) – Education, Citizenship and Sustainable Development provided (and at the time of writing continues to provide) educational, vocational and technological training, allowing to improve women's educational levels, empowerment and access to the labour market, by encouraging entrepreneurship, employability and forms of associative solidarity. The program sought to use education to promote women's empowerment, access to social rights and citizenship, aiming to achieve equality, emancipation and a sense of belonging (Brasil, 2011; UNESCO, 2013).

The training (or educational) offer within IFSC's *Mulheres Mil* Program was based upon identifying and accrediting women's prior non-formal experience (or education) and tailoring an education pathway from their past experiences towards their personal and professional ambitions. Selection came from recommendations via the municipal social service and healthcare network of the municipalities involved in this project (e.g. Department of Social Services, Department of Education, Department of Health, neighbourhood associations, mothers' clubs, parishes, forming a large network of cooperation, increasing the active search for women Participation required a minimal education level thereby allowing illiterate women to participate. Selection was based on a socioeconomic questionnaire, facilitating the grouping of participants according to their degree of social vulnerability. The programme involved vocational training courses of at least 160 hrs lasting around 5 months with classes twice a week. The students were continuously monitored throughout the programme from the intake and identified benefited community to their exit into the labour market.).

The methodology used in *Mulheres Mil* seeks to make the process of expressing value for the woman student as the primary concern. One of the specific issues for the program to violence against women in its various expressions, with coordinators reporting that violence remained a part of life for many students. Thus, reinforcing actions and initiatives on this topic in order to clarify their rights, safety nets, and institutional support are still needed in order to strengthening and empowering women. Increased schooling for many of those women may be the best alternative since there are several accounts of women interested in continuing studying with demands in computer skills, food, health and beauty, production and income. Also, the interest on the completion of basic education has been obtained in the research undertaken. Some testimonies of campuses' coordinators make this clear:

... The Mulheres Mil Program helps to improve the quality of life of many women, but also changes positively those who work with them: teachers, administrative staff and other employees, who make this program to have such importance!

... I say that this experience is humanizing our campus, since in the middle of technological courses, there is a course aimed at women in vulnerable conditions with their distinct peculiarities, in which all yearn for a better life.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

... Positives features were many: being part of the course coordination with a contact list of interested students; rely on people who know the local solidarity economy movement; meet the schedule of classes settled at the beginning of the course; find already established partnerships, such as with the CRAS; have a proactive scholarship; in short, are aspects that make a difference.

6. *MULHERES MIL* AS A SOCIAL INNOVATION

In Brazil proposals for public policies with a gender approach have been seen as a key instrument in the struggle to overcome inequality between women and men (Farah, 2004). This trend derives from recent processes of democratization and recognition of social rights and was also influenced by feminist activism struggling for a wider incorporation of gender perspectives on public policy. Some Brazilian women are more affected by exclusion than others (EC, 2014; Masika, Haan, & Baden, 2011), for example, black women and single mothers. Programs emphasising civil rights, the constitution of women as individuals, seek to expand of the space of citizenship, extending social rights to new population segments and ensuring these new segments have access to state social service support (Martinelli, 2012). *Mulheres Mil* was deliberately aligned with a set of Brazilian public policy priorities related to reducing social and economic inequality amongst marginalised populations, and the country's commitment with gender equality.

6.1. Idea Generation

The starting point for *Mulheres Mil* was pressure from the Brazilian government on its publicly-funded universities to create and structure the courses (or educational programs) to fulfil and achieve Brazilian policy goals regarding poverty reduction and social inclusion, ensuring that IFSC's senior managers were strongly supportive of the idea. The pilot project operationalized the programme via the Rectory, in response to a specific public call from the Ministry of Education. The idea underlying the *Mulheres Mil* programme did not originate in IFSC, but was originally created by NorQuest College in Canada as a fund-raising campaign to raise CA $1m to support single mothers in various ways (with child care, tuition support, part-time learning pathways) to help improve their social inclusion through education. ISFC used dialogue and collective interaction to identify the needs of each community in the state of Santa Catarina as the basis for tailoring the courses to community need.

The new courses involved non-traditional students: given that *Mulheres Mil* Program was a gender-related proposal with cross-cutting policies and issues, besides IFSC faculty and staff members, it was necessary to create a basic support network with other specialised professionals, such as social and health workers, and legal/ law experts in each municipality where those courses were offered. The main problems related to operationalising a network across IFSC that also simultaneously considered the specificity of each place or region in the active campuses. One key issue was teachers' potential lack of interest in working with these new non-traditional students, and on the basis of an analysing the availability and preliminary consent of local professionals who could be involved in the venture was sought.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

6.2. Mobilising a Solution

A pilot course was initially held in a single IFSC campus, and led to an extension to across three other IFSC campuses. The university's resources involved were primarily classrooms, staff and faculty members, materials, laboratories and inputs necessary for pedagogical activities. Some campuses organised classes in prisons or voluntary associations, with IFSC offered the faculty and staff members, educational material and financial aid for students (for transportation and food). In each participating campus, hourly charges were allocated to the multidisciplinary team working in the program. For state management, and course tracking, monitoring and evaluation an institutional coordinator for the *Mulheres Mil* Program was created, within the Deanery of Extension and External Relations, at the IFSC Rectory. The dominant arguments persuading stakeholders to participate were the program's potential to promote social inclusion and develop sense of community, alongside the welfare gains in participants' lives. Successful program implementation required persuading other stakeholders of the feasibility of the proposed solutions. For that purpose, IFSC organised several awareness meetings on the various campuses with potential program partners to demonstrate to stakeholders' potential demand for the new courses as well as the IFSC's ability to meet that demand. ISFC also undertook technical visits to other interested groups related to the scope of the project, and created products derived from the activities carried out by students/ trainees from the pilot phase including crafts, cookbooks, and dishes of regional and local cuisine.

Persuading partners of the potential viability of the solution was greatly facilitated by the backing for *Mulheres Mil* by the Brazilian Federal Government and a university, namely IFSC. Finding internal and external supporters in the state of Santa Catarina was also facilitated because of the existence of the pilot programme and the initial implementation structure. Meetings with potential partners took place and a growing number confirmed their wider interest in the pilot. However, it was at this stage that the first real resistance occurred within IFSC, related to the interest of teachers already working in courses with objectives and profiles very different to those of *Mulheres Mil*. Affinity with social issues, preferably gender, was crucial for encouraging staff to engage with the programme. However, IFSC's historical faculty profile was primary in the kinds of professional, technical and vocational education far removed from the relevant aspects demanded by *Mulheres Mil*. The bureaucracy associated with establishing partnerships was a major problem when trying to finalise and launch the demonstrator (pilot project), and in some cases these delays led to the withdrawal of some partners thereby hampering the pilot's development.

6.3. Successful Demonstrator

In creating the demonstrator, the approach was taken and adapted according to the context of each campus and consistent with local community interests and business needs, also taking into account staff and faculty members and university infrastructure availability. For specific issues, partnerships with the Department of Social Services and Health Centres were established. The IFSC progressed internally in three campuses (providing about three hundred vacancies) which provided a more favourable context for developing the *Mulheres Mil* Program courses. The program contained a methodological guide which was used as a reference for the implementation of activities. Senior IFSC managers regarded the proposal bringing direct benefits to the target audience as well as indirect institutional visibility. The initiative

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

drew significant media attention, positively contributing to dissemination as well as strengthening IFSC's image. The program coordinators' highlighted the way the program empowered vulnerable students, who had themselves showed the motivation to change their lives. External partners were strongly supportive of the course as an effective means of addressing a target audience hitherto overlooked by HEIs. External partners were important providers of resources to support the program, including space for classes when space was lacking on the campuses, transportation for students, professionals to assist in training, among others. Finally, students showed great enthusiasm and appreciation for the welcoming environment provided and the value held for each student's personal history, a factor greatly favouring a return to study.

Conversely, the program coordinators reported difficulties related to lack of interest from other campuses teachers in contributing to the program, and for those teachers that did participate, the need to adapt teaching strategies to deal with these non-traditional students. A number of teachers were initially reluctant to participate in the programme because they were more keen on contributing to the formation of high-income professionals and high-level research. Hence, those teachers had lack of enthusiasm in working with a female, uneducated and low-income audience, although that did evolve for those involved as they became aware of the students' individual learning progressions and the benefits for the individuals, IFSC and indeed for their own professional development Some external stakeholder resistance also emerged around their willingness to support the idea and work with the university, partly because of the novelty of the *Mulheres Mil* Program, but also because of a lack of clarity of each actor in the process. The other main problem was the lack of financial resources to fund courses' activities, including covering consumables and other inputs, sufficient teacher numbers and the lack of a financial contribution to the professionals involved. However, the arguments favouring the implementation of the new solution outweighed the opposing ones, particularly institutional gains: external visibility of the institution, increased number of students, and diversification of courses offered.

6.4. Expansion of Solution

After the initial pilot project was perceived as a successful demonstrator, IFSC managers decided to expand the *Mulheres Mil* program due to increased community demand and positive effects of this Program's media recognition. The decision to expand the Program to all IFSC campuses was also influenced by the Ministry of Education's policy goal to encourage its expansion and dissemination within HE. The number of participating campuses initially doubled from three to six, then rising to 11 the following year (with 1100 student places), finally expanding to almost all campuses and serving 3,000 students. However, after the various campuses initially agreed to join, one subsequently then abandoned the plan (in the face of faculty and administrator antipathy).

Some difficulties and problems arose in this stage, most importantly the need to enlarge the program management structure and stakeholder coordination. Several approaches were implemented to address these problems. Firstly, available resources were increased, including increasing the number of local program coordinators at each campus, scholarships for students, teaching materials, and allocation of new teachers to the Program. Secondly, procedures to formalize partnerships with stakeholder networks were streamlined. Finally, regular meetings were held to share experiences and collaborative monitoring among participating campuses and promote program expansion to other campuses.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

6.5. Support Coalition

As IFSC expanded its *Mulheres Mil* Program, it made extensive use of the main partner since the pilot programme, CRAS – the Social Assistance Reference Centre, a municipal government agency. Across all participating campuses CRAS was the main mediator of relations between partners, particularly linking up the target group of less socially favoured groups to the IFSC and other partners (e.g. social movements, NGOs, businesses, volunteers) to identify and adopt forms of joint action in expanding the program. CRAS used its existing database of social needs and partners, to help IFSC develop linkages to a number of other associated organizations who joined this wider support network for *Mulheres Mil*. An issue in the growth of the support coalition was the emergence of real demand for the student places being offered, both from the Ministry of Education, who provided additional financial support for additional places, as well as the communities who appreciated the course benefits. This demand pressure outstripped the willingness of IFSC teachers to participate in these courses rather than their mainstream disciplinary courses (such as engineering, management or computer science).

From the moment the Program progressed from a pilot project to a more permanent activity, IFSC realised that additional technical and administrative staff and teachers were urgently required to implement classes, workshops, fairs, as well as processing scholarship payments. Brazil's Ministry of Education of Brazil, an important supporter and funder of IFSC's programme from its inception, supported this expansion. Extending the program across all IFSC campuses implied increasing costs since the number of students increased with each student receiving, via student assistance, financial help (an average value of 100 *reais,c.* €30). With increasing numbers of campuses involved in the Program, each local coordinator received a financial incentive (an average value of 600 *reais*) to compensate for management tasks. Additionally, there was an extension of scholarships (average value of 400 *reais*) for student assistants (from other courses) to assist the coordinator.

6.6. Transforming / Codifying

The final stage in the creation of the social innovation was in developing a model that could be relatively straightforwardly replicated in other contexts. *Mulheres Mil's* had developed an underpinning legal instrument and the program's methodological guide, containing the necessary guidelines and requirements for implementing the program. Detailed information regarding the activities, timetable and the initial structure content of the courses were made available to allow each campus to prepare its work plan and to fit its course's pedagogical project to the regional and local socio-economic context. The legal instrument also provided for orientation and preparation meetings to help campuses joining the Program. Meetings were organised with the new campuses to share the difficulties and best practices to help new participants in the planning and execution of courses. One of the developments within the legal instruments was also a "Solidarity economy fairs" seeking to foster entrepreneurship, civil society associations and networking. The fairs provided students with the opportunity to sell products they made from knowledge acquired in the courses and to exchange knowledge with students from other cities/ campuses, broadening students' contact networks as well as attracting other social economy organisations (e.g. social incubators).

However, this upscaling generated novel problems and resistance were felt, particularly around the practicalities of introducing a new kind of student (and a new kind of student finance) to existing campuses

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and student communities. Introducing these new groups raised practical challenges for aligning municipal transportation schedules with classes, in ensuring students could afford to attend the social economy fair, and finding space on campus for the new activities. These problems were not insurmountable but did demand considerable efforts from the new campus staff with the support of external collaborators.

7. ANALYSIS

In this paper we have asked the research question of how can universities contribute to supporting the social elements of sustainable development by promoting social innovation activities. Our case study has analysed an example of *Mulheres Mil* as a social innovation driven forward by a single university, IFSC, who can be seen as a social innovation actor and facilitator supporting new social innovation practices through the use of education, although not at the traditional undergraduate level, highlighting the importance of capital formation and social development to driving sustainable development. The case study suggests that socially innovative university projects may contribute to community social sustainability maintaining social cohesion by increasing social capital and providing resources for empowerment of disenfranchised citizens (Garcia et al., 2015) therefore contributing to overcome social exclusion and promoting more sustainable forms of development at the community level (Baker & Mehmood, 2015). This is particularly relevant in education directed to individuals feeling the daily pressures of poverty since most results correspond to intangible benefits whose impact is only felt in the long-run (Nicholls & Dees, 2015). The analysis also suggests how universities support social innovation, providing skilled workers, creating new knowledge, and through involvement in regional social and cultural activities (Cunha, Benneworth, & Oliveira, 2015) thus increasing social capital and contributing for social development and societal change.

Expanding the innovation – even to the level of the university as a whole – required developing skills, competences, attitudes, and abilities needed to foster social innovation in order to deliver the *Mulheres Mil* project. In order to derive more general lessons from the case study, we have summarised the *Mulheres Mil* example at the different stages of the social innovation process in Table 1. On that basis, several refinements can be made to Benneworth and Cunha's (2015) social innovation process model, regarding (a) universities' multiple roles, (b) the necessity of complex networks and partnerships, (c) deep commitment between these partners, (d) the non-linearity of the process, and (e) the value of involving beneficiaries in the social innovation. The first of these is that the university played a range of different roles throughout the different stages of the social innovation process. In some cases IFSC took the lead (mobilising the solution), in others behaved more reactively (reacting to pressure from the Ministry of Education) and elsewhere facilitating the involvement of other useful partners.

Secondly, successful social innovation processes require the involvement of a complex network of formal and/or informal partnerships between various stakeholders (as found by Sharra & Nyssens, 2010). In this particular case study, IFSC was strongly involved with local authorities, local social and health services providers, and civil society organizations. Indeed, Huggins and Williams (2011) argue these kinds of networks could potentially be regarded as "ecosystems", due to their systemic, complex and evolving nature. The process was greatly assisted by the fact that all partners were collectively committed to the social inclusion goals and without that support (particularly from the national Ministry) it is not clear that the university would have succeeded in delivering the innovation.

Table 1. A summary of the Mulheres Mil project as an example of an upscaling social innovation with university involvement

Stage	Activity	University involvement	Problems encountered	Partners/ supporters enlisted	University roles
Idea Generation	Taking a model developed elsewhere and interpreting it in Brazilian context	Identifying SI Fitting it to existing IFSC activities Developing a plan	Internal skepticism of attractiveness of new student group to established teachers	NorQuest University Ministry of Education	Reactive animateur in proposing the pilot in response to Ministry headline policies
Mobilising a solution	Piloting the MM course within a single campus	Recruiting students Providing courses Creating new systems to handle students	Developing a suitable bureaucracy to run the courses regularly	Ministry of Education	Sole agent – creating an institutional environment within which the activity succeeded
Successful demonstrator	Expanding the one-off pilot into a wider pilot on three campuses	Implementing the model from the first campus into two new settings	Sustaining relationships with partners between successive cohorts	Department of Social Services Individual health centres	Tailoring suitable financial solutions to reward partner involvement
Expansion of solution	Making the MM programme as a core offer at all 11 IFSC campuses	Creating a structure to allow students from all campuses to participate in MM	Suitable funding levels/ mechanisms for staff and students	Ministry of Education	Proposing new arrangements to allow MM to work sustainably
Support coalition	Creating regional networks to ensure a through-flow of students in all 11 campuses	Providing staff and infrastructure to support new student participations	Creating good relationships with social partners in new MM campuses	CRAS –Social Assistance Reference Centre Ministry of Education	Liaising with CRAS to create local connections to channel students in
Transforming & codifying	Creating a model for implementing MM in a campus location	Finalising a set of codified & tacit best practice lessons for new MM locations	Dealing with the problems from having new kinds of student on campus	Local municipalities Local agencies Partners in solidarity economy fairs	Making the implementation model available to new campuses

Source: authors' own design

Thirdly, deep collaboration between the various principal stakeholders and agents was absolutely vital for successful social innovation. In that regard, our findings match those of Moor (2013) who emphasised that collaboration patterns amongst agents should be seen as bridges since they span general lessons learnt and situations of specific communities. Thus, individuals and organizations engaged in social innovation practices should learn how to work collaboratively and, simultaneously, understand the complexity inherent to social systems. This characteristic is very important in the context of the *Mulheres Mil* social innovation due to the nature of the social problem identified – women in vulnerable social contexts. This fits with Martins & Bermejo's (2015) observation that small social innovations can potentially change much broader systems, expanding and upscaling through a collaborative process.

Fourthly, the non-linear nature of the social innovation process proposed was evident in the current case study, in which the overall concept evolved substantially in its Brazilian implementation. In particular, the original idea of richer women donating the funding to support poorer women from the NorQuest University model was replaced by Federal education funding in response to feedback in the development problem. The implementation of the *Mulheres Mil* Program has implied feedbacks not only from the campuses coordinators but also from partner organisations as well as the target public. This kind of feedbacks and interactions are in line with Russel and Williams writing about more technological

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

innovation processes (2002, p. 55): "complex influences, unpredictable courses of development, multiple sites of innovative activity, and… extensive innovation during configuration and appropriation, has led to the overarching narrative frame of an innovation journey".

Finally, the involvement of beneficiaries (in this particular case, women in vulnerable conditions) in different stages of the process was important in order to achieve a successful implementation of the Program. There were many small refinements necessary in order to render the programmes truly accessible and valuable (such as changes to the local municipality public transport timetables or the creation of the solidarity fairs) and these were introduced into *Mulheres Mil* during the development process. As emphasised by Sharra and Nyssens (2010, p. 8) and Voorberg et al. (2013, p. 3) respectively, social innovation is a "learning process supposed to give to the end users the tools to take care of themselves" and that "deliberately seeks the active participation of citizens and grass roots organizations in order to produce social outcomes that really matter".

8. DISCUSSION AND CONCLUSION

This paper seeks to bring a more social dimension back to understandings of the delivery of sustainable development goals, and particularly in understanding the scope of social innovation to contribute to sustainable development. The case study dealt with one sustainable development problem with a strongly social dimension, namely social exclusion problems, where women from disadvantaged backgrounds are excluded from the labour market in multiple complex ways that prevent them readily addressing this (Stöger, 2009; Benneworth, 2013). Social innovation represents a way to address this thereby enhancing public policies' effectiveness and maximising positive social impact and, thus, contributing to social sustainable development. This fits with current debates in sustainable development that concede that solutions to social problems often demand important changes in political, economic and social systems (Rinkinen et al., 2016).

The analysis of the current case study regarding the process of social innovation allows understanding social innovation in the context of the association between social processes and community development. This in turn provides a better understanding of how social innovation can contribute to promoting sustainable development, and here a resonance can be seen with Nicholls' et al. (2015) argument that social innovation can be regarded as a response to:

…patterns of modernity that have marginalised certain populations and that see the individual citizen as essentially an economic/consuming actor, not as an active participant in collective decision-making (p. 6).

Following Lundstrom & Zhou (2011), the social innovation involved knowledge transfer from academia to society to create a transformatory effect that can be regarded as a 'return on investment'. The case suggests that a higher education institution (HEI) could potentially function as a key player in promoting social innovation initiatives, fostering social transformations. An HEI can contribute with different kinds of resources and inputs (from staff and teachers to spaces for lectures or conferences facilities to stimulus of innovation exchanges, and social innovation workshops and meetings) to foster new social innovation ideas or practices. HEIs can also act to catalyse other partners' actions and contributions, working with civil society organisations (or not for-profit organisations) who identify community needs,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

thereby contributing to local communities', encourage civic engagement, and mobilise social capital (Otto & Laino, 2012). We see here parallels with Ferraris & Grieco's (2015) notion of the innovation catalyst, with the university here assuming the role on the case of the Mulheres Mil program to connect collaborating stakeholders. Ferraris & Grieco (2015) regard this actor as being essential in helping to span between very diverse partners that may otherwise lack a base for effective collaboration.

This paper suggests taking a wider view of the way that universities contribute to sustainable development beyond universities' own sustainable practices or their contribution of new green technologies. Universities can under certain circumstances act as a 'greenhouse' or 'innovation catalyst' for the emergence of social innovation ecosystems, although it is clear that the *Mulheres Mil* was a relatively example of a national social development empowerment project coinciding with a university commitment to a wider social development goal. The paper's overarching conclusion is that research is necessary to better understand the ways that universities can play these roles to incubate social innovation and insulate it from market pressures to deliver the longer-term social return on investment. This may be in research on the kinds of instruments and mechanisms that universities may create (e.g. social innovation incubators) to stimulate social innovation (Cunha et al, 2015). It may also be on the policies, structures and internal organisational forms necessary to legitimate and overcome internal resistance to social innovation practices within universities. But neither of these are exclusively determined within universities, and they remain strongly dependent on the willingness of their lead outside stakeholders to permit and facilitate social innovation if they are to make these extended contributions to solving the 21st century's sustainable development challenge.

Finally, although an increasing body of literature is emerging around social innovation, it is still fragmented, requiring more systematic studies, considering not only the economic but also the social dimension of innovation (Schmitz, Urbano, Dandolini, & Souza, 2017). Martins & Bermejo, (2015) note the persisting necessity of identifying what effectively generates innovation in social practices and the mechanisms that should be developed for the resolution of social problems. This paper allows to understand the role of universities in acting as a facilitator of new social innovation practices, contributing to socio-economic development and promoting social sustainable development, therefore enriching the literature about the process dimension of the social innovation studies. It also suggests ways that programmes such as *Mulheres Mil*, focused on overcoming problems of social exclusion, could be replicated in other different regional contexts using universities to catalyse stakeholder interaction (cf. Ferraris & Grieco's, 2015).

Clearly, the role of universities in the context of fostering social innovation and promoting sustainable development falls in the wider context of universities' third mission – community engagement and social development, recognizing universities potentially important roles around addressing important socio-economic and environmental problems. Although this paper focused specifically on social exclusion, universities' social missions may also be performed in contributing to urban regeneration to overcome those social exclusion problems (Moulaert, Martinelli, González, Swyngedouw, 2007). As emphasized by Nunes, Tomé & Pinheiro (2013), universities are being encouraged to develop innovative solutions to restructuring cities, acting as an important agent of local development and territorial dynamics, and improving the capacity of cities to meet the standards of Knowledge Economy. Therefore, future research work can be extended to understand the process in which universities can be engaged on urban regeneration and development, promoting social sustainable development through social innovation initiatives.

Chapter 22
A Qualitative Analysis of Social Entrepreneurship Involving Social Innovation and Intervention

Vera Fernandes
University of Aveiro, Portugal

António Carrizo Moreira
University of Aveiro, Portugal

Ana Isabel Daniel
University of Aveiro, Portugal

ABSTRACT

Social entrepreneurship is emerging as an innovative approach for dealing with complex social and environmental needs, and is an important lever for the development of a sustainable society. Social entrepreneurship and related concepts have had a growing attention in the academy, giving rise to dissimilar approaches in the United States of America and in Western Europe. Despite the importance of the Third Sector in Portugal, it has been difficult to set ideal definitions for social entrepreneurship, social entrepreneur and social enterprises. By means of a qualitative study involving four Portuguese social ventures, this chapter identifies contemporary socio-cultural and economic factors that foster social innovation and intervention in Portugal, and contributes to understand the role of social entrepreneur in this context.

INTRODUCTION

Social entrepreneurship is emerging as an innovative approach of modern societies for dealing with complex social and environmental needs. As social and economic conditions are constantly changing – and calling for intervention – the opportunities to innovate and become socially active arise in the business

arena, in civil society, within non-governmental organizations, or even at government level (Murray, Caulier-Grice, & Mulgan, 2010).

In Portugal, the challenges faced over the last 40 years led civil society, governing bodies and Third Sector organizations to develop stronger efforts regarding societal and environmental issues. With the accession of Portugal to the European Union in 1986, a period of economic stability is established and social policies are implemented more in line with European Union standards. However, with recent economic hardship the Portuguese economy went through, the progressive downsizing in the provision of social services by the state has also been a key player in the triggering of such initiatives. Nonetheless, 'social innovation', 'social economy', 'social entrepreneurship' or 'social enterprises' are yet foreign topics for many in Portugal, especially in what conceptualization is concerned.

Whilst innovation is instinctively connected to technology-based innovation, social entrepreneurship initiatives provide solutions to pressing societal needs that technology, by itself, cannot resolve. This novel form of social innovation and intervention can manifest itself in many different ways to respond to varied phenomena. It may be a product, a process or a technology, a principle, an idea, a law, a social movement, an intervention or a combination of the former ways, among others (Social Innovation eXchange, 2010).

Thus, social entrepreneurship presents itself as a new paradigm of social innovation and intervention, a different way of addressing social risks, where everyone participates actively and may become an agent of change (Michela, Robert, & James, 2010). The fact that anyone can be this Schumpeterian agent that triggers change, either individually or in-groups, is also a hallmark of social innovation. The ability to change and innovate is not in the hands of a minority, but available to all, and the information and communication technologies have made people more alert and reactive to societal needs and more easily empowered.

It is in this context of social empowerment that a new generation of entrepreneurs has emerged, driven by innovators who are using market-based approaches to solve social problems, fostering the expansion of the social entrepreneurship phenomenon. Social entrepreneurship is, thus, emerging as an innovative approach for dealing with complex social and environmental needs in order to contribute to a sustainable development of societies (CASE, 2008). Research on social entrepreneurship is generally phenomenon-driven and one can consider it is still at its infancy (Dees, 2001). Nonetheless, the growing attention in the last years paid to social entrepreneurship from an academic point of view gave rise to dissimilar approaches in the contexts of the United States of America and Western Europe (Defourny & Nyssens, 2010). Thus, it is essential to understand the basic concepts and propose ideal-type definitions for social entrepreneurship, social entrepreneur, and social enterprise adapted to the Portuguese reality, where most initiatives, by tradition, are in the Third Sector.

International theoretical frameworks may not fit perfectly to national context, due to differences in political, regulatory and historical perspectives. However, the understanding of contemporary socio-cultural and economic factors that foster the need for both social innovation and intervention in modern societies, as well the focus on the themes of mission, impact, processes and sustainability within the social entrepreneurship initiatives, may contribute to the setting of a new research field within entrepreneurship. The main aim of this chapter is to contribute to the social entrepreneurship body of research and to the identification of contemporary socio-cultural and economic factors that foster social innovation and intervention in Portugal, by means of a qualitative study involving four social ventures. Its main goals are to:

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Explore the adequacy of current international definitions and theoretical approaches to social entrepreneurship regarding the Portuguese reality;
- Contribute to raise awareness and visibility of the distinctive characteristics and outputs of social enterprises;
- Identify facilitators, obstacles and other environmental factors that may interfere with the social venture, which may positively contribute to sustain and better promote the development of social enterprises in smart cities;
- Contribute to a better understanding of the impact of the current economic and social crises in the development of social enterprises, mainly regarding sustainability and social impact.

SOCIAL ENTREPRENEURSHIP

The growing interest for social entrepreneurship derives from economic, political, and social unbalances occurring in society creating, on one hand, problems that demand innovative solutions and, on the other hand, fostering opportunities and solutions to solve those problems (Hoogendoorn, Pennings, & Thurik, 2010). State and philanthropic efforts are not able to provide adequate and timely answers to growing societal needs. Furthermore, the competition for the available funds has increased over the years with the successive downsizing of government sponsorship. This need to self-fund organizations led nonprofit leaders to develop a pro-business mindset, ambition and marketing skills, adopting entrepreneurial attitudes and ultimately setting a different landscape of innovative institutions operating within the Third Sector (European Commission, 2003).

Social entrepreneurship blurs the boundaries between the for-profit and the non-for-profit sectors (CASE, 2008). Moreover, attempts to define it tend to engage first by the definition of what entrepreneurship is and what may be 'social' within entrepreneurship. Although entrepreneurship, even if not socially-oriented, "brings about social value by nature, e.g. in creating employment" (Bacq & Janssen, 2011, p. 376), social entrepreneurship has distinctive features that enable its distinction from commercial entrepreneurship (Santos, 2009). The mission, processes, and potential impact are key elements that allow this distinction. Firstly, the social entrepreneur, either individual or in-groups, is driven almost blindly by the mission of changing the world in some aspect, preferentially at larger scale. Martin and Osberg (2007, p. 70) reinforce the idea that "the social entrepreneur aims for value in the form of large-scale, transformational benefit that accrues either to a significant segment of society or to society at large." Thus, the alma mater of social entrepreneurship relies in the efforts done to achieve a better future for a neglected group and ideally for society in general (Martin & Osberg, 2007). Secondly, the way individuals or organizations pursue their social goals is also distinctive. Adopted efforts, and processes must be innovative, appealing, and efficient taking advantage of market skills to promote social change (Certo & Miller, 2008). Thirdly, another important aspect of social entrepreneurship is the impact, which is expected to be systemic and provoke a tangible change of old models and methods. Ideally, it breaks patterns on a wide-scale, leading to a better solution to old problems.

As Mair and Martí (2006, p. 36) state, social entrepreneurship is "still largely phenomenon-driven", as entrepreneurship has been in its early days, but the scenario is changing (Peredo & McLean, 2006; Martin & Osberg, 2007; Dacin et al., 2011). Several authors have been trying to come up with an integrated definition for social entrepreneurship, but no universally accepted version has been issued, as

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

social entrepreneurship "in addition to innovative not-for-profit ventures (…) can include social purpose business ventures, such as for-profit community development banks, and hybrid organizations mixing not-for-profit and for-profit elements" (Dees, 2001, p. 1). "Social entrepreneurship may be expressed in a vast array of economic, educational, research, welfare, social and spiritual activities engaged in by various organizations" (Weerawardena & Mort, 2006, p. 22), i.e. the term became so inclusive that wide-ranging beneficial activities, as charities or corporate responsibility may fit under its umbrella, what may constitute a problem for 'real' social and entrepreneurial efforts.

Boundaries are complex, though. Researchers from different disciplinary and geographical origins have followed different approaches (Alvord, 2004; Bacq & Janssen, 2011; Dees & Anderson, 2006). On the other hand, Smith and Stevens (2010) identified different typologies of social entrepreneurship, while Dave and Woods (2005) try to evaluate how the academic and theoretical approach differs from the practitioners' *modus operandi*. Most authors have coalesced around the notion that social entrepreneurship involves the pursuing of opportunities to catalyze social change (Mair & Martí, 2006), social value creation (Dees, 2001), new social equilibrium (Martin & Osberg, 2007) achieved through innovative approaches (Skoll, 2012).

Although being a worldwide phenomenon, space and context gave rise to different approaches, probably related to the different conceptions of capitalism and the government's role on each side of the Atlantic (Hoogendoorn et al., 2010). Nevertheless, within each continent and in the same context, differences emerge (Bacq & Janssen, 2011). Dees and Anderson (2006) identified in the US two different schools: the American Social Enterprise School and the American Social Innovation School.

The American Social Enterprise School focuses on income generation when conducting a social mission. The growing interest of non-profit organizations for new financial sources, other than grants and subsidies, motivated the creation of this movement (Hoogendoorn et al., 2010). This school focuses on the generation of "earned-income" to serve a social mission, blurring the lines between business and social sectors. Differently, the American Social Innovation School focuses on the establishment of new and better ways to address social problems or to meet social needs (Bacq & Janssen, 2011). By identifying and exploiting an opportunity innovatively, the social entrepreneur satisfies a social need and is an activist of social change. This school focuses on the individual, not on the organizational structure (non-for-profit or for-profit) and often incorporates themes effecting large scale, and social systemic change (Pritha, 2007).

According to Dees and Anderson (2006), the intersection of these two schools is of major importance to further developments in this field. They merge both paths and define "enterprising social innovation" as carrying out innovations that blend methods from the worlds of business and philanthropy to create social value that is sustainable and has the potential for large-scale impact.

In Europe, theoretical approaches have been mainly devoted to the concept of 'social enterprise', very focused on EMES research outcomes (Defourny & Nyssens, 2008; 2010), a research network of established university research centers and individual researchers, named after its first research program on "the emergence of social enterprises in Europe". EMES has studied different European national realities in the period 1996-2000 describing social enterprises as organizations providing goods and services related to their explicit aim of benefitting community, which are initiated by a group of citizens with limited material interest in terms of capital. Also, they rely on a collective dynamics involving various types of stakeholders in their governing bodies and treasure their autonomy. Rather than concluding on a single definition, EMES used indicators to frame such ventures and set boundaries for the "galaxy of social enterprises", to provide a conceptual characterization of an "ideal-type" social enterprise (Defourny

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

& Nyssens, 2008). Generally, EMES social enterprises consist of associations, co-operatives, mutual organizations, and foundations very much concentrated on the Third Sector domain.

Notwithstanding the broadness of EMES definition, the UK approach is distinct. The initiative to foster social enterprises had origins in the government itself, by promoting active "partnerships between civil society, the public sector, and the private sector" (Hoogendoorn et al., 2010). Institutions have been set to promote the establishment of social enterprises, which were defined as being comprised of "businesses with primarily social objectives whose surpluses are principally reinvested for that purpose in the business or the community, rather than being driven by the need to maximize profits for shareholders and owners" (Hoogendoorn et al., 2010, p. 9). They were given a special legal form, the "Community Interest Companies," subject to a limited distribution of profit and can be promoted by individuals, groups of citizens or by legal entities. In contrast to the EMES approach, the goods and services provided can be related, unrelated or central to the venture's mission, but must be traded within the market.

In sum, whereas in the American Social Innovation School the entrepreneur is highlighted, in all other three approaches the perspective is much more focused on the organization. Two main commonalities must be highlighted: the emphasis on the creation of social value and the existence of earned income to sustain and develop company's mission.

Retrieving the best of each school and following contemporary trends, social entrepreneurship may be defined as a process that involves the identification of an unmet social need (opportunity) and the gathering of resources to act and resolve the need (social mission) in a sustainable and innovative way, through a business-like approach.

The Social Entrepreneur

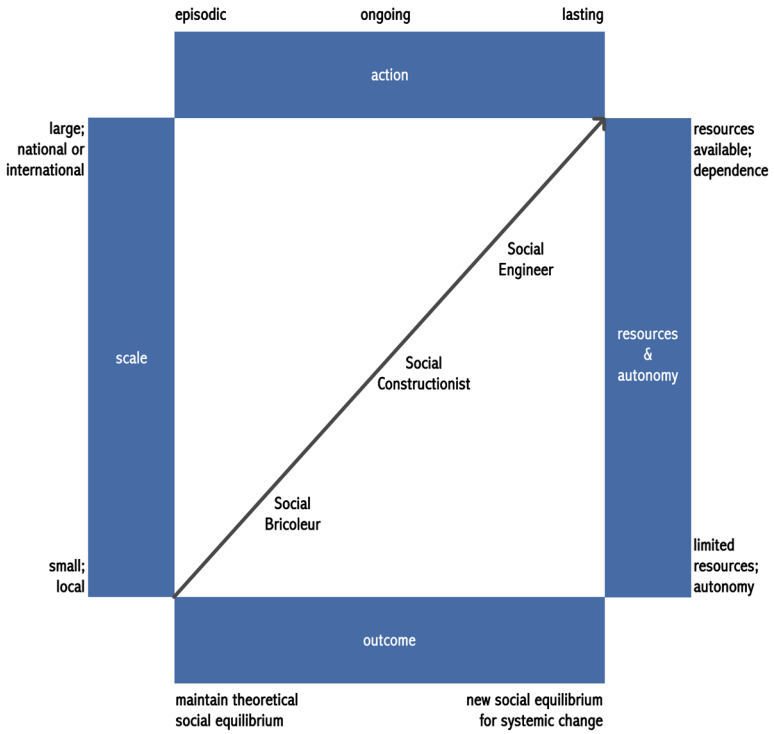
One of the most well-known definitions of 'social entrepreneur' was proposed by Dees (2001, p. 4) who recognized a social entrepreneurs as:

(…) change agents in the social sector, by adopting a mission to create and sustain social value (not just private value), recognizing and relentlessly pursuing new opportunities to serve that mission, engaging in a process of continuous innovation, adaptation, and learning, acting boldly without being limited by resources currently in hand, and exhibiting heightened accountability to the constituencies served and for the outcomes created.

As such, social entrepreneurs can be considered a 'sub-species' of the entrepreneurs' "family", where the main difference is that social entrepreneurs usually have a vision of something that they would like to solve in the social field, rather than pursuing wealth or fame in the business arena, as social value is the ultimate goal.

Some authors try not to distinguish entrepreneurship from social entrepreneurship, but rather entrepreneur from social entrepreneur (Light, 2005). Social entrepreneurs draw their strengths from collective wisdom and experience, rather than from personal competences and knowledge; they focus on long-term capacity rather than short-term financial gains; their ideas are limited only by their mission; they see profit as a means in people's service that has to be reinvested in the mission, rather than distributed to shareholders. They engage in a process of continuous innovation, adaptation, and learning, which characterizes their modus operandi (Dees, 2001), but social entrepreneurs "risk their monetary contributions and efforts and mobilize resources for investing in communities without expecting monetary

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



returns" (Autar, 2010, p. 705). Furthermore, some personality traits as agreeableness (i.e. the ability to promote social consensus and mutual understanding), the openness, and the conscientiousness have been recognized as key influence factors on potential social entrepreneurship development (Direction, 2011).

Different perspectives, different *modi operandi* and fields of action led to different "types" of social entrepreneurs. Building upon conceptualizations of social entrepreneurship, Zahra, Gedajlovic, Neubaum, & Shulman (2009) suggested three types of social entrepreneurs, namely the Social *Bricoleurs*, Social Constructionists and the Social Engineers, as Figure 1 depicts.

The Social Bricoleur stems from the perspective that "entrepreneurial opportunities can only be discovered and acted upon at a very local level" (Zahra et al., 2009, p. 524). Entrepreneurs possess the tacit knowledge to intervene at specific local situations with the resources available, thus the association to "bricolage". Their action is autonomous, but limited, as it occurs in a small local scale, intending to solve a specific and episodic situation with limited resources. In view of this, no systemic change or new social equilibrium is targeted, as social *bricoleurs*' actions are marked by a "reliance on readily available resources and improvisation rather than formal planning", what "sometimes prevents social *bricoleurs* from addressing larger needs and scaling up their operations or expanding geographically"(Zahra et al., 2009, p. 525).

Differently, the Social Constructionist builds, launches, and operates ventures to tackle social needs unsatisfactorily addressed by existing institutions. They fill in the social gaps unattended by for-profit businesses or not-for-profit organizations. They match the scale and scope of the social needs, what in some cases may be "quite small, but in many others, the response could be regional, national or even

Figure 1. Types of social entrepreneurs
Source: Own preparation.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

global in scope" (Zahra et al., 2009, p. 525). Their distinctive capacity (a) to spot and pursue opportunities that generate social wealth, and (b) to innovatively deliver goods and services to that end, turns social constructionists into global agents of change, as they are able to develop systemized scalable solutions to meet emergent needs, solutions that can be transferred to other social contexts.

The Social Engineer identifies systemic problems within the social systems and tries to address them by bringing about revolutionary change. Moved by innovation, they destroy dated systems, structures, and processes in order to replace them by newer, more efficient ones. Thus, it is easy to understand that social engineers are a strong change element that can profoundly impact society, as "the revolutionary and ideological nature of the reforms they introduce are usually a threat to the interests of established institutions, and are sometimes seen as subversive and illegitimate"(Zahra et al., 2009, p. 526).

Regardless of such typologies, some characteristics are common to social entrepreneurs. They have to meet the entrepreneurial condition and be innovators and pioneers, dealing with resistance to change. They adopt novel approaches and form social partnerships and cooperation networks. They engage in economic activities, produce goods, provide social and health services or pursue various societal objectives that contribute to the development of society in general or of local communities. The major objective is not connected to material gains to add to their assets; profits are, in principle, (re)invested in the enterprise. Social entrepreneurs mobilize their creative and managerial skills to react positively to social needs, actively and innovatively, not neglecting the sustainable character of their ventures. The social entrepreneur is a person who seeks sustainable and impactful change through pattern-breaking ideas to address significant social or environmental problems, either focusing at local, national or global level, adopting both a social- and business-oriented strategy and ensuring sustainability to the social mission and impact envisaged.

The Social Enterprise

The increasing number and impact of social enterprises, as well their role in welfare provision, environmental issues and in helping restoring post crisis economic activity is recognized in many studies (Dart, 2004; Thompson & Doherty, 2006; Michael, 2008; Nicholls, 2009; Teasdale, 2010; Defourny & Nyssens, 2010; Wilson & Post, 2011; Teasdale, Lyon, & Baldock, 2013). Yet it is still a difficult task to theorize on social enterprising (Nicholls, 2009).

For many years, the terms social entrepreneurship, social enterprise, and social capitalism were used interchangeably to describe revenue-generating activity on behalf of a social mission (Light, 2008). As a result, most of the organizations or initiatives promoted by social entrepreneurs tend to basically be labeled as social enterprises. Thompson and Doherty (2006) studied the diverse world of social enterprises, addressing different "types" of social ventures, profiled according to a basic set of markers. As such, social enterprises must have an underlying "social purpose", where "assets and wealth" are used to benefit community and where "profits and surpluses are not distributed to shareholders" (Thompson & Doherty, 2006, p. 362). The enterprise is seen as "accountable to both its members and a wider community" and "there is either a double- or triple-bottom line paradigm. The assumption is that the most effective social enterprises demonstrate healthy financial and social returns – rather than high returns in one and lower returns in the other" (Thompson & Doherty, 2006, p. 362).

Social enterprises could be described as organizations employing "business solutions to social problems" (Thompson & Doherty, 2006, p. 362). This, though, seems to be an oversimplification of the term. In most

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

countries the lack of a specific legal form to encompass these "social enterprises" dims the application of the label. Some socially oriented organizations are more likely to remain dependent on government funds, gifts and grants rather than develop true paying customers, as a true social enterprise must foster. In fact, authors contend that if an enterprise does not generate revenues, and depends mostly on grants and subsidies, then it may be only innovative, but not entrepreneurial (Boschee & McClurg, 2003).

The way social enterprises are legally constituted and financed are critical issues that reflect both distinct socio-economic contexts and the conceptions of social enterprise both in the US and in Europe (Defourny & Nyssens, 2010). To Mair and Martí (2006), however, the important element is the entrepreneurial attitude that fosters social initiatives with an entrepreneurial character. From this point of view, it is easy to understand the hybridity in the organizational forms and their flexibility towards market needs, and available resources. They can be independent; generate profit, employ people and/or hire volunteers, as well as adopt innovative strategies in their pursuit of social change.

If economic benefits are created, these should ideally be reinvested in the social mission, but this is not mandatory. In the end, only the social added value is important.

In Europe, historical developments have led to legal frameworks for enterprises with significant differences across member States, leading to a situation in which most types of social enterprises are not recognized by a legal framework at European level, but only at national level in some member States (Dees & Anderson, 2006). Open-model legal frameworks exist nowadays across Europe, as in Belgium, Italy and United Kingdom, among other countries. Within the EMES approach, social enterprises may combine revenues from sales or fees with public subsidies linked to their social mission and private donations and/or volunteering, and an "ideal-type" social enterprise that comprises the following indicators (I) to reflect both the economic and entrepreneurial dimensions of social enterprises is idealized:

I1: A continuous activity producing goods and/or selling services.
I2: A high degree of autonomy.
I3: A significant level of economic risk.
I4: A minimum amount of paid work.

As for the social dimensions of such enterprises, the following indicators have been provided:

I5: An explicit aim to benefit the community.
I6: An initiative launched by a group of citizens.
I7: A decision-making power not based on capital ownership.
I8: A participatory nature, which involves various parties affected by the activity.
I9: A limited profit distribution.

With these indicators, the authors aimed at providing governments, scholars and users with criteria and indicators to position an organization within the "galaxy" of social enterprises (Defourny & Nyssens, 2008).

Regarding Portugal, the provision of social services has been, for years, mainly promoted within the Third Sector and supported by the government, by means of the so called Private Institutions for Social Solidarity, by church-related charitable organizations or by families, which still play a central role as providers of social assistance (Defourny & Nyssens, 2008). In short, a social enterprise to this context can take any legal form, but it has to pursue a social objective to improve a given social condition (social

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

mission), in an systemic and impactful way (impact creation), and by merging social and commercial methods (business-like approach) while at the same time testing creative ways (innovative operational approaches) to mobilize resources, and to generate revenues, other than government funds (sustainability).

METHOD

A preliminary consultation to key social actors actually operating within the Third Sector and the analysis of secondary sources of information allowed an exploratory analysis at the first stage, where organizations were sought to illustrate the Portuguese reality at the time, considering their hybrid mission (both social and business oriented), as well as their potential social impact. The methodology used to carry out this study was explorative, based in the case studies' qualitative data, collected from semi-structured interviews, conducted, between June and July 2012, and available information on media. Deriving from the state-of-the-art review, frameworks adopted and specificities of the Portuguese scenario, questions were formulated and the guide for the interview comprised 10 major sets of questions, namely 1) Characterization of the organization; 2) Mission & Vision, 3) The entrepreneur, 4) Human resources, 5) Organization & Management, 6) Business strategy & performance, 7) Finances & Funding, 8) Interest & pressure groups, 9) Academic or business creation Support and 10) Future actions.

SOCIAL ENTREPRENEURSHIP INITIATIVES IN PORTUGAL

The specificities of the Third Sector, the different legal status and broad social focus, the high dependency on government, the historic proclivity of the Catholic Church, and the absence of a dynamic civil society have made it difficult the deployment of social entrepreneurship and the identification of social enterprises (Franco, Sokolowski, Hairel, & Salamon, 2012). However, given the interest in those initiatives that value, simultaneously, social impact, entrepreneurial approach, and sustainability, several cases were chosen to illustrate some potential catalysts for more initiatives.

The selection of the organizations depended on four main vectors that enabled their distinction from other socially-focused organizations, for instance: their independence, the clear social mission, the adoption of a business-like approach and the sustainability focus. The four Portuguese organizations selected, namely two foundations, an association and a co-operative, were created between 1976 and 2011 (Table 1).

ALFA's mission is to create an interface between business and social economy organizations, encouraging the first to incorporate social responsibility in their culture. The founders aim at using market

Table 1. Selected organizations

Organization	Year of Creation	Legal Status	Localization	Legal Form/Sector
ALFA	2011	Cooperative	Oporto	Second and Third Sector
BETA	2009	Foundation	Oporto	Third Sector
DELTA	1976	Association	Coimbra	Third Sector
SIGMA	2006	Foundation	Aveiro	Third Sector

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tools and strategies to serve this social cause, to give support to minorities and empower them to act, leading businessmen to pay attention for a double-line objective: profit and social benefit. The identification of this social need for more socially responsible organizations derived from the founders' former experiences as volunteers in different organizations and their academic backgrounds. By creating the interface between business and social economy organizations, this cooperative contributes to solving social problems and make companies and social organizations walk pari passu (i.e. on equal footing).

BETA is a foundation created by Oporto's City Council. The mission is to "promote social inclusion and cohesion" within the Oporto area and their vision is to be recognized as an institution that, directly or indirectly, identifies and solves the problems of Oporto's citizens. The work is centered in the development of various projects and initiatives that contribute to improve the citizen's life quality and to provide a range of infrastructural resources open to the city. Being an affiliate of Oporto City Council is a great competitive advantage as well as the effective citizens' recognition of the high degree of efficiency in the solution of problems in which it intervenes. In terms of funding, the foundation receives near 70% of the budget from the city council. This search for new forms of financing is a constant concern in order to guarantee and promote the sustainability of the foundation, either by obtaining its own revenue, whose percentage is intended to raise, through sponsorships or by the undertaking of sponsorship contracts, or by rendering services as training, lodging, rooming, and infrastructures renting.

Working under the motto "Equal People, Different Products", DELTA is a non-profit social solidarity private organization, founded in 1976 by a group of parents and a social assistant, with the objective of contributing to the effective inclusion of people with disabilities and other special needs. The mission of DELTA is to perform actively, sustainably, and entrepreneurially in the rehabilitation and in the promotion of citizenship and quality of life, believing in the human potential in difference. This entrepreneurial-type mission may also be decoded in the vision of the association, as it aims at being a sustainable organization that guarantees respect for the difference and equality of opportunity for all. Since its foundation, DELTA's action has been guided by the promotion of social inclusion and professional development of the users (ca. 430 currently sharing one or more social facilities), through targeted intervention, working side by side with public and private organizations, in a cooperative, open, and complementary way.

The SIGMA Foundation is a privately funded non-for-profit organization of public utility, established in 2006 to ensure the operation of an Affections Village, open since 2009, which was designed by the founder to be a place where "anyone, of any age, may try emotions, discover the paths, even if only a small one, to reach the hearts of others and the heart of themselves." The foundation aims to develop and implement the underlying principle: education by (and for) the affections, which is rooted solely in the work of the founder.

Doctor, professor and author of books, games for affections, thematic spaces and collections with her own publisher, the founder has been conducting, for twenty years, pioneering work centered on the theme of affection. She put all her efforts in the building of the place with determination and goodwill. Financial problems are reported, as the foundation revenues and the investment of the founder were not enough to build and give form to the project, and currently do not cover all expenses either, jeopardizing the continuity and sustainability of the foundation.

In order to characterize these organizations and to label them as social enterprises, it was important to learn about environmental factors and facilitators that contributed to their creation, as well as about obstacles to their existence.

Environmental factors are of extreme importance to create the opportunity to act and may determine the success of the venture. Regarding the main environmental factors, general sustainability demands created

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Environmental factors, facilitators, and obstacles

Organization	Environmental Factors	Facilitators	Obstacles
ALFA	• Economic crisis • Current need for organizations to be socially responsible; • General sustainability demands in all domains of society; • Growing awareness of social needs and impetus to act.	• Incubation period at a university incubator • Social contest monetary prize • Incubator business network • Counseling and guidance from university professors and senior managers at a university incubator	• Differences in the conceptualization of social responsibility; • Resistance to change and to integrate novel forms of management
BETA	• Economic crisis • Increasing social needs • Disperse social efforts	• Affiliate of Oporto City Council • Resilience and sensibility of the city mayor to the social cause	• Culture of assistentialism • Downsizing in funding • Lack of articulation in the social network
DELTA	Need to assist people with disability	• Problem shared by many local parents. • Raising awareness to the theme	• Downsizing in funding • Conceived idea of people with disability
SIGMA	• Increasing need for affections • Necessary shift in social paradigms • Economic crisis	• First initiative of the kind in Portugal • Innovative approach	• Lack of funding • Lack of awareness and sensibility to the theme of affections • Family budget constraints

the impetus to act in the founders of ALFA. The need to concentrate all social efforts gave strength to the creation of BETA, as a result of the concentration of dispersed efforts. In the case of DELTA, the main environmental factor leading to its foundation was the need to create the perfect place and environment to assist people with disabilities. Regarding Foundation SIGMA, one can also associate the economic crisis as leading to its creation, although not as pivotal as in other situations.

Regarding facilitators, the most important for ALFA has been the neighboring academic and entrepreneurial environment. The fact that ALFA won a contest launched by a Portuguese university provided them with the opportunity to grow in the university social incubator, with access to the business network and benefitting from the support, counseling and guidance from professors and senior managers. In the case of BETA, the main facilitator is the umbilical connection to the Oporto city Council. Parents sharing the same concerns have been identified as the main facilitator of the creation of DELTA, so that their children could have a proper place to learn a trade and learn how to live and outlive with a disability, where physical treatment could be appropriate and directed towards the needs of people with any kind of disability. The innovative approach in the area of affections was pointed out as the main facilitator for the creation of the Affections Village and the foundation.

As for obstacles in the case of ALFA, these are related mainly to the differences in the conceptualization of social responsibility. It is a novel theme for some companies and its introduction in the management and leadership of a company is difficult, facing resistance to change and to integrate these novel forms of social awareness and responsibility. Besides the downsizing in funding, which obliges to some additional efforts, one of the main obstacles referred by BETA was the existing culture of assistentialism in the Portuguese society. For DELTA, the main obstacles to its proper functioning are the downsizing in funding and the decreasing sales as a result of the economic crisis Portugal went through. However, the conceived idea of people with disability is also a permanent obstacle to fight back, since the creation of DELTA. Foundation SIGMA never received any public funding and the family budget constraints also hinder the possibility of the foundation's financial balance, as families focus on the economic sustainability and maintenance of life status, rather than on fostering family affections, a sensitive theme.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

All initiatives adopted a hybrid social- and business-oriented mission enlightening the contemporary application of innovative business models to address a social problem. Among interviewees there is general consensus that (a) sustainable operational processes are currently mandatory for any social initiative, regardless of the fields of action, and (b) entrepreneurial characteristics are recognized in all of them.

Generally speaking, the four cases presented have been created to respond to a societal need, i.e. have a social mission, but employ (or try to) business-like strategies to achieve sustainability and depend less on donations or subsidies, recognizing that it is vital in current days.

The entrepreneur and the venture profiles are crucial to further analyze these initiatives. Firstly, the entrepreneurs' profile may determine the large-scale impact of the organization and his/her classification as social *bricoleur*, social constructionist or social engineer. Secondly, an ideal-type social enterprise is proposed and verified, developing herein a characterization framework that sets no strict boundaries and potentially applicable to the Portuguese scenario. The basic assumption is that a sustainable enterprise is more efficient in accomplishing its mission than a company that strives for survival. Therefore, this ideal-type social enterprise proposed in Figure 2 sets the mission as the central vector, establishes relations between processes and sustainability, sustainability, and social impact and processes and social impact.

Classification of Initiatives Regarding Type of Entrepreneur

Personal profile and academic background of the entrepreneur may play here a major role. All responsible members interviewed are female and are highly qualified (Table 3).

The long experience of serving social causes, their sensibility and willingness complemented by a master in social economy, provided ALFA founders with the skills necessary to lead this venture. In the case of Foundation BETA, the executive director has developed throughout her professional career alertness to social causes. Her determination and strategy may lead the institution to a higher degree of autonomy, without losing focus on the social mission. The executive directors for management and

Table 3. Interviewees of members of organizations

Organization Member	Education	Function	Dedication /Years	Personal Characteristics
ALFA	BsC in Psychology MsC student in Social Economy	Founder and CEO	Partial 2 years	• Sensibility and willingness to social causes; • Experience of serving social causes; • Persistence and initiative; • Education
BETA	Engineering	Executive Director	Full-time 4 years	• Experienced manager • Alertness to social causes • Determined and strategist
DELTA	Management	Executive directors for management and rehabilitation	Full-time 14 years 1year	• Sensibility to social causes; • Experience of serving social causes
SIGMA	Medicine	Founder and director	Full-time 6 (+1 of preparation work)	• Persistence, endurance and motivation of the founder • Alertness and dedication to the theme of affections

rehabilitation at DELTA highlight that the institution always looks for the best practices in inclusion and rehabilitation, but at the same time strives continuously for sustainability. In the case of SIGMA, the medical career raised in the author a sense of alertness to the importance of feeling, as many current health problems may derive from the lack of affection in our daily lives. As a writer, she has been devoted to this theme for years, but always envisaged the creation of the Affections Village, a park to value and learn affections.

As provided previously in Figure 1, the three types of social entrepreneurs, namely the social *bricoleurs*, social constructionists and the social engineers (Zahra et al., 2009) allow us to understand some differences and place the founders under the large umbrella of social entrepreneurs, according to the scale, action, outcome and resources, and autonomy demonstrated.

Foundation BETA represents the Social Bricoleur, as it possesses the tacit knowledge to intervene at a specific local situation, in the case Oporto, with the resources made available by the council and with some self-income. By following an activity plan approved by the council, the foundation's action is autonomous, but limited. The scale is local and the resources controlled, so their action is limited in time and broadness, and the ultimate goal is not to create a new social equilibrium, but to maintain it, which will ultimately contribute to the harmonizing of social needs.

DELTA, the Social Constructionist, was created to respond to a social need no one addressed at that time. Their alertness derived from their own experience as parents of children with disability, so the incentive to address this social gap was enormous. The director of DELTA for almost 20 years contributed enormously for the sustainability and credibility of the institution. He was the social constructionist behind DELTA and employees and friends of the institution still share his vision. His capacity to learn, adopt new management skills in the rehabilitation field and innovative strategies to deliver goods and services to the community generated social wealth and sustainability to the institution. His management model could be easily transferred to other social contexts. The scale of DELTA is local, but the organization is large and complex. Resources must be carefully handled, as there are considerable resources and staffing needs. The action is limited to the governmental funding and to the self-income capabilities, and the ultimate goal is not to create a new social equilibrium, but to provide the best life quality to the people with disability.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ALFA and SIGMA fit both in the Social Engineer typology, although with some differences. The systemic problem within the social systems targeted by ALFA is the lack of social responsibility in companies, which is quite different from the lack of affections focused by SIGMA. Despite the differences in the object, the mission is to replace old models of dealing with social responsibility and affections by newer and more efficient ones. The Schumpeterian change element held by both institutions has the power to profoundly impact and influence society. Due to this substantial objective and scale of action, especially in the case of SIGMA Foundation, resources are hard to achieve and may impose limits to the autonomy and action of the entrepreneur, as no funding has been obtained. The scale of both institutions may be national, or even international, and the ultimate goal is to create a new social equilibrium, where companies recognize the values of social responsibility and society the value of affections.

Regardless of the differences in the scale, action, outcome and resources & autonomy, all interviewees demonstrated the willingness and capacity to deal with a social problem or need with an innovative approach, by adopting novel strategies, breaking with tradition, inertia and aversion to risk. They are social and business-oriented and are aware of the importance of social partnerships and cooperation networks to reach their goals. They engage in economic activities to reach social goals, produce goods and render services, aiming at the development of local communities, groups, etc. or society in general.

Classification of Initiatives by Ideal-Type Social Enterprise Framework

Aiming at providing a comparative analysis of social entrepreneurship initiatives in Portugal, four vectors were established, i.e. mission, impact, processes and sustainability, as previously shown in Figure 2. This framework was developed with indicators and descriptors in each vector, based on the literature revision and matching with the EMES indicators as basis. The mission has been set as the central vector and relations between processes and sustainability, sustainability and social impact and processes and social impact were established.

As previously verified, the mission of these organizations reflects a double paradigm or hybrid form, i.e. social and business-oriented. However, characteristics and *modi operandi* of the organizations BETA and DELTA are similar, aiming at promoting social and professional integration through the employment of disadvantage or disabled people. In turn, the mission of SIGMA is to "develop and implement the underlying principle: education by (and for) the affections.

The explicit social aim is to benefit community, by offering the possibility to learn more and value affections in people's lives. The mission of ALFA reflects a more proactive and business-oriented perspective, as the objective is to "create an interface between business and social economy organizations, encouraging the first to incorporate social responsibility in their culture", by applying a business model to the socially-oriented idea.

The fact that BETA and DELTA depend largely on governmental support distinguishes them from ALFA and SIGMA, which have no subsidies or financial support. Although the first two organizations have their activity mainly supported by governmental subsidies or donations, the obtained revenues percentages around 30 and 40% of revenues in the case of BETA and DELTA are to be highly treasured in the Portuguese scenario. The point to highlight here is that DELTA has always pursued this double objective and it is reflected in the mission statement as well, i.e. the social intervention and the organization sustainability.

The processes adopted seek to support sustainability, to fulfill the mission, and to create social impact. These organizations are not immune to the economic crisis Portugal was going through. As societal

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

needs grow up every day, their sustainability may be at risk with the decrease of government support. However, socially oriented initiatives fueled with social focus and social sustainability. As such, DELTA has always acted actively, sustainably, and entrepreneurially sets the difference to other rehabilitation institutions and is reflected in the organization's daily actions and habits. Several services were thought and created to respond to the local community needs and this became a win-win situation.

ALFA and Foundation SIGMA must endure without governmental direct support. The continuous production of goods or provision of services to the community provides the revenues to their existence and guarantees the independency and autonomy of decision. At the moment of the interview, ALFA had no fixed monthly expenses, but aimed to be completely autonomous and self-sustainable. The financial risk involved in ALFA is low when compared to the risky venture of the creator of SIGMA, as personal patrimony is involved and bank might be at stake. The activities of the publisher, the visitors' fees to the Affections Village and all services and products available to community may not be enough to guarantee long-term sustainability of the foundation, as a gross amount was invested in the acquisition and building of the thematic park. The foundation activities imply permanent costs with maintenance, human resources, raw materials and acquisition of services. Sustainability depends fundamentally on the creative owner, who conceived, created and manages the foundation. Thus, the foundation and the decision-making processes benefit from autonomy, but are concentrated on the social entrepreneur.

Although funded by government and other sources, Foundation BETA and DELTA share a high degree of autonomy to develop and implement other funding schemes, enabling the sustainability and enhancement of their activities (I2). ALFA, DELTA and SIGMA are continuously providing services or selling of goods to be able to provide for their objectives. ALFA focuses on a single business area (corporate social responsibility), DELTA provides services and goods to varied areas (physiatrist, laundry, gardening, boxes, cards, pottery, etc.) and SIGMA provides services and goods (therapy, books, games, etc.) in the umbrella area of affections. Unattended social gaps are permanently dealt with by such initiatives. In the case of BETA, the rendering of services is more sporadic and the production of goods is scarce. Workshops, expositions, room renting are some examples of the services rendered, but not on a permanent basis. In summary, all initiatives have a social core (I6) regardless of the form and labeling of each initiative. All envisage benefiting community, bringing about with the social venture more quality of life to the target public and general society, which may bring about social and economic prosperity to the target community (I5), as well as to empower each of the target groups. Ultimately, those organizations have the capacity to influence and empower locals to act socially (I8) by giving all the power to intervene and to participate on decision-making and management of the organization.

A networking and volunteering network (I4) is also helpful in the downsizing of dependency on funds or donors, as on the one hand, it reduces the requirement of human resources and lowers the economic risk, and, on the other hand, it is also empowering and creating the social impact foreseen. ALFA and Foundation SIGMA have not yet recruited volunteers, as the need has not been felt so far. However, it is being under consideration in the future, as the level of economic risk is higher for them. The economic risk in BETA and DELTA is minor, as a large percentage of income is provided by funds.

The existence of this non-paid work is very helpful for a sustainable achievement of the social enterprise. The sustainability pillar is currently essential for any venture, and four (out of nine) EMES indicators reflect such importance. Although all cases strive for a higher proportion of earned income, the analysis of the relationships between processes and sustainability, sustainability and social impact, and processes and social impact can provide some insights regarding the ability of these institutions to pursue their mission and boost their impact in the future.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Foundation BETA is very dependent on the funds and orientation provided by the city council. This is unlikely to change, as the council has been an important stakeholder since its foundation. It acts as a social service provider of Oporto city and the executive director is the social *bricoleur* that manages and conciliates efforts to achieve the social effects intended to provoke. Thus, it has a limited autonomy regarding its operational and investment strategy.

DELTA possesses intrinsic characteristics of social entrepreneurship, ever since its origins. The development of a business strategy allied to the social aim represents perfectly the ideal matching of social and economic activity. However, based on the specific line of activity and target segment, it is impossible for the association to run their everyday actions without governmental support.

ALFA is a well-funded project, with a social and business oriented strategy, founded by socially aware young entrepreneurs. In light of this framework, ALFA is a young social enterprise, which will certainly develop their work in a sustainable way, providing society with solutions to existing needs and empowering others to act socially as well.

SIGMA is the most entrepreneurial institution, in an innovative area that is the dream and personal effort of a social entrepreneur. The lack of funding may origin some sustainability issues, but provides the foundation with autonomy of decision and action. It is expected, however, that with time, the theme of affections will be given more attention. The focus on affections will certainly provide the foundation with the necessary income to ensure its sustainability and future action.

One of the most extraordinary effects of social initiatives is the capability to empower, and to influence others, leading social ventures and society to act and to recognize the importance of being socially active. To create social impact, either by influencing or empowering others to act, or by creating the necessary conditions for social prosperity in unfavorable situations is a *sine qua non* condition for social enterprises.

CONCLUSION

In the Portuguese context, several entities operating in the Third Sector, as co-operatives, mutual societies, associations and foundations, as well as voluntary non-profit entities self-entitle themselves as 'social enterprises'. However, not all organizations fit in the definition of "social enterprises", despite their important contribution to counteract social inequalities.

In harmony with the Portuguese reality, the term 'social enterprise' was not literally interpreted and was enlarged to social initiatives that envisage social aims and sustainability. The difficulty in the conceptualization and distinction of such initiatives was corroborated when testing the framework used by Zahra et al. (2010) and for the classification of social enterprises by means of the ideal-type social enterprise framework. Although models may seem, in theory, very easy to apply, the fact is that social concepts and fields of action are not easily separated as the practices of the real-world do not always fit the conceptual models.

The role of social entrepreneurs, although vital for the society, is still largely ignored. The positive impact of entrepreneurs providing for social needs and their unique contribution to sustainable economic and social development goals should be recognized, notwithstanding the scale of action and impact created.

The social *bricoleur*, as represented in BETA, is a social entrepreneur who seeks to change his ecosystem. It may not be a systemic or replicable change, but again, how scalable can social entrepreneurship

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

be? The social constructionist identifies the opportunity for action and puts all her/his efforts in order to solve the problem identified, even if it means operating large ventures and depending on funds and external resources. Does this make her/him less a social entrepreneur, due to the funding orientation? The social engineer holds the Schumpeterian perspective, but must all social entrepreneurs focus on large-scale and systemic change? Some problems and societal needs do not ask for a social engineer, but for a social *bricoleur* or a constructionist, as they are regionally-based or sporadic.

Regarding autonomy, BETA and DELTA can hardly be completely autonomous due to their core field of action, which influence their capacity to become completely sustainable. Understanding how the field of action or the attended societal needs may limit their long term sustainability is vital to understand how social enterprises can intervene without jeopardizing its survival.

It is interesting to substantiate that the social mission, form, and adoption of some business-oriented measures may not be sufficient for an institution to be classified as a social enterprise. For instance, Foundation BETA lacks the autonomy, a broader impact area, and sustainability is not possible without public support. Despite their mindset and efforts towards autonomy and sustainability, for DELTA it is impossible to run the everyday support without governmental funds. In light of this framework, ALFA is a young social enterprise, which will certainly develop their work in a sustainable way, providing society with solutions to existing needs and empowering others to act socially as well. SIGMA is the institution that most resembles a social enterprise, according to the definition adopted. However, the lack of funding and sizable revenues, and a poor marketing strategy may jeopardize sustainability.

One can conclude that some social entrepreneurs make the difference in such organizations. Some of them are able to lead employees to share their vision and mission and to create a true organizational culture. The professional management of social initiatives allows the organization to achieve financial viability. However, if the social mission is to be seriously deployed, strategists with business skills, and marketing orientation are still necessary to provide the organization with efficient tools to provide long-term sustainable social services.

It was also possible to conclude that the environment contributes greatly to the development of social enterprises. The access to incubators and the partnership with the university were determinant for ALFA and created the perfect conditions for its launching. The access to funding capital is eased and the contact with the network of the university provided ALFA with a large portfolio of potential clients. The lack of articulation in the city social network and the sensibility of the city mayor to the social cause were the environmental facts leading to the Foundation BETA. The creation of DELTA answered to local problems, fostered by the lack of answers in society for parents with disabled children. The awareness and sensibility to the theme of affections led to the creation of Foundation SIGMA.

Two major concerns were put forward by the interviewees: the conceptualization of the social venture and the limited funding.

Differences in the conceptualization and visibility of social responsibility in society, the novelty of the theme, and its difficult introduction within the traditional management and leadership perspectives were mentioned by ALFA, but are applicable to SIGMA as well. The innovative approach of affections in daily lives is also troublesome as families' budget constraints, and economic sustainability tend to override the importance of fostering family affections. Besides the general limitation of funding, BETA identified the existing culture of assistentialism in Portugal as a major obstacle to social enterprising and DELTA pointed out the conceived idea of people with disability as a permanent obstacle to overcome. One conclusion is clear, despite the social orientation found in the four case studies, the cultural

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

idiosyncrasies in the Portuguese scenario of social enterprises strongly influences the creation, form, and consistency of such initiatives.

Although the concept of social enterprise has been attracting much attention, little guidance has been offered on how to create social businesses. Moreover, despite ever-growing literature on the social enterprises' concept, there is no consensus regarding its definition. Among the overabundance of definitions, three elements stand out: the social mission, the social impact, and the processes adopted. However, the drive for sustainable ventures in the social field, whatever their nature, is an essential fourth element in current days that needs to be inter-connected with the other three.

Profits can always be controversial in social issues, but if rules were created to regulate their application and distribution, the issue could no longer raise doubts. The creation of social enterprises with legally set boundaries, guidelines and indicators could benefit the whole society and become advantageous for all. Furthermore, innovative business model need to be diffused and training could be provided to social entrepreneurs, in order for them to generate new sources of revenue by finding novel value propositions to address social needs.

The potential market for social enterprises in Portugal is huge, because of the wide range of social needs that remain unsatisfied by existing markets and institutions, which is the result of public policy failure. A new generation of social market-oriented entrepreneurs may be the solution to emerging social problems. Social enterprising is, thus, emerging as an innovative approach for dealing with complex social and environmental needs in order to contribute to a sustainable development of societies.

In short, the *modus operandi* of traditional organizations has been changing in their essence. The mission can no longer be merely social, meaning that profitability or, at least, financial sustainability must also become a concern of such organizations. In a time of crisis and increasing societal challenges and demands, new revenue sources and new business models needed in order to allow that social ventures thrive.

Future Research Directions

The training, background, character and gender of the organization leaders, founders or directors need to be further explored in future studies in order to understand how such variables can provide insight on the entrepreneurs' motivation, strategy, and social orientation. Moreover, it will also be important to analyze how business models are utilized in order to relate social and market orientation with long-term sustainability.

It is clear that individual characteristics, training, and the environment strongly influence social entrepreneurs' action and mirror the organizations they manage. As such it would be useful to understand how training can shape Social awareness and influence long-term performance. Again, the need to further develop the concept of social entrepreneur is mandatory and needs to be complemented with research in countries with less 'favored' social public policies.

KEY TERMS AND DEFINITIONS

Community Interest Companies: A new type of company introduced by the United Kingdom government in 2005 under the Companies Act 2004, designed for social enterprises that want to use their profits and assets for the public good.

EMES: A research network of university research centers and individual researchers whose goal is to build up an international corpus of theoretical and empirical knowledge, pluralistic in disciplines and methodologies, around our "social entrepreneurship" concepts.

Social Bricoleur: A type of entrepreneur that possesses the tacit knowledge to intervene at specific local situations in order to solve specific and episodic situations with limited resources.

Social Constructionist: A type of entrepreneur that builds, launches, and operates ventures to tackle social needs unsatisfactorily addressed by existing institutions. They fill in the social gaps unattended by for-profit businesses or not-for-profit organizations. The social constructionist aims to spot and pursue opportunities that generate social wealth through systemized scalable solutions to meet emergent needs, solutions that can be transferred to other social contexts.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Engineer: A type of entrepreneur that identifies systemic problems within the social systems and tries to address them by bringing about revolutionary change.

Social Enterprise: An organization of any legal form that pursues a social objective to improve a given social condition, in a systemic and impactful way, by merging social and commercial methods while testing creative ways to mobilize resources and ensure sustainability.

Social Entrepreneur: A person who seeks sustainable and impactful change through pattern-breaking ideas to address significant social or environmental problems, either focusing at local, national or global level, adopting both a social- and business-oriented strategy and ensuring sustainability to the social mission and impact envisaged.

Social Entrepreneurship: A process that involves the identification of an unmet social need (opportunity) and the gathering of resources to act and resolve the need (social mission) in a sustainable and innovative way, through a business-like approach.

Chapter 23
Locational Determinants of Foreign Direct Investment in the Vietnamese Economy

Ngoc Le
Northumbria University, UK

Xiaoqing Li
Brunel University London, UK

Andrey Yukhanaev
Northumbria University, UK

ABSTRACT

This chapter investigates the determinants of inward Foreign Direct Investment (FDI) in the Vietnamese economy and their connection to the rapid economic growth the country has experienced. Using the concepts drawn from the extant Ownership-Location-Internalization (OLI) paradigm and Institutional-Based View (IBV) literature, and adopting a quantitative research with the application of secondary data analysis, the study found seven significant locational factors determining FDI inflows into the Vietnamese economy, such as business freedom, market size, labor cost, trade freedom level, inflation rate, human capital, and the effectiveness of property rights. Political risk, monetary freedom, corruption, the country's WTO accession, and the global financial crisis are found to be irrelevant to the inbound investments in the modern economy. A macro-level account and the policy implications are suggested for the promotion of FDI inflows into Vietnam to ensure the country's continuous and sustainable economic development.

INTRODUCTION

After a long period of economic hardship, the political and economic reform named "Doi Moi" was launched in 1986 marking a comprehensive change in the Vietnamese economy from a centrally planned to a market-oriented system (John & Bruce, 2006). The movement towards a market economy has enabled Vietnamese companies to diverge from doing business under traditional arrangements of the Vietnam-

ese government and other partners within the Soviet trading block to being more liberalized and open to foreign trade (Nguyen, Barrett, & Fletcher, 2006). As a result, Vietnam has transformed itself from one of the poorest countries in the world to a lower middle income country with income per capita of US$1,130 by the end of 2010 (World Bank, 2013). It then has experienced an impressive constant GDP per capita growth, being the fourth highest in the Emerging Asia by the end of 2011, and expected to be the second highest by 2016 (OECD, 2012). There has also been a gradual evolvement of Vietnam's politics and society towards greater openness and opportunity for civil participation. This progress is very essential as it supports Vietnam's vision to become a modern industrialized society.

Furthermore, compared to the state sector, the private sector has become increasingly emergent and important to the country's economic growth, which is regarded as a restructuring focus on more strategic activities (World Bank, 2009). Indeed, in 2012 the government started a privatization programme to attract more foreign investment (Euronews, 2014). Moreover, since accessing to the WTO in 2007, Vietnam has shown a more proactive engagement in international integration and has also made various commitments to be a more friendly investment destination such as liberalizing its economic policies, easing regulatory restrictions on investment and joining Free Trade Agreements (FTAs) not just regionally but also globally (Petro Vietnam, 2014; World Bank, 2013). In fact, to welcome more global investment the government's legal body gave a more equal regulation environment with almost no discrimination for both domestic and foreign businesses. Vietnam has also started to negotiate FTAs with countries beyond its Asia border such as with European countries in 2011-2012.

The country has also become a negotiating member of Trans-Pacific Strategic Economic Partnership (TPP) where major economies such as Australia, Brunei Darussalam, Chile, Malaysia, New Zealand, Peru, Singapore, and the USA join together to create a more compatible business environment to assist each other in the promotion of innovations, economic development, job creation, and active participation in international trade (USTR, 2013). This event clearly creates great potential for the TPP members seeking investment opportunities in Vietnam and vice versa. Therefore, Vietnam strives to expose to a broader investment community beyond the local region. Although a major challenge for many foreign investors in Vietnam might be to adapt to the one-party system, the country's constant improvement in its legal, economic, and political systems with the practical advancements offers great benefits and potential for foreign investors in the long term. This constitutes Vietnam emerging as a key FDI destination in the region.

In comparison with other countries in the region, FDIs in Vietnam have a fairly short history and slow development due mainly to the late participation start only after the 'Doi Moi' renovation reforms in 1986 were launched. However, the country has managed to attract a considerable amount of FDI inflows to become the fourth largest FDI recipient in Southeast Asia in the 2000s despite the impact of Asian economic crisis 1997 (UNCTAD, 2013). The FDI inflows began to develop again in the 2000s because the countries in the region had recovered from the crisis and together with the positive impact of US-Vietnam Bilateral Trade Agreement in December, 2001 (Moosa, 2002). The majority of FDI inflows into Vietnam during the period 1988 to 2005 were into manufacturing and processing industry with 8,072 projects and nearly US$106 billion of registered capital accumulation until 2012 (GSO, 2013). In the service sector, despite the smaller amount in relative terms and marginal amount or even the non-existence of FDIs in the early start of the FDI history in many important service sectors such as the construction of industrial zones or offices and apartment, they are now increasingly attracting more FDI inflows (GSO, 2013). In terms of FDI origins, Vietnam mainly has attracted investors from the Asian region, accounting for nearly 80% of total number of projects with South Korea being the biggest

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

investor with US$24.8 billion of registered capital followed by Taiwan, Japan, Singapore, and China (GSO, 2013). Thus, the country has proved itself as a dynamic market with extraordinary changes in the macroeconomic indicators, the increasing regional and global integration and continuous efforts in improving the economic system, and the development of both the state and private sectors.

FDI activities have been increasing in the global economy at a faster rate than any other international business (IB) transactions of multinational enterprises (MNEs), due mainly to the compelling economic advantages both for the MNEs and the recipient countries (Peng & Meyer, 2011). Consequently, the spectacular growth of FDIs has considerably increased productive capacity and industrial standards, as well as contributed to the spread of the best practices in corporate governance, accounting rules, and legal traditions across the world (Pike, Neale, & Linsley, 2012). In fact, the increasing significance of mergers and acquisitions (M&A) is believed to stimulate domestic corporate control, information disclosure, discipline, and the accountability of managers. Furthermore, FDIs have been also evidenced to provide numerous spillover effects such as raising employment opportunities, increasing labor standards and knowledge transfers, enlarging tax revenues, and fostering competition in the domestic market, thus leading to economic growth (Meyer & Sinani, 2009; Blomstrom & Kokko, 1998). Due to such a wide range of profound socio-economic impacts, FDIs have been used extensively more than other forms of internationalization resulting in significantly greater attention by extant academic literature with empirical examination (Mody, 2007). Simultaneously, the distribution of FDIs is extremely unequal, with emerging markets accounting for the substantial share of foreign-registered capital.

This phenomenon has motived some scholars to investigate the reasons and determinants that attract these significant FDI flows into developing economies (Mody et al, 1998). However, the majority of the available studies mainly focus on FDIs in mature economies despite the fact that developing countries experienced a big increase in the last decade, absorbing nearly half of the global FDI inflows (UNCTAD, 2012). There is still a lack of evidence on the geographic and sectorial distribution of FDIs within particular recipient countries due to the limited availability of datasets and combination of the developing areas into single studies (Noorbakssh & Youseff, 2001; Hussain & Kimuli, 2012). Therefore, our chapter investigates the determinants of FDI inflows in Vietnam from 1995 until 2011 through the application of the Ownership-Location-Internalization (OLI) framework and institutional theory with particular emphasis on economic factors including market size, human capital, labour costs, and the degree of trade openness.

The analysis of the FDI determinants in developing countries has a number of benefits. First, it contributes to the economic literature regarding determinants of FDI inflows in developing countries generally and in Vietnam in particular. Second, our findings will enable policy makers to understand what factors are attractive for foreign investors in Vietnam and what further adjustments in government policies are required to motivate more companies to conduct business in the country. Finally, our discussion will help foreign investors gain an insightful overview into the Vietnamese economic, legal, and political systems so as to identify the destination's business opportunities as well as current limitations.

THE CONCEPT AND TYPOLOGY OF FDIs

One of the most important components of economic growth for any country is the volume and value of both domestic and foreign investments. Although there were some attempts made in the extant literature to explain the FDI decisions of MNEs, the exact impacts of certain determinants on FDI decisions and

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the explanation of what are the most important factors in a country's attractiveness are still controversial (Chakrabarti, 2001). Prior to discussing the relevant theories of FDI determinants, it is necessary to understand what can be regarded as FDIs. In general, investment can be understood as a risk-associated involvement of economic assets of different property types in various entrepreneurial activities by national or international investors to earn profits and obtain economic benefits. In a broad sense, FDIs can be understood as a supply of capital by foreign investors to a host country based on profit consideration with a lasting interest towards a resident entity in another economy (Caves, 1996). However, this definition does not differentiate FDIs from any other types of cross-border transactions and narrows the essence of FDIs to primarily capital management.

Noy and Vu (2007) argue that the main feature of FDIs is ownership and engagement of investors in governance matters for extended periods of time, whereas portfolio investments are short-term and pursue only financial interests without significant commitment and control over strategic development of the organizations. Nonetheless, it does not necessarily mean that portfolio investment could not include long-term securities. Here, short-term rather indicates a propensity not to hold securities for a significant duration (Moosa, 2002). Similarly, the OECD (1996, pp. 7-8) offers the following statement:

foreign direct investment reflects the objective of obtaining a lasting interest by a resident entity in one economy (''direct investor'') in an entity resident in an economy other than that of the investor (''direct investment enterprise''). The lasting interest implies the existence of a long-term relationship between the direct investor and the enterprise and a significant degree of influence on the management of the enterprise. Direct investment involves both the initial transaction between the two entities and all subsequent capital transactions between them and among affiliated enterprises, both incorporated and unincorporated.

The OECD also recognizes the ownership of a 10% investment threshold which is somewhat regarded as an arbitrary number in many cases (Moussa, 2005). In reality, the ownership of more than a 10% investment share may exert considerable control with an effective voice in management, while those with a share less than 10% may not lead to the exercise of any substantial influence (OECD, 1996). This is consistent with the International Monetary Fund (IMF) recommendations regarding foreign investors holding 10% or more of the ordinary shares or voting power in an enterprise to enable direct investors to have authority or participate in the administration of a firm (Rowley, 2006). However, Sinani and Meyer (2004) explain that FDIs should not only be viewed from financial and corporate governance perspective, but should be rather regarded as a managerial package of advanced technology, skills, tacit knowledge, and tangible and intangible business assets.

There are many reasons for the engagement of MNEs in foreign investment, such as embracing and responding to foreign market demands, imitating competitors, retaliating against foreign rivals, following customers or suppliers, creating additional return on existing assets, and pursuing new growth opportunities in international markets (Root, 1987). The theoretical basis of the IB approach to FDI motives can be recognized in an earlier taxonomy forwarded by Dunning (1993, 2000) in which FDI motives are categorized into four orientations: *market-seeking, efficiency-seeking, resource-seeking, and strategic asset-seeking*. Generally, different FDI orientations result in different MNEs' decision on location selection and, therefore, these motivations are closely linked to the determinants of FDI (Fetscherin, Voss, & Gugler, 2010). However, MNE participation in FDIs can be with multiple orientations and tend to change the motivation as they become more established and experienced on the international stage.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

First, natural resource-seeking investors are enterprises whose motive of investing abroad is to obtain particular and specific resources of a higher quality at a lower real cost than could be acquired in their home country. By doing so, these enterprises can be more profitable and can strengthen their competitiveness in the markets (Makino, Lau, & Yeh, 2002). According to Dunning and Lundan (2008), there are three main types of resource-seeking: The first kind is for primary producers and manufacturing enterprises who seek physical resources with the motives of cost minimization and security of supply sources. The second group comprises manufacturing and service MNEs from countries with high real employment costs that seek plentiful supplies of cheap and well-motivated unskilled or semi—skilled labor in other countries with lower real employment costs to supply labor-intensive intermediate phase of production or final products for export. As the global labor costs have been rising, investment has shifted from advanced industrializing developing countries such as Mexico, Taiwan, and some countries in Central and Eastern Europe to emerging countries like China, India, and Vietnam with new more open trading policies and cheaper supplies of labor (Luo & Tung, 2007).

Especially in the case of Vietnam given the China's rising labor costs recently and the country's proximity to China, it increasingly gains its foothold in the low-end manufacturing and is predicted to benefit from existing supply chain (Barnato, 2013). The third type is prompted from mostly emerging economies to industrial nations in order to gain access to financial resources and technological capability by obtaining knowledge, organizational skills, and management and marketing expertise (Dunning & Lundan, 2008). However, all of the conceptualizations of resource-seeking motivations are made under the assumption of the immobility of the required resources (Dunning, 1993). Thus, this motivation is mainly referred to physical, tangible resources that are either immobile or costly to transport, while it appears to be less imperative for investment in information-intensive industries (Nachum & Zaheer, 2005).

Second, market-seeking investment is undertaken to serve particular markets by employing local production and distribution facilities, rather than by exporting from the home country or a third country, with the purpose of maintaining or protecting existing markets, or exploiting or supporting new markets (Dunning, 2000). The most notable reasons for this kind of investment are market size and the prospects for market growth in the host countries (Dunning & Lundan, 2008). Additionally, MNEs might want to engage in FDI to follow their customers and suppliers abroad or to have the greater reduction of production and transaction costs than supplying products from a distance (Dunning, 1993). Furthermore, market-seekers are also often driven by the need for proximity to local customers so as to be aware of and able to meet their specific tastes and needs, because in many cases without familiarizing themselves with the indigenous language, business customs, legal requirements and marketing procedures, foreign firms may find themselves at a disadvantage in comparison with local firms (Nachum & Zaheer, 2005). Increasingly important, as part of a MNE's international production and marketing strategy, MNEs may want to consider market-seeking investment to gain a physical presence in the leading markets served by its rivals (Rowley, 2006). Compared to other kinds of FDI, market-seeking MNEs are prone to consider their foreign affiliates as self-contained production units rather than as part of an integrated network and, therefore, they tend to be the most reactive to indigenous needs and cultural sensitivities (Dunning & Lundan, 2008).

Third, efficiency-seekers are regarded as experienced and diversified MNEs that seek well-developed and open cross-border markets where they have already established resource-based or market-seeking investments (Dunning, 1993). Here, the intention is to rationalize the structure of the established investments in such a way that they can take advantage of common governance over geographically-dispersed activities in two possible ways. The first kind is designed to benefit from differences in the availability

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and cost of traditional factor endowments in different countries in which MNEs decide how best to configure their operations, corresponding to the comparative advantage of different locations so as to reduce costs and maximize efficiency (Zaheer & Manrakhan, 2001). An example of this kind of efficiency-seeking investment is when MNEs invest in both developed and developing nations. On one hand, it can benefit from capital, technology, and information-intensive activities from developed countries, and on the other hand it can simultaneously take advantage of cheaper labor and natural resources available in the developing locations. Another kind of efficiency-seeking investment is undertaken in countries with similar economic structures and income levels with the purpose of taking advantage of the markets of scale and scope, and of differences in consumer tastes and supply capabilities (Dunning & Lundan, 2008). Nevertheless, Kogut and Zander (1993) argue that the spread of this type of investment requires substantial geographical coordination and knowledge transfer skills, which for the reasons of various market failures is better employed internally than externally.

Finally, strategic-asset seeking investment include both established MNEs pursuing an integrated global and regional strategy, and first-time foreign direct investors hunting for access or purchase of competitive strength in an unfamiliar markets (Dunning, 2000). The central motivation for this investment is to protect or advance the firm's long-term competitive position, followed by the motives to exploit specific cost or marketing advantages together with boosting their global portfolio of physical assets and human competences (Dunning & Lundan, 2008). Thus, it is believed to aim at either maintenance or strengthening of their ownership-specific advantages or to the considerable weakening of the rival's position.

In the case of Vietnam, inward FDI is still considerably dominated by regional investors, accounting for 80% of total number of projects accumulated in 2012. Hence, the second kind of efficiency-seeking investments might play a significant role in total foreign investments, which will, in turn, be attributed to the considerable role played by the favorable local institutional and economic factors listed above. Therefore, institutional-based literature along with the real situation in Vietnam will be discussed in this chapter, followed by testing hypotheses to quantitatively examine these issues.

Fundamental Theories

Since the 1930s, there have been various context-specific theories of geographical distribution of FDI with the focus on the value-added activities of firms. However, until the 20th century, the extant economics and business literature has not given much attention to how location-related theories can explain the emergence and development of the cross-border activities and their impact on the investing firms' competitiveness (Dunning, 2000). Conventionally, explanatory variables such as sectorial composition, home and host economic conditions, and various company-specific considerations have been used to extend the standard theories of location to cover a wide range of cross-border value added activities (Dunning & Lundan, 2008). Therefore, the focus of this research is to examine locational factors attracting FDI inflows to Vietnam and to explain FDI activities through the prism of location theories without resorting to other theoretical groundings such as portfolio or risk diversification, internalization, product life cycle, and others.

Historically, one of the major theorems to explain locational determinants of FDIs was based on the Heckscher-Ohlin (HO) model of neoclassical trade theory in which FDI was regarded as part of the international capital exchange Thus, Stolper and Samuelson (1941) argue the HO model was built upon a 2x2x2 general equilibrium framework with two countries (home and foreign), two productive

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

inputs and two goods, with the assumption of perfectly competitive goods and factor markets, identical constant returns, zero transport costs, and factor endowments that exclude specialization. Furthermore, commodities are assumed to differ in relative factor intensities and countries differ in relative factor endowments, resulting in the difference in international factor price; therefore, a fairly capital-abundant country would export its capital-intensive goods to other foreign countries. In the absence of commodity trade, the home country would move capital to foreign countries where returns on capital are greater and returns on labor lower until the price factor between the home country and the foreign countries are equalized. MacDougall (1960) and Kemp (1964) supported this statement by developing their own model with the assumption of full employment, perfect competition, and constant returns, but with only one good and two productive inputs, thus reaffirming that capital would be shifted to the capital-scarce country where greater capital returns is expected.

However, the neoclassical approach received strong criticism for its limited ability to explain FDI flows. Among the first opponents to the approach was Hymer (1976) with his industrial organization hypothesis, and Kindleberger (1969) who argued that the assumption of a perfect market in neoclassical theory was unrealistic and could not thoroughly explain FDI. Both authors paid great attention to the concept of monopolistic advantage to explain the engagement of companies in cross-border activities. Thus, it is argued that the companies must possess ownership advantages such as brand names, patent-protected technology, and managerial and organizational capabilities. Moreover, there should be government interference to balance out the disadvantages of penetrating a foreign market including differences in culture, business ethics, legal system, physical distance, and other inter-country differences in order to compete with local companies.

Even though the ideas of Hymer (1976) and Kindleberger (1969) were used by Graham and Krugman (1991) to explain FDI growth in the USA, it seemingly fails to explain why companies do not utilize their own comparative advantage by producing in their home country and exporting overseas, which is an alternative to FDIs (Moosa, 2002). Moreover, although the ownership competitive advantage approach explains why companies invest overseas, it does not explain why companies choose invest in country A rather than in country B. Therefore, the primary location hypothesis seeks to fill this gap by explaining the FDI existence due to the international immobility of some production factors such as labor and natural resources, leading to location-related differences in the cost of production factors (Dunning & Lundan, 2008). One significant form of location-related differences in the cost of production factors is the host country's locational advantage of low wages, which is the level of wages in the host country relative to wages in the home country (Moosa, 2002). However, there has been mixed evidence on the hypothesis supporting the concept that cheap labor costs attract FDI. Thus, Love and Lage-Hidalgo (2000) established that real labor cost differences between the USA and Mexico had a considerable effect on FDI flows from one country to another, whereas Yang, Groenwold, and Tcha (2000) found that cheap labor cost has no considerable or even reverse impact on FDI flows. Nevertheless, high wages might be indicative of high quality of labor, in which case clearly the relationship between low wages and FDI would not hold (Moosa, 2002).

As a response to the limitations of traditional location theories, Dunning (1988) developed the eclectic OLI paradigm by integrating the industrial organization hypothesis, the internalization hypothesis, and the location hypothesis without being too precise about how they interrelate (Moosa, 2002). However, unlike internalization theory, it does not claim to be the theory of MNE *per se*, but rather a paradigm which covers various explanations of firms' cross-border value-adding activities (Dunning, 2001). It

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

provides a conceptual framework for explaining 'what is', rather than 'what should be', the level and structure of the firms' foreign value activities, for which it primarily addresses itself to positive rather than normative issues (Dunning & Lundan, 2008). Indeed, this paradigm seeks to offer a general framework for ascertaining the extent and pattern of both foreign-owned production carried out by a country's own firms and that of domestic production owned or controlled by foreign firms (Dunning, 2000). Hence, it is applicable to explaining certain kinds of trade where the trading enterprises' advantages are not only country-specific, but also firm-specific.

The OLI paradigm is described as a simple but profound construct which has remained the dominant analytical framework for accommodating a variety of operationally testable determinants and MNEs' foreign activities (Caves, 1996; Dunning, 1993). Accordingly, Dunning and Lundan (2008) posit that the level and structure of foreign activities undertaken by MNEs will depend on four conditions being satisfied. First, the firm must possess unique and sustainable ownership-specific (O) advantages over firms of other countries in the servicing of particular markets or groups of markets. These O advantages are mainly in the form of the privileged possession of intangible assets, including monopolistic power, size, and the right to a particular technology arising as a result of coordination of related cross-border, value-adding activities. Second, assuming that the first condition is in place, the extent to which the firm perceives it to be in a more beneficial position to use these O advantages rather than to sell to foreign firms. These are market internalization (I) advantages, referring to either the greater organizational efficiency or superior hierarchies' incentive structures, or their ability to exercise monopoly power over the assets under their governance. Thirdly, assuming that the first and second condition hold, the extent to which the firm perceives it will be more profitable to create, access, or utilize its O advantages in a foreign location. Correspondingly, it is assumed the spatial contribution of L-bound resources, capabilities and institutions are uneven and, therefore, will bestow a competitive advantage on the countries possessing them over those that do not. Thus, the principles of the eclectic OLI paradigm are straightforward in that the more a country's firms have desirable O advantages, the bigger the incentive they possess to internalize rather than externalize their use, and the more they find it in their interest to access or exploit them in a foreign location; consequently, the more likely they would engage in outward FDI.

LOCATION-SPECIFIC FACTORS IN VIETNAM

Since the focus of this study is to examine the FDI locational determinants of Vietnam, the focus is largely on the critical discussion and analysis of the L factors in the OLI framework. As Dunning and Lundan (2008, p. 97) highlight, "attempts to explain patterns and levels of MNE activity without taking account of the distribution of L-bound endowments and capabilities are like throwing the baby out with the bathwater!". Thus, the need to co-locate home-base activities at a particular location becomes an inevitable trend which also facilitates cross-functional coordination and integration of knowledge and inputs sourced worldwide (Porter, 1994). Conventionally, empirical studies have examined the location-specific advantage variables and detected that such factors as market size, market growth, barriers to trade, wages, production, transaction costs, political stability, cultural distance, and the host government's trade and taxation regulations have the most significant influence on FDI decisions (Dunning, 1993).

Most studies of location and trade focus endowments and factors related to cultural, legal, political, financial and institutional environment (Sethi et al., 2003). Dunning and Lundan (2008) divide them into two main categories: *traditional factors* and *institutional factors*. Notably, the institutional assets are a

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

new addition to the paradigm which encompasses the range of formal and informal institutions governing the value-added processes within firms (Globerman & Shapiro, 2003). In the section below, we will critically analyze the most representative *traditional factors* with an appropriate application to Vietnam.

Market Seeking Investments

Generally, a typical host market characteristic such as market size is identified as a considerable determinant of FDI flows – as markets enlarge in size, so do opportunities for efficient utilization of resources and the exploitation of economies of scale and scope via FDI (UNCTAD, 1998). In other words, as soon as the market size of a particular country has increased to a level ensuring the exploitation of economies of scale and scope, the country becomes a potential target for FDI inflows (Moosa, 2002). The relationship between FDI flows and the market size is explained as an adequately large market would allow for the specialization of the factors of production and therefore lead to cost minimization (Willmore, 1976). Furthermore, as the existence of large local market might also facilitate static and dynamic economies of scale, it would in turn provide an advantage for foreign investors undertaking exports apart from serving the local market (Patibandla, 2001).

The author also strongly argues this advantage can even enlarge in a host developing country with a large market for differentiated goods by cheap cost of semi-skilled and skilled manpower. Indeed, a great number of survey studies have produced results supporting the positive relationship between FDI inflows and market size (Chakrabarti, 2001). Love and Lage-Hidalgo (2000) used GDP per capita as an explanatory variable in an equation designed to explain US FDI in Mexico and the variable was a significant determinant of FDI flows. In support of this statement, recent studies on Chinese outward FDI also indicate that as a response to the increase of offensive market-seeking motives, Chinese MNEs increasingly direct their investment towards large markets (Deng, 2004). However, research of Yang *et al.* (2000) of the Australian market show an exceptional result that there was no significant relationship between FDI flows and either the contemporaneous change in the national economic output.

As a transitional economy, Vietnam has been transforming itself from a closed-market, command structure to a market-oriented economy, and now represents a market with a surplus labor force, a consistently stable increase in GDP, and positive economic changes (John & Bruce, 2006). Furthermore, most of the domestic firms were once state-owned enjoying a virtual monopoly under the old system. However, as Vietnam is opening more itself to the global economy, to meet the growing competition, many firms now are open to foreign investors. Hence, Vietnam can be depicted as a promising destination for foreign investments inflows and our first hypothesis is proposed as:

H1: Vietnamese FDI inflows are positively associated with the market size.

Host Inflation Rate

Volatile and erratic host country's inflation rates discourages market-seeking FDI by generating uncertainty and causing inability of agents to commit to future actions, hence making long-term corporate planning problematic, especially with regard to price-setting and profit expectations (Buckley et al., 2007). In factor markets, inflation might lead to a fall in real wages value and other factor prices relative to consumer prices due to an increase in business costs produced by the inflation rate (Kessel & Alchian, 1962). Such an increase in business costs would consequently result in a decline in the returns to the

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

co-operating agents or production relative to prices. More specific implications would be that high inflation rate devalues domestic currency, therefore reducing the real value of earnings in local currency for market-seeking investing companies (Morsink, 1998). As an impact of the domestic currency devaluation, the host country with high inflation rate would also suffer from lower purchasing power and capacity.

Additionally, by escalating the locally sourced inputs prices, high inflation rates make it harder for investors to maintain a cost advantage in third markets, thereby discouraging export-oriented FDI (Buckley et al., 2007). Another possible explanation for the negative effect of the inflation rate on FDI locational decisions is that because inflation rates cause significant impact on the host country's economic growth which ultimately deteriorates the host country's attraction to foreign investors (Khan & Senhadji, 2001). Therefore, high inflation rates can be an impediment to FDIs as it shows a clear sign of the host country's status in terms of macroeconomic stability (Kok & Ersoy, 2009). However, Zeng (2009) found that the inflation variable was not significant in determining FDI inflows in both China and India during the period 1984 – 2002. Therefore, our second hypothesis is:

H2: Vietnamese FDI inflows are negatively associated with the inflation rates.

Quality and Cost of Human Capital

Labor cost undoubtedly remains among the most important considerations for cross-border value-adding activities. Indeed, as a main characteristic of the lower cost locations for operations, cost of labor is regarded as the key input for a firm's production process and therefore efficiency-seeking and market-seeking investments (Buckley et al., 2007). On the same note, Vernon (1966) argues that availability of cheap inputs, especially human capital, is a significant determinant for moving production capacity overseas, and is believed to be a pull factor for the host market (Morsink, 1998). In fact, US-based MNEs selected countries in East Asia on the basis of lower wage rates to shift their manufacturing operations to gain cost-reduction in production, resulting in profit margin improvement and higher competitiveness (UNCTAD, 1997). The competitive intensity and the low-cost heaven offered by some Asian countries facilitated FDI restructuring strategies of some US-based MNEs and enabled them to shape up efficiency-seeking investments in Asian countries, leading to greater economies of scale (Sethi et al., 2003).

Furthermore, Farrell (2005) found significant savings from the difference in level of wages between developed and developing countries by showing that US firms saved US$0.58 for every dollar and the German firms saved €0.52 for every Euro spent on jobs they had moved to India. The level of cheap labor costs of the host country relative to labor costs in the home country also explains why such countries as China, India, and Vietnam attract labor-intensive production such as footwear and textiles (Moosa, 2002). In particular, Vietnam possesses a relatively low manufacturing labor costs with average expenses being roughly 35% lower than the coastal industrial zones of China (Asian Coast Development Ltd., 2013). Simultaneously, productivity and the high quality of human capital in the host country become an increasingly important driver of cross-border value-adding activities and selection decisions of the FDI locations (Morsink, 1998). Thus, Barrel and Pain (1996) argued that for long-term development, the extensive reliance on cheap labor cost without duly considering the quality of human capital might be a very risky approach.

Dossani and Kenney (2003) supported this argument by showing that while investors were at first attracted to India for low cost reasons, they retained and expanded their scales due to the high quality of the workforce, which was also partially a function of earlier investors' agglomeration and positive exter-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

nalities created. Bunyaratavej, Hahn, and Doh (2007) also argued that companies tend to seek relative parity with their home country's workforce quality and associated costs despite some wage discount in respect to domestic costs. Therefore, cost savings and abundance of skilled workforce would be expected to encourage FDI inflows into the host country:

H3: Vietnamese FDI inflows are negatively associated with the labor cost.
H4: Vietnamese FDI inflows are positively associated with the quality of human capital.

Political Risk and Institutional Development

Over the past three decades, institutions have become integral in clarifying the determinants and impacts of IB activities, due primarily to globalization, technological progress, and the volatile and complex environments in which MNEs operate (Dunning & Lundan, 2008). Accordingly, the significance of country-specific and context-based institutional factors as determinants of FDI flows has been increasingly emphasized in extant IB literature (Peng, 2003; Globerman & Shapiro, 2003). Although there have been several studies attempting to explain the firm's relationship with its broader environment, the application of mainstream theories in developing countries tends to be problematic (Peng, Wang, & Jiang, 2008). This is because some developing countries diverge considerably from developed economies on the premise of institutional development (Patibandla, 2001). Therefore, in order to effectively examine the complex and volatile relationships between the firm and external environments in emerging economies new theoretical tools incorporating the institutional-based view are required (Peng et al., 2008). Traditionally, institutions are defined as 'the humanly devised constraints that structure political, economic and social interaction. They consist of both informal constraints (sanctions, taboos, customs, traditions, and codes of conduct), and formal rules (constitutions, laws, property rights)' (North, 1991, p. 97).

Dunning and Lundan (2008) attempted to incorporate institutions into the OLI paradigm and claim that institutions along with their enforcement mechanism set the 'rules of the game' in which firms must survive and achieve their own learning and resource allocative goals. Hence, an institutional system consists of the combination of formal and informal institutions that govern individual and firm behavior (Peng & Myer, 2011). Thus, formal institutions embrace laws, regulations, and rules which are formed by the authorized bodies influencing such areas as corruption, transparency, political risk, economic liberalization, and regulatory regime (Peng et al., 2008). On the other hand, informal institutions exist in the form of norms, values, cultures, ethics concerning what behaviors are morally right and wrong, and what is important and what is not within a society (Peng *et al*., 2008). Therefore, institutional dimension is a key factor having a tremendous influence on foreign investments' strategies and operations (Estrin, Meyer, Wright, & Foliano, 2008).

As institutional frameworks may vary within countries, especially in emerging economies such as Vietnam, institutions are continuously evolving with the dynamic processes of change taking place at national and local levels (Meyer & Nguyen, 2005). Vietnam is a transition economy whose reforms initially concern primarily formal institutions at the central level (World Bank, 1996). Therefore, the country is chosen as an empirical setting to investigate the effect of institutions on FDI as a particularly suitable context since the country has been through the major economic transition process, while weakness of formal institutions still remain a big hindrance to business creating significant political risks (Tenev, Calier, Chaudry, & Nguyen 2003; van Arkadie & Mallon, 2003).

H5: Vietnamese FDI inflows are positively associated with the political risk.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Economic System

An economic system refers to the rules of the game followed in a country's economic development strategy. Thus, diametrically opposite approaches would be a pure market economy characterized by the "invisible hand" of market forces, or a pure command economy in which all factors of production are state-owned or controlled and all supply, demand, and pricing are planned by the government (Peng & Myer, 2011). Extant empirical literature on country level determinants of FDI indicates that market-oriented institutions, transparent taxation, and absence of performance requirements imposed by the government attract foreign investment in to the economy (Globerman & Shapiro, 2003). Institutional factors within a market-oriented system moderate transaction costs, or diminish significance of obtaining access to local informal networks that might either facilitate or hinder foreign investment activities (Meyer & Nguyen, 2005; Peng, 2003). Since Vietnam is changing towards a market-oriented economy with a bureaucratic but entrepreneurial business environment, the main challenge for foreign investors is to adapt to the quick pace of institutional change (Meyer & Nguyen, 2005).

In fact, legal framework for FDI has continually developed with the first FDI law passed in 1987, followed by leading changes in 1990, 1992, 1996, 2000, 2005, and especially in 2006 which officially marked when Vietnam acceded as the 150th member of the World Trade Organization (WTO) (Allens, 2012). Primarily, only several sectors were open to FDI, but such restrictions on the maximum foreign ownership stake have been gradually discarded. UNCTAD (1997) believes that subsequent failure of planned economies resulted in widespread disenchantment with restrictive policies and so developing countries in Asia gradually opened up their economies and set up agencies to attract FDI instead of earlier hostility towards MNEs. Significantly, alterations in other laws and regulations in Vietnam have been set to be equally essential to investors, embracing creation of procedures for granting investment licenses and regulations regarding land lease, recruitment, salaries, and taxation (van Arkadie & Mallon, 2003).

Nonetheless, given the fact that Vietnam began economic reform in 1986, the Communist Party still remains firmly in power with the direct influence of the government and interference by the ruling authorities in many aspects of the economy. State-owned enterprises (SOEs) still contribute more than the domestic private sector to GDP, yet their share has been gradually decreasing from 40.5% in 1997 to 38.3 in 2002 (Meyer & Nguyen, 2005). However, government policy targets are to restructure SOEs via privatization, the lessening of subsidies, and the restructuring of non-performing loans. Moreover, compared to the past with the significant discretionary interference by government authorities in private businesses, since 1999 entrepreneurship and private enterprises have received more support from government policy though the institutional framework (Tenev *et al*., 2003). Hence, along with significant changes in the economic system, the business environment, FDI legislation, and regulations throughout the history of Vietnamese development, a set of hypotheses is proposed for testing in order to investigate the role of institutional liberalization policies towards FDI. These factors are very new in this field of research and cover a wide range of assessment in terms of the development of host institutional environment. Furthermore, in order to examine whether or not Vietnamese FDI inflows are influenced by the accession of WTO in 2006 and the global crisis in 2008, a time dummy for 2006 and 2008 have been created:

H6: Vietnamese FDI inflows is positively associated with the business freedom level
H7: Vietnamese FDI inflows are positively associated with the monetary freedom level.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

H8: Vietnamese FDI inflows are positively associated with the trade freedom level.
H9: Liberalization of Vietnamese FDI policies in 2006 increased Vietnamese FDI inflows.
H10: Global economic crisis in 2008 reduced Vietnamese FDI inflows.

Legal System

Foreign investors are subject to the laws of the host country in which their businesses operate. Legal systems specify the "Dos and Don'ts"; hence, they are the cornerstone of formal institutional settings (Peng & Myer, 2011). One of the fundamental economic functions of a legal system is to protect property rights which are the legal rights to use an economic property (resource) and to derive income and benefits from its utilization (North, 1991). Thus, property rights provide the basic economic incentive system shaping resource allocation and principally can be defined by formal arrangements or informal conventions concerning the allocations and uses of property (Peng & Myer, 2011). Even though the term property traditionally refers to tangible pieces of property such as lands, home, office, and factories, intellectual property (IP) specifically refers to intangible property that results from intellectual activity such as writing, creating, and inventing, involving intellectual property rights (IPRs) associated with patents rights, copyrights, and trademarks rights (Peng & Myer, 2011). It is argued that developing countries cannot attract high-quality foreign investment if they do not have effective IPR protection (Vietnam-US Embassy, 2013).

It is easy to understand that no leading firms would like to develop manufacturing, research, operations in a country where IPRs could be freely pirated without legal penalties. In Vietnam, there have been impressive improvements in legislation related to IPRs in recent years. Indeed, bilateral agreements on the protection of IPRs with several countries and areas such as the European Union (EU), Switzerland, and the USA have been signed, and Vietnam has also committed to most obligations by the WTO TRIPS agreement. In recent years, a number of laws, decrees, and directives to establish a legal framework and measures for IPRs in the country have been issued such as IPR and civil violations governed under the Civil Code and new laws on IPRs passed in 2005 that became effective in 2006 (Vietnam-US trade, 2008). Therefore, our hypothesis for testing is:

H11: Vietnamese FDI inflows are positively associated with effective property rights.

Despite the fact that it would be expected that informal institutional constructs such as corruption are prone to work against the foreign investors, some authors argue that foreign investors might use the underdevelopment of local informal institutions as an advantage (Meyer & Nguyen, 2005). In fact, Lou (2001) argues that the relations between MNEs and governments should be seen as potentially cooperative and exerting a positive influence on subsidiary performance. Egger and Winner (2005) researched a sample of 73 developed and less-developed countries from 1995 to 1999 and found that corruption and inward FDI are positively associated with each other. Nonetheless, traditionally corruption is presumed to directly impact the cost function of MNEs, thus suggesting a negative association between corruption and inbound foreign investments. Here, a hypothesis is proposed:

H12: Vietnamese FDI inflows are positively associated with freedom from corruption.

METHODOLOGY

The deductive approach is used in this study providing the concepts and theories from previous literature, formulating hypotheses from selected concepts, and testing the truth by empirical observation of dataset (Cooper & Schindler, 2003). Hence, this refers to a general to specific method in which scientific principles are relied upon with the practice of quantitative data and a stance of positivism philosophy (Saunders et al., 2012). Our focus is to examine the FDI locational determinants in Vietnam by testing the hypotheses and building a regression model with the application of academic literature. Therefore, an experiment strategy is adopted in this study with a corresponding three-step plan -defining the research issues, constructing hypotheses and performing regression models (McBurney, 2003). The obtained data is all numerical data available in public domain - FDI inflows value (UNCTAD), GDP and GDP growth (World Bank), the inflation rate (IMF), labor costs (GSO), human capital measured by numbers of university and college graduates (GSO), the political risk index (World Bank), and related economic indexes, property rights index and freedom from corruption index (Hermitage Foundation).

According to Quinlan (2011), secondary data is conducted and written from primary sources by other scholars or organizations, and there are several advantages that motivate researchers to utilize secondary data analysis. First, secondary data is quite reliable, of higher quality, and contain a larger sample which is gathered by public organizations such as the General statistic offices of Government or the World Bank. Second, secondary data is available in continuous time-series which is appropriate for the application of a statistical test. Furthermore, most research on FDI determinants of developing countries are also examined based on secondary data such as Fung et al. (2000), Noorbakssh et al. (2001), Hasen and Gianluigi (2009), Nasser and Gomez (2009), and Hussain and Kimuli (2012).

The sampling procedure is regarded as the manner in whbich researchers select data to implement their study to make the study more practical in terms of handling the study's issue (Bryman & Bell, 2011). Hence, a full set of time series data for the years 1995 to 2011 under investigation is selected. As mentioned earlier, this period witnessed the wax and wane in the country's economy with the accession to the WTO in 2007 and the global financial crisis in 2008. FDI policies and economic and political systems in the country also experienced rapid and significant changes during this time. The secondary data is analyzed to investigate Vietnamese locational factors helping to attract FDI inflows so as to reach the final conclusion of the most FDI dominant locational factors and, hence, add appropriate policies to further attract FDI into Vietnam. To investigate the FDI locational determinants in Vietnam, the time series of 17 years over the period of 1995 and 2011 have been analyzed. This approach is inspired by the study of Buckley *et al*. (2007) about the determinants of Chinese outward FDIs, of Kok and Ersoy (2009) about FDI determinants in 24 developing countries, of Eggar and Winner (2005) regarding the relationship between corruption and inward FDI, and of Globerman and Shapiro (2002) about the importance of governance and infrastructure factors. The data analysis process contains 3 steps:

Step 1: Constructing Hypotheses in Operational Terms

Bell and Bryman (2012) clearly highlight that the nature of quantitative research is often driven by hypotheses as presenting hypotheses is a highly specific form of research questioning. The purpose of this step is to construct the 12 hypotheses in operational terms with variables' proxy, variables in operational terms, and clearly expected signs between dependent variable and independent variables, theoretical justification for hypotheses and data source. The hypothesis reflecting the belief of there is no relation-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ship between two variables is called the null hypothesis (H_o). The alternative hypothesis represented by H_1 reflects the potential outcomes of this research and, in this case, reflects the relationship between FDI and locational-specific advantage factors. The following null and alternative hypotheses will be tested related to the population correlation coefficient ρ:

The Null Hypothesis H_o: $\rho = 0$ (No linear association between FDI and each of the locational-specific advantage factors)

The Alternative Hypothesis H_1: $\rho \neq 0$ (a correlation exists between FDI and each of the locational-specific advantage factors).

Step 2: Testing the Hypotheses

The second step tests the hypotheses to examine the relationship between the dependent variable and independent variables, and to provide a foundation for further examination between these variables in the following step. In the simplest terms, dependent variable can be considered as a phenomenon which needs to be explained, and independent variable(s) are variables that can explain the phenomenon (Norris, Qureshi, Howitt, & Cramer, 2012). Therefore, independent variables can be called explanatory variables (Acton, Miller, Fullerton, & Maltby, 2009). Since the main purpose of this study is to determine the locational factors that attract FDI inflows to Vietnam and to discover the most significant factors in the period, the findings will indicate not only the relationship between FDI and the locational factors, but also the strength of the relationship. Hence, Pearson's product moment correlation coefficient (PMCC) is employed to determine the strength, direction, and statistical significance of the association between two quantitative variables (Robson *et al.*, 2012), in this case it is between FDI and each of the locational factors.

The correlation coefficient is measured by "r" value, which lies between -1 and +1 inclusive, thus indicating the direction of the relationship as negative or positive (Hair at al., 2006). A value of -1 specifies a perfect negative relationship, meaning as one variable increases in value, the other decreases. In contrast, a value of +1 represents a perfect positive relationship, which indicates that an increase in value of one variable results in an increase of the other. However, the coefficient of determination (c.o.d or r^2 = (correlation)^2) has been used to assess the strength of the relationship between a numerical dependent variable and one or more numerical independent variables by indicating the percentage variation in the dependent variable (FDI inflows) that can be explained by variation in one or more independent variables (locational-specific advantage factors).

The r^2 can be measured on a scale between 0% (random) and 100% (perfect positive or negative association – independent variables can perfectly explain dependent variables) (Robson et al., 2012). To ensure the dependent variable being considered is the FDI inflows value and independent variables are locational-specific advantage factors, but not the other way around when implementing commands in the SPSS software, both r and r^2 will be directly extracted from the outputs of simple regression models from the SPSS analysis which relates to FDI inflows value with each of the locational factors. By constructing these simple regression models, it can also help to predict the FDI inflows based on each individual independent variable. The model has the highest r^2 can be used to best predict the value of FDI inflows to the country. The simple regression model is presented as below (Acton et al., 2009):

$$Y = \alpha + \beta x + \varepsilon \quad (1)$$

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

where:

Y = Dependent variable.
X = Independent variables.
α = y – intercept.
β = Slope or gradient.
ε = Error term.

The equation (1) can be changed into natural logarithm form due to the differences in units of variables:

$$Ln(Y) = \alpha + \beta\, Ln(X) + \varepsilon \quad (2)$$

Step 3: Establishing a Multiple Regression Model

To predict the value of FDI inflows from multi locational factors after examining the relationship between FDI inflows and locational factors in step 2, a multiple regression model is established. Robson et al. (2012) regarded regression analysis as the extent of the correlation analysis by constructing a statistical model that can be used to describe and predict values of a dependent variable in terms of one or more independent variable(s). By doing so, it provides us with a tool for prediction, as well as to understand how these independent variables are combined to predict the dependent variable of interest. In this case, the dependent variable is FDI value and the independent variables are location-specific advantage factors. A multiple regression model is created as there is more than one independent variable being considered.

Multiple regression and correlation basically determine the best predictor of dependent variable, in this case the FDI value, then the next best predictor, and so forth. They also indicate how much weight to give to each predictor to yield the best prediction or correlation (this indicator is the slope β – showed in equation 3 below). However, it is worth noting that the chosen independent variables cannot have a strong relationship with each other, thus implying they cannot be highly correlated linearly with each other. In statistical terms, this phenomenon is regarded as the Multicollinearity problem which could affect the significance of variables. Thus, a higher value of Multicollinearity would result in higher standard errors and therefore lead to inappropriateness of the multiple regressions model determined (Norris *et al*., 2012).

Hair et al. (2006) also affirm that when the intercorrelations between the independent variables are very high as 0.9 or above, then the dangers of Multicollinearity are also considered high. Other common measures for Multicollinearity include the tolerance value and its inverse – the variance inflation factor (VIF). Hair et al. (2006) recommend that a very small tolerance value (0.1 or below) or a large VIF value (10 or above) indicates high collinearity. Another problem can affect the result of multiple regression model is missing value (Norris *et al*., 2012). Nonetheless, in the data collection process, the period from 1995 to 2011 was carefully chosen to ensure that all variables' data can be fully collected; therefore, the authors rejected variables having so many missing values and only selected ones having sufficient data for the examined period.

The multiple regression model is presented as below (Acton et al., 2009):

$$Y = \alpha + \beta 1\ x1 + \beta 2\ x2 + \beta 3\ x3 + \ldots + \beta n\ xn + \varepsilon \quad (3)$$

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

where:

Y = Dependent variable.
x1, x2, x3… xn = Independent variables.
α = y – intercept.
β = Slope or gradient.
ε = Error term.

Based on the hypotheses proposed and the application of the model (3) above, an estimated multiple regression model for this study can be obtained is:

$$FDI = \alpha + \beta 1\ GDPG + \beta 2\ GDP_percapita + \beta 3\ Inflation + \beta 4\ Monthly_income + \beta 5\ Human_capital + \beta 6\ Political_risk + \beta 7 Business_freedom + \beta 8\ Monetary_freedom + \beta 9\ Trade_freedom + \beta 10 TD2006 + \beta 11 TD2008 + \beta 12\ Property_rights + \beta 13\ Freedom_corruption + \varepsilon \quad (4)$$

However, because all variables have different units such as percentage, dollars, millions of dollars, and indexes, the data was transformed into natural logarithms form as a way of standard processing. Moreover, a natural logarithm model allows a linear model to be devised by avoiding violating the assumption of linearity (Robson et al., 2012), but still be able to preserve the idea of non-linearity (Menard, 1995). A natural logarithms model for this study is presented as follows:

$$LnFDI = \alpha + \beta 1\ LnGDPG + \beta 2\ LnGDP_percapita + \beta 3\ LnInflation + \beta 4 LnMonthly_income + \beta 5\ LnHuman_capital + \beta 6\ LnPolitical_risk + \beta 7\ LnBusiness_freedom + \beta 8\ LnMonetary_freedom + \beta 9\ LnTrade_freedom + \beta 10\ LnTD2006 + \beta 11\ LnTD2008 + \beta 12\ LnProperty_rights + \beta 13\ LnFreedom_corruption + \varepsilon \quad (5)$$

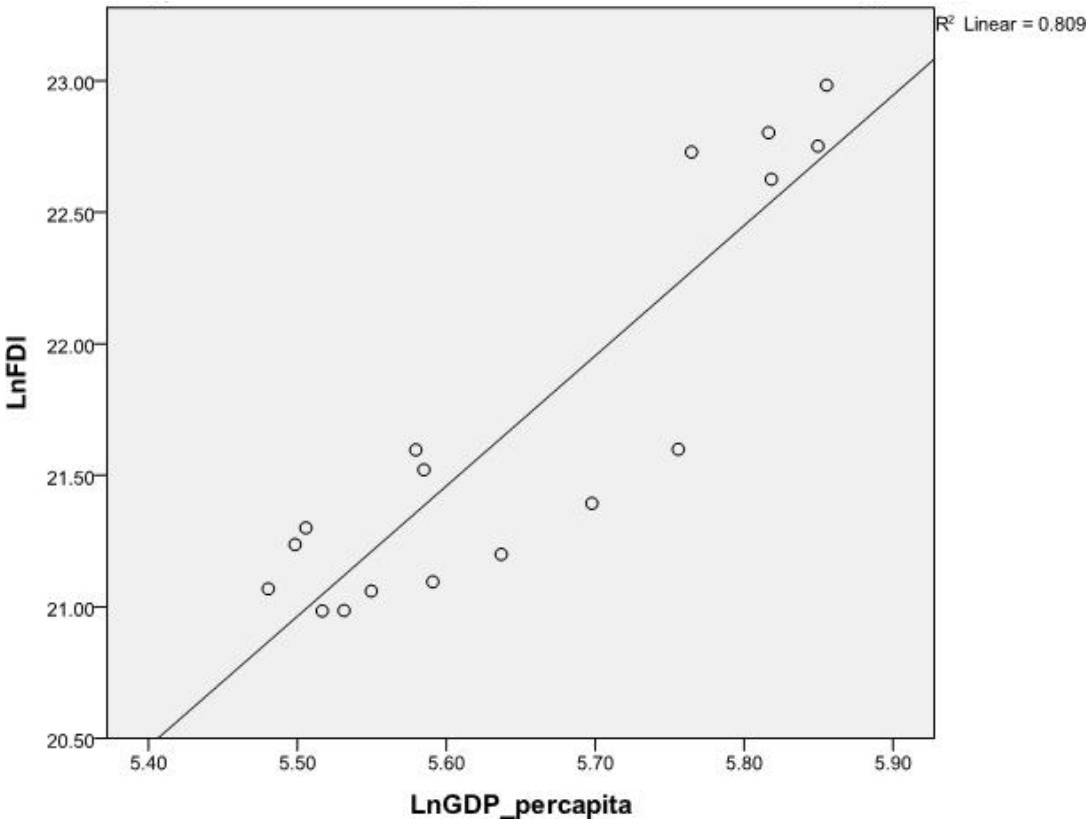
With this linear model, the ordinary least square method will be used to analyze and enable the authors to estimate the impacts of one or more independent variables on FDI. The dependent variable in this case is LnFDI and the independent variables are LnGDP, LnGD_Percapita, etc. The analysis is supported by the SPSS statistical software which is one of the most powerful statistical packages that can perform highly complex data manipulations and provide facilities to analyze and display information using a variety of techniques (Norris et al., 2012). The software can provide data descriptive analyses, regression models and other sophisticated data analyses which are widely used in many fields including financial analysis, sales forecasting, macroeconomic prediction, data analysis, and evaluation (Acton et al., 2009).

RESEARCH FINDINGS

Sparrow (1989) emphasizes that depending on research objectives, different key aspects can be considered to begin a data analysis. Accordingly, prior to implementing econometric analysis to examine the locational factors attracting FDI inflows, an exploratory data analysis about the association between FDI and locational factors will be demonstrated by the following figures to provide a broad picture about variables. All variables are transformed into natural logarithm form due to the unit differences. The variables are treated endogenously and symmetrically to show the possibility that location-specific

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

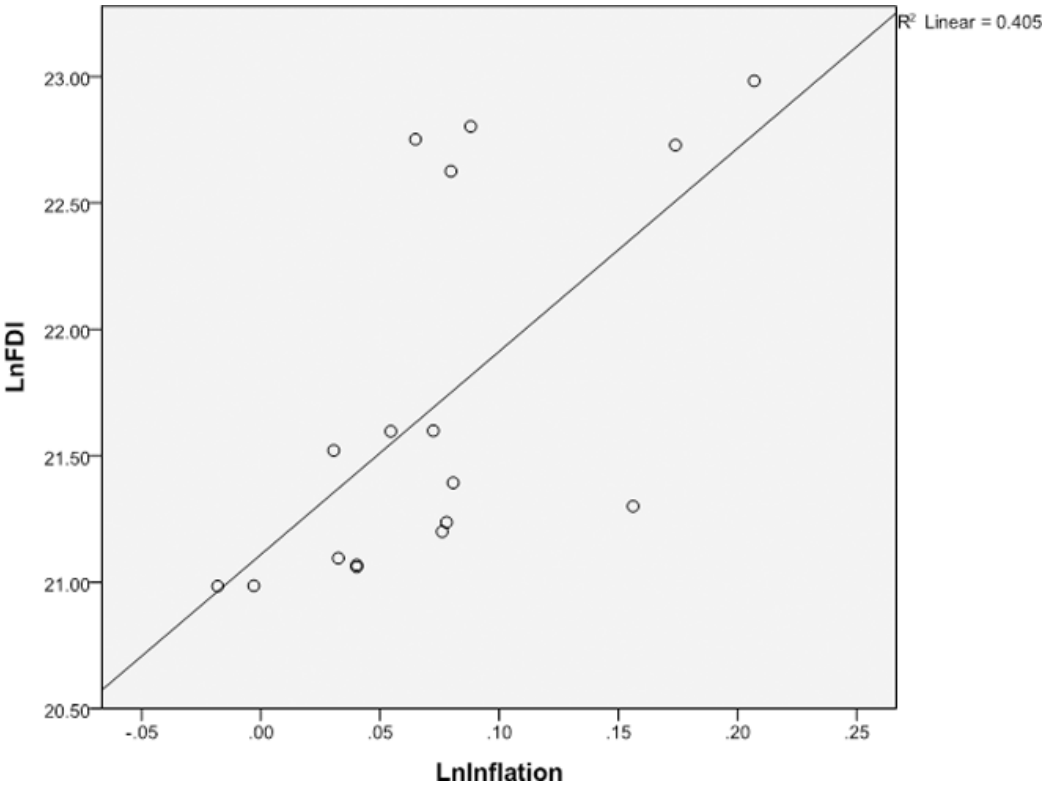
advantage factors influence FDI inflows. In this section, the association between FDI and traditional factors will be demonstrated by the following scattergrams on the relationship between FDI and traditional factors as well as institutional factors from 1995 to 2011.



Market Seeking FDIs

Given the clear linear pattern of the points and their upward direction in Figure 1, there seems to be a very strong, positive linear association existing between FDI and GDP per capita. This indicates that the greater GDP per capita, the higher the FDI inflows to Vietnam.

Host Inflation Rate



From Figure 2, a recognizable straight line or linear pattern appearing in the points can be identified in the examined period. Nonetheless, given the appearance of some outliers, there seems to be only a moderate positive association between FDI inflows and the host inflation rate.

Figure 1. Scattergram on the relationship between LnFDI and LnGDP_percapita

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Scattergram on the relationship between LnFDI and LnInflation

Labor Cost and Quality of Human Capital

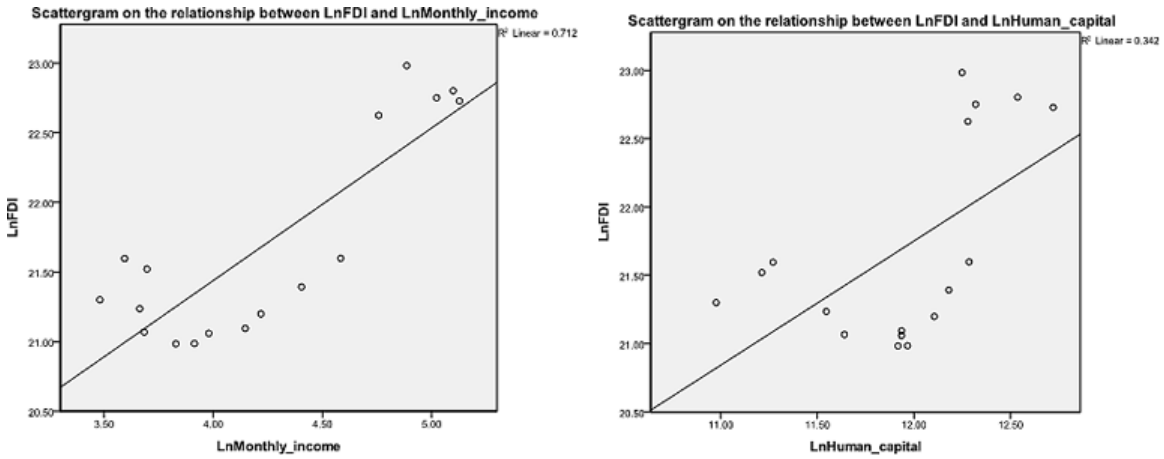
The left-hand side of Figure 3 demonstrates a clear evidence of a strong linear relationship between FDI inflows and Vietnamese labor cost (proxy by monthly income) with a recognizable straight-line pattern and an upward direction of the points. This indicates that the higher the labor cost, the higher the FDI inflows into Vietnam. In comparison, the right-hand side of the figure shows that although a linear pattern can be identified, there seems to be only a moderate positive relationship between FDI inflows and the host country quality of human capital with the existence of several outliners. In this section, the association between FDI and institutional factors will be demonstrated by the following figures.

Political Systems

Figure 4 shows there appears to be a weak relationship between FDI inflows and Vietnamese political risk due to the spread of the points and the existence of some outliers.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3.



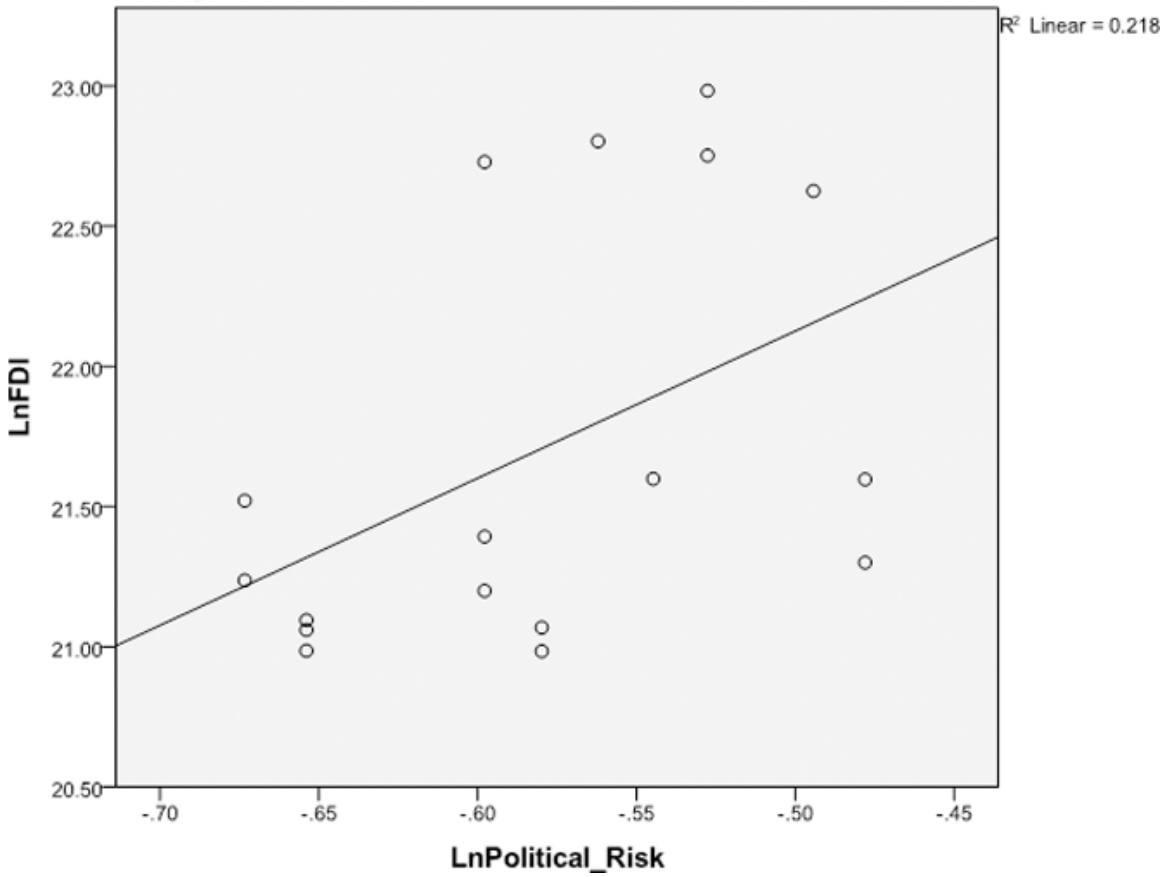


Figure 4. Sacattergram on the relationship between LnFDI and LnPolitical_risk

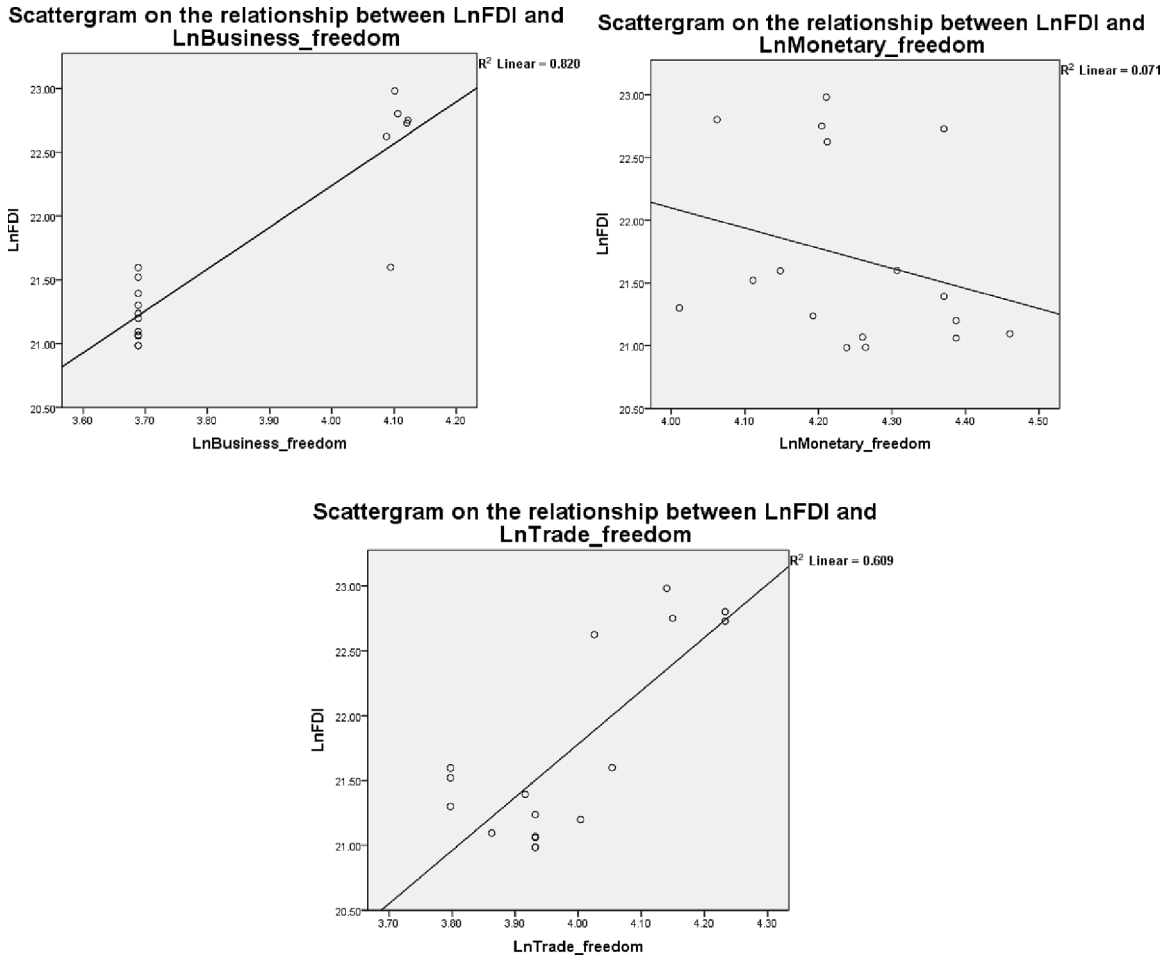


EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Economic Systems

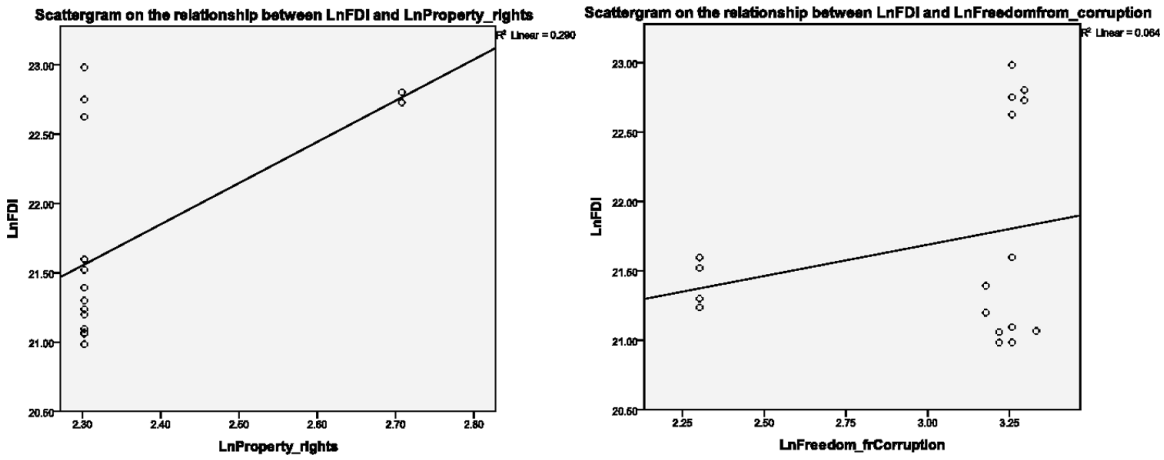
The top section of Figure 5 depicts a relationship between FDI and business freedom level. Although the points seem to be gathered at the LnBusiness_freedom level of 3.7, they then tend to increase as the LnBusiness_freedom level increases; therefore it shows a strong positive association between these two variables in Vietnam. However, with the wide spread of the points on the middle section of figure, there seems to be a very weak positive association between FDI inflows and monetary freedom level in the country. In contrast, the bottom section of the figure shows an evidence of a strong positive association between FDI inflows and the trade freedom level of the host country with an upward direction and a linear pattern appearing in the points.

Figure 5.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Legal Systems

Figure 6 shows that while FDI inflows seem to be affected by property rights at a moderate level due to the unchanged value of this independent variable through time excepting for only two outliers, the concentration of the points into different groups on the bottom section of the figure indicate there seems to be a very weak association between FDI inflows and the freedom from corruption in Vietnam. These findings from this section will be supported by the output of correlation analysis in the next section.



Data Analysis

After step 1 in the data analysis framework in the methodology part of constructing 12 hypotheses in operational terms, this section responses to step 2 by using statistical techniques to test these 12 hypotheses. All the tests are implemented at 95% confidence level or, in other words, the significant level is used at 0.05 (5%).

1. **Testing the Relationship between FDI Inflows and Traditional Factors:** This part will show the results from testing the relationship between FDI and each of the four traditional location factors (market size, inflation, labor cost, and quality of human capital). The outputs of correlation analysis and correlation coefficient (r^2) of the association between FDI inflows and traditional factors are shown in Table 1.

The result shows that all four traditional factors which are market seeking FDI factor – market size (GDP_per capita), the host inflation rates (Inflation), labor cost (Monthly_income), and quality of human capital (Human_capital) are all statistically significant and have strong association with FDI inflows to Vietnam. Market seeking FDI factor and educated human capital are correctly signed, which in turn support hypotheses H1 and H4. However, the host inflation rates and labor cost are found to be significant but with opposite signs to expectation as predicted in hypothesis H2 and H3, respectively. GDP per

Figure 6.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

capita has the strongest association with FDI inflows with r=0.899, the second strongest association is labor cost factor with r=0.844, followed by inflation with r=0.636, and human capital with r= 0.585.

Table 1 shows that the correlation between FDI and GDP per capita is $r_1 = 0.899$ (very close to 1) with significant value of 0.01 (as noted by ** in the table). Moreover, sig-value = 0.000 < 0.01 (significant level at 1% overrides 5% since we are 99% sure that we make a correct decision); hence, H_0 is rejected at the 1% significant level implying that ρ is statistically significant different to zero. That means the association between FDI inflows and GDP per capita is very strong, positive, and statistically significant. The association here is that the greater the GDP per capita, the greater the FDI inflows to Vietnam. Additionally, $R_1^2 = 0.808$ implies that when constructing a simple regression model to predict the value of FDI inflows based on GDP per capita, an 80.8% variation in FDI inflows can be explained by variation in GDP per capita. In detail, the model is:

LnFDI = -6.272 + 4.952 LnGDP_percapita

The value α, the y-intercept or in this case is LnFDI-intercept α= -6.272 indicating that if LnGDP_percapita was equal to 0, the value of LnFDI inflows = -6.272. The value of β is the slope of the regression line, β= 4.952 indicating that for every additional increase in terms of the value of LnGDP_percapita *ceteris paribus,* it would be expected the value of LnFDI would increase by 4.27. Table 1 also shows that correlation between FDI and the host inflation rate is $r_2 = 0.636$ with sig-value = 0.006 < 0.01; thus, H_0 is rejected at the 1% significant level. It reflects that the association between the host inflation rate and FDI inflows to Vietnam is positive, statistically significant, albeit at a moderate level. That implies that even when the host inflation rate increases, the FDI inflows to Vietnam still grow. In addition, $R_2^2 = 0.405$ indicates that only 40.5% variation in FDI inflows can be explained by the host inflation rate as indicated by the following model:

LnFDI = 21.109 + 8.034 LnInflation

In comparison, the correlations between FDI and labor cost and between FDI and quality of human capital are $r_3 = 0.844$ and $r_4 = 0.585$, respectively. The sig-value of r_3 and r_4 are 0.000 and 0.014, in turn, which are all greater than 0.05; hence, H_0 is rejected in both cases at the 5% significant level. Therefore, there is adequate evidence to conclude that while there is a strong, positive association between FDI inflows and labor cost implying that the higher the labor cost, the greater FDI inflows to Vietnam, the association between FDI and quality of human capital is positive, but at a more moderate level. However,

Table 1. FDI and traditional factors linear relation results

1995-2011		LnGDP_ Percapita	LnInflation	LnMonthly _Income	LnHuman_ CAPITAL
LnFDI	**Pearson Correlation (r)**	.899**	.636**	.844**	.585*
	R^2	0.808	0.405	0.712	0.342
	Sig. value (2-tailed)	.000	.006	.000	.014

**. Correlation is significant at the 0.01 level (2-tailed).

*. Correlation is significant at the 0.05 level (2-tailed).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the results are both statistically significant. These results indicate that although labor costs increase, the FDI inflows to Vietnam still increase during the period. In addition, $r_3^2 = 0.712$ indicates that 71.2% the variation in FDI inflows can be explained by labor costs as indicated by the model:

LnFDI = 17.055 + 1.096 LnMonthly_income

$r_4^2 = 0.342$ showing that there is only 34.2% quality of human capital variable can explain FDI inflows with the estimated model:

LnFDI = 10.852 + 0.908 LnHuman_capital

2. **Testing the Relationship between FDI Inflows and Institutional Factors:** This part will show and discuss the results from testing relationship between FDI and each of the eight institutional factors (political risk, business freedom level, monetary freedom level, trade freedom level, impact of the WTO accession in 2006, and the global economic crisis 2008) in FDI inflows to Vietnam. The outputs of correlation analysis and correlation coefficient (r^2) of the association between FDI inflows and institutional factors are shown in Table 2.

The results have also indicated that two factors of economic systems which are business freedom and trade freedom level and the effectiveness of the host country property rights under the legal systems are statistically significant and correctly signed. These findings support hypotheses H6, H8, and H11. In contrast, political risk, monetary freedom level, impact of Vietnamese WTO accession in 2006 and the global financial crisis in 2008, and freedom from corruption level are all insignificant. Hence, hypotheses H5, H7, H9, H10, and H12 are not supported. This might suggest these five factors may not be important locational determinants in this case. Among three significant institutional factors, Business freedom level shows the strongest association with FDI inflows (R=0.905), followed by Trade freedom level (R=0.781) and Property rights (R=0.538).

Table 2. FDI and institutional factors linear relation results

1995-2011		Political Systems	Legal Systems	
		LnPolitical _Risk	Property_Rights	Freedom_ Corruption
LnFDI	Pearson Correlation (r)	.466	.538*	.253
	R^2	0.217	0.289	0.064
	Sig. value (2-tailed)	.059	.026	.328

1995-2011		Economic systems				
		LnBusiness _Freedom	LnMonetary _Freedom	LnTrade_ Freedom	TD2006	TD2008
LnFDI	Pearson Correlation (r)	.905**	-.267	.781**	-.036	.444
	R^2	0.819	0.071	0.610	0.0013	0.197
	Sig. value (2-tailed)	.000	.301	.000	.892	.074

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In particular, according to Table 2 the correlation between FDI inflows and political risk, monetary freedom level, Time Dummy 2006, Time Dummy 2008, and freedom from corruption level are $r_5 = 0.466$ (sig-value = 0.059), $r_7 = -0.267$ (sig-value = 0.301), $r_9 = -0.036$ (sig-value = 0.892), $r_{10} = 0.444$ (sig-value = 0.074), and $r_{12} = 0.253$ (sig-value = 0.328). It is clear to see that all the sig-value of these correlations are greater than 0.05, indicating that H_0 in these cases are all accepted. That means there is sufficient evidence to conclude there is no significant association existing between FDI inflows to Vietnam and its political risks or monetary freedom level, the accession of Vietnam to WTO in 2006, the impact of the 2008 global economic crisis, or its freedom from corruption level. On the other hand, the correlation between FDI inflows and Business freedom level and between FDI inflows and Trade freedom level are $r_6 = 0.905$ (very close to 1) and $r_8 = 0.781$, respectively.

Additionally, sig-value in both cases = 0.000 < 0.01, thus in both cases H_0 is rejected at the 1% significance level implying that ρ is statistically significant different to zero. That means there is sufficient evidence to conclude there is a very strong, positive and statistically significant association between FDI inflows and Business freedom level, and between FDI inflows and Trade freedom level. The association here is that the greater the Business freedom level, the greater the FDI inflows to Vietnam, and the greater the Trade freedom level, the greater the FDI inflows into Vietnam. Furthermore, $r_6^2 = 0.819$ implying that the 81.9% variation in FDI inflows can be explained by variation in Business freedom level estimated by the following model:

LnFDI = 9.117 + 3.281 LnBusiness_freedom

$r_8^2 = 0.61$ indicating that there is 61% variation in FDI inflows can be explained by variation in Trade business freedom level, estimated by the model:

LnFDI = 5.335 + 4.112 LnTrade_freedom

Table 2 also clarifies correlation between FDI inflows and the effectiveness of the host country property rights is $r_{11} = 0.538$; however, $r_{11}^2 = 0.289$ implying that there is only 28.9% variation in FDI inflows can be explained by variation in the property rights variable based on the following model:

LnFDI = 14.712 + 2.974 LnProperty_rights

Additionally, sig-value = 0.026 < 0.05; thus, H_0 is rejected at the 5% significance level implying that ρ is statistically significant different to zero. Therefore, it is sufficient to conclude that there is a positive, statistically significant, but at a moderate level of association between FDI inflows and the effectiveness of the host country property rights. The association here is that the greater the effectiveness of the host country property rights, the greater the FDI inflows into Vietnam.

Multiple Regression Model

After accomplishing step 2 in the data analysis framework of testing hypotheses to determine the locational determinants of FDI inflows to Vietnam and to recognize the most significant factors so as to achieve the objective 2 of this research, the authors take a further step to predict the value of FDI inflows from multi locational factors with the establishment of a multiple regression model. An estimated natural

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

logarithm model in this study as shown earlier in the framework for data analysis section takes the form of Equation (3):

$$\text{LnFDI} = \alpha + \beta_1 \text{ LnGDP_percapita} + \beta_2 \text{ LnInflation} + \beta_3 \text{ LnMonthly_income} + \beta_4 \text{ LnHuman_capital} + \beta_5 \text{ LnPolitical_risk} + \beta_6 \text{ LnBusiness_freedom} + \beta_7 \text{ LnMonetary_freedom} + \beta_8 \text{ LnTrade_freedom} + \beta_9 \text{ LnTD2007} + \beta_{10} \text{ LnTD2009} + \beta_{11} \text{ LnProperty_rights} + \beta_{12} \text{ LnFreedom_corruption} + \varepsilon$$

Assuming that $\varepsilon = 0$

From the results in the hypotheses testing section, it is concluded that seven factors including GDP per capita, the host inflation rate, labor cost, human capital, business freedom level, trade freedom level, and the effectiveness of property rights all have a strong association with FDI inflows to Vietnam at a significant level of 5% or 1%. Therefore, only these variables are processed in the multiple regression model. The regression result is shown in the Table 3.

Thus, Table 3 shows that sig-value of the seven factors are all greater than 0.05, indicating that the combination of these factors with the attempt of predicting FDI inflows cannot fit within a model. Norris et al. (2012) indicate the Multicollinearity problem can contribute to the insignificance of variables as a higher value of Multicollinearity would result in higher standard errors and, therefore, leads to inappropriateness of the multiple regression model determined. Indeed, VIF and tolerance in the table indicate that variables considered have a potential collinearity apart from the inflation factor. It is reasonable as the variables collected are macroeconomic factors which reflect the host country's economy, political, and legal systems and generally accompany each other. Therefore, predicting the value of FDI inflows can be based upon the simple regression model, especially the models between FDI and business freedom, GDP per capita or monthly income as they have very high r^2.

DISCUSSION AND EVALUATION OF FINDINGS

Among the seven significant locational factors that have been identified in the previous section to explain the FDI inflows to Vietnam, Business freedom level appears to have the strongest association with FDI inflows to Vietnam with r=0.905, closely followed by market size factor (r=0.899), and labor cost factor (r=0.844). Trade freedom level is in the fourth position with r=0.781, followed by the quality of human capital (r=0.585), and the effectiveness of property rights (r=0.538).

Table 3. A summary of the natural logarithm model's result

Model	β	Sig-Value	Collinearity Statistics	
			Tolerance	VIF
LnGDP_percapita	3.403	0.244	0.027	36.918
LnInflation	0.387	0.795	0.509	1.965
LnMonthly_income	0.407	0.711	0.010	100.664
LnHuman_capital	-1.046	0.109	0.046	21.584
LnTrade_freedom	1.923	0.266	0.070	14.253
LnBusiness_freedom	0.522	0.604	0.093	10.782
LnProperty_rights	0.808	0.324	0.339	2.946

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Relationship between FDI Inflows and Traditional Factors

In terms of market size factor, the result shows it is evident this factor is a significant determinant of FDI inflows to Vietnam, thus indicating a very strong association between these two variables. This is a conventional result which states that a considerable part of the FDI inflows to Vietnam is of a market seeking type. This result is supported by the extant literature and is consistent with previous empirical studies as discussed earlier showing the host market characteristics (e.g., market size) are significant determinants of FDI flows in many developing economies (UNCTAD, 1998). The enlargement in size of the market results in the increase of opportunities for investors regarding the resources' efficient utilization and exploitation of economies of scale and scope via FDI (Moosa, 2002). Specifically, the growing economy presents a potential opportunity for specialization of the factors of production and could lead to the achievement of cost minimization as one of the most wanted factors of foreign investors engaging in cross-border activities (Willmore, 1976).

The existence of a rapidly growing economy may also facilitate static and dynamic economies of scale that highly correlate with a growth in demand (Patibandla, 2001). Therefore, the results in this study support the theory that a potential and promising market like Vietnam with a considerable consumer demand and the fast pace of economic growth and development with cheap labor cost as well as labor-surplus would present more opportunities for creating profits than those economies with slower growth rates (Deng, 2004). Thus, it can be concluded the market size is a significant factor for the Vietnamese FDI inflows and should be promoted to attract more long-term investment capital from foreign MNEs in the future.

Although the hypothesis H3 is not supported, the findings indicate that the higher labor cost stimulate greater FDI inflows to Vietnam confirming the findings in the research by Yang, Groenwold, and Tcha (2000). Moreover, the extant literature suggests higher labor costs might be indicative of higher or growing quality of labor force (Moosa, 2002); thus, the negative relationship between low wages and FDI in this case does not hold. The human capital in Vietnam, which is measured by the number of graduates from public universities and colleges, shows an obvious upward trend in the researched period with an impressive increase of 276,000 graduates from 58,500 candidates in 1995 to 334,500 candidates in 2011 (GSO, 2013). The increasing value of this variable is also found to be positively associated with the increasing value of FDI inflows to Vietnam despite being at a moderate level.

This implies the increasing quality of human capital in Vietnam might be indicative of the higher labor cost, and that despite of the increase in labor costs, MNEs still decided to make their foreign investment decisions in Vietnam. In support of this fact, Dossani and Kenny (2003) found a very interesting result in India that explains this circumstance by showing that while foreign investors were initially attracted to the country's low cost factor, the increasing quality of the workforce facilitated retention and expansion of the scales. Hence, along with maintaining a competitive labor cost, improving the quality of human capital is necessary for Vietnam to attract more foreign investments in the future and to boost economic development. Furthermore, as mentioned previously in this chapter, Vietnam possesses a locational advantage of having cheap labor costs compared to other countries in the region. Hence, the minimal increase in labor costs in Vietnam should not affect the investment decisions by MNEs since the country has still considerable cost advantage in comparison with other destinations.

Compared to other emerging countries in Asia such as China, Indonesia, Laos, Malaysia, Mongolia, Nepal, Philippines, Thailand, and Sri Lanka, Vietnam has a competitively cheaper labor cost of only US$1,000 per year on the criteria of average annual minimum wage. This number is approximately 80%

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

cheaper than that of Malaysia, over 33% cheaper than the average minimum annual salary in China, and more than 5% cheaper than the annual average salary in Laos. Thus, this comparatively cheap labor cost in Vietnam may shape the investment decisions of MNEs to the country regardless the increase in the cost.

The coefficient of inflation is statistically significant and positive which is contrary to the expectation of H2. Such a relationship may suggest that the moderate demand inflation in Vietnam makes it more attractive to foreign investors. It would be reasonable for this association to exist between the variables if assuming that moderate demand inflation accompanies economic growth (Buckley et al., 2007). It might also support the view that the foreign investment decisions of MNEs in Vietnam are unusually tolerant of the lower stability in the country regarding changing local economic conditions. This is contrary to the normal behavior of firms from profit maximizing industrialized countries, and again suggests that MNEs may be strongly attracted by other host country's location-specific advantage factors.

The Relationship between FDI Inflows and Institutional Factors

Results from the level of business freedom indicate this factor is a significant determinant of FDI inflows into Vietnam, thus demonstrating a very strong positive association between the variables. This is an interesting result as it is a new factor regarding formal institutional precepts and so contributes to the existing literature discussed earlier. Thus, a country with growing business freedom level indicates the increase of efficiency of government regulations for business operation and as result contributes to the increase of FDI inflows. In fact, Vietnam is changing itself towards a market-oriented economy with a bureaucratic, but entrepreneurial business environment (von Glinow & Clarke, 1995); hence, it is improving its political, economic, and legal systems.

The alterations in laws and regulations are now set to be equally essential to investors, embracing the creation of procedures for granting investment licenses and regulations regarding land lease, recruitment, salaries and taxation (van Arkadie & Mallon, 2003), and also to provide more support to private enterprises since 1999 (Tenev et al., 2003). Hence, although the political, economic and legal systems are not yet fully modernized, the country clearly shows a great effort in reforms which increases its attractiveness for MNEs as a potential investment destination. Vietnam is developing towards a strong market economy which is favored by many developed economies to liberalize FDI regulations (Peng & Myer, 2011; UNCTAD, 1997). Thus, not only is the business freedom level a significant locational determinant, the increase of the trade freedom level and the effectiveness of property rights in Vietnam are found to help to attract more FDI inflows to the host country as supported by the findings.

This again contributes to the extant literature that a country with the growing trade freedom level is attributed to the increase of FDI inflows. Additionally, it also proves the existing literature in terms of the host country property rights that the greater the effectiveness of the host country's property rights, the higher FDI inflows to the country (Van Arkadie & Mallon, 2003). The increase in the effectiveness of property rights in Vietnam, in fact, is clearly shown in recent efforts by completing its related laws and participating in bilateral agreements on the protection of IPRs as discussed in the previous sections (Asian Coast Development, 2013). Furthermore, our findings indicate that political risk, monetary freedom level, and freedom from corruption tend to be insignificant factors for foreign investors. This implies that these explanatory variables do not affect the ultimate decisions of MNEs to invest in Vietnam and that the variables cannot be used to explain FDI inflows in Vietnam.

This runs counter to the normal findings regarding political risks and to the expected result regarding monetary freedom level as well as freedom from corruption level (Dunning & Lundan, 2008). This can

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

be explained by continuing efforts and rigorous government dedication to improving the underdeveloped political, economic, and legal aspects in Vietnamese governance to make the country more institutionally favorable location for MNEs. Additionally, the majority of foreign investors in Vietnam originate from Asian neighboring countries, accounting for nearly 80% of the total number of projects (GSO, 2013). Thus, businesses from these countries as a group record higher levels of political risk and the MNEs from these countries may not consider the Vietnamese political risky environment as a main discouraging factor for their investment decisions (Buckley et al., 2007).

Finally, our findings also indicate that the Vietnamese WTO accession in 2006 and the global crisis in 2008 have no significant association with the variation of FDI inflows. This suggests that both events did not mark a significant change towards the volumes of FDI inflows. Indeed, IMF (2013) explains that, on average, MNEs in Asia are less exposed to a sustained growth slowdown risk as a consequence of the global financial crisis than MNEs in other regions. Hence, Vietnam may not strongly suffered from the crisis in comparison with developed countries in the West. Although Vietnam now is an official member of the WTO, its laws and regulations still require further modifications and harmonization with the more developed economies. Thus, perhaps the WTO accession in 2006 has not yet shown a big change in the volumes of FDI inflows to the country.

CONCLUSION

The growth of MNE activities in the form of FDIs has seen an impressive increase at a faster rate than most of other international transactions due to its compelling economic advantages. This leads to continuous substantial attention by international business literature to empirically examine the essential factors that drive FDI decisions of MNEs. However, given the fact that the determinants of location choice have been predominantly viewed through traditional theoretical lenses, the dominant factors in some emerging markets have not been sufficiently studied in the recent years by IB scholars. Additionally, locational factors which incorporate institutional context of the host country have been analysed in only a few studies. Therefore, this study provides a critical discussion about relevant fundamental theories, especially the OLI triad framework and extant institutional economic literature.

These theories are an important foundation for this research that provides an explicit analysis of the specific locational factors and how they make an impact on FDI inflows to the host country. The literature indicated a wide range of locational factors that can influence MNE investment decisions and also showed discrepancies among previous researches about the key factors capable of explaining a country's tendency to attract FDIs. The study on Vietnam takes an essential step in providing a greater insight into the debate on how locational factors influence MNEs' investment decision in developing countries with the observed data during the period 1995 to 2011.

Vietnam has now embarked on the globalization path with a very important stage of industrialization accompanied by economic development. The target of turning the country into an industrialized economy by 2020 could only be achieved if the economic growth is kept at a high rate and industrialization proceeds at a rapid pace. The need for long-term investments and the improvement of human capital quality are two essential pillars for this ambitious government plan. The result of this research suggests that economic institutional factors such as business freedom and trade freedom level together with the effectiveness of property rights have a very strong and positive association with FDI inflows. Moreover, although political risks, monetary freedom level, and freedom from corruption appear to be

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

insignificant in our study, all of these formal institutional factors are crucial elements for the long-term economic development of the country (Chakrabarti, 2001; Buckley et al., 2007).

The above analysis also highlights that the malfunctioning of political, economic, and legal systems might attribute to this insignificance result. Moreover, the findings also suggest that the market size is a significant factor for Vietnam FDI inflows and it should be promoted to attract more of the investment capital from foreign partners in the future. The improvement of the political and economic stability and the amelioration of legal framework are very essential for the promotion of FDI inflows to Vietnam in the coming years. At least the following actions must be implemented. First, foreign investors should be treated equally to domestic companies in certain areas where Vietnamese companies unnecessary remain a privileged position. Second, the restrictions on the maximum foreign ownership stake should be discarded so as to permit more sectors to be open to FDI inflows.

The World Bank (2013) also suggests that Vietnam establish a National Committee for Trade Facilitation (NCTF) to build and implement a sound national action plan in accordance with the country's institutional capacity to enhance trade competitiveness of the country. This might involve the simplification of regulatory procedures to reduce time and cost, as well as improve the reliability of cross-border trade. Although Vietnam's Intellectual Property legislation saw improvements as a result of recent reforms and bilateral agreements and is regarded as comprehensive and in compliance with the international standards, the enforcement agencies have found it difficult to keep up with rapid changes in the law and administrative procedures (Intellectual Property Office, 2013). Moreover, while administrative action is the usual route for dealing with infringements which offers low-cost and quick results, this deterrent impact is only limited due to the low level of penalties and the lack of compensation (Intellectual Property Office, 2013).

Therefore, further improvement in legislation and administrative enforcement is necessary. Action can be taken to cut off intermediate parties, assign an exclusive authority being responsible for this process, and revise laws regarding penalties and rewards for IPRs. Generally, regulations also need to be more transparent to investors. In this area, a broad dissemination of information about the investment environment together with investment promotion workshops can be used to reach potential investors and facilitate the best practices. Regarding recommendations for foreign investors in Vietnam, it is necessary to act accordingly and perform effectively with rapid changes in the economic, political, and legal systems in the country. Foreign investors should also establish a representative association in Vietnam where they can connect directly with the Vietnamese government to update and have their own voice in the changes. Given the fact that the one-party system might be the main challenge for many foreign investors, this establishment could bring a great advantage to the investors in negotiating relevant alterations in the country, and also to provide them with a thorough understandings in terms of the dynamic investing environment to ensure business success.

Our findings also indicate that along with maintaining a competitive labor cost, improving the quality of human capital is necessary for Vietnam to attract more FDI in the future and to accelerate the pace of economic development. Thus, government policies should be focused not only on nurturing an educated and skilled workforce, but also on maintaining the comparative advantage of labor cost with other countries in the region such as China, Philippines, Thailand, or Indonesia. This implication is strongly supported by this empirical study. First, the study seems to suggest that the country's advantage has gradually moved from a low-unskilled labor force to more skilled human resources. Second, the literature supports that for long-term development prospects, extensive reliance on cheap labor costs without the consideration of human quality might be very risky and unsustainable (Barrel & Pain, 1996).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

This is proved in the study of Dossani and Kenny (2003) in India indicating that low cost factor can only initially attract investors, but the increasing quality of the workforce then becomes a crucial factor to retain and expand their economies of scale. Therefore, a low labor cost might be an advantage for Vietnamese economy now but not in the future. Accordingly, Cimoli, Dosi, and Stiglitz (2009) suggest that in developing countries, policies should be geared towards the improvement of not only the general level of education and training, but also to technological and engineering capabilities so as to accomplish the industrialization target as is evident in the case of India.

In the case of Vietnam, this can be achieved by establishing technological and engineering colleges that provide practical knowledge and applications, not just on a theoretical basis. A range of state scholarships from the government for advanced studies or excellent students in these fields are also recommended to encourage more professionals (Cimoli & Di Maio, 2004). Besides, although over the past 20 years the improvement in literacy and numeracy skills has contributed to the country's rapid economic growth and poverty reduction by helping workers move from low productivity agriculture to higher productivity non-farm jobs, Vietnam must increase its workforce skillsets to become a modernized economy (Worldbank, 2014). In fact, with the fast pace of economic development and an increasing trend of inward FDI, many foreign companies in Vietnam require employees to have a firm skillset to include cognitive, social, behavioral, and technical aspects (Worldbank, 2014).

However, such skills are seen as a big gap and shortage among the current workforce in Vietnam. Therefore, investment in education in which children can obtain a better school readiness from an early age, a cognitive and behavioral foundation in general education, and more practical vocational classes, might be a good opportunity for many foreign investors seeking new investments in Vietnam. This could make a big positive change in the quality of Vietnamese workforce, and would enable the workers to perform more practically and more competitively, and therefore be more conducive to attracting more FDI.

Research Limitations and Further Recommendations

The main limitation in this research is the variables selected for exploration locational factors to attract FDI inflows to Vietnam. In fact, locational attractive determinants could be represented by many other factors which are not covered in this study such as the exchange rate, export, import, tax, trade deficit, or research & development (R&D). However, those factors have been widely and repeatedly researched by scholars; hence, undertaking research on these variables would provide less contribution to the existing literature. For this reason, only the most represented factors were chosen in this study. In addition, as Vietnam is a transition economy whose reforms initially concern primarily formal institutions at the central level, only formal institutions have been explored in this study. Due to the time restriction and limited resource availability, informal institution factors at the sub-national level are not included in this study.

It would be useful to investigate how foreign investors are affected by informal institutions existing in the form of norms, values, cultures or ethics in the host country. Subsequently, a link of formal and informal institutions can also merit further examination by observing the patterns of FDI in Vietnam. Future researchers may also consider the possibility of a combination of qualitative and quantitative study with the use of both primary data by adopting interviews or questionnaires to explore concerns and barriers experienced by foreign investors in Vietnam.

KEY TERMS AND DEFINITIONS

CIVETS: Are six favored emerging economies such as Colombia, Indonesia, Vietnam, Egypt, Turkey and South Africa.

Economic Development: Institutional reforms and concerted actions of policy makers and communities that promote higher standard of living and economic growth.

Foreign Direct Investment: Is a long-term investment in economy of one country by a company of another country.

Institutions: Structures, mechanisms and interactions that constrain and govern human behaviour within societies.

OLI Paradigm: A theory that provides a three-tiered framework (Ownership, Location, Internalization) for a company to follow when determining if it is beneficial to pursue direct foreign investment.

Transition: A process of changing from centrally planned to a market based economy.

Vietnam: one of the developing economies in South-East Asia.

Chapter 24
Multinational Corporations: A Boon or Bane for a Developing Economy – A Study in Indian Context

Leena Ajit Kaushal
Management Development Institute (MDI) Gurgaon, India

ABSTRACT

Foreign Investors are looking forward to enter organized retail sector, which has a mere 8 percent presence in India, but the present government in India which endorses liberal economic framework proscribe 100 percent FDI in multi-brand retail sector on the grounds of safeguarding small indigenous retailers known as 'kirana stores'. The objective of the chapter is to explore the importance of Multi National Corporations (MNCs) not only in multi-brand retail sector but otherwise as a potent source of technology, efficiency and equality for farmers and poor, poverty alleviation and growth for a developing economy as a whole.

INTRODUCTION

FDI is an integral part of every country's economic development but it deserves further contemplation for a developing country like India where economic growth and poverty elevation are both equally crucial elements for nation's progress. Government of India endorses liberal economic framework but proscribe 100 percent FDI in multi brand retail sector on the grounds of safeguarding small indigenous retailers known as 'kirana stores' and poor farmers who supply goods to them. The government is of the view that permitting FDI in organized retail sector will increase competition for the small indigenous retailers and might push them out of business which in turn will impact the poor farmers, leading to more unemployment and poverty. MNCs competitive pricing strategy is also a point of concern posing business losses for indigenous retailers. But the question arises here is, "Is this the best possible way to help poor farmers and corner shops or there is any other possible approach?"

The beauty lies in strengthening the weaker sections of the economy, uplifting their living standards and empowering them to join the growing middle income group. How long can a country protect them from facing the growing competition in the world by imposing trade restrictions, are we waiting for the

day like in 1991 when things went out of our hands with extremely severe balance of payment crisis and then India embraced liberalization and globalization policy as there was no other alternative in store. According to Ahluwalia (2002) the need for policy shift became evident way back in 1980's when many East Asian countries managed high growth and poverty decline by encouraging private sector and export oriented policies and but the Indian government signaled systematic shift to further open economy with greater reliance on market forces, larger role for private sector with foreign investment and restructured the role of government only in 1991 after the crisis.

FDI inflows in developing countries have gained attention due to the widely acknowledged FDI's potential to improve productivity of host countries and promote economic growth and development (Alfaro et al., 2010). Solow (1957) argues that the sustained economic growth occurs only in the presence of technological progress, an exogenous source, but will consequently result in diminishing returns to capital in the long run. On the contrary, the new growth theory argues that growth can be endogenous by emphasizing the idea of human capital pioneered by Schultz (1961) that promotes the investment in human beings. Solow model could not explain the reasons for different growth rates across countries except by appealing to technological progress (Chamberlin, 2006) however the addition of human capital to the model increases the ability to explain cross- human capital country differences in income levels (Mankiw et al., 1992). Several studies highlight the significance of human capital to the nation's growth. A study by Aghion & Howitt (2009) proposes human capital and technological progress as two main inputs of endogenous growth models. Barro (1991) conducted a study on a number of Sub-Saharan countries with very low level of human capital and recommended the model with human capital as exogenous factor to significantly predict the growth rate. Neo classical economist propose that foreign investment provides required capital, managerial skills, advanced technologies, export capabilities (Soyasa & Orneal,1999) and increases the rate of investment from domestic resources (Lall, 1974; Dunning & Humdani, 1997). According to Alfaro et al. (2004) FDI inflow through efficient technologies and management practices promotes domestic production and consequently economic growth.

According to Prahalad (2008) more than 4 billon people of the world constitute the bottom of the pyramid (BOP) and out of them 3 million i.e., approximately 70 percent represent developing countries, like BRICS, Thailand, Indonesia, Turkey and Mexico. India has second highest population after China and has 21.9 percent people below poverty line (Planning Commission, 2012). A developing country hence has a fair chance to grow and even tackle the most fundamental problem like poverty, unemployment and illiteracy with the FDI inflow that along with technology also invest in human capital. The study by Qadri (2014) suggests investment in human capital as one of the key macro variables for economic growth of Pakistan (Qadri 2014). Nelson and Pack (1999) argues that the rapid growth in a number of Asian economies like Korea, Taiwan, Singapore and Hong Kong was the result of capital accumulation but its productive assimilation or absorption was the key to success.

Government should proactively be involved in opening up of different sectors for FDI with a vision to alleviate poverty, strengthen the poor to face the growing completion across the globe and to gear up the economic growth. MNCs like PepsiCo and HUL are genuinely contributing to address these fundamental problems along with their profit making. The objective of the paper is to study the contributions of these MNCs alongside their routine profit making and evaluate if they are in real sense a boon for developing economy and make a substantial case to propose liberal FDI norms in various sectors including multi brand retail in India.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Background

Ever since independence in 1947, Indian government followed a restrictive trade policy. Economic reforms and liberalization in India began after the serious fiscal and balance of payment crisis in 1991. Post liberalization, economy followed the path of globalization and was opened to trade and investment. In 1990s India witnessed the aggregate annual economic growth of 5-8 percent and outshined as a developing country on the global front which is solely attributed to the economic reforms (Ahluwalia, 2002; Panagaria, 2004; Nagaraj, 2007; Ahmed, 2012). The reforms lifted the ban on Foreign Direct Investment (FDI), but the extent to which it was allowed in different sectors has been the most contentious issue over the years.

The debate over FDI in retail is actually between the Government and the Economists who look beyond the voters' bank and could foresee the benefits of it from the economic growth perspective in the near future. Nirmala Sitharaman, who is in charge of the commerce and industry portfolio, under BJP government, India, has publicly stated that the party is against FDI in multi-brand retail (TOI, 2014). Sitharaman said the party has clearly articulated its position on the multi-brand retail and had won the elections on the basis of the manifesto (Business Today, 2014).

Various studies (Bajpai & Sachs, 2000; Lensink & Morrisey, 2001; Wang & Balasubramanyam, 2011) have been conducted to examine the role of FDI in promoting economic growth. Bajpai and Sachs (2000) suggested that higher human capital and financial assistance are essential ingredients for Indian states to reap benefits from FDI. Tiwari (2009) acknowledges the potential of linkage between FDI and local industry to stimulate local and overall economic development whereas Hansen et al. (2004 & 2007) suggested that the benefits could be maximized if FDI links to local investors through joint ventures, licenses, franchisees etc. Balasubramanyam et al. (1999) acknowledges that FDI is capable of promoting economic growth through technology transfer and skill diffusion. Certain studies (Mellor, 1976; Hansen, 2004; Balasubramanyam et al., 1999) also identified conditions necessary for the FDI to promote economic development in any country. Gokhale and Sinha (2012) are of the view the retail is India being a local industry (unorganized), will not be much affected by the FDI in retailing rather it will benefit the existing organized players in the market and certainly Indian consumers in the long run with innovative retail formats, best practices and world class goods and services. Government of India should allow FDI in retail as multinational retailers have potential to improve efficiency and performance of the existing distribution system (Kohli & Bhagwati, 2011; Ghosal & Shrinivas, 2012).

India being a developing country with second largest population in the world and vast poverty should aim to ensure that FDI inflow target poverty alleviation along with economic growth which is seemingly possible if the policy reforms and government collaborative initiative are appropriately crafted and timely executed.

MULTI NATIONAL CORPORATIONS

Not a Threat to Unorganised Sector: Mom and Pop Stores, 'Kirana Stores'

India's retail industry grew at a cumulative aggregate growth rate of 10.6 percent during 2010-12 and is projected to attain 18.8 percent growth till 2015 with the market share worth of $750-850 billion. Retail sector is India is bifurcated into large unorganized sector accounting for 92 percent share and small but

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

growing organized sector accounting for 8 percent share which is expected to touch 20 percent by 2020 (Delloit 2013). Unorganized market comprises of indigenous grocery stores, corner shops, mom and pop stores and convenience shops which are usually family run and low on operating cost. Organized sector on the other hand is based on modern retailing format comprises of super market, hyper market, departmental stores and specialty stores.

Indian government is jittery to allow 100 percent FDI in multi brand retail on the ground of shielding indigenous kirana stores from the tough competition posed by organized sector. Report by Ablett et al. (2007) states that Indian household spend 48 percent i.e., highest proportion of their income in the world on food and beverages bought mainly by unorganized indigenous retailers. Government feels that organized retailers can displace unorganized retailers by being more professional, organized and price competitive. At the face of it, it appears to be a genuine concern, but detailed investigation proves it to be a phony intimidation.

Kirana shop is a small neighborhood retail store; usually family owned selling groceries and sundries. According to the estimates there are about than 12 million kirana stores in India (Bissell, 2014) employing more than 35 million or 7.3 percent of the India's workforce (Economic Survey, 2013). Study by Kohli and Bhagwati (2011) identifies that kirana shops, an unorganized retailer have an edge over organized retailer in number of ways. Kirana shops are low on running cost as usually family run and small in size, at times home is converted into shop or warehouse. These small shops accept product returns, exchange goods, understand the likes and dislike of individual customers and give credit to their long lasting customers unlike organized retailers.

There is a vast literature on the impact of super market on small grocery stores with mixed responses. Sobel and Dean (2008) suggest that Wal-Mart's presence in US only led to reallocation of small retailers resulting in expansion or contraction of their businesses. Other studies conducted by (Perloff & Salop 1985; Anderson et al., 1992; Igami 2008) suggests that the large super markets improve the survival rate of small stores as they cater to different group of consumers and therefore soften price competition. Igami (2008) signifies the difference between small and big retailers by emphasizing that stores with varying floor sizes cater diverse products to different consumer groups.

Balasubramanyam (2013) is of the view that lower income group neither demand nor afford international variety of products because of cost, reach and storage concerns unlike higher income group who are interested in wide range of products. Scarcity of prime locations and rising retail rentals in India have pushed these super markets in the suburbs or outskirts of big cities, making it difficult for a common man to commute to such distant places for daily needs. Not only the tier 1 and metropolitan cities but with the ever growing population even the tier 2 and tier 3 cities are expanding in all directions. It is highly unlikely for a common man to prefer spending on fuel and travel to distant malls for top up shopping rather prefers a local mom and pop store or a vegetable vendor for fresh fruits and vegetables. With Joint family system still prevalent in India, elders of the family often walk till the nearby kirana stores for top up shopping, fresh vegetables, fruits etc which is also the source of social engagement and chit chat with the like minded people of their age.

Prahalad (2008) observed that consumers at the 'bottom of the pyramid' buy goods frequently and in small quantities because they can neither afford nor store goods due to lack of facilities at home, which again makes nearby kirana shops a convenient destination for their daily needs. India is known to have fast growing middle income groups but it accounts for less than 30 percent of the population (Saxena et. al., 2010) and according to Planning Commission statistics (2012) 21.9 percent of population is below poverty line hence both organized and unorganized retailers will co-exist in near future as

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

they proffer different value propositions to customers. It is recommended to go for a phased opening of FDI in multi-brand retail starting with the metropolitan cities which would likely persuade and encourage the existing retail shops to modernize and cope up with the competition and address the concern of indigenous retailers and consumers.

A Boon for Underprivileged Farmers in Agriculture Sector

India is concerned about FDIs role in economic growth as well as poverty alleviation. Arguments by (Dollar & Kraay, 2002; Winters, 2002; Ganuza et al., 2005) suggest a positive relation between trade liberalization and poverty diminution. Perera et al. (2014) reports a positive impact of trade liberalization on income equality and poverty decline in both rural and urban sector in Sri Lanka. Study by Mabugu et al. (2014) also indicates long- term positive impacts of trade liberalization on reducing poverty and inequality in South Africa. Few studies have also suggested ways to reap maximum benefit from FDI to strengthen the weaker underprivileged sections of the society. Arguments by (Millor, 1976, Hansen et al., 2007 & Tiwari 2009) indicated the proper linkage between FDI and local industries to promote domestic economic development. Studies by (Keller & Yeaple, 2009; Nicolini & Resmini, 2006; Rugraff et al., 2011; Hansen, 2014) emphasized the spillover effect of MNCs latest production techniques, advance know-how, organizational and managerial practices to benefit local firms' competitiveness on the global front and to increase domestic productivity. Bwalya (2006) also advocated the positive spillover effect of advanced technology and expertise from MNCs to local industries for economy's growth and development.

Hirshman (1958) and Millor (1976) argued that the backward linkages of FDI with local industries result in economic development whereas but Nicolini and Resmini (2010) provides evidences of both horizontal and vertical spillover in backward and forward direction from MNCs to domestic firms in Bulgaria, Romania and Poland. Hansen (2014) being more precise is of the view that the upstream and downstream linkages in value chain of MNCs are more likely between inter-industries firms with the possibility of not creating competitors for themselves But it is certain, that such spillovers and linkages are boon for the economy transmitting knowledge and technology to the host country (Ivarsson & Alvstam (2009). Li and Liu (2005) also support that spillover from FDI results in increasing stock of knowledge in the host countries.

The sectoral composition of FDI engaging with domestic resources could encourage multi dimensional development of the local economy by creating livelihood opportunities and attract private and public sector investment in social sectors like education, health and infrastructure (Tiwari, 2009). Several studies argue that nation's growth depends on the absorptive capacity of variables like education (Borensztein et al., 1998) trade policies (Balasubramanyam et al., 1996) and the initial level of development (Blomstrom et al., 1992). Girma and Gorg (2002) suggest the nation's absorptive capacity to soak up spillovers from FDI as a key source to growth and productivity. Damijan et al. (2013) studied the spillover effect of FDI in ten transition countries to confirm that the positive effects of spillovers from foreign firms substantially depend on the absorptive capacity and productivity level of individual firms. As suggested by Tiwari (2009) the spillover from improved social sectors that reaches the wider population enhances the overall human capital; hence FDI could also be seen as a tool to strengthen certain absorptive capacities in a nation with the help of government's effective trade policies.

Karnani (2007) argues that it is highly unlikely for MNC to have social responsibility agenda on priority instead of economic profit but he proposes a solution where MNCs general course of business

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

activities could tackle social problems like poverty, development and jobs creation through skill upgradation by collaborating with local partners. Pepsi Co in India has collaborated with local partners and as suggested in the literature review the linkage between FDI and local industries through technology transfer and spillover effects is contributing to the poverty eradication and upliftment of the poor farmers in the country.

According to the Agricultural Produce Market Committee (APMC) Act of India which came into existence in 1991, it was made compulsory for the farmers to sell their produce to licensed merchants or middlemen at mandis' (market) set by state agriculture marketing boards instead of selling directly to retailers or consumers. These middlemen virtually operated like a cartel and monopolised the retail market by buying goods at cheaper prices from the poor farmers and selling them at high prices to the end users and pocketing the entire profit themselves. In 2014, as a measure to regulate high food inflation in the economy, Government of India requested all the states to delist fruit and vegetables from the APMC act but this measure alone is not adequate as the poor farmers faces several difficulties like transportation, storage etc to reach the consumers directly with their produce. Hence it is argued that the shops set up by foreign firms in the country could shorten the supply chain, rid farmers of intermediaries and provide them with a large share of the final selling price. (Ghosal & Srinivas, 2011).

PepsiCo, a global food and beverage leader is operating in India through 100 percent FDI route in food processing sector with the product portfolio of 22 brands and annual retail sales of over $1 billion. In India PepsiCo operates with 38 beverages and 3 food plants and proposes to invest 33,000 Crore by 2020 towards upgrading innovation, supply chain mechanism, market infrastructure and manufacturing capacity. Since inception in 1989, PepsiCo has been working with farmers through contract farming. Contract farming is an agreement between farmers and the buyers, where farmer promises to timely supply specific commodity, at pre-agreed price, quality and quantity to the buyer. According to the terms of contract, the farmer is not only required to plant contractor's crop, harvest and deliver the produce at the pre agreed price but will also receive the required inputs, technical advice or expertise for plantation. Contract farming is a powerful means to introduce new crops and farm technologies when marketing and production uncertainties pre-dominate the economy and are highly effective when offers fair price and adequate risk coverage (Chaturvedi, 2007). PepsiCo first contracted with farmers for tomato cultivation for the purpose of exporting tomato paste to foreign countries. The advanced agricultural practice and technical support resulted in increased agricultural yield by three-fold from 16 - 52 MT / hectare and doubled the length of season for growing tomatoes (Seth, 2003). The improved yield increased farmers income and lowered prices for the consumers.

PepsiCo is associated with more than 12,000 farmers across various states like Punjab, Uttar Pradesh, Karnataka, Bihar, West Bengal, Gujarat and Maharashtra for the production of world class chip-grade potatoes. In 2012, potato yield in West Bengal recorded 100 percent growth with profit reaching to Rs. 20,000– 40,000 per acre, as compared to Rs. 10000–20,000 per acre in the year 2009 (PepsiCo India). PepsiCo as a development partner reaches out to more than 22,000 farmers to produce potato, barley, tomato, paddy and chilies through contract farming and supplies them higher quality seeds, suitable agricultural inputs and tools to raise productivity free of cost. The company's guaranteed buy-back mechanism at a pre-determined rate shields the farmer from losses due to market price fluctuations. PepsiCo has brought together the world class agricultural practices to increase farm productivity and earnings and reformed the lives of thousands of poor farmers in India. Blomstrom and Kokko (2012)

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

are also of the view that research and development efforts undertaken by the MNCs and training of local employees in the foreign affiliates demonstrates an important channel of spillover of FDI on local firms.

According to Chaturvedi (2007), PepsiCo has been exporting Basmati rice since 1990's and was the first food processor in India to invest and strengthen backward linkages. PepsiCo was extensively involved in multiple location field trials and ensured successful transfer of technology from the trials to commercial field level for the best quality produce. The company procures a pre-agreed quantum of harvest at a pre -agreed price resulting in an assured income to the farmer. PepsiCo has also entered into a partnership with the Punjab government (Punjab Agriculture University and Department of Horticulture) to promote contract farming for citrus fruits. The Government of Punjab has facilitated the creation of nursery infrastructure, land for demonstration plots and import of germ plasm. PepsiCo for its part has provided international expertise on grafting and planting and has also sent farmers to citrus groves in Florida for training. This collaborative work has resulted in quality produce being directly procured by the company which eliminates middlemen from the system and guarantees a stable price to farmers and the end users.

According to Chaturvedi, PepsiCo's contract model consists of three building blocks, research and development activities, technology transfer and commercialization. It ensures best inputs to farmers for quality produce procured at a pre agreed price, facilitating company's long term planning and investments and raising the living standard of farmers. PepsiCo has emerged as a development partner by aiding farmers to create cost -effective, localized agriculture- supply chain for its business and raise their earnings. According to Karnani (2007), private sector can play a strategic role in alleviating poverty by considering poor as producers from whom they can buy and increase their real income rather than looking at them as potential buyers and selling to them. Once their income increases, this section of population will possibly join the mainstream consumer group and eventually the rising middle income group of the nation. PepsiCo seems to have been working in this direction and sets an example for other MNCs to follow. PepsiCo along with the farmers and State governments is collaborating to upturn agricultural – sustainability and crop diversification and provides customized solutions suitable to specific geographies and locations. It has tied up with State Bank of India to facilitate cheap credit to farmers and extends weather insurance policies from ICICI Lombard to overcome the unforeseen weather condition risk.

The study conducted by Wogbe (2014) indicates that FDI could be an important vehicle to achieve economic growth in Philippines provided that the government creates sufficient absorptive capacities by investing in infrastructure and human capital. Borenstein et al. (1998) and Balasubramanyam et al. (1999) suggest a threshold level of human capital endowment essential for promoting growth through FDI in any nation. Thus the government just can't rely on FDI to contribute miraculously to nation's growth but should strengthen the absorptive capacity like education, skills, infrastructure, ease of doing business and liberal trade policies.

The present BJP government has rightly initiated PPP's (Private –Public Partnerships) in training and skill up-gradation for the rural India population through Skill India initiative program. The government can largely impact the business decisions and activities of MNCs to carve out the most applicable development frameworks for the society without disturbing their profit making business. PepsiCo's initiative leads to spill-over from improved social sectors to reach the wider population enhancing the overall human capital; hence FDI could also be seen as a tool to strengthen certain absorptive capacities in a nation with the help of government's effective trade policies.

Increased Choice at Bottom of the Pyramid

It used to be the general thought that poor are not the target customers for MNCs as they don't have enough money to purchase standard products or they are not brand conscious people. Unfortunately all these thoughts have been refuted.

Prahalad (2008) suggested that an active engagement of MNCs at the BOP (Bottom of the Pyramid) will helps them identify their requirements and consider poor as their potential consumers. It is crucial to educate poor about the appropriate use and advantage of the products and services so that they can benefit from it. Prahalad argued that the success of BOP market lies in altering price-performance relationship. The per unit profit margin might be low in this segment but the large volume, low risk and high return on capital employed creates big time business opportunity and gains. Poor are penalized because of the presence of local monopolies, inadequate access, meager distribution and strong traditional intermediaries which could possibly be overcome by allowing MNCs to explore this section of the economy. There is opportunity for MNCs to built market at the BOP that can result in profit making along with poverty alleviation and a win-win situation for the economy. The capability approach as against monetary approach believes that development lies in expanding the choices available to the people to lead a valuable life as against the economic growth numbers (UNDP, 2006). It holds true in our case as the poor are equally interested in variety of products that are beneficial to health and living but the firms do not aim to tap these consumers bearing in mind the affordability and outreach.

Apart from the three traditional capabilities being global efficiency, national responsiveness and worldwide learning identified by the transnational model (Bartlett& Ghosal, 1989) for the success of MNCs, London & Hart (2004) suggested the fourth global capability in social embeddeness as the most significant strategy for MNCs to operate in emerging markets. This global capability could be considered as "social embeddedness or the ability to create comparative advantage based on a deep understanding of, and integration with the local environment" (p.364). London & Hart (2004) argued that this strategy is very important "to enter low income markets which is based on valuing and facilitating the bottom-up co-invention, by a diversity of partners, of locally appropriate solutions. These solutions also involve investing resources to develop capacity beyond the protective boundaries of the firm" (p.364). It is important for MNCs to convert BOP into a consumer market to sell them their products. As suggested by the social embeddedness approach, the key lies in the ability to understand leverage and build on the existing social infrastructure. The strategy should not be aimed to overcome the weaknesses in the emerging economies rather should target resources and knowledge in the external environment as a source of competitive advantage. The BOP consumers are as brand conscious as rich but are extremely value conscious by necessity. MNCs like Unilever and Procter & Gamble (P&G) are successfully operating in this segment with the strategy that comprehend the social context and have created the huge market for themselves. P&G provide single- serve sachet of shampoo which is preferred by this segment as they only have cash to buy what they need for that day, affordability being the main concern. There is vast distribution network for the delivery of their products and services in the rural areas.

MNCs who are exploring these markets have realized the vast untapped potential but as suggested earlier the poor and illiterate people need to be educated to understand the importance and uses of the products being offered to them . At the same time these people should be part of the business process so that they are capable enough to afford the products. Products should be sold in small affordable quantities, which make the buying easy for this section on recurring basis. The key lies in increasing the choice of products being offered to this section and should be properly advertised and marketed. BOP

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

customers readily accept the advanced technology and ITC e-chopal is the live example. ITC an Indian company came up with personal computer (PC) kiosks in villages which allowed farmers to access the rates of their food grains they wish to sell not only in Indian mandi's (markets) but also consider the future prices at Chicago Board of Trade internationally. Women entrepreneurs in Southern India used video conferencing to confirm the interest rate at various banks across villages. Villagers are easily using cell phones to negotiate their sale deals and also to communicate with their children and relatives abroad. This section is thus very open to new products and new technologies provided they are aware and is within their reach in terms of affordability.

This section of India has large untapped market potential and MNCs who look forward to these markets have substantial scope to contribute to the society along with their profit making in terms of employment, training and education, raising their standard of living and finally contributing to the development of the country. Time and again it has been witnessed that private sector involvement has contributed to well being and poverty alleviation of the society.

HINDUSTAN LEVER LIMITED

Hand Washing Revolution in India

Diarrhea is one of the most infectious diseases that annually kill 2.2 million people worldwide (Velerie, 2002), and India alone accounts for worlds 30 percent diarrhea related deaths (UNICEF, 2003). Hindustan Unilever Limited (HUL), the Indian subsidiary of Unilver, one of the largest detergent producers in India reached rural India to educate them about the importance of hand washing.

HUL is the market leader in Indian fast moving consumer products with presence in over 20 product categories like food and beverages, cleaning agents and personal care products. It is a Fortune 500 multinational company with the worldwide presence across 100 countries. It was established in 1933 by Lever brothers but was later in 1956 merged with Hindustan Vanaspati Manufacturing Company Ltd. and United Traders Ltd. The Anglo-Dutch Company Unilever owns a 67 percent controlling share in company. HUL marketed their soap by emphasizing the importance of frequently washing hands to combat deadly diarrhea was very novel method of marketing and were successful in generating the essential behavioral change. They operated through public-private partnership for hand washing with soap-Lifebuoy and incorporated hygiene and child health as an integral part of their business activity. To reach rural consumers they studied their preferences and behaviors and realized that rural population was neither aware about the presence of bacteria nor bacterial infections. HUL thus initiated the drive to educate people about the bacterial infections and hand washing as a means to keep such infections at bay. HUL along with Ogily & Mather, the advertising company planned behavioral change education campaign to link their soap Lifebuoy with germ eradication and health messages. HUL hired local people for this campaign who can communicate well with the people in the rural areas. This campaign was successfully driven in several states of India. This was hence a win-win situation for the poor consumers and the company.

The renounced Nobel laureate Amartya Sen (1981) also related to capability approach where poverty can be capability-deprivation and could be tackled by increasing people's choices and enhancing human capabilities. UNDP developed four main human development indices based on the capabilities approach namely, Gender Development Index (GDI), Human Development Index (HDI) and Human Poverty In-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

dex (HPI). Majorly these indices measures human well being in terms of longevity, health, awareness, knowledge, standard of living and gender inequality (UNDP,HDR). These are very important measures to gauge the success of poverty reduction measures and development of the rural poor population. MNC's can thus contribute to the development front when the investment and business strategies are directed to involve them and increase their earnings along with addressing the human wellbeing concerns pertaining to education, longevity, health, awareness etc.

HUL came up with rural distribution initiative Project Shakti to enhance HUL's direct rural reach. HUL creates livelihood opportunities for rural underprivileged women who are employed as direct-to-home distributors for their products in the rural market. This project target small villages with population size less than 5000 and aims at rural affluence along with profitable business. They train and educate entrepreneurs to communicate effectively, become confident and business savvy professionals capable of running their own ventures. These women entrepreneurs are called Shakti Amma who largely knows the need and demand of the people in their villages. These women entrepreneur earn Rs.100-1000 per month, though seems less but it makes significant contribution to the families who live below the poverty line and boost the buying capacity of their families. There are around 45,000 Shakti Ammas across 15 States in India and the project has been successful for both for HUL and underprivileged women in rural India (HUL, 2012).

In 2010, HUL also proposed Shaktiman initiative. Through this initiative the men from the Shakti Amma facilities were involved in distributing HUL products to the neighboring five to six villages and were also given bicycles for easy commuting. The earning by the Shaktiman further enhanced the household income and hence the standard of living. Shaktiman project has more than 26,000 distributors and is spread across the country. HUL works closely with NGOs, local and state government bodies and banks in encouraging women to take to entrepreneurial roles and contribute to the economic growth of their family and the nation. HUL has also partnered with State Bank of India to bring banking in the rural low income group people through Shakti Ammas (HUL, 2012).

HUL continuously works on developing grass root marketing initiatives to reach the poor and rural population. Hence as suggested by Karnani (2007) MNCs general course of business activities could tackle a social problem by collaborating with local partners to ease poverty, enhance development and generate jobs through skill up-gradation.

During 68th United Nations General Assembly in New York, Lifebuoy emphasized the role of private sector in accelerating progress towards the Millennium Development Goal which aims to reduce child mortality through hand washing. The partnership between businesses, NGOs and government could scale up life saving hand washing with soap and can help more children reach the age of five. Lifebuoy has a proven model for hand washing behavior change and launched its Help a Child Reach 5 hand washing campaign to improve the health of Thesgora, a village with one of the highest rates of diarrhea cases in India. Lifebuoy aim to expand its life-saving mission to more and more villages and would like to continue till child mortality due to diarrhea is eliminated (HUL, 2013).

Iodized Salt Revolution in India

Iodine Deficiency Disorder (IDD) is the leading cause of mental disorder and retardation in the human beings and the irony is that in India only 25 percent of the salt consumed is iodized. More than 70 million people have Iodine deficiency and nearly 200 million are nearing to this disorder (Rajendra &Shah 2003).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is suggested to use iodized salt for cooking but even the iodized salt loses its iodine due to improper storage, transportation and Indian cooking methods till the time it is consumed. Indian salt market is dominated by more than 300 local players and few branded players who sell salt of various qualities accounting for barely 25 percent of iodized salt. The World Health Community in 1997 banned the sale of non-iodized salt in India which pressurized few sellers to add iodine to their salt but the uneducated poor consumers still preferred low priced non-iodized salt.

HUL in 1995 launched Annapurna iodized salt on the healthy ground with stable iodine that could be trapped even while cooking and was the first in the world to be endorsed by The International Council for Control of Iodine Deficiency Disorders (ICCIDD). ICCIDD was formed in 1985 as a non-profit non government organization with the support from World Health Organization (WHO) and UNICEF to eradicate iodine deficiency disease worldwide. HUL's technological innovation of Annapurna Salt with stable iodine reveals the capability of MNCs to work for both profit and non-profit motives and collaborate with non-profit organizations, in this case to bridge the gap between IDD and healthy population. HUL's initiative also attempted to bridge the gap between poor as a problem and poor as a source of innovation and profit (Rajendra &Shah 2003).

Rural and poor population were not able to purchase big packets of salt due to affordability issues, hence HUL in order to tap the huge market potential launched Annapurna iodized salt in small 200 gram packets priced as low as 1.50 Rs per packet which was a big hit not only in the profitability terms for the company but also on the healthy front for the nation. Unilever has five research facilities worldwide including two laboratories in India established in Bangalore and Mumbai. Hindustan Lever Research Center (HLRC) has worked out the technologies to bring down the unit price of small units of salt making it affordable for the poor section and came up with the lowest possible price in the history of any HLL product. HUL's Annapurna salt is iodized salt with stable iodine that prevents people against goiter disease and promotes mental development.

HUL reached rural India through a project known as 'Shakti'. Project Shakti worked with women self help groups (SHGs) who were trained to work in rural areas as a distributer to deliver products direct-to-home and educate the poor consumers about the health and hygiene aspects of their day to day living. This project not only stimulated the rural demand for HUL products and the company profits but also spread awareness and insight about the health and hygiene related issues. HUL empowered the rural females who shouldered the execution plan by spreading awareness about the brand, developed new channels of distribution and raised social awareness to health related issues. Women associated with Project Shakti earn decent income which is very important source of uplifting their family's standard of living too.

Prahalad (2008,p.204) has rightly said that "for MNCs, BOP can serve as a profitable impetus of innovative technology and marketing savvy, and the corporations, together with NGOs can address social problems at affordable cost."

The nation should realize the benefit of implementing right kind of trade policies to leverage the expertise and technological know-how of foreign Multinational companies who are presently looking at India as the most prominent future retail destination for their investment. The innovative models developed by PepsiCo and HLL should be examined closely to determine how MNCs could be beneficial for the equity and efficiency of the rural poor section of the society and raise their standard of living that finally contribute to the nations growth.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

SOLUTIONS AND RECOMMENDATIONS

In the light of above discussion it is evident that MNCs could be a potent source of equity and efficiency for the farmers and poor. As suggested by Karnani (2007) the engagement of rural people as producers in MNCs operations will address poverty, boost development and create jobs through skill up-gradation apart from generating profit. According to Prahalad (2008) " If we stop thinking of poor as victims or as burden and start recognizing them as resilient and creative entrepreneurs and value conscious consumers, a whole new world of opportunity will open"(p.1) which is a distinctive approach to sustainable performance and growth of a developing country. HUL and PepsiCo's business operations are based on this very framework. HUL has been really successful in exploring business opportunity at the bottom of the pyramid by making more choices available to them at affordable cost and generating profit on numbers. Their distribution network encompasses women and men from the rural area who are trained, educated and groomed to work and earn their livelihood. PepsiCo through contract farming is creating employment, income and skilled labor force in the rural agricultural sector demonstrating an important channel of spillover of FDI on the host economy (Blomstrom & Kokko 2012).

MNC's like HUL and PepsiCo are operating in India through FDI route and as argued by the new growth endogenous theory (Pack, 1994) FDI is effective in promoting growth and increasing social returns along with private returns in the countries that pursue liberal foreign trade and investment policies by increasing returns to scale, imperfect competition, human capital accumulation and spillover effects (Balasubramanyam, at al., 1999). The 'Skill India initiative' by the current BJP government aligns to Balasubramanyam et al., (1999) argument of having a threshold level of human capital endowment in place for FDI to promote growth of the nation. Further it is argued that the effective co-ordination of human capital with FDI requires an effectual domestic market for the goods that are produced. HUL's rural market operation involves rural engagement that improves livelihood which further translates into the spending and purchasing of affordable goods being offered by the firm. It is also argued that for the technology and skill spill-over to materialize from FDI, countries should set off effective and well crafted policies. PepsiCo was restricted from importing potatoes from elsewhere but acknowledging the vast market potential they agreed to procure it from within the country and initiated contract farming with the rural Indian farmers. A argued by Asiedu (2002) trade restrictions can have a positive impact when the FDI is market-seeking and look forward to serve local markets. PepsiCo in India thus had all reasons to accept the restriction imposed on the import of potatoes bearing in mind the untapped market potential.

This initiative has improved rural sector's livelihood along with making them tech- savvy. They use best fertilizers to boost production and advanced irrigation techniques to reduce water consumption. Potato being a water intensive crop could only be produced in well irrigated regions but the advanced irrigation techniques introduced by PepsiCo not only reduced the water usage by 50 percent but also made potato cultivation possible in water scare region like Satara in Maharashtra.(PepsiCo,2011). Indian Government also fears that MNCs might procure supplies from foreign suppliers at the cost of rural poor farmers. The research conducted by Belderbos et al. (2001) on the sample of Japanese FDI firms operating in several host economies suggest that the MNCs largely use local suppliers when producing for the host economy markets. The study by Lall (1980) rightly argues that the MNC's operating in developing countries also have their own self vested interest in improving local suppliers and the same holds true for India where to tap the huge accessible rural sector they need to be made affluent enough in affordability terms. There will certainly be some problems in the short run but over time the economy will start reaping benefits from the FDI and operations of MNCs. As argued by Kiyota et al. (2008) FDI firms will take some time

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

to get rooted in the local economy and build sustainable linkages with the domestic firms. There are several instances of fruitful FDI backward linkages in terms of technology transfers. Jordaan (2008) and Padilla-Perez (2008) indicate positive economic effects of backward linkages by investigating a positive alliance between MNCs and productivity of local input suppliers in Mexico.

It is hence suggests that the effective policy along with the firm's motive to tap the local market might work in the favor of the local rural farmers. India should favor phased opening of FDI in multi-brand retail beginning with the metropolitan cities which will probably encourage and promote the existing retail shops to modernize and cope up with the competition and address the concern of farmers and consumers. FDI will at the same time bring in technical knowhow to establish efficient supply chains and address the issues related to high food inflation and low profit for the farmers due to presence of mandis' and middlemen. Liberalizing FDI in retail could potentially bridge the investment and infrastructure shortfall; improve supply chain management and storage facilities which is responsible for huge waste of food and vegetables every year. MNCs like PepsiCo and HUL have well contributed to the poverty alleviation, education, productivity enhancement, income growth, health, hygiene, women empowerment and uplifting standard of living of the poor and rural population. AT Kearney's Global Retail Development Index (2014) has rated India as 14th most favored retail destination in the world, it seems to be the right time to take a leap by allowing FDI in multi brand retail sector in India and outshine on the global front.

The eminent economist and philosopher Bhagwati (2015) forecasts that India will open up FDI in multi –brand retail in near future owing to the fact that current Indian government is in the process of scaling up trade liberalization and direct foreign investment. Asediu (2002) suggested the credibility of reform process as an essential tool to capitalize on gains from trade liberalization in African countries which is also applicable in the case of India. It is hence, highly recommended that India should liberalize its trade regime to boost FDI inflow in various sector of the economy by reassuring the credibility that it would not be revised in near future as it happened last year with the FDI limit in multi brand retail. In 2014 the limit of FDI allowed in multi brand retail was rolled back from earlier permitted limit of 51 percent in 2012.

It is also recommended that the Indian government should take clue from Chinese government's collaboration with PepsiCo to promote sustainable agriculture and accelerate development of farmers. Prime Minister Narenda Modi has rightly said that schemes that guarantee employment for few months like MGNREGA are actually not the means to alleviate poverty rather the need of the hour is to initiate the upliftment of poor by making them technologically sound (Livemint,2014) and shifting the focus from demand-based employment to project-based services (Business standard, 2014). FDI in retail thus seems to be the need of an hour being capable of creating employment, enhancing managerial skills and technology transfers (Asiedu, 2002) that is crucial for the growth and development of the country.

FUTURE RESEARCH DIRECTIONS

There is a need for detailed case studies of the operations of the few foreign firms such as Hindustan Lever and PepsiCo that are actively collaborating with the farmers in India. There is wide scope to study how MNCs in developing countries expand their business scope to serve poor consumers. There is also a wide scope to reinvent strategies to enter the market at the bottom of the pyramid in emerging and developing economies. Studies could aim to explore various spillover effects from foreign firms operating in the host countries and the possible linkages between local and foreign firms capable of boosting development and economic growth.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

India should allow FDI without any safeguards and restrictions in multi-brand retail sector as MNCs are capable of contributing to economic growth and development of the society as evident by the PepsiCo and HUL's operations in India. FDI in Multi brand retail is also not a threat to kirana stores rather it can incentivize existing retailers to modernize and compete with them in the near future.

ABSTRACT

Entrepreneurship has been deliberated as multidimensional and multidisciplinary study. From the economic point of view entrepreneurship is the central force for economic development for any nation. Scholars and policy makers now have started to see entrepreneurship as panacea for inclusive growth. Entrepreneurships are most widely popular and discussed area. Study on small and medium sized enterprises (SMEs) has been maturing for the last decade as it has been regarded as significant player for the social development along with the economic development. In Bangladesh, SMEs account for a large proportion of the total establishments in various sectors. Considering the importance of the SME sector in Bangladesh, this study intends to explore and sketch-out the landscape of current SME setting in Bangladesh. With this aim the study has extensively carried out literature review, observed and understood the secondary data obtained from various organizations, and finally presented a policy driven recommendation (micro and macro level) which would enable to develop the SME sector in a developing country like Bangladesh.

INTRODUCTION

Entrepreneurship is considered as multifaceted and multidisciplinary study. It has adopted different unit of analysis, theoretical standpoint and methodologies. (Low & MacMillan, 1988). From the economic point of view entrepreneurship is the central force for economic development for any nation (Ahmad, Halim, Ramayah, & Rahman, 2013). Scholars have observed increasing evidence that there is a substantial causal relationship between entrepreneurship, economic growth and poverty reduction (Chowdhury, 2007). It is believed that the growth of the entrepreneurship ventures increase the money flow in the economy, in other words triggers the circulation of money within the economy, create job opportunities, and ultimately enhance the living standard of the society and of an economy. Therefore, scholars and policy makers now have been started to see entrepreneurship as panacea for inclusive growth, where inclusive growth refers to the contributing to profit, as well as the society (Hall, Matos, Sheehan, & Silvestre, 2012). Considering the size of the entrepreneurship, Micro, Small and Medium Entrepreneurships are most widely popular and discussed area. Study on small and medium sized enterprises (SMEs) has been maturing for the last decade as it has been regarded as significant player for the social development along with the economic development. It is perhaps one of the major economic growth engine and backbone of the economic wellbeing for the developing countries. It has also been observed that SMEs are playing vital role on the rapid socio-economic growth of the developing countries and least developed countries.

In Bangladesh, one of the least developed countries, SMEs account for a large proportion of the total establishments in various sectors. Considering the importance of the SME sector in Bangladesh, this study embarked upon to explore and sketch-out the landscape of current SME setting in Bangladesh. The issues of entrepreneurship are complex and not enough and in-depth studies have been carried out in the context of Bangladesh (Chowdhury, 2007). This chapter book institutes a scope of further comprehensive study and expected to contribute to better apprehend the opportunities, challenges, dynamics, and future course of actions for the development of SME sector in Bangladesh. With this aim the study will extensively carry out literature review, observe and understand the secondary data obtained from various organizations, and finally present a policy driven suggestions for policy makers, researchers, and businesses which would enable to develop the SME sector in a developing country like Bangladesh.

OBJECTIVE AND RESEARCH METHODOLOGY

The critical and in-depth literature comprising a holistic picture of the entrepreneurship development in Bangladesh found to be rare (Chowdhury, 2007). Till now not enough significant studies have been conducted in the academic field which would give an inclusive illustration of the small-medium enterprises in Bangladesh. In addition, discussion on the opportunities, challenges, and possible guidelines also found to be sparse. Therefore, considering the frail state of studies conducted in Bangladesh, this study has made an attempt to provide a comprehensive sketch on the geo-politic and socio-economic portrait of the country. The snapshot on such areas has triggered to embark on the main objective of the study. The main objective of the study is to offer a policy guideline for the SME development in Bangladesh based on the prevailing challenges and opportunities of the SMEs. To fulfill the objective the study will carry out review from the extant literature on Bangladeshi SMEs, identify the challenges and opportunities for growth of the SME sector in Bangladesh.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The study is descriptive in nature. The study will also consider the secondary data available from various data bank such as, The World Bank, Asian Development Bank, United Nation Development Program (UNDP), International Monitory Fund, Global Entrepreneurship Monitor. The study will also highlight the information and recommendation from the renowned local research institutes such as, Bangladesh Institute of Development Studies (BIDS), Centre for Policy Dialogue. Combining and cross checking the obtained information, the study will offer a guideline for the SME development in Bangladesh.

BACKGROUND OF THE STUDY

Country Overview

Bangladesh is the country with ancient and historic events where civilization dates back over four millennia. During the 16th century British Empire ruled over the region and the country was part of British India till 1947. In 1947, the country was named as East Pakistan as part of Pakistan, which was basically partitioned based on the religious majority even though having completely different culture and territorial distance of 1,600 kilometres from West Pakistan. The country appeared in the global map as an independent nation in 1971 after the liberation war against Pakistan. Geographically, Bangladesh is located in the South Asia region. The Western, Northern and most of the Eastern part of the country have borders with India. The South-Eastern part of the country has a little border with the Eastern part of Myanmar.

In terms of size, Bangladesh Ranks at the 95th position in the world with the area of total 143,998 square kilometres. In comparison, the country is slightly smaller than the US state Iowa and almost 2.3 times smaller than Malaysia. The land area of the country occupies 130,168 square kilometres and water area is 13,830 square kilometres (The World Factbook, 2015).

Geographically, there are almost seven hundreds of rivers that have flown through the land of Bangladesh and the country is well known as "land of rivers". Therefore, there is abundance of reptiles, mammals, fish, bird, and duck throughout the riverine of Bangladesh. In fact, a large portion of the population is significantly dependent on the fisheries as major source of income.

Considering the formation of land from the geographic point, the country is composed of the world's largest Delta by Ganges-Brahmaputra-Meghna rivers. The existence of such number of rivers and delta land has augmented the fertility of approximately eighty per cent of the landmass and thus made the country depended on mostly in agriculture (National Encyclopedia of Bangladesh, 2015). Therefore the country's economic prosperity mainly depends on the agricultural development. According the Global Competitiveness Report (2015), Bangladesh is categorised as factor driven economy. Factor driven economy represents the economy which is mostly based on natural resources and unskilled labour. In addition, the country is still (after 44 years of independence) been considered as agro based economy, where most of the population lives in rural areas and dependence on agriculture.

Demography

With the population density of 1,222 per square kilometres, 10th in the world (The World Bank, 2015) Bangladesh stands on the world's 7th position (The World Factbook, 2015) in terms of population size. According to the United Nation Population Fund (UNFPA), in the year of 2015 the population Bangladesh has stood at 161 million where the world population touched at 7.3 billion (UNFPA, 2015).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Almost fifty per cent of the population (50.4%) consist of male and rest are females. In the population cohort, 65% of the population is aged between 15-64 years. This is perhaps a great opportunity for the country to turn the population in to productive human resources. In Bangladesh, people commonly live serenely together across religious divisions. The religious setting in Bangladesh and its subcontinent has always been multi-ethnic. In Bangladesh, the religious demography encompasses a broad majority of Muslims (approximately between 85 and 90 per cent of the population), Hindus as the second largest group (with around 8 per cent) as well as Buddhists (0.7 per cent) and Christians (0.3 per cent) (United Nations Human Rights Commission, 2015). The report prepared by the World Bank shows that sixty six per cent (66%) of the population resides in the rural areas of Bangladesh, while thirty four per cent (34%) lives in the urban areas of the country. Even though a rapid urbanization has been observed in the country in the last two decades, still the population in the rural areas are higher where such group of people are deprived of basic human needs and infrastructures. In the rural areas most of the population are engaged in agricultural activities with less technological advancement. Adult literacy rate for the population above 15 years of age is 60% for both the genders (The World Factbook, 2015). It is obvious notion that if the literacy could be improved further, the development of commercial activities, specifically the entrepreneurship venture would accelerate. Further, the statistics by UNFPA shows that the annual population growth rate in Bangladesh is 1.2 per cent in the year of 2015 (UNFPA, 2015), which is almost similar (1.2%) to the neighbouring country, Nepal. The annual population growth rate for other neighbouring countries are: India (1.3 per cent), Myanmar (0.8 per cent), Pakistan (2.1 per cent), Bhutan (1.5 per cent), and Sri Lanka 0.5 (per cent). Other Asian countries like China has average population growth of 0.5 per cent, Thailand 0.4 per cent, and Malaysia 1.5 per cent (UNFPA, 2015). Therefore, the present situation indicates that the population of the country is one of the major challenges for the development of the country.

Human Development

The setting of human development is critically associated with the entrepreneurship creation and development. Therefore, it is also important to have glance on the human development situation in Bangladesh. According to the Human Development Report (2015) Bangladesh ranks at the 142 out of 188 countries in the world, which indicates great challenges for the smooth economic activities and development. For the last 10 years in Bangladesh, the human rights have been severely violated by different stakeholders of the country. Strikingly, human rights violation initiated by the law enforcing agencies was spotted by the media and international community. Different human right activist, development agencies, and the civil society have pointed towards the ruling party and the law enforcing agencies for disappearance of citizens. On top, it has been clearly stated by the Human Rights Watch (2016), "The rights to freedom of speech and assembly are coming under sustained attack by Bangladesh's increasingly authoritarian government". However, considering the other indicators of the human development index is not also so impressive. Still in Bangladesh the inequality in terms of education and income persist. According to the latest Human Development Report (2015), inequality in education in Bangladesh is 38.6% and inequality in income is 28.3% as of 2014. The literacy rate of the country is 58.8 per cent, unemployment rate is 4.5 per cent, labour force participation is 70.8 per cent, participation of female in the labour force is 57.4 per cent, participation of male is 84.1 per cent, and employment to population is 67.8 per cent (Human Development Report, 2015). Another important indicator for human development is health care. In many developing countries people suffer from various diseases and also suffer from inadequate

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

health care facilities. Many of the population receive less quality health related treatments due to insufficient infrastructure. The most recent report published by the World Economic Forum, shows that in Bangladesh, only 59% of the population are satisfied with the health care quality, whereas in the country like Vietnam 72% per cent, in Bhutan 90 per cent, and in Cambodia 79 per cent people are satisfied with the health care provided by the government as basic need and right of the citizen (Human Development Report, 2015).

Economy

Bangladesh has been considered as 44th largest economy in the world (The World Bank, 2015). It has been also identified as one of the Next-11 countries along with Egypt, Indonesia, Iran, Mexico, Nigeria, Pakistan, the Philippines, Turkey, South Korea and Vietnam which holds the potentiality to be in the largest economies club. This Next-11 would be another group of countries which is expected to grow beyond the BRICS (Brazil, Russia, India, China, and South Africa) (Goldman Sachs Investment Bank 2007).

The substantial contribution for such progress in the economic arena is due to the contribution of foreign remittance, and garments export to the Bangladesh economy. The scenario of foreign direct investment in the country is quite unpleasant till 2015 since the year of 2007, due to political instability. According to the The World Bank (2015) the foreign direct investment is only 1.4 per cent of the total GDP of the country. Whereas in country like Cambodia the foreign direct investment is 8.8 per cent, in Vietnam it is 5.2 per cent. The contribution of export and import to the gross domestic product of the country has been recently dived down. According to the Human Development Report (2015), progress of Bangladesh till 2005 in terms of economic and human development was remarkable and encouraging. However, due to political instability and government mismanagement and corruption, the researchers and political scientists in Bangladesh believe that the economic progress is weakening down. The data prepared by the The World Bank (2016) also validates such claims. According to the The World Bank (2016), 19 per cent of the GDP is contributed to the export of goods and services in Bangladesh, whereas country like, Bhutan the contribution of export of goods and services to the GDP is 36.3 per cent, in Vietnam it is 86.4 per cent, and in Cambodia 62.3 per cent.

The World Bank (2015) has grouped Bangladesh in the category of lower middle income country in the world as the gross domestic product (GDP) per capita is US$1086 and gross national income (GNI) per capita is US$1080 (The World Bank, 2016). It has been reported that Bangladesh has upheld a notable track record on economic growth and development. For last few decades the economy has experienced nearly on an average 6 per cent of economic growth per year. In spite of bright track record, around 47 million people are still below the poverty line (The World Bank, 2015) and improving access to quality services for this vulnerable group is a priority. In the global platform the country is mostly known as ground of millions of poor people who earned less than US$2 per day. However, fortunately, the level of poverty has dropped by nearly a third, coupled with increased life expectancy, literacy, and per capita food intake. According to World Bank's web site, currently the world holds in total more than two billions of poor people who live on equal or less than US$2 a day and south Asia contains half of those population (The World Bank, 2014, 2016). Therefore it is very important to alleviate the poverty level in this region. According to the databank of The World Bank (2015) the poverty rate in Sri Lanka is 8.9 per cent in 2010, Pakistan 22.3 per cent in 2006, India 29.8 per cent in 2010, and for Bangladesh in 2010, its poverty rate was at 31.5 per cent, comparing to the poverty rate of 58.8 per cent in 1991 (Imai & Azam, 2012). This indicates that from 1991 until 2010 poverty has been reduced by an average

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

percentage of 1.43 per annum. The World Economic Forum published in their Human Development Report (2015) based on the data of 2011 that 49.5 per cent of the total population in Bangladesh suffers from multidimensional poverty. In this respect, Ghana which has an almost similar GNI per capita to Bangladesh, the holds 31.2 per cent population who suffers from multi-dimensional poverty, while Myanmar the percentage is 31.8.

Comparing the number of poor people of Bangladesh (56 million till 2011) with other countries the it brings out the fact that this figure (56 million) exceeded the total population of Korea Republic (48.8 million), Canada (34 million), Malaysia (27 million), or Australia (22 million) (The World Bank, 2011). As such, this data demonstrated the severity of poverty in Bangladesh. According to the General Economics Division Bangladesh (2010), poverty remains in the rural areas of the country due to inadequate access to technology and lack of infrastructural improvements. It has also been suggested that inequality in income, poor infrastructure, lack of education, poor health, inefficient public sector, lack of work opportunities, low wage rate, population growth, and lack of human resource development are among the major contributing grounds of poverty in Bangladesh (Hossain, 2005; Hye, 1996; Smith, Khan, Frankenberger, & Wadud, 2013).

In the effort to curb poverty, a number of poverty alleviation initiatives, e.g. micro-credit, development of health and education, infrastructural development, and social safety net have been carried out mostly by the government and donor agencies. All these stakeholders have been pursuing the alleviation poverty in Bangladesh since its independence in 1971. Moreover, apart from the traditional techniques, it is recognized that the private sector also contributes towards poverty alleviation, mainly through employment creation (Kolk, Rivera-Santos, & Rufín, 2013). In a similar vein, Davis (2011) surveyed on the life history of the poor in Bangladesh to explore the factor that will improve the people's life. It was revealed that 46% of the surveyed respondents gave credit to 'businesses' as their means to escape from poverty.

Small-Medium Entrepreneurship in Bangladesh

Speeding up socio-economic development, eradicating poverty, and reducing income disparity and regional inequality are the predominant objectives of the current strategic development paradigm of Bangladesh. One of the crucial and prolific strategies for achieving these goals is to create productive employment in the manufacturing and service sector by pulling out labour force out of the unproductive sectors. It is believed that nurturing the small and medium enterprises (SMEs) is the appropriate means to rightly address these national development agendas (Rahman, Amran, Ahmad, & Taghizadeh, 2015a). According to the researchers, achieving double digit growth in manufacturing and services the development of SMEs is considered as critical and obligatory. Developed micro, small and medium enterprise activities in the rural and backward regions comprise a vital constituent of the strategy for rural development and reduction of poverty and regional disparity (Bakht & Basher, 2015).

It has been a proven fact vowed by the scholars that entrepreneurship business especially the micro, small, medium enterprises (SMEs) is the key sector for the developing countries as they play a vital role in the national GDP (Shariff & Peou, 2008). In China, 99.8% of the total number of businesses are SMEs and contribute to 58.5% of total annual GDP, and also contribute 75% of new jobs (Sun, Buys, & Wang, 2011). In Bangladesh, the scenario is however less impressive, as micro, small, medium entrepreneurship business contributes only 25 percent of the total GDP (Rashid, 2012) though the country is having satisfactory upward GDP growth, which is 6.7 percent (The World Bank, 2012). Bangladesh 's SME sector contributed 40 per cent of gross manufacturing output, 80 per cent of industrial jobs, and around

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

25 per cent of the total labour force in 2003 (Chowdhury, 2007). Hence, it is important for country like Bangladesh to encourage the enhancement of entrepreneurship business in diverse range of ways. In the context of Bangladesh, the development of Small and Medium Enterprises (SMEs) can be considered as an important means of poverty alleviation and ensure the rapid industrialization (Rahman, Amran, Ahmad, & Taghizadeh, 2015b). It has been argued by the authors that the performance of SMEs of Bangladesh especially in terms of employee turnover rate, quality assurance, allocation of funds, marketing activities have been found significantly below the international standard (Rahman, Amran, Ahmad, & Taghizadeh, 2014; Rahman & Das, 2005).

Defining SMEs is one of major challenges. Due to the diverse socio-economic situation, different countries and organizations have defined SMEs differently. According to the European Union (2003), SMEs are illustrated as enterprises, which have at most 250 employees and an annual turnover not exceeding 50 million Euros. Further, there is the distinction of small enterprises which have fewer than 50 staffs and less than 10 million Euros turnover and micro-enterprises comprises of less than 10 employees and turnover of 2 million Euros per year.

According to the The World Bank (2010), micro-enterprises are those which have up to 10 persons and $100,000 turnover. The small enterprises have fewer than 50 staff members and up to 3 million US dollars turnover and medium enterprises are defined as enterprises, which have at most 300 employees and an annual turnover not exceeding 15 million US dollars.

The neighbouring country of Bangladesh, Vietnam, where the development of SMEs is striking, has classified and defined SMEs in their own way which aligns with their economic, social, and demographic context. For the categorization of micro-enterprises, the number of workers should be less 10. Small enterprises are those which have employees between 10-200 and total capital having less than 20 billion Vietnamese Dong. Enterprises which have employees between 200-300 and total capital more than 20 billion but less than 100 billion Vietnamese Dong are considered as medium enterprises.

The government of Bangladesh has categorises SME into two broad classifications, which are manufacturing enterprises and non-manufacturing enterprises. In the year of 2011, the central bank of Bangladesh has specifically numbered the classification of SMEs. According to the Bangladesh Bank (2015), in manufacturing sectors of the SMEs, medium enterprise would be those with assets worth US$14 to US$42 million (minus land and factory building, and including replacement value) and/or 100 to 250 of workers. In service industry, medium enterprises will be those which employ 50 to 100 employees and have assets (defined as above) worth of US$ 0.1 to US$ 2.1 million. In manufacturing, small enterprise would be those with assets worth US$71 thousand to US$1.4 million (defined as above) and/or 25 to 99 workers. In service industry, small enterprises will be those which employ 10 to 25 and have assets (defined as above) worth US$7 thousand to US$1.4 million.

Different consulting bodies and reports from different organization suggest that sub-sector of SMEs should be identifies and classified. According the report published by World Economic Forum (2013) various types of SMEs such as village handicraft makers (weaving, embroidery, etc.), potteries, dying, small machine shops, restaurants, knitting, small dairy process, etc. are becoming increasingly important to economic development of developing nations. In the same line, Bangladesh Bank has categorized 132 sub-sectors for the SMEs in Bangladesh such as, agro-processing, agro-based activities, horticulture, fisheries, Information technology, dry cell batteries, bio gas plant, light engineering, renewable energy, and handicrafts (Bangladesh Bank, 2015).

From the Global Entrepreneurship Monitor report, it has been revealed that total early-stage entrepreneurial activity which is the percentage of 18-64 population who are either a nascent entrepreneur

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

or owner-manager of a new business is 12.8% in Bangladesh. In the country, 11.6 percentage of 18-64 population are currently an owner-manager of an established business for more than 42 months. 72 percentage of 18-64 population in Bangladesh (individuals involved in any stage of entrepreneurial activity excluded) have indicated that fear of failure would prevent them from setting up a business (Global Entrepreneurship Monitor, 2011). It has been also reported that Bangladesh couples with affirmative insights of opportunities to start a business with low perceived capabilities and high fear of failure. From the survey by the Global Entrepreneurship Monitor (2011), it has been noted that seven out of ten individuals see good opportunities to start a business while concurrently most of these individuals contend that fear of failure would preclude them to set up a business. In the human development index Bangladesh ranks 146 out of 187, Global Competitive Index 108 out of 142, in the doing business index Bangladesh ranks 122 out of 183 (Global Entrepreneurship Monitor, 2011). From the data it can be identified that the rate of perceived capabilities was the second lowest and the fear of failure was the highest in Bangladesh in global comparison. However, service sector is playing more roles in Bangladesh in both TEA and EBA in comparison to similar economies. Making a comparative analysis, it can be infer that Bangladesh still needs to go forward for the development of entrepreneurship activities for which SMEs sector should be given higher importance. The report published by the Global Entrepreneurship Monitor (2011), indicates that 64 per cent of the entrepreneurs in Bangladesh perceive that there is immense opportunities for the entrepreneurship ventures, which is higher than other Asian countries like Iran or Pakistan. On the contrary of seeing opportunities, 72 per cent of the entrepreneurs possess fear of failures of their venture. Perhaps this is one of the most important issues that need to be consider with attention and need to scrutinize. However, the entrepreneurial intention is one of the vital issues in the entrepreneurial domain as well as in the entrepreneurship research. It has been found that only 25 per cent of the surveyed responded embeds entrepreneurial intention. This could happen due to the setting of entrepreneurial environment, which is overshadowed by the fear of failure. Perhaps such fear of failures constitutes due to the impediments and limitations of the development of the entrepreneurship venture.

Table 1. Comparison of entrepreneurship indicators

	Bangladesh	**Pakistan**	**Iran**
Perceived Opportunities	64%	40%	32%
Perceived capabilities	24%	43%	46%
Fear of failure	72%	35%	33%
Entrepreneurial intentions	25%	23%	30%
Media attention for entrepreneurship	49%	48%	58%
Nascent entrepreneurship rate	7.1%	7.5%	10.8%
New business ownership rate	7.1%	1.7%	3.9%
Early-stage entrepreneurial activity (TEA)	12.8%	9.1%	14.5%
Discontinuation of business	2.5%	1.6%	6.4%
Female Necessity driven	34%	81%	24%
Male Necessity driven	26%	43%	56%

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Table 1 shows an comparative picture of few entrepreneurship venture indicators of two countries (Iran and Pakistan) along with Bangladesh.

The participation of female in the entrepreneurship business is increasing in Bangladesh. Historical time shows that female population of the country were more inclined towards home making activities. But as the days are flowing through, capitalism is placing in the society with deep root; the incorporation of female population in the economic activities is becoming integral. In fact, it can be assert that the role of micro-credit program and Village Phone Program initiated by the Noble Laureate Professor Yunus have revolutionized the entrepreneurial setting of Bangladesh. The village phone program was supported by Grameen Bank, the mother institution of micro-credit and GrameenPhone, a leading telecommunication company in Bangladesh. The program facilitated the rural women of Bangladesh to be an entrepreneur. The program had impact the empowerment of the rural poor women in the country, which later contributed the overall national development. Under the VPP, the women entrepreneur could take out loans to buy a phone. Grameen Bank facilitated credit to the equivalent of US dollar 133 to each of these women, who were termed as Village Phone Operators or VPOs (Rashid & Rahman, 2009). GrameenPhone provided the technical and network support to the women entrepreneur. Each of the phones was under possession of the VPOs, who is responsible for expanding telecommunication services to village people and also adjacent areas. As part of the entrepreneurship business VPOs collects call charges according to the prescribed rate by GrameenPhone. This business model have facilitated both for the entrepreneurs and GrameenPhone to earn revenue (Rashid & Rahman, 2009). This has actually turned the entire community into the customer of GrameenPhone (Anderson, 2006). The VPP has significantly changed and contributed to the life of rural women in Bangladesh. It has opened up a way to earn their livelihood, increased the role in decision making, and enhanced their dignity relative to the rest of the community (Alam, Yusuf, & Coghill, 2010). From the societal perspective the VPP has able to eliminate the middlemen in trade and business of rural areas, once who were very powerful. It has also helped the rural micro-entrepreneurs to develop new business contacts (Alam et al., 2010). The concept of VPP is continuing its legacy but with different form. As reported by the Human Development Report (2015), in many villages in Bangladesh female entrepreneurs use their phones to provide paid services for neighbours. Many people sell phone cards or sell and repair mobile phones across developing countries, specifically in Bangladesh. Recently, in Kenya, an entrepreneurial initiative named M-Pesa has created much of interest and appreciation due to its effectiveness in the domain of social innovation. M-Pesa, a mobile money transfer service has created a scope to flourish entrepreneurship ventures in Kenya. Similarly, in Bangladesh a mobile money transfer services has emerged, which is not only a classic example of social innovation but also contributing a lot to create small scale entrepreneurship in Bangladesh.

Therefore, it can be comprehended that the scenario of SME sector in Bangladesh is mixture of challenge and great opportunities. To promote the development of entrepreneurship ventures, private organizations are playing important role in Bangladesh. However, as a principal stakeholder, the governed and other government related autonomous bodies have engaged themselves in the development process of SME sector in Bangladesh. To promote the development of the SME sector, there are indeed various financing scheme for the development of SME sector in Bangladesh initiated by Bangladesh Bank, SME foundation, and leading NGOs. Having said, still there are wide ranges of challenges for the development of SMEs in Bangladesh, which has been discussed in the following section.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

CHALLENGES OF ENTREPRENEURSHIP DEVELOPMENT IN BANGLADESH

Policies, regulations, discussions, and initiatives have been taking place in Bangladesh by the all government during their tenure. Despite of the fact the SME sector is not flourishing in the way that it should have been. In fact, the entrepreneurs of SME sector in Bangladesh face a number of difficulties in their business. Though the promotion of SME development has been a stated objective of successive governments since 1971, the comprehensive macro policy system has sustained to keep on biased against SME development in numerous ways and distribution of public sector investments, trade and taxation policies in particular have mostly been anti-SME development in character and contents (Chowdhury, 2007).

According to Yusuf and Schindehutte (2000), there are some factors which push the entrepreneurship development specifically during the adverse economic condition of a country. These are mainly, the need for subsistence, the need to innovate to survive, need to quickly recognize and exploit the opportunities even in the declining economic situation. From different literatures it has been revealed that these nascent entrepreneurs in the developing countries need supports to make the business a successful one. Entrepreneurship throughout the world faces different challenges and barriers from different context. In a study on tourism conducted by Lordkipanidze, Brezet, and Backman (2005) found impediments of entrepreneurship such as lack of finance, high government tax, administrative barriers, negative social attitude towards entrepreneurship specifically in rural communities, low skill level, resistance to change, lack of awareness, and lack of information on market. In a developing country like Bangladesh micro, small, medium entrepreneurship business faces barriers such as access to appropriate information (Rahman & Yousuf, 2010), frequent harassment by government officials who extort money and regulatory barriers (Khan, Nazmul, Hossain, & Rahmatullah, 2012; Rashid, 2012), access to finance (Rahman & Yousuf, 2010; Rashid, 2012), poor infrastructure, including bad roads inadequate water shortage, erratic gas and electric supply, and a poor telecommunications system (Khan et al., 2012; Rashid, 2012). Further, scholars have noted that in Bangladesh SME is characterized by Low capitalization and limited assets, geographical diversity and high mortality, poor credit knowledge, very limited access to formal source of credit (Chowdhury, 2007). Miah (2007) stated that the foremost limitations for SMEs in Bangladesh are lack of adequate investment, lack of modern technology, irregular/inadequate supply of power, poor physical infrastructure and high transportation cost, poor information about market opportunities and requirements, inadequate availability of raw materials, lack of research & development facilities, absence of operative and transparent legal system, difficulties in accessing technology, credit constraints, and most importantly the political instability.

In a survey conducted by Chowdhury (2007), it has been revealed that infrastructure facilities are one of the significant impediment for the development of SME sector. Specifically, the respondents reported that frequent power failure, load shedding, poor transport facilities, inadequate telecommunication services are the major barriers for the entrepreneurship venture. The study shows that 83 per cent of the respondents were not at all satisfied with the required infrastructure for the development of the SME ventures (Chowdhury, 2007). According to the World Economic Forum (2015), Bangladesh ranks on 107 position out of 140 countries that they have surveyed. It has been reported by the World Economic Forum (2015), Institutional setting is ranked 132, Infrastructure is in 123, Business sophistication ranked 117 out of 140 countries in the world. Further, the report highlighted the most problematic factors of doing business in Bangladesh. The most problematic factors of doing business in Bangladesh are mainly: Corruption, Inadequate supply of infrastructure, Government instability/coups, and Inefficient government bureaucracy. However, there are other factors as well, which includes: Access to financ-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing, Policy instability, Tax rates, Complexity of tax regulations, and so on. While focusing only on the infrastructure, it has also been revealed that Bangladesh ranks at 124 out of 140 countries in terms of quality of overall infrastructure. In quality of roads the country stands at 113, quality of railroad it is at 75th position, quality of air transport infrastructure the country stands at 121 out of 140 countries (World Economic Forum 2015). It has been also asserted by the scholars that Poor transport infrastructure or inefficient transport services mean higher transportation costs and longer time of delivery, which create bottlenecks to the development of healthy entrepreneurship since profit opportunities would become limited (Chowdhury, 2007). Further, supply of electricity is a major obstacle for the SME sector. Sufficient supply of electricity is vital for the inclusive development of the country. Without electricity it is in fact difficult to roll out the socio-economic activities in any given country. In Bangladesh, even after 45 years of independence, 40.4 per cent of the population still leaves without electricity (Human Development Report, 2015).

Legal and regulatory framework is one of the impediments for the development of SME sector in Bangladesh. According to the scholars, the lack of legal and regulatory framework, the ventures in Bangladesh either SME or large corporations are facing severe difficulties (Tsunoda, Ahmed, & Islam, 2013). From the study by Chowdhury (2007), it has been revealed that majority of the entrepreneurs reported that there is a prevalent lack of confidence in the legal and regulatory framework of the country, which is characterized by weak and non-transparent administrative and judicial systems, inconsistencies in enforcing laws, bureaucratic interpretation of rules, lack of firm political commitment, lack of accountability, hooliganism and political muscleman ship, lack of rule of law, and lack of control of corruption. For the last two decades there have been political turmoil continuing in the country. The credibility of the administration and to an extent the judicial system has been controversial. Specifically, the quality of the government administrative wings presumes to have deteriorated than earlier times. It happened mainly due to the political interference to the administration. Further, the rule of law in the country for the last decades is a major point issue. Local and international human rights organizations, political parties in the countries are questioning on the rule of law in the country. In fact, from the political view, currently, the country is turning to an authoritarian regime, where the government has set a puppet opposition party to legalise the parliamentarian system. During last few years, thousands billions of dollars have been looted from the public bank only by few persons who are alleged to have close connection with government leaders. Therefore, the in a sense, there is not rule of law, and no effective initiative to hold back the on-going race of corruption. Such situation is surely hindering the development of SME sector in Bangladesh.

Entrepreneurship is a multifaceted process that require for drive, vision, and tenacity for the development of business. The expansion of this route hinge on the educational system that is the most impelling factor for increasing human skills, knowledge, attitudes and values as well as encouraging creativity. The study by Chowdhury (2007), shows that 66 per cent of the total respondent have identified entrepreneurship education and training as a constraint for entrepreneurship development in Bangladesh.

Instable political climate is one of the major barriers for the SME development. A favourable and smooth political environment is essential for the development of any business in any country. Regrettably political environment in Bangladesh are too much contaminated. Political structures and the settings are still remaining hostile. Personal and political antagonism between political rivals, frequent strikes, lack of respect for elementary principles of democratic governance have become the principal characteristics of political system of the country. All these have raised the culture of corruption, bribery, and destructive

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

attitudes of the politicians. Such situation has created an absenteeism of the rule of law and dispiriting the development of entrepreneurial talent and initiative in the country.

The balance of participation among male and female is also hindering the growth of the SME sector in Bangladesh. Specifically can say, gender discrimination is one of the reason that is discouraging the female populace to participate in the commercial activities in the country. Still, in many parts of the country female cohort of the population is in danger. Female are not encouraged to work or carry out entrepreneurial activities in the society. According to the scholars, Bangladesh's labour market is a typical in the extent to which women do not participate in the formal labour market (Bauchet & Morduch, 2013). That remains one of the challenges for the inclusive development of the SME sector in Bangladesh. The intense dearth of required capital to an extent is hindering the development of SME sector and small scale ventures. Inadequate personal and family savings and an absenteeism of financial innovation severely limit the growth prospects of promising start-ups in developing countries.

However, it is true that these challenges are not those which cannot be overcome. If there is serious intention of the government and the concern bodies, it is much of sure that SME sector in Bangladesh can flourish rapidly. Therefore, it is important to consider the challenges and capitalizes the existing opportunities for the development of the SME sector in Bangladesh.

OPPORTUNITIES OF ENTREPRENEURSHIP DEVELOPMENT IN BANGLADESH

Sarder, Ghosh, and Rosa (1997) found that firms which are receiving supports services significantly take hold of higher growth resulting in business success. However, the support services are mainly from the different organizations which are considered to have more institutionalized process such as: private organizations (Islam & Tsuji, 2011; Osmonalieva, 2011), Non-government organizations (Dahan, Doh, Oetzel, & Yaziji, 2010; Webb, Kistruck, Ireland, & Ketchen, 2010), government organizations (Ahmad, Ramayah, Wilson, & Kummerow, 2010; Hansen, Rand, & Tarp, 2009). Based on the research literatures and real business practices it has been found that these organizations support the entrepreneurs in different way, in different context, for example, providing financial assistance, training, information and technological support, infrastructural support etc. Ultimately all these supports collectively may contribute to the entrepreneurship business success in Bangladesh.

As mentioned earlier, Bangladesh holds a large number of populations which is an immense opportunity for the development of the SME sector. Due to the large population there are various ways to explore the opportunity to utilize the waste materials into renewable energy. According to Human Development Report (2015), a number of 129,000 of population has the employment potential of renewable energy. Renewable energy business venture not only will contribute to the development of SME sector, but also it will generate a large number of employments.

Bangladesh has coastline of 580 kilometers as the whole southern part is faced towards the Bay of Bengal. That gives an opportunity for the country to develop the ship breaking industry. Ship breaking is a multibillion-dollar industry in which large commercial vessels are recycled at the end of their operational lives, typically at 25–30 years. Rather than leave them to gradually weather away and release large volumes of harmful pollutants to the environment, there is an active business in recycling all fuel, oils, engine parts and fixtures, followed by the steel hull. Currently, the top five ship-breaking countries are Bangladesh, China, India, Pakistan and Turkey. Nurturing the ship breaking industry would give leverage to the SME sector to develop.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Handicrafts industry has long history of success and legacy in Bangladesh. The Moslin, Jamdani, and jute made products still are well attracted in the international markets. The design and the procedure of those products are unique therefore having great opportunities to flourish.

Most importantly, the young age cohort is the biggest opportunity for Bangladesh. It has been observed that this group of youth are doing immensely good in their own field. Young aged cohort is coming up with diverse range of innovative ideas, which actually are not nurtured properly. In many international competitions they have showed their talents and proved their competencies. This group of people could be potential opportunity for the development of SME sector in Bangladesh.

Innovativeness of the people in Bangladesh is one of the opportunities, which perhaps can be promoted and should be given priority. While people are lack of supports, they tend to come up with innovative solutions by own selves. In fact, it has been observed that poverty sometimes opens up the opportunity to innovative something unique that essentially solves the problems faced by the marginalised group. As, there are large number of people still under the poverty line, the poor people perhaps can be the source of further SME sector development.

The most interesting opportunities lies within the light engineering industry in Bangladesh. As said before, people in Bangladesh are innovative; therefore, the light engineering sector can be potential area for the overall SME sector development.

Based on the automobile industry in Bangladesh, SME sector could flourish. In fact, there is a place in Bangladesh, which is famous for theft car and automobile parts. Unfortunately the law enforcing agencies are indirectly supporting them to operate stealing cars and automobile parts. These people are truly talented as they can easily fix cars and replicate automobile parts. It is a contention that rather than considering them as group of social destructor, they can be considered as potential source for the automobile based SME sector in Bangladesh. In the following sections the possible recommendation would be provided.

The fertility of the soil in Bangladesh is well known due to the geographic structure and for the formation of land (delta land). The agro business thus possess a great opportunities for the development of SME sector in the country. Already, agro-products like strawberry have started to produce in the country for the first time. Similarly, other fruits and vegetable cultivation could be prospective for the entrepreneurial business in the country.

Bangladesh is well known for arts, culture, and literacy. Publishing house in Bangladesh are famous for publishing books, novels, text books, and etc. However, embracing the strong previous experience, this industry may join to the international publishing industry where, Bangladesh could be the back and production office for the academic and research journals. Due to the lower costing, international publishing agencies would be interested to bring in business in Bangladesh thus the scope of opening up publishing based SME sector will be instituted.

Bangladesh is a country of full potential with a large number of populations. If these opportunities are capitalized it is hoped that the SME sector in Bangladesh would be one of the strongest SME sector in the region. For that, it is important to have policies and a strong body which can implement those policies. Therefore, this chapter intends to provide some recommendation which would contribute to the development of the SME sector in Bangladesh.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

RECOMMENDATION

Small-medium Enterprise (SME) sector development is the most important task for the government of Bangladesh. For long period of time this sector has been in the talk for the politicians and bureaucrats. Since the independence of the country citizens are continually been fed with hopes and aspiration that SME sector will be given highest priority. Nevertheless, for last few years, it seems that the pace of SME sector development is gearing up. Due to the high competitive environment, entrepreneurs are taking initiatives of their own to establish business venture. There have been less policy recommendation based studies have been carried out in context of Bangladesh. Based on the discussion in this chapter, the study intends to put up the following recommendations for the SME sector development in Bangladesh.

Micro Level Recommendation

- Entrepreneurship education is one of the vital means to develop the SME sector in Bangladesh. Still in the education system the entrepreneurship courses are not been made mandatory. The entrepreneurship education should start from the higher secondary level in the country. Entrepreneurship courses found to be taught only in business related programs in the country. However, it is important to include the entrepreneurship courses in the higher secondary level of the education system in Bangladesh. In addition, there should be separate courses as 'practical', where students need to create an entrepreneurship venture within their institutional premises and run the business for at least one year. Perhaps based on the running the business students will be evaluated in the exam.
- Entrepreneurship training program should be formalized in each district town of the country. Perhaps, entrepreneurship training course certification could be a pre-requisite to obtain financial assistance for the business. During the training program, entrepreneurs should be given information technology related training as well which will increase their technical competencies. From the study by Rahman et al. (2015b), it has been revealed that strategic competencies, technical competencies, conceptual competencies, and opportunity competencies are vital for the small scale venture entrepreneurs. Therefore, perhaps the government and the non-government organizations can come up with training program which would enhance the entrepreneurial competencies of the SMEs owners and managers. Such training program presumes to enhance the managerial capability of the SME entrepreneurs as well.
- There should be a strong well-built network among the SMEs in Bangladesh. SME foundation of Bangladesh should play more effective role to create a network among the SMEs. Unfortunately, still there no database for the SMEs in the country. To nurture the SMEs it is important to have detailed database for the SMEs operating in the country. Such data base would not only assist to build network, it will also open up the scope to get diverse range of benefits and business scheme for the business. SMEs should be connected with each other through the database which will allow to source and distribute product and services.
- A sturdy incubation centre based on sub sector is important for the development of the SME sector. This incubation centre will generate new business ideas for the particular sub-sector and source for potential market of the product and services.
- The SMEs business owner should be given certain level of priorities in doing banking and dealing with the government agencies. Perhaps the SMEs owner could be provided with special identity card which will allow them to get leverage for the purpose of their business.

Macro-Level Recommendation

- It is important to ensure a market-oriented economy based on sound legal and regulatory structures for the development of the SME sector in Bangladesh. For smooth functioning of the market economy, Bangladesh needs a sound legal and regulatory structure backed by the rule of law so that existing business can thrive and new businesses can emerge freely. A stable democratic system with binding rules and structures that govern all players is the best guarantor for political stability. Political and economic institutions must be built up in Bangladesh for practicing democracy geared at establishing a stable and a law enforcing government
- To create an entrepreneurial environment that is driven by friendly rules and regulations encourages the development of SMEs. And the foremost role in this scenario is played by government institutions. Effective government institutions must be open and decentralize their administrative structure which will allow a smooth flow of procedures. The government of Bangladesh should also be free from corruption and create conditions for all citizens to participate and compete in the market place without too much regulation.
- Intensifying markets for and nurturing competitiveness of SMEs (creating surroundings for SMEs to have access to information on markets and goods' prices and support them to develop markets and sell their products; supporting in presenting, introducing, promoting, and channelling their potential products; enabling participation in goods supply and service delivery under the plans on goods procurement with city corporation budget sources.
- Inspiring SMEs to accelerate export and build favourable conditions for the SMEs to collaborate with foreign partners, multiply goods and service export markets. The government of Bangladesh can come up with export promotion-support program, that will enable them meet up extra cost to create linkage with the foreign partners.
- Government should encourage to create a social entrepreneurship trend among the existing SME venture which will not only address the development of the SME but also it will assist to the development of the socio-economic sector of the country. Through the social entrepreneurship venture, the SME can achieve their financial success as well as address the need of the society and thus contribute to the social development in the country. Therefore, a spate scheme for the social entrepreneurship should be introduced in the country.
- In Bangladesh, the technology based entrepreneurial activities are popularizing. Therefore, the government should encourage to establish technological based business venture thus turn the existing entrepreneurs to techno-entrepreneur.
- The infrastructure facilities especially the, road communication, electricity, and internet should be given highest priority in order to boost up the SME sector.
- SMEs should be linked with the educational institution, particularly with the universities. This will create a win-win situation for universities and SME venture. Universities should be given additional budget to carry out research on SME sector, which can help to develop the SME sector. SMEs also can gain diverse knowledge from the universities.
- Research & Development centre should set up in every district of the country which will be under one university or highest educational institution of that particular district town,
- The government should also set up innovation centre in each district town of the country. From the Human Development Report (2015), it has been revealed that Bangladesh is far behind compare

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

with other countries in innovation. If the innovation centre is being set up in each district town, there will be a domino effect which will ultimately influence the SME development in Bangladesh.

- Large private organization should also be encouraged by the government to collaborate with small-medium enterprises for sourcing their supplies and raw materials. Large private organization may also create an environment which will enable to transfer of knowledge and skill to the SME ventures in the country.

CONCLUSION

SME is indeed a vital player for the overall development of the country like Bangladesh. Previous studies have offered different guidelines for the SME development in Bangladesh. However, time has been changed, new things, new issues are coming up in the current setting of SMEs in Bangladesh. Therefore, in the current context of Bangladesh, it is important to revise the landscape of SME in Bangladesh. With the available concurrent data, the study believes to contribute to knowledge building on SMEs in Bangladesh. The study will be helpful as guideline for the policy makers, entrepreneurs, other stakeholders, suppliers, researchers, and also academician for the further course of actions.

KEY TERMS AND DEFINITIONS

Grameen Bank: Grameen Bank is the mother institution of micro-credit and GrameenPhone. a leading telecommunication company in Bangladesh. The Grameen Bank facilitated the rural women of Bangladesh to be an entrepreneur and contributed the overall national development.

Poverty in Context of Bangladesh: In context of Bangladesh, poverty has been referred to the inequality in income, poor infrastructure, lack of education, poor health, inefficient public sector, lack of work opportunities, low wage rate, population growth, and lack of human resource development.

SMEs in Bangladesh: In manufacturing sectors of the SMEs, medium enterprise would be those with assets worth US$14 to US$42 million (minus land and factory building, and including replacement value) and/or 100 to 250 of workers. In service industry, medium enterprises will be those which

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

employ 50 to 100 employees and have assets (defined as above) worth of US$ 0.1 to US$ 2.1 million. In manufacturing, small enterprise would be those with assets worth US$71 thousand to US$1.4 million (defined as above) and/or 25 to 99 workers. In service industry, small enterprises will be those which employ 10 to 25 and have assets (defined as above) worth US$7 thousand to US$1.4 million.

SMEs' Barriers in Bangladesh: Access to appropriate information, frequent harassment by government officials who extort money and regulatory barriers, access to finance, poor infrastructure such as bad roads inadequate water shortage, erratic gas and electric supply, and a poor telecommunications system, low capitalization and limited assets, geographical diversity and high mortality, poor credit knowledge, very limited access to formal source of credit, lack of modern technology, irregular/inadequate supply of power, poor physical infrastructure and high transportation cost, poor information about market opportunities and requirements, inadequate availability of raw materials, lack of research & development facilities, absence of operative and transparent legal system, difficulties in accessing technology, credit constraints, and most importantly the political instability.

Strategic Development Paradigm of Bangladesh: The predominant objective of strategic development paradigm of Bangladesh is speeding up socio-economic development, eradicating poverty, and reducing income disparity and regional inequality.

Chapter 26
Zakat and Its Socio-Economic Merits:
A Holistic View towards Eradication of Poverty

Mohammed Abdul Karim Al-Banna
Heriot Watt University, UK

Ian Michael
Zayed University, UAE

ABSTRACT

The chapter investigates the role Zakat (alms giving) in eradicating poverty around the world. It (Zakat) is one of the five main pillars of Islam; it is the practice of charitable giving by Muslims based on accumulated wealth and is expected to be paid by all practicing Muslims having the financial means. As part of the study, a questionnaire that consisted of five questions to enquire about how Zakat can eradicate poverty was administered to 200 Muslim people living in the United Arab Emirates (UAE). Further, the questions were designed targeting the core goals of a Zakat institution that also reflected the Muslims psychometric behavioural aspects. Islam has 1.57 billion followers, making up over 23 percent of the world population (Pew Research, 2011). With such a vast population, the role of Zakat in alleviating poverty is an achievable objective.

INTRODUCTION

Zakat is one of the five main pillars of Islam, it is the practice of charitable giving by Muslims based on accumulated wealth and is expected to be paid by all practicing Muslims having the financial means. It (Zakat) is a mandatory 2.5 percent take on the wealth of well-to-do Muslims; it is endogenously infused into preferences and behavior by spiritual values of all Muslims. Recent studies had shown a need of exploring the investment of the zakat treasuries in helping the poor being micro-entrepreneurs and act as members of the society, benefiting the economic productivity of their Nations. The underlying value

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of zakat is sustainability, as the obligation is predicated upon sustainable yearly contribution from ones wealth, and it further acts an impetus for labor-intensive enrichments, resiliency and self-dependency of the impoverished. Further, Zakat financing plays a catalytic role in ethical community development, considering its importance in entitlement and empowerment formation and human resource development (Silva & Choudhury, 2006).

Throughout the Islamic era, the management of Zakat was among the duties of Muslim leaders, until the crash of the last Muslim caliphate in Turkey in the early twentieth century. Zakat is the first universal welfare system in human history that has played a significant role in smoothing the consumption of the poor. There had been times in history during the reigns of caliphate Omar Ibn Abdul-Aziz, an Umayyad Caliphate and ruled from 717 to 720, he was known to be among the most just and pious leaders in his time, hewas disdainful from worldly luxuries and extravagance, and during his reigns purported notions of fair distribution of wealth, it was even said that at the end of his rule, there were hardly poor people to give charity money to.

BACKGROUND

Aims of This Study

This study aims to define the role of Zakat in the Muslim world, not merely as a divine one-off charity giving, but as a holistic economical fiscal stream that could shape-up a healthy fiscal model. The legality of Zakat investment will also be depicted not only by an implied meaning; but a more holistic approach whereby the underlying values for the law will be highlighted (Maqasid-al-Sharia).

Hence the aims of this research and chapters are as follows:

1. To understand Zakat and its rewarding paradigm,
2. To discuss the role of Zakat and its underlying values,
3. To portray Islamic economics and the religions values, and looking at Islamic Law,
4. Shed light on the Zakat institution in UAE, and how (if at all) to improve its administrative planning, governance, and efficiency,
5. A glimpse on the historical background of zakat, and building a constructive argument about its socio-economic gains,
6. And finally, this study conducted empirical research to find the best contemporary ways to improve the efficiency of Zakat institution most of which echoed respondent's feedback.

The United Arab Emirates, Islam, and Zakat

The United Arab Emirates (UAE) is a nation located in the Arabian Peninsula; it has a total landmass of 83,600 Km2 on the Arabian Gulf. The country's neighbours include Oman to the east; Kingdom of Saudi Arabia to the south, as well as it shares its sea borders with Qatar and Iran. The UAE is a federation of seven emirates (equivalent to principalities), each emirate is governed by hereditary Sheikhs who jointly form the Federal Supreme Council which is the highest legislative and executive body in the country. "The constituent emirates are; Abu Dhabi, Dubai, Sharjah, Ajman, Umm al-Quwain, Ras al-Khaimah, and Fujairah" (UAE government Bulletin, 2012).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

In most of the Muslim countries (except for Saudi Arabia, Indonesia, and Malaysia were it is under the state's Islamic law enactment), zakat obligation is a voluntary and philanthropic activity, and not controlled by the state. A healthy socioeconomic model implies reducing the gulf between the rich and the poor and fair distribution of wealth, which is among the core values of the zakat divine obligation, and that is only attainable when the obligation is ordained by the government. This study has elucidated that there is a lack of empirical planning and a general dearth on representation of the poor in the Middle Eastern region and among majority of the world. And from this angle the study puts forth a critical standpoint of this divine economic obligation. And from here this chapter conceptualizes, that if zakat is controlled by the state in Nations Fiscal Planning, poverty would be eradicated if not totally eliminated.

In countries around the world, the causes of poverty vary from country to country; one of the causes of poverty in UAE is the society's focus on image.

As an example most of the individuals in an Emirati family own their own car, they buy high-end cars and don't mind applying for loan to cover the expense and to own it (Al Bastaki 2011). Individuals becomes indebted to banks, as a result of extravagant standard of living and loans burden, a report had shown that ninety eight percent of people taking help from Red Crescent have loans that make them overburdened and unable to settle them, which is the most common factor for the impoverished (Al Bastaki 2011).

The contribution of Zakat is collected and organized by charitable institutions, few of these are owned by government and others are social not-for-profit institutions that work autonomously. Some of the more popular ones are: The "Zakat fund in Abu Dhabi, Islamic Affairs and Charitable activities department in Dubai, Dar Al Berr society, Beit Al Kheir, they all work as independent institutions for the purpose of Zakat collection and distribution to worthy recipients. Their vision and mission had been derived from the Quran and Sunnah, distributing a subsistent amount of money to fulfill the poor's basic needs and have a deeper understanding for them.

Zakat and Its Socio-Economic Merits

ZAKAT is one of the five main pillars of Islam; it is the practice of charitable giving by Muslims based on accumulated wealth and it (Zakat) is expected to be paid by all practicing Muslims who have the financial means. "The role of Zakat is to promote social justice and to ensure sustenance of economically unfortunate sections of the society" (Al-Jaza'iri, 2001).All classical Muslim Scholars recognize Zakat as a mechanism not only to fulfil the basic needs of the poor but also to empower them with capital and earning capabilities. Some jurist's like the Shafiis allow Zakat to be disbursed in capital working tools that enable them to produce more and to secure better income. (Al Nawawi, 1977).

According to Ahmad (1979), Zakat assures the basic necessities of life to those who are in poverty, in dire need and unable to undertake gainful employment without society's help and assistance (Kurshid A, 1979). The effect of Zakat on poverty is cumulative; Zakat not only increases the income level of the poor in society but also increases the effective demand for basic needs, which in turn will encourage production of socially desired goods and services in the society (Mannan, 2000).

Other contemporary researchers has developed a framework that encompasses the socio-economic perspective of Zakat, for example Shehatas' (1994) study examined program's that can be used in the human development aspect of the poor that could make them more resilient and productive. Programs that the researcher examined was social activities such as establishing schools, health care centres, affordable housing, agricultural and cottage productions, rehabilitation and vocational centres, and further

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the study then transcended to business wealth such as provisioning of fixed assets, and working capital. (Shehata, 1994).

Many Islamic scholars have found that Islamic finance has provided global solutions not found in capitalist markets. The 2008 economic crisis that affected the global economic landscape, initially emerged from the Wall Street markets and the Mortgage Subprime in the United States of America and spawned a domino effect to the rest of the world. This was a proven testament of capitalism greed and mal-practices of Wall Street market, and accordingly economic scholars around the world started analysing the root-cause of the ailing markets and espionage for remedial actions. It has been unanimously agreed that capitalism is one of the main factors of poverty, as the rich gets more capital at the expense of poor.

On the contrary Islamic Finance sets its sights of the poor at its very core, gives a rising hand to free markets notion with government regularization when needed, it calls for fair distribution of wealth, discourages capital hoarding, it further transcend to ethical trading and asset-backed markets, as well as negates high profit margins in an exchange. Thus, Islamic finance was sought by many including Europeans to have basic fundamentals that can help the world to become a better world, and a good substitute for capitalist economy. (Al-Jaza'iri, 2001).

Zakat is a discipline and a financial behaviour; it purports social responsibility and benevolence, besides being a divine worship. Many Islamic Jurists point out that Zakat revelation is a cure for many of today's scourges; since it quells yearning and despair of the impoverished. On the long-run it reins back economic inflation, and halts greed of capitalism and bourgeoisies. According to Faridi (1992) Zakat accentuates the element of continuity and stability to public revenues, its obligatory nature of along with its fixed rates, the minimum amount of taxable wealth (nisab) and the delineation of Zakat disbursement helps in this process. The collection of Zakat is particularly useful for the planning and maintenance of public expenditures, and the delineation of recipients serves to protect its allocation against economic, fiscal or political whims of the Zakat administration (Faridi, 1980).

The Quran says, "… And they must render the dues that are proper on the day that the harvest is gathered…" (Quran 6:141), in this holy verse, Allah the Almighty ordains the contribution of share of your own wealth on yearly basis to the poor (when the harvest is gathered), and this instigates an element of continuity, steadiness, and timeframe conformity of the contribution. And from here Muslim consumers awaits the Holy month of Ramadan for extending their zakat and other contributions.

The five pillars of Islam are incumbent among all Muslims and include the declaration of faith (shahada), prayer (salat), obligatory alms (zakat), annual fast during the holy month of Ramadan (sawm) and once in life time pilgrimage to Mecca (hajj).The obligation to pay Zakat was set at the time of the prophet Muhammad (Peace be Upon Him) and was recognized as an emphatic proof of the acceptance of Islam and loyalty to the united community, all the other commandments is possible to be fulfilled individually except for zakat which needs to be fulfilled in a conjunction with a community, and thus compels people to engage with other human beings.

Moreover, Zakat is not considered as voluntary charity, this is since it was imposed as a commandment from God. Analogously, Islamic finance as empirically proven is not only an economic system predicated upon the theological doctrine but also complete with values promoted by Quran and Sunnah through which governs all forms of economic interaction in the society. The principles of Zakat is governed by Sharia Law which are the moral and ethical principles governing the Muslim societies from the Quran and Sunnah (Nomani & Rahnema, 1994).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Quran Says: "Take, [O, Muhammad], from their wealth a charity by which you purify them and cause them increase, and invoke [Allah's blessings] upon them. Indeed, your invocations are reassurance for them. And Allah is Hearing and Knowing." (Quran 9:103).

As defined in the holy Qura'nic verse, zakat means to purify, sanctify and to grow, unlike almsgiving, charity, or philanthropy, it is further an obligation that all Muslims should fulfill. Next to prayers, zakat is the most important rule of Islam, and hence it has been repeatedly mentioned to witnesses 32 times in the Holy Quran. It was an obligatory payment too in the case of the followers of all the preceding prophets. The literal meaning of Zakat is purity and enhancement. In other words by paying Zakat a person purifies his wealth and also obtains religious sanction for his possessions. And his soul too is cleansed of all sorts of wickedness and filth. From another angle there is an increase in wealth as well as a divine reward, the nuance of this divine doctrine represents the poor claim to share in society's wealth, and is at the core of social security system.

The axiological nature (study of values) of Zakat is based on prohibition of Usury (interest) and focuses on risk sharing and equal distribution of wealth. Furthermore, the Sunnah and Hadith which are the transcended anecdotes from the time of Profit Muhammed (PBUH) has determined all the items that are Zakatable and analogous with capital and those that are all kinds of growing wealth known to the Arabs in the Prophet's era, such as: livestock, agricultural products, and gold and silver. One needs to distinguish that Zakat is levied on things which have a capacity to grow capital and hence no zakat is levied on instruments, residential houses, clothes, household effects and other objects which are not capable of production or increase (Siddiqi, 1968).

According to Al Qaradawi (2004), the percentages and ratios of zakat are also determined in a scrupulous manner in sayings derived from the Quran and in more breadth in Sunnah, ranging from five to ten percent to a minimum of two and a half percent on different kinds of wealth (2.5% on capital, 5% and 10% on agriculture produce).

The tradition of the Prophet also defined the time of payment and the pattern of periodicity of zakat. The designated recipients of zakat are also well defined and delineated in the Qur'an and Sunnah and will be explored in the next section. Islam strongly emphasizes on the equality of wealth in the society, this divine obligation comes due when a certain amount of money called the nisab is reached or exceeded, and does not fall if the amount owned is less than the nisab. (Al Qaradawi, 2004). The nisab is used by Muslims to determine the minimum amount of wealth that reaches the one lunar cycle and is entitled to pay zakat, the currency of measurement used back then which was in gold and silver, for gold it was estimated to 85 grams of pure gold, and for silver it is estimated to be 595 grams of pure silver" (Al Qaradawi, 2004).This involves the payment each year for the percentage of two and a half percent of one's capital each lunar year, which in turn prompts continuity and sustainability factors, and it, is thus comprehended to be from a person's growing capital.

THE DESIGNATED RECIPIENTS OF ZAKAT

The recipients of zakat have been determined in Quran by verse 60 in Surat al-Tawba, jurists collectively agree that the distribution of zakat is limited to the eight recipients outlined, and no new group is possible. The Quran says in Surat al-Tawba "The alms (Zakat) are only for the poor (fuqara') and the needy (masakin), and those who collect them (camilun), and those whose hearts are to be reconciled (mu'allafat qulubuhum), and to free the captives (riqab) and the debtors (gharimun), and for the cause of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Allah (fi sabil li Allah), and (for) the wayfarer (ibn al-sabil); a duty imposed by Allah. Allah is Knower, Wise." (Quran. 9:60), among these groups of recipients, the Quran emphasizes the right of the needy and deprived from the share of wealth from those who own it. The Quran further says, "And in their wealth the beggar and the outcast had due share" (Quran; 51:19).

Fuqara and Masakin. 'Al Fuqara' is a plural of 'Faqir' which is an adjective describing the people who are in destitute and people who are in-need and poverty, Al Masakin is also a plural of 'Miskin' means that those who donot have anything to support themselves or their dependents; and hence both terms synonymously describes the people who do not have minimum basic needs to survive which include food, shelter, clothing, and such other needs. In the allocations of Zakat, some jurists emphasized the need of the poor and the destitute above other recipients of Zakat to ensure that religion and life are protected through the fulfillment of basic needs like food, clothing, shelter and health care. (Al Qaradawi, 2004).

Administrators (Amilun). They are the people that are employed by the ruler to facilitate the collection and distribution of zakat. Among them are the collector, writer/clerk, distributor, one who pools various types of zakat collected, and one who knows the target groups, accountant, and keeper. The term used to connote all these workers is normally 'Amil' or in plural 'Amilun'. (Al Qaradawi, 2004).

Al Mu'allafat Qulubuhum. Those whose hearts are reconciled refer to persons whom on receipt of zakat will soften their hearts towards Islam. Some jurists classify them into three categories namely: those who were given zakat by the prophet to soften their hearts towards Islam, those who were given zakat to prevent their vices towards Islam, and those who converted to Islam but their faith are still fragile. As per recent prerogative this term is also used to include those who newly embraced Islam, as an appreciation, and could be spent on their Islamic education (Al Qaradawi, 2004).

Fil-Riqab. Those slaves who make an agreement with master to pay a certain ransom for their freedom. This group comprises debt bonded or contracted slaves, the purpose of zakat payment to this group are to help them pay the debt that bonded them to their masters.

Gharimun. Debtors defined as those whose debt is basically greater than their asset. Further, Al-Qurtubi (2003) defines debtors as those who are saddled with debt and has no means to settle such debt. In Islamic law, debtors who may receive zakat are of two types: those who are in debt due to personal circumstances like having no income to pay for their everyday needs. These debtors according to jurists are ones whose debt and does not own a full nisab if his debts were paid. The majority of jurists view that these include people who own kifaya (their meager incomes are not enough to cover basic necessities)but given the debts that they owe, their wealth will reduce to be below kifaya.

Fi Sabil li Allah. The preferred views among jurists described those that are fighting for the cause of God and do not have sufficient fund to pay the related expenses and also the pilgrims who are in need. Further interpretation of 'Fe sabil li Allah' represents a wider group of recipients, it can further be expanded to include all other deeds that benefits the Muslim society and gets one nearer to God, and that includes building mosques, forts, and burials. In this context, it can be used to build public utilities like hospitals, roads, and educational institutions. And contemporarily since Islam is strong and widely spread, it would be more suitable for this era to use those funds in building people development enrichments, and projects that will alleviate the poor people conditions. In the past few years, the UAE government had invested in compassionate projects in most of the Muslim countries where political instability and poverty exists, like building hospitals in Palestine, and during the holy month of Ramadan (July 2014) the UAE government had patron a benevolent campaign of extending drinking water to the poor provinces in Pakistan and other parts of the world targeting 5 million people.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ibn al-Sabil. This describes someone who is in journey, and not a resident of the state, and who might be in lost contact with his wealth and his home country. According to Malik he considered those in pilgrimage as ibn al-sabil and even if he is rich in his country.

Thus, these groups are based on symbiotic economic and communal concerns of early Muslims. Contributions to other social imperatives in the society in Islam like the Parents (Al Aqrabun), spouse, own children, relatives, ill-people, handicapped, orphans, widows, are all part of piety and Muslims should be contributing towards them sustainably in the form of Sadaqat.

BENEFITS OF ZAKAT AT A MACRO LEVEL

According to Qaradawi (2004), zakat is not purely a worship, for in addition to being a worship it is a defined right of the poor, an established tax, and an ingredient of the social, and economic system of the society". Throughout the Islamic ages, the administration of Zakat was the duty of the leaders, it (Zakat) is said to be the first universal welfare system in human history and the first to introduce a social security system and unemployment benefits during the 2nd caliphate of Umar Ibn Al Khattab, thus zakat was an eco-welfare system which places at its core the reserved right of the poor and their consumption. Linking the historical cornerstones with contemporary business thinking the following socioeconomic benefits of zakat are practically induced.

Fair distribution of wealth and capital resources reduces inflation: Once the zakat becomes obligatory by the state as in a tax system, that will be an imperative in avoiding the hoarding and accumulation of money, and Zakat ensures that money would circulate and reach the poor's hands. Thus money reaches the entire social income pyramid strata's, creating stability in the market and the demand for basic goods increases, this in turn will thus rein back inflationary pressures created at times by the affluent, and finally good market equilibrium would be attained.

ZAKAT obligation by the state increases accountability and governance: Unlike taxation, zakat is a fiscal stream specialized towards poverty alleviation, while taxation is routed to different government spending streams, and furthermore it perpetuates the element of accountability since the recipients are pre-defined, and being an emphatic obligation held by moral values serves to be easily implemented.

Zakat puts forth the investment of capital in human development affairs such as education, which will boost economic growth in the long run, and has been proven to reduce poverty: One of the key milestones the Muslim nations should strive is education for all, and that includes the rights of the poor people in receiving proper rehabilitation and education, and inclusion of those people in intellectual property.

Governments has to patron poor people, and ensure they receive adequate accessibility to government services and receiving fair wages and treatment in the labour market: Zakat and even taxation is the government's most direct tool for redistributing income and those government tools addresses the poverty at a macro/national level, and would help in development planning while setting defined objectives with the help of composite indexes to reach a twin objective of economic growth and poverty alleviation.

Social Equality among people and feeling of equality, and Unity among the society eliminates hatred, reduces crimes, and child-labor exploitation: From a Macro-economic perspective, economic disparity between social groups affects the countries social order, raises inflation, and hence Zakat principles regulates fair circulation and spread of money, and when poor gets better social help and support from the country that that will reduce their stressed minds, and compassion would blossom.

Research: Zakat and Its Socio-Economic Merits

Conducting a research requires fundamental techniques and methods done by using certain research instruments such as in-depth interviews, surveys, questionnaires, and focus groups to address the hypothesis and reach to people consensus. Some academics have defined research as 'an art of scientific investigation', while others like (Cooper & Emory, 1995) defined it as a systematic inquiry aimed at providing information to solve problems.

According to Redman & Mory (1923) research is "a systemized effort to gain new knowledge", while Clifford Woody (1988) suggest that "research comprises defining and redefining problems, formulating hypothesis or suggested solutions; collecting, organizing and evaluating data; making deductions and reaching conclusions; and at last carefully testing the conclusions to determine whether they fit the formulating hypothesis". Thus, it (research) is a scientific and systematic way of carrying out an investigation, it entails the approach, design and tools used to collect and analyze data, which helped in reaching to a conclusion or the objective of research.

This research paper which is our case study, deals with the concept of "Zakat", and puts forwards a distinction and nuance of the values that the zakat rationales. It further synthesizes between the religious practice and underlying values, to ascribe a breadth in positioning zakat as fiscal system rather than a peripheral charity. This research utilized both qualitative and quantitative approach to obtain results in order to reach the research the objectives.

The study was conducted using in-depth interviews, and this was supported by more empirical tools such as a questionnaire, it is exploratory in building theory for the global poverty problem, and infusing the ascribed Islamic fiscal system (Zakat).

Research Philosophy

Research philosophy is an overarching term related to development of knowledge and nature of that knowledge in relation to research. Western scholars hypothesized philosophical paradigms in answering questions such as; the nature of reality which is a branch of Metaphysics imparted by Greek Philosophers such as Parmenides and Aristotle (Ontology), and the nature of knowledge (Epistemology), and axiology which is the study of values, and thereafter other branches of philosophies emerged like hermeneutics and others.

In comparison, Muslims believe in centric existent of one God 'Allah' the founder and creator of the universe, who is eternal. Allah has sent prophets throughout the ages to guide and teach people with his revelation and divine books. Islam attempts to synthesize reason and revelation, knowledge and values, and predominantly reconciling religion with philosophy. Discoveries in the modern era including astronomical, sociological, geological and economical and other spheres of knowledge had been revealed in the Quran 1,400 years ago. In short a Muslim uses the epistemology of 'Allah' which is 'The Quran and Sunnah' to know his 'Ontology'.

Research Strategy and Research Design

Setting a research strategy is essential in assuring time allocation for each chapter and promotes greater precision in the planning process, and helps overcome the research impediments in the best possible way.

"Research designing involves the planning of the research procedures as well as the procedures for data collection and analysis" (Allison, 1995). Furthermore, in research design, there are three commonly used designs for research these are "Qualitative, Quantitative and Mixed Methods" (Laerd, 2010). This study would be using a mixed- method using qualitative and quantitative methods. Thus the research philosophy is a mixture of interpretive (Phenomenological), and Positivist (empirical) that is supported with statistical data, surveys, and questionnaires.

Research Approach Methods

The research approach is deductive in nature, as it posits the zakat revelations and deconstructs the underlying values surrounding it, as this is from epistemological perspective. In the other context, since the zakat in Islamic history used to be an emphatic obligation controlled by the state which is not prevalent in many Islamic countries at present, thus it is also inductive taking the reverse angle in promulgating its importance and trying to revitalize and reconstruct theory.

Research on Zakat Institutions

This study included a sample of Muslim consumers in UAE, the sample had been given a questionnaire to around 200 people, the questionnaires was designed to accentuate what could make the Islamic zakat institution more efficient and productive, and what stimulates the Muslim consumers towards this social responsibility.

The questionnaire consisted of five main questions to instigate our above goals; the questions were designed targeting the core goals of a zakat institution, likewise reflecting the Muslims psychometric behavioural aspects.

The first question perpetuated the importance of electronic payments "what is the most appealing service offered by zakat institutions?" we had an overwhelming 83% of the respondents preferred to charter their contributions through online and electronic payments, that echoed the current trend in United Arab emirates, this is as most of the public sectors in UAE have already carved their services with state of art electronic gateways to facilitate customer online payments, it is also used as a feedback channel, which is very customer centric, and provides arrays of convenience for customers, as it saves times, effort, and money. It also serves as a facilitator for instant feedback and complaints.

The second question dealt with transparency of publicizing the charitable institutions ongoing projects "how far do you see zakat institutions are publicizing their future plans", this was welcomed by almost 92% of respondents, since they found that transparency was a part of good governance. The institutions that offered frequent updates on its corporate, managerial, and operational framework, gained quantum credibility in public, and having more contributors. Recently the UAE had extended drinking water to Tanzania through digging of wells through the Red Crescent and that had covered a significant forty

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

thousand people, worth mentioning that Tanzania is ongoing very poor conditions and scarcity of water and drought conditions.

The third questions had purported the significance of marketing and communication of value with 91% in favor of communicating. When we study consumer behavior among the Muslim nations, we will find that not all discerns the underlying values of zakat and from this stance zakat institution should also be using the latest marketing tools in order to assess their consumer behavior to induce their campaigns in customer's frequent channels and touch points. Accordingly broadcast messages should entice their moral values and create awareness about zakat, and the value proposition should be predicated upon a 'sanctification, a compassion, and a growth in wealth'.

The fourth area of research addressed the issue of using zakat for investment purposes, and is a novelty of this paper. The respondents likewise had given a striking response of 94% for this sustainability approach. As at current, the zakat is only to help the poor and meek with the very basic necessities as a one off help. However supporting the view from a famous proverbial quote 'Give a man a fish and you feed him for a day; show him how to catch a fish and you feed him for lifetime', and using this proverbial quote this study found and further recommends a revolutionary change in the zakat investment starting with rehabilitation of those poor people, offering them health care, and training them on self-fulfillment jobs.

The last question and area of research for this study dealt with how to provide knowledge and information to the younger generation about zakat and instill a philanthropic attitude among them. Various studies have proven that early adolescence-age learning is highly influenced by parents, school, and peer pressures, all having escalating influences on the child's acquired academic and moral behavior. And over the past decades newly proliferated forces came in the picture, and those are the internet and smart phone devices, with a single click young people are able to get quantum information and exchange their ideas.

Hence, using the market segmentation approach, zakat campaigns can target various groups and create appealing messages to them. Furthermore zakat institution should use the latest marketing tactics to broadcast its campaign accordingly, with the use of integrated marketing communication (IMC). For example like a placement of a Billboard on the "Khawaneej Road in Dubai" which is a very common platform for UAE desert safari lovers, with the former signifying a value proposition for zakat, or another placement on a cosmopolitan high way like Sheikh Mohammed Ben Zayed, which is a subtle and easy way of marketing that most people prefers.

CONCLUSION: SOLUTIONS AND RECOMMENDATIONS

Zakat being one of the five main pillars of Islam, according to a study conducted by the Pew Research Center (2011) Islam is the world's second largest religion. In a 2010 study whose results were released in January 2011, Islam has 1.57 billion adherents, making up over 23% of the world population (Pew Research, 2011). With such a vast population covers the corners of the universe, the role of Zakat in alleviating poverty is an achievable objective. As part of the Holy month of Ramadan, His Highness Sheikh Mohammed bin Rashid Al Maktoum, the Vice President and Ruler of Dubai, launched at the start of the Holy month of Ramadan the UAE Suqia initiative to provide clean water to approximately five million people worldwide (Staff Reporter, 25/6/14). Such initiative only goes to prove that an organized and determined procedure can be used to enable Zakat to eradicate poverty one day.

KEY TERMS AND DEFINITIONS

Al Haj: Pilgrimage to Mecca at least one in lifetime, and this is only obligatory on those are able, and having the financial capability.

Al Salat: Is the obligatory prayer and the second pillar in Islam, and Muslims needs to perform prayers five times a day.

Al Sawm: The fourth Pillar in Islam, and is fasting in the holy month of Ramadan by abstaining from food during daylight, by this Muslim closer to the feelings of the poor, having greater patience, and is a great practice by also refraining from hearting the feeling of anyone, in essence not only from food.

Al Zakat: The third pillar in Islam and this is an obligation from the Almighty to contribute a predefined sum of wealth for those having financial means.

Hadith: On the other hand, literally meaning something new that comes out, a saying, a statement, refers to narrations that are attributed to the companions of the Prophet (PBUH) who narrate a statement or a story about the Prophet (PBUH) or related to the Prophet (PBUH). The Hadith has reached us through individual or a few narrators in every generation.

Quran: The sacred book of Islam, and the revelation of Allah (God) to Prophet Muhammad PBUH (peace be upon him), dictated through the medium of angel Gabriel.

Shahada: Is the declaration of faith, and the first pillar in Islam, Muslims core believe; ("There is no god but Allah, and Muhammad is the messenger of Allah").

Sunnah: Literally meaning a path, method, way, contains those religious practices that are established by the Prophet (PBUH) among his companions and have passed to us by the consensus of generations.

Suqia: A benevolent contribution by the United Arab Emirates to provide clean water to approximately five million people worldwide.

Chapter 27
A Crowd-Funder Value (CFV) Framework for Crowd-Investment:
A Roadmap for Entrepreneurial Success in the Contemporary Society

Payal Jain
University of Northampton, UK

ABSTRACT

Crowd-funding is used by business and social entrepreneurs to fund projects that impact society in many ways. Although crowd-funders fund and support entrepreneurial projects, stakeholders are less aware of crowd-funder motivations and behaviours towards products/services, which impact on the success of these projects. The purpose of this research, therefore, is two-fold: a) development of crowd-funder value framework for understanding crowd-funder motivations; and b) provision of robust theoretical basis to the construct of 'crowd-funding'. Different social constructs, such as social identity, and symbolic, crowd and relational social capital related to crowd-funding are discussed based on symbolic convergence theory of communication and social identity theory. This framework will act as a roadmap to understand how crowd-funder motivations impact and create value for individuals, organisations and society, and inform how social, environmental and economic value and impact can be maximised through crowd-funding initiatives.

INTRODUCTION

Financiers, financial markets and financial innovation play an important role in social and environmental value creation, with recent financial innovations including - crowd-funding - that helps in democratising finance, enables small investors to become venture capitalists and creates social and environmental value along with economic value for the welfare of their communities (Shiller, 2013; Van Staveren, 2013). Crowd-funding is used as the main informal capital resource that can be used as seed capital or early stage

capital, where angel capital (i.e. private capital from business individuals) or venture capital may not be available (Bains, Wooder, & Guzman, 2014; Tomczak & Brem, 2013; Valančienė & Jegelevičiūtė, 2014). Entrepreneurs, crowd-funders and online platforms utilise different combinations of human, financial, social, economic and cultural resources to benefit society in various ways. For instance, VolunteerMatch provides human resources for individuals and organisations in need (Gerber & Hui, 2013), thus, filling the gap related to human capital in society.

With the introduction of Jumpstart Our Business Startups (JOBS) Act in the US supporting crowd-funding mechanisms and techniques, crowdfunding is increasingly gaining importance in business and society (Dushnitsky & Maron, 2013; Stemler, 2013). There are many national associations of crowdfunding operating in different countries, such as the UK Crowd-funding Association, National Crowdfunding Association of India, National Crowd-funding Association of Canada, The National Crowd-funding Association (U.S.) and the European Crowd-Funding Network (Kshetri, 2015a). Governments of many countries have implemented crowd-funding regulatory mechanisms that vary from country to country, aim to promote social and commercial entrepreneurship (Harrison, 2013; Kshetri, 2015b; Tomczak & Brem, 2013) and are providing financial support for achieving the bigger social, economic, and environmental aims for benefitting the wider communities, thereby, promoting crowd-funding ecosystems in their societies (Kshetri, 2015b; Valančienė & Jegelevičiūtė, 2014). However, although all forms of crowd-funding are supported by governments, equity and lending based crowd-funding are more strictly regulated than donation and reward based crowd-funding in most countries, such as China, India, US and UK (Cumming & Johan, 2013; Kshetri, 2015b; Lehner, 2013). Nevertheless, crowd-funding market continues to grow leaps and bounds, for instance, the UK market for crowd-funding was estimated at £200 m in 2012 and was expected to rise to £300 m in 2013 (Harrison, 2013).

Recent market trends have shown that crowdfunding is increasingly being considered and utilised as a way to fund social and business ventures by business and social entrepreneurs alike (Groves, 2015a; Lehner, 2013). Crowdfunding is still a new concept, especially in the social entrepreneurship field as compared to the traditional forms of investment models, used by entrepreneurs to fund their businesses and social ventures (Lehner & Nicholls, 2014). Business and social entrepreneurs utilise various different business models to create new ventures that impact society at different levels (Seelos & Mair, 2005; Teece, 2010). These business and social entrepreneurs that lack economic capital are increasingly utilising crowdfunding techniques and methods to fund their projects (Acs, Boardman, & McNeely, 2011; Ibrahim & Verlyantina, 2012a; Jiao, 2011) as there are very few individuals with access to funds that operate informally and provide venture-capital to other entrepreneurs (Van Staveren, 2013). Although there are informal venture capitalists that support crowd-funding, driven by social, economic and/or personal motives, few of them share these investment opportunities with friends and families, despite the fact that the costs and risks associated with crowdfunding projects are relatively low than the traditional capital venture projects (Ordanini, Miceli, Pizzetti, & Parasuraman, 2011; Shiller, 2013). The traditional approaches to raise economic capital through loans are considered costlier and difficult to access (Lehner & Nicholls, 2014; Mollick, 2014), which is encouraging social entrepreneurs to benefit from crowdfunding that allow peer to peer lending, equity, rewards or donation, to fund new social ventures aimed at radical change and positive impact on society (Dushnitsky & Maron, 2013; Kshetri, 2015b). Since micro businesses also face similar restrictions to get access to economic capital due to lack of financial history (Ibrahim & Verlyantina, 2012b), crowdfunding serves as a powerful tool for entrepreneurs contemplating to start-up new projects.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Crowdfunding may not replace old systems of financing projects, but is an attractive financing option for entrepreneurs (Feder, 2013a) as it seeks to cater to the needs of present society in unique ways and enable them to scale-up social impact in society (Lehner & Nicholls, 2014). *Crowd-funding* and *crowd-sourcing* are both closely related social constructs and rely on large crowds to participate in entrepreneurial initiatives by providing finance in small amounts to novice and experienced entrepreneurs. Enablers of crowd-funding activity is similar to that of crowd-sourcing and include 7Ps (Burkett, 2011; Dushnitsky & Maron, 2013; Gerber & Hui, 2013; Kappel, 2009; Lehner, 2013; Ordanini et al., 2011; Prpić, Shukla, Kietzmann, & McCarthy, 2015; Nagalakshmi & Sudhakar, 2013; Zheng, Li, Wu, & Xu, 2014). These are:

- **Pool:** Large number of people required to participate in crowd0funding projects to make it successful.
- **Platform:** Presence of web technology and/or a marketplace.
- **Preference:** Crowd-funders must be motivated and interested in the product/service they would invest in.
- **Product:** Crowd-funders provide feedback regarding the product or service in some way.
- **Promotion:** Crowd-funders actively or passively promote the products/services they invest in.
- **Promise:** Crowd-funders are connected and committed to the product.
- **Payment:** Crowd-funders are paid in some form through social, economic or environmental benefits.

Direct and indirect crowd-funding approaches are used by entrepreneurs when they want to reach out to a set of pre-defined crowd audiences directly through appeal for funds on their own platforms, such as a marketplace or website; and indirectly through intermediary platforms for an open call for funds to general public and crowds (Burkett, 2011), thus, expanding their horizons. Crowd-funding platforms (or service agents) are the organisations that help entrepreneurs or project proponents to gain crowdfunding from the crowd-investors, act as intermediaries and help in balancing the demand and supply of the products/services funded through crowd-investment (Ordanini et al., 2011). Crowdfunding can be understood as a two-sided market on a common platform with the crowd-investors on the subsidy side, an intermediary platform provider that provides a common platform for both investors and investees and the fundraiser on the entrepreneur side (Belleflamme, Lambert, & Schwienbacher, 2014; Kshetri, 2015b; Tomczak & Brem, 2013). Crowd-investors pay no fees to the agent, whilst entrepreneurs pay a particular amount of commission, depending upon the amount of funds raised through their crowdfunding platforms (Gerber & Hui, 2013; Tomczak & Brem, 2013), thus, creating value and network effects through enabling interactions among groups and individuals (Belleflamme et al., 2014), which indicates how valuable the project is to the crowd-investors.

Although crowdfunding is being criticised for a tool to become-rich-quickly investment option and fraudulent projects (Gobble, 2012), many benefits of utilising crowdfunding mechanisms to the crowd-investor include accessing tangible and intangible capitals, such as social capital and economic capital (Dushnitsky & Maron, 2013; Mollick, 2014; Zheng et al., 2014), which are not only essential for the operation of enterprises, but also help them achieve success. Although social capital of entrepreneur is found to be critical to the success of crowd-funded projects (Colombo, Franzoni, & Rossi-Lamastra, 2014; Lehner, 2014), multidimensional view of social capital that includes relational, structural and cognitive

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

social capital will impact crowd-funding cross-culturally even more (Zheng et al., 2014). Structural social capital refers to the social interaction, cognitive social capital refers to the shared visions and views of the members of the group and relational social capital refers to the presence of trust between the members of the group (Nahapiet & Ghoshal, 1998; Tsai & Ghoshal, 1998). Since relational, structural and cognitive dimensions of social capital impact upon the value creation within and outside the firms (Tsai & Ghoshal, 1998) and the interaction of crowd-investors results in crowd capital that can be utilised (Prpić et al., 2015), it is important for individuals involved in crowd-funding to utilise social and crowd capital for not only the benefit of crowd-investors, entrepreneurs and crowd-funding platforms, but also the wider public. Crowd-funding platforms can enable crowd-investors belonging to different social groups to interact and come together for a common cause, which can help leverage social capital for utilisation by entrepreneurs in crowd-funded projects (Zheng et al., 2014). Additionally, since crowd-investors involved in crowdfunded projects contribute through time, effort and labour, it is critical to identify and understand the role of stakeholders involved, including crowd-investors and entrepreneurs, to improve the overall crowd-funding process and experience (Valančienė & Jegelevičiūtė, 2014).

Entrepreneurs, however, lack understanding of the motivation and preferences (social and economic rewards) of their existing and potential backers (Dushnitsky & Maron, 2013), which is why this research is essential and timely. Also, since potential and existing backers struggle with the lack of trust for crowdfunded entrepreneurial activity (Colombo et al., 2014; Gerber & Hui, 2013), it is the responsibility of entrepreneurs and campaigners to create value for all those involved that invest in crowd-funding through their projects in different ways. Since crowd-funding is derived from crowd-sourcing, it is a novice concept, especially in developing countries like India (Gerber & Hui, 2013; T. Nagalakshmi And A. Sudhakar, 2013). This is why a theoretical basis of crowd-funding is important and timely to help a comprehensive exploration of the construct of *crowd-funding* by researchers and practitioners in future. The theoretical basis of crowdfunding research will also enable crowd-investors and entrepreneurs to influence approaches to crowd-funding that can be attuned closely to the unmet needs and wants of the crowd-funders and members of society, and provide effective and viable solutions for future entrepreneurs seeking to engage with crowd-investors. Therefore, as further research on crowd-investors is essential for understanding crowd-investor perceptions and motivations about crowd-funding and how crowd-funding relates to social reality, the section below investigates the theoretical basis upon which the construct of crowd-funding is related to society.

THEORETICAL UNDERPINNINGS OF THE SOCIAL CONSTRUCT OF CROWD-FUNDING

Crowdfunding research related to understanding the perceptions of crowd-investors is inspired by *social constructivist* approach as it allows multiple realities to co-exist and develop a common understanding of the concept, idea, motivations or perceptions of stakeholders (Benson, 2001; Lindgren & Packendorff, 2009). It helps in co-constructing reality in social, economic, political and cultural contexts, and utilise various qualitative or quantitative methods of research for understanding the reality subjectively (Sánchez & Loredo, 2009). Sociological crowd theories seem to form the basis of crowdfunding including - symbolic convergent theory of communication and social identity theory – is explored and discussed below in relation to crowdfunding. Convergence culture that refers to the participation of the users in the production and distribution of the product, results in collective intelligence where diverse members

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of a group help in the creation of value (Aitamurto, 2011). Since collective intelligence is present in the collective nature of the public or crowd – it applies to both the concepts: 'crowd-sourcing' and 'crowd-funding'(Jian & Shin, 2014; Prpić et al., 2015; T. Nagalakshmi And A. Sudhakar, 2013) as crowds are considered to be the source of crowd intelligence (Aitamurto, 2011; Lehner & Nicholls, 2014; Rossi, 2014). Convergent theories are based on collective efforts and collective input from a group of people that share a common viewpoint (Allport, 1962; Prpić et al., 2015), which is why the symbolic convergent theory (SCT) of communication is closely related to crowd-funding and its mechanisms.

SCT advocates that the group works in tandem to co-create and co-construct reality that impacts upon the behaviour, beliefs, attitudes, motivations and perceptions of the group and stakeholders involved (Bormann, Cragan, & Shields, 2003). SCT utilises symbols and language to facilitate interaction and understanding of group dynamics, whist impacting upon the communication flow within the group, between groups and outside the boundaries of groups in the public, thus enabling shared meanings to emerge that influences the perception and actions of individuals in the group (Allport, 1962; Dougherty, Mobley, & Smith, 2010). Sharing information between members also leads to the development of symbolic capital, resulting in identity formation of the individual (McArthur, 2015) that influences the perceptions of stakeholders about themselves. Symbolic and cultural capital creates economic value through resource exchange in crowd-funded projects, whilst social capital of entrepreneurs contributes towards the success of the crowd-funded projects (Lehner, 2014), thus, indicating that value creation can be enhanced through collective intelligence and effective utilisation of capitals and resources available to the entrepreneurs. Symbolic exchange between the members of community result in the creation of symbolic value or symbolic realities (Bormann et al., 2003; Ordanini et al., 2011) that help crowd-funders to relate to their preferred brand. Furthermore, crowd-investors that tend to associate themselves with a particular brand that offers them symbolic benefits, help them share common values and/or beliefs, thus, leading them to share identity with the brand (Ordanini et al., 2011). Brand-community members also create shared value, irrespective of the financial support from the users, and are particularly motivated by the learning, identification, and status that identify the members with the brand they associate with (Ordanini et al., 2011). This indicates that the symbolic convergent theory of communication, underpins the construct of 'crowd-funding' as crowd-investors tend to bond with the brand that it supports, and are, therefore, influenced by the its decisions.

In addition to symbolic convergent theory, social identity theory (SIT) bears important implications for crowd-funding. Identity, social or professional, is crucial for crowd-investors and the proponents of the projects alike, and crowdfunding process is contributing to the perceptions and building of social and professional identity (Aitamurto, 2011). Social identity refers to the perception of self in relation to other members of the group to which they may already belong or want to belong to, such as social and cultural groups, for instance - nationality, class, family, culture, and religion - that influence group behaviour and the values of the individuals and the groups (Hauge, 2006). Although the collective effort of the group is important, it is the social identity of individuals in the group that influences group behaviours and these groups possess the potential to become powerful entities, which is why social identity achievement for these groups to gain power through their collectiveness is crucial for achieving social change in society (Jian & Shin, 2014; Reicher, Haslam, Spears, & Reynolds, 2012). Additionally, these crowd-investors tend to help the brand in all its stages: design, development distribution and consumption (Ordanini et al., 2011), thus, highlighting and manifesting the ownership crowd-investors possess when associated with particular projects that depict their social identities. This indicates that *identity* is central to crowd-investors who associate themselves with a particular brand, image or cause and want to become a part

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the project, and therefore, end up supporting these projects (Gerber & Hui, 2013; Zhou, Wu, Zhang, & Xu, 2013). It is, therefore, important to explore the role played by social identity in crowd-investor motivations as it impacts upon the investment choices of crowd-funders.

Social identity Theory (SIT) seems to provide a robust basis for crowd-funder value framework development and facilitates our understanding of the interaction of group members. SIT also forms the basis of cognitive and motivational forces that exists in and between the groups, and discusses the group dynamics and individual self-organisation in a way that joins members of the group with an element of empathy playing a role in and between groups (DeTurk, 2001; Reicher et al., 2012). Social identity of the crowd-funders, therefore, may influence attitudes, behaviours and values of the group and may reflect in the perceptions and attitudes of the crowd-investors not only in a particular group, but also other crowd-funded projects and the public (Jian & Shin, 2014). For instance, crowdfunded projects, such as Sella Band and Kapipal, crowd-investors shared identity in with the projects or proponents in a way that motivated them to invest or donate money for social, personal or economic reasons (Ordanini et al., 2011). According to Porter and Kramer (2006, 2011) shared value is created when the venture or activity benefits both the company and society. Shared value, therefore, refers to the value created by the company when it comes in contact with its stakeholder and the environment (Manning, 2010; Porter, Hills, Pfitzer, Patscheke, & Hawkins, 2012; Porter & Kramer, 2006). This value could be social, financial or environmental that seeks to benefit the company as well as the wider society (Weitzman, 1986). Shared values help in reducing social exclusion and allow heterogeneous members of society to interact i.e. utilise social capital (Strike, 1999), which is confirmed by Putnam (1993) that social capital helps in reducing social inequalities and social exclusion existing within the social structures in society (Manning, 2010; Putnam, 1993). Therefore, social constructs that influence crowd-funder motivations, such as identity and capitals (social, relational, symbolic, and crowd) are inter-related, impact the entrepreneurial activity and are at the very heart of value creation (social, cultural, symbolic, and economic). This indicates that we must explore motivations of crowd-funders in detail to decipher the underlying phenomenon that drives crowd-funding.

MOTIVATIONS OF CROWD-FUNDERS

The role of crowd-funders in improving socio-economic conditions of society is paramount as it is up to the crowd-investors to accord importance, provide development and distribution options and finally, facilitate consumption for the creation of value for organisations, crowd-funding platforms, crowd-investors, entrepreneurs and the public (Ordanini et al., 2011). Improving end-user experience and sustaining the crowd-funded projects are the two main objectives that can be achieved by understanding the motivations of crowd-investors (Gerber & Hui, 2013). Crowd-funded research has better acceptance rates and improved perception of the product in the market due to the level of participation of crowd-investors at all the stages: planning, development and distribution of products (Rossi, 2014). Motivations of crowd-funders are also dependent upon the field of activity in which the project is being crowd-funded, this includes journalism, where fun, belief in freedom of content, self-esteem, understanding, altruism and image are more important for the members of the community (Jian & Shin, 2014). Although, it has been found that crowd-funder motivations are not static and may change over time (Jian & Shin, 2014), it is essential for entrepreneurs to understand the motivations, values, and preferences of their crowd-funders

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

to attract, engage and positively contribute to all the activities related to crowd-funding so as to ensure success of crowd-funded projects (Dushnitsky & Maron, 2013; Vezzoli, Ceschin, Diehl, & Kohtala, 2015).

There are a number of reasons that motivate crowd-funders to invest in crowd-funding projects. The quality of rewards influence crowd-funders to invest in particular projects whilst ignoring others (Hörisch, 2015). Social and environmental value creation are also a deciding factor for some crowd-funders that are interested in community and social cohesion (Perilleux, 2015). Online philanthropic behaviour influences crowd-funders to donate due to the feelings of empathy, sympathy, network and community building, including social identity due to the charitable cause of crowd-funding projects. Online consumer behaviour, such as the ease of online transfer of funds also motivate crowd-funders to donate funds more easily (Gerber & Hui, 2013; Rossi, 2014). Entrepreneurs that possess good credit score are chosen by crowd-funders to invest money in for their projects (Gerber & Hui, 2013). Online peer production, where the crowd-funders increase their interaction or learning process by coming in contact with the members of free online community, also impacts upon the crowd-funders choice of investment in particular projects (Cordova, Dolci, & Gianfrate, 2013; Gerber & Hui, 2013). Increased socialisation, new learning processes, public attention, knowledge and information sharing, social approval and maximisation of community benefit through cooperation result in shared value creation (Bröring et al., 2015; Gerber & Hui, 2013; Rossi, 2014). Additionally, as the motivations of crowd-investor include: reward-collection, self-promotion, social benefits, direct compensation, learning, support others and causes, involvement in community projects and philanthropy (Bröring et al., 2015; Gerber & Hui, 2013; Ordanini et al., 2011), these are also the primary reasons for existing and potential crowd-investors to get involved in projects. Becoming a part of project is a personal incentive for some crowd-investors that facilitate shared beliefs and values exhibited by campaigns (Feder, 2013b). Thus, there are many inter-related factors that influence crowd-investor perceptions and behaviours.

The role of social media, public relations, bloggers, news channels in creating awareness and raising interest can never be less emphasised. Customers that become crowd-funders tend to play different roles depending upon their involvement, such as participator, investor, information sources, social networker, entrepreneur, promoter, agents and financer (Ordanini et al., 2011). Likewise, the role of crowd-investors is no longer limited to that of investors as they also act as promotion and marketing managers for their investments, which is why they engage in virtual communities for collective value creation (Rossi, 2014). As knowledge transfer and knowledge-share between and within groups is facilitated utilising social capital in crowd-funding based social platforms, such as Kickstarter, or third-party social platforms, such as Facebook (Zheng et al., 2014), entrepreneurs utilise social media platforms, such as facebook, twitter, and internet; and utilise media tools and techniques to promote their investments and become successful (Gerber & Hui, 2013). It must, therefore, be emphasised that these social media platforms adopt similar approach to entrepreneurship, which is to understand behaviours, practices and beliefs of their users (Yoo, Choi, Choi, & Rho, 2014) that enable their businesses to run effectively and successfully, therefore, allowing scaling up social and environmental impact in society. Entrepreneurs utilise tools such as project monitoring and tutorials, make audios and videos, and exploit social media platforms such as Youtube and Facebook to reach out to their potential investors (Feder, 2013b; Gerber & Hui, 2013; Ibrahim & Verlyantina, 2012b). It is, therefore, crucial for entrepreneurs to not only gain an in-depth understanding of what underpins shared economy, but also make efforts to undertake strategy-driven marketing campaigns for success of the projects (Dushnitsky & Maron, 2013).

Many strategies are suggested to motivate crowd-funders to invest, and to think strategically and take strategic actions to attract them (Hörisch, 2015). This may include designing and implementing a

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

marketing campaign, such as a compelling video campaign that emphasises the rewards, perks, financial and social aims to excite crowd-funders to invest and attach themselves with the team, product or idea (Dushnitsky & Maron, 2013). In addition, project narratives must be published on the project website, along with using text messaging to engage with their crowd-investors. Since quality of the project and geography also play a role in the success of the project (Mollick, 2014), entrepreneurs must ensure and be more sensitive about the challenges faced by the crowd-investors in trusting and lending money to crowdfunded projects online. The choice of a large number of entrepreneurs, between running a project as for-profit or non-profit entrepreneurial activity, also affect the likelihood of reaching funding goals (Pitschner & Pitschner-Finn, 2014) as Belleflamme et al (2013) found that projects established as non-profit entities were more successful. This resulted in affecting potential shared value (social, economic and environmental) creation and impact in society. Engaging with crowd-funders at all level of crowd-funding project is key and will not only encourage knowledge and mind share, but also lead to the development of pool base and spark communication of common interest, thus, building momentum as early as possible (Bröring et al., 2015; Dushnitsky & Maron, 2013). As crowd-investor motivations are reflected in the typology of crowd-funding models that these investors choose to adopt, select and invest in (Jian & Shin, 2014), various crowd-funding models, are therefore, elaborated discussed in detail below.

MODELS OF CROWD-FUNDING

Crowd-funding models have been used in diverse fields, including entertainment, social entrepreneurship (Lehner, 2013), environment (Hörisch, 2015), renewable energy (Groves, 2015a; Vasileiadou, Huijben, & Raven, 2015), entertainment, music, fashion and recording industry (Kappel, 2009; Tomczak & Brem, 2013), and social finance (Perilleux, 2015). One of the fastest growing crowd-funded fields include real estate, where $1 bn has been invested in 2014 (Cooper, 2015). Crowd-funding models can be divided into two basic forms: ex post facto and ex ante: in ex post facto - crowd-investors are offered a product/service in exchange of funds at the time of investment, whilst in ex ante - the funds offered by the crowd-investors are used for the realisation of the product/service - so that a particular outcome can be achieved (Kappel, 2009). As most of the crowdfunding is ex ante, this model of funding is becoming increasingly popular as it allows investors to become involved in crowd-funded projects early on and receive monetary benefit in return, as is the case with US and European entertainment, fashion, music and recording industry in which fans assume the role of financiers of their artists so that more records can be produced and sold in the market (Kappel, 2009; Tomczak & Brem, 2013). In ex ante, crowd-investors not only play the role of funders but also entrepreneurs that utilise their internal and external social capital and networks to increase the sale of the products in order to increase the impact of their investments (Colombo et al., 2014). For instance, Kickstarter, a crowd-funding platform, displays information on the number of crowd-investors backing up a particular project and the amount of money collected, thus amassing $1 billion in March 2014, thereby, encouraging other investors to support crowd-funded projects more (Colombo et al., 2014; Meer, 2014).

There are two types of ex ante crowdfunding models being utilised in the music and recording industry: the Betting model and the Investment model. In the Betting model, fans receive the rate of return depending upon the album sales that leads them to play the role of advertiser and promoter of the records/products they support, model presently being utilised by the UK based company: Slicethepie (Kappel, 2009; Ordanini et al., 2011). In the Investment model, profits generated through the sales of

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the records are split in a particular ratio between the investors, artists and the company, model presently being utilised by a German company: SellaBond and a UK company: Bandstocks (Kappel, 2009; Ordanini et al., 2011). These models are driven by moral and social character that fans exhibit for their artists as much as it is driven by profit, and there are many state and federal laws that regulate the functioning of these companies (Kappel, 2009)., which is why it is important to understand the value these models offer for organisations, talented individuals (such as artists and writers) and the members of society. Therefore, different models of crowd-funding are adopted by entrepreneurs to fund their projects and offer value propositions to crowd-funders, crowd-funding platforms and the general public (Ibrahim & Verlyantina, 2012b; Porter & Kramer, 2011).

Entrepreneurs that are interested in additional funding or alternative funding consider crowd-funding to raise capital (Rossi, 2014; Valančienė & Jegelevičiūtė, 2014). Crowd-investors not only integrate resources available to them through their networks to create value, but also act as agents to realise projects that would otherwise either not be activated or carried out due to lack of social or economic value (Ordanini et al., 2011). Since there is ambiguity and inconsistency in the way crowd-funding models are being understood and adopted by entrepreneurs for funding their projects (Dushnitsky & Maron, 2013; Harrison, 2013; Hörisch, 2015; Lehner, 2013), therefore, this section below intends to provide a broader understanding of the crowd-funding models presently being used in society:

- **Equity Investment:** Crowd-funders are motivated by social, financial and intrinsic aims and expect a financial return on investment over time (Cordova et al., 2013; Dushnitsky & Maron, 2013). This is considered as real investment with high risks involved and is used to generate additional money for projects (Rossi, 2014). This model is followed by many entrepreneurs looking to invest money in entrepreneurial projects. For instance, Triodos, a renewable company, is owned by 5,000 shareholders and boosted capacity generation by 50% utilises crowd-funding for raising equity (Earley, 2015). Similarly, Trampoline, a finance company, aims to commercialise a software program: SONAR – a product of the London based technology company- that enhances employee's skills by mapping relationships inside the organisation. Trampoline invite bigger investments from individuals with higher net worth, and those who invest become shareholders in the company (Ordanini et al., 2011). Similarly, Crowdcube, a crowd-funding platform for venture capitalists, run a funding campaign to achieve economic value for itself and its crowd-funders. It is regulated by the UK Financial Conduct Authority and is one of the leading crowd-funding platforms in the UK (Parker, 2014; Tomczak & Brem, 2013). This type of funding managed to raise £2.9m in 2012, £ 28m in 2013, and expected to have raised £84m in 2014 in the UK (Baeck, Collins, & Zhang, 2014; Gill, 2015). Also, SellaBand, a German company, allows music artists to record a professional music album funded by the SellaBand community once an artist reaches a minimum investment target(Belleflamme, Lambert, & Schwienbacher, 2013; Burkett, 2011). Sellaband crowd-funders receive some return on their investment in the form of revenue, and to this date, more than 40 artists have recorded their music albums and receive a share of the revenues and a copy of the limited edition of the CD (Harrison, 2013; Ordanini et al., 2011).
- **Peer-to-Peer (P2P) Lending:** Crowd-funders are motivated by financial, social and intrinsic aims, and funds are provided in the form of loan to the entrepreneurs for funding their projects. Crowd-funders may expect a rate of interest on their investments depending upon their motivations (Dushnitsky & Maron, 2013; Rossi, 2014). This type of lending is flexible and may be equity, debt, profit sharing or hybrid (Macaulay, 2015). P2P helps in increasing the liquidity into

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

the market, is regulated by the British Financial Conduct Authority and has received government support in the form of £30 m of investment from the Department of Business, Innovation and Skills (Harrison, 2013). Crowd-funded projects are likely to attract more funding from crowd-investors when they possess good credit scores (Gerber & Hui, 2013; Macaulay, 2015). For instance, Funding circle is one of the leading peer-to-peer lending platforms that supports small and medium sized enterprises (SMEs) in the UK (Cooper, 2015; Macaulay, 2015).

- **Donation:** Crowd-funders are interested in funding these projects as they facilitate increased social participation, and these projects are mostly philanthropic in nature (Lehner, 2013). Crowd-funders are not paid back in equity, perks or monetarily that leads entrepreneurs to feel a sense of responsibility towards crowd-investors (Aitamurto, 2011; Dushnitsky & Maron, 2013). These types of crowd-funding is seen in the traditional non-profit and non-governmental organisations (Lehner, 2013). Donations are based principally on altruistic motivations and intrinsic values than the instrumental ones leading to social change (Dushnitsky & Maron, 2013; Rossi, 2014), allowing the relationship between the donor and the entrepreneur to strengthen (Aitamurto, 2011). An example of donation based crowdfunding is: Kapipal, an Italian company that specialised in Web 2.0 and that allows individuals to act as Kapipalists and investors to act as contributors. Kapiplists create a public or private fundraising page for personal fundraising that includes raising money for medical treatment, birthday gifts and wedding lists, and every contribution from contributors is considered a donation (Ordanini et al., 2011). Besides, donation based crowd-funding can be contribution of time in addition to economic capital as well. For instance, enviroCar, a tool that allows sensor data to be collected from the vehicles of the city in order to reduce traffic related issues, such as pollution, noise and improper traffic lights, was crowdfunded by volunteers and has been very successful (Bröring et al., 2015).
- **Crowd-Sponsoring:** Is used to re-advertise a product/service of an organisation and is used to fund non-profit ventures that has no economic return (Tomczak & Brem, 2013). It is different than donation as in crowd-sponsoring, nothing is expected in return. This type of crowd-funding is in its initial stages and project sponsors are interested in funding individuals that possess expertise, skills in the project and have similar vision as regards the potential of the crowd-funded projects (Zheng et al., 2014). Although project sponsors receive rewards and perks, they not only donate funds, but are also involved in all the stages of project (Bröring et al., 2015; Vasileiadou et al., 2015). For instance, Solar Impulse project, is a crowd-sponsored project that aims to make solar powered airplanes, in which sponsors of the project include: Deutsche Bank and the general public (Tomczak & Brem, 2013).
- **Reward (Also Called Pre-Purchase or Pre-Selling):** Crowd-funders pre-purchase a product/service and are motivated by rewards, perks or social aims that follows (Dushnitsky & Maron, 2013). It does not provide a return on investment, or share in business and projects. They, however, can receive a nominal return in the form of the product/service that allows demand to be generated and regulated, and provides market validation, thus reducing the risk of product failure (Harrison, 2013; Rossi, 2014). Some projects also provide voting rights to the crowd-funders under this model (Zheng et al., 2014).
- **Collecting from Friends, Family, and Followers (CFFF) (Also Called 5Fs: Founders, Family, Friends, Fools, and Fans):** Crowd-funders raise money from close family members, friends and social circles, thus, lowering the initial rate of interest that is required in the start-up phase (Harrison, 2013). Fools in 5F's refers to individuals taking risk with their investment (Dushnitsky

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

& Maron, 2013; Harrison, 2013). The presence of trust (i.e. relational social capital) is found to be key in this type of crowd-funding model and particularly seen in countries where family-friends bond is closely tied, such as China, (Zheng et al., 2014). Kickstarter, a platform based on crowd-funding, has raised more than $1 bn from crowd-funding emphasises that money raised from CFFF has substantially contributed to the success of many crowd-funded projects (Dushnitsky & Maron, 2013).

- **Social Crowd-Funding Finance:** This is a fairly new type of crowd-funding model, where crowd-funders are particularly interested in social, cultural and environmental value creation, scaling social impact investments and provide interest free loans to social entrepreneurs (Lehner & Nicholls, 2014). For instance, Trillion Fund, is the biggest UK' social crowd-funding finance service, providing support to social entrepreneurs in the renewable energy sector in the world (Groves, 2015b). Similarly, Socrowd is a Belgian based crowd-funding platform, and have provided its membership to 700 people. This organisation is considered a social enterprise in itself that is active in social finance (Perilleux, 2015). Social crowd-funding model helps in creating direct and open relationship between the lenders and borrowers as both are aware of community and social benefits that arise from the crowd-funded projects, and therefore, are likely to fulfil their respective responsibilities of a crowd-investor and crowd-investee (Aitamurto, 2011; Perilleux, 2015).

Since, many organisations employ hybrid models of crowd-funding, such as Razoo.com that focuses on US public schools and combine donation based crowd-funding model with peer-to-peer lending crowd-funding model (Dushnitsky & Maron, 2013), it can be argued that crowd-funding, therefore, allows different combinations of models to co-exist in entrepreneurial projects and facilitate economic and social value creation. Moreover, since crowd-investors may directly enable the production and sale of products/services, crowd-investors impact upon every stage of the design, development and distribution of crowdfunded products and/or services (Ordanini et al., 2011), thus, ensuring greater flexibility on the participation in the crowd-funding process. Crowd-investors may involve themselves actively and passively in the crowd-funded projects depending upon their interest and the level of involvement in each project. Active crowd-investors are very involved in projects they invest in, and may engage in business activities, such as product development and testing, providing suggestions and feedback on the product, and promotion of the product/service (Rossi, 2014; Zheng et al., 2014), thereby, impacting upon the outcome and success of the crowd-funded projects. Passive crowd-investors may be interested in the rewards and recognition that their investments provide, but are not much involved with the entrepreneurs and/or the sale, purchase or promotion of the product (Zheng et al., 2014). Horisch (2015) suggests that active crowd-funding includes equity based crowdfunding, whilst passive crowd-funding includes reward and lending based crowd-funding models. Upon the success of the crowd-funded projects, entrepreneurs pay a platform usage fee and payment processing fee (Colombo et al., 2014; Dault, 2014; Gerber & Hui, 2013). Crowd-funding platforms utilise two types of models during the facilitation of crowd-funding (Colombo et al., 2014; Dault, 2014; Gerber & Hui, 2013), these are:

- **All-or-Nothing:** All the funds generated are returned to crowd-investors if the project goals is not met, for instance, used by the crowd-funding platform, Kickstarter.
- **All-or-More:** All the funds that are generated are kept by the entrepreneurs, irrespective of the success of the project, such as the crowd-funding platform RocketHub.

A CROWD-FUNDER VALUE THEORETICAL FRAMEWORK

This section seeks to propose a Crowd-Funder Value (CFV) theoretical framework that is grounded in the sociological crowd theories, and will provide a theoretical understanding of crowd-investor perspective. Crowd-funder value framework, primarily, aims to increase our understanding of how crowd theories are related to crowd-funders; and how research on crowd-investors may impact future entrepreneurial activity and research directly and indirectly. It is argued that such an integrated framework is crucial for primary in-depth understanding of crowd-investor motivations and perceptions for funding projects that will help in setting up and running business and social ventures. Stakeholders will also gain an insight into sociological constructs related to crowd-funding. As crowd-funding is itself embedded within the society as much as business, this framework will add to the existing interdisciplinary evidence based by combining sociology and business in this research. Furthermore, since there is a dearth of research on the perceptions of crowd-funders and the factors that influence their selection of projects, whether depending upon crowd-funding model or crowd-funding platform, at individual level, this comprehensive framework will provide an in-depth understanding of crowd-funder influences on the overall activity of crowd-funding and how it impacts upon the overall well-being of society.

Figure 1 demonstrates a holistic overview of the crowd-funder value framework and intends to show the relationships between values and motivations of crowd-investors, thus, highlighting how crowd-investor motivations contribute towards the creation of societal values (i.e. social, environmental, economic and cultural) in society. Social media also plays a significant role in influencing the motivations of crowd-investors to invest in crowd-funding projects at initial, intermediary and later stages of crowd-funding experience of crowd-investors (Gerber & Hui, 2013; Ibrahim & Verlyantina, 2012a; Padgett, 2014). New crowd-investors are influenced by the formal and informal communication channels to understand and invest in crowd-funding projects, whilst in later stages, the former experience of crowd-investor's guide them to invest in some projects and avoiding others, depending upon their motivations at that time (Colombo et al., 2014; Zachary & Mishra, 2013; Zheng et al., 2014). Crowd-investor motivations,

Figure 1. A holistic crowd-funder value (CFV) theoretical framework

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

therefore, are susceptible to change according to their experiences, knowledge and information that they gain throughout their investment process (Lehner, 2014; Yoo et al., 2014).

The motivations and preferences of a crowd-investor guide him/her to select a crowd-funding model that appeals to his/her intrinsic (such as moral and philanthropic) and extrinsic values (such as economic and material) and is influenced by either his/her own earlier experiences of crowdfunding or through other communication channels (i.e. social media or friends and family) (Dushnitsky & Maron, 2013; Valančienė & Jegelevičiūtė, 2014). It can be argued that social capital and symbolic capital are essential to the development of crowd capital, social identity and relational social capital (that refers to the trust within and between groups). Social identity is formed by individuals in a group, in this case crowd-funding projects, when crowd-investors interact with each other irrespective of the social or cultural groups they belong to, which is why crowd-funding platforms are helpful in bridging the communication gap between crowd-investors belonging to heterogeneous groups (Hauge, 2006; Heere et al., 2013; Reicher et al., 2012; Tomczak & Brem, 2013). Social capital allows interaction to take place online or offline between crowd-funding members that result in developing crowd capital and relational social capital at the same time (Frydrych, Bock, Kinder, & Koeck, 2014; Gerber & Hui, 2013; Yoo et al., 2014). Symbolic capital also contributes through the choice of language and non-verbal communication that helps in the development of crowd capital and relational social capital at the same time as well (Heere et al., 2013; McArthur, 2015; Nakassis & Searle, 2013). Although unpleasant communication between crowd-funded members could affect their relationship, possessing similar aim and vision to invest in a particular project may help overcome the challenges that inhibit crowd-funders to co-create value. Since it has been found that crowd-funders and entrepreneurs co-create value (Colombo et al., 2014; Gummerus, 2013), crowd-funders also play a central role in the value creation process and decision-making process related to crowd-funding activity, in addition to entrepreneurs (Ordanini et al., 2011). It can, therefore, be contested that the elements that enable crowd-investors to relate to crowd-funding and crowd-funding projects include social identity, and the presence of crowd capital, relational social capital and symbolic capital, that impact upon the selection of a particular crowd-funding project by crowd-investors to invest in. The presence of trust (i.e. relational social capital) between the crowd-funders, therefore, will lead to the change in the perceptions, attitudes, values, motivations and preferences of the crowd-funders as well as other stakeholders, such as entrepreneurs, sponsors and crowd-funding platforms, thereby, resulting in the value creation within social, economic and environmental spheres, thus, a step forward towards enabling social change in society.

Crowd-funding is a useful tool that responds to the unmet needs and wants of the public by providing investment opportunities to crowd-investors and through the support and promotion of the entrepreneurial projects. This framework, therefore, intends to emphasise and reinforce the creation of shared value among crowd-funding stakeholders. Since value creation is essential for achieving sustainability in social and economic systems in society (Acs et al., 2011; Gummerus, 2013), the contribution of crowd-funding to achieving value creation for organisations, individuals and society can be seen through multiple projects being undertaken within the realms of crowd-funding in varied sectors. It can, therefore, be posited that stakeholders involved in crowd-funding processes may enhance building of positive social identity, social capital, crowd capital and engender trust through providing support to individual crowd-investors at the project and organisational levels (such as crowd-funding platform level). In addition to providing support, government may help crowd-funders access information that may be useful and essential for crowd-investors in making wise investment decisions at individual level. This framework, therefore,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

simplifies our understanding of preferences and motivations of crowd-funders, so that efforts are made by entrepreneurs, government, policy-makers, investors, sponsors, scholars and crowd-investors themselves to include crowd-investors at every stage of the product development and testing process, so that shared value is generated throughout the crowd-funding process, thus, bringing crowd-funders closer to the crowd-funded products and projects.

A Classic Way to Maximise Social Value and Impact Through Crowd-Funding

Social enterprises lead in the creation of social value and work towards identifying and tackling social problems of society in many ways (J. Austin, Stevenson, & Wei-skillern, 2006). The primary aim of social enterprises is social and environmental value creation and maximisation, whilst their secondary aim is profit maximisation in order to reinvest their profits back into solving social problems of the community (Desai & Ács, 2007; Jiao, 2011). Social enterprises strive to achieve triple bottom line i.e. the creation of social, environmental and economic value for the welfare of the community (Cornelius & Wallace, 2013; Peloza & Shang, 2011; Ruebottom, 2011). This is why social entrepreneurs are considered as social change makers, due to their capability of creating social and environmental value despite resource challenges (J. Austin et al., 2006; Ridley-Duff & Bull, 2011). The success of these enterprises are attributable to their presence in public, private and third sectors and within their local communities (Acs et al., 2011; J. Austin et al., 2006; Dacanay, 2012). Social entrepreneurs are as much as intrinsically motivated as extrinsically to achieve social aims that they continuously look for opportunities that help them become self-sustainable in the long term (Acs et al., 2011; J. E. Austin & Seitanidi, 2012; Jiao, 2011; Porter & Kramer, 2006; Ruebottom, 2011).

Utilising social entrepreneurship model that advocates creation of enterprises primarily for the benefit of society, societal value could not only be created, but possibly maximised. Motivations of crowd-investors to invest in social enterprises vary from social, psychological, cognitive to financial, and may contribute towards the success of social enterprises (Lehner, 2013). Crowd-funding models are being used by social enterprises, some of which provide social finance to entrepreneurs for the creation of social and environmental value in society (Perilleux, 2015). For instance, Trillion Fund, a fastest growing social enterprise in the energy sector, develops projects on renewable energy and utilises crowd-funding to create economic, social and environmental value for individuals, organisations and society as a whole (Earley, 2015; Groves, 2015a). Since social enterprises have a huge potential to positively impact society, it can, therefore, be argued that if social entrepreneurship and crowd-funding model, such as social crowd-funding finance, are combined together, it may be possible to maximise and add societal value for the overall development and welfare of society.

Additionally, the framework discussed above also demonstrated that by adopting social crowd-funding finance model, it may be possible to engage community members and help them become crowd-funders or entrepreneurs, leading to increased community and social cohesion. Moreover, as crowd-funders, the members of society may not only propose and consume a product, but may become the lead users, thereby, leading the product innovation through their expertise and timely anticipation and identification of the future consumer needs (Ordanini et al., 2011). Most importantly, by scaling up investment in social crowd-funding finance model, the power to run and change a society will be transferred back to the crowd-investors and the public that contribute in various crowd-funding models (debt, equity, donation, reward, sponsoring, CFFF and social crowd-funding finance) directly and indirectly in the first place, thus, leading to the possibility of democratic social change in society. The potential of crowd-funding

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

as a powerful tool to systematic social change through community involvement and engagement must not, therefore, be underestimated.

FUTURE RESEARCH AND RECOMMENDATIONS

There are many gaps in the literature related to crowdfunding, some of these gaps are mentioned below. Firstly, in order to understand the motivations of a crowd-investor, it is essential to understand the construct of crowd-funding through the application of social constructionist paradigmatic approach to research. Since, the crowd-investors may possess distinct understanding of crowdfunding, and its application, and may possess common values that these projects exhibit, social constructivism approach to future research will contribute towards exploration, and prediction of motivation, preferences and behaviours of crowd-investors (Hennink, Hutter, & Bailey, 2011). Secondly, there is a need to conduct an in-depth study on social and economic conditions that facilitate or hinder crowd-funding activities to take place in order to ease the investment process for both the crowd-funders and the entrepreneurs in the present society. Thirdly, investigation into the impact of social identity and symbolic capital on crowd-funding and crowd-funder motivations in a real world setting. This research will be useful for understanding crowd-funders in a particular society. Fourthly, empirical exploration and research on the theoretical basis of symbolic convergence theory of communication and social identity theory in relation to crowd-funding will help us expand our knowledge and information base to understand the perceptions and motivations of crowd-investors in detail. Most importantly, further empirical research into the social crowd-funding finance model and social entrepreneurship related to crowd-funding will increase our limited understanding of the social, economic and environmental impact and the factors that influence or hinder these crowd-funded social projects.

CONCLUSION

Crowd-funders play a central role in enabling an entrepreneurial project to be funded, supported and promoted in the community. From the product development and testing through to distribution, crowd-funders are involved in all the key stages actively and passively. Therefore, it is imperative for all stakeholders, including entrepreneurs, sponsors, crowd-funding platforms, and government to understand the perceptions and motivations of crowd-funders to be able to increase their involvement, engagement and responsibly respond to their needs and wants. The crowd-funder value framework posited the need to reflect and consider the motivations and perceptions of crowd-funders during crowd-funding projects at all stages due to the impact crowd-funders have on entrepreneurial activity and the value of their predictions of future societal needs. This research emphasises the need to understand theoretical basis of crowd-funding research by elaborating on the social identity theory and symbolic convergence theory of communication. These theories are not only inter-related but also prove an in-depth understanding of the process of crowd-funder engagement or disengagement. This research argues that social capital and symbolic capital are essential for the creation of crowd capital and social capital, along with building of relational social capital (i.e. trust), which leads to the creation of societal values, such as social, economic, environmental and culture for the benefit of individuals, organisations and society, thus, leading to positive social change.

KEY TERMS AND DEFINITIONS

Crowd Capital: Refers to the social, economic or cultural resources available to a particular group that can be accessed and utilised by its members when required.

Crowd-Funder Value: The value of engagement and involvement of crowd-funders at all stages of crowd-funding due to the potential positive contribution to the investment process.

Crowd-Funding Platforms: A third party service for enabling crowd-funding activity to happen by bringing together crowd-funders and crowd-funders (i.e. entrepreneurs).

Social Enterprise: An organisation that aims to benefit society by undertaking community projects, employing jobless, and looking after vulnerable populations.

Social Identity: The perception of self in relation to others when belonging to a particular group, and the feeling of similarities and differences in relation to others.

Social Relational Capital: The strength in the bond shared with others, and refers to building trust gradually.

Social Value: The social benefit that arises by employing community resources and engaging the members of the community.

Symbolic Capital: Refers to the non-verbal communication and pointers indicating that a person may belong to a specific group, by way of its associations to non-tangible things, such as brand identity.

Chapter 28
Hunger Hurts:
The Politicization of an Austerity Food Blog

Anita Howarth
Brunel University London, UK

ABSTRACT

Austerity food blogs have become prominent as household food budgets have become tighter, government finances constrained, and an ideology of austerity has become dominant. The British version of austerity privileges reducing government spending by cutting welfare benefits, and legitimizes this through individual failure explanations of poverty and stereotypes of benefit claimants. Austerity food blogs, written by those forced to live hand to mouth, are a hybrid form of digital culture that merges narratives of lived experience, food practices and political commentary in ways that challenge the dominant views on poverty. The popular blog A Girl Called Jack disrupts the austerity hegemony by breaking the silence that the stigma of poverty imposes on the impoverished and by personalizing poverty through Jack Monroe's narratives of her lived experience of it, inviting the reader's pity and refuting reductionist explanations of the causes of poverty. Monroe also challenges austerity through practices derived through her personal knowledge gained during her struggle to survive and eat healthily on £10-a-week food budget. This combination of narrative and survival practices written evocatively and eloquently resonate powerfully with readers; however the response to Monroe's blog highlights a deep uneasiness in British society over growing levels of poverty, and deep divisions over who is responsible for addressing it; and more fundamentally, over identifying and defining the modern poor and modern poverty.

INTRODUCTION

The eponymous blog *A Girl Called Jack* tells the story of an unemployed single mother's rapid descent into and rise out of food poverty in austerity Britain. When faced with escalating poverty Jack Monroe sold nearly everything she owned or had been given, moved with her son into a single room in a house share, started feeding the two of them on a shoestring budget using recipes she concocted or adapted, and blogged about her experiences. Monroe is unusual in that her budget recipes were initially created from free emergency relief parcels from her local food bank and supermarket 'value' or 'basic' packs

bought during her £10-a-week food shop because that was all she could afford. Her blog not only includes recipes; it also details daily struggles to survive, and after Monroe's intensely personal account of the pain of poverty went viral, she attracted local, national and international media attention to her blog. Her writing has expanded onto other platforms including a weekly recipe column in a national newspaper, political commentaries in a range of broadcast and online news media, and two books based on her blog recipes. Monroe has also won awards for 'revolutionizing' budget cooking, and rejected an offer to sell her life rights for a Hollywood film. At one level, this is an archetypical narrative of individual triumph over adversity, albeit with a social media angle. At another level, *Jack* challenges the ideology of austerity that became dominant after the 2010 election of a Conservative-led government in Britain, and in particular the valorizing of cuts to welfare benefits, the ascribing of the causes of poverty to individual failure, and the stigmatizing of benefit claimants. Monroe's experiences of the direct effects of benefit cuts and poverty politicized her (Monroe cited in Godwin, 2013). As her financial situation improved with income from writing, Monroe reinvented herself as an anti-poverty campaigner, drawing on her lived experience, a natural eloquence, and the platform that her media profile and sizable social media following gave her.

Jack needs to be understood within the wider context of 30 years of the rise of 'mass poverty' in Britain in which a growing number of people, like Monroe, report missing meals so they can feed their children or because they cannot afford to buy food (Lansley & Mack, 2015; Oxfam UK, 2012). This upward trend is due to a wide range of factors including long-term structural changes to the job market and systemic changes to welfare benefits. Britain's post-war welfare system was based on a normative belief in the role of the state in ameliorating poverty through an inclusive welfare system available to everybody at the point of need from 'cradle to grave' (Field, 2011). The rise in mass poverty coincides with a 30-year 're-imagining and re-constructing' of this conception of welfare (see Clarke, Gewirtz, & McLaughlin, 2000, p. 2), most notably when the 1997 Labour government reconstituted welfare as 'workfare,' restricted benefit payments and made them contingent on 'evidence' that claimants were seeking employment. The 2010 Conservative-led government drew on a new ideological and moral mantle of austerity with its emphasis on reducing the public deficit to expand workfare, legitimize 'the most radical reshaping of welfare policy since 1945' (Hamnett, 2014, p. 490), and further cut benefits. Charities and churches are openly critical of the government doing so at a time of financial crisis (Perry, Williams, Sefton, & Haddad, 2014) and medical experts warn that the government's austerity agenda has reversed 60 years of progress made against food poverty, and that an impending public health crisis is brewing (Ashton, Middleton, & Lang, 2014). While the poorest in society, particularly the unemployed, have been disproportionately affected by these changes (Lansley & Mack, 2015), more generally, household budgets across the country have been constrained by rising global food prices and falling or stagnating incomes. It is in this context that austerity-related blogs and television programs focused on the practices of making cheap, healthy meals have proliferated.

The concern here is with austerity food blogs written by those who due to force of circumstance live hand to mouth (Wren, 2013), and a hybrid form of digital culture that combines narratives of lived experience of poverty, practices developed to survive it, and political commentary. Thus, the blogs provide a bottom-up social history of food poverty at a critical juncture when welfare reform and the age of austerity have converged. Blogs facilitate this history by providing platforms for ordinary people to circulate their narratives of lived experiences, recount daily practices, and comment on wider social developments. Austerity food blogs are distinctive in that they are organized around a central motif of food poverty and surviving it; furthermore, their vantage point of the lived experience of poverty

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

potentially offers alternative views to much political discourse and popular culture. *Jack,* an exemplar of austerity food blogs, resonated powerfully as Monroe made her private trauma public, in so doing disrupting the stigmas and shame imposed on the impoverished. In making visible the vulnerabilities of a mother unable to feed her child adequately, she personalized poverty inviting the pity of readers and their proximity to her subjectivities. In detailing practices she developed to survive, Monroe resisted the stigmatizing of benefit claimants as work-shy, irresponsible, and self-indulgent by politicians seeking to legitimize austerity policies. Monroe grounded these practices in the grinding banality of a daily struggle to survive yet also provided a creative response to poverty in the form of budget yet healthy recipes circumscribed by the financial realities of a £10-a-week food shop and fluctuating food prices. Ultimately, Monroe challenged the ideology of austerity by personalizing the effects of government policies on an individual life and reasserting the role structural change and systematic failures play in acute poverty. As *Jack* moved from relative obscurity on the margins of the blogosphere to center stage, Monroe's ideas and discourses found a broad-based platform from which to mount this challenge.

FOOD BANKS, THE AGE OF AUSTERITY, AND STIGMATIZING THE POOR

Critical to Monroe's survival was her referral to charity-run food banks (Monroe, 2012) that distribute short-term emergency food relief to ameliorate hunger among the poorest in society. Unlike the American and Australian variants, British food banks distribute food directly to those referred by a doctor, care worker or school to take home and cook (Downing, Kennedy, & Fell, 2014). Ten years ago, Britain did not have any food banks but by 2014, the largest food bank operator was running over 400 and opening a further two a week (Perry et. al, 2014). Food banks are a new manifestation of older forms of charitable food provision such as alms for the poor in the Middle Ages and the soup kitchens of the Industrial Revolution and wartime Britain. During the twentieth century this fragmented provision was unified into a welfare system based on normative assumptions about the moral responsibility of the state and the practical application of this in benefit payments for housing, food and health (see Vernon, 2009). However, by the end of the twentieth century these normative assumptions had eroded, the state was withdrawing from its welfare role, and in the early part of the twenty-first century, new forms of charitable provision have emerged in the form of food banks to fill the void. The Government argues that there is no statistical evidence of a link to their austerity policies; however, charities and churches counter that the single biggest reason cited for recourse to food banks are systemic failures, in particular delays, cuts or non-payment of benefits (Downing et al., 2014). The perception of a link is highly sensitive as can be seen in the initial reluctance of parliament to debate the role of food banks (Sedgwick, 2013) and in their prominence in the 2015 general election debates (BBC News, 2014; SNP, 2015). Monroe in blogging about her personal experience of food poverty and food banks has become a key voice in an often emotive and polarized debate about the government's austerity agenda.

The escalation of food poverty in Britain after 2008 coincided with the emergence of a 'default' response across the European Union to the debt crisis. This response is rooted in a neoliberal ideology of austerity based on the normative premise of rebalancing the economy to improve competitiveness, and doing so by reducing the state's budget, debts and deficits through the raising taxes, cutting spending or both (Blyth, 2013a, 2013b). Mark Blyth argues austerity is based on a 'narrative fiction' that reduces the cause of the debt crisis to an 'orgy of state spending' so privileges cutting public spending in response to the economic crisis (Blyth 2013a, pp. 738–739). Notwithstanding the damage caused to the economy

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

and individual lives, the ideology persists, he argues, because of an 'intuitive' or common-sense appeal that the public can relate to, making it easier for politicians to sell benefit cuts—that is, 'you do not spend more than you have' and that 'you can't cure debt with more debt' (Blyth, 2013b, p. 2). The variant of austerity adopted by the Conservative-led government after the 2010 election has privileged benefit cuts over tax rises in ways that chimed with the party's historic ideological commitment to shrinking the welfare state (see Thompson, 2013). Minsters have legitimized these cuts not only through appeals to common sense but also through a moralistic argument that responsible government is prudent and encourages individual responsibility and self-reliance (see Thompson 2013). They present austerity policies aimed at 'capping welfare' and 'getting people back to work' as a manifestation of government rectitude premised on the belief that the cause of poverty is individual failure rather than structural change, so the individual is responsible for addressing their own poverty (see BBC News, 2013; Thompson, 2013).

The individual failure view of poverty assumes that most benefit claimants, of which Monroe was one, are out of work due to their own fault, have not done enough to find work, or do not want to work. This stigmatization also assumes that the welfare system rather than serving as an emergency safety net has created a dependency culture that incentivizes indolence and expects the taxpayer to fund a lifestyle through benefit payments (see Lansley & Mack, 2015). Food banks are seen as a variant of this culture rather than a manifestation of genuine need (Morris, 2013; Morse, 2013; BBC News, 2013). Ministers have used these stigmas to legitimize benefit cuts not only in instrumental terms of forcing people back into work, but also in moralistic terms of acting in the individual's best interest by weaning them off dependency and encouraging self-reliance. British popular culture reinforces this stereotyping by presenting benefit claimants as unable to manage their own finances and enjoying a self-indulgent lifestyle of large televisions, tattoos, and unhealthy diets of cheese, chips and takeaways paid for by the taxpayer (Deans, 2013; Hollows & Jones, 2010; Littlejohn, 2013). Right-wing newspapers further accentuate the polarization of society by distinguishing between the work-shy 'skivers' living off benefits and the hard-working 'strivers' whose taxes pay for benefits (Littlejohn, 2013; Williams, 2013). Recent research has suggested that public attitudes have begun to shift 'into line' with political rhetoric and popular culture in privileging an individual failure explanation of poverty and skepticism about benefits as a 'solution' to poverty (Clery & Lee, 2013). Thus, the moralistic meanings of austerity juxtapose the valorizing of individual prudence or thrift, self-reliance and hard work against a set of stigmas that view poverty in terms of individual failure, dependency, indolence and self-indulgence. Monroe's blog challenges this individual failure explanation which moralizes and stigmatizes the poor.

IDEOLOGY, BLOGS, AND FOOD

This article is based on the premise that the politics of food poverty is rooted in ideological struggle, where popular culture is a key site of engagement, and mainstream media have historically played a central role in circulating and legitimizing or delegitimizing certain ideas and 'realities' over others (Bates, 2001; Block, 2013; Fiske, 1992). Convergence culture highlights the emergence of a more fragmented and diverse media landscape since the 1990s and a multiplicity of different opportunities for content creation that reinforce or challenge existing hegemonies and flow between different platforms (Jenkins, 2006; Jenkins & Deuze, 2008). Personal blogs narrate the lived experiences of ordinary people, chronicling everyday happenings in the blogger's life and capturing their thoughts and emotions on how wider events impact their personal lives (see Tremayne, 2007). Some narrations open 'families, feelings and intimate

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

relations to public politics' in which private trauma and pity made public become 'cultivated ways of knowing' that sit alongside reason rather than supplant or displace it (Jolly, 2011, p. vi). Such narratives offer catharsis for the individual blogger (Nardi, Schiano, Gumbrecht, & Swartz, 2004) or as Monroe expressed it, 'blogging about £10 a week food shop helped me cope with life' (Monroe, 2013c) and they invite strangers to share in the lived experiences and subjectivities of the blogger. Campaigning blogs, which *Jack* becomes, are often premised on the belief that extending and accepting such invitations has the potential to 'serve as vehicles of social and political transformation' (Lénárt-Cheng & Walker, 2011, 141). This belief in the transformative power of lived narratives dates back to the Enlightenment; what is new is a greater willingness and ability to share these lived narratives, an awareness of the 'power of intimacy in individual life stories' and a 'belief in the potential communal effects' of making the private public (Lénárt-Cheng & Walker, 2011, p. 141). Monroe echoes some of this when she says that in attempting to 'explain again and again' that people 'can starve on benefits … [I] find myself a stuck record, plastering my personal circumstances across the media in an effort to make people understand' (Monroe, 2013e).

However, for blogs to be able to do this they need to be widely circulated. Consumers now actively search out new information and, as *Jack* demonstrates, can find it in a multiplicity of ways by reading her recipes or articles on mainstream media or accidentally via a Google search, hypertext links from other blogs or hearing about her on the radio or television. Social media interact with rather than replace traditional media; the latter still playing a critical role in raising the profile of bloggers such as Monroe and bringing their content to the attention to a wider audience (Tremayne, 2007). However, most personal blogs remain relatively obscure with a limited circulation, read by only a handful of friends and family (see Tremayne, 2007). The exception is food blogs, some of which have become 'online sensations turned print bestsellers' with mainstream media constructing celebrities out of previously obscure bloggers (see Denveater, 2009).

That food is able to attract such attention highlights its unique centrality in our lives and the potential for food-related issues to resonate. Food combines biological necessity, commodity, artifact and social relations; but each of these and the interactions between them are encoded with meanings that signify and that can evoke powerful emotions that resonate so reinforce or disrupt existing ideas and beliefs. That is, food is both material and symbolic but it is also ideological, political, and contested. It is not only about buying and selling, creating and consuming the material; food as artifact is a 'highly condensed social fact' (Appadurai, 1988, p. 494) that 'sums' up the individual situation, societal context and the power relations in which it is produced and consumed; in this case of food poverty. In signifying, food serves as 'vehicles' through which the political and cultural ideologies such as austerity are circulated, imposed and resisted (see LeBesco & Naccarato, 2008, p. 1). Decoding food thus draws attention to the hidden meanings and ideologies embedded in artifacts, practices and processes as well as the systems of domination and resistance.

A Girl Called Jack is concerned with a particular set of meanings used to make sense of food poverty and the constantly renegotiated tension between food as political and ideological construct rather than just commodity. Humans must eat to survive yet as omnivores they have discretion over what to eat as well as the creativity and technology to transform selected raw materials into cultural artifacts to be consumed, shared and enjoyed, or captured in the written format of recipes and circulated (see Fischler, 1988). However, food as commodity draws attention to the ideological, political and market relations that circumscribe what individuals such as Monroe can afford, what choices are available to them, so what they can create and, in extreme cases, whether they face a threat to survival. As Amartya

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sen notes, food poverty is not only about supply; 'people starve in front of shop windows full of food' (1983 cited in Douglas, 2003, p. 31) or as Monroe (2013h) put it, 'we went hungry in the world's seventh richest nation.' Food poverty, sometimes called food insecurity[1], refers to an individual's inability to, or uncertainty about, consuming an 'adequate quality or sufficient quantity' of food to meet what a society deems to be the nutritional needs and norms of an adequate or healthy diet (see Dowler & O'Connor, 2012, p. 4). There are no official figures in Britain but studies estimate that as many as one in five Britons have gone to bed hungry (Lansley & Mack, 2015; Oxfam UK, 2012), meaning the majority have little experience of food poverty. The power in Monroe's blogging lay in her narrations of the realities of her struggle to survive in ways that readers could relate to, bringing a proximity to the experience of food poverty. Monroe's personal blog thus provides a platform for connecting at a human level, so challenges the depersonalizing of the poor accentuated in Britain's age of austerity.

A GIRL CALLED JACK: DISRUPTING STIGMAS, CHALLENGING AUSTERITY

Austerity food blogs have emerged out of conditions of austerity and take as their raison d'être opposition to an ideology that has translated under the Conservative-led government into welfare cuts legitimized through an intuitive appeal about affordable spending and particular constructions of poverty based on stigmatizing the poor. The emotional valence of stigmas lies in shame; a co-construction of 'internally felt inadequacies and externally inflicted judgments' (Chase & Bantebya-Kyomuhendo, 2014, p. 5) that lie at the 'irreducible absolutist core' of the idea of poverty (Sen, 1983, p. 159).[2] External shame in Britain is imposed on the impoverished through norms surrounding work in which people are defined by and valued in terms of their job title and material possessions (see Monroe, 2012) and conversely, those out of work are often blamed for their own condition of poverty. Individual failure explanations then stigmatize benefit claimants as 'scroungers' or 'skivers' sponging off the hard-working and thrifty. Social shame is also 'internalized and experienced as a powerful negative emotion that results in social withdrawal and a sense of powerlessness' (Walker, 2014, p. 2). The 'dynamic interaction' in the co-construction of shame serves to silence the voice of the impoverished (Chase & Bantebya-Kyomuhendo, 2014, p. 5) with internalized social shame often maintaining an outward façade of normality (Walker, 2014). The façade hides what in the age of austerity is an 'epidemic of private despair … with no public spectacle to observe' (Chakrabortty, 2015). *Jack* disrupts the co-construction by making Monroe's internalized shame of poverty public, breaking the silence that confines it in private spaces.

Monroe's narratives include the physical experience of missing meals and going hungry, and being cold and wet, but it is in the relating of the trauma of poverty and in particular the pervading emotions of shame and fear, that her blog resonated, inviting pity through the affective. For instance, Monroe recounted her initial reluctance to let family and friends know 'how bad things' were, preferring instead to maintain the appearance of normality (Monroe, 2013e); of 'wanting to sink into the ground' when recognized at a food bank and of the embarrassment in meeting someone's eye when they know 'you are desperate and not coping' (Monroe, 2013k); of having to 'introduce' her son to the pawn shop (Monroe, 2012) and the 'gut-wrenching' fear and humiliation of 'failing as a parent' because she was not able to feed him (Monroe, 2014). While the particularities of her situation may be unfamiliar to most readers, the affective dimensions are not; the emotion of shame in relation to poverty is universal (Walker, 2014) and it is through evoking familiar emotions that Monroe invites proximity. The anecdotes of personal

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

shame and fear become the vehicle through which the reader can identify with, and understand, the 'core' of poverty that Sen identified, and enable *Jack* to disrupt the co-construction of shame, enabling Monroe to challenge the individual failure accounts of poverty.

The challenge is problematic. In resigning from a £27,000-a-year job, Monroe was complicit in her impoverishment, a point her critics have seized upon (see Littlejohn, 2013; Selby, 2014). However, Monroe's narrative of the interweaving of mutually reinforcing factors in her rapid descent into poverty highlighted the reductionism in these criticisms and individual failure explanations. Her counter-explanation of resigning because she could not get childcare cover for her night shifts (Monroe, 2012) drew attention to the changing nature of households and the lack of support for single mothers. In describing 300 job applications that were rejected because she was '"too old"' at 23 … [and] "16-year-olds were cheaper to hire"' (Monroe, 2012, 2015a), Monroe drew attention to the structural changes in the job market that are contributing to a 30-year rise in poverty. In detailing the impact of 'administrative backlogs' and an 11-week wait for housing benefit on her spiraling debt and going to bed hungry (Monroe, 2012, 2013e, 2015a), Monroe drew attention to the material consequences of the systemic chaos that has followed from the austerity reforms. Monroe's challenge therefore is to reductionist explanations of poverty that decontextualize unemployment, assume people are unemployed because they choose not to work and remain silent on the adverse consequences of austerity policies for those struggling to find a job.

Monroe's most vehement challenge is to the state's inaction on, and indifference to, poverty and stigmatizing of food bank users to justify this. So, when government ministers claimed that food bank use is due to 'financial mismanagement' of household budgets (BBC News, 2013); Monroe counter-claimed with a narrative of how delayed benefits payments mean those on very marginal budgets face consequences in spiraling debt from arrears, charges and fees (Monroe, 2015a). When they claimed child poverty is due to irresponsible parenting; she counter-claimed that 'in cutting welfare lifelines' it is the state that is irresponsible in 'sending its children to school, to bed, to work hungry' (Monroe, 2013d). When senior politicians claimed that food bank users were undeserving of 'sympathy' because they were 'just rational opportunists,' and growing demand was due to the availability of 'free food' (Edwina Currie cited Monroe, 2013d) she highlighted factual inaccuracies in their comments and counter-claimed this demonstrated 'a disconnect from reality' (Monroe, 2013g). When MPs voted for a 'bedroom tax' which effectively reduced housing benefit by £16, she drew attention to their '£66,000-a-year-plus expenses salary' and accused them of 'hypocrisy' (Monroe, 2013j). Thus, Monroe constructed the government as 'casting around to blame anyone else' while ignoring the cold face of true poverty in the UK, as irresponsible and neglectful. She thus inverted the moralizing and stigmatizing of government to legitimize austerity, accusing them of financial imprudence, irresponsibility, self-indulgence, and neglect. Similarly, she inverted the social shame imposed on the impoverished, turning it on MPs by asking why they were 'not ashamed' when constituents could not afford to feed themselves (Monroe, 2013f) and why a society is not ashamed when people take back food bank parcels because they cannot afford to heat them (Monroe, 2013h). However, the rolling back of the welfare state by successive governments has seen a rethinking of the normative assumption that the state would be the primary provider of welfare, so the apparent lack of public shame is unsurprising because social norms are shifting. At a practical level, the accelerated shrinkage of state welfare at a time of austerity has left an unfulfilled need that food banks only partly fill because their remit is short-term emergency relief not the addressing of long-term chronic poverty. The popularity of *Jack* is not only due to Monroe's vivid and moving writing; it is also due to her detailing practices she developed to survive.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

GROUNDED PRACTICES: NEW FORMS OF SURVIVAL TECHNIQUES, CREATIVE RESISTANCE

Austerity food blogs are more than narratives of lived experiences and political commentaries censuring austerity policies; they capture, archive and circulate a particular grounded-practice type of knowledge derived from the grinding banality of the blogger's daily struggles to survive poverty on very tight household budgets, and built iteratively and reflexively around routines of grocery shopping and cooking. The knowledge distilled from these changes become new forms of survival techniques, captured and circulated online.

The need for survival techniques has arisen from major social changes since the 1970s. At the same time as a reshaping of welfare, there has been a reshaping of British households and the social norms of eating in the home. The growth in single-parent families, working mothers, busier lives and the loss of stigma attached to convenience food has seen a dramatic increase in ready meals (Craven, 2013; Purves, 2013) to the extent that '"as a society we have lost our ability to cook"' (Baronness Anne Jenkin cited in Elgot, 2014). A cross-party parliamentary inquiry into 'feeding Britain' concluded that across the demographic spectrum there has been a loss of basic skills in how to shop on a tight budget and how to prepare and make a 'meal from scratch,' leaving many households ill-equipped to survive financial crisis (All-Party Parliamentary Inquiry, 2014). Monroe's transformation of a diet from living on cheap processed ready meals and little fruit and vegetables followed from her reflections on how their diet had 'led to poor sleep patterns, a constantly hungry child and ... spots [on her face]' (Monroe, 2013a). She decided to 'cook meals from scratch' based on her £10-a-week food shop because that was all she could afford.

The starting point of the transformation was Monroe's £10-a-week food shop, and her recipes detail a range of different techniques developed to maximize the benefits of what she could afford. The weekly shop became a carefully planned operation of stocktaking, online pricing of the cheapest and healthiest products (Monroe, 2015b), and a set of survival techniques for living on very small margins that also draw attention to the grinding banality of decision-making when a rise of 6p in the price of a jar of jam makes it unaffordable. Monroe's shopping practices are also consistent with the intuitive appeal of austerity, that is, that people do not spend more than they have, but in coming from a benefit claimant, it subverts the political ideology and challenges the assumption that certain beliefs about prudence are Conservative rather than more common ones.

Monroe started by collecting the ingredients off the back of a Lloyd Grossman sauce jar and from there created her own distinctive cuisine based on supermarket 'value' packs of vegetables and beans, chickpeas and lentils as staples. Her Internet research identified kale and spinach as particularly high in nutrition relative to cost and so feature in many of her recipes. They also capture the very tight margins that Monroe was working to with an average price-per-portion of 50p and, unusually, many of the recipes include price-per-portion making it easier for readers to substitute ingredients based on their own budgets. What she found to her 'surprise' was that 'my £10 a week budget extends to home baked breads ... wholesome protein-packed soups, winter warming casseroles and curries ... piles of fruit and vegetables' and she 'fell in love with home-cooked food again' (Monroe, 2013a). The recipes on *Jack* are thus the antithesis of the unhealthy 'chips and cheese' diet of the poor stereotyped in popular culture, and the antithesis of associations with austere Victorian gruel. Monroe also tapped into the wider green food and environmental movement out of necessity, shopping at her local supermarket because she could walk there, and, mindful of cooking on more expensive metered electricity, her recipes are fuel efficient, taking under 15 minutes to cook. She started to grow the herbs in pots in her kitchen, and in some of her

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

interactions with readers of her blog, Monroe explored the feasibility of growing her own courgettes, tomatoes or peppers in a pot (see Monroe, 2013a). All her recipes can be made on the one-ring cooker or microwave common in cheap rented accommodation (All-Party Parliamentary Inquiry, 2014) and are thus the antithesis of the celebrity chef budget cooking shows which tend to be fuel inefficient and dependent on ingredients and equipment that are more expensive than that used by Monroe. Thus, the recipes that emerged out of Monroe's lived experiences and new forms of survival techniques shaped by the particular conditions of modern poverty become a form of creative resistance that 'revolutionized' budget cooking in austerity Britain. Not only are printed copies of her recipes handed out at food banks, they are also included in some of the free cooking classes the operators run (All-Party Parliamentary Inquiry, 2014) and led to Monroe winning a number of prestigious awards (Norton, 2015), bringing an institutional validation to her grounded practices if not to her resistance.

Monroe resisted stereotypes of benefit claimants as indolent and self-indulgent by detailing practices she developed to cope; based on prudence rather than profligacy and self-indulgence; individual responsibility rather 'scrounging'; and tight financial management of household budgets rather than the mismanagement that ministers assume to be behind the need for food banks. The grounded practices detailed capture the grinding banality of a daily struggle to survive yet also constitute a creative response to her situation. What *Jack* does is capture a range of survival techniques honed through personal knowledge and experience.

RESONATING NARRATIVES, CONFLICTED SYMBOL

The narratives on *Jack* resonated with many readers because they invited pity and offered a way to identify with Monroe's subjectivities; while the recipes offered grounded practices and techniques to survive on very low budgets (see Adams, 2014; Butler, 2013; Clay, 2013). The power of Monroe's grounded practices lies not only in the institutional validation afforded through awards, but also in their popular validation as widening circulation shifted the blog from relative obscurity on the margins of the blogosphere to center stage. Alerts about Monroe's latest recipes include some of the Guardian's most viewed tweets; her social media following has expanded from 10 in 2012 to over 60,000 on Twitter before she shut it down; 3300 on Instagram; over 47,000 'likes' on Facebook; and 3000 email subscribers. Journalists have labeled her a 'fledgling social media celebrity' 'Britain's austerity celebrity' (Altman, 2014; Bennhold, 2014; Clay, 2013) and the 'face of modern poverty in Britain' (Butler, 2013); a representative of the impoverished or symbol of resistance to government policies of cutting benefits. But what does this mean?

In disrupting the silence that the stigma of poverty imposes, and in making her vulnerabilities public and visible, Monroe has become a conflicted symbol. Supporters and sympathizers construct her as providing valuable insights into realities of modern poverty; a voice for those who have similar experiences to Monroe but lack the eloquence or platform she has; or someone who could '"be anybody's daughter"' (Bennhold, 2014). Skeptics question whether someone whose experience of poverty, albeit acute, was limited to two years can speak for the long-term unemployed and impoverished (see Hinsliffe, 2014). Critics on the left view her as a ''hero' of the middle classes not the poor,' representing the 'unholy trinity of modern leftist values—thrift, subsistence and health' rather than benefit claimants (Slater, 2014). While critics on the right reiterate the individual failure argument suggesting Monroe brought poverty on herself by giving up her job, and see her as emblematic of benefit culture in which hardworking taxpayers are 'forced to subsidise those for whom claiming benefits is a '"lifestyle"' choice' and which

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

government is trying to dismantle (Littlejohn, 2013). They too see her as distant from 'ordinary people' not because she is articulate, but because her recipes include kale, which is 'too posh,' and red wine which is too extravagant for someone who is genuinely struggling (Hartley-Parkinson, 2014; Littlejohn, 2013; Monroe, 2013c, 2013i). Thus as much as Monroe's narratives and grounded practices resonated, resisting and disrupting the stereotypes, they also exposed quite profound deep ideological divides in Britain. As much as she is 'loved' by many; she is 'loathed' (Adams, 2014), but that says more about the toxic politics of food poverty in Britain than it says about Monroe herself.

CONCLUSION

This article has used *Jack* to explore a new type of hybrid blog that merges narratives, practices and political commentary, and emerged in the particular context of the convergence of a shrinking welfare state and a dominant ideology of austerity, rising levels of food poverty, new forms of food banks to provide emergency food relief, and tighter household budgets generally. The preoccupation with how to survive austerity has seen a proliferation of new cultural forms on mainstream and social media that privilege thrift and budget cooking. Austerity food blogs are distinctive, written by those who forced to live hand to mouth and take as their dominant motif food poverty, and therefore provide valuable insights into the subjectivities of Britain's modern poor and the ways in which they disrupt and challenge the dominant ideology of austerity and explanations that view poverty in moral terms of individual failure. Monroe disrupted these by breaking the silence that external stigma and internal shame impose on the individual; in making public her private trauma she personalized poverty, inviting the pity of the reader and proximity to her subjectivities. Her personal narratives challenged the reductionism in dominant explanations by suggesting multiple factors contributing to spiraling poverty; her recipes derived from grounded practices of learning to live healthily on a very tight budget offer a new range of survival techniques and a creative resistance that defies stereotypes of what poor people eat. The response to *Jack* has been phenomenal in terms of Monroe's mainstream and social media profile, and the opportunity it has afforded her to rise out of poverty, forging a new career; one she never anticipated when she started blogging. For researchers, austerity food blogs are a rich source of material. The narratives of living with food poverty, the practices developed to survive it, as well as the wider public response to the blog offer social insights into the subjectivities of food poverty. While *Jack* resonated powerfully, the challenging of austerity highlights a fragmented public conversation about what the blog and recipes symbolize as well as more fundamental questions as to who the modern poor are and what modern poverty is.

ENDNOTES

[1] Civil society organizations increasingly use the term "food poverty" but it lacks a consistent and agreed definition despite established definitions in research literature. The term "food security," while employed in policy circles, has yet to translate into public discourse (Lambie-Mumford & Dowler, 2014, p. 1421).

[2] Credit is due here to the editor of *IJEP*, Dr Yasmin Ibrahim, for drawing my attention to this point about shame, the silencing effect it has and its significance therefore for austerity food blogs.

This research was previously published in the International Journal of E-Politics (IJEP), 6(3); edited by Mehdi Khosrow-Pour, D.B.A., pages 13-26, copyright year 2015 by IGI Publishing (an imprint of IGI Global).

Chapter 29
Lorenz Curve, Gini Coefficient, and the Income Inequality in Turkey in the Last 13 Years

Sema Bölükbaş
Yıldırım Beyazıt University, Turkey

ABSTRACT

Today income inequality and poverty are among highly disputed issues all over the world. It has been well understood that this problem can not be solved only with economic growth. Some social policy implementations conducive to redistribute the national income are essential to create a decrease in social and eceonomic inequalities. This is also true for Turkey. In last decade Turkey has managed high growth rates, budget discipline and improved some basic public services. As a result, absolute poverty rates decreased considerably. Although Turkey's welfare regime is going through a serious transformation process with effect of EU accession process, these policies have not been able to reduce relative poverty rates and income inequalities. Consequently Turkey's last decade is marked by high gini coefficients and income inequalities. It is obvious that there is a great need to develop a welfare regime which is able to establish a fairer income distribution.

INTRODUCTION

Income inequality and poverty are among the most important problems awaiting a solution in Turkey as well as in the world. In order to realize their goal to attain the life standarts in developed countries, developing countries have to distribute the blessings of the eceonomic growth fairly among societal classes and individuals. The most important indicators that show the level of the fairness of this distribution are income distribution and poverty data.

The final aim of economic policies is to increase the level of welfare of all indiviuals and classes in a society. The most important way to analyse the change in the welfare of individulas and societies is to follow the changes in the statistics of income distribution and poverty. Although the increases in the growth rate and income per capita provide a general opinion about the change in the level of welfare,

income distribution and poverty are the main indicators that should be taken into consideration in the assessment of the welfare distribution between different social classes and individuals. Even though the problem of income inequality and poverty has been on the agenda of societies all the time, it has had a special importance during the industrial capitalism which emerged after the industrial revolution (Çelik, 2004), after which wages didn't increase as much as profits and even decreased. This made the distribution problem more apparent and pressing leading to enormous social unrest and ideological conflict (Çalışkan, 2010, cited from Aksu, 1993).

After the era in which welfare state is prevailent following the World War II, in 1980's, economic theory dealt with long term economic problems such as growth and capital accumulation, and it was suggested that the problem of poverty and income inequality would be solved automatically with the economic growth. In this process similar tendencies came up in Turkey, too. But the increase of poverty and deterioration of income distribution especially in the developing countries led the problems to be seen as significant as economic problems. Today this issue is among the problems threatening social peace and waiting an urgent solution. To attain the social peace and stability is up to the social policies which reduce poverty, narrrow the income gap between the rich and the poor. Along with the sense of social state, social policies which enable poor people to benefit from the increase of wealth, occupied the agenda. The understanding of social state aims to enable the all citizens to benefit from the blessings of development as well as to realize the economic growth. (Çalışkan, 2010).

The importance of a peaceful social envirenment and fair income distribution rather than just growth of income is stated by Robert Kennedy as follows:

'GNP takes into account the air pollution, cigarette advertisements, the number of ambulances on the bloody roads, our private door latchs and the prisons set up for those who break these latchs. It includes the disappearence of the trees and the death of the Superior Lake. GNP increases with the napalm production, rockets, and warheads. But it doesn't take into consideration of the health of our families, the quality of the education of our children and their joy in their games. It also remains indifferent to plants where people work with their honor and to the streets where people walk peacefully. In short GNP counts everything except for those that make life meaningful' (Cited by Rifkin, 2004, p. 73).

INCOME DISTRIBUTION AND ECONOMIC INEQUALITY

Income distribution expresses the distribution of income produced during a certain time period in a certain country, between individuals, different social groups and production factors. Income distribution is about the income differentiation and at this point economic and social relations become clearer. In this context, it is said that income distribution is the main explanatory element of an economy (DPT, 2001).

Income inequality indicates the difference between the income shares received by different groups in society. The most important effects of income inequality on the society and economy can be stated as follows:

- The balanced distribution of total income in a country increases the production capacity and provides market expansion. The income distribution determines whether income will be used for consumption or investment, and which products will be consumed. That is, it determines the composition of consumption (DPT, 2001).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

- It is not just a matter of distribution but rather a matter of using resources efficiently in an economy which prompt the economic growth.
- Inequality causes social and political unrest, and this will eventually effect economic growth (Çalışkan, 2010).
- A socially acceptable income distribution is important for a society to move forward with national unity (Kurtipek, 2011).
- Wide income disparities tend to coexist with the underinvestment in human capital that is translated into long-run economic growth. The emprical evidence suggests that there is a high correlation between income and educational level (Thorbecke and Chorumilind, 2002).
- A large body of emprical evidence supports that, other things being equal, the level of income has positive effect on health (Thorbecke and Chorumilind, 2002).
- Income inequality has also effect on violence of macro (political conflict and civil war) and micro level. Income inequality has been found to affect such behavioral outcomes as higher rates of homicide and violent crime (Thorbecke and Chorumilind, 2002).

The Kinds of Income Distribution

There are four kinds of income distribution:

Functional Income Distribution

It is a distribution which classifies the income shares of production factors according to their function in the production process. In other words it is a distribution between wages, interest, profit and rent (Kuştepeli, 2012 cited from Aktan and Vural, 2002).

Individual Income Distribution

It is a distribution which indicates the income distribution between the individuals or households in the society. This kind of distribution considers all individulas equal and does not take into consideration the social class differences.

Per capita income calculated through the divison of national income by population is an example of this measurement (Kuştepeli, 2012).

Sectoral Income Distribution

This distribution categorizes the national income according to production sectors. Sectoral income distribution indicating the income shares of the sectors such as agriculture, industry, service, commercial sectors, provide some information about economic development of the country.

Regional Income distribution

It is the distribution of income according to the people living in the different regions in a country. This kind of distribution points out the differences between the developed and the underdeveloped regions, and is an important source for the policy makers (Kuştepeli, 2012).

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

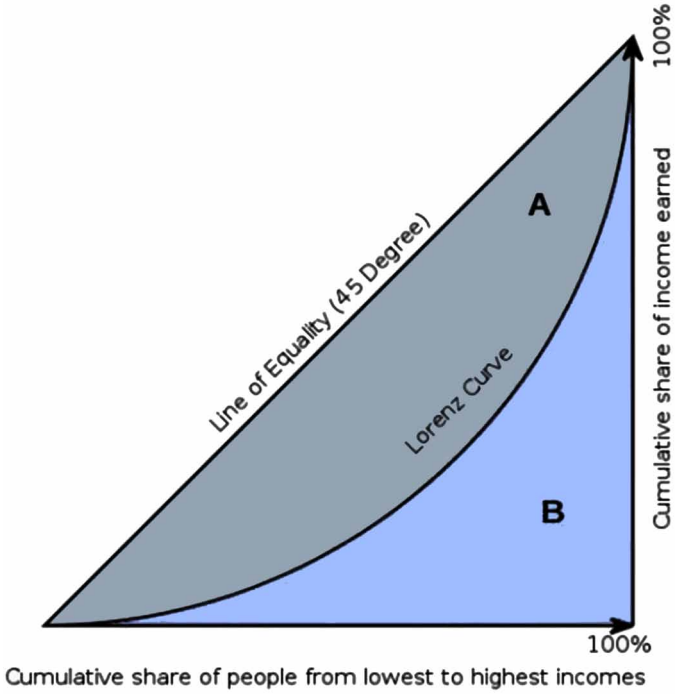
Defining Factors of Income Distribution

Defining factors of income distribution are as follows:

- The ownership of means of production
- The political and economic policies in the country
- The level of public services
- The social-traditional relations
- Labour market, the distribution of labour force, the level of organization of labour force
- The ways for political participation
- The distribution of production factors and their prices
- Education level
- The changes in the world economy (globalization, techonological change etc.)
- The changes in the country's economy (inflation, crises, budget deficits, privatiztion, devaluation etc.)
- The level of democratization
- Unemployment rate
- The location of the country (whether it is in a peaceful or conflictual area)
- The regional integrations.

Measuring Individual Income Distribution

Various measurement ways have been developed to meaure individual income inequlaity. Lorenz Curve and Gini Coefficient are the most important ones. The main purpose of measurement of the income inequality in a country is to stimulate the politicians to apply policies conducive to reduce the inequality and poverty (Çalışkan, 2010).



Lorenz Curve and Gini Coefficient

Lorenz Curve, which is a graphical demonstration that indicates the inequality in distribution of income among population, was developed by an American economist, Max Lorenz, in 1905 (Kurtipek, 2011). The Lorenz curve intersects the endpoints of a square's diagonal. Cumulative shares of income are indicated by percent on the horizontal side of the square (TURKSTAT, 2009). How may people live at the several percentage of income, and how much income they get are represented with the help of the Lorenz Curve (Kurtipek, 2011). If income distributed equally Lorenz Curve will be a line with 45 degree. This line is called perfect equality line. If the curve moves away from the line and becomes dented, it means that there is an inequality in income distribution. Lorenz Curve can be used to show what percentage of a nation's residents possesses what percentage of that nation's wealth (Kurtipek, 2011). The Lorenz Curve lies beneath the line of equality and shows the reality of wealth distribution. The area between the straight line and the curved line indicates the degree of inequality of wealth distribution, a figure represented by the gini coefficient.

As Lorenz Curve gets closer to the line of equality, income distribution becomes more equal and as it moves away from the line, distribution becomes more unequal.

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Lorenz Curve

Lorenz Curve can be used to compare the income distribution of a country at different time points or to compare the income distribution of different countries at the same time point.

There are two main reasons for widespread using of the curve. First, it can demonstrate the individual income distribution without depending on any volatile currency and without considering total national income level. Second, even if it is calculated for a certain part of a society, the results of analyse still makes sense. So, Lorenz Curve is the most understandable, most widespread method among several measuring methods.

Gini coefficient, the most general method for measuring the income distribution, was developed by Italian statistician Corrado Gini. Gini coefficient summarizes the income distribution measured according to Lorenz Curve with a figure. The coefficient is the division of area between the Lorenz Curve and the line of perfect equality (A) by the area which lies beneath the line of equality (A+B).

$$G= A \div A+B$$

Its value ranges from 0 to 1. A gini coefficient of 0 expresses perfect equality (everyone has exactly the same equal income). A gini coefficient of 1 expresses maximal inequality among the population (only one person or household has the total income). Income transfers between the income groups affect the gini coefficient (Kurtipek, 2011).

Income Distribution in Turkey in the Last 13 Years

Brief History

During 1980s liberal economic policies and globalization process caused a fast economic growth besides income distribution inequalities and increased poverty (Akçacı and Kocağ, 2012). Government officials thought that this inequlaity and poverty would reduce with the increase of national income (Çalışkan, 2010). In this process Turkey witnessed three big economic crises in 1994, 2001 and 2008 and each of them aggravated poverty and income inequality rates in the country. TURKSTAT started to hold household surveys in 1987. Before this date, several institutions measured the gini coefficient. To make a comparison between these measurements is a bit difficult as their methods are not same. So, to focus on the TURKSTAT data and make assessment on it is a healtier approach. But as there is no other data we can look at other institution's data cautiously.

When we look at Table 1, we can see that, the situation of income distribution in 1980s deteriorated with the implementation of liberal economic policies after 1980s. In 1987 the poorest 20% percent of population received only 5.24% of total income (a) while this rate was about 50% for the richest 20%. The ratio of b/a is 9,6 in 1987. In 1994 the figures were 4,86% and 55% for the poorest and the richest percentage of population. The ratio of b/a increased to 11, 2 indicating a deterioration in the income distribution. The gini coefficient was 0,43 in 1987 and 0,49 in 1994. This table also shows that between 1994-2002 the income inequality diminished. The gini coefficient in 2002 is 0.44 and ratio of b/a is 9,5. The figures of 1987 are very close to that of 2002. In other words the deterioration between the 1987-1994 is compansated in the term between 1994-2002, and the gini coefficient has the tendency to decrease as low as 0, 38 in 2005. It is a good development but it is not sufficient and it is still too high (Çalışkan, 2010).

Table 1. Individual Income Distribution in Turkey According to 20% Percentage of Population

Source of Data	Year	Percentages of Population					Gini Coefficient	b/a
		The Poorest 20%	Second 20%	Third 20%	Fourth 20%	The Wealthiest 20%

Table 2 shows us the change in income shares of different population groups for different countries in a detailed way.

As we can see from the Table 2, as shares of middle and low income groups decrease, the share of upper income group increases between 1980-1990. In this period it is evident that the lowest income group in Turkey gets poorer more than other lowest income groups in other countries except for Italy and New Zeland. The neo-liberal policies have effected income distribution negatively in all the OECD countries and Turkey is one of the most effected countries. The cause of the increase in inequality is explanied with neo-liberal policies (Bogazici University Social Policy Forum, 2010).

In Table 3, an improvement can be seen in income inequality between 1990-2000 in Turkey. The main reason for the improvement in the income inequality in this period is the rapid loss of income of the top income group. During the 2001 crises the ratio of GNP decrease was 10% (Bilge, 2009). All social groups experienced loss of income in the term between 1990-2000. As we can understand through the Table 3 the top group lost more than the other groups: So, the income distribution became fairer.

Table 2. Avarege Annual Change in the Real Income of Households in the OECD Countries from the Middle of the 1980's to Middle of the 1990's

	The Bottom Income Group	Middle Income Group	Top Income Group	Median	Mean

Source: (Social Policy Forum of Bogazici Universy,2010 cited from) OECD, 2008, Growing Unequal? Income Distribution and Poverty in OECD Countries, s.29

The distribution changed in this period slightly in favor of the middle classes. But the poorest group got poorer again (OECD, 2008).

If we look at the table 4 and 5 for poverty rates, in the both term, the above assessment of income distribution makes more sense. As these tables show, in the both term poverty rates increased.

According to Table 4 and 5, poverty, especially urban poverty, increased considerably between 1987 and 1994, and between 1994-2001. Especially after the 2001 crisis, urban food poverty rate increased seriously from 6,2% in 1994 to 17,2% in 2001. This situation is a result of 2001 crisis which crippled the urban sectors. At the same period relative poverty increased from 15,7% to 21,5% (Bilge, 2009).

When we look at the Turkey's place in the OECD countries between 1950-1998 terms, we can see that Turkey is among the countries having the highest gini coefficient.

Parallel to these figures, Turkey is defined as 'a middle income country with high level income inequality' by World Bank (World Bank, 2005).

The Individual Income Distribution in Turkey in the Last 13 Years

When we look at the gini coefficient and Lorenz Curves for the last years, we observe that there is a decrease in gini values between 2002 and 2005. In 2006, gini value increased again. In 2007 there was a decrease of 0,2, and the share of the quantile from total income is 8,1 times more than the first quantile group. It was 9,5 for the previous year. After 2007, as TURKSAT states there are no significant change until 2011 either in gini coefficient or in the share of groups from total income. The Gini Coefficient is calculated as 0,40 for both 2012 and 2013.

According to the Table 7 the share of the fifth quantile group from the total income is 9,5 times more than the first quintile group in 2002. In the succeeding years this rate reduced to 8,1 in 2007. It is a pozitif development, but it is said that this figure reflects the period before the last crisis, and this reduction occured because of the fact that the share of the fifth quintile group is diminished in the last crisis (Bogazici University Social Policy Forum, 2010). Çalışkan also interprets the tendency of decrease in the gini coefficient and he says that the improvement in the inequality rates between the 2002-2005 is not due to the increase in the income of the poorest group but due to the decrease in that of the wealthiest group (Çalışkan 2010).

The income share received by the poorest 20% of population increased from 5,3% in 2002 to 6% in 2003. This rate didn't change between 2004-2005. The wealthiest group's share was 50% in 2002, and decreased regularly and reduced to 48,3% in 2003, to 46,2% in 2004 and 44,4% in 2005. This reduction in the share of the wealthiest group is the main reason for the improvement in the inequality rates. This reduction in the income share of the wealthiest group was received and shared by the middle income groups. This information shows that income inequality is declined between 2002 and 2005, and the ratio of wealthiest group to that of poorest group reduced to 7,3 from 9,5. This is a good development

but it doesn't emanating from the increase of the income of the poorest group but from the increase in the share of the middle classses. So, it was difficult to say there is an absolute improvement (Çalışkan, 2010). Çalışkan says that the share of the poorest quintile remained stable in 2003-2005 periods, and this demonstrates that in Turkey governmets didn't attach enough importance to social policies which would reduce the income inequality. Because such policies aiming to lessen the income inequality primarily target the lowest income groups.

On the other hand, income and living conditions survey 2006-2013 by TURKSAT shows also the nominal income figures received by different quintile groups.

As we can understand from the Table 8, in 2012 and 2013 there is no serious improvement in the shares of different income groups. Actually the gini coefficient in these years is the same as the one in 2011: 0,40. But there is an important issue to think about. According to the Table 8, although the income

shares remain almost stable, the nominal income figures increase considerably. For example the first income group received 4016 TL on average in 2013 while it receives only 1615 TL in 2006. This situation holds true for the other income groups. So, there is a concrete need to make a distinction between relative poverty rates which is also an indicator of income distribution and absolute poverty rates. OECD (2014), emphasizes that changes in relative poverty referring to the current median income can be difficult to interpret during recessions. In a situation where the incomes of all households fall, but they fall by less at the bottom than at the middle, relative poverty will decline. Therefore, more absolute poverty indices, linked to past living standarts, are needed to complete the picture provided by relative income poverty. This issue is also dealt with by Şeker and Jenkins (2013). They emphasize the importance of the measurement of poverty (absolute or relative) and also use poverty decomposition methods to examine the factors accounting for changes in absolute poverty rates (Şeker and Jenkins, 2013, p. 26). So, the absolute and relative poverty rates should be investigated together. Table 9 shows the absolute poverty rates for Turkey between 2002-2013, while Table 10 shows the relative poverty rates based on the 50% of the median income between 2006- 2013.

As shown by the Table 9 and 10 there is a serious decline in absolute poverty rates although no considerable decrease in relative poverty rates can be observed. Indeed it can be claimed that it is a suc-

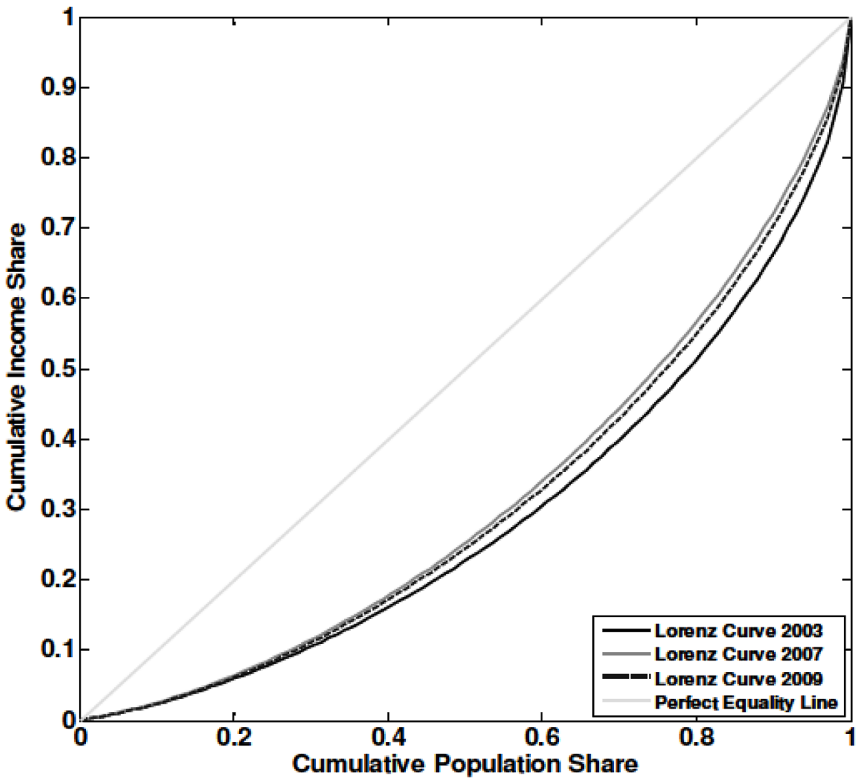
cess for Turkey to decrease the rate of population living below $4,3 per day from 30% in 2002 to 2,6% in 2013. Likewise there is almost no one living below $2,15 per day in 2013. So, how can we assess Turkey's performance about income distribution and poverty alleviation?

To answer this question we can capitalize on the Lorenz Curve by which the situation of the income distribution in a country can be best understood. The changes in the location of the Lorenz Curve in Turkey between the specific years are shown in the figures 2 and 3.

As can be seen from Figures 2 and 3 there is no serious change in the location of the Lorenz Curve in the term 2003-2011, indicating insistently high gini coefficient, namely high levels of income inequality.



According to OECD (2011), Turkey is one of the few countries reducing the income inequality but still she has one of the worst income distribution rates in the OECD. Table 11 demonstrated this in a more detailed way.

So, it can be said that due to the high economic growth and sound economic polices, the absolute poverty rates have declined radically but relative poverty rates have remained almost stable. In the next section we will try to understand the main reasons of this situation.

The Reasons of the Persistence of High Gini Coefficients inTurkey

To be able to understand the reasons of the persistently high income inequality in Turkey, we should first look at the poverty alleviation policies and programs. Because, as it is well known, these policies have the effect of decreasing the income inequalities, too.

There are two different poverty alleviation methods named direct and indirect approach which vary in terms of their implementation and results. Indirect approach emphasizes the improvement of the life conditions of the poor by economic growth. As known, strong correlation between poverty and per capita GDP makes the economic growth the solution of the poverty problem. It can be said that rapid economic growth not only increases the household incomes but also affects the human development indicators by leading to improvement of the basic public services such as education, health, infrastructure etc. (Gündoğan, 2008). The fair distribution of the growth besides the speed of it has an important affect on poverty alleviation. Therefore it can be expected that when the distribution of assets before the economic growth is unequal, these inequalities remain or even increase its negative affcets on poverty (Gündoğan, 2008). Indeed, poverty elimination debates in Turkey focus on economic growth during the crisis periods in spide of the fact that economic growth causes income inequalities at the same time (Arpacıoğlu and Yıldırım, 2011).

In the direct poverty alleviation approach, the programs conducive to solve the problem directly are put into practice. In this approach, state intervenes to the redistribution of income with basic means such as taxes, social security, social assistance, and health and education policies. Along with these political means special poverty alleviation programs are among the fundemantal enstruments of this approach (Arpacıoğlu and Yıldırım, 2011).

The most important ways of intervention to incomme distribution determined by markets are tax policies and social expenditures by state (transfer payments). Governments can levy no or less taxes on low income groups and can increase their disposable income, on the other hand they can lay more tax on the upper income groups to redistribute the national income. Another way of redistribution is to increase the disposable incomes of low income groups by transfering them public sources (Çelik, 2004).

Turkey has managed high economic growth and has tripled the per capita GDP in the last 13 years. So it can be stated that there are serious improvements in terms of direct methods for the poverty alleviation which reflect on the absolute poverty rates. But as Çelik (2004) argues, direct method of redistribution is not employed efficiently in Turkey. So, in Turkey an improvement on the market inequality can not be realized. Şeker (2008) states that the insufficiency of the allocations to the social payments in the budget and the high level of indirect taxes make it impossible to decrease the income inequalities. Furhermore, although there has been an increase in the social transfers, education and health expenditure since 1994 this limited increase can not affect the income inequality by the same rate. When we consider the reasons of this problem it can be seen that the population these transfers can reach is limited. Moreover, social transfer mecahnisms adressing to different needs are insufficient. Although the population reached by these programs increased between 2002-2005, about 30% of the poorest group of the population have no access to any social transfer mechanisms and these amounts to about one million people. Another challenge is that the amount of social transfer can not carry the individul's or household's income above the poverty treshold (Şeker, 2008). In the European Union Progress Report it is stated that a comprehensive reform on the social aid programs could not be realized (Commision of the Eurepean Communities, 2009). OECD points out the inefficient quality of the social transfers regarding redistribution in Turkey (OECD, 2008). According to the OECD report of Society at a Glance 2014, public social spending of 12.8% of GDP in Turkey is substantially lower than OECD average of 21.8%. Most of the social spending is related to health, old age and survivors' benefits, while the support for the working age population is very low (OECD, 2014).

In Figure 4 and 5 we can see the increase in the public expenditures of social security, education and health.

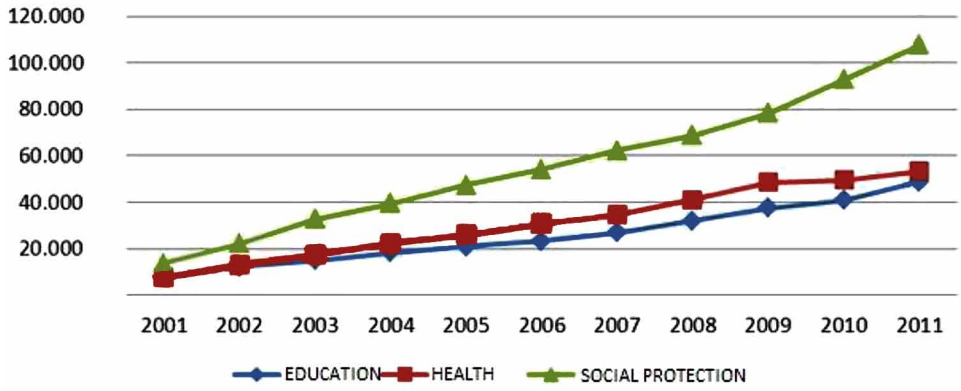
Figure 4. Social expenditures in public sector (million TL)
Source: DPT, http://ekutup.dpt.gov.tr/ekonomi/rip/tr/kamu_kesimi_sosyal_harcama_istatistikleri.pdf



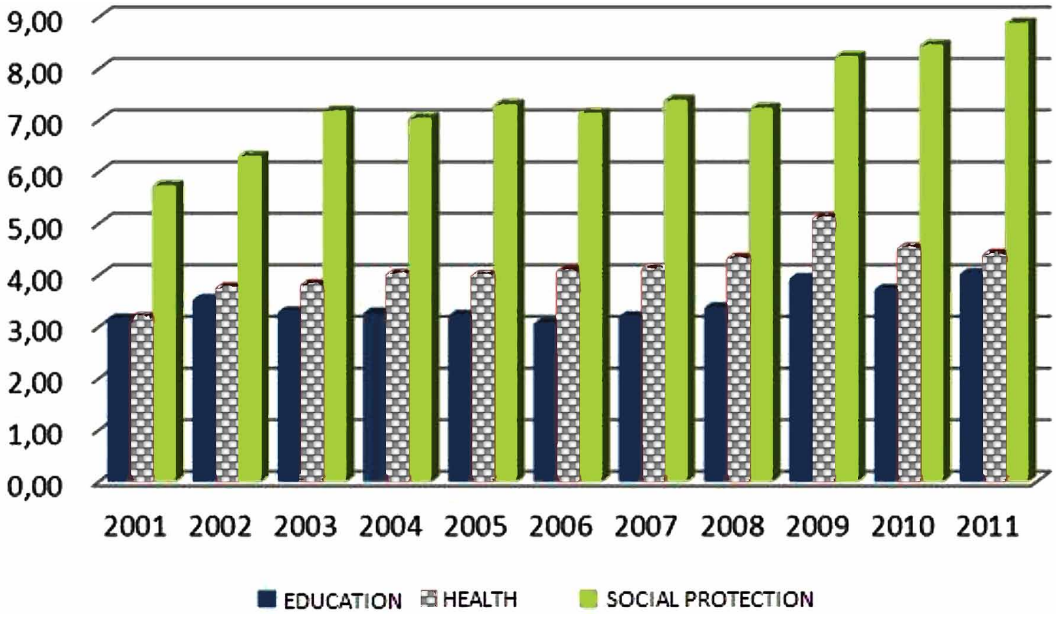


Figure 4 points out that there is an increase in the expenditure of social security, education and health. But these figures are nominal figures. So, to be able to make a healtier assessment, these values should be turned into real values. Figure 5 helps us for this evaluation.

Figure 5 shows that although there is a considerable increase in social security expenditure, there is not such high level advance in education and health. Moreover, as shown in Table 12, when we take into consideration the public social expenditures of the other countries it will be evident that even though Turkey increased its social expenditures in the budget, as mentioned above, it is not sufficient when compared to the both OECD and EU countries.

Figure 5. The ratio of social expenditure in public sector to GNP

It is clear from the Table 12 that there is a long way to go for Turkey to reach the same level of public social expenditure as the other countries.

Another significant factor for redistribution of income is tax rates. The composition of tax revenue is another obstacle for the advance in the income inequality in Turkey. Both direct/indirect tax rates and the composition of income taxes make it impossible to improve the income inequality through taxes, and it deteriorates the inequality further (DPT, 2001). The share of the indirect taxes in the total tax

revenues has increased rapidly (Çelik, 2004). In 2005 it is stated that, the indirect taxes amounted to 70% of total tax revenue.

When we analyse the burden of the excise tax on the different income groups in the society, it comes out that the poorest 20% of the population gives about 23% of their income as consumption tax, while the richest 20% gives only 16%. Consequently tax system in Turkey has no positive effect on the income inequality (Gökşen, Sağlam, Zenginobuz, 2008). This issue is underlined in TUSIAD report and it is stated that there are no efficient tax and social transfer policies which will lessen the inequalities created by the markets in Turkey (Gürsel, Levent, Selim, Sarıca, 2000). In this sense it is evident that one of the most important measures to be taken to decrease the income inequality is to attain fairness and justice through reconstruction of tax system (Bogazici University Social Policy Forum, 2010).

Şeker and Jenkins (2013), examine the poverty rates in Turkey between 2003 and 2011. They conclude that absolute poverty rates declined substantially between 2003 and 2011, while relative poverty changed little. However there were two distinct sub-periods: between 2003 and 2008 when absolute poverty declined rapidly, and between 2008 and 2011, when the decline was small. Their decomposition analyses show that the declines in poverty in both periods are primarily due to the growth rather than redistribution (Şeker and Jenkins, 2013: 26). They argue that Turkey has managed to grow considerably but has not been able to create a substantial decline in relative poverty rates and income inequality. Turkey seems to adopt indirect approach for poverty alleviation, and this caused the absolute poverty rate to decline but relative poverty rate to remain stable. Şeker and Jenkins (2013) also examine the Turkish welfare regime and conclude that in the last years, Turkish welfare regime has been going through a siginificant transformation over the last couple of decades. Especially EU membership negotiations, however turbulent and problematic, have a discernable effect on the welfare regime of Turkey (Aybars and Tsarouhas, 2010). As a matter of fact Turkey has achieved some improvements in the social policy arena, however inadequate. For example since 2002 the share of social assistance in GDP has rised threefold and some programs have been implemented successfully like Conditional Cash Transfer aiming the increase the rate of poor children benefiting from education and health services. With the political stability and budget disipline and economic growth, Turkey also has managed to improve basic social services and increase the share they receive from the budget. Maybe the effect of developing social policies in Turkey can be also understood from the rate of resilient students. According to PISA (The Program of International Student Assessment) 2012 results there is a considerable increase in the rate of resilient students, namely who manage to be successful in spide of their socioeconomic disadvantage. This rate was about 3% in 2003 and exceeded 7% in 2012 (MEB, 2012). It is out of scope of this study to assess the transformation and the effects of the social policy regime in Turkey, but it is obvious that there is a need for much deeper research about the social policy implementations in Turkey.

CONCLUSION AND SUGGESTIONS

Income inequality and poverty are among the most pressing problems in Turkey as well as in the world. It is desirable for all countries to have a fair distribution income. After 1980s, with the introduction of the neo-liberal policies all over the world, it has been thought that income equality could be attained automatically with rapid growth without any public intervention. But, soon, in the developed countries it was understood that the inequalities emaneting from market mechanisms cannot be overcome without

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

public intervention. So, in the developed countries, redistribution mechanisms have been developed and implemented efficiently, especially in the North Eurepean countries.

In Turkey, hovewer, we could not see any such stable social policy aimed to diminish the income inequality, at least until the recent years. The serious changes witnessed in recent years in social policy arena, on the other hand, are not enough to improve the relative poverty rates and income inequality considerably. Governments thought that income inequality would be solved with economic growth. Although there is a serious decline in absolute poverty rates due to the economic growth and some social policy arrangements, when we look at the gini coefficient rates and the Lorenz Curve location, we can see no persistent and substantial improvements. In some certain time periods there is a tendency towards more fair income distribution, but this tendency is not result of a delibarate social policy.

The fact that there is not a considerable reduction in relative poverty rates and in income inequality in spide of high growth rates after 2001, reveals that these problems cannot be solved though the market mechanisims and rapid growth automatically. At the root of the problem, there is the absence of effective policies conducive to redistribute the income efficiently. The current structure of the tax system is increasing income inequality. The arrangements in the tax system allowing redistribution of income, and arrengements raising the effectiveness and amount of social aids and services will prevent the problem to be more complex in the globalization process. To be able to establish a real social state like Western Europe countries there is a need for mentality transformation effecting social and economic policies, leading to redistribution of income more fairly.

KEY TERMS AND DEFINITIONS

Gini Coefficient: Gini coefficient, the most general method for measuring the income distribution, was developed by Italian statistician Corrado Gini. Gini coefficient summarizes the income distribution measured according to Lorenz Curve with a figure. The coefficient is the division of area between the Lorenz Curve and the line of perfect equality (A) by the area which lies beneath the line of equality (A+B). G= A÷A+B.

Income Inequality: One of the most important measures to be taken to decrease the income inequality is to attain fairness and justice through reconstruction of tax system.

Poverty: Income inequality and poverty are among the most pressing problems in Turkey as well as in the world. It is desirable for all countries to have a fair distribution income. After 1980s, with the introduction of the neo-liberal policies all over the world, it has been thought that income equality could be attained automatically with rapid growth without any public intervention. But, soon, in the developed countries it was understood that the inequalities emanating from market mechanisms cannot be overcome without public intervention. So, in the developed countries, redistribution mechanisms have been developed and implemented efficiently, especially in the North European countries.

Social Policy: In Turkey, however, we could not see any such stable social policy aimed to diminish the income inequality, at least until the recent years. The serious changes witnessed in recent years in social policy arena, on the other hand, are not enough to improve the relative poverty rates and income inequality considerably.

Chapter 30
The Effect of Microfinance on Poverty Reduction in Developing Economies

Christopher Boachie
Central University College, Ghana

ABSTRACT

The study explores the contributions of microfinance to poverty reduction. The study used a descriptive design to establish the relationship between sales performance and access to credit in the SME sector in Ghana. Cross sectional survey was used to gather relevant data. The target population was the micro businesses in Madina in Ghana with a sample size of 200. The study reveals that microfinance has a positive impact on micro businesses. There exist a significant relationship between microfinance and sales. It was also found out that, the dependency burdens on micro entrepreneurs coupled with the low credit access from the microfinance institution for productive activities lead them to deploy the credit to meet the demand of both the business and household.

1. INTRODUCTION

It is often argued that the financial sector in low-income countries has failed to serve the poor. With respect to the formal sector, banks and other financial institutions generally require significant collateral, have a preference for high income and high loan clients, and have lengthy and bureaucratic application procedures. With respect to the informal sector, money-lenders usually charge excessively high interest rates, tend to undervalue collateral, and often allow racist and/or sexist attitudes to guide lending decisions. The failure of the formal and informal financial sectors to provide affordable credit to the poor is often viewed as one of the main factors that reinforces the vicious circle of economic, social and demographic structures that ultimately cause poverty. It is imperative to understand the ways in which finance contributes to economic growth and poverty reduction. This provision of funds in form of credit and microloans empowers the poor to engage in productive economic activities which can help boost their income level and thus alleviate poverty in the economy. Microfinance institutions (MFIs) are im-

portant, particularly in developing countries, because they expand the frontier of financial intermediation by providing loans to those traditionally excluded from the formal financial markets (Caudill, Gropper, & Hartarska, 2012). Microfinance is an effort to improve the access to loans and to savings services for poor people. It is currently being promoted as a key development strategy for promoting poverty reduction and economic empowerment. It has the potential to effectively address material poverty, the physical deprivation of goods and services and the income to attain them by granting financial services to households who are not served by the formal banking sector.

Microfinance is an effective development tool for promoting entrepreneurship and poverty reduction. Financial services enable poor and low income households to take advantage of economic opportunities, build assets, and reduce their vulnerability to external shocks that adversely affect their living standards. Yet, much remains unclear about whether, and how, microcredit can help the poor to improve their lives. Answering these questions is particularly important now that the microcredit industry is changing in various ways. Microcredit encompasses many different models and modalities and the evidence on the relative effectiveness and on the role played by different components is limited. One important recent trend has seen increased scale and professionalization leading a number of established MFIs to move from group or joint-liability lending, as pioneered by the Bangladeshi Grameen bank in the 1970s, to individual micro lending. This chapter provides evidence from a randomized sampling of 300 from both beneficiaries and Masloc. The aim of this chapter is to assess the impact of microcredit on the performance of small scale enterprises in Ghana. The paper contributes to the literature on microfinance by answering two questions: what is the impact of microcredit on the performance of micro enterprises in Ghana. How do the micro enterprises deploy the credit? The remainder of this chapter is organised as follows: section 2 discusses the related background on microfinance. It specifically looks at the poverty situation and the use of microfinance to alleviate poverty and its relative success. Section 3 focuses on the field study, section 4 presents the results and discussion and conclusion follows in section 5.

2. BACKGROUND OF THE STUDY

The Concept of Poverty

The definition of poverty, how it is measured and who constitute the poor are fiercely contested issues. In the poverty debate, stands the question of whether poverty is largely about material needs or a much broader set of needs that permit well-being.

Majority of the poor people from underdeveloped countries have failed to achieve the financial services that are being offered by the Microfinance Institutions (MFIs) due to the limited outreach and insufficient capital or financial resources. So, these poor people also failed to get access to health and medication and better education for their children that are the major cause of poverty. So, poor people remain poor due to the unavailability of credit or financial services. A country where poor people lying below the poverty line failed to get access to the basic needs that country is called underdeveloped country, developing economy or third world country. Microfinance becomes a sole solution to reduce or breakdown the wall of poverty. It is a blessing for poor people who do not have income generating activities and have no access to the formal credit system due to the unavailability of collateral (Muhammad, 2010).

Besides these some social resources including availability of accurate and timely information, lack of education, lack of technology and resources, health and medication facilities, social status and recogni-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion and political power are the factors that are also connected with poverty up to some extent. Poverty exist when people failed to get the maximum status and social recognition due to unavailability of assets that become a cause of income generating activities. According to Rahman and Ahmad (2010) poverty has many dimensions that are occurring due to the difference between consumption and income level. Besides these illness and natural disasters like floods, heavy rains and epidemic diseases etc. According to Akram and Hussain (2011) microfinance is a key factor to improve the living standard of poor people of underdeveloped countries. An agricultural cycle is yet another cause of poverty. People that rely on fruits and vegetables they produce for household food consumption often are faced with cycles of relative abundance of scarcity. The period before harvest is always a hungry period for families that rely on subsistence production for survival. During the scarcity periods, these families lack sufficient resources to meet their minimal nutritional needs. Apart from destruction caused by natural events such as hurricanes, environmental forces always cause acute periods of crisis by destroying many crops and animals as well.

It is not enough to define poverty in terms of basic needs only because this is likely to omit other important components therefore focusing at poverty as a single sided problem. It is necessary for microfinance institutions (MFIs) to embrace broad aspects of economic development. The poor are poor because they are poor. Their poverty conditions interlock like a web to trap people in their deprivation. Poverty is a strong determinant of the others. The causes of poverty are many and must be attacked from all fronts to save the poor from the poverty trap. It contributes to physical weakness through lack of food, small bodies, malnutrition leading to low immune response to infections and inability to reach or pay for health services. It also limits or prevents access to resources from the state, legal redress for abuses and ability to dispute wage or interest rates, and only feeble influence on government to provide services for the poorer people and places. They are powerless to demand what is meant for them and cannot attract government aid, schools, good staff or other resources.

Some people take poverty to involve a subjective and comparative terms while others take it to be moral and evaluative. Defining poverty involves the question of whether it is mainly about material needs involving measuring consumption by using income as the main determinant factor, or a much broader set of needs that includes factors of wellbeing. They also have yet another definition as having a multi-dimensional nature consisting of vulnerability, powerlessness and social exclusion in addition to material deprivation. Poverty in many developing countries is largely a matter of not having enough on their tables to eat. Providing the poor with financial services is one way to increase their income and productivity, e.g. through self-employment and thus escape poverty. The section below discusses the use of microfinance to alleviate poverty and its relative success.

Microfinance and Poverty Reduction

The concept of poverty reduction has attracted the attention of some scholars. Empirical studies have identified some variables like inflation, age, household size, health problem, lack of savings and inadequate assets as the major causes of poverty (Taylor & Xiaoyun, 2012; Yusuf, Shirazi, & MatGhani, 2013). Microfinance is an important source of financing for poor, lower income people in developing countries (Nawaz, 2010). It provides these people with the chance to escape poverty and to transform their lives. It is also evident that there is a strong demand for small scale commercial financial services (both credit and savings) for poor and low income people. Access to financial services and the efficient provision of microfinance can help low income people gradually build assets, enlarge and diversify their

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

microenterprises, create jobs, enhance their income earning capacity, increase their income, and smooth consumption (Hossain, 2012). However, the impact of microfinance on poverty is mixed. The positive impact of a microfinance program on income is confirmed by studies such as Silva (2012), Imai and Azam (2012) and Swope (2010). But, some researchers also demonstrate that microfinance programs have a significant and positive impact on household expenditure (Boonperm, Haughton & Khandker, 2013; Berhane & Gardebroek, 2011; Hossain, 2012).

Nawaz (2010) conducted a research to examine the impact of microfinance program on poverty in Bangladesh and confirmed that microfinance programs have positive impact on poverty in terms of income. The study found that microfinance program increases the incomes of members. Imai and Azam (2012) used the propensity score matching method to estimate the impact by using panel data from 1997 to 2004. The results showed that the loans provided by the microfinance program had a significantly positive impact on income and poverty reduction. Swope (2007) demonstrates that microfinance can lead to an increase in income, better nutrition for families, greater high school attendance, the empowerment of women, and the reduction of poverty. Imai, Arun and Annim (2010) also found that microfinance programs significantly and positively affect multidimensional welfare indicators. Hossain (2012) attempts to measure the impact of BRAC microfinance operations on the livelihood of the borrowers of a sample village in Bangladesh by using a difference-in-difference method. The study finds that the household expenditure of borrowers increased significantly after joining the program.

Waheed (2009) evaluates the income improvement of rural borrowers in the Punjab Rural Support Programme (PRSP). The results show that microfinance significantly increases the incomes of the participants. Morris and Silva (2012) assesses the impact of microfinance on household income and saving in Sri Lanka by applying the propensity score matching method. The results show a large positive impact on both income and savings from those participating in microfinance programs. Boonperm et al. (2013) use panel data from the Thailand Socioeconomic Surveys of 2002 and 2004 to evaluate the impact of a VDF on income and expenditure by using the propensity score matching model. Their results showed that the VDF has a significantly positive impact on expenditure, but an insignificant impact on income.). Study by Ghaliba, Malki, and Imai (2014), emphases that Pakistani microfinance has positive impact on poverty alleviation which was manifested in household income and expenditure especially in clothing and health. Microfinance has positive impact on the borrowers' income especially in urban areas in India (Imai, Arun, & Annim, 2010).

To examine the impact of microfinance on the two key poverty indicators of household consumption and housing improvements in northern Ethiopia, Berhane and Gardebroek (2011) use fixed-effects and a random trend model. Their results showed that borrowing indeed causally increased consumption and housing improvements.

In a recent study in India, Banerjee, Duflo, Glennerster and Kinnan (2015) used an RCT approach to evaluate a group-lending microcredit program by a lender to 52 randomly selected neighborhoods. The programme led to an 8.4 percentage points increase in take-up of microcredit. They observed that investments and profits in pre-existing businesses went up and consumption of durable goods also increased. Additionally, expenditures on temptation goods such as alcohol decreased. However, they found no discernible impact on measures of health, education and female empowerment. Similarly, Karlan and Zinman (2010) estimated the effects of expanding access to consumer credit in South Africa by randomizing loan approvals to clients identified by the co-operating lender as being marginally creditworthy. In doing so, access to credit increased borrower wellbeing: incomes increased, food consumption went up and measures of decision making within the household went up, as did community status and overall

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

optimism. In a similar study in the Philippines in 2011 by the same authors, they observed that borrowing increased in the treatment group relative to the comparison group. Furthermore, microloans increased the ability to cope with risk, strengthened community ties and increased access to informal credit. However, the number of business activities and employees in the treatment group decreased relative to that of the comparison group, and subjective well-being also declined slightly.

A similar study of six microfinance programmes in Africa also found substantial qualitative evidence that targeted microcredit for the poor and for poor women in particular enhanced human capital through increased expenditure on consumption, education and related improvements in health. In all the cases studied, microcredit was found to have a positive impact on measures of welfare, with female beneficiaries tending to attach a higher value to the concept of well-being (Arora & Singhal, 2013). Subsequently, the beneficiaries will be able to combat the poverty and satisfy their households' needs independently and consistently. In contrast, microfinance institutions will have the ability to develop their capacity through imposing a small ratio of interest on the given loans.

However, recently the impact of microfinance has been questioned and many studies argue that the impact of microfinance is divergent between positive, no impact and even negative impact (Angelucci, Karlan, and Zinman 2013; Ganlea, Afriyie, and Segbefia 2015; Rooyen, Stewart, and de Wet 2012). The Malaysian microfinance plays an important role in socioeconomic development of poor and low income people especially women (Al-mamun, Mohammad, Mazumder and Malarvizhi, 2014; Al-Shami et al. 2013). Another study by Crépon, Devoto, Duflo and Pariente (2011) evaluated the impact of access to credit in rural areas of Morocco by randomizing the placement of new Al-Amana MFI branches; the authors found no significant impact on measures of health, education and female empowerment. Furthermore, it was observed that microcredit had no impact on non-agricultural businesses. However, for individuals with existing farming activities, access to credit increased the volume of activity. Similarly, individuals with an existing business at the start of the study reduced their consumption and considerably increased their savings. For those without prior business activities, their consumption increased.

Microfinance has been widely recognized as a crucial tool for poverty alleviation and socioeconomic wellbeing. It is shown to have a positive effect on poverty reduction at macro level (Imai et al. 2012), It plays an important role in poverty reduction and socioeconomic development in Sub-Sahara Africa countries (Rooyen, Stewart and de Wet, 2012). The Malaysian microfinance has positive effect of on economic vulnerability among hard-core poor households (Al-mamun et al., 2014).

According to the CBN Report in 2005, the development of credit facilities to serve the poor has been a very beneficial method of eliminating or eradicating poverty (Nsa, 2011). Consequently, the micro finance banks have been acknowledged as a poverty reduction tool which if well managed will reduce the level of poverty significantly.

It is convincingly clear that microfinance has made a significant and positive contribution to poverty reduction in developing countries. It is widely known as a provision of financial services such as credit, saving, deposit, insurance and repayment services to those who are deprived of accessing into conventional financial services because they are poor and they cannot offer collateral. The underlying logic in this success is that through extending financial services, low income people will have the ability to participate in the economic market and exploit entrepreneurial opportunities through start-up new businesses extending current business or introducing new activities.

Annim and Alnaa (2013) used treatment effect approach to estimate the impact of microfinance on poverty reduction in the Upper East Region of Ghana. The results supported the hypothesis that micro-

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

finance has 0.12% poverty reducing effect. Premised on this, it was concluded that even in very poor areas microfinance was capable of reducing poverty.

Hermes and Lensik (2011) investigated the impact of microfinance on poverty and concluded that household's access to microfinance may contribute to a long-lasting increase in income. This according to the authors can be achieved by means of increase households investments in income generating activities and possible diversification of resources, accumulation of resources which will smoothen household consumption, reduce the vulnerability of households due to illness, drought and crop failures, improve better education, health and housing. In addition, it would contribute to an improvement of the social and economic situation of women and have positive spill-over impact. All these research findings in developing economies indicate that microfinance has successfully contributed to poverty reduction

3. FIELD STUDY

Overview of Microfinance in Ghana

Prior to formal banking systems in Ghana, many of the poor, mainly women, and those in rural communities relied heavily on informal banking services and the semi-formal savings and loans schemes (Egyir, 2010). Cooperatives, especially among cocoa farmers of the 1920s, engaged in thrift and credit. The mission of the informal microcredit organizations or microfinance services in Ghana was to provide social and economic support for the less advantaged, especially rural women and their families (Egyir, 2010).

For some, known as Susu, there were weekly meetings, each woman donates a set sum of money to a common pot that is given to one woman each week. When there is an emergency, a participant can withdraw out of turn; otherwise the pot is rotated uniformly until all members are served.

Credit unions were introduced in 1955 when the then Father Peter Poreku Dery, a Catholic priest founded a cooperative credit union in Jirapa in the, now Upper West Region, of Ghana. It followed the German concept developed in 1846. The objective of the credit union was to encourage thrift and savings among member farmers, traders, processors and non-agricultural workers for productive ventures to improve the socio-economic lives of the people. Today, there are 28 African countries where the credit union idea operates. A credit union enables the poorest in a community to save and access loans for income generating activities (Egyir, 2010).

Cooperative Credit Unions were expected to take over some of the lending being made by moneylenders. A number of government financed loans schemes were instituted in the late 1950s with the same aim as well as the general aim of making more finance available for local development. Then in the 1960s special banks, National Investment Bank and Agricultural Development Bank, were established. Commercial banks, notably the Ghana Commercial Bank, also operated rural credit schemes. But rather than giving credit to rural producers, these banks were draining the rural areas of savings, which were invested in the commercial and housing sectors in the urban areas (Asiama & Osei, 2007; Egyir, 2010).

The need for rural banks arose by the turn of the 1970s. It had become clear that existing formal financial institutions, formed with the goal of replacing the perceived harmful informal operators, especially moneylenders, were not meeting the financial needs of the rural poor. The intermediating credit to the rural sector of the economy upon which Ghana's agricultural economy depends; currently contributing 38% of GDP had also been failing to achieve their objectives. Therefore, the first rural bank in Ghana was founded in July 1976 at Agona Nyaakro in the Central region of Ghana. A rural bank is a community

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

owned and managed bank that is mandated to operate within a catchment area of 25 kilometres from its headquarters (Asiama & Osei, 2007). Rural banks have the following objectives:

1. Mobilizing rural savings;
2. Offering credit and other banking services to rural producers;
3. Being an instrument of rural (local) development; and
4. Contributing towards national development.

As more rural and community banks (RCBs) came into operation, the Association of Rural Banks (ARB) was formed to represent and seek their interest. The RCBs were regulated and supervised by the central bank, Bank of Ghana (BoG), from which they also received technical support through the ARB, until an Apex Bank was established in 2nd July, 2002 to play the role that the BoG had been playing. Up to 2002, the reserve requirement of RCBs was set as high as 62%, to enable them benefit from the high yields on sovereign securities and improve their financial standing. This has subsequently been brought down to the current level of 8% in the form of primary reserves plus 5% deposit with ARB Apex and a 30% secondary reserve (Egyiri, 2010).

Thus, rural banks currently need to have 43% of their assets in the form of liquid assets. With the downturn of the Ghanaian economy in the late 1970s and early 1980s, the government in 1983 started implementing a Structural Adjustment Facility from the International Monetary Fund (IMF) to reform key sectors of the economy. By 1986 it was widely accepted that reforms were needed to encourage the development of the financial sector in order to deepen financial intermediation and create new investment instruments, as well as encourage the establishment of new financial institutions that would all go to make the economy much more competitive in the world economy (Asiama & Osei, 2007). The liberalization of the system therefore could not have come at a more opportune time. As part of the reform program to strengthen banks, their non-performing assets were taken off their books and turned over to a new body, the Non-Performing Assets Trust (NPART), to pursue and restructure. A number of new banks were established from the mid-1990s, formal and semiformal microcredit institutions including Womens World Banking and Citi Savings and Loans (Asiama & Osei 2007; Egyir, 2010). All these research findings clearly show that microfinance has indeed contributed positively to poverty reduction in developing economies

Research Design

Different methods were applied in different researches to measure the impact of microfinance operations. Crepon, Devoto, Duflo, and Pariente, (2014) used a method known as 'before and after' scenarios analysis of the borrowers. Others used another method to measure the impact by using member perception (Develtere & Huybrechts, 2002; Akram & Hussain, 2011). Some authors have used income and consumption as dependent variable for the measurement of the impact of microfinance operations (Samer, Majid, Rizal, Muhamad, Halim, & Rashid, 2015). In this study, the earlier method, 'before and after', mentioned above, has been used to assess the impact of microfinance operations of Masloc on the livelihood of the beneficiaries.

This study made use of descriptive design where both qualitative quantitative data was collected using questionnaire and interview. The target population were owners of micro businesses in Madina. The research study covers twenty officials of the Masloc programme and one hundred and thirty beneficiaries

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

of Masloc. However, the basic sampling unit were traders who ply their trade in Madina a suburb of Accra in the greater Accra Region. This sample unit was selected because there are several micro businesses sighted in Madina with many microfinance institutions which seem to be extending micro credit to these businesses. Data was analysed to find the type of economic activity of beneficiaries, how the amount was disbursed and the effect of credit access on sales. The amount of sales was used as a proxy for poverty reduction.

4. RESULTS AND DISCUSSION

The Table 1 shows the link between Credit and Sales performance among the various beneficiaries and non-beneficiaries of MASLOC loans.

Among the beneficiaries and non-beneficiaries of MASLOC's facilities respectively, there is no difference between the ages of entrepreneurs who operate businesses. This is shown in the various standard deviation of 37.33 non MASLOC beneficiaries and 38.404 for MASLOC beneficiaries; with the paired test, the p-value is more than the t-values (calculated). This however underscores the submission that age, is not a serious factor that is considered in considering who qualifies for a credit facility or not.

On the issue of female entrepreneurs, the data showed no difference in both the beneficiaries and non-beneficiaries of MASLOC. Again, it clearly supports the earlier assertion that women tend to benefit from credit access more than men in an attempt to reduce poverty.

More than 80% of all beneficiaries of MASLOC credit are female entrepreneurs suggesting a gender sensitive initiative. This is consistent with empirical literature which suggests that most credit schemes in informal sectors are meant to empower women and since women are usually the conduit to poverty reduction, they are the major beneficiaries (Nawaz, 2010). The result shows a statistically significant difference in gender composition of beneficiaries and non-beneficiaries. The difference is statistically significant at 1%. There is no statistically significant difference between the number of employees engaged by both beneficiary and non-beneficiary entrepreneurs. This is because; the p-value (0.772) is greater than the calculated value (0.2911). This is however an indication that in accessing credit from MASLOC, the number of employees hired by the entrepreneur will thus not guarantee an access or otherwise of

Table 1. Descriptive statistics of relevant variables

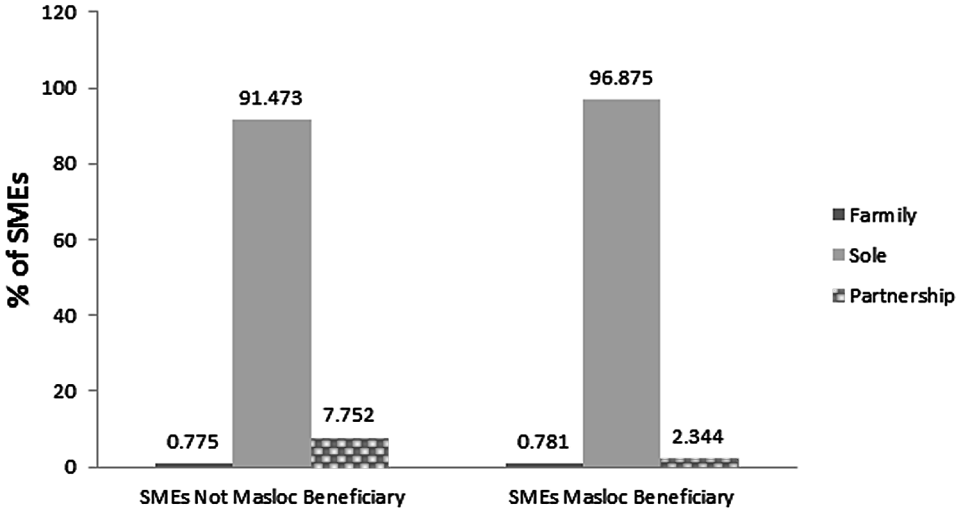
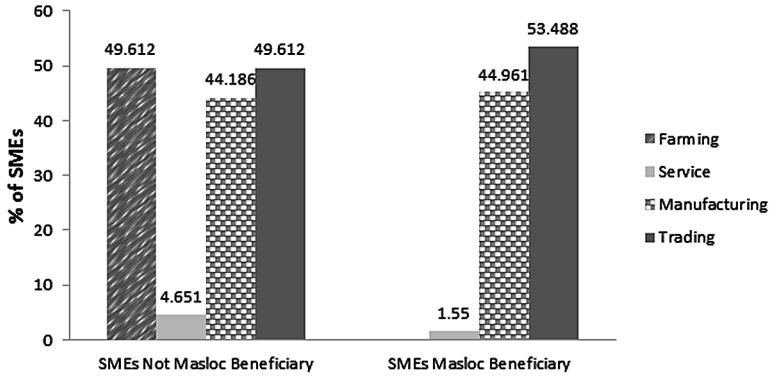
EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use



credit. It is important to note that granting of credit access is influenced by the nature of business and the level of cash flow that the business generates, as well as the credit worthiness of the entrepreneur.

There is significant difference between the issues of start-up capital. Beneficiaries of MASLOC have access to start-up capital than the non-beneficiaries of MASLOC. From the table, the standard deviation of the beneficiaries is 383.109 and that of the non-beneficiaries 373.2139. Since the t-value (2.087) is greater than the p-value (0.0381) it indicates that there is a difference in their access to start-up capital. There is also significant difference between the beneficiaries and non-beneficiaries in terms of the weekly income they get from their sales. The next section describes the ownership structure of the micro businesses (Figure 1).

Figure 1 indicates that, about 97% of the beneficiaries owned the businesses solely. This is however an indication of, one of the major reasons why commercial banks are not prepared to assist them in terms of financing as they are too much risky a business to deal with. It is important to point out that, it is always difficult if not impossible to separate the business from their owners and as such anything that affects them or any member of their family affects the business. Micro businesses lack proper records and lack of right accounting methods; they lack collateral and the technical knowhow in managing a business. This however was not different from the non-beneficiaries as about 91% also own their businesses. On partnership, beneficiaries were only 2% while that of non-beneficiaries were 8%. This means those found in this sector actually do not see the benefits of entering into partnerships but rather prefer to own their businesses. It is however not surprising that in terms of access to credit non-beneficiaries is much higher than that of beneficiaries. On ownership by family, it was virtually non-existence since it was less than 1% both for beneficiaries and non-beneficiaries. The type of economic activity follows (Figure 2).



From Figure 2, the number of non-beneficiaries is 49.612% approximately 50% followed by service with 44.19, manufacturing is 4.651% and farming is 1.550% while that of MASLOC beneficiaries, trading is 53.49%, service is 44.961%, manufacturing is 1.550% and 0% for farming. It is however not surprising that the most dominant economic activity is that of trading followed closely by service for the two groups of beneficiaries and this is mainly due to small capital required to start the business. The same

Figure 1. Ownership structure of MASLOC and non-MASLOC beneficiaries

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. A graphical presentation of the economic activities of respondents

cannot be said of manufacturing and farming whose capital requirement is much higher than trading and services. The next section shows the relationship between the sales that beneficiaries of MASLOC loans make and the amount of loans that they get from the institution (Table 2).

The loan amounts range between 200 and 500 Ghana cedis. There is a direct relationship between the amount of money borrowed and the sales volume. From the table beneficiaries who took a loan of GHs200 had sales volume of about GHs1500 while those of GHs500 had sales volumes of GHs40, 000. This indicates that the higher the loan, the higher the sales. All things been equal higher profit, an increase in disposable income, injected back into the business will increase the working capital of the entrepreneur. However, an increase in sales might not necessarily result in an increase in profit and increase in working capital since the cost of borrowing from these micro finance institutions are very high. It is worth noting that high interest rate has resulted in the collapse of a number of micro businesses. Apart from the rates, poor business management skills have resulted in the collapse of most of the micro businesses since they tend to spend the loan on consumables instead of injecting the loan into the business. For example, in a study to examine the impact of microfinance on rural farmers in Malawi, Aguilar (2006) reported that farmers who borrow from microfinance institutions were no better off than those who did not borrow. Like Aguilar (2006), Boomperm et al. (2013), Berhane and Gardebroek (2011) and Augsburg (2012) argue that there is the need for a plus component (training in financial management, marketing and managerial skills and market development) for microfinance to succeed.

Coleman (2001) found that the village bank credit did not have any significant impact on physical asset accumulation, production and expenditure on education. In other words, credit on its own is not an effective tool for helping the poor to enhance their economic conditions, unless, for example, there

Table 2. Sales and credit

Amount (GHS)	Number of Beneficiaries	Range of Sales (GHS)
2000	1	3000 - 4000
3000	15	3000 - 10000
4000	40	3000 - 25000
5000	244	3000 - 40000

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

is access to markets and other inequalities are removed. The next section explores other expenses that micro businesses spend the loans on after accessing the facility (Table 3).

From Table 3, the loans taken by the clients of MASLOC use the loans facility for payment of salaries, purchase of inputs, payment of school fees and for other expenses. A major area of usage is for other expense which shows sales value (r-value) of 39.4550. The amount spent on school fees is 20.933 of sales. This is also shown with a t-value of 0.79. The other area where the clients of MASLOCs invest is in the purchase of inputs. This is confirmed in a value of 5.7565 and a t-value of 2.57. Payment of salary is another area where part of the credit is invested into. There is a positive relation between the loans and salaries. This is clear from the table with a t-value of 2.32. Purchase of equipment, office rentals, and family upkeep are areas that most of the loans taken by MASLOC clients show little interest in investing. There is a negative correlation between MASLOC loans and amount used to purchase equipment. This indicates that clients take loan with little intentions of investing in the purchase of equipment. On the other hand, there is a high negative correlation between the MASLOC loans granted and amount of the loans used by the clients for office rentals. On family upkeep, there was also a negative relation

between the amounts taken as loans and how much they invest in their family upkeep. It is however clear from the above that, apart from putting the money into the business, the loan is also spent on payment of school fees, salaries, purchase of inputs and other expenses as clearly indicated on the table. However, these expenses are likely to affect the repayment of the loan since these areas are not likely to generate immediate profit to support the payment of the loan. The principal loan amount has reduced whiles the interest rate remains the same. Ideally, these expenses should have been paid out of the business profit. This could however result in the entrepreneur paying back the loan with the principal instead of the profit and this might affect the growth of the business.

Discussion of Results

In the quest of the researcher to establish whether there are differences in performance of recipients and non-recipients of microcredit, assess the influence of alternative use of microcredit by small firms on performance as well as identify the factors explaining the link between access to credit and performance of small scale enterprises in Ghana, the following are the results of the findings.

Firstly, those who had access to microcredit were able to increase their sales. This indicates a direct relationship between access to credit and an increase in sales. This has however been collaborated with Karlan and Zinman (2008) who examined how individuals make economic decisions over time and whether micro-lending policies aid economic development. Proponents argue microcredit mitigates market failures, spurs microenterprise growth and boosts borrowers' well-being.

Again, the study was able to confirm that indeed respondents who took microcredit used some of the funds to pay salaries, buy inputs, payment of their wards school fees and other expenses. This was however confirmed by a study undertaken by Karlan and Zinman (2008) that studied the impact of consumer credit on low income borrowers in South Africa. According to them, it is surprising to learn that micro-loans aren't just for business use; recipients use them for household consumption and investment as well (however, some specific microfinance products are more tailored towards small businesses others towards consumer lending). For instance, many use micro-loans to pay for their child's school fees, to install a new roof on their house, to repair the motorcycle that they use to get to work, for food purchases in hard times (what economists refer to as 'consumption smoothing') and many other uses.

Finally, in establishing a link between credit access and the performance of small scale enterprises, it was found out that, women tend to have more access to credit than men even though gender was not a factor that was considered in granting credit to a business.

5. CONCLUSION AND RECOMMENDATION

This chapter provides the effect of microfinance on poverty reduction and entrepreneurial development. The central issue in such credit markets is twofold: the lender does not know much about the borrower asymmetric information, and effective, commonly used contractual arrangements for contending with asymmetric information do not work because the borrowers are too poor for the lender to use financial sanctions to achieve repayment of loans.

It was shown that access to microcredit has a positive impact on the growth of small businesses. This is because those who had access to credit were able to increase their sales; the beneficiaries of micro credit did not use their proceeds only for the business but on other things such as payment of school fees,

EBSCOhost - printed on 2/8/2023 3:41 PM via . All use subject to https://www.ebsco.com/terms-of-use

wages and salaries of workers. The impulse of this is that, the beneficiary will have difficulty in paying back the loan; and it is established that gender is a factor that determines access to credit because the numbers were skewed towards women. The study also confirmed that majority of the beneficiary were sole proprietors whose economic activities were that of trading. Review of literature across developing countries confirm the success of microfinance in reducing poverty

Accessing small amounts of credit at reasonable interest rates give people an opportunity to set up their own small business. It has been said that poor people are trustable, with higher repayment rates than conventional borrowers. Poor households use microfinance to move from everyday survival to planning for the future: they invest in better nutrition, housing, health, and education.

The micro entrepreneurs should be encouraged to make savings their habit in order to reduce their dependent on the micro finance institutions (MFI). Since most micro entrepreneurs prefer to deal with these MFI's instead of the traditional commercial banks, the laws on its operation should be strengthened by policy makers in ensuring that their savings are safe as well as a check on their interest rates. An increase in loan size will have a greater multiplier effect on households' income through profits from income generating activities. The credit services should be diversified by providing working capital loan, fixed asset loan, seasonal agricultural loan, car loan, consumer loan, emergency loan and parallel loan. To increase the impact, the loan products have to fit the financial needs of a wider range of household economic activities. This will however help reduce diversion and a significant reduction in the defaulting rate of customers.

Suggestions for Future Research

The empirical discussion has focused on the effect of microfinance on poverty reduction. There is clear evidence that microfinance improves entrepreneurship and reduce poverty, research must be extended to determine the impact of microfinance on recipients over time, since some studies suggest that it takes time for microfinance to have an effect on livelihoods of the poor. Aguilar (2006) and Augsburg (2012) argues that, there is the need for a plus component, i.e. training in financial management, marketing and managerial skills and market development, for microfinance to succeed. Again, this study looked a sample population in Madina and as such the research cannot be said to be very representative and will recommend that an institution will take this topic up in the whole of greater Accra.

KEY TERMS AND DEFINITIONS

Accumulating Savings and Credit Associations (ASCAs): Informal savings groups. All members regularly save the same fixed amount while some participants borrow from the group. Interest is usually charged on loans. ASCAs require bookkeeping because the members do not all transact in the same way. Some members borrow while others are savers only, and borrowers may borrow different amounts on different dates for different periods. If members pay interest on their loans, the return to savings has to be individually calculated and fairly shared among the group.

Bankable: People who are deemed eligible to obtain financial services that can lead to income generation, repayment of loans, savings, and the building of assets.

Collateral: An asset pledged by a borrower to secure a loan, which can be repossessed in the case of default. In a microfinance context, collateral can vary from fixed assets such as a car, a sewing machine to cross-guarantees from peers.

Compulsory Savings: Savings payments that are required as part of loan terms or as a requirement for membership, usually in a credit union, cooperative, microfinance institution, and village bank or savings group. Compulsory savings are often required in place of collateral. The amount, timing, and level of access to these deposits are determined by the policies of the institution rather than by the client. Compulsory savings policies vary: deposits may be required weekly or monthly, before the loan is disbursed, when the loan is disbursed, and/or each time a loan instalment is paid. Clients may be allowed to withdraw at the end of the loan term; after a set number of weeks, months or years; or when they terminate their memberships.

Credit Union: A non-profit, member-based financial intermediary. It may offer a range of financial services, including lending and deposit taking, for the benefit of its members. The basic credit union is composed of a group of people having a 'common bond' who may be resident in the same neighbourhood or employed at the same place of work, or it can be a religious or ethnic grouping. The principal reason for the emphasis on a common bond is that the social pressure of the group is considered a very important condition as security for loans. It is a form of collateral which is not available in conventional

finance. While not regulated by a state banking supervisory agency, it may come under the supervision of regional or national cooperative council.

Group Lending: A lending mechanism which allows a group of individuals - often called a solidarity group to provide collateral or loan guarantee through a group repayment pledge. The incentive to repay the loan is based on peer pressure, if one group member defaults, the other group members make up the payment amount.

Loan Agreement: A written contract between a lender and a borrower that sets out the rights and obligations of each party regarding a specified loan.

Micro Savings: Deposit services that allow people to store small amounts of money for future use, often without minimum balance requirements. Savings accounts allow households to save small amounts of money to meet unexpected expenses and plan for future investments such as education and old age.

Microcredit: A small amount of money loaned to a client by a bank or other institution. Microcredit can be offered, often without collateral, to an individual or through group lending. The incentive to repay is based on peer pressure; if one person in the group defaults, the other group members make up the payment amount.

Microloan: A loan imparted by a microfinance institution to a micro entrepreneur, to be used in the development of the borrower's small business. Microloans are used for working capital in the purchase of raw materials and goods for the microenterprise, as capital for construction, or in the purchase of fixed assets that aid in production, among other things.

Solidarity Economics: An economics based on efforts that seek to increase the quality of life of a region or community through not-for-profit endeavours.

Chapter 31
Children and Youth Making Digital Media for the Social Good

Jill Denner
Education, Training, Research, USA

Jacob Martinez
Digital NEST, USA

ABSTRACT

This chapter describes how children and youth are using digital media to address inequity in their schools, communities, and in society. The chapter begins with a review of the historical and cultural roots of children making digital media for the social good, and situates the approach in the context of other civic and community-based movements. The next section focuses on the range of ways that children and youth are making digital media, including who is participating, and the social and institutional factors involved. The next sections describe the benefits for the participants and for society, as well as the barriers to broader participation. Two case studies highlight key strategies for engaging marginalized youth in making digital media for the social good, and ways to expand the popularity of this approach. The chapter concludes with suggestions for future research, and the broader implications for education, civic engagement, social practice and policy.

INTRODUCTION

This chapter builds on a long history of youth-led movements to address issues of social justice in their schools, communities, and beyond. Efforts to reframe youth in terms of their agency and impact have had a profound effect on how they are viewed and on what researchers study (Ginwright, Noguera, & Cammarota, 2006; Giroux, 2003; Tuck & Wang, 2013). This view of youth has become increasingly relevant as we witness a growing access to opportunities to create content with and for large and diverse audiences, which has exploded with the digital media outlets now available through mobile devices.

Although these two movements--social justice and digital media--have some obvious points of intersection, they are rarely talked about together.

In this chapter, we focus on the implications of children and youth making, not just using digital media. Our approach extends a long history of media studies that shows the way that media production is not neutral. For example, Morrell (2002) describes how the critical teaching of popular culture makes it a site for resisting injustice, an approach that is now captured in the DIY (do-it-yourself) movement in digital media and technology. Lankshear and Knobel (2008) describe DIY as a movement where novices reclaim the authority previously held by trained experts, as they express themselves through mechanisms that include podcasting, photography, music videos, and animation. In school settings the DIY movement has explored ways to use activities that include blogs, videos, and game making to engage youth and promote new literacies (Guzzetti, Elliott, & Welsch, 2010). Outside of school, DIY media creation often provides an outlet for creativity and self-expression through animated stories and e-textiles (Kafai & Peppler, 2011; Kafai & Peppler, 2014). To a great extent, the DIY movement has focused on artifacts produced by "everyday people to meet their own goals and personal satisfaction" (Lankshear & Knobel, 2008, p. 10). However, the excitement about DIY digital media is also about its potentially transformative role.
